height, their collision occasions a swell and agitation of
the waves, no less surprising than formidable. In this
conflict, the irresistible torrent of the river so far pre-
vails, that it freshens the ocean many leagues with its
flood. Columbus, before he could perceive the dan-
ger, was entangled among those adverse currents, and
tempestuous waves; and it was with the utmost diffi-
culty that he escaped through a narrow streight; which
appeared so tremendous, that he called it La Boca del
Drago. As soon as the consternation which this occa-
sioned permitted him to reflect upon the nature of an-
appearance so extraordinary, he discerned in it a source
of comfort and hope; he justly concluded, that such
a vast body of water, as this river contained, could not
be supplied by any island, but must flow through a
country of immense extent, and of consequence, that
he was now arrived at that continent which it had
long been the object of his wishes to discover. Nor
was he mistaken; for it amply answered his expecta-
tions." Many reasons obliged him to return to Hispani-
niola, in his way to which he discovered the islands of
Cubagua and Margarita, which afterwards became re-
markable for their pearl fishery.

This great man, however, was obliged to submit to
innumerable mortifications; for such were the clam-
ours of his enemies, and the ingratitude of the court
of Spain, that after all his services in making one half
of the world known to the other, he was treated like a
traitor, and carried to Europe in irons. When he ar-
rived in Spain, the court began to be ashamed of their
ungenerous treatment of this great man, and orders
were instantly issued to set him at liberty. He
vindicated his conduct, in the presence of the
king and queen, in the most satisfactory manner,
and gave ample evidence of the malevolence of
his enemies. Ferdinand and Isabella expressed their
sorrow for what had happened, disavowed their know-
ledge of it, and joined in promising him protection
and future favour. This great man, however, retained
a deep sense of the indignity with which he had
been treated; the fetters that he had been loaded
with were constantly hung up in his chamber, and
he gave orders that when he died they should
be buried in his grave. But, notwithstanding this
ill treatment, which he had received, he further-
took another voyage, in order to make further
discoveries; in the course of which he underwent
great fatigues; and, returning to Spain, ended his life

at Valladolid, on the 20th of May 1506, in the 59th year of his age; dying, it is said, with abundance of resignation, under a sense, no doubt, that the most important services, attended by the most surprising successes, were thrown away upon an ungrateful nation: he saw they could not procure him a continuance of the fame he had so justly acquired, or a moment's repose in his old age; and that there was no rest, or real felicity to be found on this side the grave. After his death indeed, his Catholic majesty was so just to this great man; as to bury him magnificently in the cathedral of Seville, and to erect a tomb to his memory, with an inscription, importing,

A new-found world, Columbus brave
To Castile and to Leon gave.

Columbus had the glory of rendering one half of the world known to the other; a glory so much the more precious; as it was unfulfilled by cruelty or rapine, which disfigured all the exploits of those who came after him, and completed his plan. The succeeding governors of Cuba and Hispaniola endeavoured to purchase, by the blood of the natives, those advantages which Columbus had obtained by his wise conduct and moderation. The above-mentioned islands contained mines of gold. The Indians only knew their situation; and the insatiable avarice of the Spaniards, too furious to work by the gentle means of persuasion, hurried them on to acts of the most shocking violence and barbarity against those unhappy men, who, they believed, concealed from them part of their treasure. The slaughter once begun, they set no bounds to their fury; in a few years they depopulated Hispaniola, which contained 3,000,000 of inhabitants; and Cuba, that had about 600,000. Bartholomew de la Casas, a witness of those atrocious depopulations, says, that the Spaniards went out with their dogs to hunt after men. The unhappy savages, almost naked and unarmed, were pursued like deer in the thick of the forests, devoured by dogs, killed by gun-shot, or surprised and burnt in their habitations. The same want of regard either to justice or mercy marked the future proceedings of the Spaniards; impelled by a thirst for gold, Cortez and Pizarro made entire conquests of the rich kingdoms of Mexico and Peru, and, after numberless acts of the basest treachery and tyranny, reduced the surviving parties to the most abject bondage and subjection. These conquests were no less extraordinary for the trivial means by which they were accomplished, than for the shortness of time in which they were completed; for, from the departure of Columbus, in 1492, to the entire reduction of Chili; which happened in 1541, seven large kingdoms, inhabited by a vast number of warlike nations, were reduced under the Spanish yoke.

A General Description of the MANNERS, CUSTOMS, GOVERNMENT, RELIGION, CHARACTER, &c. of the NATIVES of AMERICA.

WE now proceed to the study of those particulars respecting different nations, which has always been considered as one of the most important branches of human learning. Perhaps in America only, it is possible to acquire a thorough knowledge of mankind, unbiassed by education, unimpeded by learning, and untainted by corruption. Though divided into an infinite number of nations and tribes, they differ very little from each other in their manners and customs, and all form a striking portrait of the most distant nations. When we examine with attention the manners of the American studies, in some measure, the antiquities of all nations and from which considerable light may be thrown upon many passages in ancient writers, both sacred and profane.

The Americans are tall, and have straight limbs: their bodies are strong, but of a species of strength rather adapted to support a series of hardship, than to perform laborious work: it is the strength of a beast of prey rather than that of a beast of burden. Their bodies and heads are flatish, the effect of art; their features are regular, but their countenances fierce; their hair long, black, and strong, as that of a horse. They have no beards. The colour of their skin is of a reddish brown, which, being admired among them, is improved by the constant use of bears fat and paint.

The character of the Indians is founded upon the circumstances and way of life; on any serious occasions they are grave even to sadness; observant of those company; respectful to the aged; of a temper cool and deliberate, they never speak before they have considered the matter, and are sure the person who spoke before them has entirely finished. Hence they have the greatest contempt for the vivacity of the Europeans, who continually interrupt each other, and frequently speak all together. Nothing is more surprising than their behaviour in their assemblies and public councils. Every man there is heard in his turn according as his years, his wisdom, or his services to his country have ranked him. No indecent condensation or ill-timed applause is ever heard. The young attend for instruction. Here they learn the history of their nation; here they are inflamed with the fame of those who celebrate the heroic actions of their ancestors; and here they are taught the interests of the country, and the manner in which they ought to be pursued. The laws of hospitality are sacred among them. Their generosity to their friends is unbounded; but to the enemies of his country, or to those who have privately offended, the American is implacable. He conceals his sentiments, he appears reconciled, until by some treachery or surprise he has an opportunity of executing a horrible revenge. To such extremes do the Indians push their friendship or their enmity.

of the MANNERS, CUSTOMS, RELIGION, CHARACTERS, & CIVILIZATION OF AMERICA.

The study of those particular manners which has always been considered the most important branches of human knowledge, and which, in a country where it is possible to attain to a state of civilization, and untainted by the influence of an infinite number of different customs, and all forms of distant nations. Whoever wishes to know the manners of the Americans, and the antiquities of all nations, the most valuable light may be thrown upon the subject by the ancient writers, both sacred and

and have straight limbs: they are a species of strength rather than of hardship, than to perform the strength of a beast of prey, or the effect of art; their features are tenacious fierce; their hair is that of a horse. The colour of their skin is of a red, admired among them, it is of a bears fat and paint.

The Indians is founded upon their sense; on any serious occasions, they are observant of their dress; of a temper cool, and speak before they have well considered. They are fine the person who is rarely finished. Hence they are not for the vivacity of the mind, they interrupt each other, and are never. Nothing is more common in their assemblies, and there is heard in his name, wisdom, or his services are never. No indecent conduct is ever heard. The young men, when they learn the history, are inflamed with the story of the heroic actions of their ancestors, which they ought to be. Hospitality is sacred among them, their friends is unbounded, and to those who are American is implacable. He appears reconciled, with a wife he has an opportunity to engage. To such extremes of friendship or their enmity.

of such indeed, in general, is the character of all un- cultivated minds.

The prevailing passion of the Americans is liberty in its fullest extent. To this they sacrifice every thing, and this is what renders a life of uncertainty and want supportable; and their education is directed principally to cultivate and cherish this disposition. They know no punishment but death; and even when this is inflicted, it is rather a consequence of a species of war declared against a public enemy, than an act of judicial power executed on a citizen or subject. This disposition is general, and though some tribes are found in America, with a head, whom they call a king, his power is rather persuasive than coercive, and he is revered as a father more than feared as a monarch. He has no guards, no prisons, no officers of justice. The other forms, which may be considered as a species of aristocracy, have no more power. In some tribes, indeed, there subsists a kind of hereditary nobility, who, when they come to years of discretion, are entitled to a seat and vote in the council of their nation, from which the rest are excluded. Their great council is composed of these heads of tribes and families, with which whose capacity has raised them to the said degree of consideration. These councils are public, and in them all matters which concern the state are proposed and determined. Here their orators are employed, and display those talents which distinguish them for eloquence and the knowledge of business, in both which some of them are admirable. Their principal business consists in giving an artful turn to affairs, and in expressing their thoughts in a bold, figurative manner, stronger than the refined nations of Europe can bear, and with gestures equally violent, but often extremely natural and expressive.

The same council of their elders regulates whatever regards the internal peace and order of the state. Their laws are few and quickly decided, having neither property nor art sufficient to render them perplexed or tedious. Criminal matters come before the same jurisdiction, when they are so flagrant as to become a national concern. In ordinary cases, the crime is either revenged or compromised by the parties concerned. The supreme authority of the nation bestows the action without concern, and never rouses its strength, nor exerts the fulness of a power more sacred than felt, but upon some signal occasion, when the power seems equal to the occasion. Every one is hallowed to execute the orders of their senate; nor ever was there an instance of disloyalty or rebellion known among this people. Governed as they are by manners, not by laws, example and education inspires them with the most religious regard for their constitution, and the customs of their ancestors. Family love, so rare among us, is a virtue among them, of which all partake. Friendships are found among them that may vie with those of fabulous antiquity; and where such friendships exist, the families concerned

congratulate themselves as upon an acquisition that promises to them a mutual strength, and to their nation the greatest honour and advantage.

This band of friendship connects the whole society; and the loss of any one of their people, whether by war or a natural death, is lamented by the whole town to which he belongs. No business however important is taken in hand, no rejoicing, however interesting the occasion, is heard, till all the pious ceremonies due to the dead are performed; and these are always executed with the greatest solemnity. The dead body is washed, anointed, and painted, so as in some measure to abate the horrors of death. It is then followed by the whole village with mourning and lamentations to the grave, and there interred in the most pompous ornaments of the deceased. His bow and arrows, together with the things he most valued, and provisions for the long journey he is to take, are placed by him in the grave. After the funeral, those who are nearly allied to him conceal themselves a considerable time in their huts to indulge their grief. The compliments of condolence are never omitted, nor are presents wanting on this occasion. After some time, they revisit the grave, they renew their sorrow, they clothe the remains of the body in new ornaments, and repeat the solemnities of the first interment.

But the most striking instance of their friendship, and, at the same time, the greatest instance of their regard to their deceased brethren, is what they call the feast of the dead, or the feast of souls: a feast celebrated every eight or ten years. The day for this ceremony is appointed in the council of their chiefs, who give orders for every thing necessary for celebrating it with pomp and magnificence. The riches of the nation is exhausted on this occasion, and all the ingenuity of the Indians displayed. The neighbouring people are invited to partake of the feast, and be witnesses of the solemnity. All those who have died since the last feast of souls are now taken out of their graves. Those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

The horror of this general disinterment is painted in a striking manner, by the ingenious Laftau: "Without question, says that elegant writer, the opening of these tombs displays one of the most striking scenes that can be conceived;—this humbling portrait of human misery, in so many images of death, wherein she seems to take a pleasure in painting herself in a thousand shapes of horror, in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered, others have a sort of parchment upon their bones, some look as if they were baked and smoked, without any appearance of rottenness; some are just turning towards the point of putrefaction, while others are swarming with the worms."

worms, and drowned in corruption. I know not which ought to strike us most, the horror of so shocking a spectacle, or the tender piety and affection of these poor people towards their departed friends; for nothing surely deserves our admiration more, than the eager diligence and attention with which they discharge this melancholy duty of their tendernefs; handling the carcases, loathsome and disgusting as they are, cleansing them from the worms, and carrying them upon their shoulders through tiresome journeys of several days, without being discouraged by their insupportable stench, and without suffering any other emotions to arise, than those of regret for having lost persons who were so dear to them in their lives. When all the bodies they can possibly collect are brought to the great rendezvous of mortality, they are dressed in the finest skins they can procure. A feast is held on this solemn occasion, when their great actions are celebrated, and all the tender intercourses that took place between them are recounted. A large pit is dug in the ground, and the bodies re-interred with pomp, with mourning, and with lamentation. In this manner they endeavour to footh the calamities of life by the honours they pay to their dead, honours which are the more cheerfully paid, because each in his turn expects to receive them himself. Though among these savage natives this custom is impressed with strong marks of the ferocity of their nature; an honour for the dead, a tender feeling of their absence, and a revival of their memory, are some of the most excellent instruments for smoothing our rugged nature into humanity. In civilized nations such ceremonies are less practised, because other instruments for the same purposes are less wanted; but it is certain a regard for the dead is ancient and universal.

The principal occupations of a North American Indian are hunting and war. He is never considered as a brave and useful man among his tribe, till he has increased the strength of his country with a captive, or adorned his hut with the scalp of an enemy. When their chiefs resolve upon a war, they do not always declare what nation they mean to attack; that the enemy upon whom they intend to fall may be off his guard. Sometimes whole years are suffered to elapse, that the vigilance of the enemy may be entirely suspended by the uncertainty of the danger: in the mean time, they are not idle at home. The principal captain summones the youth of the town to which he belongs, the war-kettle is set on the fire; the war-songs and dances commence; the hatchet is sent to all the villages of the same nation, and to all its allies, who are expected not only to adopt their enmities, but to have their resentment wound up to the same pitch of resentment with themselves: the fire catches, the war-songs are heard in all parts, and the most hideous howlings, without intermission, day and night, are heard over that whole tract of country. The women add their cries to those of the men, la-

menting the friends they have lost either in war, by a natural death, and demanding their places to be supplied by captives from the enemy. A variety of ceremonies succeed; none are forced into the war, but when they have given small oillets of wood to their war-captain, they are considered as enlisted, and in then death to recede. All the warriors have their faces blackened with charcoal, intermixed with streaks of vermilion, which give them a horrid appearance. They then exchange their clothes with their friends, and dispose of all their finery to the women; who accompany them to a considerable distance, to receive those last tokens of their inviolable friendship and esteem.

The requisite qualities of an Indian war are valour and attention, to give and to avoid a surprise; patience and strength to endure the intolerable fatigues and hardships which always attend it. The nations of Indians in America are separated by vast desert frontiers, and hid in the bosoms of thick, gloomy, and almost boundless forests; these must be traversed before they meet an enemy, who often resides at so great a distance as it is reasonable to suppose must prevent either quarrel or danger. But it should be remembered, that the Indians take no pains to give their wars even a colour of justice. Their only motive for attacking an enemy are either to obtain the glory of the victory, or to procure captives, in order to increase the strength of their nation, or furnish them with victims for the exercise of their brutal fury.

The nation they intend to attack is sometimes wholly ignorant of any danger, and falls an easy prey to the unexpected fury of the invaders; but it more frequently happens that the nation devoted to destruction has notice of the design, and is prepared to take the same advantage of the least want of vigilance in the aggressors. They never fight in the open field but on some very extraordinary occasions. Secrecy is the soul of all their actions, and on this the success of the expedition entirely depends. During their tedious march they light no fire to warm themselves, or dress their victuals, but subsist wholly on the miserable pittance of a little meal mixed with water; they lie close to the ground during the whole day, and march only in the night, and even then with the greatest precaution. When they discover an army of the enemy, they throw themselves flat on their faces among the withered leaves, the colour of which their bodies are painted to resemble exactly. They generally let a part pass unmolested, and then rising a little, and setting up a most tremendous shout, which they call the War-hoop, they pour a storm of musket-bullets upon the enemy. The party attacked returns the same cry, and every man shelters himself behind a tree, and returns the fire of the adverse party the moment they rise themselves from the ground to give the second fire. After fighting for some time in this manner, they leave their covert, and rush upon each other with small axes, which they dart with great

addrels

AMERICA.]

have lost either in war, or in the enemy. A variety of small billets of wood to be considered as inflated, and in all the warriors have their coat, intermixed with down, which give them a more than exchange their clothes to dispose of all their finery to any them to a considerable last tokens of their esteem.

of an Indian war are very and to avoid a surpris, endure the intolerable fatigue attend it. The nation separated by vast desert of thick, gloomy, and these must be traversed often resides at so great to suppose must prevail. But it should be remarkable no pains to give them. Their only motives are to obtain the glory of captives, in order to increase, or furnish them with a brutal fury.

an attack is sometimes wholly and falls an easy prey to the others; but it more frequently devoted to destruction has compared to take the same vigilance in the aggression held but on some very emergency is the soul of all their excess of the expedition their tedious march they light or dress their victuals, but the pittance of a little meal close to the ground during the night, and occasionally throw themselves flat on dried leaves, the colour altered to resemble exactly the grass unmolested, and then a most tremendous storm, they pour a storm of my. The party attacked every man shelters himself the fire of the adverse party themselves from the ground-fighting for some time in a covert, and rush upon which they dart with great

ness and dexterity. The contest is soon decided, the conquerors satiate their savage fury with the horrid insults and barbarities on the dead bodies of the enemy, which they scalp, and treat in a manner shocking to humanity.

The fate of a North American Indian, who has the fortune to be taken prisoner, is still more severe, unless he has the good fortune to please the capricious humour of the enemy; it being customary to offer a reward to each cottage that has lost a friend, and he is either received into the family, or sentenced to death. In the former, the prisoner is adopted in the place of a father, son, or husband that is lost; and no other mark of captivity remains, than a prohibition of returning; to attempt this would be certain death: but if the prisoner is refused, it is no longer in the power of any one to save him. The nation is assembled; a scaffold is raised, and the prisoner is fastened to the cross. He immediately opens his death-song, and presumes on the ensuing scene of cruelty with a most intrepid courage, while his persecutors make ready for it to the utmost proof by every torment which the mind of man, ingenious in mischief, can invent. The prisoner suffers all their tortures with a constancy and resolution that appears more than human. Not a groan, not a sigh, not a distortion of countenance escapes him; he possesses his mind entirely in the midst of his torments; and (astonishing to relate!) the women, forgetting the human as well as the female nature, and transformed into something worse than furies, will even do the men in this horrid tragedy. It is shocking to dwell on a scene of cruelty, which degrades humanity to a degree below the ferocious beasts of the desert: let it suffice to say, that the torments inflicted should only be invented and executed by persons nursed in barbarity, and wholly destitute of the common feelings of mankind for objects in distress. These circumstances of cruelty, however, serve to shew, in the strongest light, to what an inconceivable degree of barbarity and eternal rage the passions of men may carry them, when unbridled by the refinements of polished society, and unsoftened by the benign dictates of Christianity; a religion that teaches compassion to our enemies, which is either known nor practised in other institutions; and which will tend to make us more sensible, than some appear to be, of the value of commerce, the arts of civilization, and the light of literature; which, if they have benefited the force of natural virtues, by the luxury which attends them, have taken out likewise the sting of our natural vices, softened the ferocity of the human race, improved their intellectual powers, rendered men more useful members of society, and, in some measure, destroying the character of rational and accountable beings.

Religion is little known, and less practised by the American Indians: if we except the inhabitants of Mexico and Peru, who were civilized people, and of whom a further account will be given in the respective

descriptions of each kingdom. The Indians have no temples. Some of them have very little idea of a God: others entertain better notions; they hold the existence of a Supreme Being, eternal and incorruptible, who has power over all things that exist. Satisfied with this acknowledgement, they pay him no sort of worship. There are, indeed, nations who seem to pay some religious homage to the sun and moon; and as most of them have a notion of the existence of invisible beings who intermeddle in their affairs, they often mention demons and other spirits, particularly one whom they call Areskoui, or the god of war, whom they always invoke before they march against an enemy. They have also ceremonies that seem to shew they had once a more regular form of religious worship; for they make a sort of oblation of their first fruits; observe certain ceremonies at the new and full moon, and have in their festivals many things that very probably flowed from a religious origin, though they now perform them as things handed down from their ancestors, without knowing or inquiring into the reason. Though destitute of religion, they abound in superstitions. They are great observers of omens and dreams, and pry into futurity with the greatest eagerness. Hence their country abounds in diviners, augurs, and magicians; and on their predictions they firmly rely in all their affairs, whether they relate to health, to war, or to hunting.

Agriculture, and the whole care of the family, devolves upon the women: but though they bear the laborious weight of oeconomy, they are far from being the slaves they appear, and are not at all subject to the great subordination in which they are placed in countries where they seem to be more respected. On the contrary, all the honours of the nation are on the side of the women. They even hold their councils, and have their share in all deliberations which concern the state; nor are they found inferior to the part they act. Polygamy is practised in some nations, but it is not general. Incontinent before wedlock, but after marriage the chastity of their women is remarkable. The punishment of the adulterers, as well as the adulterer, is in the hands of the husband himself; and it is often severe, as it is inflicted by one who is at once the injured party and the judge.

The continent of America, often known by the name of the New World, extends from about 80 deg. north lat. to the Straights of Magellan; in 53 deg. south lat. Some geographers extend it to the southern extremity of Terra del Fuego, in the lat. of 53 deg. 42 min. but as that country is an island, it ought not to be considered in the dimensions of the American continent. The breadth is very various; in some places it stretches from the 35th to the 136th deg. of long. It is above 9000 English miles in length, and enjoys the principal climates of both hemispheres. It is bounded on the north by unknown countries; on the south by the

Southern Ocean; on the east by the Atlantic; and on the west by the Great South Sea, or Pacific Ocean. It consists of two large continents, joined together by a narrow neck of land, called the Isthmus of Darien; and distinguished by the epithets north and south. A great variety of islands are scattered on both sides of America; but the most remarkable are situated in a large gulf formed by the coasts of the northern and southern continents, and those of the Isthmus of Darien. Some of these islands are very large, most of them fertile, and the greater part full of inhabitants. They are called the West-Indies, and will be described in their proper place.

These continents are subdivided into a great number of parts; but before we proceed to lay down these subdivisions, and to describe the different countries, it will be proper to take notice of some mountains and rivers, which, as it were, disclaim to be confined within the limits of any particular province. The most remarkable mountains in South America, form that prodigious chain called the Andes, or Cordilleras. This ridge begins in the Terra Magellanica, the southernmost country of South America, traverses the kingdom of Chili, the provinces of Buenos Ayres, Peru, and Quito; where, contracting themselves, as it were, for a passage through the Isthmus of Darien, they again expand their ample dimensions, and continue their course through the provinces and kingdoms of Nicaragua, Guatemala, Costa Rica, St. Miguel, Mexico, La Puebla, and others; with several arms or ramifications for strengthening, as it were, the conjunction between the northern and southern continents of America. In the province of Quito the Andes form a double chain, called the Cordilleras of the Andes; and between these two ridges, the city of Quito, and a large extent of fertile lands are situated. The mountains which form the Andes extend above 5000 English miles in length: nor is their height less remarkable than their extent; their summits are always covered with snow, even in the midst of the torrid zone. Many of them are volcanoes, and the greater part of them mines of the most precious metals. North America has also several lofty and extensive chains, the principal of which are called the Allegany, or Apalachian mountains.

North America is watered by innumerable rivers, some of which are very remarkable, and will be described in their respective provinces. The river Mississippi, rising from unknown sources, runs a prodigious course from north to south, and receives the vast tribute of the Ohio, the Ouabache, and other immense rivers, navigable almost to their very sources, and laying open the inmost recesses of that continent. Near the heads of these rivers are five great lakes, or rather seas of fresh water, communicating with each other, and all with the ocean by the river St. Lawrence. These afford such an inlet for commerce, as must be productive of the greatest advantages, whenever the adjacent countries shall be fully inhabited by an indus-

trious and civilized people. The eastern side of North America is watered by the noble rivers of Hudson, Delaware, Susquehanna, Patowmack, and several others of great depth, length, and commodious navigation. Many parts are indeed so intersected with navigable rivers and creeks, that great numbers of the planters may, without exaggeration, be said to have each a harbour at their own door.

South America has three of the largest rivers in the world, the river of the Amazons, the river Plata, and the river Oroonoko. The first has its source in the lake of Lauricocha, near the city of Guanaco, in 10 deg. south lat. In its course, it receives all the rivers and streams issuing from the eastern Cordilleras of the Andes, between its source, and the government of Popayan, and at last becomes rather a sea than a river, and falls into the ocean under the equinoctial. Its length, reckoning its windings and windings, is at least 3,300 miles. The river Plata rises in the audience of the same name in the eastern Cordillera of the Andes, and after running through many territories, and adding fertility to a great extent of country, falls into the ocean with such rapidity, that the water is fresh many leagues from the land. The Oroonoko has its source near Popayan, in Terra-Firma, and, after a course of 700 miles, falls into the sea in 9 deg. 13 min. north latitude.

The vast extent of South America, which lies on each side of the equator, occasions it to have a variety of soils as well as climates. Here are produced most of the metals, minerals, plants, fruits, trees, and wood, to be met with in other parts of the world, and many of them more valuable and in greater quantities. Europe has been supplied with such immense quantities of gold and silver from America, that those valuable metals become much more common than formerly; and the gold and silver of Europe now bear little proportion to the high price they bore upwards of a century ago. This country also produces diamonds, pearls, emeralds, amethysts, and other costly stones, which, by being brought in great numbers into Europe, have contributed likewise to reduce their value.

Spanish America, besides the chief part of the above-mentioned productions, abounds with a great number of other commodities, which, though of less price, are of much greater use. They consist of cochineal, indigo, annatto, logwood, brazil, fustic, pimento, lignum vitae, rice, ginger, cocoa, sugar, cotton, tobacco, barbilla, red-wood, the balsams of Tolu, Peru, and Chili, Jesuits-bark, mechoacan, saffras, sarsaparilla, casta, tamarinds, hides, furs, ambergris, and a great variety of woods, roots, and plants, which, before the discovery of America, the Europeans bought of the Venetians and Genoese at an extravagant price. The soil of this continent is so fertile, that many exotic productions are raised here in great perfection. A variety of excellent fruits also grow wild here, as pine-apples, pomegranates, citrons, lemons, oranges, malicorns, cherries,

The eastern side of North America, the great rivers of Hudson, Delaware, and several others, afford a commodious navigation. Many of these rivers are navigable for many leagues; and the planters may, with ease, have each a harbour at the mouth.

The largest rivers in the continent, the river Plata, and the Amazon, both have their source in the Cordillera of Guayana, in the city of Guanaco, in the north of Peru. The Amazon receives all the waters of the eastern Cordillera of the continent, and the government of Peru is situated on the banks of this river, which is a sea than a river. The equinoctial, by the trade winds, is at least 100 leagues from the Cordillera of the Andes, and the waters of the Amazon territories, and adjacent country, falls into the sea, where the water is fresh, and the soil is fertile. Oronoko has its source in the mountains of Guayana, and, after a course of 1500 leagues, falls into the sea in 9 deg. 13 min.

North America, which lies on the north of the equinoctial, is a country that has a variety of productions. There are produced many sorts of fruits, trees, and woods, and many quantities of water. Europe imports immense quantities of gold, silver, and those valuable metals, which were formerly; and the country bears little proportion to the value of a century ago. Diamonds, pearls, emeralds, rubies, sapphires, and stones, which, by being transported to Europe, have considerable value.

The chief part of the above-mentioned commodities are produced with a great number of hands, though of less price, and the assistance of cochineal, indigo, saffron, pimento, lignum vitae, cotton, tobacco, bark, sugar, Tolu, Peru, and Chilli, saffron, saffaparilla, castoreum, and a great variety of other commodities, which, before the discovery of the Indies, were bought of the Venetians at a high price. The soil of the continent produces many exotic productions of great perfection. A variety of plants are found here, as pine-apples, oranges, malicorns, cherries,

berries, pears, apples, figs, grapes, great numbers of medicinal, and other herbs, roots, and plants.

North America, so far as known, is chiefly claimed, and divided into colonies, by the Spaniards, English, and Portugese; for the French and Dutch having only a few settlements upon Surinam and Guiana, scarcely deserve to be considered as proprietors of any part of the northern continent. The Spaniards, who were the first discoverers of this country, have the largest and richest territory, extending from New Mexico and Louisiana, North America, to the Straights of Magellan, in the South Sea, excepting the large province of Brasil, which belongs to the Portugese.

Before the late unhappy war, Great-Britain was not so much interested in North America as she is now; she derived her claim to North America from the first discovery of that continent by Sebastian Cabot, in the name of Henry VII. anno 1497, about 20 years after the discovery of South America by Columbus. This country was at first called Newfoundland, and it was a long time before the English attempted to settle it. The great Sir Walter Raleigh first shewed the way, by planting a colony in the northern part, to which he gave the name of Virginia, in honour of his mistress Queen Elizabeth. From this time, till the conclusion of the late war, the French had a claim to, and actually possessed Canada and Louisiana, which included all that extensive inland country, reaching from Hudson's-Bay, on the north, to Mexico and its gulf on the south; regions which all Europe could not people in many ages; but no territory, how extensive soever, nor could the most boundless empire gratify the ambition of that aspiring nation; therefore, during the most solemn treaties, they consented to make gradual advances upon the English back settlements, and rendered their acquisitions more secure and permanent, by a chain of forts well supplied with all kinds of warlike stores. They laboured at the same time, by various arts, industriously to gain the friendship of the Indians, even by intermarriages, and they only trained these savages to the use of arms, but refused into them the most unfavourable notions of the English, and the superior strength of their nation.

The British colonies, thus hemmed in, and confined to a strip of land along the sea-coast, by an ambitious and powerful nation, the rivals and natural enemies of Great-Britain, began in 1755 to take the alarm. The British empire in America, scarcely raised from its infant state, was threatened with a total dissolution. In their distress, they solicited the assistance of the mother

country. The bulwarks and thunder of England, accompanied with powerful armies, commanded by a set of heroes, the Scipios of that age, were sent to their relief. A long war succeeded, in which the colonists took an active part, and success every-where attended the British arms; so that after a very bloody and obstinate contest, the French were driven from Canada and its dependencies, and obliged to relinquish all that part of Louisiana lying on the east side of the Mississippi. Thus at an immense expence, and with the loss of many brave men, our colonies were preserved and secured to us, whereby we had possession of a territory, which, from north to south, extended near 4000 miles in a direct line; but to the westward our boundaries reached to countries unknown, even to the native Indians; a tract supposed to be nearly equal to all Europe. But all our flattering prospects respecting the American possessions are now annihilated by the late unhappy war, which, after a continuance of eight years, with a prodigious expence of blood and treasure, terminated in their entire disunion from Great-Britain, and in the establishment of a new republic, styled, *The Thirteen United States of America*. This vast country is washed all the way by the Atlantic Ocean on the east, and by the Gulf of Mexico on the south.

The Spaniards, English, and French, possess the multitude of islands which lie between the two continents of North and South America. Three or four small islands indeed belong to the Dutch, but these, in any other hands, would be of no consequence; and the Danes have one or two, but they are too inconsiderable to entitle the owners to a claim on America. The French, it is said, have lately ceded to Sweden the small island of St. Bartholomew.

In describing the situation, extent, and boundaries of the numerous colonies which now compose that great empire, we have totally rejected the accounts given us by partial French writers, as well as those of Salmon and other English geographers, if men deserve that name, who have wandered so widely from the truth, and who seem either unacquainted with the subject, or have been at no pains to consult the latest and most authentic materials. This we thought necessary to premise, that the reader may be prepared for the following Table, which he will find to differ widely from any book of geography hitherto published, being composed from the latest treaties and partitions, and the best maps and drawings; the surest guides in giving the geography of these important provinces.

We shall now proceed to the particular provinces, beginning, according to our method, with the northern.

The following TABLES, taken from the latest and most authentic Materials, will exhibit the Situation of the Countries which compose NORTH-AMERICA with respect to each other, and the several Particulars relative to each.

Colonies.	Length.	Breadth.	Sq. Miles.	Chief Towns.	Belonging to
New Britain	850	750	318,750	Quebec	Great-Britain
Province of Quebec	600	200	100,000	Quebec	Ditto
New Scotland	350	250	57,000	{ Halifax	Ditto
New Brunfwick				{ Shelburne	
New England	550	200	87,000	Boston	United States
New York	300	150	24,000	New York	Ditto
New Jersey	160	60	10,000	Perth Amboy	Ditto
Pennsylvania	300	240	15,000	Philadelphia	Ditto
Maryland	140	135	12,000	Annapolis	Ditto
Virginia	750	240	80,000	Williamsburgh	Ditto
North Carolina	700	380	110,000	{ Edenton	Ditto
South Carolina				{ Charleston	
Georgia				{ Savannah	
East Florida	500	440	100,000	{ St. Augustine	Spain
West Florida				{ Pensacola	
Louisiana	1200	645	516,000	New Orleans	Ditto
New Mexico and California	2000	1000	600,000	{ St. Fee	Ditto
Mexico, or New Spain				{ St. Juan	
	2000	600	318,000	Mexico	Ditto

* It may be necessary to observe here, in order to prevent mistakes, that though the above Table, contains the territories now belonging to the United States of America, is strictly accurate; yet as New-England then comprises four provinces, viz. New-Hampshire, Massachusetts-Bay, Rhode-Island and Providence Plantations with Connecticut; and Pennsylvania includes Delaware; those four, therefore when added to the rest begining at New-York, will compose the whole Thirteen Provinces claimed by, and appropriated to the Americans, when they withdrew their allegiance from Great-Britain, and asserted in Congress their independence, on the 4th of July 1776; and which provinces are generally arranged in the following order: New-Hampshire, Massachusetts-Bay, Rhode-Island and Providence Plantations, Connecticut, New-York, New-Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia.

GRAND DIVISIONS OF SOUTH AMERICA.

Nations.	Length.	Breadth.	Chief Towns.	Belonging to

CHAP.

THIS country, which lies round Hudfon's-Bay, and is commonly called the country of the Esquimaux, comprehending Labrador, New North and South Wales, is situated between 50 and 62 deg. of north lat. and between 50 and 95 deg. of west long. It is bounded by unknown lands and frozen seas about the north; by the Atlantic ocean and Baffin's Bay, on the east; by the bay and river of St. Laurence, Canada, on the south; and by unknown lands, on the west.

The mountains towards the north are exceeding high, and their tops perpetually covered with snow: as the winds blow from thence three quarters of the year, the winter all over this country is extremely severe and cold.

The chief rivers are the Moose, Severn, Rupert, Nelson, Albany, and Black River. Hudfon's-Bay, which includes several others, is the principal; its extent in length is about 690 miles, its northern boundary is marked at Davis's Streights; the other chief streights are those of Hudfon and Belleisle.

The soil of this country is in general barren, owing to the great severity and rigour of the climate; even the hardy pine-tree is not seen, and the cold womb of the earth produces only some miserable shrubs; every kind of European seed brought hither has perished; but as the place from whence the seed comes is of great moment, it is therefore probable that the feed of corn brought from the northern parts of Sweden and Norway, might thrive better in this inhospitable climate.

The woods in this part of the world abound in moose-deer, elks, stags, rein-deer, bears, tygers, buffaloes, wolves, foxes, beavers, otters, lynxes, ermins, martens, squirrels, wild-cats, and hares. The fowls found here are geese, buftards, ducks, partridges, and many other sorts, both wild and tame. In the seas are found whales, morfes, seals, cod, and a white fish preferable to herrings; and the rivers and fresh waters furnish plenty of pike, perch, carp, and trout.

One general remark here may not be improper: it is observable, that the animals of America are neither so large nor so fierce as those of Asia and Africa; and even those which are sent hither from Europe are found to degenerate. The taprette, which is the largest animal found in the New World, does not exceed in size a well grown calf; whereas the Asiatic elephant when grown to above fifteen feet in height; and there

is still a greater disproportion between the lama of America, and the African camel. The tyger of Bengal has been sometimes known to measure twelve feet in length, while the congar, or tyger of America, does not exceed three; and the American toqua and toquarretti are despicable, in comparison of the Asiatic leopard and panther. It is observable, however, that though the quadrupeds of the new continent are greatly inferior in size to those of the old, they are much more numerous; the goat, exported from Europe to South America, will, in a few generations, become much less, as well as more prolific, and, instead of one or two kids at a time, generally produces five, six, and sometimes more. The wisdom and goodness of Providence is very conspicuous, in causing the smallest animals to multiply in the greatest proportion, and the most formidable to be less prolific; for had the elephant, the rhinoceros, and the lion been endued with the same degree of fecundity with the rabbit or the rat, all the arts of man would not have been sufficient to check their outrage, and we should soon perceive them become the tyrants of those who now call themselves the masters of the creation, to the endangering the utter extirpation of the human species.

In summer the animals in the northern extremities of America are of a variety of colours, as in other parts of the world: but as soon as the winter approaches, they gradually change; the beasts, and many of the birds, becoming as white as the snow with which the ground is covered. Even the dogs and cats carried from England to Hudfon's-Bay, are subject to the same alteration, and acquire a much longer, softer, and thicker fur, than they had in their own climate.

The lands near the south parts of Hudfon's-Bay produce large timber and plenty of herbage, and, if properly cultivated, might yield corn. About Fort Nelson, the country, which is low and marshy, produces juniper, birch, poplar, and a small tree of the spruce or fir kind; but there is little other herbage, besides mofs.

The Esquimaux Indians, who inhabit the inland parts of Labrador, are the most cowardly, ferocious, and untractable people in America. They lead a vagrant life, have no settled habitations, nor do we know of any villages or towns among them; but they are extremely numerous, and so mischievous, that often, during the night, they will cut the cables of ships, that they may enjoy their wrecks in the morning. They trade with the European vessels, exchanging the furs of their country for knives, scissors, pots, kettles, and other hardware; but they are never suffered to come on board in too great numbers, instances having been known where they have mastered the crew, and plundered the ship. The food of these, and the American Indians in general, consists chiefly in what they take by hunting and fishing. They clothe themselves in winter with beaver skins, which they oil and grease in the same manner as they do their own in summer,

summer, which prevents both the cold and heat from penetrating them. They wear a kind of buskins on their legs, and shoes of deer skins; they use also beaver skins and furs for their beds and covering in the night. A number of Indian men, and some women, come down annually, in about six hundred canoes, to Fort-Nelson, in order to trade with the English. These people are of a darker complexion, and smaller size, than those of Labrador, but they are much more gentle and tractable. They wear scarce any clothes in summer, but anoint themselves with bear's grease, or the oil of seals, which defends them from the attacks of musquetoos, bugs, and other troublesome insects. Many of them come from very distant countries, and their voyages are rendered still longer, by being oblig'd to go on shore every day to hunt for provisions, their canoes, or kiacks, which they manage very dexterously, being only large enough to contain two persons, and a parcel of beaver-skins. The people of this country bear no resemblance in their shapes and faces to the southern Americans; but are much more like the Laplanders and Samoiets of Europe, from whom they are very probably descended.

The commerce with this country is carried on by a company consisting of nine or ten persons, called the Hudson's-Bay Company, who, in 1670, obtained an exclusive charter for trading to this bay, and they have acted under it ever since with great benefit to themselves, though comparatively with little advantage to Great-Britain. The fur and peltry trade might be carried on to a much greater extent, were it not entirely in the hands of this exclusive company, whose interest, not to say iniquitous spirit, has been the subject of long and just complaint. The company employ four ships, and 130 seamen. They have several forts; viz. Prince of Wales's Fort, Churchill River, Nelson, New Severn and Albany, which stand on the west side of the bay. In May 1782, the French took and destroyed these forts, settlements, &c. by which the company sustained a loss of near 500,000l. They export commodities to the value of 16,000l. and in return they bring home to the amount of 20,340l. which yield to the revenue 3,734l. This includes the fishery in Hudson's-Bay. Small as this commerce is, it affords immense profits to the company, and even some advantage to our manufacturers here; for as the Indians are not very nice in their choice, such commodities of British manufacture are sent them, as we have great plenty of, some of which would not meet with a market elsewhere. In exchange for these, they have deer, beaver, and other skins, castor, feathers, whalebone, and blubber. Since our conquest of Canada, the trade of this company is less advantageous; but the profit it affords in its present restrained state, prove incontestably the immense benefit that would accrue to Great-Britain, by throwing open the trade to Hudson's-Bay.

THE HISTORY OF NEW-BRITAIN

THESE northern countries and seas were not discovered till long after the other parts of the new world were known; and might perhaps still have remained in obscurity, had not the active genius of mankind prompted them to make discoveries of a very different nature. As early as the year 1576, a project started in England, for the discovery of a North-West passage to China; and the East-Indies. Frobisher only discovered the main of New-Britain, or Terra de Labrador, and those tracts which bear his name; but failing in his principal attempt, the design was laid aside till the year 1585, when John Davis sailed from Portsmouth, and surveyed the coasts of Labrador; but did not extend the discoveries of his predecessor. Hudson, a remarkable seaman, and experienced, made three voyages the first in 1607, the second in 1608, and the third in 1610. Fearless of dangers, and proof against the piercing cold of the climate, this intrepid mariner penetrated as far as 80 degrees and a half north latitude; he even wintered here, and would, in all probability, have finished the discovery, had not his enterprise discontinued, and committed their brave commander, and seven of his faithful adherents, to the fury of the seas, in an open boat; where they were either swallowed up by the waves, or, gaining the inhospitable shore, destroyed by the savages. This was an irreparable loss to the public, as most of the discoveries he had made were buried with him. Other attempts towards a discovery were made in 1612 and 1613, and a patent for planting the country, with a charter for a company, was obtained in 1670. Captain Barrow, in 1746, wintered as far north as 57 degrees and a half; and Captain Christopher attempted further discoveries in 1761.

Besides these voyages, which satisfy us that we need not look for a passage on this side of the latitude of 60 degrees north, we are indebted to the Hudson's-Bay Company for a journey by land; which throws some additional light on this matter, by affording what may be called demonstration, how much farther north, at least some parts of their voyages, ships must go, before they can pass from one side of America to the other. The northern Indians, who come down to the company's factories to trade, had brought to the knowledge of our people a river, which, on account of much copper being found near it, had obtained the name of Copper-Mine-River. The company, being desirous of thoroughly investigating this matter, directed Mr. Hearne, a young gentleman in their service, who, from his skill in the sciences, was extremely well qualified for the purpose, to proceed over land, under the convoy of those Indians, for that river, which he had orders to survey, if possible, go down to its exit into the sea; to make observations for fixing the latitudes and longitudes; and to bring home maps and drawings both of it, and of what

OF NEW-BRITAIN

other parts of the new world perhaps still have remained the active genius of mankind. Discoveries of a very different year 1576, a project started by a North-Well passage. Prohibiter only discovered, or Terra de Labrador, his name; but failing in his sign was laid aside till the failed from Portsmouth, Labrador; but did not extend. Hudsou, a French, made three voyages in 1608, and the third, and proof against the climate, this intrepid man 60 degrees and a half north here, and would, in all probability, had not his men their brave commander, were to the fury of the where they were either for, gaining the inhospitable savages. This was an attempt, as most of the discoveries with him. Other attempts made in 1612 and 1613 in the country, with a chance in 1670. Captain Baffin north as 57 degrees and the philosopher attempted further

which satisfy us that we are on this side of the latitude indebted to the Hudson's Bay land; which throws matter, by affording what may go much farther north, at least, ships must go, before they can reach America to the other. To come down to the company, brought to the knowledge on account of much copper obtained the name of the company, being desirous of this matter, directed the man in their service, who was, was extremely desirous, to proceed over the Indians, for that purpose survey, if possible, near the sea; to make observations of longitudes; and to both of it, and of what

er occurred worthy of notice in the course of his

Mr. Hearne accordingly set out from Prince of Wales's Fort, on Churchill-River, on December 7, 1770, and on the 13th of June 1771 reached the Copper-Mine-River, and found it all the way, even to the exit into the sea, incumbered with shoals and falls, and emptying itself into it over a dry flat of the shore, the tide being then out, which seemed, by the edges of the ice, to rise about twelve or fourteen feet. This, on account of the falls, will carry it but a very small way within the river's mouth, so that the water it was not in the least brackish; Mr. Hearne is, however, sure of the place it emptied itself into being the sea, or a branch of it, by the quantity of whale-bones and seal-skins which the Esquimaux had at their tents, and also by the number of seals which he saw upon the ice. It appears by the map which Mr. Hearne drew of this singular journey, that the mouth of the copper-mine lies in lat. 72 deg. N. and long. 65 deg. W. from Churchill-River, that is, about 119 deg. W. of Greenwich.

Mr. Hearne's journey back from the Copper-Mine to Churchill, lasted till June 30, 1772; so that he was absent upwards of a year and a half. The unparalleled hardships he suffered, and the essential service he performed, have met with a suitable recompence from his employers. This gentleman has been several years Governor of Prince of Wales's-Fort, on Churchill-River, where, in 1782, he was taken prisoner by the French; but he afterwards returned to his station. We now see, from the particulars of this extensive discovery, that the continent of North-America stretches from Hudson's-Bay, so far to the north-west, that Mr. Hearne travelled near 1,300 miles before he arrived at the sea; and that the whole of his track to the northward of 61 deg. N. lat. lay near 600 miles due west of the western coast of Hudson's-Bay; at the same time that his Indian guides were certain that a vast tract of land stretched still further in the same direction.

C H A P. III.

C A N A D A.

Situation, Extent, Climate, Mountains, Rivers, Animals, Fish, Produce, Lakes, Inhabitants, Government, and Religion.

THIS country, after its reduction by the English, in the war of 1756, was formed into a British colony, called the Province of Quebec. It is situated between 61 and 81 deg. west long. and between 45 and 52 deg. north lat. its length is 600 miles, breadth 200, and contains 100,000 square miles. It is bounded

on the north and east, by New-Britain and Hudson's-Bay; on the south, by Nova-Scotia, New-England, and New-York; and on the west by unknown lands.

All that vast tract on the back of the British settlements, from Canada and the Lakes, to the Pacific Ocean, which washes America on the west, is perfectly unknown to us, no European having ever travelled thither. From the climate and situation of the country, it is supposed to be fruitful: it is inhabited by innumerable tribes of Indians, many of whom used to resort to the great fair of Montreal, even from the distance of 1000 miles, when that city was in the hands of the French. In some of these inhospitable regions, their nights are from one to six months, and the earth bound up in impenetrable snow; so that the miserable inhabitants live underground great part of the year; but when the sun revisits them, they have a day of equal length.

The climate of Canada varies greatly in this extensive tract; but along the banks of the river St. Laurence, it is prodigiously cold in winter, and exceeding hot in summer, as most of those parts of America commonly are, which do not lie too far to the northward. The rest of the country, as far as is known, being intersected with large woods, lakes, and rivers, is still colder. Notwithstanding the length and severity of the winters here, the soil is in general very good, and in many parts affords a pleasing view by its fertility, producing wheat, barley, rye, with many other sorts of grain, fruits, and vegetables; tobacco is also much cultivated here, and thrives well. The Isle of Orleans, near Quebec, and the lands upon the river St. Laurence, are remarkable for the richness of their soil; and the meadow grounds in Canada, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle.

Some authors assert, that silver has been found in the mountains of Canada: this may be true, but we do not find that any great advantage has hitherto been made by it. Near Quebec, however, is a fine lead-mine; and coals are found in great plenty here.

The rivers in this province are very numerous, and many of them large, bold, and deep, running through a prodigious tract of territory. The principal are, the Outawais, St. John's, Seguinay, Desprairies, and Trois Rivieres, but they are all swallowed by the river St. Laurence, which has its source in the Lake Ontario, and, after a course of near 750 miles, falls into the sea at Cape Rosieres. It receives the Outawais at Montreal, forms several fine islands, and meets the tide above 400 miles from its mouth. It is navigable for large ships many miles above Quebec, and at Cape Rosieres, where it falls into the sea, it is above 90 miles in breadth, and is so deep, that, in the war of 1756, ships of the line contributed to reduce that capital. It has several falls or cataracts in its course, so that the navigation is interrupted; but the difficulties might be easily surmounted, and the navigation continued

continued to Lake Ontario. In its progress it forms a great variety of bays, harbours, and islands, many of them fruitful, and extremely pleasant. The French (now subjects of Great-Britain) have a great many settlements made on its banks, where the soil is very fruitful, and all the necessaries of life may with very little trouble be procured. It is not improbable that Canada, and those vast regions to the west, will be enabled of themselves to carry on a considerable trade upon the great lakes of fresh water which these countries environ.

Here are five lakes; that of Ontario, which is the smallest, is not less than 200 leagues in circumference, and therefore larger than any other piece of fresh water in the old world. The lake Erie, or Oswego, is longer, but not so broad, and about the same in extent. The lake Huron is much broader than either of the former, and about 300 leagues in circuit. The lake Michigan is about equal to that of Huron in circumference, but narrower and longer; and lake Superior far exceeds all the rest. It has several large islands, and is not less than five hundred leagues in circumference. A small flux and reflux have been observed, but not regulated by the course of the moon, but rising and falling as it were instantaneously; the surface of the rocks near the banks being covered and uncovered several times in a quarter of an hour, even when a calm prevails, and the surface of the lake is smooth and level. They are all navigable by vessels of very considerable burden, and all communicate with one another. The navigation is indeed stopped between lake Ontario and lake Erie, by the most tremendous cataract in the world, called the Falls of Niagara. The freight which connects the two lakes is here about two miles broad, but separated by an island into two streams, the largest of which is about half a mile in breadth. This stream, which forms the grandest part of the cataract, is crossed by a rock in the form of a half moon, from which the water tumbles near 160 feet perpendicularly. Imagination itself can hardly paint a more awful scene than this amazing sheet of water hurled headlong from so great a height on the rocks below. The traveller is struck with consternation at so tremendous a sight, while his ears are deafened with the prodigious roarings of the waters. The vapours arising from the cataract form a kind of cloud, or pillar of smoke, which in calm serene weather may be seen at a great distance; and when the spectator is in a proper position with regard to the sun, this cloud or vapour exhibits a beautiful rainbow. The noise of this cataract is plainly heard at fifteen miles distance. Many beasts and water-fowl lose their lives by attempting to cross the river at the island already mentioned, where the stream is extremely rapid, so that before they can reach the further shore, they are hurried over the precipice and dashed to pieces. Many of the Indians have met with the same fate either by drunkenness, or want of care. Perhaps no place in the world is frequented by such a number of eagles as are invited

hither by the carnage of deer, elks, bears, &c. which these birds feed. These lakes, whenever the adjacent countries are settled by a civilized and mercerial people, must prove of the greatest advantage to the adjacent country indeed seems to have been intended by nature for the seat of a numerous and trading people. We have already observed, that the river of Laurence communicates with lake Ontario; and that river might be rendered navigable, a communication would be opened with the Atlantic Ocean, and consequently with all the parts of Europe.

As we are now entering upon the cultivated provinces of British America, and as Canada is upon the borders of the United States, and contains almost all the different species of animals, wood, and vegetables that are found in these colonies, we shall here speak of them at some length, in order to avoid repetitions. The animals make the most curious and hitherto the most interesting part of the natural history of Canada, which abounds in stags, elks, deer, bears, foxes, martlets, wild cats, ferrets, weasels, large grey squirrels, hares, and rabbits. In the southern parts of it are found great numbers of wild bulls, various kinds of bucks, deer of a small size, goats, wolves, &c. and the marshes, lakes, and pools, throughout the country are filled with beavers, of which remarkable animals some further account will doubtless be expected.

The beaver is near four feet in length, its body greatly resembling that of a mountain rat. The fur is long, the eyes small, the ears short, round, and hairy on the outside, but smooth within. The legs particularly the fore ones, are short, and the nails of the fore feet stand obliquely, and are hollow like quills; but the hind feet are flat, and furnished with membranes or webs between the toes. The tail, which is almost oval, is a foot in length, an inch thick, four inches broad at the root, five in the middle, and three at the extremity. It is covered with scales, indented in such a manner as to be easily separated after the death of the animal. The jaws are amazingly strong, and each furnished with ten teeth, two incitive and eight molar. They live from fifteen to twenty years, and the female generally brings forth four young ones at a time. It is an amphibious quadruped, never continues any length of time in the water, but cannot exit without frequently bathing in it. Beavers are of different colours, black, brown, white, yellow, and straw colour; the black and the white are the most valuable. The skin of the beaver is of two kinds, the dry and the green; the first is the skin before it has been applied to any use, and the second are the furs, several of which being sewed together, are worn by the Indians, who rub them over with unctuous substances, which render them pliable, and at the same time give the fine down which is manufactured into hats, &c. that oily quality proper for mixing with the dry tur, when worked. Of late years both the Dutch and the English have discovered the art of making excellent cloths, gloves, and

of deer, elks, bears, &c. These lakes, whenever settled by a civilized and improved of the greatest advantage seem to have been intended by a numerous and trading people observed, that the river is navigable, a communication with the Atlantic Ocean, and upon the cultivated provinces as Canada is upon the banks, and contains almost all the grain, wood, and vegetables that we shall here speak of, to avoid repetitions. The curious and hitherto the natural history of Canada, which deer, bears, foxes, martlets, large grey squirrels, hares, in the southern parts of it are found, bulls, various kinds of roe, size, goats, wolves, &c. and woods, throughout the country of which remarkable animals doubtless be expected.

four feet in length, its head of a mountain rat. The forehead the ears short, round, and smooth within. The legs are short, and the nails are hollow like quills, and furnished with membranes. The tail, which is almost an inch thick, four inches in the middle, and three at the tip, with scales, indented in fish, and separated after the death of the animal, is amazingly strong, and each of the two incise and eight molar teeth, in twenty years, and the female young ones at a time. It never continues any length of time that cannot exist without travellers are of different colours, brown, black, and straw colour; the most valuable. The fur is in two kinds, the dry and the green; it has been applied to many of the furs, several of which are worn by the Indians, who use various substances, which render them in some time give the fine down of hats, &c. that oily quality of the dry fur, when worked by the Dutch and the English has produced excellent cloths, gloves, and

stockings, from the beaver fur. The skin is not only thing for which this animal is valuable; it produces that useful drug called castoreum, contained in the bags formed by nature for this purpose only, in the lower part of the belly. The flesh of the beaver is said to be exceeding good eating; the tail is esteemed the most delicious dish that can be imagined. The capacity of these animals in erecting their huts, and providing against the approach of winter, is so amazing, that the savages suppose them rational creatures, who live in societies, and are governed by a leader or chief, and take care of themselves. It must indeed be allowed, that the various accounts given of this animal by ingenious travellers, the manner in which it contrives its habitations, provides food to serve during the winter, and always in proportion to the continuance and severity of the season, are sufficient to shew the near approaches of instinct to reason, and even, in some instances, the superiority of the former. The Americans have two or three different ways of taking beavers; they sometimes shoot them, and at others take them in traps, which last method they prefer, because it does not damage the skin. There is a diminutive species of beaver, called the musk-rat, which resembles that animal in every respect but the tail, and affords a very strong musk.

The buffalo of Canada is larger than that of Europe, but their appearance is much the same; the body is covered with a black wool, which is very valuable, and the hide is as soft and pliant as chamois leather, but so exceeding strong, that the Indian bucklers, which are made of it, are almost proof against a musket ball. The elk is of the size of a horse or mule, and his colour a mixture of light grey and dark red. They delight in cold climates, where, during the winter, they live upon the bark of trees. When this animal is hunted, he becomes very violent; sometimes springing furiously on his pursuers, and trampling them to death. To prevent this, the hunter throws his clothes to him, and while the deluded animal spends his fury on these, he takes proper measures to kill him. Wolves are exceeding scarce in Canada, but they afford the finest furs in all the country. The black foxes are also very uncommon there, but highly valued. Those of other colours are common; and some on the Upper Mississippi are of a silver colour, and very beautiful. The Canadian wood-rat, which is likewise of a fine silver colour, is as large again as the European rat, and has a fine bushy tail; the female has a bag under her belly, which she opens and shuts at pleasure; and here she conceals her young when pursued. The pole-cat of Canada is entirely white, except the tip of the tail, which is as black as jet. When pursued, he lets fly his urine to annoy the assailants, which, it is said, infects the air for a quarter of a league round: hence he is called by the inhabitants the devil's brat, or the stinkard. There are two sorts of bears in this country; one of a reddish, and the other of a black colour; but the first is the most dangerous. The bear is not naturally fierce; for he is

never known to attack a man, unless when wounded or oppressed by hunger. There is a carnivorous animal found here, called the Carcajou, which is of the cat kind, with a tail of such prodigious length, that Charlevoix declares he has twitted it several times round his body. It is said that this animal, winding himself about a tree, will dart from thence upon the elk, twist its strong tail round its body, and tear open its throat in an instant. There are three sorts of squirrels in Canada; one of which is called the flying squirrel; it has, however, no wings; but on each side a loose skin, extending from the fore to the hind feet, to which it is connected. This the creature can stretch out like a sail, and the air which it contains, buoys him up in such a manner, that he can leap from tree to tree forty paces asunder. This little animal is easily tamed, and very lively, except when asleep, which is often the case; and he puts up wherever he can find a place, in one's sleeve, pocket, or muff; he first pitches on his master, whom he will distinguish among twenty persons. The Canadian roe-buck is a domestic animal; and the porcupine not so large as a middling-sized dog. We have been thus circumstantial in our description of these animals, because in their furs consist the chief commerce of the country, and to these we owe the materials for many of our manufactures.

The forests of Canada contain two kinds of eagles, the largest of which have a white head and neck, but the others are entirely grey. The falcons, goshawks, and terrels, are exactly the same as in Europe. The partridges are red, grey, and black, with long tails, which they spread out like a fan, and make a fine appearance: woodcocks are very scarce, but snipes and water-fowl are exceeding plentiful. Twenty-two different species of ducks are found in Canada, and a great number of swans, turkeys, geese, bustards, teal, water-hens, cranes, and other large water-fowl; but they are always at a distance from the inhabited part of the country. A Canadian raven is by some writers affirmed to eat as well as a pullet, and an owl better. Thrushes and goldfinches, resembling those of Europe, are found here; but the chief singing-bird of Canada is the white bird, a species of ortolan, very shewy, and remarkable for proclaiming the return of spring. The wood-pecker is a beautiful bird, but far exceeded by the fly-bird, which is supposed to be equalled by none of the feathered tribe; with all his plumage he is not larger than a cock-chaffer, and makes a noise with his wings like the humming of a large fly: his legs are not thicker than a small needle; and from his bill, which is of the same size, a small sting proceeds, with which he pierces the flowers, and, by that means, nourishes himself with the juice: the head of the male is adorned with a beautiful black tuft; his breast is red, his belly white; his back, wings, and tail, green, while specks of gold, scattered all over the plumage, add greatly to its beauty, and an almost imperceptible down produces the most delightful shades that can be imagined.

The vast rivers and lakes in this country, particularly that of St. Laurence, contain a prodigious variety of fish, among which are sea-wolves, sea-cows, porpoises, the lencornet, the gobeque, salmon trouts; turtles, lobsters, the chaourafou, the achigau, the gilt-head, and sturgeon. The seal, or sea-wolf, so called from its howling, is an amphibious creature, and very large; some of them are said to weigh 2,000 pounds: a description of it will be given in our account of Greenland. The sea-cow is larger than the sea-wolf, but resembles it in figure: it has two teeth of the thickness and length of a man's arm, which, when full grown, have the appearance of horns, and are very fine ivory. Some of the porpoises caught in the river St. Laurence are said to yield an hoghead of oil, and waistcoats are made of their skins, which, besides the excellent property of being exceeding strong, are musket-proof. The lencornet is a species of cuttle-fish, of an oval figure: there are two sorts of them, which differ only in size, some being as large as a hoghead, and others only a foot long; but the latter only are caught, which is done by torch-light. The chaourafou is an armed fish, resembling a pike, and covered with scales proof against a dagger: some of them are above five feet long, and about the thickness of a man's thigh: the colour is a silver grey, and there grows under the mouth a long bony substance, ragged at the edges. This creature lives upon birds; to procure which, he conceals himself among the reeds, in such a manner, that nothing of him can be seen but the above weapon, which he holds erect above the surface of the water. The fowls, mistaking it for a withered reed, perch upon it; but they are no sooner settled, than the fish opens his mouth, and darts so suddenly on the prey, that it seldom escapes. The gobeque has the taste and smell of a small cod. The sturgeon is from eight to twelve feet long, and proportionably thick; but there is a small species, the flesh of which is very delicate. Some of the rivers breed a kind of crocodile, that differs in no material respect from those of the Nile. The achigau and the gilt-head are fish peculiar to the river St. Laurence.

Canada furnishes a variety of reptiles, among which the rattle-snake is the most remarkable. Some of these are as big as a man's leg, and long in proportion: but the most remarkable part of this animal is the tail, consisting of several hollow joints, in each of which is a small round bone, that makes a rattling noise as the creature moves, and seems designed by Providence to give notice of its approach: it is asserted by authors, that a joint is added to this rattle every year. The bite of this snake is mortal, if the root of the rattle-snake plant, or some other specific, is not immediately applied to the wound. The above plant is a sovereign antidote against the poison, and grows in all places where the snake is found: it is either pounded or chewed, and applied to the wound as a plaster. This creature, however, seldom bites passengers unless trod

upon, or otherwise provoked. The Indians, who esteem its flesh a great delicacy, often hunt it; and when thus pursued, if it has but a little time to recover, it folds itself round, placing its head in the centre, and then darts itself with the utmost violence against its antagonist, who receives the bite with the utmost calmness, assured of an immediate cure by the above root.

Such lands as have been properly cultivated in Canada, yield large and rich crops of Indian corn, barley, rye, and other grain. All kinds of fruits found in France, even melons and grapes, are produced here, and also the hop plant. The meadow grounds, which are well watered, yield excellent grass, and feed numbers of great and small cattle.

The greatest forests in the world are in the uncultivated parts of North America, which are a continued wood, not planted by the hands of men, and in all appearance as old as the world itself. Nothing can be more magnificent to the sight: the trees lose themselves in the clouds, and their prodigious variety of species cannot be numbered. The forests of Canada, which are amazingly extensive, contain also a vast variety of trees, among which are two sorts of pines, the white and the red; three sorts of ash-trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; the male and female maple; white and red elms, and poplars. The Iroquois Indians hollow the red elms into canoes, some of which, made out of one piece, will contain twenty persons. About November the bears and wild cats take up their habitations in the hollow elms, and remain there till April. Here are also found cherry-trees, plum-trees, the vinegar-tree, the fruit of which, infused in water, makes excellent vinegar; the white-thorn, the cotton-tree, the pod of which contains a very fine kind of cotton: several sorts of flowers are produced on the top of this tree, which, if shaken in a morning before the dew falls off, produce honey that may be boiled into sugar; the sun-plant, and an aquatic plant called atoca, the fruit of which is often made into an excellent confection.

The inhabitants on the banks of the river St. Laurence, above Quebec, were very numerous before the late war; but the number of French and English settled in this province cannot be precisely ascertained, though they are supposed to be upon the decrease. Canada and Labrador were supposed, in the year 1783, to contain about 130,000 inhabitants. The different tribes of Indians in Canada are almost innumerable; the most considerable at present are, the Iroquois, the Hurons, Miamis, Nokes, Oumamis, Outagamis, Sakis, Illinois, Oubaches, Otters or Loutres, Saranots, Sioux, Assiniboils, and Chirilineaux; but these people are observed to decrease in population where the Europeans are most numerous, owing chiefly to the immoderate use of spirituous liquors, of which they are exceedingly fond.

Canada

Canada does not contain any remarkable towns,
though very considerable efforts have been made for
improving this extensive country. The principal places
are Quebec, Trois Rivieres, and Montreal.

Quebec, the capital of all Canada, and the see of a
bishop, is situated at the confluence of the rivers St.
Laurence and St. Charles, or the Little River, about
seventy miles from the sea. It is built on a rock com-

posed partly of marble and partly of slate. The town
is divided into two parts, called the Upper and Lower
town. The fortifications, though not regular, are
strong. The fort, or citadel, in which the governor
resides, is a noble work; in the church of the Ursuline

is the tomb of Mons. Montcalm, who commanded
the French, and was killed at the battle of Quebec;
which also fell that young hero Wolfe, who com-
manded the English. The river, which from the sea

is four or five leagues broad, narrows on a sud-
den to about a mile in width. The harbour is flanked
by two bastions, raised twenty-five feet from the ground,
which is about the height of the tides at the time of the
spring-tides: it is safe, commodious, and about five fathom

deep. From Quebec to Montreal, in sailing up the
river St. Laurence, the eye is entertained with beauti-
ful landscapes, the banks being in many places bold
and steep, and shaded with lofty trees, and in others

strewed with villages, of which there are also many
on the islands, wherewith the channel of the river is
interspersed. After passing the Richlieu-Islands, in
the summer months, the air becomes so mild and tem-

perate, that the traveller thinks himself transported
to another climate. The town called Trois Rivieres, or Three Rivers,
is about half way between Quebec and Montreal, and
takes its name from three rivers which join their
waters about a quarter of a mile below it, where they
empty into the river St. Laurence. It is much frequented
by several nations of Indians, who come hither with
their furs and peltry. The adjacent country is plea-
sant and fertile in corn, fruits, &c. A considerable
number of handsome houses stand on both sides the
river. It gives name to a district.

Montreal stands at the foot of a mountain, in an
island ten leagues in length, and almost four in breadth,
crossed by the river St. Laurence. While the French
possessed Canada, both the city and island of Montreal
were private property, and were so well improved,
that the whole island was a delightful spot, producing
every thing necessary for the conveniences of life.

Since the town has been in the hands of the English,
it has suffered extremely by fire. When reduced by
General Amherst, it was of an oblong form, well
supplied, and surrounded by a wall flanked by eleven
bastions, which serve instead of bastions. The streets
were well laid out, and the houses built in a very hand-
some manner. The ditch is about eight feet deep,
and of a proportionable breadth, but dry. The forti-
fications have been much improved by the English.

The governor's palace is a large fine building. The
general hospital, and many elegant villas, decorate the
adjacent country, which produces all the vegetables of
Europe.

Respecting the government of Quebec, it will be
necessary to observe, that the French, before the war
of 1756, were very agreeably situated, being free from all
taxes, and having full liberty to hunt, fish, fell timber,
and to sow and plant as much land as they could culti-
vate; and their rights and privileges were continued to
them by the capitulation, when the country was reduced
by the English. But by an act passed in 1774, his
Majesty was impowered to appoint a council, from
seventeen to twenty-three persons, resident at Quebec,
for managing the affairs of the province, who were
vested with authority to make ordinances for the peace,
welfare, and good government thereof. By this act,
all matters of controversy relative to property and civil
rights are to be determined by the French laws of
Canada; and the inhabitants are not only allowed to
profess the Romish religion, but the Popish clergy are
invested with a right to claim and attain their accu-
stomed dues from those of the same religion. This
law gave great offence to many persons both in England
and America, and is thought to have contributed in a
great measure towards spreading a spirit of disaffection
to the British government in the colonies. The city
of London objected in strong terms to the passing of
the bill into a law, declaring, that they conceived it to
be entirely subversive of the great fundamental princi-
ples of the British constitution, &c. and in one of the
petitions of the American congress to the king, they
remonstrated, that by the Quebec act, the limits of
that province were extended, the English laws abolished,
and the French laws restored, whereby great numbers
of British freemen were subjected to the latter; and
that an absolute government, and the Roman Catholic
religion, were also established by that act, throughout
those vast regions that border on the westerly and
northerly boundaries of the free Protestant English
settlements. But notwithstanding every argument and
petition brought in opposition to this obnoxious bill,
it passed both houses, received the royal assent, and now
subsists as a law in full force throughout the province.

Our settlements in North America were secured by
expelling the French, and at the same time the in-
habitants enabled to attend more closely to agriculture,
and the improvement of that country. While the
important conquest of Canada removed a rival power
from that part of North America, it put us in the sole
possession of the fur and peltry trade, the use and im-
portance of which is well known to the manufacturers
of Great-Britain, and enables us to extend the scale of
a general commerce.

The nature of the climate is severely cold in winter,
and the people manufacturing nothing, points out
what Canada principally wants from Europe; wine,
or rather rum, cloth, chiefly of the coarser kind, linen,
and

and wrought iron. The Indian trade requires rum, tobacco, a species of duffil blankets, guns, powder, balls and flints, kettles, hatchets, toys, and trinkets of all kinds.

While the French were in possession of this country, the Indians supplied them with peltry; and the French had traders, who, in the manner of the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and trafficked with nations entirely unknown to any other Europeans. But their trade with these distant people was not the only service they did their country, they habituated the Indians to commerce, and induced them to visit the French in their settlements. Accordingly, people from all parts, even to the distance of a thousand miles, repaired to the French fair at Montreal, which began in June, and lasted near three months. Many solemnities were observed on this occasion, guards were placed, and the governor himself assisted to preserve order, in such a concourse of people, composed of so great a variety of savage nations. But it often happened that all attempts used to preserve tranquillity were in vain.

The Indians are so remarkably fond of spirituous liquors, that they often give all their merchandise for a small quantity of brandy; but, reflecting on their folly, are exasperated, and foment riots and disturbances. And what is very remarkable, many of the Indian nations actually passed by our settlement at Albany in the province of New-York, and continued their journey 250 miles further to Montreal, in order to purchase the very same commodities from the French, which they might have had from the English at Albany at a much cheaper rate; the French themselves having before purchased those goods from the English merchants settled in that country. So great an ascendancy had the French, by their polite behaviour and insinuating address, gained over the minds of the Indians.

Since we have been possessed of the whole country of Canada, our trade with that country employs thirty-four ships, and 400 seamen. The exports from thence, at an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amounted to 105,500*l*. and the imports from Great-Britain, consisting of a great variety of articles, are computed at nearly the same sum. It is unnecessary to make any remarks on the importance of this trade, which not only supplies us with unmanufactured materials, indispensably necessary in many articles of our commerce, but also takes in exchange the manufactures of our own country, or the productions of our other settlements in the East and West-Indies.

There are certain inconveniencies, proceeding from natural causes, which the trade and peopling of Canada are liable to, that no attention whatever will be sufficient to overcome; one of these is, the severity of the winter, which is so excessive from December to April,

that the greatest rivers are frozen over, and the snow often lies on the ground to the depth of four and five feet, even in those parts of the country which are situated three degrees of London, and in the temperate latitude of Paris. The falls in the river St. Laurence below Montreal, are another inconvenience; they render it difficult for very large ships to penetrate that emporium of inland commerce; but vessels from 300 to 400 tons arrive there every year. Hence will evidently appear, that our communication with Canada, and the immense regions beyond it, will always be interrupted in winter, till roads are formed that can be travelled on with safety from the Indians who often commence hostilities against us without any previous notice; and these savage people, without any provocation, frequently commit the most horrid cruelties for a long time with impunity. But when their barbarities and depredations have at length roused the resentment of the English, they will then even sue for a peace, which they know we always readily grant, this being obtained, they promise it shall endure as long as the sun and moon: hereupon a temporary cessation of hostilities takes place, till some fresh incident, too often accompanied with ill treatment received from our traders, gives them a fresh pretext for renewing their cruelties and insults in the neighbouring settlements.

The reader is referred to our general account of America, for the history of this province.

C H A P. IV.

NOVA-SCOTIA, OR NEW SCOTLAND

Boundaries, Situation, Extent, Rivers, Lakes, Soil, Produce, Exports, &c.

THIS country, by the French called Acadie, is bounded on the east by the bay of St. Laurence and the Atlantic ocean; on the south; the same ocean, on the north; the bay of St. Laurence, on the north; and Canada and New-England, on the west. It is situated between the 44th and 67th degrees of east long. and between the 44th and 49th of north latitude; being about 350 miles long, and 250 broad. This province was divided into two governments in 1784. That now styled Nova-Scotia is bounded, on the westward of the mouth of St. Croix river, by the same river to its source, and by a line drawn due north from thence to the southern boundary of Quebec; to the northward, by the same boundary as far as the western extremity of the Bay of Chaleurs; to the eastward, by the said bay to the bay of St. Laurence to the bay called Bay Verte; to the south, by a line in the centre of the bay of Fundy from the said river St. Croix, to the mouth of the Miramiquet river, by the said river to its source; and from thence by a due line across the isthmus into the Bay

is frozen over, and the sea is
to the depth of four and six
fathoms of the country which
London, and in the temperate
falls in the river St. Lawrence
another inconvenience; that
very large ships to penetrate
of commerce; but vessels from
there every year. Hence
that our communication with
these regions beyond it, will
in winter, till roads are formed
with safety from the Indian
hostilities against us without
these savage people, without
commit the most horrid rancour
punishment. But when their
ships have at length rounded the
point, they will then even find
now we always readily grant
they promise it shall endure
season: hereupon a temporary
takes place, till some fresh
panied with ill treatment
gives them a fresh passage
and insults in the negotia-

led to our general account
of this province.

A P. IV.

OF NEW SCOTLAND

*Extent, Rivers, Lakes, Soil, &c.
Exports, &c.*

The French called Acadia
reference and the Atlantic
ocean, on the south; the
north; and Canada and New
it is situated between the 66th
of longitude, and between the 48th
of latitude; being about 350 miles
This province was divided into
1764. That now styled New
from the westward of the mouth
of the same river to its source, and
from thence to the southern
extremity, the northward, by the
western extremity of the Bay of
Fund, by the said bay to the point
of the bay called Bay Verte; to the
centre of the bay of Fund
Croix, to the mouth of the
said river to its source; and
across the isthmus into the
Bay

Verte, to join the eastern lot above described: all lands within six leagues of the coast being included these limits. The rivers and lakes are very numerous. Of the former, the most considerable are the St. John, Passamagadi, Penobscot, and St. Croix, which run from north to south, and fall into the Bay of Fundy; and those of Rigouche, and Digouit, which run from west to east, and fall into the Gulf of St. Laurence; and that of Chebucto, which runs into the Atlantic. Of the latter, those called St. John and Freneuse are very large; but there are many which have not yet received any particular names. The river St. Laurence forms the northern boundary.

A great part of this country consists of the peninsula which is formed by the Bay of Fundy, Chénigto, and Green Bay; all the east of which, from Cape Sable on the west, to Cape Canso on the east, is lined with shoals and sands. Besides the bays above mentioned, there is a great number of others all along the coast, particularly the Bay of Chaleurs, and Chedibucto, on the north-east; the Bay of Illands, Chebucto, and La Here, on the north; and the Bay of Annapolis, on the south-side of the Bay of Fundy. In these bays, and other parts of the coast, are many fine roads and havens. The chief places are those of Rosieres and Gaspé on the north; Capes Portage, Ecoumenac, Tourmentin, Port, St. Forgeroy, and Canso, on the east; Capes Blanco, St. Theodore, Dore, la Heve, and Negro, on the north; Cape Sable, and Cape Fourche, on the south.

Though this country is situated within the temperate zone, its climate is rather unwholesome, which is generally ascribed to the sudden transition from heat to cold, which is found in this part of America; a seven months cold being sometimes succeeded by insupportable heat, without the intervening refreshing seasons of spring and autumn; besides this, the air is frequently rendered insufferably moist by fogs that come from off the sea, and sometimes in an instant envelop every object in an obscure gloom.

The soil of Nova-Scotia is not more favourable to vegetation than the climate is to health, the whole country being almost a continued forest. The timber is extremely proper for ship-building, and produces pitch and tar. Great improvements are said to be making in the new settlements and the Bay of Fundy: a great quantity of land hath been cleared, which abounds in timber, and ship-loads of excellent masts and spars have been shipped for England. Agriculture, though attempted by the English settlers, has hitherto made little progress. As the soil is in general thin and barren, the corn it produces is of a thrivell'd kind, like rye, and the grass intermix'd with a cold spongy moss. There are, however, some tracts in the peninsula to the southward, which are not inferior to the best land in New England; and the soil is for the most part adapted to the produce of hemp and flax.

The animals found here are in common the same with those of the other American provinces, deer, beavers, otters, &c. wild fowl, and all species of game. European quadrupeds, and fowls, which have been sent there at different times, likewise succeed, and multiply prodigiously. At the close of March the fish begin to spawn, when they enter the rivers in such shoals as are incredible. Herrings come up in April, and sturgeon and salmon in May. But the most valuable appendage to Nova-Scotia is the coast of Cape Sables, along which is a series of cod-fishing banks, and excellent harbours.

This country, unpromising as it is, and neglected for the more delightful tracts to the southward, was one of the first European settlements on the continent of North America. The first grant of lands in it were made by James I. to his secretary Sir William Alexander, from whom it obtained the name of Nova-Scotia, or New Scotland. Since that period it has often changed masters, from one private proprietor to another, and from the French to the English backwards and forwards. Before the French attempted any settlement in Canada, they had fixed themselves in Nova-Scotia; and certainly their industry and vigour, while they were in possession of this province, deserve applause; for though they had infinitely more difficulties to struggle with than the English have at present, they not only subsisted with very little assistance from Europe, but also increased exceedingly. But the province being confirmed to the English by the treaty of Utrecht, and experience during a long war having convinced them of the impropriety of suffering a colony of the enemy to remain here, a resolution was taken, in the year 1749, to form a settlement in this province at the expence of the government. Accordingly 3000 families were transported into Nova-Scotia. A town was erected on the bay of Chebucto, and called Halifax, in honour of the late Earl of that name, to whose wisdom and care we owe this settlement. The town of Halifax is very commodiously situated for the fishery, and has a communication with most parts of the province, either by land-carriage, the sea, or navigable rivers, with an excellent harbour, capable of receiving the largest ships of war, and where they may ride with the utmost safety in all winds. This town has a very flourishing appearance, when all the difficulties attending an infant settlement in this cold climate are considered. It is large and well built. It has a good entrenchment of timber, strengthened with a sort of the same materials, so as to be in little danger, at least from an Indian enemy. Three regiments are stationed here to protect the inhabitants from the insults of the savages, whose resentment, however excited, has been found implacable against the English. The number of inhabitants is said to amount to fifteen or sixteen thousand, who live very comfortably by the trade they carry on in furs and naval stores, by their fisheries,

SUPPLEMENT for the LAKES of CANADA.

and being the residence of the governor, and the garrison.

Formerly the chief town in this province was called Annapolis-Royal; but, though once the capital, it is a small place, wretchedly fortified, worse built, and very thinly inhabited. There have been stationed here, ever since the reign of Queen Anne, the remains of a regiment very little recruited. But though this place never flourished, it stands on one of the best harbours in North America, capable of containing 1000 vessels at anchor, in the utmost security: it is protected by a fort and garrison. St. John's is a new settlement at the mouth of the river of that name, that falls into the Bay of Fundy on the west side.

The emigration of loyalists from the United States to this province, since the conclusion of the American war, hath been very great. New towns have been erected by them; but particularly at Port Roseway, where a city named Shelburne now stands, which extends two miles on the water side, and one mile back, having wide streets, which cross each other at right angles. We are told it contains above 9000 inhabitants, exclusive of what is styled the Black Town, which stands about a mile from Shelburne, and is separated from it by a small fresh-water river; this town is inhabited by 1200 free blacks, who served on the king's side during the war. The harbour is deep, capacious, and secure, and the tide hath a great rise and fall.

Those loyalists who apply for land, obtain it in proportion to the property they possessed before the troubles commenced, allowing for such as have families to provide for. The governor lately appointed over New Brunswick is impowered, it is said, in his instructions, to "grant, without fee or reward, to such reduced officers as served in his provincial corps, during the late war in North America, and who shall personally apply for the same, the following quantities of lands, subject, at the expiration of ten years, to the same quit-rents as other lands are subject to in the province of Nova-Scotia, as also subject to the same conditions of cultivation and improvement; that is to say, To every person having the rank of a field officer, 3000 acres; to every captain, 2000 acres; and to every subaltern, 1000 acres." The same proportion of land is allotted to the reduced officers of the navy.

The principal exports from Great-Britain to this country, consist of woollen and linen cloth, and other necessaries for wear, of fishing tackle, and rigging for ships. Our exports, at an average of three years, before the new settlements, amounted to about 26,500l. The only articles we can get in exchange are timber, and the produce of the fishery, which, at a like average, amount to about 38,000l. The late increase of inhabitants induces us to suppose that they will erect saw mills, and endeavour to supply the West-India islands, with lumber of every kind, and likewise the

produce of the fishery, which will prove equally beneficial to both countries. The whole population of Nova-Scotia, with the islands adjoining, is computed at 50,000. This settlement being yet in its infancy, we can form no exact estimate of its utility, which, with its own prosperity and increase in the future, will in a great measure depend on the industry and wise conduct of the inhabitants.

CHAP. V.

THE UNITED STATES OF AMERICA

Account of their Confederation.

OUR readers will find an account, in our review of the principal transactions in the history of Great-Britain, of the rise, progress, and most remarkable events of that war, between Great-Britain and the American colonies, which at length terminated in the establishment of the United States of America, and therefore need not repeat them in this place, but shall only mention, that on the 4th of July 1776, the Thirteen American provinces, by a solemn declaration, renounced their allegiance to the British crown, contracted a reciprocal treaty of alliance and friendship for their common defence, for the maintenance of their liberties, and for their general and mutual advantage, &c. and from that time considered themselves as Free and Independent States, and have been recognized as such by all the belligerent powers. Each of the colonies, however, reserved to themselves alone the exclusive right of regulating their internal government, and of framing laws in matters not included in the articles of confederation; but every state is to abide by the determinations of the United States in Congress assembled, in all questions which are submitted to them by the confederation. Delegates from each state are to meet in Congress on the first of November in every year for managing the general interests. On the 30th of January 1778, the French king concluded a treaty of amity and commerce with the Thirteen United Colonies of America, as Independent States. On April 19th, 1782, Holland acknowledged them as such; and on the 30th of November 1782, provisional articles were signed at Paris, by the British and American commissioners, in which his Britannic Majesty acknowledged the Thirteen Colonies to be Free, Sovereign, and Independent States; and these articles were afterwards ratified by a definitive treaty. On February 5th, 1783, Sweden acknowledged them as such; on the 25th of the same month, Denmark; on March 1783, Spain; and Russia, in July following.

By the report of the committee appointed by Congress for that purpose, the foreign debt of the United States, incurred by the late war, in obtaining

at Independence, amounted to 7,885,085 dollars; the domestic debt to 34,115,290; the total of both, at 4s. 6d. each, is equal to 9,450,084l. sterling; the interest at six per cent, is 567,005l. On the other hand, the cost of the war to Great-Britain is moderately computed at 115,654,914l. and the national burthen by it, since January 1775, is 57,575l. During this ever-to-be-lamented war, the States of America, according to authentic estimates, lost by the sword and in prison 80,000 men; and the number of British soldiers killed in the service amounted to 43,633 men, according to the returns from New-York.

Location, Boundaries, Extent, Divisions, Rivers, Climate, Produce, Mines, Animals, Natives, Laws, Religion, Customs, Commerce, Manufactures, and Government.

THIS country is situated between 41 and 49 deg. north lat. and between 67 and 74 of west long. It is 550 miles in length, and 200 in breadth; and is bounded on the north-east by Nova-Scotia; on the south, by New York; on the east, by the Atlantic Ocean; and on the west by Canada.

the north division, } the government. . .	New Hampshire.	Portsmouth.
the middle division. . .	Massachusetts's colony.	Boston.
the south division. . .	Rhode-Island, &c.	Newport.
the west division. . .	Connecticut.	{ New-London. Hertford.

The principal rivers in this country are Connecticut, Thames, Patuxet, Menimack, Piscataqua, Saco, Casco, Kennebeck, Penobscot, or Pentagonet.

The most remarkable bays and harbours are those named by Plymouth, Rhode-Island, and Providence Plantations; Monument-Bay, West harbour, formed by the bending of Cape Cod; Boston harbour, Piscataqua, and Casco-Bay.

The chief capes are, Cape Cod, Marble-Head, Cape Cod, Cape Nettick, Cape Porpus, Cape Elizabeth, and Cape Small-Point.

Notwithstanding New England is situated near ten degrees nearer the equator than the mother-country, yet the winter begins sooner, and continues longer, than in us. But the summer is extremely hot, and even more so, than in places that lie under the same parallel in Europe: for the space of two months, however, the sky is perfectly clear, which renders the country so healthy, that it is reported to agree better with English constitutions, than any other of the American provinces.

The length of their day at Boston, in summer and winter, is pretty nearly the same as in London.

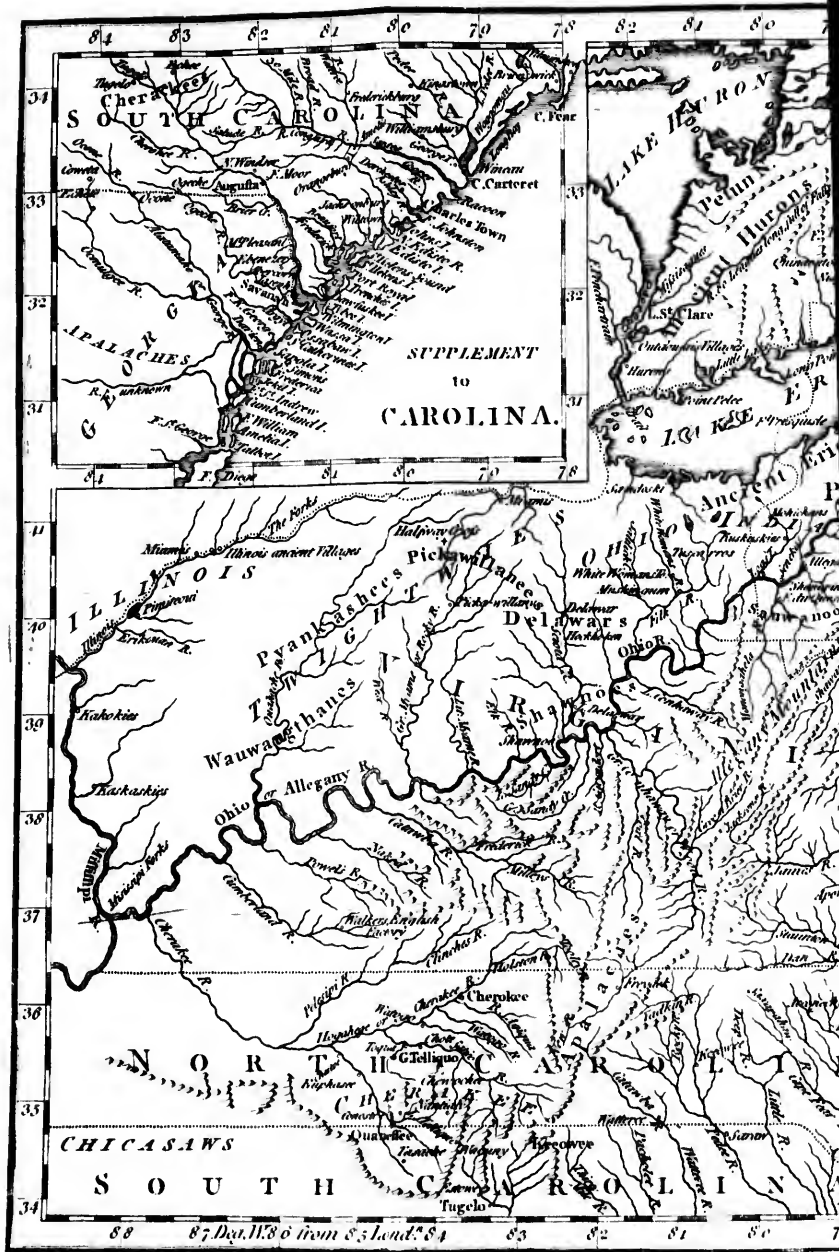

With respect to the soil, all the lands on the eastern shore of America are mostly low, and in some parts swampy; but further back they rise into hills. The north-east parts of New England are rocky and mountainous, and the earth shallow. Near Massachusetts-Bay, the soil is black, and as rich as in any part of England; and here the first planters found the grass above three feet high. The soil of the uplands is less fruitful, being a mixture of sand and gravel, inclining to clay: the low grounds abound in meadows and pastures: they commonly allot about two acres to the maintenance of a cow. The best meadows produce about a ton of hay to the acre; some produce two tons; but the hay is rank and four.

European grain has not been cultivated here with much success. The wheat is very subject to be blasted; the barley is a hungry grain, and the oats are lean and chaffy: but the Indian corn, which makes the food of the common people, flourishes here in high perfection. The New England people not only make bread of this grain, but malt, and brew it into beer, which is not contemptible, though their common drink is cyder and spruce-beer; the latter is made of the tops of the spruce fir, with the addition of a small quantity of molasses. They also raise in New England a large quantity of flax and hemp: all the fruits of Old England come to great perfection here, particularly peaches and apples. It is not unusual to see seven or eight hundred fine peaches on a single tree; and seven barrels of cyder have, in one season, been pressed from the fruit of a single apple-tree.

This country is chiefly distinguished for the variety and excellence of its timber; particularly oak, ash, pine, fir, cedar, elm, cypress, beech, walnut, chestnut, hazel, salisfras, sumach, and other woods, used in dyeing or tanning leather, carpenters work, and ship-building. The oak is thought to be inferior to that of the mother-country; but the firs are of prodigious height and bulk, and furnish the royal navy of England with masts and yards: they also extract from them considerable quantities of pitch, tar, rosin, gums, and balm. The productions of their forests are of prodigious service to this country, where ship-building makes a very considerable branch of trade.

The iron mines of New England are truly valuable: the metal is of an excellent temper, and, if improved, may become a great national benefit: copper and lead are also found, but in no great plenty.

All kinds of European animals thrive here, and multiply exceedingly. Horned cattle are very numerous, and some of them very large. Oxen have been killed of eighteen hundred weight. Hogs also are numerous, and particularly excellent; some are so large as to weigh eighteen score. The horses are small, but extremely hardy. They have also a great number of sheep, and of a very good kind; but the wool,

PART

NEW ENGLAND, NEW YORK,
NEW JERSEY, PENNSYLVANIA,
MARYLAND, VIRGINIA,
CAROLINA & GEORGIA.

wool, though of a staple sufficiently long, is not near so fine as that of England: they however manufacture a great deal of it with success. Elks, deer, hares, rabbits, squirrels, beavers, otters, bears, monies, martins, racoons, sables, wolves or wild dogs, foxes, ounces, and a variety of other wild and tame animals, are found in this province, most of them in great abundance: but one of the most singular animals of this and the neighbouring countries, is the moose, or moose-deer. There are two species of this animal; the light grey moose, and the large black moose: the former often herd thirty or more together, is a very fine animal, and resembles the ordinary deer: the latter, or black moose, is a very stately creature, about twelve feet high; his body about the size of a bull; his neck resembles a stag, and his flesh is extremely grateful; the horns, when full grown, are about four or five feet from the head to the tip, where they spread twelve feet, and have shoots or branches to each horn, which spread about six feet. When he travises a wood or thicket, he lays his horns on his back, in order to prevent their being entangled in the boughs. These prodigious horns he sheds every year. The black moose does not spring or rise like the common deer in going; but one of the largest size has been seen, in his common walk, to step over a gate five feet high: when unharboured, he will run a course of twenty or thirty miles, before he stands at bay; and, when closely pursued, generally takes to the water. The Indians hunt this creature, and generally with success, notwithstanding his great swiftness.

Few countries abound more with fowls, as turkies, geese, partridges, ducks, wigeons, dappers, swans, heathcocks, herons, storks, black-birds, all sorts of barn-door fowl, vast flights of pigeons, ravens, crows, &c. Among a vast variety of reptiles, rattle-snakes, toads, and frogs, abound in the uncleared parts of the province, where, with the owls, they make in the summer evenings a most hideous noise.

Nor are the New England seas and rivers less prolific than the land. They abound in fish; and even whales of several kinds are found here: the whale-bone, however, is said to be less valuable than that of Greenland. A terrible fish, called the whale-killer, is also found in these seas: it is from twenty to thirty feet long, with remarkably strong teeth and jaws. Ten or twelve of these fish will attack a large whale, and often destroy him; but they frequently pay dear for their temerity; a single stroke from the tail of the whale being sufficient to put an end to the contest; and therefore they are very careful not to come within the reach of that part. At the mouth of the river Penobscot is a mackerel fishery; and vast quantities of cod are taken during the winter season.

The most populous and flourishing parts of Great-Britain, do not make a much better appearance than the cultivated parts of New England, which reach

above sixty miles back: with respect to population the number of considerable and trading towns, and the manufactures carried on in them, this country greatly superior to any other of the colonies. Here are many gentlemen of considerable landed estates, which they let to farmers, or manage by their stewards or overseers; but the greater part of the people are composed of a substantial yeomanry, who cultivate their own freeholds, without a dependence on any but Providence, and their own industry. These lands generally pass to their children in the manner of gavel-kind, which prevents the far greater part of them from being able to emerge out of their original happy mediocrity. This manner of inheriting has remarkable good effects: it keeps the people within bounds of their original happy mediocrity, or, if necessity urges, makes them more ready to go back into the uncultivated parts of the province, where land may be had at an easy rate, and in large portions. By this means, and from the form of their government they acquire a very free, bold, and republican spirit. The common sort of people in no part of the world are so independent, or possess so many of the conveniences of life: they are used, from their inclination to the exercise of arms; and they have a military which, considered as such, is by no means contemptible, but their military strength is now greatly augmented.

Dr. Douglas, a well-informed writer, who published at Boston an account of the British colonies in America about the year 1752, computes the number of inhabitants at 354,000; and proportions them in the following manner:

Massachusetts's Bay	200,000	in 1783,	they were	350,000
Connecticut	100,000	—	—	206,000
Rhode Island	30,000	—	—	60,000
New Hampshire	24,000	—	—	82,000
			<u>354,000</u>	<u>698,000</u>

so that, by this calculation, the number of inhabitants has so amazingly increased by new settlers from various parts of Europe, and by a very rapid population, that they at present amount to near 700,000, including Negroes, and a small number of Indians.

Throughout the whole populous and fertile province of Connecticut, the greatest care is taken of the limbs and bodies of infants, which are kept straight by means of a board; a practice learnt of the Indian women, who abhor all crooked people; so that deformity is very uncommon here. The men are in general well built, stout, and tall. The women are fair, handsome and genteel; and in their manners and behaviour reserved and modest. They are not deeply versed in the laws or mysteries of whist or quadrille, nor have they any great acquaintance with plays and operas; but they will converse freely upon matters relative to

In this part of America, the church of England is
ar from being in a flourishing condition; in several
aces, the number of auditors do not amount to twelve
ersons; and in the year 1768, the four provinces con-
tained upwards of 700 religious assemblies, of which
irty-six only observed the forms of the church of
England; but the form of its worship having lately
ndergone some material regulations in these parts,
y reducing it to more moderate Anti-trinitarian prin-
ples, so as to make it more nearly resemble that of
the Presbyterians, it is therefore thought that the pro-
fessors of that denomination will soon become more
umerous. The Connecticut province hath also pro-
ided a bishop for the Episcopalians among them, by
ending one of their number to Scotland, to be or-
ained by the non-juring bishops of the Episcopal
church in that kingdom, which ceremony was per-
ormed at Aberdeen. Every particular society or
urch of Dissenters is independent of all other eccle-
astical jurisdiction; nor does there lie any appeal
om their punishments or censures. The ministers
of Boston depend entirely on the liberality of their
erers for support, a voluntary contribution being
ade for them by the congregation, every time divine
ervice is celebrated. It is but lately that they suf-
ered any member of the church of England to have a
are in the magistracy, or to be elected a member of
the Commons, or House of Representatives.

Their laws were formerly very severe against Quakers.
o bring one in, was a forfeiture of 100l. to conceal
ce, 40s. an hour; to go to a Quaker's meeting, 10s.
preach there, 5s. A Quaker, not an inhabitant, was
bged to banishment; and if he returned, death.
agrant Quakers were sentenced to be whipped,
anded with the letter R. on the left shoulder, and
hished; if they returned, death: but these, and some
her severe ecclesiastical laws are now repealed, in
onsequence of the diffusion of more humane and
uitable principles. Calvinism, from the principles
the first settlers hath been very prevalent in New
ngland, many of whose inhabitants formerly ob-
erved the Sabbath with a kind of Jewish strictness;
nd their rigorous observance of it hath of late been
ch diminished. Since their independence, there is
established religion in the province, but every sect
allowed the free exercise of their religion, and is
ually under the protection of the laws.

It is not improbable that this province will, in a
curse of years, make a considerable figure in the re-
public of letters; since we find, that on the 4th of
ay 1780; an act was passed by the Council and
onse of Representatives of Massachusetts-Bay, for
orporating and establishing a society for the cul-
ivation and promotion of the arts and sciences; it is
itled, The American Academy of Arts and Sciences;

the first members were named in the act; and they
were never to exceed 200, nor to be fewer than
forty. It was declared in the act, that the end and
design of the institution of the said Academy, was, to
promote and encourage the knowledge of the An-
tiquities of America, and of the Natural History of
the country, and to determine the uses to which its
various natural productions might be applied; to pro-
mote and encourage medicinal discoveries; in mathe-
matical disquisitions, philosophical inquiries and ex-
periments; astronomical, meteorological, and geogra-
phical observations; improvements in agriculture, arts,
manufactures, and commerce; and, in short, to culti-
vate every art and science which might tend to ad-
vance the interest, honour, dignity, and happiness of a
free, independent state. This act, which was calculated for
promoting the above-mentioned laudable purposes, was
framed and established as a law, since the commence-
ment of the late war between Great-Britain and the
colonies, and even while that destructive war was
carried on with great animosity on both sides.

No person can be arrested in this province, if there
are any means of satisfaction; nor imprisoned, unless
there be a concealment of effects. Adultery was
formerly death to both parties.

Boston is the chief town of the county of Middlesex,
and of all New England; it was formerly the chief of
the British empire in America. It stands on a penin-
sula at the bottom of Massachusetts-Bay, about eight
miles from its mouth, and is well fortified. The ap-
proach to the harbour by shipping is narrow; but with-
in it there is room enough for 500 sail to lie at anchor,
in a good depth of water. On one of the islands of the
Bay stands Fort William, the most regular fortress in the
British plantations: no ship can approach the town,
without passing directly under the guns of the fort.
About two leagues from the city is a light-house,
erected on a rock, which, in time of war, makes sig-
nals to the castle, and the castle to the town. At the
bottom of the bay, which is spacious enough to con-
tain a numerous navy, is a pier, near 2000 feet in length,
with a row of merchants warehouses on the north side.
The city lies in the shape of a half-moon round the
harbour, being in length about two miles, and in some
places near three quarters of a mile broad. There are
ten churches of different denominations, a fine town-
house, a printing-office, and several bookellers shops.
Here also the governor resides, the general assembly
and the chief courts of judicature are held, and here
are transacted the affairs of the whole province. There
is a market every Thursday, and fairs for three days
together, beginning on the first Tuesday in May, and
the last Tuesday in October. Above 600 ships have
been laden here in a year, for Europe and the British
plantations, with lumber, beef, pork, fish, &c. The
neck of land which joins the peninsula on which the
city is built to the continent, is not above fifty yards
wide. An adjoining district, called Charles-Town,

was destroyed since the commencement of the late civil war.

Cambridge Town, commonly called Newton, is situated on the northern branch of Charles River, about three miles from Bolton, in which are several good streets; but is most considerable for its university, consisting of three colleges. It is governed by a president, five fellows, and the treasurer, who have each of them a competent revenue settled on them.

Salem, Portsmouth, Newhaven, Newport, and the other towns of New England, are in general neatly built, and commodiously situated on fine navigable rivers, with good harbours, but have nothing remarkable in them.

New England is remarkable for its commerce; its own productions furnish a large quantity of goods for exportation; but this is far from forming the whole trade of this province, their ships are the chief carriers of all the colonies of North-America, especially to and from the West-India sugar islands. The principal commodities of the country are pig and bar iron, which, under the British government, was imported into England duty free; malts, yards, pitch, tar, and turpentine, for which they make large contracts for the royal navy; pot and pearl ashes, pipe staves, lumber, boards; all sorts of provisions, which they send to the French, Dutch, and British sugar islands; as corn, biscuit, meal, beef, pork, butter, cheese, apples, cyder, onions, dried mackerel and cod fish. They also send to those islands, cattle, horses, planks, hoops, shingles, pipe staves, oil, tallow, turpentine, bark, calves skins, and tobacco. Their peltry trade, which was formerly very considerable, is now of small account. They have very valuable fisheries on their coast, in mackerel and cod, which employ a vast number of hands, and of which they are at great pains to reap the advantage. With the produce of these fisheries, they trade to Spain, Italy, the Levant, and the West-Indies, to a considerable amount annually.

The manufactures of this country are daily improving. They make coarse linen and woollen cloth for home consumption; hats are also made here, and sold in a clandestine manner, in all the other colonies, where they are eagerly purchased. Sugar-baking, the distillery, paper-making, and salt-works are in an improving state. The business of ship-building is one of the greatest and most profitable employments of this country. Ships are often built here upon commission; but the greatest number on their own account. The merchants of New England, as soon as a ship is constructed, load her with the produce of the country, as naval stores, fish, and train oil, and send her out on a trading voyage to Spain, Portugal, or the Levant; where, after disposing of the cargo, they engage with the merchants in carrying goods from one port to another, till an opportunity offers of selling the ship to advantage, which is generally done in a very short time. This lucrative branch of commerce is now on the decline. In the year 1738, they built at Boston

forty-one large ships, burden in all 6,324 tons; in 1749 only thirty; in 1749 they were reduced to fifteen, making in the whole no more than 2,430 tons of shipping. Since which we had no exact account, but it is supposed to continue much in the same manner. The ships and vessels built at the other towns in New England, are not included in this account.

Before the late unhappy differences, the value of British manufactures and Indian commodities sent from this province from the mother-country, on an average of three years, amounted to about 395,000*l.* and the imports to Great-Britain, about 370,500*l.* but both are greatly decreased, though the trade has been reviving for some time.

The history and government of New England demand our attention. This part of North America is at present divided into the four provinces of New Hampshire, Massachusetts, Rhode-Island, and Connecticut. In 1606, James I. had erected two companies by letters patent, with a power to send colonies into those parts, then comprehended under the general name of Virginia, being the north-east coast of America. However, as no settlements were made in consequence of this authority, the companies contented themselves with sending out a few ships to trade with the Indians for their furs, and to fish on their coast. Things continued in this state, till the accession of Charles I. when they were far from mending. This prince, who gave himself up entirely to church and churchmen, finished his ill conduct by placing Dr. Laud at the head of the church; this prelate, at the very time when religious dissensions, which England was torn in pieces, had become warm and furious, persecuted all sects of nonconformists with unrelenting severity; which, instead of raising terror, produced a sort of indignant hatred in the sufferers, who became every day more averse from listening to the least terms of agreement with surplices, organs, common prayer, or communion tables at the east end of the church; and there was no part of the known world whither they would not fly for liberty of conscience.

A number of the same persuasion had taken refuge in Holland at the beginning of James's reign; but even in that country, where every sect of religion is tolerated, they were equally unhappy. They were not persecuted indeed, but narrowly watched. In this state of indolent security, their zeal began to have dangerous augurs for want of opposition; and, being destitute of power and consequence, they became tired of the asylum, and desirous of residing where they had no superior. Accordingly, an agent was dispatched to England, who agreed with the company who had obtained a charter for an exclusive trade to North America, under the title of the Plymouth Council, for a tract of land in the New World for forming a settlement. The royal permission was also obtained, and a number of those restless people embarked for America, than better than a thick and gloomy forest.

differences, the value of Indian commodities sent to the mother-country, on an average about 395,000*l.* and the value of the goods sent out about 370,500*l.* but both the trade has been revived

ment of New England near this part of North America. The four provinces of New England, Rhode-Island, and Connecticut, had erected two companies with a power to send colonies to be settled under the general authority of the north-east coast of America. The settlements were made in 1630, and the companies continued out a few ships to their furs, and to fishery in this state, till when they were far from giving himself up entirely to his ill conduct and the church; this produced religious dissensions, which had become warlike pieces, had become wars of nonconformists with

instead of raising terms of hatred in the sufferance was so odious to the greatest part, that one of the first persecutions in this country was exercised on a small party among themselves, who were hardly enough to mention that the civil magistrate had no power to use compulsory methods in the affairs of religion. The fury of unbridled zeal was let loose; and, after the people had been harassed by all the vexatious methods that could be devised, they were driven from their farms, and forced to fly for shelter to another district. They settled to the southward of their brethren, near Cape Cod, where they formed a new government on their own principles, and built a town which they called Providence; and such is the connection between justness of sentiment and external prosperity, that the government of Rhode-Island, though small, became extremely populous and flourishing. In a word, as persecution gave rise to the first settlement in New England, so subsequent persecutions among themselves gave rise to new colonies, and thus facilitated the spreading of the people over the whole country; and, in process of time, America became the main asylum of all discontented and enterprising spirits; and such were the

This colony gave the name of New Plymouth to the place where they first settled. The number of adventurers was but small, they laboured at a bad season of the year, and were supported only by their own private means. The winter was dreadfully cold, and the country covered with wood, afforded very little for the refreshment of persons rendered sickly by a tedious voyage, or for the sustenance of an infant colony. The consequences were such as might have been expected; near half of them perished by the scurvy, by want, and the severity of the climate. They who survived, however, were not dispirited either by the losses or the hardships they were still doomed to endure. Supported by that vigour which then formed the character of Englishmen, and by the satisfaction of being beyond the reach of the arm of spiritual power, they reduced, by unremitting labour, the savage country to yield them a tolerable livelihood, and by degrees a comfortable subsistence. This establishment was made in the year 1630. In the mean time, the same class of people in England being harassed by the arm of ecclesiastical authority, many of them retired to their brethren in America. The colony now began to wear the face of prosperity, and, by the end of the year, they had built four towns, Salem, Dorchester, Charles-Town, and Boston, of which the latter has since become the capital of New England.

It might be naturally expected that the inhabitants of New England, who had themselves so lately fled from persecution, would have been disposed to grant the greatest freedom to others in similar circumstances; but the truth is, they had no idea of such a freedom. Many of them were bigoted Calvinists; and, though they had felt the weight of persecution themselves, they had no charity for those who professed sentiments different from their own. The very doctrine of any kind of toleration was so odious to the greatest part, that one of the first persecutions in this country was exercised on a small party among themselves, who were hardly enough to mention that the civil magistrate had no power to use compulsory methods in the affairs of religion. The fury of unbridled zeal was let loose; and, after the people had been harassed by all the vexatious methods that could be devised, they were driven from their farms, and forced to fly for shelter to another district. They settled to the southward of their brethren, near Cape Cod, where they formed a new government on their own principles, and built a town which they called Providence; and such is the connection between justness of sentiment and external prosperity, that the government of Rhode-Island, though small, became extremely populous and flourishing. In a word, as persecution gave rise to the first settlement in New England, so subsequent persecutions among themselves gave rise to new colonies, and thus facilitated the spreading of the people over the whole country; and, in process of time, America became the main asylum of all discontented and enterprising spirits; and such were the

numbers which embarked for it from England, that, in 1637, a proclamation was published, prohibiting any person from sailing thither, without an express licence from the government. It is said, that, for want of such a licence, Oliver Cromwell, and others of that party, were prevented from going to New England, after they had taken shipping with that intent.

These provinces, namely, New Hampshire, Massachusetts, Rhode-Island, and Connecticut, were empowered by their charter to establish such order, and form such laws as they thought requisite, provided they were not contrary to the laws of England. Strangers to the qualifications necessary in legislators, and violent enthusiasts, the first settlers imitated the ancient Jewish polity in almost every respect; they adopted the books of Moses as the laws of the land. These were ill suited to the occasion, and therefore were soon after laid aside. Few charters were ever more ample than those granted to the first settlers of New England. The colonists were indeed almost independent of their mother-country. Not only the power of making laws was vested in them, but they also enjoyed the privilege of choosing their own magistrates, the governor, the council, and the assembly. But it seems even these powers were not sufficient; for, towards the end of Charles the Second's reign, the Massachusetts colony were accused of violating their charter, as was the city of London, and deprived of it by a judgment in the King's Bench. From that time they continued without a charter till the Revolution; the bigotted reign of James the Second was a very improper season for Dissenters to apply for favours. But soon after his abdication, when English liberty was restored, the colonists of New England obtained a new charter, but much inferior in extensive privileges to the former. The appointment of the governor, lieutenant-governor, secretary, and all the officers of the admiralty, were vested in the crown; the command of the militia was placed in the hands of the governor, as captain-general of the province; all judges, justices, and sheriffs, intrusted with the execution of the laws, were nominated by the governor, with the advice of the council; the governor had a negative in the choice of counsellors, peremptory and unlimited. He was not obliged to give a reason for what he did in this particular, or restrained to any number; authentic copies of the several acts passed by the colony, as well as others, were to be transmitted to the court of England, for the royal approbation; but, if the laws of this colony were not repealed within three years after they were presented, they were not afterwards repealable by the crown: no laws, ordinances, or elections of magistrates, or any acts of government whatever, were valid, without the governor's assent in writing; and appeals for sums above 300*l.* sterling were made to the king and council. But, notwithstanding these restrictions, the Massachusetts colony still enjoyed many valuable privileges: they not only chose the members of the assembly, or lower house of parliament, but that assembly,

sembly, with the governor's concurrence, chose the council, which resembled the English house of lords; and the governor himself depended upon the assembly for his annual support. The ancient colony of Plymouth and territory called Main are united to the Massachusetts's government.

The colony of New Hampshire, as a royal government, was more dependent on the mother-country; the council, as well as the governor, were appointed by the crown. In other respects, the government of New Hampshire and that of Massachusetts-Bay were the same.

The colony of Connecticut never forfeited their charter; but enjoyed all the privileges granted at their first settlement.

There were originally three sorts of governments established by the English on the continent of America, viz. royal governments, charter governments, and proprietary governments. A royal government was properly so called, because the colony was immediately dependent on the crown, and the king remained sovereign of the colony. A charter government was so called, because a company, incorporated by the king's charter, was in a manner vested with sovereign authority. A proprietary government was so denominated, because the proprietor, either by purchase or gift, had a kind of regal authority.

In consequence of the independence of the colonies on the legislative authority of Great-Britain, the government of New England has been entirely changed. By an order from the council at Boston, the declaration of the American congress, absolving the United Colonies from their allegiance to the crown of Great-Britain, and declaring them free and independent, was, on the 25th of July 1776, publicly proclaimed from the balcony of the state-house in that town; and, in October 1780, a constitution, or form of government, for the commonwealth of Massachusetts, with a declaration of rights, was agreed to and established by the inhabitants of that province; the preamble to which represented, that "the end of the institution, maintenance, and administration of government, is, to secure the existence of the body politic; to protect it, and to furnish the individuals who compose it with the power of enjoying, in safety and tranquillity, their natural rights, and the blessings of life; and that whenever these great objects are not obtained, the people have a right to alter the government, and to take measures necessary for their prosperity and happiness;" &c. It was in this constitution provided, amongst other things, that no peaceable subject should be hurt, molested, or restrained, in his person, liberty, or estates, for worshipping God in the manner and season most agreeable to the dictates of his own conscience: it was also enacted, that all religious societies, &c. should at all times have the exclusive right of electing their public teachers, and of contracting with them for their support and maintenance; that no subordination of any sect or denomination to another should ever be established by law; and that

every denomination of Christians, demeaning themselves peaceably, and as good subjects of the commonwealth, should be equally entitled to its protection; it was likewise therein declared, that, as the liberty of the press is essential to the security of freedom in a state, it ought not therefore to be restrained in that commonwealth.

The legislative department is to be formed by a senate, and a house of representatives; each of which have a negative on the other; the senators, and members of the house of representatives, are to be elected annually; every male, of twenty-one years of age upwards, resident during one year in any particular town of the commonwealth, and possessed of a freehold estate in the said town of the annual income of fifty shillings, or any estate of 60*l.* value, is entitled to a vote for senators and representatives of the district of which he is an inhabitant. The senators are forty, viz. for Suffolk six, Essex six, Middlesex five, Hampshire four, Plymouth three, Barnstable one, Bristol three, York two, Duke's and Nantucket one, Worcester five, Cumberland one, Lincoln one, Berkshire two. The house of representatives is also chosen in certain proportions, and paid by the constituent body.

A supreme executive magistrate, who should be styled the governor of the commonwealth of Massachusetts, and also a lieutenant-governor, were directed to be annually chosen by the whole body of electors; they were to be assisted by nine counsellors, chosen by ballot, out of the senate. The secretary, treasurer, receiver-general, notaries-republic, and naval officers, are elected annually by the senators and representatives. The judiciary power is to be septennial, and the delegates to congress are to be chosen each year by and out of the senate and house of representatives, or general court. The governor has no control in the choice of officers, but has a negative on bills transmitted to him for assent from the general court.

New Hampshire and Connecticut have not long since finally settled their forms of government; for they at first, for the most part, adopted that of Massachusetts-Bay. The state of Rhode-Island adheres to their original charter as the rule of government, since it contains an ample grant of all legislative, judicial, and executive powers.

The inhabitants of New England are almost universally of English descent; and it is owing to this circumstance, and to the great and general attention that has been paid to education, that the English language has been preserved among them so free of corruption. It is true, that from laziness, inattention, and want of acquaintance with mankind, many of the people in the country have accustomed themselves to use some peculiar phrases, and to pronounce certain words in a slow, drawing manner. Hence foreigners pretend they know a New Englandman from his manner of speaking. But the same may be said with regard to a Pennsylvaniaian, a Virginian, or a Carolinian; for all have some phrases and modes of pronunciation peculiar to themselves, which distinguish them from their neighbours. inence in the several learned professions and col-
 ought to be considered as forming the standard
 nunciation for their respective states; and not
 of people who have imbibed the habit of using
 of singular and ridiculous phrases, and who
 ound badly.

The New Englanders are generally tall, stout, and
 built. They glory, and perhaps with justice, in
 that spirit of freedom, which induced their
 to leave their native country, and to brave the
 ivers of the ocean, and the hardships of settling a
 ernes. Their education, laws, and situation, serve
 ure them with high notions of liberty. Their
 is awakened at the first motion towards an in-
 on of their rights. They are indeed often jealous
 cels; a circumstance which is a fruitful source of
 rinary grievances, and of innumerable groundless
 ions, and unjust complaints against government.
 these ebullitions of jealousy, though censurable,
 roductive of some political evils, shew that the
 ce of true liberty exists in New England; for jea-
 is the guardian of liberty, and a characteristic of
 republicans. A law, respecting the descent of

es which are generally held in fee simple, which
 substance is the same in all the New England states,
 the chief foundation and protection of this liberty.
 this law, the possessions of the father are to be
 ally divided among all the children, excepting the
 son, who has a double portion. In this way is
 erved that happy mediocrity among the people,
 ch, by inducing oeconomy and industry, removes
 them temptations to luxury, and forms them to
 is of sobriety and temperance. At the same time,
 e industry and frugality exempt them from want,
 from the necessity of submitting to any encroach-
 on their liberties.

In New England learning is more generally diffused
 ong all ranks of people than in any other part of the
 e; arising from the excellent establishment of
 ools in every township.

Another very valuable source of information to the
 eople is the newspapers, of which not less than thirty
 usand are printed every week in New England, and
 ulated in almost every town and village in the
 untry.

A person of mature age, who cannot both read and
 rite, is rarely to be found. By means of this general
 establishment of schools, the extensive circulation of
 ewspapers, and the consequent spread of learning,
 ery township throughout the country is furnished
 th men capable of conducting the affairs of their town
 th judgment and discretion. These men are the
 annels of political information to the lower class of
 eople; if such a class may be said to exist in New
 ngland, where every man thinks himself at least as
 od as his neighbour, and believes that all mankind
 e, or ought to be, equal. The people from their
 hildhood form habits of canvassing public affairs, and

commence politicians. This naturally leads them to
 be very inquisitive. It is with knowledge as with
 riches, the more a man has, the more he wishes to ob-
 tain; his desire has no bound. This desire after know-
 ledge, in a greater or less degree, prevails throughout
 all classes of people in New England; and from their
 various modes of expressing it, some of which are blunt
 and familiar, bordering on impertinence, strangers have
 been induced to mention *impertinent inquisitiveness* as a
 distinguishing characteristic of New England people.
 But this is true only with regard to that class of people
 who have confined themselves to domestic life, and have
 not had opportunity of mingling with the world; and
 such people are not peculiar to New England—they
 compose a great part of the citizens of every state.
 This class, it is true, is large in New England, where
 agriculture is the principal employment. But will not
 a candid and ingenious mind ascribe this inquisitiveness
 in these honest and well-meaning people to a *laudable*
 rather than to a censurable disposition?

A very considerable part of the people have either
 too little or too much learning to make peaceable sub-
 jects. They know enough, however, to think they
 know a great deal, when in fact they know but little.
 "A little learning is a dangerous thing." Each man
 has his independent system of politics; and each as-
 sumes a dictatorial office. Hence originates that rest-
 less, litigious, complaining spirit, which forms a dark
 shade in the character of New Englandmen.

This litigious temper is the genuine fruit of republi-
 canism; but it denotes a corruption of virtue, which is
 one of its essential principles. Where a people have a
 great share of freedom, an equal share of virtue is ne-
 cessary to the peaceable enjoyment of it. Freedom,
 without virtue or honour, is licentiousness.

Before the late war, which introduced into New
 England a flood of corruptions, with many improve-
 ments, the sabbath was observed with great strictness;
 no unnecessary travelling, no secular business, no visit-
 ing, no diversions were permitted on that sacred day.
 They considered it as consecrated to divine worship,
 and were generally punctual and serious in their attend-
 ance upon it. Their laws were strict in guarding the
 sabbath against every innovation. The supposed leve-
 rity with which these laws were composed and exe-
 cuted, together with some other traits in their religious
 character, have acquired, for the New Englanders, the
 name of a superstitious, bigotted people. But supersti-
 tion and bigotry are so indefinite in their significations,
 and so variously applied by persons of different princi-
 ples and educations, that it is not easy to determine
 whether they ever deserved that character. Leaving
 every person to enjoy his own opinion in regard to this
 matter, we will only observe, that, since the war, a
 catholic, tolerant spirit, occasioned by a more enlarged
 intercourse with mankind, has greatly increased, and
 is becoming universal; and if they do not break the
 proper bound, and liberalize away all true religion, of

In the winter-season, while the ground is covered
 with snow, which is commonly two or three months,
 skating is the general diversion. A great part of the
 skaters throughout the country are furnished with
 skates and sleighs. The young people collect in parties,
 and with a great deal of sociability resort to a place of
 rendezvous, where they regale themselves for a few
 hours with dancing and a social supper, and then retire.
 These diversions, as well as all others, are many times
 carried to excess. To these excesses, and a sudden ex-
 posure to extreme cold after the exercise of dancing,
 physicians have ascribed the consumptions which are so
 frequent in New England among the young people.

C H A P. VI.

NEW YORK.

*Location, Extent and Boundaries, Rivers, Climate, Pro-
 ducts, Cities, Towns, and Government.*

THIS province is situated between 40 and 46 deg.
 of north latitude, and between 71 and 76 deg.
 of west longitude. It is about 300 miles in length,
 and 150 in breadth, bounded on the North by New
 England, on the West by Canada, on the South by
 Pennsylvania and New Jersey, and on the East by
 New England and the Atlantic Ocean. It contains
 46,000 square miles.

New York, including the island of the same name,
 Long-Island, and Staten-Island, is divided into ten
 counties, as follows:

COUNTIES.	CHIEF TOWNS.
New York	New York.
Albany	Albany.
Ulster	} None,
Duchess	
Orange	Orange.
West-Chester	West-Chester.
King's	None.
Queen's	Jamaica
Suffolk	Southampton
Richmond	Richmond

The principal rivers in New York are Hudson's and
 the Mohawks: the former has many excellent harbours,
 and is stored with a great variety of fish. Between
 the head and the estuary of the Mohawks river, is the
 Cataract or fall of Cohoes, where the water rushes down
 a precipice near seventy feet high. The only remark-
 able lakes in this province, are lake George, and part of
 the Champlain. The capes are, Sandy-Hook, near
 the entrance of the Raritan river; Montock Point, at

the east end of Long-Island; and Cape May, at the en-
 trance of Delaware river.

The climate of this province is more temperate than
 that of New England, and the air is very healthy.
 The face of the country is low, flat, and marshy, to-
 wards the sea. The soil is remarkably fertile, and in
 general well cultivated. The vegetable productions
 are wheat, barley, rye, Indian corn, oats, hemp, flax,
 and a vast variety of fruits in great abundance and per-
 fection. The timber is nearly the same with that of
 New England, and large quantities of pot and pearl
 ashes are made from the refuse of the woods. The
 iron here is excellent, and found in great plenty.

New York stands between 40 deg. 40 min. north lat,
 and 74 deg. west long. on the fourth-west of York-Island;
 it is twelve miles long, and between two and three
 broad, extremely well situated for trade, at the mouth
 of Hudson's or the Iroquois river. The city is a mile
 long, and about a quarter of a mile broad. Many of
 the houses are very elegant; and the city, though ir-
 regularly built, affords a fine prospect. The inhabitants,
 who are chiefly the descendants of Dutch families, are
 computed at about 5000, and the whole province con-
 tains near 200,000. They are in general endowed with
 a liberal, generous, and hospitable turn of mind. The
 city and harbour are defended by a fort and battery.

Kingston is a pretty populous, well-built town,
 ninety miles up the river, where the *Æsopus* from
 New Jersey falls into it. Albany is 143 miles up the
 river, and but five miles below which it is parted into
 two branches. It contains between 3 and 400 families,
 and has a strong fort and garrison.

There is not much essential difference between the
 commerce of New York and New England. The
 principal commodities of the trade are wheat, flour,
 Indian corn, oats, beef, pork, furs, and skins. They
 have a considerable share in the logwood trade, and
 that which is carried on with the French and Spanish
 plantations. Their European trade is the same with
 that of New England, and they import the same species
 of commodities. From an average of three years, their
 exports amount to 526,000l. and their imports from
 Great-Britain to 531,000l.; but whether they are the
 same since the late troubles in America, is not certainly
 known.

All religions were tolerated here, except the Jewish
 and Roman Catholic, and there professors enjoyed equal
 privileges. There was originally no established reli-
 gion, except that of the Dutch, who followed the
 Presbyterian discipline, which was granted the inhabi-
 tants when the province surrendered to the English, can
 be called such. Here Protestants, according to the
 church of England, Dutch and English Presbyterians,
 German Calvinists, Lutherans, Baptists, Quakers, &c.
 have all their respective places of worship, and all live
 in harmony with one another, without discrimination
 or preference to any.

The synods of New York and Philadelphia, during
 their

their session at Philadelphia, in May 1788, resolved themselves into four synods, viz. the synod of New York; the synod of Philadelphia; the synod of Virginia; and the synod of Carolina. These synods are to meet annually in their respective states, whence they take their names; and once a year, by their commissioners, in general council, at Philadelphia.

There are a number of Presbyterian churches, commonly called *Seceders*, who have a separate ecclesiastical jurisdiction. These, as well as the other Presbyterians, and the Dutch reformed churches, hold the doctrines of the gospel upon the Calvinistic plan, without any essential differences.

The Dutch reformed churches in this state are divided into four classes, viz. the classis of New York, comprehending eighteen churches; the classis of Kingston, twenty-three churches; the classis of Albany, twenty-three churches; part of the classis of Hackinsack, four churches. These classes, together with the classes of Hackinsack and New Brunswick, in New Jersey, compose the Dutch reformed synod of New York and New Jersey. The classes consist of ministers and ruling elders; each classis delegates two ministers and an elder to represent them in synod. From the first planting of the Dutch churches in New York and New Jersey, they have, under the classis of Amsterdam, been formed exactly upon the plan of the established church of Holland, as far as that is ecclesiastical. A strict correspondence is maintained between the Dutch reformed synod of New York and New Jersey, and the synod of North Holland and the classis of Amsterdam. The acts of their synods are mutually exchanged every year, and mutual advice is given and received in disputes respecting doctrinal points and church discipline.

The principles and constitution of the Baptist churches are much the same as in Great-Britain.

The Episcopalian churches hold the same principles, have the same mode of worship and church government, and are in every other respect constituted upon the same plan with the church of the same denomination in England.

The Methodist interest, though small in this state, has greatly increased in the southern states since the revolution. They have estimated their number at 37,800. But their numbers are so various in different places, at different times, that it would be a matter of no small difficulty to find out their exact amount. The late famous Mr. John Wesley has been called the father of this religious sect. They warmly oppose the Calvinistic doctrines of election and final perseverance, and maintain that sinless perfection is attainable in this life. Their mode of preaching is entirely extemporaneous, very loud and animated, bordering on enthusiasm. They appear studiously to avoid connection in their discourses, and are fond of introducing pathetic stories, which are calculated to affect the tender passions. Their manner is very solemn, and their preaching is frequently attended with a surprising effect upon their

audiences. Their churches are supplied by their pastors in rotation.

The Shakers are a sect who sprung up in Europe. A part of them came over from England to New York in 1774, and, being joined by others, they settled Nissequama, above Albany, whence they spread their doctrines, and increased to a considerable number; but their interest is now fast declining. The late *Anna Lee*, whom they styled the *Elect Lady*, was the founder of this sect. Her followers asserted, that she was a woman spoken of in the twelfth of the Revelation, and that she spoke seventy-two tongues; and although the tongues were unintelligible to the living, the conversation with the dead, who understood her language. They alleged also that she was the mother of all the Elect, and that she travelled for the whole world; that no blessing could descend to any person but only by and through her, and that in the way of her being possessed of these powers, by their confessing and repenting of their sins, according to her direction. The *Elect Lady* was to assert that she was immortal; that the day of judgment had commenced, and that she and her followers were already set to judge the world. But her death indisputably proved that she was not immortal as to bodily presence; and this circumstance, no doubt, has created suspicions in the minds of some of her followers respecting some other of her assertions and doctrines, and occasioned them to renounce the scheme.

Their worship, if such extravagant conduct may be so called, consists principally in dancing, singing, leaping, clapping their hands, falling on their knees, and uttering themselves in groans and sighs, in a sound resembling that of the roaring of water; turning round on their heels with astonishing swiftness, to shew, they say, the power of God. All these gesticulations are performed in the most violent and boisterous manner, and occasion, at intervals, a shuddering not unlike that of a person in a strong fit of the ague. Hence they are called, not improperly, *Shakers*.

Before we leave this head, we must mention, that in April 1784, the legislature of this state passed an act enabling all religious denominations to appoint trustees not less than three, or more than nine, who shall be a body corporate, for the purpose of taking care of the temporalities of their respective congregations, and for the other purposes therein mentioned.

The ministers of every denomination in the state are supported by the voluntary contributions of the people, raised generally by subscription, or by a tax upon the pews, except the Dutch churches in New York, Albany, Skeneclady, and Kingston, which have, except the two last, large estates confirmed by a charter. The Episcopal church also in New York possesses a very large estate in and near the city.

This province was originally settled by the Dutch and Swedes, some time before the Dissenters transported themselves into New England. They called it the New Netherlands, and continued in possession of it till

we must mention, that of this state passed an act to appoint trustees, than nine, who shall be of taking care of the five congregations, and mentioned.

nomination in the state contributions of the people, or by a tax upon the churches in New York, Albany, which have, excepted by a charter. The York possess a very large

reign of Charles II. when it was taken by the English in 1664. The Dutch, to balance this conquest, made themselves masters of Surinam, then belonging to the English. At the treaty of Breda, these respective possessions were confirmed to the conquerors; the Netherlands were ceded to the English, Surinam to the Dutch. This exchange produced a violent clamour among the political writers of those times: it was said that the two provinces were far from being equal; that Surinam was more than double the value of the Netherlands; and, consequently, that the ministry made a very imprudent agreement; but time has recently shewn the mistake, and the superiority of the province of New York is universally allowed. The Netherlands had not been long in our possession when they were divided into provinces; and New York obtained its name from the King's brother, James, of York, to whom his majesty granted it, with powers of government, by letters patent, bearing date the 20th of March 1664. On the accession of Charles II. to the crown, this province became a royal government, and continued so till the Americans rejected their allegiance to the king of Great-Britain.

The government of New York was administered by the governor, who had his commission from the crown. The legislative power was lodged in the governor, council, and house of representatives. The council consisted of 12 members nominated by the king: the house of representatives of 27 members elected by the people: in other respects, the government was as nearly conformable to the laws of England as possible. The members of representatives were elected every seven years; and no laws were valid till the royal assent had been obtained.

The supreme legislative power of this province has however, since 1777, been vested in two separate and distinct bodies of men; viz. 1. The assembly of the states of New York, to consist of 70 members: and, 2. The senate of the state of New York, to consist of 24 for four years; they are to meet once in each year for the dispatch of public business. Delegates to the congress, judges, &c. are chosen by ballot out of the senate and assembly. A governor is appointed to the supreme executive power, and to be assisted by four counsellors, chosen by and from the senate: he is to continue in office three years.

A want of good water is a great inconvenience to the citizens, there being few wells in the city. Most of the people are supplied every day with fresh water, conveyed to their doors in casks, from a pump near the end of Queen-Street, which receives it from a spring, almost a mile from the city. Several proposals have been made by individuals to supply the citizens by pipes, but none has yet been accepted.

New York is the gayest place in America. The cities, in the richness and brilliancy of their dress, are not equalled in any city of the United States; not even Charleston (S. C.) which has heretofore been called

the centre of the *beau monde*. The ladies, however, are not solely employed in attentions to dress. There are many who are studious to add to their brilliant external accomplishments, the more valuable and lasting accomplishments of the mind. Nor have they been unsuccessful; for New York can boast of great numbers of refined taste, whose minds are highly improved, and whose conversation is as inviting as their personal charms. Tinctured with a Dutch education, they manage their families with good economy and singular neatness.

In point of sociability and hospitality, New York is hardly exceeded by any town in the United States. If, however, in regard to these agreeable characteristics, the preference must be given to any one place, it decidedly belongs to Charleston. Some travellers have, in these respects, given Boston and Newport the preference to New York. Several causes have operated to diminish the sociability of the citizens of New York—particularly the change of inhabitants, by emigrations from Europe—the loss of property during the ravages of the war—and the unfavourable state of business—a great part of the time since the peace. These causes have operated no less unfavourably in some other parts of the union.

An inquirer, who would wish to acquaint himself with the true state of the people of New York, their manners and government, would naturally ask the citizens for their societies for the encouragement of sciences, arts, manufactures, &c. for their public libraries? for the patrons of literature? their well-regulated academies? for their female academy for instructing young ladies in geography, history, belles lettres, &c.? Such inquiries might be made with propriety, but could not, at present, be answered satisfactorily.

On a general view of this city, as described thirty years ago, and in its existing state, the comparison is flattering to the present age; particularly the improvements in taste, elegance of manners, and that easy unaffected civility and politeness, which form the happiness of social intercourse.

CHAP. VII.

NEW JERSEY.

Situation, &c. Divisions, Rivers, Towns, Trade, Religion, and Government.

THIS province is situated between 39 and 43 deg. of north lat. and between 74 and 76 deg. of west long. It is about 160 miles in length, and 60 in breadth; bounded by the Sound which separates Staten-Island from the Continent, and Hudson's river, on the north; by Delaware river and bay on the west and south-west; and on the south-east and east by the Atlantic Ocean.

It is divided into thirteen counties, as in the following table:

DIVISIONS.	COUNTIES.	CHIEF TOWNS.
East division, or East Jer- sey, contains	Middlesex . . .	Perth-Amboy, New-B.
	Monmouth . . .	None.
	Essex	Elizabeth, Newark.
	Somerfet	None.
	Bergen	Bergen.
West division, or West Jer- sey, contains	Burlington . . .	Burlington.
	Gloucester . . .	Gloucester.
	Salem	Salem.
	Cumberland . .	Hopewell.
	Cape May	None.
	Huntingdon . . .	Trenton.
Morris	Morris.	
Suffex	None.	

The air is healthy, and the climate nearly the same with that of New York; the soil is various; one part in four, at least, of the province, is barren, sandy land, but produces excellent pines and cedars; and the arable lands large crops of fine wheat, barley, rye, Indian corn, &c. together with a great variety of delicious fruits. There is a valuable copper mine in the county of Bergen, and excellent iron ore is found in other parts.

The principal rivers are Delaware, Raritan, and Passaic; on the latter is a remarkable cataract; the height of the rock, over which the water falls, is near 70 feet perpendicular, and the breadth of the river 80 yards.

Perth-Amboy and Burlington are the chief towns; the former is situated at the mouth of the Raritan, near its efflux into Sandy-Hook Bay; the latter is pleasantly situated in a small island formed by the river Delaware, about 20 miles from Philadelphia. These towns were the seats of government; the governor generally resided in the latter. Perth-Amboy is as good a port as most on the continent; the harbour is safe, and will contain many large ships. Both have been lately made free ports for 25 years.

The foreign trade of this province is very small, owing principally to its vicinity to the large trading towns of New York and Philadelphia. The province is however in a very flourishing condition, and their paper currency, which some years ago amounted to upwards of sixty thousand pounds, has more credit than that of either Pennsylvania or New York; for the Pennsylvania bills are not received in payment in New York, nor the New York bills in Pennsylvania, whereas the New Jersey bills circulate through both these provinces.

The established religion is that of the church of England, but all religious sects are tolerated, and enjoy their respective places of worship without the least molestation. From a list of the houses appropriated to divine service, made by a member of the council in 1765, it appears, that there are in the province of New Jersey,

twenty-two episcopalian churches; fifty-seven houses belonging to the Scotch Presbyterians; nine to the Quakers; twenty-two to the Dutch Presbyterians; twenty-two to the Baptists; seven to the Moravians; one to the Separatists; and one to the Rogereans; in all 172. There is no establishment of any one religious sect in this province, in preference to another.

In 1746, Governor Belcher founded a college, Prince-Town, and procured it the privilege of conferring degrees, in the same manner as at Oxford and Cambridge. Before the late war, there were 80 and 100 students here, who came from all parts of the continent for the benefit of pursuing their studies.

The government of New Jersey is now vested in the governor, legislative council, and general assembly, which are to be annually elected. The governor and lieutenant-governor are to be chosen out of and by the general assembly and council. The judges of the supreme court are chosen for seven years, and the officers of the executive power for five years. The members of the legislative council must be freeholders, worth 1000l. real and personal estate; and those of the general assembly 500l. Fifty pounds is a qualification for representatives, and all public officers.

This province was originally part of the New Netherlands, and given by Charles II. to his brother James, duke of York, who sold it, for a valuable consideration, to Lord Berkeley and Sir George Carteret; these sold it again to others, who, in the year 1702, surrendered the government to Queen Anne. The number of inhabitants, by a list published in 1700, were about 100,000, but are supposed, since that time, to have increased to 130,000.

Many circumstances concur to render the character, manners, and customs of the people various in different parts of the state. The inhabitants are a collection of Low Dutch, Germans, English, Scotch, Irish, and New Englanders, or their descendants. National attachment and mutual convenience have generally produced these several kinds of people to settle together in a body; and in this way their peculiar national manners, customs, and character, are still preserved, especially among the lower class of people, who have little intercourse with any but those of their own nation. Religion, although its tendency is to unite people in those things that are essential to happiness, occasions wide differences as to manners, customs, and character. The Presbyterian, the Quaker, the Episcopalian, the Baptist, the German and Low Dutch Calvinist, the Methodist, and the Moravian, have each their distinguishing characteristics, either in their worship, their discipline, or their dress. There is still another very perceptible characteristic difference, distinguished from either of the others, which arises from the intercourse of the inhabitants with different states. The people in West Jersey trade to Philadelphia, and of course imitate their fashions, and imberbe their manners.

churches; fifty-seven members Scotch Presbyterians; thirty-two to the Dutch Reformed Baptists; seven to the Methodists; one to the Separatists; in all 172. There is no other religious sect in this

scholar founded a college, and it the privilege of commerce as at Oxford. In the late war, there were general who came from all parts of it pursuing their studies. New Jersey is now vested in a council, and general assembly elected. The government is to be chosen out of and by a council. The judges of the supreme court are for seven years, and the officers for five years. The members must be freeholders, or free tenants; and those of the general assembly is a qualification to be public officers.

ally part of the New York. Charles II. to his brother sold it, for a valuable consideration, and Sir George Carteret, who, in the year 1702, went to Queen Anne. The first list published in 1702 supposed, since that time

to render the character of the people various in different parts. The inhabitants are a collection of English, Scotch, Irish, and German descendants. National prejudices have generally prevented the people to settle together. Their peculiar national manners are still preserved, especially of people, who have little

of their own nationalities is to unite people in all to happiness, occasions, manners, customs, and even the Quaker, the Episcopalian, the German and Low Dutch, the Moravian, have each their own, either in their words or dress. There is still another difference, distinguished by the different States. The people to Philadelphia, and do not and imbibe their manners.

inhabitants of East Jersey trade to New York, and imitate their fashions and manners according to those of New York. So that the difference in regard to fashions and manners between East and West Jersey, is nearly as great as between New York and Philadelphia. As to all these, the differences common in all countries, arising from the various occupations of men, such as the mechanic, the divine, the lawyer, the physician, the merchant, the clownish, the decent, and the respectable farmer, of whom have different pursuits, or pursue the same differently, and of course must have a different set of ideas and manners: when we take into view all these differences (and all these differences exist in New Jersey, in many of them in all the other states) it cannot be expected that many general observations will apply. It is, however, in truth, to be said, that the people of New Jersey are generally industrious, frugal, and hospitable. There are comparatively but few men of fortune in the state, nor can it be said that the people generally have a taste for the sciences. The lower classes, in which may be included three-fifths of the inhabitants of the whole state, are ignorant, and are generally neglectful in the education of their children: there are, however, a number of gentlemen of the first rank in abilities and learning in the civil offices of the state, and in the several learned professions.

It is not the business of a geographer to compliment ladies; nor would we be thought to do it when we say that there is at least as great a number of industrious, neat, amiable, genteel, and handsome women in New Jersey, in proportion to the number of inhabitants, as in any of the thirteen states. Whether an adequate degree of solid mental improvement, answerable to the personal and other useful qualities we have mentioned, is to be found among the fair of this state, is a more weighty concern. Perhaps it may be said with justice, that in general, though there is not the same universal taste for knowledge discernible among the ladies here, as in some other of the states, owing to a great measure, to the state of society, and the means of improvement, there are, however, many significant instances of improved talents among them, not surpassed by those of their sisters in any of the other states.

Among the several religious sects in America, that of the Dumplers, or Dunkards, is one of the most harmless, and perhaps the most extraordinary, that has ever appeared since the establishment of Christianity. They reside at a small town called Ephrata, situated on the frontiers of the province, between two little hills, in the most delightful situation that can well be imagined, if nature had created it for the indulgence of contemplation. A German hermit, who settled on the spot where Ephrata is now built, was the founder of this extraordinary sect. The Germans of both sexes, who first saw the hermit, soon accustomed themselves to his way of thinking, and consequently to his manner of living; industry became part of their duty, and divided

their time with devotion. Their gains they throw into one common stock, which supplies all their exigencies, private as well as public. Their females are cloistered by themselves in a separate part of the town, the situation of which is delightful, and screens them from the north wind. Both their dress and diet are very simple. They hold free-will; deny the doctrine of original sin; disclaim all violence; observe the Sabbath very strictly; their prayers and sermons are extempore; the Christian virtues are the subjects of their discourses; they imagine the souls of departed Christians are employed in converting others who had been ignorant of the gospel; and, lastly, they deny the eternity of hell torments. These people live in harmony and mutual affection, and their hospitality to strangers is unbounded, but they never accept any recompense.

There are, in this state, about fifty Presbyterian congregations, subject to the care of three presbyteries, viz. that of New York, of New Brunswick, and Philadelphia. A part of the charge of New York and Philadelphia presbyteries lies in New Jersey, and part in their own respective states. To supply these congregations, there are at present about twenty-five ministers.

There are upwards of forty congregations of Friends, commonly called Quakers; who are in general sober, plain, industrious, good citizens. For an account of their religious tenets, see Pennsylvania.

There are thirty associated congregations of Baptists in New Jersey, whose religious tenets are similar to those already mentioned under Connecticut.

The Episcopal interest consists of twenty-five congregations.

There are, in this state, two classes belonging to the Dutch Reformed Synod of New York and New Jersey. The classis of Hackensack, to which belong thirteen congregations; and the classis of New Brunswick, to which belong fifteen congregations. We have already given an account of their church government, discipline, &c.

The Moravians have a flourishing settlement at Hope, in Suffex county. This settlement was begun in 1771, and now consists of upwards of 100 souls.

The Methodist interest is small in this state. The Swedes have a church in Gloucester county; and there are three congregations of the Seventh-Day Baptists. All these religious denominations live together in peace and harmony; and are allowed, by the constitution of the state, to worship Almighty God agreeably to the dictates of their own consciences; and are not compelled to attend or support any worship contrary to their own faith and judgment. All Protestant inhabitants, of peaceable behaviour, are eligible to the civil offices of the state.

There are two colleges in New Jersey one at Princeton, called Nassau-Hall, the other at Brunswick, called Queen's College. The college at Princeton was first founded by charter from John Hamilton, Esq. President of the Council, about the year 1738, and enlarged

larged by Governor Belcher in 1747. The charter delegates a power of granting to "the students of said college, or to any others thought worthy of them, all such degrees as are granted in either of our universities, or any other college in Great-Britain." It has twenty-three trustees. The governor of the state, and the president of the college, are, *ex officio*, two of them. It has an annual income of about 9000. currency; of which 2000. arises from funded public securities and lands, and the rest from the fees of the students. The president of the college is likewise professor of eloquence, criticism, and chronology. The vice-president is also professor of divinity and moral philosophy. There is besides a professor of mathematics and natural philosophy; and two masters of languages. The four classes in college contain about seventy students. There is a grammar school, of about thirty scholars, connected with the college, under the superintendance of the president, and taught by two masters.

Before the war this college was furnished with a philosophical apparatus, worth 5000. which (except the elegant orrery constructed by Mr. Rittenhouse) was almost entirely destroyed by the British army in the late war, as was also the library, which now consists of between 2 and 3000 volumes.

The college edifice is handsomely built with stone, and is 180 feet in length, fifty-four in breadth, and four stories high; and is divided into forty-two convenient chambers for the accommodation of the students, besides a dining hall, chapel room, and a room for the library. Its situation is exceedingly pleasant and healthful. The view from the college balcony is extensive and charming.

This college has been under the care of a succession of presidents eminent for piety and learning; and has furnished a number of civilians, divines, and physicians, of the first rank in America. It is remarkable, that all the presidents of this college, except Dr. Witherpoon, who is now president, were removed by death very soon after their election into office.

The charter for Queen's College, at Brunswick, was granted just before the war, in consequence of an application from a body of the Dutch church. Its funds, raised wholly by free donations, amounted, soon after its establishment, to 40000.; but they were considerably diminished by the war. The students are under the care of President Hardenberg. The grammar school, which is connected with the college, consists of between thirty and forty students, under the care of the trustees. This college has lately increased both in numbers and reputation.

There are a number of flourishing academies in this state. One at Trenton, in which are about eighty students in the different branches. It has a fund of about 1500. per annum, arising from the interest on public securities. Another in Hackinsak, in the county of Bergen, of upwards of 100 scholars. Instruction and board are said to be cheaper here than in any part of the state. There is another flourishing academy at Orangedale, in the county of Essex, consisting of nearly

as many scholars as either of the others, furnished with able instructors, and good accommodations. Another has lately been opened at Elizabeth Town, and consists of upwards of twenty students in the languages, and is increasing. There is also an academy in Burlington, in which young ladies and gentlemen are taught the English language grammatically, geography, and other learned languages. Besides these, there are grammar schools at Newark, Springfield, Morristown, Boxborough, and Amboy. There are no regular establishments for common schools in the state. The usual mode of education is, for the inhabitants of a village or neighbourhood to join in affording a temporary supply for a school-master, upon such terms as is mutually agreeable. But the encouragement which these occasional teachers meet with, is generally such, as that a person of abilities adequate to the business will not undertake it; and, of course, little advantage is derived from these schools. The improvement in these common schools is generally in proportion to the wages of the teacher.

M. Briffot de Warville, in his "New Travels through the United States of America," has given us the following interesting account of the school of negroes at Philadelphia:

"There exists, then, a country (says he) where the negroes are allowed to have souls, and to be endowed with understanding capable of being formed to virtue and useful knowledge; where they are not regarded as beasts of burden, in order that we may have the privilege of treating them as such.—There exists a country where the blacks, by their virtue and their industry, rebelye the calumnies which their tyrants elsewhere lay against them; where no difference is perceived between the memory of a black head whose hair is craped by nature, and that of a white one craped by art. I have had a proof of this to-day. I have seen, heard, and examined these black children. They read well, repeat from memory, and calculate with rapidity. I have seen a picture painted by a young negro, who never had a master: it was surprisngly well done.

"I saw in this school, a mulatto, one-eighth negro, it is impossible to distinguish him from a white boy. His eyes discovered an extraordinary vivacity; and this is a general characteristic of people of that origin.

"The black girls, besides reading, writing, and the principles of religion, are taught spinning, needle-work, &c. and their mistresses assure me, that they discover much ingenuity. They have the appearance of decency, attention, and submission. It is a nursery of good servants and virtuous housekeepers. How criminal are the planters of the islands, who form but a debauchery and ignominy creatures so capable of being fashioned to virtue!

"It is to Benezet that humanity owes this useful establishment—to that Benezet whom Chastelleux has not blushed to ridicule, for the sake of gaining the infamous applauses of the parasites of despotism.

The life of this extraordinary man merits to be known to such men as dare to think, who esteem more the benefactors of their fellow-creatures, than their oppressors, so basely idolized by many during their

Anthony Benezet was born at St. Quintin, in Picardy, in 1712. Fanaticism, under the protection of a bigot king, directed by an infamous confessor, and an infamous woman, spread at that time its ravages in France. The parents of Benezet were Calvinists; they fled to England, and he embraced the doctrines of the Quakers. He went to Philadelphia in commerce, the business to which he had been educated. But the rigidity of his principles and his taste not agreeing with the spirit of commerce, he quitted that business in 1736, and accepted a place in the academy of that society. From that time all his moments were consecrated to public instruction, the relief of the poor, and the defence of the unhappy negroes. Benezet possessed an universal philanthropy, which was not common at that time; he regarded, as his brothers, all men, of all countries, and of all colours; he composed many works, in which he collected all the authorities from Scripture, and from other writings, to discourage and condemn the slave trade and slavery. His works had very much influence in determining the Quakers to emancipate their

It was not enough to set at liberty the unhappy blacks; it was necessary to instruct them—to find them school-masters. And where should he find men willing to devote themselves to a task which prejudice rendered painful and disgusting? No obstacle could arrest the zeal of Benezet; he set the first example himself; he consecrated his little fortune to the foundation of this school; his brethren lent some assistance; and by the help of the donations of the society of London, the school for blacks at Philadelphia enjoys a revenue of 200l. sterling.

He consecrated his fortune and his talents to their instruction; and in 1784, death removed him from his holy occupation, to receive his reward. The tears of the blacks, which watered his tomb, the sighs of his fraternity, and of every friend of humanity which attended his departing spirit, must be a prize more precious than the laurels of a conqueror.

Benezet carried always in his pocket a copy of his works on the slavery of the blacks, which he gave and recommended to every one he met, who had not seen them. It is a method generally followed by the society of friends. They extend the works of utility; and it is the true way of gaining proselytes.

This philanthropic Quaker was preceded in the same career, by many others, whom I ought to mention. He celebrated George Fox, founder of this sect, went from England to Barbadoes in the year 1673, not to

preach against slavery, but to instruct the blacks in the knowledge of God, and to engage masters to treat them with mildness.

The minds of men were not yet ripe for this reform; neither were they when William Burling, of Long-Island, in 1718, published a Treatise against Slavery. He was a respectable Quaker: he preached, but in vain; the hour was not yet come.

Ought not this circumstance to encourage the friends of the blacks in France? Sixty years of combat were necessary to conquer the prejudice of avarice in America. One year is scarcely passed since the foundation of the society at Paris; and some apostates already appear, because success has not crowned their first endeavours.

Burling was followed by Judge Sewal, a Presbyterian of Massachusetts. He presented to the General Assembly a Treatise entitled, 'Joseph sold by his brethren.' He discovers the purest principles, and completely overturns the hackneyed arguments of the traders, respecting the pretended wars of the African princes.

It is often said against the writings of the friends of the blacks, that they have not been witnesses of the sufferings which they describe. This reproach cannot be made against Benjamin Lay, an Englishman, who, brought up in the African trade, afterwards a planter at Barbadoes, abandoned his plantation, on account of the horror inspired by the frightful terrors of slavery endured by the negroes. He retired to Philadelphia, became a Quaker, and ceased not the remainder of his life to preach and write for the abolition of slavery. His principal treatise on this subject appeared in 1737. He was thought to have too much zeal, and to have exaggerated in his descriptions. But these defects were expiated by a life without a stain, by an indefatigable zeal for humanity, and by profound meditations. Lay was simple in his dress, and animated in his speech; he was all on fire when he spoke on slavery. He died in 1760, in the 80th year of his age.

One of the men most distinguished in this career of humanity, was a Quaker, named John Woolman. He was born in 1700. Early formed to meditation, he was judged by the Friends worthy of being a minister at the age of twenty-two. He travelled much to extend the doctrines of the sect; but was always on foot, and without money or provisions, because he would imitate the apostles, and be in a situation to be more useful to the poor people, and to the blacks. He abhorred slavery so much, that he would not taste any food that was produced by the labour of slaves. The last discourse that he pronounced, was on this subject. In 1772, he undertook a voyage to England, to concert measures with the Friends there, on the same subject; where he

died of the small-pox. He left several useful works, one of which has been through many editions, entitled 'Considerations on the Slavery of the Blacks.'

An Account of the METHODS used to abolish SLAVERY in America.

"WOOLMAN and Benezet had in vain employed all their efforts to effect the abolition of this traffic under the English government. The mistaken interest of the mother-country caused all the petitions to be rejected in the year 1772; yet the minds of men were prepared in some of the colonies; and scarcely was independence declared, when a general cry arose against this commerce. It appeared absurd for men defending their own liberty, to deny liberty to others. A pamphlet was printed, in which the principles on which slavery is founded, were held up in contrast with those which laid the foundation of the new constitution.

"This palpable method of stating the subject was attended with a happy success; and the Congress, in 1774, declared the slavery of the blacks to be incompatible with the basis of republican governments. Different legislatures hastened to consecrate this principle of Congress.

"Three distinct epochs mark the conduct of the Americans in this business—the prohibition of the importation of slaves—their manumission—and the provision made for their instruction. All the different states are not equally advanced in these three objects.

"In the northern and middle states, they have prohibited for ever the importation of slaves; in others, this prohibition is limited to a certain time. In South Carolina, where it was limited to three years, it has lately been extended to three years more. Georgia is the only state that continues to receive transported slaves. Yet, when General Oglethorpe laid the foundation of this colony, he ordained, that neither man nor slaves should ever be imported into it. This law, in both its articles, was very soon violated.

"We must acknowledge however, that the Americans, more than any other people, are convinced that all men are born free, and equal: we must acknowledge, that they direct themselves generally by this principle of equality; that the Quakers, who have begun, who have propagated, and who still propagate this revolution of sentiment, have been guided by a principle of religion, and that they have sacrificed to it their personal interests.

"Unhappily their opinion on this subject has not yet become universal, interest still combats it with some success in the southern states. A numerous party still argues the impossibility of cultivating their soil without the hands of slaves, and the impossibility of

augmenting their number without recruiting them Africa. It is to the influence of this party, in the General Convention, that is to be attributed the article which tarnishes that glorious monument of human reason, the new federal system of the United States. It was this party that proposed to bind the hands of the new Congress, and to put it out of power for twenty years to prohibit the importation of slaves. It was said to this august assembly, Sign the article, or we will withdraw from the union. To avoid the evils, which, without meliorating the fate of the blacks, would attend a political schism, the Convention was forced to waver from the grand principle of universal liberty, and the preceding declaration of Congress. They thought it their duty to imitate Solon, to make, not the best law possible, but the best circumstances would bear.

"But, though this article has surprised the friends of liberty in Europe, where the secret causes were not known; though it has grieved the society in England, who are ready to accuse the new legislation of a cowardly defection from their principles; yet may regard the general and irrevocable proscription of the slave-trade in the United States, as very near hand. This conclusion results from the nature of things, and even from the article itself of the new constitution now cited. Indeed, nine states have already done it; the blacks, which there abound, are considered as free. There are then nine asylums for them to escape to from Georgia; not to speak of the neighbourhood of the Floridas, where the slaves from Georgia take refuge, in hopes to find better treatment from Spaniards; and not to speak of those vast forests and inaccessible mountains which make part of the Southern States; and where the persecuted negro may easily find a retreat from slavery. The communications with the back country are so easy, that it is impossible to prevent the fugitives; and the expence of reclaiming is proportioned to their value. And though the Southern states do not in appearance oppose these reclamations, yet the people there hold slavery in such horror, that the master who runs after his human property, has little respect, and finds little assistance. Thus the possibility of flight creates a new discouragement to the importation, as it must lessen the value of the slave, induce to a milder treatment; and finally tend, with the concurrence of other circumstances, to convince the Georgian planter, that it is more simple, more profitable, and less expensive, to cultivate by the hands of freemen. We are right then in saying, that the nature of things in America is against the importation of slaves.

"Besides, the Congress will be authorised in twenty years to pronounce definitively on this article. By that time, the sentiments of humanity, and the calculation of reason, will prevail; they will no longer be forced to sacrifice equity to convenience, or have any thing to fear from opposition or schism."

CHAP. VIII.

PENNSYLVANIA.

Section, &c. Divisions, Climate, Produce, Rivers, Towns, Inhabitants, Penn's Settlement and Government.

THE province of Pennsylvania is situated between 39 and 44 deg. of north lat. and between 74 and 80 deg. of well long. It is about 300 miles in length, and 100 in breadth; bounded, on the north, by the country of the Iroquois, or five nations; on the south, by Maryland; on the east, by the Delaware river, which separates it from New Jersey; and on the west by the Pennsylvania river. It is divided as in the following table.

COUNTIES.	CHIEF TOWNS.
Philadelphia.....	Philadelphia.
Chester.....	Chester.
Bucks.....	Newtown.
Berks.....	Reading.
Northampton.....	Easton.
Lancaster.....	Lancaster.
York.....	York.
Cumberland.....	Carlisle.

To these we may add Bedford, a county westward of the mountains upon the Ohio, purchased by Mr. Penn, from the Indians, in 1768, and established in 1771.

Besides these, the three following counties, situated in the Delaware, formed, in some measure, a separate government, having an assembly of their own, though under the same governor with the province of Pennsylvania. They are now distinct, and called the Delaware state, having a president, council, and house of assembly; judges, and other officers of state, civil and military.

} on Delaware.

The air of Pennsylvania is clear, sweet, and healthy. In the fall, or autumn, begins about the 20th of October, and lasts till the beginning of December, when the winter sets in and continues till March; during which the weather is often so very severe, that the river Delaware, though very broad at Philadelphia, is frozen over. The spring commences in March, and continues till June, when the weather is more unsettled than in the other seasons. The months of July, August, and September, are the summer months, when the heat would be intolerable were it not mitigated by frequent cool breezes. During the summer the wind

is generally at south-west, but in the winter at north-west, which, by passing over the frozen mountains and lakes of Canada, renders the cold so excessive at that season. The soil is not greatly different from that of New York, but something more fertile; nor is there so much sandy and useless land in Pennsylvania as in New York. Some rice, but no great quantity, is cultivated here; and there are some tobacco plantations, but the produce is not equal to that of Virginia. In all parts of our plantations, from New York to the extremity of Florida, the woods are full of vines of different species. They are very thick at the bottom, and bear great plenty of grapes, but very small. From these the Indians procure a sort of wine, with which they often regale themselves. The timber produced in Pennsylvania is of the same species as that of New England; but here, and in all the southern colonies, it is not so proper for shipping as that of the northern colonies; it is less compact, and splits with a much smaller force. These properties render it less valuable in ship-building, but more useful for pipe-staves, and wainscoting.

The principal rivers in this province are the Delaware, the Susquehanna, and the Schuylkill. The Delaware is navigable more than 200 miles above the city of Philadelphia. The Susquehanna is also navigable a great way up the country. The Schuylkill is navigable for boats above 100 miles. These rivers, with the numerous creeks and harbours in Delaware bay, are extremely favourable both to the foreign and inland trade of Pennsylvania.

This province has many towns that deserve particular notice; but the city of Philadelphia stands unrivalled in British America, and when completed will, in point of plan and regularity, exceed any in Europe. The city forms a parallelogram, or long square, two miles in length, and one in breadth; extending from the river Delaware to the Schuylkill, forming, as it were, a connection between these two navigable rivers. The plan of this elegant city was drawn by William Penn, at once the founder and legislator of this flourishing colony. Part of the plan is already executed, and will in all probability soon be completed. Every quarter of the city will then form a square of eight acres; having in the centre a square of ten acres, surrounded by the town-house, and other public buildings. The high-street is an hundred feet wide, and extends the whole breadth of the town, from one of the above rivers to the other. Parallel to the high-street run nineteen others, which are crossed by eight more at right angles, all of them thirty feet wide, and communicate by canals with the two rivers; which add at once to the beauty and wholesomeness of the city. According to the original plan, every person who possessed 1000 acres in any part of the province, was to have his house either in one of the fronts facing the river, or in the high-street, running from the middle of one front to the middle of the other. Besides the above.

nt it their duty to limit
st law possible, but the

above privilege every owner of 5000 acres, was entitled to an acre of ground in the front of his house, and all others half an acre for gardens and court-yards. The town-house is a stately, spacious, and regular building, and would be an ornament to any capital in Europe. The other public buildings, which consist chiefly of structures dedicated to religion, besides the military barracks, markets, and almshouses, are proportionally grand. The quays are spacious and noble; the principal quay is 200 feet wide, furnished with cranes, and other conveniences for loading, and unloading ships; and the water is so deep, that a ship of 500 tons burden, may lay her broadside to the quay. The proprietor's seat, where the governor usually resides, is situated about a mile above the town, and is the first private building both for magnificence and situation in all British America. But the noblest institution in Pennsylvania, is the academy established some years since in Philadelphia. Very considerable subscriptions were raised both in England and Scotland for completing this noble design, and it bids fair in time to rival the most celebrated seminaries of learning in the mother country. The number of inhabitants in Philadelphia is computed at 30,000. The meetings of the general congress of America were held in this city from the year 1774 till 1777, when the British troops took possession of it, but the king's forces retreating to New York in 1778, the congress again made Philadelphia their residence.

There are several towns besides the capital in the county of Philadelphia; the most considerable are, Germantown, so called from being inhabited wholly by Germans; Frankfort, Abington, Dublin, Radnor, and Amerland. In the county of Bucks, are Bristol, Falls-Town, and Pensbury. In the county of Chester, are Chester, Chichester, and Marcus Hook. Newcastle, Haverfordwest, Merioneth, and St. George, are found in the county of Newcastle; Dover, Cranebrook, Marden; and Mespeliven plantations, in the county of Kent; Lewis in the county of Suffex; and Lancaster in the county of that name.

The inhabitants in the province of Pennsylvania, are not less than 350,000, half of whom are Germans, Swedes, or Dutch. It is certainly very right policy to encourage the importation of foreigners into Pennsylvania, as well as into our other colonies. By this we are gainers without diminishing the inhabitants of Great-Britain. But it has been frequently lamented, that these people are suffered to remain foreigners, and likely to continue so for many generations; they have erected schools of their own, printed books, and even the common newspapers in their own language; by which means, together with their possessing large tracts of land without any intermixture of English, they continue, as it were, a separate people. At the same time, their remarkable industry, frugality, and abstemious method of living, enable them to increase their tract of country to the ruin of the Americans;

so that there is some danger of the whole colony coming in time wholly foreign in language, in manners, and perhaps in inclinations. It seems therefore necessary that some regulations should take place with regard to their settlement, and some means be pursued in order to naturalize them effectually. But it must however, be acknowledged, that the inhabitants of Pennsylvania, are an industrious and hardy people; most of them are substantial, though few of the persons possessed of landed property are rich. They are all well lodged, well fed, and, when their circumstances are considered, well clothed; and at a more reasonable rate than can be well imagined, as the inferior manufactures most of their wearing apparel, both in wool and woollen.

A great number of wealthy merchants inhabit the city of Philadelphia. Nor will this appear surprising when the great trade they carry on is considered. Their commerce is not confined to the provinces of America, it is extended to the French, Dutch, and Spanish colonies; to the Azores, the Canaries, and the Madeira islands; to Great-Britain, and Ireland; and to Spain, Portugal, and Holland. Many of the branches of trade are very profitable, and cannot be of enriching a frugal and industrious people. Besides the quantity of commodities produced by this province and brought down the rivers Delaware and Schuylkill, the Dutch employ several hundred waggons, each drawn by four horses, in bringing the produce of their farms to the markets of Philadelphia. In the year 1774, 303 vessels entered at this port, and 291 cleared outwards. The commodities formerly exported to Great-Britain, and other markets, besides timber, ships materials, for sale, copper ore, and iron in pigs and bars, consisted of grain, flour, and many sorts of animal food; and at an average of three years, were calculated at 705,500. But after the conclusion of the late war, trade had greatly increased, that the duty in Philadelphia upon imported goods of a 4 percent. *ad valorem*, produced from the 1st of March 1784, to the 1st of December 1784, 132,000*l.* which, supposing their value not undervalued, nor any indirect methods used to save the duty, makes their value amount to the amazing sum of 3,168,000*l.*

This province, together with New Jersey and New York, composed what was formerly called the Netherlands, and was originally possessed by the Dutch and Swedes. After the country was taken by the English, Admiral Penn, who in conjunction with the Venables, had some years before taken the island of Jamaica, being greatly in favour with Charles II. obtained a promise of a grant of the tract of country now called Pennsylvania, from that monarch. Upon the Admiral's death, his son, the celebrated founder and legislator of Pennsylvania, claimed the royal promise, and after a tedious court solicitation, obtained the

patent

ent in right of his father. Conscious that the only
method of rendering the grant he had obtained from
fairly valuable to himself, was to make both the
country and its government as agreeable as possible to the
settlers, he began with purchasing the soil, at a low
price, indeed from the Indians, as the original possessors,
whom it was of very little value. By this cheap act
of justice at the beginning, he rendered all his future
dealings with these people successful. Prepossessed
with a favourable opinion of him as to his designs,
they were so far from giving any disturbance to the set-
tlers, that they were ready to give them assistance when-
ever it was wanted.

Having thus wisely secured the Indians, he applied
himself to execute the other part of his plan, that of
improving the country. This he found greatly facilitated
by the uneasiness of his brethren the Quakers in
England, who, by refusing to pay tithes and other
church dues, suffered a kind of persecution from the
Bishops. Their high opinion and regard for Penn, who
was indeed an honour to their new church, made them
more ready to follow him over a wide and pathless
sea, to settle in a country then little better than a
howling wilderness, and in a climate whose properties
were unknown. Nor was he himself wanting in any
thing that had the least tendency to encourage and sup-
port the resolution they had formed. He expended
great sums of money in transporting, and finding them
all necessaries; and not aiming at a sudden profit,
but at great man disposed of his lands at a very small pur-
chase; 20s. for 1000 acres, and 1s. quit-rent for every
100, were the reasonable terms on which he bestowed
them. At this time land is granted at 12l. for every
100 acres, with a quit-rent of 4s. reserved. Near
Philadelphia land lets at 20s. the acre, and even at
several miles distance from that city, sells at 20 years
purchase. By pursuing such a generous plan, the
colony of Pennsylvania was soon established, and has
since been rapidly increasing.

But what crowned all his proceedings was the noble
charter of privileges, by which he made them as free
as any people in the world; and which has since in-
duced such vast numbers of people of different per-
suasions and different countries to abandon their native
land, and put themselves under the protection of his
laws. All his institutions were founded on the solid
basis of civil and religious liberty, considered in its full
extent. No laws can be made without the consent
of the people given by the suffrages of their repre-
sentatives in the general assembly. Even matters of
benevolence, to which the laws of few nations have
extended, were by Penn subjected to regulations. The
rights of widows and orphans were to be inquired into
by a court constituted for that purpose. The causes
between man and man were not to be subjected to the
delay and chicanery of the law, but to be decided by
wise and honest arbitrators. In short, such was the ex-
cellent spirit of the laws framed by William Penn, that

had he been a native of Greece, his statue would have
been placed next to those of Solon and Lycurgus.

Religious liberty was founded on the same ample
basis. Christians of all denominations might not only
live unmolested in the colony, but even have a share in
the government. In a word, the diversity of people,
religions, nations, and languages here, is prodigious;
and what is still more wonderful, they live together in
harmony.

In consequence of the plan for a new constitution
agreed on at the Convention of Philadelphia in 1776,
the commonwealth, or state of Pennsylvania is now
governed by an assembly of the representatives of the
freemen of the same, and a president and council; the
supreme legislative power is vested in a house of repre-
sentatives of the freemen of the state; and the supreme
executive power is vested in a president and council of
twelve. It was likewise agreed, that the house of rep-
resentatives should consist of persons most noted for
wisdom and virtue, to be chosen annually by the free-
men of every city and county. The president of the
supreme executive council may appoint and com-
mission judges, naval officers, a judge of the admiralty,
attorney general, and other officers, civil and military;
he is likewise empowered to hold the office of com-
mander in chief of the forces of the state, but shall
not command in person, except advised thereto by the
council, and then only so long as they shall approve.
All trials to be by jury; and that freedom of speech,
and of the press, to be allowed. All persons in public
offices are required to declare their belief in one God,
the creator and governor of the universe, the rewarder
of the good, and the punisher of the wicked; and are
also to acknowledge the Scriptures of the Old and New
Testament to be given by divine inspiration. This plan
of government contained a variety of other particu-
lars; amongst which, we shall only mention the
following; viz. that the freemen are to elect annually,
by ballot, for each city and county, two persons, to be
called the council of censors, whose business it is
to examine into the conduct of the legislative and
executive powers. The other is, the training and
arming the freemen and their sons for the defence of the
commonwealth, under such regulations, restrictions,
and exceptions, as the general assembly should by law
direct, with liberty for the people to choose their own
officers, &c.

In a plan for the establishment of public schools, and
the diffusion of knowledge in Pennsylvania, by Dr.
Benjamin Rush, professor of chemistry in the Univer-
sity of Philadelphia, lately published, there is this ob-
servation in a note, "There are 600 schools in the
small state of Connecticut, which have in them 25,000
scholars;" and mark the good effects of education
"only two natives of this state have been condemned
in the course of the last 25 years: is there any county
in England, either great or small, can make such a glo-
rious

rious boast? The German Lutherans in Pennsylvania take uncommon pains in the education of their youth; not one of this society has submitted to the ignominy of a legal punishment of any kind in the course of the last 17 years." The writer of the above intelligence hereupon very pertinently remarks, that, "in all cases whatever, no argument can possibly overthrow or exceed real matter of fact. What can we think then of those persons (continues he) who, so far from contributing to the support and encouraging of Sunday schools, have been weak or wicked enough to write against them? If ever a reformation can be effected on the morals of the people, it must be done by instilling better principles into, and inuring to better habits, the rising generation. And how can this be better done for the poor than in Sunday schools?"

Of the great variety of religious denominations in Pennsylvania, the Friends, or Quakers, are the most numerous. George Fox is called the father of this religious sect, because he first collected them into a society in England, about the middle of the 17th century. The true appellation of these people is Friends; that of Quakers was early and invidiously given them by way of contempt. They came over to America as early as 1656, but were not indulged the free exercise of their religion in New England.

They were the first settlers of Pennsylvania in 1682, under William Penn, and have ever since flourished in the free enjoyment of their religion. They believe that God has given to all men sufficient light to work their salvation, unless it be resisted: that this light is as extensive as the seed of sin, and saves those who have not the outward means of salvation; that this light is a divine principle, in which dwells God, the Father, Son, and Holy Ghost. They maintain that the Scriptures are not the principal ground of all truth and knowledge: nor yet the primary rule of faith and manners; but because they give a true testimony of the first foundation, they are and may be esteemed a secondary rule, subordinate to the Spirit, from whom they derive all their excellence. They believe that immediate revelation has not ceased, but that a measure of the Spirit is given to every person. That as, by the light or gift of God, all spiritual knowledge is received, those who have this gift, whether male or female, though without human commission or learning, ought to preach; and to preach freely, as they have freely received the gift. All true and acceptable worship of God, they maintain, is by the inward and immediate moving of his Spirit; and that water baptism and the Lord's supper were commanded only for a time. They neither give titles, nor use compliments in their conversation, or writings, believing that *whatsoever is more than yea, yea, and nay, nay, cometh of evil*. They conscientiously avoid, as unlawful, kneeling, bowing, or uncovering the head to any person. They discard all superfluities in dress or equipage; all games, sports, and plays, as unbecoming the Christian.

'Swear not at all' is an article of their creed, likewise observed in its utmost extent. They believe it unlawful to fight in any case whatever; and think that their enemy *smite them on the one cheek, they ought to smite him the other also*. They are generally honest, punctual, and even punctilious, in their dealings; providing for the necessities of their poor; friends to the humane, and of course enemies to slavery; strict in their discipline; careful in the observance even of the punctilios in dress, speech, and manners, which their religion enjoins; faithful in the education of their children; industrious in their several occupations. In whatever peculiarities and mistakes those of other denominations have supposed they have fallen into, at the point of religious doctrines, they have proved themselves to be good citizens. Next to the Quakers, the Presbyterians are the most numerous, concerning whom we have nothing to add to what we have already said under New York.

The Protestant episcopal church of New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and South-Carolina, met in convention at Philadelphia, October 1785, and revised the book of common prayer, and administration of the sacraments, and other rites and ceremonies, and published and proposed the book, thus revised, for the use of the church. The revision was made in part, in order to render the liturgy consistent with the American revolution, and the constitutions of the several states. In this they have discovered their liberality and their patriotism. In Pennsylvania and the southern states this revised book is pretty generally used by the episcopal churches. In New York and New Jersey it has not been adopted.

There are upwards of sixty ministers of the Lutheran and Calvinist religion, who are of German extraction, now in this state; all of whom have one or more congregations under their care; and many of them preach in splendid and expensive churches; and yet the Lutheran minister, who arrived in Pennsylvania about fifty years ago, was alive in 1787, and probably is still 1793, as was also the second Calvinistical minister.

min. to the middle of the peninsula, which line
 sides the state from Worcester county in Maryland; it
 west, by Maryland, from which it is divided by a line
 down from the western termination of the southern
 boundary line, northwards up the said peninsula, till it
 either forms a tangent to the western part of the
 periphery of the above-mentioned territorial circle:
 containing about 1400 square miles.

The climate is in many parts unhealthy. The land
 is generally low and flat, which occasions the waters
 to stagnate, and the consequence is, the inhabitants
 are subject to intermittents.

The Delaware state is divided into three counties,
 viz. Newcastle, Kent, and Susssex; its chief towns are,
 Wilmington and Newcastle, Dover, Milford, and
 Swiftown.

The rivers are, Choptank, Nanticok, and POCO-
 CAKE; all have their sources in this state, and are
 navigable for vessels of 50 or 60 tons, 20 or 30 miles
 to the country. They all run a westwardly course
 to Chesapeake Bay. The eastern side of the state,
 along Delaware bay and river, is indented with a great
 number of small creeks, but none considerable enough
 to merit a description.

With respect to soil and productions, the south part
 of the state is a low flat country, and a considerable
 portion of it lies in forest. What is under cultivation
 is chiefly barren, except in Indian corn, of which it
 produces fine crops. In some places rye and flax may
 be raised, but wheat is a stranger in these parts.
 There nature is deficient in one resource, she is
 generally bountiful in another. This is verified in
 the tall, thick forests of pines, which are manufactured
 into boards, and exported in large quantities into every
 part of the three adjoining states.—As you pro-
 ceed north the soil is more fertile, and produces wheat
 in large quantities, which is the staple commodity of
 the state. They raise all the other kinds of grain
 common to Pennsylvania. The state has no mountain
 range, except Thunder Hill, in the western part of
 Newcastle county, and is generally level, except some
 small parts, which are stony and uneven.

The chief towns are the following: **DOVER**, in the
 county of Kent, is the seat of government. It stands
 on Jones' creek, a few miles from the Delaware river,
 and consists of about 100 houses, principally of brick.
 Four streets intersect each other at right angles, in the
 centre of the town, whose incidencies form a spacious
 square on the east side of which is an elegant state-
 house of brick. The town has a lively appearance,
 and drives on a considerable trade with Philadelphia.
 Wheat is the principal article of export. The landing
 is five or six miles from the town of Dover.

NEWCASTLE is thirty-five miles below Philadelphia,
 on the west bank of Delaware river. It was first settled
 by the Swedes, about the year 1627, and called Stock-
 holm. It was afterwards taken by the Dutch, and
 called New Amsterdam. When it fell into the hands

of the English, it was called by its present name. It
 contains about sixty houses, which have the aspect of
 decay, and was formerly the seat of government.—
 This is the first town that was settled on Delaware
 river.

WILMINGTON is situated a mile and a half west of
 Delaware river, on Christiana creek, twenty-eight miles
 southward from Philadelphia. It is much the largest
 and pleasantest town in the state, containing about 400
 houses, which are handsomely built upon a gentle
 ascent of an eminence, and shew to great advantage
 as you sail up the Delaware.

Besides other public buildings, there is a flourishing
 academy of about forty or fifty scholars, who are
 taught the languages, and some of the sciences, by an
 able instructor. This academy, in proper time, is in-
 tended to be erected into a college. There is another
 academy at Newark, in this county, which was in-
 corporated in 1769, and then had fourteen Trustees.

MILFORD, the little emporium of Susssex county, is
 situated at the source of a small river, fifteen miles
 from Delaware bay, and 150 southward of Philadel-
 phia. This town, which contains about eighty houses,
 has been built, except one house, since the revolution.
 It is laid out with much taste, and is by no means dis-
 agreeable. The inhabitants are Episcopalian, Quakers,
 and Methodists.

DUCK CREEK, is twelve miles north-west from
 Dover, and has about sixty houses, which stand on
 one street. It carries on a considerable trade with
 Philadelphia—and certainly merits a more pompous
 name. A mile south from this is situated Governor
 Collins's plantation. His house, which is large and
 elegant, stands a quarter of a mile from the road, and
 has a pleasing effect upon the eye of the traveller.

The trade of this state, which is inconsiderable, is
 carried on principally with Philadelphia, in boats and
 shallops. The articles exported are principally wheat,
 corn, lumber, and hay.

With respect to religion, there are, in this state,
 twenty-one Presbyterian congregations, belonging to
 the Synod of Philadelphia—Seven Episcopal churches
 —Six congregations of Baptists, containing about 218
 souls—Four congregations of the people called Quakers;
 besides a Swedish church at Wilmington, which is one
 of the oldest churches in the United States, and a
 number of Methodists. All these denominations have
 free toleration by the constitution, and live together
 in harmony.

In the convention held at Philadelphia, in the
 summer of 1787, the inhabitants of this state were
 reckoned at 37,000, which is about twenty-six for
 every square mile. There is no obvious characteris-
 tical difference between the inhabitants of this state
 and the Pennsylvanians.

At the revolution, the three lower counties on
 Delaware became independent by the name of *The
 Delaware State*. Under their present constitution,
 which

which was established in September 1776, the legislature is divided into two distinct branches, which together are styled *The General Assembly of Delaware*. One branch, called the *House of Assembly*, consists of seven representatives from each of the three counties, chosen annually by the freeholders. The other branch, called the *Council*, consists of nine members, three for a county, who must be more than twenty-five years of age, chosen likewise by the freeholders. A rotation of members is established by displacing one member for a county at the end of every year.

All money bills must originate in the house of assembly, but they may be altered, amended, or rejected by the legislative council.

A president or chief magistrate is chosen by the joint ballot of both houses, and continues in office three years; at the expiration of which period, he is ineligible the three succeeding years. If his office becomes vacant during the recess of the legislature, or he is unable to attend to business, the speaker of the legislative council is vice-president for the time; and in his absence, the powers of the president devolve upon the speaker of the assembly.

A privy council, consisting of four members, two from each house, chosen by ballot, is constituted to assist the chief magistrate in the administration of the government.

The three justices of the supreme court, a judge of admiralty, and four justices of the common pleas and orphans courts, are appointed by the joint ballot of the president and general assembly, and commissioned by the president—to hold their offices during good behaviour. The president and privy council appoint the secretary, the attorney-general, registers for the probate of wills, registers in chancery, clerks of the common pleas, and orphans courts, and clerks of the peace, who hold their offices during five years, unless sooner removed for mal-conduct.

The house of assembly name twenty-four persons in each county for justices of peace, from which number the president, with the advice of his council, appoints and commissions twelve, who serve for seven years, unless sooner dismissed for mal-administration. The members of the legislative and privy councils are justices of the peace for the whole state.

The courts of common pleas and orphans courts have power to hold chancery courts in certain cases.

The clerk of the supreme court is appointed by the chief justice; and the recorder of deeds, by the justices of the common pleas; for five years, unless sooner dismissed.

All the military and marine officers are appointed by the general assembly.

The court of appeals consists of seven persons—the president, who is member, and presides by virtue of his office, and six others, three to be chosen by the legislative council, and three by the house of assembly. To this court appeals lie from the supreme court, in

all matters of law and equity. The judges hold their office during their good behaviour.

The justices of the several courts, the members of the privy council, secretary, trustees of the office, clerks of the common pleas, and all persons concerned in army or navy contracts, are ineligible either house of assembly. Every member, before taking his seat, must take the oath of allegiance, subscribe a religious test, declaring his belief in the Father, in Jesus Christ, and the Holy Ghost; and in the inspiration of the Scriptures.

The house of assembly have the privilege of impeaching delinquent officers of government, and such impeachments are to be prosecuted by the attorney-general, or other person appointed by the assembly, and tried before the legislative council. The punishment may extend to temporary or perpetual disability to hold offices under government, or to such other penalties as the laws shall direct.

There is, in Delaware, no establishment of one religious sect in preference to another, nor can a preacher or clergyman, while in his pastoral employment, hold any civil office in the state.

In treating of the HISTORY of this province, it will be proper to observe, that the Dutch, under the pretence of a purchase made of Henry Hudson, took possession of the lands on both sides the river Delaware; and as early as the year 1623, built a fort at the place, which has since been called Gloucester.

In 1627, by the influence of William Uffeling, a respectable merchant in Sweden, a colony of Swedes and Finns came over, furnished with all the necessaries for beginning a new settlement, and landed at Cape Henlopen; at which time the Dutch had just quitted the country. The Dutch, however, returned in 1630, and built a fort at Lewistown, by the name Hoarkill. The year following the Swedes built a fort near Wilmington, which they called Christen or Christiana. Here also they laid out a small town, which was afterwards demolished by the Dutch. The same year they erected a fort higher up the river, upon Tenecum island, which they called New Gottenburgh; they also, about the same time, built forts at Chester, Elsinburgh, and other places. John Printz then governed the Swedes, who, in 1643, deputed his son-in-law, John Pappoia, and returned to Sweden. Pappoia soon followed his father-in-law to his native country, and John Ryfing succeeded to the government.

In 1655, the Dutch, under the command of Peter Stuyvesant, arrived in Delaware river, from New Amsterdam (now New York) in seven vessels, with 6 or 700 men. They dispossessed the Swedes of their forts on the river, and carried the officers and principal inhabitants prisoners to New Amsterdam, and thence to Holland. The common people submitted to the conquerors and remained in the country.

GEOGRAPHY.

On the first of October 1664, Sir Robert Carr ordered the submission of the Swedes on Delaware. Four years after, Colonel Nicolls, Governor of New-York, with his Council, on the 1st of April, appointed a *scout* and five other persons, to assist Captain Carr in the government of the country.

In 1672, the town of Newcastle was incorporated into the government of New-York, to be governed by a bailiff and six assistants; after the first year, the four were to leave their office, and four others to be chosen.

The bailiff was president, with a double power; the constable was chosen by the bench. They had power to try causes not exceeding ten pounds, without appeal. The office of *scout* was converted into that of sheriff, who had jurisdiction in the corporation and along the river, and was annually chosen. They were to have a free trade, without being obliged to make entry at New York, as had formerly been the case.

Wampum was, at this time, the principal currency of the country. Governor Lovelace, of New York, by proclamation, ordered that four white grains and the black ones, should pass for the value of a stiver or penny. This proclamation was published at Albany, New-York, Delaware, Long-Island, and the parts adjacent.

In 1674, Charles II. by a second patent, dated June 16, granted to his brother, Duke of York, all that country called by the Dutch *New Netherlands*, of which were three counties of Newcastle, Kent, and Suffex were a part.

In 1683, the Duke of York, by deed, dated August 12, sold to William Penn, the town of Newcastle, with the district of twelve miles round the same; and by another deed, of the same date, granted to him the remainder of the territory, which, till the Revolution, was called the Three Lower Counties, and has since been called the Delaware State. Till 1776, these three counties were considered as a part of Pennsylvania, in matters of government. The same government presided over both, but the assembly and courts judicature were different: different as to their constituent members, but in form nearly the same.

Situation, &c. Divisions, Climate, Produce, Rivers, Inhabitants, Discovery of it, Former and Present Government.

THIS province is situated between the 75th and 80th deg. of west long. and between the 37th and 40th of north lat. It is about 140 miles in length, and 85 in breadth; being bounded by Virginia, on the

south; by the Apalachian mountains, on the west; by Pennsylvania, on the north; and by the Atlantic Ocean, and another part of Pennsylvania, on the east.

The Bay of Chesapeak divides Maryland into two parts, viz. the eastern and western.

DIVISIONS.	COUNTIES.	CHIEF TOWNS.
The eastern division contains the counties of.....	Somerset.....	Somerset.
	Dorchester.....	Dorchester.
	Talbot.....	Oxford.
	Cecil.	
The west division contains the counties of.....	St. Mary's.....	St. Mary's.
	Charles.....	Bristol.
	Prince George....	Masterkent.
	Calvert.....	Abington.
	Ann Arundel.....	Annapolis.
	Baltimore.....	Baltimore.

Maryland is a healthy country, and enjoys a clear air; the summers are excessively hot, and the winters are equally cold, but short. The soil is extremely good, when cultivated. The chief vegetable production is tobacco, but great quantities of hemp and flax, Indian corn and grain, with most kind of fruits, are now produced here. The trees are oaks, black walnuts, poplars, cedars, and chestnuts. The hills are in general of easy ascent, and yield iron ore. The woods contain prodigious herds of wild swine.

The chief rivers are, Potomack, Pocomac, Patuxent, Severn, Cheptrouk, Sassafras, Wicomicoc, and St. George. These and several others are navigable for large ships, and add greatly to the fertility of the soil. The chief bays are those of Chesapeak and Delaware, and the most noted cape that of Henlopen, at the entrance of Delaware-Bay.

The inhabitants of Maryland were some years ago computed at 80,000, but are now supposed to amount to 220,700. Its commerce pretty nearly resembles that of Virginia, and will therefore be considered under that head. We shall only mention here, that, besides tobacco, their exports are, salted pork, iron, flax, and hemp. In 1782, a college was founded at Chester-Town, in this province, under the name of Washington-College, in honour of General Washington, Commander in Chief of the American forces, during the late war.

Maryland was discovered in the year 1606, when Virginia was first planted, and for some time was esteemed a part of Virginia, till King Charles I. in 1632, granted all that part of Virginia which lay north of Potomack river to the Lord Baltimore, of the kingdom of Ireland, and his heirs. The year following about 200 Popish families, some of considerable distinction, embarked with his lordship, to enter into possession of this new territory. These settlers, who had that liberality and good breeding which distinguishes gentlemen of every religion, bought

their land at an easy price of the native Indians, and for some time lived with them in the greatest harmony and friendship. Their generous method of proceeding gained the confidence of the natives; they ceded to them one half of their principal town, and soon after gave up the whole to these strangers. The Indian women taught the English the manner of making bread of their corn; the men took the English with them when they went either to hunt or fish; they assisted them in the chase, and sold them the game they took themselves for a trifling consideration; so that the new settlers had a sort of town ready built, ground ready cleared for their subsistence, and no enemy to disturb them in the quiet possession of the country: but envy, the growth of every clime, instigated the neighbouring planters in Virginia to destroy the happiness of the Baltimore colony. They spread ill-grounded reports among the Indians, in order to render them jealous of their new friends. Alarmed at the consequences of a war with the savages, the Popish settlers erected a fort with the greatest expedition, and took every other method in their power to secure themselves from the brutal fury of the Indians, but at the same time treated them with every act of kindness in their power. These precautions and friendly dispositions had the desired effect; the Indians, awed by their preparations, and soothed by the generous treatment they received, laid aside their hostile intentions, and the malicious designs of the Virginian planters were rendered abortive.

The flourishing state of this infant colony, and the uninterrupted peace they had enjoyed in their new settlement, induced many of the Roman Catholic families in England, the severity of whose treatment increased in proportion as the power of the royal cause declined, to leave their native soil, and join their brethren in Maryland. They were encouraged and supported by the governor, and the colony continued to receive fresh reinforcements, till the English constitution was overturned, and Cromwell seized the reins of government. Baltimore had nothing to hope from the protector; he had always been a warm friend to the royal party, and therefore expected to fall with the cause of his master. He was not deceived; he was deprived of his rights; and a new governor substituted in his room. Under this government Maryland continued till the Restoration, when Lord Baltimore was re-instated in his lawful possessions, which he cultivated with his former wisdom, care, and moderation.

Not satisfied with procuring ease and security for his own sect, he was desirous of extending the benefits of his mild and equitable administration to others. Accordingly, he procured an act of assembly to be passed, for allowing a free and unlimited toleration for all who professed the Christian religion, of whatever denomination. This liberty, which was

never violated, encouraged a great number, not only of the church of England, but Presbyterians, Quakers, and all kinds of Dissenters, to settle in Maryland. But though Lord Baltimore had received his charter from Charles I. though he had always been attached to the royal cause, though he was guilty of no mal-administration, yet the bigoted and tyrannical council of James the Second, who wanted dissentment to distinguish friends from enemies, deprived this noble family of their rights and possessions, the Revolution, however, Lord Baltimore was re-put in possession of the profits of his province, which were not inconsiderable, though he was not re-stituted to the right of government; which could not consistently be conferred on a Roman Catholic. But soon as his descendants had conformed to the church of England, they were re-instated in all their rights fully as the legislature thought fit for them to be enjoyed by any proprietor.

The government of Maryland exactly resembles that of Virginia, except with regard to the appointment of the governor, which belonged to the proprietors; but he was confirmed by the king. The customs also belonged to the crown, and the governor appointed to collect them were independent of the government of the province. The Roman Catholic religion was at first the only one professed in the country. At the Revolution, the original constitution was reversed, the Protestant religion was established, and the Papists excluded from all offices and power, and even the penal laws of England were adopted against them. The church of England was established by law, and the clergy were paid in tithes; every Christian male sixteen years old, whether negroes male and female, above that age, was obliged to pay forty pounds of tobacco, or pay the value in cash, if he raised no tobacco; it was levied by the sheriff, among other public burdens, and yielded about 1000. sterling, at a medium, to each; and dissenting clergy were not exempted.

But by the declaration of rights, and the constitution established and agreed to in the convention of delegates at Annapolis, in August 1746, the legislature is now to consist of the senate and the house of delegates; the latter to be annually chosen, viva voce by the freeholders in every respective county, five delegates each; Baltimore town and the city of Annapolis, two each: the delegates for the senate are to be elected in like manner every five years, two for each county, out of whom fifteen senators are to be chosen by ballot; nine for the western, and six for the eastern shire. The executive power is lodged in a governor and five council, chosen annually by the joint ballot of the general assembly, who may appoint the chancellor, judges, field officers, &c. but the sheriffs and justices of the peace are chosen by the freeholders in each county. A freehold of fifty acres or property to the value of 300. gives a right of suffrage

C H A P. XI.
VIRGINIA.

Location, &c. Divisions, Population, Climate, Produce, Animals, Birds, Fish, Vegetables, Rivers, Trade, Inhabitants, Buildings, and Government.

VIRGINIA is situated between the 75th and
90th deg. of west long. and between the 36th and
40th of north lat. It is about 750 miles in length, and
100 in breadth; bounded by Carolina, on the south;
the river Potomack, which divides it from Mary-
land, on the north-east; by the Atlantic Ocean, on the
east; and by the Apalachian mountains, on the west.
It is properly divided into four parts: the north, the
middle, the south, and east.

In the north division are the counties of Nor-
folk, Lancaster, Westmoreland, Richmond,
Stafford; containing the parishes of Wincomoca,
Christ-Church, and St. Paul's.

In the middle division are the counties of Essex,
Middlesex, Gloucester, King and Queen, King Wil-
m, New Kent, Elizabeth, Warwick, York, Princeps,
&c.; containing the parishes of Farnham, Christ-
church, Abingdon, Stratton, St. John's, St. Peter's,
Elizabeth, Denby, York, and Lynhaven.

In the south division are the counties of Norfolk,
Sussex, Stafford, Isle of Wight, Surry, Prince George,
Charles, Henrico, James; containing the parishes of
Elizabeth, Chutakuk, Newport, Southwark, Wyanoke,
Yellower, Brillol, James Town, and Williamsburg.

In the east division, between Chesapeak-Bay and the
Ocean, is the county of Accomac; with its parish of the
same name.

With respect to population, Mr. Jefferson, in his
history of Virginia, allows a duplication of souls here
once in twenty-seven years and a quarter. He takes
the space of 118 years inclusive, from 1654 until the
year 1772, when the tythes of Virginia had increased
from 7,209 to 153,000; which estimate, he says, is
probated by the particular uniformity of the im-
mediate enumeration, taken in 1700, 1748, and
1759. According to this increase, he supposes the in-
habitants of Virginia alone will amount to between
7,000,000 within ninety-six years.

The climate of this province is subject to violent
and sudden changes, in consequence of the air and
seasons depending greatly on the wind as to heat and
cold, dryness and moisture. The north and north-

west winds are piercing cold, and either clear or
stormy; the south-east and south, hazy and sultry hot,
but in winter the air is clear and dry. The frosts
are short, but so severe, that rivers, three miles in
breadth, are frequently frozen entirely over. The
spring is about a month earlier than in England;
in April the rains are frequent; in May and June the
heat increases; and the summer nearly resembles ours,
the heat being mitigated with gentle sea-breezes that
begin to blow about nine in the morning, increasing
and decreasing as the sun rises or falls. In July and
August these breezes cease, when the air becomes
stagnant and sultry hot: in September the weather
generally changes suddenly, and heavy rains fall, which
produce a terrible effect on the health of the in-
habitants. Storms of thunder and lightning are very
frequent here, but they seldom are attended by any
mischief. It is a general observation in regard to all
these colonies, that as they become inhabited, and
the lands cleared, the air is improved, and rendered
more salutary; for the whole country, before it was
planted, was one continued forest, interspersed with
swamps or marshes.

As to the face of this country, it is generally low,
and flat towards the sea, and for 100 miles within, so
that there is scarce a hill or stone to be seen, except
here and there some rocks of iron ore, and some banks
of a kind of petrified oyster shells. In the inland
parts the soil is light and sandy; but towards the sea-
coast, and on the banks of rivers, it is generally very
rich, yielding very good corn, and tobacco.

Virginia has, in common with the chief part of the
American provinces, elks, bears, wolves, foxes, a
species of panther, or tyger, red deer, musk rats, ra-
coons, beavers, and wolves; but the most curious
animal found in that country is the opossum, which is
about the size of a cat, and, besides the belly common
to it with other animals, it has another peculiar to it-
self, hanging beneath the former. This additional
belly has a large aperture towards the hinder legs,
which discovers a number of teats on the usual part of
the common belly. Upon these, when the female of
this animal conceives, the young are formed, and,
when arrived at their appointed size, drop from thence
into the second belly, from whence they go out at
pleasure, and into which they are received whenever
there is the least appearance of danger. Horses, cows,
sheep, and hogs, were animals unknown in America,
till introduced from Europe, and now, particularly in
Virginia and the southern colonies, they run wild in
prodigious numbers.

In this province, are several sorts of eagles, hawks,
and owls. The white owl is esteemed a great curiosity,
all the feathers of the back and breast being perfectly
white, except a black spot underneath the throat.
Their turkeys are exceeding large, some of them
weighing forty pounds. The partridges are not so big
as those of England, but their flesh finely flavoured.

as are every other sort of wild fowl. The Virginian nightingale, which takes its distinguishing epithet from this province, is adorned with a plumage of bright crimson and blue, and sings most delightfully; but his note is thought to be exceeded by the mocking bird, which is likewise an inhabitant of Virginia. The natural note of this bird is prodigiously fine, besides which, as its appellation implies, it attains that of the linnæus, lark, nightingale, &c.

Fish of all sorts are found here in vast quantities, and three species of them are remarkable, viz. the sting-grass, the toad-fish, and tobacco-pipe-fish. The first takes its name from a sting in its tail; the second, from its swelling to a monstrous size when taken out of the water; and the third, from its resemblance to a tobacco-pipe. In February, March, April, and May, shoals of herrings come up, even into the brooks, some of which are about the size of ours, but, in general, they are much larger.

Snakes, particularly the rattle-snake, and lizards, abound here; and in summer great number of worms are found in the waters, which having a sort of horn or screw on their heads, force their passage into the bottoms and sides of ships, whenever they find the coat of pitch, tar, or lime worn off.

The principal vegetable production in Virginia, as in Maryland, is tobacco. The culture of this plant, which in its excellent quality surpasses that of all other countries, so engrosses the attention of the inhabitants, that they only rear corn sufficient for their own use. The next object of their attention, is hemp and flax, great quantities of which are exported from this country; rice is likewise cultivated, but very sparingly. The forests yield oaks, poplars, pines, cedars, cypresses, sweet baytrees, chestnuts, hickory, walnut, dog-wood, elder, hazel, chinkapines, locust-trees, sassafras, elm, ash, and beech. A great variety of sweet gums and incense distil from several of these trees, and others produce pitch, tar, rosin, turpentine, plank-timber, masts, and yards. The trees in general are much lofter than ours, and no underwood or bushes grow beneath, so that travellers may cross the forests on horseback, and always find a comfortable shelter from the intense heat of the climate in the middle of summer. Besides excellent pasture, many places produce a species of grass, called silk grass, the fibres of which are as fine as flax, and much stronger than hemp. The plains and vallies are adorned with an almost perpetual succession of flowers, among which are the finest crown imperial in the world, the cardinal flower, and the tulip-bearing laurel-tree.

The principal rivers in this country are James river, York river, Rappahannock, and Potomack, all of which rise in the Apalachian mountains, and, running along the borders of this province from the north-west to the south-east, fall into the bay of Chesapeake, which is near 300 miles in length, 18 in breadth in some places, and seven in others; in most places

the water is nine fathoms deep. James river is usually about two miles in breadth, and navigable at least 27 leagues. York and Rappahannock rivers are not so large; but Potomack is navigable for 200 miles.

Here are quarries of stones, mines of coals and lead, and vast quantities of iron ore.

The Virginians, before the late war, carried on a great trade with the West-Indies in lumber, pitch, tar, corn, and provisions; and with Great-Britain in flax, hemp, iron, pipe-staves, and planks: but its principal articles of export, and chief manufacture, was tobacco; and it is computed that this province, together with that of Maryland, exported, of tobacco alone, to the amount of value of 768,000*l.* into Great-Britain, which, at 8*l.* per hoghead, makes the number of hogheads amount to 96,000. Of these it is supposed about 13,500 hogheads are consumed at home, the duty on which, at 26*l.* 1*s.* per hoghead, amounts to 351,675*l.* The remaining 82,500 hogheads are exported by our merchants to other parts of Europe, and their value returned to Great-Britain. This, however, was not the only advantage we reaped from so extensive a branch of commerce: in the prosecution of it no less than 330 sail of ships, and 7,960 seamen were employed; so that not only our wealth, but the refinements of our national strength were braced by it. The whole of our imports from Maryland and Virginia were said to amount to 1,040,000*l.* annually, while our exports to those places, which consisted of the same articles with which we furnished our other colonies, came to 865,000*l.*

The number of white people in Virginia are said to be 100,000, and the negroes nearly twice that number. The better sort of people among them are cheerful, hospitable, and genteel; but they have, with too much justice, acquired the character of being once vain and ostentatious.

The American Indians on the frontiers of Virginia are of a middling stature, straight and well proportioned with the finest limbs in the world; nor is there a dwarf or misshapen person among them. Their colour is that of copper, rendered darker by greasing themselves, and being exposed to the weather. They have black eyes, and their hair is coal-black, which the men cut into several shapes, and both men and women grease so that it shines. The better sort wear a kind of coronet four or five inches broad, and open at the top composed of a sort of beads, and some a wreath of dyed furs; they have also bracelets on their necks and arms; but the common people go bare-headed, and they stick large shining feathers in their hair. Their clothes are a large mantle, carelessly wrapped round their bodies, and sometimes girt closely with a girdle. The common sort only pass a piece of cloth or skin round their middles, and put a piece of cloth or skin between their thighs, which turns over the string at each end. Their shoes, when they wear any, are made of an entire piece of buckskin. The dress of the women

men differs little from that of the men, only the
er sort have more beads and bracelets. They com-
ly go naked as far as the navel downwards, and
wards to the middle of the thigh; their breasts are
and small, and never hang down as those of
black women on the coast of Guinea. Instead
keeping their children warm, they dip them over
and ears in cold water as soon as born, and then
them to a board with something soft, in which
they remain till their limbs begin to acquire
strength, when they are set at liberty, and suf-
fer to crawl about in the best manner they can.

The chief part of the inhabitants of Virginia are
members of the church of England, and the rest are
Baptists and Presbyterians. In each parish there is a
church built with brick, stone, or timber, and decently
furnished with all things necessary for the celebration of
the service. When the parishes are large there is a
chapel of ease, and sometimes two, for the convenience
of the parishioners. The annual income of the ministers
settled at 16,000l. of tobacco each, besides perqui-
tes, which they are allowed to make. Formerly, the
parishes and churches were under the immediate inspection
of a commissary, appointed by the Bishop of London,
in the power of induction, upon the presentation of
candidates, was lodged in the hands of the governor.

Virginia is adorned by several magnificent public
buildings, but the only towns worthy the least notice
are Williamsburg and James-Town. The former was
the seat of the government, assembly, and chief courts,
and contains a college, called William and Mary Col-
lege, having been founded by William III. who gave
100,000l. towards it, and 20,000 acres of land, with
power to purchase and hold lands to the value of 2,000l.
per year, and a duty of one penny per pound on all
tobacco exported to the other plantations. It consists
of a president, six masters or professors, and other
officers, who are named by the governors or visitors.
The Hon. Mr. Boyle made a very large donation to
this college for the education of Indian children. Be-
sides this college, there are some other handsome edifi-
ces in Williamsburg, as the town house, the church,
a magazine for arms and ammunition, a public prison,
a school, and a play-house.

James-Town is situated about 26 miles above the
mouth of the river of that name; it was once the
capital, and the seat of government, but is now dwind-
led into an inconsiderable village.

This was the first colony planted in America by the
English. It has been already observed that Sebastian
Cabot, in the year 1497, discovered the northern con-
tinent of the New World; but nothing was done
towards settling a colony till the reign of Queen
Elizabeth. Sir Walter Raleigh, one of the most ex-
traordinary geniuses of his own, or perhaps any other
ages, was the first Englishman that attempted a set-
tlement in America. He was the only person who had

any idea of the nature of foreign trade, or was capable of
forming a right conception of the advantage of settle-
ments in a distant country. Animated with the idea of
future greatness, and desirous of increasing the pow-
er and commerce of his native country, he applied to the
queen for a patent; and having got together a company
composed of several persons of distinction, and many
eminent merchants, they agreed to settle a colony, and
open a trade in that part of the world, which, in
honour of Queen Elizabeth, he called Virginia.

Towards the close of the 16th century, several
attempts were made for settling this colony, but with-
out success. The three first companies who sailed into
Virginia, perished through hunger and diseases, or
were cut off by the Indians. The fourth was reduced
to almost the same situation; and being dwindled to a
small remnant, had set sail for England, in despair of
living in such an uncultivated country, inhabited by
fierce and warlike savages. But in the mouth of Che-
sapeake-Bay, they were met by Lord Delaware, with a
squadron loaded with provisions, and with every thing
necessary for their support and defence. At his per-
suasion they returned; and by his wise management
and engaging behaviour, the government of the colony
was settled within itself, and began to appear formida-
ble to its enemies. This nobleman, who had accepted
the government of this unpromising colony, from the
best motives, was obliged, by the decline of his health,
to return to England. However, he left behind him
his son, as deputy, with Sir Thomas Gates, Sir George
Simmers, the Hon. George Percy, and Mr. Newport,
for his council. They erected James-Town, the first
place built by the English in the New World; they
cleared large tracts of land, and raised a sufficient
quantity of corn and vegetables for their support.
The value of this colony now began to be known in
England; and great numbers of people transported
themselves to Virginia, which was considered as one of
the genuine sources of wealth. During the dreadful
troubles in the reign of Charles I. many of the royal
party fled to Virginia, and under the conduct of Sir
William Berkeley held out for the crown, till the par-
liament, rather by stratagem than force, found means
to reduce them.

After the Restoration, the history of this colony has
very few interesting events: a kind of rebellion, indeed,
broke out in Virginia, on account of the mismanage-
ment of the government, and some restrictions laid
upon trade. The insurgents were headed by one Bacon,
a young gentleman bred to the law; but the unexpected
death of their leader restored the peace of the colony,
and prevented the dreadful consequences of a civil war.

At the first establishment of this colony, the govern-
ment was adapted to the principles of the English
constitution, and to the enjoyment of that liberty
which every Englishman considers as his birthright.
It was directed by a governor and council appointed
by the crown; but, as the inhabitants increased, the in-
convenience

conveniency of this government became more conspicuous: the people complained, and it was found necessary to give them a share in the government. Accordingly a new branch was added to the legislature: the people were allowed to elect their own representatives for each county into which the colony is divided, with privileges resembling those of the commons of England: and thus two houses, called the upper and lower house of assembly, were formed. The upper house, which was before called the council, continued on its former footing; the members were appointed by the crown; they held their posts during pleasure; were styled honourable, and answered, in some measure, to the British house of peers. The lower house was the guardian of the liberties of the people; and the governor represented the king. Thus the government of Virginia bore a striking resemblance to the British. When any bill had passed the two houses of assembly, it was sent up to the governor, who gave his assent or negative as he thought proper; but it did not acquire the force of a law, till it had been transmitted to England, and received his majesty's approbation. The upper house of assembly, besides making a part of the legislature, formed also a privy-council to the governor, who, without their consent, could do nothing of moment: it sometimes acted also as a court of chancery.

With regard to the present government of Virginia, the convention at Williamsburg, in July 1776, agreed, that the legislative, executive, and judiciary departments should be separate and distinct. The house of delegates are to be chosen annually by the freeholders, two for each county, and for the district of West Augusta, and one representative for the city of Williamsburg and town of Norfolk. The senate consists of 24 members, chosen by the freeholders of the state, and divided into 20 districts. The executive government is a governor and privy council of eight members, chosen annually by the joint ballot of the general assembly of the state, who also elect the delegates to congress, the judges, president, treasurer, secretary, justices, sheriff, coroners, &c.

A DESCRIPTION of the Situation and Plan of the CITY of WASHINGTON, in the District of Columbia, in North-America, now building for the METROPOLIS of the UNITED STATES.

THE city of Washington, in the district of Columbia, now building for the permanent seat of the government of the United States of America, stands at the junction of the rivers Potomack and the Eastern Branch, extending about four miles up each, including a tract of territory scarcely to be exceeded, in point of convenience, salubrity, and beauty, by any in the world: for although the land is apparently level, yet, by gentle and gradual swellings, a variety of

elegant prospects are produced. This territory partly in the state of Virginia, and partly in that of Maryland, and was ceded by those two states, to the United States of America, and by them established to be the seat of government, after the year 1800.

Within the limits of the city are twenty-five natural springs of excellent water; and, by digging wells, water of the best quality is readily had: besides the never-failing streams that now run through the territory, are also to be collected for the use of the city.

The Eastern Branch is one of the safest and most commodious harbours in America, being sufficiently deep for the largest ships, for about four miles above the mouth; while the channel lies close along the edge of the city, and is abundantly capacious. This branch contains thirty and thirty-five feet to near the upper end of the city, where it is eighteen and twenty feet deep.

The city being situated upon the great post road, exactly equidistant from the northern and southern extremities of the Union, and nearly so from the Atlantic Ocean to the River Ohio, upon the best navigation, and in the midst of the richest commercial territory in America, commanding the most extensive internal resources, is by far the most eligible situation for the residence of Congress; and it is now pressing forward by the public-spirited enterprise, not only of the people of the United States, but also of foreigners.

The inland navigation of the Potomack is so far advanced, that craft loaded with produce now come down that river and its several branches, from upwards of 180 miles to the great falls, which are within fourteen miles of the new city. The canals at the great and little falls are nearly completed, and the locks in such forwardness, that, in the course of the ensuing summer, the navigation will be entirely opened between tide water and the head branches of the Potomack, which will produce a communication by water between the city of Washington and the interior parts of Virginia and Maryland, by means of the Potomack, the Shannandoah, the South Branch, Opecan, Cape Capon, Paterfon's Creek, Conococheague, and Monocasy, for upwards of 200 miles through one of the most healthy, pleasant, and fertile regions in America, producing, in vast abundance, tobacco of superior quality, hemp, Indian corn, wheat, and other small grain, with fruit and vegetables peculiar to America, in vast abundance.

The lands upon the Potomack above the city of Washington, all around it, and for sixty miles below, are high and dry, abounding with innumerable springs of excellent water, and are well covered with large timber of various kinds. A few miles below the city, upon the banks of the Potomack, are inexhaustible mountains of excellent freestone, of the white and red Portland kinds, of which the public edifices in the city are now building. cellent coal, limestone, and marble, with blue slate
of the best quality.

The founding of this city, in such an eligible situa-
on, upon such a liberal and elegant plan, will by
future generations be considered as a high proof of
judgment and wisdom of the present president of
United States, while its name will keep fresh in
mind, to the end of time, the obligations they are
under to that illustrious character.

The plan of this city, agreeably to the directions
of the president of the United States, was designed by
Major L'Enfant, and is an inconceivable improve-
ment upon all other cities, combining not only con-
venience, regularity, elegance of prospect, and a free
circulation of air, but every thing grand and beautiful
that can be introduced into a city.

The city is divided into squares or grand divisions,
the streets running due north and south, and east
and west, which form the ground-work of the plan.
However, from the capitol, the president's house, and
some of the important areas in the city, run transverse
avenues or diagonal streets, from one material object
to another, which not only produce a variety of
pleasing prospects, but remove that insipid sameness
which renders some other great cities displeasing. They
are devised to connect the separate and most distant
objects with the principal, and to preserve through-
out the whole a reciprocity of sight. These great lead-
ing streets are all 160 feet wide, including a pave-
ment of ten feet, and a gravel walk of thirty feet
lined with trees on each side, which will leave
eighty feet of paved street for carriages. The rest of
the streets are, in general, 110 feet wide, with a few
only ninety feet, except North, South, and East Cap-
itol Streets, which are 160 feet. The diagonal
streets are named after the respective states composing
the Union, while those running north and south are,
from the capitol eastward, named, East First Street,
East Second Street, &c. and those west of it are in
the same manner called West First Street, West Second
Street, &c. those running east and west, are from the
capitol northward, named, North A Street, North B
Street, &c. and those south of it are called South A
Street, South B Street, &c.

The squares, or divisions of the city, amount to
350. The rectangular squares generally contain from
three to six acres, and are divided into lots of from
twenty to eighty feet in front, and their depth, from
about 113 to 300 feet, according to the size of the
square.

The irregular divisions produced by the diagonal
streets are some of them small, but generally in valu-
able situations. Their acute points are all to be cut
off at forty feet, so that no house in the city will
have an acute corner. The lots in these irregular
squares will all turn at a right angle with the respec-
tive streets, although the backs of the houses upon

them will not stand parallel to one another, which
is a matter of no consequence.

By the rules declared and published by the presi-
dent of the United States, for regulating the buildings
within the city, all houses must be of stone or brick:
their walls must be parallel to the streets, and either
placed immediately upon them, or withdrawn there-
from at pleasure. The walls of all houses upon streets
160 feet wide must be at least thirty feet high.

The area for the capitol (or house for the legisla-
tive bodies) is situated upon the most beautiful emi-
nence in the city, about a mile from the Eastern
Branch, and not much more from the Potomack, com-
manding a full view of every part of the city, as
well as a considerable extent of the country around.
The president's house will stand upon a rising ground,
not far from the banks of the Potomack, possessing a de-
lightful water prospect, with a commanding view of
the capitol, and some other material parts of the
city.

Due south from the president's house, and due west
from the capitol, run two great pleasure parks or
malls, which intersect and terminate upon the banks
of the Potomack, and are to be ornamented at the
sides by a variety of elegant buildings, houses for for-
eign ministers, &c.

Interpersed through the city, where the most ma-
terial streets cross each other, are a variety of open
areas, formed in various regular figures, which in
great cities are extremely useful and ornamental.

Fifteen of the best of these areas are to be appro-
priated to the different states composing the Union;
not only to bear their respective names, but as pro-
per places for them to erect statues, obelisks, or co-
lumns, to the memory of their favourite eminent
men. Upon the small eminence, where a line due
west from the capitol, and due south from the presi-
dent's house, would intersect, is to be erected an
equestrian statue of General Washington, now presi-
dent of the United States.—The building where Mas-
sachusetts and Georgia streets meet, is intended for a
marine hospital, with its gardens.

The area at the south end of East Eight Street is
for the general exchange, its public walks, &c.—In
the original plan of this city, the broad black line,
which runs along part of North B Street, and,
separating, joins the Eastern Branch at two places,
denotes a canal, which is to be eighty feet wide, and
eight feet deep. The area, where South G Street
crosses the canal, is intended to contain a city hall,
and a basin of water; there being now a very large
spring in the middle of it.

The area, at the junction of the rivers, is for a
fort, magazines, and arsenals.

At the east end of East Capitol Street is to be a
bridge, and the present ferry is at the lower end of
Kentucky Street, where the great road now crosses
the Eastern Branch.—The Tyber, which is the principal

cipal stream that passes through the city, is to be collected in a grand reservoir beside the capitol, whence it will be carried in pipes to different parts of the city; while its surplus water will fall down in beautiful cascades, through the public gardens west of the capitol, into the canal.—In various parts of the city places are allotted for market-houses, churches, colleges, theatres, &c.

The president of the United States, in locating the seat of the city, prevailed upon the proprietors of the soil to cede a certain portion of the lots in every situation, to be sold by his direction, and the proceeds to be solely applied to the public buildings, and other works of public utility within the city. This grant will produce about 15000 lots, and will be sufficient, not only to erect the public buildings, but to dig the canal, conduct water through the city, and to pave and light the streets, which will save a heavy tax that arises in other cities, and consequently render the lots considerably more valuable.

The grants of money made by Virginia and Maryland, being hitherto sufficient, few of the public lots had been sold; but a sale was advertised to commence on the 17th day of September.

In January 1793, most of the streets were run, and the squares divided into lots. The canal was partly dug, and the greater part of the materials provided for the public buildings, which are to be entirely of freestone polished, and are now carrying on with all possible expedition.—Last summer several private houses were erected, and a great many proprietors of lots were then preparing to build the ensuing summer.

C H A P. XII.

K E N T U C K Y.

Extent, Division, Rivers, Soil, Produce, Climate, Chief Towns, &c.

THE fine flourishing country of Kentucky having risen into importance but very lately, it is no wonder that the generality of geographers who have attempted a map or description of America, seem either to have had no knowledge of this fertile tract, or to have totally neglected it. As we are happy, therefore, to present our readers with every new and valuable acquisition in geography, we have selected the following account from an excellent work, entitled, "The American Geography, by Jedidiah Morse;" to which we have added some judicious extracts from the topographical accounts of this western territory by Captain George Imlay, and Mr. John Filson.

This new state belongs, at present, to the province of Virginia. It is situated between 36 deg. 30 min. and 39

deg. 30 min. north lat and 8 deg. 15 min. west long. 250 miles in length, and 200 in breadth; being bounded north-west, by the river Ohio; west, by Cumberland river; south, by North-Carolina; east, by Sandy river, and a line drawn due south from its source, till it strikes the northern boundary of North Carolina.

Kentucky was originally divided into two counties, Lincoln and Jefferson. It has since been subdivided into seven, which follow:

JEFFERSON; chief town, Louisville; FAYETTE, chief town, Lexington; BOURBON; M. RICH; chief town, Harrodstown; NELSON; chief town, Bardonia; MADDISON; LINCOLN.

As most of these counties are very large, it is probable that subdivisions will continue to be made, as the population increases.

The river Ohio washes the north-western side of Kentucky, in its whole extent. Its principal branches, which water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, and Cumberland rivers. These again branch, in various directions, into rivulets of different magnitudes, fertilizing the country in all its parts. At the bottoms of these watercourses the lime-stone rock, which is common to this country, appears of a greyish colour; and where it lies exposed to the air, in its natural state, it looks like brown freestone. On the banks of these rivers and rivulets, the stone has the appearance of fine marble, being of the same texture, and is found in the greatest plenty.

Sandy, Licking, and Kentucky rivers rise near each other, in the Cumberland mountains. Of these, Sandy river only breaks through the mountain. This river constitutes a part of the eastern boundary of Kentucky. Licking river runs in a north-west direction, upwards of 100 miles, and is about 100 yards broad at its mouth. Kentucky is a very crooked river, and after running a course of more than 200 miles, empties into the Ohio by a mouth of 150 yards broad.

Salt river rises at four different places near each other. The windings of this river are curious. The four branches, after a circuitous course around a fine tract of land, unite; and after running about fifty miles, empty into the Ohio, twenty miles below the Falls. Its general course is westward—its length about twenty miles—and its mouth is eighty yards wide.

Green river pursues a western course upwards of 150 miles, and, by a mouth eighty yards wide, falls into the Ohio, 120 miles below the Rapids.

Cumberland river interlocks with the northern branch of Kentucky, and rolling round the other parts of Kentucky, among the mountains, in a southern course, 100 miles—then in a south-western course for above 200 more—then in a southern and south-western course for about 250 more, finds the Ohio, 413 miles below the Falls. At Nashville, this river is 200 yards broad, and at its mouth 300. The river, in about half its course, passes through North Carolina.

These rivers are navigable for boats almost to their sources.

8 deg. 15 min. west long. 36 deg. 10 in breadth; being bounded by Virginia; west, by Cumberland river; east, by Sandy river; south from its source, till it enters the North Carolina, it is divided into two counties, and has since been subdivided

in, Louisville; FAYETTE; BOURBON; MERCER; CLAY; CLAYTON; chief town, Bardonia; COLN.

The rivers are very large, it is very fertile, and continues to be made, and

the north-western side of the country. Its principal branches are the Green, and Cumberland rivers, in various directions, intersecting the country, and fertilizing the bottoms of these watercourses, which is common to this country; and where it lies exposed to the sun, it looks like brown iron ore. These rivers and rivulets, which are of fine marble, being of the same nature in the greatest plenty.

The Kentucky rivers rise near each other, and are separated by mountains. Of these, Sandusky is the highest mountain. This river crosses the boundary of Kentucky, and runs in a north-west direction, upwards of 100 yards broad at its mouth, and crooked river, and, after a course of 200 miles, empties into the Ohio, 100 yards broad.

The rapids are curious. The course of the river is around a fine tract of land, running about fifty miles, and is only a few miles below the Falls, and its length about twenty miles wide.

The northern course upwards of the river is eighty yards wide, and is called the Rapids.

The rapids with the northern course round the other mountains, in a southern direction, the south-western course to the southern and south-western ends of the Ohio, 413 miles long, this river is 200 yards wide. The river, in about half the distance to the North Carolina.

The river, in about half the distance to the North Carolina, is very fertile, and continues to be made, and

without rapids, for the greatest part of the year. The little rivulets which chequer the country, are in general very shallow, and tend to lessen in June, and quite disappear in the months of August, September, and October. The annual rains, however, in November, replenish them again. The method of getting a supply of water in a dry season is by sinking wells, which are easily dug, and afford excellent water. The want of water in autumn, is the great complaint. Mills that may be erected with water, eight months in a year, may be erected in a thousand different places. Wind-mills and horse-mills may supply the other four months. The banks of the rivers are generally high and composed of lime-stone. After heavy rains the water in the rivers rises from ten to thirty feet.

There are five noted salt springs or licks in this country; viz. The higher and lower Blue Springs on the Licking river, from some of which, it is said, issue means of brinish water—the Big Bone lick, Drennon's licks, and Bullet's lick, at Saltburgh. The last of these licks, though in low order, has supplied this country and Cumberland with salt at twenty shillings the bushel, Virginia currency; and some is exported to the Illinois country. The method of procuring water from these licks, is by sinking wells from thirty to forty feet deep. The water drawn from these wells is more strongly impregnated with salt than the water from the sea. A straight road, forty feet wide, has been cut from Saltburgh to Louisville, twenty-four miles.

As far as has yet been discovered, this whole country lies upon a bed of lime-stone, which in general lies about six feet below the surface, except in the vallies, where the soil is much thinner. A tract of about twenty miles wide, along the banks of the Ohio, is hilly, broken land, interspersed with many fertile spots. The rest of the country is agreeably uneven, gently ascending and descending at no great distances. The angles of ascent are from eight to twenty-four degrees, and sometimes more. The soil is very thin, and of an inferior quality; and along the ascending ground is frequently not much water; for where you see a tree blown up, you find the roots clinging to the upper parts of the rock. The soil, on these agreeable ascents (for they cannot be called hills) is sufficiently deep, as is evident from the growth of the trees. The soil is either black or tinged with a lighter or deeper vermilion, or is of the colour of dark ashes. In many places there are appearances of potters clay, and coal in abundance. The country is well supplied with wholesome, well-tempered water. In Nelson county, north-west of Rolling-fork, a branch of Salt river, is a tract of about twenty miles square, mostly barren, interspersed with small and strips of good land, which are advantageous situations for raising cattle, as the neighbouring barrens are covered with grass, and afford good pasturage.

The lands east of Nolin creek, a branch of Green river, are in general of an inferior quality; but the banks of Green river afford many desirable situations.

Towards the head waters of Kentucky river, which interlock with the waters of Cumberland and Sandy rivers, and the whole country eastward and south-eastward, as far as the Holstein river, is broken, mountainous, and almost impenetrable; and from the description given by hunters, it is much doubted whether it will ever be practicable to make a passable road from Kentucky across to Winchester, in Virginia, on the east side of the mountains, which, on a straight line, is not perhaps more than 100 miles, and the way now travelled is 600.

No country will admit of being thicker settled with farmers, who confine themselves to agriculture, than this. But large stocks of cattle, except in the neighbourhood of barrens, cannot be raised.

The river Elkhorn, a branch of the Kentucky, from the south-east, waters an exceeding fine country. Indeed, the country east and south of this, including the head waters of Licking river, Hickman's and Jessamine creeks, and the remarkable bend in Kentucky river, may be called an extensive garden. The soil is deep and black, and the natural growth, large walnuts, honey and black locust, poplar, elm, oak, hickory, sugar-tree, &c. Grape vines, running to the tops of the trees; and the surface covered with clover, blue grass, and wild rye. On this fertile tract, and on the Licking river, and the head waters of Salt river, are the bulk of the settlements in this country. The soil within a mile or two of Kentucky river is generally of the third and fourth rates; and as you advance towards the Ohio, the land is poor and hilly. Dick's river runs through a great body of first rate land, abounding with cane, and affords many excellent mill seats. Salt river has good lands on its head waters, except that they are low and unhealthy; but for twenty-five miles before it empties into the Ohio, the land on each side is level and poor, and abounds with ponds. Cumberland river, so much of it as passes through Kentucky, traverses, some few parts excepted, a hilly poor country. Green river overflows its banks a considerable way up, at the season when the Ohio swells, which is in April. This swell in Green river occasions several of its large branches to overflow, and cover the low grounds with water, leaves, and vegetable substances, which in summer become noxious and unhealthy. Its banks are fine and fertile. There is a great body of good land near the falls or rapids in the Ohio, called Bare grass; but the climate is rendered unhealthy by ponds of stagnant water, which may be easily drained.

This country in general is well timbered. Of the natural growth which is peculiar to this country, we may reckon the sugar, the coffee, the papaw, and the cucumber tree. The two last are a soft wood, and

bear a fruit of the shape and size of a cucumber. The coffee tree resembles the black oak, and bears a pod, which encloses good coffee. Besides these, there is the honey locust, black mulberry, wild cherry, of a large size, buck eye, an exceedingly soft wood—the magnolia, which bears a beautiful blossom of a rich and exquisite fragrance. Such is the variety and beauty of the flowering shrubs and plants which grow spontaneously in this country, that in the proper season the wilderness appears in blossom.

The accounts of the fertility of the soil in this country have, in some instances, exceeded belief; and probably have been exaggerated. That some parts of Kentucky, particularly the high grounds, are remarkably good, all accounts agree. The lands of the first rate are too rich for wheat, and will produce fifty and sixty, and in some instances, it is affirmed, 100 bushels of good corn, an acre. In common, the land will produce thirty bushels of wheat or rye an acre. Barley, oats, cotton, flax, hemp, and vegetables of all kinds common in this climate, yield abundantly. The old Virginia planters say, that if the climate does not prove too moist, few soils known will yield more and better tobacco.

In the rivers are plenty of buffalo and catfish of uncommon size, salmon, mullet, rock, perch, garfish, eel, suckers, sunfish, &c.—Trout, shad, and herrings have not been caught in the western waters.

The land fowls are turkeys, which are very frequent, pheasants, and partridges*. The parroquet, is a bird every way resembling a parrot, but much smaller. The ivory-bill woodcock, of a whitish colour, with a white plume, flies screaming exceedingly sharp. It is asserted, that the bill of this bird is pure ivory, a circumstance very singular in the plumy tribe. The great owl resembles its species in other parts, but is remarkably different in its vociferation, sometimes making a strange, surprising noise, like a man in the most extreme danger and difficulty.

There are few swamps in Kentucky; and of course the reptiles which they produce, such as snakes, frogs, &c. are not numerous. The honey-bee may be called a domestic insect, as it is not found but in civilized countries. This is confirmed by a saying which is said to be common among the Indians, when they see a swarm of bees in the woods, "Well, brothers, it is time for us to decamp, for the white people are coming." The quadrupeds, except the buffalo, are the same as in Virginia and the Carolinas.

The climate is healthy and delightful, excepting some few places in the neighbourhood of ponds and low grounds. The inhabitants do not experience the extremes of heat and cold. Snow seldom falls deep, or lies long. The winter, which begins about Christmas, is never longer than three months, and is commonly but two, and is so mild as that cattle can subsist without fodder.

* What is called a partridge by most people in America, is a quail; and what is called a pheasant, is a species of grouse.

LEXINGTON, which stands on the head waters of the Elkhorn river, is reckoned the capital of Kentucky. Here the courts are held, and business regularly conducted. In 1786, it contained about 100 houses, and several stores, with a good assortment of dry goods, and must have greatly increased since.

LEESTOWN is west of Lexington, on the east bank of Kentucky river. It is regularly laid out, and is flourishing. The banks of Kentucky river are remarkably high, in some places 3 and 400 feet, composed generally of stupendous perpendicular rocks; consequence is, there are few crossing places. The best is at Leestown, which is a circumstance that contributes much to its increase.

Louisville stands on the Kentucky side of the Ohio, opposite Clarksville, at the Falls, in a fertile country, and promises to be a place of great trade. Its rapid thinness, owing to stagnated waters back of the town, has considerably retarded its growth. Besides this, there is Bardlow, in Nelson county, and Harrodsburg, in Mercer county, both on the head waters of the river; Danville, Boonsborough, and Granville are increasing towns.

It is impossible to ascertain, with any degree of accuracy, the present number of inhabitants; owing to the numerous accessions which are made almost every month. In 1783, in the county of Lincoln only (now divided) there were, on the militia roll, 3570 men, chiefly emigrants from the lower parts of Virginia. In 1784, the number of inhabitants were reckoned at upwards of 30,000. From the accounts of their astonishing increase since, we may now safely estimate them at 100,000. It is asserted that at least 20,000 migrated here in the year 1787. These people collected from different states, of different manners, customs, religions, and political sentiments, have been long enough together to form an uniform and distinguishing character. Among the settlers there are many gentlemen of abilities, and many genteel families, from several of the states, who give dignity and respectability to the settlement. They are, in general, more orderly, perhaps, than any people who have settled a new country.

The most numerous religious sect in Kentucky are the Baptists. In 1787 they had sixteen churches established, besides several congregations where churches were not constituted. These were supplied with upwards of thirty ministers or teachers. There are several large congregations of Presbyterians, and some few of other denominations.

The government here is the same as in Virginia. But they expect to be admitted into the union as an independent state, in a convenient time after the new government is put in operation. The inconveniences to which they are necessarily subjected, from their connection with Virginia, are great. These the legislature of Virginia have considered; and, in the session of 1786, passed an act, providing, on their part,

erection of
ndent state.

pendent state. In no part of the United States is
justice administered with more propriety and dispatch.
For promoting literature and improvements, the
Legislature of Virginia have made provision for a college
in Kentucky, and have endowed it with very consider-
able landed funds. The Rev. John Todd has given
a very handsome library for its use. Schools are esta-
blished in the several towns, and, in general, regularly
and handsomely supported. They have a printing-
office, and publish a weekly Gazette. They have
erected a paper-mill, an oil-mill, fulling-mills, saw-
mills, and a great number of valuable grist mills.
Their salt works are more than sufficient to supply all
the inhabitants, at a low price. They make consider-
able quantities of sugar from the sugar trees. La-
borers, particularly tradesmen, are exceedingly wanted
at. No tradesman will work for less than fifty per
cent. advance upon the Philadelphia price.

Caves have been discovered in this country, of
several miles in length, under a fine lime-stone rock,
supported by curious arches and pillars. Springs that
emit sulphurous matter have been found in several
parts of the country. One is near a salt spring, in
the neighbourhood of Boonshorough. There are three
springs or ponds of bitumen near Green river, which
do not form a stream, but empty themselves into a
common reservoir, and when used in lamps, answer
the purposes of the best oil. Copperas and alum
are among the minerals of Kentucky. Near Lexing-
ton are found curious sepulchres full of human skele-
tons. We have been told that a man, in or near Lex-
ington, having dug five or six feet below the surface
of the ground, came to a large flat stone, under which
was a well of common depth, regularly and artificially
lined with stone.

Among the natural curiosities of this country, the
rising banks, or rather precipices, of Kentucky and
the Ohio Rivers, deserve the first place. The astonish-
ed beholder there beholds almost every where three or four
hundred feet of a solid perpendicular lime-stone rock;
on some parts a fine white marble, either curiously
arched, pillared, or blocked up into fine building
precipices. These precipices are like the sides of a deep
creek, or canal; the land above being level, except
where creeks set in, and crowned with fine groves of
cedar. It is only at particular places that these rivers
are crossed, one of which is worthy of admiration;
a great road, large enough for waggons, made by the
Italians, sloping with an easy descent from the top to
the bottom of a very large steep hill, at or near the
place above Lees-Town.

HISTORY OF KENTUCKY.

THE first white man we have certain accounts of,
who discovered this province, was one James M. Bride,

who in company with some others, in the year 1754,
passing down the Ohio in canoes, landed at the mouth
of Kentucky river, and there marked a tree with the
first letters of his name, and the date, which remain
to this day. These men reconnoitred the country,
and returned home with the pleasing news of their
discovery of the best tract of land in North America,
and probably in the world. From this period it re-
mained concealed till about the year 1767, when one
John Finley and some others, trading with the In-
dians, fortunately travelled over the fertile region,
now called Kentucky, then but known to the Indians
by the name of the Dark and Bloody Grounds, and
sometimes the Middle Ground.

This country greatly engaged Mr. Finley's atten-
tion. Some time after disputes arising between the In-
dians and traders, he was obliged to decamp; and re-
turned to his place of residence in North Carolina,
where he communicated his discovery to Col. Daniel
Boon, and a few more, who, conceiving it to be an
interesting object, agreed in the year 1769 to under-
take a journey in order to explore it. After a long
fatiguing march, over a mountainous wilderness, in
a westward direction, they at length arrived upon its
borders; and from the top of an eminence, with joy
and wonder, descried the beautiful landscape of Ken-
tucky. Here they encamped, and some went to hunt
provisions, which were readily procured, there being
plenty of game, while Col. Boon and John Finley
made a tour through the country, which they found
far exceeding their expectations; and returning to
camp, informed their companions of their discoveries.
But in spite of this promising beginning, this com-
pany, meeting with nothing but hardships and adver-
sity, grew exceedingly disheartened, and were plun-
dered, dispersed, and killed by the Indians, except
Col. Boon, who continued an inhabitant of the wil-
derness until the year 1771, when he returned home.

Kentucky had, about this time, drawn the atten-
tion of several gentlemen. Doctor Walker, of Vir-
ginia, with a number more, made a tour westward
for discoveries, endeavouring to find the Ohio river;
and afterwards he and General Lewis, at Fort Stan-
wix, purchased from the five nations of Indians the
lands lying on the north side of Kentucky. Col.
Donaldson, of Virginia, being employed by the state
to run a line from six miles above the Long Island,
on Holstein, to the mouth of the Great Kanaway,
and finding thereby that an extensive tract of excel-
lent country would be cut off to the Indians, was so-
licitated, by the inhabitants of Clench and Holstein,
to purchase the lands lying on the north side of Ken-
tucky river from the Five Nations. This purchase he
completed for five hundred pounds, specie. It was
then agreed, to fix a boundary line, running from the
Long Island on Holstein to the head of Kentucky
river; thence down the same to the mouth; thence
up the Ohio to the mouth of Great Kanaway; but
this valuable purchase the state refused to confirm.

Col.

Col. Henderson, of North Carolina, being informed of this country by Col. Boone, he, and some other gentlemen, held a treaty with the Cherokee Indians at Wataga, in March 1775, and then purchased from them the lands lying on the south side of Kentucky river for goods, at valuable rates, to the amount of 6000*l.* specie.

Soon after this purchase, the state of Virginia took the alarm, agreed to pay the money Col. Donaldson had contracted for, and then disputed Col. Henderson's right of purchase, as a private gentleman of another state, in behalf of himself; however, for his eminent services to this country, and for having been instrumental in making so valuable an acquisition to Virginia, that state was pleased to reward him with a tract of land, at the mouth of Green river, to the amount of 200,000 acres; and the state of North Carolina gave him the like quantity in Powell's Valley. This region was formerly claimed by various tribes of Indians; whose title, if they had any, originated in such a manner, as to render it doubtful which ought to possess it: hence this fertile spot became an object of contention, a theatre of war, from which it was properly denominated the Bloody Grounds. Their contentions not being likely to decide the right to any particular tribe, as soon as Mr. Henderson and his friends proposed to purchase, the Indians agreed to sell; but notwithstanding the valuable consideration they received, have continued ever since troublesome neighbours to the new settlers.

In short, the progress in improvements and cultivation which have been made in this country to the present year 1793, almost exceeds belief.—Twelve years ago Kentucky lay in forest, almost uninhabited but by wild beasts. Now, notwithstanding the united opposition of all the Western Indians, she exhibits an extensive settlement, divided into seven large and populous counties, in which are a number of flourishing little towns, containing more inhabitants than are in Georgia, Delaware, or Rhode-Island states, and nearly or quite as many as in New Hampshire. Mr. Inlay, in his description of this Western Territory, says, he has known upwards of 10,000 emigrants to arrive in the single state of Kentucky within one year, and from 4 to 10,000 in several other years. An instance of the like kind, where a settlement has had so large and so rapid a growth, can scarcely be produced from the page of history.

Mr. Filson concludes his account of Kentucky with the following observations on the happy circumstances, that the inhabitants of Kentucky will probably enjoy, from the possession of a country so extensive and fertile.

“There are four natural qualities necessary to promote the happiness of a country, viz. A good soil, air, water, and trade. These taken collectively, excepting the latter, Kentucky possesses in a superior degree: and, agreeable to our description of the western

trade, we conclude, that it will be nearly equal to any other on the continent of America, and the advantages it is subject to, be fully compensated by the fertility of the soil.

“This fertile region, abounding with all the luxuries of nature, stored with all the principal materials for art and industry, inhabited by virtuous and ingenious citizens, must universally attract the attention of mankind, being situated in the central part of the extensive American empire, where agriculture, industry, laws, arts, and sciences, flourish; where civilized humanity raises her drooping head; where springs a harvest for the poor; where confidence ceases to be a slave, and laws are no more than the security of happiness; where nature makes reparation for having created man; and government, so prostituted to the most criminal purposes, establishes an asylum in the wilderness for the distressed mankind.

“The recital of your happiness will call to your country all the unfortunate of the earth, who, having experienced oppression, political or religious, will find a deliverance from their chains. To you innumerable multitudes will emigrate from the hated regions of despotism and tyranny; and you will surely welcome them as friends, as brothers; you will welcome them to partake with you of your happiness.—Let the memory of Lycurgus, the Spartan legislator, who banished covetousness, and the love of gold from his country; the excellent Locke, who first taught the doctrine of toleration; the venerable Penn, the first who founded a city of brethren; and Washington, the defender and protector of persecuted liberty, be ever the illustrious examples of your political conduct. Avail yourselves of the benefits of nature, and of the fruitful country you inhabit.

“Let the iron of your mines, the wool of your flocks, your flax and hemp, the skins of the savage animals that wander in your woods, be fashioned into manufactures, and take an extraordinary value from your hands. Then will you rival the superfluities of Europe, and know that happiness may be found, without the commerce so universally desired by mankind.

“In your country, like the land of promise, flowing with milk and honey, a land of brooks of waters, of fountains and depths, that spring out of valleys and hills, a land of wheat and barley, and all kinds of fruits, you shall eat bread without scarceness, and lack any thing it; where you are neither chilled with the cold of Capricorn, nor scorched with the burning heat of Cancer; the mildness of your air so great, that you neither feel the effects of infectious fogs, nor pestilential vapours. Thus your country, favoured with the smiles of heaven, will probably be inhabited by the first people the world ever knew.”

C H A P. XIII.

NORTH AND SOUTH CAROLINA, WITH GEORGIA.

Boundaries, Divisions, Climate, Rivers, Soil, Productions, Animals, principal Towns, Inhabitants, and Government.

THESE countries are bounded, on the north, by Virginia; on the west, by the Mississippi; on the east, by the Atlantic Ocean; and on the south, by the river St. John, which separates Georgia from Florida. They are composed of three divisions, the north, the middle, and the south; in the following manner:

DIVISIONS.	COUNTIES.	TOWNS.
North Carolina are the counties of ..	Albemarle	Newburn.
	Bath, and Clarendon in part	Edenton. Wilmington.
	Clarendon in part	St. James.
South Carolina, being the middle division, are the counties of ..	Craven	Christ-Church.
	Berkeley. Colleton	Charleston.
Georgia, being the south division, contains	Granville	Port-Royal.
	Richmond	Savannah.
	Effingham.	
	Chatham.	
	Camden.	
	Wilkes	Sunbury.
	Glynn	Frederica.
Burke	Parisburgh.	
	Liberty.	

The climate of these countries is nearly alike, and very temperate, in general, with that of Virginia. The air of the Carolinas and Georgia is, for the most part, clear, serene, and pleasant. Sometimes violent rains fall both in winter and summer, attended by high winds; but these hurricanes seldom do any mischief. The heat in summer is indeed very intense, but the winters are moderate, and extremely short. Like that of Virginia, &c. the climate is subject to sudden transitions from heat to cold; a north-west wind, even in summer, blows exceedingly sharp, and the hottest day will often be succeeded by a very cold evening; against the effects of which, the inhabitants find it necessary to guard as much as possible. Many tender plants, which do not stand the winter of Virginia, flourish in Carolina.

The chief rivers are, the Albemarle, or Roanoke; Pamlico, Pamlico Neus; Cape Fear, or Clarendon river; Pedee, Santee, Savannah, Alatomaha, or George

river; and St. Mary's, which divides Georgia from Florida; all which rise in the Apalachian mountains, and, running east, fall into the Atlantic Ocean. The back parts are watered by the Cherokees, Yaffous, Mobile, Apalachicola, the Pearl river, and several others, which fall into the gulf of Mexico, or the Mississippi.

The Atlantic Ocean is the only sea bordering on this country, and is very shallow near the coast. The best harbours are those of Roanoke, at the mouth of Albemarle river, Pamlico, and Cape Fear. There are, in South Carolina, the harbours of Charleston, Winyaw or George-Town, and Port-Royal. The mouths of the Savannah and Alatomaha form good harbours in Georgia. Cape Hattera, in 35 deg. north lat. Cape Fear to the south of it, and Cape Carteret still farther south, are the most remarkable promontories.

The two Carolinas, in the fertility of nature, have the advantage of Virginia; but the soil of Georgia is not so good as that of the other provinces. The vegetation of every kind of plant is incredibly quick in Carolina; for the soil, even when left to itself, yields flowers and flowering shrubs; and all the European plants arrive at a degree of perfection here, far exceeding what they attained in their native soil. The productions of the Carolinas are vines, some wheat, Indian corn, barley, oats, peas, beans, hemp, flax, cotton, sarsaparilla, tobacco, and indigo; olive, orange, lemon, citron, cypress, oak, walnut, cassia, and pine trees, from which the inhabitants make great quantities of turpentine, tar, and pitch. There are also several trees that yield gums; one, from which distils an oil of extraordinary virtue for curing wounds, and another that produces a balm supposed to be little inferior to that of Mecca. White mulberry-trees for feeding silk-worms flourish here exceedingly; so that with proper care and encouragement, silk, wine, and oil might be exported from hence: but the whole attention of the Carolinians seems turned to the culture of indigo and rice; and though cochineal is said to be found there, they make no advantage of it. The trees in this and every other part of America grow to an amazing size, their trunks being often from 50 to 70 feet high, without a branch or limb, and frequently upwards of 36 feet in circumference. The Indians and people of Charleston hollow these into canoes, which serve to transport provisions and other goods from place to place; some of them, consisting of one entire piece of timber, are so large, that they will carry from 30 to 40 barrels of pitch each: curious pleasure-boats are likewise made of them. The whole country is in a manner one forest, where the planters have not cleared it, and the trees are almost the same in every respect with those produced in Virginia. The land in Carolina is easily cleared, as there is little or no underwood, and the forests chiefly consist of tall trees at a considerable distance from each other.

Wheat grows extremely well in the back parts, and yields a prodigious increase. It is a most fortunate circumstance for this province, that the low and flooded part of its land is favourable to a species of the most valuable of all its products, namely, one of its kinds of indigo; and the low, rich, and swampy grounds bear their great staple rice. Prodigious quantities of excellent honey are produced in the Carolinas, from which the inhabitants make a fine spirit, and mead equal to Malaga sack; but they make very little wine, though they have plenty of grapes.

The animals here are nearly the same as those in Virginia. The European black cattle have multiplied amazingly; it is no uncommon thing for one person to be owner of 300 cows, and many have upwards of 1000. These are turned out in the morning, and range the forests for food; but their calves being separated from them in fenced pastures, the cows always return to them in the evening. The hogs and horses are equally numerous. Many of the cattle would in all probability have been destroyed by the wolves, tigers, and panthers, which certainly range the forests in great numbers, were it not that the beasts of prey here are less ravenous than those of Africa and Asia.

Charleston, the capital of South Carolina, is the only town in either of these provinces that deserves attention. It is situated at the confluence of the two navigable rivers Allhley and Cowper, and for size, beauty, and traffic, is one of the first in North America. The harbour is an exceeding good one, being attended by no other inconvenience than that of a bar, which prevents vessels of more than two hundred tons burthen from entering it. The town is regularly built, and pretty strongly fortified both by nature and art. The streets, which are wide and straight, intersect each other at right angles, and those running east and west extend about a mile from one river to the other. It contains about a thousand houses, some of which are of brick and others of wood, but all of them very handsome, and let at amazing high rents. The church is a spacious building, and executed in an elegant taste; there are also several meeting-houses belonging to different sects of Dissenters, some of which are extremely neat. Charleston, being the residence of the governor, and the place where the assembly meets, is always lively and gay; several handsome equipages are kept there; and the planters and merchants are rich, well-bred, and both shewy and expensive in their dress and manner of living.

The most effectual attempt to settle the province of Carolina was made in the year 1663, when several English noblemen, and others of great distinction, obtained a charter from the crown, investing them with the property and jurisdiction of that country. They parcelled out their lands to such as were willing to go over to this settlement, and to submit to a system of laws drawn up by the celebrated Mr. Locke.

On the arrival of the colony in Carolina, they began their first settlement on a point of land near the southern limits of their district, between two navigable rivers, where they laid the foundation of a town called Charleston, which was designed to be, what is now really is, the capital of the province. But the process of time the disputes between the church and England people and the Dissenters caused a total confusion in the colony, which was rendered still more tolerable by the incursions of the Indians, whom they had irritated by their insolence and injustice. In order to prevent the fatal effects of these intestine divisions and foreign wars, an act of parliament was passed which put this colony under the immediate protection of the crown. The lords proprietors accepted the sum of 24,000*l.* for both the property and jurisdiction; but Earl Granville thought fit to retain his seventh share of Carolina was, in 1728, divided into two districts, and two separate governments, and from that time peace was restored in the internal government, also with the Cherokees and other Indian tribes, and trade began to flourish.

Edenton is the capital of North Carolina, but little more than a trifling village: a town further inland which would be more central, has been lately projected.

The exports of South Carolina to Great-Britain, native commodities, on an average of three years, amounted to more than 395,000*l.* annual value; and its imports to 365,000*l.* The exports of North Carolina were computed at about 70,000*l.* and its imports 18,000*l.* The trade of Georgia being in its infancy, the exports amounted to little more than 74,000*l.* and the imports to 49,000*l.* The trade between Carolina and the West-Indies was very large; their trade with the Indians was in a thriving condition; and the formerly carried English goods on pack-horses 500 miles into the country west of Charleston.

No thoughts were entertained of settling Georgia in the year 1732, when a scheme was formed for enabling poor and indigent families to settle in that province. A patent was accordingly obtained, large sums were subscribed, and a considerable number of settlers embarked for Georgia, under the care of Mr. Oglethorpe, who generously undertook the troublesome task, without any reward, for the advancement of the settlement. But it soon appeared that the regulations, which had been drawn up with the greatest care, were not adapted to advance the prosperity of the colony. The settlers complained, that they were on a worse footing than any other colony in America. Some of their grievances were removed, but a sufficient number remained to give the inhabitants a dislike to the country; many of them fled, and dispersed themselves into the other settlements: so that of above 2000 people, who had transported themselves from Europe, not more than five or six hundred were to be found in Georgia. The mischief every day increased till 1734, when the

colony in Carolina, they had on a point of land near the district, between two mountains, the foundation of a city was designed to be, which was the seat of the province. But disputes between the church and dissenters caused a total cessation of the settlement, which was rendered still more difficult by the opposition of the Indians, whom the government treated with violence and injustice. In order to settle these intestine divisions, a committee of parliament was appointed in 1733, under the immediate protection of the proprietors accepted the same property and jurisdiction; but to retain his seventh share, he divided into two districts, North and South, and from that time a separate government, also with the Indian tribes, and trade began.

of North Carolina, but the village: a town further from the centre, has been lately pro-

Carolina to Great-Britain, an average of three years 395,000l. annual value; and the exports of North Carolina about 70,000l. and its value of Georgia being in its infancy little more than 7,000l. The trade between Carolina was very large; their thriving condition; and the goods on pack-horses 300 miles west of Charleston.

obtained of settling Georgia, a scheme was formed for enabling the settlers to settle in that province; and large sums were expended to obtain a considerable number of settlers under the care of Mr. Oglethorpe, who by his troublesome talk, which advanced the settlement, had that the regulations, which the greatest care, were necessary for the prosperity of the colony. They were on a worse footing than in America. Some of the settlers had a sufficient number of servants; a dislike to the country dispersed themselves into the mountains of above 2000 people, who were from Europe, not more were to be found in Georgia increased till 1753, when the

government found it necessary to revoke the charter, the province now became the property of the crown. The particular regulations were annulled, and Georgia was placed exactly on the same footing with Carolina. This interposition of the legislative power saved the colony from destruction. The settlement, for a considerable time, been emerging out of the difficulties that attended its first establishment; and it is not to be doubted but that, when the internal divisions are entirely composed, the remaining errors of the government corrected, and the people sufficiently multiplied, Georgia will become a rich and flourishing province.

Savannah and Augusta are the principal towns in Georgia. Savannah, the capital, is situated ten miles from the river of the same name, where it forms a half moon, and where ships that draw ten or twelve feet water may ride for a mile in length within ten yards of the bank. From the quay may be seen the whole course of the river towards the sea one way, and on the other for about sixty miles up the country. This river is navigable for large boats, from the capital to Augusta, which are two hundred miles distant from each other. Augusta is situated in one of the most fertile parts of the province, and carries on a considerable trade with the Creek and Cherokee Indians. The late Rev. Mr. George Whitefield founded an orphan-house at Savannah, which was converted into a college for the education of young men, chiefly designed for the ministry; and, through his pious care and fervent zeal, that gentleman had the pleasure of seeing this religious seminary in a flourishing condition before his death; but since that period, we are told it has been converted to a very different use.

By a late estimation, the number of inhabitants in North Carolina amounted to 200,000; those in South Carolina to 170,000; and those in Georgia to 25,000. The legislature of North Carolina now consists of two separate bodies, namely, the senate and house of commons. The executive power is lodged in a governor and seven counsellors, annually chosen by and out of the general assembly, who also appoint the judges, field-officers, secretary, treasurer, &c. The justices and sheriffs are recommended by the people; and the delegates to congress are elected annually by ballot out of the general assembly. This form of government was settled in convention at Halifax, Dec. 10, 1776.—The constitution established for South Carolina, by the council and assembly in March 1778, vests the legislative authority in the general assembly, consisting of the senate and house of representatives. The executive power is composed of a governor, lieutenant-governor, and eight privy-counsellors. The assembly is to nominate justices of the peace, sheriffs, and other officers. By the constitution agreed to in 1777, for Georgia, the legislative, executive, and judiciary departments are to be distinct and separate bodies; the legislative to consist of representatives

electd by the freeholders in each county, annually, by ballot. Seventy-two representatives constitute the house of assembly, out of whom are chosen, by ballot, the governor and executive council, and also the delegates to congress, annually. The respective bodies, and the several courts they depend on, appoint the subordinate officers.

The United States of America have lately struck a halfpenny, on one side of which, encircled within a wreath of laurel, exceedingly well executed, are the letters US in a cypher, surrounded with an inscription, LIBERTAS ET JUSTITIA, dated 1785. On the reverse, in the centre, is a constellation, from which issue thirteen illuminated rays, and between each ray is a small star, expressive of the Thirteen United States; around these rays, and the stars, is the following inscription, NOVA CONSTELLATIO.—The new American halfpenny is in weight as three to two of the English coin.

THE WESTERN TERRITORY.

ALL that part of the United States which lies north-west of the Ohio, is comprised under this name. It is bounded, on the west, by the Mississippi river; on the north, by the Lakes; on the east, by Pennsylvania; and on the south-east and south, by the Ohio river: containing, according to Mr. Hutchins, 411,000 square miles, equal to 263,040,000 acres—from which, if we deduct 43,040,000 acres for water, there will remain 220,000,000 acres, belonging to the federal government, to be sold for the discharge of the national debt; except a narrow strip of land, bordering on the south of Lake Erie, and stretching 120 miles west of the western limit of Pennsylvania, which belongs to Connecticut.

Only a small proportion of these lands is yet (1793) purchased of the natives, and to be disposed of by Congress. Beginning on the meridian line, which forms the western boundary of Pennsylvania, seven ranges of townships have been surveyed and laid off by order of Congress. As a north and south line strikes the Ohio in an oblique direction, the termination of the 7th range falls upon that river, 9 miles above the Muskingum, which is the first large river that falls into the Ohio. It forms this junction 172 miles below Fort Pitt, including the windings of the Ohio, though in a direct line it is but 90 miles.

The lands in which the Indian title is extinguished, and which are now purchasing under the United States, are bounded by Pennsylvania on the east, by the Great Miami on the west, by the Ohio on the south, and extend nearly to the head waters of the Muskingum and Sioto on the north. On these lands two settlements are commencing, one at Marietta, at the mouth of Muskingum, under the direction of the Ohio company. This settlement consists, at present, of about 220 souls, and is almost daily increasing. The other

other between the Miami rivers, under the direction of Colonel Symmes, which, though very small at present, is in prospect of a rapid enlargement. There are several other tracts, delineated on the map, which have been granted by Congress to particular companies, and other tracts for particular uses, which remain without any English settlements.—It is, in general, a fine, fertile, and well-watered country.

C H A P X I V .

V E R M O N T .

Situation, Extent, Boundaries, Divisions, Counties, Towns, Rivers, Mountains, Soil and Produce, Climate, Militia, Population, Character, Curiosities, Constitution, first Discovery and Settlement, &c.

THIS independant state is situated between 42 deg. 50 min. and 45 deg. of north latitude, and between 1 deg. 30 min. and 3 deg. of east longitude. It is bounded, on the north, by Canada; on the east, by Connecticut river, which divides it from New Hampshire; on the south, by Massachusetts; and on the west, by New York.

Vermont is divided into the seven following counties: Bennington, Rutland, Addison, Windham, Chittenden, Orange, and Windsor.

These counties are subdivided into townships, which are generally six miles square. In every township is a relieve of two rights of land, of 350 acres each; one to be appropriated for the support of public schools, the other to be given in fee to the first miller who settles in the township. A part of the townships were granted by the governor of New Hampshire, and the other part by that of Vermont. In those townships granted by the former, a right of land is reserved for the support of the gospel in foreign parts; in those granted by the latter, a college right, and a right for the support of county grammar schools, are reserved. In these reservations, liberal provision is made for the support of the gospel, and for the promotion of common and collegiate education.

This state, on the east side of the mountain, is watered by the following rivers; viz. Paupanhoosak, Quechey, Welds, White, Black, and Wet rivers, which run from west to east into Connecticut river; and west of the mountains, by the river Lamoi, over which is a natural stone bridge, seven or eight rods in length, by Onion river and Otter Creek, which empty by one mouth into Lake Champlain, 20 or 30 miles south of St John's. Otter Creek is navigable for boats 50 miles. The land is adjacent are of an excellent quality, and are annually enriched by the overflowing of the water, occasioned by the melting of the snow on the Green Mountains.

A chain of high mountains, running north and south, divides this state nearly in the centre between Connecticut river and Lake Champlain. The height of land is generally from 20 to 30 miles from the river, and about the same distance from the New York line. The natural growth upon this mountain is hemlock, pine, spruce, and other evergreens; hence it has always a green appearance, and on the account has obtained the descriptive name of *Verde Green Mountain*. On some high parts of this mountain, snow lies till May, and sometimes till June.

The country is generally hilly, but not rocky. It is finely watered, and affords the best of pasturage for cattle. On the banks of the lakes, rivers, and rivers are many fine tracts of rich interval land. The heavy growth of timber, which is common throughout the state, evince the strength and fertility of the soil. Elm, black birch, maple, ash, and balsam grow in the moist low ground; and the banks of the rivers are timbered principally with white pine, intermingled with vales of beech, elm, and white oak. The inhabitants cultivate wheat, 25 and 30 bushels of which grow on an acre; rye, barley, oats, Indian corn, &c. The corn, however, is frequently cut off by the early frosts, especially on the mountain hills. That which grows on the banks of the river is not so frequently injured. Flax is raised in considerable quantities, and the soil is good for hemp, Potatoes, pumpkins, and garden roots and vegetables grow here in great plenty. Large quantities of sugar of a good quality and flavour, are made from the sugar maple.

With respect to the climate, no country in the world is more healthy. Snow begins to fall commonly in the beginning of November, and is generally gone by the middle of April. During this season, the inhabitants generally enjoy a serene sky, and a keen cold air. The ground is seldom frozen to any great depth, being covered with a great body of snow before the severe frosts begin. In the spring, the snow in common, is gradually dissolved by the warm influences of the sun. In this way the earth is enriched and moistened, and spring advances with surprising quickness.

There are upwards of 17,000 men upon the militia rolls of this state. These consist of two divisions, one on the west, the other on the east side of the mountain. In these two divisions are 7 brigades, which are made up of 21 regiments. From the number of militia, reckoning 5 for one, we may estimate the number of inhabitants in the state at 85,000. Others, who reckon 6 for one, estimate them at 100,000. The bulk of the inhabitants are emigrants from Connecticut and Massachusetts, and their descendents. There is one settlement of Scotch people, which are almost the only foreigners in the state. As to the character, the manners, the customs, the laws, the policy, and the religion of the people in Vermont.

mountains, running north and south nearly in the centre between Lake Champlain. The highest part is from 20 to 30 miles from the same distance from the Montreal growth upon this mountain spruce, and other evergreen trees appear, and on the descriptive name of *Ver Mont*. The high parts of this mountain are generally hilly, but not rocky, and afford the best of pasture for the lakes, rivers, and rivulets of rich interval land. The soil, which is common through the strength and fertility of maple, ash, and balsam poplar; and the banks of the river are principally with white pine, yellow beech, elm, and white oak. Wheat, 25 and 30 bushels per acre; rye, barley, oats, Indian corn, &c. however, is frequently cultivated on the mountains and hills. Flax is raised in considerable quantities, and the soil is good for hemp, garden roots and vegetables. Large quantities of sugar maple, are made from the climate, no country in the north. Snow begins to fall in the month of November, and is generally melted in the month of April. During this season the people generally enjoy a serene sky, and the ground is seldom frozen to any great depth, with a great body of snow in the winter. In the spring, the snow is dissolved by the warm weather, and in this way the earth is enriched, and the crops advance with surprising rapidity. In the year 1777, 17,000 men upon the mountains of these consist of two divisions, one on the east side of the mountains, and the other on the west. The divisions are 7 brigades, and 21 regiments. From the year 1775 for one, we may reckon 6 for one, estimate the bulk of the inhabitants as about equal to Massachusetts, and is one settlement of Scotch-Irish, the only foreigners in the state. The manners, the customs, and the religion of the people is the same as in Vermont.

In Vermont, it is sufficient to say they are New Englanders. In the township of Tinmouth, on the side of a hill, is a very curious cave. The chasm, at its entrance, is about four feet in circumference. Entering this you descend 104 feet, and then opens a spacious room 20 feet in breadth, and 100 feet in length. The angle of descent is about 45 degrees. The roof of this cavern is of rock, through which water is continually percolating. The stalactites which hang from the roof appear like icicles on the sides of houses, and are continually increasing in number and magnitude. The bottom and sides are daily overflowing with spar and other mineral substances. On the sides of this subterraneous hall, are tables, chairs, benches, &c. which appear to have been artificially formed. This richly ornamented room, when illuminated with the candles of the guides, has an enchanting effect upon the eye of the spectator. If we might be indulged in assigning the general cause of these astonishing appearances, we should conclude from the various circumstances accompanying them, that they arise from water filtrating slowly through the incumbent strata; and taking up in its passage a variety of mineral substances, and becoming thus saturated with metallic particles, gradually exuding on the surface of the caverns and fissures, in a quiet manner, the aqueous particles evaporate, and leave the mineral substances to unite according to their affinities. At the end of this cave is a circular hole, 15 feet in diameter, apparently hewn out, in a conical form, entering gradually as you descend, in the form of a barrel loaf. At the bottom is a spring of fresh water, in continual motion, like the boiling of a pot. Its temperature has never been founded. On the 25th of December 1777, the inhabitants of Vermont, by their representatives in convention at Windsor, declared that the territory called Vermont was, and of right ought to be a free and independent state; and for the purpose of maintaining a regular government in the same, they made a solemn declaration of their rights, and ratified a constitution, of which the following is an abstract.—This declaration, which makes part of their constitution, asserts, that all men are born equally free—with equal rights, and ought to enjoy liberty of conscience—freedom of the press—trial by jury—power to form new states in vacant counties, and to regulate their own internal police—that all elections ought to be free—that all power is originally in the people—that government ought to be instituted for the common benefit of the community—and that the community have a right to reform or abolish government—that every member of society hath a right to protection of life, liberty, and property—and in return is bound to contribute his proportion of the expence of that protection, and to yield his personal service when necessary—that he shall not be obliged to give evidence against himself—that

the people have a right to bear arms—but no standing armies shall be maintained in time of peace—that the people have a right to hold themselves, their houses, papers, and possessions free from search or seizure—and therefore warrants without oaths first made, affording sufficient foundation for them, are contrary to that right, and ought not to be granted—that no person shall be liable to be transported out of this state for trial for any offence committed within this state, &c.

By the frame of government, the supreme legislative power is vested in a house of representatives of the freemen of the state of Vermont, to be chosen annually by the freemen on the first Tuesday in September, and to meet the second Thursday of the succeeding October—this body is vested with all the powers necessary for the legislature of a free state—two thirds of the whole number of representatives elected, make a quorum.—Each inhabited town throughout the state has a right to send one representative to the assembly.—The supreme executive power is vested in a governor, lieutenant-governor, and twelve counsellors to be chosen annually in the same manner, and vested with the same powers as in Connecticut.—Every person of the age of 21 years, who has resided in the state one whole year next before the election of representatives, and is of a quiet, peaceable behaviour, and will bind himself by his oath, to do what he shall in conscience judge to be most conducive to the best good of the state, shall be entitled to all the privileges of a freeman of this state.—Each member of the house of representatives, before he takes his seat, must declare his belief in one God—in future rewards and punishments, and in the divinity of the scriptures of the Old and New Testament, and must profess the protestant religion.

Courts of justice are to be established in every county throughout the state.—The supreme court, and the several courts of common pleas of this state, besides the powers usually exercised by such courts, have the powers of a court of chancery, so far as relates to perpetuating testimony, obtaining evidence from places not within the state, and the care of the persons and estates of those who are *non compos mentis*, &c. All prosecutions are to be commenced in the name, and by the authority of the freemen of the state of Vermont. The legislature are to regulate entails, so as to prevent perpetuities.

All field and staff officers, and commissioned officers of the army, and all general officers of the militia, shall be chosen by the general assembly, and be commissioned by the governor.

Every seventh year, beginning with the year 1785, thirteen persons (none of whom are to be of the council or assembly) shall be chosen by the freemen, and be called "the council of censors," whose duty it shall be to inquire whether the constitution has been preserved inviolate in every part—whether the

legislative and executive powers have been properly exercised—taxes justly laid and collected—the public monies rightly disposed of—and the laws duly executed.—For these purposes, they shall have power to send for persons, papers, &c.—to pass public censures—to order impeachments, and to recommend the repeal of all laws enacted contrary to the principles of the constitution. They are to be vested with these powers for one year only, after the day of their election.

The council of censors, when necessary, may call a convention, to meet within two years after their sitting—to alter the constitution—the proposed alterations to be published at least six months before the election of delegates to such convention.

Bennington is the principal town in Vermont. It is situated in the south-west corner of the state, near the foot of the Green Mountain. Its public buildings are a church for Congregationalists, a court-house and gaol. It has a number of elegant houses, and is a flourishing town. Near the centre of the town is Mount Anthony, which rises very high in the form of a sugar-loaf. The assembly commonly hold their sessions at Windfur.

Origin, Rise, and Name of this State, described.

IT was formed by emigrations from New Hampshire and New York. The emigrants having settled on lands to the westward, neither claimed or cultivated by the people of the provinces before mentioned, soon grew numerous, and spread themselves to a considerable extent. The inhabitants of those provinces had long been jealous of the rising greatness of the colony of Vermont, and desirous of crushing it, but never could effect their design, while the colonies were under the jurisdiction of the mother country. When the late dissensions began, they represented the Vermontese to Congress as a disaffected and encroaching people.

The Vermontese, on their part, professed their attachment to the general American cause, and requested representation in Congress, in common with the other states. Congress, far from complying with the request of the Vermontese, decided in favour of the colonies of New Hampshire and New York, and contracted the boundaries of that of Vermont. In process of time, however, Congress relaxed in their severity, and transmitted a favourable proposal to the Vermontese, which being acceded to, matters were adjusted in April 1782.

ETHAN ALLEN, famous for the expedition he undertook against Ticonderago in 1775, without any other aid than that of a body of volunteers who followed his fortunes, made himself chief of this country. This enterprising genius formed there an assembly of representatives. The inhabitants were

known, for a considerable time, by the name of "Green Mountain Boy"; but thinking that an invidious appellation, they frenchified Green Mountain, which made Verd Mont, and, by corruption, Vermont. Hence the origin of the name of this state.

Dr. Franklin has favoured us with the following accurate account of the internal state of America:

"There is (says this judicious writer) a tradition that in the planting of New England, the first settlers met with many difficulties and hardships, as is generally the case when a civilized people attempt to establish themselves in a wilderness country. Being persecuted, they sought relief from heaven, by laying their wants and distresses before the Lord in frequent days of fasting and prayer. Constant meditation and discourse on these subjects kept their minds gloomy and discontented; and, like the children of Israel, there were many disposed to return to the Egypt which persecution had induced them to abandon. At length, when it was proposed in the assembly to proclaim another fast, a farmer of plain features, and remarked, that the inconveniences they suffered, and concerning which they had so often worried heaven with their complaints, were found not so great as they might have expected, and were diminishing every day as the colony strengthened; that the earth began to reward their labour, and to furnish liberally for their subsistence; that the seas and rivers were found full of fish, the air sweet, the climate healthy; and, above all, that they were there in the enjoyment of liberty, civil and religious; he therefore thought, that reflecting and conversing on the subjects would be more comfortable, as tending more to make them contented with their situation; and that it would be more becoming the gratitude they owed to the Divine Being, if, instead of a fast, they should proclaim a thanksgiving. His advice was taken; and from that day to this they have, in every year, observed circumstances of public felicity sufficient to furnish employment for a thanksgiving day, which is therefore constantly ordered and religiously observed."

"I see in the public news-papers of different states frequent complaints of *hard times, deadness of trade, scarcity of money, &c. &c.* It is not my intention to assert or maintain that these complaints are entirely without foundation. There can be no country or nation existing, in which there will not be some people so circumstanced as to find it hard to gain a livelihood; people who are not in the way of any profitable trade, and with whom money is scarce, because they have nothing to give in exchange for it; and it is always in the power of a small number to make a great clamour. But let us take a cool view of the general state of our affairs, and perhaps the prospect will appear less gloomy than has been imagined.

e continent is agricultur
nt, I suppose we have
had

about 100 farmers, by far the greatest part cultivators
of their own fertile lands, from whence many of
them draw not only food necessary for their subsistence,
but the materials of their clothing, so as to need very
few foreign supplies; while they have a surplus of
productions to dispose of, whereby wealth is gradually
accumulated. Such has been the goodness of Divine
providence to these regions, and so favourable the
climate, that since the three or four years of hardship
the first settlement of our fathers here, a famine or
scarcity has never been heard of amongst us; on the
contrary, though some years may have been more
and others less plentiful, there has always been pro-
vision enough for ourselves, and a quantity to spare
for exportation. And although the crops of last
year were generally good, never was the farmer bet-
ter paid for the part he can spare commerce, as the
highest price currents abundantly testify. The
lands he possesses are also continually rising in value
with the increase of population; and, on the whole,
he is enabled to give such good wages to those who
work for him, that all who are acquainted with the
world must agree, that in no part of it are the
labouring poor so generally well fed, well clothed, well
edged, and well paid, as in the United States of
America.

If we enter the cities, we find that, since the Re-
volution, the owners of houses and lots of ground have
had their interest vastly augmented in value; rents
have risen to an astonishing height, and thence en-
couragement to increase building, which gives em-
ployment to an abundance of workmen, as does also
the increased luxury and splendor of living of the
inhabitants thus made richer. These workmen all
demand and obtain much higher wages than any
other part of the world would afford them, and are
paid in ready money. This rank of people therefore
do not, or ought not, to complain of hard times;
and they make a very considerable part of the city
inhabitants.

At the distance I live from our American fisheries,
I cannot speak of them with any degree of certainty;
but I have not heard that the labour of the valuable
rank of men employed in them is worse paid, or that
they meet with less success, than before the Revolution.
The whalers indeed have been deprived of one
market for their oil; but another, I hear, is opening
for them, which it is hoped may be equally advan-
talous; and the demand is constantly increasing for
their spermaceti candles, which therefore bear a much
higher price than formerly.

There remain the merchants and shopkeepers.
Of these, though they make but a small part of the whole
population, the number is considerable, too great indeed
for the business they are employed in; for the con-
sumption of goods in every country has its limits;
the faculties of the people; that is, their ability to
buy and pay, is equal only to a certain quantity of

merchandise. If merchants calculate amiss on this
proportion, and import too much, they will of course
find the sale dull for the overplus, and some of them
will say that trade languishes. They should, and
doubtless will, grow wiser by experience, and import
less. If too many artificers in town, and farmers
from the country, flattering themselves with the idea
of leading easier lives, turn shopkeepers, the whole
natural quantity of that business divided among them
all, may afford too small a share for each, and occa-
sion complaints that trading is dead; these may also
suppose that it is owing to scarcity of money, while,
in fact, it is not so much from the fewness of buyers,
as from the excessive number of sellers, that the mis-
chief arises; and, if every shopkeeping farmer and
mechanic would return to the use of his plough and
working tools, there would remain of widows, and
other women, shopkeepers sufficient for the business,
which might then afford them a comfortable main-
tenance.

Whoever has travelled through the various parts
of Europe, and observed how small is the proportion of
people in affluence or easy circumstances there, com-
pared with those in poverty and misery; the few rich
and haughty landlords, the multitude of poor, abject,
rack-rented, tythe-paying tenants, and half-paid and
half-starved ragged labourers; and views here the
happy mediocrity that so generally prevails through-
out these states, where the cultivator works for him-
self, and supports his family in decent plenty; will,
methinks, see abundant reason to bless Divine Provi-
dence for the evident and great difference in our fa-
vour, and be convinced that no nation known to us
enjoys a greater share of human felicity.

It is true, that in some of the states there are par-
ties and discords; but let us look back, and ask if we
were ever without them? Such will exist wherever
there is liberty; and perhaps they help to preserve it.
By the collision of different sentiments, sparks of truth
are struck out, and political light is obtained. The
different factions, which at present divide us, aim all
at the public good; the differences are only about the
various modes of promoting it. Things, actions, mea-
sures, and objects of all kinds, present themselves to
the minds of men in such a variety of lights, that it is
not possible we should all think alike at the same
time on every subject, when hardly the same man re-
tains at all times the same ideas of it. Parties are
therefore the common lot of humanity; and ours are
by no means more mischievous or less beneficial than
those of other countries, nations, and ages, enjoying
in the same degree the great blessing of political li-
berty.

Some indeed among us are not so much grieved for
the present state of our affairs, as apprehensive for the
future. The growth of luxury alarms them, and they
think we are from that alone in the high road to
ruin. They observe, that no revenue is sufficient with-
out

out economy, and that the most plentiful income of a whole people from the natural productions of their country may be dissipated in vain and needless expences, and poverty be introduced in the place of affluence.—This may be possible. It however rarely happens; for there seems to be in every nation a greater proportion of industry and frugality, which tend to enrich, than of idleness and prodigality, which occasion poverty, so that upon the whole there is a continual accumulation. Reflect what Spain, Gaul, Germany, and Britain were in the time of the Romans, inhabited by people little richer than our savages, and consider the wealth they at present possess, in numerous well-built cities, improved farms, rich moveables, magazines stocked with valuable manufactures, to say nothing of plate, jewels, and coined money; and all this, notwithstanding their bad, wasteful, plundering governments, and their mad destructive wars; and yet luxury and extravagant living has never suffered much restraint in those countries. Then consider the great proportion of industrious frugal farmers inhabiting the interior parts of these American states, and of whom the body of our nation consists, and judge whether it is possible that the luxury of our sea-ports can be sufficient to ruin such a country. If the importation of foreign luxuries could ruin a people, we should probably have been ruined long ago: for the British nation claimed a right, and practised it, of importing among us, not only the superfluities of their own production, but those of every nation under heaven; we bought and consumed them, and yet we flourished and grew rich. At present our independent governments may do what we could not then do, discourage by heavy duties, or prevent by heavy prohibitions, such importations, and thereby grow richer;—if, indeed, which may admit of dispute, the desire of adorning ourselves with fine clothes, possessing fine furniture, with elegant houses, &c. is not, by strongly inciting to labour and industry, the occasion of producing a greater value than is consumed in the gratification of that desire.

“The agriculture and fisheries of the United States are the great sources of our increasing wealth. He that puts a seed into the earth is recompensed, perhaps, by receiving forty out of it; and he who draws a fish out of our water, draws up a piece of silver. Let us (and there is no doubt but we shall) be attentive to these, and then the power of rivals, with all their restraining and prohibiting acts, cannot much hurt us. We are sons of the earth and seas, and, like Antæus in the fable, if in wrestling with a Hercules we now and then receive a fall, the touch of our parents will communicate to us fresh strength and vigour to renew the contest.”

Before we take leave of this continent, we shall present our readers with some observations on the

peopling of America; and likewise an interesting account of the customs and manners of the Indians eastward of the Mississippi:

An accurate writer observes, that there are twenty-eight different nations of Indians eastward of the Mississippi; the principal of which are the Cherokees, the Chickasaws, the Choctaws, the Creeks, the Delaware, the Six Nations, the Shawanese, the Hurons, the Illinois, &c. Allowing about 700 to a nation or tribe, they will contain, in all, 20,000 souls, and consequently, may furnish between four and five thousand warriors.

Many systems, no less idle than curious, have been formed to account for the population of this immense continent. There is scarce a people in the old world which has not had its advocates; and there have not been wanting some, who, despairing of loosening, have cut the knot, by supposing that the power which furnished America with plants, has, in the same manner, supplied it with men; or at least that a remnant in this continent was saved from a universal deluge, as well as in the other. As the subject is rather curious than useful, and, in its nature, does not admit of certainty, every thing that has passed in America before the arrival of the Europeans being plunged in Cimmerian darkness, and those little traditional records which diffuse a glimmering light on the two empires of Mexico and Peru for about two hundred years, at most, before that period, we shall only slightly touch on that subject, chiefly for the sake of taking notice of some modern discoveries which seem to strengthen the probability of some former theories.

The great similarity, or rather identity, of the customs and manners of the Americans, and those of the Tartars of the north eastern parts of Asia, together with a presumption, which has long possessed the learned, that Asia and America were united, or at least separated only by a narrow sea, has inclined the more reflecting part of mankind to the opinion that the true origin of the Indians is from this quarter. The immense seas, which separate the two continents on every other side, render it highly improbable that any colonies could ever have been sent across them before the discovery of the magnetic compass.

The ingenious M. Buffon has remarked, and his observation appears to be just, that there are no animals inhabiting in common the two continents, such as can bear the colds of the north. Thus there are no elephants, no lions, no tigers, no camels in America; but bears, wolves, deer, and elks in abundance, absolutely the same in both hemispheres. This hypothesis, which has been gaining ground since its first appearance in the world, is now reduced almost to a certainty by the late discoveries of Captain Cook. That illustrious, but unfortunate navigator, in his last voyage, penetrated for a con-

and likewise an interesting

we may now therefore conclude, that no further
quiry will be made into the general origin of the
merican tribes: yet, after all, it is far from being
probable that various nations, by shipwreck, or
erwise, may have contributed, in some degree, to
population of this continent. The Carthaginians,
had many settlements on the coast of Africa, be-
ed the streights of Gibraltar, and pushed their dis-
eries as far as where the two continents in that
eter approach each other the nearest, may probably
been thrown by tempests on the American coast,
the companies of the vessels finding it impracti-
le to return, may have incorporated with the for-
e inhabitants, or have formed new settlements,
ch, from want of the necessary instruments to ex-
e the arts they were acquainted with, would natu-
ally degenerate into barbarity. There are, indeed,
the ancient writers, who give us reason to suppose,
there were colonies regularly formed by that
ion in America, and that the communication,
er having continued for some time, was stopped by
er of the state. But it is difficult to conceive that
e people, established with all those necessaries pro-
for their situation, should ever degenerate; from
high a degree of cultivation as the Carthaginians
sessed in a total ignorance even of the most ne-
ary arts. and therefore it seems probable, that if
ation ever had such colonies, they must have
in cut off by the natives, and every vestige of
em destroyed.

The Danes, about the ninth and tenth centuries,
re the greatest navigators in the universe. They
covered and settled Iceland; and from thence,
964, planted a colony in Greenland. The an-
ient Icelandic chronicles, as reported by M. Mallet,
tain an account of some Icelanders, who, in the
e of an unsuccessful war, fled to Greenland, and
n thence westward, to a country covered with vines,
ich from thence they called Vinland. The ad-
vurers returned home, and conducted a colony to
r new discovery; but disturbances arising in Den-
ark, all communication with Greenland, as well as
land, ceased; and those countries remained un-
own to the rest of the world for several ages.
e remains of this colony are probably to be found
the coast of Labrador, in the nation of the Esqui-
aux. The colour of their skins, their hairy bodies,
bushy beards, not to mention the difference of
anners, mark an origin totally distinct from that of
other Indians.

About the year 1170, Madoc, son of Owen Gwyn-
th, prince of Wales, dissatisfied with the situation
affairs at home, left his country, as related by the
Welsh historians, in quest of new settlements, and,

leaving Ireland to the north, proceeded west till he
discovered a fertile country; where, leaving a colony,
he returned, and persuading many of his countrymen
to join him, put to sea with ten ships, and was never
more heard of. This account has indeed at several
times drawn the attention of the world; but as no
vestiges of them had then been found, it was con-
cluded, perhaps too rashly, to be a fable, or at least,
that no remains of the colony existed. Of late years,
however, the western settlers have received frequent
accounts of a nation, inhabiting at a great distance
up the Missouri, in manners and appearance resem-
bling the other Indians, but speaking Welsh, and re-
taining some ceremonies of the Christian worship;
and, at length, this is universally believed there to
be a fact.

In Kentucky there are several ancient remains,
which seem to prove, that this country was formerly
inhabited by a nation further advanced in the arts
of life than the Indians. These are there usually at-
tributed to the Welsh, who are supposed to have for-
merly inhabited here; but having been expelled by
the natives, were forced to take refuge near the
sources of the Missouri. It is well known, that no
Indian nation has ever practised the method of de-
fending themselves by entrenchments; and such a
work would even be no easy one, while these na-
tions were unacquainted with the use of iron.

Near Lexington, the remains of two ancient forti-
fications are to be seen, furnished with ditches and
bastions. One of these contains about six acres
of land, and the other nearly three. They are now
overgrown with trees, which, by the number of cir-
cles in the wood, appear to be not less than one
hundred and sixty years old. Pieces of earthen ves-
sels have also been plowed up near Lexington, a ma-
nufacture with which the Indians were never ac-
quainted.

The sepulchres already mentioned, form another
strong argument that this country was formerly in-
habited by a people different from the present In-
dians. Although they do not discover any marks of
extraordinary art in their structure, yet, as many na-
tions are particularly tenacious of their ancient cus-
toms, it may perhaps be worthy of inquiry, whether
these repositories of the dead do not bear a con-
siderable resemblance to the ancient British remains;
Some buildings, attributed to the Picts, are mentioned
by the Scottish antiquaries, which, if the author mis-
takes not, are formed nearly in the same manner.
Let it be enough for him to point out the road, and
hazard some uncertain conjectures. The day is not
far distant, when the furthest recesses of this continent
will be explored, and the accounts of the Welsh
established beyond the possibility of a doubt, or con-
signed to that oblivion which has already received so
many suppositions founded on arguments as plausible
as these.

It is well known that the Indians are not born white; and that they take a great deal of pains to darken their complexion, by anointing themselves with grease, and lying in the sun. They also paint their faces, breasts, and shoulders, of various colours, but generally red; and their features are well formed, especially those of the women. They are of a middle stature, their limbs clean and straight, and scarcely any crooked or deformed person is to be found among them. In many parts of their bodies they prick in gun-powder in very pretty figures. They shave, or pluck the hair off their heads, except a patch about the crown, which is ornamented with beautiful feathers, beads, wampum, and such like baubles. Their ears are pared, and stretched in a thong down to their shoulders. They are wound round with wire to expand them, and adorned with silver pendants, rings, and bells, which they likewise wear in their noses. Some of them will have a large feather through the cartilage of the nose; and those who can afford it, wear a collar of wampum, a silver breast-plate, and bracelets on the arms and wrists. A bit of cloth about the middle, a shirt of the English make, on which they bestow innumerable broaches to adorn it, a sort of cloth boots and moccasins, which are shoes of a make peculiar to the Indians, ornamented with porcupine quills, with a blanket or match-coat thrown over all, completes their dress at home; but when they go to war, they leave their trinkets behind, and mere necessaries serve them. There is little difference between the dress of the men and women, excepting that a short petticoat, and the hair, which is exceeding black, and long, clubbed behind, distinguish some of the latter. Except the head and eye-brows, they pluck the hair, with great diligence, from all parts of the body, especially the looser part of the sex.

Their weapons of war are guns, bows and arrows, darts, scalping-knives, and tomahawks. This latter is one of their most useful pieces of field-furniture, serving all the offices of the hatchet, pike, and sword. They are exceeding expert in throwing it, and will kill at a considerable distance. The world has no better marksmen, with any weapon. They will kill birds flying, fishes swimming, and wild beasts running.

The North American Indians are not so ignorant as some suppose them, but are a very understanding people, quick of apprehension, sudden in execution, subtle in business, exquisite in invention, and industrious in action. They are of a very gentle and amiable disposition to those they think their friends, but as implacable in their enmity; their revenge being only completed in the entire destruction of their enemies. They are very hardy, bearing heat, cold, hunger, and thirst, in a surprising manner, and yet no people are more addicted to excess in eating and drinking, when it is conveniently in their power. The follies, nay mischief, they commit when inebriated, are entirely

laid to the liquor; and no one will revenge any injury (murder excepted) received from one who is more himself.

Among the Indians all men are equal, perfections being most esteemed. No distinction of rank, renders any man capable of doing justice to the rights of private persons; and there is no eminence from merit, which begets pride, and makes others too sensible of their own inferiority. Though there is perhaps less delicacy of sentiment among the Indians than among us; there is, however, abundantly more probity, with infinitely less ceremony, and equivocal compliments. Their public conferences shew them to be men of genius; and they have, in high degree, the talent of natural eloquence.

They generally live dispersed in small villages either in the woods, or on the banks of rivers, where they have little plantations of Indian corn, and are not enough to supply their families half the year, subsisting the remainder of it by hunting, fishing, and fowling, and the fruits of the earth, which grow spontaneously in great plenty. Their huts are generally built of small logs, and covered with bark, each having a chimney, and a door, on which they place a padlock. Old Chelicothe is built in form of a Kentucky station, that is, a parallelogram, or long square, and some of their houses are shingled. A long council-house extends the whole length of the town, where the king and chiefs of the nation frequently meet, and consult of all matters of importance, whether a civil or military nature. Some Indian huts are built by setting up a frame on forks, and placing bark against it; others of reeds, and surrounded with clay. The fire is in the middle of the wigwag, and the smoke passes through a little hole. The joints of reeds together by cords run through them, which serve them for tables and beds. They mostly lie upon skins of wild beasts, and sit on the ground. They have brass kettles and pots to boil their food, gourds or calabashes, cut asunder, serve them for pails, cups, and dishes.

Travellers give various accounts concerning their religion; and although it cannot be absolutely affirmed that they have none, yet it must be confessed very difficult to define what it is. All agree that they acknowledge one Supreme God, but do not adore him. They have not seen him, they do not know him, believing him to be too far exalted above them, and too happy in himself to be concerned about the trifling affairs of poor mortals. They seem not to believe in a future state, and that after death they shall be removed to their friends, who have gone before them, to an elysium, or paradise.

Near Detroit, the Wyandotts, and some others have the Roman Catholic religion introduced among them by missionaries. These have a church, a minister, and a regular burying-ground. Many of them appear zealous, and say prayers in their families. The

is the wisdom of Providence in this particular, that when the sun is far advanced towards the tropic of Cancer, and becomes almost vertical, he draws after him such a vast body of clouds, that they intercept his direct rays, and, dissolving into rain, cool the air, and refresh the country, parched with a long drought which frequently continues from the beginning of January to the latter end of May.

An European, who has seen no other part of the world, can form very little idea of what are called rains in the West-Indies. The most violent that fall in our northern climates are little more than dews, when compared to those of the torrid zone. They are rather floods of water poured from the clouds with an amazing impetuosity. In a moment the rivers swell above their banks, new ones are formed, and all the low country presently exhibits the appearance of a deluge. The ancients imagined that the lands in the burning zone were scorched up with one continued fervent heat, and therefore the whole country uninhabitable: but their opinion was so far from being true, that the greatest rivers in the world have their source in the torrid zone; and the greatest inconveniencies many places in that climate suffer, arise from the moisture of the air.

The seasons in the West-Indies have no other distinction than the rains; the trees are always clothed with leaves: frosts and snows are unknown, and even hail extremely rare. Indeed, when storms of hail happen, they are dreadfully violent, and the hailstones prodigiously large. But the consequences of these storms are nothing, when compared to the hurricanes to which this part of the world is very subject. These generally happen in the rainy season, and are often dreadful beyond conception. The elements seem to have united for the destruction of the world. The labours of many years are destroyed in a moment, and all the hopes of the planter, even when he thinks himself almost beyond the reach of danger, wrested from his hand. This dreadful scourge of heaven is a sudden and violent storm of wind, rain, thunder, and lightning, attended with the swelling of the sea, and sometimes an earthquake; in short, with every terrible and destructive circumstance the elements can assemble. The first objects of the approaching devastation that generally strike the eyes of the planter, are whole fields of sugar-canes whirled into the air, and scattered over the whole face of the country. The stoutest and firmest rooted trees of the forest are torn up and whirled about like stubble; the windmills are swept away in a moment; even the works of the planter, the copper boilers, and stills of many hundred weight, which seem to bid defiance to the storm, are hurried and battered to pieces: the houses are no protection, the first blast tears away the roof; while the rain, which in less than an hour rises near five feet, rushes in upon the wretched inhabitants with a force altogether irresistible.

The Indians, who inhabited these islands many years before they were discovered by Columbus, have taught the Europeans to know the signs that indicate an approaching hurricane, which always happens either in the quarters, or at the full and change of the moon. These signs appear about a fortnight before the hurricane. Thus, if at the change of the moon the sea appears very turbulent; the sun redder than at other times; a dead calm succeeds, instead of the usual breezes; the hills are clear of those clouds and mists which usually hover about them: if a hollow rumbling sound, like the rushing of a violent wind, is heard in the wells and clefts of the earth; the stars at night appear larger than usual, and surrounded with a kind of burrs; the sky in the north-west has a black menacing appearance; the sea emits a strong smell, and rises into vast waves, often without any wind; the wind itself forsakes its steady stream from the north and shifts to the west, blowing violently and irregularly at intermissions: these signs predict that a hurricane will happen at the succeeding full. Nearly the same signs happen at the full, before a hurricane comes on at the change; and by these indications the planters often secure some of their effects, together with the lives of themselves, and those of their families.

Sugar is the grand staple commodity of the West-Indies; this useful article was not at all known to the Greeks and Romans, though it was made in China in very early times, and from that country the first knowledge of it was obtained by the Europeans. The Portuguese were the first who cultivated the sugar-cane, and brought it into request: their first plantations were in the Madeira islands, but afterwards removed to Brasil. They for some time supplied the markets of Europe; and though much greater quantities are now made by the English and French, yet the Portuguese sugar is still esteemed the best in Europe. The juice within the sugar-cane is the most lively, elegant, and least cloying sweet in nature; and when sucked raw, has proved extremely wholesome and nutritive.

Rum is distilled from the molasses, and from the scummings of the sugar a meaner spirit is procured. Great quantities of rum are carried to North America for sale, where it is consumed by the inhabitants, or employed in the African trade, or distributed from thence to the Newfoundland fishery, or other parts, besides what Great-Britain and Ireland import. A great quantity of molasses is taken off raw, and carried to New England, where it is distilled. No part of the sugar-cane is without its use: the tops, and the leaves which grow upon the joints, make very good provender for their cattle; and the refuse of the cane, after grinding, serves for fuel.

It has been computed, that the rum and molasses, when all the processes are rightly managed, pay the charges of the plantation, and that the sugars are cleared

ited these islands many years ago by Columbus, has taken the signs that indicate an approaching storm, which always happens either by a fall and change of the moon, or a fortnight before the beginning of the change of the moon, the sun is redder than at other times, instead of the usual appearance of those clouds and winds which are attended with a storm: if a violent wind, is heard blowing from the north-west, or if the sea emits a strong smell, or if a steady stream from the north is blowing violently and irregularly, these signs predict that a storm is succeeding full. Near the full, before a hurricane, and by these indications the effects of their effects, together with themselves, and those of their

le commodity of the West-Indies was not at all known, though it was made in China, from that country the first was brought by the Europeans. The first who cultivated the sugar-cane in the West-Indies, were the first planters of the West-Indies, but afterwards for some time supplied the market, and though much greater quantities were brought by the English and French, it is still esteemed the best in the sugar-cane is the most proper, being sweet in nature; and is valued extremely whole

the molasses, and from the meaner spirit is procured, and carried to North America, where it is used by the inhabitants, either in trade, or distributed from the sugar-cane, or other parts of the island, and Ireland import it. It is taken off raw, and where it is distilled. Without its use, the tops, and the joints, make very little; and the refuse of the sugar-cane is used for fuel.

that the rum and molasses, if rightly managed, pay the duty, and that the sugars are cleared

to the planters: but by the most credible accounts it appears, that the expences of a plantation in the West-Indies are very great, and the profits at the view precarious; for the chargeable articles of a plantation, are the mill, the boiling, cooling, and distilling, together with the buying and maintaining a great number of slaves and cattle, besides the purchase of the land, will not permit a person to begin a plantation of any consequence, under a capital of at least 5000*l*. Moreover, the life of a planter, who wishes to acquire a fortune, is far from being a life of ease and luxury; he must always keep a watchful eye upon his overseers, and must himself oversee occasionally. And at the boiling season, if he is not properly attentive to his affairs, no way of life can be so laborious, and more dangerous to the health; he must attend a constant attendance day and night, in the extreme heats of the climate, and the most fierce and violent winds, add to this, the losses by hurricanes, earthquakes, and bad seasons; and then consider when the goods are in the cask, that he quits the hazard of a plantation, to engage in the hazards of a merchant, and ships his produce at his own risk. These considerations might make one believe that it could never answer to engage in this business; but notwithstanding all this, there are no parts in the world, where great estates are made in so short a time, from the produce of the earth, as in the West-Indies. The produce of a few good seasons generally provide against the ill effects of the worst, as the planter is sure to find a speedy and profitable market for his produce, which has a readier sale than perhaps any other commodity in the world.

Large plantations are generally under the care of a manager, or chief overseer, who has commonly a salary of 150*l* a year, with overseers under him in proportion to the greatness of the plantation, one to about twenty negroes, and at the rate of about 40*l*. Such plantations too have a surgeon at a fixed salary, employed to take care of the negroes which belong to it. The course which is the least troublesome to the owner of the estate is, to let the lands with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of the rent, and the keeping up repairs and stock. The estate is generally estimated to such a tenant at half the neat produce of the best years; such tenants, if industrious and frugal men, soon make good estates for themselves.

The negroes in the plantations are kept at a very low rate. This is generally by allotting to each family of them a small portion of land, and allowing them two days in the week, Saturday and Sunday, to cultivate it: some are kept in this manner, but others of their negroes with a certain portion of Guinea Indian corn, and to some a salt herring, or a small portion of bacon or salt pork a day. All the charge consists in a cap, a shirt, a pair of

breeches, stockings and shoes; the whole not exceeding 40*s* a year, and the profit of their labour yields 10 or 12*l*. The price of men negroes upon their first arrival is from 33 to 36*l*. women and grown boys about 50*s* less; but such negro families as are acquainted with the business of the islands generally bring about 40*l*. upon an average one with another, and there are instances of a single negro man expert in business bringing 150 guineas, and the wealth of a planter is generally computed from the number of slaves he possesses.

Traders there make a very large profit upon all they sell, but from the numerous shipping constantly arriving from Europe, and a continual succession of new adventurers, each of whom carrying out more or less as venture, the West India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost or under. But those who can afford to store their goods, and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicraftsmen, especially carpenters, bricklayers, brassiers, and cooper, get very great encouragement. But it is the misfortune of the West-Indies, that physicians and surgeons even outdo the planter and merchant, in accumulating riches.

Before the last war but one, the number of negro slaves was at least 230,000, whereas the whites do not amount to 90,000 souls. This disproportion sufficiently shews how much the colonies are endangered; they are at once exposed to the assaults of a foreign enemy, and to the insurrection of their own slaves.

The disposition to industry has a variety of characters, and is by no means constantly of the same colour. Some acquiesce in a moderate labour through the whole of their lives, attended with no risk either to their persons or their gains; people of such qualifications, who form the best citizens in general, are properly adapted to stay at home. Others, full as remote from an indolent disposition, are of a quite different character. These are fiery, restless tempers, willing to undertake the severest labour, provided it promises but a short continuance, who love risk and hazard, whose schemes are always vast, and who place no medium between being great and being undone. Characters of this sort, especially when they happen in low and middling life, are often dangerous members in a regular and settled community; but the West-Indies open a fair and ample field to encourage persons of such a disposition; and it may be reckoned one very great benefit to our possessions in that part of the world, that besides the vast quantities of our fabrics which they consume, our seamen whom they employ, and our revenues which they support, they are a vent to carry off such persons, whom they keep occupied greatly to the advantage of the public. Our dominions are so circumstanced, and afford such a variety, that all dispositions to business, of what kind

soever, may have exercise without pressing upon one another.

Our seamen distinguish the West-India islands into the Windward and Leeward Islands, merely with regard to their situation either to the east or west. For as the wind is always easterly, those that lie in the eastern part are called the Windward, and those in the western, the Leeward Islands. Some geographers distinguish them into the Great and Little Antilles, while others call them all by the name of the

Caribbees, from their first inhabitants. But by whatever name they are distinguished, they lie in a line or semi-circular form; stretching almost from the coast of Florida to the main continent of America, near the river Oroonoko.

Previous to our description of the British islands in America, we shall present our readers with the following TABLE of the

J A M A I C A.

Location and Extent, Soil, Climate, Vegetable Productions, Rivers, Inhabitants, Towns, &c.

THIS island, which is the most important of those belonging to England, is situated between the 17th and 19th deg. of west long. from London, and between the 17th and 18th of north lat. and lies near 4,500 miles south west of England. It is about 140 miles in length, from east to west, and about 60 miles breadth in the centre, for it is of an oval form, and consequently grows gradually narrower towards each end.

As to the soil and face of the island, there is a ridge of hills, called the Blue Mountains, that run through it from east to west; the tops of which are covered with different kinds of trees, particularly cedar, lignum-vitæ, and mahogany, which render them equally pleasant and profitable to the inhabitants. Several fine rivers, well stored with fish, and navigable by canoes, take their rise from these mountains. A lower ridge runs parallel to the greater, and the hills, or savannahs, are exceeding level, without stones, fit for pasture, and fruitful, when cleared of wood, especially on the south side of the island. After the rains, or seasons, as they are called, the savannahs are very pleasant, and produce such quantities of grass that the inhabitants are sometimes forced to burn it; but, after long droughts, they are quite parched and burnt up.

The air of this island is in most places excessively hot, and unfriendly to European constitutions; but the cool breezes, which constantly set in at ten o'clock in the morning, render the heat more tolerable; and the air upon the high grounds is temperate, pure, and cooling. A night seldom passes here without lightning, but it is not always attended by thunder, which in this island roars with uncommon violence, and is dreadful to the astonished hearer, particularly as at these times the lightning does great damage. In February or March, the inhabitants always expect earthquakes, which have been productive of the most fatal effects in these parts.

The chief vegetable production of this island is the sugar-cane, which deservedly employs the principal attention of the inhabitants, it being the staple commodity of their trade. It is propagated by planting cuttings of it in the ground, in furrows dug parallel for that purpose; they are laid level and even, and covered up with earth, from whence they soon shoot out new plants from their knots or joints, and grow so quick, that in eight, ten, or twelve months at furthest, they are fit to cut for making of sugar.

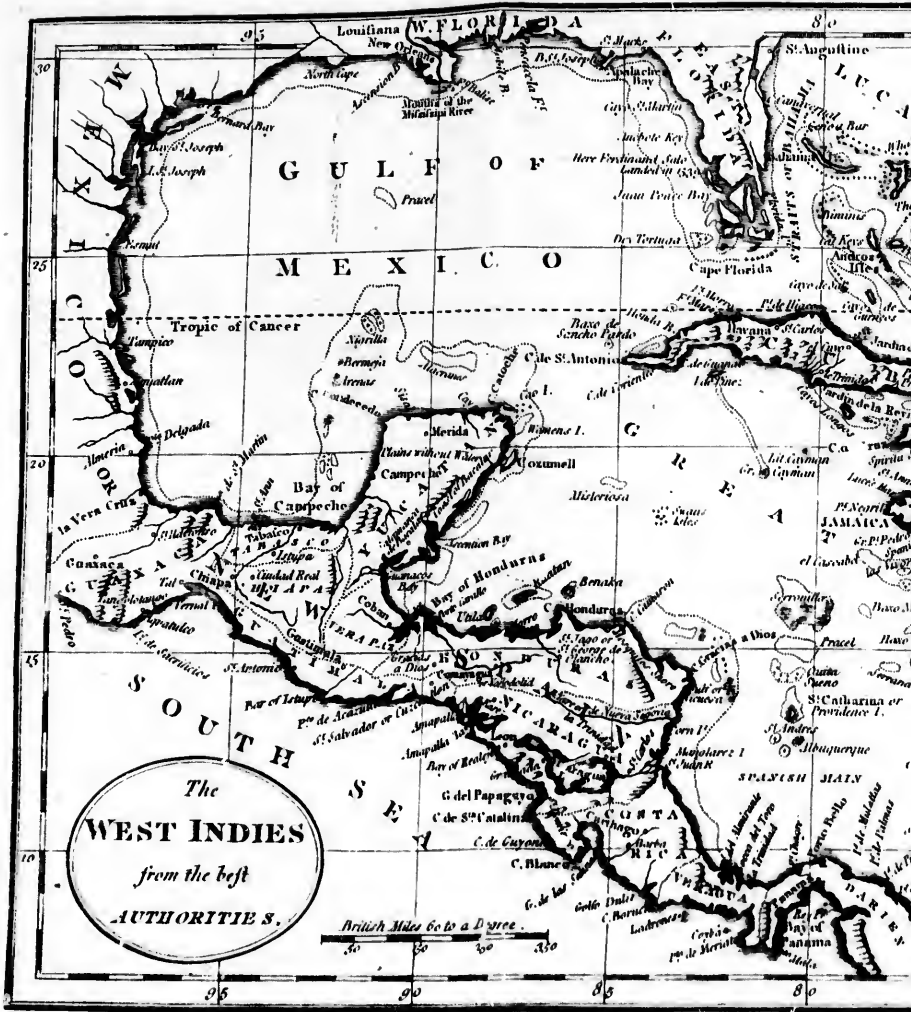

No sort of European grain grows in Jamaica; they have only Indian corn, Guinea corn, peas of various kinds, but none resembling those produced in England, with a variety of roots, among which are the yams and cassava. The fruits found there are oranges, lemons, limes, citrons, dates, pomegranates, shaddock, mameys, papas, sour-ops, pine-apples, cullard-apples, star-apples, prickly pears, alicada pears, plantains, melons, and guavas, besides several kinds of berries. It also produces cotton, coffee, pimento, some cacao, and indigo, guaiacum, China-root, sarsaparilla, califfistula, tamarinds, venellas, and a coarse kind of tobacco. Woods for dyeing, as fustic, red-wood, log-wood, and mangrove, and olive-bark for the tanners. The most remarkable trees are, the manchineel, whose fruit appears exceeding beautiful to the eye, but is of a poisonous quality; the cabbage-tree, the wood of which is so hard that it scarcely yields to any kind of tool, and when dry is incorruptible; the mahogany, so much used by our Cabinet-Makers; the wild cinnamon-tree, the bark of which is useful in medicine; and the soap-tree, whose berries answer all the purposes of soap.

Horses, asses, mules, goats, hogs, and sheep, are very numerous in Jamaica; black cattle were also formerly very plentiful, but through the inattention of the inhabitants to grazing, there are very few, so that they are at present supplied with beef from Carolina and other American settlements on the continent. There are plenty of racoons and rabbits, but no hares or deer. Of wild fowl there is a great variety, as ducks, teal, wigsons, geese, turkeys, pigeons, Guinea-hens, plovers, flamingos, and snipes; various kinds of parrots, and parroquets, and that beautiful little animal the humming-bird. The bays and rivers of Jamaica abound with excellent fish of almost all the European and American kinds, particularly tortoises, or turtles, sea-cows, and alligators. The mountains breed adders and other noxious animals, as the fens and marshes do the guana and gallewasp, but these last are not venomous. Among the insects which infest this island, is the nigra, siror, or chege, which eats into the nervous and membranous parts of the flesh of the negroes, and frequently of the white people. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as the person feels them, which is not perhaps till a week after they have been in the body, they pick them out with a needle, or the sharp point of a knife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may remain behind. They sometimes get into the toes, and eat the flesh away to the bone.

A great number of small rivers have their source among the rocks called the Blue Mountains, and fall down their sides in cataracts at once stupendous and dreadful. The waters of these rivers taste of copper,

and

British Miles 60 to a Degree

and are very unwholesome. There are some fine springs in the island; but, upon the whole, this useful element is in many places very scarce; in others, it is so mixed with sand, and earthy particles, that it is not drinkable till it has settled for some days; and, in some years, several of the cattle have perished for want of water. Many salt springs are found in the plains; and in the mountains, at a little distance from Spanish Town, is a hot spring, which the inhabitants resort to as a bath, and attribute several medicinal virtues to the water.

The number of inhabitants in Jamaica does not exceed twenty-five thousand whites, and ninety thousand negroes: but about the beginning of this century, the former amounted to sixty thousand, and the latter to an hundred and twenty thousand: this decline is attributed to earthquakes and epidemical diseases. The inhabitants are either English, or of English extraction born upon the island; Indians, Negroes, and Mulattoes, or the descendants of them.

There is no country in the world where luxury is carried to a higher pitch than in this island: equipages, clothes, furniture, tables, all bear the marks of the greatest wealth, affluence, and profusion; and to this may be imputed the short stay which all the treasure they receive makes among them; the whole not being more than sufficient to answer their necessities and luxurious calls on Europe and North-America. The common drink of the better sort of people is Madeira wine mixed with water; but those of inferior rank usually drink rum punch, which they term Kill Devil; because being frequently drunk to excess, it heats the blood, and brings on fevers that in a few hours send them to the grave, especially strangers, which is the reason that so many die there upon their first arrival.

On Sundays, and particular occasions, gentlemen wear wigs, and appear very gay in silk coats and vests trimmed with silver; but at other times their usual dress is thread stockings, linen drawers, a vest, a handkerchief tied round the head, and a hat. The morning habits of the ladies consist of a loose gown wrapped carelessly round them; but against noon they always dress in a rich and most becoming taste. Men servants wear a coarse linen frock, with buttons at the neck and hands, and long trowsers of the same. The negroes of both sexes go naked, except those who are immediately employed in the house.

Besides the ordinary provisions, rats are sold here by the dozen, and when they have bred among the sugar canes, are thought, by some people, very delicious food. Snakes and serpents, and colli, a sort of worms, are eaten by the Indians and negroes.

There is great reason to believe that there were formerly a great many more persons of property in Jamaica than there are now, though their fortunes were not very large. The inhabitants were undoubtedly very

numerous, till reduced by earthquakes and by terrible epidemical diseases, which immediately succeeded former calamities, swept away vast multitudes. The decrease of the inhabitants, as well as the decline of their commerce, arise from the difficulties to which their trade is exposed, of which they do not fail to complain to the court of Great-Britain; particularly that they are of late deprived of the most beneficial part of their trade, the carrying of negroes and goods to the Spanish coast; the low value of the produce, which they ascribe to the great improvements the French make in their sugar colonies, that they are enabled to underfell them by the lowering of their duties; and also on account of the trade carried on from Ireland and the northern colonies to the French and Dutch islands, where they pay no duties, and are supplied with goods at an easier rate. Some of these complaints, which equally affect other islands, have been heard, and others still remain undressed. Both the logwood-trade, and the trade carried on by our islands with the continent of New Spain and Terra Firma, have often been the subject of great contention, and even caused a war between the crowns of Great-Britain and Spain. The former we always avowed, and claimed as our right; and it was accordingly, by a late peace, confirmed to us: the latter we permitted, from a natural disposition, that if the Spaniards found themselves grieved by any contraband trade, it lay upon them, and not upon us, to put a stop to it; especially if they have guarda costas cruising in those seas, and are found carrying on an illicit trade. These arguments were thought sufficient till the conclusion of the peace of 1763, when the British ministry, in compliance with the court of Spain, thought proper to send English cruisers to the American coast, and to attempt to crush that lucrative trade: a proceeding which has occasioned the complaints of the whole body of British subjects in America, as a stop thereby put to the principal channel which has enabled them to remit such prodigious sums to Great-Britain.

They import from England linen, silk, and woollen cloth of all kinds; wrought iron, brass, and copper, all sorts of hard-ware, toys, household-furniture, and great quantities of flour.

Sugar, rum, molasses, and cotton, are the chief produce of the island. In 1753, they exported 20,315 hogsheads of sugar, some of them very great, which were worth in England 424,725*l*. Of rum, they export about 4,000 puncheons. In molasses, they make a great part of their returns for New England, where they are vast distilleries. The other commodity is cotton, of which they send out 2000 bags. They also carry on a considerable trade with the Spanish colonies of New Spain and Terra Firma; in the former they cut great quantities of logwood, and in both they

Kingston, the new capital of this island, is situated
 the bay of Port Royal. The harbour is one of
 the most commodious in America, being about three
 leagues broad in most places; so deep that a ship of
 1000 tons may lay close to the shore; and so capacious,
 that a thousand sail may ride in safety. The entrance
 is defended by Fort Charles, one of the strongest forti-
 fications on the English islands, a battery of 60 pieces
 of cannon, and a garrison of regulars maintained by
 the crown. The town, which stands commodiously
 on a hill, has fresh water, and every other convenience of life,
 about a mile long, and half a mile broad. The
 streets are handsome, regular, and contain upwards of
 1000 houses, most of which are well, and some ele-
 gantly built, according to the taste of these islands,
 which is only one story high, with porticos. Its in-
 habitants are estimated at 17,000, among whom are
 but 5000 whites and 12,000 free negroes or mu-
 lattoes.

Port-Royal, the old capital, stood upon the point
 of a narrow neck of land, which, towards the sea,
 formed part of the border of the above-mentioned
 harbour, the excellency of which induced the inha-
 bitants to build their chief city on this spot,
 though it was hot dry sand, and produced none of
 the necessaries of life. It soon, however, became a
 scene of great consequence, and the resort of those
 famous pirates called Buccaneers, a people who made
 annual depredations on the Spanish coast, and
 fought with an inconsiderate bravery to obtain a for-
 tune, which they spent with as inconsiderate dissi-
 pation in this town. This, together with the trade of
 the island, had so good an effect, that about the be-
 ginning of the year 1692, the place exceeded every
 other of its size, for wealth, and an entire corruption
 in manners. But this prosperity was of no long
 continuance: in the month of June, the same year,
 an earthquake shook the whole island to its founda-
 tion, and totally overwhelmed this city: the earth
 opened and swallowed up nine-tenths of the houses,
 and two thousand of the inhabitants. The water
 gushed out from the openings of the earth, and tum-
 bled the people in heaps; some of them, however,
 were the good fortune to catch hold of beams and raft-
 ers of houses, and were afterwards saved by boats.
 Several ships were cast away in the harbour, and
 the Swan frigate, which lay in the dock, was carried
 to the tops of sinking houses; but, fortunately, she
 was not overlet, and afforded a retreat to some hun-
 dreds of people, who by that means saved their lives.
 An officer, who happened to be on the spot, observes,
 that the earth opened and shut very quick in some
 places, and he saw several people sink down to the
 middle, while others appeared with their heads just
 above the ground, and were pressed to death. At
 Port-Royal, above a thousand acres were sunk, with

the houses and people, the place appearing for some
 time like a lake. The waters afterwards dried away;
 but not the least vestige of the houses remained.
 Some of the mountains were split asunder; at one
 place, a plantation was removed to the distance of
 a mile, and the most stupendous rocks were whirled
 from their eminences. After the consternation, oc-
 casioned by this shocking scene of horror and desola-
 tion, had some time subsided, the town was rebuilt,
 but, about ten years after, it was again destroyed by
 fire. The extraordinary convenience of the harbour,
 however, induced the inhabitants to raise it a third
 time; and a third time it was laid in rubbish by a
 hurricane, the most terrible on record. This hap-
 pened so lately as the year 1722, and almost ruined
 the island. Such repeated catastrophes occasioned
 them to abandon the place, and accordingly they
 built Kingston, on the opposite side of the bay: of
 late years, however, Port-Royal has been in some
 measure rebuilt; its commodious situation having
 tempted many to settle on this seemingly devoted
 spot, and run all hazards.

On October 3, 1780, there was a dreadful hurri-
 cane, which almost overturned the little sea-port town
 of Savannah-la-Mer; in this island, and part of the
 adjacent country, very few houses were left standing,
 and a great number of people were killed. In other
 parts of Jamaica much damage was also done, and
 many lives lost.

St. Jago de la Vega, commonly called Spanish-
 Town, in Middlesex, is a small city, pleasantly si-
 tuated on the river Cabre. It contains a number of
 good houses, and is the residence of the governor,
 of the courts of justice, and the place where the assem-
 bly is held. The greater part of the inhabitants are
 persons of fortune or rank, which gives it an air
 of splendor and magnificence. The principal building
 is the governor's house, which is one of the most
 elegant in America. Here are also a handsome
 church, a chapel, and a Jewish synagogue.

Between this town and that of Kingston, is Fort-
 Passage, a village of but few houses, and so called,
 because they who go from one town to the other land
 or embark there.

The misery and hardships of the negroes, in general,
 are great; and though the utmost care is taken to
 make them propagate, the ill treatment they receive
 so shortens their lives, that, instead of increasing by
 the course of nature, many thousands are annu-
 ally imported, to supply the place of those who pine
 and die by the hardships they receive. They are, in-
 deed, stubborn and untractable for the most part,
 and they must be ruled with a rod of iron; but they ought
 not to be crushed with it, or to be thought a sort
 of beasts, without souls, as many of their overseers
 think them at present, though some of these tyrants
 are themselves the dregs of England, and the refuse
 of the jails of Europe. Many of the negroes, how-

ever, who fall into the hands of gentlemen of humanity, find their situations easy and comfortable; and it has been observed, that in North America, where in general these poor wretches are better used, there is a less waste of negroes, they live longer, and propagate better.

The slaves, on their first arrival from the coast of Guinea, are exposed naked to sale: they are then generally very simple and innocent creatures; but they soon become roguish; and when they come to be punished for their faults, excuse themselves by the examples of the whites. They believe every negro returns to his native country after death. This thought is so agreeable, that it cheers their spirits, and renders the burthen of life easy, which would otherwise to many be quite intolerable. They look on death as a blessing; and it is surprizing to see with what courage and intrepidity some of them meet it: they are quite transported to think their slavery is near at an end, that they shall revisit their native shores, and see their old friends and acquaintance. When a negro is about to expire, his fellow slaves kiss him, wish him a good journey, and send their hearty good wishes to their relations in Guinea. They make no lamentations; but with a great deal of joy inter his body, believing he is gone home, and enjoys perfect happiness.

English money is seldom seen here, the current coin being entirely Spanish. There is hardly any place where silver is more plentiful, or has a quicker circulation. Notwithstanding provisions are in general tolerably reasonable, yet a person cannot dine decently for less than a piece of eight, and the common rate of boarding is three pounds per week.

Learning is here at a very low ebb: there are, indeed, some gentlemen well versed in literature, and who send their children to Great-Britain, where they have the advantage of a polite and liberal education; but the bulk of the people take little care to improve their minds, being generally engaged in trade or riotous dissipation.

The established religion here, as well as in all the British islands, is that of the church of England; but there are yet no bishops: the bishop of London's commissary is the principal ecclesiastic in these islands.

The government of Jamaica is the same with that of Virginia, and indeed all other royal governments. It is, next to that of Ireland, the best in the king's gift. The standing salary is 2,500*l.* a year, the assembly vote the governor as much more, and this, with the other great profits of his office, make it little less than 10,000*l.* a year.

Jamaica was conquered by the English forces sent out by Cromwell on an expedition against Hispaniola. That attempt failing, they laid siege to this island with an army of 10,000 men; and the place being in no posture of defence, the Spaniards surrendered it up to the besiegers. They made no attempt after-

wards to retake it; and after the Restoration it was ceded to Great-Britain by treaty. Some of the troops employed in its reduction were settled in the island by Cromwell; and many of the royalists, uneasy at home, sought an asylum there, while the amazing fertility of the soil, and other advantages which it offered, induced many of the planters in Barbadoes to quit their abode, and settle in Jamaica. The latter taught the former settlers the manner of raising the sugar-canes and making sugar; for, before their arrival, they followed the customs of the Spaniards, and applied themselves entirely to the raising of cocoa. They also introduced the culture of indigo; and from that period, sugar and indigo became the principal staple commodities of the island.

To the north-west of Jamaica are three small islands dependent on this, and known by the name of the Caymans. The most southerly is distinguished by the name of Great Cayman: the other two, which are distant from it about 20 leagues, are called Little Cayman and Cayman-Brack. Great Cayman is the only one that is constantly inhabited: it is very low, and covered with high trees. It has not any harbour for ships of burthen, only a tolerable anchoring place on the south-west. The inhabitants, who amount to about 200, are descended from the old Buccaneers. They have given themselves a set of laws, and choose a chief to see them executed, in conjunction with the justices of peace appointed by commission from the governor of Jamaica. As they have no clergyman among them, they go to Jamaica to be married. This colony is undoubtedly the most happy in the West-Indies; the climate and the kind of food, which are of a singular salubrity, rendering the people healthy and vigorous, and making them live to a very advanced age. Their little island produces plenty of corn and vegetables, hogs and poultry, much beyond what is required for their own consumption. They have, besides, sugar canes, and fountains of pretty good water. Being quite handsomely to the sea; they are excellent pilots for the neighbouring coasts; and their island, as well as their civility and humanity, have been many times a refuge to ships which were distressed in this part of the sea. Their principal employment is fishing for turtle. In strict every year leads a prodigious number of turtles to these islands to lay their eggs, the greater part of which come from the Bay of Honduras. The low and sandy shores of these islands, particularly of the Great, are perfectly commodious to receive and cover their eggs. A female lays some hundred. When they have done laying, the turtles retire towards the Isle of Cuba, and the other large islands, where they recover themselves in the submarine pastures, and, in about a month's time, acquire that strength which makes them so much esteemed on the tables of the great. The inhabitants of Great Cayman shut them up, as soon as they are caught, in

ity which has a place among the exportations to
Great-Britain.

BARBADOES.

*Description and Extent, Climate, Soil, Produce, Inhabitants,
Chief Towns, Religion, &c.*

THIS is the most easterly of all the Caribbee
lands, being situated in the 59th deg. of west
long, and the 13th of north lat. It is 21 miles in
length, and 14 in breadth. When the English, some-
time after the year 1625, first landed here, they found
the place the most wild and desolate that can be ima-
gined. It did not exhibit the least appearance of
having been ever peopled, even by savages. There
was no kind of beast of pasture or of prey; no fruit,
herb, no root, fit for supporting human life. Yet,
the climate was good; and the soil fertile, some
specimen of small fortunes in England resolved to
come adventurers in cultivating it. These planters
not only the desolate nature of the place, and
extreme want of provisions to struggle with, but
trees were so large, and the wood so hard and
thorn, that they met with great difficulty in clear-
ing as much ground as yielded them a subsistence.
By degrees things grew better; some of the wood
proved useful, a wood wanted by the dyers; cotton
and indigo agreed well with the soil, and tobacco,
becoming fashionable in England, yielded toler-
ably. These good appearances, with the storm
which some time after began to gather in England,
encouraged many to go over; and so great was the
increase of people in Barbadoes, that in 1650, after
having been settled only 25 years, it contained 50,000
whites, and a much greater number of negro and In-
dian slaves; the latter they basely seized in the neigh-
bouring islands, and carried into slavery; which disho-
nourable conduct has rendered the Caribbee Indians
unconcilable to us ever since. Their cultivation of
sugar soon rendered them extremely wealthy. The
number of slaves still increased; and it is supposed that
in 1676 they amounted to 100,000, which, together
with the 50,000, make 150,000 souls on this small spot, a
number of population unknown in Holland, or even
in the best inhabited parts of China.

The trade of Barbadoes with Great-Britain, &c.
amounts to 400 vessels of all burthens. The principal
articles of exportation are aloes, cotton, ginger, sugar,
and molasses. In 1770 this exportation amount-
ed to 331,000*l.* to Great-Britain; 120,000*l.*

to North America; and 11,000*l.* to the other islands;
and their circulating cash at home was 200,000*l.* But
this island has lately been much on the decline, which
is attributed partly to the growth of the French sugar-
colonies, and partly to our own establishments in the
neighbouring isles. Their numbers are now computed
at 20,000 whites, and 100,000 slaves. Their capital is
Bridgetown, situated in Carlisle Bay; here the governor
resides, and has a salary of 5000*l.* per annum. Here
is a college founded and well endowed by Col. Codring-
ton, a native of this island. Barbadoes has suffered
much by pestilence, hurricanes, and fires. On Octo-
ber 10, 1780, a dreadful hurricane caused great devas-
tation in this island, great numbers of the houses were
destroyed, many damaged, a great number of per-
sons were buried in the ruins of the buildings, and
others driven into the sea, and perished there. The
church of England is the established religion here; the
Dissenters are very few. Here is, in general, a greater
appearance of order and decency, and of a settled people,
than in any other of the West-India islands.

St. CHRISTOPHER'S.

THIS island, sometimes, for brevity's sake, called
St. Kitt's, is situated in 62 deg. west long, and 17 deg.
north lat. It is about twenty miles long, seven broad,
and seventy-five in circumference. It owes its name to
Christopher Columbus, who first discovered it for the
Spaniards, who, not finding it to abound in the precious
metal, abandoned it; and, in 1626, it was settled by
the French and English conjointly, but entirely ceded
to England by the treaty of Utrecht. It contains about
7000 whites, and 36,000 negroes. Besides cotton,
ginger, and the tropical fruits, it generally produces as
much sugar as Barbadoes.

Basseterre is the most considerable town upon this
island, and was formerly the capital of the French part:
the other is called Sandy Point, and always belonged
to the English. There is no harbour; on the contrary,
the surf is continually beating on the sandy shore at the
few places fit to land, which not only prevents the
building any quay or wharf, but renders the landing or
shipping of goods always inconvenient, and very often
dangerous. They have been, therefore, obliged to adopt
a particular method to embark, or put the heavy goods,
such as hogheads of sugar or rum, on board. For this
purpose, they use a small boat of a peculiar construc-
tion, called a *myses*; this boat sets off from the ship
with some very active and expert rowers; when they
see what they call a *fall*, that is, an abatement in the
violence of the surge, they push to land, and lay the
sides of the mokes on the strand, the hoghead is rolled
into it, and the same precautions are used to carry it to
the ship. It is in this inconvenient and very hazardous
manner that the sugars are conveyed on board by single
hogheads.

hogheads. Rum, cotton, and other goods that will bear the water, are generally floated to the ship both in going and coming.

The public affairs at St. Christopher's are administered by a governor, a council, and an assembly chosen from the nine parishes into which the island is divided, and which have each a large handsome church.

The island of St. Christopher sustained great damage by a violent hurricane, which happened in the month of October 1780. All the goods in the warehouses and cellars near the beach were totally destroyed, and upwards of 100 vessels were driven out to sea, many of which were lost, and the crews perished.

The French took this island in February 1782, but it was restored by the peace with England in 1783.

A N T I G U A.

THIS island was discovered by Christopher Columbus, but not settled upon till the year 1632, when the English took possession of it. It is situated in 61 deg. west long. and 17 deg. north lat. and is of a circular form, about twenty miles each way, and near sixty in circumference. It is more noted for good harbours than all the English islands in these seas, yet so encompassed with rocks, that it is of dangerous access in many parts, especially to those that are not well acquainted with the coast.

Here the climate is hotter than in Barbadoes, and very subject to hurricanes. The soil is sandy, and much of it overgrown with wood. There are but few springs, and not so much as a brook in the whole island; so that the principal dependence of the inhabitants arises from the water supplied by casual rains, which they save in cisterns.

St. John is the capital of Antigua; it is a regular built town on the western shore, with a good harbour of the same name, whose entrance is defended by Fort James. It is the residence of the governor-general of the Caribbee Leeward-Islands, the place where the assembly for this island is held, and the port where the greatest trade is carried on. It was a very flourishing town before the fire in 1769. The number of inhabitants are computed at 7000 whites, and 30,000 slaves. The best port in the island is English Harbour, on the south side. At much trouble and expence it has been made fit to receive the greatest ships of war. There are also a dock-yard with stores, and all the materials and conveniences necessary to repair and careen. English Harbour is at a small distance from the town and harbour of Falmouth. There are, besides, Willoughby Bay, to the windward of English Harbour; Nonsuch Harbour, on the east point; and the town and harbour of Parham, on the north side; also a great number of creeks and smaller bays; but, in general, the shore being rocky, wherever the landing would be practica-

ble, it is defended by forts and batteries; and there commonly one regiment of regular troops quarters there for the defence of the island. When the governor-general thinks proper, he calls a general assembly the other islands.

Antigua has, besides, a lieutenant-governor, a council, and its own assembly, composed of twenty-four members. It is divided into six parishes and eleven districts, of which ten send each two representatives, and that of St. John four.

A gentleman (Mr. T—wle) residing at St. John in Antigua, has favoured us with the following pleasing account: he writes, that at the end of the year 1790, in consequence of a plan set on foot by some benevolent persons for instructing the negroes on that island, the congregation he belongs to amounted then to 5495 negroes, who are remarkably punctual and devout in their attendance on divine worship, and that their singing particularly pleasing: that, since May 1793, there have been baptised about 244 adults, or grown negroes, besides very many children; and a great number of adults and children have been baptised on their sick beds. He adds, that Antigua is a very pleasant island, and produces large quantities of sugar, oranges, limes, pineapples, and several other kinds of delicious fruits; the other sorts of provision are very dear, cheese being one per pound English money, and porter 1s. a bottle. He observes further, that some of the slaves are, for the smallest offence, treated very unmercifully; and hoing, are whipped before their driver like so many beasts.

GRENADA AND THE GRENADINES.

GRENADA is situated in 12 deg. north lat. and 61 deg. 40 min. west long. near thirty leagues south-west of Barbadoes, being about thirty miles long, and fifteen broad. The soil of this island is exceeding proper for the culture of sugar, tobacco, and indigo. A mountain, about the centre of the island, is a lake that supplies it plentifully with streams of fresh water, which adorn and fertilize it. The bays and harbours of the island are very convenient for shipping, and it is not subject to hurricanes. In the harbour of St. George's Bay 100 vessels may be safely moored. The French first established a colony here, between whom and the natives there was a long and bloody war, in which the latter, though few in number, defended themselves against their invaders with the most resolute bravery. When Grenada was attacked by the English in the late war but one, the French inhabitants were so amazed at the reduction of Martinico and Guadalupe, that they surrendered without opposition; and the property of this island, together with that of the Grenadines lying on the north of it, were ceded to the English by the treaty of Paris in 1763; but, in July 1779, the French again made themselves masters of Grenada, though

DOMINICA.

THIS island is situated in 16 deg. north lat. and 62
deg. long, and lies about half way between Guadalupe
and Martinico. It is about twenty-eight miles in
length, and thirteen in breadth; and received its name
from being discovered by Columbus on a Sunday. The
soil of this island is thin, and better adapted to the rear-
ing of coffee than sugar; but the sides of the hills bear
the finest trees in the West-Indies, and the whole island
is well supplied with rivulets of fine water. Here, as
in some other of the Caribbees, is a sulphur mountain,
and hot spring, equal in salubrity to those of Bath in
England; and the fine fruits, particularly the pine-
apples, are superior to any that grow on the French
islands. At the north-west end of the island, is a deep,
spacious, sandy bay, called Prince Rupert's, which is
well secured from the winds by mountains on all sides.
The most distinguished place in this island is the town
of Roseau, situated on a spacious harbour. The houses
are low and irregularly placed, and the town is sheltered
by the circumjacent mountains, some of which rise to a
considerable height. The most advantageous view of
the town is from the bay, or harbour, where ships of
considerable size ride at anchor with the greatest safety.
This island, on account of its situation, between the
principal French settlements here, and the commodious-
ness of its harbour, has been formed into a government
in itself, and declared a free port. It was taken by the
French in 1778; but, by the ensuing peace, was restored
to Great-Britain.

ST. VINCENT.

THIS island is about twenty-four miles in length,
and eighteen in breadth, lying about fifty miles north-
west of Barbadoes. It is generally allowed to be one of
the best of all the Antilles. Out of the ridge of moun-
tains, which crosses it from north to south, rise a great
number of rivers well stored with fish. These moun-
tains are in general of an easy ascent; and the vallies
and plains, some of them of a large extent, are exceed-
ingly fertile, producing most of the necessaries of life,
particularly sugar, coffee, cocoa, and annatta. When
this island was ceded to Great-Britain, by the treaty of
Versailles, in 1763, there was a great number of a
mixed breed of Caribbees, and of shipwrecked or run-
away negroes; but these have been all long since ex-
terminated. The most remarkable place in St. Vin-
cent's is Kingstown, situated on a bay of the same
name at the south-west end of the island. It is the re-
sidence of the governor, and the place where the assem-
bly meet. About three miles from Kingstown, towards

the south-east, is the town of Calligua, whose harbour
is the most considerable in the whole island. Many
of the inhabitants are Caribbees, and many here are also
fugitives from Barbadoes and the other islands. The
Caribbees were treated with so much injustice and
barbarity, after this island came into possession of the
English, to whom it was ceded by the peace in 1763,
that they greatly contributed towards enabling the
French to get possession of it again in 1779; but, by the
treaty of peace, it was restored to Great-Britain.

NEVIS.

THIS is no more than a vast mountain rising to a
very considerable height. It is situated about four miles
to the south of St. Christopher's. The soil is fruitful,
and the staple commodity sugar, which serves all the
purposes of money. Here are sometimes violent
storms and hurricanes, as in the other islands, and the air is
even hotter than that of Barbadoes.

Here are many remarkable insects and reptiles, par-
ticularly the flying-tyger, the horn-fly, and a kind of
snail called the soldier. The sea abounds with a variety
of excellent fish, as groopers, rock-fish, old wives, cav-
allites, wellshmen, mud-fish, wilks, cockles, lobsters,
&c. Land-crabs are very common here; they are
smaller than sea-crabs, and make little burrows, like
rabbits, in the woods, towards the tops of the moun-
tains. The only venomous creatures are scorpions and
centipedes.

On this island there is plenty of asparagus; they have
also a tree called diddle-doo, which bears a lovely blos-
som of the finest yellow and scarlet colours, and is
esteemed a sovereign remedy in some disorders. The
liquorice bush runs wild along the stone walls of com-
mon fields, like the vine. The butter here is not good,
and their new cheese far worse. The sheep have nei-
ther horns or wool, but are clothed with smooth hair,
and generally full of small red or black spots, resem-
bling those of a fine spaniel. They breed twice a year,
if not oftener, and generally bring two, three, or four
lambs at a time, and, what is more extraordinary,
suckle them all. The rams are of a pale red colour,
with a thick row of long, straight, red hair, hanging
down from the lower jaw to the breast, as far as the
fore legs. The hogs, being fed with Indian corn,
Spanish potatoes, and sugar-cane juice, are exceeding
sweet food, white, and fat; as are the fowls and tur-
kies, which are fed with the same diet. The ground
doves here are about the size of a lark, of a chocolate
colour, spotted with a dark blue, their heads like that
of a robin-red-breast, and their eyes and legs of a most
pure red. They have excellent game-cocks and fierce
bull-dogs, besides large cur-dogs, but no hounds or
spaniels.

Nevis was formerly much more flourishing than at
present,

ent, and, before the Révolution, contained 30,000 inhabitants. The invasion of the French about that time, and some epidemical disorders, have strangely diminished the number to what they then were. Here are three tolerable roads or bays, on which are as many little towns, viz. Newcastle, Littleborough on Moreton-Bay, and Charles-Town the capital, with a fort called Great Fort, that defends the anchoring-place, where the governor, council, and assembly, meet; the last is composed of five members for each of the three parishes into which the island is divided. Here, as in some of the other Caribbees, if a white man kills a black, he cannot be tried for his life for the murder; and all that he suffers is a fine of 500. currency to the master for the loss of his slave. If a negro strikes a white man he is punished with the loss of his hand; and, if he should draw blood, with death. A negro cannot be evidence against a white man.

The inhabitants of this place have three public annual fasts, to implore the divine protection against hurricanes; and, if none happen in July, August, or September, they appoint a public thanksgiving in October. The trade of Nevis consists in molasses, rum, and a prodigious quantity of lemons.

This island, as well as the following, was taken by the French in the year 1782, but restored at the peace in 1783.

M O N T S E R R A T.

This small island was discovered by Columbus in 1493. It lies in 16 deg. 37 min. north lat. and 62 deg. 13 min. west long. It is twenty-five miles almost south-south-east from Nevis; twenty west south-west from Antigua; forty north-west from Guadalupe; and 240 from Barbadoes. It is of an oval figure; about three leagues in length, the same in breadth, and eighteen in compass. The Spaniards gave it the name of Montserrat from a fancied resemblance it bore to a mountain of that name near Barcelona in Old Spain. It was settled in 1632 by Sir Thomas Warner, and taken in the beginning of the reign of Charles II. by the French, who restored it to England at the peace of Bréda. The first settlers were Irishmen, and the present inhabitants are principally composed either of their descendants, or of natives of Ireland.

With respect to climate, soil, and produce, they are much the same as those of the other English Caribbee Islands. The mountains yield cedars, the cypress-tree, the iron-tree, with other woods, and some odouriferous shrubs. It is well-watered and fruitful; and the planters formerly raised a great deal of indigo. The surrounding seas produce some hideous monsters, particularly two, which, from their remarkable ugliness, as well as the poisonous quality of their flesh, are called sea-devils. The lamanture, by some called the sea-cow, is found in this island, and generally at the entrance of fresh

water rivers. According to the accounts we have of it is a amphibious animal, and lives mostly on land. Its flesh is reckoned very wholesome food, when salted; and they are so large, that two or three will load a canoe.

Montserrat is governed by a lieutenant-governor, council, and an assembly of eight representatives, one for each of the four districts which divide the island.

There is not any harbour belonging to this island, only three roads, namely, at Plymouth, which is the chief town in the island, Old Harbour, and Ker's Bay, where the shipping and landing of goods is attended with the same inconveniences as in the island of St. Christopher.

This island, as well as the former, was taken by the French in the year 1782, but restored at the peace in 1783.

B A R B U D A.

THIS island is situated in 18 deg. 6 min. north lat. and 61 deg. 35 min. west long. It is about twenty miles in length, and twelve in breadth. The air Barbuda is not unsalutary; and the soil is fertile enough to yield all the vegetable productions of the other West-India islands; but the inhabitants apply themselves most wholly to the breeding of cattle, and raising provisions for the neighbouring isles. On the west side the island is a good well-sheltered road, clear from rocks and sands. This island is the property of the Codrington family, and contains about 1500 inhabitants.

To the north of Barbuda are several small uninhabited islands. The most remarkable of them lies at six leagues distance, and is about a league long. It consists of an eminence, to which the Spanish discoverers, finding some resemblance to a hat, gave it the name of Sombrero, which it has always preserved.

To the west of Barbuda and Sombrero, after having crossed a channel of eight leagues, begin the Virgin Islands. These take up a space, from east to west, about twenty-four leagues long, quite to the eastern coast of Porto Rico, with a breadth of about five leagues. They are composed of a great number of islands whose crasts, rent throughout and sprinkled with rocks every where dangerous to navigators, are famous for shipwrecks, and particularly of several galleons. Hospitality for the trade and navigation of these islands, has placed in the middle of them a large basin of water, or four leagues broad, and six or seven long, the shape that can be imagined, and in which ships may not be landlocked, and sheltered from all winds. The Spaniards called it the Virgins' Gangway; but its true name is the Bay of Sir Francis Drake, who first entered it in 1580, when he made his expedition against St. Domingo.

One of these islands is called the Tropic Keys, for the astonishing quantity of Tropic birds which breed

and plump like a partridge, and very good to eat.
their plumage is quite white, except two or three fea
ers in each wing, which are of a clear grey. Their
cks are short, thick, and of a pale yellow. They
ve a long feather, or rather quill, about seven inches
g, which comes out of their rump, and is all the
l they have. They obtained their name from not
ing been ever seen but between the Tropics.

The Virgin Islands are all of them small, and the
east part uninhabited.

A N G U I L L A.

THIS island is situated in 18 deg. 15 min. of north
and in 62 deg. 57 min. of west long. It is about
fifty miles long, and ten broad. Anguilla is capable
great improvement; and the inhabitants formerly
anted sugar, which they still continue to do in small
quantities; but, like those of Barbuda, they chiefly
ply themselves to the breeding and feeding of cattle,
ning of Indian corn, and other parts of husbandry.
Within a few years, industry, and the indefatigable
ours of the planters of Anguilla, have convinced
em that their island not only produces all the necessa
s of life, but, besides, many provisions which they
ll to their neighbours, as well as sugar and cotton.
The climate is very healthy, and the inhabitants strong
d vigorous. Their exportations are sugar, rum, and
otton.

Besides the British West-India islands above de
cribed, Great-Britain is also possessed of several others
the ocean, which are situated at the distance of some
ousand miles from each other. Our survey of these
all begin at the northern extremity, and the first that
ill engage our attention, is

NEW FOUNDLAND.

THIS island is situated to the east of the gulf of St.
Laurence; between 46 and 52 deg. north lat. and be
tween 53 and 59 deg. west long. of a triangular form,
d nearly as large as Ireland; being separated from
brador, or New-Britain, by the straits of Belleisle;
d from Canada, by the bay of St. Lawrence. The
ncipal towns are Placentia, Bonavista, and St. John.
The air on the coasts is thick and foggy, and there are
quent storms of snow and sleet. The winter is long,
d often intensely cold; the summer is very hot, but
short continuance, and, as the soil in most parts is
cky and barren, the vegetable productions are but
w. It is, however, watered by several good rivers,
d hath some noble and capacious bays. The best
duce of this island consists in a great variety of ex-

cellent timber, which will afford an ample supply for
masts, yards, and all sorts of timber, when those com
modities begin to grow scarce in our colonies.

But Newfoundland is chiefly valuable for the noble
cod fishery on its coasts and the neighbouring banks.

Great-Britain and North America, at the lowest
computation, annually employ three thousand sail of
small ships in this fishery; on board of which, and on
shore, to cure and pack the fish, are upwards of 10,000
hands; so that this fishery is not only a valuable branch
of trade to the merchant, but a source of livelihood to
many thousands of poor people, and a most excellent
nursery of seamen for the royal navy: at the same time,
it is computed that this fishery increases the national
stock 300,000l. annually, in gold and silver, remitted to
us for the cod we sell in the northern kingdoms, in
Spain, Portugal, Italy, and the Levant. The plenty
of cod, both on the great bank and the lesser ones,
which lie to the east and south-east of this island, is in
conceivable; and not only cod, but several other spe
cies of fish, are caught there in great abundance; all of
which are nearly in an equal plenty along the shores of
Newfoundland, Nova Scotia, New England, and the
isle of Cape Breton; and very profitable fisheries are
carried on upon all their coasts, which makes ample
amends for the barrenness of the soil, &c. The main
fishery is on the Great Bank, and the other banks about
this island, as also along the coast.

The Great Bank is a vast mountain under water, ex
tending, in length, according to the most accurate sea
charts, from the 41st deg. of north lat. to 49 deg. 25
min. and, in breadth, from 42 deg. 30 min. to 51 deg.
30 min. of west long. Its depth of water is from five
to sixty fathoms. This bank is covered with a vast
quantity of shells, and several kinds of fish of all sizes,
most of which serve for food to the cod-fish, whose num
ber is immense. Great numbers of vessels have loaded
here annually for two centuries, yet this vast consump
tion has produced no very apparent diminution of their
numbers.

The Great Bank is about 120 miles long, and about
fifty over where broadest. It lies off the south-coast
of Newfoundland. There are several other banks, but
they are not considerable enough to deserve particular
notice.

The Great Strand, or drying-place for fish, which is
about a league in extent, lies between two steep hills,
one of which is separated from the Strand by a small
rivulet, which forms a kind of lake, called the Little
Bay, abounding with salmon. The Great Strand may
contain at once wherewithal to load sixty ships. There
is another lesser Strand for the use of the inhabitants,
who fish all along the coast. The fishing season is from
Spring to September. All the train oil that comes
from Newfoundland is drawn chiefly from the livers of
the cod.

The process in catching the fish, preparing them,
&c. is as follows: the cod is caught with a harpoon,
the

the best bait being a little fish called capelan; but, for want of this, they sometimes make use of the intestines of the cod-itself. As soon as the fisherman has caught a fish with his line, he pulls out its tongue, and gives the fish to another man, whom they call the beheader. This man, with a two-edged knife, like a lancet, slits the fish from the vent to the throat, which he cuts across to the bones of the neck; he then lays down his knife, and pulls out the liver, which he drops into a kind of tray, through a little hole made on purpose in the scaffold he works upon; he then guts it, and cuts off the head. This done, he delivers the fish to the next man, who stands over-against him. This man, who is called the slicer, takes hold of it by the left gill, and rests its back against a board, a foot long, and two inches high; he pricks it with the slicing knife on the left side of the vent, which makes it turn out the left gill; then he cuts the ribs, or great bones all along the vertebræ, about half way down from the neck to the vent; he likewise does the same on the right side; then cuts assant three joints of the vertebræ through to the spinal marrow; lastly, he cuts all along the vertebræ and spinal marrow, dividing them into two; and thus ends his operation. A third helper then takes this fish, and, with a kind of wooden spatula, scrapes all the blood that has remained along the vertebræ that were not cut. When the cod is thus thoroughly cleaned (sometimes washed) he drops it into the hold, through a hole made for that purpose, and the salter is there ready to receive it. This assistant crams as much salt as he can into the inner part of the fish, lays it down, the tail end lowest, rubs the skin all over with salt, and even covers it with more salt; then goes through the same process with the rest of the cod, which he heaps up one upon another till the whole is laid up. The fish, thus salted and piled up in the hold, is never meddled with any more till it is brought home and unloaded for sale. The cod intended for drying is caught and beheaded in the same manner; but the operation of salting varies in some few particulars.

The Indians, or natives, of this island, are said to be a gentle, mild, tractable people, easily gained by civility and good usage. They paint their bodies, and, in winter, are clad in skins and furs.

Disputes were frequent for many years between France and England: at last the whole island was formally ceded to the English by the treaty of Utrecht, in 1713; but the French were left at liberty to dry their nets and cure their fish on the northern coasts of the island; and, by the treaty of 1763, they obtained liberty to fish in the gulf of St. Laurence, but with this limitation, that they should not approach within three miles of any of the shores belonging to the English. The small islands of St. Pierre and Miquelon, situated to the southward of Newfoundland, were also ceded to the French for curing their fish; but they engaged to erect no fortifications on these islands, and to keep only fifty soldiers to enforce the police. In 1793, they were again taken

by the English, during the war with the French public.

The French, by the late treaty, were to enjoy fisheries on the north and west coasts of the island, but the Americans were allowed the same privileges in fish as before their independence. Placentia, Bonaville, and St. John, are the chief towns in Newfoundland; in the winter, not above 1000 families remain here, a small squadron of men of war are sent out every year to protect the fisheries and inhabitants of this island; the naval commander on this station is the governor.

CAPE BRETON,

THIS island is situated between 45 and 57 north lat. and between 61 and 62 deg. west long. It is 100 miles long, and eighty broad. It is situated about 100 leagues south-west from Newfoundland, and is separated by the stright of Causo from Nova Scotia. The north coast is high, and almost inaccessible; but the south coast contains several excellent harbours, particularly that of Louisburg, one of the finest in America. The air is nearly the same with that of Newfoundland; the heat and cold also is very little different; the soil in many places barren, but, in some, deep and rich, though it has never been properly cultivated. Horses, black cattle, sheep, goats, hogs, and poultry are found in plenty on the island, but game is scarce. The partridges are almost as large as pheasants, and not unlike them in the colour of their feathers. The quantity of cod and other fish in the adjacent sea is most incredible; whales, seals, porpoises, &c. are frequently seen near the coast. The vegetable productions are apples, pulse, wheat and other corn, flax and hemp. Oaks of a prodigious size, pinés, ash, maple, plane, and aspin trees abound here. Coals and lime-stone are found in almost every part of the island.

This island was suffered for many years to remain uninhabited: at last the French took possession of it in 1714, built Louisburg, and fortified it in the strongest manner. It was taken by the English in the year 1758, but restored to the French by the treaty of Aix-la-Chapelle. It was again taken during the last war but was and the fortifications of Louisburg totally demolished. By the treaty of peace in 1763 it was ceded to the English, so that the French have now no port or shelter for the relief of their trading ships either to or from the West-Indies. There are several small islands lying round Cape Breton, particularly those of St. Peter and Madame, or Maurepas.

islands and fertility of soil. It is 60 miles long,
 and near 40 broad, and has many fine rivers. On
 the reduction of Cape Breton, the inhabitants of this
 island, amounting to 4000, submitted quietly to the
 British arms; and to the scandal of the French gov-
 ernor, in his house several English scalps were
 brought thither to market by the savages of
 Nova Scotia; this being the place where they were
 encouraged to carry on that inhuman trade. When
 this island was in the possession of the French, they
 much improved it, that it furnished great quan-
 tities of beef and pork, and also plenty of corn, so
 that it was styled the granary of Canada.

BERMUDAS, OR THE SUMMER ISLANDS.

THESE islands, which received their first name
 from John Bermudas, a Spaniard, who discovered
 them; and their second from Sir George Sommers,
 who was shipwrecked on the rocks in his voyage
 to Virginia in 1609, are situated in the Atlantic
 Ocean, in 32 deg. 25 min. north lat. and 66 deg.
 47 min. west long. These islands, which are said
 to be 400 in number, are very small, not containing
 all more than 20,000 acres. They are very dif-
 ficult of access, being, as Waller (who resided there
 for some time) expresses it, walled in with rocks.
 There are, however, several open channels between
 them; but a pilot well acquainted with the coast is
 necessary.

The air of these islands is clear and healthy, the
 climate temperate and delightful, the soil prodigiously
 fertile, and the vegetable productions, both of trees,
 plants, and flowers, very numerous, and of various
 kinds. The number of white inhabitants is about
 2,000, and the negroes 1,500. Their chief trade
 consists in building and navigating light sloops and
 brigantines, which they employ for the most part
 in the trade between North America and the West
 Indies. These vessels are remarkably swift sailers;
 and the cedar, of which they are principally built, is
 valued for its hard and durable quality.

The capital, called the town of St. George, is
 situated at the bottom of a harbour, on an island of
 the same name, and is defended by seven or eight
 guns mounted with 70 pieces of cannon. It con-
 tains about 1000 houses, and is decorated with a
 handsome church, and other elegant public buildings.

CHAPTER XVII.

THE LUCAYS, BAHAMA, AND
OTHER ISLANDS.

THESE islands are situated to the south of Ca-
 rolina, between 22 and 27 deg. north lat. and
 78 and 84 deg. west long. They extend along

the eastern coast of Florida quite down to the Isle of
 Cuba, and are said to be 500 in number; many of
 them, however, are only barren rocks; but twelve
 are large and fertile, though only one of them is pro-
 perly inhabited, namely, Providence, which is 100
 miles east of the Floridas. The air and soil are
 nearly the same with those of South Carolina; they
 are well watered every where with springs and rivers.
 Limes, four oranges, and sea-turtle abound in these
 islands.

The Lucays, or Bahamas, were the first land Co-
 lumbus discovered in America; but, being destitute
 of gold mines, they were never settled by the Spa-
 niards; nor were they known to the English till the
 year 1667, when Captain Seyle, being driven among
 them in a voyage to Carolina, examined them
 carefully, particularly that which is now called Pro-
 vidence. On his return, he reported the discovery he
 had made, and the benefit these islands might be to
 the state. Grants were in consequence made out to
 proprietors, but the government was reserved for the
 crown. The proprietors granted a lease of these
 islands to a number of merchants, called the Bahama
 Company; but the design proved abortive; and the
 proprietors taking no care to prevent pirates shelter-
 ing themselves in these islands, the government re-
 sumed the grant. In the year 1718 Captain Woodes
 Rogers was sent with a fleet to dislodge the pirates,
 and make a settlement. He executed his commission,
 erected a fort, and was made governor of the Bahama
 islands, where he died in 1733. From that time
 they have been improving, though not in any rap-
 id manner; and perhaps they will never be of
 any great consequence, except as preventive settle-
 ments, and affording shelter to ships and priva-
 teers in time of war, when the people gain consid-
 erably by the prizes condemned there; and at
 all times, by the wrecks, which are frequent in this
 labyrinth of rocks and shelves. Between these islands
 and the continent of Florida, is the gulf of Bahama,
 or Florida, through which the Spanish galleons sail in
 their passage to Europe. The Spaniards and Amer-
 icans captured these islands during the last war; but
 on April 13, 1783, they were retaken by a British
 detachment from St. Augustine.

FALKLAND ISLANDS.

THESE islands are situated between 51 deg. 30
 min. and 52 deg. 15 min. south lat. and between
 55 deg. 40 min. and 56 deg. 47 min. west long.
 being about 50 miles in length from north to south,
 and 38 in breadth from east to west; they lie near
 the straits of Magellan, the extremity of the con-
 tinent of South America. These islands were first
 discovered by Sir Richard Hawkins in 1594; the
 principal

HENN'S.

near Cape Breton and Nova
 advantage of: both in place
 fact

principal of which he named Hawkins Maidenland, in honour of Queen Elizabeth. The present English name Falkland was probably given them by Captain Strong, in 1699, and being adopted by Halley, it has from that time been received into our maps.

King Charles II. having considered the discovery of this coast of great consequence, sent Sir John Narborough to survey the streights of Magellan, the neighbouring coast of Patagonia, and the Spanish ports in that frontier; with directions, if possible, to procure some intercourse with the Indians of Chili, who are generally at war, or at least on ill terms with the Spaniards; and to establish a commerce and lasting correspondence with them. Though Sir John, through accidental causes, failed in this attempt, which, in appearance, promised so many advantages to this nation, his transactions upon that coast, besides the many valuable improvements he furnished to geography and navigation, should be rather incentives for further trials of this kind, than any objection against them. The precautions and fears of the Spaniards plainly indicated that they were fully convinced of the practicability of the scheme he was sent to execute, and extremely alarmed with the apprehension of its consequences. The British monarch, however, is said to have been so far convinced of the advantages which might accrue to the nation from this expedition, that having intelligence of Sir John Narborough's passing through the Downs, on his return, he had not patience to attend his arrival at court, but went himself in his barge to meet him at Gravesend.

In the year 1764, the late Lord Egmont, then first lord of the admiralty, revived the scheme of a

settlement in the South Seas, and Commodore Byron was sent to take possession of Falkland Islands in the name of his Britannic majesty, and in his journal represents them as a valuable acquisition. On the other hand, they are represented by Captain M'Brayne, who in 1766 succeeded that gentleman, as the worst cast of nature. "We found, says he, a mass of barren mountains, beaten by storms almost perpetual. Yet this is summer; and if the winds in winter hold their natural proportion, those who but two cables length from the shore, must pass weeks without having any communication with the land. The plants and vegetables which were planted by Mr. Byron's people, and the fir-tree, which in other rugged and cold climates, had withered away, goats, sheep, and hogs, that were carried thither, were found to thrive and increase as in other places. Geese, of a fishy taste, snipes, loxes, sea-lions, porpoises, plenty of good water, and, in the summer months, wild celery, and sorrel, are the natural productions of these islands.

But notwithstanding the dangerous navigation through these tempestuous seas, and the barrenness of the soil, an English settlement was at length made here, of which we were dispossessed by the Spaniards in 1770. That violence was, however, disavowed by the Spanish ambassador, and some concessions made to the court of Great-Britain; in order, therefore, to avoid giving umbrage to the court of Spain, the British ministry, in 1774, gave directions that the settlement should be finally abandoned.

SPANISH DOMINIONS IN NORTH AMERICA.

C H A P. XVIII.

EAST AND WEST FLORIDA.

Situation, Extent, Boundaries, Produce, Mountains, Rivers, Inhabitants, Chief Towns, &c.

THIS country is situated between 80 and 91 deg. west long. and between 25 and 32 north lat. being 500 miles in length, and 440 in breadth, and contains 100,000 square miles. It is bounded, on the north, by Georgia; on the west, by the Mississippi; on the south, by the gulf of Mexico; and, on the east, by the Bahama streights. The Floridas in-

clude a part of Louisiana, and were, by the late treaty of peace, ceded by Great-Britain to Spain.

The accounts which have been given concerning the climate, air, and soil of Florida, have so amazingly varied, that to give credit to one, we must entirely disbelieve the other. There is no doubt but in so extensive a tract these particulars must be very different in some parts from what they are in others; and it was natural for authors, who wrote either for or against this country, to give a description of its parts only as suited their purpose; observing a profound silence with regard to the rest. Thus we have some have represented it as a terrestrial paradise, while others have pronounced it the tomb of

AMERICA.]

Angels, who are unhappy as a truth, that I take possession of it, Spaniards asked them, "Is it a country of at home?" The grants of lands in England, and were determined the climate to resist the scorching heat of the summer, and a change of the north wind. In November and December, the leaves, vegetation is perceived, but so much as the plantain, the pine-apple, the orange, during the winter in England, are unknown to the equinoxes, the autumn is very heavy every day, when the thow is immediately, and all is covered with snow, and wholefome, and longevity of life respects far exceeds the Spaniards; and Augustus, many of the islands, upwards of 90. The distance is 100 miles back, especially in the mountains, but in other parts the vegetables produced are, pumpkins, pulle, roots, herbs, and in some parts limes, and likewise a fruit called the European, and of the cordial julep, and cyresses, chefnut, and others, are found in the mendihoca, of which is made; also a species of corn, and even the country crops of Indian corn a production in the vegetable country, is the naturalists the palmello little near the ground, appearance of a substantial weight. angers who are unhappy enough to go thither, af-
 firming as a truth, that upon the landing of our troops
 take possession of it, after the peace in 1763, the
 Spaniards asked them, "What crimes have you been
 guilty of at home?" The people, however, who ob-
 tained grants of lands in Florida, when belonging
 to England, and were desirous to settle or sell them,
 represented the climate as a very agreeable medium
 between the scorching heat of the tropics, and the
 piercing cold of the north latitudes; that there is in-
 deed a change of the seasons, but it is a moderate
 one. In November and December many trees lose
 their leaves, vegetation goes on slowly, and the winter
 is perceived, but so mild, that snow is never seen
 here; and the tenderest plants of the West-Indies,
 such as the plantain, the alligator pear-tree, the ba-
 nan, the pine-apple, the sugar-cane, &c. remain un-
 hurt during the winter in the gardens of St. Augustine;
 and the fogs and dark gloomy weather, so common
 in England, are unknown in this country; and though
 the equinoxes, the autumnal particularly, the rains
 are very heavy every day for three weeks together,
 when the shower is over, the sky clears up im-
 mediately, and all is calm and serene. The air is
 pure and wholesome, which appears from the size,
 and longevity of the Floridian Indians, who in
 all respects far exceed their more southern neigh-
 bours, the Mexicans; and when the Spaniards quitted
 St. Augustine, many of them were very old, some
 upwards of 90. The soil near the sea-coast, and
 100 miles back, especially in East Florida, is flat and
 sandy, but in other parts it is rich and fertile.

The vegetables produced in the Floridas are Indian
 corn, pulse, roots, hemp, flax, vines, prunes,
 and in some parts limes, oranges, and lemons. There
 is likewise a fruit called tura, so exquisite and whole-
 some, that the Europeans have given it the appella-
 tion of the curdial julep; oaks, pines, laurels, palms,
 cedars, cyresses, chestnuts, salisfras, cotton trees, and
 various others, are found here; as is silk-grass, the
 root mendihoca, of which the cassava flour and bread
 are made; also a species of grain resembling our oats;
 and even the country round St. Augustine yields two
 crops of Indian corn a year. But the most singular
 production in the vegetable system in this, or in any
 other country, is the cabbage-tree, called by some
 naturalists the palmello royal. The trunk bulges out
 a little near the ground, which gives it the becoming
 appearance of a substantial basis to support its tow-
 ering weight. It is straight as an arrow, rises
 above an hundred feet in height, and the trunk near
 the earth is about six or seven feet in circumference,
 the whole body growing tapering to the top. The
 slide texture of the leaves appears as thread-like
 aments, which being spun are used in making cor-
 dage of every kind, as well as fishing-nets. What is
 called the cabbage lies in many thin, white, brittle
 slices, which, when raw, have something of the

taste of almonds, and when boiled something of that
 of cabbage, but sweeter and more agreeable.

A writer of respectable credit observes, that there is
 not, in the whole continent of America, any place
 better qualified by nature to afford not only all the ne-
 cessaries of life, but also all the pleasures of habitation,
 than that part of this country which lies upon the
 banks of the Mississippi.

Indigo is found in the greatest plenty; and it is
 said that great quantities of cochineal are to be met
 with here; also amethysts, turquoises, lapis lazuli, and
 other precious stones; copper, quicksilver, pit-coal,
 and iron ore. The wild animals are the same as in
 the Carolinas and Georgia; black cattle and sheep
 are found in vast plenty; and horses are so numerous,
 that a good saddle-horse may be purchased in exchange
 for goods of 5s. value prime cost, and sometimes for
 much less. The trade for furs, and various other
 branches, as likewise the fisheries, might be rendered
 very profitable.

The Apalachian mountains, so often mentioned,
 are the most considerable; these give rise to many
 of the noble rivers that run through the Floridas; the
 principal of which are the Mississippi, the Ohio, the
 Coza or Coussa, and the river St. John. The Missis-
 sippi, which the French call St. Louis, is one of the
 finest rivers in the world, and supposed to run a course
 of 3000 miles, free from shoals and cataracts, and
 navigable within sixty leagues of its source. Its nu-
 merous mouths, however, are in a manner choked
 up by sands, which deny access to vessels of any con-
 siderable burthen; and even the principal entrance is
 said to have no more than twelve feet water on the
 bar, but within it is 100 fathom deep. The channel
 is every-where free from shallows, and the current
 gentle, except at a certain season of the year, when,
 like the Nile, it becomes extremely rapid, and over-
 flows its banks. The principal bays are, St. Bar-
 nard's, Ascension, Mobile, Pensacola, Dauphin, Jo-
 seph, Apalaxy, Spiritu Sancto, and Charles Bay.
 The chief capes are, Cape Blanco, Sables, Anclore,
 St. Augustine, and Cape Florida, at the extremity of
 the peninsula. Pearls, it is said, are found upon the
 coasts.

The most considerable Indian tribes here are the
 Creeks, Cherokees, Choctaws, Chickesaws, and
 Natches. Their hair is long and black. Both sexes
 go naked, except a deer-skin round their waist. The
 men have robust bodies, and finely proportioned limbs.
 The women are handsome and well shaped; and so
 remarkably active, that they will swim across broad
 rivers with their children on their backs, and climb
 with surprising agility to the tops of the highest trees.
 In religion, they are bigotted idolaters; and the
 cruelty of the Spaniards has rendered Christianity
 odious to them.

Pensacola is the chief town in West-Florida, and
 is situated in 30 deg. 22 min. north lat. and 87 deg.
 20 min.

20 min. west long. within the bay of the same name, on a sandy shore, accessible only by small vessels; but in the road, which is one of the best in all the gulf of Mexico, ships may lie secure against every kind of wind, being surrounded on all sides by land. This place sent in skins, logwood, dyeing stuff, and silver in dollars, to the yearly amount of 63,000l. and, at an average of three years, received to the value of 97,000l. of our manufactures.

The capital of East Florida is St. Augustine, in 29 deg. 45 min. north lat. and 81 deg. 12 min. west long. The town runs along the shore, is of an oblong form, divided by four regular streets crossing each other at right angles; it is fortified with bastions, enclosed with a ditch, and defended by a castle called Fort St. John; and the whole is well furnished with cannon. At the entrance into the harbour are the north and south breakers, which form two channels, whose bars have eight feet water at low tides.

It was natural to expect, from the luxuriancy of the soil, the salubrity of the air, the cheapness and plenty of provisions, and the encouragement given by the British government for persons to settle here, that the number of English inhabitants would have been much more considerable; but this defect is by some ascribed to the injudicious management of the colony. However this may be, the reduction of Pensacola in 1781, by the arms of the king of Spain, and his possession of this country at present, have deprived us of those flattering prospects of great advantages to England, which were expected to have been derived from our property in the Floridas.

There being many particulars respecting person, dress, manners, and customs, which are peculiar to the original Indians of Florida, we shall present them to the reader. They stain their skin with the juice of plants, and have long black hair, which they have a method of twisting and binding upon the head, so as to render it rather becoming. The women, in general, have good features, and are well made. The men, being stout and well proportioned, make use of bows and arrows with great dexterity. The strings of their bows are made of the sinews of stags; and they point the ends of their arrows with sharp stones, or the teeth of fishes.

In the management and distribution of their corn, which is accounted the common stock of the public, their economy is well worthy of notice. The crop, which is calculated to serve only half the year, is collected into granaries appointed for that purpose, and afterwards regularly delivered out to every family, in proportion to the number of persons it contains. The soil is, indeed, capable of affording much more corn than they are able to consume; but they choose to sow no more than will serve them for that term, retiring, for the remainder of the year, into the recesses of the forests, where they build huts of palm trees, and live upon roots, wild fowl, and fish. They

are very fond of the flesh of alligators, which has a strong musky smell. Their meat is dressed in a stew, and smoko upon a gridiron made of sticks, and water for their common drink.

The people are, in general, satisfied with one wife, but the chiefs are indulged with more, though the children of only one of them succeed to the father's dignity.

The government of the original Floridas is in the hands of many chiefs, who are called Caciques. They are frequently at war with each other. In their warlike expeditions they carry with them honey, maize, and sometimes fish dried in the sun. The chief marches at the head, carries a bow in one hand and a bow and arrows in the other; his quiver hangs at his back; and the rest follow tumultuously with the same arms. In their warlike deliberations, it is a matter of great moment, their priests, who are also a kind of physicians, are called in, and their opinions particularly asked. Then the cacique commands round a kind of liquor like our tea, made by the infusion of the leaves of a certain tree.

They celebrate the funeral of a deceased cacique with great solemnity. They place upon his tomb a bowl out of which he was accustomed to drink, and stick great numbers of arrows in the earth around him, bewailing his death for three days with fasting and loud lamentations. The generality of them cut off their hair as a singular testimony of their sorrow. Their chieftains also set fire to, and consume, all the household furniture, together with the hut that he had belonged to the deceased, after which some old women are deputed, who every day, during the space of a year, at morning, noon, and evening, bewail him with dreadful howlings, according to the practice of some more civilized nations, and particularly the ancient Pomans, who frequently hired women at the funerals of their relations and friends.

C H A P. XIX.

NEW MEXICO, INCLUDING CALIFORNIA.

Situation, Boundaries, Divisions, Climate, Vegetable Produce, Mines, Inhabitants, and Chief Towns.

NEW MEXICO is situated between 23 and 36 deg. of north lat. and between 94 and 109 deg. of west long. being about 2000 miles in length, and 1600 in breadth. It is bounded to the north by unknown lands, on the south by California, to the east by the Pacific Ocean, on the east by Louisiana, and on the west by the South Sea, and contains 600,000 square miles. The divisions, and are the following.

DIVISIONS.

fish of alligators, which their meat is dressed in the side of sticks, and water fern

neral, satisfied with one which is dressed with more, though they succeed to the latter.

The original Floridas is in the north-east, and are called Caciques. They are called each other. In their war they carry with them honey which is dried in the sun. They carry a bow in one hand, and a quiver in the other; his quiver hangs from his shoulder, and he follows tumultuously with his bow and arrow, and warlike deliberations, if they are called in, and they are called in, and they are called in.

Then the cacique carries a pipe of our tea, made by the tree.

neral of a deceased cacique they place upon his tomb, and they were accustomed to drink, and arrows in the earth around for three days with fasting.

The generality of them are of testimony of their former fire to, and consume, all the other with the hut that they enter which some old women say, during the space of ten days, and evening, bewail him according to the practice of the Indians, and particularly the frequently hired women at the end friends.

West division	California, a Peninsula	St. Juan.

The air of this extensive country is in general clear and healthy, and the climate very pleasant; the summers, though very warm, are neither sultry nor unwholesome, and the winters, though pretty sharp, far from being insupportable.

This country is beautifully diversified with plains, and is embellished with flowers, gentle eminences clothed with beautiful trees of various kinds, some producing excellent fruit, and intersected with rivers and streams of water. The soil in many places is exuberantly rich, and the provinces might be rendered one of the most delightful countries in America, or any other part of the world. A great variety both of wild and tame animals are found in this kingdom. Their vegetable productions consist of pistachios, figs of different colours, pumpions, and water-melons of a prodigious size, grapes, &c. They have also a species of manna, being a juice which exudes from a particular species of rose-tree, and has all the sweetness of refined sugar, though without its whiteness.

In New Mexico are rich mines of gold and silver, but their value cannot be ascertained; turquoises, emeralds, and other precious stones are also found here. The multitude and variety of fish with which the rivers are supplied, is incredible: salmon, turbot, herring, skate, mackerel, &c. also oysters, cray-fish, lobsters, and other exquisite shell-fish, abound in the Gulf of California, which affords one of the richest pearl-fisheries in the world; excellent turtle are also caught in the utmost plenty on the coast of the South-sea; and in the heart of the country there are plains of salt quite firm, which, if the country should ever be inhabited by an industrious trading people, would be of the utmost service in curing the fish that are found on the coasts.

Santa Fé, the capital of New Mexico, in W. long. 103. N lat. 36. stands near the Riodel Norte, and about 130 leagues from the gulf. It is said to be a handsome, well-built, rich town, and the seat of a bishop, suffragan of Mexico, as well as of the governor of the province, who is subordinate to the viceroy of Old Mexico.

California was first discovered by Hernando Cortez, the great conqueror of Mexico; but Sir Francis Drake, our famous navigator, landed there in 1578, and took possession of it, which was confirmed to him by the chief king of the peninsula, who formally invested him with his principality. Since that time, however, the English have never made any pretensions to it, though their right is undoubtedly preferable to that of the Spaniards. The inhabitants and government here

do not materially differ from those of Old Mexico. Though the Spanish settlements here are at present comparatively weak, yet they are increasing every day, in proportion as new mines are discovered. The inhabitants are chiefly Indians, whom the Spanish missionaries have in many places brought over to Christianity, to a civilized life, and to raise corn and wine, which they now export pretty largely to New Spain.

The original Indians who inhabit California are, in general, well formed and robust, of a healthy countenance, but swarthy complexion. Their habitations are wretched huts, built near the few streams, wells, and ponds found in the country. As they are under the necessity of frequent migrations in search of food, they easily shift their residence, it requiring only the labour of a few hours to build a little habitation fitted for all their purposes; and it is usual with them, in the severity of winter, to live in subterraneous caverns. Their furniture and property consists of implements for fishing, hunting, and war, in which most of their time is spent. Their boats are only rafts; and their arms are bows, arrows, and jagged clubs.

The dress of the men is little more than a girdle round the waist, with a few ornaments about their hair. The women wear their hair loose. They have also a kind of cloak and petticoat, made of palm-leaves; some wear fillets of neat net-work. Their arms are likewise frequently adorned with net-work, or strings of pearls in the form of bracelets. The love of ornament prevails among the women more than among the men. Their greatest ingenuity appears in their fishing nets, which are made with admirable skill, of various colours, and such diversity of texture and workmanship, as cannot be described.

At the gathering in of the fruits of the earth, they have a high festival, when they indulge themselves in feasting, dancing, and mirth.

The gulfs or bays of Mexico, Campeachy, Vera Cruz, and Honduras, are on the north sea; and the bays Micoya and Amapalla, Acapulco and Salinas, are in the Pacific Ocean. The capes in the North-Sea are, Cape Sardo, St. Martin, Corundeceda, Caroché, Honduras, Cameroon, Graifas Dios; and those in the South-Sea are, Cape Marques, Spirito Sancto, Corientes, Gallero, Blanco, Burica, Pruceros, and Mala.

Most part of Mexico being situated within the torrid zone, the climate is very hot; but this heat is in a great measure allayed by the land and sea breezes, which blow alternately. The greatest heats are during the months of February, March, and April, when the sun is seldom shaded by a cloud, and in many places the waters are entirely dried up. Towards the latter end of April the rainy season comes on, and continues till the month of September, being always preceded by the most dreadful tempests of thunder, lightning, and winds, which the Spaniards term tornados. At this time, all along the eastern coast, where the land is low and marshy, it is flooded, and always extremely unwholesome; but on the western side, which lies higher, and in the inland parts, the air is more temperate and salutary. About the full and change of the moon, the winds in the gulf of Mexico, and the adjacent seas, blow strongly from the north. Trade-winds prevail every where at a distance from land within the tropic; and near the coast in the South-Sea, they have the monsoons, or periodical winds.

The soil is various, but in most places rich, fertile and proper for culture, and were the inhabitants industrious, all sorts of grain might be produced here.

No country under heaven has a greater variety of vegetable productions than Mexico. Beridel-maiz, its native grain, pine-apples, oranges, lemons, citrons, figs, and cocoa-nuts, grow here in the greatest plenty and perfection. This country also produces a great quantity of sugar, especially towards the gulf of Mexico, and the provinces of Guaxaca and Guatimala. The Mahoe tree also flourishes here, and furnishes the natives with thread for linen and cordage. Copal, aninics, taca-mahuca, carinica, liquid amber, guaiacum, china-root, safaparilla, and the lightwood-tree, are among the productions of New Spain. The bays of Campeachy and Honduras afford cedar trees and logwood. But the prodigious mines of gold and silver with which this part of North America abounds, was the first inducement the Spaniards had to settle in it. The valuable productions are generally found in the mountainous and barren parts of the country; the principal gold mines being in Veragua and New Granada, while those of silver, which are much richer, as well as more numerous, are found in several parts, but in none so much as the province of Mexico.

Gold is discovered either in the sand of rivers, native and in small grains, or it is dug out of the earth, in the same condition, in small pieces, almost wholly metallic, and of a tolerable purity; or it is found like the ore of other metals, in an aggregate of opamass, in a mixture of earth, stone, sulphur, and other metals: in this state it is of all colours, and makes very little shew of the riches it contains. But gold however found, whether native, or in what is called the ore, is seldom or ever without a mixture of other metals, which are most commonly silver or copper. When the ore is dug out of the mine, the most usual method is to break it to pieces in a mill; the gold is then separated as much as possible from the impurities by repeated washings, and mixed with a quantity of quicksilver, which has, of all other bodies, the greatest attraction to gold. This therefore immediately breaks the links whereby it was held to the former earth, and adheres closely to this congenial substance. It is then put into a trough, and a rapid stream of water suffered to run upon it, which scums away, through a hole made on purpose, the lighter earth leaves the gold and mercury, precipitated by its weight, at the bottom. This amalgama, or paste is put into a linen cloth, where it is squeezed fast to make part of the quicksilver separate and run out; but to complete this separation entirely, it is necessary to fuse the metal, and then all the mercury flies off in fumes.

Silver, the second metal in rank, is the first in consequence to the Spaniards, as their mines yield a much greater quantity of it, than of gold. It is found

in most places rich, fertile

rank, is the first in con-
as their mines yield
than of gold. It is found

the earth under different forms; the manner of
mining it does not essentially differ from the process
which is employed for gold, though the method of
refining it is much more difficult.

Old Mexico, with the other provinces of Spanish
America, supply the whole world with silver; and it
is said that the revenues of Mexico, proceeding from
gold and silver only, amount to 24,000,000l. sterling
annually. Cochineal and cocoa are the next im-
portant articles to gold and silver; the former is used
in dyeing, and also in medicine as a sudorific and
purgative; of the latter, chocolate is made. This
country is also said to produce silk and cotton in great
abundance, and to contain precious stones, jasper,
emerald, opal, and pearl.

The inhabitants of New Spain are composed of
Whites, Indians, Negroes, and the several mixtures
of these. These mixtures form various gradations,
which are carefully distinguished from each other,
because every person expects to be regarded in pro-
portion as a greater share of Spanish blood runs in
his veins. The first distinction arising from the in-
termixture of the Whites with the Negroes, is that
of the Mulattoes, which is well known. Next to
these are the Tercerones, produced from a White and
a Negro: from the intermixture with these and the
Indians, arises the Quarterones, who, though still
nearer the former, are disgraced with a tint of Negro
blood. The race descending from these and the Whites
are the Quinterones, who are only to be distinguished
from the Spaniards by being of a fairer complexion.

The same gradations are formed in a contrary order,
from the intermixture of the Mulattoes and the Negroes;
and besides which there are a thousand others, some of
which are scarcely known even by the natives them-
selves. The Whites are either born in Old Spain,
or are Creoles. Those who are native Spaniards are
usually in offices or in trade. They possess the same
character and manners with the Spaniards of Europe;
the same gravity of behaviour; the same natural fa-
cility and good sense; the same indolence, and a yet
greater share of pride and stateliness. The Creoles,
who are descendants of the native Spaniards, but
born in the country, have little of that courage,
firmness, and patience, which constitute one of the
best parts of the character of their ancestors, and
are universally weak and effeminate. Residing
constantly in an enervating heat, surfeited with
luxury, and giving up their whole time to loitering
in inactive pleasures, they have nothing bold
enough to fit them for making a figure in active
life, and few of them have any taste for the satis-
factions of a learned retirement: luxurious without
elegance, and expensive with great parade
and little convenience; their general character is no
other than a grave and specious insignificance. They
are temperate in eating and drinking, and their whole
conduct seems to be amour and intrigue, which they

carry on in the old Spanish taste, by doing and saying
extravagant things, by bad music, worse poetry, and
excessive expences. The ladies are not distinguished
by their great chastity, or domestic virtues. One-fifth
of the white people are priests, monks, and nuns, of all
orders, who enjoy immense revenues: but in general
the clergy there are too ignorant to be able instructors
by their preaching, and too loose and debauched in their
own manners to instruct by their example; so that the
people, over whom they have great influence, are little
the better for their numbers. The Indians, whatever
they were formerly, are now humble, dejected, timor-
ous, and docile. Their numbers are still considerable,
and they are treated by the Spaniards with the greatest
haughtiness. The negroes who are imported from
Africa, like those of our colonies, are stubborn, hardy,
of little understanding, and fitted for the gross slavery
they endure.

The civil government of Old Mexico is administered
by tribunals, called audiences, consisting of a certain
number of judges, divided into different chambers, which
bear some resemblance to the parliaments in France.
At the head of the chief of these chambers the viceroy
himself presides when he thinks proper: his employ-
ment is one of the greatest for trust and power the King
of Spain has in his gift, and is perhaps the richest gov-
ernment intrusted to any subject in the world; but
neither the viceroy, nor any other officer, is suf-
fered to hold his post longer than three years. In this
respect, as in all others relative to the Indies, the spirit
of jealousy influences all the regulations of the court of
Spain, and is attended with this very bad effect, that
every officer, from the highest to the lowest, has the
avidity which a new and lucrative post inspires; raven-
ous, because his time is short, he oppresses the people
and defrauds the crown; another succeeds him with the
same dispositions; and no man is ambitious to establish
any useful amendment in his office, knowing that his
successor will trample upon every regulation which is not
subservient to his own interests.

A council for the Indies is established in Old
Spain, which consists of a governor, four secretaries,
twenty-two counsellors, and other officers. The mem-
bers are generally chosen from the viceroys, and others
who have been employed in America, and their deci-
sion is final in matters relative to that country.
There are some troops kept in New Spain, and a
good revenue appropriated for their maintenance, and
for the support of the fortifications: but the soldiers
are few, ill clothed, ill paid, and worse disciplined.
Mexico, the capital city, stands in the midst of a
great lake of its own name, in lat. 19 deg. 40 min.
about 170 miles west of the gulf of Mexico. The
streets are straight, and so exactly disposed, that, from
any part of the town, the whole is visible; the public
edifices are magnificent, and the inhabitants are com-
puted at 300,000. This city may be reckoned the cen-
tre of commerce in these parts; for here the principal
merchants

merchants reside, and the greatest part of the business is negotiated. The East-India goods from Acapulco, and the European from Vera Cruz, pass through it. Hither all the gold and silver come to be coined, here the king's fifth is deposited, and here are wrought all those utensils and ornaments in plate which are every year sent into Europe. Acapulco stands in 17 deg. north lat. on a large and commodious bay of the South-Sea, about 110 miles south-east from Mexico. The town is large, but ill built; a part of it consists of warehouses. The above described are the most considerable places: we shall only add to this article, that, on the seventh of June 1773, the city of Guatimala was swallowed up by an earthquake, when 8000 families instantly perished. New Guatimala, which stands at some distance, is well inhabited.—

The whole of the trade between Old Spain and the Spanish American dominions, is by means of a fleet, called the flota, which is fitted out at Cadiz, and destined to La Vera Cruz. The ships are not permitted to break bulk, on any account, till they arrive there. When all the goods are landed and disposed of at La Vera Cruz, the fleet takes in the plate, precious stones, cochineal, indigo, cocoa, tobacco, sugar, and hides, which are the returns for Old Spain. From La Vera Cruz they sail to the Havannah, which is the place of their rendezvous, where they meet the galleons. These are another fleet, which carry on all the trade of Terra Firma, by Cartagena; and of Peru, by Panama and Porto-Bello; in the same manner as the flota serves for New Spain. When the flota arrives at the Havannah, and joins the galleons and register ships, which assemble at the same port from all quarters, some of the cleanest and best sailing vessels are dispatched to Old Spain, with advice of the contents of these several fleets, as well as with treasure and goods of their own, that the court may judge what indulgence or duty is proper to be laid on them, and what convoy is necessary for their safety.

Register-ships are sent out by merchants at Cadiz and Seville, when they judge that goods must be wanted at any particular ports in the West-Indies. Their way is, to petition the council of the Indians for a licence to send a ship of 300 tons burthen, or under, to that port; they pay for this licence forty or fifty dollars, besides presents to the officers, in proportion to the convenience necessary to the design; for, though the licence runs only to 300 tons at most, the vessel fitted out is seldom less than 600. This ship and cargo are registered at the pretended burthen: it is required too, that a certificate be brought from the king's officer at the port to which she is bound, that she does not exceed the size at which she is registered; all this passes of course. These are what they call register-ships, and by these the trade of Spanish America has been carried on for many years past.

Though this trade is carried on entirely through the hands of the Spaniards, and in the very heart of their dominions, yet they are comparatively but small gainers

by it; for, as they allow the Dutch, the English, and other commercial states, to furnish the greater part of the cargo of the flota, so the Spanish inhabitants of the Philippines, tainted with the same indolence which ruined their European ancestors, permit the Chinese merchants to furnish most of the cargo of the galleons. We are however told, that, notwithstanding great quantities of gold and silver are run and concealed, not more than 2,000,000 of silver marks, weighing eight ounces each, are entered yearly, out of which they coin 700,000 marks into pieces of eight, quarter-pieces, rials, and half-pieces, the value of the latter being about three pence sterling.—

The sacrifices of the ancient Mexicans were cruel, and horrid beyond expression. In general the victims suffered death by having their breasts opened; sometimes they were drowned in a lake; sometimes they died with hunger shut up in caverns of the mountains; and sometimes they fell in what was called gladiatorial sacrifice.

The place for the performance of the common sacrifice was the temple, in the upper area of which stood the altar. The ministers were the priests, chief of whom, on such occasions, was clothed in red habit fringed with cotton. On his head he wore a crown of green and yellow feathers. The other ministers, which were five in number, were dressed in habits of the same make, but embroidered with blue and their bodies were dyed all over with the same colour. These barbarous ministers carried the victim naked to the upper area of the temple, and having pointed out to the by-standers the idol to whom the sacrifice was made, extended him upon the altar. Four priests held his legs and arms, and another held his head firm with a wooden instrument made in the form of a coiled serpent, and put about his neck. The body of the victim lay arched, the breast and belly being raised up and totally prevented from moving. The inhuman chief priest then approached, and with a cutting knife made of flint dexterously opened the breast, and tore out the heart, which, while it was palpitating, he offered to the sun, and afterwards threw it at the feet of the idol: he then took it and burnt it, and the ashes were preserved as a precious relic. If the idol was of large size and hollow form, it was customary to introduce the heart of the victim into its mouth with a golden spoon. It was usual also to anoint the lips of the idol, and the corners of the door of the temple, with the blood of the victim. If the victim was a prisoner of war they severed the head from the body, to preserve the skull. The body was carried by the officer, or soldier to whom the prisoner had belonged, to his house, where he boiled and dressed for the entertainment of his friends. If he was not a prisoner of war, but a slave purchased for sacrifice, the proprietor carried off the body from the altar for the same purpose. They cut only the legs, thighs, and arms, burning the rest.

GEOGRAPHY.

the Dutch, the English, and to furnish the greater part of the Spanish inhabitants of the same indolence which their ancestors, permit the Chinese to be less frequent; such as putting the victims to death by fire, drowning children of both sexes in the sea, flouting them up in a cavern, and suffering them to perish with fear and hunger.

But the principal sacrifice among the ancient Mexicans was that called by the Spaniards the Gladiation. This was an honourable death, and only prisoners distinguished by their valour were permitted to die by it. The prisoner was placed on a stone in a conspicuous part of the city, armed with a shield and a sword, and tied by one foot. A Mexican officer, soldier, better armed, mounted the stone to combat with him. If the prisoner was vanquished, he was carried by a priest, dead or alive, to the altar of the common sacrifices, where his breast was opened, and his heart taken out, while the victor was applauded and rewarded with some military honour. If the prisoner conquered six different combatants, who successively engaged him, he had his life and liberty granted, and was dismissed with honour to his native country.

performance of the common duties in the upper area of which ministers were the priests, on occasions, was clothed in a crown. On his head he wore a plume of feathers. The other ministers in number, were dressed in a blue robe, but embroidered with black and red, and lay over with the face of the ministers carried the victims to the altar of the temple, and handed the idol to whom they offered him upon the altar, and arms, and another wooden instrument made in the shape of a bow, and put about his neck a golden arch, the breast of which was totally prevented from moving by a priest then approached, and with a flint dexterously opened the heart, which, while he was doing so, the sun, and afterwards the idol: he then took it out, and preserved as a relic. These were of large size and hollowed out to introduce the heart, and were filled with a golden spoon. At the lips of the idol, and at the temple, with the blood of the victim was a prisoner of war, whose body, to prevent the heart from being carried off, was tied to his house, to the entertainment of his friends. This was a slave proprietor carried off for the same purpose. The latter arms, burning the reli-

quishing it for food for wild beasts and birds of prey. Some sects among them having slain the victim, tore the body in pieces, which they sold at market. Others sacrificed men to their gods, women to their goddesses, and children to their inferior deities. This was the most common mode of sacrifice: there were others less frequent; such as putting the victims to death by fire, drowning children of both sexes in the sea, flouting them up in a cavern, and suffering them to perish with fear and hunger.

But the principal sacrifice among the ancient Mexicans was that called by the Spaniards the Gladiation. This was an honourable death, and only prisoners distinguished by their valour were permitted to die by it. The prisoner was placed on a stone in a conspicuous part of the city, armed with a shield and a sword, and tied by one foot. If the prisoner conquered six different combatants, who successively engaged him, he had his life and liberty granted, and was dismissed with honour to his native country.

HISTORY OF MEXICO, AND CONQUEST OF IT BY THE SPANIARDS.

MEXICO was under the sole government of its monarchs, till the Spaniards, under the command of Fernando Cortez, invaded and conquered it. This expedition was undertaken with only 508 foot, sixteen galleys, and 108 seamen. Cortez, with his forces, landed on the coast of the bay of Campeachy, and having dispersed the natives with his artillery, marched to the city of Tobasco, which he seized upon. The next day the Indians assembled an army of 40,000 men, with which they attacked the Spaniards; but Cortez, at the head of the horse, attacking them in the flank, they retired. The day after the battle, the cacique, or prince, sent a solemn embassy to Cortez, to implore peace, attended with a present of such fruits and provisions as his country afforded, together with jewels, plumes, and painted cotton linen, and whatever he thought most acceptable to the conquerors. The ambassadors approached Cortez, and they used to do their gods, with golden pads or censers, in which they burnt aromatic gums, and other incense: the cacique afterwards came in person, and made his submission, bringing him twenty beautiful Indian virgins, which he made Cortez a present of. One of these, whom the general afterwards caused to be baptized by the name of Donna Marina, served him, during the whole expedition, in the double capacity of concubine and interpreter; for she was a

native of Mexico, a female of ready wit, and understood the customs of the country, and the language perfectly well; and indeed to her merit and address the Spaniards ascribe the success of their arms in a great measure. When the cacique of Tobasco came to make his submission, Cortez let him know, that he came from a powerful prince; and that his principal view was to make them all happy in this world and the next, by making them subjects of the same sovereign, and converting them to the true religion. To this the frightened cacique answered, that he and his people should think themselves happy in obeying a king, whose power and greatness appeared to such advantage in the valour of his subjects: but as to the point of religion, he gave very little hopes of their conversion.

As Cortez was about to advance still further with his fleet on the Mexican coast, he was under the greatest concern that he must leave those people before he had fully instructed them in the Catholic religion; and on Palm-Sunday, the day he appointed to embark his troops, he first caused an altar to be erected in the open field, where he celebrated high mass in the presence of the Indians, and all his troops marched in their ranks to the altar, with boughs or palms in their hands, to celebrate that festival: the procession seemed to excite in the natives the utmost awe and reverence, inasmuch that some of them cried out, "This must be a great God, that such brave men adore." Cortez sailed to the port of St. John de Ulva, where he landed, and Donna Marina acted as interpreter.

When the general was informed that Montezuma, the Emperor of Mexico, had sent to know the reason of the Spaniards invading his country, he answered ambiguously, but still preserved his design of penetrating into the country. Montezuma, in all his messages, tried to prevent the Spaniards from coming to Mexico, and Cortez as inflexibly persisted in that intent. He foresaw that the Mexicans would not be able to prevent his approaching Mexico, especially as he was joined, about this time, by a cacique, or prince of the country, named Zempoala, who offered to enter into an alliance with Cortez against Montezuma, whom he represented as a cruel tyrant and oppressor. The cacique furnished him with 400 men to carry his baggage, and others to draw his artillery, there not being any beasts in this part of the country fit to draw carriages, but every thing of this kind was done by the strength of men.

The Spanish commander continuing his march by the sea-coast to Vera Cruz, was joined there by about thirty caciques from the mountains, who reinforced his troops with 100,000 men; and some parties of Europeans, hearing of the success of Cortez, also voluntarily followed him thither, and joined his troops: whereupon he became so confident, that he burnt all his ships, and having fortified Vera Cruz, in which he left a small garrison, he began his march directly for the city of

Mexico, being joined by the people of Tlascala, a country of great extent, who offered to become subjects of the King of Spain; at which Montezuma was so alarmed, that he offered to pay the Spaniards an annual tribute, amounting to one half of his revenues; and, when he found it in vain to oppose the general's march, he thought fit to give him an invitation to his capital; but Cortez, who was determined to have the plunder of the capital city, pretended that the Mexicans were not sincere in their invitation, but had entered into a conspiracy to surprize the Spaniards, when they had drawn them into an ambuscade, and massacre them; and, therefore immediately began hostilities, and cut to pieces some thousands of Montezuma's subjects.

The Spaniards, after this, continuing their march, were attended by several other caciques and lords of the country, who complained of the intolerable oppressions of Montezuma; telling Cortez, that they looked upon him as their deliverer, sent from heaven to restrain and punish the injustice and cruelty of tyrants; to whom he promised his protection, and drawing near to Mexico, in order to strike the greater terror into the natives, he ordered his artillery and small arms to be discharged; and caused several Indians to be shot, that approached too near his quarters, while he lay encamped at Amemeca, on the borders of the Mexican lake. Here Prince Cacumatzin, the nephew of Montezuma, attended by the Mexican nobility, came to the general, and bid him welcome; assuring him, that he would meet with a very kind and honourable reception from the emperor; but intimated, that there having been lately a great scarcity of provisions in the city of Mexico, occasioned by unseasonable weather, they could not accommodate them as they desired; and, therefore, entreated he would defer his entrance into that capital, if he did not think fit entirely to decline going thither. But Cortez appearing determined to advance, the prince seemed to acquiesce; and the preparations for the reception of the Spaniards were continued.

Arriving at Quitlavaca, a city situated on an island in the great lake, five or six leagues from Mexico, Cortez had some apprehensions that the Mexicans would break down the causeway, and remove the bridges on it, which would have very much embarrassed him, because he could neither have advanced or retired in that case, especially with his horse and artillery. But the cacique of Quitlavaca, who appeared to be a friend of the Spaniards, very much encouraged the general, telling him, he had nothing to fear; that the prodigies in the heavens, the answers of the oracles, and the fame of the great actions and surprising arms of the Spaniards, had perfectly dispirited their emperor, and disposed him to submit to whatever the general should impose on him. Soon after, Cortez entered Mexico at the head of 450 Spaniards and 6000 Tlascalans; when they were met by Montezuma himself, who was brought in a chair of braten gold, on the shoulders of his favourite

courtiers. The conference between the emperor and the general was short, their speeches were suitable to the occasion, and the emperor commanded one of his princes, his relation, to conduct the general to the palace assigned for his residence, and then returned to his palace.

About noon, the Spaniards were brought to the house appointed for their reception, which was so spacious, as to contain all the Europeans and their auxiliaries: it had thick stone walls, flanked with towers on the roof of the palace was flat, and defended by battlements and breast work; insofmuch that, when the general had planted his artillery, and placed his guns, it had very much the appearance of a fortress. To this place Montezuma came the same evening, and was received by Cortez in the principal square of the palace, and that monarch having entered the room of state and seated himself, ordered a chair for Cortez, and a signal was made for his courtiers to retire to the wall: whereupon the Spanish officers did the same, and Cortez being about to begin his speech by his interpreters, Montezuma prevented him, by speaking as follows;

" Illustrious and valiant stranger! Before you disclose the important message the great monarch has come from has given you in command, it is necessary some allowance be made for what fame has reported us on either side. You may have been informed some, that I am one of the immortal gods; that my wealth is immensely great, and my palaces covered with gold; and on the other hand, you may have heard that I am tyrannical, proud, and cruel. Both the one and the other have equally imposed upon you: you see I am a mortal of the same species with other men; and though my riches are considerable, my vassals make them much more than they are; and you find that the walls of my palaces are nothing more than plain lime and stone. In like manner, no doubt, but the severity of my government been magnificent, but suspend your judgment of the whole, till you have an opportunity of informing yourself concerning it, and you will find that what my rebellious subjects call oppression, is nothing more than the necessary execution of justice.

" After the same manner have your actions been presented to us: some speak of you as gods; affirming that the wild beasts obey you; that you grasp the thunder in your hands, and command the elements while others assure me, you are wicked, revengeful, proud, and transported with an insatiable thirst after the gold our country produces.

" I am now sensible ye are of the same composition and form as other men, and distinguished from them only by accidents which the difference of countries occasions.

" These beasts (horses) that obey you are, probably a large species of deer, that you have tamed and brought up in such imperfect knowledge as may be attained by animals

between the emperor and his subjects. His speeches were suitable to the occasion, and he commanded one of his officers to conduct the general to the palace, and then returned to his quarters.

The Spaniards were brought to the reception, which was so liberal to the Europeans and their arms, flanked with towers, and defended by battlements, and somuch that, when the general entered the room of state, he placed his chair in the same evening, and was seated in the principal square of the palace. Cortez entered the room of state, and gave credit to his courtiers to retire to their apartments. The Spanish officers did the same, and began his speech by praising the emperor, which prevented him, by speaking

at stranger! Before you could see the great monarch in command, it is necessary that what fame has reported may have been informed to the immortal gods; that I, and my palaces cannot be proud, and cruel. I have equally imposed upon the mortal of the same species with myself, my riches are considerable more than they are; and my palaces are nothing more. In like manner, no doubt your government been magnificent of the whole, till you have turned yourself concerning me, that my rebellious subjects are more than the necessary

have your actions been made of you as gods; affirming you; that you grasp the command the elements, you are wicked, revengeful, and an insatiable thirst after

are of the same composition, and distinguished from me, the difference of countries

that obey you are, probably, that you have tamed and broken, as may be attained by

animals: your arms are made of a metal, indeed, unknown to us, and the fire you discharge from them, with such an astonishing sound, may be some secret taught by your magicians. As to your actions, my ambassadors and servants inform me, that you are pious, courteous, and governed by reason: that you bear hardships with patience and cheerfulness, and are rather liberal than covetous; so that we must, on both sides, lay aside our prejudices and prepossession, and enquire on what our eyes and experience teach us."

To this the general answered, "That it was true, the reports they had heard; some endeavoured to despise and asperse him, while others adored him. But the Spaniards, who were endowed with a penetrating spirit, easily saw through the different colours of discourse; and the deceit of the heart; that they gave credit to his rebellious subjects, or those who flattered him; but came in his presence, assured that he was a great prince, and a friend to reason; but very well satisfied, however, that he was a mortal, as they themselves were: that the beasts which obeyed him were not deer, but fierce and generous animals, inclined to war, and seemed to aspire after the same glory as their masters. That their fire-arms were the effect of human industry, and owed nothing to the skill of the magician, whose arts were abominated by the Spaniards."

Cortez, having thus given some answer to the emperor's speech, proceeded to inform him, "That he was ambassador from the most potent monarch under heaven, to desire his friendship and alliance: that there ought to be a communication and intercourse between their respective dominions; and by that means, the Spaniards might have an opportunity of convincing him of their errors, and, instead of blocks of wood (the works of men's hands) instruct them to worship and adore the true God, the Creator of the whole universe. That this was the first and principal thing which his master commanded him to insist on, as the most likely means of establishing a lasting amity; and, being united in principles of religion, their alliance might become indissoluble."

The emperor replied, that "he accepted the alliance proposed by the King of Spain; but as to the nature concerning religion, he totally objected to it, and making Cortez a rich present, returned to his palace."

For some time, Cortez continued very intimate with Montezuma, often visiting the Mexican court; and the monarch frequently came to the Spanish quarters, bringing presents to the general, and to his officers and soldiers, exhibiting shows and entertainments for their diversion. The Mexicans still treated the Spaniards with a respect that favoured of great humility and deference. Montezuma spoke of their king with the greatest veneration. His nobility paid a profound respect to the Spanish officers, and the people bowed down to the meanest Spanish soldier.

But an accident happened, which very much lessened the esteem, or rather dread, the Mexicans at first entertained of these foreigners. It was this: One of the emperor's generals, levying the annual tax imposed on the vassal princes in that part of the country, which lay in the neighbourhood of the Spanish garrison of Vera Cruz, these caciques, who had thrown off their subjection to the Mexican empire, and entered into an alliance with the Spaniards, applied themselves to John de Escalante, governor of Vera Cruz, for protection; who thereupon marched out of that fortress, with 40 Spaniards, and 3 or 4000 confederate Indians, to their assistance; and though he had the good fortune to defeat the Mexican general, yet one of the Spaniards was killed, and his head sent up to the court; and the governor, with five or six more of his garrison, were mortally wounded. This news being brought to Cortez, gave him great uneasiness; and the more, because he was informed, by the confederate Indians, that the Mexicans were consulting how to drive him out of their territories, which they did not apprehend to be impracticable since the engagement near Vera Cruz. The Spanish general, therefore, finding it impossible to maintain his authority among the Indians any longer, without entering on some action that might give them fresh cause of astonishment, and recover that reputation they seemed to have lost by that unfortunate accident, resolved to seize the person of Montezuma, and bring him prisoner to his quarters; and accordingly, at an hour when the Spaniards were used to pay their court to that prince, Cortez, having given orders for his men to arm themselves without noise, and possess themselves of all the avenues leading to the palace, in small parties, that no notice might be taken of it, went to the Mexican court, attended by several of his officers, and 30 soldiers, whose resolution he could rely on, and being admitted to the emperor's presence, he complained of the violation of the peace between them, by one of the Mexican generals falling upon his confederates, and afterwards killing a Spaniard, he had taken in cool blood. To which Montezuma answered, "That if any thing of that nature had been done, it was without his orders; and he was ready to make satisfaction for any injury that might have been done undesignedly, either to the Spaniards or their allies." But Cortez gave him to understand, that nothing would satisfy them but his surrendering himself into their hands, and residing with them in the palace assigned to the Spaniards for their quarters.

This insolent demand at first astonished Montezuma, who remained for some time silent; but recovering from his surprise, he said, that princes of his rank were not accustomed to yield themselves up to a prison; nor would his subjects permit this, even if he should forget his dignity so far. Cortez answered, "If he would go along with them voluntarily;

tarily, they were not afraid of any opposition his subjects should make; and they would treat him with all the regard due to his dignity: he might continue to exercise his authority as formerly, and no restraint should be put on his actions; only, for their security, he insisted that the emperor should reside among them." Montezuma, still refusing to put himself into their hands, was given to understand, that if he would not, they would carry him off by force, or murder him if they were opposed; whereupon he submitted to do what he found it was impossible to avoid; and gave orders to his officers to prepare for his removal to the Spanish quarters, whither he went in the usual state, and voluntarily, to all appearance, except that he was attended by a company of Spaniards who surrounded his chair.

The Indian monarch, as must be easily supposed, was rendered very miserable by this indignity; and his servants, lamenting their emperor's hard fate, threw themselves at his feet, endeavouring to ease him of the weight of his fetters; and though, when he recovered from his first amazement, he began to express some impatience, yet, correcting himself, he acquiesced in his misfortunes, and waited the event, not without apprehensions that there was a design against his life: but Cortez having seen his plan performed, by which he found he had struck such a terror into the Mexicans, that little was to be feared from them, he returned to Montezuma's apartment, and ordered his fetters to be taken off; and, as some writers relate, he fell on his knees, and took them off with his own hands; for which favour the emperor embraced and thanked him. But, what is still more difficult to be believed, they assure us, that Cortez gave the emperor leave to return to his palace, and that he refused the offer out of regard to the Spaniards; telling them, he knew very well that as soon as he was put out of their power, his subjects would press him to take up arms against them, to revenge the wrongs he had suffered: nay, the Spanish historians positively affirm, that, notwithstanding all the injuries and indignities they had offered to Montezuma, he expressed a more than ordinary friendship and regard for them, preferring their interest to that of his own subjects.

The Spanish historian, De Solis, relates, that Cortez gave Montezuma leave to go whither he pleased, which he seems to contradict in a very few lines afterwards: for he tells us, when that prince only desired to perform his devotions in one of his temples, it was granted upon certain conditions, namely, that he should give his royal word to return to the Spanish quarters again, and from that day abolish human sacrifices; and we make no doubt but they insisted on a third, viz. that he should take a guard of Spaniards with him; for they acknowledge that a body of Spaniards actually attended him to the temple, which they could do with no other view than that of se-

curing their prisoner: though De Solis says, indeed it was at the request of Montezuma that they went with him: nor did he ever go abroad without a Spanish guard, or without asking leave of Cortez, or ever lay one night out of their quarters, by their own confession; which they would have us ascribe purely to choice, and his affection to the Spaniards, who had put such indignities upon him. They add, that Cortez was now become his prime minister, that all posts of honour or profit were disposed of by him and his principal officers, who were courted by the Mexican nobility, when they saw that no places or preferments could be had but by their interest, which possibly might be true; but surely it is much more probable that Montezuma was influenced more by his fears than his affection for the Spaniards. And we may observe from hence, that, with all these advantages, Cortez, and his Spaniards, might have established their power upon such a foundation, could not easily have been overthrown, without such a deluge of blood as they spilt afterwards, if Cortez had been as able a politician as he was a soldier; or if his benevolence and humanity had exceeded his cruelty and avarice.

Cortez seems to have left scarce any means tried for his security and establishment but the principal, namely, gaining the affections of the Indians, and winning them over to his party, as well as to the Christian religion, by acts of generosity and beneficence. He was so careful of himself, that he caused some brigantines to be built on the lake of Mexico, whereby he entirely commanded the lakes and the causeways leading to the city; and at the same time he increased his reputation with the Mexicans by the artful management of those vessels; for the Indians were, at this time, ignorant of the use of sails and rudders.

About this time, Don Diego Velasques, governor of Cuba, being informed that Cortez had met with great success in Mexico, and was endeavouring to render himself independent of him, declared him a rebel, and sent Pamphilio de Narvaez, with 800 men, to reduce him, and take upon him the command of the Spanish forces in Mexico. Whereupon Cortez leaving a garrison in the city of Mexico, and confining Montezuma there, marched to meet Narvaez his rival, surprised him in the night, made him prisoner, and so corrupted the officers of the troops that came over with Narvaez, by the presents he made them, that they agreed to join Cortez. Thus reinforced, he returned to the city of Mexico again; and now imagining himself powerful enough to subdue that empire by force, without counting Montezuma or his subjects, he treated the monarch with great contempt. But some of the Spanish historians observe, that in this he committed a very great error: for had the general, on his returning in triumph with such an addition of forces, en-

gh De Soto says, indeed, Montezuma that they were never go abroad without asking leave of Cortez of their quarters, by they would have us ascribe affection to the Spaniards upon him. They add some his prime ministers profit were disposed of by others, who were courted by them they saw that no place had but by their interest; but surely it is much Montezuma was influenced more affection for the Spaniards; hence, that, with all the his Spaniards, might have soon such a foundation, overthrown, without such spilt afterwards, if Cortez as he was a soldier; humanity had exceeded his

left scarce any means of establishment but the private affections of the Indians to his party, as well as acts of generosity and careful of himself, that to be built on the lake were merely commanded the lake to the city; and at his reputation with the Mexican of those vessels; at the time, ignorant of the

Diego Velasquez, governor that Cortez had met with and was endeavouring to get of him, declared him to be de Narvaez, with whom he take upon him the command in Mexico. Whereupon he in the city of Mexico there, marched to meet him in the night-time, to corrupted the officers of with Narvaez, by the night that they agreed to join Cortez returned to the city, imagining himself powerful in the empire by force, without his subjects, he treated them apt. But some of the Spaniards in this he committed the general, on his return an addition of forces, en-

tered into a treaty with that emperor and his nobility, they would have yielded to almost any terms; and he might have gained the dominion of that empire, for the King of Spain, his master, without any bloodshed. But he was too much elated with success, to think of such measures. On the contrary, he resolved to give the Mexicans all manner of provocations, and even rendered them desperate, that he might have a colour to destroy them, and seize all their possessions, whether lands or treasure. He found a garrison of 80 Spaniards able to repel the whole force of Mexico; and he did not doubt, now he saw himself at the head of 1100 Spanish horse and foot, with a multitude of confederate Indians, he should be able, by force, to reduce the Mexicans, and make slaves of them.

But Cortez was near paying very dear for his presumption; for sending out a detachment of 400 Spaniards and confederate Indians in search of the enemy, who were retired to the furthest part of the city, they were surrounded, and in danger of having their retreat cut off; and he himself, with the rest of his troops, very narrowly escaped being starved, or cut in pieces; the Mexicans, rendered brave by their despair, were not afraid to attack Cortez in his quarters, though defended by a numerous garrison, and a train of artillery; and when, at any time, he made a sally, he found intrenchments in the streets, and the bridges broken down, which rendered his cavalry, in a manner, useless; and though he usually came off victorious, he found he had committed a very great error in putting himself up in Mexico, from whence it was almost impossible to make his retreat, and where he found it impracticable to fetch in provisions; the enemy being masters of all the causeways that led to the town, and of all the boats upon the lake; so that if his people were not destroyed by the continual attacks of the enemy, they must certainly, in a short time, be reduced by famine. In this distress, Cortez thought fit to endeavour a reconciliation with Montezuma, and to make use of the authority he still retained among his subjects, to induce them to lay down their arms, and permit the Spaniards to march out of Mexico, which, if it was presumed, they would readily have come into, that they might get rid of a people so much dreaded, as well as hated, by them.

Accordingly, a parley being proposed and agreed to, Montezuma appeared on the battlements of the place, and some of the Mexican nobility advancing to hear what overtures he would make them, the Spaniards tell us, their emperor made a speech to his subjects, wherein he greatly reprimanded them for taking up arms without his leave, though it was with intention to obtain the liberty of their prince, desiring that he was, in reality, under no manner of constraint, but remained with the Spaniards from choice; that he thought himself obliged to throw the Spaniards in favour, on account of the respect they had always

paid him, and out of duty to the prince that had sent them; that their embassy being dispatched, he was about to dismiss these foreigners from his court, and desired his subjects would lay down their arms, and not interrupt their march, and he would readily pardon their having taking up arms; or to that effect.

This speech was but little regarded by the Mexicans, who knew that whatever their emperor's words were, they were put into his mouth by the Spaniards, whose prisoner he was, and tended only to procure them a safe retreat; and they were sensible, if they lost the advantage they had, they must never expect such another opportunity of getting rid of these unwelcome guests. They had them now cooped up in this fortress, where no relief could be brought them, and from whence it was scarce possible for them to retreat, if the Mexicans broke down the bridges and causeways upon the lake, and made such ditches and trenches in the streets, as the Spaniards themselves had taught them; but forefaw, if ever their enemies got over the lake again, they might not only receive fresh reinforcements from Spain and their Indian allies, but they must engage them to great disadvantage in their open country, having nothing to oppose their horse and artillery. The Mexicans resolved, therefore, not to consent to a cessation of arms, but rejected the overture with disdain, as being framed only to give their mortal enemies an opportunity of escaping out of their hands, and reinforcing themselves to the destruction of their country; and they were so enraged at the overture, that they shot at their emperor for making it to them, and mortally wounded him.

The Spaniard, finding the Mexicans were not to be amused with insidious proposals, from what hand soever they came; that his provisions were almost spent, and that it would be impracticable to make his retreat in the day-time; resolved to attempt it in the dark night. Having divided the treasure, therefore, amongst his men, with which they were pretty well loaded, for it amounted to an immense sum, he issued out of his quarters at midnight, the weather being extremely tempestuous, whereby his march was for some time concealed; but he had not advanced a mile upon the causeway before he found himself attacked on every side by the Mexicans, both by land and water, the lake being filled with their canoes or boats; and as they had broken down the bridges, and cut the causeways through in several places, the Spaniards were in great danger of being entirely cut off. Cortez, indeed, had foreseen this, and provided a portable bridge to pass the breaches in the causeway, which was of great use to him in several places; but the Indians found means to destroy this bridge before they were all passed over, and their rear-guard, consisting of 2 or 300 Spaniards, and 1000 confederate Indians, were cut in pieces. They also lost their artillery, prisoners, baggage, and treasure, with 46 horses. Cortez,

tez, however, with the best part of his force, broke through the Indians, and escaped to the other side of the lake. Some impute this loss to the avarice of his soldiers, who were so loaded with gold and silver, that they could scarce make use of their arms; and possibly there may be some truth in it: but we believe every one who considers his circumstances, must be of opinion, that he was very fortunate in escaping so well. Had the enemy provided a body of forces to oppose him on the further side of the lake, he must inevitably have perished; but they did not expect his falling out so suddenly, especially in that tempestuous season, and were not, therefore, provided to attack him.

The Spanish historian endeavours to give us a particular account of this action, admires the valour and conduct of Cortez and his officers, and informs us how every one distinguished himself in this memorable retreat. He proceeds to inform us, that they arrived just as it was day-light on firm land, and thought themselves very happy that there was no army to oppose them there, and that they were pursued no further, till they had time to form and recover themselves from their consternation.

This good fortune, it seems, was owing to the compassion the Mexicans expressed for the two sons of Montezuma, and several princes of the royal blood, whom they found slaughtered among the Spaniards, when the day-light appeared. The Mexicans relate that Montezuma himself was of this number; and that the Spaniards murdered both him and his sons, when they found they could not carry them off. The Spaniards, on the other hand, say, that Montezuma was killed before by the arrows of the Mexicans; and that the princes, also, were accidentally killed in the engagement while it was dark, as they could not distinguish friends from foes. But however that was, it is agreed that the princes were found dead, pierced through with many wounds; and the Mexicans deferred the pursuit of the Spaniards, to solemnize the obsequies of those two princes, or of Montezuma himself. To which piece of piety, Cortez and the Spaniards, who were left alive, in a great measure owed their safety.

The Spanish forces having halted some time to refresh themselves, and take care of their wounded men, continued their march towards Tlascala, the country of their faithful allies and confederates: but they had not advanced many leagues before they were again overtaken, and attacked by the Mexicans, at a time when they were so fatigued and harassed, that had not Cortez taken possession of a temple, that very fortunately lay in his way, he would have found it difficult to have repulsed the enemy. But the Mexicans, finding they could make no impression on the Spaniards, as they lay entrenched within those walls, thought fit to found a retreat. However, Cortez apprehending he should be distressed here for want

of provisions, began his march again at midnight, with great silence, in hopes to have got the start of the enemy so far, that he should have reached the Tlascalan territories before they could have overtaken him; but, to his great surprize, being arrived on the top of a very high mountain, he discovered the whole army of the Mexicans, consisting of 200,000 men drawn up in battalia in the valley of Otumba, through which it was necessary to pass, in his way to Tlascala; whereupon Cortez made only this short speech to his officers, "We must either die or conquer," and finding an uncommon ardour in his soldiers, he immediately led them on.

The fight was, for some time, bloody and obstinate, and Cortez, apprehending his men would be wearied out by the continual supplies of fresh forces, which the Indians poured in upon him, gave a surprizing turn to the battle, by attacking the imperial standard carried by the Mexican general, who was surrounded by the nobility; for having routed them, killed the general, and taken the standard, the rest of their troops turned their backs and fled, and were pursued with incredible slaughter by the Spaniards and their Indian allies, who made themselves ample amends with the spoils of the enemy, for the treasure they lost in retiring from the city of Mexico. Cortez now found it necessary to cultivate a good understanding with the caciques and princes of the country, and to take the troops into his service; and made himself master of such posts as might be of most advantage to him, reducing the city of Mexico; and as he could not approach it by land, but on the causeways, he built brigantines and sloops, whereby he became master of the navigation of the lake, and then attacked the town by water as well as on the land side, having about 1000 Spaniards in his army, and 200,000 Indian allies. He took the city by storm on the 13th of August 1521. One hundred thousand Mexicans perished in the defence of the city; and this conquest was attended with the submission of most of the neighbouring provinces, who consented to acknowledge themselves the subjects to the king of Spain (the emperor Charles V.)

The city of Mexico being thus reduced, Cortez distributed the plunder among his soldiers, retaining only a fifth, with the most remarkable curiosities, for the king, which he sent to Spain by some of his principal officers, together with an account of his conquest, and the state of that country, desiring his majesty would confirm the magistrates he had appointed to govern it, with the grants of the conquered lands and Indian slaves he had made, to his soldiers. Among the rich jewels Cortez sent to the emperor, it is said there was a fine emerald, of a pyramidal form, as large as the palm of a man's hand at the biggest end, a noble set of gold and silver vessels; several things cast in gold and silver, viz. beasts, birds, fishes, fruits, and flowers; bracelets, rings, pendants, and other

ornamental pieces of plate and jewels; some of their cloths, cotton vestments of their priests, furs, and feathers of various colours.

The general requested his Imperial Majesty to send over persons qualified to survey the country, that it might be improved to the best advantage, with the priests and missionaries for the conversion of the people; as also cattle, with seeds and plants to improve the lands: but, it is said, he provided particularly

against the sending over physicians or lawyers. What could have been his reason against sending physicians, is not easy to be conceived; but he had certainly all the reason in the world to desire that neither laws or lawyers should be admitted there, having determined to treat the natives as slaves, and seize both their persons and possessions, and, indeed, to usurp an arbitrary dominion over both Spaniards and Indians in the New World.

SPANISH DOMINIONS IN SOUTH AMERICA.

C H A P. XXI.

TERRA FIRMA, OR CASTILLA DEL ORO.

Location, Boundaries, Divisions, Bays, Harbours, Capes, Climate, Soil, Vegetable Produce, Animals, Fish, Natives, Commerce, and Government.

THE province of Terra Firma is situated between the equator and 12 deg. north lat. and between 80 and 82 deg. of west long. being about 1400 miles length, and 700 in breadth. It is bounded on the north by a part of the Atlantic Ocean, called the North Sea; on the south by Peru and the country of the Amazons; on the east by Guiana; and on the west by Old Mexico and the Pacific Ocean. It is divided as in the following table:

DIVISIONS. SUBDIVISIONS. CHIEF TOWNS.

	} Terra Firma,	} Porto Bello,

The line which separates Terra Firma from the Kingdom of New Spain, forms also the boundary between North and South America. This boundary is drawn across the isthmus of Darien, a few leagues to the westward of Porto Bello and Panama. It

crosses the isthmus in its narrowest part, which is not here above sixty miles in breadth.

The chief bays in Terra Firma are those of Panama and St. Michael, both in the South Sea. In the North Sea are the bays of Porto Bello, Sino, Carthagena, Maracaiba, Guiana, and Curiaico, together with the gulfs of Darien, Venezuela, Tricsto, and Paria.

The principal harbours are those of Porto Bello and Carthagena.

The capes most worthy of notice are, Cape del Agua, de Vela, Conquibacao, Cabelo, Blanco, Galera, Three Points, Nassau, Sambles Point, Point Canoa, and Swart Point.

The climate is neither pleasant nor healthy; the inhabitants, one part of the year, being scorched by the most intense and burning heat, and the other almost drowned with perpetual floods of rain, pouring from the sky with such violence as if a general deluge was to ensue.

In so large a tract of country, the soil must necessarily vary. Accordingly, in some parts, it is a barren sand, or drowned mangrove land, that will scarce produce any kind of grain; in others, it yields Indian corn, balsms, gums, and drugs, almost all manner of fruits, as well of Old as of New Spain, sugar, tobacco, Brazil wood, and several kind of dyeing woods; a variety of precious stones, particularly emeralds and sapphires; venison, and other game. The plantations of cacao, or chocolate nuts, in the district of Caracas, are esteemed the best in America. The trees, most remarkable for their dimensions, are, the cedar, the maria, and balsam-tree. The manchinel tree is very remarkable: it bears a fruit resembling an apple, but which, under this specious appearance, contains the most subtle poison, against which common oil is found to be the best antidote. Such is the malignity of this tree, that should a person only sleep under it, he would find his body all scalled, and racked with the severest tortures. The bralls, from instinct alone, avoid it.

The mountains abound with tygers, and, according to fable, with lions, and great numbers of other wild beasts. Among the animals peculiar to this country, the most remarkable is the Sloth, or, as it is called by way of derision, the Swift Peter. It bears some resemblance to an ordinary monkey in shape and size, but is of a most wretched appearance, with its bare hams and feet, and its skin all over corrugated. He stands in no need of either chain or hutch, never stirring, unless compelled by hunger, and is said to be several minutes in moving one of his legs, and blows do not make him mend his pace. When he moves, every effort is attended with such plaintive and disagreeable cries, as excites at once pity and disgust. The whole defence of this wretched creature consists in this cry; for on the first hostile approach he naturally puts himself in motion, which is always accompanied with disgusting howling, so that his pursuer flies much more speedily in his turn, to be beyond the reach of the horrid noise he makes. This animal, when he finds no wild fruits on the ground, looks out with a great deal of pains for a tree well loaded, which he ascends with a great deal of uneasiness, moving slowly, crying, and stopping by turns. Having at length mounted the tree, he plucks off all the fruit, and throws it on the ground, to save himself such another troublesome journey, and rather than undergo the fatiguing labour of coming down again, he wraps himself together in a bunch, and with a shriek drops to the ground. Other species of monkeys are very numerous in these countries; they keep together 20 or 30 in a herd, rambling over the woods, leaping from tree to tree, and if they meet with a single person, he is in danger of being torn to pieces by them; if not, they chatter, and make a frightful noise, throwing things at him; they hang themselves by the tail on the boughs, and seem to threaten him all the way he passes, but they usually scamper away, when they see two or three people together. Many of the animals of North-America, already described, are found in these southern parts.

The rivers, seas, and lakes, teem with fish, and also with alligators; and the bowels of the earth were once furnished with the richest treasures, now almost exhausted. The same may be said of pearl fisheries on the coast, which are far from being so profitable now as formerly.

The natives of Terra Firma are bold and warlike, and as they have almost impregnable and inaccessible fortresses, and bear an inveterate hatred to the Spaniards, they never have been, and it is probable never will be, entirely subdued. They have lank, coarse, long black hair. Their natural complexion is a copper colour. The inhabitants are differently dressed, according to the Spanish fashion. The men wear a cassock without folds, descending to the knees, a large cape, and sleeves open at both sides; it has button-holes, and two rows of buttons. The habits of the

better sort are made of embroidered stuffs. The Indians wear a blue stuff, of the manufacture of the country, but in make it differs not from the other. The Indians of distinction are singular, in wearing a kind of trowsers of white cotton, which descends from the waist to the middle of the leg. The ladies wear the *Faldelin*, a species of stays or rather jumps, a shirt which descends only to the waist; a bay mantle encloses the upper part of the body, consisting of a full and a half of that stuff; and their whole dress is ornamented with rich laces. The dresses of the laboring women are not distinguishable from that of the ladies, but by its inferior quality, the fashion being the same. A mongrel, or Creole, is known by the superiority of his habit and his ingenuity. The Indian peasant wears a bay mantle; and the common native Indian, a piece of sackcloth fastened over the shoulders by two pins.

The commerce of this country is chiefly carried on from the ports of Panama, Carthagena, and Porto Bello, which are three of the most considerable cities in Spanish America, and each containing several thousand inhabitants. Three annual fairs, for Indian, American, and European commodities are held here. Among the natural merchandise of Terra Firma are the pearls found on the coast, particularly in the bay of Panama, are not the least considerable. An immense number of negro slaves are employed in fishing for these, and their dexterity in this occupation is very surprising. This kind of fishing is of great advantage to the inhabitants of all the islands in the bay, since every one of these negro-divers is obliged to deliver to his master daily a certain number of pearls. They are sometimes, however, devoured by fish, particularly the sharks, while they dive to the bottom, or are crushed against the shelves of the rocks.

The government of Terra Firma is on the same footing with that of Mexico. The governor of Porto Bello, who always belongs to the army, is subordinate to the president of Panama, which is the capital town, whither all the treasures of gold and silver with other rich merchandise from all parts of Peru and Chili, are brought, and lodged in store-houses till they can be transported to Europe.

DIVISION.	PROVINCES.	CHIEF TOWNS.
North division	Quito	Quito, Payta.
Middle division	Lima, or Los Reyes	Lima, Cusco, & Callao.
South division	Los Charcos	Potosi, Porco.

The Pacific Ocean, or South Sea, borders on Peru.
The principal bays and harbours are Payta, Mala-
ngo, Cuanchaio, Cofina, Vermeio, Guara, Ylo, Arica,
and Callao, the port-town to Lima. The rivers are,
Granada, or Cagdaleira, Oronoque, Amazon, and
late, which rise in the Andes, as do likewise many
others, which fall into the Pacific Ocean, between
the equator and eight deg. south lat. The water
of most of the rivers is as red as blood; others, in
their course, turn whatever they touch, or pass over,
into stone; and here are fountains of liquid matter,
called Coppey, resembling pitch and tar, and used
for that purpose by the seamen.

Though this country is situated within the torrid
zone, it is not so prodigiously hot as tropical countries
in general are, and in some parts the cold is even
painful. By the elevation of Peru above the surface
of the sea, or rather of the whole earth, the winds
are more subtle, congelation more natural, and the
heat moderated. The sky too, which is almost con-
stantly covered with clouds, shields them from the
direct rays of the sun; but what is remarkable, it
scarcely ever rains here, which defect is supplied by a
soft, kindly dew that falls every night, and refreshes
the vegetable creation sufficiently, so as to produce in
many places the greatest fertility; but near Quito
they have sometimes very heavy rains, attended by
frequent storms of thunder and lightning; earthquakes
are also frequent, and sometimes very destructive in
this country. The soil, in the inland parts of Peru,
and by the banks of rivers, is usually very fertile, but
along the sea coasts it is a barren sand.

Vast quantities of cattle were imported by the
Spaniards into Peru, when they took possession of that
country; these are now so amazingly increased, that
they run wild, and are hunted like game. There are
a few wild beasts, and those not very fierce or dangerous;
but the most remarkable animals are the Peruvian
sheep, called lamas, and the vicunnas. The lama in
several particulars resembles the camel, as in the shape
of its neck, head, and some other parts; but has no
hump, is much smaller, and cloven-footed. Its upper
lip is cleft like that of a hare, through which, when
enraged, it spits a kind of venomous juice, that in-
flames the part on which it falls. The wool with
which it is covered, is of different colours, but usually
brown. These animals are naturally docile, so that
the Indians use them as beasts of burden, and they

will carry any load under a hundred weight. Formerly
they used to eat their flesh, and still continue to make
that use of such as are past their labour, esteeming it
preferable to mutton. The vicunna resembles the
lama in shape, but is smaller, and its wool shorter and
finer. It is brown all over the body except the belly,
which is whitish. In this creature is found the be-
zoar-stone, esteemed a specific against poisons.

The most remarkable birds found in Peru are the
cendors, and zumbadors or hummers. The cendor
is prodigiously large and strong, and in colour and ap-
pearance resembles the bird called galinazo, and
like that, is exceedingly carnivorous, frequently seizing
the lambs as they are feeding on the heath, and flying
away with them. The strength of this bird is so
great, that it will sometimes knock down with its
wing the man who approaches to kill it: their wings
also serve them as a shield, by which they ward off
blows aimed at them. The zumbador, or hummer,
is a bird peculiar to the mountainous deserts of Peru.
They are seldom seen, though frequently heard, both
by their singing, and a strange humming made in the
air by the rapidity of their flight, which, when near,
causes a noise equal to that of a rocket. The insects
found in Peru are musquitoes in prodigious numbers,
miguas, and several others equally venomous: also a
variety of beautiful butterflies; and that valuable
article in the commerce of this country, the cochineal,
formerly supposed to be the fruit or seed of a plant, but
is now proved to be an insect; as hereafter described.

The vegetable productions are, plenty of European
corn, maize, cassava, and other roots; pine-apples,
melons, grapes, from which the Peruvians make ex-
cellent wine and brandy, guavaes, patolas, bananas,
tamarinds, olives, and figs; several sorts of gums and
drugs, as sarsaparilla, dragons blood, balsam of Tolu
and Peru, some rhubarb, storax, and guaiacum. Among
their forest-trees the most valuable is that which yields
the quinquina, or Jesuits bark. It is about the size
of a common cherry-tree; the leaves are round and
indented, and it bears a long reddish flower, from
whence arises a pod, containing a kernel resembling
an almond; but neither the kernel nor the fruit have
the same virtue as the bark, which is an efficacious
medicine in intermitting fevers, and various other
disorders. In the plains of Truxillo there is a tree
which bears twenty or thirty flowers, all of them dif-
ferent, and of divers colours, hanging together like a
bunch of grapes. Another, called maguey, is of the
utmost use to the inhabitants, as it supplies them
with honey, vinegar, and drink. The stalks and leaves
are not only good to eat, but may be wrought like
hemp; and from them they make a thread called
pica. The wood is fit for covering houses; the
prickles or thorns, with which it abounds, serves for
needles, and the fruit has all the qualities of soap.
Guinea or Cayenne pepper, is produced in the great
abundance in the vale of Arica, a district in the

southern parts, from whence they export it annually to the value of six hundred thousand crowns.

That valuable article of the commerce of this country, cochineal, formerly supposed to be the fruit or seed of some particular plant, but now ascertained to be an insect; it is bred on a plant called Opuntia, or Prickly Pear, which consists wholly of thick succulent oval leaves joined end to end, and spreading out on the sides in various ramifications. The flower is large, and the fruit resembles a fig; this is full of a crimson juice, and to this juice the cochineal owes its colour. When the rainy seasons come on, those who cultivate this plant cut off the heads which abound most with such insects as are not arrived at their full growth, and preserve them very carefully from the weather and all other injuries. These branches, though separated from their parent stock, preserve their juices for a long time, and this enables the insect not only to live till the rains are over, but to grow to its full size, and be in readiness to bring forth its young as soon as the inclemency of the season is past. When this time comes on, they are brought out, and placed upon the proper plants, disposed in little nests of some mossy substance. By the enlivening influence of the fresh air, they bring forth in three or four days at furthest, when the young, scarce bigger than a mite, run about with wonderful celerity, and the whole plantation is immediately filled. What is singular, this animal, so lively in its infancy, quickly loses all its activity, and, attaching itself to the least exposed, and most succulent, part of the leaf, clings there without ever moving. It is also remarkable, that it does not, at least in any visible manner, injure the plant, but extracts its nourishment by means of its proboscis, through the fine teguments of the leaves. The males, of this species of insect, differ greatly from the females, than which they are smaller. The males, in fact, are of no value, the females only being gathered for use. The value of the drug chiefly consists in the method of killing and drying the insect. The first is, by dipping the basket, into which they are gathered, into boiling water, and afterwards drying them in the sun; the second, by drying them in ovens; and the third, by drying them on cakes of maize, which are baked upon flat stones. The last is the worst kind. One admirable quality of this drug is, that, though it belongs to the animal creation, it never decays. Without any other care than having been put into a box, some have been known to keep 60, and even an 100 years, and retain their quality. It is used in dyeing all the several kinds of the finest scarlet, crimson, and purple.

In the northern parts, not far from Lima, there are many gold mines; and silver is produced in great abundance in various provinces; but the old mines are constantly decaying, and new ones daily opened. The towns thit with the mines. That of Potosi, when first worked at an easy expence, contained

90,000 souls, Spaniards and Indians, of which the latter were six to one; but the miners having dug very deep, the silver is not so easily brought up.

Lima, the capital of Peru, and of the whole Spanish empire, is situated in a fine valley, about two leagues from the sea, in lat. 12 deg. 2 min. south. It is large, magnificent, populous, contains many noble structures, and is the residence of the viceroy. The city is well watered by the river Rimac; and for the splendour of its inhabitants, the grandeur of its public festivals, the extent of its commerce, and the deliciousness of its climate, is superior to all other cities in South-America. These eminent advantages are however ever considerably overbalanced by the dreadful earthquakes which frequently happen here, and which have the inhabitants in perpetual apprehensions of being buried in the ruins of their own houses: it has more than once been laid in ruins by these tremendous convulsions of nature.

The last earthquake happened in the year 1746, when Callao, the sea-port of Lima, was entirely swallowed up, and three-fourths of the capital levelled with the ground. The destruction of Callao was the most perfect and terrible that can be conceived, not only of all the inhabitants escaping, and so by a providence the most singular and extraordinary imaginable. This man was on the fort which overlooks the harbour, going to strike the flag, when he perceived the sea to retire to a considerable distance, and then swelling in a mountainous wave, returning with irresistible violence. The inhabitants ran from their houses in the utmost terror and confusion; he heard a dreadful cry rise from all parts of the town, and immediately all was silent; the sea had utterly overwhelmed the place, and buried it for ever in its bosom; but the same wave which destroyed the town, drove a little boat by the place where the man stood, into which he threw himself, and was saved. The town, before this dreadful earthquake happened, contained about 3,000 inhabitants. But the calamity did not stop here; for the convulsions continued, with short intervals, for the space of four months afterwards, in which time no less than 450 shocks had been felt, some of them no less violent than the first, so that it was computed 12,000 people perished, some being swallowed up in the earth, or buried in the ruins of their houses and effects, and others drowned by the waves of the sea, which laid great part of the neighbouring country under water.

This city, which extends two miles in length, and one and a quarter in breadth, contains about 60,000 inhabitants, of whom the whites make only a sixth part. Its wealth will be sufficiently demonstrated by the following remarkable event: when the viceroy, the Duke de la Paladas made his entry into Lima in 1682, the inhabitants, to do him honour, caused the streets to be paved with ingots of silver, amounting to seventeen millions sterling. general mention with astonishment the decorations of
the churches with gold, silver, and precious stones,
which load and ornament even the walls.

Cusco, the capital of the empire of Peru before the
arrival of the Spaniards, and the ancient seat of the
Incas, stands above 326 miles from Lima towards the
south. It was then very large, magnificent, and popu-
lar. Here stood the famous Temple of the Sun,
which was called Curiachanchi, and contained im-
mense riches. The Incas resided in a part of the
temple, the walls of which were incrusted with gold
and silver, and the whole fortress was built of stones,
so long that several oxen could hardly draw one of
them. It is still a considerable town, containing about
30,000 inhabitants, three parts Indians. The air is
very pure and wholesome, and the neighbouring
country very pleasant and fruitful. Here are some
manufactures of bays and cotton cloth, and leather;
and in the adjacent mountains are gold and silver
mines.

Quito, the capital of the province of the same
name, is seated in a pleasant valley, between two
chains of high mountains. It is about a mile in
length, and three quarters of a mile in breadth, and
is a bishop's see. There are several religious com-
munities, and two colleges, which are a sort of uni-
versities, under the direction of the Jesuits and Do-
minicans. It contains about 35,000 inhabitants, of
which one third are original Spaniards. All sorts of
merchandises and commodities are exceeding dear,
chiefly on account of the difficulty of bringing them
thither. It is the seat of the treasurer of the kingdom,
as well as of the other officers.

A very extensive commerce is carried on by the
merchants of Lima, who are immensely rich; they
are said to deal with all the quarters of the world, and
that both on their own accounts, and as factors for
others. Here all the products of the southern
provinces are conveyed, in order to be exchanged at
the harbor of Lima for such articles as the inhabi-
tants of Peru have occasion for; the fleet from Europe,
and the East-Indies, land at the same harbour; where
the commodities of Asia, Europe, and America, are
bartered for each other. The merchants of Lima
purchase on their own accounts what there is not an
immediate vent for, which they lay up in warehouses,
knowing that they must soon have an opportunity of
selling them, from the great communication they have
with almost every trading nation. There are in Cusco
several manufactures of cotton, wool, and flax, which
supply all the kingdom of Peru with those articles.
Those who trade in European commodities, resort to
Potosi, as to a market, where they are sure of con-
verting their merchandise into silver. Another species
of commerce, carried on by a set of people called
Aviadores, consists in exchanging coin, towards paying
the necessary expences of the workmen, for ingots and
pianos. The article of silver is wholly engrossed by

the crown. At Lima, there is a treasury court, for
receiving a fifth of the produce of the mines, and cer-
tain taxes paid by the Indians, which belong to the
King of Spain.

The inhabitants of Peru greatly resemble those of
Mexico, only the former seem to be of a more liberal
turn, and of greater ingenuity; but they are equally
defstitute of all cultivation, and possess a most un-
bounded share of laziness and pride.

The slavery of the Indians is, if possible, more se-
vere than in other parts of the Spanish West-Indies.
The magistrate and the priest devour their whole sub-
stance, and every Spaniard insults them with impunity.
The native Spaniard has alone all the lucrative offices,
civil, ecclesiastical, and military. He despises the
Creolian: the Creolian hates and envies the Spaniard;
both contemn and maltreat the Indians, who, on their
side, are not insensible of the indignities they suffer:
even the Blacks are encouraged to trample on the
Indians, and to consider their interests as altogether op-
posite; whilst the Indians, in their nominal freedom,
look with an envious disdain upon the slavery of the
Negroes, which makes them their masters.

Peru is governed by a viceroy, who is absolute;
but it being impossible for him to superintend the
whole extent of his government, he delegates a
part of his authority to the several audiences and
courts, established at different places throughout his
territories.

THE HISTORY OF PERU.

THIS country was discovered by a Spaniard called
Valco Numez de Balbao, and no design was enter-
tained of conquering it, till the conclusion of the war
in Mexico, when the expedition was undertaken by
three private persons, viz. Pizarro, Almagro, and De
Luque; the two first being officers, and the last an
ecclesiastic. It was stipulated, that Pizarro should
command the embarkation; that Almagro should from
time to time raise and send him recruits: and, that
De Luque should remain at Panama, and lay in am-
munition and provisions for the support of the enter-
prize: and they agreed to share the profits arising by
the expedition equally, after the emperor's fifth should
be deducted.

Pizarro met with many difficulties, in his first at-
tempt, from the cross winds and currents; these, and
the incessant rains that fell near the Equator, were
such discouragements, that all his men forsook him,
and returned to Panama, except fourteen; but Al-
magro joining him with some recruits, these two
heroes determined to continue their course to the
southward, and having crossed the bay of Panama,
went on shore, expecting to have found a passage to
Peru by land; but the country being overflowed, and
encumbered by rocks, woods, and mountains, they
were

were obliged to return on board again, and setting sail to the southward, made so little way, that they were two years in advancing to the bay of Guaiquil. The first considerable town they visited there was the city of Tumbez, to the cacique whereof Pizarro sent one of his officers, to let him know they came as friends, and the cacique thereupon sent them all manner of refreshments.

Not having a sufficient body of troops to undertake so important an expedition, he returned to Panama for reinforcements, taking with him some of the inhabitants, animals, and treasures of Peru. Pizarro then went to Spain, procured the emperor's commission, returned and took with him three of his brothers, and set sail for Panama upon another expedition, A. D. 1530. He had now with him 125 soldiers, and 37 horses, with which he landed and began his depredations. The Indians fled before him, but many of his people dying, he sent the ships back laden with plunder, to bring more recruits. Almagro joining him with reinforcements, they advanced together, defeated a large body of Peruvians, took the town of Tumbez, with immense treasures which were heaped up in the temple of the Sun and the inca's palace. They now erected a fortress near the sea, and then pursued the inca or emperor Atabilipa.

Finding that the Peruvians were engaged in a civil war among themselves, Pizarro took pains to foment their intestine divisions, in order to prevent their uniting against him. The case was, that Atabilipa, a prince of illegitimate birth, had deposed and confined the emperor Huascar, and oppressed his friends. These latter, applied to Pizarro for assistance to dethrone the usurper. On the contrary Atabilipa made a similar application to the Spaniards for their friendship and countenance. Atabilipa and Pizarro, having appointed an interview, the Spaniards traiterously attacked the Indians during the conference; and having slaughtered many, made the inca prisoner. Almagro, having raised a considerable body of forces at Panama, arrived at the camp of Pizarro soon after the slaughter of the Indians, and the imprisonment of their emperor Atabilipa.

Pizarro went out to meet Almagro, congratulated his arrival, received him with all the marks of affection and esteem imaginable, and offered to divide the spoils with him, though it is evident they were, at that time, meditating each other's destruction; and it is said, Pizarro distributed as much gold and silver at this time among the Spanish soldiers as amounted to 15,000,000l. sterling. The soldiers being possessed of this prodigious wealth, fell into all manner of excesses, raising the price of things to a very great rate, by offering any sums to gratify their appetites or fancies. And now Pizarro thought it a proper time to send over the fifth part of the treasure to the emperor, as he had stipulated, and with it his brother Ferdinand Pizarro, to solicit for such rein-

forcements as might establish the dominion of the Spaniards in Peru, and to petition that his government might be extended still further to the southward. Marshal Almagro also employed his agents to represent to the court of Spain, with what expense and application he had sent and carried reinforcements, and supplied the general with ammunition and provisions from time to time, to enable him to prosecute this conquest; and to desire that all that part of South America which lay to the southward of the lands granted to Pizarro, might be put under the government: and with these agents, sent by the general and the marshal, returned several adventures to the number of fifty or sixty, who having obtained 30,000 or 40,000 ducats apiece for their respective shares of the spoils, were perfectly satisfied with it, and chose to enjoy what they had got, the remainder of their lives, in their own country, rather than undergo more hazards and difficulties to increase their fortunes.

In the mean time, Atabilipa, the royal prisoner, having offered Pizarro a prodigious treasure for his liberty, and actually paid great part of it, was still detained, and at length being tried upon what were called Articles of Impeachment, was most unjustly put to death. Ataulchi, the brother of this unfortunate prince, having determined on revenge, surprised the Spaniards on their march to Cusco, killed several, and took others, Sancho de Cellar, who had drawn up the process against the late inca, being among the latter. With these they retired, strangling Sancho at the very place where the emperor was put to death, but such of the Spaniards, as had been against the cruel measure, they restored to liberty. The Peruvians were still inclined to treat upon reasonable terms; but the Spaniards insisted that they should immediately renounce their religion, give up their country, and resign their freedom. This broke off the treaty, when Pizarro marched forward to the capital city of Cusco, where he arrived in the month of October 1532, the people having abandoned the city, and carried off the greatest part of their treasure; but still the Spaniards found so much left behind, that they were amazed at the heaps of gold and silver they met with there; but the reigning inca, Manco Capac, being about to assemble the whole Peruvian nation against these invaders, Pizarro thought fit to treat with the inca and the Peruvians. He even invited the emperor to return to his capital, and proclaimed him Inca. These measures Pizarro found himself under the necessity of taking at this time, not only because he saw all the southern provinces of Peru assembling against them, under the inca Manco Capac, but because Ruminavi, Quinquavi, and other Peruvian generals, had assembled a very great army in the northern provinces, and possessed themselves of Quito, which obliged him to send a considerable detachment of his forces under the com-

&c. had assembled a very
of the provinces, and possessed
of the country obliged him to send a
of his forces under the com-
mand

of Sebastian Belcazar, to reinforce the new
colony to St. Michael's, and to make head against
the Peruvian generals in Quito. Belcazar, there-
upon, marching into Quito, made himself master of
the capital city, and was in a fair way of reducing
the rest, when advice was brought that Don Pedro
Alvarado was upon the coast of Peru with a con-
siderable fleet, and landed 700 or 800 men, intending
to take the government of Peru upon him, and expel
Pizarro and Almagro from thence; at which news,
these two adventurers were thunderstruck, appre-
hending they should be dispossessed of all the spoils
they had taken, and perhaps sent prisoners to Spain,
to give an account of their murdering the late Inca
Atablipa, and massacring his people; they continued
therefore to cultivate a good understanding with the
Indians of the southern provinces, and treated the
Inca and his subjects as their friends and allies,
promising to perform punctually whatever they had
agreed on; knowing how great an advantage it must
be to have the country in their interest, if they were
obliged to contend with Alvarado for the possession of
it. They, however, at length found means to bribe
Alvarado from the country, and to persuade mult of
his followers to enter into their service.

These additional forces rendered the adventurers
very formidable; when Almagro marched to Cusco;
and Pizarro founded the city of Lima, and other
places on the coast. Pizarro now, according to the
grant of the emperor, remained in possession of Peru,
and Almagro made an expedition into Chili. Al-
magro advanced as far as the province of Charcas,
300 leagues to the southward of Cusco, without
meeting with any thing to obstruct his designs, that
country being all under the dominion of the Inca; and
supplying him with provisions as he went; but finding
Charcas a wretched barren country, and being ig-
norant of the rich mines it contained, he resolved to
proceed further to the kingdom of Chili; though, had
he known the invaluable mines of Potofi were situated
in this barren country, he would certainly have set up
his rest here, for in this mountain was afterwards
found more silver than any, or perhaps all the coun-
tries in the Old World produced at that time.

Almagro was now informed by the Indians, that
there were two ways to approach the kingdom of
Chili, both extremely difficult and hazardous. The
first was over a branch of the mountains of the Andes,
or Cordilleras, which, at this time (being winter)
were covered deep in snow, and so cold that no In-
dian could live on the tops of them, though this was
much the shortest passage, if it could be performed;
the other was over a sandy desert by the sea-side, in
which they would be in danger of perishing by ex-
cessive heat, and the scarcity of water; intimating
that they were averse to the journey either way, but
most dreaded that over the mountains of the Andes:
however, Almagro, resolving to remove forward, took

the way of the mountains, as being the shortest, and
more agreeable to the constitutions of his Europeans,
than the scorching sands; and having gathered what
provisions the country afforded, and laid it on the
shoulders of the Indian porters, he began to ascend
the hills; but had not advanced far before he found
the snows so deep, that they were forced to dig their
way through them, the Indians dying by hundreds
with the intense cold: the Spaniards, also, were al-
most starved, and many of them perished with their
horses on those mountains, either by cold or want;
and some of the men, who escaped with their lives,
lost their fingers and toes. However, Almagro him-
self, with between 300 or 400 Spaniards, the Inca
Paula, the high-priest, and about 5000 Indians,
reached the other side of the mountains, and came
into a fine temperate and pleasant country. The
people of Chili presented the Spaniards with many
presents; and Almagro penetrated into the country a
considerable way: but being informed, by the arrival
of some Spaniards from Europe, that the part allotted
to him by the emperor, included Cusco, he returned
to Peru.

Having suffered so much in their march over the
mountains, the Spaniards and Peruvians returned by
the way of the desert, where the hardships they un-
derwent were but little inferior to the former. In
the mean time the Inca Manco Capac, observing that
Pizarro only gave him the title of Inca, and that in
reality he had very little command even in the capital
city of Cusco, where he resided, put him in mind of
his promise of restoring him to his empire, and per-
forming the capitulations that had been agreed on
between them; but Pizarro put him off from time
to time, telling him he must wait with patience till
he heard that those capitulations were ratified by his
sovereign the emperor, which he expected to receive
every day by his brother Ferdinand, and was going
to Lima in hopes of meeting him there; desiring that
the Inca, during his absence, would reside in the
castle, and not stir from thence. The Inca finding
they would make him prisoner by force, if he
did not voluntarily submit to this confinement, dis-
guised his resentment, and immediately went to the
castle.

The Indians were far from taking this imprison-
ment of their emperor patiently, and only waited for a
favourable conjuncture to obtain his liberty; for Ferdi-
nando Pizarro returning from Spain with his brother's
new commission, and the patent for the title of mar-
quis, brought some orders with him that were not ac-
ceptable to the marquis or his people; particularly he
informed them, that the emperor expected they should
be accountable to him for all the treasure they had
received as the ransom of Atablipa, his imperial
majesty alone being entitled to it; or at least that they
should raise him a good round sum, to be sent over to
Spain in lieu of it; but the marquis and his officers

replied, this was neither reasonable or possible; as they had hazarded their lives, and made a conquest of the country at their own expence, without any charge to his imperial majesty, they ought to reap the fruits of their labour; and besides, that money had been long since spent in supporting the conquest, building towns, and planting colonies, to preserve what they had gained, which would all redound to the honour and profit of his majesty, who by that means was confirmed and established in the sovereignty of that rich country.

Ferdinando hereupon desired his brother would confer on him the government of the capital city of Cusco, and he did not doubt but he should soon have it in his power to raise a sum of money to gratify the court of Spain; which the marquis consenting to, his brother Ferdinando immediately repaired to his government of Cusco; where observing that several officers had been greatly enriched by presents Manco Inca had made them, in order to be kindly used, he applied himself also to the inca, giving him to understand, that he would be restored to his dominions, and all his demands granted, if he could procure a considerable sum for the court of Spain; and suffered the inca to come out of the castle to his palace in the city again, and to be treated with the honours of a sovereign prince. Whereupon the inca sent expresses to several parts of his dominions, directing them to bring their usual tribute of gold and silver plate, as the most probable means of delivering him from the hands of the Spaniards. The treasures were brought, but the Spaniards still deceived him, when he delivered himself by the following stratagem.

He pretended, that in the valley of Yarico great riches were hid, particularly a statue of solid gold as big as life, but that none but himself could find out the place. Ferdinando Pizarro was deluded by this pretence, and suffered the inca to go to the valley with only a guard of Spaniards, from whom (as they did not suspect his design) he made his escape. Being at liberty, he raised three powerful armies, one being designed against Lima, the second to attack Cusco, and the third to cut off Almagro. The principal army, under the inca himself, attacked Cusco with great fury, but were repulsed with terrible slaughter. After cutting off several detachments of Spaniards, the second Peruvian army invested Lima, which not being able to take, they only blockaded; but the third army did not attack Almagro, who arriving before the walls of Cusco, summoned Ferdinando Pizarro to surrender, who refused; but the place was betrayed to Almagro by some of the garrison, when the governor and another of the marquis of Pizarro's brothers were made prisoners.

The marquis of Pizarro, not hearing from his brothers, sent a strong force to Cusco under the command of Don Alonzo de Alvarado. Peter de Lerma was ordered also to march with this detach-

ment as a private captain of a troop of horse, though he was an older officer than Alvarado, and had done great service in those wars; which so disgusted Lerma, that he, from this time, meditated the success of the enterprize, as is supposed by the Spanish writers. Alonzo de Alvarado continuing his march with the utmost diligence, most of the Indians that were to carry his baggage, amounting to upwards of 3000, perished in the first part of the journey, either by intolerable fatigue, being loaded and driven beyond their strength, or starved for want of food.

Almagro, having received intelligence that Alonzo was advancing to the city, sent some Spaniards of quality to him, to represent that Cusco belonged to his government, according to the division the emperor made of Peru; between him and the marquis of Pizarro, and therefore advised him to retire to Lima again, till he and the marquis should adjust the limits of their respective governments; but Alvarado was far from entertaining any pacific thoughts, that he made all the gentlemen prisoners that were sent to treat with him. Whereupon Almagro took the field, constituting Don Orgonez his lieutenant-general; and having made a party of Alvarado's horse prisoners, understood by them, that great part of his troops were better affected to him, than they were to the Pizarros; particularly, he understood that Peter de Lerma, with a great many of his friends, would desert Alvarado the first opportunity. He advanced therefore as far as the bridge of Abantay, on the other side where Alvarado lay encamped, so that there was nothing but a small river that parted their forces; they remained quiet, however, without attempting to attack each other all day; but in the night time, Orgonez fording the river, at the head of Almagro's horse, put Alvarado's forces into great confusion; and giving Peter de Lerma, and the rest of their friends, by this means, an opportunity to join them, Almagro gained an easy victory, with very little bloodshed, making Don Alonzo de Alvarado his prisoner; with which he returned in triumph to Cusco.

After the battle, Almagro marched with 500 Spaniards on horse and foot, and some thousand Indians, towards the valley of Chinca on the sea-coast, taking with him his prisoner Ferdinando Pizarro; but he left Alonzo Pizarro and Alonzo de Alvarado prisoners in the city of Cusco.

The marquis de Pizarro, in the mean time, hearing no news from Alonzo, and imagining the Indians might have possessed themselves of the passes in the mountains, and thereby cut off his communication with that general, marched in person at the head of 900 or 1000 Spaniards, towards the mountains, to get intelligence; and after some days march, received advice, that the Indians had raised the siege of Cusco: that Almagro was returned from Chili, had possessed himself of that capital, and made his brothers Ferdinando and Alonzo prisoners; and, that his other brother

his Pizarro was killed during the siege of Cusco;
a day or two after he had news brought him of
the defeat of Don Alonzo de Alvarado. Whereupon
thought fit to retire to Lima, and fortify himself
till he should receive a reinforcement of troops,
which he expected every day; and to divert Almagro
from taking the advantage of his present weakness,
by putting his brother to death, he dispatched several
hundreds of quality to attend him; and offer him any
terms he should insist upon, to procure his brother's
pardon: Almagro was willing to treat, and an inter-
view with only twelve horsemen of a side was agreed,
with so much treachery on Pizarro's side, that Al-
magro with great difficulty escaped an ambushade laid
for him.

At length Pizarro, by various artifices, obtained the
consent of his brothers, and then demanded not only
Cusco, but all the conquests in Peru. Almagro very
generally rejected this unreasonable requisition, when
war immediately commenced between those rivals;
Almagro was defeated and taken prisoner, and
at the same time the city of Cusco was lost. The
fortunate Almagro was afterwards cruelly put to
death by his rival Pizarro; but the latter did not long
survive him, being assassinated in his palace at Lima
by a natural son of Almagro. Thus untimely fell
two conquerors of Peru, by means of their own
reciprocal enmity, of whom it is only necessary to say,
that both were equally possessed of courage, fortitude,
temperance; but both were equally ambitious
and rapacious. Almagro was the most generous,
Pizarro the most politic; the former possessed the
most noble sentiments, but the latter had the greatest
ambition.

the west side of the Andes..	Chili Proper.....	{ St. Jago. Baldivia. Imperial.
the east side of the Andes. }	Cuyo, or Cutio....	{ St. John de Frontiera.

The Pacific Ocean, on the west, is the only sea
that borders upon Chili. The most noted rivers are,
the Salado, or Salt River; Gacafo, Caquimbo, Bohio,
and the Baldivia; these fall into the Pacific Ocean,
and are scarcely navigable but at their mouths. The
principal bays, or harbours, are; Castro, Brewer's-
Haven, La Moucha, Copiapo, Baldivia, Coquimbo,
Jata, Guvanadore, Voluparifo, Santa Maria; Con-
ception.

The climate of Chili, considered in general, is one
of the most delightful in the world, being a medium
between the intense heats of the torrid, and the
piercing colds of the frigid zone. Along the coast of
the Pacific Ocean, they enjoy a fine temperate air,
and a clear serene sky most part of the year; but
sometimes the winds that blow from the mountains,
in winter, are exceedingly sharp. There are few
places in this extensive country where the soil is not
exuberantly fertile, producing Indian and European
corn, hemp, grapes, and other fruits; some medicinal
plants, and the panqua, used in tanning leather;
and were its natural advantages seconded by the in-
dustry of the inhabitants, Chili would be the most
opulent kingdom of any in America.

The animal productions of Chili resemble those of
Peru, but the latter has the preference. Their horses
and mules, particularly the former, are in great esteem:
horses and asses were originally carried hither from
Spain, and are greatly improved. Here are prodigious
numbers of fine oxen, goats, and sheep. Turkeys,
geese, and all kinds of poultry and wild fowl, are
also found in great numbers in this country. A very
particular species of bird is found in Chili, called
disperadore, or the awakener. It is about the size of
a middling fowl; its plumage black and white, has
a thick neck, the head rather large, erect, and beauti-
fully adorned with a tuft of feathers; its eyes are
large, sharp, and lively; its bill well proportioned,
strong, and a little curved. On the fore-part of its
wings are two spurs, about an inch in length, of a
reddish tint towards the root, but their points re-
semble those of a cock, being very hard and sharp.

These are the weapons it makes use of against other
birds, particularly those of prey. It has obtained the
appellation of the awakener, from the notice it gives
to its companions on the least appearance of danger.
On hearing the noise of the approach of any creature,
whether man or beast, it immediately rises from the
ground, and makes a loud chattering, not unlike that
of a magpye, continuing the noise, and flying about in
the air over the object which caused the alarm. This
being understood by every bird near, they take wing,
and by that means avoid the impending danger.

The original natives of Chili, or the free Indians, have
hitherto eluded all attempts of the Spaniards to civilize
and reduce them. However, about the year 1723, the
missionaries had formed several villages, and flattered
themselves that they should induce their converts to
practise

practise the precepts they had endeavoured to inculcate; but an insurrection happening at that time, their innate savageness returned, they abandoned the priests, and joined their countrymen; and there have lately been some formidable insurrections of the Chileans against the Spaniards, which have greatly alarmed the Spanish court. The Spaniards amount to about 20,000; and the Indians, negroes, and mulattoes, are supposed not to be fewer than 60,000.

The chief cities are St. Jago, Concepcion, and Valdivia, or Valdivia.

St. Jago, the capital of Chili, is situated in 77 deg. west. long. and 34 deg. south lat. It stands at the west foot of the Cordilleras, on the little river Mapocho. The town is about a mile in length, and half a mile in breadth. The streets are all spacious, paved, and straight. The houses are low, to prevent their being demolished by the earthquakes, to which this place is subject. That in July 1730 laid the greatest part of it in ruins, and was succeeded by an epidemical distemper, which swept away most of those who had escaped the preceding calamity.

Concepcion stands on the south-west shore of a beautiful bay, on a small declivity, having a little river running through it. The houses are all either of mud-walls or unburnt bricks, but covered with tiles. This city suffered, if possible, more than St. Jago, by the same earthquake, succeeded by a dreadful inundation from the sea, which, being followed by other violent shocks, demolished the whole city.

Valdivia, or Valdivia, is situated on a river to which it gives its name. This city is defended by four strong castles, mounting above 100 pieces of fine brass cannon; but they are never properly supplied either with men or ammunition. This is the chief port whereby the commerce is carried on between Chili and Peru, and 10 large ships are constantly employed in that trade.

The foreign commerce of Chili is entirely confined to Peru, Panama, and some parts of Mexico. Their articles of export to these places are gold, copper, cattle, salted provisions, corn, tallow, grass, hides, dried fish, neats tongues, hemp, flax, cordage, coconuts, bend leather tanned, Cordovan leather, wines, and fruits: in return for which, they receive iron, cloth, hats, bays, though not many of the latter, there being manufactures of the same kind in Chili; sugar, cacao, sweetmeats, pickles, tobacco, oil, earthen-ware, and all kinds of European goods, which are brought to the port of Callao for sale.

THE HISTORY OF CHILI.

IN the history of Peru, we have already observed, that Almagro, who fell a victim to the imperious cruelty of Pizarro, attempted the conquest of Chili, but was defeated in his design by the Indians laying

siege to Cusco, which rendered his presence necessary in that country. The conquest of Chili was therefore suspended till the year 1541, when Pedro Valdivia was sent to finish the war which Almagro had begun. He penetrated to the valley of Mapocho, where he founded the city of St. Jago, and built castles for its defence. The Chileans attacked the castles; but Valdivia, receiving reinforcements from the viceroy of Peru, did all he could to secure conquests. But still it appears that he was strong enough to make any great progress; and the Indians giving out that there were many very rich gold mines in a certain part of the country, not far from St. Jago, drew a detachment of his forces (he went in search of them) into an ambush, and cut off every man of them, except their commander, a negro, who escaped to St. Jago by the swiftness of his horses; whereupon Valdivia sent for another reinforcement of troops, to enable them to advance against the Chileans, and built the town and castle of Coquimbo, or Serera, on a bay of the sea, to secure his communication with Peru.

The civil wars between the Spaniards in breaking out, Valdivia was recalled, but afterwards returned to Chili with a large body of veteran troops. The Spaniards now disagreeing among themselves, the Chileans took advantage of their broils, and destroyed the garrisons of Copiapo and Coquimbo, molesting, at the same time, the towns and fortifications. Valdivia, however, recovered what he had lost, rebuilt those towns, proceeded further southward, and erected the town of Concepcion. The fortifications here being finished, though under considerable difficulties, Valdivia determined to continue his march still further southward, when he founded the city of Imperial, four leagues east of the Pacific Ocean, and 40 south of Concepcion. From hence he marched to the mountains of Andes, 16 leagues east of Imperial, and built the city of Villa Rica.

The bravest nation of the Chileans, called Araucans, had opposed the Spaniards with the greatest success, but had been at last obliged to submit; this being one of the most desirable countries in Chili, Valdivia, in the distribution of the lands, had reserved this valley for himself; and being sensible that the natives were not to be kept under but by force, he erected three castles in this valley, and put garrisons in them, while he marched further southward. He built the town of Valdivia, where being still richer mines, it is said, he employed 30,000 Indians in working them, and spent so much time in amassing wealth, that the Araucans, taking advantage of his absence, engaged the whole country in a conspiracy against the Spaniards, and chose the celebrated Caupolican for their general.

Intelligence being received by Valdivia of the intended insurrection, he returned in some haste to the valley of Arauca, where he found 13 or 14,000

rendered his presence necessary for the conquest of Chili was the year 1541, when Pedro de Valdivia, with the war which Almagro had led to the valley of Mapocho, and the city of St. Jago, and built the city of Valdivia. The Chileans attacked him, receiving reinforcements from Peru. It appears that he was not able to make any great progress; and there were many very small settlements in that part of the country, not fit for the attachment of his forces, but into an ambush, and except their commander St. Jago by the assistance of a Valdivia sent for another to enable them to advance and build the town and castle on a bay of the sea, to face Peru.

When the Spaniards in Peru was recalled, but afterwards a large body of veteran troops were sent among themselves, and the ruins of their towns, and the towns of Copiapo and Coquimbo, and the towns and fortifications, recovered what he had proceeded further southward to Concepcion. The fortifications, though under consideration, determined to continue his march when he founded the city of Concepcion on the coast of the Pacific Ocean.

From thence he marched about 16 leagues east of Imperia Rica.

The Chileans, called Araucanians with the greatest reluctance, were obliged to submit to the Spaniards, and the most desirable countries in Chile, and the most fertile, and the most fertile of the lands, had been kept under but by the Spaniards in this valley, and he marched further southward to Valdivia, where he said, he employed 5000 men, and spent so much time in the Araucans, taking and engaged the whole country of the Spaniards, and chose their general.

He was obliged by Valdivia of the Spaniards, and returned in some haste to Peru, where he found 13 or 14,000

Spaniards assembled in arms, whom he charged with the Spaniards, and obliged them to retire into the woods and enclosures as often as they appeared, but was not in a condition to disperse them entirely. They frequently rallied, and attacked his troops; and thus they continued to encounter him for several days in a fort and a manning fight. The Chilean general, observing that his engaging the Spaniards with such numbers only occasioned confusion among the people, those in the front frequently giving way to the Spanish cavalry, he disordered the rest of his forces, before ever they were engaged, divided his army into battalions of 1000 men each, ordering them to charge the enemy by turns. He represented to them, that the Spaniards were but 2000 horse, and that 1000 of his brave countrymen might easily maintain their ground for some time against so small a number, notwithstanding the advantage the enemy had in their arms and horses. However, he only desired they would make their utmost effort. He had no expectation that the first battalion would gain the victory, but when they found themselves obliged to retire, required them to take care, in their retreat, not to disorder the other bodies, but rally themselves, and draw up in the rear, that they might be ready for a second charge; and the same commands he gave to the officers of the other battalions.

The first battalion, in pursuance of these orders, engaged the Spanish horse with great resolution, and having held them in play some time, leisurely retired, being succeeded by the second, and that by the third, and so on, till the Spaniards had continued the engagement for seven or eight hours without intermission, and both men and horses began to faint with the labours of the day, or for want of refreshment; which Valdivia too late observing, made a precipitate retreat, ordering his troops to take possession of a pass about five miles from the field of battle, where he did not doubt he should be able to defend himself against all the power of the enemy. But a Chilean, who had been obliged to Valdivia, and baptized by the name of Philip, whose Indian name was Lautaro, hearing his master's orders for their retreat, deserted at that instant to his countrymen, and directed them to take possession of the pass before the Spaniards could arrive there. He bid them make use of the advantages they had in their hands, recover their liberties, and rescue their country from destruction, by cutting off these thieves and usurpers who had invaded it; and, taking a spear, charged his late lord Valdivia at the head of a company of Chileans, while another detachment of the Indians secured the pass as he directed them.

As the Chileans now perceived the Spaniards were unable to resist their attacks any longer, they assailed them on every side, without giving them a moment's time to breathe. They cut them all in pieces on the spot, except the general Valdivia; him

they bound and carried before Caupolican, the Chilean general, who ordered him to be tied to a tree, that he might be executed with more ceremony than those that fell in the battle. Valdivia, it is said, meanly begged his life of the conquerors, addressing himself chiefly to Lautaro, who was but a few hours before his slave. He promised, if they would spare him, to withdraw all the Spanish forces out of Chili, and never more disturb their peace, swearing by all that was sacred to perform his promise; but the unrelenting enemy was deaf to his entreaties: even Lautaro observed, that it was madness to trull to the promises of a captive, who would infallibly change his note if he was set at liberty; whereupon the general pronounced his doom.

Authors differ about the manner of Valdivia's execution. Some affirm that they poured melted gold down his throat, bidding him satisfy himself with that metal he so violently thirsted after. Others relate, that one of the Indian caciques, not bearing to hear it debated whether the destroyer of their country should live or die, beat out his brains with a club, without asking the general's leave: and all the Spanish writers agree, that they made trumpets and flutes of his bones, and preserved his skull as a memorial of that important victory, which they celebrated by feasting and dancing after their country manner; and instituted public sports and exercises, such as running, wrestling, and leaping, to be observed annually in memory of it; and expecting the Spaniards would give them another visit, they encamped in some of their most inaccessible woods and mountains, and Caupolican constituted Lautaro his lieutenant-general, for the services he had done in the late battle, finding him every way qualified for that post. The Spaniards, however, attempted to recover their losses; the war continued about 50 years, but the Chileans were most generally successful, and at length almost expelled them from their country.

The Dutch being informed of these particulars in 1642, sent a squadron of men of war under the command of Captain Brewer, with some land forces on board, to make a settlement at Chili. This officer arrived on the coast of Chili on the 30th of April, 1643; and landing 50 soldiers on the 20th of May, they had a smart engagement with a Spanish party, whom they defeated, and some Chileans came on board, who gave the Hollanders hopes of success; but Brewer, the Dutch commodore, dying, who projected the enterprize, and the natives growing jealous of the designs of the Hollanders, and seeming ready to join the Spaniards against them, Herekerman, who succeeded Brewer in the command of the squadron, thought fit to return home without effecting anything, having first demolished a little fort they had erected on the harbour of Valdivia.

An old Spaniard, who resided in the court of England, having represented to King Charles II. that the

Spaniards had been beaten out of most of their settlements on the coast of Chili, and that it would be no difficult matter for the English to possess themselves of them. Sir John Narborough was sent, in 1669, with a man of war, called the Sweepstakes, of 36 guns, to view the coast of Chili, and inquire into the feasibility of planting colonies there: he was accompanied thither by the old Spaniard, named Don Carlos. Sir John passed through the straits of Magellan, and not round Cape-Horn, as Brewer had done; and arriving on the coast of Chili near Valdivia, Don Carlos was set on shore, and took the road to the fort of Valdivia, which the Spaniards had rebuilt, being then in possession of the country, and Don Carlos was never heard of more. The Spaniards permitted the English to trade with their people for trifles at first, but would not suffer them to have a communication with the Indians, and, at length, made one of the lieutenants and three seamen prisoners, whom they refused to release, and what became of them was never known. Sir John Narborough soon after returned home, having no authority to commit hostilities against the Spaniards. In Queen Ann's reign the design of making settlements here was resumed, but proved abortive.

Thus the martial genius of the natives continually retarded the progress of foreigners, and has always been the cause why the Spanish settlements here are so disproportionate to the extent, fertility, and riches of the country. The free Indians are much more numerous than the Spaniards, who are computed at no more than 20,000. All the inhabitants of Chili, including Europeans, Mestizoes, Mulattoes, and Negroes, are reckoned at 150,000 only. Even the free Indians, it seems, now acknowledge the dominion of the King of Spain, and pay tribute to his governor; but the subjected Indians belong entirely to the Spaniards, living among them, and serving them in the same manner as the natives of Peru and Mexico.

The greater part of Chili is still possessed by the free Indians, who are rather allies than subjects of Spain; having, it is said, in the last treaty, consented to acknowledge the king of Spain for their lawful sovereign, only upon condition that they were suffered to continue under the protection of their own laws and government; an engagement which it will be hazardous for the Spaniards to break, however it may counteract their great design of gaining entire possession of these countries, and thereby repairing the constant decline of wealth and decay of their precious metals in their other settlements. The free Indians are governed by their own chiefs, whom the Spaniards call caciques, who claim no authority, besides that of administering justice, and commanding their tribes in times of war; having neither palaces, guards, revenue, or any other badges of sovereign authority, vested in them.

C H A P. XXIV.

PARAGUAY, OR LA PLATA.

Situation, &c. Divisions, Cattle, Poultry, Wild Animals, Chief Towns, Provinces, and Commerce.

THIS country is situated between the 50th and 75th deg. of west long. and between the 12th and 37th deg. of south lat. being 1500 miles in length, and 1000 in breadth. It is bounded by Amazonia on the north; by Brazil on the east; by Patagonia on the south; and by Peru and Chili on the west.

DIVISIONS.	PROVINCES.	CHIEF TOWNS.
The east division contains	Paraguay.....	Assumption.
	Parana.....	St. Ann.
	Guaira.....	Civdad Real.
	Uragua.....	Los Reyes.
The south division contains	Tucuman.....	St. Jago.
	Rio de la Plata.....	Buenos Ayres.

Besides horses, mules, sheep, goats, hogs, poultry, game, grain, fruits, &c. this country produces an admirable drug called by the name of the country, Paraguay; which is an excellent emetic, and of itself might form a considerable article of commerce. The forests abound with wild beasts, and the rivers and lakes, besides various kinds of fish, with crocodiles, alligators, &c. The mines contain gold, silver, copper, iron, amethysts, &c. To the west of the great river Paraguay, the country is barren, but to the east, where the Jesuits have erected a temporal and spiritual monarchy, it is fertile. The next considerable river is that of Plate or La Plata, which rises in Peru, and falls into the Atlantic Ocean.

This country abounds with lakes, the chief of which are the Xaraya, the Caracoracs, and the Veronas. The principal bay is that at the mouth of the river La Plata, on which stands the capital city of Buenos Ayres, hereafter mentioned; and Cape St. Antonio, at the entrance of that bay, is the only promontory.

The climate of Paraguay differs but little from that of Spain; and the distinctions between the seasons are much the same. In winter, indeed, violent tempests of wind and rain are very frequent, accompanied with such dreadful claps of thunder and lightning, as fill the inhabitants, though used to them, with terror and consternation. In summer, the excessive heats are mitigated by gentle breezes, which constantly begin at eight or nine in the morning. In short, for the enjoyment of life, especially with regard to the softness of the air, a finer country cannot be imagined.

Nostra

Nostra Señora de Buénos Ayres, the capital of
Paraguay, stands on a point called Cape Blanco, in 34
34 mi. south lat. in a fine plain, rising by a
ste ascent from a small river fronting it. It has
eight broad streets, and is of a considerable extent,
containing no less than 3000 houses, built mostly of
alk or brick. The river La Plata, is here seven
ges in breadth, and navigable for any ship 60
ges above the town, but no further, by reason of
ataract. The Spaniards bring hither, down the
er, part of the treasures of Peru; and ship them
Spain, with vast quantities of hides, cotton, stuffs,
its, and other commodities of this country, and
their returns are very valuable.

There are three other towns in Paraguay, called
onte de Vides, Corrientes, and Santa Fé; but nei-
er of them merits a particular description.

What has rendered this province so very remarkable,
an extraordinary species of commonwealth which was
established in the interior parts by the labours of the
Jesuits. The foundations of this remarkable republic
were laid about the middle of the last century, when
the fathers obtained an uncontrolled liberty to prac-
tise every expedient, within certain limits, for con-
verting the Indians, and forming them into a body or
public. At the same time the governors of the ad-
jacent provinces received strict orders not to interfere;
no Spaniard to enter into this district with-
out a licence from the fathers. On the other hand,
the Jesuits agreed to pay a certain capitation tax in
proportion to the number of their converts, and to send
a certain number to work in the mines, whenever they
could be wanted; and the missions became sufficiently
pulous to answer the demand.

The terms being settled (says a modern author)
the Jesuits applied themselves with indefatigable indu-
stry to settle the country of which they had obtained a
licence. They began with gathering a few Indian fam-
ilies they had before converted, from the several
parts of the country where they were settled, and uni-
ting them into a small township; upon this slight
foundation they have erected a superstructure which
has astonished the world. Wholly intent upon exe-
cuting the arduous undertaking, no difficulties could
stop, no dangers: repress their ardour. They visited
every tribe of the Indians; they mollified the minds
of the most savage nations; they fixed the most ram-
bling; they subdued the most averse to government.
Thousands of dispersed families embraced their reli-
gion, and submitted to their government. By this ra-
pid increase, their subjects amounted a few years ago
to near 400,000 families. They lived in towns, were
regularly clothed, practised agriculture, carried on
manufactures; and some of them professed the polite
arts of music and painting. They were instructed in
the military art with the most exact discipline, and
could bring a force of sixty thousand men, well armed,
to the field. In order to effect these valuable pur-

poses, the fathers had from time to time brought
over from Europe several mechanics, musicians, paint-
ers, &c.

"The whole country was divided into forty-seven
missions or districts, over each of which a Jesuit pre-
sided in chief. He resided in a large and commodious
house, called the Presbytery; adjoining to this house
were the church and the magazines. No person under
the jurisdiction of the fathers had any thing that could
be justly called his own property. Each man's labour was
allotted him in proportion to his strength, or to his
skill in the profession which he exercised. The pro-
duce was brought faithfully to the public magazines,
from whence he was again supplied with all things
which the managers judged to be expedient for the
sustenance of himself or his family. All necessaries
were distributed regularly twice a week; and the ma-
gazines always contained such a stock of provisions
and goods of every kind, as to answer not only the
ordinary exigencies, but to provide against a time of
scarcity, or for those whom accidents, age, or infir-
mities, have rendered incapable of labour. Under the
Jesuits, magistrates or caciques were chosen from
among the Indians; these regulate all matters respect-
ing marriages, decide such differences as were too mi-
nute for the attention of the father, and gave him re-
gularly an exact account of the state of his district,
and the merit and demerit of its inhabitants; and
according to this report they were rewarded or pun-
ished. Nothing could equal the obedience of the
people of these missions, except their contentment un-
der it. Far from murmuring that they have only the
necessaries of life, by a labour which might, in some
degree, procure them the conveniences of it, they
thought themselves a distinguished and favoured peo-
ple in wanting them; and they believed their obedi-
ence a duty, which not only secured their order and
repose in this world, but the very best means of in-
suring their happiness in the next. This was care-
fully inculcated; and the Indians under their juris-
diction were, by their instructions, rendered an in-
nocent people; civilized without being corrupted.

"In order to preserve this innocence and tranquil-
lity, the Jesuits were extremely strict in preserving
their privilege in keeping all strangers from among
them. If any person happened either through acci-
dent, or in pursuing his journey, to enter the coun-
try of the missions, he was immediately carried to the
Presbytery, where he was treated with great hospitality
during his stay, but watched with the utmost circum-
spection. The curiosities of the place were shewn
him in company with the Jesuit; but he was allowed
no private conversation with any of the natives. In a
reasonable time he was civilly dismissed, with a guard
to conduct him to the next district without expence,
where he was treated in the same manner till he had
passed the limits of the country of the missions. Cau-
tions equally strict, and in the same spirit, they ob-
served,

served, whenever the natives were obliged to go out of their own territories. They avoided all manner of conversation with strangers, looking upon them with a kind of horror; and therefore returned to their country as uninformed and untainted as they left it.

"It is impossible to imagine any thing in the Indies more regular or more magnificent than their parish churches: they were capacious, well built, and very elegantly furnished; gilding and painting strike the eye on every side, all the sacred utensils were gold and silver, and many of them adorned with emeralds and other precious stones. Divine service was celebrated with the most solemn splendor: on one side of the high altar were tribunes for the civil magistrates; and, on the other, the same conveniences for military officers: the father himself officiated with the utmost devotion. Their music, both vocal and instrumental, was far from being contemptible; and the Indians had a genius for music, which the fathers took care to cultivate."

In the year 1757, the court of Spain thought proper to make a cession of some part of this territory to the crown of Portugal, in exchange for Santo Sacramento, and to make the Uragna the bounds of their possessions; but the inhabitants refused to comply with this division, or to suffer themselves to be transferred from one hand to another, like cattle, without their own consent. We were, however, informed, upon government authority, that the Indians actually took up arms; but, notwithstanding the exactness of their discipline, they were easily, and with considerable slaughter, defeated by the European troops, who were sent to reduce them. And in 1767 the Jesuits were sent out of America by order of the king, and their late subjects were put upon the same footing with the rest of the inhabitants of the country.

P A T A G O N I A.

SOME writers have described Patagonia, at the southern extremity of America, as part of Chili: but as neither the Spaniards, nor any other European nation, have any colonies here, it is almost unknown, and is generally represented as a barren, inhospitable country. Some of the inhabitants are from six to seven feet high, but the greater part of them are of a moderate and common stature. Some are mere savages, and others of a more gentle, humane disposition. They live upon fish and game, and what the earth produces spontaneously. Their huts are thatched, and, notwithstanding the rigour of the climate, they wear no other clothes than a mantle made of seal-skin, or the skin of some beast, and that they throw off when they are in action. Their complexions are tawny, their hair black, and they paint their faces and bodies with several colours. They are exceedingly hardy, brave, and active, making use of their arms, which

are bows, and arrows headed with flints, with amazing dexterity. In 52 deg. south lat. are the Straights **MAGELLAN**, having Patagonia on the north, and the islands of **TERRA DEL FUEGO**, or the Land of Fire on the south. These Straights extend from east to west 110 leagues, but the breadth in some places falls short of one. They were first discovered by **MAGELLAN**, or **Magelhaens**, a Portuguese; in the service of Spain, who sailed through them in the year 1520, and thereby discovered a passage from the Atlantic to the Pacific or Southern Ocean. In 1616, **La Maire**, a Dutchman, keeping to the southward of the Straights, discovered in lat. 54, one-half of another passage, since known by the name of **Straights La Maire**, and this passage, which is practicable only in January and February, and is called **doubling Cape Horn**, has been generally preferred by succeeding navigators.

GUIANA in South America, extends from the equator to the eighth degree of north latitude, and is bounded by the river **Oronoque** on the north, and the **Amazons**, on the south, but is little known, except a little along the coast, where the French at **Cayennes**, and the Dutch at **Surinam**, have made some settlements, which, from the unhealthiness of the climate, almost under the equator, and other causes, can hardly be extended any considerable way back. The inhabitants of **Guiana** are either natives who are of a reddish brown, or negroes and Europeans, or a mixed progeny of these. This country abounds in serpents of various kinds; one sort, not venomous, measures sometimes above 30 feet in length, and three in circumference: it has a taper tail armed with two claws like those of a dunghill cock; small deer have been found in their stomach.

AMAZONIA is bounded by **Terra Firma** on the north, **La Plata** on the south, **Brazil** and the **Atlantic Ocean** on the east, and by **Peru** on the west. It is 1800 miles in length, and 960 in breadth; but this vast extent of country is but little known, except along the banks of the great river **Amazons**, and towards the **Brazilian** frontiers. The river of **Amazons** is the largest in the world. It rises in the **Cordillera**, and increases in a most amazing manner as it proceeds towards the **Atlantic**, into which it discharges itself by 84 channels. It winds 5000 miles, is several miles broad, and near 40 fathoms deep. Many rivers fall into it, particularly the rivers **Negro**, **Xaux**, and **Maranhon**. No European nation has hitherto made any settlement here: some attempts have indeed been made by the Spaniards and Portuguese, but always attended with vast difficulties, so that few of the adventurers ever returned back; and no gold is found in the country, as was expected.

THE SPANISH ISLANDS IN AMERICA.

C H A P. XXV.

C U B A.

Situation, Fertile Soil, Produce, Towns, Commerce, and Valuable Exports.

THIS island extends in latitude from 20 deg. 20 min. to the tropic of Cancer, and from 75 deg. 15 min. west long. It lies 60 miles to the west of Hispaniola, 25 leagues to the north of Jamaica, 100 miles to the east of Yucatan, and as many to the south of Cape Florida, being about 700 miles in length, and not above 70 in breadth. A chain of hills, which runs through the middle of the island from east to west, gives rise to several rivers, but their course is short from thence into the sea, that scarce any of them are navigable. The land near the sea, being on the most part level, is flooded in the rainy season, when the sun is vertical.

The whole island is well watered, and agreeably fertilized with woods, lawns, and vallies. The soil is capable of producing, in the greatest plenty, every thing that grows in the other American islands; and Cuba, commonly called the Havannah tobacco, is particularly thought to excel that of all the world; and their sugar would equal their tobacco in goodness, did they hands to cultivate the canes. The other products are, ginger, long pepper, and other spices; cassia, mastic, aloes, large cedars, and other odoriferous trees; oaks, pines, palm-trees, plenty of large vines, the cotton trees, plantains, bananas, ananas, guavas, lemons, cocoas, and two sorts of fruit, called camiloro and guanavana; the first like a china-orange, and the other shaped like a heart, with a juice between sweet and acid. There are several good harbours in the island, which belong to the principal towns, as that of St. Jago, facing Jamaica, advantageously situated, and strongly fortified, but neither populous nor rich. The Havannah, the capital, on the north-west part of the island, and fifty leagues from Cape Antonio, is a place of great strength and importance, containing about 2000 houses, a great number of convents and churches, and about 26,000 souls. Towards the close of the war of 1756, this city, after a long and obstinate defence, surrendered, with all its forts and dependencies, to his Britannic majesty's arms, in capitulation, on the 12th of August 1762; but was restored at the peace. The value of the cargo of the galleons, flota, and other ships which rendezvous here in September to take in provisions and water,

previous to their return to Old Spain, is seldom less than 7,000,000l. sterling.

The other towns in the island, worth mentioning, are, St. Jago, which is much inferior to the Havannah, and stands at the bottom of a large bay, about two leagues from the sea, on the south side of the island; Santa Cruz, which has a tolerable harbour, and stands about 163 miles east of the Havannah; Porto del Principe, situated on the coast, about 300 miles south-east of the Havannah; and Baracoa, situated on the north-east part of the island, and having a small harbour.

HISPANIOLA, OR ST. DOMINGO.

THIS island is possessed in common by the Spaniards and French, but the far most considerable part is now in the hands of the French. The great Columbus discovered it in 1492, and called it The Spanish Island, a denomination it has preserved, under that of Hispaniola, ever since. It is situated about 13 leagues to the east of Cuba, between the 17th and 21st deg. north lat. and the 67th and 74th of west long. The face of the island presents an agreeable variety of hills, vallies, woods, and rivers; and the soil is allowed to be uncommonly fertile, producing sugar, indigo, cotton, maize, cassava-root, cocoa, coffee, tobacco, ginger, various kinds of drugs and dyeing woods, pine-apples, bananas, grapes, oranges, lemons, citrons, tonionias, limes, dates, and apricots: in the centre of the island are mountains well covered with cabbage-trees, elms, oaks, pines, acajon, and other large and lofty trees. Salt is found in plenty, and great quantities of ambergris. Mines of silver and gold have been discovered, but they are not worked. Herds and herds of cattle are so numerous in this island, that they supply the neighbouring colonies. There are also several kinds of fowl, and the coasts abound in fish, but are also infested with alligators. The north-west parts, which are in possession of the French, consist of large fruitful plains, which produce the articles above-mentioned in great plenty. In short, this is the pleasantest and most fruitful island in the West-Indies, being every where diversified with hills and vallies, woods and rivers.

St. Domingo, the capital, is situated on the south side of the island, has a spacious harbour, and is a large, well built city, inhabited by Europeans, creoles, mulattoes, mellizoes, and negroes, whose number is about 30,000. This most ancient town in all the

new world was founded by Bartholomew Columbus, brother to the Admiral, in 1504, who called it Domingo in honour of his father Dominic, which appellation the French give to the whole island. Conception, twenty leagues north of St. Domingo, belonging to the Spaniards, is also a considerable town.

Cape François, the capital of the French division of the island of St. Domingo, is situated on a cape on the north side of the island, at the edge of a large plain, twenty leagues long, and about four broad, between the sea and the mountains. There are few lands better watered, but there is not a river that will admit of a sloop above three miles. This space is cut through by straight roads, forty feet broad, constantly lined with hedges of lemon-trees, intermixed with long avenues of lofty trees, which lead to plantations producing a greater quantity of sugar than any country in the world. The town, which is situated in the most unhealthy place of this most extensive and beautiful plain, consists of twenty-nine straight, narrow, and dirty streets, divided into 226 allotments, which comprehend 810 houses. The governor's house, the barracks, and the king's magazine, are the only public buildings which attract the notice of the curious; but those that deserve to be considered by the humane, are two hospitals, called the houses of Providence, founded for the support of those Europeans who come thither without money or merchandize.

The harbour is only a bay, open to the N. and E. winds, before which is a considerable extent of sand-banks, reefs, and rocks, by which it is sheltered from the sea. What is called the port, is in the bottom of the bay, about three quarters of a mile from the town; the W. point going in, which is high and steep, is called Point Picolet.

The town is situated on the W. side, about two miles from Point Picolet, close to the water, and near the mountains; lat. 19. 45 N. long. 72. 13 W.

On the 18th of June 1793, the Civil Commissioners, Messrs. Sonthonax and Polverrel, arrived at the Cape from Port-au-Prince: they immediately suspended Mons. Galbau, the governor and commander of the troops at that place, and sent him on board; on the 12th a number of mulattoes were encouraged by these gentlemen to come into the town, who, by unfair means, armed all the negroes belonging to the citizens, and encouraged them to assist in destroying the whites; which scene actually began on the 20th about noon, when a most horrid massacre took place, neither women nor children were spared; upwards of 10,000 white inhabitants were butchered, and 2500 saved themselves in the French and American vessels in the harbour: the wretches then began to plunder the town, after which they set fire to it; and on the 23d, when the Captain sailed, the burning was going on, and there was only the church, govern-

ment-house, le Caferne, and Gregarie saved; the rest there the Amerique of seventy-four guns. Captain Fanning sailed in company with about 150 sail vessels, bound to different ports in America, under convoy of two French seventy-fours, and six frigates.

Cape François was a neat, well-built city, the buildings chiefly of stone—said to be as large as New-York. The large church has escaped the flames, being all of stone, and covered so as fire cannot make any impression. The government-house suffered much from the cannon shot. The soldiers were still engaged in fighting in town. It is supposed that this disastrous affair proceeded entirely from the difference between the two Commissioners who assumed the power, and the Governor Galbau, who thought his rightful authority invaded. He headed a number of sailors from the ships, who made the first attack, and repulsed the mulattoes, but having at hand a number of negroes with arms, repulsed the sailors and whites. Capt. Fanning, who brought this account to New-York, observes, that could have carried off loads of plunder when he came away, as the inhabitants had left their houses and property to save their lives.

As the French possess the most fertile part of the island, they omit no pains or industry which may tend to its improvement. Upwards of thirty years ago it is said, their exports in sugar, indigo, tobacco, and coffee, amounted to 1,200,000l. annually, and there is no doubt they have been much exceeded by the time. The Spaniards themselves also contrived greatly to increase the power and wealth of the French in this island; for, being possessed of great treasures and no industry, they lavish their dollars in exchange for the manufactures and commodities of their indefatigable neighbours.

When Hispaniola was first discovered by Columbus the number of its inhabitants was computed to be at least one million; but such was the infernal cruelty of the Spaniards, and to so infamous a height did they carry the oppression of the poor natives, that they were reduced to sixty thousand in the space of fifteen years. The gold mines here were found to be exceedingly rich, which brought all the robbers of Spain in crowds. The greater part of the male Indians perished in these mines; and almost all the females, by the excessive labour of cultivating the fields of maize for the use of the conquerors; the others were massacred either in cool blood or in ranged battles, for so they called those kind of chaces which the Spaniards, covered with iron and followed by bull-dogs, made to a multitude of these unhappy wretches quite naked, and flying with all their might.

For further particulars of the Spaniards' cruelties, see p. 318. of this work.

PORTO

P O R T O - R I C O .

THIS island is situated between the 64th and 67th deg. of west long. and in the 18th of north lat. lying between Hispaniola and St. Christopher's. It is about 100 miles in length, and 40 in breadth.

The chief part of the country is diversified with woods, vallies, and plains; and is extremely fertile, producing the same fruits as the other islands. It is well watered with springs and rivers; but the air is excessive hot, and, during the rainy season, very unwholesome.

The north part of the island, which is the most barren, contains several mines, some of which formerly produced great quantities of silver and gold. It was on account of the latter that the Spaniards settled here, but there is no longer any considerable quantity of gold in it.

The woods are stored with parrots, wild pigeons, and other fowl. European poultry is found here in plenty, and the coast abounds with fish. A breed of dogs, which the Spaniards brought over to hunt and tear in pieces the defenceless natives, are said to run wild in the woods near the sea-shore, and subsist upon land-crabs that burrow in the ground.

Porto-Rico, the capital town, is situated on a small island on the north coast. This island forms a capacious harbour, and is joined to the chief island by a causeway. It is defended by forts and batteries, which render the place almost inaccessible: it was, however, taken by Sir Francis Drake, and afterwards by the Earl of Cumberland, in the reign of Queen Elizabeth. The town is well built, and populous, being the centre of the contraband trade carried on by the English and French with the Spaniards; it is also the seat of a governor, as well as a bishop's see.

The Spanish government have taken great pains to prevent an illicit trade being carried on at this place; but such is the convenience of its situation for that traffic, that all the severe edicts issued against it have been ineffectual.

At the east end of Porto-Rico are a number of small islands, called Virgin Islands; and there is one on the same coast called Crab's Island, from the great number of crabs with which it abounds.

T R I N I D A D .

THIS island is situated between the 60th and 62d deg. of west long. and in the 10th deg. of north lat. It lies between the island of Tobago and the Spanish main, from which it is separated by the Straights of Paria, and is about 90 miles in length, and 60 in breadth. The number of inhabitants is small when compared with the extent of the island, which may be attributed to the unwholesomeness of the climate. The soil however is fertile, and produces sugar, to-

bacco, indigo, cotton, ginger, and Indian corn. This island was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered it, and extorted from the inhabitants a considerable sum of money.

M A R G A R E T T A .

THIS is a small island situated in 65 deg. of west long. and in 11 deg. 30 min. of north lat. being about 40 miles in length, and 24 in breadth. It abounds in wood, pasture, Indian corn, and all kinds of fruit, but has very little good water. Formerly a valuable pearl-fishery was carried on here, but it is now discontinued. In 1620, the Dutch invaded this island, and demolished the castle, since which it has been entirely abandoned by the natives.

There are several other small islands in these seas, belonging to the Spaniards, but entirely disregarded by them. In the South-Seas they claim the islands of Chiloe, St. Mary's, Quiriquina, de la Moca or Mochia, Juan Fernandez, Tierra, Fuerra, and many others; but Chiloe and Juan Fernandez are the only ones that deserve to be described.

C H I L O E .

THIS is a considerable island, on the coast of Chili, lies between 42 and 44 deg. south lat. is above 112 miles long, and 21 broad. The south part is divided from the continent by a narrow sea, and the continent there makes a bay. This coast is subject to tempestuous weather, especially in March, when winter begins. The Spaniards have but one little fort in this island, called Chacao, always ill provided with warlike stores. Except wine, this island produces all necessary refreshments and provisions; and a great deal of ambergris is found here. About this island are forty more, all taking name from it.

These islands of Chiloe are by a late navigator reputed barren; but their soil is not really so, only the excessive rains choke the seed, and let no corn thrive; so that they are without wheat, wine, or oil, and other plants which need much sun.

With respect to the climate of this cluster of islands, we are told, it rains almost all the year; so that only maize, or other such grain, can ripen, that do not want so much sun. The diet of the natives is mostly of a root called papahs, which grows bigger here than in any other place. The manufactures are clothing for the Indians, who have a kind of vest, which they call macun, without sleeves, over which is a kind of cloak. They have vast woods of cedar trees of a prodigious size, so as hardly to be encompassed by a rope of six yards long. Castro is the principal town, and is the residence of a governor; it has a harbour well fortified.

J U A N

JUAN FERNANDEZ.

THIS island, which lies in 83 deg. west long. and 33 south lat. 300 miles south of Chili, is at present uninhabited; but having some good harbours, is found extremely convenient for the English cruisers to touch at and water; and here they are in no danger of being discovered, unless when, as is generally the case, our good friends in Brasil give notice to the Spaniards of their arrival in the South-Seas, and their motions. This was formerly a place of resort for the Buccaneers, who annoyed the western coast of the Spanish continent; they were induced to come hither from the multitude of goats, which it nourished; to deprive them of this advantage, the envious Spaniards transported to it a considerable number of dogs, which increasing greatly, have almost extirpated the goats, who now only find security among the steep mountains in the northern parts, which are inaccessible to their pursuers.

There are instances of two men living, at different times, alone on this island for many years; the one was a Musquito Indian; and the other Alexander Selkirk, a Scotchman, who being left ashore in this solitary place by the crew of an English ship, was at length discovered by Capt. Woodes Rogers, in 1709; when taken up, he had forgotten his native language, and could scarcely be understood, seeming to speak his words by halves: he was dressed in goat's skins, would drink nothing but water, and he could not for a considerable time relish the ship's victuals. During his stay in this island, he had killed 500 goats, which he caught by running them down; and marked as many more on the ear, which he let go. Thirty years after, some of those were caught by Lord Anson's people, and bore strong marks of antiquity. From the history of this recluse, Daniel Defoe is said to have conceived the idea of writing his celebrated performance, called the Adventures of Robinson Crusoe, Selkirk having, we are told, put his papers into the hands of Defoe, to prepare them for publication, for which they were probably too crude and indigested.

The GALLIFAGO ISLES, situated 400 miles west of Peru, under the equator; and those in the bay of Panama, called the King's, or Pearl Islands; are, besides the above described, the only places deserving notice.

FUERA, OR MASA-FUERO.

IN 1765, Commodore Byron anchored off this island, and sent out his boats to endeavour to get wood and water; but as the shore was rocky, and a surf broke with great violence upon it, he ordered the men to put on cork jackets, by the help of which

they brought off a considerable quantity of wood. Here they found plenty of goats, which proved to be as good food as venison in England. In this expedition the gunner, and a seaman who could not swim, went on shore with the waterers, and, when the business was completed, the violence of the surf which beat against the shore, made them afraid to venture off to the boat; they were, therefore, left behind on the island. The next day the Commodore sent out a boat to bring them back. The gunner swam through the surf, and got on board; but the seaman had so thorough a presage of being drowned in the attempt to reach the boat, that, preferring to social intercourse, he chose to remain on the island at all events.

Having formed this resolution, he took an affectionate leave of the people in the boat. A midshipman, however, just as they were about to return without him, taking one end of a rope in his hand, jumped into the sea, and swam through the surf to the beach, where the poor insolated dependant sat musing on his situation. The young man remonstrated to him on the absurdity of the resolution he had formed, and having made a running noose in the rope, suddenly threw it over the sailor, and fixing it round his body, the people in the boat began to drag him through the surf, and thus brought him on board; though he had swallowed so great a quantity of water on his passage, that he was to all appearance dead; but proper means being used, he soon recovered, and was, no doubt, abundantly thankful for the friendly violence that had forced him from the dreary solitude which his fears had before courted.

This island is by Capt. Carteret described to lie in 33 deg. 45 min. south longitude, 80 deg. 46 min. west from Greenwich. It is very high and mountainous, and, at a distance, appears as one hill or rock. It is of a triangular form, and seven or eight leagues in circumference. Here is such plenty of fish, that a boat, with a few hooks and lines, may presently catch as much as will serve 100 people. Here are coal-fish, cavilliers, cod, halibut, and cray-fish. Capt. Carteret's crew caught a king-fisher that weighed eighty-seven pounds, and was five feet and a half long. The sharks here were so ravenous, that, in taking soundings, one of them swallowed the lead, by which they hauled him above water; but he regained his liberty by disgorging his prey. Seals are so numerous here, that Capt. Carteret says, if many thousands were killed in a night, they would not be missed the next morning. These animals yield excellent train oil; and their hearts and plucks are very good food, having a taste something like those of a hog. Their skins are covered with very fine fur. There are many birds here, and some very large hawks. Of the pintado bird the crew of the swallow caught 700 in one night.

After the foregoing descriptions of the Spanish
settlements in America and the West-Indies, a few
remarks on the policy of the Spaniards with regard
to their colonies in the New World, may not be im-
proper.—Happy would it have been for the natives,
if even for the Spaniards themselves, had not South
America produced such amazing quantities of gold,
had the veins of that metal still remained unknown
to the bowels of the mountains: the former would
then have been sacrificed at the shrine of avarice
with cruelty, nor the latter bartered their virtue, in-
dustry, and military character, for inhumanity, in-
fluence, and ease. No country in Europe receives
such vast treasures as Spain, yet in no country in
Europe is seen so little money; and, strange as it
may appear, from the time the Indies fell into the
hands of Spain, the affairs of that monarchy have
been constantly going backward. The treasure which
is poured in annually from the New World, found them
in debt to every part of the Old; for to the rest of
their revenues they had forgot to add œconomy; a
small revenue itself, and a sure support of all others.
The Spaniards unhappily adopted no means of re-
forming their conquests but by extirpating the people;
no schemes for the advancement of trade; no attempts
at the reformation of abuses, which became formi-

dable in proportion to the mischiefs they had suffered
by them; so that in government, there was tyranny;
in religion, bigotry; in trade, monopoly. The Spanish
nation have relied too much upon their riches; and
the whole state being moulded into a system of cor-
ruption from the top to the bottom, things grew at
last so bad, that the evils themselves became a species
of remedies, and they felt so severely the consequences
of their former conduct, that they have for some years
past turned their thoughts into a new and much better
channel. They are beginning to open the American
trade to some other ports in Spain besides Cadiz.
They have made a difference, in point of duty, be-
tween their own manufactures and those of foreigners.
They are, in short, opening their eyes to the true
interest of their country; they are moving their hand,
though slowly, to promote it; and may in time, by
perseverance, rise again, while others shall fall, by
adopting the abuses which brought them to the brink
of ruin.

At present, the politics of Spain, with regard to
America, seem to be;—to preserve South-America,
and particularly the navigation of the South-Seas,
as much as possible, to themselves; to destroy ef-
fectually the contraband trade; and to encourage the
export of their own manufactures.

PORTUGUESE AMERICA.

CHAP. XXVI.

B R A S I L.

Situation, Extent, Boundaries, Divisions, Climate, Soil, Produce, Animals, Lakes, Rivers, Fish, Inhabitants, Towns, Trade, and Exports.

THIS country is situated between the 35th and 51st deg. of west long. and between the equator, and 33 deg. of south lat. being about 700 miles in breadth, and 2500 in length. It is bounded by the mouth of the river Amazons and the Atlantic Ocean, to the north; by the same Ocean, on the east; by the mouth of the river Plata, on the south; and by a chain of mountains, which divide it from Paraguay, to the west.

After

There are also some small islands on the coast of Brasil, where ships touch sometimes for provisions in their voyage to the South-Sea; particularly Fernando, St. Barbara, and St. Catharine's. These will be described in their proper place.

The name Brasil was given to this country, because great quantities of a wood of that name were found in it.

The coast of Brasil is washed by the Atlantic Ocean, on the north and north-east, upwards of 3000 miles, forming several fine bays and harbours; viz. the harbours of Pernambuco, All Saints, Porto Seguro, the port and harbour of Rio Janeiro, of St. Vincent, of St. Salvador, on the north shore of the river La Plata, and the harbour of St. Gabriel. The principal capes are Cape St. Mary, the most southern promontory of Brasil, Cape Roque, Cape St. Augustine, and Cape Trio.

In the southern provinces the heat, though excessive, is tolerable; the air being constantly refreshed with breezes that blow from the sea, and likewise from the mountains in the inland parts of the country. But the northern provinces are subject to great rains, and variable winds, particularly in the months of March and September, when they have such deluges of rain, accompanied with storms and tornadoes, that the country is almost entirely overflowed, and the climate rendered extremely unwholesome. The soil is in general amazingly fertile, producing sugar, tobacco, indigo, ipecacuanha, balsam of Copiaba, and Brasil wood, which is of a red colour, hard and dry, chiefly used in dyeing, but the colour produced by it is none of the best. Here are also five different sorts of palm-trees, woods of ebony, mastic, cotton-trees, citron, &c. and many others which produce admirable fruits and balsams, diffusing around a most delicious fragraney.

The animals in Brasil nearly resemble those of Peru and Mexico: and no country in the world affords a greater number of birds; some remarkable for their beauty, and others for their taste. Their eatable fowls are turkies, very large and delicious; also hens, ducks, &c. Their bats are of a prodigious size; they will go into houses in the night-time, and if they find any persons asleep and uncovered, will fasten on them, and suck their blood.

The sea-coasts, lakes, and rivers, are stored with great plenty and variety of fish, among which is the globe fish, called by the Latins *orbis minor*, from its circular form; it is so beset all round with sharp spikes, like those of a hedge-hog, as to bid defiance to all fishes of prey. But of all the living creatures in this sea, the most remarkable is the sea bladder, so called because it greatly resembles one, and swims on the surface of the waves. The inside is only filled with air, except about a spoonful of water that serves to poise it. The skin is thin and transparent, and, like a bubble raised in the water, reflects a great variety of colours.

The Portuguese in America are represented, by most judicious travellers, as a people at once sunk in the most effeminate luxury, and practising the most desperate crimes; of a dissembling, hypocritical temper; of little honesty in dealing, or singularity of conversation; also lazy, proud, and cruel. They are poor and penurious in their diet, not more from necessity than inclination; for, like the inhabitants of most southern climates, they prefer parade, state, and attendance, to the joys of free society, and the satisfaction of a free table; yet their feasts, though seldom made, are sumptuous even to profusion. Being ambitious to distinguish themselves from the rest of mankind, by shewing themselves above using the legs which nature hath given them to walk on, they cause themselves to be carried about, in a most stately manner, on beds of fine cotton hanging by the ends a long pole, which two negroes carry either on their heads or shoulders. The bed is covered with a tapestry or canopy, to which are hung some curtains to defend from close or open, by which the person is secured from rain, wind, and if he pleases from sight. Thus lying along at his ease, and his head reclined on a soft rest or pillow, the proud saggard is carried about by his domestics more gaily than in a coach, or sedan. These canopies, hammocks are called, according to our author, *bermudas*, and not palankins, as travellers commonly call them. Almost every person of fashion passes in this manner through the streets.

The city of St. Salvador, or Ciudad da Bahia, is situated in the bay of All Saints, and has a most spacious, and commodious harbour. It is built on a high rock, having the sea on one side, and a hill forming a crescent, inverting it wholly on the other. This situation has rendered it almost impregnable in nature, to which strong fortifications have been added by the Portuguese. The houses are handsome, and the public buildings sumptuous and magnificent. A prodigious trade is carried on in this city; and the streets are crowded with negroes of both sexes, naked, except a piece of cloth wrapped round the middle.

All the ships in the Brasil trade, being under the direction of the government, have their appointed seasons for going and returning, under a convoy of certain number of men of war; nor can a single ship clear out, or set sail, except with the fleet, but by special licence from the king, which is seldom obtained. The fleets sail in exact order and at equal periods, viz. the first to Rio Janeiro, in January, the second to Bahai, or the Bay of All Saints, in February; and the third and last to Pernambuco, the month of March. About May or June they rendezvous in the bay of All Saints, and set sail together for Europe, with a cargo little inferior in value to the treasures of the flota and galleons: the value alone amounts to near four millions sterling; but this is not all extracted from the mines in Brasil, for the

merica are represented, by

 ur millions sterling; but
 the mines in Brasil, for

ing from Africa, especially from their settlers: at at
 Mozambique, vast quantities of gold, together with
 and ivory, which goes into the amount of the
 of the Brasil fleets for Europe. Great part of
 gold is coined in America.
 The exports of Brasil are gold, diamonds, and other
 precious stones; ambergris, sugar, tobacco, indigo,
 silks, cotton, hides, tallow, Brasil wood, rosin, and
 treatments. Formerly the Portuguese employed only
 ve ships in their Brasil commerce; but at present
 are no less than twelve hundred sail of large
 sels constantly going to and returning from these
 colonies. The slave-trade, from the number of slaves
 usually transported from Africa to Brasil, also em
 ys a great number of ships.
 In order to form some idea adequate to the riches of
 the Brasil fleet, it is necessary to observe, that the
 wood-mines are not rented at one-fifth part of their
 value; and that there is returned to Europe, in
 of precious stones, to at least the value of 130,000l.
 This, with the sugar, which is principally the cargo
 of the Fernambuco fleet, the tobacco, the hides, the
 shable drugs for m^edicine and manufactures, may
 convince us of the importance of this trade, not only
 Portugal, but to all the trading powers of Europe.
 The returns to Brasil are not the fiftieth part of the
 produce of Portugal: they consist of the woollen goods
 of all kinds from England, France, and Holland; the
 silks and laces of Holland, France, and Germany;
 the silks of France and Italy; oil from Spain; lead,
 iron, copper, and all sorts of utensils wrought in
 these metals, from England, as likewise salt-fish, beef,
 cur, and cheese: wine, with some fruits, is nearly
 all with which they are supplied from Portugal. The
 profits in this trade are exceedingly large, yet few of
 the Portuguese merchants trade upon their own
 stocks, but are generally credited by the foreign
 merchants, whose commodities they vend, especially
 the English.
 The Portuguese, following the example of the
 Spaniards, have endeavoured to prevent all foreign
 powers from trading to their plantations; but these
 regulations are as little attended to in Portugal as in
 Spain. The Portuguese are properly nothing more
 than trustees and factors, in which capacity they act
 with a fidelity equal to that of the Spaniards; though
 it is well known that, in most other occurrences, this
 nation is not remarkable for their sentiments of
 honour.
 Some writers have represented the Brasilians as very
 savage, devoid of all principles of religion, cruel in
 war, and cannibals, or devourers of flesh; but these
 stories are generally looked upon as fictions of the
 Portuguese, to justify their cruel and inhuman treat
 ment of them. They believe in certain invisible
 beings, the dispensers of good and evil, the rewarders
 and punishers of virtue and vice; and their notion
 with respect to a future state is, that after death they

shall visit their ancestors, dwelling beyond the Andes;
 but they have no temples. Their priests make them
 believe, that if they bring them offerings, those in
 visible beings, who give them food and all the good
 things they enjoy, will prosper their affairs, but if
 they neglect this, some terrible misfortune will befall
 them. They have caciques who rule them in peace,
 and lead them in war. Their towns are without
 walls; their mode of carrying on war is by ambuscades,
 and their weapons are bows, arrows, wooden
 clubs, and shields for defence.

THE HISTORY OF BRASIL.

AMERICUS VESPUTIO was the first discoverer
 of Brasil, in 1498. but the Portuguese did not plant it
 till 1549, when they settled at the bay of All Saints,
 and founded the city of St. Salvador, or St. Saviour.
 The court of Spain, considering the whole continent
 of South America as their property, gave them some
 interruption at first; but the affair was at length ad
 justed by treaty, and the Portuguese were allowed to
 possess all the country lying between the two great rivers,
 Amazon and Plata, which they still enjoy. The French
 afterwards attempting to plant colonies on this coast,
 were driven from thence by the Portuguese, who re
 mained without a rival till 1580, when they were
 struck down by one of those incidents, which at one
 blow often decides the fate of kingdoms. Don Se
 bastian, king of Portugal, lost his life in an ex
 pedition against the Moors in Barbary, by which event
 the Portuguese lost their liberty, their kingdom being
 absorbed into that of Spain. Some time after, the
 Dutch becoming independent, first attacked the Spanish,
 and afterwards the Portuguese American territories:
 they took almost all the fortresses of the latter in the
 East-Indies, and some time after took seven of the
 captainships or provinces of Brasil; and would have
 subdued the whole country, had not their career been
 stopped by the archbishop, at the head of his monks,
 and a few scattered forces: however, about the year
 1654, the Dutch were entirely driven out of Brasil;
 but their West-India company, continuing their pre
 tensions, still pursued the Portuguese at sea, till the
 latter agreed, in 1661, to pay the Dutch eight tons of
 gold to relinquish their interest in that country; which
 was accepted.

The only islands on the coast of Brasil, belonging to
 the Portuguese, which merit description, are those of
 Fernando de Norona, Barbara, and St. Catharine's.
 Fernando de Norona lies in 3 deg. 50 min. south
 lat. and 39 deg. 35 min. west long. It is only about
 twenty miles in circumference, and almost wholly
 insusceptible of tillage, for want of moisture, in
 somuch that from the scarcity of water, the plants
 wither

wither and die in their growth. Here are two harbours capable of receiving ships of the greatest burden, and two small forts are erected on the east part. The French took possession of this island soon after the Portuguese settled at Brasil, but they were driven out in 1738, when the latter sent a colony thither.

St. Barbara is a very small island situated near the coast of Brasil, in 18 deg. six min. south lat. and 40 deg. 4 min. west long. it is no more than 12 miles in circumference, but very fertile, and at the same time very thinly inhabited: it has no harbour capable of receiving ships of any considerable burden, and therefore very little frequented.

St. Catharine's is situated in 27 deg. 45 min. south lat. and in 47 deg. 58 min. west long. It is about 27 miles in length, and six in breadth, and lies about 40 miles east of the coast of Brasil. The soil is very luxuriant, producing fruits of most kinds spontaneously. The ground is covered with one continued forest of trees, of a perpetual verdure. Fruits and vegetables of all climates thrive here, almost without culture, and are produced in the greatest plenty; so that there is no want of pine-apples, peaches, apricots, grapes, oranges, lemons, citrons, melons, plantains, onions, and potatoes. Here are a species of wild black cattle, resembling buffaloes; monkeys, parrots, and pheasants. The harbours and bays are stored with plenty of excellent fish, of various kinds. The water is extremely good, and found in various parts of the island. But amidst all these bounties of nature, the air is far from being salutary, owing to the woods and mountains, which prevent a free circulation, and to other causes.

CHAPTER XXVII.

FRENCH AMERICA.

BEFORE the war of 1756, the French made their possessions in North America, as appears by the maps, to consist of almost the whole continent; and divided this vast country into two great provinces, the northern of which they called Canada (comprehending a much greater extent than the British province of that name, and in which a great part of the provinces of New-York, New England, and Nova-Scotia, was included). They called the southern province Louisiana, comprising therein a division of Carolina. These unreasonable claims, and the measures taken by the French to support them, laid the foundation of the war in 1756, between Great-Britain and that nation, the issue of which has been already noticed. But while the French were using every means to increase their infant colonies, and with the most flattering hopes forming vast designs of an extensive empire, one injudicious step in politics lost

them the whole; and their imaginary dominions which had no existence but in their maps, vanished like smoke. Having over-rated their strength, they commenced hostilities many years too soon; and the consequence was, they were forced to yield to Great-Britain all that fine country of Louisiana, eastward of the Mississippi; but at the treaty of peace in 1763, they were allowed to keep possession of the western banks of that river, and the small town of New Orleans, near the mouth of it; and even this they ceded to Spain in 1769, for reasons best known to themselves.

OLD CAYENNE, OR, EQUINOCTIAL FRANCE.

THIS country is situated between the equator and 5th degree of north lat. and between the 50th and 53rd of west long. It extends 240 miles along the coast of Guiana, and near 300 miles within land; is bounded by Guiana, on the west; by Amazonia, on the south by the Atlantic Ocean, on the east; and by Surinam on the north. Caen is the chief town. The land along the coast is low, marshy, and very subject to inundations during the rainy seasons, from the multitudes of rivers which descend with great impetuosity from the mountains; higher up there are five hills very proper for settlements, where the air is healthy, and the heats greatly mitigated by the sea breeze; but the French have not yet extended them so far as they might, though they raise here the same commodities which they have from the West-India islands, and in no inconsiderable quantity.

The island of CAYENNE, which the French have taken possession of, on this coast, lies at the mouth of the river of that name, and is about 45 miles in circumference, it is very unhealthy, but having some good harbours, they have several settlements; but the fort, which stands at the bottom of one of the harbours, has no other fresh water than what is saved from rain in large cisterns. The island is, however, extremely fertile in sugar, coffee, tobacco, Indian corn, plants, fruits, and other necessaries of life.

MARTINICO.

considerable of all the West-
ing to the French. It lies
north-west of Barbadoes,
between

between the 14th and 15th deg. of lat. and in
deg. west long. The island is a mountain-
ous, and from thence arise numerous rivulets,
which in their course towards the sea at once adorn
and fertilize the country. The soil is in general fer-
tile, and yields sugar, tobacco, cotton, coffee, ginger,
cacao, indigo, cocoa, aloes, plantains, and such
plants as are common in these parts. Its bays and har-
bours, are numerous, safe, and commodious; and so
well fortified, that they for some time bid defiance
to the attempts of the English to take the place; but
in the war of 1756, when the British arms were every-
where triumphant, this island surrendered to them,
and was restored to the crown of France at the peace.
Sugar is here, as in all the West-India islands, the
principal commodity, of which they export every year
a considerable quantity. Martinico is the residence
of the governor of the French islands in these seas.
The most considerable places in the island are St.
Pierre, Port-Royal, and Trinity-Town. An ineffectual
attempt to take this island was made by the English
in 1793.

GUADALUPE.

THIS island is situated in 16 deg. north lat. and
64 deg. west long, about 30 leagues north of Mar-
tinico, and almost the same south of Antigua; it is
about 45 miles long, and 38 broad, and divided into
two parts by a small arm of the sea, or rather a nar-
row channel, through which no ships can venture; the
inhabitants pass it in a ferry-boat. It has a healthy
climate; and the soil is amazingly fertile, producing sugar,
coffee, cotton, indigo, ginger, bastard cinnamon, and
a variety of vegetables. This island is in a flourish-
ing condition; and its exports of sugar, which is of
an excellent quality, are almost incredible, amounting,
it is said, to 100,000 hogsheds annually; and it is
asserted, that if the soil of Guadalupe was as well
cultivated as that of Barbadoes, it would yield sugar
enough to supply all Europe. Every attempt to re-
duce this island proved ineffectual; till the year 1759,
when it was obliged to submit to the English valour;
but, like Martinico, it was, by the treaty of peace in
1763, given back to the French. Guadalupe was fo-
und by Columbus, from the resemblance of its
mountains to those of that name in Spain.

ST. LUCIA.

THIS island is about 23 miles in length, and 12
in breadth; and situated in 14 deg. north lat. and in
61 deg. west long. 80 miles north-west of Barbadoes.
It is diversified with hills and valleys, well watered,

and furnished with excellent harbours; so that upon
the whole, it is esteemed one of the best islands
among the Caribbees. The land is rich, but little of
it cleared. The woods yield excellent timber, and
abound in wild fowl, as the surrounding sea does in
fish. The English first settled on this island in 1697.
From this time they encountered with various misfor-
tunes from the natives and French; and by the De-
finitive Treaty it was agreed on between the latter and
the English, that this island, together with Dominica
and St. Vincent, should remain neutral. But before
the war of 1756 broke out, the French began to set-
tle these islands, which, by the treaty of peace, were
yielded up to Great-Britain, and this island to France.
The English made themselves masters of it in 1778,
but it was restored to the French by the subsequent
peace; and is now declared a free port under certain
restrictions.

T O B A G O.

THIS island lies in 11 deg. 15 min. north lat. and
in 60 deg. 27 min. west long. being 40 leagues south
by west from Barbadoes, about 35 south-east from St.
Vincent, 40 east from Grenada, and between 30 and
40 from the Spanish main. It is 32 miles in length,
about 9 in breadth, and 70 in circumference; so that
it is rather larger than Barbadoes, or, indeed, any of
our Leeward Islands; and near the north-west ex-
tremity lies a small island called Little Tobago, which
is two miles in length, and one in breadth.

The climate is far more temperate than could be
expected in an island that is but 11 deg. 10 min.
north from the equator; for the force of the sun is
diminished by the sea breezes. The spice and gum
trees, with which it abounds, contribute to its salu-
brity. Tobago has another favourable circumstance
to recommend it, namely, its lying out of the track
of those hurricanes that often prove so fatal to the
other West-India islands. The north-west extremity
is mountainous, but the rest of the island agreeably
diversified with risings and fallings. The soil, in ge-
neral, is a rich black mould, proper for producing, in
the greatest plenty, whatever is raised in other parts
of the West-Indies. There are many springs, toge-
ther with commodious bays and creeks. But the va-
luable trees which grow here are, perhaps, its greatest
riches; for, besides the different kinds of wood that
are found in the other West-India islands, it is said,
that the true nutmeg-tree, and the cinnamon-tree, with
that which produces the real gum-copal, are found on
this island. The fig-trees of Tobago are reckoned
equal to those of Spain and Portugal. Indian and
Guinea corn, French beans, various kinds of peas,
the cashou-apple, that is both meat and drink, and
yields an excellent lamp-oil; the prickly-apple, bā-

mana, pomegranate, pine-apple, sweet and bitter orange, lemons, sugar, tobacco, indigo, ginger, farfaparilla, semper vivum, citrons, vanellus, limes, guavas, plantains, tamarinds, grapes, custard-apple, four-apple, papaw-apple, mamma-apple, yellow plum, cherries; the cocoa-tree, that yields both meat, drink, and clothing; musk, cucumbers, water-melons, pumpkins, gourds, potatoes, yams, carrots, turnips, parsnips, onions, cassada-root, natural balsam, silk-grass, with five different sorts of pepper, the long, the cod, the bell, the round, and the Jamaica.

As for animals, here are wild hogs, pickarees, which resemble a hog; armadilloes; guanoes, which are of the alligator kind; Indian conies, badgers, horses, cows, asses, sheep, deer, goats, and rabbits. No island in the world, we are told, can boast such a variety of fishes, both shell and others, particularly turtle and mullets, of a most delicious taste. Of the feathered species there is also a great variety. Lastly, in different parts of the island are found green tar, soap earth, with many curious shells, stones, marcasites, and minerals.

King Charles II. granted this island to the duke of Courland, under whose auspices a colony of English, and another of Dutch, were settled on it: but their plantations were so often ravaged by the Caribbees of the neighbouring continent, that the English abandoned the place. The Dutch, however, continued in their settlements, and had such an opinion of their value and importance, that they long supported themselves with the most obstinate perseverance against all the attempts of the English and French. It was declared a neutral island by the treaty of Aix-la-Chapelle, in 1748; ceded to the English by the treaty of 1763; taken by the French in June 1781, and yielded to them by the late peace. It was taken by the English April 15, 1793.

MARIGALANTE.

THIS island was discovered by Columbus, in his second voyage to America, in 1493, and received its appellation from that of his ship. It is situated a little to the south-east of Guadalupe, about five leagues in length, and four in breadth: it abounds in all the productions of the other islands. A great many grottoes are found here, abounding with large land crabs; and the high rocks, that run along the eastern shore, being full of great holes, give shelter to vast numbers of tropical birds. There are several rivers and ponds of fresh water in the island. The French began to send colonies hither about the year 1647; and, before the last reduction of it by the British arms, it manufactured above one thousand hogheads of sugar annually.

St. MARTIN, St. BARTHOLOMEW AND DESEADA.

THESE are three of the most inconsiderable islands the French possess in these parts.

St. MARTIN lies a little to the north-west of Bartholomew, and is of no consequence whatever.

St. BARTHOLOMEW is situated about ten leagues north of St. Christopher's, and, though encompassed with formidable rocks, produces tobacco and cassava with some excellent woods, and lime-stone; but the island is now to be considered as belonging to the crown of Sweden, being ceded to it by France 1785.

DESEADA, which is a corruption of the word Desiderada, or the Desirable Island, was so called by Columbus, from being the first land he discovered his second voyage to America. It is situated about twenty miles north-east of Guadalupe, and is said to produce the best cotton of any of the French West India islands.

Though the French were among the last nations who formed settlements in the West-Indies, they have made ample amends for the time they had lost by the vigour with which they pursued their undertakings, and by that chain of judicious and admirable measures which they used in drawing from them every advantage which the nature of the climate would admit, and in struggling with the difficulties which attend infant settlements, especially in the torrid zone.

As France is become sensible that all the benefits of her labours and acquisitions, as well as all the prosperity of her plantations, must be derived from the attention with which they are regarded at home; we shall therefore lay before our readers some part of the wise plan of conduct which this politic nation pursued in order to render her colonies so highly advantageous to the mother country.

The colonies were particularly under the care and inspection of the council of commerce; a board judiciously constituted to answer all the purposes for which it was designed: for, to give it a proper respect and authority, it is composed of twelve of the most considerable officers of the crown; and then to enable it to judge perfectly of the matters which come before it, these twelve are assisted by the deputies of all the considerable trading cities and towns in France, chosen out of the richest and most intelligent of their traders, and paid handsome salaries for their attendance at Paris, from the funds of their respective cities. This council sits once a week. The deputies propose plans for redressing every grievance in trade; for raising the branches that are fallen; for extending new ones; for supporting the old; and, in fine, for every thing that may improve the working or promote the vent of their manufactures, according to their

their

their own lights, or the instructions of their constituents.
They keep a watchful eye upon every article of com-
merce; and they not only propose helps and improve-
ments to it themselves, but they hear the proposals of
others, which are not disdainfully rejected, nor rashly
received; nor do they render the access to themselves
difficult by unwieldy state. They do not discourage
those who apply, by admitting the vexatious practice
of fees, perquisites, and exactions in their inferior of-
fices. They do not suffer form and methods to load
the burden that business they were solely intended to
advance. They summon and examine those who are
supposed the most competent judges of the matter be-
fore them, and of every part of it, even the lowest
artizans. But though they examine those men, and
gain instruction from their experience, they are not
determined by their opinions. When they are satis-
fied of the usefulness of any regulation, they propose
it to the royal council, where their report is always
received with particular attention. An edict to enforce
it issues accordingly, and it is executed with a punc-
tuality which distinguishes their government, and
which alone can render the wisest regulations any-
thing better than serious mockeries. To the care of
this body the plantations are particularly intrusted.

That the colonies may have as little load as possi-
ble, and that the governor may have less temptation
to stir up troublesome intrigues, or favour factions in
his government, his salary is paid by the crown. His
perquisites are none; and he is strictly forbidden to
carry on any trade, or to have any plantations in the
islands or on the continent, or to have any interest
whatsoever in goods or lands within his government,
except the house he resides in, and a garden for his
convenience and recreation. All the other officers
are paid by the crown out of the revenues of France; the
fortifications are built and repaired, and the sol-
diers are paid out of the same fund.

The colonies pay hardly any taxes; and when upon
extraordinary emergency taxes have been raised,
they are very moderate; and even then, they who
have begun new plantations are exempted from them.
The duty upon the export of their produce at the
islands, or at its import into France, is next to no-
thing; in both places hardly making two per cent.
The commodities exported from France to the islands
pay no duty.

Besides those above-mentioned, their regulations re-
specting the judges of the admiralty, law-suits, reco-
very of debts, lenity to such as have suffered by
earthquakes, hurricanes, or bad seasons, the peopling
their colonies, number of whites to be employed by
the planters, and, lastly, the management of negroes,
cannot be sufficiently admired; and some of them
could, no doubt, be of great service, were they in-
troduced into our sugar islands, where suitable re-
gulations in many respects seem to be loudly called
for.

C H A P. XXIX.

DUTCH AMERICA.

SURINAM, OR DUTCH GUIANA.

THIS country is situated between 5 and 7 deg.
north lat. bounded by the Atlantic Ocean, on
the north; by the French settlements, on the east and
south; and by the Spanish settlements, on the west: ex-
tending 100 miles along the coast from the mouth of
the river Oronoque, north, to the river Maroni, or
French Guiana, south.

Surinam is the most considerable of all the Dutch
colonies in Guiana; the plantations extend 30 leagues
above the mouth of this river, on which the town is
built. The climate of this country is generally rec-
koned unwholesome; and a considerable part of the
coast is low, and covered with water. The colony
itself is in a less prosperous condition than it was some
years since, owing, among other causes, to the wars
the Dutch have been engaged in with their fugitive
negroes, whom they have treated with great barba-
rity, and who are become so numerous by their con-
tinual increase year after year, that they have formed
a kind of colony in the woods, which are almost im-
penetrable, along the rivers of Surinam, Saramaca,
and Copename, and have been very troublesome neigh-
bours. They have even elected chiefs among them-
selves, cultivate lands for their support, and take fre-
quent opportunities of revenging the injuries they
have received from their old oppressors, by making in-
cursions into their plantations.

The exports from Surinam consist of sugar, tobacco,
coffee, gums, dyeing woods, drugs, cotton, flax, and
skins. In these the Dutch trade with Europe, and
our American colonies; from the latter of which they
receive in return, molasses, horses, live cattle, and va-
rious kinds of provisions. They also carry on a con-
siderable traffic with the West-India islands, to which
they transport various kinds of timber, adapted for the
building of mills. This is purchased by the planters
at a very advanced price, not less than sixty pounds
sterling being given for the largest pieces.

The two Dutch colonies of Ilsequebo and Demera-
ry, on account of their proximity, are comprised in
one colony, which bears the name of them both.
Ilsequebo, however, is the most ancient, having been
settled between 60 and 70 years, while the settlement
of Demerary does not exceed 20 years. On these
rivers are several forts, islands, and plantations. One
of the islands in the Demerary is the residence of the
commandant, and there the courts of judicature are
held, and the company's troops stationed. They were
taken by the English in 1781, and retaken by the
French.

The

The inhabitants of Dutch Guiana are a mixture of whites or Europeans, blacks, and Aborigines, improperly called Indians, together with their several castes or divisions, already enumerated in our account of New Spain, and whose colours depend on their degree of consanguinity to either whites, Indians, or negroes; the several intermediate divisions of them proceed from their heterogeneous intercourse with each other. The four tribes of Indians are distinguished by the appellations of Caribbees, the Warrrows, the Accowars, and the Arrowauks.

Horses, asses, mules, bulls, cows, &c. run wild in this country, as in many other parts of America: Among the amphibious animals are the hippopotamus and the laubba; the latter is peculiar to this country; it is about the size of a pig four months old, its head resembles that of a pug dog; it has a short thick neck, small eyes and ears, short legs, and no tail; and is covered with a fine short hair of a chestnut colour, intermixed with white circular spots, except under the belly, where it is agreeably white. The flesh of this creature, being extremely delicate and tender, is preferred by the Europeans who reside here to all other kinds of meat. There are in this country an immense number and variety of snakes, which form one of its principal inconveniences. Some years ago a snake was killed on a plantation that belonged to Peter Amyatt, Esq. which was upwards of 33 feet in length, and three feet in circumference near the middle of the body: it had a broad head, large prominent eyes, and a very wide mouth, in which was a double row of teeth. The birds are very numerous here, and of various species; some of them are so remarkable for the beauty of their plumage, that several persons in Guiana have employed themselves advantageously, with their slaves and dependents, in killing and preserving some of the most curious sort for the cabinets of naturalists in different parts of Europe.

The torporific eel is found in the rivers of Guiana, which, when touched either by the hand, or by a rod of iron, gold, silver, copper, or by a stick of some particular kinds of hard American wood, communicates a shock perfectly resembling that of electricity. The insects of this country are very numerous, some of them venomous, and others destructive; but the beetles and butterflies are extremely beautiful.

C H A P. XXX.

DUTCH ISLANDS IN AMERICA.

ST. EUSTATIUS, OR EUSTATIA.

THIS island, situated between 17 and 29 min. north lat. and 63 deg. 10 min. west long. is only a mountain, rising out of the sea like a pyramid, and

almost round. It is about 29 miles in circumference and is well cultivated. Besides tobacco, the inhabitants have of late years raised and exported great quantities of sugar. They also breed hogs, rabbits, goats, and most sorts of poultry. The air is wholesome, but it is subject to terrible thunder-claps, earthquakes, and hurricanes; and there is a scarcity of fresh water.

St. Eustatius is reckoned the strongest of all the Caribbee islands, there being but one landing-place which is commanded by a fort, and may be easily defended by a few men. The Dutch took possession of it in 1635; and since the treaty of Ryswick, has preserved it without interruption, till after hostilities were commenced by Great-Britain against Holland in 1781, when this island surrendered at discretion to Admiral Rodney, who was sent against it with considerable land and sea force: but on the 27th November, the same year, it was retaken by the French, commanded by the marquis de l'Ouille, whose force consisted of only three frigates and some small craft, and about three hundred men. After the capture of St. Eustatius by the English, as above mentioned, the private property of the inhabitants was confiscated, with a degree of rigour very uncommon among civilized nations, and entirely inconsistent with the humanity and generosity by which the British nation used to be characterised, even by her rival neighbours. The reason assigned for this extraordinary conduct was, that the inhabitants of the place had assisted the Americans with warlike stores during her contest with the mother country.

CURASSOU, OR CURACOA.

THIS island is situated about ten leagues from the coast of Terra Firma, in 12 deg. 14 min. north latitude. It is about 30 miles in length, and 10 in breadth. The climate is neither wholesome or agreeable, nor the soil fruitful; yet the island is populous, and the industry of the inhabitants such, that it produces a great deal of sugar and tobacco. It is well supplied with provisions, and all other commodities from Europe, and the other Dutch settlements, in which it carries on a very lucrative and extensive contraband trade with the Spaniards in Terra Firma. Let the Spanish governors prohibit this trade never so severely, the Spaniards find so much in need of European commodities, that they will run all hazards to obtain them: for these they pay in gold and silver coined or in bars, cocoa, vanilla, jesuits bark, cochineal, and other valuable articles. In times of peace the trade of this island is said to be annually worth 500,000. to the Dutch, but the profit is still greater in time of war, when it furnishes the contending parties with arms and ammunition to destroy each other.

 originally carried on by the West-India company
 are: at present, such ships as go upon that trade,
 two and a half per cent. for their licences: the
 company, however, reserve to themselves the whole of
 that is carried on between Africa and the American

The chief town and harbour is about three leagues
 from the south-east end of the island. The town, for
 size, is one of the fairest and finest in America, and
 contains every thing necessary to render it commo-
 dious and agreeable, as far as the climate and soil
 will permit.

The Dutch ships from Europe touch at this island
 for intelligence, or pilots, and then proceed to the
 Spanish coasts for trade; which they force with a
 strong hand, it being very difficult for the Spanish
 vessels to take these vessels; for they are not
 only stout ships, with a number of guns, but are
 manned with large crews of chosen seamen, deeply in-
 creded in the safety of the vessel and the success of
 the voyage. They have each a share in the cargo, of
 value proportioned to the station of the owner, sup-
 plied by the merchants upon credit, and at prime
 cost. This animates them with an uncommon cou-
 rage, and they fight bravely, because every man fights
 for defence of his own property. Besides this; there is
 a constant intercourse between this island and the
 Spanish continent.

Other their islands are, Bonaire, Aruba, Saba, and
 St. Martin's.

Bonaire and Aruba are chiefly considerable for their
 situation near the coast of Terra Firma, which gives
 the inhabitants an opportunity of carrying on a
 clandestine trade with the Spanish settlements in Terra
 Firma: they may also be regarded as appendages to
 Curassou, for which they are chiefly employed in
 raising cattle and other provisions. Saba and St.
 Martin's are two small islands, situated about 13 miles
 north-west of Eustatius, and are too inconsiderable
 to merit particular description. They were both cap-
 tured by Admiral Rodney and General Vaughan,
 about the time of the surrender of Eustatius, but the
 French retook them afterwards.

On the south side of Bonaire is a good salt-pond,
 whither the Dutch sloops come for salt, which is be-
 come a considerable commodity.

CHAP. XXXI.

DANISH ISLANDS IN AMERICA.

THE Danes have very little interest in America.
 They have no settlement on the continent, and
 only two small islands lying in the Archipelago,

known by the name of the West-India islands: these
 are St. Thomas, and St. Croix, or Santa Cruz.

The island of St. THOMAS is situated in the 64th
 deg. of west long. and the 18th of north lat. It
 is the largest of that cluster called the Virgin Islands,
 being about 15 miles in circumference. It has an ex-
 cellent harbour, nearly surrounded by two promon-
 tories, which defend the ships that lie within from
 almost every wind. In the centre of the port is a
 very small fortress very indifferently fortified. The
 soil is tolerably good, and every foot of it cultivated;
 the chief production being sugar, of which the an-
 nual quantity is about 3000 hogheads of 1000 weight
 each. The Brandenburgers have a considerable fac-
 tory here; but the principal persons now belonging
 to it are French refugees, who fled thither when the
 Protestants were expelled from the French islands.
 The inhabitants, who are very numerous, are supplied
 with most of their provisions from Porto Rico.

The principal town, called St. Thomas, consists of
 one long street, at the end of which is the magazine,
 a large, magnificent, and convenient building, wherein
 there is room for stores, slaves, and goods of all sorts.
 This is the residence of the governor, who is always
 a man of rank, and soon acquires a large fortune,
 as do most of the inhabitants, owing to the extensive
 and various kinds of trade carried on here. The
 Spaniards not only purchase slaves, which the Danes
 bring hither from Africa, but likewise all sorts of
 European goods, of which there is always a confi-
 derable stock in the magazines, belonging principally
 to the Dutch, who carry on an extensive and advan-
 tageous commerce in the island of St. Thomas. In
 time of war, the trade of this island is amazingly
 increased; for being a neutral port, the privateers of
 all nations resort hither to sell their prizes, and the
 Dutch have always agents there, with large sums of
 money, ready to purchase these goods.

This island derives a peculiar advantage from its
 commodious harbour, mentioned above: it lies on the
 south side, where 50 ships may lie in safety. It is de-
 fended by a fort, whose batteries at the same time
 protect the small town built round the shore. This
 harbour is much frequented by merchant ships: when
 they are chased, in time of war, they find here a safe
 protection; and, in time of peace, a vent for their
 goods, by the clandestine trade which the boats of St.
 Thomas continually carry on with the Spanish coasts.

Two leagues to the south of St. Thomas is ano-
 ther island, about the same size, called St. John's.
 It is the best watered among the Virgins, and its
 harbour has not only the reputation of being better
 than that of St. Thomas, but passes also for the best
 to the leeward of Antigua. The English give it the
 name of "Crawl Bay." But notwithstanding these
 advantages there is so little good land in the island,
 that its planting and exportations form only a very
 trifling object.

ST. CROIX, or SANTA CRUZ, situated about five leagues to the east of St. Thomas, is between ten and twelve leagues in length, and about four in breadth. The soil is rich and fertile, yielding several kinds of fruits, and excellent timber. This island, not many years since, was a perfect desert; but the number of settlers now begin to increase apace: several persons from the English islands, and among them some of great wealth, have gone to settle there, and received very great encouragement. The air of St. Croix is extremely unhealthy; but this ill disposition will probably continue no longer than till the woods, with which the island at present is almost covered, are cut down, and the land improved by cultivation.

The Danes, when they first settled in America, were under the government of a West-India company; so that their affairs appeared with a very unpromising aspect, and nothing like the proper advantages were made of these settlements. The late king of Denmark, who was inferior in abilities to none of his ancestors, saw that there were no hopes of rendering these islands flourishing while the company continued their preposterous measures; accordingly he purchased the company's stock, and laid the trade open. The effects were soon perceived; commerce raised its head, and the colonies were soon changed from a state of torpid indolence into that of vigorous traffic; the plantations daily increased, new settlers continually arrived; and the island of St. Croix, from an almost desolate wilderness, became a cultivated garden, and the inhabitants an opulent people.

In time of war, privateers bring in their prizes here for sale; and a great many vessels trade from hence along the Spanish main, and return with money in specie or bars, and valuable merchandise.

The Dutch and Danes, hardly deserve to be mentioned among the proprietors of America; their possessions there are comparatively nothing. But as they appear extremely worthy of the attention of these powers, and as the share of the Dutch is worth to them at least 600,000*l.* a year, what must we think of our extensive and valuable possessions? what attention do they not deserve from us? and what may not be made of them by that attention?

"There seems to be a remarkable providence (says an ingenious and polite writer) in casting the parts, if

I may use that expression, of the several European nations who act upon the stage of America. The Spaniard, proud, lazy, and magnificent, has an aversion to walk in which to expatiate; a soft climate to indulge his love of ease, and a profusion of gold and silver to procure him all those luxuries his passions demand, but which his laziness would refuse him.

"The Portuguese, naturally indigent at home, and enterprising rather than industrious abroad, has gold and diamonds as the Spaniard has, wants them as he does, but possesses them in a more useful, though less ostentatious manner.

"The English, of a reasoning disposition, though cool and calm, and men of business rather than great industry, impatient of much fruitless labour, and abhorrent of constraint, and lovers of a country life, have a lot which indeed produces neither gold nor silver; but they have a large tract of a fine continent; a noble field for the exercise of agriculture, sufficient to furnish their trade without laying them under great difficulties. Intolerant as they are of the most useful restraints, their commerce flourishes from the freedom every man has of pursuing it according to his own ideas, and directing his life after his own fashion.

"The French, active, lively, enterprising, pliable, and politic; and, though changing their pursuits, always pursuing the present object with eagerness, are, notwithstanding, tractable, and obedient to rules and laws, which bridle their dispositions, and wind and turn them to proper courses. These people have a country (when Canada was in their possession) where more is to be effected by managing the people than by cultivating the ground; where a peddling commerce, that requires constant motion, flourishes more than agriculture, or a regular traffic; where they have difficulties which keep them alert by struggling with them, and where their obedience to a wise government (meaning the excellent regulations already mentioned respecting the French colonies in America) serves them for personal wisdom. In the islands, the whole is the work of their policy, and a right turn their government has taken.

"The Dutch have a rock or two, on which to display the miracles of frugality and diligence (which are their virtues) and on which they have exerted these virtues, and shewn those miracles."

BOOK V.
EUROPE.

INTRODUCTION.

EUROPE, though by far the smallest division of the globe, is in many respects superior to the other three, and that which particularly deserves our attention. It is situated between the 36th and 72d degree north latitude, and between the 10th degree west, and 65th degree east longitude, computed from the meridian of London; being 3000 miles in length from Cape St. Vincent in the west, to the mouth of the river Volga in the north-east; and 2500 in breadth from north to south, from the North Cape in Norway to Cape Matapan in the Morea, the most southern promontory in Europe. It is bounded on the north, by the Frozen Ocean; on the east, by Asia; on the south, by the Mediterranean Sea, which divides it from Africa; and on the west, by the Atlantic Ocean, which separates it from America.

This quarter of the globe, though the least extensive, is beyond comparison the most happy and valuable part of it, both with regard to religion, arts, learning, riches, and commerce. It justly claims a pre-eminence over the other parts, because the human mind hath here made the greatest progress in whatsoever is useful and ornamental to mankind in general. The mildness of the climates of most parts of Europe; the fertility of its soil, which produces every thing necessary for the support, and even luxury of human life; the flourishing state of the arts and sciences; and the nature of the several governments, which are far less despotic, and far more equitable than those of either Asia or Africa; render this the most desirable quarter of the terraqueous globe for the residence of a rational being. To these advantages we may add, that no part of it is situated within the torrid, and but a small portion within the frigid zone; and the difference of its face, or variety of its surface, by seas, rivers, mountains, &c. which are at once innumerable and beneficial, contribute largely to its superiority.

The present inhabitants of the principal states of Europe are descended from those multitudes of northern people who destroyed the Roman empire. Constantine the Great had some time before removed the seat of empire from Rome to Constantinople, and this occasioned its fall. The Visigoths forced a passage into Italy, and took Rome in the year 409, and settled in Italy, Languedoc, and Spain. The provinces of Gaul fell to the share of the Franks and Burgundians, and still retain the name of their conquerors. About the same time Hunns subdued Pannonia, and called it Hungary after their own name. The Britons, being expelled from their habitations by their foreign allies, crossed the Severn, and took refuge in the lofty mountains of Wales, the inhabitants of which principally are said to be immediately descended from the original natives of Britain, and to retain their language in its purity.

The languages of Europe are derived from six radical ones, namely, 1. Latin, of which the Italian, French, Spanish, and Portuguese, are dialects. 2. Teutonic, from whence proceed the German, Dutch, Swedish, Danish, and English tongues. 3. Slavonian, which reigns in different dialects in Poland, Muscovy, Bohemia, and a great part of Turkey in Europe. 4. The Celtic, of which there are remaining dialects in Wales, Ireland, the Highlands of Scotland, Brittany in France, and Lapland. 5. Greek, of which several dialects are spoken in the Morea, and the islands of the Levant. 6. Gothic, some remains of which are preserved in the islands of

the Baltic, and the southern parts of Sweden. To these we may add the languages spoken in Turkey and Little Tartary as European languages.

Most of the European governments are monarchical; but many, if not all of them, are checked by a variety of little springs which break their force, and soften their rigour. But besides monarchical, there are aristocratical and republican governments in Europe. Venice is an aristocratical state, where the government is in the hands of the nobles; and Holland is a democracy, or government of the people. Great Britain is a government of a very singular kind, consisting of the three species above-mentioned, and partakes of all their benefits, while it rejects the inconveniences annexed to them. The other mixed governments of Europe, Poland, Sweden, &c. are composed of two only of the simple forms; as will be explained in their proper places.

The Christian religion is established in every part of Europe, except the districts possessed by the Tartars, where the Mahometan tenets are professed. The Christians are divided into a number of different sects, which may be comprehended under three general denominations; namely, 1. The Greek church; 2. Popery; 3. Protestantism: which last is again divided into Lutheranism and Calvinism, so called from Luther and Calvin, the two eminent reformers of the 16th century: but all their principles are founded upon the same basis, since they all acknowledge Christ to be the Redeemer of mankind, and that the scriptures were written by divine inspiration.

The following TABLE contains the principal Kingdoms and States of Europe, their Length, Breadth, Chief Cities, Distances and Bearings from London, Difference of Time from London, and their Religions.

Kingdoms.	Length	Breadth.	Chief Cities.	Distance and Bearing from London.	Religions.
Greenland	Uncertain.				
Greenland	Uncertain.				
Lapland	Uncertain.				
Norway	1000	300	Bergen	540 N.	} Lutherans

Turkey in Europe

EUROPE contains the following principal ISLANDS, exclusive of the British before mentioned.

Islands.	Chief Towns.	Subject to
the Northern Ocean .. Iceland	Skalholt.....	Denmark.
{ Zealand, Funen, Alsen, Falster, Langland, Laland, Femenen, Mona, Bornholm..... }	Ditto.
the Baltic Sea..... { Gothland, Aland, Rugen	Sweden.
{ Ofel, Dagho	Russia.
{ Ufedom, Wollin	Prussia.
{ Ivica	Ivica	Spain.
{ Majorca	Majorca	Ditto.
{ Minorca	Port Mahon	Ditto.
{ Corfica	Bastia	France.
{ Sardinia	Cagliari	King of Sardinia.
{ Sicily	Palermo	King of Two Sicilies.
the Adriatic, or Gulf of Venice. Lufiana, Corfu, Cephalonia, Zant, Leucadia.	Venice.
the Archipelago, and Levant Seas..... { Candia, Rhodes, Negropont, Lemnos, Tenedos, Scyros, Mitylene, Scio, Samos, Patmos, Paros, Cerigo, Santorin, &c. being part of ancient and modern Greece .. }	Turkey.

We judge it expedient to begin our description of EUROPE with an account of the dominions belonging to his Danish majesty, being the most northerly situations, and divide them into four parts: 1. East and West Greenland, Iceland, and the islands in the Atlantic Ocean; 2. Norway; 3. Denmark proper; and 4. The Danish territories in Germany. The following TABLE will exhibit, at one view, the dimensions of these countries:

The Dimensions of the Danish Dominions.

Denmark.	Square Miles.	Length	Breadth	Chief Cities.	
Denmark proper. { North Jutland ..	9,600	155	98	Wyburg.

C H A P. I.

WEST GREENLAND.

Description of the Country, Climate, Soil, Vegetable and Animal Productions, &c.

WEST GREENLAND, otherwise called Old-Greenland, or Groenland, begins in 59 deg. 50 min. north lat. The eastern coast is supposed to extend as far northward as Spitzbergen, or East Greenland; and the western part is only separated by a channel of 40 miles in breadth. The western shore has been discovered higher than the 70th deg. of north lat. The country is exceeding mountainous; and the mountains are so very high that they may be discerned at sea at the distance of 30 leagues. The inland mountains and hills are perpetually covered with snow; but the low lands on the sea side are, in summer, clothed with verdure. The coast is difficult of access, on account of the great number of rocks with which the surrounding seas, and the mouths of the Greenland rivers, abound, independent of the vast mountains of floating ice which seem to threaten with destruction the adventurous navigator.

The climate, from the most southerly part of Greenland to the 68th deg. of north lat. is not so severe as might at first be imagined. The summer includes the latter end of May, the whole of June, July, and August, and half the month of September; during which the weather is generally warm: while the wind blows easterly the sky is always serene, but when it veers to the other points, storms are sure to ensue. The sea coast is generally infested with unhealthy and disagreeable fogs, which are, however, so fattening to the land, that the shores are covered with verdure; but the inland mountains are capped with snow perpetually.

The weather, to the northward of the 68th deg. is much more severe, and the cold so very intense, that even in the midst of summer the very strongest spirituous liquors will freeze close to the fire side. The winter in this part continues from September to May, and sometimes June, during which time the sea is covered with vast mountains of ice. "Nothing (says an eminent writer) can exhibit a more dreadful, and, at the same time, a more dazzling appearance than those prodigious masses of ice that surround the whole coast in different forms of rocks, castles, towers, and spires, reflecting a variety of colours according to the nature of the concrete, and floating from place to place, as if the whole scene was illusion, or enchantment; such are the prospects they yield in calm weather, but when the winds begin to blow, and the sea to swell in vast successive billows, the conflict of those congregated bodies of ice encountering, dashing,

cracking, bursting, and shivering into ten thousand fragments, fills the eye and ear with terror and astonishment.

Thunder and lightning seldom disturb the natural phenomena, such as shooting stars, and particular the aurora borealis, or northern-light. In the spring of the year, and about the new moon, this phenomenon appears so universally bright on the face of the whole northern sky, darting in rays and glaring with such radiance, as to afford sufficient light whereby to read

There is no night at the summer solstice, and people who reside here have the pleasure to see the sun above about the horizon all the twenty-four hours: but the depth of winter they have but little comfort; that planet, the nights being proportionably long; they can see to travel up and down the country, though sometimes it is neither moon-shine or star-light. The temperature of the air is not unwholesome; for, except the scurvy, and the distemper of the lungs, the inhabitants know nothing of many other diseases which other countries are plagued; and these peculiar infirmities are not so much the effect of the excessive cold, as of the foggy weather, to which this country is very much subject. From the beginning of April to the end of July is the foggy season; and from that time the fog daily decreases. But as in the summer time they are troubled with fogs, so in the winter season they are plagued with the vapour called frost-smoke, which, when the cold is excessive, rises out of the sea, as the smoke out of a chimney, and is as thick as the grossest mist, especially in bays, where opening in the ice is found.

A wonderful harmony and correspondence is observed in Greenland between fountains and the sea: at spring tides in new and full moon, when the strongest ebbing is at sea, the hidden fountains or springs of fresh water break out on the shore, and discover themselves often in places where they might be little expected, especially in winter, when the ground is covered with ice and snow; yet there are no waterspings in those places at other times.

In Greenland the hills are barren, and indeed frozen all the year; the low lands are tolerably fertile, particularly towards the sea. A few oak trees are found in the southern parts near the States Promontory. In these particular parts the meadows are rich in grass: turnips and coleworts are easily raised, and excellently flavoured: underwood, which grows to a vast height, is plentiful: birch, elm, and willows are not scarce, and juniper-berries grow in abundance. The herb angelica grows wild, and is found in great profusion: it is endued with a turpentine flavour, and yields an aromatic oil, which is extracted by distillation.

A pleasant and salutary kind of scurvy-grass grows in great plenty on the shores, and the mountains near

bays and creeks a species of grass bears several, and many of them, abound in this country, are bramble-berries, and juniper-berries. Here is said relative to the southern part of the northern parts no herbs various metals are toward of the Dute Egele once received Greenland, and himself. He likewise saw a land mixed with copper company, which is as much as what could not, however, ever after able to find specimens: it is called among a great he had set up that he could not

Red and white rock woolly; and a bastard very plentiful about known by the name natives make bow the seas and bays, believe great quantities of the greatest natural curiosities, or amianthus, of earth-flax, a general substance, elements. It is a stone differing from is neither so bright is not composed elements, like flax. formed into paper, and not to be are flexible. The cloth; the latter in manufacture appears, which, according the dead in cloth their ashes separate use to which some kind of cloth. This country is animal, the great wher, very seldom appear the quadrupedes of rein-deer. The speckled; and the peculiarity belongs

days and creeks are covered with wild thyme. Various species of grass bearing yellow flowers, the herb *mentha*, and many other plants, herbs, and vegetables, abound in this country. The fruits of Greenland are bramble-berries, bil-berries, blue-berries, and *hyper-berries*. Here it is to be observed, when any thing is said relative to the fertility of Greenland, that the southern parts are only meant, for in the northern parts no herbs and plants will grow.

Various metals are produced in Greenland: to the southward of the Dutch colony copper ore is found. *Egede* once received a lump of ore from a Greenland, and himself found calamine of a yellow colour. He likewise sent a considerable quantity of yellow sand mixed with vermilion streaks to the Dutch company, who, by letter, requested him to procure as much as possible of that commodity; he could not, however, execute his commission, as he never after able to find the place where he got the first specimen: it was, it seems, one of the islands among a great cluster of islands, and the vessel he had set up was blown down by a storm, so that he could not trace out the spot a second time.

Red and white rock crystals are the produce of this country; and a bastard marble, of various colours, is very plentiful about the Danish colony, which is known by the name of Good Hope; of the latter the natives make bowls, lamps, pots, and crucibles. In the seas and bays, besides a variety of beautiful shells, are found great quantities of excellent coral. But one of the greatest natural curiosities of this country is the *asbestos*, or *amianthus*, which has the vulgar appellation of earth-flax, and is a fibrous, flexible, and general substance, composed of short and abrupt filaments. It is a stony concrete, of the talcky kind, though differing from talc in its external appearance.

It is neither so bright, so smooth, or so unctuous, as talc is not composed of leaves or plates, but of long filaments, like flax. It has been spun into cloth, and formed into paper, both of an incombustible nature, and not to be consumed by fire. Some kinds are filaments that are rigid and brittle, and others are flexible. The first cannot be spun, or formed into cloth; the latter may, but not without difficulty. This manufacture appears to have been known to the ancients, who, according to Pliny, wrapped the bodies of the dead in cloth made of earth-flax, to preserve their ashes separate from those of the funeral pile, a use to which some of the Tartarian chiefs still apply this kind of cloth.

This country is not infested with any ravenous animal, the great white bear excepted, which, however, very seldom appears near the Danish colony. The quadrupedes of Greenland are dogs, foxes, hares, and rein-deer. The dogs are large and rough, white speckled; and their ears stand upright, which is peculiarly belonging to curs in general in all cold

climates. These dogs are timorous and stupid, do not bark, but make a most dismal howling at times. In the northern parts they are rendered of infinite service, as the natives there yoke them to sledges, which, when heavy laden, they are able to draw upon the ice at the rate of seventy miles a day. These poor useful animals are, however, very ill rewarded for their services, being left to provide for themselves, except when their owners happen to be successful in taking a great number of seals, at which times their masters gratify them with a meal, composed of the entrails and blood. The foxes appear of different colours, white, grey, and blueish. They are neither so hairy, or so large, as those of Denmark and Norway. Hares are found in Greenland in great abundance; they are of a white colour, very fat in summer, and of an exquisite flavour. Rein-deer feed in great herds, and are hunted all the summer by the natives, who are usually accompanied by their wives and children in these excursions, and in pursuit of their game will penetrate very far into the country.

Lizards, serpents, toads, newts, &c. are unknown in Greenland; but gnats swarm, and are exceedingly troublesome in the summer time.

Here are vast numbers of partridges, which are white in winter, and grey in summer; as well as sparrows, linnets, snow-birds, and ice-birds. A great many ravens hover about the huts of the Greenlanders, as, near the habitations of these people, the ground is usually strewed with the offals of seals, and other fish. Greenland likewise abounds with eagles and falcons of a prodigious size, and large speckled owls.

Bees, wasps, spiders, and flies, are the insects of this country. The people, however, are not plagued with beetles, ants, mice, or rats.

The inhabitants are fond of the seal, which contributes at once to their sustenance and convenience. There is some difference in seals, but the most remarkable species is that called the Cap-miss, which appellation it receives from the cap, or cawl, with which it covers its head occasionally. The head itself resembles that of a dog with cropped ears, his snout is bearded like a cat, his eyes are large, and his teeth sharp. His skin is covered with a short thick fur, which is white, black, brown, or tawny: he is web-footed, which is a great convenience to him in swimming; and he seems to drag himself along, rather than walk. Seals are from five to eight feet in length. The fat of this creature furnishes the Greenlanders with oil, the flesh with food, the skin with clothing, and with coverings for their huts and boats.

The Greenland seas abound also with turbot, cod, haddock, scate, salmon, halibut, cat-fish, roe-fish, stents, whittings, bream, muscles, crabs, shrimps, and other fish. Under the article of East or New Greenland, that astonishing creature the whale will be amply described from some late minute observations.

The

south part of the island, another house, which he called Stelburg, that is, Starburg; there he kept several instruments, and lodged some students and servants, who applied themselves to some particular study. But Uraniburg is now gone to decay; and the island of Huen belongs now to the Swedes.

The chair in which Tycho Brahe used to sit, to make his astronomical observations, is still preserved in the royal museum, and held, by the Danes, in the highest veneration. "Thus," says a judicious traveller, in a letter to a friend, "it ever happens! I need not remind you that the astronomer himself was driven from his native country by faction and malevolence; or that he died at Prague, in the court, and under the protection, of the emperor Rodolphus, who sheltered this illustrious fugitive, and afforded him an asylum."

Fredericksburg is a small town, twenty miles distant from Copenhagen to the north-west, and eighteen from Ellineur to the south-west. It is considerable only by the stately castle and royal palace which stands near it. That castle was formerly but a small seat belonging to a private gentleman. King Frederick II. being charmed with its situation, bought it of him, and began to enlarge it. His son, Christian IV. finished it. This is the Versailles of Denmark. The house is built on piles in a lake. The body of the castle consists of a very fair front, with two great wings. The chapel is well adorned, and covered with gilt copper. It has twelve silver statues of the apostles; and all the locks, bolts, &c. were silver, till it was plundered by the Swedes. The hall is adorned with paintings, and has the pictures of several of the kings of Denmark, and of the royal family, as large as the life; and a frame of paintings, which represent the sea and land battles of the kings of Denmark. It is hung with rich tapestry of mohair, representing the actions and battles of Christian IV. There is a gallery which leads from the castle to the hall of audience, adorned with pictures, most of which were bought in Italy. Here is a park about nine miles long, of a proportionable breadth, and interspersed with pools and fish ponds, with a mixture of green plods, hillocks, and small vallies. It was stocked with fallow-deer from England. There is a pretty flower garden behind the castle, in the very lake; in which, though it is exceeding deep, they have built a kind of terrace on piles that cost an hundred thousand crowns.

The town of Roschild, or Roskild, lies at the bottom of the bay of Iseford, and is eighteen miles distant from Copenhagen to the west. It was formerly the capital of Denmark, when the king resided there; but since they have chosen Copenhagen for their residence, it has dwindled greatly in point of importance, and is much decayed with respect to wealth and commerce. Of twenty-seven churches, which formerly embellished this town, only two are now standing. It continues,

Among the monuments of the Danish sovereigns, of which are extremely magnificent, stands a beautiful marble pillar, erected by queen Margaret, as a funeral monument to the whetstone sent her by Albert, king of Sweden, who sharpened her needles, in derision to her sex. But it testified her resentment in such a manner, that he suffered severely for his sarcasm; for he was taken prisoner by the queen, detained seven years in custody, and obliged to relinquish all his pretensions to the crown of Sweden.

Here is a convent of Lutheran nuns belonging to the best families; but they are not obliged to wear any particular habit, or to be restricted by the vows common in convents; but are permitted, if they think proper, to quit the convent, and marry. In 1658 the peace treaty of peace was here concluded between Denmark and Sweden. The university is in a declining condition; and, indeed, the whole town exhibits evident marks of poverty and decay.

Sora is situated on the banks of a lake, about the centre of Zealand, was formerly the seat of a bishopric, and has many pleasant fields and forests near it. To this place the academy of Fredericksburg was removed, and the foundations of the university were augmented by Christian IV. Charles Gustavus, king of Sweden, was educated here, and retained such a veneration for the place, that when he invaded Zealand, he would not suffer his soldiers to enter the town. But the revenues of this seminary have been annexed to the crown of Denmark, and the whole is gone to decay. Absalom, archbishop of Lund, once founded here an establishment for the maintenance of the poor, who should write the history of Denmark; and to this foundation we owe the history written by the celebrated Saxo Grammaticus.

FUNEN is the next island to that of Zealand, in point of scale of importance, among the several parts which compose the Danish kingdom. It is bounded by the Greater Belt on the east, by the Lesser Belt on the west, by the Baltic on the south, and by a little channel, which separates it from the island of Samsey, to the north. It is about 36 miles from east to west, and 30 from north to south. The country is fertile and agreeable, being finely diversified with verdant hills, shady woods, pleasant groves, fruitful fields, rich pastures, &c. The soil is good, well cultivated, and affords a great deal of grain; not only for home consumption, but exportation. Great quantities of black cattle, horses, hogs, &c. are bred here. This island is an appendage to the eldest sons of the kings of Denmark; and is deemed one of the richest governments belonging to that sovereignty. It contains five fortified towns, and 264 villages; but the most considerable places, and the only ones of any note,

Odense, the capital, and is a capital of the kings once met before the sovereign absolute dedicated to St. Car near a century a copper coffin. The most beer in the wks On the narrower women and Zealand some trade, the h country is fertile. nations in the law thoroughly repaired. land are made at Schwenborg is an harbour, situated. From hence 1658, began his march, Zealand, the small town a little gulf on against the island distant from Schwed In the duchy of this island, over is about 11 mile the year 1535 th founded by John R Christopher, earl of Holf, archbishop belted this town On the western the Lesser Belt, it is 17 miles di and as many from it is a small, but with all the necessity of this place, not being b Swesend. FALSTER lies which it is separa as Zealand on the north-east. breadth. Its fo ment from hence

the Danish sovereigns, magnificent, stands a beautiful tower, in honour of Margaret, as a tribute to her sex. But in the manner, that he suffered, was taken prisoner by the Danes, and confined in custody, and obliged to attend the crown. The nuns belonging to the abbey are not obliged to wear habits, if they think proper. In 1658 the abbey was concluded between the university is in a state of decay, the whole town is situated on the banks of a lake, about 10 miles from the city. The fields and forests near Fredericksburg was the seat of the university when Charles Gustavus, king of Sweden, invaded Denmark, and retained his quarters here when he invaded Zealand, and when he invaded Zealand, the soldiers to enter the town, and the whole is gone. Lunden, once founded by the Danes, for the maintenance of the Danish crown; and to the Danes, and to the Danes, written by the celebrat

Odensee, the capital of the island, stands about its centre, and is a capacious, well-built, pleasant town. Here the kings once resided, and the assembly of the nobles met before the crown became hereditary, and the sovereign absolute. In a church here, which is dedicated to St. Canute, the body of that prince was deposited near a century and a half ago. It was deposited in a copper coffin, gilt, and adorned with precious stones. The most particular circumstance relative to this town, at present, is, that the inhabitants brew the beer in the whole kingdom.

On the narrower part of the Greater Belt, between Funen and Zealand, lies Nyburg. This place has a good trade, the harbour is good, and the adjacent country is fertile. The damages done to the fortifications in the late wars with Sweden, are not yet thoroughly repaired. Embarkations for the island of Zealand are made at this town.

Schwenborg is an agreeable town, with a commodious harbour, situate on the south-east part of the island. From hence Charles Gustavus, in the year 1658, began his march, over the ice, to the islands of Langeland, Zealand, and Falster.

The small town of Woburg, or Foburg, is situate on a little gulf on the southern coast of Funen, over against the island of Arros, and is about 10 miles distant from Schwenborg to the west.

In the duchy of Sleswick, on the south-west coast of this island, over-against Hadersleben, lies Assens. It is about 11 miles distant from Odensee to the south.

In the year 1535 the army of king Christian III. commanded by John Rantzaw, routed that commanded by the bishop, earl of Oldenburg, and killed Gustavus Troll, archbishop of Upsal. Rantzaw afterwards settled this town with the ground.

On the western shore of the island, lies Middlefar, in the Lesser Belt, hence also called Middlefar-Sound. It is 17 miles distant from Affens to the north-west, and as many from Odensee towards the south-west. It is a small, but neat town, in a country abounding with all the necessaries of life. It is the common passage from this island to Colding in Jutland; the Belt not being broader here than the Thames is at Gravesend. On the 13th of January 1658, Charles Gustavus, king of Sweden, led his army over the ice to this place, routed the Danish forces that opposed him, and made himself master of the whole island of Funen.

FALSTER lies to the north-east of Laland, from which it is separated by a narrow strait. This island lies Zealand on the north, and the island of Moon on the north-east. It is 20 miles in length, and eight in breadth. Its soil is very fruitful; and much corn is sent from hence to Mecklenburg, and other parts of Germany. It is divided into two bailiwicks; that of

or Norre-Herrit. It has several towns; among which the chief are Nycoping, on the western coast of the island, of which it is the capital. It is one of the most pleasant and well-built towns in the whole kingdom, and styled, by Dr. Heylin, the Naples of Denmark. It has a strong castle, and a well frequented harbour. Stubcoping, in Latin, Stubcopia, seated on the north coast, is a place of some trade, being the usual passage from Zealand into Germany.

ARROE is situated near the coast of Funen, being eight miles in length, and two in breadth. It is extremely fruitful in corn, and abounds in aniseed, with which the inhabitants give a flavour to their bread, and season their meat. In this island are plenty of horses and black cattle; and some woods, in which are abundance of hares. The whole island has but three parishes, the most considerable of which is Kopin, or Kioping. The town belonging to it stands on the southernmost part of the island, and bears the same name as the parish. It has a trade on account of its port, and is situated at the bottom of the bay.

LALAND is situated on the eastward of Langeland, and to the southward of Zealand, from which it is separated by a narrow strait, called Grono Sound. From its lowness, or flatness, it has the appellation of Laland, or Lowland. It is near 40 miles in length, and about 20 in breadth, where widest. The soil is very fertile; so that Copenhagen is supplied from hence with great quantities of corn, besides what the Dutch traders are furnished with for exportation. This island is divided into five districts, or bailiwicks, is the seat of a governor, and has several small islands subject to its jurisdiction. It contains various pleasant little villages and hamlets, and a few seats belonging to the noblesse, exclusive of four towns, Nascow, Saxcoping, Levenscoping, and Nysted.

Nascow, or Naxkow, the capital, is 59 miles south-west from Copenhagen, and has a commodious harbour for trade. The fishery is of some consequence, and the circumjacent country is rich in meadow and pasture lands.

MOON lies to the south-east of Zealand, and to the north-east of Falster. It is about 20 miles long, eight broad, and full of high chalky hills. Here is some pasture ground, but very little corn land. It was formerly part of the Danish admiral's allowance, as being the first place for him to reside in. There are in this island several villages, large parishes, and a considerable city, called Stege, or Stekoe, which lies on the north of the island, on a little rivulet, that

Lubeckers in the year 1510, and forced them to retreat; and the valour of the inhabitants of the whole island was signalized in 1659, when they defended themselves better against the Swedes than the larger islands had done.

LANGELAND is 22 miles long, and eight broad, is situated on the Greater Belt, to the southward of Funen. This island abounds with wheat, rye, and barley, of which the natives export great quantities. It is divided into 16 parishes; and Ruteop, on its western coast, is the most considerable town, being defended by the fort of Tranekar, which is always furnished with a strong garrison.

FEMEREN lies near the coast of Holstein, from whence it is separated by a strait which is not above two miles broad, and is called Der Femmer Sundt, i. e. the Straights of Femeren. Though it is but a small spot of ground, yet it has always been looked upon as one of the keys of Denmark, with regard to the empire. Therefore king Christian IV. was more afraid of the Germans becoming masters of this island, than of their over-running Jutland, which caused him to fortify all the old castles, and put strong garrisons in every place of importance here. This island is extremely fruitful in corn and pastures, and yet has but two parishes, namely, Borg and Peterdorp. There is a fort at the place where people land from Holstein, called Fethschans, that is, the Fort of the Passage.

BORNHOLM, anciently called Boringia, is said to have been discovered by Thieloraus, the son of a prince of Jutland. It is the remotest and most easterly of all the islands belonging to the king of Denmark, being about 75 miles distant from Zealand to the east, and not above 15 from the nearest coast of Schonen to the south-east. It is about 18 miles long, from north-west to south-east; and about 10 in breadth, from south-west to north-east. Bornholm is a place of great importance for its situation and fruitfulness, and belonging once to the archbishop of Lunden; but king Christian II. took possession of it in the year 1524, as being absolutely necessary for the fleet he was preparing against Sweden; which usurpation George Sesteburg, who was then archbishop, opposed with all his power, but in vain; for he was forced afterwards to fly into Germany, to avoid the effects of the king's displeasure. The Swedes have frequently laid this island waste; and in the war with Frederick II. they made themselves masters of it.

May 27th, 1660. The most considerable places Sandwyck, on the northern coast; Ratenby, on the south-western; Nex, on the eastern; and Sand-Ham, to the north of Nex, on the same coast; besides which here are several villages.

Many little islands surround the above-mentioned more considerable ones; but they are either uninhabited, or of so little importance, as not to be thought worthy of notice by travellers; or of mention by geographers. Some others are contiguous to them, and belong to the other provinces of Denmark; the most considerable of which are Samsoe and Lessaw, on the coast of Jutland.

SAMSOR, or SAMSOI, is in the Baltic, eight miles from the coast of Jutland. It is near nine miles in length, three in breadth, fruitful, healthy, and pleasant.

LESSAW belongs to the diocese of Aabur, opposite to which it lies, at about the distance of 12 miles from the shore. It is surrounded by sand-hills, but has two places where ships may ride safely at anchor on the north and east sides, and contains three fine villages.

Appertaining and contiguous to the duchy of Schleswick, are the following islands, viz.

1. ROM, which is in length seven, and in breadth four miles, contains several small hamlets, and about 1500 inhabitants. Towards the eastern parts the pasture for cattle is excellent; and on the western side of the island are several harbours, in which small vessels may ride in safety.

The greatest part of Manoe, formerly a considerable island, has been swallowed up by the sea.

2. SYLT, situated to the northward of Fora, and is of a triangular form, the longest side being about 14 miles in length. It is sandy, barren, and inhospitable; and the people, who are a hardy, clownish race, are annually engaged in the whale fisheries, on the coasts of Iceland, Greenland, and Spitzbergen. Earthen urns, containing human bones, ashes, &c. have been found in the hills of this island, which further evinces that the ancient inhabitants burned their dead.

3. NORTHSTRAND lies opposite to the bailwick and town of Hufum, and was, it is said, separated from the continent by a violent storm. When it became an island it was about 12 miles long, and four broad, in some places, and in others less. Its soil is very fruitful, and produced abundance of corn before the inundations we shall mention hereafter. It had also very fat pastures, where they fed exceeding good cattle; and they used to send daily to Hufum, and other places, a prodigious number of sheep.

ants; but it has suffered prodigiously at several times
fatal inundations. In the year 1300 the little city
Rangholt, with several churches and villages, were
carried away by the waves, which drowned also great
numbers of people, as well as cattle.

In 1539 there arose such a violent storm here, that
small the whole island was overflowed; when 1600,
according to others, 1900 persons perished in the
water. The next year another storm damaged the
islands very much. From 1612 to 1618, there hap-
pened every year such inundations, as occasioned pro-
digious losses, and put the inhabitants to very great
oppression; and particularly in 1615, when 300 persons
perished in the waves. They were afterwards free for
some years, and had time to repair their banks and
dykes; but all their care and precautions proved in-
effectual against the storm that happened October the
10th, 1634. At ten of the clock at night the whole
island lay under water, above 6000 persons were
drowned; and, of all the inhabitants, there were
scarcely 1500 that saved their lives. The churches,
which stood on the rising grounds, held out the storm
some time, but fell down afterwards; and 28 windmills
were carried away by the waves. The loss of cattle
at all parts was reckoned to amount to 50,000 heads;
and the dykes were broke in 44 different places. The
whole island continued thus overflowed, except a small
spot of ground which stood high, than the rest. Since
that time the inhabitants have laboured, with the
assistance of some Dutchmen, to regain part of the
ground they had lost.

4. AMRON, or Amroen, is a small island to the north-
west of Northstrand, from which it is about seven
miles distant. It is in the form of a crescent, and is
highly considerable for its oyster fishery.

5. FORA, or Foehr, lies towards the north-east of
Amron, and nearer the coast of Sleswick, than of
Northstrand and Sylt. It belongs to the prefectorship
of Tunder, and is of an oval figure, about six miles
in length, and four in breadth. It abounds in cattle
and corn, has about 4200 inhabitants, and several
villages. The inhabitants still preserve the language,
manners, and dress of the ancient Frisones, though
some of them speak the dialect of Lower Saxony.

Denmark is extremely well situated for commerce;
her harbours are well calculated for the reception
of ships of all burthens, and her mariners are very
expert in the navigation of the different parts of the
ocean. The dominions of his Danish majesty furnish
a great variety of timber, and other materials for
ship-building; and there are many productions for
exportation in some of his provinces. Besides fir, and
other timber, here are black cattle, horses, butter,
black-fish, tallow, hides, furs, train-oil, tar, pitch,
and iron, which being the natural product of the

portation of oats is prohibited. Salt, wine, brandy,
and silk from France, Portugal, and Italy, are the
imports. The Danes have lately had a great inter-
course with England, from whence they import
broad-cloths, clocks, cabinet and lock-work, hard-
ware, &c.

But the commercial spirit of the Danes appears in
a very favourable light, when we consider their settle-
ments in the East and West-Indies. A company for
carrying on the former was established at Copen-
hagen in the year 1612, under the protection of Chris-
tian IV. About four years after the establishment,
four large ships sailed for the East-Indies; and the
Danes made a settlement at Tranquebar on the coast
of Coromandel. Here they built a fort, which is
reckoned the strongest in the Indies. This colony
soon increased from the encouragement given by
the Danes to the Indians, who, finding themselves pro-
tected in their privileges, and permitted to carry on
their trade without oppression, resorted to Tranquebar
in such numbers, that the commerce soon became
very valuable, and the company received a yearly
tribute of 10,000 rix-dollars. But not content with
this increasing establishment, the Danes attempted,
in the year 1620, to make a settlement on the island
of Ceylon, in order to acquire the spice-trade, then
monopolized by the Portuguese.—This scheme, how-
ever, failed in the attempt, and the Danes having em-
broiled themselves with the Indian princes on the con-
tinent, their settlement at Tranquebar must have been
taken by the rajah of Tanjour, had not Mr. Pitt, an
English East-India governor, generously sent them
assistance.

After the death of Charles XII. of Sweden, when
the wars in Europe were ended, the Danish East-
India company found themselves so much in debt,
that they published proposals for a new subscription
for enlarging their ancient capital stock, and for fitting
out ships to Tranquebar, Bengal, and China. The
capital was considerably enlarged for these purposes by
a spirited subscription, which alarmed France and the
maritime powers. The Dutch raised a process against
the projects of Van Asperin, who, being a subject of
the States, was condemned and executed in effigy.
Every objection that could be started against the ac-
complishing of the scheme, was published in the
newspapers of Paris, London, and Amsterdam, with
a view to discourage people from engaging in the
commerce. The ministers of Great-Britain and Hol-
land, who resided at the court of Denmark, were
ordered to make remonstrances to his Danish majesty
against this new charter, which they apprehended
would interfere with the East-India trade of their
subjects. The king prudently answered, that he was
not restricted by any treaty whatever from supporting

ention to violate. After great difficulties the company was established, their commerce extended, and they now carry on an advantageous trade to China, and the coast of Coromandel. Their credit is extensive; their funds are considerable; their warehouses, magazines, yards, and docks in complete order; and they send annually two or three ships richly laden to the East-Indies.

Besides the trade to the East-Indies, the Danes have extended their commerce to the West-Indies, where they possess the islands of St. Thomas and St. Croix, and the small island of St. John, which are free ports, and celebrated for smuggling; also the fort of Christianburg on the coast of Guinea, and to Greenland. Within a short period of time, the Danish merchants have opened new channels of trade, particularly with the Mediterranean; the number of ships has been doubled, and the revenues of the kingdom increased in proportion.

Denmark is not famous for its antiquities, if we except the royal Museum at Copenhagen, which consists of a very numerous collection of them. Besides artificial skeletons, curious carving in ivory, models, clock-work, and a beautiful cabinet of ivory and ebony made by a Dutch artist who was blind, here are a great variety of astronomical, optical, and mathematical instruments, which are placed in the round tower at Copenhagen, so contrived that a coach may drive to its top: a set of medals ancient and modern; and two famous antique drinking vessels, one of gold, and the other of silver, and both in the form of a hunting horn. That of gold seems to be of Pagan manufacture, and from the raised hieroglyphical figures on its outside, it was probably made use of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two English pints and a half, and was found in the diocese of Rippen, in the year 1739. The other, of silver, weighs about four pounds, and is termed Cornu Oldenburzicium; which, they say, was presented to Otho I. duke of Oldenburg, by a ghost. Some, however, are of opinion that this vessel was made by order of Christian I. king of Denmark, the first of the Oldenburg race, who reigned in 1448. See before, p. 480.

The constitution of Denmark was heretofore of the free Gothic original. The convention of the states, even including the representatives of the boors or peasants, elected a king for his personal virtues, having a due regard to the son of their late monarch, whom, however, they made no scruple of setting aside, if they deemed him unworthy of the royal dignity. They enacted laws, conferred the great offices of state, debated all affairs relative to commerce, peace, war, and alliances; and occasionally gave their consent to the imposition of necessary taxes. The king

tially; to command the army in time of war; to encourage industry, religion, arts and sciences, and watch over the interests of his subjects. He had public revenue from the state, but lived like a private nobleman from the produce of his own lands and demesnes. Such was the constitution of Denmark till the year 1660, when it underwent a very extraordinary revolution.

At the conclusion of the peace with Sweden, the nation resounded with the clamour of misery and discontent. There was nothing left in the public treasury to pay off and disband the army, which therefore became insolent and licentious. The common people and even the burghers, were exhausted by the expensive war: the clergy were unsatisfied with the condition and want of importance, and the nobles were become proud and tyrannical. When the estates assembled to deliberate and redress the grievances of the nation, the commons proposed that an equal share should be laid upon all persons without distinction in proportion to their circumstances. The nobles pleaded their privilege of being exempted from imposition. The burghers alleged, that as the nobility engrossed all the lands and riches in the kingdom, it was reasonable they should bear their share of the common burthen; in consequence of this, violent disputes ensued. At length a nobleman, named Olof Craeg, stood up, and in a transport of passion told the commons, that they neither understood the privileges of the nobility, who were always exempted from such impositions, nor the condition of themselves, who were no other than their slaves. This inglorious behaviour produced an immediate ferment in the assembly, at the hall resounded with murmurs and altercation. Nanfon, speaker of the commons, starting up in a rage of indignation, swore that the nobility should repent their having branded the commons with such an opprobrious epithet. He had previously concerted the design with the bishop of Copenhagen, and the court was not ignorant of their intention. The clergy and burghers breaking up in disorder, marched under the auspices of these leaders to Brewer's-Hall, where after much debate, they agreed to make a solemn tender of their freedom and services to the king, that he might become absolute monarch of the realm, and see the right of hereditary succession established in his family. Next morning they marched in couples, each burgher being paired with a clergyman, through the streets, which were filled with the populace, who shouted as they passed to the council-hall, where the nobles had re-assembled. There Nanfon, in a loud harangue, signified the intention of the clergy and commons, demanded the concurrence of the nobles, and threatened that, in case of a refusal, they would forthwith proceed without them to the palace. consequence might not be precipitated. The others,
being deaf to their remonstrances and entreaties, con-
tinued their procession to the palace, where they were
met by the prime minister, who conducted them to
the hall of audience. There the bishop of Copen-
hagen, in a florid speech, as deputy from the two
provinces, made a solemn tender to the king of an ab-
solute and hereditary dominion; assuring his majesty,
that he might command their purses and arms, to
support a measure so necessary to the welfare of his
people. He received them graciously, assented to the
proposal, thanked them for their zeal and confidence,
and assured them they might depend upon his royal
favour and protection. The city gates were imme-
diately shut, that none of the senators should escape,
in precaution by which the nobles were so greatly
intimidated, that they immediately signified their
readiness to concur with the step which the other
two orders had taken. Preparations were forthwith
made for this strange inauguration. Scaffolds were
erected in the open space before the castle, and the
knights and burghers received orders to appear in arms,
under their respective officers. On the sixteenth day
of October, in the year 1660, the king, queen, and
royal family, ascended an open theatre, and placing
themselves on chairs of state, under canopies of velvet,
received in public the homage of all the senators,
nobility, clergy, and commons, couched in an oath
of allegiance composed for the purpose. Thus the
people, with a rash and desperate hand, from motives
of revenge, fomented by an artful ministry and am-
bitious clergy, resigned their liberty and independence,
and invested their sovereign with a despotic power
over their lives and fortunes.

Soon after this extraordinary revolution took place,
the king of Denmark divested the nobility of many of
the privileges which they had before enjoyed; though he
took no method to relieve or reward those poor people
by whose means he was invested with the sovereign
power, but left them in the same state of slavery in
which they were before, and in which they have re-
mained to the present age.

When the revolution in the reign of Frederic III.
had been effected, the king re-united in his person
the rights of the sovereign power; but as he could not
exercise all by himself, he was obliged to intrust some
part of the executive power to his subjects. The su-
preme court of judicature for the kingdoms of Den-
mark and Norway is holden in the royal palace at
Copenhagen, of which the king is the nominal presi-
dent. The German provinces have likewise their su-
preme tribunal; which for the duchy of Holstein is
holden at Glückstadt, and for the duchy of Sleswick
in the town of Sleswick.

The king for the most part decides matters of im-

authority; here likewise great changes or establish-
ments are proposed, and approved or rejected by the
king; and in the council, or in the cabinet, he grants
privileges, and decides upon the explication of laws,
their extension, or their restriction, and upon the most
important affairs of the kingdom, according to his
sovereign will and pleasure.

The kings of Denmark not only preside nominally
in the sovereign court of justice, but they have a
throne erected in it, towards which the lawyers al-
ways address their discourses in pleading, and the
judges the same in giving their opinion. The king is
present every year at the opening of this court, and
often gives the judges such instructions as he thinks
proper. The decision of those judges is final in all
civil actions; but no criminal sentence of a capital
nature can be carried into execution till it is signed by
the king. There are three courts in Denmark, and
an appeal in extraordinary cases lies from the inferior
to the superior tribunal. As every man is permitted
to plead his own cause, a trial is attended with very
little expence; nor can any suit be suspended longer
than 18 months.

In Denmark, the judges are punishable for any mis-
demeanors they may be guilty of, and there are many
excellent regulations for the due administration of
justice; but notwithstanding this, it is so far from
being distributed in an equal and impartial manner,
that a poor man can scarcely ever obtain justice in this
country against one of the nobility, or against one
who is favoured by the court or by the chief minister.
If the laws are so clearly in favour of the former,
that the judges are ashamed to decide against them,
the latter, through his influence with the minister,
procures an order from the king to stop all the law-
proceedings, or a dispensation from observing par-
ticular laws; and thus every rule of equity being
perverted and set aside, the lower class of subjects
are aggrieved and injured without any possibility of
redress.

The code of laws at present established in Denmark
was published by Christian V. founded upon the code
of Valdemar, and all the other codes which have been
since published, and is nearly the same with that pub-
lished in Norway. These laws are contained in a
quarto volume, drawn up in the language of the
country, in so plain and perspicuous a manner, and
founded upon such unerring principles of justice, that
the most ignorant may understand, and every im-
partial person approve of them; and, if carried into
execution in an equitable manner, would be pro-
ductive of many beneficial effects to the people. But
as the king can change, alter, and dispense with the
laws as he pleases, and support his ministers in their
disregard and violation of them, the people of Den-

their liberties, and thereby established absolute monarchy.

The police is very strict in Denmark, hence highway robberies, burglaries, coining, clipping, &c. are crimes scarce ever heard of; and to speak against the government is so strongly prohibited, that none dare wag their tongues licentiously in political matters. The common method of execution here is beheading and hanging: in some cases, as an aggravation of the punishment, the hand is chopped off before the other part of the sentence is executed. The other principal modes of punishment are branding in the face, whipping, condemnation to the rasp-house, to houses of correction, and to public labour, and imprisonment. The public executioner, though universally despised, is commonly rich, as he is not only well paid to deprive malefactors of life, but is the general contractor to empty all the privies, and remove from houses, stables, streets, &c. all kinds of filth, and, in particular, dead cats, dogs, &c. which no other Dane will touch upon any account whatever.

The revenues of Denmark arise from crown lands, taxes, and duties, and these are extremely heavy. Wine, salt, tobacco, and provisions of all kinds are taxed. Marriages (a most impolitic tax!) paper, corporations, land, houses, and poll money, also raise a considerable sum. The expences of fortifications are borne by the people; and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The tolls paid by strangers arise chiefly from the passage of their ships through the Sound into the Baltic. The income of this toll is at present much less than formerly. About the year 1640, it produced 240,000 rix-dollars per annum; but since 1645 it has not yielded above 190,000; some years not above 80,000; in 1691, it did not extend to full 70,000, and is now much less. This tax has more than once thrown the northern parts of Europe into a flame; having been disputed by the English, Dutch, and Swedes, who deemed it arbitrary and unjust, being originally only a voluntary contribution of the merchants towards the expence of light-houses on the coast; but it was at length, by the treaty of 1720, between Sweden and Denmark, agreed to be paid by the former and other powers. The toll is paid at Elfsneur.

The whole revenue of Denmark, including what is received at Elfsneur, amounts at present to above 5,000,000 of rix-dollars, or 1,002,000l. sterling yearly. By a list of the revenue taken in 1730, it then amounted only to 454,700l. English money, which is less than half the sum it now produces.

The military force of Denmark consists in its regular troops, militia, and navy. The greatest part of the regular troops are foreigners, particularly Germans. The cavalry and dragoons are well mounted, and

regiments are quartered in Zealand; one in Funen, three in Jutland, and four in Holstein. The infantry is composed of sixteen regiments; of which two are on duty as the king's guards. When the regiments are complete, each consists of two battalions, and each battalion contains six companies of 100 each. The artillery consists of three regiments, one of which is stationed in Denmark, another in Norway, and the third in Holstein. The body of engineers is divided into three parts, each of which comprises two officers of various ranks.

Since the late reduction of the Danish forces, the numbers are, 10,000 cavalry and dragoons, and 30,000 infantry and artillery, which, with the militia, make up a body of 70,000 men. Every person who cultivates or possesses 360 acres of land, is obliged to find one man for the militia, and pay half the expence of a man towards a corps-de-reserve, to be embodied and called out only upon great emergencies. They receive no pay, but are registered on the army list, and exercised every Sunday.

Though the Danish army is extremely burdensome to the nation, yet it costs little to the crown: great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peasantry are obliged to maintain the cavalry in victuals and lodging, and even to furnish them with money.

The present fleet of Denmark is composed of thirty-six ships of the line, and eighteen frigates; but many of the ships being old, and wanting great repairs, they can send out twenty-five ships upon the greatest emergency, this is thought the most they can do. This fleet is generally stationed at Copenhagen, where are the dock-yards, store-houses, and all the material necessary for the use of the marine. They have 26,000 registered seamen, who cannot quit the kingdom without leave, nor serve on board a merchantman without permission from the Admiralty; 4000 of these are kept in constant pay, and employed in the dock-yards; their pay, however, scarcely amounts to nine shillings a month, but then they have provisions and lodgings allowed for themselves and families, and a sort of blue uniform, faced with different colours.

The Danish men of war carry the same complement of men, in proportion to their guns, as the French ships of war do; but they are much inferior in point of construction, both to English and French ships of war; and, indeed, are far from being equal to the Swedish ships.

The three last kings of Denmark, notwithstanding the degeneracy of their subjects in martial affairs, were very respectable princes, by the number and discipline of their troops. Frederic IV. established a marine academy for fifty young cadets, to be trained

Zealand, one in Funen, and one in Holstein. The infant regiments; of which two are in Norway, and two in Denmark. When the regiments are on duty, they consist of two battalions, and each of 1000 men. The regiments, one of which is in Norway, and the other in Denmark, consist of engineers is divided into two companies, which comprises twenty-four men. The Danish forces, the infantry, the dragoons, and the artillery, with the militia, were in 1792, 1793, and 1794. Every person who possesses land, is obliged to serve, and pay half the expenses of the reserve, to be called upon in great emergencies, and registered on the army list.

order to join practice to theory, they were annually to make a voyage in a frigate, and successively to perform the services of common seamen, pilots, and officers. But this noble institution is now totally neglected, and the money appointed to support it is sunk into venal pockets; so that except a few officers, who have been bred in the English and French services, the Danes would have a great difficulty, in case of a war, to prepare with any naval power, to find proper persons to command their ships of war.

To the court belong two ancient orders of knighthood, viz. that of the elephant, and that of Daneburg. The badge of the former, which is the most honourable, is an elephant surmounted with a castle tower, with diamonds, and suspended to a sky-coloured ribbon, worn like the George in England. This order was instituted by Christian I. at his son's wedding. It is conferred only on persons of the highest quality; and the number of companions amount to 30 besides the sovereign. The order of Daneburg, though less honourable, is much more ancient; so that the origin of it is lost in fable: it is bestowed, as an honorary reward, upon the noblest of inferior rank, its insignia being a white ribbon with red edges, worn over the left shoulder, from which depends a small diamond star, and an embroidered star on the breast of the coat, surrounded with the motto PIETATE ET JUSTITIA, piety and justice.

A COMPENDIOUS HISTORY OF DENMARK, NORWAY, &c.

VERY little is known of the early periods of the Danish history. Even the name of the first Christian king of Denmark is uncertain; and those of the people whom they commanded were so blended together, that it is impossible for the reader to conceive a precise idea of the old Scandinavian history. All that we can discover relative to the inhabitants of these kingdoms is, that they appear to have been colonies of the ancient Scythians, who spread themselves through all the northern and western parts of Europe. In the 4th century, the Saxons, a name under which the Danes, Norwegians, and other nations of the North were comprehended, committed dreadful ravages on the coasts of Britain and Gaul, and obliged the Romans to station their forces along the coasts, under the command of an officer called Comes Littoris Saxonicæ. Their ravages, like their manners, were cruel and inhuman; their tracks were marked with blood and desolation; and neither age, innocence, nor religion could afford protection from the swords of

Few very interesting events in Denmark preceded the year 1387, when Margaret II. ascended the throne. That princess married Aquin, king of Norway, by which the two kingdoms became united. Aquin died soon after; but Margaret, partly by address, and partly by the right she had obtained by her marriage, formed a treaty, anno 1397, by which she was acknowledged sovereign of Denmark, Norway, and Sweden. This treaty is generally known by the name of the union of Calmar. Margaret, whose soul was formed for greatness, swayed the sceptre of these kingdoms with honour to herself, and advantage to her country. Her friendship was courted by most of the European powers, so that historians have justly styled her the Semiramis of the North. But, like all other sublunary greatness, it was fleeting and transient. The successors of Margaret were far inferior to her in abilities; and the union of Calmar was soon destroyed. The Swedes rebelled, and placed Gustavus Vasa on the throne of his ancestors. Norway, however, still continued united to Denmark, nor has there been any rebellion in that kingdom since the union.

In the year 1448, the crown of Denmark passed to Christian, count of Oldenburgh, from whom the present royal family is descended. In 1513, Christian II. one of the most complete tyrants that modern times have produced, mounted the throne of Denmark; and having married the sister of the emperor Charles V. he gave a full proof of his innate cruelty. Being driven out of Sweden for the bloody massacres he committed there, the Danes rebelled against him likewise; and he fled, with his wife and children, into the Netherlands. Frederic, duke of Holstein, was unanimously called to the throne, on the deposition of his cruel nephew: he openly embraced the opinions of Luther; and about the year 1536, the protestant religion was established by that wife and politic prince, Christian III. He was opposed in the Reformation by his bishops, and therefore seized on the lands and revenues of the church, annexing them to his own.

Christian IV. of Denmark, though very brave in his own person, wanted the abilities proper for the command of an army. He was chosen head of the protestant league formed in 1629, against the house of Austria; but was foiled in every attempt, and even in danger of losing his own dominions; when he was succeeded in the command of the army by the celebrated Gustavus Adolphus, king of Sweden, under whose command the protestant forces acquired immortal honour.

Frederic III. who succeeded his father Christian IV. in 1648, declared war against the Swedes, at the instigation of the Dutch. This precipitate conduct had nearly proved fatal to Denmark. Charles took

armies, made him the master of Odenice and Nyburg, and, pursuing his victories, marched over the Great Belt, and besieged Copenhagen itself. Frederic, however, defended his capital with the greatest resolution; and Cromwell, who then governed England under the title of Protector, interposing, the peace of Roschild was concluded, by which Frederic ceded the provinces of Halland, Bleking, and Scania, the island of Bornholm, and Bahus and Drontheim in Norway. Frederic was very desirous of eluding these severe terms, and postponed the surrender of the places stipulated in the treaty so long, that Charles put his army in motion, made himself master of Cronenburg, and once more invested Copenhagen by sea and land. Frederic bore these misfortunes with such an heroic firmness and constancy of mind, as endeared him to his subjects. Charles made several attacks upon the city, but was always repulsed with considerable loss, and there seemed no other way of reducing it but by famine. In the mean time a strong Dutch fleet arrived in the Baltic, and soon defeated and dispersed the Swedish ships which blocked up Copenhagen by sea. Animated by this assistance, the Danes exerted all their power, and Charles was obliged to raise the siege. The fortune of war was now entirely changed in favour of Frederic, who was actually making preparations for invading the territories of the enemy: but before he was ready to carry his plan into execution, an English fleet arrived, and the Dutch were obliged to retire. Charles was now enabled to renew the siege of the capital; but by the mediation of France and England, a peace was concluded at Copenhagen, by which Charles agreed to restore the island of Bornholm; and Frederic to cede the islands of Rugen, Bleking, Halland, and Schonen, to the Swedes.

The magnanimous behaviour of Frederic, during this destructive war, so endeared him to his subjects, that on the nobles refusing to subject their estates to the payment of an equal tax proposed by the commons to be levied on all persons whatever, they made the king a tender of their liberties, and the government of Denmark became arbitrary in the manner we have already mentioned.

Christian V. who ascended the throne of Denmark in 1670, was at first very successful in his war against the Swedes; he recovered several places in Schonen, that had been wrested from him, and obliged the duke of Holstein Gottorp to renounce all the advantages he had acquired by the treaty of Roschild: While he was pursuing his victories with amazing success, fortune forsook his standard, and his army was totally defeated in the bloody battle of Lunden, by Charles XI. Christian, however, determined to persevere, notwithstanding the dreadful misfortune he had suffered. He raised a new army, and led his forces once more

almost strangers to military discipline, were totally defeated at the decisive battle of Landskron. Christian was now in no condition of facing the enemy, his allies having abandoned a cause which they considered as desperate, he was obliged, in 1679, to sign a treaty of peace on the terms prescribed by France. The love of glory, however, would not suffer Christian to abandon his military projects; and being incapable of carrying on the operations of war unassisted, he became a subsidiary ally to Lewis XIV. who threatened Europe with slavery. This treaty with the French monarch enabled him to pursue the scheme he had formed against Holstein, Hamburg, and other northern powers; but before any thing of importance could be effected, Christian, after a vain victory treating and fighting with the Hollanders, Hamburgers, and other northern powers, ended his reign in the year 1699.

Frederic IV. ascended the throne on the death of his father, and, like his predecessors, maintained his pretensions to the duchy of Holstein. He laid siege to Tonningen, and would probably have taken the place, had not the English and Dutch fleets forced him to abandon the enterprise. In the mean time Charles XII. of Sweden, then only sixteen years of age, landed in Zealand within eight miles of Copenhagen, in order to make a diversion in favour of his brother-in-law, the duke of Holstein. Charles pursued the war with that rapidity which constituted his character, and would, in all probability, have taken the capital of Denmark, had not his Danish majesty agreed to the peace of Travendahl, which was granted in the duke's favour. By another treaty, concluded with the States-General, Charles obliged himself to furnish a body of troops, who were to be paid by the confederates; and afterwards did great service against the French in the war between the allies and Louis XIV.

This, however, did not prevent Frederic from being continually engaged in disputes with the Swedes; and taking the advantage of the misfortunes of Charles, he made a descent on Swedish Pomerania, another upon Bremen, and took the city of Stadt. But his troops were totally defeated at Gadesbusch, by the Swedes, who laid his favourite city of Altena in ashes. Frederic had however soon after an opportunity of revenging the affront he had received. He made himself master of great part of Holstein, and obliged count Steinbock, the Swedish general, to surrender himself prisoner, with all his troops. He pursued his victories with such success, that in the year 1716 his allies began to suspect that he intended to usurp the crown of all Scandinavia. Charles now returned from his exile, and carried on the war with great vigour and a most embittered spirit against Frederic; but being killed at the siege of Fredericksbush, his Prussian

Stockholm, by which Frederic obtained the duchy
of Sleswick. He died in 1730, leaving the crown to
his son Christian Frederic, or Christian VI. who made
no other use of his power, than that of cultivating
peace with all his neighbours, and in promoting the
happiness of his subjects. He abolished a grievous
monopoly established by his father, relating to the
sale of wine, brandy, and tobacco. He terminated
the old dispute between the crown of Denmark and
the city of Hamburg, by which he obtained several
valuable concessions in favour of his people, besides a
million of marks of silver. He instituted a council
of trade, to examine all proposals for the extension
and encouragement of commerce: he invited artists
and workmen from foreign countries, and established
manufactures at his own expence: he maintained a
respectable fleet and army; and that these might not
be burdensome to his subjects, he, from time to time,
concluded subsidiary treaties with foreign powers, by
which his finances were always in a flourishing condi-
tion. In a word, he acted on all occasions with equal
moderation and discretion, as a great king, a wise poli-
tician, and a prince who had always at heart the in-
terests of his people. He died in 1746, much re-
gretted by his subjects.

Frederic V. son and successor of Christian VI. im-
proved upon his father's plan, for the happiness of his
people: but took no active part in the German war,
being only a mediator between the contending powers;
and by his intervention the treaty of Cluser-seven was
concluded between his Royal Highness William, late
Duke of Cumberland, and the French general Rich-
lieu. He married the princess Louisa, daughter to
his Britannic Majesty George II. by whom he had a
son, his present Danish Majesty: he afterwards, on
the death of his first queen, married a daughter of the
Duke of Brunsvick-Wolfenbattelle. He died in 1766,
and was succeeded by his son,

Christian VII. the present king of Denmark and
Norway, L.L.D. and F.R.S. who was born Jan.
10, 1749; married, in 1766, to the princess Caroline-
Matilda, youngest sister of his present Britannic Ma-
jesty; and has issue Frederic, prince-royal of Den-
mark, born Jan. 28, 1768; and Louisa-Angula, born
July 7, 1771. The reign of this young monarch
opened auspiciously; but was afterwards darkened by
a fatal event, that occasioned much astonishment to all
Europe, and which is partly attributed to the intrigues
of the queen-dowager, mother-in-law to the present
king, who has a son named Frederic, and whom she
is represented as desirous of raising to the throne. She
possesses a great deal of dissimulation; and when the
princess Caroline-Matilda came to Copenhagen, she
received her with all the appearance of friendship and
affection, acquainting her with all the king's faults,
and at the same time telling her, that she would take

queen's confidante, whilst at the same time, it is said,
she placed people about the young king, to keep him
constantly engaged in all kinds of riot or debauchery,
to which she knew he was naturally too much ad-
dicted: and it was at length so ordered that a mistress
was thrown in the king's way, whom he was per-
suaded to keep in his palace.

When the king was upon his travels, the queen-
dowager used frequently to visit the young queen Ma-
tilda; and, under the mark of friendship and affection,
told her often of the debaucheries and excesses which
the king had fallen into in Holland, England, and
France, and often persuaded her not to live with him.
But as soon as the king returned, the queen reproach-
ing him with his conduct, though in a gentle manner,
his mother-in-law immediately took his part, and en-
deavoured to persuade the king to give no ear to her
counsels, as it was presumption in a queen of Den-
mark to direct the king.

Queen Matilda now began to discover the designs of
the queen-dowager, and afterwards lived upon very
good terms with the king, who for a while was much
reclaimed. The young queen also assumed to her-
self the part which the queen-dowager had been
complimented with, in the management of public
affairs. This stung the old queen to the quick; her
thoughts were now entirely occupied with schemes of
revenge, "and who is able to stand before envy?"
But her views of this kind appeared the more difficult
to carry into execution, because the king had displaced
several of her friends who were about the court, who
had been increasing the national debt in times of pro-
found peace, and who were rioting on the spoils of
the public. However, she at length found means to
gratify her revenge in a very ample manner. We
shall give the particulars of this unfortunate affair in
the words of an intelligent gentleman, who made very
minute inquiries concerning it, of the most cool and
dispassionate Danes, and wrote this narrative in the
city of Copenhagen.

"I have," says this gentleman, "made it my en-
deavour, since my arrival here, to gain the most au-
thentic and unprejudiced intelligence respecting the
late celebrated, and unhappy favourite count Struens-
ee, and the late extraordinary revolution which expelled a
queen from her throne and kingdom, and brought the
ministers to the scaffold. Struens-ee had not any noble
blood in his veins, nor, consequently, any hereditary
and prescriptive title to the immediate guidance of
affairs of state. Fortune, and a train of peculiar cir-
cumstances coinciding with his own talents and ad-
dress, seem to have drawn him from his native me-
diocrity of condition, and placed him in an elevated
rank. He originally practised physic at Altona, on
the Elbe, and afterwards attended the present king of
Denmark, on his travels into England, in the year of

equally the favourite of both king and queen. He was invested with the order of St. Matilda, instituted in honour of her majesty, created a count, and possessed unlimited ministerial power; his conduct, in this sudden and uncommon eminence, marks a bold and daring mind, perhaps I might add, an expanded and patriotic heart. Unawed by the precarious tenure of courtly greatness, and more peculiarly of his own, he began a general reform. The state felt him through all her members; the finances, chancery, army, navy, nobles, peasants, all were sensible of his influence. He not only dictated, but penned his replies to every important question or dispatch; and a petition, or a scheme of public import and utility, rarely waited two hours for an answer. At present, I am told, you may be two months without receiving any.

"The civil judicature of this capital was then vested in 30 magistrates. Struensee sent a message to this tribunal, demanding to know the annual salary or pension annexed to each member. Rather alarmed at this inquiry, they sent an answer, in which they diminished their emoluments near two-thirds, and estimated them at 1500, instead of 4000 rix-dollars. The count then informed them, that his majesty had no further occasion for their services; but, in his royal munificence and liberality, was graciously pleased to continue to them the third part of their avowed incomes as a proof of his satisfaction with their conduct. He, at the same time, constituted another court composed, only of six persons of integrity, to whom the same power was delegated. He proceeded to purge the chancery and other bodies of the law. Then entering on the military department, he, at one stroke, broke all the horse-guards, and afterwards the regiment of Norwegian foot-guards, the finest corps in the service, and who were not disbanded without a short, but very dangerous sedition. Still proceeding in this salutary, but most critical and perilous achievement, he ultimately began to attempt a diminution of the nobles, and to set the farmers and peasants at perfect liberty: no wonder that he fell a victim to such measures; and that all parties joined in his destruction. These were his real crimes, and not that he was too acceptable to the queen, which only formed a pretext. It was the minister, and not the man, who had become obnoxious. I do not pretend, in the latter capacity, either to excuse, or condemn him; but, as a politician, I rank him with the Clarendons and Mores, whom tyranny, or public business, and want of virtue, have brought, in almost every age, to an untimely and ignominious exit, but to whose memory impartial posterity have done ample justice. Yet I must avow, that though I cannot think Struensee made a bad use, yet he certainly made a violent and imprudent one of his extensive power. He seems, if one may judge

adverted tacitly to the examples which history furnishes of Wolfseys in former days, and of Choiseul in modern times, who most strikingly evince the necessary and necessary foundation of political grandeur. When he was even pressed, only a short time before his seizure, to withdraw from court and pass the Belts, with most ample security for his annual remittance of five or sixty, or even an hundred thousand dollars, an unhappy fascination detained him, in defiance of every warning, and reserved him for the prison and block. The queen-dowager and prince Frederic were only the feeble instruments to produce this catastrophe, as being, by their rank, immediately about the person of the sovereign, though common report has talked loudly of the former's intrigue, and attributed to her imaginary abilities. The only mark of capacity or address, they exhibited, was in preserving a secret which deluded Struensee, and the queen Matilda, at the time of their being arrested. I have been assured that on the last levee-day preceding this event, the count was habited with uncommon magnificence, and never received greater homage, or court servility, from the crowd, than when on the verge of ruin. On the night fixed for his seizure, there was a bal, or masked ball, in the palace. The queen, after dancing as usual, one country dance with the king, gave her hand to Struensee during the rest of the evening. She retired about two in the morning, and was followed by him and count Brandt. The moment was now come; the queen-dowager, and her son prince Frederic, hastened to the king's private chamber where he was already in bed. They kneeled down beside him, and implored him, with tears and expostulations, to save himself and Denmark from impending destruction, by arresting those whom they called the authors of it. It is said the king was not easily induced to sign the order, but did it with reluctance and hesitation. At length their entreaties prevailed, and he affixed his sign manual to the paper. Colonel Koller Banner instantly repaired to Struensee's apartment, which, as well as Brandt's, was in the palace; they were both seized at nearly the same instant, and as all defence was vain, hurried away immediately to the citadel. When count Struensee stepped out of the coach, he said, with a smile, to the commandant: "I believe you are not a little surprised at seeing me brought here as a prisoner." "No, and pleased your excellence, replied the old officer bluntly, I am not at all surprised, but, on the contrary, have long expected you." It was five o'clock in the morning when count Rantzaw came to the door of her majesty's ante-chamber, and knocked for admittance. One of the women about the queen's person was ordered to wake her, and give her information that she was arrested: they then put her into one of the king's coaches, drove her down to Elsinore, and she

examples which his days, and of Chloé strikingly evince the laudour. When he before his seizure, the Belts, with annual remittance of four thousand dollars, an in defiance of every for the prison and prince Frederic produce this catastrophe immediately about the perdition report has taken, and attributed to the only mark of capacity in preserving a secret the queen Matilda, I have been assured preceding this event, common magnificence, or court servility, for a charge of ruin. On there was a bal par, the queen, after dancing with the king, gave the rest of the evening morning, and was t. The moment was, and her son prince's private chamber. They knelt down with tears and expressed Denmark from impense, those whom they called the king was not satisfied it with reluctance, their entreaties prevailed on the paper. Colonel Struensee's appearance, was in the palace the same instant, and away immediately Struensee stepped out to the commandant, he surprised at seeing "No, and pleased officer bluntly, I am contrary, have long clock in the morning the door of her maneked for admittance the queen's person was her information that her into one of the to Elsinore, and the

precaution was taken to prevent it; the most numerous and silly reports were circulated among the populace, to render the state prisoners odious; that they put poison into the king's coffee to destroy him; that they intended to declare him incapable of governing; to send the dowager-queen Juliana out of the kingdom, as well as her son prince Frederic, and to appoint Matilda regent. To confirm these extraordinary and contradictory reports, the king himself, and his brother, appeared in a state coach, and paraded through the streets of the city, to shew himself unhurt, and as if escaped from the most horrid conspiracy. During these transactions, Struensee and Brandt were detained in the most rigorous imprisonment. They loaded the former with very heavy chains about his arms and legs, and he was at the same time fixed to the wall by an iron bar. I have seen the room, and can assure you it is not above 10 or 12 feet square, with a little bed and a miserable iron stove; yet here, in this abode of misery, did he, though chained, complete, with a pencil, an account of his life and conduct, as a common genius."

After this, the government seemed to be entirely changed in the hands of the queen-dowager and her son, supported and assisted by those who had the principal share in the revolution; while the king appeared to be little more than a pageant, whose person and name it was necessary occasionally to make use of. All the officers who had been instrumental in the revolution were immediately promoted, and an almost total change took place in all the departments of administration. A new council was appointed, in which prince Frederic presided, and a commission of eight members, to examine the papers of the prisoners, and to commence a process against them. The son of queen Matilda, the prince royal, who was entered into the fifth year of his age, was put into the care of a lady of quality, who was appointed governess, under the superintendency of the queen-dowager.

The two counts were beheaded on the 28th of April 1772, having their right hands previously cut off; and their skulls and bones are yet exposed on wheels, about a mile and a half from the metropolis. Many of their friends and adherents, eighteen of whom had been imprisoned, were set at liberty. Struensee at first had absolutely denied having any criminal intercourse with the queen, but this he afterwards confessed; and though he is said by some to have been induced to do this only by the fear of torture, the proofs of his guilt in this respect were esteemed notorious, and his confessions full and explicit. Besides, no measures were adopted by the court of Great-Britain for clearing up the queen's character in this respect.

In the following May, his Britannic Majesty sent a small squadron of ships to convoy the unfortunate prin-

ce she died there, of a malignant fever, on May 10, 1775, aged 23 years and 10 months. In 1780, his Danish Majesty acceded to the armed neutrality proposed by the empress of Russia. He appears at present to have such a debility of understanding, as to disqualify him for the proper management of public affairs.

On the 16th of April 1784, another revolution took place in Denmark. The queen-dowager's friends were removed, a new council formed under the auspices of the prince royal, some of the former old members restored to the cabinet, and no regard is to be paid for the future to any instrument, unless signed by the king, and counter-signed by his royal highness prince Frederic, his son, heir apparent to the throne of Denmark.

CHAP. V.

LAPLAND.

Extent, Boundaries, Divisions, Subdivisions, Climate, Soil, Mountains, Rivers, Forests, Vegetables, Animal and Mineral Productions, &c.

THIS country is divided into six provinces, viz. 1. Angermanland-Lapmark; 2. Uma-Lapmark; 3. Pitha-Lapmark; 4. Lula-Lapmark; 5. Torno-Lapmark; and 6. Kinna-Lapmark.

The first of these provinces is the most southern, and contains only one town of any consequence, which is called Aofalko, and situated about 300 miles distant from Stockholm.

The second province, which adjoins to the former, contains two little villages, viz. Loifby and Semisjorkio.

The third province, which is situated between the Norwegian mountains, contains four unimportant villages, viz. Sitonia, Arieplogs, Locketari, and Arivitzers.

The fourth province, which adjoins to the latter, contains three little villages, viz. Jackmoth, Torpajour, and Sirkeflucht.

The fifth province, which is the most northern of Swedish Lapland, is well watered by many rivers, has several lakes, and contains four towns, viz. Tingavara, Sandewara, Ronnala, and Titifara.

The sixth province, which is contiguous to Russian and Danish Lapland, is likewise well watered; it contains the great lake Enure, and has six towns, viz. Soinby, Kalajerfoi, Kitijsfuityle, Kimibi, Solden-Kyle, and Kimi.

The known part of Lapland extends from the North Cape, in 71 deg. 30 min. north lat. to the White Sea, under the arctic circle. Part of it belongs to the Danes, and is included in the government of Wardhuys; part to the Swedes, which is by far the most valuable; and some parts in the East, to the Muscovites

called Mourmankoi Leporic, Jerthoi Leporic, and Bel-lamofeskoï Leporic. But as the most considerable and best-peopled division of this country belongs to the Swedes, we shall therefore begin with a description of it.

Swedish Lapland is bounded on the east by Russian Lapland; on the west by a ridge of mountains that separate it from Norway; on the north by Danish Lapland; and on the south by Bothnia, Angermania, and Septerland. Its greatest extent, from east to west, is about 360 miles; in breadth it extends from 63 deg. 39 min. to 69 deg. of north latitude. It is divided into six provinces, or districts, the names of which, as above noticed, are the following; viz. Angermanland-Lapmark, Uma-Lapmark, Pitha-Läpmark, Lula-Lapmark, Terno-Lapmark, and Kima-Lapmark.

Each of these provinces receives its name from the chief river that waters it; they are again subdivided into smaller districts called biars, and these contain a certain number of families, called by the Swedes reckars. Every reckar, or family, is allowed a considerable tract of land, with forests, lakes, and brooks, for the maintenance of their families and cattle; but their lands are not enclosed, so that the property of one is often converted to the use of others.

In general, Lapland is situated so near the pole, that the sun neither sets in summer, or rises in winter. In the latter season, the cold is so intense, that none of the natives are able to bear it. The most rapid rivers are then frozen up, and the ice is two or three, and sometimes four or five feet thick. In summer the weather is as sultry as it is cold in winter; for autumn and spring are unknown in this climate. The excessive heat, however, is qualified by the vapours that rise from the sea, and by the snow that continues all the summer on the tops of the mountains, and in ditches that are sheltered from the sun. It seldom rains in the summer, but the whole country is covered with snow in winter.

M. Maupertuis, who, with several other astronomers, was sent hither by order of the king of France, to discover the figure of the earth at the polar circle, has given the best description of the climate of this country. "In December, says he, the snow continually falling, or ready to fall, for the most part hid the sun the few moments he might have appeared at mid-day. In the month of January the cold was increased to that extremity, that M. Reaumur's mercurial thermometer, which, at Paris, in the great frost of 1709, it was thought strange to see fall to fourteen degrees below the freezing point, was now got down to thirty-seven. The spirits of wine in the others was frozen. If we opened the door of a warm room, the external air instantly converted all the vapour in it into snow, whirling it round in white vortices. If we went abroad, we felt as if the

the violence of the froit, continually alarmed us with increase of cold. In this country you may often see people who have lost an arm or a leg by the frost. The cold, which is always very great, sometimes increases to such violent and sudden degrees, as are almost infallibly fatal to those who are so unhappy as to be exposed to it; and sometimes there rise sudden tempests of ice that are still more dangerous.

"The winds seem to blow from all quarters at once and drive about the snow with such fury, that all the roads are in a moment rendered invisible. Dreadful the situation of a person surpris'd in the fields by such a storm; his knowledge of the country, and even the mark he may have taken by the trees, cannot avail him, he is blinded by the snow, and, if he attempts to find his way home, is generally lost. In short, during the whole winter, the cold was so excessive, that on the 7th of April, at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing; though every afternoon it rose two or three divisions above it; a difference in the height not much less than that which the greatest heat and cold felt at Paris usually produce in that instrument. Thus in 24 hours we had all the variety felt in the temperate zones in the compass of a whole year."

But though in winter the nights are very cold, long and tedious, yet those inconveniences are, in some degree, obviated by the serenity of the sky, the brightness of the moon and stars, and the resplendent light of the aurora borealis, which is reflected from the white surface of the earth covered with snow; from all which such light is produced, that the inhabitants are enabled to discharge their ordinary occupations. The above writer, in speaking of these nocturnal lights, says, "The days are no sooner closed than fires of a thousand figures and colours light up the sky, as if designed to compensate for the absence of the sun. These fires have been here, as in more southern climates, any constant situation. Though a luminous arch is often seen fixed towards the north, they seem more frequently to possess the whole extent of the hemisphere. Sometimes they begin in the form of a great scarf of bright light, with its extremities upon the horizon, which, with a motion resembling that of a fishing-net, glides softly up the sky preserving, in this motion, a direction nearly perpendicular to the meridian; and most commonly after they prelude, all the lights unite at the zenith, and form the top of a crown. Arcs, like those seen in France towards the north, are here frequently situated towards the south, and often towards both the north and south at once. Their summits approach each other; the distance of the extremities widens towards the horizon. I have seen some of the opposite arcs, whose summits almost joined at the zenith; and both the one and the other have frequently several concentric arcs beyond it. Their tops are all placed in the direction of the meridian, though

would be endless if the meteors represented which they are agitated like that of the different times of the appearance of so many of them; sometimes they are seen in the eighteenth of this kind, that, which I was now observing. To the south of Orion looked as if it were with so lively a light, which was at that time into other colours, whose top it touched. The moon shined in this colour, and such are the names. After all, we were with an unphosphoric discover in their very chaotic, and a For the most part, being to grow, any thing will grow, owing to the heat which it about of rocks and mountains, which is of a prodigious height, here prevent all the mountains are large, there are many trees, and some from each of the highest vallies, which country, being well watered, and springs.

would be endless to mention all the different figures
of meteors represent, and the various motions with
which they are agitated. Their motion is most com-
monly like that of a pair of colours waved in the air,
and the different tints of their lights give them the ap-
pearance of so many vast streamers of changeable taffe-
s, sometimes they line a part of the sky with scarlet.

On the eighteenth of December I saw a phenomenon
of this kind, that, in the midst of all the wonders to
which I was now every day accustomed, raised my ad-
miration. To the south a great space of the sky appeared
covered with so lively a red, that the whole constellation
Orion looked as if it had been dipped in blood. This
red, which was at first fixed, soon moved, and chang-
ed into other colours, violet and blue, settled into a
white, whose top stood a little to the south-west of the
pole. The moon shone bright, but did not in the least
diminish. In this country, where there are lights of so
many different colours, I never saw but two that were
new, and such are taken for presages of some great mis-
fortune. After all, when people gaze at these pheno-
mena with an unphilosophic eye, it is not surprising if
they discover in them the appearance of armies engaged,
of chariots, and a thousand other prodigies."

For the most part, the soil of this country is exceed-
ingly bad, being so intermixed with stones, that hardly
any thing will grow in it; but in some places it is very
fertile, owing to the number of marshes and brooks
in which it abounds. The whole country is also full
of rocks and mountains. Those called the Dofrine
Mountains, which separate Lapland from Norway, are
of a prodigious height; and the high winds that blow
thence prevent all trees from taking root. Beneath these
mountains are large marshes and extensive forests, where
there are many trees, though they stand at a great dis-
tance from each other. At the bottom of the hills are
pleasant vallies, which are the most fertile parts of the
country, being well watered by a great number of brooks
and springs.

Many of the rivers rise from the mountains of Nor-
way, and fall into the Bothnian Gulph. The chief of
these are the Uma, Lula, Riina, and Torna. The Uma
is greatly increased by the waters that flow into it from
the rivers Vendilor and Skialfre. The Lula and Riina
are both very considerable, and are swelled, in their
course, by a great number of lesser ones. The torna
receives 29 rivers, one of which is a Swedish mile in
breadth. When the snow melts, all these rivers over-
flow their banks; and the chief part of them have stu-
pendous cataracts. Besides the rivers, here are also
many lakes, which abound with various kinds of fish,
as well as the rivers.

There are a great number of trees in the forests of Lap-
land, among which are the birch, pine, and fir. Some
parts of it also produce the service-tree, willow, pop-
ple, alder, and the cornel. They have several sorts of

them in their food. They have likewise different kinds
of grass, heath, and fern; but the most plentiful, as well
as most useful vegetable, is the moschus, or moss, of
which there are several species, either adhering to trees,
or growing on the surface of the earth. The rein-deer
is almost wholly sustained by this vegetable, which, in-
deed, he prefers to all others, and without which he
cannot subsist. The natives not only use it as forage for
their cattle, but boil it in broth as a cordial and restora-
tive. Here are also great quantities of berries, such as
black currants; the Norwegian mulberry, which grows
upon a creeping plant, and is much esteemed as an an-
tiscorbutic; rasberries, cranberries, and bilberries. Ju-
niper-berries are also very plentiful, and some of the
trees grow to a considerable height.

Among the animals of this country are stags, bears,
wolves, foxes of several colours, squirrels, ermines,
martens, hares, glittens, beavers, otters, elks, and rein-
deer; but the last of these is the most useful to the na-
tives, who, without them, could not possibly preserve
their existence; for these animals not only afford them
food and garments, but also supply the place of horses,
and travel in those parts where the latter animals could
be entirely useless. The rein-deer is a kind of stag,
with large branched horns, the tops of which bend for-
ward like a bow. He is larger, stronger, and swifter
than the stag, and his hair changes colour according to
the season of the year. His hoofs are cloven and move-
able, for which reason he spreads them abroad as he runs
along the snow, to prevent his sinking into it. The
horns are very high, and divided into two branches near
the root. On each horn are three branches, one above
another, which are again subdivided into smaller ones,
insomuch that no horned beast whatever has the like,
either for bulk, branches, or weight. The horns are of
a light colour, and there are veins, or blood-vessels,
running along them, under which there are furrows.
When the beast runs he lays these horns upon his back;
but there are two branches that always hang over his
forehead, and almost cover his face. Most of these ani-
mals are wild; but some of them are tame, and exceed-
ing serviceable to the natives.

Those rein-deer which are produced between a tame
doe and a wild buck are not only the largest, but by far
the strongest. These animals are of infinite use to the
Laplanders, for without subjecting them to the least
expence, they supply them with almost every necessary
of life. From these creatures they are furnished with
milk and cheese, as also flesh, which they lay up for
winter store. The skins afford caps, clothes, boots, shoes,
bedding, thongs, and many other articles. The nerves
and sinews are twisted into thread. Their bows and ar-
rows are tipped with the bones, and their boxes inlaid
with the horn, which is likewise formed into curious
spoons, toys, and utensils. These creatures are likewise
used as beasts of draught or burthen, and are from dis-

one of their pastimes consists in reciting verses. Sometimes a man and a woman take one another by the hand, and by turns sing stanzas, which is a kind of dialogue, and in which the company occasionally join in choros.

The inhabitants of this island live chiefly along the sea-coast; their number is computed at 60,000, which is by no means adequate to the extent of the country. It has been much more populous in former times, but great numbers have been destroyed by contagious diseases. From the years 1402 to 1404, the plague carried off many thousands: famine has also made dreadful havock among them: for though the Icelanders cannot in general be said to be in want of necessary food, yet the country has several times been visited by great famines, chiefly occasioned by the Greenland floating ice; which, when it comes in great quantities, prevents the grass from growing, and puts an entire stop to their fishing. The small-pox has likewise been very fatal here; for that disease destroyed 16,000 persons in the years 1707 and 1708.

These people do not measure time by the clock or hour, but take their observations from the sun, stars, or tide, which last is always regular; and parcel out the day into different divisions, each of which has its particular appellation; viz. night, midnight, twilight, broad day, forenoon, noon, afternoon, evening, mid-evening.

The Lutheran is the only religion tolerated in Iceland. The churches on the east, south, and west quarters of the island are subject to the bishop of Skalholt, the capital of the island, and those of the north quarter are under the jurisdiction of the bishop of Hoolun. The island is divided into 189 parishes, of which 127 belong to the see of Skalholt, and sixty-two to that of Hoolun. All the ministers are natives of Iceland, and receive a yearly stipend of 4 or 500 rix-dollars from the king, exclusive of what they obtain from their congregations. The clergy are generally persons of good morals, and tolerable education. The bishop is obliged to maintain the rector and corector, the minister of the cathedral church, and a certain number of scholars. In each diocese is a Latin school, under the inspection of a rector and proper assistants; where the languages, theology, and other branches of literature are taught, in order to qualify youth for the university.

With respect to their learning and learned men, we are told that poetry formerly flourished among them; and that Egil Skallagrinnson, Kormuk Ogmundson, Glum Geirson, and Thorliet Jarlaa, were celebrated as great poets. But writing was little practised till after the year 1000; though the Runic characters were introduced there before that time, and probably from Norway. Soon after the Christian religion was established, the Latin characters were adopted, as the Runic alphabet, which consists of only sixteen letters, was found insufficient.

The first Icelandic bishop, Illeif, founded a school at Skalholt; and four other schools were soon afterwards, wherein the youth were taught the Latin tongue, divinity, and some parts of theoretic philosophy. And from the introduction of the Christian religion here, till the year 1264, when Iceland came subject to Norway, it was one of the most cultivated countries in Europe, and the only one in the north, where the sciences were either cultivated, or held in esteem; and this period of time seems to have produced more learned men in Iceland, than any period since.

From their ancient chronicles it appears, that they had made a considerable progress in the study of natural philosophy, natural history, and astronomy. They wrote most of their works from the 11th to the 14th centuries, some of which have been printed. Sir Joseph Banks presented 162 Icelandic manuscripts to the British Museum. In 1772, that gentleman visited Iceland, accompanied by Dr. Solander, Dr. Van Troil, and Dr. Lind. An account of this voyage was published by Dr. Van Troil, who observes that he found more knowledge among the poorer sort of people in this island, than is to be met with in most other places; as a proof of which, he adds that many of them could repeat the works of some of their poets by heart; and that a peasant was found to be found, who was not only instructed in the principles of religion, but also acquainted with the history of his own country; this knowledge in a great measure proceeds from the great delight they take in frequently reading; by way of amusement, the traditional histories, thus happily blending profit with pleasure. What inconceivable advantage would accrue to the lower class among us, what multitudes would be made useful members of society, if rescued from untimely destruction, could they be brought thus to employ and improve their talents!

About the year 1530, John Arfson, bishop of Hoolun, employed John Matthieson, a native of Sweden, to set up a printing-press in Iceland; he began with printing the Breviarium Nidarosiense; he afterwards printed an ecclesiastical manual, Luther's catechism, and other books of that nature. In 1578, the Icelandic code of laws appeared; and in 1584, the Icelandic Bible. Several valuable books have likewise been printed at a printing-office lately established and privileged at Hrappey in this island.

Amongst all the curiosities in Iceland, the hot spouting-water springs are most worthy of notice. None of the hot springs or water-works in Germany, France, or Italy, can by any means be compared with those. Some of them spout columns of water, of several feet in thickness, to the height of many fathoms; and, as many affirm, of several hundred feet. These springs are of unequal degrees of heat. From some, the water flows gently as from other springs

In 1741, when Iceland was one of the most uncultivated, or best uncultivated, of any part of the island, than any part of it appears, that in the study of metaphysics, and astronomy, from the 17th to the 18th century, have been printed in Icelandic manuscripts. In 1772, that gentleman, Dr. Solander, on account of this, Troil, who observed among the poorer people, to be met with of which, he added that the works of the peasant here is only instructed in the acquainted with the knowledge in a great delight they take of amusement, the blending profit would advantage would us, what multitude of people imagine them to be piled upon one another by giants, who made use of supernatural force to effect it. They have generally from three to seven feet, and are from four to six feet in thickness, and from twelve to sixteen yards in length, without any horizontal divisions. In some places, they are only seen here and there among the lava in the mountains; but in other places, they extend two or three miles in length, without interruption. They are supposed to have been produced by subterraneous fires.

The whole trade of Iceland is engrossed by a company of Danish merchants, who have been indulged by their monarch with an exclusive charter; and though there is not any considerable town in the whole island, the Icelanders have several frequented ports. Their exports consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox furs of various colours, rider-down, and feathers. Their imports consist of brandy, wine, salt, bread, tobacco, timber, fishing-lines and hooks, horse-shoes, linen, and a little silk; besides some necessaries and superfluities for the more

wealthy. They have properly no manufactures: they make a coarse baize, termed wadmál, in a very awkward manner. Some of their woollen yarn they dye in verdigris; and afterwards make into pretty stuffs. The women knit great numbers of stockings and gloves.

The governor of this island, called Staffs-amptmand, is appointed by the king of Denmark, and is generally a person of distinction. He has the power of choosing a deputy, called Amptmand, who always resides in Iceland, and in spiritual cases sits as judge, with the clergy as his assessors. A third officer of the crown in Iceland, is a receiver, whose business it is to collect all the taxes and revenues, and transmit them to the royal treasury. Besides him, there are people termed fýsilmenn, who farm the king's taxes in certain districts, and act as justices of the peace; each within his own province.

For the regular administration of justice in this island there are two judges, called Langmænd, one of whom presides over the northern, and the other over the southern division. Actions are first begun in the court of the fýselman, from whence they may be removed to the langret, or general court, held under one of the judges. If satisfaction is not obtained there, an appeal may be lodged at the high court, in which the Amptmand presides, together with the other judge, and eleven fýsilmenn; and if the cause is not determined there, it is carried to the supreme court at Copenhagen. The only legal method of putting men to death in Iceland, is by beheading, or hanging them; but when a woman is condemned to die, she is sewed up in a sack, and flung into the sea.

The inhabitants of Iceland depend entirely upon his Danish majesty's protection; and the revenues which the king draws from this country, amounts to about 30,000 crowns per annum. They arise chiefly from taxes and dues, a yearly sum paid by the company of merchants, secularized abbey-lands, and other royal demesnes farmed out to the natives.

The FARO or FERRO ISLANDS are 24 in number, lying in a cluster in the northern ocean, between 61 and 63 deg. of north lat. and 6 and 8 deg. of west long. having Shetland and the Orkneys on the south-east, and Greenland and Iceland upon the north and north-west. The space of this cluster extends about 60 miles in length, and 40 in breadth, 300 miles to the westward of Norway. They are separated from each other by deep and rapid channels; are all indented by the sea, and furnished with many inlets, creeks, and harbours, which afford protection to fishermen, and trading vessels, in bad weather. The largest of these islands, called Stromoe, is about 17 miles in length, and eight in breadth; the rest are much smaller, and not inhabited. The revenues of Denmark acquire little addition from the trade and income of the inhabitants, who may be about 3000 or 4000.

C H A P.

C H A P. III.

N O R W A Y.

Situation, Boundaries, Extent, Divisions, Animal and Vegetable Productions, Towns, &c.

THIS country is situated towards the north-pole, Norvegia, Nordway, and Norway, signifying the Northern Way. It lies between the 57th and 72d degrees of north latitude, and between the 5th and 31st deg. of east long. It is bounded on the south by the entrance into the Baltic, called the Scaggerac, or Catogate; on the west and north, by the Northern Ocean; and on the east it is separated from Sweden by a long ridge of mountains, which have the various appellations of Rundfield, Dofrefield, Dourfield, and Fillefield. Its length is computed at 1020 miles, its breadth at 290, and its area is supposed to contain 82,824 square miles.

Norway is divided into four governments; viz. 1. The province of Aggerhus, which extends in length about 300 miles, and comprehends the south-east part of Norway. 2. Bergen, situated in the most southerly and westerly part of the country. 3. Drontheim, or Trontheim, which stretches about 500 miles on the coast. And, 4. The province of Wardhus, which extends to the north cape, and includes the islands of Finmark and Norwegian Lapland. Besides these, there is the province of Bahus, being a narrow tract of land, about 90 miles in length, situated on the coast of Scaggerac, which, though now yielded to Sweden, is reckoned part of Norway.

The climate of this country is exceedingly different, according to the difference of its situation towards the sea. In the eastern parts, the ground is generally covered with snow; and the cold, which sets in about the middle of October, is very intense till the middle of April, during which time the waters are frozen to a considerable thickness. In 1719, 7000 Swedes, who were on their march to attack Drontheim, perished in the snow on the mountains which separate Sweden from Norway, and their bodies were found in different pastures. At Bergen, the winter is so moderate, that the seas are navigable both to mariners and fishermen, except in creeks and bays, which extend far enough up the country to be affected by the keen north-east winds from the land. In Finmark, a part of Norway, situated in the frigid zone, the cold is so great, that very little of the country has ever been explored.

In proportion to the extreme cold of this climate in winter, is its heat in summer, occasioned by the reflection of the sun's rays from the sides of the mountains, and the shortness of its duration below the horizon. The warmth in the vallies is in general

so exceedingly great, that barley is sown and fit to be housed in the short space of six weeks.

At Bergen the longest day consists of nineteen hours and the shortest does not exceed six; so that in summer it is very easy to see to read at midnight, by twilight; and in the district of Tromsen, at the extremity of Norway, the sun never sets at Midsummer; but in the depth of winter it is invisible weeks, and all the light, even at noon-day, is a faint glimmering occasioned by the reflection of the sun's rays upon the highest mountains. Happily for the inhabitants, however, the sky at this season of the year is exceedingly serene and clear, so that the mountains shined without obstruction, and her light, being reflected from the mountains, illuminates the vallies. The aurora borealis, or northern lights, which are very strong in this country, are also of infinite use to the people, who by these helps employ themselves in their daily occupations in the open air. This country is subject to frequent rains, and sometimes the sudden thaws prove terrible to the Norwegians; for vast masses of snow being thereby loosened, fall from precipitous high precipices, and overwhelm men, cattle, boats, houses, nay sometimes entire villages.

The air in Norway is generally pure and salubrious, and so dry in the midland parts of the country, that meal may be kept for many years without being warmed, eaten, or otherwise damaged; but on the sea-coast the vapours and exhalations render it moist, and so unhealthy, except to people in consumptions, who whom it is supposed to agree best.

No country in the world contains more mountains than Norway, a long chain of which runs from north to south. The roads over these mountains are equally terrible and dangerous, there being often no other path than what is formed by an ill-secured wooden bridge, thrown over a breach in a frightful precipice, or roaring cataract. These roads wind in such a manner, as to render the passage over the mountain Hardangerfield, about seventy English miles, extremely dangerous. The same may be observed of that over Filefield, which is about fifty miles, and the passage road. To prevent travellers from being lost or bewildered, the way is pointed out by posts fixed at the distance of two hundred paces from each other; and on Filefield are two houses furnished with fire, lights, and kitchen utensils, at the public expence, for the convenience of those who are obliged to pass along this dreadful road.

Besides this chain, there are various other mountains scattered over the country, of extraordinary height. On the left hand, in sailing up Joering Creek, is a cluster of these mountains, which has the appearance of a city, decorated with old Gothic towers and edifices. The summit of the mountain Skopthorn, in the parish of Oerskong, represents the figure of a fortification, with regular walls and ballions. A very high range of mountains, in the district of Hilgeland,

distinguished by the having seven habitable at sea for a considerable time from the rest of the world, his hat on his head, and his hundred and fifty in length, forming

are

istinguished by the appellation of the Seven Sisters,
having seven high pinnacles on their tops, dis-
tinguishable at sea for a considerable distance. The moun-
tain of Torghatten, in the same district, derives its
name from the resemblance the summit bears to a
woman with her hat on; an aperture in the mountain
is a hundred and fifty ells high, and three thousand
ells in length, forming a single eye to the supposed

innumerable are the difficulties and dangers to which
the rocks and mountains subject the Norwegians.
Their journeys from place to place are always per-
formed at the hazard of their lives: their habitations
are rendered insecure by the vast torrents, and falls of
water, which frequently overwhelm them, together
with their cattle, and their land. This misfortune is
much greater, as a very trifling part of the whole
country is arable. Sometimes huge pieces of rock
fall into the plains below, and crush every thing they
meet with into ruins. Entire risers of rocks, many
hundreds in length and breadth, have been known to
fall all at once, and cause such a concussion of the
earth, as seemed a prelude to the dissolution of the globe.

At Steerbroc in Laerdale, a stupendous body appears
to have been severed and tumbled from the mountain,
in large, sharp, and ragged fragments, through which
the river roars with a continual and dreadful noise.
Frequently both men and beasts, by one false step,
are hurled down these dreadful precipices and dashed
in pieces. When a kid, sheep, or goat, is unlucky
enough to fall from some height on the projection of
a rock, from whence it can neither ascend nor descend,
the owner generally endeavours to preserve the life of
the animal, though with the utmost hazard of his
own. He seats himself on a cross stick tied to the
end of a long rope, whereby he is lowered down, by
the aid of his companions, till he arrives at the place
where the creature stands, which he fastens to the
end of the rope with himself, and both are drawn up to-
gether.

The caverns in Norway are equally wonderful with
the stupendous mountains. In the lower part of
the Torghatten is one of these caves, into which a
cannon, fastened to a line four hundred fathoms in
length, being let down, did not reach the bottom.
In the year 1750, two clergymen resolved to make
discoveries concerning a cavern at Herroe in Sundmoer,
called Dolsteen. Accordingly, they entered this sub-
terranean cavity, and proceeded till they heard the sea
bubbles over their heads. The passage was as wide and
high as an ordinary church, the sides perpendicular,
and the roof vaulted. They descended one flight of
stairs, and arrived at a second, which they did not
venture to go down, but returned again, having con-
sumed two candles from the time they entered, to the
time they came back. In the district of Rake, in the
neighbourhood of Frederickshall, are three cavities in
a rock; one of which is so deep, that a small stone

dropped down, is two minutes in arriving at the
bottom, when it produces a sound like that of a bell:
and a cavern of a very curious nature penetrates
through the sides of the mountain Limur, and serves
as a conduit to a stream of water.

The large and extensive forests of Norway form the
principal source of the wealth of that kingdom. In
these, which are very numerous, are found in amazing
quantities, fir, pine, elm, ash, yew, benreed, birch,
beech, oak, eel, or alder, juniper, aspen-trees, comel,
or sloe-tree, hazel, elder, lyme, willow, and some
ebony. The Norwegians supply foreigners with masts,
beams, planks, and boards. A vast quantity of wood
is likewise expended in home consumption, for build-
ing houses, ships, bridges, piles, moles, fences, and
in making charcoal for the founderies. In the timber
trade, their lakes and rivers prove of the utmost con-
sequence; for the masts and large beams are not only
floated down them for embarkation, but they erect
mills on their banks for sawing balks into planks,
and deals, which, by this contrivance, is done with
inconceivable expedition. A tenth of sawed timber
is claimed by the king of Denmark, and forms a
considerable part of his revenue. The best timber
grows in the provinces of Gulbrandsdale, Tellemark,
Valders, Romsdale, Saltan, Sogniford, Oesterdale,
Helleland, Soloe, Hallingdale, and the lordship of
Nedere. The principal exports of this article are
made from Frederickshall, Frederickstadt, Christiana,
Christianland, Christien's-Bay, Drontheim, Skeen,
Drammen, and Anendal. Great quantities are ex-
ported annually from the western coast of Norway
to Spain and Scotland.

The principal rivers in Norway are the Nied; the Sule
Ely; the Gulen; the Otteroen; the Syre; the Nid; the
Sheen; the Tyreford, or Dramme; the Loven; the
Glaaman, or Great River; and the Worme. In the
year 1344, the Gulen buried itself under ground;
from whence it burst forth again with such violence,
that the earth and stones, thrown up by the eruption,
filled the valley and formed a dam, which, however,
was soon demolished by the force of the water.
Several churches, farm-houses, and 250 persons were
destroyed on this occasion. The Syre discharges itself
into the sea, through a narrow streight formed by two
rocks, which contraction augmenting its natural im-
petuosity, it shoots with great swiftness into the ocean,
where it produces vast agitation. The water-falls of
the Nid and Sheen have been diverted with infinite
labour and expence, by canals and passages cut through
rocks, and they are now of the utmost convenience
to the inhabitants for floating down their timber.
Many of the lakes contain floating islands, formed by
the cohesion of the roots of trees and shrubs in the
soil, which, though thus separated from the main land,
bear herbage and trees. Near Frederickstadt is a lake
300 ells in length, and about half as broad, formed
by the sudden sinking of the noble family seat of

Borge, into an abyss one hundred fathoms in depth. This accident, whereby 14 persons and 200 head of cattle were killed, was occasioned by the river Glaman precipitating itself down a water-fall, near Sarp, and undermining the foundation of the house.

The fresh water of this country is very agreeable to the taste, and remarkably salubrious, but it is generally turbid, deposits a thick sediment, and is often impregnated with oker and particles of iron.

Norway abounds in quarries of excellent marble, of all colours: some detached pieces of alabaster; several kinds of spar, chalk-stone, cement-stone, sand-stone, mill-stone, baking-stone, slate, talc, swine-stone, the magnet, or load-stone, and the amianthus, or asbestos, whose delicate fibres are woven into cloth, which, when dirty or soiled, is cleansed by being thrown into the fire, which has not the power of consuming it. In this country are likewise found amethysts, agate, granates, beautiful crystals, thunder-stones, eagle-stones, and pyrites or quartz; but there are no flints.

At present there are no gold mines worked in Norway, though formerly a small quantity, found in the diocese of Christianland, was coined into ducats. Mines of silver have been discovered in several parts of the country, and there is now one working at Koningsburg, at the sole expence and account of his Danish majesty, out of which a piece of 560lb weight being taken, is preserved as a curiosity in the Royal Museum at Copenhagen. The copper mines are worked with the greatest success: the principal of these is at Roraas, an hundred English miles from Drontheim, which yields annually about 1100 ship-loads of pure copper. Iron is still in greater plenty, and the profit arising from this metal is estimated at 300,000 rix-dollars yearly. A few mines of lead have lately been opened in the district of Polcer, but no very considerable advantage has as yet been derived from them.

The minerals found in Norway are vitriol, sulphur, alum, and salt.

The animals found in Norway are all natives of Denmark, with an addition of many more. The wild beasts peculiar to this country are the elk, the rein-deer, the hare, the rabbit, the bear, the wolf, the lynx, the fox, the glutton, the lemming, the ermine, the martin, and the beaver. The elk is a tall, ash-coloured animal, its shape partaking at once of the horse and the stag; it is harmless, and, in the winter, social; and the flesh of it tastes like venison. The rein-deer (which we shall describe more particularly afterwards) is a species of stag. The hares are small, and are said to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are strong and sagacious: they are remarkable for not hurting children: they are hunted by little dogs; and some prefer bear-hams to those of Westphalia. The Nor-

wegian wolves are very fierce, but at the same time even of a cow or goat, unless impelled by hunger: natives are dexterous in digging traps for them, in which they are taken or killed. The lynx, by some called the goupes, is smaller than a wolf, but equally dangerous; they are a species of cat, with claws like those of a tyger. They often undermine sheep-folds, and they make dreadful havock. The fur of the lynx is very beautiful and valuable. The foxes of Norway are of different colours, white, red, and black; the skin of the latter is the most esteemed: the white and red foxes partake of the nature of that which is common in other countries; they draw crabs ashore, dipping their tails in the water, which the crabs hold off. The glutton, in shape and size of a turn-dog, with a long body, thick legs, sharp claws, and teeth: his fur, which is variegated, is so precious that he is shot with blunt arrows, to preserve the animal unharmed. This animal, which is sometimes called the erven, or vielfras, is remarkably fierce and voracious, and of such an insatiable appetite, that he will devour a carcass larger than himself, and disburthen his stomach by squeezing himself between two standing trees: and when he has overgorged himself with eating, he becomes an easy prey to the hunter; when taken, he has been even known to eat stone and mortar. The ermine is a little creature, very shy, and so remarkably cleanly, that, it is said, he will rather let himself be taken, than run through the least dirt to avoid his pursuers. The marten, or haaren, is of a beautiful glossy brown, and the fur very valuable: it resembles a great forest cat, is very fierce, and is dangerous.

There are most of the birds in this country common to Europe, and its sea coasts are covered with innumerable flocks of water-fowl, among which are wild geese and ducks. But the birds peculiar to Norway are the alk, the berg-ugle, the basier, the strass-sneppe, the gagl, the hav-aare, the hav-hell, the hav-sule, the imber, or great northern diver, the jo-fugl, the krage, the kryk-kie, the lax-tite, the lom, the gorm or maage, the favoren, the skare or loon, the tre, the north-wind's-pipe, the fouden-wind's-fugl, the ne-dem-paps or cocothrans, and the tiur ura-gall-major, or the cock of the wood. Some of the most remarkable of these birds will here meet with a particular description. The alk is an aquatic fowl, about the size of a large duck: they frequent the rocks in such numbers, as frequently darken the air, and the noise of their wings is equal to the roaring of a storm. The north-wind's-pipe is something less than a starling, and of a grey colour: this bird makes a particular noise before the north wind begins to blow, and the fouden-wind's-fugl never appears but against a southerly wind. The he-dom-paps is a very beautiful bird, the male particularly, whose plumage is variegated with red, black, and white: some of them are green, with red tufts of feathers on their heads,

these are most valuable. The cock may justly be placed in the fowl. He is very like some resemblance of a dark grey, and not unlike that of the eagles of Norway, viz. the land and strength; they are to carry off large years old in their former in size, his starts down with arms his destruction, strong for him, the and crooked, prev before his antagonist. The tiur country: he bears son to fierce. There are thirty different, and a great variety numerous. About the wing in large fish-water lakes, cho where they res sensibility, and reviv The Norwegians, amazingly expert to take the birds down; all which pro them. When these flocks, two of them to a moderate length, with a net fixed to the mouth of the holes in flight, which are by them will suffer themselves of their nests. They are pushed on by the flies at a proper station; and the second of the rope which down. In this manner they arrive at the part of one of these mountains, and withstanding their happens, he drags both perish in the lowered down, by rope, over dreadful wife attended with the loose fragments by his descent, fall at others, the pointed stones, he among the rocks.

these are most valuable: the hens are generally of
 this grey. The cock of the wood is a noble bird,
 may justly be placed at the head of the Norwegian
 fowl. He is very large, and in the bill and feet
 some resemblance to the wild Turkey-cock: his
 is a dark grey, approaching to black, and his
 not unlike that of a pheasant.

The eagles of Norway, of which there are two
 viz. the land and the sea, are of a prodigious
 and strength; the first of these having been
 down to carry off lambs, kids, and even children of
 years old, in their talons. The sea-eagle surpasses
 former in size, his chief food is fish, upon which
 starts down with amazing velocity: but this often
 his destruction, for when he strikes a large fish,
 strong for him, the form of his talons, which are
 and crooked, prevents him from disengaging him-
 before his antagonist dives, whereby he is always
 owned. The tiuren is also an inhabitant of this
 country: he bears some resemblance to an eagle, but
 not so fierce.

There are thirty different kinds of thrushes in Nor-
 way, and a great variety of hawks. The swallows are also
 very numerous. About the latter end of summer they
 wing in large flights, and plunge themselves into
 shallow lakes, choosing a place filled with reeds and
 sedges, where they remain all the winter in a state of
 insensibility, and revive again in the spring.

The Norwegians, who reside upon the sea-shore,
 are amazingly expert in climbing the steepest rocks in
 order to take the birds, with their eggs, feathers, and
 down; all which prove of the utmost advantage to
 them. When these bird-men intend to climb the
 rocks, two of them tie themselves together with a rope
 of a moderate length, each having a pole in their hands
 with a net fixed to the end; this net is applied to the
 mouth of the holes from whence the birds take their
 flight, which are by these means secured; but some of
 them will suffer themselves to be taken with the hand
 out of their nests. The man who first begins to climb
 is pushed on by the pole of his comrade, till he ar-
 rives at a proper standing place, where he fixes him-
 self; and the second man clammers up by the assistance
 of the rope which is tied round the waist of his fel-
 low. In this manner they proceed alternately, till
 they arrive at the place most frequented by the birds.
 If one of these men makes a false step, which, not-
 withstanding their great care and dexterity, too often
 happens, he drags his companion down with him, and
 both perish in the fall. Sometimes these men are
 lowered down, by upwards of a hundred fathom of
 rope, over dreadful precipices; which method is like-
 wise attended with the utmost danger, for sometimes
 the loose fragments of the rock, being put in motion
 by his descent, fall upon, and crush him to death; and
 at others, the rope being cut asunder by the sharp
 pointed stones, he is precipitated and dashed in pieces
 among the rocks. The farmers in the northern dis-

tricts train their dogs to assist them in bird catching, and
 these animals will take birds from holes almost in-
 accessible.

There is scarcely a fish to be named which is not
 found in the lakes, rivers, or seas of Norway, and
 the latter is the habitation of several extraordinary
 monsters, a description of which we shall add for the
 satisfaction of the reader; but shall first take notice of
 the prodigious shoals of herrings which annually come
 from under the ice at the north pole, where they breed,
 to the western coasts of Norway. These fish are the
 prey of the whale, porpoise, shark, &c. which pursue
 them along shore into inlets and creeks, where they
 may be taken up by pails. One of these shoals ex-
 tends a considerable way in length and breadth, and
 will reach from the bottom to the surface of the water,
 even in the depth of two hundred fathoms. These
 fish are in the greatest perfection from Christmas to
 Candlemas; at which season the country people as-
 semble in multitudes on the sea-shore with their boats,
 casks, fishing-tackle, and salt. Three hundred boats,
 within the compass of a mile, may meet with employ-
 ment for a whole month; and frequently, at one single
 cast, a fisherman will take more fish than he can dis-
 pose of. About the latitude of Iceland the herrings
 divide themselves into three bodies; one of which sup-
 plies the western isles and coast of Scotland; a second
 directs its course round the eastern parts of Great-Bri-
 tain down the channel; and the third enters the Baltic
 through the Sound. The cod fishery is another great
 source of wealth to the Norwegians; and this, toge-
 ther with the herring-fishery, is computed to employ
 and maintain above 150,000 people.

The coasts of Norway abound in shell fish, among
 which are exceeding fine rock oysters; and on the
 west side of this country is found the pearl mussel.

There are seven different species of whales found in
 the Norwegian seas, whither they follow the herrings
 and other fish. The largest of these resembles the cod,
 having small eyes, a dark marble skin, and white belly.
 They measure seventy feet in general from head to
 tail, sometimes more, and the water, which they take
 in by inspiration, they spout out again through two
 apertures or holes in the back part of the head.
 Their throats are exceedingly narrow in proportion to
 their size; their tails are placed horizontally, and un-
 der the skin the flesh is covered with fat two or three
 feet thick, which is called the blubber. The whales
 copulate like land animals, and the female brings forth
 one, and sometimes two at a birth, about nine or ten
 feet long. Besides small insects, which float in my-
 riads upon the water, they feed upon cod, herring, and
 divers other fish, which they drive together in shoals,
 and swallow in such amazing numbers, that their
 bellies are distended almost to bursting, in which case
 they roar most hideously from pain. Numberless are
 the enemies which encounter the whale. The
 thresher fastens on his back, and beats him without
 inter-

intermission; while another, called the saw-fish, furnished with a sharp horn, assaults him from below, and frequently rips open his belly. The spekhuggeren, a species of porpoise, having very long and sharp teeth, bites and tears the flesh from his body; and, when he comes up to the surface, he is assaulted by divers birds of prey. In the midst of these tortures he roars most dreadfully, and leaps so as to raise himself perpendicular above the sea, and then plunges down again with such violence, that, if he happens to be in shallow water, where there are rocks, he usually fractures his skull, and comes floating up quite dead.

A species of shark are found in these seas, called haac-mæren, ten fathoms in length, and its liver yields three casks of train-oil. The tuella-flynder is shaped like a turbot, but exceedingly broad. It is reported that a fisherman in striking at one of these fish happened to fall overboard, and sink to the bottom, upon which the tuella-flynder immediately dived and spread his enormous body over the man to prevent his rising again; and he must have been inevitably drowned, though there was only between two and three fathom water, if his companions in the boat, who saw all that passed, had not drove the fish away with their boat-hooks. The rana-piscatrix, or sea-devil, is about six feet in length, and is so called from its monstrous appearance and voracity. The sea-scorpion, found in the seas of Norway, is about four feet long, with a head larger than the whole body. The aspect of this animal is frightful: he has a wide mouth, monstrous jaws, and his bite is said to be poisonous.

It is now a generally received opinion that the kraken, or korven, and the sea-snake or serpent of the ocean, are no longer the fictitious productions of travellers and authors, but that these monsters really exist in the seas of Norway. The first of these is of the polypus kind, and supposed to be about a mile and a half in circumference. In summer, when the Norwegian fishermen find no more than twenty or thirty fathoms water, where the depth is usually eighty or a hundred, they are certain that the kraken is below them, and if, by their lines, they perceive that he rises, they row away with the greatest expedition. As soon as part of the kraken has attained the surface of the water, it has the appearance of a number of small islands, interspersed with sand banks, covered with sea-weeds, and abounding with a great variety of small fish. On his further emerging, a number of pellucid antennæ rise upon his back, as large and as high as the masts of a moderate vessel; by means of these arms, or tentacula, he moves himself and gathers in his food, which consists of small fish. Having remained a short time in this situation, he begins to sink again, and, though the motion is very slow and gradual, it produces a dangerous swell and whirlpool in the water. In 1680, a young kraken perished among the rocks and cliffs in the parish of Alstahong,

where it had by some means entangled itself, and the stench of the putrified carcase was for some time great, that it rendered the channel impassable.

In 1756, a sea-snake was shot at by a master of a Norwegian vessel. The head of this monster resembled that of a horse; the mouth was very large and thick as were the eyes; and a long white mane hung down from its neck and floated upon the sea. Besides the head, which this animal held about two feet above the surface of the water, they saw seven or eight coils of him, about the distance of a fathom one from another, and each about the size of a hoghead. Immediately upon its being shot at, this snake disappeared, though it was undoubtedly wounded, as the water for some space was tinged with blood.

Egede, an author of veracity, says, that on the 6th of July 1734, a large and frightful sea monster raised itself so high out of the water, that its head reached above the main-top-mast of the ship: that it had a long sharp snout, broad paws, and spouted water like a whale: that the body seemed to be covered with scales, the skin was uneven and wrinkled, and the lower part was formed like a snake. Though it is impossible to ascertain the exact dimensions of this frightful animal, yet from the testimony of numbers who have seen it, it is natural to suppose, that he is a hundred fathoms in length, and the circumference of his body as large as that of an hoghead. His skin, which he is said to shed annually, is smooth and variegated like tortoiseshell, and his excrement, which floats upon the surface of the water, is so corrosive, that if the seamen touch it, their hands immediately blister. The sailors suppose that this creature has an exquisite sense of smelling, from his avoiding a vessel which has castor on board; for which reason all masters of ships provide themselves with that drug, to prevent being overset or sunk, the serpent's olfactory nerve being remarkably exquisite.

The mer-man and mer-maid, are likewise said to reside in the Norwegian seas, and in 1719 one of the males of this species was found dead on a point of land in Norland. This animal was of a dark grey colour, with a face resembling, in some respects, that of a man; the mouth was large, the nose flat, the forehead high; the eyes were exceeding small, and it had neither chin nor ears. The arms, which were short and without joints or elbows, were fastened to the sides by a thin membrane, and terminated in members somewhat like a human hand, having the fingers connected by a membrane. The body tapered into a fish's tail, like that of a porpoise, which it always kept under water, and the length extended to three fathoms. The mer-maid is formed in the same manner, except the difference of sex, which is distinguished like that of the human race, and they have breasts at which they suckle their young. These creatures have been seen in different parts of the North, and are of various sizes, from two feet to three fathom.

With

With regard to the vegetable productions, it will be sufficient to observe, that the cultivated parts of Norway yield plentiful crops of barley, oats, and rye; but the whole country does not produce corn sufficient to support half its inhabitants. Peas, buck-wheat, hemp, flax, and hops, are propagated there, but not with any great degree of success. Till within these few years the Norwegians imported their roots, cabbages, and every other kitchen vegetable from England and Holland; but, by taking some pains in the culture of their own lands, they now have gardens which produce these salutary necessaries of life in as much perfection as in other northern countries. There are numbers of plants which grow wild; and many of them peculiar to the country. The meadows afford plenty of excellent pasture for sheep and cattle; and among the other kinds of grafs found there, is that called by the botanists *viola canina*, described below.

Here are many wild plants, the infusion of one of which some of the inhabitants drink in the manner of tea, and deem it an admirable pectoral.

As the scurvy is a prevailing disorder in Norway, nature hath bountifully supplied that country with a profusion of antiscorbatic herbs, such as angelica, rose-mart, gentian, crests, tresails, sorrel, scurvy-grafs, &c. but to counterbalance these conveniences, Norway abounds with many noxious and poisonous herbs and plants, that are prejudicial both to men and cattle.

That admirable grafs, called *viola canina*, which grows here, was rendered particularly famous by having, in the year 1652, contributed, in a most astonishing manner, to the preservation of two Norway youths. The story of this transaction is as follows:

On the first day of August, in the said year, two brothers made an excursion of about seven leagues from their father's house, to take their pleasure in hunting, shooting, fishing, &c. After having enjoyed the diversion of fishing for the space of four days, in the lake of Riff, they roved, in a little skiff, to a very small island on the said lake. While they staid here a sudden squall of wind occasioned the skiff to break loose, and drive to the shore, where their dog stood waiting for them. As neither of the youths could swim, they saw themselves suddenly abandoned to famine, on a desolate island, and sequestered from all intercourse with mankind.

Their first care was to build a kind of hut, with small stones, that they might, in some degree, be screened from the inclemency of the weather. Towards the close of the second day, their appetites being whetted to the keenest sense of hunger, they industriously sought some vegetable food, and ventured to eat the *viola canina*, each to the amount of an ounce twice a day; and this was all that they could find at one search. Their stomachs were eased, their spirits refreshed, and the acute pains which had begun to seize their arms and shoulders immediately abated. Eleven days did they subsist on this vegetable,

but it failed on the twelfth, and they were reduced to the brink of despair; when they accidentally found a little spot overgrown with sorrel, which they consumed at one meal: nevertheless it was re-produced in less than twenty-four hours, and the devout young men, with tears of gratitude to heaven, owned it as an interposition of Providence in their behalf.

During the first days of their suffering they had called and beckoned to their dog, and used every possible allurements to induce that animal to swim over, that they might kill him for their subsistence, but he would not obey their signals. They were now reduced to such a weak condition that they could not stand, and could hardly make shift to creep from their hut in quest of the sorrel: The eldest was seized with a violent palpitation of the heart; and the youngest carved their names, and a short account of the sad accident they had met with, upon a piece of timber, pointing out, at the same time, a text of the psalms, on which he requested that their funeral sermon might be preached. Then having joined in fervent prayer, they embraced each other, and became perfectly resigned to their approaching fate.

Their dog, in the mean time, having carried eight days with their baggage on the shore, returned to their father's house, where he refused food, and incessantly moaned in a most dismal manner: hence the parents concluded that their sons had met with some misfortune, and dispatched a man in search of them. The messenger arrived at the lake, found their baggage, and concluding they were drowned, returned with the melancholy tidings. On the thirteenth day of their being on the island, and after having resigned every hope of relief, they heard the trampling of horses feet, and exerting their utmost efforts, they called out loud enough to be heard. The travellers immediately came to the shore, and, having found the skiff, humanely put off to the island, where they found the brothers almost exhausted. The eldest, when food was offered him, could scarce bear the smallest portion; and, after being conveyed to his father's house, remained for some time in great danger; but at length recovered, and survived this disaster thirty-seven years. The younger recovered his strength somewhat sooner, and afterwards drew up this narrative as a pious acknowledgment of God's providence in their favour.

Common fruits grow tolerably well here; but the superior sort but very indifferently. No way, however, produces a great variety of excellent berries, such as juniper-berries, sun-berries, gooseberries, barberries, cranberries, coriander-berries, raspberries, black-berries, bilberries, strawberries, &c.

With respect to the stones of Norway, they have a brown pebble, which easily decays; black, white, blue, grey, and variegated marble; alabaster, chalk-stone, cement-stone, sand-stone, mill-stone, baking-stone, load-stone, slate, talc, amianthus or asbestos, swine-stone or a kind of crystal, real crystals, granates,

amethysts, agates, various kinds of spars, thunder-stones, and eagle-stones. The eagle-stone is very singular, and seems to consist of several shells, or crusts, laid one over another: but that which distinguishes it from all others is its being hollow in the inside, in which cavity there is another stone that is smaller. This, when it is shaken, may be heard to rattle. It is of various colours, as white, grey, dun, or brown. Modern authors mention only three sorts of this stone; the first of which is rough on the outside, and is of different colours, but commonly of a black dun. This makes a very distinct noise when rattled. The second is of an ash colour, and contains a sort of marle in the inside, which is sometimes white, yellow, red, or blue; the outside is rough and sandy, and seems to consist of the particles of flint. A third is of several colours, but has the like contents as the former. The first kind is no larger than a peach-stone, but the other two are often as large as a man's fist. These sort of stones are found in most parts of the country.

The curiosities of Norway are only natural, consisting of stupendous mountains, caverns, water-falls, and whirlpools. The most remarkable vortex, or whirlpool, is on the coast, lat. 67, called Malestrom or Moskoelstrom, and, by navigators, the navel of the sea. Moskoe, the island from whence this whirlpool takes its name, belongs to the district of Lofoden, in the province of Norland, lying between the mountains Helsinggen in Lofoden, and the island Ver, which are about a league distant; and between the island and coast, on each side, the stream makes its way. Between Moskoe and Lofoden it is near 400 fathoms deep; but, between Moskoe and Ver, it is so shallow as not to afford passage for a small ship. When it is flood, the stream runs up the country between Lofoden and Moskoe with a boisterous rapidity; and, at ebb, returns to the sea with a violence and noise unequalled by the loudest cataracts, and is heard at many leagues distance. At the same time, it forms a vortex or whirlpool of great depth and extent; so violent, that, if a ship comes near it, it is immediately drawn irresistibly into the whirlpool, and there disappears, being absorbed and carried down to the bottom in a moment, where it is dashed into pieces against the rock; and just at the turn of ebb and flood, when the water becomes still for a quarter of an hour, the wreck rises again, but in fragments so small as scarcely to be distinguished for parts of a ship. When the natural fury of this vortex is heightened by a storm, it is dangerous for a vessel to venture within a league of it. Whales, and even land animals, in attempting to swim from the coast to the island, have sometimes, notwithstanding their utmost efforts and hideous bellowings, been absorbed in the vortex, and destroyed. If brutes are thus affected by the view of their approaching danger, how must it affect a whole ship's crew with horror, when, beholding themselves on the brink of inevitable destruction, they cry out for that help which they know cannot be obtained; and see be-

fore them the dreadful abyfs in which they are about to be plunged, and dashed among the rocks at the bottom of the water. Bears, in their attempts to swim to the island, to prey upon the sheep, have frequently experienced the same fate.

The inhabitants of Norway are a middling kind of people, between the simplicity of the Greenlanders and the Icelanders, and the more polished manners of the Danes. In their persons, the men are well formed, tall, and robust. The women are likewise tall, but of good shapes and comely features, and are remarkable for their fair. They are an honest, hospitable, and ingenious people, but, at the same time, rath, quarrelsome, and litigious.

Every man is in some degree a soldier, and the method of deciding their quarrels, even among the farmers, is by single combat with their knives. There is no nation where the nobility and merchants live better than in Norway, but the lower class subsist in a very frugal manner. Their common bread is made of oatmeal, and, when that is scarce, they mix it with the bark of the fir or elm tree, ground into powder, which composition they make hasty pudding and soup; the latter being enriched with the addition of a pickle of herring, or salted mackerel. Fish, grouse, partridges, hares, red deer, and rein deer, form their summer provisions, as the flesh of cows, sheep, and goats, pickled, smoked, or dried, does their winter. Their common drink is a liquor made from four whey, which they call cyre, mixed with water; but, against festivals and holidays, they have always a reserve of strong ale, with the use of which, at such times, they indulge themselves even to intoxication; and this excess, added to the natural warmth of their tempers, seldom fails to produce bloodshed, if not murder. They are remarkable for longevity, nothing being more common than to see a peasant of an hundred years of age following his profession with alacrity and cheerfulness; and, in the year 1733, four men, together with their wives, danced before his Danish Majesty at Frederickshall, whose ages, when added together, exceeded 800 years.

Some few, by temperance taught, approaching slow
To distant fate, by easy journies go;
Gently they lay them down, as evening sheep
On their own woolly fleeces, softly sleep.
So noiseless would I live, such death to find,
Like timely fruit not shaken by the wind,
But ripely dropping off the sapless bough,
And dying, nothing to myself would owe.
'Tis daily changing, with a duller taste
'Tis lessening joys, I by degrees would haste;
So'll quitting ground by unperceiv'd decay,
And steal myself from life, and melt away.

Some of the Norwegians, however, are subject to

gout, epilepsy, rheumatism, &c.
Both sexes wear jackets, and gaiters; those of the nobility wear belts; those of the lower ranks wear garters of silver, and are decorated with medals of the same metal, which in its place is supplied with a new one, as the occasion requires. The women likewise wear gaiters, and their bosoms, with frills, are beat into them, with a view to their health. In winter they wear, snow shoes, and are well at an amazing rate. The Norwegians soldiers, their horses. They are famous for skating, blowing, and the guitar, and their houses are in general of pine-tree laid upon the corners; the windows, but a square light, and letting in the edifices, and houses of stone.
There is a tincture of opium, they play on the harp, and while the country is often done in a boat. The rude Irish ask whether his wife and children such questions, for being forgiveness of the offended him.
The Norwegians practice their church is governed by Drontheim, and four bishops, Staffanger, Hamme, and the same language that the original tongue is that of their commerce difficult we shall particularly mention. Their exports are, dollars; and commodities imported are, copper, iron, lead, tin, musk, fox-skins, martens, ermines, marten, ling, salmon, lobster, water, tallow, train oil, glass, tar, nuts, and commodities imported from the East, and most of the East. We are assured, from the year 1700, that they can furnish out 14,000 brave soldiers, and an annual revenue of 1,000,000, and, till the

gout, epilepsy, rheumatism, catarrha, leprosy,
ery, &c.
Both sexes wear jackets, girt round them with lea-
thorn belts; those of the women being adorned with
aments of silver, and their hair, caps, and handker-
chiefs, are decorated with small plates, rings, and but-
tons of the same metal, if they can afford it, and, if
not, its place is supplied by brass and tin. Those in
poverty likewise wear silver chains round their necks.
The men, except upon particular occasions, never cov-
er their bosoms, but suffer the wind, rain, and snow,
to beat into them, without receiving the least injury in
their health. In winter, they wear buskins made of
sheep's hair, saow shoes, and long skaitis, with which they
are shod at an amazing rate; and it is said, that a corps of
Norwegian soldiers, thus accoutred, will outmarch the
best of the English. Their usual diversions are riding,
skaiting, skating, blowing the horn, or playing upon
the fiddle, and the violin, and in making verses.
Their houses are in general made of the trunks of fir
trees, laid upon each other, and joined by mor-
tar at the corners; some have neither chimnies nor
windows, but a square hole on the top, for admitting
light, and letting out the smoke. The church,
and houses of the people of fashion, are
built of stone.
There is a tincture of Paganism in their funeral cere-
monies: they play on the violin at the head of the cof-
fin, and while the corpse is carried to church, which
is often done in a boat. In some places, the mourners
of (strong ale, with
the rude Irish) ask the dead person why he died; and
whether his wife and neighbours were kind to him, and
if not, they ask such questions, frequently kneeling down, and
begging forgiveness of the deceased, if they had ever
offended him.
The Norwegians profess the Lutheran religion.
Their church is governed by an archbishop, who resides
at Drontheim, and four suffragans, whose sees are Ber-
gen, Staffanger, Hammer, and Christiana. They speak
the same language that is used in Denmark; but their
original tongue is that of Iceland.
Their commerce differs little from that of Denmark,
which we shall particularize in our description of that
kingdom. Their exports amount annually to 100,000
dollars; and consist of wrought and unwrought
copper, iron, lead, marble, mill-stones, cow-hides,
bear-skins, fox-skins, seal-skins, bear-skins, beavers,
ermine, masts, deal boards, timber, herrings,
salmon, lobsters, flounders, down, swathers,
tallow, train oil, juniper, and other berries,
glass, tar, nots, alum, vitriol, pot-ashes, &c. The
commodities imported chiefly consist of luxurious arti-
cles, and most of the necessaries of life.
We are assured, from the best calculations, that Nor-
way can furnish out 14,000 excellent seamen, and above
10,000 brave soldiers, for the use of their king. The
royal annual revenue from Norway amounts to near
100,000*l.* and, till his present Majesty ascended the

throne, the army, instead of being expensive, added
considerably to his income, by the subsidies it brought
him in from foreign potentates.

The principal cities in Norway are Christiana, Ber-
gen, Christiansand, Konigsberg, Frederickshall, Fre-
derickstadt, and Drontheim.

Christiana, considered as the chief city of Norway,
is thirty miles distant from the Baltic, situated on the
west side of a bay, and defended by the castle of Ag-
gerhus. It is a large and regular city, the buildings
in general are good, and some of them elegant. Its
trade is considerable; and, in the year 1636, an aca-
demy was established here, but it has lately declined,
and is now little better than a public school.

Bergen, the capital of Norway, is 127 miles distant
from Christiana, to the north-west. This is a confi-
derable city and port on the German ocean, and carries
on a very large trade. It stands in the middle of a
valley, forming a semicircle, or rather horse-shoe, on the
shore of a bay called Waag, and is the principal place
of trade in this kingdom. On the land side it is de-
fended from any attack by a range of lofty mountains,
and, towards the sea, the harbour is defended by several
strong fortifications. There were formerly no less than
thirty churches and convents in Bergen; but, at pre-
sent, there are only six. All the churches, public
structures, and most of the burghers houses, are of
stone. The castle is a considerable building, which,
together with the school built and endowed for twelve
scholars in the year 1554, by bishop Petri, and the Fre-
derick seminary, are worth notice. The number of
inhabitants are computed at 30,000. It is the see of a
bishop, suffragan to the archbishop of Drontheim.

Christiansand, so called from Christian IV. of Den-
mark, and the sandy beach on which it is situated.
The city is of a quadrangular form, has broad and regular
streets, and a good town-house. It is advantageously
situated, and has a pretty good trade. In 1734, the
church and the greater part of the city were reduced to
ashes by an accidental fire.

Konigsberg is more remarkable for the silver mines
in its neighbourhood, than for its buildings. It has,
however, some good houses, and a few public edifices.

Frederickshall is situated on the Categate, at the
mouth of the river Glammen, and carries on a pretty
good trade. It is well fortified, and is considered as the
key of the kingdom. Charles XII. of Sweden besieged
this place in December 1718, but was killed by a shot
from the ramparts, as he was viewing the trenches,
about nine at night.

Frederickstadt is a considerable place, well fortified,
and situated on the frontiers of Sweden. It carries on
an extensive trade, and some of the buildings are neat
and elegant.

Drontheim, situated on a little gulf at the mouth of
the river Nider, is about 220 miles distant from Bergen
to the north-east. This was formerly the capital, where
the kings of Norway resided, and the city had once ten
churches

churches and five convents; but, at present, there are only two churches, and a chapel belonging to the hospital. The cathedral, a beautiful structure, was burnt in 1530, except the choir, which still remains. It is fortified on the land side, and its harbour is defended by Monkholm fort, erected on a rock surrounded by the sea. There is a good Latin school, a mission seminary, an orphan house, an infirmary, and an hospital. It carries on a considerable trade in timber, fish, coarse cloths, and copper from the neighbouring works at Meldal and Roraas.

The ancient Norwegians were certainly a very brave and powerful people, and the hardiest seamen in the world. If we may believe their histories, they were no strangers to America long before it was discovered by Columbus. Many customs of their ancestors are yet discernible in Ireland and the north of Scotland, where they made frequent descents, and some settlements, which are generally confounded with those of the Danes. When the two kingdoms of Denmark and Norway were united under one monarch, by the marriage of Aquin, King of Norway, with Margaret, Queen of Denmark, in the year 1376, the people of both nations enjoyed considerable privileges; but, from the time that the Danish government became absolute, Norway has been governed by a viceroy, who presides in the supreme court of judicature, and regulates his conduct according to the laws of Denmark. Since the union, from the most turbulent, they are become now the most loyal subjects in Europe; which we can easily account for, from the barbarity and tyranny of their kings when a separate people. We must refer to Denmark for further particulars relating to their history, and shall conclude this part with the character of the peasantry of Norway, and a view of the present state of the country, extracted from Mr. Coxe's Travels into Poland, &c.

"The Norwegians, being the same race with the Danes, and so long connected with them in religion and government, speak the same language, with a necessary mixture of provincial expressions. Wilsø, a native of Norway, informs us, that the gentry and inhabitants of the principal towns, allowing for a few provincial expressions, speak purer Danish than is usual even in Denmark, not excepting Copenhagen; that the inhabitants of the eastern confines bordering on Sweden naturally blend many Swedish words; that, throughout the whole country, the general accent and cadence is more analogous to the Swedish than to the Danish pronunciation: and that the inhabitants on the western coasts, who have a more constant communication with the Danes, partake less of this peculiarity.

"The people of this country maintain their own army, which consists of 24,000 infantry, and 6,000 cavalry. The troops are much esteemed for their bravery, and, like the Swiss mountaineers, exceedingly attached to their country. The horses which supply their ca-

valry are small, but strong, active, and hardy. Every peasant (those excepted who inhabit the coasts, and are classed as sailors) not born in a town, or upon a noble estate, is by birth a soldier, and enrolled for service at the age of sixteen. From that year till he has attained the age of twenty-six, he is classed in the militia. At twenty-six he enters into the old militia, and continues till thirty-six, at which period he receives his discharge. The militia take the field every year in the month of June, and remain encamped about a month.

"The Norwegians are blessed with a particular law, called the Norway Law, compiled by Griefffeldt, the command of Christian the Fifth, the great legislator of his country. By this law, the palladium of Norway, the peasants are free, a few only excepted on certain noble estates near Frederickstad. But the vigour of this law extends itself even to those serfs, for no proprietor can have more than one of these private estates; and unless he possesses a title or certain rank, and resides on his estate, he loses his privilege, and peasants are free. The benefits of the Norway law are so visible in its general effects on the happiness in the appearance of the peasants, that a traveller would be blind who does not instantly perceive the difference between the free peasants of Norway and the entire vassals of Denmark, though both living under the same government.

"Many of the peasants pretend to be descended from the ancient nobles, and some even from the royal line: they greatly pride themselves upon this supposed descent, and are careful not to give their children any marriage but to their equals in birth and blood.

"A curious custom prevails in Norway, called the right, or right of inheritance, by which the property of certain freehold estates may re-purchase his estate, which either he or any of his ancestors have sold, provided he can prove the title of his family. But, in order to enforce his claim, his ancestors, or he, must have declared every tenth year, at the sessions, that they lay claim to the estate, but that they want money to redeem it; and if he, or his heirs, are able to obtain a sufficient sum, then the possessor must, on receiving the money, give up the estate to the odels-man. For this reason, the peasants, who are freeholders, keep a full account of their pedigree.

"This custom is attended with advantages and disadvantages. As to the advantages, it fixes the abode of the peasant on his native place, and he improves with pleasure those possessions which are so strongly attached to him: it increases the consequence and value of the industry of his family. On the contrary, the estate loses its value when sold to another person, because he possesses only a precarious estate, which he may be obliged to resign, he is not inclined to improve his lands, as if they were irrecoverably his own.

"The Norwegian peasants possess much spirit and fire in their manner, are frank, open, and undaunted

active, and hardy. They inhabit the coasts, and in a town, or upon the coast, and enrolled for the militia. From that year till he is sixteen, he is classed in the youth, and enters into the militia. At which period he receives the field every year, and remains encamped about

with a particular discipline, as is observed by Grieffeld. Fifth, the great legislation of the palladium of Norway, only excepted an certain parts. But the virtues of those laws, for no one of these principles has a title or certain privilege, and the rights of the Norway are affected on the happiness of the peasants, that a traveller may perceive the difference between Norway and the English, both living under the same

pretend to be defective, some even from the royal families upon this subject, to give their children in birth and blood. In Norway, called by which the property may re-purchase his estate, and his ancestors have sold, of his family. But his ancestors, or he, at the fissions, that they want money, are able to obtain, or must, on receiving the odels-man. For the freeholders, keep a

with advantages and stages, it fixes the place, and he improves which are so strongly the consequence and contrary, the other person, because of ellate, which he may inclined to improve probably his own. He possesses much spirit, open, and undaunted

not insolent; never fawning to their superiors, yet giving proper respect to those above them.

Their principal mode of salute is by offering their hand; and, when we gave them or paid them a trifle, the peasants, instead of returning thanks by words or by bow, shook our hands with great frankness and cordiality.

The peasants here are well clothed and well lodged, and appear to possess more comforts and conveniencies than any which I have seen in the course of my travels, excepting in some parts of Switzerland.

They weave their ordinary cloth and linen; they make also a kind of stuff like a Scotch plaid. The cloth which the men use for their coats is principally of one colour, with red button-holes, and white metal buttons.

The women, while employed in their household affairs, frequently, as in Sweden, appear only with a petticoat and a shift, with a collar reaching to the throat, and a black sash tied round the waist. Their dress is remarkably fine; and, as they are usually well clothed, this mode of dress sets off their shapes to the best advantage.

The common food of the peasant is milk, cheese, and salted fish, and sometimes, but rarely, flesh or red meat, oat-bread, called flad-brod, baked in small cakes about the size and thickness of a pancake; it is usually made twice a year. I observed a woman employed in preparing it: having placed over the fire a round iron plate, she took a handful of dough, and rolled it out with a rolling-pin to the size of the iron plate; she then placed it on the plate, and baked it on the side, then turned it on the other with a small stick. In this manner she baked an astonishing number in less than a quarter of an hour; and I was informed that the woman, in one day, can bake sufficient for the family during a whole year. The peasants also, in times of scarcity, mix the bark of trees, usually of the birch tree, with their oatmeal; then dry this bark before the fire, grind it to powder, mix it with some oatmeal, then bake it, and eat it like bread: it is bitterish, and affords but little nourishment.

As a luxury, the peasants eat sharke, or thin slices of meat, sprinkled with salt, and dried in the wind, or hung beef; also a soup made like a hasty-pudding, of oat-meal or barley-meal, and, in order to render it more palatable, they put in it a pickled herring or salted mackerel. The use of potatoes has been lately introduced, but these roots do not grow to any size in a country where the summer is so short.

Fabricius strongly recommends, in times of scarcity, the mosses and lichens, and particularly the *lichen islandicus*, which yields a very nourishing sustenance, and is commonly used for food in Iceland.

According to a series of meteorological observations taken by Mr. Wilsø, pastor of Sydeborg, it snows most in December and in the middle of January. It rains most in April, October, and August. The clearest

weather is during the whole month of March, and from the middle of June to the middle of July. Winds are most violent in the middle and latter end of April, May, and October. The stillest season is in January; from the tenth of June to the eleventh of July, and in the middle of August, a circumstance very profitable to the oat-harvest, which of all corn is more easily subject to cast its ripe grain in windy weather. If we compare the climate of Norway with the climate of London, March at London is like April and the beginning of May in Norway; and the March of Norway is our January. On account of the frequent spring frosts, seeds ought not to be sown in gardens before the twentieth of May; and the frosts of the latter end of August are no less detrimental.

The heat and cold varies so much in Norway, that, in June or July, the mercury in Fahrenheit's thermometer, as observed by Mr. Wilsø at Sydeborg, near Frederickshall, not unusually rises to 88, and, on the first of January 1782, fell to 22, or 54 degrees below the freezing point. At Eger, according to Professor Stroem's observations, it fell, on that same day, to 36½; and, at Konigsberg, to 40, or 72 below the freezing point, a degree of cold by which quicksilver is congealed. This extreme rise and fall of the quicksilver makes a difference of 110 degrees, between the greatest heat and the greatest cold at the same place; a difference much more considerable than is observed at Upsal or Stockholm, which lie nearly in the same latitude as Sydeborg.

In some places vegetation is so quick, that the corn is sown and cut in six or seven weeks. Tillage cannot generally be very flourishing in a country which is in many parts so rocky as to defy the plough; where the climate is so severe, that the hoar-frosts begin in September, and where the cold in the high lands prevents the maturity of the corn. It is true, indeed, that the small vallies, and the intervals between the rocks, are usually provided with a fruitful soil, and that the industry of the peasants covers the naked rocks, and the sandy grounds with a new earth; yet the arable grounds are few, and no parts of Norway yield sufficient corn for interior consumption, the districts of Hedemark, Tøten, and Ringerike, excepted. This deficiency is occasioned by the nature of the climate and soil.

In spring, and in the first summer months, the drought and heat are frequently so intolerable, and the vegetable mould so thin, that the roots of the corn and grass are burned up, if a few days of sunshine succeed each other without rain. Also the greatest part of the soil is so much blended with sand, that too much rain cannot fall in spring and summer. In autumn, on the contrary, the decreased warmth, and the great quantity of rain, prevents the corn from ripening, and it is frequently cut green. Not unusually, when a favourable season has ripened the corn, the frequent and violent autumnal rains hinder the carrying of it in until it is almost spoiled. Also the small quantity of arable

" This mode of roofing occasions such a large consumption of the outward bark, that the birch, which is killed, would not supply a sufficient quantity; it is, therefore, not unusual to strip off the outward bark while the tree is standing, and, if peeled with care, it grows again.

" The inner bark of the birch is applied, like the bark of oaks, for tanning hides, fishing-nets, and sails, which it renders more durable.

" This tree also supplies a kind of wine by the following process: a hole is bored in the trunk, and the wine distils into a flask placed under it. The tree suffers little damage, if the hole is immediately closed by a wooden peg. The twigs of the birch, as well as the elder and aspen, are given to horses in scarcity of fodder. A decoction of oak-leaves in beer is used by the peasants as a cure for the rheumatism, by applying a cloth dipped in the decoction to the part affected.

" The general exports of Norway are tallow, butter, salt, dried fish, timber and plank, horses and horned cattle, silver, alum, Prussian blue, copper, of which the celebrated mine of Roraas yields annually to the value of 67,500*l.* and iron, of which the most productive mine is near Arendal.

" Norway is remarkable for the number and beauty of the bays fringed with wood. Many of the lakes (some of which we have described above) are so large, that they appear like inlets of the sea; and the bays are so small, that they appear like lakes."

CHAP. III.

D E N M A R K.

Situation, Extent, Boundaries, Climate, Soil, Produce, Population, Cities, Inhabitants, and History.

THIS kingdom, commonly styled Denmark Proper, is situated between 54 and 58 deg. of north lat. and 8 and 11 deg. of east long. It extends, from north to south, near 240 miles; and the breadth, in some parts, is only about 24, and, in others, near 180. It is bounded on the north from Norway by the Scagerrack sea, and from Sweden on the east by the Sound; on the south by Germany and the Baltic; and, on the west, by the German Ocean, which separates it from Great-Britain. It is divided into two parts; the peninsula of Jutland, anciently called Cimbria Chersonesus, and the islands at the entrance of the Baltic, mentioned in the table. Though all these together constitute the kingdom of Denmark, yet not any one of them is separately called by that name.

The air is not so piercing cold in Denmark as it is in some parts of Germany, situated much further to the southward, being here tempered by the vapours of the sea, which surrounds it in almost every part. These vapours also greatly mitigate the heats of summer.

Spring and autumn are seasons scarcely known in Denmark, on account of the sudden transitions from cold to heat, and from heat to cold, which distinguish the climate of this kingdom. In all the northern provinces of Denmark the winters are very severe, so that the inhabitants often pass arms of the sea in sledges upon the ice; and, during the winter, all their harbours are frozen up. The soil, as in all other countries, is various, but principally consists of the sandy and clayey; the former abounds in the islands, and the latter on the continent. The mountains, near their summits, are barren, but the valleys fertile.

Jutland is one of the largest and most fertile of all the provinces of this kingdom, produces abundance of all sorts of grain and pasturage, and is a kind of magazine for Norway on all occasions. A great number of small cattle are bred here, and afterwards transported into Holstein, to be fed for the use of Hamburg, Lubeck, and Amsterdum. This province is every-where interspersed with hills, generally barren; and, on the east side, has fine woods of oak, fir, beech, and other trees; but, the west side being less woody, the inhabitants are obliged to use turf and heath for fuel.

Zealand is, for the most part, a sandy soil, but rather fertile in grain and pasturage, and agreeably variegated with woods and lakes of water. The climate is more temperate here, on account of the vapours from the surrounding sea, than it is in many more southerly parts of Europe.

In some parts of the country there are large forests, which produce excellent timber, and are full of game. Most of the lakes abound with fish of a very delicate flavour. There are few rivers in Denmark; the most considerable is the Eyder, which rises at the foot of a mountain near Segeberg, and falls into the sea at Toningen.

The Danes have an excellent breed of horses, greatly esteemed for the saddle and carriage; above 5000 are sold annually out of the country, and of their horned cattle near 30,000. Besides numbers of black cattle, they have sheep, hogs, and other useful animals; also plenty of poultry and wild fowl.

In 1559, a numeration was made, by authority of the number of people in his Danish majesty's dominions of Denmark, Norway, Holstein, the islands in the Baltic, and the counties of Oldenburgh and Delmenhorst, in Westphalia, and found it to amount to 2,444,000, exclusive of the Icelanders and Greenlanders. But the most accurate account of the population is that made under the direction of the famous Struensee, by which Jutland numbered 258,136; Danish Iceland, 283,466; Funen, 143,988; Norway, 723,141; Islands of Ferro, 4,754; Iceland, 46,201; duchy of Sleswick, 243,605; duchy of Holstein, 134,665; Oldenburgh, 62,854; Delmenhorst, 16,217: in all, 2,017,027. Several of the smaller islands, included in the district of Fionia, are omitted in this computation, which may add a few thousands to it.

Though

Though the above number may seem disproportioned to his Danish majesty's dominions, yet, every thing considered, it is far greater than could have been expected from their uncultivated state. The nobles of Denmark formerly lived at their country-seats with great magnificence and hospitality, and possessed a degree of courage which approached to ferocity; but by a continual series of tyranny and oppression, their national character is much changed, and from a brave, enterprising, and warlike people, they are become indolent, timid, and dull of apprehension. The corruption and arbitrary proceedings of the Danish ministers have greatly shackled the trade of the country; and her merchants are so terrified by the despotism of her government, that, instead of being rich and flourishing, it is at present one of the most indigent and distressed states in Europe. These circumstances prevent Denmark from being so populous as it would otherwise be, if the administration of government were more mild and equitable, and if proper encouragement were given to foreigners, and to those who engage in useful arts and agriculture.

The higher ranks of people value themselves extremely upon those titles and privileges which they derive from the crown, and are exceedingly fond of pomp and shew. They endeavour to imitate the French in their manners, dress, and even in their gallantry; though they are naturally the very contrait of that nation.

The lower class of people are as absolute slaves as the negroes in the sugar islands, and subsist on much coarser provisions. They have not the least piece of furniture of any value in their houses, except featherbeds, which are excellent in Denmark, from the amazing quantity of feathers annually collected.

The warlike genius of the Danes subsists no longer: the common people are timorous and dispirited, nor do they possess that talent for mechanics and natural ingenuity, so remarkable in other nations of the North.

The Danes, like other northern nations, are greatly given to intemperance, in eating, drinking, and other convivial entertainments. There was great reason to hope, at the beginning of his present majesty's reign, that these and several other vicious customs would have been reformed; but these pleasing expectations are now vanished, and the good of the people seems to be forgotten.

The Lutheran doctrine is universally embraced through all Denmark, Sweden, and Norway, so that there is not another sect in these kingdoms. Denmark is divided into six dioceses; one in Zealand, one in Funen, and four in Jutland: but the bishops are, properly speaking, no other than superintendants of the church. They have no cathedrals, ecclesiastical courts, or temporalities. Their business is to inspect the doctrine and morals of the inferior clergy. They are only distinguished from other ministers by their

habit. The revenue of the bishop of Copenhagen amounts to about two thousand six-dollars, and is the richest benefice in the kingdom. The clergy are wholly dependent on the government: they never intermeddle, nor are employed or consulted in civil affairs: they nevertheless have acquired great influence over the minds of the common people, by whom they are greatly revered. Their churches are kept extremely neat, and have organs in them. They preach without notes, and inveigh severely against the vices of the great, whom they scruple not to attack personally. The commonalty admire their courage, and the government connives at their presumption, while they confine themselves to their own province of preaching. They are, generally speaking, men of good morals, exemplary lives, and some erudition.

Literature receives very little encouragement in Denmark, which may be the principal cause of its being more cultivated there, though, it must be confessed, they begin now to make some promising attempts in history, poetry, and the drama. This kingdom has formerly produced several men of eminence, especially in astronomy and medicine, among whom Tycho Brahe, Borrichius, and the Bartholines, have done honour to their country: but though the university at Copenhagen has funds to the amount of 300,000 six-dollars, for the gratuitous support of 300 students, yet the Danes in general make no progress in letters. The language of Denmark is the dialect of the Teutonic; but High Dutch and French are spoken at court, and the nobility have lately made great advances in the English, which is now publicly taught at Copenhagen, as a necessary part of education. As they are great lovers of music, and encourage it, a company of English comedians occasionally visit the capital, where they meet with a pretty favourable reception.

We shall now proceed to describe the divisions, cities, and towns of this country, with their respective divisions and circumstances.

Denmark is divided into the four following duchies: 1. Jutland, properly so called, or North Jutland. 2. The duchy of Sleswic, or South Jutland. 3. The duchy of Holstein; and, 4. The Danish islands.

JUTLAND PROPER, or North Jutland, is bounded on the south, by the duchy of Sleswic; on the east and west, by the German Ocean; and towards the north, by the Baltic, the Categate, and the Lesser Belt.

This country is divided into four dioceses, viz. Ripen to the south, Ahusen to the east, Wyburg to the west, and Aalborg to the north.

Ripen diocese is bounded, on the south, by the duchy of Sleswic; on the north, by the dioceses of Ahusen and Wyburg; and extends east and west from the Baltic to the German Ocean. It contains 30 parishes, or bailiwicks, 282 parishes, 10 royal palaces, 100 noblemen's seats, and seven cities, which are as follows:

or dioceses, viz. Ripen Wyburg to the west

e South, by the duchy dioceses of Arhus and west from the It contains 30 parishes, 10 royal palaces, which are as follows
Ripen

Ripen, Rypen, or Ripa, is seated on the river Sleslaw, which, before it comes to this city, divides itself into three branches, the largest of which runs to the north side of the town; the middle branch, which is the smallest, runs on the south of it; the third also on the south, but at some distance; they run again a little lower, and fall into the German Ocean, three miles below, forming a commodious harbour. This city is 26 miles distant from Tonder, towards the north, and 24 from Colding, to the north-west. It is a place of considerable trade: the neighbouring pastures and fields produce abundance of cattle and corn. Hither are driven almost all the black cattle from many parts of Jutland, which are shipped off for foreign countries, especially for Holland; and their corn they export into the neighbouring countries. These articles afford them very great profit. But the city is often exposed to imminent dangers from the tides flowing in with prodigious violence from the sea, so that the water sometimes comes into the very church-yard of the cathedral, which stands on a hill; and even during the terrible inundation that afflicted Jutland in the year 1734, the water rose an ell high in the very cathedral. This town is strong by nature only, without much assistance from art. Towards the west there is a castle marked with four bulwarks, after the old fashion, built in the year 1150. The citizens houses are pretty well built, and the inhabitants were formerly in better circumstances than they are now; but they suffered very much during the wars with Sweden, the city being taken by the Swedes in 1645, but soon after recovered by the Danes. Before the Reformation this was a bishop's see, as it is now of a superintendent or Lutheran bishop. The cathedral is a noble pile, built with free-stone, as well as its steeple, which is square, very high, and covered with lead. This church is adorned within with several marble columns, and with the tombs of some kings. There is another church dedicated to St. Catharine. Here are also two public schools for the education of youth in polite literature, and a college for divinity, in the court of the bishop's palace, where there is also a public library. The city is governed by two burgomasters, or consuls, and by a senate, who formerly administered justice with so much severity, that *the justice of Ripen* was become proverbial saying, to express a rigorous execution of the law.

Colding, or Kolding, an ancient city mentioned by Ptolemy, stands on the banks of a little river called Coldingger Aa, which parts North Jutland from the duchy of Sleswick, and falls into a little gulf, thence named the Gulf of Colding. The city is about 11 miles distant from Haderleben to the north. It was burnt down during the civil wars in 1247. In 1268, king Eric VI. redeemed it out of the hands of Eric, duke of Sleswick, and son to king Abel. He built a Citadel there, to be a bulwark to Denmark, and forti-

fied the town, especially towards the south. Christian III. who liked the city very much, on account of its agreeable situation, and wholesome air, built the castle of Arnburg, above the city, removed thither with his court, and died there January the 1st, 1559. The hospital was built by Frederick II. whose son endowed it considerably.

In May 1664, the Danes gained a considerable victory over the Swedes near Colding. This town is but small, since it does not contain above 100 or 120 houses; but what makes it chiefly considerable is its bridge over the Aa, which is called Boherrit, and gives name to the whole country about it. All the black cattle and horses that come from Jutland, and go into Sleswick, must pass over this bridge, and pay each a crown for toll; whence arises a considerable part of the king of Denmark's revenue. Though this town lies commodious for trade on the Lesser Belt, over-against Middlefort in Funen, yet they have hardly any trade but in cattle. They have good fish, and the river Aa produces excellent eels.

Frederick's Ode, or Frederici Oda, stands on the banks on the Lesser Belt, 10 miles from Colding to the north-east, and about 27 from Ripen towards the east. It was built by king Frederick III. of Denmark, and is well seated on a point of land, with an easy descent to the sea-ward: it has been well fortified, being a pass over the Lesser Belt, or Middlefort Sound. The works are very high on the land side; and on the other side of the point there are eight bastions: it has four gates, and before each a ravelin, but ruinous. Towards the sea the fortifications are lower, and of a greater extent; where there are bastions, platforms, and some batteries on the shore. These fortifications enclose a great deal of ground, but the fifth part of it is not inhabited, for there are many corn-fields and orchards within the walls. This place was formerly a refuge for bankrupts and Jews; but king Frederick IV. recalled those privileges. Here are two churches, one Danish, and another German, but they have no steeples. In 1658 this town was taken by Charles Gustavus's troops, commanded by Wrangel; the garrison, consisting of 2000 men, were all killed or taken. This opened a way to the king of Sweden to undertake his expedition over the ice from this place to Funen, where the passage over the Belt is above three English miles.

Weil's, or Weel, is six miles distant from Frederick's Ode to the north-west, and about 12 from Colding to the north. It stands on a little river, which falls into a great bay that communicates with the Lesser Belt, and makes a good harbour. The city is neat, and well-built, but not large. About 22 miles to the north-west stands Warde, on a river that falls into the German Ocean, 10 miles below the town, which is conveniently situated for trade.

Ringcoping, or Ringkiobing, is 45 miles from Ripen, and 24 from Warde, to the north. It lies on

a bay of the German Ocean, made by a neck of land 25 miles in length from north to south, so that ships ride in the port safe from all winds.

Lenwick stands on the gulf of Limford (from whence it has its name) on the north-west borders of this diocese, 10 miles from the German Ocean to the east, 56 from Ripen, and 81 from Ringcöping, to the north.

Hofflebrow, or Hoffelbrow, stands about 11 miles from Lenwick to the south-east, and 12 from Ringcöping to the north-east. It is an inland town, but lies on a river which communicates with the German Ocean by a lake, into which the river falls.

Arhusen diocese is the eastern part of Jutland, having on the north the dioceses of Wyburg and Aalborg, on the west and south that of Ripen, and on the east the Categate and Lesser Belt. It extends about 60 miles along the coast of the Baltic, but is not much above 30 miles in breadth at the widest part. It contains 31 prefectorships, or bailiwicks, 304 parishes, five castles, or forts, and eight cities, or walled towns, viz. 1. Arhusen, the capital of the diocese, stands at the mouth of the river Gude, which runs through it, and a little lower falls into the Categate. It is 86 miles to the northward of Sleswick, and 42 north-east of Ripen. The situation is pleasant, being surrounded with forests full of game, pastures that are exceeding rich for the country, and fields which produce a considerable quantity of grain. The town itself is neat and agreeable, well furnished with provisions and domestic necessaries from the neighbouring country, and with other commodities and luxuries from various countries, by the means of shipping. The harbour is tolerable, and the cathedral church erected after a curious style of architecture, beautified and embellished with various monuments of noblemen, prelates, &c. The bishop's palace was once a magnificent structure, but is now fallen to decay. The city was made an episcopal see in the year 1014, and is now the see of a superintendent. 2. Scanderburg, six miles from Arhusen to the south-west, is a good fortress, near the spring of the river Gude. 3. Horsens, 12 miles distant from Arhusen to the south-west, is a small city or town situated on a little gulf, which serves it instead of a harbour, and falls into the Baltic. 4. Randers is a very ancient city, situated on the river Gude, which, about 12 miles lower, falls into the Baltic, and thus affords this place a good conveniency for navigation. It is a place of great trade, and famous for the best salmon in Jutland. The neighbouring fields produce plenty of corn. 5. Ebelitot is seated at the bottom of a bay of the Categate, about 18 miles from Arhusen to the north-west. 6. Grinaa stands near the point or cape of a peninsula, which juts out into the Categate, and is seven miles distant from Ebelitot to the north. It is defended by a castle. 7. Mariager stands on the south-side of a large bay of the Categate, 16

miles distant from Arhusen to the north. 8. Hebro, or Hebro, is a small town on the same bay, six miles above Mariager to the west.

Wyburg diocese has that of Aalborg on the north from which it is partly separated by the gulf of Limford, Arhusen on the east, and Ripen on the south and west. It is not above 24 miles from east to north, and 26 from east to west, being almost of round figure. Though it is an inland country, yet wants not the conveniency of navigation; for here are large lakes, that branch out into several parts of the land, and from whence, by means of the Limford into which they run, and which communicates with the Baltic Sea, they receive vessels of great burthen. Among these lakes there is one named Otiofunde, from the emperor Otio, surnamed the Great, who, about the year 948, made an inroad this way, penetrating even as far as this country, and, casting his javelin into the water, gave it the name it still retains. The best horses in Denmark are bred in that part of the diocese named Salling. In this territory are comprehended 16 prefectorships, or bailiwicks, 248 parishes, and three garrisons. The most considerable towns are 1. Wyburg, which stands in the middle of North Jutland, of which it is the capital city. It is a place of great resort, being the seat of a high court of justice, which receives the appeals from inferior courts, but none can be made from it, except to the king. This Wyburg has been the see of a bishop for above 600 years; but the exact time cannot be fixed; for it is a matter still disputed whether this or Aalborg is the most ancient. The bishop and chapter still subsist. It stands near a branch of the gulf of Limford, called Virksund, and was anciently called Cimmerburg, being the chief city of the Cimbrici; but whence it has its present name is not certain. 2. Selve, or Schlehnis, which stands on the same gulf, and is situated 10 miles from Wyburg to the north-west. The peninsula of Salling, surrounded on all sides by the same gulf, except towards the south, is the most notable place in Denmark for fine horses, which are exported by foreigners. 3. Nibe, on the same gulf, 18 miles from Wyburg to the north-east, is also noted for a good breed of horses.

Aalborg diocese is the most northern part of Jutland, and surrounded by the sea on all parts, except on the south, where it is divided from Wyburg and Ripen by the gulf called Limford, which runs from the Baltic Sea above 50 miles across the country, and is shut out of the German Ocean by a narrow isthmus, or neck of land, made by the sand-hills on the west shore of Jutland, over-against a great shoal called Jusche-Riff. This diocese is about 70 miles long, from the south-west to the uttermost point of Schager-Riff in the north-east; but as it is of a triangular form, its breadth is not equal every-where, being but about 40 miles where broadest. The north part of this diocese, which is cut off by the gulf (for the city of Aalborg

on the south-side of Latin authors Vandol the seat of the Vand the king of the country is fruitful, and is divided into 13 bishoprics, 100 castles, &c. 1. Aalborg; for vessels taken in the gulf with shore of it, about the year 1060; but the glow, whence the diocese of Burglaw; but the Danish bishops have had Wensful, or Burglaw, which is 14 miles lower, from which this city is removed. It was formerly removed to Aalborg, as the inhabitants, or cape, which is the northern land of Jutland, and the Categate, are more frequented by more than any other place here in their world be far greater than any coast it lies on. The city of Mors, made by the sea, is a considerable town. 5. Tyne, in this diocese, stands near the middle of the German Ocean and gulf of Jutland, a very beautiful place of this kind of university, which is founded by Christian the first, a port town on the coast of Schagen, towards

SLESWICK, or Sleswick, is a city dependent on the king, in the year 1128, King Valdemar Canute, the first, afterwards deprived of it. It is about 86 miles in length, surrounded by Jutland or the duchy of the German Ocean on several streams, which in the most parts; and in general, the western, and in the north, which produce a great quantity of the nobility here are to enjoy a great share of the land, which is divided into four ci-

on the south-side of it) is called Wenfufal, and Latin authors Vandalia, whence some apprehend it by the feat of the Vandals. The inhabitants are the subject of the king of Denmark's subjects. The country is fruitful, and pretty well enriched by trade. It is divided into 13 bailiwicks, which contain 177 parishes, 100 castles, and the following cities and towns: 1. Aalborg, so called from the great quantity of seals taken in the gulf of Limford, stands on the north shore of it, about six miles from the Categate to the west. It is the see of a bishop, founded about the year 1060; but the bishops resided anciently at Burglaw, whence the diocese was then called the diocese of Burglaw; but since the reformation, the Lutheran bishops have had their palace at Aalborg. Wenfufal, or Burglaw, stands on the river Ryaa, which, 14 miles lower, falls into the gulf of Limford, from which this city is as many miles distant to the west. It was formerly the see of a bishop, which has been removed to Aalborg. 3. Schagen, Scagen, or Scagen, or cape, which it gives name to; and is the northern land of Jutland, betwixt the Norwegian coast and the Categate, or Schager-Rack. The town is more frequented by merchants from all parts of Europe than any other town in Jutland, because they come here in their way to the Sound. Its trade would be far greater still, were it not for the dangerous coast it lies on. 4. Nikioping situated in the bay of Mors, made by the gulf of Limford, is a considerable town. 5. Tyfted, on the south-west part of this diocese, stands near 30 miles from Aalborg to the west, in the middle of the isthmus made by the German Ocean and gulf of Limford, which is the most fruitful place of this district. This town is noted for a kind of university, which was first a free-school only, founded by Christian the Third. 6. Seiby is a small seaport town on the eastern shore, 15 miles distant from Schagen, towards the south-west.

SLESWICK, or SOUTH JUTLAND, is an ancient duchy dependent on the kingdom of Denmark; for, in the year 1128, king Nicolas the First gave it to his nephew Canute, the son of Eric. Denmark was afterwards deprived of it; but, in the year 1459, Christian the First re-united it to that kingdom. It is about 86 miles in length, and 60 in breadth, being bounded by Jutland on the north, by the Baltic on the east, by the duchy of Holstein on the south, and by the German Ocean on the west. It is watered by several streams, which render it exceeding fruitful in most parts, and in general abounds in meadows and pastures. The eastern parts lie considerably higher than the western, and in the latter there are large plains, which produce a great plenty of all sorts of corn. The nobility here are rich, and the common people enjoy a great share of independence. This duchy is divided into four circles, viz. Gottorp, Tonderon,

Flensburg, and Hadersleben. The principal cities and towns are the following: 1. Sleswick, the capital of the whole duchy, which is situated on a small arm of the sea, called the Sley, at the distance of about 38 miles from Gluckstadt to the north-east, and 28 from Lemden to the east. Christianity was established here in the ninth century, and the great church founded by Eric Barn, in conjunction with St. Anshar, bishop of Hamburg; and in the year 930, king Harold Blatand erected an episcopal see. Afterwards the Slavonians invaded these parts in the year 1065, destroyed the church, and restored the pagan superstitions; but soon after these foreigners were expelled, Christianity was restored, and the cathedral rebuilt. In the next century, it became a place of great trade, and much frequented by merchants from Great-Britain, France, Spain, Flanders, &c. The soil, especially towards the south and east, is not very fruitful; but the town is sufficiently supplied with all necessaries of life from the neighbouring country, and the Sley affords abundance of fish. They brew beer here, which is not very palatable; but they import some from abroad, as well as wine, which is pretty cheap. Among the public buildings is a ducal palace, which they shew to strangers; it does not contain much that is worthy of notice, except a library, which contains a few ancient manuscripts; and a cabinet of rarities in natural history, which has several things that are really curious. In the gardens are some water-works, and many walks in the old taste, which the poor people of this country think great exertions of magnificence. The principal church is ancient, and a very large fabric; it contains many monuments of the ducal families, but none that will yield much entertainment to a traveller. In the suburbs there is a church dedicated to St. Michael. Sleswick was formerly the see of a Roman Catholic bishop, and is now that of a Protestant superintendent.

A few miles distant from Sleswick, to the south, are yet to be seen, in many places, the ruins of the famous wall and trench which was built in ancient times by the Danish kings, against the incursions of the Saxons. It is thought to have been begun by Gotherick, or Gothofred, king of Denmark, to keep out the armies of the emperor Charles the Great, about the year 808; and afterwards improved by queen Thyra, and other Danish monarchs, and rendered so strong, as to be esteemed impregnable by the counsellors of Henry, surnamed the Lion, duke of Saxony. This rampart was called Danewark, and, like Hadrian's wall in England, is reported to have reached from sea to sea, quite across this neck of land.

2. Gottorp was the ancient seat and patrimony of the dukes of Holstein, the chief branch of which family, after the royal one, took from thence the title or surname of Gottorp. It is about six miles distant from Sleswick to the south-west, and stands on the Sley, which.

which almost surrounds it, and carries vessels of small burthen to and from the Baltic. This place is, at the same time, a fortress, and a noble palace, being accounted one of the finest seats in all these northern parts. The castle stands to the west of the Sley, in the middle of a little lake, and is built in the form of an oblong square, fortified with four bastions of earth; the bottom is paved with free-stone, the curtains are long, and the sides stand north and south. You approach the castle by a bridge, which joins it to the south shore. It is commanded by a mountain that stands north-east of it, from whence the Danes annoyed the castle in the year 1675, when the duke was treacherously surpris'd by the king of Denmark at Rentsburg. The duke, before his death, had designed to rebuild the castle, but the front only is finished; if the whole had been completed, it would have been one of the finest palaces in Europe. A rampart encompasses the first court, and the gate of the castle is a fine blue stone, as hard as marble, with a lantern over it that has 27 lights.

On the north side of the castle there is a bridge of 200 paces over the lake; and, at the end of the bridge, a walk, between two rows of trees, that lead to the garden, which is adorned with many fine water-works and cascades. On the left there is a basin, or fish-pond, 200 paces square, with rows of trees on all sides, except to the north; there are, also, fine arbours on the sides of the pond; and, in the middle, a Hercules, of a monstrous size, represented with his club, going to kill the Lernaean hydra. Out of every part the water plays. In every corner of the pond, there are statues which form cascades. On the north there is a parterre, in the form of a crescent, divided into several compartments, with niches round, containing busts of many kings, and modern princes. There are also the representations of many fabulous animals, that throw water. At the end of the walk there is a small room, in which is to be seen a globe, made by the famous Tycho Brahe, so contrived, that, by mechanism, it represents his system of the world. There is another admirable globe of copper, 10 feet and an half in diameter, with a sphere, wherein the sun moves in the ecliptic, and all the heavenly bodies are carried round in exact order, by means of certain wheels, which are turned about by water conveyed from the adjacent mountain. Before this house there is a level ground 50 paces broad, and three times as long, divided into three parts: those on the sides have fine parterres, and that in the middle has a great basin in the centre, with water-works; the next terrace is higher; and the whole is enclosed with green pales, as high as each terrace, with busts all round.

From the highest terrace there is the finest prospect perhaps in the world, viz. the castle in the front, in the middle of a lake surrounded with a charming country, and a fine plain before it. On the left there is a great orangery, or green-house, where they keep

the Indian trees, myrtles, pomgranates, and other exotics, in boxes. The park is noble, about four English miles in circumference, and full of fallow deer and stags. There is a toll-booth, or custom-house, where all toll is paid for great numbers of black cattle, that pass from Jutland into Germany; this produces a considerable sum to the king of Denmark, since, in four years, toll is paid for above 50,000 head of cattle.

3. Eckrenford stands on a little gulf of the Baltic, which makes a very commodious haven, and affords a considerable trade, being one of the safest ports on that shore. It is about 22 miles distant from Gotten to the east, and six from Kiel towards the north.

4. Christianpreis, the capital of a bailiwick of the same name, which borders on the duchy of Holstein, is situated on a gulf of the Baltic, at the entrance of a haven of Kiel, and is commanded by a castle that was built in 1637, by Christian IV. king of Denmark. It is about five miles distant from Kiel to the north, and four from Eckrenford to the east. It has about 500 houses, and two gates, defended with strong works. The Eyder serves for a ditch, and makes it inaccessible; and where the river grows narrower they have built a crescent in the water, with port-holes of 16 pieces of cannon.

5. Frederickstadt, thus called from its founder, Frederick, duke of Holstein and Sleswick, who built it in the year 1621, peopled it with Hollanders, and granted them great privileges. He endeavoured also to settle a silk trade there, and, for that purpose, sent an embassy to Muscovy and Persia, which gave occasion to Adam Olearius, secretary to it, to publish an account thereof in an excellent book of travels. The town stands on the banks of the river Eyder, and is 24 miles distant from Sleswick towards the west, and 42 from Gluckstadt to the north. It is built after the Dutch fashion, and all religions are tolerated there. The town is square, and surrounded with a large canal, planted with rows of trees. It is divided into two parts by another canal, also with trees on the sides. The Lutheran church is built with bricks, and very neatly.

6. Tonderon is also situated on the river Eyder, 10 miles below Frederickstadt, and about 14 miles from the German Ocean. It is not an ancient town, but it has a good trade, which increases daily, by means of its commodious harbour formed by the Eyder. It was formerly well fortified, but the fortifications were demolished in 1714 by the Danes, who, after a long blockade, forced the town to surrender upon terms. This is the capital of the bailiwick of Eyderstadt, and much frequented by the Dutch, who buy black cattle here.

7. Flensburg, the capital of a district known by the same name, as well as that of Angelen, or Engelnd (the country of the Angles, who invaded South Britain, and bestowed upon it the appellation of England) is situated eight miles to the northward of Sleswick,

of the gulf of Flens, formed by the Baltic;
 the harbour is so commodious, that ships of great
 when may come up, and lie loaded from the ware-
 houses, which is 10 miles from Tonderon, and
 on the gulf of Hoyer, was formerly flourishing
 opulent, but it is now greatly decayed; its ruin
 deduced from three capital causes, war, inunda-
 tions, and conflagrations.
 Lohm-Closter is an inconsiderable town, situated
 the river Lohm-Becke, about 10 miles from the
 man Ocean.
 Haderleben is a large sea-port town, by the
 of Haderleben, which runs into a narrow gulf,
 disembogues itself into the Baltic. The inha-
 bitants carry on a tolerable trade by means of the
 that are caught in great plenty, both in the lake
 and gulf.
 Timder, 12 miles to the westward of Hader-
 leben, is a remarkable neat town, situated in a fertile
 on the southern bank of the river Wydaw.
 is a small strong fort, which the king keeps
 excellent repair. The harbour, however, is
 sanded up at present, and the town hath scarcely
 any trade.
 Apenrade is situated at the bottom of a gulf
 the Baltic, 25 miles north of Sleswick. It is de-
 scribed by a tolerable citadel; but has, nevertheless, been
 frequently plundered in time of war.
 Luxburg, or Glucksburg, is four miles to the
 westward of Flensburg, near the same gulf, but on
 the opposite side. It is but a small town, yet has a
 castle, and gives title to the dukes of Holstein-
 Glucksburg.
 The Duchy of HOLSTEIN, part of the king of
 Denmark's German dominions, lies on the north-east
 of the river Elbe, and is one of the richest pro-
 vinces in the dominions of that monarch. A tra-
 veller, who had access to the public records of the
 kingdom of Denmark, and received many curious
 particulars from the unfortunate prime minister Count
 Brevensee, thus describes this duchy:
 The great duchy of Holstein, which is all united
 the Danish dominions at present, is famous for its
 pastures, and for producing excellent beef. Great
 quantities of horned cattle are bought up in Jutland,
 and other provinces of Denmark, and brought here to
 be fattened: and their beef, besides what is used for
 the consumption of Hamburg and Lubeck is salted,
 dried, and exported; the former to Holland, and the
 latter to all parts of Lower Germany; and, together
 with an excellent breed of horses, of which great num-
 bers are exported yearly, bring considerable sums of
 money into the province, of the whole of which the
 part of Denmark has not hitherto found the means
 to drain them; so that this province may justly be said
 to be the richest in the Danish dominions.

Holstein is bounded on the west by the German
 Ocean, on the east by the Baltic, on the south-east by
 Mecklenburg, on the south-west by the river Elbe,
 and on the south by the territory of Hamburg, and
 by Lauenburg. It is 80 miles in length, 60 in
 breadth, where broadest, and divided into four princi-
 pal parts, or provinces, viz. Holstein Proper, Wag-
 rita, Stormar, and Ditmarsh.
 This duchy is remarkably fertile, and contains
 many rich marsh, pasture, and meadow lands. Dykes
 have been cut through the marsh lands at an immense
 expence, not only to drain off the waters, which na-
 turally accumulate there, but to drain off such as are
 occasioned by the inundations both of the sea and
 rivers, which are frequent. These, however, give
 such a richness to the soil of the marshes, that cattle
 are bred in great numbers, and fattened in them; and
 vast quantities of excellent butter and cheese are made
 of the milk. In some parts of them they sow wheat,
 barley, peas, beans, rape-seed, &c. which thrive ex-
 ceedingly. Sheep are bred in the more sandy, heathy,
 and barren districts; and woods and orchards abound
 in other parts. The beef, veal, mutton, lamb, and
 pork, are all fat and palatable; and the best sea and
 river fish are caught in great plenty. The Holstein
 horses are exceeding beautiful, and, on that account,
 are highly prized both in Denmark and Germany.
 The principal people usually farm out their cattle to
 a kind of bailiff, who runs all hazards, receives all
 profits, and allows the proprietor so much per head
 for the whole: thus the gentry receive a certain
 income without having any trouble, and the bailiff is
 sufficiently rewarded for his pains, as he usually makes
 a fortune by the extra profits.
 In general, the country is plain and level, and wa-
 tered by the rivers Eyder, Stor, and Trave, with many
 rivulets, dykes, &c. An odd custom prevails here,
 which is, to drain the lakes and ponds, at certain times,
 and sell the carp, lampreys, pike, perch, &c. which
 are found in them; and then some years after to sow
 them with oats, or use them for pasture; and after that
 to lay them under water, and breed fish in them again.
 The houses and churches are very neat; for the people
 here, with respect to nicety, resemble the Hollanders.
 The duchy contains about 35 cities and towns, great
 and small, and 600 parishes. The clergy are annually
 chosen, and removable at pleasure. The people are
 rigid Lutherans; so that they give but very little
 countenance to Calvinists, and are strongly prejudiced
 against the Roman Catholics. With regard to their
 character, in other respects, they are, in general, well
 made, finely featured, fair, strong, courageous, and so
 celebrated for their integrity, that the expression Hol-
 steinglaube, or honest Holsteiner, is proverbial through-
 out Germany, Denmark, &c.
 The principal cities, towns, &c. in Holstein, are,
 1. Lubeck, an imperial city, and chief of the Hans
 Towns, is situated at the conflux of several rivers,
 6 D. the

the largest of which is the Trave. It is 12 miles from the Baltic, where it has a fine harbour, 25 miles north of Lauenburg, 40 north-east of Hamburg, and 117 south-west of Copenhagen. It is a bishopric under the archbishop of Bremen, and was translated hither from Oldenburg in 1163.

This is a government or republic within itself, with royal jurisdiction, viz. to make and execute its own laws, as well in civil as in capital causes. From the consistory there lies an appeal to the senate of the city, which consists of four burgomasters, two syndics, who are civilians, and sixteen common-council-men; each of whom has his particular province, and they are all for life: but the common-council is only formed of lawyers and merchants, with an exclusion of mechanics. Father and son, or two brothers, cannot be in the reignty at the same time.

The name of Lubeck is supposed to be derived from Lob-eck, the German word for a point of land, which agrees with its situation. It is an ancient place, and, as the Poles say, was founded by one of their kings, who conquered this part of the kingdom; but the Germans ascribe its foundation to Codeschalk, one of the kings of the Vandals, in 1040. It has sustained wars, both offensive and defensive, for several years, not only against the dukes of Mecklenburg, but against the king of Sweden. It is said to have been a considerable city when taken in the year 1134, by Crito, a prince of Reugen, who destroyed it; but it was rebuilt in the year 1140, by Adolph II. count of Holstein, and then first endowed with the immunities of the city. In 1158 it was again reduced to a heap of ruins by fire, and was afterwards restored by Henry the Lion, duke of Saxony, in whose time the collegiate church was founded. In 1164, the famous league of the Hans Towns was begun here; and their college is still kept, together with their records, and common stock raised by contributions. In 1181 the emperor Frederick I. brought it under subjection to the empire; but Henry the Lion retook it; upon which it fell into the hands of Holstein, and afterwards of Denmark. The city having suffered greatly by fire, particularly in 1276, was rebuilt in the handsome manner now seen; the senate having made an order that none of the houses should, for the future, be built with timber, or covered with thatch. In 1350 it was almost depopulated by the plague, which carried off vast numbers of the inhabitants.

At present, this is a fine noble city, spacious, and well fortified; two miles in length, and more than one broad; the streets being straight, uniform, and wide. Many of the streets have rows of lime-trees on the sides, and a canal in the middle. The churches are magnificent, and about twenty of them have high spires. The two chief streets leading from the cathedral, and the Miller's Gate, to the royal and castle gate, being the highest parts of the city, are intersected by others that descend gradually on each side to the Trave and

Wagnitz rivers. The houses are large and stately, and adorned with sculpture. The river Trave empties into the very heart of the city, which is near 10 miles from the sea. The largest vessels, however, load at Travemund, a fort on the bay of Lubeck. The principal trade is to Riga, Revel, Narva, and Petersburg; and the magazines and warehouses are well stocked with the productions and commodities of Poland, France, Spain, Holland, the East and West Indies, &c. The fortifications are strong, well situated, and kept in good repair. The bastions are lofty and extensive, the out-works numerous, and the haven defended by several forts and ramparts. The few market-places are large, and well supplied; and public buildings stately, particularly the senate-house, arsenals, hospitals, &c. All parts of this city are furnished with water by pipes from a reservoir.

St. Mary's church is the most considerable in the place, being a lofty edifice, standing in the midst of the city, and has a double steeple, 217 yards high, built 1304. The inside of it is profusely ornamented with pillars, monuments, &c. but there are few of them which deserve much notice. The great altar is richly executed in marble, by Quillin, who executed many at Antwerp; and near it is a famous clock, which is the most remarkable object at Lubeck, exhibiting the celestial, zodiac, equator, and tropic, and the planets in their several courses; which is so minutely done, that the station of any of them is to be found at every hour of the day. It shews the regular variations of the celestial bodies, sun rising and setting, the eclipses, festivals, and other remarkable days; all which it will continue to shew till the year 1875. Besides all this, there are several automata, and, among others, a figure of our Saviour, with a dial on its right hand, which opening at twelve at noon, comes out, in order of procession, the emperor and his seven eldest electors, and, turning to the image, makes a profound obeisance; this the figure returns by a wave of his hand; after which the whole group retires in the same order, through a door on the left, and both doors shut directly. In the tower is another piece of machinery, the chimes, which play the hours with a pleasing melody, and minute exactness. Under them is a bell, on which is struck the hour. This is performed by a figure of Time; whilst a lesser figure, representing Mortality, and standing at the other side of the bell, turns aside his head at every stroke. This work, for its preservation, is surrounded with a frame of wire. By the inscription it appears to have been erected in 1405.

Here is, among others, a very curious piece called the Death's Dance, which represents human beings in all stations of life, from an emperor to the meanest peasant, and from an old man to an infant, led round a circle by so many skeletons, shewing that death spares neither age or condition.

Ab! what is life,
Amidst our hopes
To-day the state
To-morrow death
Is mock'dly treasure
Think all that treat
The heir with smile
And all thy hoards
Should certain fate
Thy mirth will feel
Thou feeble age will
No more thy blood

Ab! what is life, with ills encompass'd round?
Amidst our hopes fate strikes the sudden wound.

To-day the statesman of new honour dreams,

To-morrow death destroys his airy schemes.

In modesty treasure in thy chest confin'd?

Think all that treasure thou must leave behind.

The heir with smiles shall view the blazon'd herse,

And all thy hoards with lavish hands disperse.

Should certain fate th' impending blow delay,

Thy mirth will sicken, and thy bloom decay:

Then feeble age will all thy nerves disarm;

No more thy blood its narrow channels warm.

Who then would wish to stretch this narrow span,

To suffer life beyond the date of man?

Lubeck cathedral is a building of very great antiquity, being erected in the year 1170, by duke Henry the Lion, ancestor of the present elector of Hanover. The occasion of building it is mentioned in an inscription on one of the walls, viz. that 'Henry the Lion, duke of Saxony, hunting in this part of the country, caught a stag, with a gold collar and cross about its neck, on which was this inscription, *Hæc me Cæsar donavit*, "Cæsar gave me this;" containing the date of the year, which was in the reign of Charlemagne; and the duke, from surprise at this accident, erected this cathedral, for commemoration of it, on the same spot, and endowed it with a handsome revenue. In the top of the church is to be seen the figure of the stag.

The next staple commodity to corn is beer, which is of high estimation, not only as a pleasant liquor, but as a medicine, when externally applied to bruises, wounds, &c. Here are several hospitals, which are well supported. There is one for ancient people of both sexes, which was once a castle, from whence the citizens drove out the Danish garrison. St. Ann's is for orphans, and other children of poor burghers, who are instructed in some handicraft business; and there is an apartment for the confinement of libertines and lunatics. There are two other hospitals for the reception of poor travellers, where they are allowed three days refreshment, and then sent forward with a pass; but such as happen to be sick, are provided with all necessaries till they recover or die. The richest foundation of this sort is St. George's Cloyster, which is chiefly for the maintenance of such artificers as are grown old and past their labour. There is also St. Gertrude's hospital, which is a pest-house. There are, moreover, several alms-houses, endowed by the merchants, for the maintenance of the widows of poor members; besides several little streets of houses for the widows of other poor citizens.

2. Travemund, dependent on Lubeck, from whence it is but nine miles to the north-east, and thirty-two miles from Wismar, is a little town near the mouth of the river Trave. One of the counts of Holstein sold it, in 1300, for 4000 marks, to the Lubeckers, who fortified

it with four good bastions, erected a light-house to guide the ships at night, and commonly keep a garrison here of 3 or 400 men, commanded by a commander of Lubeck, who receives his orders from the burgo-masters, and admits no persons into the place without a passport. It was seized by the czar in 1617, in order to secure transports for his troops; but he was persuaded to quit it. There is a peninsula over-against it, about a quarter of a league in circumference, which belongs to the duchy of Mecklenburg. The river Trave rises out of a great lake, in the jurisdiction of Segeberg; and, after a serpentine course from north to south, by Segeberg and Oldeslo, turns short to the east, waters the city of Lubeck, of which this town is the port, and then falls into the Baltic.

3. Oldeslo, or Odelslo, on the river Trave, seven miles south of Segeberg, eighteen west of Lubeck, and thirty-one north-east of Hønborg, is a little old town, which was formerly a very flourishing place, and the capital of this part; but suffered so much by the neighbouring princes, who contended for this province, and by a duke of Brunswick, who destroyed its fort-works, to favour those of Lunenburg, that it is greatly decayed.

4. Travendal, on the same river, within a mile of Segeberg, is only noted for several treaties betwixt the king of Denmark and the duke of Holstein in 1700, for adjusting the duke's rights.

5. Eutin, or Utin, about sixteen miles from Lubeck, has given title of duke, and seat, to the younger son of the duke of Holstein, ever since the year 1596.

6. Ploen is a town almost surrounded by lakes: it is the capital of what is deemed a principality of the same name. It has a palace, which stands high, and commands a beautiful prospect, and is adorned with pleasant gardens and a park. The neighbouring lakes and woods furnish great quantities of fish and timber, upon the sale of which the inhabitants principally subsist.

7. Oldenburg, or Altenburg, was once a very considerable town, but is now fallen to decay. It is situated near the Baltic, twenty-seven miles north of Lubeck, and gives name to a small district. In ancient times the Slavonian kings kept their court here.

8. Lenden is a market-town on the confines of Sleswick, not far from the Eyder. It is celebrated for its beer, which is sent into many parts of the circumjacent country, and even transported abroad.

9. Meidorp, or Meldorf, is a large town, standing on a river or stream, called the Meele. It has some trade, and three market-places round its church, distinguished by the names of the north, south, and west markets. Here is likewise a public school for the study of the classics and rhetoric.

10. Heyde is a large but poor town, ten miles to the north of Meldrop.

11. Krempi is a small open town, on a little river of the same name.

12. Gluckstadt,

10. *Gluckstadt* is situated on the north side of the Elbe, twenty-six miles south-west of Hamburg. It is a neat well-built town, as strong as to be deemed impregnable. The Danes have 2000 men in garrison here, and some men of war in the harbour, which is very safe and spacious. Here the Calvinists have a church, the Roman Catholics a chapel, and the Jews a synagogue. The town was founded in 1623, when Christian IV. king of Denmark, ordered it to be called *Gluckstadt*, which implies *Fortunate-Town*. There being no springs about the town, the inhabitants use rain-water, or that of the river. Those who are convicted of theft receive this sentence—to draw, during life, the dust-carts belonging to the town, to which they are chained like slaves.

13. *Bredenbergh*, or *Breitenburg*, is a village on the Stör, defended by a castle: it gives name to a lordship that has long been the property of the ancient and celebrated family *Ranzau*.

14. *Primeburg* is a market-town on the Pinace, thirteen miles from Hamburg, and fourteen from *Gluckstadt*. It is only remarkable for giving name to a county which fell to the crown of Denmark by the death of its last count, in 1640.

15. *Altena*, a large and populous village, is joined by a row of houses on the Elbe to Hamburg. It had its name from the king of Denmark, as it is said, purely to banter the deputies of Hamburg. The latter remonstrated to him against building this town too near their city; and having frequently observed thereupon, in their discourse to the king, "Dat is al te na," which, in the language of this country, is, "It is too near;" the king, taking particular notice of the three last monosyllables, said to the deputies, he could not excuse himself if he did not go on with the buildings; but that, to oblige them, he would call it by the name they had given it. It was formerly a refuge, not only for insolvent debtors, but even malefactors, that came from Hamburg; because, although the inhabitants, a few fishermen and sailors, subject to the king of Denmark, depended entirely on the trade and business of that city, yet it was quite out of his jurisdiction.

This place is noted for a treaty in 1689, between the king of Denmark and the duke of Holstein-Gottorp; but much more for its calamity in 1719, when count *Steinboch*, the Swedish general, having just defeated the king of Denmark and his army at *Gadebusch*, came and burnt this town to the ground. The reasons pretended by the Swedes were, that magazines of bread, beer, &c. were preparing here for the Muscovites and Saxons; and that it was partly in reprisal for the burning of *Staden*, and other cruelties committed by the Danes and Muscovites in the duchies of Bremen and Pomerania: but there was this difference as to *Staden*, that the Danes besieged it in form, and destroyed it by their bombs; whereas, *Steinboch* was judged to act the part of an incendiary. As soon as he appeared before *Altena*, he sent in a message to advise the inhabitants to

retire with what they could carry off; for that he would out in a body, and, falling at his feet, offered him 50,000 rix-dollars to save the town; but *Steinboch* insisted on 200,000, which they were ready to comply with, and only desired time to go to Hamburg for the money; but the General would admit of no delay, so that the poor inhabitants were obliged to turn out the mothers with their infants, at their breasts, and for others groaning under loads of household-goods, all lamenting their fate with the most lamentable cries. The Swedes stood at the barriers with flaming torches in their hands while they passed, and before they were all gone out, entered the town, and set fire to all parts of it, which burnt 2000 houses, with several fine magazines, and the Popish church. Several men and women, besides infants, perished in the flames; but they spared the Lutheran and Calvinist churches, with about 80 houses that lay nearest to Hamburg. Never was greater desolation known. But what completed the ruin of this place was the raging of the plague at the same time in Holstein, insomuch that the Hamburgers were forced, for their own preservation, to shut the gates against their distressed neighbours, many of whom perished with cold and want. The king of Denmark relieved them as far as the necessity of the times would permit, and caused them to be supplied with materials for rebuilding their town.

The buildings at *Altena* are now better in appearance than those of Hamburg; the streets are straight and regularly built, wide, and well paved. There is a town-house erected; and several other public buildings shew that the place is on a flourishing and improving hand. The merchants houses are on the water side, so that ships unload and load at their doors. The king of Denmark made it the staple of the Danish East-India company, which has been of very great importance to the town. This measure was an admirable one; for *Altena*, by means of her situation, distributes the India goods where no other town in Denmark could: she sends large quantities into most parts of Germany, and herein rivals the Hamburgers, who are forced to buy theirs of the Dutch. In all these points the interest of Denmark has been very well considered for this last century, from a noble attention in their kings to promote whatever has been most for the interest of their subjects.

Toleration is allowed here, which is denied at Hamburg, to all Christian sects, of whom there is said to be a greater variety at *Altena* than in any city of Europe, except *Amsterdam*. The Calvinists of Holland and France have handsome churches, built altogether on two sides of the same court. The Papists, though tolerated, are not so publicly countenanced as the Protestants.

16. Kiel is a town of great trade at the mouth of the river Swentin, on a bay of the Baltic, and the capital of all Holstein, 17 miles east of Rensburg, 36 north-west of Lubeck, and 48 north of Hamburg, and stands between hills on an arm of the sea, where it forms a lake. It has a good harbour, well frequented by ships from Germany, Sweden, &c. and is populous and wealthy. Both the town and harbour are defended by a castle on a neighbouring hill. On the right, or east side of this castle, the sea washes its walls; and on the other side of the bay there is a delightful country, though woody. On the left there is a small arm of the sea, and another delicate country adjoining to it. There is a garden facing the castle, which is the only place whereby Kiel has communication with the main land; only to the left of the castle there is a row of houses leading to a village called Brunswick. This garden, which stands along the sea side, is above 200 feet broad, and consists of a terrace walk, levelled with the foundation of the castle, from whence there is a descent to parterres, full of all sorts of flowers, and adorned with a fountain and wilderness; and this leads to other parterres, from whence there is a small ascent to another terrace. It suffered very considerably during the war between Sweden and Denmark. An university was established here by the duke in 1665, which has had many learned professors.

It is divided into the new and old towns, of which the former is the largest and most pleasant, the streets being planted with rows of trees. The old town, which is a sort of peninsula, is fortified by deep ditches; and there are fine walks of trees on the harbour. There is a palace facing the town, on the north-side, but it is in very bad repair. Here are several considerable buildings, particularly a large church and an hospital, which, before the Reformation, was a Franciscan monastery.

In this town, the trade is not so considerable as it was in the time of duke Frederick, who sent an embassy to Persia in 1633, to settle a commerce with that country. But it is much enriched by its yearly fair, which is kept for three weeks after Twelfth-day, and frequented by multitudes of all ranks, especially by the nobility and gentry of the duchies of Sleswick and Holstein, who meet every evening at a house, where there is a variety of gaming; and very often parties are made for supper, which is generally followed with a ball. Vast sums of money are here negotiated; and payments made of sums contracted beforehand, as particularly as by an Amsterdam banker upon the Exchange; insomuch that the man who does not preserve his credit at this fair, is looked upon as a bankrupt, and subjected to punishment, besides the scandal. During this fair Hamburg looks like a desert, because every body hurries hither to pay their rents, to renew their leases, or to let out money, &c. by which means the town, which at other times is but inconsiderable,

is so full, that it is difficult to get lodgings. The old town is separated from the new one by a bridge, at the end whereof is a draw-bridge and gate, guarded.

17. Rensburg is situated near 20 miles west of Kiel, and 32 south-east of Lunden, being near the borders of Sleswick. It is small, but well built, and very strong, having modern built fortifications, a capacious morass on one side, and a neat old castle, with a round tower, on the other. The town is surrounded by the river Eyder, which forms two small lakes, that abound with fish. It is divided into the old and new town.

18. Willter is a small town on a river of the same name, six miles from Gluckstadt.

19. Itzehoe is a small town on the river Stor, which is navigable from thence to the Elbe. The country from hence to Hamburg is remarkably pleasant, and exceeding fertile. The town is divided into the old and new, the latter of which is extremely well built. Here is a Lutheran nunnery for ladies of quality, but they do not make vows, or lie under those restrictions which are customary in Roman Catholic convents. It consists of an abbess and 19 other ladies, and has the advowson of several churches annexed to it.

To our description of the continent of Denmark, we shall here add its islands, which comprehend the principal parts and places in the Danish dominions, because, collectively considered, they are the seat of regal and legislative government, contain the metropolis of the realm, the general archives of the nation, and are the sources whence flow the chief political, civil, and ecclesiastical decrees, statutes, &c. They are likewise so absolutely blended with, and nearly contiguous to, the other main parts of the nation, that it would be impossible to describe Denmark as a kingdom, without taking them into particular consideration. But, before we enter into a description of these parts of the Danish monarchy, it will be necessary to premise a few observations concerning the Baltic.

This sea, or rather inland gulf, situated between Denmark, Sweden, Germany, and Russia, receives into its bosom several other gulfs, particularly the gulfs of Finland, Bothnia, Livonia, and Dantzick. It is remarkable that this sea, or gulf, neither ebbs or flows; and there is always a current from it, that sets through the Sound into the ocean. It is likewise generally frozen over three or four months in the winter-season.

ZEALAND, called also Zealand, or Seeland, is the most extensive and fertile island of the Baltic, and the principal part of the kingdom of Denmark. It is bounded on the east by the Sound, which divides it from Schonen, and on the west by the Greater Belt, which separates it from Funen. The islands of Moon, Falster, and Laland, lie on the south; and on the north are the Categate and Schagerack. It is almost of a round form; being 70 miles in diameter, and about 200 in circumference. The land, in general,

is low, and very fertile; and its woods, forests, &c. abound with game. The coast is indented with many gulfs, bays, creeks, &c. which are of great commercial use, as they afford many secure harbours. The sea vapours render the air thick, but not unwholesome, as the people here, in general, live to a very old age; but they are dull, dispirited, and inactive: Zealand is divided into 26 bailiwicks, called herrits, and these contain 346 parishes, with several considerable cities, towns, &c. The principal of these is,

Copenhagen, the capital of the whole kingdom. This city takes its name from the commodiousness of its port; for the word itself signifies, *The Merchant's Port, or Haven*. It is situated on the eastern shore of Zealand, upon a fine bay of the Baltic, near the streight called the Sound, in 55 deg. 30 min. north lat. and 12 deg. 56 min. east long. This city was originally a mean little village of fishermen's huts, which, by the assistance of the bishops of Roschild, gradually rose to be a considerable town, and at length was declared a city, and made the royal seat of the Danish sovereigns. The houses were formerly of wood; but, in the year 1728, almost the whole city was reduced to ashes by fire; and since that time it has been more sumptuously and securely built of free-stone. The then reigning king exhausted immense treasures to erect a superb palace; and the town is embellished with elegant houses, belonging to the nobility, and many magnificent churches, and other elegant public edifices.

An ingenious gentleman, who lately took an accurate survey of this city, says, "So few persons visit this metropolis, or kingdom, from motives of curiosity, that they are quite surpris'd when I assure them I have no sort of business here, and am only employ'd in the search of knowledge. There is no face of industry or business here; and Copenhagen, though one of the finest ports in the world, can boast of little commerce. The public places are filled with officers, either in the land or sea service; and they appear to constitute three-fourths of the audience, both at the comedy and the opera. The number of forces are indeed much too large for this little kingdom. They can boast, it is true, a vast extent of dominion; but of what importance are the barren and almost uninhabited mountains of Norway and Lapland, stretching to the pole, or the plains of Iceland, where the inhabitants are yet, and will probably ever remain, in the most profound barbarism? Their dominions in Holstein are by far the most rich, and furnish a large part of the royal revenue. There needs, indeed, no stronger proof of the poverty of the kingdom, than the scarcity of specie. I have seen no gold, and hardly any silver. They pay every thing in paper; and if you lose a single dollar at the card-table, or the billiard-table, it is given in a bill." The excellency of the harbour is owing to the island of Amack, which breaks off the waves, and shelters it from the

surge of the sea. Here stands the arsenal, the change, the castle, and the mint, with about houses, known by the name of the New Town.

"The whole city of Copenhagen is about five miles in circumference. It lies very low; but there is a rising ground within about half a league of it, on two or three little hills that cover it on the west-side from whence the city may easily be bombarded. It has a very regular citadel on the north and north-west, built on the shore, with several fine bastions with ravelins of earth, well stored with cannon, and palisaded. The other sides are of more difficult access, by reason of marshes. There are several royal bastions, with ravelins before the curtains, which rise from the citadel to the south part, and continue beyond the arm of the sea, which separates Zealand from Amack. A circuit of fortifications, consisting of eight royal bastions, and a ravelin, encloses the new city, the port, and fleet, and faces the north side. The houses, which are not above 7000 in number, do not take up above half the ground enclosed. The entrance into the harbour is so narrow, that one ship only can pass at a time; and this entrance is shut up every night with a strong boom. The citadel on one side, and a good block-house, well furnished with cannon, on the other, command the mouth of it. Within this haven rides the royal navy, every ship having its place assigned to it. A wooden gallery ranges round the whole enclosure where the fleet lies, and is laid over the water in such a manner, that all the ships may be view'd near at hand, as easily and commodiously as if they lay on dry land. This harbour is capacious enough to hold 500 sail, when neither the wind or the enemy can do them the least mischief. The road without is very good and safe, being fenced from the sea with a large sand-bank on the points of which are always two buoys floating, to direct all ships that come in or go out. Here are no tides to fear, and there is always a sufficient depth of water. Sometimes, indeed, according as the wind blows in or out of the Baltic, there lies a current, but it is neither frequent or dangerous."

AMACK lies east from the city of Copenhagen, on the other side of the haven, and is called the Garden of Copenhagen. It is almost of an oval form, and was chiefly peopled by Hollanders, sent thither by Margaret, duchess of Savoy, and governess of the Low Countries, at the desire of Christian II. who had married her niece, sister to Charles V. emperor of Germany. He wish'd that his queen might have some pulse, and other garden-stuff, planted there, which none knew so well how to cultivate as the Hollanders. Half the island was granted to them, and keeps to this day the name of Hollandesby. They still retain the Dutch fashions, and supply Copenhagen with milk, butter, and cheese. The other half of the

land is inhabited by Danes. Besides pulse, and other
 which this island produces, here is also plenty
 of wheat, barley, and oats. It also produces abun-
 dantly of hares. The inhabitants are industrious, and
 their houses neat and cleanly.

On this island is a place which approaches nearer to
 the nature of a circus than a square. Each side is
 formed of only one single palace; and in the centre is
 an equestrian statue, in bronze, of king Frederick the
 first. This place has a good effect, and is much
 more handsome than the Place des Victoires at Paris.
 There is a fine collection of paintings in one of these
 palaces, and a very curious private museum in another.
 Among the greatest curiosities, natural and artificial, both
 of variety and intrinsic value, are preserved in the
 royal Museum, in eight chambers, erected over the
 king's library. The chambers, or apartments, are
 large and well furnished. One of these rooms is
 wholly taken up with medals, antique and modern;
 each sort being kept by themselves, and very judi-
 cially arranged; and in a separate case are contained
 the Paduans, and other counterfeit medals, which,
 by workmanship, so nearly resemble the true Grecian
 and Roman antiquities, that a good judge can scarcely
 distinguish them from originals. The series of the
 modern medals of European nations are absolutely
 complete, and those of each nation kept distinct.
 Here it is proper to observe, by way of explanation,
 that a Paduan, amongst medalists, is a modern medal
 struck with all the marks and characters of antiquity.
 The name is taken from a famous Italian painter,
 called the Paduan, from Padua, the place of his birth;
 who succeeded so well in the cheat, that the best
 judges are at a loss to distinguish his medals from those
 which are really antique.

Among the natural rarities preserved in the cham-
 bers, one of the most remarkable is a petrified child.
 It was cut out of the mother's belly at Sens, in Cham-
 pagne, in the year 1582, after having lain there be-
 tween 20 and 30 years; and that it is a human foetus,
 and not artificial, is evident beyond all dispute. Its
 head, shoulders, and belly, are of a whitish colour,
 and very much resemble alabaster; the back and loins
 are somewhat brown and harder; but, from the hips
 downwards, it is of a red colour, and as hard as per-
 sian stone can be, exactly resembling the hard sort
 of stones generated in the bladder. This foetus, after
 it was taken from the mother, was first carried to
 Paris, where it was sold to a jeweller of Venice, who
 happened to be there, for about 20*l.* sterling; of whom
 it was afterwards purchased by Frederick III. king
 of Denmark, for 60*l.* and added to this collection.

In one of the chambers are to be seen two elephants
 teeth, each weighing an hundred and fifty pounds,
 which were dug out of a stone quarry in Saxony.

In this fine collection of curiosities there are several
 large pieces of silver ore, dug out of the mines of Nor-
 way in 1666, one of which weighs 460 pounds, and

is valued at 5000 crowns. Another piece, somewhat
 less, is valued at more than 3000; both being so rich,
 that they are reckoned to contain at least three parts
 silver. They are composed of a whitish stone, the
 cracks or cavities whereof seem to be filled with pure
 virgin silver, which, in some places, lies in broad flat
 plates, and in others like pieces of fine silver lace.
 But what is most admired in these pieces of ore, are
 the threads, or branches of silver, which shoot out an
 inch or two beyond the surface of the stone, appear-
 ing in the form of small shrubs or bushes. Several
 other rarities of this kind are to be seen among the
 silver ores preserved in this museum. Here are also
 several large pieces of amber, some weighing 40 or 50
 ounces; which, upon opening the ditches about Cop-
 penhagen, when they fortified the city, were found
 sticking to the sides of old trees that were buried there,
 like the gum on the plum-trees in our gardens.

In the same chamber are a great many large branches
 of white and red coral, and one of black; likewise a pair
 of stag's horns growing out of a piece of wood in a sur-
 prising manner. Here is a human thigh bone three
 feet three inches long; and two very large scollop-
 shells, holding about three gallons each, and weighing
 224 pounds apiece. These were brought from the
 East-Indies; and, it is said, the fish they belong to is
 of such strength, that if a man happens to get his arm
 or leg between the shells when they open, it claps them
 together so forcibly as to cut the limb clear off.

In this collection a piece of marble is preserved,
 which the Lutherans reckon a very valuable curiosity,
 the natural veins of the stone running in such a manner
 as to represent the exact figure of a crucifix. Some,
 indeed, have suspected the representation to have been
 by art; but, upon the nicest examination, it appears
 to be entirely the work of nature.

Among the artificial curiosities there is a skeleton
 made of ivory, two feet six inches high, in imitation
 of a human one; and it is so nicely formed and put to-
 gether, that it may be easily taken for a natural one.
 There are likewise two crucifixes of ivory, and the
 whole history of our Saviour's passion, beautifully ex-
 pressed in a piece of carved work. A small man of
 war in ivory, with silver guns, is a curiosity much ad-
 mired; as is also a watch made of ivory, with all its
 wheels and movements. Besides these, there are many
 other curiosities in ivory, ebony, box, amber, and other
 materials, which are kept for the sake of their elegant
 workmanship. There is likewise a common cherry-
 stone, on the surface of which are engraved 220 heads,
 but their smallness makes them appear imperfect and
 confused.

In this royal repository are six golden sepulchral
 urns, which were found in the island of Fuen in 1685,
 by a peasant, as he was ploughing his land, and con-
 tained each of them some ashes of a greyish colour.
 The largest of them weighs two ounces and a half,
 and the others two ounces and a dram. They are ex-
 tremely

tremely thin, and each has three rings of gold about its neck, with several circles carved upon the outside of the urn, having one common centre. This discovery confirms the accounts given by various writers, that it was an ancient custom among the northern nations to burn their dead, and then bury their collected ashes in golden urns. There is another sepulchral urn of crystal, of a conical figure, which has also a golden ring about it, and was found near Bergen in Norway.

There are likewise in this collection several vessels of different sizes, some of glass, and others of earth, which are called lachrymal urns, or lachrymatories, being used by the ancient Romans to catch the tears of weeping friends, which were afterwards mixed with the ashes of the deceased.

We shall close our account of this celebrated museum with a description of the Danish and Oldenburg horns, two curiosities which are greatly admired. The Danish horn is of pure gold, weighs an hundred and two ounces and a half, is two feet nine inches long, and holds about two quarts of wine measure. This horn was, accidentally, discovered in the year 1699, by a country girl, in the diocese of Ripen, in Jutland, and is undoubtedly a piece of great antiquity, by the figures carved on the outsides, which seem to be hieroglyphics, &c. It is likely that some of these figures were designed to represent their deities; and the horn was probably used in sacrifices, as among the ancient Assyrians, and other nations, who upon such solemnities, made a great noise with horns and trumpets, and used them to drink out of at their solemn entertainments.—The Oldenburg horn is of pure silver, gilt with gold, weighs about four pounds, and is curiously enamelled with green and purple colours. The Danish antiquaries relate many fabulous stories of this horn, which are not worth repeating; and as to what they say of its being given to Otho, earl of Oldenburg, in the year 982, it is plain it cannot be of that date, for the figures and characters on the outside are modern; which, however, with the enamelling, and other ornaments, are of excellent workmanship, and make it a very fine and valuable curiosity.

An ingenious traveller, in his description of the palace of Rosenburg, in this island, says, it was constructed by our famous Inigo Jones, and stands in the middle of a large garden. It is small, and at present very little used by the king, or royal family. There is an air of antiquity in all the apartments, tapestry, and furniture, which is not displeasing, and impresses with respect. The grand sala, or dining-room in particular, is in this style. The hangings, which are not ill-executed, represent the various actions by sea and land, which diversified the ancient laws between the Swedes and Danes, who seem always to have had the same rivalry and animosity which the French and English are distinguished for, and which, it is probable, they will ever, in some degree, retain. At one end of this

grand apartment are three silver lions as large as life, who seem, by the ferocity and rudeness of their appearance, designed to characterize the age and nation, in which they were cast. Here are several cabinets full of curious rarities, which the various sovereigns of Denmark have successively collected and left to posterity. Many of them are intrinsically valuable, others only preserved from some event or accident connected with them. Among the first is a figure on which Christian IV. made a sort of triumphant entry into Copenhagen. It is covered with diamonds, and other precious stones; and the figure is of stones enriched with jewels. The coat worn by the king, and a light helmet on the same occasion are likewise covered with pearls. They preserve likewise a handkerchief, of this prince, dyed with his blood from a wound which he received by a ball, that deprived him of an eye. The man who accompanied us shewed me, with exultation in his countenance, a sword of Charles XII. of Sweden. It is just such a sword as such a monarch would be supposed to have used, and would well become a meanest soldier. It, indeed, evinces his strength and vigorous frame of body, by its size and weight; the blade is at least four feet long, and both the hilt and garde are entirely composed of brass.

The gardens of this place constitute one of the chief diversions of this city, as they are always open and on festivals or Sundays, crowded with company. They are large, but not laid out with taste, or adorned with any productions of art, one statue only excepted, of Hercules vanquishing the Nemean lion, which stands under a portico, raised to defend it from the inclemency of the weather. This is of Italian workmanship; and the artist has found means to display great anatomical skill and beauty in the attitude and muscles of the hero, who, by an extraordinary exertion of strength, forces open, and breaks the jaw of his adversary.

The other principal buildings of Copenhagen are the king's muse, or stables, the orphan-house, the opera-house, the military school, the royal library, which contains above 40,000 printed books and manuscripts, in various languages, and the university. With respect to the latter, it must be observed, that prior to the reign of Christian I. (who was one of the best kings that ever ruled the Danes, and indeed may be deemed the Alfred of Denmark) the Danish nobility and gentry, for want of proper seminaries of learning in their own country, were under the necessity of sending their children to the French and German universities; and colleges for education. To remedy this great inconvenience Christian applied to, and obtained leave of, the pope, to establish a public seminary of learning in his own dominions, when the university of Copenhagen was accordingly founded in the year 1475. But neither the successors of this wise and patriotic monarch, or even the clergy, have

It is observed, that who was one of the Danes, and indeed mark) the Danish proper feminaries were under the protection of the French and for education. The Christian applied to establish a public mission, when the singly founded in professors of this wise the clergy, have recorded

his laudable endeavours with a proper degree of spirit; for a very intelligent gentleman, who recently visited this city, says,
 There are several hundreds of students in the university of Copenhagen who were entered upon the institutions which were made by former kings, when all the necessaries of life were very cheap, and their young men could live decently upon what was allowed them; but now, as all these necessaries are become much dearer, and as few of those students have any private fortune, many of them are in the greatest misery. I have met with several young men in the university, which might make a considerable figure in the world; but since the new nobility bear the sway here, ignorance and indifference, as coming the nearest to their own character, are rewarded; whilst real merit, modesty, and decency, are treated with the greatest contempt. Some time since, the king had a French comedy established at Copenhagen, to the sight of which every decent person was admitted gratis: but I was really astonished to see one or four young men of genius refused admittance to this comedy because they were students in the university, though they were very decently dressed, and were solicited to be admitted into the galleries; while the other places were filled with valets de chambre, and others of that class. No class of people are held in more contempt, in this country, than the students of the university. What encouragement, then, have men of genius to study and cultivate the sciences?
 Elsinour is situated about 20 miles north of Copenhagen, on a neck or strait of the sea, called the Sound, and surrounded by walls. The castle of Cronenburg, which defends Elsinour, and the castle of Cronenburg, on the opposite shore, command the commerce of the Baltic; for between these two forts all vessels that trade into that sea must pass; so that this strait is most frequented of any in Europe, that of Gibraltar excepted. The castle of Cronenburg was built by Frederick II. of free-stone, brought from Gothland. Every ship that passes this strait must make sail at Cronenburg, and come to the town to compound for the custom; under the penalty of forcing the vessel and cargo. Elsinour was surrounded with walls under the reign of Christian IV. and peopled not only with Danes, but also with citizens from several nations. The city suffered very much when Charles Gustavus, king of Sweden, besieged Cronenburg in 1658. It was taken by him, but restored to the Danes by the treaty of Copenhagen in 1660. This was the native place of the celebrated John Isaac Pontanus, though his parents were of Haerlam in Holland. He was doctor of physic, professor in the university of Hardewyck, and historiographer to the king of Denmark, and the province of Gelderland.
 Cronenburg castle is 4 or 500 paces distant from Elsinour, on the spot where stood formerly the fortrefs of Orekrange. It is built upon oaken-piles, fastened

with hewn stones; and so solid, that it supports the fury of the tide, which sometimes beats against it most violently, without damaging it in the least. It makes a large square court, and was adorned with fine statues; the apartments also being very splendid. The pipes of the cistern, which supplied the garrison with water, and the locks of the doors, were all of fine silver, before it was plundered by the Swedes. It has four little towers at each corner, covered with copper: but the castle, with the chapel, steeple, and ornaments of it, are all going to decay. It has a ditch towards the sea, surrounded with another ditch; and the land side is secured by five bastions, and a half bastion. They have five cannons upon them; but the bastion that secures the passage of the Sound has but two cannons, 96 pounders each; and 11 more of smaller size. The rampart is vaulted with free-stone. Frederick II. who built this castle, spent none but his own money in the building of it; and declared, that if he knew there was one single stone in it that cost his people a farthing, he would have it removed. The unfortunate queen Caroline Matilda was confined in this castle.

There is a little hunting-seat, or palace, about a quarter of a mile from Elsinour, to which the king resorts, for a few hours, in summer. There is nothing worthy of observation in the structure itself; but from the roof the prospect is enchanting, as it commands the town of Elsinour, the castle of Cronenburg, the Sound, and the coast of Sweden, for a considerable way.

Opposite Elsinour, lies the island of HURN, or Ween, remarkable only for the castle of Uraniburg, built by the famous Tycho Brahe. King Frederick II. had given him that island for his life, that he might build an observatory there, with other buildings proper for his purpose. The king gave him also a pension of 2000 golden crowns, a considerable fief in Norway, and a prebend in the church of Roschild. This island was perfectly well suited to Tycho Brahe's design; for it is properly a hill, which rises in the middle of the sea, the top of which is flat and smooth, and commands a prospect all over the coast of Schonen, and the neighbouring country, affording thus a very extensive horizon. Add to this, that the sky is here generally clear, there seldom arising any fogs. Tycho Brahe laid, towards the middle of the island, the foundation of his castle, which he named Uraniburg, that is to say, the Town of Heaven; and finished it in four years time. From the disposition and convenience of the apartments, together with the engines and instruments for observations it contained, it was looked upon as a building that had not its equal in the world. In the neighbourhood of it were lodgings for workmen of all kinds, maintained at the expence of the master; a printing-house, a paper-mill, forges for making of instruments, laboratories for chymical experiments, &c. Four years after he built, in the

South part of the island, another house, which he called Stelburg, that is, Starburg; there he kept several instruments, and lodged some students and servants, who applied themselves to some particular study. But Uraniburg is now gone to decay; and the island of Huen belongs now to the Swedes.

The chair in which Tycho Brahe used to sit, to make his astronomical observations, is still preserved in the royal museum, and held, by the Danes, in the highest veneration. "Thus," says a judicious traveller, in a letter to a friend, "it ever happens! I need not remind you that the astronomer himself was driven from his native country by faction and malevolence; or that he died at Prague, in the court, and under the protection, of the emperor Rodolphus, who sheltered this illustrious fugitive, and afforded him an asylum."

Frederickburg is a small town, twenty miles distant from Copenhagen to the north-west, and eighteen from Ellineur to the south-west. It is considerable only by the stately castle and royal palace which stands near it. That castle was formerly but a small feat belonging to a private gentleman. King Frederick II. being charmed with its situation, bought it of him, and began to enlarge it. His son, Christian IV. finished it. This is the Versailles of Denmark. The house is built on piles in a lake. The body of the castle consists of a very fair front, with two great wings. The chapel is well adorned, and covered with gilt copper. It has twelve silver statues of the apostles; and all the locks, bolts, &c. were silver, till it was plundered by the Swedes. The hall is adorned with paintings, and has the pictures of several of the kings of Denmark, and of the royal family, as large as the life; and a frame of paintings, which represent the sea and land battles of the kings of Denmark. It is hung with rich tapestry of molair, representing the actions and battles of Christian IV. There is a gallery which leads from the castle to the hall of audience, adorned with pictures, most of which were bought in Italy. Here is a park about nine miles long, of a proportionable breadth, and interspersed with pools and fish ponds, with a mixture of green plots, hillocks, and small vallies. It was stocked with fallow-deer from England. There is a pretty flower garden behind the castle, in the very lake; in which, though it is exceeding deep, they have built a kind of terrace on piles that cost an hundred thousand crowns.

The town of Roschild, or Roskild, lies at the bottom of the bay of Iseford, and is eighteen miles distant from Copenhagen to the west. It was formerly the capital of Denmark, when the king resided there; but since they have chosen Copenhagen for their residence, it has dwindled greatly in point of importance, and is much decayed with respect to wealth and commerce. Of twenty-seven churches, which formerly embellished this town, only two are now standing. It continues, however, to be the burial-place of the royal family.

Among the monuments of the Danish sovereignty, of which are extremely magnificent, stands a beautiful marble pillar, erected by queen Margaret, as a monument to the whetstone sent her by Albert, king of Sweden, to sharpen her needles, in derision to her sex. But it testified her resentment in such a manner, that he suffered severely for his sarcasm; for he was taken prisoner by queen, detained seven years in custody, and obliged to relinquish all his pretensions to the crown of Sweden.

Here is a convent of Lutheran nuns belonging to the best families; but they are not obliged to wear particular habit, or to be restricted by the vows in convents; but are permitted, if they think proper, to quit the convent, and marry. In 1698 the famous treaty of peace was here concluded between Denmark and Sweden. The university is in a declining condition; and, indeed, the whole town exhibits evident marks of poverty and decay.

Sora is situated on the banks of a lake, about the centre of Zealand, was formerly the seat of a great abbey, and has many pleasant fields and forests near it. To this place the academy of Frederickburg was moved, and the foundations of the university were augmented by Christian IV. Charles Gustavus, king of Sweden, was educated here, and retained in veneration for the place, that when he invaded Zealand, he would not suffer his soldiers to enter the town. But the revenues of this seminary have been annexed to the crown of Denmark, and the whole is gone to decay. Absalom, archbishop of Lunden, once founded here an establishment for the maintenance of the who should write the history of Denmark; and to the foundation we owe the history written by the celebrated Saxo Grammaticus.

FUNEN is the next island to that of Zealand, in point of scale of importance, among the several parts which form the Danish kingdom. It is bounded by the Greater Belt on the east, by the Lesser Belt on the west, by the Baltic on the south, and by a little channel, which separates it from the island of Samsø, on the north. It is about 36 miles from east to west, and 30 from north to south. The country is fertile and agreeable, being finely diversified with verdant hill-side woods, pleasant groves, fruitful fields, rich pastures, &c. The soil is good, well cultivated, and affords a great deal of grain, not only for home consumption, but exportation. Great quantities of black cattle, horses, hogs, &c. are bred here. This island is an appendage to the eldest sons of the kings of Denmark, and is deemed one of the richest governments belonging to that sovereignty. It contains some fortified towns, and 264 villages; but the most considerable places, and the only ones, indeed, worthy of description, are the following:

Odense,

Odense, the capital of Funen, and is a spacious town, where the kings once met before the sovereign absolute was dedicated to St. Canute near a century ago. It is situated near a copper mine, and a copper coffin, &c. The most particular notice is, that it has beer in the whole of Denmark. On the narrower part of Zealand, between the narrow trade, the harbour is fertile. The country is fertile. The city is thoroughly repaired. Zealand are made at the town of Schweneborg is an excellent harbour, situated on the coast. From hence the trade began his march to Zealand, Zealand, the small town of Zealand, a little gulf on the coast of the island of Zealand, distant from Schweneborg, in the duchy of Schleswig, is about 11 miles distant. In the year 1535 the town was founded by John Rantzow, archbishop of Funen, and was named after him, and was called this town with the name of the Lesser Belt, he is 17 miles distant from Zealand, and as many from the coast. It is a small, but nevertheless, with all the necessaries of life, and a safe passage from this island. It is not being broadened towards the east. On the coast of Funen, Gustavus, king of Sweden, came to this place, rode to the sea, and was killed here, and was buried in the island of Funen.

FALSTER lies to the north-east of Zealand, and is separated from Zealand on the north-east. It is fertile. Its soil is fertile. It is distant from hence to Germany. It is distant from the south, or Sydnø.

Danish sovereign, the king's lands a beautiful island, as a gift to her sex. But it is known, that he suffered as taken prisoner by the Danes, and obliged to her crown.

nuns belonging to the island, are obliged to wear a white habit, if they think proper. In 1678 the island was concluded between the university is in a state of decay.

of a lake, about 10 miles long, and the seat of a noble family, and forests near the city.

Fredericksborg was the seat of the university, which Charles Gustavus, king of Sweden, retained such when he invaded Zealand. Several of the nobles have been annexed to the whole is good land, once found in the maintenance of the island; and to the Danes; and to the Danes; and to the Danes.

of Zealand, in several parts which is bounded by the Lesser Belt on the east, and by a little channel on the west, and the country is fertile, and with verdant hills, and fertile fields, rich pastures well cultivated, and only for home consumption quantities of black. This island is the seat of the kings of Denmark, the richest government in the world, but the most fertile, indeed, worthy of

Odenfee,

Odenfee, the capital of the island, stands about its western coast, and is a capacious, well-built, pleasant town, where the kings once resided, and the assembly of the nobles met before the crown became hereditary, and the sovereign absolute. In a church here, which is dedicated to St. Canute, the body of that prince was deposited near a century and a half ago. It was deposited in a copper coffin, gilt, and adorned with precious stones. The most particular circumstance relative to this town, at present, is, that the inhabitants brew the beer in the whole kingdom.

On the narrower part of the Greater Belt, between Funen and Zealand, lies Nyburg. This place has a good trade, the harbour is good, and the adjacent country is fertile. The damages done to the fortifications in the late wars with Sweden, are not yet thoroughly repaired. Embarkations for the island of Zealand are made at this town.

Schwenborg is an agreeable town, with a commodious harbour, situate on the south-east part of the island. From hence Charles Gustavus, in the year 1658, began his march, over the ice, to the islands of Langeland, Zealand, and Falster.

The small town of Woburg, or Foburg, is situate on a little gulf on the southern coast of Funen, over-against the island of Arroe, and is about 10 miles distant from Schwenborg to the west.

In the duchy of Sleswick, on the south-west coast of this island, over-against Haderleben, lies Affens. It is about 11 miles distant from Odenfee to the south. In the year 1535 the army of king Christian III. commanded by John Rantzaw, routed that commanded by Christopher, earl of Oldenburg, and killed Gustavus Troll, archbishop of Upsal. Rantzaw afterwards levelled this town with the ground.

On the western shore of the island, lies Middlefar, or the Lesser Belt, hence also called Middlefar-Sound. It is 17 miles distant from Affens to the north-west, and as many from Odenfee towards the south-west. It is a small, but neat town, in a country abounding with all the necessaries of life. It is the common passage from this island to Colding in Jutland; the Lesser Belt not being broader here than the Thames is at Gravesend. On the 13th of January 1658, Charles Gustavus, king of Sweden, led his army over the ice to this place, routed the Danish forces that opposed him, and made himself master of the whole island of Funen.

Falster lies to the north-east of Laland, from which it is separated by a narrow strait. This island lies between Zealand on the north, and the island of Moon on the north-east. It is 20 miles in length, and eight in breadth. Its soil is very fruitful; and much corn is sent from hence to Mecklenburg, and other parts of Germany. It is divided into two bailiwicks; that of the south, or Synder-Herrit; and that of the north,

or Norre-Herrit. It has several towns; among which the chief are Nycoping, on the western coast of the island, of which it is the capital. It is one of the most pleasant and well-built towns in the whole kingdom, and styled, by Dr. Heylin, the Naples of Denmark. It has a strong castle, and a well frequented harbour. Stubcoping, in Latin, Stubcopia, seated on the north coast, is a place of some trade, being the usual passage from Zealand into Germany.

ARROE is situated near the coast of Funen, being eight miles in length, and two in breadth. It is extremely fruitful in corn, and abounds in aniseed, with which the inhabitants give a flavour to their bread, and season their meat. In this island are plenty of horses and black cattle; and some woods, in which are abundance of hares. The whole island has but three parishes, the most considerable of which is Kopin, or Kioping. The town belonging to it stands on the southernmost part of the island, and bears the same name as the parish. It has a trade on account of its port, and is situated at the bottom of the bay.

LALAND is situated on the eastward of Langeland, and to the southward of Zealand, from which it is separated by a narrow strait, called Grone Sound. From its lowness, or flatness, it has the appellation of Laland, or Lowland. It is near 40 miles in length, and about 20 in breadth, where widest. The soil is very fertile; so that Copenhagen is supplied from hence with great quantities of corn, besides what the Dutch traders are furnished with for exportation. This island is divided into five districts, or bailiwicks, the seat of a governor, and has several small islands subject to its jurisdiction. It contains various pleasant little villages and hamlets, and a few seats belonging to the noblesse, exclusive of four towns, Nascow, Saxcoping, Levenscoping, and Nysted.

Nascow, or Naxkow, the capital, is 59 miles south-west from Copenhagen, and has a commodious harbour for trade. The fishery is of some consequence, and the circumjacent country is rich in meadow and pasture lands.

MOON lies to the south-east of Zealand, and to the north-east of Falster. It is about 20 miles long, eight broad, and full of high chalky hills. Here is some pasture ground, but very little corn-land. It was formerly part of the Danish admiral's allowance; as being the first place for him to reside in. There are in this island several villages, large parishes, and a considerable city, called Stege, or Siekoe, which lies on the north of the island, on a little rivulet, that a mile lower falls into the strait called Grone Sound.

ants; but it has suffered prodigiously at several times
fatal inundations. In the year 1300 the little city
Rungholt, with several churches and villages, were
rried away by the waves, which drowned also great
umbers of people, as well as cattle.

In 1532 there arose such a violent storm here, that
most the whole island was overflowed; when 1600,
according to others, 1900 persons perished in the
ater. The next year another storm damaged the
akes very much. From 1612 to 1618, there hap
ped every year such inundations, as occasioned pro
igious losses, and put the inhabitants to very great
opence; and particularly in 1615, when 300 persons
erished in the waves. They were afterwards free for
ome years, and had time to repair their banks and
kes; but all their care and precautions proved in
ectual against the storm that happened October the
th, 1634. At ten of the clock at night the whole
land lay under water, above 6000 persons were
rowned, and, of all the inhabitants, there were
rdly 1500 that saved their lives. The churches,
hich stood on the rising grounds, held out the storm
eared, but fell down afterwards; and 28 windmills
ere carried away by the waves. The loss of cattle
f all forts was reckoned to amount to 50,000 heads;
nd the dykes were broke in 44 different places. The
hole island continued thus overflowed, except a small
oot of ground which stood high, than the rest. Since
at time the inhabitants have laboured, with the
ssistance of some Dutchmen, to regain part of the
nd they had lost.

4. AMRON, or Amroen, is a small island to the north-
est of Northstrand, from which it is about seven
iles distant. It is in the form of a crescent, and is
ly considerable for its oyster fishery.

5. FORA, or Foehr, lies towards the north-east of
Amron, and nearer the coast of Sleswick, between
Northstrand and Sylt. It belongs to the prefectorship
of Tunder, and is of an oval figure, about six miles
length, and four in breadth. It abounds in cattle
and corn, has about 4200 inhabitants, and several
villages. The inhabitants still preserve the language,
manners, and drefs of the ancient Frisons, though
ome of them speak the dialect of Lower Saxony.

Denmark is extremely well situated for commerce;
her harbours are well calculated for the reception
of ships of all burthens, and her mariners are very
expert in the navigation of the different parts of the
cean. The dominions of his Danish majesty furnish
a great variety of timber, and other materials for
ship-building; and there are many productions for
exportation in some of his provinces. Besides fir, and
other timber, here are black cattle, horses, butter,
back-fish, tallow, hides, furs, train-oil, tar, pitch,
and iron, which being the natural product of the
country, are properly denominated exports; these ena-
ble Denmark to carry on a very profitable trade with
France, Spain, and the Mediterranean; but the ex-

portation of oats is prohibited. Salt, wine, brandy,
and silk from France, Portugal, and Italy, are the
imports. The Danes have lately had a great inter-
course with England, from whence they import
broad-cloths, clocks, cabinet and lock-work, hard-
ware, &c.

But the commercial spirit of the Danes appears in
a very favourable light, when we consider their settle-
ments in the East and West-Indies. A company for
carrying on the former was established at Copen-
hagen in the year 1612, under the protection of Chris-
tian IV. About four years after the establishment,
four large ships sailed for the East-Indies; and the
Danes made a settlement at Tranquebar on the coast
of Coromandel. Here they built a fort, which is
reckoned the strongest in the Indies. This colony
soon increased from the encouragement given by the
Danes to the Indians, who, finding themselves pro-
tected in their privileges, and permitted to carry on
their trade without oppression, resorted to Tranquebar
in such numbers, that the commerce soon became
very valuable, and the company received a yearly
tribute of 10,000 rix-dollars. But not content with
this increasing establishment, the Danes attempted,
in the year 1620, to make a settlement on the island
of Ceylon, in order to acquire the spice-trade, then
monopolized by the Portuguese.—This scheme, how-
ever, failed in the attempt, and the Danes having em-
broiled themselves with the Indian princes on the con-
tinent, their settlement at Tranquebar must have been
taken by the rajah of Tanjour, had not Mr. Pitt, an
English East-India governor, generously sent them
assistance.

After the death of Charles XII. of Sweden, when
the wars in Europe were ended, the Danish East-
India company found themselves so much in debt,
that they published proposals for a new subscription
for enlarging their ancient capital stock, and for fitting
out ships to Tranquebar, Bengal, and China. The
capital was considerably enlarged for these purposes by
a spirited subscription, which alarmed France and the
maritime powers. The Dutch raised a process against
the projects of Van Asperin, who, being a subject of
the States, was condemned and executed in effigy.
Every objection that could be started against the ac-
complishing of the scheme, was published in the
newspapers of Paris, London, and Amsterdam, with
a view to discourage people from engaging in the
commerce. The ministers of Great-Britain and Hol-
land, who resided at the court of Denmark, were
ordered to make remonstrances to his Danish majesty
against this new charter, which they apprehended
would interfere with the East-India trade of their
subjects. The king prudently answered, that he was
not restricted by any treaty whatever from supporting
and extending the traffick of his subjects by every
means in his power, provided he did not infringe the
laws of nature and nations, which he had no in-

ention to violate. After great difficulties the company was established, their commerce extended, and they now carry on an advantageous trade to China, and the coast of Coromandel. Their credit is extensive; their funds are considerable; their warehouses, magazines, yards, and docks in complete order; and they send annually two or three ships richly laden to the East-Indies.

Besides the trade to the East-Indies, the Danes have extended their commerce to the West-Indies, where they possess the islands of St. Thomas and St. Croix, and the small island of St. John, which are free ports, and celebrated for smuggling; also the fort of Christianburg on the coast of Guinea, and to Greenland. Within a short period of time, the Danish merchants have opened new channels of trade, particularly with the Mediterranean; the number of ships has been doubled, and the revenues of the kingdom increased in proportion.

Denmark is not famous for its antiquities, if we except the royal Museum at Copenhagen, which consists of a very numerous collection of them. Besides artificial skeletons, curious carving in ivory, models, clock-work, and a beautiful cabinet of ivory and ebony made by a Dutch artist who was blind, here are a great variety of astronomical, optical, and mathematical instruments, which are placed in the round tower at Copenhagen, so contrived that a coach may drive to its top: a set of medals ancient and modern; and two famous antique drinking vessels, one of gold, and the other of silver, and both in the form of a hunting horn. That of gold seems to be of Pagan manufacture, and from the raised hieroglyphical figures on its outside, it was probably made use of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two English pints and a half, and was found in the diocese of Rippen, in the year 1739. The other, of silver, weighs about four pounds, and is termed *Cornu Oldenburzicum*; which, they say, was presented to Otho I. duke of Oldenburg, by a ghost. Some, however, are of opinion that this vessel was made by order of Christian I. king of Denmark, the first of the Oldenburg race, who reigned in 1448. See before, p. 480.

The constitution of Denmark was heretofore of the free Gothic original. The convention of the states, even including the representatives of the boors or peasants, elected a king for his personal virtues, having a due regard to the son of their late monarch, whom, however, they made no scruple of setting aside, if they deemed him unworthy of the royal dignity. They enacted laws, conferred the great offices of state, debated all affairs relative to commerce, peace, war, and alliances; and occasionally gave their consent to the imposition of necessary taxes. The king was in reality no other than chief magistrate, generalissimo, and, as it were, prime minister to his people. His business was to see justice administered impar-

tially; to command the army in time of war; to encourage industry, religion, arts and sciences, and watch over the interests of his subjects. He had public revenue from the state, but lived like a private nobleman from the produce of his own lands and demesnes. Such was the constitution of Denmark till the year 1660, when it underwent a very extraordinary revolution.

At the conclusion of the peace with Sweden, the nation resounded with the clamour of misery and content. There was nothing left in the public treasury to pay off and disband the army, which therefore became insolent and licentious. The common people, and even the burghers, were exhausted by the expensive war: the clergy were unsatisfied with their condition and want of importance, and the nobles were become proud and tyrannical. When the estates assembled to deliberate and redress the grievances of the nation, the commons proposed that an equal should be laid upon all persons without distinction in proportion to their circumstances. The nobles pleaded their privilege of being exempted from imposition. The burghers alleged, that as the nobility engrossed all the lands and riches in the kingdom, it was reasonable they should bear their share of the common burthen; in consequence of this, violent disputes ensued. At length a nobleman, named O. Craeg, stood up, and in a transport of passion told the commons, that they neither understood the privilege of the nobility, who were always exempted from impositions, nor the condition of themselves, who were no other than their slaves. This inglorious reproach produced an immediate ferment in the assembly, the hall resounded with murmurs and altercations. Nansen, speaker of the commons, starting up in a rage of indignation, swore that the nobility should repent their having branded the commons with an opprobrious epithet. He had previously concerted the design with the bishop of Copenhagen, and the court was not ignorant of their intention. The clergy and burghers breaking up in disorder, marched under the auspices of these leaders to Brewer's-Hall, where after much debate, they agreed to make a solemn tender of their freedom and services to the king, lest he might become absolute monarch of the realm, and see the right of hereditary succession established in his family. Next morning they marched in couples, each burgher being paired with a clergyman, through the streets, which were filled with the populace, who shouted as they passed to the council-hall, where the nobles had re-assembled. There Nansen, in a short harangue, signified the intention of the clergy and commons, demanded the concurrence of the nobles, and threatened that, in case of a refusal, they would forthwith proceed without them to the palace. The nobles, confounded and abashed, endeavoured to purchase time: they professed a desire of concurring with the other states, but desired that an affair of such impor-

consequence might not be precipitated. The others, being deaf to their remonstrances and entreaties, conducted their procession to the palace, where they were met by the prime minister, who conducted them to the hall of audience. There the bishop of Copenhagen, in a florid speech, as deputy from the two orders, made a solemn tender to the king of an absolute and hereditary dominion; assuring his majesty, that he might command their purses and arms, to support a measure so necessary to the welfare of his people. He received them graciously, assented to the proposal, thanked them for their zeal and confidence, and assured them they might depend upon his royal favour and protection. The city gates were immediately shut, that none of the senators should escape, and the nobles were so greatly intimidated, that they immediately signified their readiness to concur with the step which the other two orders had taken. Preparations were forthwith made for this strange inauguration. Scaffolds were erected in the open space before the castle, and the nobles and burghers received orders to appear in arms, under their respective officers. On the sixteenth day of October, in the year 1660, the king, queen, and royal family, ascended an open theatre, and placing themselves on chairs of state, under canopies of velvet, received in public the homage of all the senators, nobility, clergy, and commons, couched in an oath of allegiance composed for the purpose. Thus the people, with a rash and desperate hand, from motives of revenge, fomented by an artful ministry and ambitious clergy, resigned their liberty and independence, and invested their sovereign with a despotic power over their lives and fortunes.

Soon after this extraordinary revolution took place, the king of Denmark divested the nobility of many of the privileges which they had before enjoyed; though he took no method to relieve or reward those poor people by whose means he was invested with the sovereign power, but left them in the same state of slavery in which they were before, and in which they have remained to the present age.

When the revolution in the reign of Frederic III. had been effected, the king re-united in his person the rights of the sovereign power; but as he could not exercise all by himself, he was obliged to intrust some part of the executive power to his subjects. The supreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace at Copenhagen, of which the king is the nominal president. The German provinces have likewise their supreme tribunal; which for the duchy of Holstein is holden at Glückstadt, and for the duchy of Sleswick in the town of Sleswick.

The king for the most part decides matters of importance in his council, the members of which are named and displaced at his will. In this council the laws are proposed, discussed, and receive the royal

authority; here likewise great changes or establishments are proposed, and approved or rejected by the king; and in the council, or in the cabinet, he grants privileges, and decides upon the explication of laws, their extension, or their restriction, and upon the most important affairs of the kingdom, according to his sovereign will and pleasure.

The kings of Denmark not only preside nominally in the sovereign court of justice, but they have a throne erected in it, towards which the lawyers always address their discourses in pleading, and the judges the same in giving their opinion. The king is present every year at the opening of this court, and often gives the judges such instructions as he thinks proper. The decision of those judges is final in all civil actions; but no criminal sentence of a capital nature can be carried into execution till it is signed by the king. There are three courts in Denmark, and an appeal in extraordinary cases lies from the inferior to the superior tribunal. As every man is permitted to plead his own cause, a trial is attended with very little expence; nor can any suit be suspended longer than 18 months.

In Denmark, the judges are punishable for any misdemeanors they may be guilty of, and there are many excellent regulations for the due administration of justice; but notwithstanding this, it is so far from being distributed in an equal and impartial manner, that a poor man can scarcely ever obtain justice in this country against one of the nobility, or against one who is favoured by the court or by the chief minister. If the laws are so clearly in favour of the former, that the judges are ashamed to decide against them, the latter, through his influence with the minister, procures an order from the king to stop all the law-proceedings, or a dispensation from observing particular laws; and thus every rule of equity being perverted and set aside, the lower class of subjects are aggrieved and injured without any possibility of redress.

The code of laws at present established in Denmark was published by Christian V. founded upon the code of Valdemar, and all the other codes which have been since published, and is nearly the same with that published in Norway. These laws are contained in a quarto volume, drawn up in the language of the country, in so plain and perspicuous a manner, and founded upon such unerring principles of justice, that the most ignorant may understand, and every impartial person approve of them; and, if carried into execution in an equitable manner, would be productive of many beneficial effects to the people. But as the king can change, alter, and dispense with the laws as he pleases, and support his ministers in their disregard and violation of them, the people of Denmark undergo a great degree of tyranny and oppression, and have abundant reason to regret the tameness and servility with which they surrendered; their

their liberties, and thereby established absolute monarchy.

The police is very strict in Denmark, hence highway robberies, burglaries, coining, clipping, &c. are crimes scarce ever heard of; and to speak against the government is so strongly prohibited, that none dare wag their tongues licentiously in political matters. The common method of execution here is beheading and hanging: in some cases, as an aggravation of the punishment, the hand is chopped off before the other part of the sentence is executed. The other principal modes of punishment are branding in the face, whipping, condemnation to the rasp-house, to houses of correction, and to public labour, and imprisonment. The public executioner, though universally despised, is commonly rich, as he is not only well paid to deprive malefactors of life, but is the general contractor to empty all the privies, and remove from houses, stables, streets, &c. all kinds of filth, and, in particular, dead cats, dogs, &c. which no other Dane will touch upon any account whatever.

The revenues of Denmark arise from crown lands, taxes, and duties, and these are extremely heavy. Wine, salt, tobacco, and provisions of all kinds are taxed. Marriages (a most impolitic tax!) paper, corporations, land, houses, and poll money, also raise a considerable sum. The expences of fortifications are borne by the people; and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The tolls paid by strangers arise chiefly from the passage of their ships through the Sound into the Baltic. The income of this toll is at present much less than formerly. About the year 1640, it produced 240,000 rix-dollars per annum; but since 1645 it has not yielded above 190,000; some years not above 80,000; in 1691, it did not extend to full 70,000, and is now much less. This tax has more than once thrown the northern parts of Europe into a flame; having been disputed by the English, Dutch, and Swedes, who deemed it arbitrary and unjust, being originally only a voluntary contribution of the merchants towards the expence of light-houses on the coast; but it was at length, by the treaty of 1720, between Sweden and Denmark, agreed to be paid by the former and other powers. The toll is paid at Elfsneur.

The whole revenue of Denmark, including what is received at Elfsneur, amounts at present to above 5,000,000 of rix-dollars, or 1,002,000l. sterling yearly. By a list of the revenue taken in 1730, it then amounted only to 454,700l. English money, which is less than half the sum it now produces.

The military force of Denmark consists in its regular troops, militia, and navy. The greatest part of the regular troops are foreigners, particularly Germans. The cavalry and dragoons are well mounted, and consist of eleven regiments; and each regiment in four squadrons, including the body guards. Three of these

regiments are quartered in Zealand, one in Funen, three in Jutland, and four in Holstein. The infantry is composed of sixteen regiments; of which two are duty as the king's guards. When the regiments are complete, each consists of two battalions, and each battalion contains six companies of 100 each. The artillery consists of three regiments, one of which is stationed in Denmark, another in Norway, and third in Holstein. The body of engineers is divided into three parts, each of which comprises two officers of various ranks.

Since the late reduction of the Danish forces, the numbers are, 10,000 cavalry and dragoons, and 30,000 infantry and artillery, which, with the militia, make up a body of 70,000 men. Every person who cultivates or possesses 360 acres of land, is obliged to find one man for the militia, and pay half the expence of a man towards a corps-de-reserve, to be embodied and called out only upon great emergencies. They receive no pay, but are registered on the annual list, and exercised every Sunday.

Though the Danish army is extremely burdensome to the nation, yet it costs little to the crown: great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peasantry are obliged to maintain the cavalry victuals and lodging, and even to furnish them with money.

The present fleet of Denmark is composed of thirty-six ships of the line, and eighteen frigates; but many of the ships being old, and wanting great repairs, they can send out twenty-five ships upon the greatest emergency, this is thought the most they can do. This fleet is generally stationed at Copenhagen, where are the dock-yards, store-houses, and all the material necessary for the use of the marine. They have 26,000 registered seamen, who cannot quit the kingdom without leave, nor serve on board a merchantman without permission from the Admiralty; 4000 of these are kept in constant pay, and employed in the dock-yards; their pay, however, scarcely amounts to nine shillings a month, but then they have provision and lodgings allowed for themselves and families, and a sort of blue uniform, faced with different colours.

The Danish men of war carry the same complement of men, in proportion to their guns, as the French ships of war do; but they are much inferior in point of construction, both to English and French ships of war; and, indeed, are far from being equal to the Swedish ships.

The three last kings of Denmark, notwithstanding the degeneracy of their subjects in martial affairs, were very respectable princes, by the number and discipline of their troops. Frederic IV. established a marine academy for fifty young cadets, to be trained up to a thorough knowledge of naval affairs, and to be perfectly taught navigation, gunnery, drawing, fencing, history, geography, geometry, &c. and

to join practice to

order to join practice to theory, they were annually to make a voyage in a frigate, and successively to perform the services of common seamen, pilots, and officers. But this noble institution is now totally neglected, and the money appointed to support it is sunk into venal pockets; so that except a few officers, who have been bred in the English and French services, the Danes would have a great difficulty, in case of a rupture with any naval power, to find proper persons to command their ships of war.

To the court belong two ancient orders of knighthood, viz. that of the elephant, and that of Daneburgh. The badge of the former, which is the most honourable, is an elephant surmounted with a castle with diamonds, and suspended to a sky-coloured ribbon, worn like the George in England. This order was instituted by Christian I. at his son's wedding; it is conferred only on persons of the highest quality; and the number of companions amount to 30 besides the sovereign. The order of Daneburgh, though less honourable, is much more ancient; so that the origin of it is lost in fable: it is bestowed, as an honorary reward, upon the noblesse of inferior rank, its insignia being a white ribbon with red edges, worn over the left shoulder, from which depends a small diamond cross and an embroidered star on the breast of the coat, surrounded with the motto PIETATE ET JUSTITIA, piety and justice.

A COMPENDIOUS HISTORY OF DENMARK, NORWAY, &c.

VERY little is known of the early periods of the Danish history. Even the name of the first Christian king of Denmark is uncertain; and those of the people whom they commanded were so blended together, that it is impossible for the reader to conceive a precise idea of the old Scandinavian history. All that we can discover relative to the inhabitants of these kingdoms is, that they appear to have been colonies of the ancient Scythians, who spread themselves through all the northern and western parts of Europe. In the 4th century, the Saxons, a name under which the Danes, Norwegians, and other nations of the North were comprehended, committed dreadful ravages on the coasts of Britain and Gaul, and obliged the Romans to station their forces along the coasts, under the command of an officer called Comes Littoris Saxonicæ. Their ravages, like their manners, were cruel and inhuman; their tracks were marked with blood and desolation; and neither age, innocence, nor religion could afford protection from the swords of those barbarians. They formed settlements on the coasts of Normandy, Ireland, and Scotland; and in the year 1012 made a conquest of England.

Few very interesting events in Denmark preceded the year 1387, when Margaret II. ascended the throne. That princess married Aquin, king of Norway, by which the two kingdoms became united. Aquin died soon after; but Margaret, partly by address, and partly by the right she had obtained by her marriage, formed a treaty, anno 1397, by which she was acknowledged sovereign of Denmark, Norway, and Sweden. This treaty is generally known by the name of the union of Calmar. Margaret, whose soul was formed for greatness, swayed the sceptre of these kingdoms with honour to herself, and advantage to her country. Her friendship was courted by most of the European powers, so that historians have justly styled her the Semiramis of the North. But, like all other sublimary greatness, it was fleeting and transient. The successors of Margaret were far inferior to her in abilities; and the union of Calmar was soon destroyed. The Swedes rebelled, and placed Gustavus Vasa on the throne of his ancestors. Norway, however, still continued united to Denmark, nor has there been any rebellion in that kingdom since the union.

In the year 1448, the crown of Denmark passed to Christian, count of Oldenburgh, from whom the present royal family is descended. In 1513, Christian II. one of the most complete tyrants that modern times have produced, mounted the throne of Denmark; and having married the sister of the emperor Charles V. he gave a full proof of his innate cruelty. Being driven out of Sweden for the bloody massacres he committed there, the Danes rebelled against him likewise; and he fled, with his wife and children, into the Netherlands. Frederic, duke of Holstein, was unanimously called to the throne, on the deposition of his cruel nephew: he openly embraced the opinions of Luther; and about the year 1536, the protestant religion was established by that wife and politic prince, Christian III. He was opposed in the Reformation by his bishops, and therefore seized on the lands and revenues of the church, annexing them to his own.

Christian IV. of Denmark, though very brave in his own person, wanted the abilities proper for the command of an army. He was chosen head of the protestant league formed in 1629, against the house of Austria; but was foiled in every attempt, and even in danger of losing his own dominions; when he was succeeded in the command of the army by the celebrated Gustavus Adolphus, king of Sweden, under whose command the protestant forces acquired immortal honour.

Frederic III. who succeeded his father Christian IV. in 1648, declared war against the Swedes, at the instigation of the Dutch. This precipitate conduct had nearly proved fatal to Denmark. Charles took the fortress of Frederickstadt by storm; and in the succeeding winter, 1658, marched his army over the ice to the island of Funen, where he surprisèd the

Danish forces, made himself master of Odensee and Nyburg, and, pursuing his victories, marched over the Great Belt, and besieged Copenhagen itself. Frederic, however, defended his capital with the greatest resolution; and Cromwell, who then governed England under the title of Protector, interposing, the peace of Roschild was concluded, by which Frederic ceded the provinces of Halland, Bleking, and Scania, the island of Bornholm, and Bahus and Drontheim in Norway. Frederic was very desirous of eluding these severe terms, and postponed the surrender of the places stipulated in the treaty so long, that Charles put his army in motion, made himself master of Cronenburg, and once more invested Copenhagen by sea and land. Frederic bore these misfortunes with such a heroic firmness and confidence, as endeared him to his subjects. Charles made several attacks upon the city, but was always repulsed with considerable loss, and there seemed no other way of reducing it but by famine. In the mean time a strong Dutch fleet arrived in the Baltic, and soon defeated and dispersed the Swedish ships which blocked up Copenhagen by sea. Animated by this assistance, the Danes exerted all their power, and Charles was obliged to raise the siege. The fortune of war was now entirely changed in favour of Frederic, who was actually making preparations for invading the territories of the enemy: but before he was ready to carry his plan into execution, an English fleet arrived, and the Dutch were obliged to retire. Charles was now enabled to renew the siege of the capital; but by the mediation of France and England, a peace was concluded at Copenhagen, by which Charles agreed to restore the island of Bornholm; and Frederic to cede the islands of Rugen, Bleking, Halland, and Schonen, to the Swedes.

The magnanimous behaviour of Frederic, during this destructive war, so endeared him to his subjects, that on the nobles refusing to subject their estates to the payment of an equal tax proposed by the commons to be levied on all persons whatever, they made the king a tender of their liberties, and the government of Denmark became arbitrary in the manner we have already mentioned.

Christian V. who ascended the throne of Denmark in 1670, was at first very successful in his war against the Swedes; he recovered several places in Schonen, that had been wrested from him, and obliged the duke of Holstein Gottorp to renounce all the advantages he had acquired by the treaty of Roschild: While he was pursuing his victories with amazing success, fortune forsook his standard, and his army was totally defeated in the bloody battle of Lunden, by Charles XI. Christian, however, determined to persevere, notwithstanding the dreadful misfortune he had suffered. He raised a new army, and led his forces once more against the enemy. But he had lost the veteran part of his forces, and his troops, new to the field, and

almost strangers to military discipline, were totally defeated at the decisive battle of Landscroon. Christian was now in no condition of facing the enemy, his allies having abandoned a cause which they considered as desperate, he was obliged, in 1679, to sign a treaty of peace on the terms prescribed by France. The love of glory, however, would not suffer Christian to abandon his military projects; and being incapable of carrying on the operations of war unassisted, he became a subsidiary ally to Lewis XIV. who threatened Europe with slavery. This treaty with French monarch enabled him to pursue the scheme he had formed against Holstein, Hamburg, and other northern powers; but before any thing of importance could be effected, Christian, after a vast variety of treating and fighting with the Hollanders, Hamburgers, and other northern powers, ended his reign in the year 1699.

Frederic IV. ascended the throne on the death of his father, and, like his predecessors, maintained pretensions to the duchy of Holstein. He laid siege to Tonningen, and would probably have taken the place, had not the English and Dutch fleets forced him to abandon the enterprize. In the mean time Charles XII. of Sweden, then only sixteen years of age, landed in Zealand within eight miles of Copenhagen, in order to make a diversion in favour of his brother-in-law, the duke of Holstein. Charles prosecuted the war with that rapidity which constituted his character, and would, in all probability, have taken the capital of Denmark, had not his Danish majesty agreed to the peace of Travendahl, which was granted in the duke's favour. By another treaty, concluded with the States-General, Charles obliged himself to furnish a body of troops, who were to be paid by the confederates; and afterwards did great service against the French in the war between the allies and Louis XIV.

This, however, did not prevent Frederic from being continually engaged in disputes with the Swedes; and taking the advantage of the misfortunes of Charles, he made a descent on Swedish Pomerania, and laid siege upon Bremen, and took the city of Stadt. But his troops were totally defeated at Gadesbusch, by Charles Swedes, who laid his favourite city of Altena in ashes. Frederic had however soon after an opportunity of revenging the affront he had received. He made himself master of great part of Holstein, and obliged count Steinbock, the Swedish general, to surrender himself prisoner, with all his troops. He pursued his victories with such success, that in the year 1716 his allies began to suspect that he intended to usurp the crown of all Scandinavia. Charles now returned from his exile, and carried on the war with great vigour and a most embittered spirit against Frederic; but being killed at the siege of Fredericks-hall, his Britannic majesty offered his mediation for a peace, which Frederic durst not refuse. Accordingly a treaty was concluded

Stockholm, by which Frederic obtained the duchy of Sleswick. He died in 1730, leaving the crown to his son Christian Frederic, or Christian VI. who made no other use of his power, than that of cultivating peace with all his neighbours, and in promoting the happiness of his subjects. He abolished a grievous monopoly established by his father, relating to the sale of wine, brandy, and tobacco. He terminated the old dispute between the crown of Denmark and the city of Hamburg, by which he obtained several valuable concessions in favour of his people, besides a million of marks of silver. He instituted a council of trade, to examine all proposals for the extension and encouragement of commerce: he invited artists and workmen from foreign countries, and established manufactures at his own expence: he maintained a respectable fleet and army; and that these might not be burdensome to his subjects, he, from time to time, concluded subsidiary treaties with foreign powers, by which his finances were always in a flourishing condition. In a word, he acted on all occasions with equal prudence and discretion, as a great king, a wise politician, and a prince who had always at heart the interests of his people. He died in 1746, much regretted by his subjects.

Frederic V. son and successor of Christian VI. improved upon his father's plan, for the happiness of his people: but took no active part in the German war, being only a mediator between the contending powers; and by his intervention the treaty of Closter-seven was concluded between his Royal Highness William, late Duke of Cumberland, and the French general Richelieu. He married the princess Louisa, daughter to his Britannic Majesty George II. by whom he had a son, his present Danish Majesty: he afterwards, on the death of his first queen, married a daughter of the Duke of Brunswick-Wolfenbattel. He died in 1766, and was succeeded by his son,

Christian VII. the present king of Denmark and Norway, L.L.D. and F.R.S. who was born Jan. 17, 1749; married, in 1766, to the princess Caroline-Matilda, youngest sister of his present Britannic Majesty; and has issue Frederic, prince royal of Denmark, born Jan. 28, 1768; and Louisa-Augusta, born July 7, 1771. The reign of this young monarch opened auspiciously; but was afterwards darkened by a fatal event, that occasioned much astonishment to all Europe, and which is partly attributed to the intrigues of the queen-dowager, mother-in-law to the present king, who has a son named Frederic, and whom she is represented as desirous of raising to the throne. She possesses a great deal of dissimulation; and when the princess Caroline-Matilda came to Copenhagen, she received her with all the appearance of friendship and affection, acquainting her with all the king's faults, and at the same time telling her, that she would take every opportunity, as a mother, to assist her in reclaiming him. By this conduct, she became the young

queen's confidante, whilst at the same time, it is said, she placed people about the young king, to keep him constantly engaged in all kinds of riot or debauchery, to which she knew he was naturally too much addicted: and it was at length so ordered that a mistress was thrown in the king's way, whom he was persuaded to keep in his palace.

When the king was upon his travels, the queen-dowager used frequently to visit the young queen Matilda; and, under the mark of friendship and affection, told her often of the debaucheries and excesses which the king had fallen into in Holland, England, and France, and often persuaded her not to live with him. But as soon as the king returned, the queen reproaching him with his conduct, though in a gentle manner, his mother-in-law immediately took his part, and endeavoured to persuade the king to give no ear to her counsels, as it was presumption in a queen of Denmark to direct the king.

Queen Matilda now began to discover the designs of the queen-dowager, and afterwards lived upon very good terms with the king, who for his sake was much reclaimed. The young queen also now assumed to herself the part which the queen-dowager had been complimented with, in the management of public affairs. This stung the old queen to the quick; her thoughts were now entirely occupied with schemes of revenge, "and who is able to stand before envy?" But her views of this kind appeared the more difficult to carry into execution, because the king had displaced several of her friends who were about the court, who had been increasing the national debt in times of profound peace, and who were rioting on the spoils of the public. However, she at length found means to gratify her revenge in a very ample manner. We shall give the particulars of this unfortunate affair in the words of an intelligent gentleman, who made very minute inquiries concerning it, of the most cool and dispassionate Danes, and wrote this narrative in the city of Copenhagen.

"I have," says this gentleman, "made it my endeavour, since my arrival here, to gain the most authentic and unprejudiced intelligence respecting the late celebrated, and unhappy favourite count Struensee, and the late extraordinary revolution which expelled a queen from her throne and kingdom, and brought the ministers to the scaffold. Struensee had not any noble blood in his veins, nor, consequently, any hereditary and prescriptive title to the immediate guidance of affairs of state. Fortune, and a train of peculiar circumstances coinciding with his own talents and address, seem to have drawn him from his native mediocrity of condition, and placed him in an elevated rank. He originally practised physic at Altena, on the Elbe, and afterwards attended the present king of Denmark, on his travels into England, in quality of physician. On his return he advanced, by rapid strides, in the royal favour; and seems to have eminently possessed

possessed the powers of pleasing, since he became equally the favourite of both king and queen. He was invested with the order of St. Matilda, instituted in honour of her majesty, created a count, and possessed unlimited ministerial power; his conduct, in this sudden and uncommon eminence, marks a bold and daring mind, perhaps I might add, an expanded and patriotic heart. Unawed by the precarious tenure of courtly greatness, and more peculiarly of his own, he began a general reform. The state felt him through all her members; the finances, chancery, army, navy, nobles, peasants, all were sensible of his influence. He not only dictated, but penned his replies to every important question or dispatch; and a petition, or a scheme of public import and utility, rarely waited two hours for an answer. At present, I am told, you may be two months without receiving any.

The civil judicature of this capital was then vested in 30 magistrates. Struensee sent a message to this tribunal, demanding to know the annual salary or pension annexed to each member. Rather alarmed at this inquiry, they sent an answer, in which they diminished their emoluments near two-thirds, and estimated them at 1500, instead of 4000 rix-dollars. The count then informed them, that his majesty had no further occasion for their services; but, in his royal munificence and liberality, was graciously pleased to continue to them the third part of their avowed incomes as a proof of his satisfaction with their conduct. He, at the same time, constituted another court composed only of six persons of integrity, to whom the same power was delegated. He proceeded to purge the chancery and other bodies of the law. Then entering on the military department, he, at one stroke, broke all the horse-guards, and afterwards the regiment of Norwegian foot-guards, the finest corps in the service, and who were not disbanded without a short, but very dangerous sedition. Still proceeding in this salutary, but most critical and perilous achievement, he ultimately began to attempt a diminution of the nobles, and to set the farmers and peasants at perfect liberty: no wonder that he fell a victim to such measures; and that all parties joined in his destruction. These were his real crimes, and not that he was too acceptable to the queen, which only formed a pretext. It was the minister, and not the man, who had become obnoxious. I do not pretend, in the latter capacity, either to excuse, or condemn him; but, as a politician, I rank him with the Clarendons and Mores, whom tyranny, or public business, and want of virtue, have brought, in almost every age, to an untimely and ignominious exit, but to whose memory impartial posterity have done ample justice. Yet I must avow, that though I cannot think Struensee made a bad use, yet he certainly made a violent and imprudent one of his extensive power. He seems, if one may judge by his actions, to have been intoxicated with royal favour, and such accumulated honours; and not to have

adverted sufficiently to the examples which history furnishes of Wolsseys in former days, and of Choiseul in modern times, who most strikingly evince the necessary foundation of political grandeur. When he was even pressed, only a short time before his seizure, to withdraw from court and pass the Belts, with the most ample security for his annual remittance of four hundred, or even an hundred thousand dollars, an unhappy fascination detained him, in defiance of every warning, and reserved him for the prison and block. The queen-dowager and prince Frederic were only the feeble instruments to produce this catastrophe, as being, by their rank, immediately about the person of the sovereign, though common report has tallied loudly of the former's intrigue, and attributed it to her imaginary abilities. The only mark of capacity or address, they exhibited, was in preserving a secret which deluded Struensee, and the queen Matilda, at the time of their being arrested. I have been assured that on the last levee-day preceding this event, the count was habited with uncommon magnificence, and never received greater homage, or court servility, from the crowd, than when on the verge of ruin. On the night fixed for his seizure, there was a bal paré, masked ball, in the palace. The queen, after dancing as usual, one country dance with the king, gave her hand to Struensee during the rest of the evening. She retired about two in the morning, and was followed by him and count Brandt. The moment was now come; the queen-dowager, and her son prince Frederic, hastened to the king's private chamber, where he was already in bed. They knelt down beside him, and implored him, with tears and expostulations, to save himself and Denmark from impending destruction, by arresting those whom they called the authors of it. It is said the king was not easily induced to sign the order, but did it with reluctance and hesitation. At length their entreaties prevailed, and he affixed his sign manual to the paper. Colonel Koller Banner instantly repaired to Struensee's apartment, which, as well as Brandt's, was in the palace; they were both seized at nearly the same instant, and as all defence was vain, hurried away immediately to the citadel. When count Struensee stepped out of the coach, he said, with a smile, to the commandant, "I believe you are not a little surprised at seeing me brought here as a prisoner." "No, and please your excellence, replied the old officer bluntly, I am not at all surprised, but, on the contrary, have long expected you." It was five o'clock in the morning when count Rantzaw came to the door of her majesty's ante-chamber, and knocked for admittance. One of the women about the queen's person was ordered to wake her, and give her information that she was arrested: they then put her into one of the king's coaches, drove her down to Ellsneur, and lodged her up in the castle of Cronenburg.—Mean while they dreaded an insurrection in Copenhagen; every

military

ular precaution was taken to prevent it; the most
 and silly reports were circulated among the
 to render the state prisoners odious: that they
 put poison into the king's coffee to destroy him;
 they intended to declare him incapable of govern-
 to send the dowager-queen Juliana out of the
 to claim Matilda regent. To confirm these extraordi-
 and contradictory reports, the king himself, and
 brother, appeared in a state coach, and paraded
 the streets of the city, to shew himself unhurt,
 if escaped from the most horrid conspiracy. Du-
 these transactions, Struensee and Brandt were de-
 in the most rigorous imprisonment. They loaded
 former with very heavy chains about his arms and
 and he was at the same time fixed to the wall by
 iron bar. I have seen the room, and can assure you
 is not above 10 or 12 feet square, with a little bed
 and a miserable iron stove; yet here, in this abode
 misery, did he, though chained, complete, with a
 an account of his life and conduct, as mi-
 which is penned, as I have been assured, with
 common genius."

After this, the government seemed to be entirely
 in the hands of the queen-dowager and her son,
 and assisted by those who had the principal
 in the revolution; while the king appeared to be
 more than a pageant, whose person and name it
 was necessary occasionally to make use of. All the of-
 ficers who had been instrumental in the revolution were
 immediately promoted, and an almost total change took
 place in all the departments of administration. A new
 council was appointed, in which prince Frederic pre-
 sided, and a commission of eight members, to examine
 the papers of the prisoners, and to commence a process
 against them. The son of queen Matilda, the prince
 royal, who was entered into the fifth year of his age,
 was put into the care of a lady of quality, who was ap-
 pointed governess, under the superintendency of the
 queen-dowager.

The two counts were beheaded on the 28th of April
 1772, having their right hands previously cut off; and
 their skulls and bones are yet exposed on wheels, about
 a mile and a half from the metropolis. Many of their
 friends and adherents, eighteen of whom had been im-
 prisoned, were set at liberty. Struensee at first had ab-
 solutely denied having any criminal intercourse with
 the queen, but this he afterwards confessed; and though
 he is said by some to have been induced to do this only
 by the fear of torture, the proofs of his guilt in this re-
 spect were esteemed notorious, and his confessions full
 and explicit. Besides, no measures were adopted by the
 court of Great-Britain for clearing up the queen's char-
 acter in this respect.

In the following May, his Britannic Majesty sent a
 small Squadron of ships to convey the unfortunate prin-
 cess to Germany, and appointed the city of Zell, in his
 electoral dominions, for the place of her future residence.

She died there, of a malignant fever, on May 10, 1775,
 aged 29 years and 10 months. In 1780, his Danish
 Majesty acceded to the armed neutrality proposed by
 the empress of Russia. He appears at present to have
 such a debility of understanding, as to disqualify him
 for the proper management of public affairs.

On the 16th of April 1784, another revolution took
 place in Denmark. The queen-dowager's friends were
 removed, a new council formed under the auspices of
 the prince royal, some of the former old members re-
 stored to the cabinet, and no regard is to be paid for the
 future to any instrument, unless signed by the king, and
 countersigned by his royal highness prince Frederic,
 his son, heir apparent to the throne of Denmark.

CHAP. V.

L A P L A N D.

*Extent, Boundaries, Divisions, Subdivisions, Climate, Soil,
 Mountains, Rivers, Forests, Vegetables, Animal and
 Mineral Productions, &c.*

THIS country is divided into six provinces, viz. 1.
 Angermanland-Lapmark; 2. Uma-Lapmark; 3.
 Pitha-Lapmark; 4. Lula-Lapmark; 5. Torno-Lap-
 mark; and 6. Kima-Lapmark.

The first of these provinces is the most southern, and
 contains only one town of any consequence, which is
 called Aofalko, and situated about 300 miles distant
 from Stockholm.

The second province, which adjoins to the former,
 contains two little villages, viz. Loifby and Semisjorfe.

The third province, which is situated between the
 Norwegian mountains, contains four unimportant vil-
 lages, viz. Sitonia, Arieplogs, Locketari, and Arivit-
 zerfs.

The fourth province, which adjoins to the latter,
 contains three little villages, viz. Jackmoth, Torpajour,
 and Sirkestucht.

The fifth province, which is the most northern of
 Swedish Lapland, is well watered by many rivers, has
 several lakes, and contains four towns, viz. Tingavara,
 Sandewara, Ronnala, and Titifara.

The sixth province, which is contiguous to Russian
 and Danish Lapland, is likewise well watered; it con-
 tains the great lake Enure, and has six towns, viz. Soin-
 by, Kalajerfui, Kitijsfulye, Kimibi, Solden-Kyte, and
 Kimi.

The known part of Lapland extends from the North
 Cape, in 71 deg. 30 min. north lat. to the White
 Sea, under the arctic circle. Part of it belongs to the
 Danes, and is included in the government of Ward-
 huys; part to the Swedes, which is by far the most va-
 luable; and some parts in the East, to the Muscovites
 or Russians, and are situated between the lake Eparak
 and the White Sea, being divided into three distinct

prefectures, viz. that of the sea-coast towards the north, called Mourmankoi Leporic, Jerthoi Leporic, and Bel-lamofekoi Leporic. But as the most considerable and best-peopled division of this country belongs to the Swedes, we shall therefore begin with a description of it.

Swedish Lapland is bounded on the east by Russian Lapland; on the west by a ridge of mountains that separate it from Norway; on the north by Danish Lapland; and on the south by Bothnia, Angermania, and Septerland. Its greatest extent, from east to west, is about 360 miles; in breadth it extends from 65 deg. 33 min. to 69 deg. of north latitude. It is divided into six provinces, or districts, the names of which, as above noticed, are the following; viz. Angermanland-Lapmark, Uma-Lapmark, Pitha-Lapmark, Lula-Lapmark, Tornio-Lapmark, and Kima-Lapmark.

Each of these provinces receives its name from the chief river that waters it; they are again subdivided into smaller districts called biars, and these contain a certain number of families, called by the Swedes reckars. Every reckar, or family, is allowed a considerable tract of land, with forests, lakes, and brooks, for the maintenance of their families and cattle; but their lands are not enclosed, so that the property of one is often converted to the use of others.

In general, Lapland is situated so near the pole, that the sun neither sets in summer, or rises in winter. In the latter season, the cold is so intense, that none of the natives are able to bear it. The most rapid rivers are then frozen up, and the ice is two or three, and sometimes four or five feet thick. In summer the weather is as sultry as it is cold in winter; for autumn and spring are unknown in this climate. The excessive heat, however, is qualified by the vapours that rise from the sea, and by the snow that continues all the summer on the tops of the mountains, and in ditches that are sheltered from the sun. It seldom rains in the summer, but the whole country is covered with snow in winter.

M. Maupertuis, who, with several other astronomers, was sent hither by order of the king of France, to discover the figure of the earth at the polar circle, has given the best description of the climate of this country. "In December, says he, the snow continually falling, or ready to fall, for the most part hid the sun the few moments he might have appeared at mid-day. In the month of January the cold was increased to that extremity, that M. Reaumur's mercurial thermometer, which, at Paris, in the great frost of 1709, it was thought strange to see fall to fourteen degrees below the freezing point, was now got down to thirty-seven. The spirits of wine in the others was frozen. If we opened the door of a warm room, the external air instantly converted all the vapour in it into snow, whirling it round in white vortices. If we went abroad, we felt as if the air was tearing our breasts in pieces; and the cracking of the wood, of which the houses are built, as if split by

the violence of the frost, continually alarmed us with increase of cold. In this country you may often see people who have lost an arm or a leg by the frost. The cold, which is always very great, sometimes increases to such violent and sudden degrees, as are almost insupportable to those who are so unhappy as to be exposed to it; and sometimes there rise sudden tempests of ice that are still more dangerous.

The winds seem to blow from all quarters at once, and drive about the snow with such fury, that all the roads are in a moment rendered invisible. Dreadful the situation of a person surpris'd in the fields by such a storm: his knowledge of the country, and even the mark he may have taken by the trees, cannot avail him; he is blinded by the snow, and, if he attempts to find his way home, is generally lost. In thurt, during the winter, the cold was so excessive, that on the 7th of April, at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing; though every afternoon it rose two or three divisions above it; a difference in the height not much less than that which the greatest heat and cold felt at Paris usually produce in that instrument. Thus in 24 hours we had all the variety felt in the temperate zones in the compass of a whole year."

But though in winter the nights are very cold, long, and tedious, yet those inconveniences are, in some degree, obviated by the serenity of the sky, the brightness of the moon and stars, and the resplendent light of the aurora borealis, which is reflected from the white surface of the earth covered with snow; from all which such light is produced, that the inhabitants are enabled to discharge their ordinary occupations. The above winter, in speaking of these nocturnal lights, says, "The days are no sooner closed than fires of a thousand figures and colours light up the sky, as if designed to compensate for the absence of the sun. These fires have here, as in more southern climates, any constant situation. Though a luminous arch is often seen fixed towards the north, they seem more frequently to possess the whole extent of the hemisphere. Sometimes they begin in the form of a great scarf of bright light, which its extremities upon the horizon, which, with a motion resembling that of a fishing-net, glides softly up the sky preserving, in this motion, a direction nearly perpendicular to the meridian; and most commonly after this prelude, all the lights unite at the zenith, and form the top of a crown. Arcs, like those seen in France towards the north, are here frequently situated towards the south, and often towards both the north and south at once. Their summits approach each other; the distance of the extremities widens towards the horizon. I have seen some of the opposite arcs, whose summits almost joined at the zenith; and both the one and the other have frequently several concentric arcs beyond it. Their tops are all placed in the direction of the meridian, though with a little declination to the west; which I did not find to be constant, and which is sometimes insensible

would be endless to mention all the different figures
 meteors represent, and the various motions with
 which they are agitated. Their motion is most com-
 monly like that of a pair of colours waved in the air,
 and the different tints of their lights give them the ap-
 pearance of so many vast streamers of changeable taste-
 fulness. Sometimes they line a part of the sky with scarlet.
 On the eighteenth of December I saw a phenomenon
 of this kind, that, in the midst of all the wonders to
 which I was now every day accustomed, raised my ad-
 miration. To the south a great space of the sky appeared
 tinged with so lively a red, that the whole constellation
 Orion looked as if it had been dipped in blood. This
 light, which was at first fixed, soon moved, and chang-
 ed into other colours, violet and blue, settled into a
 zone, whose top flood a little to the south-west of the
 zenith. The moon shone bright, but did not in the least
 dim it. In this country, where there are lights of so
 many different colours, I never saw but two that were
 common. After all, when people gaze at these pheno-
 mena with an unphilosophic eye, it is not surprising if
 they discover in them the appearance of armies engaged,
 fiery chariots, and a thousand other prodigies."

For the most part, the soil of this country is exceed-
 ingly bad, being so intermixed with stones, that hardly
 anything will grow in it; but in some places it is very
 fertile, owing to the number of marshes and brooks
 with which it abounds. The whole country is also full
 of rocks and mountains. Those called the Dofrine
 mountains, which separate Lapland from Norway, are
 of a prodigious height; and the high winds that blow
 here prevent all trees from taking root. Beneath these
 mountains are large marshes and extensive forests, where
 there are many trees, though they stand at a great dis-
 tance from each other. At the bottom of the hills are
 pleasant vallies, which are the most fertile parts of the
 country, being well watered by a great number of brooks
 and springs.

Many of the rivers rise from the mountains of Nor-
 way, and fall into the Bothnian Gulph. The chief of
 these are the Uma, Lula, Rima, and Torna. The Uma
 is greatly increased by the waters that flow into it from
 the rivers Vendilor and Skialfre. The Lula and Rima
 are both very considerable, and are swelled, in their
 course, by a great number of lesser ones. The torna
 receives 20 rivers, one of which is a Swedish mile in
 breadth. When the snow melts, all these rivers over-
 flow their banks; and the chief part of them have stu-
 pendous cataracts. Besides the rivers, here are also
 many lakes, which abound with various kinds of fish,
 as well as the rivers.

There are a great number of trees in the forests of Lap-
 land, among which are the birch, pine, and fir. Some
 parts of it also produce the service-tree, willow, pop-
 lar, elder, and the cornel. They have several sorts of
 plants; but the most useful are the angelica and sorrel,
 which are greatly esteemed by the natives, who use

them in their food. They have likewise different kinds
 of grass, heath, and fern; but the most plentiful, as well
 as most useful vegetable, is the moschus, or moss, of
 which there are several species, either adhering to trees,
 or growing on the surface of the earth. The rein-deer
 is almost wholly sustained by this vegetable, which, in-
 deed, he prefers to all others, and without which he
 cannot subsist. The natives not only use it as forage for
 their cattle, but boil it in broth as a cordial and restora-
 tive. Here are also great quantities of berries, such as
 black currants; the Norwegian mulberry, which grows
 upon a creeping plant, and is much esteemed as an anti-
 scorbutic; raspberries, cranberries, and bilberries. Jun-
 niper-berries are also very plentiful, and some of the
 trees grow to a considerable height.

Among the animals of this country are stags, bears,
 wolves, foxes of several colours, squirrels, ermines,
 martens, hares, glittens, beavers, otters, elks, and rein-
 deer; but the last of these is the most useful to the na-
 tives, who, without them, could not possibly preserve
 their existence; for these animals not only afford them
 food and garments, but also supply the place of horses,
 and travel in those parts where the latter animals could
 be entirely useless. The rein-deer is a kind of stag,
 with large branched horns, the tops of which bend for-
 ward like a bow. He is larger, stronger, and swifter
 than the stag, and his hair changes colour according to
 the season of the year. His hoofs are cloven and move-
 able, for which reason he spreads them abroad as he runs
 along the snow, to prevent his sinking into it. The
 horns are very high, and divided into two branches near
 the root. On each horn are three branches, one above
 another, which are again subdivided into smaller ones,
 insomuch that no horned beast whatever has the like,
 either for bulk, branches, or weight. The horns are of
 a light colour, and there are veins, or blood-vessels,
 running along them, under which there are furrows.
 When the beast runs he lays these horns upon his back;
 but there are two branches that always hang over his
 forehead, and almost cover his face. Most of these ani-
 mals are wild; but some of them are tame, and exceed-
 ing serviceable to the natives.

Those rein-deer which are produced between a tame
 doe and a wild buck are not only the largest, but by far
 the strongest. These animals are of infinite use to the
 Laplanders, for without subjecting them to the least
 expence, they supply them with almost every necessary
 of life. From these creatures they are furnished with
 milk and cheese, as also flesh, which they lay up for
 winter store. The skins afford caps, clothes, boots, shoes,
 bedding, thongs, and many other articles. The nerves
 and sinews are twisted into thread. Their bows and ar-
 rows are tipped with the bones, and their boxes inlaid
 with the horn, which is likewise formed into curious
 spoons, toys, and utensils. These creatures are likewise
 used as beasts of draught or burthen, and, far from de-
 manding any provision or provender, dig with their feet
 among the snow for the moss, which they prefer to
 every

every other kind of food. The dogs here are very small, not being above a foot in height. They turn up their tails, which are short; and their ears stand erect, like those of wolves. They are of a red colour, and in hunting are very serviceable.

In Lapland, the birds are swans, geese, ducks, lapwings, snipes, most sorts of water-fowl, heath-cocks, stock-doves, woodcocks, and partridges. Besides these, they have two kinds of fowl peculiar only to this country. The first is called the kniper, and is a kind of snipe, black on the head, back, and wings; but the breast and belly are white. It has a long red beak, set with teeth, and short red feet, resembling those of water-fowl. The other is called the loom, and is never seen on the ground, but either in the water, or flying. The partridges here are as white as snow, and, instead of feathers, their bodies are covered with a kind of wool. The rocks and mountains are frequented by eagles, hawks, falcons, kites, and birds of prey of various kinds.

The principal insects here are flies, which, in the summer, are hatched in the morasses and woods, and are frequently so numerous as to obscure the light of the day. They are venomous, and exceeding troublesome, inasmuch that the rein-deer fly to the tops of the mountains for shelter, and the inhabitants move to the sea-side, those parts being the least infested by these pestilent vermin. Monsieur Maupertuis says, that, while he was here, the flies were so troublesome, that even the Finland soldiers, who are counted the most hardy troops in the service of Sweden, were obliged to cover their faces with the skirts of their coats from the attacks of these animals, which swarmed to such a degree, that the moment a piece of flesh appeared, it was blackened all over. Some of these flies are very large, with green heads, and, where-ever they strike, draw blood from the skin.

In the rivers and lakes there is abundance of delicious salmon, which come from the Gulf of Bothnia; also trout, bream, and perch, all of which are of an amazing size, and exquisite flavour.

Mines of silver, lead, and copper, together with excellent veins of iron, are in some of the districts, but they are not at present worked to any considerable advantage, their situation being almost inaccessible. In the district of Tornio there is a vein of gold and silver mixed, another of lead and silver, and a third of copper; and here they have both copper works and a foundery. They have also furnaces in the province of Lula, where they melt the silver which they dig in that part of the country. These mines, however, are only worked for a short time in the summer, the climate being so severe for the principal part of the year, that the engines cannot work them.

Beautiful crystals of a prodigious size are found in the rivers and lakes; these are so hard and fine, that, when polished, they appear like real diamonds. Here are likewise a great variety of curious stones, some of which bear the resemblance of animals, trees, &c.

When the natives find these, they place them in a conspicuous place, and worship them as idols.

The generality of the Laplanders are remarkable for short stature, not being above four feet and a half, and some of them even under that size; the cause of which is attributed to the severity of climate, and the poorness of their living. They are in general, very disagreeably formed, having a large head, a broad forehead, hollow and beared eyes, a short and flat nose, and a broad face, with black, and rough hair. They have broad broad slender waists, and small legs; but they are stout, hardy, and active, inasmuch that they will bear incredible fatigue; and it is remarked, that the stoutest Norwegian is not able to bend the bow of a Laplander. The women, however, are much less hardy than the men; and the complexions of some of the women are delicate and florid.

With respect to their dispositions, they are very honest and hospitable; but so timorous, that they fly the moment they perceive a vessel at sea, or the least footsteps of a stranger. They are naturally haughty and passionate, and, when once provoked, not easily appeased. They indulge themselves in laziness to such a degree, that they neither plough or sow, nor leave their ground totally uncultivated; neither do they seek for provender either by hunting or fishing, till they are compelled to it from mere necessity. It hath been observed, that when they have been transported to more moderate climates, they have died, though in their own country they live to a great age. It is no uncommon thing to see a Laplander upwards of an hundred years of age, hunting, lowing, skating, and performing with the most astonishing agility the severest exercises.

The Lapland houses, or rather huts, are made of pieces of timber, or rafters, joined together, and covered with turf, or the branches of pine trees and coral cloths. Some of them are built upon trees to prevent the being overwhelmed with snow, and to secure them from the wild beasts. Their huts have two doors, the lesser of which no woman must enter, because from thence the men go to hunt; and should they meet the woman at going out, it would be considered as a bad omen. They have no other chimney than a hole at the top of their huts, which serves to let the smoke out, and the light in. Their stone houses are built in trees, to secure their provision from bears and other beasts of prey.

In summer their dress consists of a close garment reaching to the middle of the legs, and fastened round the waist with belts. They have not any linen, and their clothes are made of coarse wool, of a dark green colour. The richer sort have their clothes of various colours, but red is the most universally esteemed. At their girdles they hang a Norway knife and a pouch, the latter of which contains flints, matches, and tobacco, with other necessaries; the girdle itself being decorated

decorated with brass rings and chains. Their night-
caps are made of the skins of the bird-loom, with the
lashes on; and their shoes of the skins of rein-deer,
with the hair outwards. In winter they are totally
wrapped up in coats, caps, boots, and gloves, made of
the rein-deer's skin, with the hair inwards. The
women's apparel differs but little from that of the
men: they hang to their girdles many rings, chains,
knives, and knives, with a needle case, and other trifles.
Their thread is made of the sinews of rein-deer; and
in winter they lie in their skins. In summer they all
cover themselves at night with large pieces of coarse
cloth, to secure them from being stung by the gnats
and flies.

These people make all their own furniture, boats,
bows, and arrows. The boards with which
they make their boats are fastened together with
the nerves of rein-deer, or the small roots of
trees twisted together like ropes; and they calk them
with moss to keep out the water. They make boxes
of their birch planks, which they neatly inlay with
the horns of rein-deer; and they are very dexterous at
making baskets of the roots of trees, slit in long
pieces, and twisted together. Some of these are
made so neat that they will hold water; and the
Laplanders greatly admire them. These articles are made
by the men, who also perform the office of cook,
by dressing victuals for the family.

The women are employed as taylors and em-
broiderers; they make clothes, shoes, and boots, and
knives for the rein-deer: they spin thread with fur,
and knit it into caps and gloves, which are very soft
and warm: they likewise draw tin into wire through a
horn, and with this they cover their thread, which
they use, in embroidering on their caps and girdles
the figures of bealls, flowers, stars, and the like.

Those who inhabit the mountains live chiefly on
the flesh and milk of the rein-deer; the former of
which they dry, and from the latter they make great
quantities of cheese. Those who live in the low
country feed on venison and fish. They have neither
bread or salt; but instead thereof use the inner rind
of the pine-tree, dried and ground, and dried fish
reduced to powder. They make broth of fish and
beef boiled together; and their usual drink is water
beaten in a kettle, which in winter hangs continually
over the fire: but their greatest dainty is bear's flesh,
which they eat on all particular festivals. On these
occasions likewise they indulge themselves with brandy,
and never think themselves so happy as when they
can enjoy a pipe of tobacco. These commodities they
buy for purchase at Norway, as also a few cows
and sheep for the winter store. They make de-
coctions of berries, angelica, and sorrel, which they
are not only fond of, but also deem them excel-
lent preservatives against all disorders of a scorbutic
nature.

The Laplanders, besides their domestic business, em-

ploy themselves in hunting, in which excursions they
travel through the snow with astonishing expedition.
They wear a pair of skais, or snow shoes, which are
made of fir boards, covered with the rough skin of the
rein-deer: one of these is usually as long as the person
who wears it, but the other is about a foot shorter.
The feet are placed near the middle, and the shoes
are fastened to them with strings, or thongs made with
the sinews of the rein-deer. When the Laplander
travels in this manner he carries a long pole in his
hand, near the end of which is a round ball of wood;
and this not only secures him from penetrating too
deep into the snow, but also enables him to stop him-
self when there is occasion. A Laplander will travel
in his snow shoes at the rate of sixty miles a day
without being fatigued. But the most expeditious
method of travelling in this country is with a sledge
drawn by rein-deer. This carriage, which is called
by the natives pulkha, is made in the form of a small
boat, with a convex bottom, that it may slide the
more easily over the snow; the head of it is sharp
and pointed, but the hinder part is quite flat. The
traveller sits, or rather lays with his back against the
end of the sledge, and holds a stick in his hand, with
a large wooden ball at the end of it, with which he
disengages the sledge from such obstructions as he
may happen to meet with in the course of his journey.
He must likewise take care properly to balance the
carriage with his body, otherwise he will be subject
to be overturned. The traces, by which the sledge
is fastened to the rein-deer, are fixed to a collar about
the animal's neck, and run down over the breast,
between the fore and hind legs, to be connected with
the prow of the sledge; the reins are tied to the
horns, and the trappings are furnished with little bells,
the sound of which is very pleasing to the animal.
The rein-deer is so fleet that he will run with his
carriage upwards of 100 miles a day. Before a Lap-
lander sets out on his journey, he whispers in the
ear of the animal the way he is to go, and the place
at which he is to halt, from a persuasion that the beast
understands his meaning; but, in spite of this im-
itation, he frequently stops short, and sometimes
over-shoots the mark by several miles. Though this
method of travelling is exceedingly expeditious, yet
it is far from being easy, the person being continually
in a confined posture; neither is it exempted from the
most imminent danger, on account of the uncertainty
of the roads, and the drifts of loose snow, which, if
the wind blows high, are driven about with incredible
fury, and in prodigious quantities.

When the winter commences, the Laplander's mark
the most frequented roads by strewing them with fir-
boughs. Indeed, these roads are no other than path-
ways made through the snow by the rein-deer and
sledges: their being frequently covered with new snow,
and alternately beaten by the carriage, consolidates
them into a kind of causeway, which is the harder if

the surface has felt a partial thaw, and been crufted by a fubfequent froft. It requires great caution to follow thefe tracks; for if the carriage runs either on one fide or the other, the traveller is thrown into an abyfs of fnow. In lefs frequented parts, where there is no fuch beaten road, the Laplander directs his courfe by certain marks which he has made on the trees; but, notwithstanding all his caution, the rein-deer very often finks up to his horns in fnow; and fhould a hurricane arife, which is fometimes the cafe, the traveller would be in great danger of his life, were he not provided with a kind of tent, to fcreen him in fome meafure from the fury of the tempeft. But the rein-deer in winter is rather weak and difpirited, fo that he cannot travel with the fame alacrity as in fummer. In this feafon the traveller is obliged to halt at different times, that the animal may reft himfelf; and in thefe intervals be fed with a kind of cake made of mofs and fnow, which ferves him for drink and provender at the fame time.

The chief employment of the Laplanders, exclusive of their domeftic affairs, confifts in hunting and fifhing. Thofe who praftife the latter have fmall boats, fo lightly conftituted that they can carry them on their foulders, which they frequently do, when interrupted on the rivers by whirlpools or cataracts. The boats are of different fizes, from two to fix yards in length, managed with oars, and calked with mofs fo tight, as effectually to keep out the water. They fteer with amazing rapidity, even among the rocks, and down the moft rapid water falls; but when they go againft the ftream, and meet with a cataract, they take out their boat, and carry it on their foulders till they have paffed it, when they launch it again, and proceed on their way.

Such as employ themfelves in hunting, perform it various ways. In fummer, they hunt wild beafts with fmall dogs trained to the diverfion. In winter, they purfue them by their tracks upon the fnow; fcaiting with fuch velocity, that they frequently run down their prey. They catch ermines in traps, and fometimes with dogs. They kill fquirrels, martens, and fables, with blunt darts, to avoid injuring the fkins. Foxes and beavers are killed with fmall pointed darts and arrows, in fhooting of which they are accounted the beft markfmen in the world. The larger beafts, fuch as bears, wolves, elks, and wild rein-deer, they either kill with fire arms, or elfe enfnare by digging pits in places moftly reforted to by thefe creatures.

The Laplanders have particular laws relative to the chace, which they obferve with great punctuality. The beaft becomes the property of the man in whole fcare or pit he is caught; and he who difcovers a bear's den has the exclusive privilege of hunting him to death. The conqueft of a bear is the moft honourable achievement that a Laplander can perform; and the flefh of this animal they think more delicious than that of any other whatever. The bear is

always difpatched with a fufil, fometimes laid in a fcare, ready cocked and primed; but more frequently by the hands of the hunter, who, on miffing his aim, would run the moft imminent danger of his life.

Thefe people celebrate the killing a bear with great rejoicings. The carcafs is drawn to the cave or hut of the victor, by a rein-deer, which, on that account, is afterwards kept a whole year without doing any work. The bear is furrrounded by a great number of men, women, and children, who recite a particular fong of triumph, in which they thank the vanquifhed enemy for having allowed himfelf to be overcome, without doing any mifchief to his conqueror; after this they addrefs themfelves to Providence, acknowledging the fingular benefits they receive from his having created beafts for their ufe, and endowed them with ftrength and courage to attack and overcome them. The conqueror is faluted by the women, and is feafted by the men of the village for three fucceffive days; befides which, he is ever after diftinguifhed from the reft, by having his wroughit with tin ware round his cap.

Nuptial ceremonies among the Laplanders are remarkable and ludicrous. When a young man has made choice of a female, he employs fome friends or mediators with the girl's parents; and thefe being provided with fome bottles of brandy, the fuitors accompany them to the hut of his intended father-in-law, who invites the mediators to enter; but the fuitor is left without, until the liquor be drank, and the propofal difcuffed. After this he is called in, and entertained with fuch fare as the hut affords, but without feeing his miftrefs, who, on this occafion, is obliged to retire. The fuitor having at length obtained leave to make his addreffes to the girl in perfon, he goes home, puts on his beft attire, and then returns to the hut, when his miftrefs appears, and he falutes her with a kifs; after which he prefents her with the tongue of a rein-deer, a piece of beaver's flefh, or fome other kind of provision. The girl firft declines the offer, it being made in the prefence of her relations; but at the fame time the makes a fignal to the lover to follow her into the fields, where he accepts the prefents. Thus encouraged, he begs permiffion of her to let him fleep with her in the hut; if the confents, he keeps the prefents; but if not, he throws them with contempt on the ground.

When the lovers are agreed, the youth is permitted to vifit his miftrefs as often as he thinks proper; but every time he comes he muft purchafe this pleafure with a frefh bottle of brandy, a perquisite fo agreeable to the father, that he often poftpofes the celebration of the nuptials for two or three years. At length the ceremony is performed at the neareft church, by the prieft of the parifh; but even after this, the hufband is obliged to ferve his father-in-law a whole year, at the expiration of which he retires to his own habitation with his wife, and then receives prefents

from all his relations. He fequefters his wife from the male fex, and is attended by a woman's eye.

In Lapland, as fo often, the child is born over with fnow, which muft not be removed, till the child has been baptifed. The child is generally kept in a child-bed for fourteen days, and the mother is generally obliged to be bap- tized at the refidence of the child. The mother fometimes fuffers large forefts to be cut out of the extended walls of the child-bed, covered with mofs, and covered with fnow, and fometimes the child is always fuckled in a cradle which is hung up to the wall. The child is lulled to fleep by the mother. When the mother is very careful in te- nuring the child from their infancy, and they are not allowed to be hit the mark. The bufinefs peculiar to the Laplanders is

There are no phyficians among them, but they are fubject to thofe diftempers which they are al- ways fometimes afflic- ted with; and a few of thefe are cured by drink made with the bark of the birch-tree, which they call *jerit*. They boil the bark of the rein-deer. When they are feized with a fever, they take a kifs upon the birch-tree bark, apply it, burning it, which produces a blift- er, and the peccant humour is thereby difcuffed. When they have a fever, they take a kifs upon the birch-tree bark, apply it, burning it, which produces a blift- er, and the peccant humour is thereby difcuffed.

From this time
from all his relations and friends. The priest
the sequellers his wife from the company of all strangers
of the male sex, and watches over her conduct with a
jealous eye.

In Lapland, as soon as a child is born, it is washed
all over with snow or cold water, except the head,
which must not be touched with water till after the
child has been baptized. The woman does not re-
main in child-bed above four or five days, and in
fourteen is generally quite recovered. She then carries
the child to be baptized; but before she can reach
the residence of the priest, she is often obliged to
traverse large forests, mountains, lakes, and wide
extended wastes of snow. The infant is fastened in a
hollowed piece of wood, stretched naked on a bed of
fine moss, covered with the skin of a young rein-deer,
and hung by two straps to the back of the mother,
who always suckles her own child. At home this
little cradle is hung to the roof of the hut, and the
child is lulled to sleep by swinging it from one side to
the other. When the children grow up, their parents
are very careful in teaching them most kinds of work;
but they have a great aversion to schools. The boys,
from their infancy, are taught to practise the bow;
and they are not allowed to break their fast till they
have hit the mark. The girls are early initiated in
the business peculiar to females.

There are no physicians among the Laplanders;
neither have they, indeed, occasion for any, not being
subject to those distempers common in other countries.
The disorder they are most subject to is sore eyes,
occasioned by the smoke of their huts, and the fire
to which they are almost continually exposed. They
are sometimes afflicted with rheumatic pains, and the
scurvy; and a few are subject to the vertigo and
apoplexy. To cure all inward disorders they use a
drink made with the root of a certain species of moss,
which they call *jerib*; and when that cannot be pro-
cured, they boil the stalk of angelica in the milk of
reindeer. When they feel a pain in any part of the
body, they take a kind of mushroom, which grows
upon the birch-tree like a cake, and having set fire to
it, apply it, burning hot, to the part affected; and
this produces a blister, which is supposed to draw off
the peccant humour. They have no other plasters
for wounds but the rosin which drops from fir-trees.
When they have any limb frozen, they put a red-
deer horn into a cheese made of reindeer's milk, and
with the fat that drops from it, like a kind of oil,
they rub the part affected, which is almost instantly
cured by that means.

When a native of this country is supposed to be on
his death-bed, such friends as are advocates for the
Christian religion, give him Christian exhortation.
But those who have no great zeal for the Christian
religion, to save the dying person, and think of
nothing but the funeral entertainment. As soon as
the breath is out of the body, most of the company

leave the hut, being of opinion they shall receive
some injury from the spirit or ghost, which they be-
lieve remains with the corpse, and takes all oppor-
tunities of doing mischief to the living. The de-
ceased is wrapped up in linen or woollen, according
to his circumstances, and deposited in a coffin by a
person selected for that purpose; but this office he
will not perform till he receives a consecrated brass
ring, which is placed on his left arm, and which he
imagines secures him against receiving any injury from
the ghost of the deceased person.

The Laplanders, before they embraced the Christian
religion, used to bury their dead in the first place they
happened to think of, which they still do when they
are very far from any church. Many of them also pre-
serve the rites of heathenish superstition; for with the
body they put in the coffin an axe, a flint and steel, a
flask of brandy, some dried fish, and venison. With
the axe the deceased is supposed to hew down the
bushes or boughs that may obstruct him in the other
world; the steel and flint are to furnish him with a
light, should he find himself in the dark; and the
provision is for him to subsist on during his journey
thither.

Previous to the body being carried to the place of
interment, the friends of the deceased kindle a fire of
fir boughs near the coffin, and express their sorrow in
tears and lamentations. They walk in procession
several times round the body, demanding, in a whi-
ning tone, the reason of his leaving them on earth.
They ask whether he was out of humour with his
wife? whether he was in want of meat, drink,
clothing, or other necessaries and whether he had
not succeeded in hunting or fishing? These, and other
such interrogatories, are intermingled with groans and
hideous howlings; and between them the priest
sprinkles the corpse and the mourners alternately with
holy water. After these ceremonies are over, the body
is conveyed to the place of interment, in a sledge
drawn by a rein-deer, and followed by the friends and
relations, who shew their concern for the loss of the
deceased, by dressing themselves in the worst garments
they have, and keeping a continual howl during the
procession. As soon as the ceremony is over, the
people retire; and the sledge, with the clothes which
belonged to the deceased, are left as the Priest's
perquisite.

Three days after the funeral, the relations and
friends of the deceased are invited to an entertainment,
where they eat the flesh of the rein-deer which con-
veyed the corpse to the grave. The animal being
made a sacrifice to the manes of the deceased, the
bones of it are collected together, put into a basket,
and interred with great ceremony. The effects of
the deceased are divided between the brothers and
sisters, the former having two-thirds, and the latter
one; but the lands, lakes, and rivers, are held jointly
by all the children of both sexes, according to the
division

division made by Charles IX. of Sweden, when he assigned to each family a certain tract of land for their support.

The Lapland language is altogether barbarous, and varies in different parts of the country, according to the correspondence which the natives maintain with the different nations; such as Norwegians, Swedes, Finlanders, and Russians. The greater part of them are totally ignorant of letters; and the same may be said also of arts, except such as necessity has taught them to make use of for their own preservation and convenience.

With respect to religion, Christianity was first supposed to have been introduced into Lapland about the year 1300. However, no material progress was made in the establishment of it till the last century, when missionaries were sent for that purpose from Norway, Sweden, and Russia. Several churches were built in different parts of the country, and supplied with ministers from Sweden and Russia. Gustavus Adolphus founded two schools, one in the province of Pitha, and the other in that of Ulma, for instructing the children of the Laplanders in the Christian religion and in letters. He also ordered several pious books to be translated from the Swedish into the Lapland language; such as the catechism, with some prayers, and the manual, containing the Psalms of David, the Proverbs of Solomon, &c. That they might be encouraged to send their children to school, an annual revenue was allotted for the maintenance of the scholars. Hence Lapland produced some preachers, which greatly promoted the knowledge of Christianity in that country; for, heretofore, their clergy having been Swedes, whose language the people did not understand, it could not be reasonably supposed that they should profit much by their instructions. Since that time, however, many have intermixed idolatry with the pure profession of Christianity, and, from local customs, their particular fondness for omens, particular times and seasons, distinguished by the names of black and white days, &c. retain many of their former superstitions. They have some notion of the doctrine of the transmigration of souls; for they not only respect the manes of their departed relations and friends, but dread them as being mischievous, till they imagine the spirits of the dead have re-animated other bodies. They believe there are fairies that wander about among the rocks, mountains, rivers, and lakes, and give them also a share of their devotion.

They own one Supreme Being, whom they arm with thunderbolts; they make the rainbow his bow, and have the same notion of him that the old Pagans had of their Jupiter. They have another subordinate deity, to whom they acknowledge they owe all the blessings of life, and never fail to worship him. The sun is another of their divinities, because of his influence on the bodies of men and beasts. They have

temples and images consecrated to each of their gods. Their idols are either the trunks of trees rudely carved, or of stone. One of these is preserved in the royal cabinet of antiquaries at Upsal. All the women are excluded from worship. They anoint the idol with the heart's blood of the sacrifice; and when they cannot reach the top of a mountain consecrated to Storjunker, one of their deities, they dip a stone in the blood of the sacrifice, throw it up to the mountain, and conclude their devotion by that act.

These people were formerly deemed great magicians, and the credulous supposed them to be mightily skilled in divination. So excessively credulous, indeed, were these poor Laplanders, and so preposterously attached to their conjurers, that they implicitly follow their directions. If these pretended wizards tell them that on such a day they shall take plenty of fish in game, they will not fail to go out that day; and where there is most commonly abundance of both in the country, they usually verify the prediction, by coming home loaded whenever they go out in search of game. And if the wizards mark another day as unfortunate, they infallibly make it so, by not going abroad in quest of any.

Different governors, or prefects, are deputed, by the three powers to whom Lapland is now subject, to preside over their respective districts. The Laplanders, however, had kings of their own till the year 1377, when the Swedes conquered part of the country, and the Russians and Norwegians soon after followed their example, and subdued the remaining part.

As Swedish Lapland is the most considerable district of the three, the laws of Sweden are observed; and three tribunals, or courts of justice, are erected: one for Angermansland-Lapmark; a second for Uma, Pitha, and Lula-Lapmark; and the third for Tornea and Kemi-Lapmark; in each of which courts there is a prefect who determines all causes. They administer justice in the king's name, and in the presence of the priest belonging to the district.

Such of the Laplanders, as live near the mountains which part Norway from Sweden, trade with the inhabitants of those countries. Others, who are at a greater distance from those mountains, trade only with the Swedes; and they who are situated towards the north and east, trade with the Russians and Finlanders. The commodities they receive from those nations are six-dollars, woollen stuffs, linen, copper, tin, flour, salt, hides, needles, knives, spirituous liquors, and especially tobacco, of which they are extremely fond. They give, in return, rein-deer and fish, of the last of which they take such large quantities, that they flock whole reservoirs with them, and put them afterwards into barrels, which they carry to the neighbouring countries; namely, the north of Bothnia, and White Russia. They also trade in fine crinines, the skins of several wild beasts, dried pikes, and cheese made of the milk of their rein-deer.

Formerly, the tribute paid by the Laplanders, consisted in skins of wild beasts; but now they consist in certain coin, rein-deer, and in skins, either dressed to certain uses, or raw; and are proportionable to the extent of land possessed by each head of a family. The largest are styled entire territories, or territories in full tribute; and the owner is obliged to pay yearly two rix-dollars, in coin, to the crown of Sweden. They who possess a territory, or land of less extent, pay only one rix-dollar. But as it happens very often, that many of them have no rix-dollars, they are allowed to give skins of foxes or squirrels instead of coin. Fifty squirrel skins, or one fox's skin, with a pair of shoes, after the fashion of Lapland, are valued at one rix-dollar: besides which, every head of a family is obliged to give yearly a pair of fox's skin, or a pair of shoes; and if he cannot procure those things, he must give half a pound of silver pikes. Part of these taxes are employed for the maintenance of the priests who live in that country, and to instruct the Laplanders. The inhabitants of the other districts of Lapland trade much in the same commodities; and pay the revenues in a similar manner to the respective states, under whose particular jurisdiction they are.

The Laplanders have neither castles, bulwarks, or garrisons, for the defence of their country: nor indeed is there occasion for any, its frightful aspect forming a more effectual barrier than all the fortifications of art garrisoned by innumerable armies of veteran soldiers; the judges have no military to enforce their decrees, the people having a re-

markable aversion to war, and, we believe, are never employed in any army. With respect to the security of their property, few disputes happen.

C H A P. VI.

S W E D E N.

Situation, Dimensions, Provinces, Cities, Climate, Soil, Produce, Mountains, Inhabitants, Religion, &c.

THIS country is situated between 56 and 69 deg. north lat. and between 10 and 30 deg. east long. being 800 miles in length, and 500 in breadth; and is bounded, on the south, by the Baltic, the Sound, and the Categate, or Scaggerac; by Danish or Norwegian Lapland, on the north; by Muscovy, on the east; and by the impassable mountains of Norway, on the west. Such a vast tract of country may naturally be supposed to contain a great number of inhabitants; but these bear a very small proportion to the extent of Sweden, great part of it being rendered uninhabitable by seas, lakes, mountains, and marshes. It is divided into seven parts or provinces; viz. Sweden, properly so called, bounded by Norway and the gulf of Bothnia, Gothland, Livonia, Ingria, Finland, Swedish Lapland, and the Swedish islands. But it is necessary to observe, that Livonia and Ingria, though reckoned as part of Sweden, belong now to the Russians, having been conquered by Peter the Great, and ceded by posterior treaties.

The following are the Dimensions of the Kingdom of Sweden :

Places.	Length	Breadth	Square Miles.	Capital Cities.

SWEDEN PROPER contains the following provinces; namely, Uplandia, Sudermania, Westmania, Nericia, Gellericia, Helsingia, Dalecarlia, Medelpedia, Angermania, Jemtia.

Gothland contains East Gothland, West Gothland, Smaland, Wermeland, Dalia, Schonen, Bleking, Halland.

Swedish Lapland contains Thorne-Lapmark, Kimi-Lapmark, Lula-Lapmark, Pithia-Lapmark, Uma-Lapmark.

In West Bothnia, the principal places are Umea, Pitea, and Tornea.

Finland contains East Bothnia, Cajania, Savoloxia, Nyland, Travastia, Finland Proper.

Gothland, Oeland, Aland, and Rugen, are the Swedish islands.

The climate, air, and soil of Sweden, are pretty similar to those of Norway and Lapland, already described; in this, as in the other countries, there is an uninterrupted day-light of several weeks in summer, which is proportionably defective in winter. Spring and autumn are not known: the sun is so excessively hot in summer, as sometimes to set forests on fire; and the winter is so intensely cold, that the noses and extremities of the inhabitants are frequently mortified; and in such cases, the best remedy that has been found out, is, rubbing the part affected with snow: they endeavour to mitigate the severity of the weather, by stoves and warm furs.

The soil is much the same with that of Denmark, and some parts of Norway, generally very bad, but in some vallies surprisngly fertile. The Swedes, till of late years, had not industry enough to remedy the one, or improve the other. But since the days of Charles XII. they have been at incredible pains to correct the native barrenness of their country, by erecting colleges of agriculture, and in some places with great success. The peasants now follow the agriculture of France and England; and some late accounts say, that they raise almost as much grain as maintain the natives. In summer, a beautiful verdure, interspersed with flowers, overspreads the fields; currants, strawberries, raspberries, with other small fruits, are produced spontaneously. Great plenty of pot-herbs and roots are reared in the kitchen-gardens. In dry seasons, melons are brought to great perfection, and the orchards abound with cherries of different kinds, and of excellent flavour. Apples, pears, and plums are pretty scarce here; and the common people know, as yet, little of the cultivation of apricots, peaches, neclarines, pine-apples, and the like high-flavoured fruits.

The mountains in Sweden are numerous, huge, and hoary; the principal among them are the Dofrine, which begin about Jemptland, and extend near four hundred English miles north. The face of the country is in a great measure overspread by vast forests of fir, pine, alder, juniper, beech, birch, and some oak. These trees grow so close together, and such a number of those that fall are left to rot, that in many places the woods are entirely impassable. The timber is in general as good as that of Norway.

Their seas are the Baltic and the gulfs of Bothnia and Finland, which are arms of the Baltic; and on the west of Sweden are the Categate sea, and the Sound, a streight about four miles over, which divides Sweden from Denmark. These seas have no tides, and are usually frozen up four months in the year; nor are they so salt as the ocean, never mixing with it, because a current sets always out of the Baltic sea into the ocean.

This kingdom is watered by many navigable rivers, among which are the Lahla, Tornea, and Kima; but

the chief of them is the Uma, which is augmented by many others.

The lakes in Sweden are of prodigious extent and depth, and are traversed by the inhabitants in boats in the summer, and sledges in the winter. The names of the principal of these are the Veller, the Wenner, and the Maeler. In the lakes, and along the sea-coast, there are innumerable islands, of which six thousand are inhabited, but the rest are either bare rocks, or small islands covered with wood.

Sweden has several mines of silver, many of copper, and vast numbers of iron. The principal of these is the great silver mine, into which workmen are let down in baskets to the first floor, which is 105 fathoms under ground: the roof there is as high as a church, supported by vast arches of oak; thence the descent is by ladders, or baskets, to the lowest mine, above 40 fathoms. They have no records so ancient as the first discovery either of this or the great copper mine, which must needs have been the work of many ages. The ore seldom yields above four per cent. and requires great pains to refine it. They are also at the charge of a water-mill to drain the mines, and have the benefit of another to draw up the ore. This mine formerly produced between 20,000 and 30,000 fine silver crowns annually, and the king had a privilege in his favour, of being allowed to purchase whatever quantity he thought proper of it, and to pay one fourth less than the intrinsic value. A late traveller informs us, that this mine is, at present, much diminished in value, by having been so greatly exhausted. However, it may not be improper, in this place, to describe the metal called silver, and the nature of the various ores from which it is produced.

Silver is a noble and perfect metal, of a white shining colour, sonorous and ductile, but not so perfect as gold. It is sometimes found in small masses of many different shapes, but most commonly like filaments and scales in several sorts of stones and moulds, and in many sorts of land.

The Vitrean silver is of an irregular form, very weighty, and may be easily flatted with a hammer, for it is not much harder than lead, and is much of the same colour; for which reason it is often mistaken for lead. It melts presently, and soon grows red-hot. It consists of sulphur and pure silver, and above three quarters of it is silver. The horny silver ore is half transparent, and of a deeper yellow or brown colour, according as it consists of larger or smaller lumps. It looks like rosin, and is of an irregular shape. When carefully examined, it appears to consist of very thin plates. It is not very weighty or hard, for it may be easily ground, and when brought suddenly to the fire, it crackles, bursts, and exhales a sulphurous smell, and sometimes bursts lightly. This hard sort contains two thirds of silver. The red silver ore is sometimes of a lighter, and sometimes of a deeper scarlet colour. The first case is transparent, like a garnet, and has been mistaken for transparent cinnabar, and in the second case

it is of a deeper dye. It is heavier than the former horny ore, but bursts when brought near a candle or a mild fire, and the remaining part melts before it grows red-hot; then it emits a disagreeable smell of arsenic, together with a thick smoke. It contains the same quantity of silver as the horny ore just mentioned.

The white silver ore is of a light grey colour, of an irregular figure, pretty weighty, and very brittle. It has not only copper in it, but sometimes more of it than of silver, for it differs from the white copper ore in nothing but the quantity of silver it contains. These are the principal silver ores hitherto known, though many others are looked upon by some as such, because they contain a considerable quantity of silver; but then there is always more of other metals along with them, therefore they cannot properly be called silver ores.

Silver may be easily extracted from lead, by melting it in channels, made with ashes in the furnace, and then blowing up the fire till it turns into glass, sinks into the channels, and leaves the pure silver behind.

Silver is harder than gold, but not so ductile, and is lighter than gold or lead, the weight, with regard to gold, being little less than five to nine. It will not rust, but will grow black by sulphurous vapours, and will dissolve in aqua fortis, but not in aqua regia. When it is mixed with common salt, and melted, it turns into a half transparent mass like horn, which is hard to be brought back to silver again, because it is volatile, and in a violent fire will all fly away. When silver is dissolved in aqua fortis it may be crystallized, and the crystals are very corrosive, and of an exceeding bitter taste. When applied to the skin, they leave an impression like that of a burning coal, and make an escar of a black colour. The solution of silver will turn any thing black, and therefore, when properly diluted, is often used to colour the hair. These crystals will melt in a very moderate heat before they grow red, and form a blackish mass: it is then proper for the use of surgeons, and is called the silver caustic.

The great copper mine is about 80 fathoms deep, of great extent, but subject to damages by the falling-in of the roof; yet that is sometimes recompensed by the abundance of ore which the ruined pillars yield, though most commonly the loss is very great. The occasion of these falls is ascribed to the throwing the earth and stones, brought out of the mine, upon the ground over it; by which the pillars become overcharged, and give way. The reason of this is said to be, that the profit arising to those who are concerned is so little, that they are not able to work it off as they ought, and to remove the rubbish to a greater distance; and unless the king abates a considerable part of the profit arising to the crown from this mine, it is believed it will, in a few years, be at a stand, especially if the designs of making copper, which are on foot elsewhere, take any tolerable effect. The copper yearly made out of this mine amounts to the value of about 200,000*l.* of which the king has a fourth part, not by way of pre-emption, but

in kind; besides which, he has upon the remainder a custom of 25 per cent. when it is exported unwrought. Many years ago a gentleman of Italy came into Sweden, with proposals to make copper a shorter and cheaper way than had till then been practised, so as to make that in five days, which before required three weeks, and with one fifth part of the charcoal, and with fewer hands. The bargain was made, and his reward to be 100,000 crowns. The first essay he made succeeded to admiration; but when he came to work in earnest, and had got his new ovens built to his mind, the miners, as he complained, picked out the very worst ore, and were otherwise so envious and untractable, that he failed of success, and lost his reward, nor was it without difficulty that he obtained leave to buy ore, and practise his invention at his own charge.

This mine, travellers tell us, in the last century, supplied the greatest part of Europe with copper; but at present it is worked so very deep, that it is become extremely expensive; and though the ore is uncommonly rich, the produce is considerably diminished.

Copper is a hard, ignoble metal, softer than iron, and, when polished, is of a shining reddish colour. It will melt in the fire, and is so ductile, that it may be beaten into exceeding thin leaves. It is more frequently found in its metallic form than iron, in various shapes, but its ore never distinguishes itself by any certain figure, for it is almost always irregular. But the finest colours of any kind, except the red and transparent, most commonly betray the presence of copper; for this reason there is hardly any copper ore that is not mixed with iron, in a larger quantity than the ores of other metals commonly are. However, there is not so much in some as in others; and those that contain the least iron, are naturally more easily melted than the rest. The vitreous copper ore is of a darkish violet sky colour, like that of a piece of steel that has touched a red-hot iron. It is very heavy, and of a moderate hardness, but commonly variegated with spots and grey veins. One hundred weight of this ore contains from 50 to 80 pounds of copper. The azure copper ore is of a most beautiful blue colour, not soft, but very heavy, and, when broken, shines like blue glass. This is most free from iron, arsenic, and sulphur; and a great quantity of excellent copper may be extracted out of it with ease. The green copper ore is like green crystal, and sometimes very prettily streaked; but in other things it has the properties of the former. The light dusky blue concretes, as well as the green, called by some copper okers, yield a great deal of very good copper when they are pure, which may be known from their colour and weight; but those that are more light are mixed with unmetallic earth, and those that are yellow contain iron oker; on which account they are the more difficult to be met with, and yield less copper of an inferior sort.

A Dutch officer has given the following extraordinary account of a descent into the copper mine of Falun in Sweden. "During the four hours that I wan-

dered

dered into the bowels of Kopperberg, as I descended from gallery to gallery, sometimes by ladders, and sometimes by stairs, my astonishment increased at every step. At first I went down by zigzag stairs, tolerably commodious, into a large cavity, about 300 feet deep, and 2000 paces in circumference. At the extremity of the cave I saw, in a corner, a hut built of wood, six or seven feet in height, at the door of which stood two figures half naked, and as black as ink. I took them for the pages of Pluto. Each had a lighted torch in his hand. In this hut, is one of the entries into the subterraneous regions, and it is the most commodious of the four which communicated with the cave. I and my servant were immediately presented with a black dress, a precaution that is generally taken to preserve the clothes of the inquisitive from being spoiled in the narrow passages of the galleries. This mournful apparel, together with a prayer uttered by my guides, imploring the divine aid, that we might escape unhurt from these regions, intimidated my servant, who was a young Frieze, in such a manner, that he would scarcely submit to be dressed *en Scaramouche*, much less descend into the mine.

"Passing at one time through alleys propped up by timber, at another, underaults that supported themselves, we came to immense large halls, the height or extremities of which could not be reached by the feeble lights that we carried. In some of these are forges, where the different tools used in working the mines are made and repaired. It was here so excessively hot, that the workmen were entirely naked. Other halls served either for magazines of gunpowder, or cordage, and other utensils necessary for their operations. These communicate by means of the galleries, and these galleries communicate with each other by ladders or steps. There are also apertures made from the upper surface, in a perpendicular line to the lowest gallery, without any interruption. These serve at once to convey fresh air, and for the passage of any burdens, which, being placed in large vessels, are moved upward and downward by means of pulleys, that are in continual motion during the whole time of labour. The pulleys are kept in motion by horses on the top of the mountain. The vessels are attached to chains of iron, common ropes being subject to speedy erosion by the vitriolic vapours which ascend from the mines. The irons themselves will not endure for a long space of time, and therefore ropes of cows hair, or of hogs bristles, are often made to supply their place. The apertures are not only convenient for the purposes above mentioned, and give vent to a pestilential atmosphere; but co-operating with the heat proceeding from the forge, and other physical causes, they excite, even in the deepest parts, such excessive draughts of air, that they resemble the most violent hurricanes. The roofs that are not supported by art, afford, in many places, a very singular appearance. The vitriol distilling through the rocks, crystallizes on their surface, and forms prisms of different figures.

These are suspended from a thousand places, ten, twelve, twenty feet in length, and of a most beautiful green. The reflection of the light from their various surfaces, and from the minerals that surround the walls, produces an effect more easy to be conceived than described.

"In one of the passages, upwards of seven hundred feet below the surface of the earth, the vitriol is dissolved, and it is pumped out of the mine by means of a curious hydraulic machine. The water which springs up at this depth very copiously, is set in motion by horses, dissolves the vitriol, and conveys it into a reservoir, which contains a quantity of old iron. Twenty-four of these horses have stables in the gallery, their mangers being cut out of the rock. This work continues night and day, horses and men being relieved every six hours. These animals are hoisted up through the openings once in a year, to undergo a general review. Curiosity induced me to descend to about eleven hundred feet under the earth, to the lowest gallery, where the principal explosion is made. Notwithstanding the excessive cold of this place, the men who were occupied in cleaving the rock, were not only naked, but in profuse sweats. The obscurity of these regions, the distant fires spreading a visible gloom, naked men dark as the minerals which they work, surrounded by the sparks that fly from their hammers; the horrid noise of their labour, and of the wheels of the hydraulic machines, joined with the tremendous figures which we met, from time to time, with lighted torches in their hands, made me doubt whether I was not really in Tartarus.

"Having at length arrived at a kind of hall, the roofs of which were supported by pillars hewn out of the rock, and surrounded with seats of the same nature, my guides desired me to repose myself, and listen to some music that would amuse me. On my inquiring of what kind, they answered it was the noise which proceeded from blowing up the rocks, to facilitate their labour. I consented, on condition that they should remain with me. They readily agreed, as this was the only place totally free from danger. One of them went out for a moment to give the necessary directions, and returning, sat by my side. After waiting about a quarter of an hour, trembling with cold, and my patience exhausted, I threatened to renounce the music, if they were not more expeditious. While I was speaking, the explosion began. My ears had hitherto been strangers to the like. The whole extent of these subterraneous regions, as far as our sight could reach, was instantly illuminated, and we were immediately left in total darkness, for the pressure of the air had extinguished our torches. This obscurity was only interrupted by a new explosion on the right and left, accompanied with sudden flashes of light. Echoes redoubled the strokes with thundering noise. The vaults seemed to split over our heads, the ground trembled, and our seats rocked under us. The recollection that we were eleven hundred

dred and thirty feet below the surface of the earth, at every step, my astonishment increased at every step. At first I went down by zigzag stairs, tolerably commodious, into a large cavity, about 300 feet deep, and 2000 paces in circumference. At the extremity of the cave I saw, in a corner, a hut built of wood, six or seven feet in height, at the door of which stood two figures half naked, and as black as ink. and places, ten, twelve, or more, most beautiful green, their various surfaces, round the walls, produced, and conceived than de-

wards of seven hundred, the vitriol is dissolved in the mine by means of the water which springs, is set in motion by, conveys it into a reservoir of old iron. Twenty men in the gallery, their work continued. This work continued, men being relieved, are hoisted up through, undergo a general refreshment to about eleven, to the lowest gallery, made. Notwithstanding, the men who were, were not only naked, purity of these regions, sole gloom, naked men, work, surrounded by, mers; the horrid noise, of the hydraulic machines, figures which, lighted torches in their, I was not really in

at a kind of hall, the pillars hewn out of, of the same nature, myself, and listen to, e. On my inquiring, was the noise which, ecks, to facilitate their, n that they should re-, freed, as this was the, r. One of them went, necessary directions, and, waiting about a quar-, old, and my patience, nce the music, if they, le I was speaking, the, it herto been strangers, f these subterraneous, reach, was instantly, ediatey left in total, air had extinguished, only interrupted by a, ft, accompanied with, redoubled the strokes, s seemed to split over, and our seats rocked, we were eleven hun-

ded and thirty-six feet under the surface of the earth; the light, at every repeated flash, of our guides, and of myself, dressed in sable hue; the fall of the rocks that were detached by the explosion; and the smoke of the gunpowder, will plead my apology should I candidly confess that I felt all the *toupee* which I had, stood erect. This concert continued about half an hour, and suddenly ceasing, left us in profound silence; which, together with the obscurity of the place, and the suffocating steam of the gunpowder, rather increased than diminished the horror. This operation is repeated every day at noon."

Iron mines and forges are in great numbers, especially towards the mountainous parts, where they have the convenience of water-falls to turn their mills. From these, besides supplying the country, there is yearly exported, iron to the value of near 300,000l but of late years the number of these forges has been so much increased, that each endeavouring to undersell others, the price has been much lowered. Since the prohibition of foreign manufactures, in exchange for which iron was plentifully taken off, it is grown so cheap, that it is found necessary to lessen the number of forges. Neither has that contrivance had the effect intended, but, on the contrary, many more are like to fall of themselves, because they cannot work but with loss; in which case, many thousands of poor people, whose livelihood depends upon those forges and mines, will be reduced to a starving condition.

Iron is an ignoble metal, remarkable for its hardness. It is of a whitish livid colour when polished, but before that it is blackish. When it is cleaned it is called steel. The ore of common iron is of no certain form, but most commonly of a rusty colour. There is also an ore which is very heavy, and of a red bluish colour when broken. It is very rich in the best kind of iron, and usually yields, at the first melting, from sixty to eighty pounds out of an hundred weight. There is also a singular kind of iron ore, of a yellowish colour, though sometimes grey, and sometimes of a kind of semi-transparent white. It will yield, when melted, about thirty pounds of iron out of an hundred weight.

When iron is melted, it is formed into large masses, which are long and thick, and commonly called pigs. These are melted over again, and stirred with an iron rod, in order to render them malleable. While they are yet red hot, they are placed under hammers, and by that means the heterogeneous particles are forced away by the repeated strokes. One sort of iron differs greatly from another, but that which is toughest is best, and that which is most brittle is worst of all. However, all sorts of iron are of the same nature, and they are only more or less tough, in proportion to the earthy, vitriolic, and sulphurous particles mixed therewith. Iron being often melted and cleansed, is turned into steel; though, in some cases, little labour is required for that purpose, and in others a great deal. When iron is very good, they melt it in a furnace, and throw in gradually

a mixture of equal parts of an alkalous salt, and filings of lead, with the rasings of oxes horns; then they stir the melted metal, and at length place it on the anvil, where they beat it into rods.

A late traveller gives the following remarkable description of his descent into the mines of Danmora.

"We lay, says he, at a pretty village, called Ostarby, and went about three miles the next morning to see the mines of Danmora. They are celebrated for producing the finest iron ore in Europe, the iron of which is exported into every country, and constitutes one of the most important sources of the national wealth and royal revenues of Sweden. The ore is not dug as in the mines of tin or coal which we have in England, but is torn up by powder. This operation is performed every day at noon, and is one of the most tremendous and awful it is possible to conceive. We arrived at the mouth of the great mine (which is near half an English mile in circumference) in time to be present at it. Soon after twelve the first explosion began; I cannot compare it to any thing so aptly as subterraneous thunder, or rather volleys of artillery discharged under ground. The stones are thrown up by the violence of the powder to a vast height above the surface of the earth; and the concussion is so great as to shake the surrounding earth, or rock, on every side. I felt a pleasure mixed with terror, as I hung over this vast and giddy hollow, to the bottom of which the eye in vain attempts to penetrate. As soon as the explosions were finished, I determined, however, to descend into the mine. There is no way to do this but in a large deep bucket, capable of containing three persons, and fastened to chains by a rope. The inspector, at whose house I had slept the preceding night, took no little pains to dissuade me from the resolution, and assured me that not only the rope, or chains, sometimes broke, but that the snow and ice, which lodged on the sides of the mines, frequently tumbled in, and destroyed the workmen; nor could he warrant my absolute security from one or both of these accidents. Finding, however, that I was deaf to all his remonstrances, he provided me a clean bucket, and put two men into it to accompany me. I wrapped myself, therefore, in my great coat, and stepped into the bucket. The two men followed, and we were let down. I am not ashamed to own, that when I found myself thus suspended between heaven and earth by a rope, and looked down into the deep and dark abyss below me, to which I could see no termination, I shuddered with apprehension, and half repented my curiosity. This was, however, only a momentary sensation, as before I had descended an hundred feet, I looked round on the scene with very tolerable composure. I was near nine minutes before I reached the bottom, it being 80 fathoms, or 480 feet. The view of the mine, when I set my foot to the earth, was awful and sublime in the highest degree. Whether terror or pleasure formed the predominant feeling, as I looked at it, is hard to say. The light of the day was

very faintly admitted into these subterraneous caverns. In many places it was absolutely lost, and flambeaux supplied its place. I saw beams of wood across some parts, from one side of the rock to the other, where the miners fast employed in boring holes for the admission of powder, with as much unconcern as I could have felt in any ordinary place, though the least dizziness, or even a failure in preserving their equilibrium, must have made them lose their seat, and dash them to pieces against the rugged surface of the rock beneath. The fragments torn up by the explosion, previous to my descent, lay in vast heaps on all sides, and the whole scene was calculated to inspire a gloomy admiration in the beholder. A confinement for life in these horrible iron dungeons, must surely, of all punishments which human invention has devised, be one of the most terrible. I remained three quarters of an hour in these gloomy and frightful caverns, and traversed every part of them which was accessible, conducted by my guides. The weather above was very warm, but here the ice covered the whole surface of the ground, and I found myself surrounded with the colds of the most rigorous winter, amid darkness and caves of iron. In one of these, which runs a considerable way under the rock, were eight wretches warming themselves round a charcoal fire, and eating the little scanty subsistence produced from their miserable occupation. They rose with surprise at seeing so unexpected a guest among them; and I was not a little pleased to dry my feet at their fire, which were wet with treading on the melted ice. There are no less than 1300 of these men constantly employed in the mines, and their pay is only a common dollar, of three-pence English, a day. They were first opened about 1580, under the reign of John the Third, but have been constantly worked only since the time of Christina. After having gratified my curiosity with a full view of these subterraneous apartments, I made the signal for being drawn up, and can most seriously affirm, I felt so little terror while re-ascending, compared with that of being let down, that I am convinced, in five or six times more, I should have been perfectly indifferent to it, and could have solved a problem in mathematics, or composed a sonnet to my mistress, in the bucket, without any degree of fright or apprehension. So strong is the effect of custom on the human mind, and so contemptible does danger or horror become, when familiarized by continual repetition!"

Speaking of the manner in which the peasants manufacture the iron, the same writer says, "I have visited six or seven forges on my journey, each of which constantly employs from four to fourteen hundred workmen, only in iron. Wherever there is a country seat, you may be certain to see one of these fabrics, and no Cyclops were ever more dextrous in working their materials. I have seen them stand close to, and hammer, in their coarse frock of linen, a bar of ore, the heat and resplendence of which were almost insupportable to me at 10 feet distance, and with the sparks of which

they are covered from head to foot. I had the pleasure of viewing the whole process used to reduce the ore into iron, and must own it is very curious. They first roast it in the open air for a considerable time; after which it is thrown into a furnace, and, when reduced to fusion, is poured into a mould of sand about three yards in length. These pigs, as they are then denominated, are next put into a forge heated to a prodigious degree. They break off a large piece with pickers when red hot, and this is beat to a lesser size with hammers. It is put again into the fire, and from thence entirely finished, by being laid under an immense engine resembling a hammer, which is turned by water and flattens the rude piece into a bar. Nothing can exceed the dexterity of the men who conduct this concluding part of the operation, as the eye is their guide, and it requires an exquisite nicety and precision. It is certainly a most happy circumstance that Sweden abounds with these employments for her peasants, since from the ungrateful soil and inclement latitude, they must otherwise perish by misery and famine."

The animals in Sweden are elks, bears, wolves, deer, hares, foxes, wild cats, squirrels, &c: and these are hunted either for their flesh, skins, or furs, the Swedish huntsmen using guns, and being in general excellent marksmen.

The Swedish squirrel is somewhat thicker than our weasel; but not quite so long. He is of a reddish colour on the upper part of the head and back, but on the belly is white. The tail is long and bushy, which being turned over his back, is sufficient to shade it, whence the Latin name *sciurus*, which signifies a shade.

This animal sits upon his backside when he seeks, laying hold of the provision with his fore feet, and putting it into his mouth. He lives upon nuts and acorns of all kinds, but is most fond of hazel nuts, which he gathers in the proper season, and hoards up against winter. Squirrels are generally to be met with upon trees, where they build their nests, and bring up their young. They can leap very readily from bough to bough, and sometimes from tree to tree, at which time they use their tails instead of wings, for it is of great help in keeping them from sinking.

Poultry of various kinds are reared in Sweden. Of game there is plenty, both of land and water-fowl, particularly partridges, and a bird called the *yerper*, which resembles a partridge.

The *orra* is a fowl of the size of a hen, and the leader is very near as big as a turkey. In winter the Swedish sportsmen are use themselves with killing black-birds, thrushes, and sydenswans, the latter being beautiful birds, sumptuously arrayed in gorgeous plumes, which are finely tipped with scarlet: they are about the size of fieldfares, and their flesh is of a most exquisite flavour. Pigeons are scarce, on account of the great number of voracious birds which destroy them.

The eagle is the most remarkable bird of prey. This bird is of a large size, very strong, and can never be

The eagle principally inhabits inaccessible moun-
tains, and roolls on the loftiest trees, being fond of
such places as are least frequented by mankind. How-
ever, as birds, as well as other animals, are found in
greater plenty round the habitations of men, the eagle
is sometimes induced to frequent those places for the
convenience of its prey. They live much on fish,
crabs, tortoises, wild ducks, poultry, pigeons, and the
like. They have been known not to spare even
their own species, when pressed with hunger. They
attack not only lambs and young goats, but sometimes
deer, sheep, and even horned cattle. They build their
nests on the most inaccessible parts of rocks, and the
highest trees, some of which have been found near
six feet in diameter. They are usually lined with
the hair of foxes, wool, or the fur of hares and rab-
bits, to keep the eggs warm, of which the female ge-
nerally lays two, or sometimes three at a time, and
hatches them in thirty days, during which time the
male supplies her with food. As soon as the young
ones are produced, the old become remarkably mit-
chievous, and destroy lambs and poultry for several
miles round them. They often bring hares and par-
tridges alive to their young, to regale them with the
freshness of warm blood. The country folks sometimes
avail themselves of these provisions, by taking it from
the eagles in the absence of the old ones, and carry-
ing it home for their own use.

The vulture differs from the eagle in not having its
beak turned immediately crooked from the root, it
continuing straight to the length of two inches. It
is much more lazy than the eagle, and fond of carrion,
which the eagle will not touch. However, they prey
upon live birds, hares, kids, fawns, &c. if they can
get them; and if not, eat any filth that comes in
their way.

The hawk has wings so long as to reach to the end
of the tail, which resembles that of a sparrow-hawk.
The beak is partly blue and partly yellow; the feet
are of a pale green; the toes are slender; the talons
large, sharp, and darkish; the breast, belly, and thighs,
white, streaked with black; the neck, back, wings,
and head are brown, and the latter is flattish at the
top; the tail is of a light brown, with black lines
running across it; and the legs and feet are of a
yellow colour. Some years ago a hawk was killed in
Finland, which had a plate of gold on one leg, and a
plate of silver on the other. On the former was this
French inscription: "Je suis au Roi;" which, in
English, implies, "I belong to the King;" and, on
the latter, were these words in the same language:
"Le Duc de Chevreuse me garde;" which may be
thus translated: "The Duke of Chevreuse keeps
me."

The kite is distinguished from all other rapacious

birds by having a forked tail. It is usually about 28
inches long, from the head to the tip of the tail, when
the neck is straight; but when the wings are ex-
tended, it measures, from extremity to extremity, 64
inches, or better. The head is of an ash-colour, the
neck red, the back brown, and the wings are diversifi-
ed with red, black, and white. The beak is black,
the tongue thick, the legs and feet yellow, and the
talons of a sable hue. It has always been famous for
its rapacity, and is often mentioned by the ancients.

— " Thus the spreading kite,
That smells the slaughter'd victim from on high,
Flies at a distance, if the priests are nigh,
And sails around, and keeps it in her eye."

} OVID.

The seas of Sweden; as well as the rivers, abound
with a great variety of fish, particularly salmon, perch,
pike, streamling, trout, tench, eels, seals, &c.

Pikes are so abundant that vast quantities are salted
and dried for sale; and great numbers of streamlings
(which is a delicious fish, smaller than a pilchard,
or pilchard) are pickled and barrelled, both for home
consumption and exportation. The train-oil, ex-
tracted from the seals, is a valuable article of traffic in
their exports.

The Swedes, in their persons, are in general of
a large stature, with white or yellow hair. There is
a great diversity with respect to their characters; and
what is peculiarly remarkable among them, they are
known to have had different characters in different
ages. At present the nobility are brave, hospitable,
fond of glory, and strictly attached to the rules and
punctilios of honour: but as a foil to these excellen-
cies, they are proud, ostentatious, jealous, and vindic-
tive. The lower class of people are religious, sober,
loyal, industrious, and quiet; except when intoxicated
with liquor, at which time they are furious and un-
governable; and some accuse them of being over-
reaching, rapacious, envious, and exceedingly averse
to foreigners. In their persons they are usually strong
and hardy; whereby they are capable of bearing great
labour and fatigue, which are excellent qualifications
towards the performance of the duties of a military
life, and the Swedes have been supposed the best sol-
diers in Christendom. They have no great genius,
but they are indefatigable in executing whatever they
undertake. Their great poverty obliges them to prac-
tise several mechanical arts, which necessity teaches
them to exercise, and the peasants make their own
clothes, shoes, and implements of husbandry; but the
trading part of the nation continue in the paths trodden
by their ancestors, without ingenuity to discover, or
spirit to pursue, new branches of commerce.

The Swedish women are fair, well shaped, exceed-
ingly fruitful, and more eminent for chastity before

than

than after marriage. From the highest to the lowest they are subservient to the will of their husbands, even to a degree of slavery. As to the meaner sort, besides the offices peculiar to their sex, they perform all kinds of drudgery, such as plowing the fields, threshing the corn, rowing the boats, and carrying burdens.

Persons of quality dress after the fashion of France; but the peasants, &c. wear clothes made of coarse stuff, and lined with sheep-kin, to defend them from the extreme cold of winter.

The marriages in Sweden generally take their rise from the mercenary views of parents, and not from the least degree of affection in the young couple, whose inclinations have perhaps never been once consulted in the whole course of the affair. It is seldom that the children of noble families marry before the age of thirty, their parents having little to spare in their lifetime. The wedding, as well as the funeral entertainments of this country, are performed with great pomp, and both are commonly attended with riot and excess.

The reformed religion, according to the tenets of Luther, is professed with the utmost strictness in Sweden; and owes its establishment there to Gustavus Vasa, about the year 1523. An attempt having been once made to re-establish Popery, to the great disturbance of the kingdom, they have ever since had such an aversion to that religion, that castration is the fate of every Roman Catholic priest discovered in their country. The common people are surprisingly uniform and unremitting in religious matters, never inquiring into, or disputing about controverted points of faith and doctrine, but submitting themselves entirely to the directions of their clergy, who by their morals, and the sanctity of their lives, endear themselves so much to the people, that the government would repent making them its enemies. Their revenues are very moderate, that of the archbishop of Upsal, the primate, not exceeding 400*l.* a year: he has under him 13 suffragans, besides superintendents, with moderate stipends. The church is governed by a body of ecclesiastical laws and canons, revised by a committee chosen from the different states that compose the diet, and approved by the sovereign. The clergy are not intrusted with the execution of their own laws, nor can they transact affairs of importance without the concurrence of the civil power. A conversion to Popery, or a long continuance under excommunication, which are punished by imprisonment or exile, cannot pass without the king's permission, since in either case he would be deprived of a subject. Christianity was introduced into Sweden by Ansgarius, bishop of Bremen, in the year 829.

The language spoken in Sweden bears a near affinity to that of Denmark, being a dialect of the ancient Gothic, or Teutonic. This country has produced many persons of learning, at the head of which class may justly be placed the celebrated Puffendorf,

who was at once an historian, civilian, and philosopher, and a native of Sweden. The name of Linnæus will be perpetuated to the latest posterity, for having carried most of the branches of natural philosophy, particularly botany, to the greatest height; he was one of the greatest ornaments to learning Europe could boast in his time.

The Swedish nobility and gentry shewed their attention to the improvement of literature, by sending Haselquist, that excellent and candid natural philosopher, into the eastern countries, in order to make discoveries, and where, unhappily for the learned world, he died. But, as this noble spirit is eminently encouraged by the royal family, his labours were not entirely lost, the queen of Sweden having purchased his collection of curiosities at a great expence. The fine arts, particularly drawing, sculpture, and architecture, are at this time known, and encouraged in that kingdom; and, since the decline of their iron manufacture, many of the people have applied themselves to agriculture, which is carried to a great degree of perfection, and must be of infinite advantage to the nation. From the above instances it appears, that it has been chiefly owing to the Swedes not having had an opportunity to exert their talents, that they have been represented by some writers as a dull, heavy people, fit only for bodily labour.

Their principal university is that of Upsal, instituted near 400 years ago, and patronized by several successive monarchs, particularly the great Augustus Adolphus, and his daughter Christina, whose passion for literature is well known to the public, and who may be accounted a genius in many branches of knowledge. This university has a chancellor, a vice-chancellor, a rector, and twenty professors, all provided with comfortable salaries, the largest of which is 1000*l.* per ann. There are near 1500 students here; but, in the most part, they are extremely indigent, and live five or six together in poor hovels. At Abo in Finland there is a second university, which is neither flourishing, nor so well endowed as that of Upsal; and at Lunden in Schonen there was a third, which is now entirely fallen to decay.

An academy of arts and sciences was some years since established at Stockholm, and is now in a flourishing condition. They have published several volumes of memoirs, which have been well received by the public.

Every diocese in Sweden is provided with a school, wherein boys are qualified for the university, and there are also inferior schools, where children are taught to read, write, and instructed in the principles of the Christian religion.

The common people in Sweden subsist principally by agriculture, mining, grazing, hunting, and fishing. Their materials for traffic and exportation consist principally of bulky and useful commodities, such as beams, deal-boards, and other sorts of timber.

ships; tar, pitch, bark of trees, pot-ash, wonden uten-
sils, hides, flax, hemp, poultry, furs, lead, iron, brads,
copper, cordage, and fish. In exchange for these
commodities, they import corn, sugars, wines, spices,
silk, and English cloths.

The manufacturing of iron was introduced into
Sweden so late as the 16th century; for till that time
they sold their old crude ore to the Hanse-Towns,
and brought it back again; but at present vast quan-
tities of copper, brads, steel, and iron, are wrought
in Sweden; they have also founderies for cannon,
forges for fire-arms and anchors, armories, wire and
knitting mills; also mills for piling, and for boring
and stamping; and of late they have built many ships
for sale. About the middle of the 17th century, by
the assistance of the Dutch and Flemings, they set up
some manufactures of glass, starch, tin, woollen, silk,
soap, leather-dressing, and saw-mills: bookselling was
at that time unknown in Sweden. They have since
had sugar-baking, tobacco-plantations, and manufac-
tures of sail-cloth, cotton, fustian, and other stuffs;
of linen, alum, and brimstone; paper-mills and gun-
powder-mills.

About the year 1752 the Swedes had greatly in-
creased their exports, and diminished their imports,
most part of which arrive, or are sent off in Swedish
ships; the Swedes having now a kind of navigation-
skill, like that of the English; but the madnes and
zealousness of the Swedish government have blasted these
promising appearances.

Among their curiosities and antiquities are the fol-
lowing: A few leagues from Gottenburg is a hideous
precipice, down which a dreadful cataract runs with
such impetuosity into a deep bed of water, that large
trunks and other bodies of timber, which are precipi-
tated, disappear, some being half an hour, and others
much longer, before they are recovered. Several hun-
dred fathoms of line have been used in endeavouring
to find the bottom of this bed, but it has never yet
been discovered. In various parts of Sweden a stone
is found, of a yellow-colour, intermixed with streaks
of white, which give it the appearance of a composi-
tion of gold and silver. This stone yields sulphur,
alum, vitriol, and minium. In the southern parts of
Gothland is a remarkable slimy lake, which has the
inconmon property of singeing every thing that is
thrown into it.

The Swedes have no artificial curiosities to boast of;
but they pretend to be in possession of a manuscript
copy of the translation of the Gospel into Gothic, the
work of a bishop 1300 years ago. Two clocks, one
at Upsal, and the other at Lunden, are esteemed by
them pieces of curious workmanship: that at Lunden
shews the remarkable motions of the heavenly bodies,
with all festivals, both fixed and moveable.

Many changes have happened in the government of
Sweden. At the decease of Charles XII. who go-
vern'd as an absolute prince in Sweden, his sister,

Ulrica Eleonora, ascended the throne, and, knowing
how unweary the despotism of Charles had rendered
his subjects, the first action of her reign was, to issue
a proclamation, declaring her intention of abolishing
and renouncing, for herself and successors, all absolute
power and dominion, and of re-establishing the old form
of government. The states of Sweden being assem-
bled, in the year 1719, she made a declaration that she
would accept the crown on no other condition than
that of election; which resolution was so agreeable to
the states, that they immediately exerted the power she
had given them, by unanimously choosing her for their
sovereign; and soon after her husband, the handgrave
of Hesse-Cassel, was associated with her in the gov-
ernment. This condescension of the queen has been
justly blamed for the unbounded length to which she
carried it; for the states now acquired more ample
privileges than they had ever before enjoyed; and at
the same time the power of the king of Sweden was
so limited, that he could scarcely be called by that
name, being cramped in every exercise of govern-
ment, and even in the education of his own children.
The great officers of the kingdom were appointed by
the diet of the states; and all employments of any
value, ecclesiastical, civil, or military, were conferred
by the king only; with the approbation of the senate.
The estates were formed of deputies from the four or-
ders, nobility, clergy, burghers, and peasants. The
representatives of the nobility, which included the
gentry, amounted to above 1000, those of the clergy,
to 200, the burghers to about 150, and the peasants
to 250. Each order sat in its own house, and had its
own speaker; and each chose a secret committee for
the dispatch of business. The fixed time for convok-
ing the states was once in three years, in the month
of January, and the session was appointed to continue
three months; but it might break up sooner, if all the
orders consented to the separation. The immediate
business of the states was, to regulate every thing of
importance relating to the constitution, and to take
cognizance of every circumstance in which the
welfare and advantage of the community was in-
terested.

The affairs of the public, when the states were not
sitting, were managed by the king and senate, which,
in fact, was a committee of the states, but chosen in
a particular manner; the nobility, or upper house,
appointed 24 deputies, the clergy 12, and the burghers
12; these chose three persons, to be presented to the
king, that he might fill the vacant seat with one of
the three. The peasants had no vote in electing a
senator. Almost all the executive power was lodged
in the senate, which consisted of 14 members, be-
sides the chief governors of the provinces, the pre-
sident of the chancery, and the grand marshal. Dur-
ing the recess of the states, those senators formed the
king's privy-council; but he had no more than a
casting vote in their deliberations. Appeals lay to

them from courts of judicature, but each senator was accountable to the states for his conduct.

Upon the whole, in consequence of this arrangement, the government of Sweden might be called republican, for the king's power was inferior to that of a stadtholder. The senate had even authority to impose on the king a sub-committee of their number, who were to attend upon his person, and to be a check upon all his proceedings, to the very management of his family. Appeals were to be made to them from the different courts of judicature; and one half of the senate was constantly employed in the revision of sentences, the administration of justice, and the regulation of foreign affairs; while the other half was occupied with matters of less importance. Each senator, however, was responsible to the diet for his conduct relative to every affair in which his advice or vote was given. We shall only add, that though nothing could be more plausible than the whole plan of their distributive powers, yet nothing was less practicable; inasmuch as their officers and ministers, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and by the tedious forms through which the business of government must necessarily pass, it was greatly retarded, if not rendered altogether ineffectual. But another extraordinary change has lately taken place, which we shall here give some account of.

By the new form of government, established in 1772, the king is empowered to assemble and separate the states whenever he pleases; he is also to have the whole disposal of the army, navy, finances, and all civil and military employments; and though by this new form the king does not openly claim an authority to impose taxes on all occasions, yet such as already subsist are to be perpetual; and in cases of urgent necessity, he may impose some, till the states can be convened: but even these circumstances depend wholly on his will and pleasure, as likewise the subject of their deliberations when assembled; so that it may be plainly perceived that such a government as this very nearly resembles the most absolute monarchy. The Swedes, however, notwithstanding the great power vested in the sovereign, are still amused with some slight appearances of a legal and limited government: for in the new system, which consists of 57 articles, a senate is appointed, consisting of 17 members, including the great officers of the crown, and the governor of Pomerania, who are required to give their advice in all affairs of state, when required by the king. On this occasion, if the questions agitated are of great importance, and their unanimous opinions should be contrary to that of the king, he is required to follow their advice; though it cannot be easily imagined that so many great officers of the crown should decide against the king; but in every other case the sovereign is to hear their opinions, and afterwards act as he pleases. There are some other restraints on

the regal power in the present new form, but these are inconsiderable, and overbalanced by the king's authority and influence.

In Sweden, the common method of execution is beheading and hanging. Malefactors are never put to death, except for very atrocious crimes; such as treason, murder, adultery, house-breaking, highway robbery, or repeated thefts. Other crimes, many of which in some countries are considered as capital, are chiefly punished by whipping, condemnation to live without bread and water, imprisonment and hard labour, either for life, or for a stated time, according to the nature of the offence. For murder, the hand of the criminal is first chopped off, and he is then beheaded and quartered; women, after being beheaded, instead of being quartered, are burned. Criminals of the nobility or gentry are usually shot to death. No capital punishment is inflicted before the king confirms the sentence. Every prisoner is at liberty to petition the king within a month after the trial. The petition either complains of unjust condemnation, and in such a case demands a reversal of the sentence; or else prays for pardon, or mitigation of punishment. Till the reign of the present king, criminals were tortured to extort confession; but in 1773 his Swedish Majesty abolished this cruel and absurd practice. Debtors are punished with the utmost rigour; for if a person receives an affront, he is to complain to his national court, when the recantation of the offending party, and begging pardon in public, are generally awarded as a sufficient reparation of honour.

Titles of estates in Sweden are rendered perfectly secure by the registers of sales, mortgages, and alienations, kept by every tribunal. Estates descend by inheritance in equal portions to the children, of which portions a son inherits two, and a daughter one. It is not in the power of a parent to alter this disposition, unless a child proves vicious or disobedient, and even in such cases, he must first obtain a judicial sentence; but he may bequeath one-tenth of his acquired estate to his favourite child, whenever he pleases. If a man dies, whose estate is incumbered with debts, the heir is allowed three months to inquire into the circumstances of the deceased; at the expiration of which, if he declines accepting the inheritance, the law becomes next heir, and always administers.

The cities and principal towns in Sweden, most worthy of notice, are as follow:

Stockholm, the capital of this kingdom, stands 280 miles north-east from Copenhagen, 224 from Gottensburg, 342 from Wyburg, 387 west from Petersburg, 465 from Warsaw, 660 north from Vienna, 830 from Paris, and 790 north-east from London: it is situated on a cluster of small islands; the houses being built upon piles. If we include the two suburbs, one of which stands on the peninsula of Toren, and the other in Athundria, the town is as large and as populous as Bristol. The island on which the greatest part of the

city stands, is surrounded by two branches of a river,
that runs with great rapidity out of the lake Macler;
and over each of these arms there is a wooden bridge.
The prospect from the city is very beautiful, owing
to the lake being in view on one hand, and the sea on
the other.

The castle or palace is a spacious building, but de-
stitute both of taste and magnificence. It is not only
the residence of the royal family, but likewise of the
greater part of the officers belonging to the house-
hold. It also contains the national or supreme court
of justice, the colleges of war, chancery, treasury, and
commerce; a chapel, armory, library, and office for the
public records. This, together with all other public
buildings in the kingdom, are roofed with copper.
The palace of the nobility in which this order sits,
during the session of the diet, is an elegant building,
adorned on the outside with marble statues and col-
umns, and on the inside with paintings and sculp-
ture. This, together with three other palaces, stand
on the banks of the lake, and are built on the same
model, so as to compose one uniform piece of archi-
tecture. The bank, erected at the expence of the
city, is a noble edifice; and, with several other sump-
tuous buildings belonging to the nobility, exhibits a
very splendid appearance. The houses of the burghers
are generally built of brick in the city; but in the
suburbs they are commonly of timber, and therefore
very subject to conflagrations. These houses are fre-
quently framed in Finland, according to the plan and
dimensions prescribed; they are then conveyed in
pieces to Stockholm by water, and erected on the in-
tended spot by the carpenters. These houses, if kept
in proper repair, will last about thirty years, and are
 esteemed warmer and more healthy than those of
stone or brick. The number of house-keepers, who
pay taxes, are 60,000.

The city is divided into twelve wards, to prevent a
general desolation by fire; to each of these there is a
master and four assistants, who immediately repair to
the place where the fire breaks out; and all porters
and labourers are obliged to range themselves under
the master of the ward to which they belong. A cen-
inel is maintained in the steeple of every church, to
 toll the bell on the first appearance of fire, and a watch
patrols the streets during night, to alarm and give assist-
ance to the inhabitants.

The government of this city is in the hands of the
great stadtholder, who is also a privy councillor. He
 sits once a week in the town-house, and presides in the
 college of execution, assisted by an under stadtholder,
 and a bailiff of the castle. Next to him are the four
 burgomasters; one for justice, another for trade, the
 third for the polity of the city, and the fourth has
 the inspection over all public and private buildings, and
 determines such cases as arise on that account. With
 them the counsellors of the city always sit, and give
 their votes, the majority of which decides. Their

number is uncertain, but usually about twenty, mostly
merchants and shop-keepers, or such as have served the
king in some inferior employment. Besides their sa-
lary, they have an immunity from such impositions as
are laid on the inhabitants to support the government
of the city; which all its officers and servants,
maintains a guard of 600 men, and defrays the charge
of all public buildings and repairs. To support this
expence, besides a duty belonging to the city, of goods
imported and exported (which is about four per cent.
of the customs paid to the king, and amounts to about
5000*l.* per ann.) the magistrates impose a yearly tax
upon the burghers, in which they are assisted by a com-
mon-council of forty-eight, which chuses its own mem-
bers, and meet every spring, to proportion the payments
for the ensuing year. On the traders they usually im-
pose forty, fifty, or sixty pounds sterling; upon others
of a meaner condition, as shoe-makers, taylors, &c. five
or six pounds; and on no housekeeper less than fifteen
shillings; besides quartering the guards, inferior of-
ficers, and servants of the court, with other lesser
charges; which, all together, would be thought a great
burden, even in richer countries: neither is it oth-
erwise esteemed by the inhabitants of this city, who can
scarce be kept in heart by the privileges they enjoy, as
well in customs, as in the trade of the place, which
most needs pass through their hands; for the natives of
other parts of the kingdom, as all foreigners are obliged
to deal only with the burghers (except those of the
gentry, who make iron) have not the privilege to sell
it immediately to strangers.

This city is, in a manner, the staple of Sweden; to
which most of the goods of their own growth, as iron,
copper, wire, pitch, tar, masts, deals, &c. are brought
to be exported. The greatest part of the commodities
imported from abroad come to this port, where there
is a haven capable to receive 1000 sail of ships, and a
bridge or quay near an English mile long, to which the
greatest vessels may lie with their broadsides. The only
inconvenience is, that it is ten miles from the sea, the
river very crooked, and no tides. It opens into the
Baltic, but is of dangerous access, by reason of the
rocks. Within it is one of the most commodious har-
bours in Europe; for ships of the largest size lie close
to the quay, where they are so secure from the wind,
that they need neither anchors or cables to hold them.
Its entrance is defended by two forts.

Upsal stands on the banks of the river Sal, or Sala,
which falls into the lake of Ekolen, and is forty-two
miles distant from Stockholm towards the north-west.
It is a very ancient city, formerly the capital of the
north, and the seat of the king. It is divided into
two parts by the river, which is here pretty large, and
so hard frozen up in February, that a fair is yearly kept
there upon the ice in that month. The town is large,
but without any considerable fortifications. Here is to
be seen the finest church in the whole kingdom, namely,
the cathedral. It is covered with copper, and adorned
with

with several tombs, especially those of the kings. In the chapel, behind the altar, stands the monument of King Gustavus in marble, between the statues of his two wives, who lie also buried here. In another chapel is the tomb of king John's wife, who was mother to Sigismund III. king of Poland; it is of white marble. Above the city, on a steep hill, there is a beautiful castle, which is fortified. It is very large, built after the Italian manner, and has a noble prospect over the city, which it commands, and over the whole country.

Upsal was, at first, a bishop's see, but afterwards converted into an archbishopric by pope Alexander III. at the request of King Charles, successor to St. Erick. Stephen, who died in the year 1158, was the first archbishop of this see; and John Magnus, who, at the reformation, refused to admit the Lutheran confession, and removed to Rome, was the fifty-sixth. Since his time, there have been only Protestant archbishops, who do not live with the same pomp and magnificence as the Roman Catholic prelates used to do; for the latter never appeared in public without a retinue of 4 or 500 people on horseback.

The university of Upsal consists of a chancellor, who is always a great minister of state; a vice-chancellor, always the archbishop; and a rector, chosen out of the professors, of which there are about twenty, that have each 120*l.* a year salary. The ordinary number of students is about 7 or 800, fifty of which are maintained by the king, and some few others were formerly by persons of quality: the rest, that cannot subsist of themselves, spend the vacation in gathering the charities of the diocese they belong to, which is commonly given them in corn, butter, dried fish, or flesh, &c. upon which they subsist at the university the rest of the year. They do not live collegiately, but in private houses; wear no gowns, nor observe any other discipline than their own necessity or dispositions lead them to.

The city of Upsal boasts the residence of the celebrated Linnæus, who was the head of the university, and whose fame in natural history is as great as that of Charles XII. for his victories. This great man, who was of a social communicative disposition, always received strangers with the greatest politeness, and was happy in solving any questions in the line of his botanical profession, which they might propound. To him we are indebted for an account of the Swedish turnip, a root of inestimable value in this country. He says, the farmers had it originally from Lapland. It spread by degrees through the northern parts of the kingdom, and was found of more use than all the other winter plants put together. The great property of it is resisting the sharpest and most continual frosts known in the country. Besides this, cattle are remarkably fond of them, and will thrive on them better than on any other winter plant. One of the greatest advantages of the culture of this root, is its being as good a preparation for corn as

a fallow of mere ploughing, which is an object of infinite importance.

Gottenburg was erected in the year 1607, during the reign of Charles IX. whose successors indulged it with many extraordinary privileges, in consequence of which it is become a place of considerable commerce. The Danes, in the year 1641, exerted their utmost endeavours for the destruction of this city, but they proved ineffectual; and it is at present one of the strongest maritime towns in the kingdom. At Skaren, about eighty miles to the north-west of Gottenburg, was the seat of the ancient kings of Sweden. The ruins of the palace are still to be seen; and, if any judgment may be formed from the walls and other remains of the structure, it appears to have been a very stately edifice. Near this palace, stands the mountain Kendaculle, remarkable for its height and fertility; for it is covered with a great variety of trees, shrubs, herbs, and plants, affording at once a beautiful prospect, and food and shelter to a vast number of birds that frequent it in summer.

Norkoping, the chief town of East Gothland Proper, stands about seventy-five miles to the southward of Stockholm, on the bank of a stream which runs from the lake Velter to the gulf of Brawiken. The town is large, populous, and hath considerable commerce.

Calmar, capital of the district of Smaland, is a very considerable city. It is situated 160 miles to the southward of Stockholm, and built upon a strait of the Baltic, called Calmar Sund, which is situated opposite to the isle of Oeland. It is divided into the Old and New Town. Old Calmar is famous by a deed executed there in the year 1393, by which the three northern crowns of Sweden, Norway, and Denmark, were settled on the head of Queen Margaret. This is called in history the union of Calmar. Eric, Margaret's successor, founded thirteen prebends here, and gave a decree, by which he put the church of Calmar among the collegiate ones. After the division of the crowns, which the fatal union of Calmar had united, this city became a frontier town, with regard to the Danes, who were in possession of Schonen. It was often taken, retaken, and plundered; and, to complete its ruin, it was burnt down to the ground in the year 1547; nothing escaped the fire but the church, and about threecore houses. Soon after this misfortune, the new city was built at a musquet shot's distance from the old town, in a little island called Ovarnholm. This new city is large, the streets are broad and straight, and the houses well built, but the town is not populous. The new fortifications consist only of thick walls built with large pebble stones taken out of the sea, and a few ramparts built only with sand, and therefore supported by another wall, which the sea surrounds almost on all sides, except the gate. The situation of this city renders it very strong, all the avenues to it being full of marshes, or cut off by water from the sea, which abounds here with rocks, between which there are, as it were, so many abysses, that it is impossible to approach the

place either in boats, on horseback, or on foot. On the sea-side there is a long mole built with stone, along which boats and ships ride secure. This mole is defended by a fortress called Grimkar, built at about fifty paces from it, on a rock surrounded by the sea, and where a garrison is constantly kept. Behind the Old Town stands the castle, which is of very difficult access, having on one side the sea, which is full of rocks, and, on the other, good ramparts, large bastions, and ditches full of water. This city is at present the residence of a superintendent for the government of the clergy, who is honoured with a place in the public consistory of the kingdom. This is a town of good trade, and the passage from Sweden into Germany.

Abo, the capital of Finland Proper, is situated on the Bothnic gulf at the mouth of the river Aurojoki, opposite to the isle of Aland. This is said to be a wretched capital of a barbarous province. The houses are almost all of wood, and the archiepiscopal palace is composed of no better materials, and is painted red. Here is, however, an university, which was founded and endowed by the celebrated queen Christina.

Wibby, or Wisburg, the chief place of Gothland, or Gothia Insula, is situated on the western coast of the island. It is built on the declivity of a rock near the sea shore, is surrounded with a strong wall, and defended by a pretty strong castle, erected near the harbour, where the governor of the island usually resides. This was formerly a considerable city, but is now very much decayed.

Carlsrona, the capital of the province of Blekingen, and the residence of the governor, is situated on the shore of the Baltic, and built on a large rock, which forms an island. Charles XI. by whom it was founded, honoured it with his name, and gave it the privilege of being a staple town, that is, a town having a magazine, or repository for goods. To arrive at it, one must pass two other islands, which are joined to the continent by large bridges. On these two islands there are two suburbs, which are pretty extensive, but as they are inhabited only by the lower classes of people, they are ill-built and dirty. This, however, is not the case with the town itself, which is well built, though the greater part of the houses are of wood. Several of them consist of three stories, ornamented with sculpture and colonades, and so neatly painted, that they exhibit a very handsome appearance. Great pains are bestowed upon the embellishment of this place, and no expence is spared to render it in time one of the prettiest towns in Sweden. A church, built at one of its extremities, towards the dock-yard, will contribute much to ornament it, as well as the square, in the centre of which it is erected. This square is very extensive, and, according to the plan laid down, will be bordered by several beautiful edifices. "Whilst I was at Carlsrona (says a late traveller) workmen were still employed in levelling it, and during my stay there, I often heard explosions, occasioned by their blowing up the rocks, which rendered it rugged and uneven. The

same operation was performed in different streets, where the rock rose in many places into points disagreeable to the sight, which were inconvenient for foot travellers, and prevented the use of carriages. Few of the streets are paved, and as you tread upon the bare rock, walking here is extremely fatiguing. The inhabitants of Carlsrona pretend that Blekingen is the most beautiful province in the whole kingdom. I am not, however, entirely of the same opinion; for towards Smoland it appears to be very mountainous, but towards Scandia the country becomes level, exhibits every mark of fertility, and is covered with beautiful trees, and among others the oak. I saw also several flourishing estates belonging to different proprietors, ornamented with mansions, which at a distance seem to be so many castles. These houses for the most part are built of wood, and have a magnificent aspect. This province maintains no land soldiers, but is obliged to furnish a regiment of marines.

"The marine militia, dispersed throughout different parts of Sweden, amount to about 13,000 men, of whom no more than a thousand are employed in the time of peace, or when they are not exercised. The garrison of Carlsrona consists of about sixteen hundred men, divided into three companies. As I was furnished with two letters of recommendation, one to Mr. Pylgardt, a rich merchant, who was honoured with the title of patron of the mines; and the other to rear-admiral Chapman, director of the dock-yard, I was received by both these gentlemen in the politest manner. Having signified to the latter, that I had come to Carlsrona partly with a view to see the works at the dock-yard, and the new dock, which I had heard so much celebrated, he promised to procure me admission to them next morning, and in the mean time permitted me to examine the plans of them drawn by himself. Rear-admiral Chapman is a gentleman as much valued for his personal qualities as for his abilities, which raised him to his present station. He is much respected, and the Swedes entertain a high opinion of him, and particularly with regard to his skill in constructing ships. He has invented a new form for the hulls, and it is asserted, that all vessels built after his model, are infinitely better sailers than others. He has written a treatise on naval affairs, which is held in great estimation.

"Next day he was so obliging as to send an officer to me, who had served in Holland under Mr. Dodel, and who bestowed the highest praises on his old captain, whose character and abilities he greatly extolled. The officer who, by admiral Nort-Aiker's permission, conducted me to the dock, and the port of Stockholm, had also been in the Dutch service, and had sailed in the Zephyr, under the command of Mr. Van Oyen. It shewed a very polite attention in these two admirals, to procure me guides, who had served an apprenticeship in our republic, and who spoke Dutch.

"They conducted me to the port, which is capacious, very commodious, and surrounded by docks. Vessels

out of commission are moored here close to a long bridge, which affords one the pleasure of walking across the whole fleet. I counted here twenty vessels, comprehending ships of the line and frigates, among which I saw one of 100 guns, one of 96, one of 84, two of 74, and several from 50 to 60. I saw nine vessels which had been constructed in the course of four years. Five of these nine were entirely finished, and sitting out; the other four were launched, but not rigged. There were several others on the stocks, either begun or having their inside timbers put together. One in particular was pointed out to me, all the parts of which having been prepared beforehand, was constructed in the space of six weeks. The plan for renewing the Swedish navy was formed several years ago; part of 1782 was employed in procuring and preparing the materials, and in 1783 vessels began to be built. It is intended to continue to construct four ships annually, until the navy shall be put on a respectable footing. To defray the expence incurred by the execution of this plan, the king has suspended the half of the works at the new dock, until the navy shall be in that state which is desired. I saw every thing relating to the docks, and my conductor was so polite as to point out to me what was principally worthy of notice. The most perfect order seems to prevail here. After this we went to see the new dock, of which I formed a very high idea, from what I had heard; but I confess that what I saw far surpassed my expectation. This is a work worthy of the ancient Romans: workmen have been employed on it for twenty-nine years, and a considerable length of time will still be necessary before it can be finished. At the entrance of the dock there is a bafon cut out in the solid rock, about 50 feet in depth, and so large that four men of war may be loaded or unloaded together along its quays, which are built of cut stone. From this bafon each vessel may enter its lodge by means of large sluices, and canals of communication. Twenty of these lodges are destined for ships of the line, and ten for frigates.

One of these lodges, with its canal and sluice, is entirely finished. The bottom of it is cut out in the rock, and the sides are built of cut stone, joined together with Pozzolane, which is a kind of cement, brought from Italy at a very great expence. The bottom of it is shaped like the keel of a vessel. Along each side of the lodge there are two rows of steps, which serve for supporting beams and scaffolding when the vessel is dry, and has need of being repaired. The walls which support the roof are of cut stone, joined with the same kind of cement as before. These walls, which are at least twenty feet in thickness to the top, where they must be on a level with the upper deck of the vessel, separate the different lodges. At that height they are converted into platforms, which communicate with the interior part of the lodge, by means of large arched windows. These platforms are in-

tended to receive the guns of each vessel, which may be conveyed in or taken out through these windows, constructed in such a manner as to be opened or shut according to circumstances. The roof is of wood, covered on the outside with large plates of iron, and formed so as to serve as a fulcrum or prop to different levers, employed in loading or unloading the vessel. The sluice of communication is made with so much art, that the small force of two feet of water raises it, and makes it turn. When the canal and lodge have received the requisite quantity of water, the vessel enters; and when it may be necessary to leave it dry, a communication at the bottom of the lodge is opened by a machine made expressly for that purpose, and the water runs into a bafon much lower than the lodge, and cut out also in the rock, from which it is conveyed into the bafon before mentioned by means of a windmill. Whilst I was here, workmen were employed in constructing a second lodge. The first may serve as a specimen of the magnificence of the whole work. When finished, these lodges will form a vast semicircle, but, according to every appearance, they never will be brought to perfection. The immense sums which government is obliged to expend, will perhaps induce them, instead of finishing this, to complete rather the old dock, which will be of as much utility as the new, though ships cannot be laid up there under cover, and in lodges.

It is very doubtful, whether vessels preserved in this manner last longer than others. Even supposing that ships sheltered from the inclemencies of the weather, are less subject to rot than those which remain in the open air, it is to be inquired, whether the millions expended in constructing these lodges, sluices, canals, &c. and the repairs, which all these require, can be compensated by the savings gained by keeping vessels in this manner.

The person who suggested the first idea of this new dock, which was begun in the reign of Gustavus III. is a very old man, of the name of Thunberg. He has a son, who is reckoned to be equally expert as his father. This Thunberg has the direction of the works and sluices, which have been constructed along the Gotha. The old dock was begun in 1715, after the plan of Polheim the engineer, and finished in 1724. It is a kind of canal, 350 feet in length, and nearly 30 in depth, dug entirely out of the rock. It is situated between the port and the new dock, and communicates on the one side with the dock-yard and the port, and the other with the sea, by two canals, sufficiently large for a first-rate man of war to enter or go out. These canals are shut by large sluices. Before that which opens a communication to the sea, there is a piece of machinery, very ingeniously constructed, which defends it from the efforts of a high tide. When a ship is brought in here, and when it is necessary to leave her dry, in order to be hove down, the sluices are shut, and, by means of an immense

pump.

pump, put in the dock is raised twelve hours. which the Dutch raised, yet, when the solid rock works are nothing more, are not equal.

pump,

pump, put in motion by several men or some horses,
the dock is rendered perfectly dry in the space of
twelve hours. The dykes, sluices, canals, and mills,
which the Dutch industry has executed, are justly ad-
mired, yet, when we consider that all this is cut out
of the solid rock, we are obliged to confess, that our
works are nothing in comparison of these, which, per-
haps, are not equalled by any in Europe.

The entrance of the port of Carlscrona is easy on
account of its great depth, and it is so large as to be
capable of containing an hundred ships of the line.
It is defended by two very strong forts, well mounted
with artillery, which are so planted, that when fired,
their shot crosses each other. These forts, the one
called *Kongsholm*, or the King's Island, and the other
Drininghiar, or the Queen's Rock, are situated upon
rocks in the sea, and could sink any ship which might
attempt to pass without their permission.

I saw in the harbour a small Squadron of six ships,
amounting from 60 to 70 guns each, and three frigates,
all ready to sail. This Squadron afforded exercise for
the conjectures of the politicians. Some believed that
it was destined for the service of the Empress of
Russia, whilst others pretended that it would be em-
ployed by the Dutch. All these conjectures were,
however, proved to be false, for it afterwards appeared
that this fleet was intended only for a naval review,
which took place in the presence of his majesty, in
1783.

The sailors belonging to the garrison of Carlscrona
are employed in different works in the dock-yard,
when they are not obliged to be on board their vessels.
The greater part of the officers are men of great ex-
perience, and must naturally be so, since, if they wish
for promotion, or to be held in any estimation, they
must travel, and serve for some time in foreign coun-
tries, and particularly in those states which are carry-
ing on war. This, doubtless, is an excellent regu-
lation, and must tend greatly to procure good naval
officers to Sweden. I quitted Carlscrona, delighted
with the town, and its inhabitants, as well as with
all the works, which I greatly admired.

Three miles thence I stopped at a large village called
Runneby, situated in Blekingen, half way between Carl-
scrona and Carlham, which is celebrated for its mar-
ket, and which appeared to me to be in a very flourish-
ing condition. At the distance of half a league from
this place, the little river of Aune forms a very singu-
lar cataract through rocks, which exhibit nothing but
ruination and ruin. The water precipitates itself be-
tween two enormous fragments of rock, which appear
to have once formed only one mass, and which at
present are at the distance of twenty or thirty feet
from each other. They stand exactly parallel, and
seem to be 40 or 50 feet in height. The one is as
convex in the interior part as the other is concave,
and a third of less size lies upon the top of them,
which forms a most singular bridge. The road passes

over it, and appears truly awful, on account of its
situation, and the horrible noise occasioned by the
efforts of the river, which throws itself with great
violence through the vacancy formed by these three
masses. Below the cataract are found immense shelves
of rock, around which the water in some places is up-
wards of forty feet in depth. Here I was in great
danger of losing my life, for as I was descending
with much difficulty and danger, and jumping from
one stone to another, in order to find a proper point of
view for taking a sketch of this picturesque scene,
I had the misfortune to fall, and had not my guide,
by laying hold of me, given me an opportunity of
clinging to the point of a rock, I should have tumbled
down the precipice, and been either drowned, or
dashed to pieces on the rocks by the force of the cur-
rent. This place, so remarkable for the different parts
of the rock, which are concave on the one side, and
convex on the other, evidently announces that an
earthquake or some other convulsion must have oc-
casioned here the most dreadful ravage. This river,
which is not large, throws itself into the Baltic, near
Runneby."

There are 24 towns in Sweden, called staple-towns,
where the merchants are allowed to import and ex-
port commodities in their own ships. Those towns
which have no foreign commerce, though lying near
the sea, are called land-towns. A third kind are
termed mine-towns, as belonging to the mine-districts.

The revenues of Sweden formerly amounted to a
million sterling per annum, arising from crown-lands,
poll-money, tythes, silver, copper, and iron-mines;
but since the unfortunate wars of Charles XII. and
that which was afterwards engaged in with Russia,
they have been greatly reduced. Livonia, Bremen,
Verdun, and other places this kingdom was stripped
of, contained about 78,000 square miles. Her gold
and silver specie, in a former reign, arose chiefly from
the king's German dominions. The payments that
are made in copper, which is here the chief medium
of commerce, is extremely inconvenient, some of those
pieces being as large as tiles; and a cart or wheel-
barrow is often required to carry home a moderate sum.

The current coin of Sweden consists of gold ducats,
and eight-mark pieces of silver, valued at 5s. 2d. each;
but these are very scarce, and the inhabitants of Swe-
den have now very little specie, almost their only cir-
culating money consists of copper stamped, and small
bank-notes.

The standing army of Sweden, which, before the
loss of Livonia, was 60,000, may now amount to
about 40,000 men, horse and foot, and is properly
nothing more than a well regulated militia, under the
immediate command of freeholders, whose interest is
intimately connected with the liberty of their fellow-
subjects. The cavalry is raised and maintained by the
nobility and gentry, in proportion to the value of
their estates; and are under such regulations, that nei-
ther

the man nor horse, after having been once listed in the service, can be put to any other employment than what are specified in those regulations, both being required to be kept, with proper arms and equipage, in continual readiness for service. The infantry is maintained by the peasants: every farm of 60l. per annum or upwards, being charged with the support of one foot soldier, finding him in diet, lodging, ordinary clothes, and about 20s. a year in money; or, in lieu of all these, a little wooden hut is built for him by the farmer, who allows him hay, and pasturage for a cow, and ploughs and sows land enough to supply him with bread. When embodied, the army is subject to the military law; but at other times to the civil law of the country. Each company is exercised once in a month, and every regiment reviewed twice or thrice a year; on which occasions only they wear their uniforms, which, when the service is over, are carefully deposited in the churches.

The navy of Sweden formerly consisted of 40 sail of the line; and, till of late years, their ships, together with the docks, were suffered to run greatly to decay.

With respect to the political disposition of the Swedes, and the nature of their constitution, the following observations naturally present themselves:

It clearly appears, that these people have, at some periods, discovered an ardent love of liberty; at others, they have seemed fitted only for slavery: and when they were labouring to render themselves free, they have wanted that sound political knowledge, which would have pointed out to them the surest methods for securing their proper freedom. The most capital defect of the Swedish constitution was the total want of a proper balance of its parts: and the division of the Swedish nation into three distinct classes, of nobles, burghers, and peasants, whose interests were perpetually clashing, has been a circumstance very unfavourable to the liberty of the Swedes. The power of their kings was much restrained; but no sufficient regulations were adopted for securing the personal freedom of the subject. These defects in the Swedish constitution paved the way for the late revolution; but it is, notwithstanding, a just subject of surprise, that a bold and hardy people, who had so cautiously limited the power of their prince, should at once, without a struggle, suffer him to proceed to so great an extension of his authority, so as at length to alter and subvert that constitution which their fathers had bequeathed to them after the death of Charles XII. as a bulwark against any attempts their future monarchs might make to deprive them of their privileges.

A COMPENDIOUS HISTORY OF SWEDEN,

From the earliest Accounts to the late Revolution.

THE history of this country, for many years after the establishment of Christianity, is very obscure and

uninteresting, unless a recital of murders, massacres, and ravages, deserve attention; nor is there any consistency in the accounts of historians till about the middle of the 14th century, when it assumes a more regular aspect, and affords wherewith to recompense the attention of those who choose to make it an object of their studies. At this time, however, the government of the Swedes was far from being clearly ascertained, or uniformly administered. The crown was elective, though in this election the rights of blood were not altogether disregarded.

The whole wealth and lands of the kingdom were divided between the nobles and clergy. The peasants toiled to support a few worthless mortals in pomp and luxury. Agriculture was little known and less practised; and commerce was in its cradle, and the arts and sciences banished from the kingdom. To complete the misery of Sweden, there existed the most deadly dissensions between the clergy and nobility, and the blood of the people was spilt in quarrels not their own. Sometimes the king joined one party, and sometimes the other; but whether the ecclesiastical or civil power prevailed, the people equally suffered, and their chains were as galling under the spiritual, as under the civil power. In this state of debility and distraction, Sweden was in no condition to resist the power of a foreign enemy. The Danes knew this, and, ever watchful to promote their own interests, and enlarge their territories, took advantage of the civil dissensions in Sweden, and subdued the kingdom.

Sweden continued in this deplorable situation for more than two centuries, sometimes under the nominal subjection of its own princes, sometimes united to the kingdom of Denmark, and in either case equally oppressed and insulted. Magnus Zadulus, who ascended the throne in 1276, seems to have been the first king of Sweden who pursued a regular system to increase his authority; and to succeed in this, he made the augmentation of the revenues of the crown his principal object. He was one of the ablest princes who had ever sat on the Swedish throne; by his art and address he prevailed upon the convention of estates to make very extraordinary grants to him for the support of his royal dignity. The augmentation of the revenues of the crown was naturally followed by a proportionable increase of the regal power; and Magnus, by the steady and vigorous exertion of this power, not only humbled the haughty spirit of the nobles, and created in the rest of the nation a respect for the royal dignity, with which they appear to have been but little acquainted; but at the same time, by employing his authority in many respects for the public good, reconciled his subjects to acts of power, which, when exercised by former monarchs, they would have opposed with the utmost violence. The successors of Magnus did not maintain their authority with equal ability; so that the government was for a considerable time in the most unsettled state, and

the nation thrown by the several conquests subjected to.

Margaret, daughter of Denmark, and the wife of the Swedish king, by her industry and the ambition of her son, rendered the penetration and conducting arduous of Calmar, so far from this remarkable Sweden, Denmark united under one crown in its turn, and equally among the reign of

The maintain their author government was les unfetted state, and

the nation thrown into great disorder and confusion, by the several commotions and revolutions it became subject to.

Margaret, daughter and heiress of Valdemar, king of Denmark, and widow of Huguin, king of Norway, conveyed the sceptre of these united kingdoms in 1387, while Sweden was rent with faction. Possessed of all the ambition natural to her sex, and blessed with a penetration and vigour of mind necessary in conducting arduous enterprizes, she projected the union of Calmar, so famous in the North. By the articles of this remarkable treaty, the three kingdoms of Sweden, Denmark, and Norway, were to remain united under one sovereign, elected by each kingdom in its turn, and who should divide his residence equally among them. This union continued till the reign of

Christian II. who, filled with the lawless ideas of unbounded ambition, was not contented to reign over the northern nations in the manner of his predecessors; he disdain'd the thought of being confined by any compact, and determined to become absolute. He well knew that the nobility of Sweden would oppose his arbitrary measures with firmness and intrepidity; and therefore determined to put it out of their power to render his design abortive. Deaf to the dictates of conscience, and regardless of all laws both human and divine, he formed the horrid scheme of massacring all the Swedish nobility. The design was executed, but not so completely as he intended; Gustavus Vasa, a young prince, descended from the ancient kings of Sweden, made his escape to the mountains of Dalecarlia. Christian, dreading the return of this exile, who was greatly beloved by the people, took every method in his power to destroy him, and even set an immense price upon his head.

Vasa found means to elude every attempt; and after suffering a series of unparalleled hardships, and surmounting a thousand obstacles, prevailed upon the savage but warlike inhabitants of Dalecarlia to oppose the despotic proceedings of the tyrant. The attempt succeeded; and Gustavus was seated on the throne of his ancestors. The late massacre had freed Vasa from those proud and haughty nobles, who had so long prevented the establishing any regular government in Sweden: and though the dangerous power of the clergy still subsisted, yet the opinions of Luther, which then began to prevail in the North, together with the credit they had already acquired among the Swedes, gave the young king an opportunity of changing the religion of his country; and he accordingly established the Reformation in 1544. A regular monarchical government was thus founded on the ruins of a Gothic aristocracy, blended with a religious tyranny. The advantages of the change were soon visible; arts and manufactures were established and improved; letters and polite learning were introduced; navigation was studied, and commerce be-

gan to flourish. These advantages soon gave Sweden considerable weight in the political scale of Europe; and its friendship was courted by foreign princes. Gustavus paid the debt of nature in the year 1559, and was succeeded by his son

Eric, who fell far short of his father in abilities either for peace or war. He introduced the titles of count and baron, and made them hereditary; but his imprudent and causeless jealousy of his brothers soon put a period to his reign. The innocent princes were obliged to have recourse to arms, and the senate joining them, the forces of Eric were defeated, and himself deposed in 1566. The throne being thus vacant, it was given to

John, the brother of Eric. That prince, instead of studying to promote the happiness of his country, and cultivating the arts of peace, engaged in a ruinous war with Russia. Disappointed in executing his schemes of ambition, he turned his thoughts towards the church; and, by the advice of his queen, attempted to re-establish the Romish religion in Sweden. His first step was to reconcile himself to the Pope, which being accomplished, he made several efforts to establish his favourite religion. He had however soon the mortification to find that all his attempts were ineffectual, and that it was necessary to desist from his purpose. He notwithstanding found means to place his son Sigismund on the throne of Poland in 1587. This event filled him with hopes of his being able to complete his former scheme; but he found so many difficulties to encounter, that he died before it was accomplished, in 1592. On the death of John, his brother

Charles, who was a zealous Protestant, was chosen administrator of Sweden. Sigismund could not behold this advancement of Charles without envy; and endeavoured to deprive him of the honours conferred upon him, but without effect. Exasperated at the practices of Sigismund, the states of Sweden excluded him and his family from the throne, and placed the crown upon the head of Charles. Sigismund, who was not only a powerful prince himself, but also at the head of a strong party both in Sweden and Russia, rendered the reign of Charles very troublesome and uneasy. The Danes, hoping to profit by these disorders, invaded Sweden; but their progress was soon checked by Gustavus Adolphus, heir apparent to the crown, then only a youth. Confounded at meeting with a very different reception from what they expected, the Danes returned to their own country, leaving behind them sufficient marks of their cruelty. But this defeat did not restore peace to Sweden: Sigismund continued his practices; and Charles, after a troublesome reign of eighteen years, expired, leaving the crown to his son, who had given such early proofs of his abilities.

Gustavus Adolphus, though only in his 18th year when he ascended the throne in 1611, was declared of

age by the senate, and immediately applied himself to free his country from the troubles with which it was surrounded. He found himself, at this early period of life, engaged in a war with all his neighbours; his finances low, and his army undisciplined. But all these discouraging circumstances did not intimidate Gustavus; he surmounted every difficulty, and would have made himself master of the Russian empire, had not the love of independency, the ruling passion of that people, rendered his scheme abortive. A peace was concluded between the Swedes and the Russians in 1617, under the mediation of James I. of England, by which Gustavus recovered Livonia, with four towns in the prefecture of Novogorod, and received a large sum of money for reimbursing the charges of the war.

The princes of the house of Austria, jealous of the rising genius of Gustavus, supported Sigismund, his sworn enemy. The Swedish prince had now surmounted most of the difficulties which attended him at his accession to the throne. His finances were in a more flourishing condition; his army consisted of warlike and the best disciplined troops in Europe; he had himself seen a great deal of military service, and was assisted by the counsel and advice of La Gardie, one of the best generals, and wisest statesmen in Europe. With all these advantages Adolphus was not to be intimidated by the power of Sigismund, though assisted by the forces of Austria. He attacked and defeated the Polish army, and formed the siege of Dantzic, which must have fallen into his hands, had not a sudden rise of the Vistula obliged him to abandon the enterprise.

The Protestants of Germany had for some time formed a confederacy in support of their religion; but their army, under the command of Christian IV. king of Denmark, had been hitherto unsuccessful. The fame of Gustavus pointed him out as the most proper person to command the confederate forces; and experience soon convinced the protestant princes, that they had not made an improper choice: the most rapid series of victories attended the standard of Gustavus. He took Riga, over-ran all Livonia, was victorious in Poland, drove the Germans out of Mecklenburg, defeated and killed the famous count Tilly, the Austrian general, till then thought invincible, and over-ran all Franconia.

The house of Austria now trembled for its greatness. Wallenstein, another general of great reputation, was sent to command the Austrian army, and a dreadful battle ensued at Lutzen, where Gustavus was again victorious; but he received a mortal wound in the contest, and died on the field of battle, soon after the defeat of the enemy, in the year 1633. The death of Gustavus saved the house of Austria; but he left behind him a set of generals, trained by himself, who nobly supported the protestant cause, and maintained the glory of the Swedish arms with astonishing valour

and success. Their military actions will always shine with distinguished lustre in the annals of Europe.

Gustavus was fiery and impetuous, very severe, but nevertheless just and equitable. The following anecdote is related concerning him: One day, as his army was filing off before him, he grew angry with colonel Scato, who, endeavouring to excuse himself for his mistake, received a violent blow on the face from the hand of Gustavus. This correction was the more cruel and dishonourable, since, being given in public, it deprived the colonel of all hopes of retaliation. Scato, thus disgracefully humbled, immediately demanded his discharge, which was granted, and he retired. Gustavus, on his return to the palace, coolly reflecting on what had passed, soon perceived his error in thus dishonouring an useful subject, and ordered the colonel immediately into his presence; but Scato was gone, as supposed, to enter into the Danish service. Gustavus instantly quitted the palace, mounted his horse, and, attended only by a few domestics, went towards the frontiers which separated Sweden from Denmark. Gustavus, overtaking the colonel on the Danish borders, went up to him: "Colonel," said he, "you have been injured, and I was the cause of it; I am sorry for it, because I esteemed you: I am come here to give you satisfaction, being now out of my own dominions: here Scato and Gustavus are equal; here are a brace of pistols, and two swords, to revenge the insult if you can." Scato, astonished at such noble condescension, threw himself at the feet of Gustavus, thanked him heartily for the satisfaction he had condescended to give him, and swore an eternal fidelity to his service. Gustavus embraced him, and they returned together to Stockholm, where the king himself, in the presence of all his courtiers, related what had passed between him and Scato.

This prince, like Scipio, pursued study and the arts amidst his military fatigues. He would sometimes pleasantly say, "I will shew Grotius the difference between theory and practice, and how easy it is to prescribe rules, but how difficult to bring them into practice." As he exposed himself to great danger during the siege of Riga, he was advised to be more careful of himself: "Kings (answered he, smiling) seldom die in battles or sieges."

While he was besieging Ingoldstat, his horse was shot under him by a cannon ball: an officer having fled to his assistance, the king said very coolly, "I have nicely escaped, but it is plain the pear is not yet ripe." On another occasion, his chancellor beseeching him not to expose his life to such danger, the king answered him a little hastily, "You are always too cold in affairs, and stop me in my career." "It is true, Sire, (replied the chancellor) I am cold; but were I not sometimes to temper your fire with my ice, you would have long since been consumed."

The allies of Gustavus lamented his death; but the mean joy of his enemies, and particularly of the

Spaniards, cast this hero: a tragical death. The Death of Gustavus. Christina, the daughter of Gustavus, was only six years of age when she succeeded to the throne; but the great and summate political education, her prudence and discretion, which established her manner dictated Oxenstiern neglected his care; she received sufficient proofs of her kingdom. She was married to Charles, Salmassius, a courtier; expressed an excellent judgment in her patronage. She was a virtuous and indeed a fantastic religion, and knew suffer any performance on the throne of Sweden. Her cousin, Charles X. was crowned at Stockholm, and retired to his estate. Charles X. was crowned in the year 1659, on the 11th of August. He was successful in his reign, and received from them a good opinion of his government. He soon left their country, and returned to his own. We have seen this monarch in his march to his capital. He died in the year 1675, and his crown to his son Charles XI. who was crowned in the year 1675. He died; which was intrusted to the young prince during his minority. The European powers were alarmed at the island of Bornholm, which were ceded to the Danes. He was however in a state of peace, though the guard was prudent to carry a great weight in the young prince came to a treaty with Louis XIV. that the French universal monarch should be joined in an alliance, or rendering the Danes happy. Happy was his engager.

Spaniards, cast an additional lustre on the ashes of this hero: Philip IV. had even the meanness to be present at a tragedy, or rather a burlesque farce, called "The Death of the King of Sweden," the representations of which lasted twelve days.

Christina, the daughter and successor of Gustavus, was only six years of age when her father was killed; but the great chancellor Oxenstiern, at once a consummate politician and general, who had the care of her education, held the reins of government with such prudence and discretion, that the peace of Westphalia, which established a new system in Europe, was in a manner dictated by the queen of Sweden. Nor did Oxenstiern neglect the young princefs committed to his care; she received a noble education, and gave sufficient proofs of her ability to govern a powerful kingdom. She was fond of learning, and invited Des Cartes, Salmasius, and other celebrated persons to her court; expressed a great regard for Grotius; and was an excellent judge of the polite arts, but not a liberal patroness. She had not sat long on the Swedish throne, before her fine genius took an uncommon, and indeed a fantastical turn; she embraced the Romish religion, and knowing that her subjects would not suffer any person of that persuasion to sit quietly on the throne of Sweden, she resigned her crown to her cousin, Charles Gustavus, son to the duke of Deux-Ponts, and retired to Rome, where she died.

Charles X. who ascended the Swedish throne in the year 1659, on the resignation of Christina, was very successful in his wars against the Poles; he even received from them an oath of allegiance, but had no sooner left their country, than they renounced it, unwilling, perhaps, to forfeit their character of independence. We have already mentioned the success of this monarch in his war against the Danes, and of his marching his army over the ice to besiege Copenhagen. He died of a fever in the year 1660, leaving his crown to his son,

Charles XI. who was only in his fifth year when his father died; which rendered it necessary for those who were intrusted with the government of the kingdom during his minority, to conclude a peace with all the European powers, though attended with the loss of the island of Bornholm, and Drontheim in Norway, which were ceded to the Danes. The Swedish forces were however in a very respectable condition, so that, though the guardians of Charles did not think it prudent to carry on expensive wars, the kingdom had great weight in the affairs of Europe. When the young prince came of age, he concluded a subsidiary treaty with Louis XIV. but soon after perceiving that the French monarch had formed a scheme of universal monarchy, he abandoned his connections, and joined in an alliance with England and Holland, for rendering the ambitious intentions of that prince abortive. Happy had it been for him, had he fulfilled his engagements with the maritime powers;

but he afterwards joined with France, was totally defeated at Felim-Bellin, and a powerful confederacy was formed against him. The elector of Brandenburg made himself master of Swedish Pomerania, the bishop of Munster over-ran the duchies of Bremen and Verdun, and the Danes took Wismar, and several places in Schonen. Charles was however afterward victorious, and recovered by the treaty of St. Germain's all he had lost, a few places in Germany only excepted. Determined to render his army still more formidable, and himself despotic, instead of cultivating the arts of peace for the good of his country, he impoverished and enslaved his people: the states lost all their power, and Sweden was reduced to the same condition as Denmark. But this was not effected without great injustice, and the most arbitrary stretch of power.

The inhabitants of Livonia presented a petition to the king, in which they pointed out, in the strongest colours, the unjust proceedings of the parliament. This was, however, so far from procuring them the redress they expected, that they were considered as traitors to their country. The celebrated Patkul, whose great talents enabled him to place the impoverished state of his country, and the unjust proceedings of the government, in the most forcible point of light, was marked out for a sacrifice to despotic vengeance; but he fortunately made his escape. Charles however was not to be diverted from his purpose by petitions: he saw, unmoved, the miseries of his people, and determined to persevere in his arbitrary measures, though founded on cruelty and injustice. He succeeded; and became one of the most powerful princes in Europe. He did not indeed long enjoy his arbitrary government: he died in 1697, a few years after he had trampled on the liberties of his country, and was succeeded by

Charles XII. his son, who was a minor when he ascended the Swedish throne. His age of majority had been fixed by the will of his father to eighteen; but by the intrigues of count Piper, it was set aside for a more early date. The youth of Charles, on his ascending to the throne, encouraged the kings of Denmark and Poland, and the czar of Muscovy, to form a powerful confederacy against him; but he nobly opposed all their efforts, and landing in Zealand laid siege to Copenhagen. Reduced to extremity, the king of Denmark was obliged to sign the peace of Travendahl, by which the duke of Holstein was re-established in his dominions.

In the mean time Peter the Great, Czar of Muscovy, was ravaging Ingria at the head of 100,000 men, and had formed the siege of Narva. The Swedish army did not exceed 20,000 men, and lay at a great distance from Narva; but the impatience of Charles was so great, that he marched directly, at the head of four thousand horse, and an equal number of foot, to attack the Russian army. Peter had polled 40,000 men

men at a league's distance from the town, in the road through which it was necessary for Charles to pass; and at double that distance 30,000 more, and before them an advanced guard of five thousand. Charles was obliged to force his way through these three detachments before he could assault the grand army, lying in a camp before Riga, fortified with a rampart and double ditch.

The intrepidity of Charles surmounted all these difficulties: without giving the Russians time to know the number of his forces, he attacked all their posts successively. The advanced guard, imagining that the whole Swedish army was advancing, fled immediately at his approach. Terrified at the flight of their countrymen, the troops occupying the second post fled also in confusion; and those of the third followed their example. Charles lost no time, but pursuing the fugitives as close as possible, attacked and routed the grand Russian army, leaving near 20,000 of the enemy dead on the field of battle. Terrified at the name of a prince, who, at the head of such a handful of men, was able to defeat so numerous an army, the Russians ascribed his success to magic; and accordingly addressed their prayers to St. Nicolas, to protect them against the horrid crew of forcerers, combined together to destroy their country. After defeating the czar's army, Charles marched into Saxony, where he performed actions equal at least to those of the great Gustavus Adolphus; he dethroned Augustus, king of Poland, and placed the crown on the head of Stanislaus. His prodigious success rendered his name terrible to all the princes of Europe, and his friendship was courted by the most respectable powers. His conduct however was often so imprudent, and his stubbornness and implacable disposition so destructive of all peace, that he can only be considered in the light of an illustrious madman. The cruel and ignominious death to which he put the brave count Patkul, will be an eternal stain on his memory, which all his victories can never obliterate.

After his success in Poland, he formed the romantic design of dethroning Peter the Great, and accordingly marched his army into Russia, and besieged the town of Pultowa. The czar's army had now seen a great deal of service, were inured to discipline and hardships, and commanded by able and intrepid generals: it is therefore no wonder that Charles here suffered a reverse of fortune; his brave army was totally ruined, and he himself, with a few followers, obliged to take refuge among the Turks at Bender. Here he resided till the Mahometans found it necessary for their affairs for him to withdraw. He however refused to comply with repeated requests for that purpose, and even attempted to defend himself with three hundred men, against an army of 30,000 Turks, an action which proves him to have been worse than frantic. Even this reverse of fortune could not cure him of his

military frenzy; for after his return to his own dominions he prosecuted his revenge against Denmark with the utmost fury, till he was killed in the trenches at the siege of Frederichshall, in Norway. This event happened in 1718, when he was only thirty-six years of age. On the death of Charles XII. his sister

Ulrica Eleonora ascended the Swedish throne. We have already seen in what manner the Swedes recovered their liberty, and given the substance of the capitulation signed by the queen and her husband, when they entered on the exercise of the government. She immediately made a peace with all the belligerent powers combined against Sweden; though this could not be effected without considerable sacrifices made by Ulrica.

But the influence of the French court in Sweden, in consequence of their subsidies and intrigues, had occasioned considerable factions in that kingdom. In 1738, a most powerful party appeared in the diet in favour of French measures. The persons who composed it, went under the denomination of *Hats*. The object they held out to the nation, was, the recovery of some of the dominions yielded to Russia; and consequently the system they were to proceed upon, was, to break with that power, and connect themselves with France. The party directly opposed to them was headed by count Horn, and those who contributed to establish the new form of government, which was settled after the death of Charles XII. Their object was peace, and promoting the domestic welfare of the nation: the system, therefore, which they adopted, was, to maintain a close correspondence and friendship with Russia, and to avoid all further connection with France: these were styled the *Caps*. There was besides a third party, called the *Hunting Caps*, composed of persons who were as yet undetermined to which of the other two they would join themselves. These parties long continued; but the French party generally prevailed, greatly to the detriment of the real interest of the kingdom: during the last war, for instance, with the king of Prussia, the crown of Sweden, for the sake of a small subsidy from France, was forced to contract a debt of 2,500,000, which has since been considerably augmented, so that this debt now amounts to near five millions. Some efforts were employed by the English court to lessen or destroy the French influence in Sweden, and for some time they were successful: but the Hat party again acquired the ascendancy. These parties, however, are now abolished, in consequence of the late king of Sweden having made that total change in the government, which we shall presently give an ample account of.

At the death of Ulrica, who left no issue, the Swedes elected the prince of Holstein Eutin, bishop of Lubbeck, who ascended the throne in 1751. But he sufficiently felt the weight of the Swedish crown, and after a troublesome reign of twenty years, occasioned by the per-

 in February 1771, and was succeeded by his son
 Guiliavus III. of Holstein Gottorp, who was about
 twenty-five years of age when he was proclaimed
 king of Sweden: with an understanding much cul-
 tivated, he had a graceful and commanding elo-
 quation, and an insinuating address. At the time of
 his father's death, he was at Paris, from whence he
 returned in the most gracious terms to the senate, re-
 assuredly assuring them, that he designed to govern
 according to the laws. Not long after which, an
 extraordinary diet was convened to regulate the affairs
 of the government, and to settle the form of the
 coronation-oath.

On the 28th of March 1772, being some time after
 his arrival in Sweden, his majesty solemnly signed and
 swore to observe twenty-four articles, relative to his
 future administration of government; among which
 were the following: "The king promises, before
 God, to support the government of the kingdom as
 then established; to maintain the rights and liberties
 of the states, the liberties and security of all his sub-
 jects, to reign with gentleness and equity according to
 the laws of the kingdom, and to preserve the form of
 the regency as was established in the year 1720, and
 conformable to the present act of capitulation.—In
 consequence of the declaration of the itates, the king
 shall regard every person, who shall openly or secretly
 attempt to introduce absolute sovereignty, as a traitor
 to his country, and an enemy of the kingdom; and
 that before any person can take possession of an
 employment, he shall be required to take an oath
 respecting this matter.—The king promises to follow
 the regulations of the year 1720, with regard to the
 affairs of the cabinet and senate, which were always
 to be directed by a majority of votes; and that he will
 never do any thing therein without, and much less
 contrary to their advice.—And in order that the coun-
 cil of state may be satisfactorily convinced of the
 uprightnefs of his majesty's designs, and of his sincere
 love for the good of his people, he declares them to
 be entirely disengaged from their oath of fidelity,
 in case he wilfully acts contrary to his coronation
 oath, and to the capitulation.—And lastly, the king
 threatens any person with his highest displeasure,
 who shall be so inconsiderate as to propose to him a
 greater degree of power and splendor than is herein
 marked out, as his majesty desires only to be the
 powerful defender of his subjects against any en-
 croachments which may be made upon their lawful
 liberties, and to gain the affection of his faithful and
 loyal subjects."

Notwithstanding the king had taken these solemn
 oaths, to rule according to the then established form
 of government, and accepted the crown upon these
 conditions, it was not long before he formed a plan
 to govern as he thought proper, regarding these oaths
 only as matters of ceremony; and he made use of every

art, the most profound dissimulation, and the utmost
 dexterity and address, in order to render this hazard-
 ous enterprise successful.

At his first arrival at Stockholm, he adopted every
 method which might increase his popularity. He gave
 regular audience three times in the week, to all that
 presented themselves. He became easy of access to
 all his subjects of whatever rank, listened to them
 with courtesy, and entered into the minutest details
 of their complaints; and by appearing, in various re-
 spects, to interest himself in their welfare and hap-
 piness, was regarded and beloved as the common
 father of his people, who, in the warmth of their
 gratitude, did not consider that such an extraordinary
 conduct in their prince, tempered with so much con-
 descension, might possibly flow from sinister motives,
 or ambitious views, instead of principles of the purest
 benevolence.

While the king laboured, by these means, to render
 himself generally popular, he also endeavoured to per-
 suade the leading men, that he was inviolably attached
 to the constitution, that he was perfectly satisfied with
 the share of power allotted to him, and declared, on
 every occasion, that he considered it as his greatest
 glory to be the first citizen of a free people. He
 seemed intent only on banishing corruption, and pro-
 moting union: disclaimed being of any party but that
 of the nation at large, and engaged to pay the most
 implicit obedience to whatever should be enacted by
 the diet. Though these professions charmed great
 numbers into security, they at the same time caused
 suspicions in the breasts of a few, who, rather, thought
 his majesty promised too much to be in earnest. In
 the mean time there happened some contentions be-
 tween the different orders of the people; and no
 methods were left untried to foment their jealousies.

On the 19th of August 1772, when Gustavus found
 his scheme ripe for execution, having taken proper
 measures for bringing a considerable number of officers
 and soldiers over to his interest, all the military force
 of Stockholm being at his devotion, he planted gren-
 adiers, with fixed bayonets, at the door of the council-
 chamber, in which the senate were assembled, and
 made all the members of it prisoners: and that no
 intelligence of the transaction, in which the king
 was engaged, might be conveyed to any other part
 of the kingdom till the scheme was completed, cannon
 were drawn from the arsenal, and planted at the
 palace, the bridges, and at all the avenues leading to
 the town. All communication with the country was
 cut off, no one being allowed to leave the city with-
 out a passport from the king. Some of the senators
 were then confined in separate apartments in the
 palace. The remainder of this day was employed
 by the king in visiting different quarters of the town,
 in order to receive oaths of fidelity to him from the
 magistrates, colleges, and city militia.

The next day, oaths were tendered to the people in
 6 Q general,

general, to whom he addressed a speech, which he concluded by declaring that his only intention was to restore tranquillity to his native country, by suppressing licentiousness, overturning the aristocratic form of government, and restoring the ancient laws of Sweden, such as they were before 1680. "I renounce now," said he, "as I have already done, all idea of the abhorred absolute power, or what is called *sovereignty*, esteeming it still, as heretofore, my greatest glory to be the first citizen among a truly free people." After these assurances on the part of his majesty, heralds were sent into the different quarters of the town, to proclaim orders for an assembly of the states the following day. This proclamation contained a threat, that if any member of the state should without just cause absent himself, he should be considered and treated as a traitor.

On the 21st of August, in the morning, a large detachment of guards was ordered to take possession of the square where the house of nobles stands. Troops were also ordered to invest the palace on all sides, and cannon were planted in the court opposite the hall where the states were to meet. By the king's command, the several orders of the state were here compelled to assemble, and these military preparations were declared to be made in order to assist their deliberations.

The king being seated on his throne, surrounded by his guards, and a numerous band of officers, after having addressed a speech to the states, caused the plan of a new form of government to be read by a secretary, and offered it to the states for their acceptance, who thought proper to comply with what was required of them. The marshal of the diet, and the speakers of the other orders, then signed the form of government, and the states took the oath which the king had dictated to them. This transaction, which had been planned with great sagacity and judgment, conducted with secrecy, and effected by eloquence, concluded in a manner no less extraordinary: the king drew a book of psalms from his pocket, and, taking off his crown, began to sing *Te Deum*, in which the whole assembly joined: the senate took a new oath of allegiance to the prince, who gave them to understand that he intended in six years time again to convene an assembly of the states. Thus this great revolution was completed, and tranquillity restored, without any bloodshed; very few persons were imprisoned, and that only for a short time; nor did any of them experience, in the smallest degree, a diminution of the royal favour, on account of their opposition. And this remarkable event, which had produced an almost total change in the Swedish constitution, did not appear to have any influence on the conduct of Gustavus III. who continued to exercise with moderation the power he had thus assumed.

The circumstances of perfidy with which the revolution of 1772 was accompanied, were not likely to leave a favourable impression, with respect to the character of the king, on the minds of the people, and

particularly of the nobility. While he externally courted popularity, he was aiming to destroy whatever was popular in the state. While he made professions the most flattering, disclaimed the title of king, and affected to call himself only the first citizen of the republic, he was meditating the downfall of all that wore even the guise of freedom. While with his lips he pronounced the solemn oath by which he bound himself to maintain inviolate the constitution of 1720, his heart most have been internally conscious of the intended perjury. The revolution left many discontented spirits among persons of the first rank and character in the nation; and baron Pechlin, a nobleman of great worth and popularity, was among the most strenuous of its opponents.

It frequently happens that despotic power is not less difficult to maintain than to acquire. A standing army was the only instrument by which Gustavus could preserve his usurped authority; and yet to levy exorbitant taxes would not, in such a situation, have been a prudent measure. The intrigues of France were, therefore, triumphant on this occasion; he became of necessity the pensioner of that court, and the connexion was not dissolved till the finances of France became unable to support the detail of the public expences, and till the wise and upright administration of Necker directed the attention of the late monarch from foreign projects to internal economy and improvement.

It is generally believed that the necessitous king, when bereft of this resource, looked anxiously round for a source to supply his pressing wants, and it is as generally believed that his exertions in favour of the Ottoman cause in the late war were very amply rewarded. Of the nature of the connexion which afterwards took place between Gustavus and the court of Petersburg, but little is known. It is probable that he was the dupe of that insatiable power, whose views might be faintly directed to the possession of Sweden, when he had sufficiently exhausted his force in the absurd crusade in which, under her influence, he was about to engage.

The Swedish nation in the mean time had beheld the blood and treasure of the country squandered away in quarrels, in which they could not possibly have the most distant interest. They beheld something still more alarming. They beheld their king, under the influence of an insidious court, upon the point of raising his standard in the public defence of the cause of despotism, and saw him degraded to be a captain of banditti, marching to plunder the treasures, and crush the rising liberties of France.

The high spirit of the Swedish nobility was particularly manifested in the diets, and the very first of these which met after the revolution plainly evinced that the seeds of dissension had taken deep root in the minds even of those who swayed the highest offices of the state. In this diet, which met in 1778, the king attempted

tempted to re-establish the ancient classes among the
Swerdth nobles, viz. the high nobility, the equestrian
order, and the gentry. Each class was to vote separately,
and as every question was to be decided by the majority
of the classes, that is, by the union of any two, the king
flattered himself that a majority in the superior classes
would be easily obtained, and that in this manner the
people would be abused with the shew of representation,
while the substantial power remained in his own hands.
In this expectation, however, the views of the sovereign
were disappointed. The higher orders, who felt more and
more their own consequence, proved untractable; and the
lower house, who saw themselves degraded by this ar-
rangement, entered into a state of implacable opposition.

A motion by Mr. Hummelkein to ascertain and li-
mit the royal prerogative put a sudden termination to
the diet. The registers, &c. were sealed up, and have
ever since remained unopened in the royal closet. Nei-
ther was the diet which assembled in 1786 more satis-
factory to the views of Gustavus. Most of the measures
propofed by the king (the main object of which, it
must be confessed, was to replenish his exhausted trea-
sury) were rejected; and to obtain one point, the esta-
blishment of granaries under his inspection, he was ob-
liged to relinquish a prerogative which was attached to
the crown by the old constitution from the reign of
Gustavus Adolphus, that when the orders of the diet
should be divided on any question, the determination
should be referred to the king. This diet broke up with
unequivocal symptoms of dissatisfaction, and with mu-
tual recriminations between the king and its leading
members.

After such experience of their refractory conduct, it
is surprising the king should have been averse to the as-
sembling of the states at the commencement of the late
war. The revolt of the army at Frederickstadt, and the
urgent want of supplies, compelled him however to as-
semble a diet again in 1789. The discontents which
had prevailed in the former sessions seemed to increase
in this. Some popular laws were notwithstanding pas-
sed; in particular, the privileges which the nobility
had before exclusively enjoyed, were by a law of this
diet extended to all settled inhabitants of the kingdom.
This circumstance, and the attention which was paid
by the king to the inferior orders of citizens, probably
enabled him, with the concurrence of the people, when
the disputes increased, to imprison the leaders of the
dissatisfied nobles, among whom were the barons De-
geer, Maclean, Stiernhold, counts Horn, Ferfen, and
Brahe, &c.

The vice-marshal colonel Liljehorn observed a very
guarded conduct, but was generally considered as ill
affected to the measures of the court. Several young
gentlemen of spirit, among whom were counts Rib-
bing, Delagardie, and Stenbock, resigned their places;
the ladies deserted the drawing-rooms and assemblies;
the places of public amusement were closed for want
of a resort of company. In the end, a kind of compro-

mise took place. The prisoners were set at liberty, and
the king obtained his object with respect to supplies,
&c. and concluded the diet by abolishing the power of
the senate, which was a further step to arbitrary power,
and extremely obnoxious to the nobility.

Though Gustavus must necessarily have been ren-
dered averse to these assemblies, his necessities in the
beginning of 1792 compelled him once more to sum-
mon a diet, but every precaution was employed to ren-
der it as little injurious as possible to his usurped autho-
rity. The proclamation for assembling the diet was
issued only three weeks previous to its meeting, so that
the elections were made in haste, and the patriotic
party had no time to make any arrangements with re-
spect to their choice of representatives. Instead of
assembling in the capital, the states were ordered to meet
at Gessle, a solitary situation on the Bothnic Gulf, and
70 miles from Stockholm. The diet during the whole
of its deliberations was surrounded by mercenary
troops. Thus the expectations of the public were com-
pletely frustrated. No reform was effected, nor was
there any censure passed upon the king for the manifest
infraction of both the old and new constitutions, in
entering into war without the consent of the states.
In his great object, however, Gustavus found himself
in some measure disappointed; the diet were still too
parsimonious to satisfy either his necessities or his
wishes, and he was obliged to rest contented with only
a part of his demand. The diet was dissolved on the
24th of February 1792.

Notwithstanding the dissatisfaction which the con-
duct of Gustavus had excited was thus prevented from
bursting into an open flame, still the evil was not era-
dicated, and the sword of faction impended over his
devoted head. Not only the nobles, but the people
were averse to the crusade against France. The coun-
try was already sufficiently exhausted of its population
and its industry; the finances were miserably deranged;
immense loans had been negotiated; and the people
suffered equally from oppressive taxes, and a depreciated
paper currency. Perhaps private and personal offences
might co-operate with public grievances, to arm against
Gustavus that formidable conspiracy which was planned
even under his roof, and might hasten the catastrophe
which we have now to record.

Immediately on the dissolution of the diet at Gessle,
his majesty returned to Stockholm, where he probably
flattered himself that his address and affability would
dissipate the chagrin which his conduct at Gessle had
produced. On the 16th of March, as he was preparing
to attend a masquerade at the opera-house, he received
the following anonymous letter:

“ SIRE,

“ Deign to listen to the advice of a man, who, nei-
ther being attached to your service, nor desirous of your
favour,

favour, flatters not your crimes, but is desirous of averting the danger with which your life is menaced.

"Be assured, that a plot is formed to assassinate you. Those who have entered into it, are furious at being foiled last week, by the balls being countermanded. They have resolved to execute their scheme this day. Remain at home; avoid balls during the present year; thus the fanaticism of criminality will be suffered to evaporate. Avoid the road to Haga (the king's country residence); in fine, be upon your guard for at least a month.

"Do not endeavour to discover the author of this letter; the damnable project against your life is come to his knowledge by accident; be assured, however, that he has not any interest whatever in forewarning you of your intended fate.

"If your mercenary troops had made use of any violence against the citizens at Gessle, the author of this letter would have fought against you sword in hand; but detests assassination."

On reading the note, the king, it is said, was observed to turn pale. He affected, however, to hear it with contempt, and to consider it as an insult to his courage, to attempt to deter him from enjoying his evening's entertainment. It was further remarked, that it was late before he entered the ball room; but after some time he sat down in a box with the comte D'Essen, and observed that he was not deceived in his contempt for the letter, since had there been any design against his life, no time could be more favourable than that moment. He then mingled, without apprehension, among the crowd; and just as he was preparing to retire, in company with the Prussian ambassador, he was surrounded by several persons in masks, one of whom fired a pistol at the back of the king, and lodged the contents in his body. A scene of dreadful confusion immediately ensued. The conspirators, amidst the general tumult and alarm, had time to retire to other parts of the room, but one of them had previously dropped his pistols and a dagger close by the wounded king. A general order was given to all the company to unmask, and the doors were immediately closed, but no person appeared with any particular distinguishing marks of guilt. The king was immediately conveyed to his apartment, and the surgeon, after extracting a ball and some slugs, gave favourable hopes of his majesty's recovery.

The 17th was a day of apprehension and terror. The Swedish guards were all under arms; patrols and pickets were ordered to traverse the streets of Stockholm both night and day; and the houses of the citizens were to be shut alter eight in the evening. Suspicions immediately fell upon such of the nobles as had been notorious for their opposition to the measures of the court. The anonymous letter was traced up to colonel Liljehorn, major in the king's guards, and he was immediately apprehended. But the most successful clue

that seemed to offer was, in consequence of the weapons which had fallen from the assassin. An order was issued, directing all the armourers, gunsmiths, and cutlers in Stockholm, to give every information in their power to the officers of justice concerning the weapons. A gunsmith, who had repaired the pistols, readily recognised them to be the same, which he had repaired some time since for a nobleman of the name of Ankarstrom, a captain in the army; and the cutler, who had made the dagger, referred at once to the same person.

No sooner was Ankarstrom apprehended, than he confessed with an air of manifest triumph, that he was the person "who had endeavoured to liberate his country from a monster and a tyrant." Suspicions at that same time fell on the counts Horn and Ribbing, baron Pechlin, baron Ehrensvard, baron Hartsmundorf, Baron Engerstrom the royal secretary, and others. Baron Beilke, the king's private secretary, being also apprehended on suspicion, declared without hesitation that he was privy to the plot, but added, that he had provided against the punishment which he knew awaited him, and against the risk of being compelled by torture to betray those who were associated with him. He had in fact swallowed poison, and expired shortly after this declaration. His body was afterwards drawn on a hurdle, and exposed to public view at the common place of execution.

It appeared from the confession of Ankarstrom, that he had been himself a principal in the conspiracy from the beginning. That in consequence of an intimacy which existed between him and count Horn, they had often been led to converse upon political subjects, on which they were perfectly agreed. They deplored the annihilation of their country's liberty and constitution, and resented the recent calamities which the false ambition of Gustavus had brought upon the nation, and concluded, that the only means of redressing the grievances under which it laboured, and of rescuing it from others which were still more to be apprehended, would be to assassinate the king, or at least remove him from the government. In consequence of this determination, they concerted a plan for carrying him off by night from his villa at Haga, where he usually slept; and in the beginning of January they walked round through the park and woods of Haga, but found every avenue too securely guarded.

Count Ribbing was informed of the conspiracy through count Horn, and readily acceded to it. Ankarstrom undertook to be the immediate agent for the assassination; and with this intention, in company with count Horn, he attended the theatre on the 10th of January, and sat in the next box to the king's, but his majesty did not appear at the theatre that evening. With the same purpose in view they went to the masquerade, which was given by the king on the 11th of the same month; but as the concourse of people did not appear sufficient to afford them any hopes of concealment, the design was deferred.

The king was Ankarstrom and Stockholm. The masquerade was performed by the king and baron Horn approved. The king was Ankarstrom, not seeing his dagger in or with a tremor, Ankarstrom on the floor mingle immediate cry of fire, w appearance of the king's death. The king lay March. The

The king was accompanied to the diet at Gessle by Ankerstrom and Ribbing, who returned with him to Stockholm. They determined to effect their purpose by a masquerade on the 2d of March, but that enter-ainment was put off. Count Ribbing informed Liljeborn and baron Pechlin of the plot, which both of them approved, and promised their assistance. On the 16th of March, when Ankerstrom had fired his pistol, not seeing the king fall immediately, he drew his dagger in order to effect his purpose, but was seized with a tremor, and dropped both the dagger and the pistol on the floor. He, however, had presence of mind to mingle immediately with the crowd, and to join in a cry of fire, which probably arose at first from the appearance of that confusion which it afterwards contributed to increase.

The king languished from the 17th to the 29th of March. At first the reports of his medical attendants were favourable; but on the 28th a mortification was found to have taken place, which terminated his existence in a few hours. On opening his body, a square piece of lead, and two rusty nails, were found unex-pected within the ribs.

Thus fell, by the hand of treason, Gustavus III. in his forty-sixth year.

Ankerstrom, in a subsequent examination, apologized for having so far exposed the secrets of his friends, by observing that no torture should have wrested this confession from him, had he not been informed that Liljeborn, who wrote the anonymous letter, and count Horn, were both in custody, and that his letters to the water had been seized by the government. He mentioned, slightly, that his private misfortunes, by which he probably alluded to some slights which he suffered from the king, had contributed to render him despe-rate. After a very fair and ample trial, Ankerstrom was condemned to be publicly and severely whipped on three successive days, his right hand and his head to be cut off, and his body impaled, which sentence he suffered not till the 17th of May, long after the death of the king. His property was given to his children, who, however, were compelled to change their name.

Counts Horn and Ribbing were condemned to lose their right hands, and to be decapitated. Colonel Liljeborn, and lieutenant Ehrenjwerd were also to be be-headed. All these conspirators were degraded from the rank of nobles, and their property declared to be confiscated. Major Hartmansdorf was to forfeit his rank in the army, and to be imprisoned for one year. Ankerstrom was to suffer perpetual imprisonment, and baron Pechlin and secretary Lillestrahle to be imprisoned during pleasure. Four others, accused of being concerned in the conspiracy, were pardoned, and some were acquitted.

During the king's illness, and particularly after he was made acquainted with the certainty of his approaching dissolution, Gustavus continued to display that unshaken courage which he had manifested on

every occasion during his life. A few hours before his decease he made some alterations in the arrangement of public affairs. He had before, by his will, appointed a council of regency; but convinced, by recent experience, how little he could depend on the attachment of his nobles, and being also aware of the necessity of a strong government in difficult times, he appointed his brother, the duke of Sudermania, sole regent, till his son, who was then about fourteen, shall have attained the age of eighteen years. Immediately on the death of the king, the young prince was proclaimed by the title of Gustavus IV.

The late Gustavus was a prince of high ambition, but rather a man of address than of ability. His manners were popular and insinuating, his eloquence fluent and bold. His conduct was, however, seldom tempered with judgment, or his speeches replete with solid information. He was too desirous of being great, to permit himself or his people to be happy; and the unfortunate predilection which he had imbibed for arbitrary power, made him, in reality, a slave and a dependent during the greater part of his reign. A passion for war in a sovereign is the greatest curse that can afflict a state; and if a revolutionary power could be established consistently with the safety of a limited monarchy, the great disqualification should be, the love of war. If in private life a turbulent disposition unfits a man for society, surely the evil is increased in an infinite proportion, where the lives of millions and the treasures of nations are wantonly squandered. By the imprudence of Gustavus in this respect, Sweden was exhausted of its resources, and reduced in its population; and had he proceeded on his wild enterprize against France, his country would, in all probability, at the termination of the crusade, have fallen an unresisting prey to the insatiable ambition of Russia.

As the king of Sweden was desirous of emulating, in every instance, the character of his uncle, the late king of Prussia, he was not superior to the vanity of appearing as an author. Some dramatic compositions, which were acted at the national theatre, we have heard well spoken of; but we must confess that none of his writings, that have fallen under our notice, deserve much commendation; and his orations, at the opening of the Swedish academy in particular, are turgid and yet feeble, poor in matter, and abounding only in words. It is but just, however, to add, that, except his love of war, which certainly always indicates a want of feeling and humanity in a character, the errors of Gustavus appear to have been rather errors of the understanding than of the heart. Even in desiring arbitrary power, he does not seem to have been prompted by any inclination to abuse it, for he was not practically a tyrant. The last scene of his life was such indeed as ought to blot from remembrance a long catalogue of crimes. His last words were a declaration of pardon to the conspirators against his life. The actual murderer alone was excepted, and he was excepted only at the

strong instance of the regent, and those who surrounded his majesty in his dying moments.

As a man, Gustavus had a mixture of character, in which the good seems almost to be predominant, inasmuch that it cannot be doubted that he was a bad king. His perfidy, his usurpation, his military spirit, all conspired against the good of his country; and, much as human nature shudders at the crime of assassination, still it cannot be dissembled that the death of Gustavus III. was a happy event for Sweden. The mild and equal conduct of the regent has preserved the country from the horrors of internal war, while the wisdom, spirit, and patriotism of his council, will probably save it from the insidious attacks of a restless and dangerous neighbour. Wisely averse to hostility, the duke of Sudermania has cultivated successfully the friendship of all the belligerent powers, except Russia. In the mean time, his attention has been laudably directed to excite the dormant spirit of industry in the nation; to the encouragement of their domestic manufactures, and to the enforcing of rigid economy among all the dependents of government, in order that the example of the court, co-operating with his own, may exert a salutary influence over the people in opposing the increase of luxury, gambling, and dissipation. It is a pleasure to contemplate such dispositions in so elevated a station; and while the regent perseveres in this conduct, he will undoubtedly merit the enviable title of the father of his country.

In the mean time, it is somewhat painful to reflect upon what a tottering balance, upon what trivial causes, the prosperity and happiness of nations is frequently found to depend. The attention of the public has been frequently called to the alarming increase of power which the great monarchs of Europe have lately achieved. In the case of Russia, that increase has been gradual, but it is the effect of system, and of a system, which, if pursued through the course of another protracted reign, must inevitably be attended with the most fatal consequences to the independence and liberties of Europe and of mankind. To Great-Britain herself, though the danger may appear remote, from the remoteness of the source, perhaps no more is reserved than the melancholy privilege of being the last devoured. The spirit of humanity rises indignantly at such unprovoked and unprincipled attacks upon the independence and freedom of a nation. In the subjugation and dismemberment of Poland, the spirit of that nefarious band of conspirators, who signed the treaty of Pilnitz, is sufficiently manifested; and that man who does not feel himself actuated by the strongest resentment at such violations of every thing that is laudable and right, must necessarily be deficient either in sense or in honesty.

Against a combination so hostile to the felicity of mankind, we are persuaded that nothing will act as a counterpoise, but a firm union among the weaker states; such a measure, whatever be their form of go-

vernment, or their political principles, it will be the undoubted interest to adopt. The alarm which has been raised against the extension of democratic principles, and the ill conduct of the French, which it is a part of our will either to dissemble or extenuate, has caused a considerable portion of the people of Europe to lose sight, for a moment, of the real danger which besets them; but we have sanguine hopes of the speedy return of common sense and reflection; and trust, that in fighting for a shadow, the nations of Europe will not expose themselves to the imminent danger of losing the substance.

The late sovereign Gustavus III. king of Sweden was born the 24th of January 1746, and succeeded his father Adolphus in 1771. He married Sophia-Margareta, the princess-royal of Denmark in 1766, by whom he has issue a prince, Gustavus-Adolphus, born November 1, 1778, now the reigning monarch. His brothers and sister are Charles, born in 1748; Frederic-Adolphus, in 1750; and Sophia-Albertina, in 1752.

The royal style is, King of the Goths and Vandals, Great Prince of Finland, Duke of Schonen, Pomerania, &c. Here are three orders of knighthood, viz. the order of the Polar star, the order of Vasa, and the order of the sword; the latter of these was created in the memorable year 1772.

C H A P. VII.

THE EMPIRE OF GREAT RUSSIA, OR MUSCOVY.

Situation, Extent, Provinces, Climate, Soil, Produce, Rivers, Population, Inhabitants, Customs, Laws, Government, &c.

RUSSIA is situated between the 47th and 72d deg. of north lat. and between the 29d and 69th deg. of east long. It is supposed to be about 1530 miles from west to east, and 1200 from north to south: these limits, however, are not to be entirely depended upon, as the eastern part is a mere desert, being entirely abandoned on account of the incursions of the Tartars, and the northern parts are rendered almost inaccessible by cold. We know, however, that the whole comprehends the northern parts of Europe and Asia, stretching from the Baltic and Sweden, on the west, to Kamtschatka and the eastern ocean; and on the north, from the Frozen Ocean to the 47th degree of latitude, where it is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caspian Seas, Great Tartary, Chinese Tartary, and other unknown regions in Asia.

This mighty empire, according to the most authentic accounts, consists of 15 provinces or governments, besides part of Carelia, Esthonia, Ingria, Livonia, and part of Finland, which were conquered from Sweden;

the Crimea, or Crim Tartary, anciently the Taurica Chersonesus, a peninsula in the Euxine Sea, formerly subject to the Turks, but added in the year 1783 to the Russian empire, with the isle of Taman, and part of Cuban; by the cession of which last the Russians are said to have gained above a million of subjects; also the duchy of Courland in Poland, of which the empress of Russia has now the entire disposal.
The Russian empire, in its most extensive sense, in-

cluding all the acquisitions in Tartary, now known by the name of Siberia, with the provinces above specified, is nearly equal in its dimensions to all the rest of Europe, and greater than the Roman empire in the zenith of its power, or the empire of Darius subdued by Alexander, or both put together. The proper divisions of Russia in Europe, with its acquisitions from Sweden in the present century, will be found in the following table.

Places.	Length	Breadth	Square Miles.	Chief Cities.

| 15. Moscow. | 30. Seeffk. |
| 16. Belgorod. | 31. Ukranic, or country of the Old Cossaks. |

The following nations, as comprehended in this vast empire, have been enumerated by Mr. Tooke, chaplain to the British factory at Petersburg, who has lately published an account of Russia, viz.

The Mongols, Kalmucs, Tartars, Samoiedes, Ostiaks, Buzattians, Jakutans, Tungusians, Voguls, Laplanders, Finns, Lettonians, Estonians, Lieffs, Ingrians, Ischerimiffes, Tschouwasches, Mordvines, Voriaks, Terptyalreis, Tartars of Kafan and Ofenbury, Tartars of Tobolsk, Tartars of Tomsk, Nogayan Tartars, Tartars of the Ob, Ischoulym Tartars, Katschintz Tartars, Teleutes, Abinzes, Biryouffes, Kurilians, Kistim and Toulbert Tartars, Vergho Tomskoi Tartars, Sayan Tartars, Touralinzes, Bougharians, Baschkirians, Meltscheraiks, Barabinzes, Kirkguifions, Belitirians, Yakoutes, and Kamtschedales, amounting, all together, to thirty-three nations, besides various others; but some of these are not considerable enough to be ranked as nations, but should rather be denominated distinct tribes.

The names of Russia and Muscovy, by which this empire is arbitrarily called, are probably owing to the ancient inhabitants, the Rusli or Borulli, and the river Mosca,

Mosca, upon which the ancient capital Moscow was built. It hath likewise been called White Russia, on account of the snow with which it is covered the greatest part of the year, but at present it is usually distinguished by the name Russia, the Russias, or Great Russia.

The climate of this vast empire varies according to the difference of situation. In the southern parts of Muscovy the longest day does not exceed fifteen hours and a half; whereas in the most northern, the sun in summer is seen for two months continually above the horizon. Notwithstanding these different climates, the air is in general exceeding cold in winter, and by the severity of it many persons are deprived of their limbs, and frequently of their lives, particularly towards the north, where the ground is covered three parts of the year with ice and snow. In this season, which begins about the latter end of August, and continues till the month of May, the rivers are frozen to the depth of four, and sometimes five feet; water sprinkled upwards with the hand, will freeze before it reaches to the ground; birds flying in the air will often fall down and die; and it is no uncommon thing for travellers to be frozen to death in their sledges. When the Russians go out, they are clothed so warmly that they almost bid defiance to frost and snow; and it is observable that the wind is seldom violent in the winter; but when there is much wind, the cold is exceedingly piercing. The method of warming the houses in Russia is by an oven constructed with several flues; and the country abounds with wood, which is the common fuel. These ovens serve also for the ordinary people to dress their food, and consume but a moderate quantity of wood, and the heat may be increased or diminished at pleasure. The heats of summer are in some provinces as scorching as the colds of winter are rigorous; on which account the quickness of vegetation is pretty much the same here as has been described in Sweden and Denmark.

The Russians derive one advantage from the severity of their climate, which is, the preserving provisions by the frost. Good housewives, as soon as the frost sets in for the winter, about the end of October, kill their poultry, and keep them in tubs packed up with a layer of snow between them, and then take them out for use as occasion requires: by which means they save the nourishment of the animal for several months. Veal frozen at Archangel, and brought to Peterburgh, is esteemed the finest they have, nor can it be distinguished at the table from what is fresh killed, being equally juicy. The markets in Petersburgh are by this means supplied in winter with all manner of provisions, at a much cheaper rate than would otherwise be possible; and it is not a little curious to see the vast stocks of whole hogs, sheep, fish, and other animals, which are piled up in the markets for sale. The method of thawing frozen provisions in Russia, is by immersing them in cold water: for when the opera-

tion of thawing them is effected by heat, it seems to occasion a violent fermentation: but when produced by cold water, the ice seems to be attracted out of the body, and forms a transparent incrustation round it. If a cabbage, when thoroughly frozen, be thawed by fire or hot water, it becomes so rancid and strong that it cannot be eaten; but if it be thawed by cold water, it is as fresh as if just gathered out of the garden.

With respect to the soil of Russia, it is rather more various than the climate. The southern provinces produce wheat, barley, rye, oats, peas, herbs, with various kinds of fruit; and all these with a vegetation so uncommonly expeditious, that corn is frequently reaped in two months after it begins to appear above the surface of the ground. This is attributed to the snow, which not only enriches and mellowes the land, but cherishes and shelters the produce of it, and makes it take deeper root.

The sowing time, in many parts, must follow the harvest immediately; because the summer not lasting above three months, there can be no sowing after the frost is begun. But in more moderate climes they will not sow till April or May, and their reaping time comes in August, and sometimes in July. As for manure, they have no need of any, the snow supplying that in every respect. Besides grain and fruit of various sorts, the country produces plenty of rhubarb, flax, hemp, good pasture for cattle, honey, wax, &c.

The astonishing quantity of mushrooms produced spontaneously in Russia are a great blessing and relief to the poor, while at the same time they are deemed delicacies at the tables of the rich and luxurious. It has been known, that above a thousand waggon loads of mushrooms have been annually sold at Moscow.

Agriculture was but little understood in this country till the time of Peter the Great, who brought his subjects in some measure better acquainted with it. The principal articles in a Russian farm are wax and honey, which sometimes produce to the peasant a competency: as he sells the wax and some of the honey, and makes a domestic drink of the rest. This drink is a kind of metheglin extremely strong, and very palatable. The Russian method of forming bee-hives is as follows: the peasant cuts down a tree, saws the trunk into many parts, hollows the pieces, then stops up the extremities, and bores small holes into the body for the admittance of the bees; then the bee-hive is made, and the honey secured from all the attacks of the bear, who is exceedingly fond of it, and tries a variety of experiments and stratagems, to make himself master of the sweet treasure.

The rye here serves not only for bread, but a strong spirituous liquor is extracted from it, which the Russians prefer to brandy.

Russia is in general a flat, level country, except towards the north, where the mountains are almost insurmountable, remarkably high, and of prodigious extent.

In the province of Vognlezi is a ridge, or chain, called Zimmopoiias, or the Girdle of the Earth, and supposed to be the Montes Riphæi of the ancients. On the western side of the Dnieper comes in part of the Carpathian mountains; and between the Black Sea and the Caspian, Mount Caucasus borders a range of vast plains extending to the sea of Oral. From Petersburg to the north part of France, by the road of Danzick, Hamburg, and Amsterdam, we scarcely can perceive the smallest hill; and from Petersburg to Pekin, there is hardly a mountain to be seen on the road through Independent Tartary.

Forests and woods abound in this empire, and produce fir trees of various kinds, oak, beech, alder, juniper, and many other sorts of inferior woods and shrubs; whereby the inhabitants are enabled to build very comfortable houses, and at the same time are supplied with fuel at a very easy rate, which, in so cold a climate, may justly be esteemed an infinite blessing. Their fir-trees are of the utmost advantage; it being from these they extract the tar and pitch; the process is as follows: a circular floor of clay is prepared, declining a little towards the centre, from whence a pipe of wood is laid; the upper part of this pipe is even with the floor, and extends ten feet beyond the circumference: under the end of this pipe the earth is dug away, and barrels placed to receive the tar as it runs upon the floor, upon which is placed a large pile of fir-wood, boughs, and branches, surrounded with a wall of earth. The whole is covered with earth and turf, except a small opening at the top, where the fire is first kindled; and when that begins to burn fiercely, this hole is likewise closed with earth, to prevent any flame. By means of this violent heat, which is tempered at pleasure, by thrusting sticks through the earthen walls, and letting in the air, the tar is forced down upon the floor, and runs through the wooden pipe into the barrels. Pitch is nothing more than tar boiled to a proper consistency. From the yellow mountain pine is extracted the common turpentine, and from that the oil of turpentine is extracted by distillation; the first running of which, being finer and more volatile, is usually called spirits of turpentine. The sediment left in the still is the common rosin, which, if taken out before it is drawn so high, is termed the yellow rosin, but, if left to evaporate to a greater degree, becomes black rosin. The Russians likewise extract frankincense from a species of fir and pine.

The rivers in Russia are very considerable, and among the first of them is placed the Wolga, which, after traversing the greatest part of Muscovy, and winding a course of above two thousand English miles, falls into the Caspian Sea. The source of this famous river is the lake of Uranow, near the city of Rzeva, or Modimerski, on the frontiers of Lithuania. The Wolga begins to be navigable about six miles below its source. Along its banks are found truffles and wild

asparagus, of a most delicious flavour, and the only oaks which are produced in Muscovy.

The Oby, formed by the junction of the Tobal and the Irtyis, in the sixty-fifth degree of northern latitude, runs northward into the Frozen Ocean, opposite to Nova Zembla, and is the boundary between Europe and Asia.

The Don, or Tanais, divides the most eastern parts of this empire from Asia. It has its source in the Rezan, and in its course towards the east approaches so near the Wolga, that the czar, Peter I. attempted to cut a communication between them. The river then runs towards the south-west, receives a great number of other rivers; waters several cities, forms many beautiful islands, and at last discharges itself into the Palus Mæotis, at the fortrefs of Asoph, about four hundred miles from its rise.

The Dwina rises in the province of Wologda, and, after running a northerly course, falls into the White Sea below Archangel.

The Nieper, formerly known by the name of the Boristhenes, rises in the province of Moscovy, runs through Poland, re-enters Muscovy, passes Kiof, waters the Ukraine, and, after a southerly course through Tartary, falls into the Euxine Sea at Oczakow.

The other rivers of Russia are the Mologaw, Mosco, Kiomo, Ocka, Samar, Dwina, and several less remarkable.

Some of the lakes in Russia extend above forty leagues in length. The lake Ladoga, on the borders of Finland, is formed by four rivers, the principal of which are the Vöxen, or Corela, the Fair, which flows into it from the lake of Onega, and the Volchova, which falls into it from the south. It has a communication by a channel with the Gulf of Finland. The lake Onega is likewise situated on the borders of Finland, and filled by a considerable number of rivers. This lake is forty leagues in length, and eighteen in breadth. The other considerable lakes are Brela-Ozera, Iwa-Noferocargapol, both which give their names to two different provinces; and Honnet, in the neighbourhood of the Great Novogorod.

The wild beasts in this country are much the same as those already described in Lapland, Norway, Sweden, &c. such as rein-deer, foxes, martins, hares, bears, ermines, fables, and squirrels. The lynx, famous for its piercing eye, is a native of this empire; it makes a prey of every creature it can master, and is said to be produced chiefly in the fir-wood forests. In the southern provinces are bred black cattle, camels, small horses, goats, sheep, &c. Their cows and sheep, as well as their horses, are small: the czar Peter encouraged a breed of large horses for war, and carriages.

The whole empire abounds with poultry, wild fowl, game, birds of prey, &c. most of which have been already described.

The different parts of this vast country are plentifully

fully supplied with various kinds of fish, by means of the Northern Ocean, Baltic, Gulf of Finland, White Sea, Black Sea, Caspian Sea, and innumerable lakes, rivers, rivulets, &c. These produce immense quantities of salmon, trout, pike, sturgeon, and beluga: the latter resembles a sturgeon, and is often called the large sturgeon; it is from 12 to 15 feet in length, and weighs from 9 to 16 and 18 hundred weight; its flesh is white and delicious. Of the roe of the sturgeon and the beluga the Russians make the famous caviare, so much esteemed for its richness and flavour, that it is often sent in presents to crowned heads.

In cutting up the beluga's, they often find a sort of stone, which is concealed in that mass of glandular flesh which covers the posterior part of the dorsal spine, supplying the place of a kidney in fish. The instant it is taken from the fish, it is soft and moist, but quickly hardens in the air. Its size is that of a hen's egg, shape sometimes oval and sometimes flattened, and commonly sells for a ruble: it holds a considerable rank, though with little merit, among the domestic remedies of the Russians, who scrape it, and, mixed with water, give it in difficult labours, in the diseases of children, and in other disorders. This stone is supposed by Professor Pallas to belong to the genitals of the fish.

The summer's heat hatches innumerable insects in the sand, morasses, forests, &c. and they are indeed very troublesome throughout the whole empire. Some are like those before described in the northern countries of Europe which we have already considered; and others are so imperfect as not to have received a name, or at least not to have been assigned to any particular species.

In Russia, mines and minerals are as plentiful as in Scandinavia; and the people are daily improving in working them. Mountains of rich iron ore are found in some places, most of which produce the load-stone, and yield from 50 to 70 per cent. Rich silver and copper mines are found on the confines of Siberia. Here is also lead ore, which contains a small quantity of silver. The green lead-ore is very rare; but, when found, it is variegated with a yellowish green colour, and is semi-transparent.

The population of this vast empire has been greatly miscalculated by several authors; since nothing can be more injudicious, or remote from truth, than those accounts which make the whole of it not to exceed, at most, seven millions. It is not a little surprising that writers should remain so long under this mistake, when we consider the very numerous armies the sovereigns of Russia have brought into the field, and the long and bloody wars they have maintained in Europe and Asia. But the public has been at length undeceived in this matter, by a list, taken in 1747, by Mr. Voltaire, of all the males who paid the capitation or poll-tax, and which amount to 6,646,490. Boys and old men are included in this number; but girls and women are

not reckoned, nor boys born between the making of one register of the lands and another. Now, if we only reckon triple the number of heads subject to taxation, including women and girls, we shall find near twenty millions of souls. There may be added to this account 350,000 soldiers, and 200,000 nobility and clergy; as also (the same writer observes) the inhabitants of the conquered countries, namely, Livonia, Esthonia, Ingria, Carelia, and a part of Finland; the Ukraine, and the Don Cossacs, the Kalmucs, and the other Tartars. The Samoiedes, the Laplanders, the Ostiaks, and all the idolatrous people of Siberia, a country of greater extent than China, are not included in this list: the new register in 1764 contains 8,500,000 subject to the poll-tax.

A late ingenious writer, resident some time in Russia, has favoured us with the following estimate, which sets the matter in a clear point of view. He there informs us, that

Of the lower class of people paying the capitation tax, the whole number amounts to.....	18,000,000
Conquered provinces	1,200,000
Noble families.....	60,000
Clergy.....	100,000
Military.....	360,000
Civil.....	30,000
Ukraine, Siberia, Cossacs, &c.....	350,000
	20,100,000

To this calculation, we may reasonably suppose that the acquisitions of the Crimea and part of Cuban Tattary must have added near a million more, so that the subjects of this extensive empire may be estimated at 21,000,000.

When we consider that her Imperial Majesty now possesses many of the countries formerly inhabited by those prodigious swarms of barbarians who overwhelmed the Roman empire, there will be sufficient reason to believe, not only that her dominions must have been formerly better peopled than at present, but that even twenty-four millions are a thin population for the immense tract of country under her government. The like decrease in the inhabitants of some other parts of the globe may probably arise from the same natural causes; and it is highly probable that the vast quantities of strong and spirituous liquors, consumed by the inhabitants of the North, which are universally allowed to be unfriendly to health and generation, together with the introduction of the small-pox and venereal disease among them, must have greatly contributed to the depopulation of those countries.

The inhabitants of Russia are in general well-made, hardy, vigorous, and impatient of labour, especially in the field: the common soldiers, from a principle of superstition, are taught to despise life, and by this

means are brought their ranks, perhaps. The complexions of the English are generally fair, and the addition of red to the face seems to be the snow, which of the year.

means are brought to stand their ground, and keep their ranks, perhaps equal to any troops in the world. The complexions of the people differ little from those of the English or Scots; but the women, who are generally fair, comely, and well-shaped, think that an addition of red heightens their beauty. Their eye-sight seems to be defective, occasioned, probably, by the snow, which is before their eyes for a long time of the year.

The Russians, before the days of Peter the Great, were the most part uncivilized, despicable, and much addicted to drunkenness: 4000 brandy-shops have been seen in Moscow. The common people, and also the boyars or nobles, had contracted a constant habit of indolence and intoxication; in consequence of which, the most shocking objects of misery and barbarity presented themselves in the streets, while the court of Moscow exceeded all others in splendour and pomp. The czar and grandees, dressed after the most superb Asiatic manner, exceeded every idea that can be conceived of modern grandeur; nothing but gold and precious stones were to be seen in the robes of the czar and his courtiers. These, and all other luxuries, were furnished by Italians, Germans, and all other foreign-ers.

When the czar Peter ascended the throne, the bulk of his subjects appeared to him little better than beasts of burden destined to support the magnificence of the court. Struck with the impropriety of the ancient customs in these respects, he obliged his great men to lay aside their long robes, and dress in a plainer mode, like other Europeans, and even ordered the laity to cut off their beards, besides making other improvements in learning and the arts, which we shall take notice of hereafter.

The Russians, before the time above mentioned, had hardly a ship upon their coasts: they had no conveniences for travelling, no pavements in their streets, no public places of diversion, and entertained a sovereign contempt for all improvements of the mind; but at present a French or English gentleman may live as comfortably and agreeably in Russia, as in most other parts of Europe. Since the accession of the present emperors, their polite assemblies have been put under proper regulations, and few of the ancient irregularities prevail. But notwithstanding the severity of Peter, and the prudence of succeeding governments, many barbarous usages and excesses are not yet suppressed.

The nuptial ceremonies of the Russians are peculiar to themselves, and formerly consisted of some very whimsical rites, many of which are now disused. When the parents are agreed upon a match, though the parties perhaps have never seen each other, the bride is examined stark naked by a certain number of females, who are to correct, if possible, any defect they find in her person. After the priest has tied the nuptial knot, the bride is led home, with abundance of coarse, and indeed indecent ceremonies, which are wearing off even

amongst the lowest ranks; and the barbarous treatment of wives by their husbands, which extended even to scourging or even broiling them to death, is either guarded against by the laws of the country, or by particular stipulations in the marriage contract. But, notwithstanding the rigorous treatment which married women are still subject to; they are said to be in general loose in their behaviour, and far from shy of their favours, and will even bear their husbands company in their drunken debauches, which may in some measure justify these for the brutish jealousy they are commonly addicted to: and so little gallantry, or even decency, is used towards the fair sex in this whole country, that no respect is paid to them, though they are even of quality. The only chance they have in wedlock is, from the kindness of their parents, who take care to bind the husband under some sort of penalty, to use them well and kindly, to feed them with wholesome food, and to forbear all unreasonable correction and ill treatment. But all these precautions often prove ineffectual, so that it is not without reason that they crown the bride, on her wedding day, with a garland of wormwood, to put her in mind of the bitterness that attends the marriage-state, and the bridegroom with one of hops, to intimate to him the fruitfulness of it; which is there paid so much regard to, that he may divorce her, and shut her up, for the very fault of her not bearing him any children.

A very ingenious writer has left upon record a whimsical and entertaining account of the same ceremony. "In 1713 the princess Natalia, only sister to the reigning czar, by the same mother, ordered preparations to be made for a grand wedding, for two of her dwarfs, who were to be married. On this occasion several small coaches were made, and little Shetland horses provided to draw them. All the dwarfs in the kingdom were summoned to celebrate the nuptials, to the number of ninety-three. They went in grand procession through all the streets of Moscow. Before them went a large open waggon, drawn by six horses, with kettle-drums, french-horns, and hautboys. Then followed the marshal and his attendants, two and two, on horseback. Then the bridegroom and bride, in a coach and six, attended by the bride-man and maid, who sat before them in the coach. They were followed by fifteen small coaches, each drawn by six Shetland horses, and each containing four dwarfs.

"It was surprising to see such a number of little creatures in one company together, especially as they were furnished with an equipage conformable to their stature. Two troops of dragoons attended the procession, to keep off the mob, and many persons of fashion were invited to the wedding, who attended in their coaches to the church where the small couple were married. From thence the procession returned in order to the princess's palace, where a grand entertainment was provided for the company. Two long tables were covered on each side of a long hall, where the company

of

of dwarfs dined together. The princess, with her two nieces, were at the trouble themselves to see them all seated, and well attended, before they sat down to their own table. At night the princesses, attended by the nobility, conducted the married couple to bed in grand state; after which ceremony the dwarf company had a large room allotted them to make merry among themselves. The entertainment concluded with a grand ball."

It may not be improper to add, in this place, an account of the courtships and marriages of the natives of Kamtschatka, a part of the Russian dominions, as given by a person who resided among them.—When a Kamtschadale inclines to marry, he looks about for a bride in some of the neighbouring villages, seldom in his own; and when he finds one to his mind, he discovers his inclination to the parents, desiring that he may have the liberty of serving them for some time: this permission he easily obtains, and during his service he shews an uncommon zeal, in order to satisfy them of what he can do. After having thus served, he desires liberty to seize his bride; and if he happens to please the parents, his bride, and her relations, this is presently granted; but if they disapprove of it, they give him some small reward for his services, and he departs. It sometimes happens that these bridegrooms, without discovering any thing of their intentions, engage themselves in service in some strange village; and though every one suspects their design, yet no notice is taken of them till either he or his friends declare it.

When a bridegroom obtains the liberty of seizing his bride, he seeks every opportunity of finding her alone, or in the company of a few people; for during this time all the women in the village are obliged to protect her: besides, she has two or three different coats, and is swaddled round with fish-nets and straps, so that she has little more motion than a statue. If the bridegroom happens to find her alone, or in company with but few, he throws himself upon her, and begins to tear off her cloaths, nets, and straps; for to strip the bride naked, seems to constitute the ceremony of marriage. This is not always an easy task; for though she herself makes small resistance (and indeed she can make but little) yet, if there happen to be many women near, they all fall upon the bridegroom without any mercy, beating him, dragging him by the hair, scratching his face, and using every other method they can think of, to prevent him from accomplishing his design. If the bridegroom is so happy as to obtain his wish, he immediately runs from her; and the bride, as a proof of her being conquered, calls him back with a tender voice: thus the marriage is concluded. This victory is seldom obtained at once; and after every attempt the bridegroom is obliged to take some time to recover his strength, and to cure the wounds he has received. There was an instance of one, who, after having persevered for seven years, instead of obtaining a bride, was rendered quite a cripple, the women having used him so barbarously.

After the above ceremony is over, he has liberty next night to go to her bed, and the day following, without any ceremony, carries her off to his own village. Some time after the bride and bridegroom return to the bride's relations, where the marriage is celebrated in the following manner, of which the relator was an eye-witness in 1739.

The bridegroom, his friends, and his wife, visited his father-in-law in three boats; and the men, being naked, pushed them along with poles. About one hundred paces from the village to which they were going, they landed, began to sing, and used conjurations with tow fastened upon a rod, muttering something over the head of a dried fish, which they wrapped in the tow, and gave to an old woman to hold. The conjuration being over, they put upon the bride a coat of sheep's skin, and tied four images about her: thus loaded, she had difficulty to move. They went again into their boats, and came up to the village, where they landed a second time; at this landing-place a boy of the village met them, and led the bride by the hand, all the women following.

When the bride came to the hut, they tied a strap round her, by which she was let down the stairs, the old woman who carried the head of the fish going before her: she laid down the head of the fish at the foot of the stairs, where it was trodden upon by the bride and bridegroom, and all the people present, and then thrown into the fire.

All the strangers took their places, having first stripped the bride of her superfluous ornaments. The bridegroom heated the beef, and dressed the victuals which they had brought with them, and entertained the inhabitants of the village. The next day the landlord entertained the strangers with great superfluity, who on the third day departed, the bride and bridegroom only remaining to work some time with their father. The superfluous dress which was taken from the bride was distributed among the relations, who were obliged to return them presents of far greater value.

Many fantastic notions are entertained by the Russians, respecting the state of departed souls. When a person dies, the servants, acquaintance, and relations of the deceased, being ranged round the room, take their leave, some by kissing the hand, others the face, speaking to the corpse, asking pardon of it for any crime committed, and all making the most terrible noise imaginable, rather howling than crying. After the dead body is dressed, they hire a priest to pray for the departed soul, to purify it with incense, and to sprinkle it with holy water, while it remains above-ground, which, among the better sort, it generally does for eight or ten days. When the body is carried to the grave, which is done with many gesticulations of sorrow, the priest produces a ticket, signed by the bishop and another clergyman, as the deceased's passport to heaven. When this is put into the coffin between the fingers of the corpse, the company return to the deceased's

After the pricell to pray for the ense, and to sprinkle rains above-ground, generally does for y is carried to the y gesticulations of et, signed by the e deceased's passpart the coffin between npany return to the deceased's

deceased's house, where they drown their sorrow by intoxication; which lasts, among those of higher rank, for forty days, with little intermission. During that time, a priest is appointed to say prayers every day over the grave of the deceased; for though the Russians do not believe in purgatory, they suppose that their departed friend may be assisted, in his long journey to the place of his destination after this life, by the prayers of the survivors.

Many of the punishments in Russia are terribly severe, and are both inflicted and endured with a wonderful insensibility. In the reign of Peter I. the robbers upon the Wolga, and other parts, were fixed to gibbets by iron hooks, fastened to their ribs, by hundreds, nay thousands at a time, and there left to writhe themselves to death. The single and double knout is likewise used in this empire on the nobility of both sexes; the latter is the most excruciating, and is performed in the following manner: the criminal's hands are bound behind his back, and the cord being fixed to a pulley, lifts him from the ground, to which he is again violently let down, with the dislocation of both his shoulders; after which, the executioner scarifies his back with a hard thong made out of a wild ass's skin. This punishment has been so often fatal, that a surgeon generally attends the patient, to pronounce the moment that it should cease. It is not always the number of the strokes, but the method of applying them, which occasions the death of the criminal; for the executioner can kill him in three or four blows, by striking him upon the ribs; though persons are sometimes recovered in a few weeks, who have received three hundred strokes, moderately inflicted.

A particular account of the manner in which this punishment was inflicted upon a Russian lady, is given in Mons. L'Abbé Chappé d'Auteroche's journey into Siberia. Madam Lapouchin was one of the finest women belonging to the court of the empress Elizabeth, and was intimately connected with a foreign ambassador, when engaged in a conspiracy. This lady, therefore, being suspected to be concerned in the conspiracy, was condemned, by the empress Elizabeth, to undergo the punishment of the knout. She appeared at the place of execution in a genteel undress, which contributed still to heighten her beauty. The sweetness of her countenance, and her vivacity, were such as might indicate indiscretion, but not even the shadow of guilt, although several persons, of whom inquiry was made, affirmed that she was really guilty. Young, lovely, admired, and sought for at the court, of which she was the life and spirit; instead of the number of admirers her beauty drew after her, she then saw herself surrounded only by executioners. She looked on them with astonishment, seeming to doubt whether such preparations were intended for her. One of the executioners then pulled off a kind of cloak which covered her bosom; her modesty taking the alarm,

made her start back a few steps; she also turned pale, and burst into tears. Her clothes were soon after stripped off, and in a few moments she was quite naked to the waist, exposed to the eager looks of a vast concourse of people profoundly silent. One of the executioners then seized her by both hands, and turning half round, threw her on his back, bending forwards, so as to raise her a few inches from the ground; the other executioner then laid hold of her delicate limbs, with his rough hands hardened at the plough, and, without any remorse, adjusted her on the back of his companion, in the properest posture for receiving the punishment. Sometimes he laid his large hand brutally upon her head, in order to make her keep it down; sometimes, like a butcher going to slay a lamb, he seemed to soothe her, as soon as he had fixed her in the most favourable attitude. This executioner then took a kind of whip called knout, made of a long strap of leather prepared for this purpose; he then retreated a few steps, measuring the requisite distance with a steady eye; and leaping backwards, gave a stroke with the end of the whip, so as to carry away a slip of skin from the neck to the bottom of the back; then striking his feet against the ground, he took his aim for applying a second blow parallel to the former; so that in a few moments all the skin of her back was cut away in small slips, most of which remained hanging to the shirt. Her tongue was cut out immediately after, and she was directly banished into Siberia. Peter III. in 1762, recalled her from banishment.

A late traveller writes, that he saw three women buried alive for drowning their husbands. They had, it seems, crossed the Mosco in a boat, all three together, in search of their husbands, whom they found all drunk in a public-house, and endeavouring to persuade them to go home, were severely beaten by them. However, by the assistance of some other people, they got them at last into the boat, where they fell asleep. The wives, to be revenged on the husbands for beating them, when the boat had reached the middle of the river, threw them in one after another; and, after drowning them, came on shore very unconcerned. The matter immediately came to light. They were seized, tried, condemned, and ordered to be put alive into the ground up to their necks, and there to remain till they died. Two of them lived ten, and the other eleven days. They spoke the first three days, complaining of great pain, but not after that. They certainly must have got some sustenance in the night time, or they could not have existed so long. The eldest was not above twenty years of age.

The traveller last cited, gives the following account of the whimsical manner in which libellers are punished in Russia: "While I resided at Moscow, there was a gentleman who thought fit to publish a quarto volume, in vindication of the liberties of the subject, grossly reflecting upon the unlimited power of the czar, and

ensuring the legislature of that empire. The offender was immediately seized by virtue of a warrant, signed by one of the principal officers of the state. He was tried in a summary way; his book determined to be a libel; and the author condemned to eat his own words. This sentence was literally carried into execution on the following day. A scaffold was erected in the most populous part of the town: the imperial provost was the executioner; and all the magistrates attended at the ceremony. The book was severed from the binding, the margins cut off, and every leaf rolled up, as near as I can recollect, in the form of a lottery ticket, when it is taken out of the wheel at Guild-Hall by the bluecoat-boy. The author of the libel was then served with them separately by the provost, who put them into his mouth, to the no small diversion of the spectators. The offender had received a complete mouthful before he began to chew; but he was obliged, upon pain of the severest bastinado, to swallow as many of the leaves as the czar's serjeant-surgeon and physician thought possible for him to do without immediate hazard of his life. As soon as they were pleased to determine that it would be dangerous to proceed, the remainder of the sentence was suspended for that time, and resumed again the next day, at the same place and hour, and strictly conformable to the same ceremony. I remember it was three days before this execution was over; but I attended it constantly, and was convinced that he had actually swallowed every leaf of the book. Thus I think he may be very justly said to have eaten his own words."

Traitors, after having undergone a variety of tortures, are banished to Siberia; but sometimes not till they have been deprived of their eyes or ears. Coiners are obliged to swallow the melted metal of the coin which they counterfeited. Those who are hanged are obliged to put the noose about their own necks, and to sing themselves off the ladder, when commanded by the executioner.

Felons, after receiving the knout, and having their cheeks and foreheads marked, are sometimes sentenced for life to the public works at Cronstadt, Vithnei, Voloshok, and the mines in Siberia, at which last place there are from 1600 to 2000 convicts, some of whom have been previously deprived of their eyes or ears.

The punishment for robbery is scourging; and every lord or master has a right to inflict the betags on his servant: this punishment consists in stretching the offender naked on the ground, and causing him to be beaten with sticks by two of his fellow-servants, or slaves.

Should a wife, exasperated by cruel treatment, kill her husband, the unhappy victim is immediately fixed alive in the earth up to her neck, where she is left to perish, in a manner shocking to human nature, no person being suffered to afford her any relief.

Though there are no capital punishments in Russia,

except in the case of high-treason, and no person can be convicted of a capital crime but by his own confession; nevertheless, to extort that confession, the most inhuman tortures are used, as the prisoner is obliged to undergo the scourge, the strappado, and the knout; and as many felons die under the knout, and others of fatigue in their journies to Siberia, and from the hardships they suffer in the mines, there is herefore reason to believe there is much less humanity exercised in Russia, respecting punishments for capital offences than is commonly supposed, and that no fewer criminals suffer death here than in those countries where the laws seem more severe.

The method of travelling, of late introduced into Russia, is extremely remarkable, and the expence very trifling. The facility with which the Russians perform the largest and most uncomfortable journies, must appear equally surprising either to a reader or a stranger. Like the Danes and Norwegians, they travel in sledges, made of the bark of the Linden-tree, lined with thick felt, drawn by rein-deer, when the snow is frozen hard enough to bear them. In the interior parts of Russia, horses draw their sledges; and the sledge-way, towards February, becomes so well beaten, that they erect a kind of couch upon the sledges, in which they may lie at full length, and sleep and travel night and day, wrapt up in warm furs; thus they perform a journey of 400 miles, such as that between Petersburg and Moscow, in three days and three nights. Her imperial majesty, in her journies, is drawn in a house, containing a bed, table, and chairs, with other conveniencies for four persons, and the whole drawn by twenty-four post-horses; and the house itself is fixed on a sledge in the winter time.

Inland navigation has for some time past been promoted in Russia: Peter the Great well knew the use of it, and employed a prodigious number of men in works of that kind. The canal extending from Moscow to Petersburg, is one of the most stupendous works of that great prince. It begins at Niewa, and is continued from lake to lake, and from river to river, for near 100 leagues. What is properly considered as the artificial canal, begins at the city of Novogorod, and is carried on with incredible labour and expence through the territories of Bragnitz, Chrillitz, Chilolova, Wittschora, Voloscha, Fortschok, the province of Twere, and the district of Kilia. Another prodigious work of this kind is at the city of Veronis, in the province of Rezan, where the river of the same name is made navigable for ships of eighty guns, from that city to the Don. A navigable canal is also cut between the Wolga and the Don, in order to convey provisions and materials to Azoph. The distance of this communication is about 140 Russian miles, by way of two small rivers, one called the Lassa, which falls into the Don; and the other the Camilinka, which falls into the Wolga.

These

These two rivers are made navigable by means of locks and sluices, and a canal of near four Russian miles is cut through the neck of land between these two small streams. Peter employed two artists at different times to perform this work; but they having failed in the execution, it has been since completed by another.

The religion established in Russia is that of the Greek church mingled with several superstitious rites of their own. They deny the pope's supremacy, and will not worship images; but their churches abound in pictures of saints, whom they look upon as mediators between them and God. They observe a number of fasts and lents, living half the year very abstemiously — an institution extremely convenient for their soil and climate. They have many peculiar notions with regard to the sacrament of the Trinity. They administer baptism by plunging the child three times into the water, and give it the sacrament of the Lord's supper in one species, from the time of its birth till it attains the age of seven years, after which it receives it in both kinds. If a person on his death-bed does not receive the eucharist and extreme unction, the body is denied Christian burial; and when a body is deposited in its coffin, they always place with it a luncheon of bread, a pair of shoes, a few pieces of money, together with a certificate, signed by the parish priest, directed to St. Nicholas, who is one of their great patrons. Their priests, who depend for subsistence upon the benevolence of their flocks, are distinguished by the name of papa, or father, and each priest is allowed to marry one woman; but if she dies, he must pass the remainder of his life in celibacy. The bishops are not allowed to marry at all.

Before the reign of Peter the Great, every person in Russia, convicted of being a heretic, was burnt; but now all sects are tolerated throughout the country.

This prince declared himself head of the church; and preserved the subordinations of metropolitans, archbishops, and bishops: after establishing this great reformation, he left his clergy in full possession of all their idle ceremonies; nor did he cut off the beards of his clergy; that impolitic act was reserved for the late emperor, and greatly contributed to his fatal catastrophe.

The conquered provinces retain the use of their own religion; and, so great is the extent of this empire, many of its subjects are Mahometans: but in Siberia and the uncultivated provinces they are chiefly Pagans.

The language chiefly spoken in Russia, is a mixture of the Polish and Slavonian; but the clergy make use of modern Greek. The Russian alphabet bears a great affinity to the Greek, and consists of thirty-six letters.

With respect to learning and learned men, it is but very lately that the Russians have emerged from the grossest ignorance; for so far was learning from being known among them, that the nobility themselves were entirely illiterate, and it was with difficulty some of the clergy read the prayers. The efforts to civilize

them, began by a small glimmering, like the first day-break, under czar Iwan, in the middle of the 16th century. This became more conspicuous under Alexius Michaelowitz. But in all probability this darkness would have continued much longer, for they had neither university nor school for the instruction of youth, if that great genius Peter I. had not appeared amongst them, and, by his indefatigable endeavours, in some degree dispelled those clouds of ignorance and error in which they were still involved. For this purpose he invited foreigners into his dominions, encouraged the liberal arts and sciences, obliged the nobility to send their sons to more civilized countries for their improvement, and instituted academies and seminaries in Moscow and Petersburg. The effect of these excellent measures are now visible to the whole world, by the daily progress the Russians make in literature; the papers exhibited by them at their academical meetings, particularly those relative to astronomy, the mathematics, and natural philosophy, have been received with applause by the literati of Europe; and, at the late opening of the commission for a new code of laws, the speeches pronounced by the bishop of Turess, the metropolitan of Novogorod, the vice chancellor, and the marshal, are nervous, elegant, and classical: so that in all probability the arts and sciences will make as great a figure in Russia as in any other part of Europe.

An university has, within these few years, been founded in Moscow by M. de Shorealow, high chamberlain to the empress Elizabeth, daughter of Peter the Great. In the same city are three colleges founded by Peter: the first for classical learning and philosophy, the second for mathematics, and the third for navigation and astronomy. There are also two academies in Petersburg, one on the plan of the Royal Society, and the other for instructing youth in navigation, astronomy, &c.

The government of Russia is entirely despotic; and here, as in all other arbitrary monarchies, the laws, as well as the lives and properties of the subjects, depend wholly on the will of the sovereign. These, if males, were called czars; if females, czarinas; but at present the imperial title is assumed. The people are no less slaves than formerly, but much of the power of the nobility is swallowed up in the great importance and authority of the crown. The sovereign appoints vaivods, or governors of provinces, and bestows all offices of consequence, whether ecclesiastical, civil, or military. The czar Peter introduced the titles of count and prince of the empire, and instituted an order of knighthood in honour of St. Andrew, the patron of Russia, distinguished by a blue ribbon and a star.

Here state prisoners are, in general, privately seized, partially adjudged, and secretly dispatched, or sent into banishment to Siberia, of which the following is a singular incident, as related by a character of eminence,

nence, who resided many years in Russia. "I was not long in Riga (says that person) when I received the following intelligence from good authority. One Dr. Fonderholt, a German, was, a few years before my arrival, physician to the army. He was said to be a man of learning, but of no great foresight. Happening to receive an affront from one of the great men of the court, who was in favour with the empress, the doctor retorted severely, and rendered him very ridiculous. The courtier had the address to get the doctor sent to Siberia in the following manner: One day, as the doctor was attending the field-marshal, who was sick, a captain of the guards arrived with expresses from St. Petersburg, and demanded immediate audience. He was introduced, and whispered something in the field-marshal's ear, who desired the doctor to amuse himself in the great hall till he had finished some business with the officer. When that was done, the doctor was again called upon; and when he had given the field-marshal his advice about some disorder which he at that time laboured under, and was going to retire, the count desired him to come to dinner, as he might need his further assistance; and, at the same time, advised the captain of the guards to dine, telling him he was not able to sit at the table himself, but the vice-governor, prince Dolgoruki, who was present, would bear him company. This was agreed to. At dinner the captain told the vice-governor, that a relation of his, in his way to the army, was suddenly taken ill, and obliged to remain in a house distant three or four versts from the city; and that therefore he desired him to appoint an able physician to attend him, for which he would be amply rewarded. The deputy-governor pointed to Dr. Fonderholt, as physician to the army, and one of the ablest professors in Riga; and, at the same time, politely desired him to visit the officer. The doctor agreed, and was giving directions to his servants to get his coach ready, when the prince told him that was needless, as his coach was large enough to carry them all to such an inconsiderable distance. After dinner, when they had arrived at the house where they pretended the patient was, and had taken a few glasses of wine, the doctor desired to see him, but was answered, that he was a state prisoner by order of the cabinet; and therefore they advised him to make no resistance, but get into a travelling waggon ready at the door; telling him, at the same time, that if he offered the least resistance, he would be bound fast with ropes, and might be very cruelly treated, on the way, by the soldiers who were appointed to convey him to his place of destination. Thus this man was conveyed to Siberia, and there long immured, or kept in a hole in the wall, with only a small slit through which he received his provisions. It seems he had some money about him when he was arrested; but the captain took nothing from him except his sword. The soldiers, on the way, robbed him of his watch; but he concealed from them what little mo-

ney he had. Foreseeing that his money could not maintain him long, and persuaded that he could not long subsist upon the poor provisions allowed to such prisoners, he affected to be a fortune-teller; and apprised the soldiers, who kept guard upon him, of his design, offering them the half of what he got by his art. The soldiers, being acquainted with many of the superstitious inhabitants, told the doctor every thing concerning them before they came to him, which he repeated to them, whereby his fame, as a wife man, spread far, and he acquired the means of support. Having neither books or company to amuse him in this miserable situation, he got a few hens, and diverted himself with feeding them. He gave their eggs a black colour; and wrote upon them with a pin, *Dem ungelucklick Doctor Fonderholt*. *Ungelucklick* signifies *unfortunate*. These eggs he sold to the inhabitants as charms. They knew not the meaning of the writings, but thought it rendered the eggs more valuable. After he had been many months thus confined, it happened that the governor's lady put up in this village, in her way from Russia to Siberia, and wanted eggs, among other things, for dinner. The hostess told her that there was, in the place, a prisoner, a very wife man, who sold extraordinary eggs. She desired to see them; and, as she understood the German language, was surprised to see written upon them the name of the very physician who, a few years before, had recovered her from a very dangerous fever. She went to the hole, spoke to the doctor; then applied to her husband, and caused his situation to be made much easier; and, as she was a great favourite with the empress, wrote to her majesty, and represented his undeserved misfortune so pathetically, that the governor received orders to liberate him, and send him, at her expence, to Moscow."

A gentleman who travelled over the greatest part of this empire, has given us the following new and concise description of the Russians, and the arbitrary government under which they live:

"The valour and prowess, which the Russians have discovered in the late war with the Turks, have rendered them the object of universal attention. It will therefore be no disagreeable amusement for the public to see their civil and military character briefly displayed.

"In Turkey the sultan puts out the eyes of his relations, because he cannot bear any brother near the throne. In Russia the sovereign is supposed to have no relations. No person is allowed to keep any coin stamped with the image of a deposed prince; nor must any one pass the palace without pulling off his hat, or letting down the glasses, if he is in a carriage. If you write the sovereign's name in small characters in a letter, you are liable to severe punishment. In a room upwards of thirty feet square, in which there were but three Frenchmen, one of them asked whether the prince Iwan was, or was not, still alive. The

answer

answer

answer was, that in Russia nobody talked of that
prince. When the empress Elizabeth was at the eve
of death, none durst make the least inquiry con-
cerning her health: and, when her death was univer-
sally known, all thought it dangerous to make it the
subject of conversation. Every Russian has a right to
cry in public *flow drelov*, or, I declare you are guilty
of treason in words and actions; and then every by-
stander is obliged to assist in apprehending the ac-
cused.

"The father arrests the son, and the son the father,
and nature suffers in silence. Both parties are first
conveyed to prison, and then to Petersburg, where they
are tried by the court of Chancery; a tribunal much
more odious and oppressive than our ancient court of
star-chamber, or high commission; for if the accuser
submits to the punishment of the knout without flinch-
ing, the culprit is condemned, though no proof of
guilt can be produced. Hence universal distrust pre-
vails throughout the empire, and no such thing as
society can be said to exist. This jurisdiction is al-
lowed to subsist for the sake of cutting off with the
greater ease any person that happens to be the object
of court jealousy. For this purpose the false accuser
is never punished with death, and the knout is seldom
exercised upon him with severity. The nobility, having
bowed to this dreadful slavery, do not fail to retaliate
upon the people, who are absolute slaves to them, to
the sovereign, and to the governors of the provinces.
The slaves of the sovereign pay tribute only to the
crown; the slaves of the nobles pay tribute to the
crown and their lords, who sell them as cattle are
sold in other parts of the world. They are not, in-
deed, allowed the power of life and death; but as they
may punish them with the battogen, the difference is
not considerable. Slaves, that is, the body of the
people, have no property, as in Poland:

"Hence the difference between the two nations;
the latter being ignorant, but industrious and honest;
and the former ignorant, brutal, lazy, and knavish.
The vulgar make haste by drinking to place all their
acquisitions beyond the reach of their masters. Big-
gotted even to fanaticism in favour of the Greek faith,
they make religion consist in ceremony, and are, in
fact, less moral than their neighbours, the Pagans.
A murderer being asked in the course of his trial,
whether he had kept the lent-falls, appeared as much
surprised as the most upright man, if his honesty had
been called in question, and declared with warmth,
that he was incapable of neglecting the duties of re-
ligion. Yet this religionist, who had been at the head
of the band of robbers, made no scruple of undressing
travellers, without any regard to sex, and tying them
up naked to trees, of opening their breasts near the
heart, of drinking their blood, and sealing his eyes
with the dreadful contortions and convulsions of his
unfortunate victims. If this fact be thought incre-
dible, what will become of the story of Procrustes,

and the American cannibals? Except at Petersburg
and Moscow, married women are seldom to be seen;
and jealousy is as prevalent among them as among
the Mahometans. Instead of a ring, they are married
with a whip and a bundle of rods. Hence another
obstacle to social commerce.

"Unmarried women are but little watched; so
that their jealousy begins too late; and the fair sex
cannot properly be said to possess any virtue. A ma-
gician, and three or four ancient matrons, wait at
every wedding, in order to determine, after consum-
mation, whether the bride has the true signs of vir-
ginity. When they are satisfied, the men sit down,
get drunk, and throughout the whole entertainment
occasion ten times more embarrassment and confusion,
by drinking one another's health, than we see in some
families in London when the first glass, after the re-
moval of the cloth, goes round. The Russians, be-
ing slaves, are far from being naturally warlike and
courageous; but, as they are strong, hardy, and inured
to every indifferent food, they have, according to the
constitution of modern armies, all the stamina of sol-
diers. Besides, the troops of other countries are made
up of the very dregs of the people: here, the re-
cruiting parties have a *congé d'élire*, or a right to
pitch upon whom they please; so that the Russian
forces may with propriety be, after the example of
the Romans, called legions. A foreigner travelling
through Russia found a father chained to a post in the
middle of his family. By his cries, and the little re-
gard paid to him by his children, he took him to be
mad: but this by no means was the case. One of
the recruiting parties, who here enter the villages to
pitch upon soldiers, as butchers in other countries go
into the folds to mark the sheep, had selected this
man's son for the service. The son had made his
escape without the father's knowledge; and the father
was made a prisoner in his own house, his children
being appointed his jailors. He was in daily expecta-
tion of receiving his sentence. How dreadful is the
situation of human nature under this detestable des-
potism! It extinguishes every tender affection, every
principle of humanity. In any country, where the
least degree of freedom prevails, men would sooner die
than be guilty of such an unnatural action as the chil-
dren of this Russian."

The executive part of the government of Russia is
vested in the sovereign council of chancery, which is
chiefly composed of the third class of the nobility, and
divided into six departments, in which are separately
considered, foreign affairs, war, finances, public ac-
counts, civil processes brought by appeal, and criminal
causes brought by appeal.

The determination of the two last mentioned, for-
merly depended upon the equity of the judge. In
1647 a code, or body of laws, was ordered to be
compiled by the wisest men in the empire, which was
accordingly done, in one volume in folio, entitled, Sa-

brona Ulofenia, that is to say, Universal and General Right; and by this the judges were to regulate their sentences. There is this great and singular advantage in the courts of judicature of this country, that they are neither expensive or tedious; for a law-suit is begun and determined in the space of six or seven weeks; nevertheless they are extremely venal.

All the peasants and husbandmen are slaves, either directly to the sovereign, to the boyars or lords, to monasteries, or to some of the gentry; and the greater number any of them hath, the richer he is esteemed. These are employed by them in whatever work or business they think fit; and this is one reason why they affect to appear more dull and untractable than they, perhaps, naturally are; because, if any of them betrays a greater vivacity or dexterity than the rest, he is sure to have more business and trouble upon his hands, without any proportionable reward or encouragement. It is usual for the sovereigns to reward some of the services done to them by any nobles or officers, with a number of those villains; and as there is an account of their number in all provinces, in forty days two or three hundred thousand of them may be raised, by summoning each master to furnish such a quota.

At present, the system of civil laws established in Russia is very imperfect, and, in many respects, barbarous and unjust; being an assemblage of laws and regulations drawn from those of most states in Europe, ill-digested, and, in many instances, not at all adapted to the genius of the Russian nation. But the present empress has, indeed, made a noble attempt to give her subjects a new code of laws. In order to this, she assembled the states of the kingdom in the year 1768, and presented them with instructions for their proceedings, according to her ideas of distributive justice. These instructions do the highest honour to her great capacity, and place both her political and personal virtues in the fairest point of light. The code has since been drawn up, but was not then published. Very pleasing ideas, have, however, been formed with regard to the rectitude of its precepts; and it has accordingly been for some time expected with impatience.

The constitution of Russia differs little from that of other arbitrary empires. There is, indeed, a senate, composed of the most respectable persons in the kingdom; and the czarina treats the institution with the highest regard and deference, submits the greatest concerns of her empire to their deliberations, but at the same time this parliament can be considered in no other light than the privy-council. They never presume to canvass any of the measures of government, or even to give their sovereign advice, unless it be commanded.

The ancient nobility of Russia consisted of three degrees, knezes, boyars, and vaivods. The knezes were sovereigns in their own estates, till their exorbitant power was reduced by the czars. The boyars were the second degree of nobility; and the vaivods

were the governors of provinces. Peter the Great suffered these distinctions to continue; but the late empresses, perceiving that these titles too often revived the ideas of their ancient and destructive power, thought it prudent to introduce the titles of counts and princes, in conformity to the custom of other European nations.

The Russian coin at present consists of gold ducats, rubles, half rubles, quarter rubles, griveners, or 10 copecks, copecks of silver, five copecks, two copecks, half and quarter ditto. The ducat is worth two rubles; and the ruble is, in value, about 4s. 6d. sterling. The half and quarter rubles are expressive of their own value. A grivener is the tenth part of a ruble, and a copeck is an hundredth part of the same.

The pound weight in Russia is exactly the same as our pound apothecaries weight: 40 pounds make a pood; 40 poods a berkowitz; 63 poods a tort.

The liquid measures are as follow: 8 cruiskas make 1 vedro, 2 half vedro 1 stackan; 2 stackans make 6 anchors 1 hog, which is exactly the same as an English hoghead.

The principal measure of extension is the verst, which is 3500 feet, and 104 versts make a degree; and the Russians reckon distances by versts, as the English do by miles.

It is impossible to ascertain the revenue of a kingdom where the monarch has the disposal of the fortunes of all his subjects, which is the case in Russia. It has, however, been computed at about three millions sterling annually, but then it must be observed, that the intrinsic value of money is at least three times greater in the empire than in England. If we add to the above calculation the vast exertions for promoting industry, made by the successors of Peter the Great, especially her present Imperial Majesty, the revenue must have considerably increased, and can scarcely be reckoned at less than 30,000,000 of rubles, or near six millions sterling annually. The sovereign monopolizes all the best furs, the mines, minerals, and trade by land to the East-Indies: as, the tobacco, brandy, wine, mead, beer, and other liquors, together with the taverns, inns, public houses, baths, and sweating-houses, are farmed out by him; besides which, the customs upon merchandize, the imposts upon corn, and the toll exacted from cities, towns, and villages, are very considerable. He possesses demesnes to a very great value; inherits the effects of all those who die intestate, or under accusation of capital crimes, and claims a duty from all law-suits. In short, according to the increase of commerce, or the will of the czar, the revenues of Russia are more or less considerable. Peter the Great even seized the church lands, but they were afterwards restored.

We apprehend that the following is the nearest computation that can be given of the different levies which constitute the revenue of Russia; viz. capitation tax, 8,500,000 rubles; other taxes and duties, 7,000,000;

the empress's of from the clergy doze of the m liquors, 4,000 amounting, in The deficiency respect to that by the profit a edice, and oth culation, besides capital of every revenues of the bignis, bees, i some monies al often necessary i from the clergy.

the empress's own estates, with other dominions taken from the clergy by Peter the Great, 6,000,000; produce of the mines, 1,500,000; monopoly of distilled liquors, 4,000,000; monopoly of salt, 1,800,000; amounting, in the whole, to 28,800 millions of rubles. The deficiency of the sum total here set down, with respect to that above mentioned, may be easily supplied by the profit arising from stamp-paper, patents, postage, and other articles omitted in the general calculation, besides one per cent. exacted on the yearly capital of every Russian merchant. The pecuniary revenues of the crown arise from taxes upon estates, baggins, bees, mills, fisheries, and other particulars; some monies also arise from monopolies, which are often necessary in the infancy of commerce; and some from the clergy, who are taxed in Russia.

The revenue of this empire, as here estimated, may be reckoned very great, when we consider the vast armies maintained and paid by the late and present emperors in Germany, Poland, and elsewhere, when no part of the money returned to Russia; nor does it appear that they received any considerable supply from France or Austria, who indeed were in no condition to grant them any.

We are told by Mr. Voltaire, that in 1735, reckoning the tribute paid by the Tartars, with all taxes and duties in money, the sum total amounted to 13,000,000 of rubles, each ruble amounting to about 4s. 6d. sterling. This income was at that time sufficient to maintain 339,500 men, employed in the land and sea-service. The other expences are very considerable, besides the payment of the army and navy of her present majesty, the number and discipline of which are at least equal to those of her greatest predecessors. Her court is elegant and magnificent; her guards and attendants splendid; and, exclusive of her ordinary expences of state, the encouragement she gives to learning, the improvement of the arts, and useful discoveries, cost her vast sums. It is, however, a favourable circumstance, that the Russian armies are raised at little or no expence; and, while in their own country, subsist chiefly on provisions furnished them by the country people, according to their internal valuation. The pay of a soldier scarcely amounts to thirty shillings yearly; in garrison he receives only five rubles yearly. The pay of a sailor and a gunner is a ruble a month, and, when ashore, they are bound with provisions by the inhabitants of the place where they reside.

The chief cities and towns in Russia are the following:

The czar, Peter the Great, being desirous of opening a communication between Archangel and the Baltic, by means of the gulf of Finland, in order to improve the commerce of his dominions, determined to make himself master of Ingria, which he accordingly did in the beginning of this century. To render it an European maritime power, he determined on one of

the most stupendous undertakings that ever was entered upon by human resolution, the building the city of PETERSBURG, which he designed to make not only the capital of Ingria, but of the whole Russian empire, the centre of trade, and the principal seat of the imperial residence. It is situated between Ingria and Finland, in a fenny island, surrounded by the river Nieva, in 60 deg. north lat. and 31 deg. 34 min. east long.

A late traveller, who calls this city a creation of the present century, says further of it, "I am struck with a pleasing astonishment while I wander among havens, streets, and public buildings, which have risen, as by enchantment, within the memory of men still alive; and have converted the marshy islands of the Nieva into one of the most magnificent cities on the earth. The imagination, aided by so many visible objects, rises to the wondrous fonder, and beholds, in idea, the titulary genius of Peter yet hovering over the child of his own production, and viewing, with a parent's fondness, its rising palaces and temples. The names on which ancient story dwells with so much fondness, sink on a comparison with this immortal man; and the fabulous legislators of Greece and Egypt never presumed to attempt the mighty transformation which the czar completed. The followers of Cadmus, of Theseus, and of Romulus, were animated with the same ardor as their leader; but the Muscovites (Russians) wrapt in the most profound barbarism, secluded by their illiberal prejudices from an intercourse with European nations, and equally the slaves of superstition and long prescription, were forcibly torn from this night of ignorance, and compelled to accept of refinement and civilization.

The island on which this fine city has been so wonderfully raised, was nothing but a heap of mud in the short summer of these climates, and a frozen pool in winter, not to be approached by land but by passing over wild forests and deep morasses, and had been till then the habitation of bears and wolves, when it was, in 1703, inhabited by above 300,000 Russian, Tartar, Cossack, &c. peasants, whom the czar called together from all corners of his vast empire, some near 1200 miles; and these made a beginning of this work. He was obliged to break through forests, open ways, dry up moors, and raise banks, before he could lay the foundation. The whole was a force upon nature. At first the workmen had neither sufficient provisions, or even pickaxes, spades, wheelbarrows, planks, or huts to shelter in; yet the work went on so expeditiously, that, in five months, the fortress was raised; though earth thereabouts was so scarce, that the greatest part of the labourers carried it in the skirts of their clothes, or in bags made of old rags and mats, barrows being then unknown to them. It is computed full 100,000 perished at the place; for the country had been desolated by war, and supplies by Ladoga lake were often retarded by contrary winds. The czar himself drew

the

the main plan. While the fortress was going on, the city began gradually to be built. He obliged many of the nobility, merchants, and tradesmen, to go and live there, and trade in such commodities as they were ordered. Provisions being scarce, and conveniences wanting, the place, at first, was not at all agreeable to persons of distinction; who had in Moscow large buildings, and seats in the country, with fish-ponds, gardens, and other rural elegancies: however, he little regarded the complaints of those who only considered their own ease. The boyars (nobility) brought great retinues with them; and merchants and shopkeepers soon found their account in settling here. Many Swedes, Finlanders, and Livonians, from towns nearly depopulated by the wars, continued here. Artificers, mechanics, and seamen, were invited hither, to encourage shipping; who, having worked out the time agreed on for the czar, were hired by the boyars; and also built for themselves, and settled; each man being allowed to pitch on the spot he liked. In one year 30,000 houses were erected, and, in two or three more, double the number, which doubtless are very much increased since. Some, indeed, but chiefly in the *slabodas*, or suburbs, are mean, and may be taken to pieces in two or three hours, and set up elsewhere. To build this town, that of *Nienchans* (a strong fort on the *Nieva*, not far from *Noteburg*) was demolished for the materials, and the inhabitants removed hither. As he intended to remove the trade of *Archangel* to *Petersburg*, in 1713 he made 1000 families come from *Moscow*, and offered great advantages to all foreigners that should settle there; and ordered that all goods usually sent to *Archangel*, to be sold, &c. to strangers, should be sent hither, and the duties to be in every respect the same. But the commerce, &c. were not entirely removed till some years after. In 1714 it was ordered that all houses should be built of brick, and tiled.

The citadel is a long and irregular hexagon, with six bastions parallel to each other, except the two middlemost, one of which, opposite to *Carelia*, has two orillons or blinds; that over-against the river none; each of the four others one. They were all, at first, but earth and turf; but, in 1710, the czar resolved to have them all lined with strong walls. Those on *Carelia* side were finished in his life-time; and the work has been carried on and completed by his successors. The wall is thirty feet high to the parapet, and the faces are all lined with large iron and brass guns. On the flanks, which are pretty short, are two rows of *cazemattes*, one above the other, arched over, and covered with beams and turf, bomb-proof. The curtain on the right of this citadel's gates has one of the finest royal dispensaries in Europe, both for the great quantity of drugs and medicines, and the large number of beautiful porcelain vessels from *China* and *Japan*, which it contains. This citadel has two gates; one adorned with statues, particularly *St. Peter* with his

two emblematic keys, and on its inside the black eagles of *Russia*, with the globe and the sceptre in its talons; and below is the figure of the *Russian* *Saint* *Nicholas*. Before that gate is a ravelin, from whence is a bridge, with two draw-bridges over an arm of the river. In this place galleys and small vessels are sheltered from bad weather.

The academy established by *Peter* the Great has a multiplicity of professors in most sciences, and the belles lettres, who have liberal salaries. The building is a superb pile, containing two stories, with a beautiful cupola in the middle, and an observatory. Here is a good library, and all manner of natural and artificial curiosities. "In one of the galleries (says a curious observer) in a case, is the skin of a Frenchman tanned and stuffed. This has been the tallest man ever saw. In another case is his skeleton, and a pair of breeches made of his wife's skin, also dressed. The leather was like buff. On the bottom, or pavement stands the skin of an English chestnut horse, saddled, and bridled, and beside it the skeleton of the Great used to ride this horse. Here I saw the head of the unfortunate *Miss Hamilton*, a Swedish lady, who lost it for having murdered her child unlawfully begotten; and this is the only murder of that kind I ever heard of in *Russia*. This lady was maid of honour to the empress *Catherine*. It is said *Peter* went and saw her executed. He wept much, but could not prevail upon himself to pardon her. He caused her head to be capped and injected. The forehead is almost complete. The face is the beautifullest my eyes ever beheld. The *dura mater*, and brain, are all preserved in their natural situation. This is kept in spirits in a large crystal vessel."

Besides the above here are deposited great quantities of earths, fossils, stones, ores, natural metals, minerals, shells, mosses, corals, &c. In one room is a figure of *Peter* the Great in wax-work, as large as life. He sits in an elbow chair cross-legged, dressed in a blue suit of clothes, white stockings, and has a hanger by his side. He has short black hair, his head covered; and the figure is surrounded by mathematical, philosophical, and mechanical instruments.

Peter the Great also formed regulations for the management of this seminary. These referred to the professors, the students, the respective sciences, the succession to offices, and other particulars conducive to the interest of the institution in general.

Petersburg is amazingly increased in size within the sixty years. At the death of *Peter* the Great, it did not contain 80,000 inhabitants; and now the *Russians* assert that there are 500,000; but this is deemed an exaggeration. It covers a very great extent of land and water. The streets are some of them very broad and long, and with canals in the middle of them; and others are planted in the Dutch fashion. The bridges are immensely large. The palaces of the nobility exceed in size those of most cities. That of the em-

press is an immense great than be the buildings there is hardly portions. The Dutch, and which true ornament. By separate parts streets at large very fine one.

prefs is an amazing structure. But these are rather
great than beautiful. The size is all that strikes; and
the buildings are stuck so thick with ornaments, that
there is hardly any such thing as judging of their pro-
portions. The Italian architecture is mixed with the
Dutch, and the whole forms very inelegant piles, in
which true taste is totally sacrificed to a profusion of
ornament. But if the eye does not scrutinize into the
separate parts of the buildings, but takes only the
streets at large, the city may be fairly pronounced a
very fine one.

Among the public buildings there are many ex-
tremely worthy the attention of a traveller, particularly
the dock yards, the naval magazines, the arsenal, found-
ery, admiralty, &c. without insisting on the imperial
palace, the cathedral, or many churches. In the docks
they continually employ a great number of carpenters.
They build here all sorts of vessels, from ships of 120
guns down to boats; and the number on the stocks at
a time is considerable. After the death of Peter the
Great the marine was neglected, inasmuch that the
empress's naval strength was not computed to be a
fifth part of what that great monarch possessed; and
this was owing to a want of trade, which can alone
make seamen; unless when in the hands of such a man
as Peter, who created every thing. But the present
empress, who has thrown the spirit of that great
monarch into all the departments of the state, has
received it wonderfully; so that, at present, the Russians
have a formidable navy.

There is scarcely any thing at Petersburg more de-
serving notice than the foundery. The iron is brought
from Kexholm by water; and the number of cannon
and mortars that are cast here is very great; also cannon
balls, and all sorts of military implements in which iron
is used; which are made here at as small an expence as
in Sweden, or any other part of the world. The
arsenal is always well stored with them; and there are
small quantities made on a private account for ex-
portation, forming a very considerable branch of com-
merce.

The grand market-place is on the southernmost part
of the city, with many warehouses, to deposit all kinds
of commodities and merchandize, both domestic and
foreign, for sale. It is a large square, with four en-
trances, and a range of shops on each side, both within
and without, with covered galleries, to secure those
who frequent it from the rain.

Woolen and linen manufactories were set up here,
of which the latter is brought to great perfection, as we
may observe by the linen of late imported from thence.
Here is particularly a workhouse, where an old Dutch
woman has eighty young nymphs under her care, who
are taught, with a whip, how to handle the spinning-
wheel; and several regulations are made for improving
the plantations of hemp and flax. Paper-mills and
powder-mills have also been erected, with laborato-
ries for gunnery and fire-works; and other places for

preparing salt-petre and brimstone. Rope-yards, like
those in England and Holland, for making of cables
and tackling for the navy, are also set up here. A
printing-house is established, and news-papers are
now as regularly printed as in other countries of Eu-
rope. Several useful books have been translated out
of the High Dutch, and printed; the government en-
couraging their subjects to inquire into the state of the
world abroad, instead of keeping them in ignorance,
according to their ancient maxims. As to their silk
and woollen manufactures, they have not been able
hitherto to bring them to any degree of perfection.

At a little distance from Petersburg is a noble seminary
for educating females only, founded by the late empress
Elizabeth. The building is capacious and grand.
Children of distinction are kept separate from those of
an inferior rank; and the whole contains between 700
and 800 females.

Near the Niwa is a small palace, built by the
present Empress, and called *The Hermitage*. When
her majesty resides in this building, she is in retreat,
and there is no drawing-room or court. These apart-
ments are very elegant, and furnished with great
taste. There are two galleries or paintings, which have
been lately purchased, at an immense expence, in Italy.
The crown, in the palace itself, is perhaps the richest
in Europe. It is shaped like a bonnet, and totally
covered with diamonds. In the sceptre is the celebrated
one purchased by prince Orloff for 300,000 rubles,
(112,500*l.*) and presented by him to his sovereign
mistress. It far exceeds Pitt's diamond in size, and is
not inferior in water. Lapidaries declare it the most
beautiful and rare ever brought from Golconda. One
of the noblest monuments of the gratitude and veneration
universally paid to Peter I. is that which the em-
press Catherine II. has ordered to be erected: it is an
equestrian statue; in which protection the artist has
united the greatest simplicity with truest sublimity
of conception. No other statuary, whether ancient or
modern, gave him the design, which is singular in its
kind, and admirably adapted to express the character
of the man, and of the people over whom he reigned.
Instead of a pedestal adorned with inscriptions, or sur-
rounded by slaves, he appears mounted on a rock, or
stone of a prodigious size, upon the ascent of which the
horse labours, and appears to have nearly reached its
summit. This attitude has given him room to exert
great anatomical beauty and skill in the muscles of the
horse's hind parts and hauns, on which the whole of
his body is necessarily sustained. The czar's figure is
full of fire and spirit. He sits on a bear-skin, and is clad
in a simple habit, not characteristic of any particular
country, but such as may be worn without violation of
propriety by an inhabitant of any country.

About twenty miles west from Petersburg is the beau-
tiful palace of Peterhoff, situated on an eminence, in a
large garden, commanding a fine view, and surrounded
by many out-houses, offices, &c. for servants and

attendants. It faces the south; and, in the front, there is a beautiful canal of clear transparent water, from which three jets d'eau are supplied, and constantly play. When the empress is here, the guards are encamped in a part of the garden, where their tents make a very agreeable appearance. In speaking of one of these jets d'eau, a curious traveller says, "Out of the water, much to my agreeable surprize, arose a dog and three ducks, made of copper, or iron, and, in appearance, all alive. The ducks flutter through the water quacking, the dogs follow after them barking. There is, in a subterraneous place, a charming chime of crystal balls, which play by water. The grotto, which is covered before by a cascade, has two entries, one on each side. The entries are guarded by statues, which, when you are in, prevent any one from getting out, till the keeper, by turning a handle, puts a stop to them. These flames evacuate so much water, by vomiting and shooting out of stone pistols and guns, that the keeper said it would overwhelm any man. Besides the curiosities before mentioned, there is a beautiful gallery full of the finest china in the world; in one end of which is a small but commodious room, with a bed in it, whither the Empress sometimes retires to repose herself.

The apartments here are all splendid and nobly furnished; and among the paintings there are five matchless portraits of the sovereigns of Russia, viz. 1. Peter the Great. 2. The Livonian villager, whose virtues raised her from a cottage to an imperial diadem, and to share the bed of Peter the Great. 3. The empress Ann. 4. The empress Elizabeth. 5. The reigning sovereign Catherine II.

Such was the foundation, and such is the present state, of the city of Petersburg, as appears from the most authentic and modern accounts we could possibly select. The only material circumstance relative to it, which remains to be mentioned, is the dreadful inundation and hurricane which happened in 1777, and were productive of the most fatal effects.

The adjacent country is covered with country houses and gardens; but the soil is so extremely barren, that the town is obliged to be supplied with provisions from a great distance, and of consequence they are very dear. There are great quantities of woods, consisting of pine, fir, alder, poplar, birch, and elm; but the oak and beech are generally brought from Casan. The weather in winter is exceeding cold, and excessive hot in summer. In June the length of the night does not exceed three hours, during which the natives enjoy a continued twilight; but in December the sun is not visible more than three hours above the horizon.

Moscow, the capital, once the metropolis of, and the greatest city in, the whole Russian empire, lies in lat. 55. 42. long. 38. 45. east, and is seated in a fine spacious plain, on the river of its name, over which it hath a stately bridge of twelve arches, of a pro-

digious height and breadth, because that river often overflows. It was built by prince Gassichin, from the design of a Polish monk. The town stands in a gravelly soil, and wholesome air, and almost in the centre of the best provinces of Moscow. The population of this city cannot be ascertained. In 1662, when lord Carlisle was ambassador there from king Charles II. it was twelve miles in compass, full of houses and inhabitants, inasmuch that the number of the former is, by the lowest calculations, said to have amounted to 40,000; and by the Russians affirmed to have been above double that number. According to Voltaire, Moscow, when he wrote, was twenty miles in circumference, and its inhabitants amounted to 500,000; but it is almost impossible to form a precise estimate of their present number. The houses are, in general, miserable timber booths, which always have subjected the city to dreadful conflagrations.

This great city is of a circular form, and consists of four distinct parts, or quarters, all surrounded with a distinct wall, viz. Cataigorod, Czargorod, Skorodoma, and Strelitze-Slaboda, so called because it was formerly the quarter of the Strelitzes, or czar's guards.

The Cataigorod, or middle city, is surrounded with a brick wall; and on this stands the castle, which is two miles in circuit, and fortified with three stout walled stately towers, and a fosse. In the castle are two palaces of the czar, one of timber, the other of stone, built after the Italian manner; the patriarchal palace, a large ancient building; the exchequer, chancery, and other offices; the grand magazine; two handsome monasteries; five large churches, among which is that noble one of St. Michael, in which are the tombs of the grand dukes, or czars. There are several other stately buildings in this great castle. At the great stands that stately ancient fabric called the church of Jerusalem.

Near the churches are hung several large bells, one of which is of a stupendous size. Concerning the celebrated great bell of Moscow, a learned traveller says, "I went to see the great bell, which was then in a large pit. A fire had, about two months before this, burnt down about two thirds of this great city, and the bells, being all of timber, shared the same fate. The bell fell into the bottom of the pit, and had a piece broken out of its edge, large enough to permit any man to get into it. Its weight is 443,772 pounds, and its height about twenty-one feet four inches and a half. I then went to the top of a very high tower, called Ivan Veliki, or the Great John. From this tower I had a complete view of the whole city, which, indeed, made a very grand appearance. The weather being very cold, the Russians heat their sleeves before day-light, and make use of a fire at no time of the day except to get dinner ready; so that the view is never but at those times obstructed by the smoke. Upon the top of this tower there are three bells, I think the least of which is larger than the largest in London. Under the tower

about 2090 paces in circumference."

This quarter is called Cataigorod from Catai, the
ancient and Russian name of China, because the chief
merchandizes sold in it come from that country: so
that the name implies the same as the Chinese city.

The Czargorod, or ducal city, contains, among other
buildings, the great arsenal, and is watered by the
Negliga, which runs through it, and thence flows into
the ditch that surrounds the middle city.

The quarter called Skorodum, or Scorodum, is chiefly
inhabited by timber-mongers and carpenters, who
sell houses ready made. These houses are moveable,
sold very cheap, and in great numbers: and, indeed,
considering the frequent fires that happen in it is city,
owing either to drunkenness, a reigning vice here, or
to the neglect of putting out the candles, which they
light to some favourite saint, in their houses and
chambers, they have need of such a large market to
repair to on those occasions. It is called Scorodum,
which, in the Russian language, signifies done in haste,
alluding to the speedy raising of the mud wall that
surrounds it.

The Strelitze-Slaboda, formerly the quarter of the
soldiers, or guards, stands on the east and south-east
side of the Cataigorod and the castle; and is itself sur-
rounded and fortified with wooden ramparts, and
divided from the rest by the river Moscow; for which
reason it is styled a slaboda, or suburb.

Though the houses of the people in common are
poor huts, those of the nobility and opulent, are fine
fabricks of brick and stone; most of them having, on
the back part, large courts and gardens, which are
spacious, in ample order, and surrounded with high
and strong walls. The streets are not paved with
stones, but boarded with thick fir planks.

Churches and chapels here, including those that be-
long to monasteries, are computed to amount to above
1500. Some of them are very large and stately; that,
particularly, which is in the Crimline, or grand im-
perial palace, is a vast, ancient building: on the right
side of the altar is the czar's throne, and on the left
that of the patriarch; and in the body of the church
hangs a chandelier of immense weight and value. The
very jewel, and other costly ornaments, that enrich a
picture of the Virgin Mary here, are valued at half a
ton weight of gold; besides a vast number of chalices,
pikes, patins, statues, and other church utensils of gold
and silver, finely wrought, and enriched with precious
stones; a vast number of other precious vestments of
great value, and an immense quantity of donations and
presents offered to the relics of three eminent Russian
saints, which are here interred. So that the treasure
of this church is deemed equal to that of any church
in Europe,

The superb church of Saboor is 90 feet in length
hath a stately dome, supported by four large pillars,
and is, though in the ancient style, magnificent within
and without. That of St. Michael is the repository of
the dead czars, and of all the royal family of the male
sex. The bodies of the princesses of the blood are in-
terred in the stately abbey of the nuns, called Tzudoff
Monastir, in the same castle, and near the church
above mentioned. The tombs of the princes who
never reigned, are in a separate chapel. The palls with
which their coffins are covered are superb. Those of
the czars, especially, are of the finest velvet, and have
either a massy or embroidered golden crucifix upon
them, of curious workmanship, and enriched with vast
variety of costly ornaments, especially inscriptions,
which are mostly done with pearls and other precious
stones.

Monasteries of men and women are here numerous;
and, in general, next to the palaces and noblemen's
houses, some of the best edifices in the city; the found-
ers of them having spared no cost to adorn them with
curious architecture, paintings, gardens, and every
thing that is convenient and beautiful. There is one
called Dewitze Monastir, about a mile out of the city,
in which the ambitious princess Sophia, who had con-
certed so many plots against her brother the czar Peter
I. was at length confined, and ended her days. It is
situated on a spacious plain, and hath 300 nuns belong-
ing to it, who lead a very regular life, and never stir
out of their limits, as some others are permitted to do.
These are only allowed, on holidays, to walk on the
terraces round their gardens, which are raised to a con-
venient height for them to enjoy the prospect of the
adjacent plain.

Of the monastery, church of Jerusalem, &c. a late
traveller gives the following account: "The church,
bishops, priests houses, &c. are all enclosed with
high brick walls; the wall, forming one side of the
bishop's palace, is built on a beautiful detached hill;
having on the east, north, and west, the finest lawns in
the world, through which glides a noble river. In the
plain, upon the banks of the river, stands the builder's
romantic house, all built of stone. It is quite alone,
three stories in height, in every one of which are four
rooms, except the ground story, where are his kitchen,
store-room, and a room for his attendants. The area
of each of these rooms is but about eight or at most
but nine, feet square. In every one is a small stove.
His bedstead is of stone, as are his bed and pillow; his
chairs are of the same materials. Every story of his
house is vaulted; and it is flat on the roof, for the con-
venience of taking a view of the country. It has but
one entry, and every room receives light from one
window of the least size. The builder was a hermit,
and a religious devotee. The hospital is not large, but
well provided with every necessary but medicine,
prayers being (in their opinion) sufficient to cure all
diseases which appear in this holy place. At the west
end

end of the church is a most capacious cupola. The dome is very magnificent and high, with a gallery which surrounds it near the top. The windows are large, and it is well lighted. The walls are all hung round with various pictures of the saints, very richly adorned with silver, gold, pearls, and precious stones; and the altar is very grand, and adorned with various pieces of curious workmanship.

The late czar Peter I. founded here three colleges, which he took care to fill up with men well versed in arts and sciences, and all kinds of literature, for the polishing of the next generation. The first is for humanity, rhetoric, and philosophy; the second for mathematics; and the third for navigation, astronomy, and other sciences subservient to them. In all these, youth are kept under strict discipline, and have, at the same time, all due encouragement to excel in their respective studies. To these the same prince added a dispensary, which is not only one of the finest structures in Moscow, but one of the best furnished with all sorts of medicines, drugs, &c. in Europe. It is put under the care of some Germans, who are allowed the best masters in that art, though the most slovenly in their compositions, never studying to please the eye or taste in their prescriptions, as we do in England, but nauseate their patients by the inelegance of their drugs, which could not possibly be taken by the people of any other country. This dispensary hath a yearly revenue of 20,000 rubles, to renew their *materia medica*; and furnishes not only all the army, but likewise all the principal cities in the empire with medicines.

We cannot omit to mention, in this place, the founding hospital, founded by the empress Catherine II. supported by voluntary contributions, well endowed, and conducted by very judicious regulations. It is a grand pile of building, and contained 3000 foundlings some few years ago; but their number is, in all probability, now much increased. The children are taken great care of, and, at the age of fourteen, have the liberty of choosing any particular branch of trade; and for that purpose there are different species of manufactures established in the hospital. When they have gone through a certain apprenticeship, they are allowed the liberty of setting up for themselves. A sum of money is bestowed upon each foundling; and they are permitted to carry on trade in any part of the Russian empire. This is a great privilege in Russia, where the peasants are slaves, and cannot leave their villages without the permission of their masters.

The courts of judicature, custom-house, and other offices, are generally large, and built of stone, and resemble gaols, and, indeed, are such in some sense; having apartments for debtors, as well as criminals, who are kept there chained up. Justice is, in general, administered with some strictness and severity; but the people here being naturally lazy, and given to drinking, the whole city swarms with beggars and vagabonds, and

mostly of such a sturdy breed, that it is dangerous to deny them alms. This makes it very hazardous to walk the streets in the night; for they frequently lurk in corners, with a short truncheon, or bludgeon, in their hands, which they throw at the heads of passengers with such dexterity, that they seldom fail of knocking them down, after which they rob and murder them, and go off. These disasters have happened more frequently on holidays, and especially during the carnival. When a person was found murdered, they carried the body to a certain place, where it lay exposed a day or two; and, if it was not owned, it was flung into a deep large pit, made to serve on all such occasions. On the Whitfuntide holidays some priests come thither to say mass for their souls.

Murders were formerly so frequent in Moscow, that few nights passed without some people being found dead in the streets in the morning. The villains went in strong parties, and slew before they robbed. This they did with so little fear, that they often performed it before the person's own door; and the terror of these ruffians was so great, that none of the neighbours dared assist the unhappy victim, for fear of being butchered themselves, or, at least, having their houses burnt. This obliged people, who had occasion to be in the streets in the night, to go in companies together, or have a sufficient guard of servants on horseback to attend them. The weapon used by these ruffians was called a *dubina*, which was a long stick, with a round knob at one end, and made heavy with iron, with which they struck a man dead at one stroke; and if any one of them happened to be taken, a good sum of money, from the gang they belonged to, would generally get them off.

The highways were also much infested by these *rashonies*, as they were called, which made it very dangerous travelling in any part of Russia; for they had their spies in the towns, who informed them when any person was to set out on a journey, and how they were to be attended. According to this information they prepared themselves for an attack, and way-laid them in some wood through which they were to pass.

The writer of this account was informed by a gentleman of rank and veracity, that the czar himself had been attacked in his younger days, in the following manner. Going upon a visit one evening, in the following manner. Going upon a visit one evening, attended by two servants, the one riding before, and the other standing behind the sledge, he came a sledge with eight rahonies in it, and were just going to fasten his sledge to theirs with a grappling iron, which they commonly used on these occasions; but the czar being then young, stout, and vigorous, got up and seized one of the robbers by the hair of the head, pulled him out of their sledge, and keeping his hold, drove out of their reach, dragging the fellow along with him till he reached the house of the nobleman he intended to visit, which he entered all in a sweat, still holding the fellow by the hair.

Wien

When the ruffian understood it was the czar they had attacked, he shook and trembled, saying, if they had known who he was, they would not have meddled with him; and then begged he might be put to death without being put to the torture. To this his majesty consented, on condition that he discovered the rest of his gang; but this he would not do, without a promise of his life, and a reward, which was also granted him; and he went with a detachment of soldiers to the rendezvous of his companions, and, coming to the house, he called to them to open the door. On hearing his voice they directly opened it; so that the soldiers rushed in, and seized not only his seven accomplices, but thirteen others of the same gang, who were soon after all executed, except the informer.

At another time the czar was attacked on his way from Moscow to Novogorod, when he was attended by four servants only. Going from Tever he was stopped by a strong party of ruffians; on which he immediately jumped out of his sledge with a sword drawn in one hand, and a cocked pistol in the other, and told them he was the czar, asking them what they wanted? They replied they were poor fellows, reduced to great want; and as he was their lord and master, he was the properest person to relieve them. He told them he had no money about him; to which they answered, if he said, they would take none from him; but desired that he would give them a written order to the governor of Novogorod, for what sum he pleased to bestow upon them; begging that it might be such as would relieve them from their straits. The czar then asked them, if 1000 rubles would be sufficient; and on their saying it would, he wrote an order for that sum, payable at sight; for which they dispatched one of their number, who very soon returned with the money. They then obliged the czar to return to Tever, and to pledge his royal word not to prosecute, or even inquire after them; promising to amend their lives, and become good subjects for the future. Instead of proceeding to Novogorod, the czar returned back to Moscow.

The city of Moscow is much decayed from its ancient grandeur and opulence, since the building of that of Peterburg. However, it is full of inhabitants; and all kinds of provisions are brought to it in great plenty, and sold very cheap; fish being the only dear food, which is occasioned both by the number of inhabitants, the four lents, and other fasts, that are observed by the Russians. This cheapness hath so far lowered the price of land all about the country, that the nobility and gentry are great sufferers by it, their estates being reduced to little more than one-third of what they formerly brought in, when the city was in its flourishing state. The canal, made by the order and direction of the late Peter the Great, to open a communication between this metropolis and his new-built and favourite city of Peterburg, and, by that means, to the Baltic and German Ocean, is a great and noble work, which hath been some time finished, at an

immense charge and labour, running between two cities, which, in a direct line, stand near 90 leagues asunder. It begins at Petersburg, on the river Niewa, or Nieva, which empties itself into the gulf of Finland, and going up that river quite to the lake of Ladoga, crosses it at the south end, and enters into the Woltoff, another river, which flows thither from the province of Novogorod. From the capital of that province begins what is properly called the artificial canal, which, passing through the territories of Brognitz, Chrestitz, Chilolova, Witfchna-Voloscha, Toischock, the province of Twere, and the district of Kilm, reaches, at length, the city of Moscow, and enriches it by the vast quantities of merchandize that are brought to and from that capital.

There is a very considerable manufacture at Moscow of various hemp fabricks, particularly sail-cloth and sheeting, which employs some thousands of looms, and many thousands of people. The hemp is most of it brought from the Ukraine. There are also great numbers of considerable merchants here, who carry on a very extensive commerce with all parts of the empire; for there is water-carriage from hence to the Black and Caspian Seas, and with but few interruptions to the Baltic also, which are circumstances that make it the centre of a very great commerce.

This city is much better situated for the metropolis of the empire than Peterburg. It is almost in the centre of the most cultivated parts of it; communicating, in the manner above mentioned, with the three inland seas, not at a great distance from the most important province of the empire, the Ukraine; open to the southern territories on the Black Sea; and, by means of the rivers Wolga and Don, commanding an inland navigation of prodigious extent. Its vicinity also to the countries which must always be the seat of any wars with the Turks, the enemies most to be attended to of all those with whom the Russians wage war, upon the whole made it infinitely a better situation for the seat of government than that of Peterburg, which is at the very extremity of the empire, and possessing few of these advantages. Founding that city, and making it the seat of foreign commerce and naval power, was an admirable exertion of genius; but the seat of government, in our opinion, should always have been at Moscow.

It is almost impossible to make an exact estimate of the present dimensions and population of Moscow. Voltaire says, when he wrote, that it was twenty miles in circumference, and the inhabitants amounted to 500,000.

RIGA, the capital of Livonia, is a very considerable city, standing on a large plain on the western bank of the river Dwina, about six miles above the place where it discharges itself into the Baltic, at the gulf of Riga, being 120 miles to the southward of Revel. This town was formerly possessed by the Teutonic Order, and the grand-master resided here: it afterwards en-

gaged in the Hanſeatic confederacy; and for many years continued a free town, under the protection of the German emperors. In the ſixteenth century the inhabitants univerſally embraced the religion of Luther, expelled the Roman Catholic clergy, and ſeized upon their eſtates. Since that period Riga has been ſeveral times reduced, and alternately ſubject to the Muſcovites, the Poles, and the Swedes. In the month of July 1710, it was finally taken by the Ruſſians, after they had reduced it to a heap of rubbiſh, and ſtill continues under their dominion. The city is rebuilt, and is more beautiful than it was before; it is large, commodious, and carries on a very conſiderable trade in corn, hemp, flax, pitch, tar, planks, furs, Ruſſian leather, and pot-aſhes. Theſe articles are exchanged for the commodities of more ſouthern countries. The harbour is guarded by the fort of Dunamander-Schans, built about ſix miles below the city, near the mouth of the river Dwina. The town is well fortified with walls, baſtions, a large and deep ſoſſe, a ſtrong caſtle on the river, in which the governor reſides, and a fortrefs oppoſite to the town on the other ſide of the river.

WOLOGDA, ſituated on both ſides of a river of the ſame name, is a large and populous city, inhabited by a rich trading people. This is the paſs through which all commodities muſt be conveyed to and from Archangel; and here are a number of magazines and ſtores, kept by the merchants of England, Holland, and other nations. The city is ſurrounded with a ſubſtantial ſtone wall, and defended by a fortrefs ſo ſtrong, that in times of danger the czars ſend hither their moſt valuable effects for ſafety. Wologda ſtands about ſeventy-five leagues to the northward of Moſcow, and is one of the moſt ancient archiepiſcopal ſees in all Ruſſia. The ſtreets are open and regular, the houſes well built, and the markets plentifully furniſhed with all kinds of merchandize. They are divided into four quarters, in one is ſold the fleſh, in another the wood, in the third the furs, and in the fourth the cloths. The cathedral, called Saboor, is a very noble ſtructure; it has five cupolas covered with tin, and ſurmounted with croſſes finely gilt. There are twenty churches in this city, built of ſtone, and forty-three of timber; there are likewiſe three nunneries, in each of which is an elegant ſtone chapel. The river, which is broad and navigable, contributes greatly to the traffic of the city.

NOVGOROD VELIKI, called by the Dutch New-garten, is ſituated on the banks of the Wolohowa; it is a large, populous, and well fortified city; but the houſes are mean, and all built of timber, and the town-walls are compoſed of the ſame materials. It is very evident from the ruins of towers, ſteeples, and old walls, without the circuit of the preſent city, that it was once much more magnificent and extenſive. It ſuffered greatly from the arms of the Ruſſians, Poles, and other nations. In the year 1477, John Baſilius

Grotſden made himſelf maſter of Novogorod; he afterwards went there in perſon, and pillaged the city, from whence he is ſaid to have carried to Moſcow many hundred waggons loaded with gold and ſilver, precious ſtones, rich ſtuſſs, and other valuables; he likewiſe removed the principal inhabitants to Moſcow, and peopled Novogorod with Ruſſians. Since it became ſubject to the czar of Muſcovy, its trade and ſplendour have been greatly diminiſhed. It is however ſtill the ſee of an archbiſhop, and carries on a conſiderable trade. The cathedral, dedicated to St. Sophia, is an elegant Gothic ſtructure. The caſtle is ſituated on the oppoſite ſide of the river, and near it is the archiepiſcopal palace, and a monastery dedicated to St. Anthony of Padua. Beſides theſe there are near an hundred churches, and ſeventy monaſteries in this city, which is about two leagues in circumference.

ARCHANGEL, by the Ruſſians called Archania, is ſituated on the eaſt ſide of the Dwina, about ſix leagues above the place where that river falls into the White Sea. The city extends about two miles in length, is rich, populous, and built in the modern taſte. It is a metropolitan ſee, and ſtands between the ſixty-fourth and ſixty-fifth degrees of north latitude. Archangel is indebted to the Engliſh for its great wealth and importance, by whom it was diſcovered in 1553. Richard Chancellor, maſter of one of the ſhips ſet out under the command of Sir Hugh Willoughby, who had received a commiſſion to go in queſt of the north-eaſt paſſage to China, was ſeparated from the reſt of the fleet, and obliged by diſtreſs of weather to put into the bay of St. Nicholas, on the White Sea. The czar Iwan Baſilowitz, being informed of his arrival, invited him to his court, where he was hoſpitably entertained, and the czar indulged the Engliſh with a free trade in his dominions. The houſes of Archangel are moſtly of wood, but well contrived; the fineſt edifice is a large town-houſe, built of ſquare ſtones after the Italian manner: it is divided into three parts; one of theſe conſiſts of four large commodious apartments, for the accommodation of merchants, ſtrangers as well as natives; here they are permitted to reſide with their merchandize till the month of October, when all the foreign ſhips ſet fail for their reſpective countries to which they belong. The ſtreets are paved ſo extremely bad with broken pieces of timber and rubbiſh, that it is dangerous to walk along them, except when they are rendered ſmooth and equal by the ſnow that falls, and freezes in the winter.

CAZAN or **CAZANUM**, the capital of a duchy of the ſame name, ſtands in the latitude of fifty-fix degrees fifty-four minutes, on the river Caſanka, in the miſt of a ſpacious and fruitful plain. It is a large and populous city, the ſeat of a Ruſſian metropolitan, abounding with a great number of churches, monaſteries, and ſpires, which afford a magnificent proſpect both from the land, and from the veſſels that are continually

continually falling up and down the Volga, into which the Casanka falls about four miles below the city. The houses in general, as well as the ramparts and towers, are built of wood. The castle, however, is fortified with stone walls, surrounded by the river, which forms a formidable fosse, well stored with artillery and ammunition, secured by a strong garrison of Russian soldiers, under the command of its own governor, independent of the governor of the city. At the confluence of the Casanka and the Volga there is a large commodious dock for building ships and other vessels of considerable burthen, to carry on the commerce of the Volga and the Caspian sea.

RUSSIAN LAPLAND.

WE have already presented our readers with a general description of Lapland, as to the country, inhabitants, customs, manners, &c. and have observed, that it is divided into three distinct sovereignties, namely, those of Denmark, Sweden, and Russia; it remains for us, under the last article, to give a particular account of that part which is distinguished by the appellation of Russian Lapland. This country is bounded, on the north, by the Northern Ocean, on the east and south, by the White Sea; and on the west, by Danish Lapland. It is further divided into three parts, according to their situation. One is called Leporia Mouremankoi, or Maritime Leporia; Terrkoi, or Inland Leporia; and Bellamoureskoi Leporia. The whole territory of Leporia-Mouremankoi is barren, woody, and mountainous; the air is extremely cold; the inhabitants rude and ignorant; and, in general, the country is much like the Swedish and Danish Lapland, formerly spoken of. Most of the islands, cities, and towns, stand on the east-coasts. The only observation worthy of mentioning concerning any of them is, that there are, in some of them, ancient monasteries; and that the rivers contiguous abound with fish, and particularly salmon. Terrkoi Leporia, or the inland part of Russian Lapland, is almost surrounded with the sea, and is the land that makes the gulf of the White Sea. It is no less woody and barren than the rest; and the chief town in it is Warsiga, situated on the south coast, against Archangel. Bellamoureskoi Leporia lies at the bottom of the above-mentioned gulf, called the White Sea, and, like the rest, is cold, barren, and thinly inhabited. The chief town is Soma, situated at the very entrance into the Russian Lapland, on the White Sea. The natives of Russian Lapland are of a middling stature; they have generally a flattish face, fallen cheeks, dark grey eyes, thin beard, brown hair, are well built, straight, and of a yellowish complexion, occasioned by the weather, the smoke of

their habitations, and their habitual filthiness. Their manner of life renders them hardy, agile, and supple; but, at the same time, they are much inclined to laziness. They have plain common sense, are peaceable, obedient to their superiors, not given to theft, not fickle, and cheerful in company; but mistrustful, cheats in commerce, proud of their country and constitution, and have so high a notion of it and themselves, that, when removed from the place of their nativity, they sometimes die with longing to return. Their women are short, complaisant, chaste, often well made, and extremely nervous; which is also observable among the men, though not so frequently. It often happens, that a Lapland woman will faint away, or even fall into a fit of frenzy, on a spark of fire flying towards her, an unexpected noise, or the sudden sight of an uncommon object, though in its own nature not in the least alarming. During these paroxysms of terror, they deal about blows with the first thing that presents itself; but, on coming to themselves, are utterly ignorant of all that has passed. This probably arises from their amazing credulity in supernatural agents.

Notwithstanding the introduction of Christianity, the Laplanders have preserved the manners of the Nomades, so that agriculture prospers not much among them. They divide themselves into Lapland-fishers, and Lapland-mountaineers. The former always make their habitations on the brink, or in the neighbourhood of some lake, whence they draw their subsistence. The others seek their support upon the mountains and their environs, with their rein-deer, more or less numerous, according to the season, and are almost always ambulatory. They are excellent and very industrious herdsmen, and are rich, in comparison of the Lapland-fishers. These last are also called Laplanders of the woods; because in summer they dwell upon the borders of the lakes, and in winter in the forest; they live by fishing and hunting, and choose their situation by its convenience for either. They do not travel much on foot, as the greater part of them have some rein-deer, and they are active and expert in the chase. The introduction of fire-arms has almost entirely abolished the use of the bow and arrow.

The men, besides looking after their rein-deer, the fishery, and the chase, employ themselves in the construction of their canoes, which are small, light, and compact. They also make sledges, to which they give the form of a canoe, harness for the rein-deer, all sorts of utensils in wood, as cups, bowls, and such like, which are sometimes prettily carved, and ornamented with bones, brags, or horn. It is also the man's business to look after the kitchen, in which the women never interfere.

The employment of the women consists in making nets for the fishery, in drying fish and mear, in milking the rein-deer, in making cheese, and in tanning hides. They prepare the nerves of the rein-deer in such a manner,

manner, as to make them serve as thread; and they draw brass-wire by the help of the horns of the rein-deer pierced, instead of a drawing iron. They embroider their clothes, which they make themselves, with brass wire, silver, sham gold, or wool, which they have the art of dyeing in all colours.

These people live in huts in the form of tents. The carcass of the hut is composed of poles stuck in the ground, and bent up at top in such a manner as to compose a vault almost round. A hut is about four or five fathom in diameter, and not much above one in height. They cover them according to the season and the means of the possessor; some with briars, bark of birch, and linen; others with turf, coarse cloth, felt, or the old skins of rein-deer. The door is of felt, made like two curtains, which open asunder. A little place surrounded with stones is made in the middle of the hut for the fire, over which a chain is suspended to hang the kettle upon. Round the fire they lay boughs of fir, which they cover with skins, felt, and the like. They are not able to stand upright in their huts, but constantly sit upon their heels round the fire. At night, they lie down quite naked; and, to separate the apartments, they place upright sticks at small distances. They cover themselves with their clothes, or lie upon them, and in winter they put their feet into a fur bag.

Their household furniture consists of iron or copper kettles, wooden cups very neatly cut, bowls, spoons, and sometimes tin, or even silver basons, to which may be added the implements of fishing and hunting. That they may not be obliged to carry all these things with them in their excursions, they build in the forests, at certain distances, little huts made like pigeon-houses, and placed upon a post, which is the trunk of a tree cut off at about the height of a fathom from the root. In these elevated huts they keep their goods and provisions, and they are never plundered, though they are never shut.

They use no kind of linen in their dress. The men wear close breeches, reaching down to their shoes, which are made of untanned skin, pointed, turned up before, and, in winter, they put a little hay in them. Their doublet is made to fit their shape, and open at the breast. Over this they wear a close coat with narrow sleeves, whose skirts reach down to the knees, and which is fastened round them by a leather girdle, ornamented with plates of tin or brass. To this girdle they tie their knives, their instruments for getting fire, their pipes, and the rest of their smoking apparatus. Their clothes are made of fur, leather, or cloth; the close coat, of cloth or leather, is always bordered with fur, or bindings of cloth of different colours. Their caps are edged with fur, pointed at top, and the four seams adorned with lists of a different colour from that of the cap. The skins of rats are generally used for the borders of the caps of the Russian Laplanders.

The women wear breeches, shoes, doublets, and close coats, in the same manner as the men; but their girdle, at which they carry likewise the implements for smoking tobacco, is commonly embroidered with brass wire. Their close coat has a collar, which comes up a little higher than that of the men. Besides these, they wear kerchiefs, and little aprons, made of Russian painted cloth, rings on their fingers, and ear-rings, to which they sometimes hang chains of silver, which pass two or three times round the neck. They are often dressed in caps, folded after the manner of turbans. They wear also caps of the shape of the head, but all are ornamented with the embroidery of brass wire, or at least with list of different colours, which, in their opinion, make an elegant appearance.

The greatest part of the food of the Laplanders is the rein-deer; the chase and the fishery furnish the rest. Among their game, the wild rein-deer is very useful, and in plenty; but the flesh of the bear is the most delicate meat. They eat every kind of fish, even the sea-dog, as well as all sorts of wild animals, not excepting birds of prey, and carnivorous animals. Their winter provisions consist of flesh and dried fish in the open air, both of which they eat raw, without any sort of dressing. They put the milk of the rein-deer into the stomachs of that animal, and so let it freeze. The cold also preserves their provisions, which consist of all sorts of wild-fruits, myrtle-berries, gooseberries, and a kind of cranberries, which grow in the moss in the forests. In the winter, when they want to use their frozen milk, they chop off pieces with a hatchet. A sort of sweet milk, curdled, and retaining all its cream, is one of the greatest dainties of a Laplander. Their common drink is water, sometimes mixed with milk, and they also make broths and fish soups; but brandy, which is very scarce with them, is the highest article of their luxury.

The most considerable branch of their commerce is the traffic they carry on with the Norwegians. This trade was formerly carried on in the way of barter; but coin is now more current among them. The balance is always in favour of the Laplanders; because they can furnish more merchandize in skins and furs, than they buy flour, oatmeal, cloth, knives, hatchets, and other utensils and hardware goods. Hence it is that they commonly pay their taxes in current coin, though they might pay them in skins and furs, if they chose it.

Whenever they are inclined to eat, the head of the family spreads a mat on the ground, for they never lay their meat on the bare ground. Men and women squat round this mat, which is covered with dishes; and every Laplander always carries about him a knife, a spoon, and a little up which drink out of. Each has their portion separately given them, that no person may be injured; for they are great eaters. Before and after the meal, they make a short prayer; and, as soon as they have done eating, each gives the other his hand.

They bury in the earth all the money they have not
immediate occasion for, as well as their plate, and
whatever they think of value; nor even at the point
of death do they declare the spot where it is hidden,
imagining that they shall want it in the other world.
By these means, the best part of their property is en-
tirely lost. Many of their children die by the hardy
manner in which they are brought up; but such as
survive are generally robust and alert. What may
contribute much to the strength of their constitution is
their living free from care, their temperance, and con-
tinual exercise; yet, after all, it is very rare that any
of them live to be far advanced in years.

Sterility, among the Lapland women, is a sort of
approach. They are generally delivered without dif-
ficulty; the husband assists at the labour, and affords
his wife the necessary help. Without this practice
they would often be distressed, as the inhabitants are
frequently at such a distance from one another as to
preclude the aid of any woman. Their cradle, formed
out of wood, is small, light, and made in the shape
of a shuttle, or of a canoe pointed at two of the ex-
tremities. Into this the child is put, quite naked, upon
moss, and is covered with a piece of fur fastened to
the cradle by a piece of string. The Laplanders sus-
pend these cradles in their huts, or, if the season per-
mits, to the branch of a tree; but the women carry
them at their backs when they go a journey.

The father presents his new-born son with a female
reindeer, on which he makes some figure as a dis-
tinctive mark. This mark becomes afterwards the
proper and peculiar signature of the new citizen; and
all the produce of this female reindeer is the un-
alienable property of the child, and makes no part
of the family possession. On the child's cutting its first
tooth, the father, if he be rich, or in easy circum-
stances, gives him a second reindeer. In general, the
fathers bestow an extravagant fondness on their chil-
dren; the consequence of which is, in Lapland, as
well as every where else, that these too indulgent
parents find themselves, if not hated by their children,
too frequently abandoned by them in that period of
life, when they should have most to expect from their
gratitude and duty.

The marriages of the children are directed by the
fancy of the parents, and in this they have no other
view than interest. Hence the most contemptible
woman may make a good match, if she possess but
some property. A young man is not permitted to
marry until he be able to take and kill a reindeer;
and in some provinces, they manage the contract of
marriage with all the formality of a bargain, when
the pretensions on both sides frequently rise very high
on the first proposal. They reckon severally whatever
the young man is to give in order to obtain his fair-one,
which most commonly consists of reindeer, or different
kinds of skins.

The wedding is celebrated at the bride's house; she

is dressed in the best manner, and appears before the
guests with her head quite uncovered, which, at other
times, is never the custom with either women or
maidens. The feast is a kind of merriment, to which each
of the guests bring meat and drink. Their diversion
at weddings, and other merry-makings, is the game of
fox and goose, a kind of draughts, with thirteen men,
twelve representing geese, and the thirteenth a fox. They
wrestle, and jump over a stick held horizontally, and
are fond of giving grotesque accounts of different ad-
ventures. They likewise dance and sing, or rather
howl in disagreeable measures. The new-married
people live with the woman's relations for the first
year, at the end of which they retire to a hut of their
own.

These people bury their dead without coffins, in some
cantons with their clothes on, in others quite naked.
The Pagan Laplanders in their most famous hunters
near the places consecrated to sacrifice. Formerly
their custom was, to throw the body into the ground
naked, and without ceremony; afterwards to surround
the spot with stones, and to pile others upon it. They
generally place a sledge with its bottom upwards upon
the grave, and some eatables and pieces of furniture
near it. The rich give some little refreshment to the
funeral attendants; but the generality of people do not
observe that custom.

All the Swedish and Norwegian, as well as the
greater number of the Russian Laplanders, bear the
name of Christians; but their religion is full of su-
perstition, and a compound of Christian and Pagan
ceremonies. The heathens still acknowledge, as their
ancestors heretofore did, an universal God. Besides
him they admit of inferior divinities, good and bad,
gods and goddesses. These deities, as they imagine,
dwell and rule in heaven, and take to themselves at
death, such as have conducted themselves well through
life. Other gods inhabit the air, such as the sun; and
their celebrated Thor, who rules the thunder. They
have other divinities, who direct the storms, and ter-
restrial deities, who preside over hunting. Maderakko
is a goddess, who, with her three daughters, direct
every thing relating to women. Jabme Akko, or the
mother of the dead, has her abode on the surface of
the earth, and takes care of departed souls till the final
decision of their doom. They have their infernal and
malevolent gods, who dwell in the centre of the earth,
where they place their hell; and also evil demons,
who have their habitations in the waters. They are
afraid of fiery goblins and spectres, satyrs or demons
of the woods, and malevolent fairies of the lakes.
There is, however, a great difference in matters of
faith; one man believes in all these divinities, while
another admits a larger stock, and some reduce their
number considerably.

Instead of temples, they have consecrated moun-
tains, and have lakes and rivers that are sacred. There
are also consecrated trees, on which figures are carved,
6 Z and

and around them are little scaffoldings, for the offerings, from three to five feet high. Even the Christian Laplanders have so much veneration for these places, that they never approach them without making some offering; nor will they, upon any account, hunt or make their habitation in the neighbourhood of them. Here are to be seen mis-shapen idols of wood and stone, or carved out of roots of trees. The stone idols are chiefly found near lakes and rivers, and consist of a great heap of stones, shaped and piled up in the most whimsical manner. While they are fishing in these holy waters, they are forbidden, among other things, to speak, to have a dog with them, or to be assisted by women.

In cases of sickness, of unfruitful marriages, in times of epidemical diseases among the rein-deer, and other temporal adversities, they make their offerings, always consulting a magician, to which of the gods they shall sacrifice, what offering they shall make, in what place they shall deposit it, and many more particulars. For this purpose, the magician makes use of his magical drum, which is a box of an oval shape, covered on one side with a skin, and furnished on the other side with several strings and pieces of iron, to rattle and make a noise. Strange figures, intended to represent the heavenly bodies, such as beasts and birds, are drawn on the skin. The forcerer puts a ring upon his drum, beats on it with his drum-stick, which is made of the mossy horn of a rein-deer; and, according to the figure on which the vibration of the skin causes the ring to fall, he answers all questions concerning former or future events. At the same time, he invokes the spirits to assist his drum, and, during this immumery, he falls into a fit, when his soul is supposed to be with the spirits of the air, hearing their converse, and learning the decrees of heaven.

Every person carries his offering himself. Previous to this, the votary performs his purifications, ties up all his dogs, that they may not cross his way, and proceeds, without speaking, towards the holy place, bearing the bones, or the horns, of the animal prescribed by the forcerer; and, as soon as he comes within sight of the place appointed for the offering, he falls down on his hands and knees, and crawls up to it. He then places his offering on the scaffold, and makes his prayer, continuing all the while prostrate with his face upon the earth. This done, the business is over, and the votary returns home.

It is not at all surprising that people of such principles should be fertile in visions, apparitions, superstitions and childish tales, which the Laplanders are in a great degree. They imagine their magicians possess the power of controlling the winds and the rain, of producing and destroying insects, of speaking to spirits, and a thousand other fooleries; but they believe, at the same time, that the thunder is inimical to the magicians; and hence their proverb, "If it were not for thunder, the world would be destroyed by

magic." They attribute singular effects to certain words and phrases, and scarcely undertake any thing without a previous charm.

NOVA ZEMBLA.

The above name was given by the Russians to their new-discovered tract, and in their language signifies New Land. It is separated from the northern part of Russia by the strait called Veigatz, or Wygatz, which lies in north lat. 70 deg. The land that forms this strait is a promontory, advancing southward from the main country, which is supposed to extend itself much further north. It was long doubted, whether this country joined to the continent of Greenland on the west, or of Tartary on the east, but it is now known to be an extensive island.

This inhospitable region was first discovered by the English, anno 1553, when captain Hugh Willoughby sailed thither with three vessels, and advanced from the north cape of Finmark as far north as the 72d deg. of lat. where he thought he had deserted this land; but being obliged, through stress of weather, to put into port of Lapland, he there perished with cold, with all his company. Captain Burroughs sailed in search of it three years after, and having doubled the above-mentioned cape, discovered the strait of Wygatz, between the south part of Nova Zembla and the north coast of Samoieda. Since that time it hath been often visited, both by Dutch and English, in hopes of finding out the north-east passage; but the coldness of the climate, and the mountains of snow which covered that whole country, prevented their making any great discoveries. Some Dutchmen wintered there, anno 1596, but found the cold so excessive, that they, with great difficulty, kept themselves alive till the next summer. They saw no sun from January 4 to June 24, during which long and dark interval they had no light, but what the moon gave them from the first to the last quarter, in which the stone by day as well as night. The account they gave of it is, that some parts of that country is inhabited by a people of low stature, who are idolaters and barbarous.

The attempts made afterwards by Barentz, a Hollander; by Hudson, Wood, and Flaws; proved likewise of little or no consequence to the public, and of destructive consequence to themselves. Wood, indeed, made some remarks, which gave him reason to think there was a passage between this country and that of Greenland. Nova Zembla he represents as the most forlorn spot in all the world, the greatest part of which is laid under snow and ice; and that where there is neither of these, nothing presents itself to the view but dismal quagmires, covered with moss, and some blue and yellow flowers. Upon digging two or three feet into the earth, they found the ice as hard as marble, which shews how vain it would be to attempt to winter there in caves dug under ground. In other north-

ern countries the ice and snow is observed to melt
much sooner on the sea-coasts than in the inland parts,
but here it proves the reverse; and the sea, which beats
against mountains of it of a prodigious height, hath fo
underrated it, that it seems to hang in the air, and disc
overs such monstrous chafms, as cannot be beheld
without horror.

Nova Zembla, so far as our author had an oppor
tunity to view it, breeds some sorts of wild creatures,
such as large white bears, foxes, some small creatures
like rabbits, larger than rats, large penguins, &c. The
penguin is of the size of a goose, and the feathers are
somewhat like hairs, and of an ash colour. The wings
are very short in proportion to the body; the bill is
black, and the legs are of a bright green. They keep
in the water all the day, where they feed upon fish. As
they cannot fly, they cannot shun their enemies, except
by leaping along, which they do pretty well by the help
of their short wings. However, this bird is active upon
the water, and seems to be very skilful in catching its
food. When the sun begins to set, they retire to the
rocks near the sea, where they continue till morning,
at which time they are easily taken. They build their
nests upon the rocks, on the craggy points, to which
these birds can get up very easily. Their eggs are very
good, but the flesh has a disagreeable fishy taste, and is
never eaten but in cases of great necessity. It is wor
thy of remark, that the bird penguin, which is not
only common to these northern parts, but likewise in
several countries of North America, is every where
known by the same name, with little or no variation;
and that the word penguin, in the Celtic, and in our
present Welsh, signifies a white head, as that bird actu
ally hath. This, together with some great affinity
which is found in many of the radical words and pro
per names, used by those distant regions, confirms a
curious conjecture of the authors of the Universal
History, which is, that the descendents of Gomer, the
eldest son of Japhet, were not only the first peoplers of
Europe, even in its remotest parts, but have preserved
their ancient language more than any other nation we
know of, except the Chinese.

The southern part of this country has been since
found to be inhabited by a squat, swarthy sort of people,
who clothe themselves with seal-skins, or with the skin
of the bird penguin, with the feathers outward. They
live upon what game or fish they catch; they worship
the sun and moon, and have some little wooden idols,
in human shape, but monstrously carved, or rather
notched.

A variety of romantic tales, and manifest absurdities,
having been published by many of the Dutch
voyagers, these, together with the ridiculous relations
of Ferdinand Mendez and Pinto, and the improbable
stories of Sir John Mandeville, gave rise to a witty and
ingenious satire, written by the celebrated Sir Richard
Steele, and published in the Tatler, as if from a manu
script of Sir John Mandeville. The scene being founded

in Nova Zembla, the humour being admirable, and
the satire pointed against all travellers and voyagers
who attempt to impose upon the public, we shall make
an extract from it without further apology.

Sir John Mandeville is supposed to be the narrator,
and to relate as follows: "We were separated by a
storm, in the latitude of 73, inasmuch that only the
ship in which I sailed, with a Dutch and French ves
sel, got safe into a creek of Nova Zembla. We landed
in order to rest our vessels, and store ourselves with
provisions. The crew of each vessel made themselves a
cabin of turf and wood at some distance from each
other, to fence themselves against the inclemencies of
the weather, which was severe beyond imagination.
We soon observed, that, in talking to one another, we
lost several of our words, and could not hear one an
other at above two yards distance, and that too when
we sat very near the fire. After much perplexity, I
found that our words froze in the air, before they could
reach the ears of the person to whom they were spoken.
I was soon confirmed in the conjecture, when, upon
the increase of the cold, the whole company grew
dumb, or rather deaf; for every man was sensible, as
we afterwards found, that he spoke as well as ever; but
the sounds no sooner took air, than they were condensed
and lost. It was now a miserable spectacle, to see us
gaping and nodding at one another, every man talking,
and no man heard. One might observe a seaman that
could hail a ship at a league's distance, beckoning with
his hand, straining with his lungs, and tearing his
throat, but all in vain.

"We continued here three weeks in this dismal
plight. At length, upon a turn of wind, the air about
us began to thaw. Our cabin was immediately filled
with a dry clattering sound, which I afterwards found
to be the crackling of consonants that broke above our
heads, and were often mixed with a gentle hissing,
which I imputed to the letter S that occurs so frequently
in the English tongue. I soon after felt a breeze of
whispers rustling by my ear; for those being of a soft
and gentle substance, immediately liquified in the warm
wind that blew across our cabin. These were soon
followed by syllables and short words, and at length
by entire sentences, that melted sooner or later, as they
were more or less congealed; so that we now heard
every thing that had been spoken during the whole
three weeks that we had been silent, if I may use that
expression. It was now very early in the morning, and
yet, to my surprize, I heard somebody say, "Sir John,
it is midnight, and time for the ship's crew to go to
bed." This I knew to be the pilot's voice; and, upon
recollecting myself, I concluded, that he had spoken
these words to me some days before, though I could
not hear them till the present thaw. My reader will
easily imagine how the whole crew was amazed, to
hear every man talking, and see no man open his
mouth. In the midst of this great surprize we were all
in, we heard a volley of oaths and curses, lasting for a
long

long while, and uttered in a very hoarse voice, which I knew belonged to the boatswain, who was a very choleric fellow, and had taken his opportunity of cursing and swearing at me, when he thought I could not hear him; for I had several times given him the strappado on that account, which I did not fail to repeat for these his pious soliloquies when I got him on shipboard.

"I must not omit the names of several beauties in Wapping, which we heard every now-and-then in the midst of a long fight that accompanied them, as Dear Kate! Pretty Mrs. Peggy! When shall I see my Sue again? This betrayed several amours which had been concealed till that time, and furnished us with a great deal of mirth in our return to England.

"When this confusion of voices was pretty well over, though I was afraid to offer at speaking, as fearing I should not be heard, I purposed a visit to the Dutch cabin, which lay about a mile further up in the country. My crew were extremely rejoiced to find they had again recovered their hearing, though every man uttered his voice with the same apprehensions that I had done,

"And, try'd his tongue, his silence softly broke."

"At about half a mile's distance from our cabin, we heard the groanings of a bear, which at first startled us; but, upon our inquiry, we were informed by some of our company that he was dead, and now lay in salt, having been killed upon the very spot about a fortnight before, in the time of the frost. Not far from the same place, we were likewise entertained with some posthumous snarls and barkings of a fox."

Very few of the Russian Tartars are tall; but they are for the most part straight and well-made, have small faces, fresh complexions, and a sprightly and agreeable air. They are haughty and jealous of their honour, but of a very moderate capacity. They are sober and frugal, skilful at mechanical trades, and fond of neatness. The Tartarian women are of a wholesome complexion, rather than handsome, and of a good constitution; from their earliest infancy they are accustomed to labour, retirement, modesty, and submission. The Tartars of Kafan take great care of the education of their children. They habituate their youth to labour, sobriety, and a strict observance of the manners of their ancestors. They are taught to read and write, are instructed in the Arabic tongue, and the principles of their religion. Every little village has its chapel, school, priest, and school-master; but some of the priests and school-masters are not much skilled in the Arabic language.

The best Tartarian academies in the Russian empire are those of Kafan, Tobolski, and Astracan, which are under the direction of the gagoons or high-priests. Small collections of historical anecdotes in manuscripts are pretty frequently found in the huts of the boors;

and their merchants, besides what these little libraries contain, are pretty well acquainted with the history of their own people, that of the circumjacent states, and with the antiquities of each. Those persons who are desirous of making a progress in theology, enter themselves into the schools of Bukharia, which are more complete than the rest.

In Kafan, Orenburg, and other governments, the Tartar citizens carry on commerce, exercise several trades, and have some manufactories. Their manner of dealing is chiefly by way of barter: coin is seldom seen among them, and they have no bills of exchange. They are not in general very enterprising; but by means of many partners and clerks, they carry on a great deal of business, which is rendered very lucrative by their parsimonious method of living. At Kafan they prepare for sale what the English call Morocco leathers.

The villages inhabited by the Kafan Tartars comprehend from 10 to 100 farms. These villages were at first composed of troops of wandering shepherds, but being more closely united by successive populations, they were under the necessity of cultivating the earth, and erecting fixed habitations. They never leave their fields fallow, for which reason they use more manure than the Russians. They bestow much labour on the cultivation of bees, and reap great profit from this part of rural oeconomy. There are tanners, shoe-makers, smiths, carpenters, taylor, and dyers, in most of the villages. The laborious females make thread from hemp of their own cultivation; they likewise spin, and make cloth from the fleece of their flocks.

These Tartars have, for the most part, only such moveables as are absolutely necessary for common use; their kitchen and table furniture consists but of few articles, which may be also laid of their utensils of agriculture and mechanics. They commonly make four meals a day, at which their bench serves them for table and chairs; for on this they place themselves round the dishes, each person sitting on his heels, after the Eastern manner. At the beginning and end of all their meals they make ablutions, and say prayers. Like most of the Mahometan Tartars, they are very polite, both to each other and to strangers. Old men, who have maintained good characters, are held in great veneration among them, and a grey beard always commands respect. Their old men are the arbiters in all disputes; preference and precedence is always given to them, and these people are fond of asking their advice.

Before we give an account of the people inhabiting the rest of eastern and western Muscovy or Russia, it may be proper to remark, that the present subjects of the Russian empire, in its most extensive sense, are the descendants of many different people, and inhabit prodigious tracts of country; so that it is no wonder that among them we find a vast variety of characters and manners; and the great reformatations introduced of late years, as well as the discoveries made, which render former accounts little to be depended upon.

We may also the Tartars of derived from the for the character in their near

We may also observe, that the mien and character of the Tartars of Kafan, above described, and of those derived from them, are very uniform, and may serve for the characteristic marks of all the Mahometan Tartars in their neighbourhood.

Of late years Russian colonies have been established in the kingdom of Siberia and province of Dauria, which till that period were inhabited only by Tartars, who lived in tribes under distinct governments, and shifted their habitations occasionally. Most of them, however, conformed to the customs of the Russian emigrants, built themselves houses, learned to till their ground, and now pay an annual tribute of furs to the crown. But there are other Tartars who still live in tents, and refuse to acknowledge obedience to the monarch of Russia. Both sides of the river Wolga are inhabited by the Zeremisses and Morduars, an inoffensive people, who employ themselves in agriculture, and pay taxes like the other subjects of Russia. From Kafan to the frontiers of Siberia, the country is peopled by the Baskirs, a powerful nation, who have had some privileges granted them by the Russians, of which they are very tenacious. Kafan and Altcran were originally kingdoms belonging to the Tartars, and still contain a great number of those people; but they are not suffered to reside in the cities which the Russians have built there. A large tract of land extending from the boundaries belonging to the Baskirs as far as Altcran, and the frontiers of the Usbecks, is frequented by the wandering Kalmucks, who live in tents, which according to the season, or for convenience of subsistence for themselves and cattle, they remove at pleasure. These people receive annual presents from the crown, of cloth, money, and arms, in return for which they are obliged to serve in the Russian army without pay.

The Cossacks, who have lately made so considerable a figure in the military transactions of Europe, are distinguished into three tribes, known by the places where they made the first settlements; though all of the same nation speak the same language, profess the same religion, and live under the same form of government. They were originally Polish peasants, who, being formed into a militia, were posited in the Ukraine, to oppose the incursions of the Tartars; but finding themselves oppressed by their own lords, they turned their arms against them. In the first engagement they were defeated, and several of them fled to the banks of the Don or Tanais, at that time entirely uninhabited, where they established a colony. In 1637, they were joined by a considerable number of their countrymen, and soon after attacked and reduced the town of Afoph; but on the approach of the Turkish army, were obliged to abandon that place, having first reduced it to ashes. Their next step was, to put themselves under the protection of the Russians, and built a town, which they called Circasky, on an island in the Don. Their settlement extended itself with surprising

rapidity; thirty-nine towns, situated on both sides the river, from Rybna to Afoph, being built, and peopled by them, in a few years. They enjoy their own laws and customs, being exempt from tribute; neither do they furnish recruits, but, when summoned by the czar, are obliged to appear in arms at their own expence. Though their country is fruitful, they sow very little corn, subsisting chiefly on flesh, fish, and fruits; and their wealth consists in cattle, horses, camels, and dromedaries. They surpass the Russians in the neatness of their dresses and houses, profess the Greek religion, and delight in war. Their number is far from being so considerable as formerly; for, in the reign of Peter the Great, thinking themselves oppressed, they revolted, and were not without the utmost difficulty reduced again to obedience. In the contest many of their towns were burned, and the inhabitants massacred without distinction of age or sex.

The internal government of the Cossacks is military and democratic. The captains and officers of the nation choose a chief, termed Hetman, who always resides at Circaska, and holds his authority during life; but he must first be confirmed by the czar. His power extends over the other towns of the nation, each of which is formed into a commonwealth, governed by its own hetman, who is chosen annually, and is accountable to the chief hetman, at Circaska.

The Cossacks of the Ukraine are much more numerous than the Don Cossacks, and enjoy an extent of land for several hundred miles, between the rivers Nieper and Don. They did not revolt from the Poles till the year 1654; but at present their country is populous and well cultivated, abounding with fortified towns, and large villages neatly built of wood. This tribe likewise complained that their liberties were encroached upon in the reign of the czar Peter, and he being at that time engaged in war with Charles XII. they, together with their hetman Mazeppa, joined that monarch, but with very little success; for during their revolt their town of Bathurin was burned, and six thousand of the inhabitants destroyed.

The third tribe of these people is distinguished by the name of the Zaporovian Cossacks, who, after their revolt from Poland, settled about the falls of the river Nieper, or Borystenes. Three thousand of these joined Mazeppa, after he was abandoned by his own people, and engaged with him in the service of Sweden; but they were most of them cut to pieces.

The Finns come originally from Asia, and very nearly resemble the Laplanders, but are more civilized and better informed. They inhabit towns and villages, make some progress in the arts and sciences, profess the tenets of Luther, and, in their computation of time, use the Christian æra. These people carry on commerce, and are employed in most of the common trades. The peasants chiefly attend upon agriculture, hunting, and fishing. They are great eaters, making five meals a day, and drink brandy to excess. The

Russian government has continued to them the enjoyment of the privileges which they formerly had under the crown of Sweden; so that they possess a considerable degree of freedom.

The Votiaks, or Viatkis, are descended from the Finns, and chiefly inhabit the province of Viatki, in the government of Kasan: they were formerly under the protection of the Tartars; but, since their subjection to Russia, have preferred the quiet and security which agriculture affords, to the wandering life of herdsmen and shepherds. These people are middle-sized, and in general red-haired: in their manners, they are honest, peaceable, and hospitable; but are addicted to superstition, and very credulous. In rural œconomy, they are assiduous, neglecting neither the culture of bees, nor the chase; in the latter, they use indifferently the bow or fire-arms. Many of them employ their leisure hours in making all sorts of turnery, such as cups, spoons, and shuttles; and others varnish all kinds of bowls and cups. The women spend their time in sewing, making linen, coarse cloths, and ornaments of embroidery. Some of the Votiaks are Christians, but a great part of them are heathens and idolaters; though even these believe the doctrine of a future state of rewards and punishments. Their town has little or nothing in it worth notice, except its being a bishop's see, and having a stout castle to defend it against the incursions of the Scheremille Tartars that infest those parts.

The Ostiocs are one of the most numerous nations in Siberia, and are likewise sprung from the Finns. Before they were subjected to Russia, they were governed by their own princes, whose descendents are still reputed noble. These people divide themselves into different stocks or tribes, and choose their chiefs from among the progeny of their ancient rulers. These superintend the payment of the taxes, and preserve peace and good order. They are extremely ignorant, and entirely unacquainted with the use of letters or figures, and, like the other Finnish nations, can only reckon as far as ten. A singular custom among them is, that the daughter-in-law never uncovers her face in the presence of her father-in-law; nor is the son-in-law allowed to appear before the mother-in-law till his wife has had a child. The greatest part of them are idolaters; and one of their strange notions is, that bears, after death, enjoy a happiness equal to that which they expect for themselves; and are so fixed in the belief of this, that whenever they kill one of these animals, they sing songs over him, in which they ask his pardon for the injury he has received at their hands: they also hang up his skin, to which they shew many civilities, and address with many fine compliments, in order to avert his vengeance from them in the world of spirits. It appears, indeed, that among all the Pagan nations of the north and north-east, bears are in great estimation.

The Vogouls, or Vogulizi, differ so much from all

their neighbours round about, that they have been supposed to be of Tartaric extraction, but without any probability; since all the Tartars, either of Siberia, Kasan, or Astracan, are all Mahometans; whereas these Vogulizi are heathens, and resemble most, in their religion and customs, the Siberian Pagans, only they are more civilized. They are rather below the middle stature, have generally black hair, and a scanty beard. They are of a gay disposition, honest, laborious, and acute; but slovenly and sickly, and inclined to be very passionate. Their women are well-made, robust, civil, and laborious. They are unacquainted with the use of letters, as well as some of their kindred nations: they do not reckon their time by years, though they mark the months, and name them after the various revolutions of nature which they observe in their forests.

They acknowledge a Supreme Being, the creator and preserver of all things; and sacrifice to him once a year, at the end of summer, in one of the nearest forests, some of the best cattle they are masters of, one of each sort; but can give no reason for their so doing, but that their fathers did so before them. They believe a future life of rewards and punishments, but will not bear being told that there are any devils, or malevolent spirits, alleging, that they have no instances among them of any such. They go dressed much like the Russian peasants, and bury the dead in their best clothes, together with some money. As there is little corn comes to perfection in their country, they live chiefly upon the milk of their cattle, and such game as they kill. They marry as many wives as they can maintain, which they buy of their parents, but they are very scrupulous of marrying within the forbidden degrees of consanguinity.

They have neither cities or towns, but villages made up of huts, of a conic figure, with a hearth in the middle, and a hole at the top, to let the smoke out; which hole, however, they cover with a thin transparent piece of ice, to let some light into their huts, as soon as their fuel is burnt to a coal. When a woman is near the end of her pregnancy, she is obliged to go into a private hut reared on purpose for her, and to live in it separate from her husband, and all matrimonial intercourse. The men go a shooting of elks, fallow deer, and other game: they live quiet under the Russian government, and pay their tribute in skins and furs, which are sent into the public repository at Siberia. Their country reaches from 62 deg. 30 min. to almost 63 deg. of north latitude.

The Schouvaches, or Tschouvaches, live on the banks of the Wolga, in the governments of Kasan, Oreburg, and Nischnei-Novogorod. These people never dwell in towns, but assemble in small villages, and choose the forests for their habitations. One of their marriage ceremonies is, that on the wedding-night the bride is obliged to pull off her husband's boots. We are told by a late writer, that among the Tschouvaches

the husband is master of the house; he orders every
thing himself; and it is the duty of the wife to pay
implicit obedience to his orders: by this custom, many
domestic broils are prevented, and family quarrels very
uncommon. They are very fond of hunting, and pro-
cure for that purpose screw-barrel muskets, which they
prefer to the bow.

The Kirguisians, in their air and deportment, resem-
ble the Tartars of Kasan. They dwell always in
portable huts, wandering about their deserts in search
of pasturage for their flocks and herds, which constitute
their chief occupation. In summer, they traverse the
northern deserts, and the southern parts in winter.
They follow hunting and fishing, but are entirely unac-
quainted with agriculture. Their stock of cattle, which
consists of horses, camels, cows, goats, and sheep,
supply them both with food and raiment. Their
camels are very serviceable to them, as in all their
migration they carry their huts and furniture, to the
weight of 900 pounds. With respect to their persons,
the Kirguisians have a sharp but not a fierce look, and
their eyes are smaller than those of the Kasan Tartars.
The decoration of their horses takes up almost as much
time as that of their persons. The great and wealthy
live perfectly in the same manner as the rest of the
people, and are distinguished only by the numerous
train that accompanies them in the cavalcades, and the
quantity of huts which surround their quarters, inha-
bited by their wives, children, and slaves. They are
great eaters, and smoke tobacco to excess. Men,
women, and children all smoke and take snuff: they
keep the latter in little horns fastened to their girdles.
In their dispositions, they are affable and high-spirited,
and have good natural sense; but are voluptuous, and
fond of their ease.

The Tungusians are a more numerous people than
any that inhabit Siberia. They are of a middle size,
well made, and have an agreeable aspect. Their sight
and hearing are amazingly acute and delicate; but
their smelling and feeling are greatly inferior to ours.
They have excellent capacities, learn foreign languages
with ease, are alert on horseback, good hunters, and
dexterous at the bow. They are acquainted with al-
most every tree and stone they have met with in the
course of their travels, and can even describe a space
of some hundreds of miles by the shape and form of
the trees and stones they have noticed, and can teach
others to pursue the same course by such descriptions.
They also discover the tracks of the game by the com-
pression of the grass or moss they have passed over.

The Kalmucks are a numerous tribe, inhabiting a
prodigious desert which lies between the rivers Don and
Volga. They are for the most part raw-boned and
stout, have reddish and yellowish-brown complexions,
a flat visage, thick lips, a small nose, and short chin.
The women are shaped like the men, have a whole-
some white and red in their faces, and are lively,
agreeable, and industrious. The sole profession among

them is the breeding of cattle; they pursue hunting as
an amusement; live in tents, or yurts of felt, which
they call *gar*, and the Russians *kibitka*, and in many
respects resemble Kirguisians. Their clothing is after the
altern manner, and they dress their heads exactly like
the Chinese: some of their women wear a large golden
ring in their nostrils. They are great eaters, but can
endure want for a long time without complaint. Their
principal food is animals tame and wild, and even their
chiefs will feed upon cattle that have died of age or
distempers, though it stink ever so much; so that the
flesh market in every herd hath the appearance and
scent of a lay-stall of carrion: they eat likewise the
roots and plants which grow in the deserts. Both
sexes smoke continually. As their courses are regu-
lated by necessity, they keep to the north in the sum-
mer, and to the southern deserts in the winter. They
sleep upon felt or carpeting, and cover themselves with
the same. They are characterized as a rough kind
of people, but are less base and dissolute than they are
represented to be. Their attachment to their chiefs
or masters is very great; but their active spirit, together
with their improvidence and carelessness, render them
thievish and dirty. In their robberies, they prefer stra-
tagem to violence, and are seldom known to commit
murder, from their belief in the nocturnal wandering
of dead men's spirits. Their code is very favourable
to females, to whom they never impute any crime. A
rape and adultery is punished with a mulct of nine-
herd of cattle. They affect to profess the Chinese
religion, but know very little of its principles. They
are superstitious about good and bad days; and have
written laws which are founded on reason, custom,
and the will of the prince. Their speech is a mon-
grel dialect with many Tartarian words; but their
religious books are in the Tangut or Tibetan.

The Kamtschadales live in villages consisting of a
few small houses, and situated in general near some river.
When a village becomes too populous, they separate,
and form another. They have a lively imagination, a
strong memory, and a great genius for imitation. Be-
fore they were prevailed upon to embrace the Christian
religion, they believed the mortality of the soul: they
are, however, superstitious to extravagance, and ex-
tremely singular and capricious in the different enjoy-
ments of life, particularly their convivial entertain-
ments. Their chief employments are hunting and
fishing; they are very expert at the latter, and well
acquainted with the proper seasons for it: their nets
are made of the stamina of nettles. The chase fur-
nishes them with fables, foxes, and other game. When
they are not engaged in hunting and fishing, they
sometimes employ themselves in building huts, form-
ing wooden utensils, cutting wood for fuel and building,
and making bows and arrows. They pass much of
their time in absolute idleness. Poverty gives them
no concern; and, as they are naturally extremely
indolent, nothing but the calls of hunger can drive
them.

them to the chase. They eat and drink a great deal; but as what they eat is always cold, their teeth are very fine. Dogs are their only domestic animals; and they put a high value upon them. Some of them travel in small carriages drawn by dogs; and a complete Kamtschadaljan equipage, dogs, harness, and all, costs in that country 41. 10s. or near 20. rubles. Kamtschatka is now considered as the most horrid place of exile in the vast empire of Russia, and here some of the greatest criminals are sent.

In this wide and forlorn region, that was so long unknown to Europe, some new mines have been lately discovered, which, upon their first opening, have yielded 45,000 pounds of fine silver, and which is said to have been obtained with little difficulty or expence. The manners of the Siberians were formerly so barbarous, that Peter the Great thought he could not inflict a severer punishment upon his capital enemies the Swedes, than by banishing them to Siberia. The effect was, that the Swedish officers and soldiers introduced usages and manufactures into the country, and thereby acquired a comfortable living, besides contributing in some degree to the civilization of the natives.

The curiosities to be found in Russia, by reason of its recent civilization, can afford no great entertainment to the reader. This country can, however, produce many stupendous monuments of the genius and public spirit of her sovereigns; among which are the canals (already described) made by Peter the Great, for the benefit of commerce. Siberia abounds with old sepulchres of an unknown nation, whose instruments and arms were all made of copper. In the museum at Petersburg, there is a rhinoceros dug up on the banks of the river Valuis, with the skin and hair upon it perfect. Besides the great bell at Muscovy, of which an account is given in our description of that city, a late writer mentions another there, founded in czar Boris's time, 19 feet high, 23 in diameter, 64 in circumference, and two in thickness, that weighed 336,000 lb. The building of Petersburg, and raising it on a sudden from a few fishing huts to be a populous and rich city, is perhaps a curiosity hardly to be paralleled in the erection of the Egyptian pyramids. The same may be said of the fortress of Cronstadt, which, with the city, employed for some years 300,000 men in laying its foundations and driving piles, night and day; a work which no monarch in Europe, Peter excepted, could have executed. What is more wonderful, he drew the plans of all his undertakings, raised a formidable navy, and wrought with assiduity as a common labourer in all his amazing works.

THE HISTORY OF RUSSIA.

THERE is no doubt but some of the most neglected parts of this country were early peopled, and

possibly much richer than at present; but the few accounts we have of this northern nation are so enveloped in fable and fictitious relations, that it is hardly possible to form a consistent narrative, founded on truth, before the introduction of Christianity, about the tenth century, when Olha, a Russian princess, was baptized at Constantinople, and called Helen. Her example however was not generally followed till the year 987, when Volodimer her grandson, having formed an alliance with Basil, emperor of Constantinople, patriarch Photius, so famous for his amazing erudition, his disputes with the Roman church, and his misfortunes, sent proper persons to baptize the Russian princes, and add that part of the world to his patriarchate.

In the year 1450, John or Iwan Basilides, a man of courage and intrepidity, ascended the Russian throne, delivered his country from the yoke of the Tartars, and increased his territories by the acquisition of Novogorod, and the city of Moscow. He even extended his conquests into Finland, which has so often been the source of wars between Russia and Sweden. It is said that this emperor brought back from Moscow three hundred cart loads of gold, silver, and precious stones; but we have already observed that the history of these rude times abound with fictions.

John Basilides, his grandson, who mounted the Russian throne in 1530, pursued the steps of his predecessor, and cleared his country from the incursions of the wandering Tartars; he subdued the kingdoms of Kafan and Aitracan, in Asia, and annexed them to his dominions, but could not maintain his ground on the side of Finland; his forces were always defeated by the regular troops of Sweden.

John Basilides II. who died in 1584, left two sons, the one named Fedor, or Theodore, the other Demetrius. Fedor succeeded his father, and Demetrius was confined to a village called Ughis, with the czarina, his mother. The rude manners of the Russian court had not yet adopted the policy of the Turkish sultans, in sacrificing the princes of the blood to the security of the throne. Boris-Godonow, the prime minister, whose sister was married to Fedor, persuaded his master that he could never reign quietly unless he imitated the Mahometan court, in assassinating his brother. Fedor listened to his advice, and an officer was dispatched to execute his inhuman resolution. The officer at his return to court declared that he had put Demetrius to death, and demanded the reward that had been promised him for this sanguinary service; but Boris, instead of a reward, put him to death, in order to suppress every possible proof of the murder. It was reported, that Boris-Godonow, some time after poisoned the czar Fedor; but though he was strongly suspected of the crime, yet it did not prevent his ascending the throne. This event happened in 1597.

About the same time there appeared in Lithuania, a young man, who pretended to be prince Demetrius, asserting that he had escaped from the hands of the assassin.

assassin. Several who had seen him at his mother's house, knew him again by particular marks. He perfectly resembled the prince; he shewed the cross set with diamonds which had been tied about the neck of Demetrius. The palatine of Sandomir acknowledged him immediately for the son of John Basilides, and for the lawful czar. The diet of Poland made a solemn inquiry into the proofs of his royal extraction, and finding them abundantly sufficient, furnished him with an army to drive out the usurper, and recover the throne of his ancestors.

In the mean time, however, Demetrius was treated in Russia as an impostor, and even as a magician. The Muscovites could not believe that Demetrius, who was supported by the Poles, a catholic nation, and who had two jesuits in his council, could be their king. So little did the boyars question his being an impostor, that, upon the death of the czar Boris, they made no difficulty of placing his son, then only fifteen years of age, on the Russian throne.

During these transactions Demetrius was on his march into Russia, at the head of a Polish army: and all those who were dissatisfied with the government, declared in his favour. A Russian general advancing within sight of Demetrius's army, cried out, "He is the only lawful heir of the empire," and immediately joined his standard with the forces under his command. The revolution was sudden and complete, and Demetrius was no longer a magician. The inhabitants of Moscow ran to the palace, and dragged the mother and son of Boris to prison. Demetrius was unanimously proclaimed czar; and it was given out, that both young Boris and his mother had killed themselves in confinement. Probably they were put to death by Demetrius. This event happened in 1605.

The widow of John Basilides, mother of the real or pretended Demetrius, had been long since banished to the northern parts of Russia; and the new czar now sent a magnificent carriage to bring her to Moscow. He went himself part of the way to meet her; they embraced each other with transports and tears of joy, in the presence of a prodigious multitude of people, so that none doubted but Demetrius was the lawful emperor. In 1606, he married the daughter of the palatine of Sandomir, his first protector, and this brought on his ruin. Shocked at seeing a catholic empress, a court composed of foreigners, and, above all, a church erected for the jesuits, the people no longer considered Demetrius as a Russian, the son of John Basilides, and determined to drive him from the throne.

Accordingly, in the midst of the entertainments at the marriage of the czar, a boyar, whose name was Zulfki, put himself at the head of a number of conspirators, and entering the palace with a sword in one hand, and a cross in the other, cut the Polish guards in pieces, hurried Demetrius to prison, and loaded him with chains. He was soon after confronted with the

dowager czarina, who had so solemnly acknowledged him for her son. The clergy obliged her to swear upon the cross, and to declare whether Demetrius was or was not her son. Accordingly she affirmed, that the czar was not her child; that the real Demetrius was murdered in his infancy; that she had only followed the example of the whole nation in acknowledging the new czar, and to be revenged for the blood of her son upon a family of assassins. Demetrius was now said to have been originally, nothing more than a peasant named Griska Utropoya, who had for some time lived as a monk in a Russian convent. But however that be, Zulfki killed him with his own hand, and took his place on the throne in the year 1606.

The rest of the boyars however who had before been Zulfki's equal, but now his subjects, could not behold his exaltation with patience. They asserted that the late czar was not an impostor, but the real Demetrius, and that the murderer was unworthy of the throne. The name of Demetrius now became dear to the Russians; and the chancellor of the murdered czar declared, that he was so far from being dead, that he would soon recover of his wounds, and appear again at the head of his loyal subjects.

Accordingly, the chancellor traversed every part of Muscovy, with a young man in a litter, whom he called Demetrius, and treated as a sovereign. At the very name of Demetrius the people flew to arms; they fought several battles in his favour, without seeing him; but the chancellor's party having been defeated, the second Demetrius disappeared. The people however were so fond of this name, that a third Demetrius soon after arose in Poland. This man was more fortunate than the rest. He was supported by Sigismund, king of Poland, and laid siege to Moscow, where Zulfki resided. The tyrant was shut up in his capital, but he had still the widow of the first Demetrius, and the palatine of Sandomir, her father, in his power. The third Demetrius demanded the princess his wife. Zulfki delivered up both the father and the daughter, hoping, perhaps, to soften the king of Poland, or flattering himself that the palatine's daughter would disown him. He was however mistaken; the widow of the first, declared this third Demetrius to be her real husband; the palatine swore that this was his son-in-law, and the people made no doubt but it was true. The boyars, divided between Zulfki and the impostor, would acknowledge neither. They deposed Zulfki, and shut him up in a convent, where he finished his days; and Demetrius was assassinated at a public entertainment by a gang of Tartars, in the year 1610.

The throne of Russia being thus vacant, the boyars offered it to prince Uladislav, son to Sigismund, king of Poland. But before he had finished the necessary preparations for his journey to Moscow, a fourth Demetrius started up, and claimed the crown of Russia. This impostor pretended that God had constantly preserved him, though he had been assassinated at Uglis

by the orders of the tyrant Boris, at Moscow by the usurper Zulkii, and afterwards by the Tartars. This story, however improbable, was countenanced by many of the people; it was considered as a miracle, and as such it was believed. The town of Pleskou acknowledged him as czar; and there, for a few years, he fixed his residence. During this interval, the Russians repenting they had called in the Poles, drove them back to their own kingdom, and Sigismund renounced all hopes of seeing his son Ladislaus placed on the Russian throne. In the midst of these disturbances, Michael Federowitz, the son of the patriarch Fedor Romanow, or Philaretus, was made czar, at the age of seventeen, by the great influence of his father. All Russia acknowledged him for its sovereign, and the city of Pleskou delivered up to him the fourth Demetrius, who was hanged upon a gibbet.

A fifth Demetrius however still remained. He was the son of the first of that name, by the daughter of the palatine of Sandomir. His mother removed him from Moscow, when she went to meet the third Demetrius, and pretended to acknowledge him for her real husband. She afterwards retired with this child into the country of the Cossacks; and he was always considered, and probably really was, the grandson of John Basilides. But Michael Federowitz was no sooner seated on the Russian throne, than he obliged the Cossacks to deliver up the mother and child, who were both drowned.

It would hardly be expected that a sixth Demetrius should appear; but this was really the case. During the reign of Michael Federowitz, some young men bathing with a Cossack of their own age, they took notice of certain Russian characters on his back, pricked with a needle; and, on a more careful examination, found them to be, "Demetrius, son to the czar Demetrius." This person was immediately supposed to be the prince whom the czar Federowitz had caused to be drowned: a miracle had been wrought in his favour; and he was treated as the czar's son at the court of Uladislaus, in order to excite fresh disturbances in Russia. The untimely death of his protector, however, blasted all his hopes; he retired to Sweden, and afterwards to Holstein. Unfortunately for him, the duke of Holstein having sent an embassy into Russia in order to open a communication for a silk trade with Persia; but failing in the attempt, and having contracted considerable debts at Moscow, the duke of Holstein, in order to discharge these incumbrances, ungenerously delivered up Demetrius, who was quartered alive.

These kind of impostures sufficiently display the despicable state of ignorance in which the Russians were then immerged. But the time was now arrived when that empire began to know its own power, and to support that independence which was on the point of being extinguished.

It has been already observed, that the Russians had

offered their crown to Uladislaus. This offer was carried by Philaretus; and during his stay at the Polish court, his son was raised to the throne. Exasperated at the behaviour of the boyars, Sigismund committed Philaretus to prison: but being afterwards exchanged for some Polish prisoners, he held the reins of government for his son, with great prudence and discretion. If a government of this kind appears strange to those acquainted only with the legislative powers of modern times, the marriage of Michael, which was the method then in use, will appear still more uncommon though practised for several centuries in Russia.

The czar having declared his intention to marry most of the celebrated beauties in his dominions were sent for to court, and entertained in a very elegant manner. The czar saw them often, the wedding-day was fixed, and the necessary preparations for the solemnity was finished, before it was known on whom the happy lot had fallen. On the morning when the nuptial ceremony was to be performed, the fortunate lady was presented with a wedding-robe and a cascade of magnificent jewels; the other candidates also received valuable presents, and were sent to their respective places of abode. The name of the lady's father who pleased Michael was Streschmen, and he was ploughing his own little farm when the czar's chamberlain informed him that his daughter was placed upon the Russian throne. On the death of Michael Romanow which happened in 1645, his son Alexis Michaelowitch then in his seventeenth year, ascended the throne. He married in the same manner as his father, and chose the most amiable among the beauties presented to him. The tranquillity of his reign was disturbed both by bloody and furious commotions and foreign wars. He recovered the Ukraine, together with Smolensk and Kiow; though he was unfortunate in his wars against the Swedes. He was not, however, so wholly taken up with wars and military transactions, but he found leisure to draw up a code of laws, which, though imperfect, sufficiently proved that he had formed a proper idea of legislation and distributive justice. He cultivated a polite correspondence with most of the powers of Europe, introduced manufactures of silk and linen into his dominions, and peopled the banks of the Volga and Kama with Lithuanian, Polish, and Tartar families taken in his wars. Before his time all prisoners became the slaves of those into whose hands they fell; Alexis made them husbandmen. Their labours enriched his country, and many of the Russians followed their example. Other schemes equally advantageous to his people were formed by this great prince, but before they could be carried into execution, death put a period to his life. He died suddenly in the beginning of the year 1675.

The death of this great prince was a dreadful blow to the Russian empire; confusion once more prevailed, and the blood of innocent persons again stained the streets of Moscow. Alexis left three sons and five daughters;

daughters; the sons were Fædor or Theodore, Iwan
John, and Peter; the last was by a second marriage.
Among the daughters one only deserves attention in
the history of Russia. Her name was Sophia, a princess
famous for her talents, and still more for her ambition
and intrigues. Alexis, dreading the consequences of
leaving the Russians, so prone to rebellion, without
a prince upon the throne, had caused Theodore, his
eldest son, to be acknowledged emperor some time
before his death.

Theodore accordingly took possession of the govern-
ment on the decease of his father, without the least
opposition. He was a prince of a weak and sickly
constitution, but these infirmities had no effect upon
the vigour of his mind. He formed several schemes
for the good of his people; but the war in which he
was engaged against the Turks, or rather the Crim
Tartars, which continued during his whole reign, pre-
vented him from carrying them into execution. Theo-
dore soon perceiving that the crown of Russia was a
burthen too heavy for a person of his weak constitu-
tion, and that his brother Iwan, who was almost blind
and dumb, was still less able to support it, he nomi-
nated Peter, his second brother, then only ten years of
age, as his successor to the throne.

Peter had already given many indications of extra-
ordinary abilities, but his youth rendered him incapable
of holding the reins of government; and the ambitious
Sophia, perceiving her brother Theodore could not
long support the fatigues of royalty, determined, if
possible, to ascend the Russian throne, at least to sway
the sceptre during the minority of Peter. Accordingly
she formed a strong party among the Strelitzes, or
standing forces of Russia, by bribes and promises, and
immediately on the death of Theodore convened a
meeting of the princesses of the blood, the generals of
the army, the boyars, the patriarch, the bishops, and
even the principal merchants. In this assembly she
expatiated on the injustice of appointing Peter successor
to the throne in opposition to the natural right of his
brother Iwan; that the talents of the latter for govern-
ment were far from being contemptible; and that Peter
was too young to hold the reins of government.

These representations produced the desired effect;
a dreadful sedition was raised by the Strelitzes; many
of the nobles, who were thought to favour Peter, were
massacred with circumstances of cruelty shocking to
humanity; and Moscow again experienced all the
horrors of anarchy and confusion. But at last the
sword of assassination was sheathed, and Iwan and
Peter declared joint sovereigns of Russia, though Sophia
acquired the whole power, and was, in every thing but
title, the czarina of the empire. Her bust was struck
upon the coin, she presided in the council, she planned
and signed all expeditions, and her will became the
law of Russia.

Soon after Iwan was placed on the throne, he mar-
ried a young lady called Soltikoff; but during the

rejoicings that followed his espousals, the Strelitzes
fomented a dangerous sedition on account of some
religious disputes. The insurrection did not however
long continue, but soon after broke out with much
greater violence, under the influence of a popular
nobleman, to revenge himself on Sophia for her ingra-
titude, who had totally neglected his interest, though it
was principally to him that she owed her elevation.
He, however, thought proper to conceal his real mo-
tives under the mask of religion; a pretence which
cannot fail of rousing an ignorant bigotted people to
the most flagrant acts of injustice and cruelty.

Sophia, aware of the consequences that might prob-
ably attend this popular insurrection, retired with her
two brothers and the other branches of the royal family,
to the monastery of the Trinity, situated about twelve
leagues from Petersburg. This monastery, which be-
longs to the monks of St. Basil, is surrounded with
large ditches, and strong ramparts mounted with a
numerous artillery. In this place of safety Sophia
entered into a negotiation with the leader of the rebels;
and, under pretence of granting him his own terms,
she prevailed upon him to repair to a certain town in
the neighbourhood in order to sign the treaty. Deceived
by the artifices of Sophia, the nobleman, attended by
one of his sons, and thirty-seven of the officers of the
Strelitzes, repaired to the place, where they were all
immediately seized and beheaded. This rebellion
however convinced Sophia, that she wanted power
to sway the sceptre of Russia conformable to her
own will, and therefore determined to marry the
prince Galitzin, a man of sense, spirit, and some
learning. She had already placed him at the head
of the army, made him prime minister, and keeper of
the seals.

Peter, who was now in his eighteenth year, being
alarmed at the partiality of Sophia for Galitzin, deter-
mined to assert his right to the crown. Iwan and
Sophia were at Moscow when this resolution was
taken; but Peter had retired to the convent of the
Trinity, where he declared that a conspiracy was
formed against his life. He was immediately joined
by the Strelitzes, and many of the most powerful
nobility; upon which he marched directly for Mos-
cow, and Sophia, with her brother Iwan, were obliged
to retire to the monastery of the Trinity. All the
conspirators were punished with a severity common in
that country, except Galitzin, who was stripped of
his immense fortune, and banished into Siberia. His
sentence was very curious, it was as follows: "Thou
art commanded by the most clement czar to repair to
Karga, a town under the pole, and there to continue
the remainder of thy days. His majesty, out of his
extreme goodness, allows thee threepence per day for
thy subsistence." The princess Sophia was confined
to a monastery in Russia; a punishment sufficient to a
woman of her ambition. Nor had Iwan any other
share in the government, except that of having his

name.

name in the public acts. He led a private life at Moscow, and died in 1696.

On Peter's accession to the throne, he associated himself with foreigners, and laboured assiduously to improve his education, which had been greatly neglected through the ambition of his sister. He was, even from his infancy, fond of the arts, and shocked at the rude manners and ignorance of his subjects. His favourite Le Fort, a Piedmontese, encouraged this disposition; and at the same time raised and exercised a body of 12,000 men, among whom he introduced the French and German exercise, in order to render them capable of opposing the insolence of the Strelitzes; while general Gordon, a Scotchman, disciplined the czar's own regiment, consisting of 5000 foreigners.

This great prince, after providing for the internal peace of his dominions, began his travels into foreign parts, as an attendant on his own ambassadors. His adventures in Holland and England are at once too numerous and too well known to be repeated here. By working as a common shipwright in the yards of Deptford and Saardam, he completed himself in ship-building and navigation; and prevailed on several very ingenious men to settle in Russia, in order to introduce the arts into his empire. At the same time he procured a great number of manufacturers from Germany to remove to Moscow, and other cities, in order to carry on their respective trades, to the great advantage of his subjects. The forces disciplined by Le Fort and Gordon were soon in a condition of crushing all insurrections and seditions, and even of exterminating the two feeble regiments of Strelitzes. Peter, in the mean time, preferred men of ability only; he paid no regard to nobility or fortune; merit alone was the passport to his favour; and possessed of merit, no man however poor or depressed, ever applied in vain. He himself rose gradually through every rank and service both in the fleet and army; and the many defeats he received from Charles XII. served only to extend the sphere of his ambition. After the fatal battle of Narva, the czar was so far from abandoning himself to despair, that when advice arrived of this alarming misfortune, he only said to his officers, "I expected to be defeated by the Swedes, and shall possibly be again defeated; but they will, in time, teach us to be conquerors." He was not deceived; the battles he lost added experience to his courage; and Charles, in his turn, was soon after totally defeated at Pultowa. The military and naval triumphs which readily succeeded one another, after that decisive victory, are far from forming the chief glories of Peter's reign. His assiduous application to the improvement of commerce, arts, and sciences, by which his people were enriched and civilized, place him in a more distinguished point of light; even among the few princes who have laboured for the benefit of mankind, and whose names will be mentioned with gratitude by posterity. Always intent on the civilization and happiness of his people, and

knowing that the life of any person is too short for completing so noble a design, he married a young Lithuanian woman, called Catherine, who had been betrothed to a Swedish soldier; because, after a long cohabitation, he found her possessed of a soul capable of executing his plans, and assisting his counsels.

The wisest and most fortunate princes are, however, not exempt from misfortunes. Peter experienced one of the sharpest of this kind in the undutiful behaviour of his son; who not only married without his royal parent's consent, but was also guilty of dangerous practices against his person and government. He was tried, and condemned to death; but died in prison before his sentence was carried into execution. Soon after the death of his son, he caused Catherine to be crowned with all the pompous ceremonies used by the Grecian princes while the eastern empire subsisted, and to be recognized as his successor. He died on the 28th of January 1725.

Catherine, who ascended the Russian throne on the death of the czar, governed that great empire by the same principles on which it had been founded; and during her whole reign was respected, both by her own subjects and all the powers of Europe, as the worthy successor of Peter the Great. She did not however, long enjoy this high dignity; for she paid the debt of nature in 1727, after a short but glorious reign.

Peter II. grandson of Peter the Great, then a minor, ascended the throne on the death of Catherine. His reign, though short, was attended with many domestic revolutions; but the most remarkable was the disgrace and exile of prince Menzikoff, the principal favourite in the two last reigns, and esteemed the richest subject in Europe. He was a person of boundless ambition, and had formed a design of marrying his daughter to the czar. Possibly he might have succeeded, had he not, by an act of insolence, incurred the displeasure of the emperor, who disgraced and banished him into Siberia. He died of the small-pox on the nineteenth of January 1730.

The Russian senate, upon the death of Peter II. notwithstanding the despotism of Peter and his wife, ventured to set aside the succession, as it had been established by the empress Catherine. According to the will of that princess, the son of her eldest daughter, Anne Petrowna, duchess of Holstein, ought to have been called to the throne; but he being at that time not more than two years old, it was thought prudent, in order to avoid so tedious a minority, to place Anne Iwanowna, duchess of Courland, on the Russian throne, contrary to all the rules of succession for she was the second daughter of the emperor Iwan and her eldest sister, the duchess of Mecklenburg, was then alive. Her reign was however at once prosperous and glorious. She indeed accepted of the crown under limitations; but she soon cancelled them all, and banished the nobles who had imposed them upon her. She made choice of grave and wise persons for

her ministers, and gave the command of her army to
able and experienced generals. By pursuing these wise
methods, she was enabled to govern her empire with
reputation, and to maintain the credit of Russia, with
regard to the rest of Europe, in as great a degree as
any of her predecessors. She nobly assisted the em-
peror Charles VI. against the house of Bourbon; she
placed Augustus, the late king of Poland, on the
throne of that kingdom; she raised her favourite Biron
to the duchy of Courland; she carried on a very suc-
cessful war against the Turks, and, in the course of
it, totally ruined the power of the Crim Tartars.

Anna's death happening in October 1740, John,
son of her sister the princess of Mecklenburg, was
placed on the Russian throne; but being then only two
years old, Biron was appointed administrator of the
empire during his minority. This destination was dis-
agreeable not only to the princess of Mecklenburg, but
also the people themselves. Biron was therefore soon
arrested, tried, and condemned to die; but his sentence
was changed into banishment. Nor was the admini-
stration of the princess of Mecklenburg and her hus-
band agreeable to the Russians, on account of their
German connections; and schemes were soon formed
for changing the government.

Peter the Great left a daughter called Elizabeth
Petrowna, a princess of distinguished accomplishments,
and then about thirty-eight years of age. She had
lived at court in a manner far from being suitable
to her birth; and the prudence of her behaviour,
joined to that magnanimity with which she sup-
ported her misfortunes, had such an influence on
the whole nation, that she had long reigned in the
hearts of the people, though others were invested with
the ensigns of royalty. At last, the whole Russian
nation, princes, nobility, senators, soldiers, and even
the populace, testified such an affection for her person,
that some who had served her father with fidelity, and
enjoyed the rewards of their services, determined
to hazard their lives and fortunes in her defence, and
to place her on the throne of her ancestors, or
perish in the glorious attempt. They succeeded; and
one night put an end to the contest; the sun at his
setting saw her nothing less than a prisoner in the
palace, and at his rising beheld her placed on the
throne. The young emperor, his father and mother,
were made prisoners, and sent to the castle of Riga.

No sooner was Elizabeth possessed of the reins of
government, than she displayed those virtues which
rendered her worthy to fill the throne of her illustrious
ancestors. She abolished capital punishments; and
introduced into all civil and military proceedings a
moderation till her time unknown in Russia. She
made peace with Sweden, and settled the succession to
that crown, as well as of her own dominions, on the
most equitable foundation. In a word, few princes
ever enjoyed a more uninterrupted career of glory than
Elizabeth. She was completely victorious over the

Swedes. Her alliance was courted by Great-Britain,
at the expence of a large subsidy; but many political,
and perhaps some private reasons, determined her to
take part with the house of Austria against the king of
Prussia. Her armies turned the scale in favour of the
empress-queen; and seemed to threaten destruction to
Prussia, which was saved by her critical death, on the
fifth of January 1762.

Whereupon Peter III. grand duke of Russia, and
duke of Holstein Gottorp, ascended the throne. This
prince is accused of having observed no rules of pru-
dence or moderation, either in his public or private
proceedings. It is certain that he mounted the throne
possessed of an enthusiastic admiration of his Prussian
majesty's virtues, and whose principles he seemed to
have adopted as rules to direct his future reign. One
of his first acts of government was that of making
peace with Prussia, which gave some uneasiness to the
Russians. But in all probability he would have sur-
mounted the effects of this, and other particulars,
unpopular as they were in Russia, had not he aimed at
reforming the church. He even ventured to cut off the
beards of his clergy, which even Peter the Great had
attempted in vain. He highly offended the Russian
nobility by his warm attachment to the Germans. He
has also been accused of certain domestic infidelities,
which were too provoking for a princess of spirit and
fortitude to bear; and it is even said that he had formed
a design of shutting his consort up in a convent, and
raising his mistress, the countess of Woronzoff, to be
his partner in the throne. Whatever truth there may
be in these suggestions, it is certain that so ill was the
czar served, that the conspiracy was become general,
without his receiving the least notice of it; and he
remained in perfect security, whilst the senate and
clergy were assembled to pass the sentence of his
deposition. He was indulging himself in indolent
amusements, and lulled in the most profound security,
at a house of pleasure called Oraniebaum, on the sea-
shore, when he received news that his kingdom was
taken from him. After some short and tumultuous
deliberations, he resolved to throw himself on the
compassion of the empress; and accordingly sent letters
to her, containing a renunciation of the empire, and
stipulating no other terms than leave to return to
Holstein, and the satisfaction of taking with him, as
the companion of his retreat, the countess of Woron-
zoff, and one single friend. His terms were rejected,
and he was required to sign an unconditional resignation
of his crown, according to a form that was prepared
for him. After he had signed this abdication, which
was in July 1762, he gave up his sword, and was
conducted to prison, where in a short time he died of a
disorder called the hæmorrhoidal cholick. Thus was a
revolution of such immense importance effected in
a single day, and without shedding a single drop of
blood; the unfortunate emperor having enjoyed the
power, of which he made so imprudent an use, only
fix

six months. His consort, without any hereditary claim, was immediately placed on the Russian throne, and has since swayed the sceptre of that vast empire under the title of Catherine II.

This princess always pursued a very different conduct. She studied the Russian language, assiduously complied with the customs and manners which prevailed in that empire, and expressed, on all occasions, a remarkable zeal for the Greek church. By this method she obtained so great an influence over the minds of the Russians, that it was no difficult task to bring about a revolution which placed her on the throne. The most remarkable domestic transaction of her reign hitherto, is the death of prince Iwan, son to the princess of Mecklenburgh, and, while in his cradle, emperor of Russia. He lost his life in an ill-concerted conspiracy, formed by a few private officers: to place him on the throne.

Russia has always considered the internal quiet of Poland as a capital object; and this induced her imperial majesty to take a principal part with regard to the election of the present prince to the throne, and to secure the rights which the treaty of Oliva had given to the Dissidents, or the Greek and Protestant subjects of Poland. This gave great umbrage to the Roman-Catholic Poles; and the Russian troops still continuing in their country, first occasioned a civil war, and afterwards the forming of the most dreadful confederacies, which have rendered Poland a scene of slaughter and devastation.

The conduct of Russia respecting Poland gave so much offence to the Ottoman court, that the grand signor sent Obreskoff, the Russian minister, to the prison of the seven towers, declared war against Russia, and marched a very numerous army to the confines of Russia and Poland, whereupon hostilities soon commenced between these rival and mighty empires.

In the months of February and March 1763, Crim Gueray, khan of the Tartars, at the head of a great body of those people, supported by 10,000 spahis, having broken the Russian lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off some thousand families captive. In April following, the grand vizier, at the head of a great army, began his march from Constantinople, and proceeded towards the Danube.

Mean time, prince Gallitzin, who commanded the Russian army on the banks of the Niester, thought this a proper time to attempt something decisive, before the arrival of the great Turkish force in that quarter. Having accordingly crossed the Niester with his whole army, he advanced to Choczim, where he encamped in sight of a body of 30,000 Turks, commanded by Caraman Pacha, and intrenched under the cannon of the town. The prince, having made the necessary dispositions, attacked the Turks in their intrenchments early in the morning of the 30th of April, and, notwithstanding an obstinate defence, and a dreadful fire

from the fortrefs, at length forced them from their trenches. The Turks endeavoured to cover their retreat, by detaching a large body of cavalry to attack the right wing of the Russian army; but they had such a warm reception from the artillery, that they soon retired in great disorder. General Stoffeln and prince Dolgorucki were then ordered to pursue the fugitives, at the head of eight battalions; which they did so effectually, that they followed them into the suburbs of Choczim, and their pursuit was at length only stopped by the palisadoes of the fortrefs. The town was soon after set on fire by red-hot balls; and a great number of Jews and Christians took refuge in the Russian camp. It might have been expected, from these successes, that Choczim would have immediately fallen into the hands of the Russians; but this was not the case, for prince Gallitzin thought proper to retire from the place, and repass the Niester: his reasons were, that Choczim was garrisoned by 18,000 men well provided with artillery; that several bodies of Turkish troops appeared in the neighbourhood; that the country was so wasted that the army could not be supplied with provisions; and that, not having sufficient artillery along with him, he chose for the present to suspend his design of besieging the place.

During these operations between the Russians and Turks on the side of Europe, the Tartar Asiatic nations, in the different interests of these powers, extended the rage of war into another quarter of the globe. A bloody engagement was fought, on the 9th of May, between the Kalmucks and those Tartars that inhabit the banks of the Cuban, lying between the Black and the Caspian seas. This engagement continued from two in the afternoon till sun-set; when the Kalmucks, assisted by some Russian officers, with a detachment of dragoons and Cossacks, and two pieces of cannon, obtained a complete victory, having made a great slaughter of the enemy, as the Kalmucks gave no quarter. The European Tartars, on the other hand, penetrated into the Russian Ukraine, on the side of Backmuth, where they committed great ravages.

A very obstinate battle was fought, on the 13th of July, between a considerable Turkish army and the Russians under prince Gallitzin, near Choczim, in which the Turks were defeated. The Russians immediately invested the town; but the garrison being numerous, made frequent sallies, and was greatly strengthened by reinforcements from the grand vizier's camp, who was now considerably advanced on this side the Danube. Several actions ensued, and prince Gallitzin was at length obliged to retreat from before Choczim, and again repass the Niester. The Russians are supposed to have lost 20,000 men by the siege of Choczim and the actions consequent to it. The grand vizier, who had the management of this war, had acted with that prudence which it has been thought would have proved fatal to the designs of the Russians, if the same conduct had been afterwards pursued: but the army he

commanded

commanded was extremely licentious, and his caution
displeas'd the janissaries; so that in consequence of their
clamours, and the weakness of the counsels that pre-
vail'd at the Ottoman court, he at length became a fa-
vourite; and Moldovani Ali Pacha, who possess'd more
courage than conduct, was appointed to succeed him in
the command of the army.

The Russian general Romanzow, during these trans-
actions, committed great devastations upon the Turks
in the borders of Bender and Oczakow, where he plun-
dered and burnt several towns and villages, defeated a
Turkish detachment, and carried off a great booty of
cattle. The Tartars also committed great ravages in
Poland, where they almost totally destroyed the palati-
nate of Brucklaw, besides doing much mischief in other
places.

In the beginning of September, the Russian army
appeared again on the banks of the Niefter, in order to
obtain the passage of that river against the Turks, whose
whole army, under the command of the new vizier,
was posted on the opposite shore. The two armies be-
ing thus situated, on the 3d of September, 8000 Turks,
consisting entirely of janissaries and spahis, the two most
celebrated corps of the bravest and best disciplined
Turkish horse and foot, pass'd the river in the night,
and at break of day attack'd a body of Russians who
were encamped on this side. Prince Reppin, who was
station'd near the spot, march'd immediately to the relief
of this corps, and attack'd the Turks at the head of
four regiments with fixed bayonets. The engagement
was furious and bloody; but at length the Turks were
driven back, and pursu'd to the river, which they endea-
vour'd to pass in the utmost disorder and confusion;
above 4000 of their number being either killed or
wounded in this ill-judg'd attempt.

This misfortune was not sufficient to convince the
vizier, who was rash and obstinate, of the danger of
sending detachments across a great river, in the face of
a powerful enemy, without a communication with the
main army, or the least probability of support. Hav-
ing therefore laid three bridges over the Niefter, the
Turkish army, without making use of any stratagem or
deception, began to pass the river in the face of the
enemy. Prince Gallitzin, having perceiv'd this motion
early in the morning of the 9th of September, imme-
diately attack'd those troops that had cross'd the river
in the night; who consequently could neither choose
their ground, nor have time to extend or form them-
selves properly where they were. Notwithstanding
these great disadvantages, the engagement was very fe-
re, and continued from seven in the morning till noon.
The Turks fought with great oblinacy; but they were
at length totally defeated, and oblig'd to repass the
river with considerable loss, and in the greatest disorder
and confusion. It was comput'd that about 60,000
Turks cross'd the river before and during the time of
the engagement. Prince Gallitzin charg'd at the head
of five columns of infantry, with fixed bayonets, who

destroy'd the flower of the Turkish cavalry. The loss
of the Turks, in this battle, is said to have amount'd
to 7000 men kill'd upon the spot, besides wounded and
prisoners, and a great number who were drown'd.

Though the ill conduct of the vizier had greatly con-
tributed to this capital misfortune, yet this considera-
tion did not deter him from engaging in another opera-
tion of the same nature. He now laid but one bridge
over the river, which he had the precaution to cover
with large batteries of cannon, and prepar'd to pass
over with the whole army. Accordingly, on the 17th
of September, 8000 janissaries, and 4000 regular ca-
valry, the flower of the whole Ottoman army, pass'd
over with a large train of artillery; and the rest of the
army were in motion to follow, when a sudden and ex-
traordinary swell of the waters of the Niefter carri'd
away and totally destroy'd the bridge. The Russians
lost no time in making use of this great and unexpected
advantage. A most desperate engagement ensu'd, in
which the slaughter of the Turks was prodigious. Not
only the field of battle, but the river, over which some
few hundreds of Turks made their escape by swim-
ming, was for several miles cover'd with dead bodies.
The Russians took 64 pieces of cannon, and above 150
colours and horse-tails. The Turks immediately broke
up their camp, and abandon'd the strong fortress of
Choczim, with all its stores and numerous artillery,
and retir'd tumultuously towards the Danube. Prince
Gallitzin plac'd a garrison of four regiments in the
fortress of Choczim, and soon after resign'd the com-
mand of the army to general Romanzow, and return'd
to Petersburg, cover'd with laurels. The Turks
were much exasperat'd at the ill conduct of their com-
mander; and it was comput'd that they lost 28,000 of
their best and bravest troops within little more than a
fortnight; and that 40,000 more abandon'd the army,
and totally desert'd, in the tumultuous retreat to the
Danube.

The war continu'd to be carried on successfully by
the Russians, who over-ran the great province of Mol-
davia; while general Elmpt took possession of the ca-
pital city of Jassy without opposition: and as the Greeks
in this province had always secretly favour'd the Rus-
sians, they now took this opportunity of their success,
and the absence of the Turks, to declare themselves
openly. The Greek inhabitants of Moldavia, and af-
terwards those of Wallachia, also acknowledg'd the
empres of Russia as their sovereign, and took oaths of
fidelity to her.

On the 18th of July 1770, general Romanzow de-
feat'd a Turkish army near the Larga: the Turks are said
to have amount'd to 80,000 men, and were command'd
by the khan of the Crimea; and, on the 2d of August,
the same general obtain'd a still greater victory over
another army of the Turks, command'd by a new grand
vizier. This army, though very numerous, was totally
defeat'd; above 7000 Turks are said to have been kill'd
on the field of battle, and that the roads to the Danube

were

were covered with dead bodies. There fell into the hands of the Russians some thousand carriages laden with provisions, 143 pieces of cannon, and a vast quantity of ammunition.

The Russians not only carried on the war successfully against the Turks by land; for the empress sent a considerable fleet of men of war, Russian-built, into the Mediterranean, to act against the Turks on that side; and, by means of this fleet, the Russians spread ruin and desolation through the open islands of the Archipelago, and the neighbouring defenceless coasts of Greece and Asia; in which attempt they were greatly assisted by the English.

The war continued for some time to be carried on between the Russians and Turks, both by land and sea, to the advantage of the former. Some attempts were, however, at length made to negotiate a peace; but it was a long time before matters could be accommodated between their great contending powers; hostilities were repeated, suspended, and afterwards renewed: but at last a peace was concluded, highly honourable and beneficial to the Russians, and by which they obtained the liberty of a free navigation over the Black Sea, and a free trade with all the ports of the Ottoman empire. For an ample account of the naval transactions during this war, we must refer our readers to the concluding part of the history of the Turks, which closes the description of that nation.

The war with the Turks was not quite concluded, when a rebellion broke out in Russia, which gave much alarm to the court of Peterburg. A cosack, whose name was Pugatcheff, took upon him to personate the late unfortunate emperor Peter III. He appeared in the kingdom of Kafan, and pretended that he made his escape through an extraordinary interposition of Providence, from the murderers who were employed to assassinate him; and that the report of his death was only a fiction invented by the court. He is said to have greatly resembled the late emperor in his person; which circumstance induced him to engage in this enterprise. As he possessed abilities and address, his followers soon became very numerous; and he at length found himself so powerful, and his followers being armed and provided with artillery, that he stood several engagements with able Russian generals, at the head of large bodies of troops, and committed great ravages in the country: but he was at last totally defeated and taken prisoner; and, being brought to Moscow in an iron cage, he was, on the 21st of January 1775, beheaded in that city.

Notwithstanding the very unfavourable circumstances the empress of Russia was subject to, on her taking possession of the government of that extensive empire, it is on all sides allowed that she has, from the commencement of her reign, continued to govern with distinguished reputation and ability. She has endeavoured greatly to extend the commerce of her subjects; and, as far as the extreme despotism of the Russian government would

permit, has given great encouragement to learning and the arts and sciences. Many beneficial and important regulations have been made by her in the interior police of her vast empire; one of which is, the abolition of the use of torture; besides adopting an excellent plan for the reformation of prisons. But one of the most remarkable transactions of her reign, is her establishment of an armed neutrality, for the protection of the commerce of nations not at war, from any attacks or insults from belligerent powers. In 1780, her imperial majesty invited to it those powers not at war; and the kings of Sweden and Denmark and the States-General accordingly acceded to it the same year.

In the year 1793, the flames of war again broke out, in which the Russians and Danes united their forces against the Swedes, whose bravery was greatly signalized against the enemy, particularly at sea, under the conduct of the duke of Sudermania. The king of Sweden also attacked the Russian fleet in the road of Revel on the 13th of May; in this engagement the Russians had eleven ships of the line and five frigates, which were supported by the guns of the works and several batteries; notwithstanding which, the Russians received much damage, and had it not been for a storm, during which the wind changed, and the Swedish ships could not use their lower-deck guns, and many of them could not keep their place in the line, the Russian fleet must have been ruined.

The Swedes also, in the same month, entered the Russian territories, and possessed themselves of a very strong post called Karnankosky, on the borders of the lake Saima, where the Russians, with 10,000 men, made an attempt to dislodge them. The Swedes withstood their assault, and repulsed the Russians, who are said to have left near 2000 men on the field.

After various success in the course of this war, the contending parties seemed disposed for peace. The same motives which, for a series of years, had rendered Gustavus the devoted instrument of France; the same motives which had induced him to sacrifice the lives of his people in the present contest, might be employed to convert him from the enemy into the ally of Russia: on the 14th of August 1790, therefore, a convention was signed between the courts of Russia and Sweden, and was ratified in six days after. The basis of the convention was, a general treaty of peace and amity, an alliance of the strictest nature, and an agreement that the boundaries of their respective territories should remain the same as confirmed by the treaties of Abo and Nyfstadt. Thus, at the close of the year 1790, the empress had the satisfaction to see her conquests no longer bounded by the course of the Danube.

After several actions between the Imperialists (since confederates in the war with Russia) and the Turks, in which the emperor's troops were for the most part victorious, an engagement took place, in Sept. 1790, near Tobak in Bessarabia, between prince Repnin and Hafan Ali, late casitan pacha, in which, his men being

struck with panic and alarm, obliged him to a precipitate retreat. The Russians made themselves masters of the Turkish camp, and Hassan was obliged to retire with speed as far as Ismail. About the same time, an action was fought between the van-guard of the army of prince Potemkin and a body of Turks, at Canschan near Bender, in which the Russians obtained the victory.

The last act of this protracted campaign, which was not interrupted even by the severity of winter, how much soever it might contribute to the advantage, certainly did not redound to the honour, of Russia; and evinces, that, whatever steps may have been taken by the present or other sovereigns of this empire to produce a forced civilization, both the monarchs and the people of Russia are still barbarians. The reader will easily perceive that what ensued on the taking of Ismail is alluded to in this reflection. The progress of the Russians, during the whole of the war, was indeed marked with blood and cruelty; but all their former executions were exceeded by the horror of their proceedings at Ismail. That place had been fortified during the war, and, previous to the siege, had been reinforced by the Tower of the Turkish army.

On the 22d of December 1790, the town was taken by storm by general Suwarow; and it is said that the siege and the capture did not cost the Russians less than 10,000 men. The most shocking part of the transaction is, that the garrison (whose bravery merited, and would have received from a generous foe, the highest honours) was massacred in cold blood by the mercilefs Russians, to the amount of, by their own account, upwards of 30,000 men; and the place was given up to the unrestrained fury of the brutal soldiery. The most horrid outrages were perpetrated on the defenceless inhabitants, and the conduct of the conquerors resembled more that of a horde of cannibals than of a civilized people. After this bloody scene, the Russians went into winter quarters; the vizier retired towards Constantinople, and, on his return, fell a sacrifice to the sanguinary policy which has long disgraced the Ottoman councils.

The campaign of 1791 opened, on the part of Russia, with the taking of Maczin, on the 4th of April, by prince Gallitzin; and in a subsequent victory on the 18th, by the same general, in the neighbourhood of Brailow, when the Turks lost not less than 4000 men, and upwards of 100 officers, besides many pieces of cannon. On the 14th, the Russian arms experienced a check, by which they lost about 700 men, and were obliged to relinquish the intention of besieging Brailow.

In the month of June, 15,000 Turks were defeated by a party of cavalry under general Kutusow. On the 3d of July the fortress of Anape was taken by general Gudowitsch, and the garrison, to the amount of 6000 men, made prisoners. This event was followed, on the 9th of the same month, by a signal victory which prince Repnin obtained near Maczin over a body of

70,000, the flower of the Turkish army. The Ottomans left upwards of 4000 dead upon the field of battle, and lost their entire camp, equipage, colours, and thirty pieces of cannon. The Russians are said to have lost only 150 men killed, and between two and 300 wounded.

While the war was thus vigorously carried on, and the arms of the empress being almost every where successful, the Porte was disposed to treat of peace. The negotiation, after being some time protracted, was at length opened on the 11th of August 1791, when peace was concluded between the czarina and the Porte upon these terms: that Russia should confine her views to the possession of Oczakow, with the district extending from the Bog to the Nicster, and even then providing for the free navigation of the latter river. These conditions, if we consider the ill success of the war, cannot be accounted very disadvantageous to the Porte, who has lost a fortress more useful for the purpose of annoying Russia, than for defending their own territories; but certainly of considerable importance to Russia, who, by this cession, has secured to herself the peaceable enjoyment of the Crimea. Add to this, that peace was probably, at this period, the more desirable to Russia, from an event which, while it enlarged the scale of human happiness and liberty, certainly was calculated to countenance, in no small degree, the unwarrantable usurpations of that ambitious power.

Catherine II. the present empress of all the Russias, princess of Anhalt-Zerbst, was born in May 1729, and ascended the throne in 1762. She was married to her late husband, while duke of Holstein-Gottorp, in 1745, by whom she has issue Paul Petrowitz, great duke of Russia, born in 1754, who has been twice married, and has had two sons, Alexander and Conitantine, and a daughter, named Alexandrina Pawleona, by his present duchess the princess of Wirtemberg.

C H A P. VIII.

I S L A N D S O F S C O T L A N D.

Situation, Extent, Climate, Inhabitants, Animal and Vegetable Productions, Curiosities, &c.

BEFORE we proceed to the description of the ancient kingdom of Scotland, we shall treat of the islands belonging to it, and, to avoid prolixity, comprehend them under one head. They consist of three clusters, those of Shetland, Orkney, and the Hebrides or Western Isles.

SHETLAND ISLANDS lie north-east of the Orcaides, or Orkney Islands, between 60 and 61 deg. of north lat. and are part of the shire of Orkney. The Orcaides lie north of Dungsby-Head, between 59 and 60 deg. of north lat. divided from the continent by a tem-

pestuous freight called Pentland Frith, twenty-four miles long and twelve broad. The Hebrides, or Western Islands are very numerous, and some of them large, situated between 55 and 59 deg. of north lat. these lie scattered in the Deucalidonian sea, to the north-west of Scotland.

The air of these islands is salutary, but keen and piercing, except in summer, when it is very serene. During the months of June and July, the inhabitants can see to read at midnight; but then they are subject to a winter of eight months, in which season they are involved in darkness, storms, and fogs. In summer their sea is covered with fishing-vessels belonging to different nations, who resort thither to catch herrings, with which their coast abounds; but from October to May, they are deprived of every communication with other countries; and not a single ship is seen on their coast. The soil is in general rocky and sandy, and consequently barren in many places.

Many of the Shetland islands (which are forty-six in number) are uninhabited, Mainland is the largest, being sixty miles in length, and twenty in breadth. Larwick is the principal town, and contains 300 families; the whole number of families in the island not exceeding 500. Skalloway is another town, where may be seen the remains of a castle, and it is the seat of a presbytery. The Dutch begin at Midsummer to fish for herrings on the coast of this island, and their fishing-season lasts six months. The Shetlanders derive a great advantage from this fishery. A great traffic is carried on between these islanders and the people of Hamburg and Bremen, who take in return for brandy, spices, &c. their live stock, hosiery, and mittens.

The ORKNEY ISLANDS are about thirty in number but most of them unpeopled; the largest is called Pomona, being thirty-three miles in length, and nine in breadth, in some places. It contains nine parish churches, and has four excellent harbours. The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic building, dedicated to St. Magnus, but now converted into a parish church. Its roof is supported by fourteen pillars on each side, and its steeple, in which is a good ring of bells, by four large pillars. The three gates of the church are chequered with red and white polished stones, embossed and elegantly flowered.

MULL, one of the Hebrides, is twenty-four miles long, and in some places almost as broad. It contains two parish churches, and a castle, called Duert, which is the chief place in the island. The other principal western islands are Lewis, or Harris, both which form one island, which belongs to the shire of Ross, and is 100 miles in length, and thirteen or fourteen in breadth; its chief town is Stornovay.

SKY, belonging to the shire of Inverness, is forty miles long, and thirty broad in some places; fruitful, and well peopled

BUTE, about ten miles long, and three or four

broad, is famous for containing the castle of Rothsay, which gave the title of duke to the eldest sons of the kings of Scotland; as it now does to the prince of Wales.

ROTHSAY is likewise a royal burgh; and the islands of Bute and Arran form the shire of Bute.

ILA and JURA are part of Argyleshire, and contain together 370 square miles, but they have in them no remarkable towns.

NORTH ULST contains an excellent harbour, called Lochmaddy, famous for herring-fishing.

Many other of the Hebrides islands are of small importance either to the public or the proprietors, though, by the very improveable fisheries upon their coasts, it is not unlikely they may in future times be of great consequence to both.

JONA was once famous for being the seat and sanctuary of ancient learning, and the burying-place of many kings of Scotland, Ireland, and Norway.

ST. KILDA, or HIPP, is the remotest of all the north-west islands, and very difficult of access: it contains about thirty-five families.

The inhabitants of Shetland were originally emigrants from Norway, to which for many years they paid a tribute called Schet, from whence their new settlement derived the name of Schetland. But some centuries ago these islands were ceded to the king of Scotland, for a valuable consideration, and have ever since been annexed to the Scottish crown, and, with the isles of Orkney, form a shire. The Shetlanders are in general simple, honest, religious, hospitable, humane, and commonly live to a great age. Those who possess estates, are of Scotch extraction, and live in as great elegance as the gentry of that kingdom; but the poorer sort of people subsist chiefly upon fish, which supplies them with light as well as food; for they make an oil of it, which they burn in lamps during the continuance of their long winter; when, having no wood, they make fires of turf, peat, and heath. Their common drink is butter-milk mixed with water and whey; which latter, by a peculiar method of fermentation, acquires a vinous quality, when they barrel it for use.

The people who inhabit the lesser isles subsist upon the eggs and flesh of sea-fowl, the first of which they obtain at the imminent hazard of their lives, climbing up the rocks to the nests, or being lowered down to them by ropes, over dreadful precipices. These islanders, in general, enjoy an excellent state of health, and, when attacked by any disease, seldom employ a physician. They are subject to the scurvy, which they cure with the cochlearia or scurvy-grass, and their sovereign remedy for the jaundice is powder of snail-shells.

The inhabitants of the Hebrides are descended from the same ancestors with those who live in the High-lands of Scotland, to whose customs they entirely conform; but are much more simple and industrious.

their lives, climbing

They are in general strong, vigorous, and healthy. The men are fond of tobacco to excess, and make use of it in all the different ways of chewing, smoaking, and snuff. They sometimes eat flesh, but their most common food consists of oatmeal, cheese, butter, milk, and whey. The better sort of people live very comfortably, but the poor dwell in wretched cabins built of loose stones and mud, and thatched with straw. The partitions within are no other than a kind of hurdle, plastered with clay, and they have neither glass in their windows, nor any other chimney, than a hole in the centre of the roof, immediately under which is a hearth made of stone, whereon they burn wood, peat, or turf. Around this hearth the family sit in the day time, and lie at night, during the winter.

At the further end of the same house, the cattle are stalled, and the children, calves, and pigs, frequently sleep all together; for these people are exceedingly cleanly, and to this sluttishness in themselves and habitations may be imputed that inveterate itch with which they are so generally infected. The attachment of these islanders to their chieftains is remarkably strong, notwithstanding great pains have been taken by the legislature of Great-Britain to overcome connections so dangerous to government. Both sexes are exceedingly fond of dancing to their own music, and the men are very expert and agile in all the exercises of the field.

With regard to that remarkable mantology, or gift of prophecy, which distinguishes the inhabitants of the Hebrides, under the name of second sight, we shall neither undertake to disprove, nor can we readily admit the reality of the instances produced on the subject. Though the adepts in these visions pretend that they have certain revelations, or rather presentations, either really or typically, which swim before their eyes, of certain events that are to happen in the compass of twenty-four or forty-eight hours; yet it does not appear, from the best information, that any two of those adepts agree as to the manner and forms of those revelations, or that they have any fixed method for interpreting their typical appearances. The truth seems to be, that those islanders, by indulging themselves in lazy habits, acquire visionary ideas, and overhear their imaginations, till they are presented with those phantoms which they mistake for fatidical or prophetic manifestations. They instantly begin to prophesy; and it would be absurd to suppose, that amidst many thousands of predictions, some did not happen to be fulfilled; and these, being well attested, give a sanction to the whole. In short, the fallacy of these pretended prophecies has been so often demonstrated, that they are at present ridiculed by many of the common people.

The islands of Orkney, which were originally peopled from Norway, were formerly sometimes subject to the Norwegians, and at others to the Scots, just as the chance of war determined; but at length

they were entirely ceded to Alexander, king of Scotland, by Magnus, king of Norway, for the sum of 4000 marks sterling, and an annual acknowledgment of 100 more.

The genteeler sort of people in these islands are exceedingly polite, hospitable, frugal, sagacious, circumspect, and religious; conforming themselves entirely to the manners of the Scots, from whom they are in general descended. The common people, particularly the mariners, are bold, active, dextrous, hardy, and inured to fatigue even from their infancy. They are exceedingly adventurous, both in fishing, and in climbing the rocks for the eggs and down of sea-fowl. Their common food is salt-fish, which subjects them to severe attacks of the scurvy. In most disorders they make use of plants, but being exceedingly superstitious, they put great faith in charms and amulets. These people, like the Shetlanders, are remarkable for longevity.

The population of these three divisions of islands cannot be given with certainty. They are represented by credible historians as having been much better peopled about 400 years ago, than they are at present: for the Hebrides themselves were often known to send 10,000 fighting men into the field, without prejudice to their agriculture: it is said, their numbers do not now exceed 48,000. The religion professed in the Hebrides is chiefly Presbyterian, as established in the church of Scotland; but Popery and ignorance still prevail among some of the islanders; whilst they are extremely addicted to superstitious practices and customs. The language of the inhabitants of the Hebrides seems to be a compound of the Danish, Norwegian, and that of other northern people, but in no degree approaches to the purity of the Celtic, commonly called Erse, which has been the received, though erroneous opinion, of many learned men.

Iron, tin, lead, and silver mines; marble, slate, free-stone, and even quarries of marble, have been found upon these islands; also talc, crystals, and numbers of curious pebbles; and they are not destitute of fine fresh water, nor of lakes and rivulets that abound with excellent trout. The present face of the soil is bare, and unornamented with trees, except a few that are reared in gardens; but experience daily shews, that, if the soil of the northern and western islands was, till of late barren, cold, and uncomfortable, it must have been owing to its want of improvement by cultivation; for such spots as are now cultivated, produce corn, vegetables, and garden-stuff, more than sufficient for the inhabitants; and even fruit-trees are now brought to maturity. Many of these islands have been the habitations of the Druids, whose temples are still visible in most of them; and those temples were surrounded with groves, though little or no timber now grows in the neighbourhood. The slumps of former trees, however, are discernible, as are many vestiges of grandeur, even since the admission of the Christian religion;

religion; which prove the decrease of the riches, power, and population of the inhabitants.

The trade and commodities of these islands are in their infancy. Their staple commodities consist of fish, especially herrings, which are the best in the world, and, when properly cured, are superior even to those of the Dutch. They carry on likewise a considerable trade in down and feathers; and their wool, which they manufacture into coarse cloths, stockings, and a variegated stuff called tartan, and the linen manufactures, make no small progress in these islands. They carry their black cattle alive to the adjacent parts of Scotland, where they are disposed of in sale or barter, as are large quantities of their mutton, which they salt in the hide. From the Orkneys, they annually export, besides cattle, skins of seals, otters, lambs, and rabbits; also corn, butter, tallow, salt, down, feathers, writing quills, and hains; to which we may add, wool and stuffs, the only manufacture they have.

Most of the birds and fishes common to the northern countries are to be found here; besides which, here is a species of falcon or hawk, of a more docile nature than any that are to be found elsewhere. The Shetland islands are famous for a small breed of horses, which are exceedingly active, strong, and hardy, and frequently seen in the streets of London, yoked to the splendid carriages of the curious or wealthy. The Orkneys bear plentiful crops of barley, and oats will come to perfection. In these islands are also, besides a great variety of cattle, all kinds of domestic animals, and poultry. Plenty of red deer, partridges, grouse, heath-cock, and plover, are found on the heaths and commons; and the waters abound in duck, teal, and widgeon. The sea, besides whales, seals, and otters, furnishes the inhabitants with cod, ling, tusk, herrings, crabs, oysters, remarkable large muscles and cockles. The rocks are covered with eagles, hawks, kites, wild geese, solan geese, barnacles, lipes, and other species of wild fowl.

The artificial curiosities consist chiefly in the remains of Druidical monuments, ancient castles, and churches. The first are found in many of the islands; but the most remarkable is situated near the village of Clatsknifs in the island of Lewis. This monument consists of thirty pyramidal stones standing upright, about six or seven feet high above the surface of the ground; forming a kind of avenue eight feet wide, leading to a circle of twelve stones of the same dimensions, and one in the centre. The central stone is thirteen feet high, and shaped like the rudder of a ship. On the east, south, and west sides of this circle, are four stones similar to those which compose the circle and avenue, forming three right lines, or rays, issuing from the body of the circle. This is supposed to have been a Druid temple, and the inhabitants have a tradition that the chief Druid stood by the large stone in the centre, and harangued the audience.

The ancient fortifications are principally those erected by the Danes, and consist of watch-towers, beacons, and a great number of caves, or caverns, some of which are capacious, and almost impregnable.

A great variety of ecclesiastical antiquities, consisting of the ruins of churches, convents, and other structures dedicated to religion, are found in many of these islands; but the most remarkable are those on Jona, or St. Columb-kill. According to ancient tradition, St. Columba first landed in this island from Ireland; and after converting the Picts by his preaching the Christian religion, the king bestowed this island on him as a mark of his gratitude for the eminent service he had done his country. But however that be, it is certain that he erected in that island two churches and two monasteries, and instituted a seminary which soon became famous for learning and sanctity. Here the remains of ancient literature were cultivated and preserved, when it was almost obliterated in other parts of Europe, by a deluge of ignorance and superstitious bigotry. These foundations were richly endowed by the kings of Scotland, and lords of the isles; Jona became the residence of the bishop of the isles, and on account of its supposed sanctity, was chosen as the burial place for kings, heroes, and ecclesiastical persons.

The church of St. Mary is built in the form of a cross, and in the Gothic style of architecture. On each side of the choir are two chapels, adorned at the entrance with large pillars carved in bas-relief; the steeple, doors, and windows, are decorated with curious fretwork: the altar is large, magnificent, and composed of fine polished marble. Several abbots are interred within the church, and among these, MacHikenich, whose statue of black marble, as big as the life, is placed over his tomb, in an episcopal habit with his mitre and crozier. Behind the church are the ruins of a cloister, library, and hall. At the west end of the church is a small cell, where we find the tomb of St. Columba, but without any inscription. Near it stands the cross of St. Martin, an entire piece of porphyry, eight feet high, placed on a pedestal, and exhibiting on the east side the figure of a tree, and on the west a large crucifix. On the south side of the church of St. Oran is the cemetery, where the kings and chieftains lie buried under shrines. Here are three vaults distinguished by inscriptions, now not legible. In that on the right hand, four kings of Ireland lie interred: in that on the left, eight kings of Norway; and in the middlemost, forty-eight kings of Scotland.

In a gloomy valley belonging to Hoy, one of the western islands, is a kind of hermitage, cut out of a stone called a dwarf stone, thirty-six feet long, eighteen broad, and nine thick; in which is a square hole about two feet high, for an entrance, with a stone of the same size, for a door. Within this entrance is the resemblance of a bed, with a pillow cut out of the

the stone, big enough for two men to lie on; at the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. Barrows, as they are called in England, are frequent in these islands; and the gigantic bones found in many burial-places here, give room to believe that the former inhabitants were of larger size than the present. It is likewise probable, from some ancient remains, particularly catacombs, and nine silver fibulae, or clasps, found at Stennis, one of the Orkneys, that these parts were not unknown to the Romans.

The natural curiosities in these islands are very numerous: they abound with rocks of various uncommon forms, prodigious caverns, and cataracts. But the whirlpool, or vortex, near Jurah, called Cory-Vielan, must not be passed over without notice. It is situated between the north-end of Jurah, and the small island of Scarba. In this vortex, which extends about a mile in breadth, the sea begins to boil and ferment with the tide of flood, increasing gradually to a number of whirlpools, which, in the form of pyramids, spout up the water with a great noise, as high as the mast of a small vessel, agitated into such a foam, as gives the sea a white appearance, at two leagues distance. About half flood the violence begins to decrease, and continues gradually subsiding, till about half an hour after high-water, when the smallest fishing-boat may cross it without the least danger. And Sir Joseph Banks, in relating his voyage through the Hebrides, anno 1772, gives us the following description of one of the most astonishing appearances in nature. "We were no sooner arrived (says this gentleman) than we were struck with a scene of magnificence which exceeded our expectations, though founded, as we thought, upon the most sanguine probability: the whole of that end of the island (viz. Staffa, a mile in length, and half a mile in breadth) supported by ranges of natural pillars, mostly above fifty feet high, standing in natural colonades, according as the bays or points of land formed themselves: upon a firm basis of solid unformed rock, above these, the stratum which reaches to the soil or surface of the island, varied in thickness as the island itself formed into hills or vallies; each hill, which hung over the columns below, forming an ample pediment; some of these above sixty feet in thickness from the base to the point, formed, by the sloping of the hill on each side, almost into the shape of those used in architecture." But the most striking object in this field of scenery is Fingal's Cave, thus described by Mr. Banks: "We proceeded along the shore, treading upon another Giant's Causeway, every stone being regularly formed into a certain number of sides and angles; till, in a short time, we arrived at the mouth of the most magnificent cave that has probably ever been described by travellers. The mind can hardly form an idea more magnificent than such a space, supported on each side by ranges of columns, and

roofed by the bottoms of those which have been broken off in order to form it; between the angles of which, a yellow stalagmitic matter has exuded, which serves to define the angles precisely, and at the same time vary the colour, with a great deal of elegance; and, to render it still more agreeable, the whole is lighted from without; so that the furthest extremity is very plainly seen from without; and the air within being agitated by the flux and reflux of the tide, is perfectly dry and wholesome, free entirely from the damp of vapours with which natural caverns generally abound." The length of this wonderful cave, from the arch without, is 371 feet; from the pitch of the arch, 250; breadth at the mouth, 53; height of the arch at the mouth, 117; at the end, 70; height of an outside pillar, 39; of one at the N. W. corner, 54; depth of the water at the mouth, 18; at the bottom, nine feet.

On the west side of the island of Pabbay, a stream running down the face of a rock petrifies into a white hard substance, of which the natives make excellent lime.

For an account of learning, learned men, and history, the reader is referred to the ensuing description of SCOTLAND.

C H A P. IX. SCOTLAND.

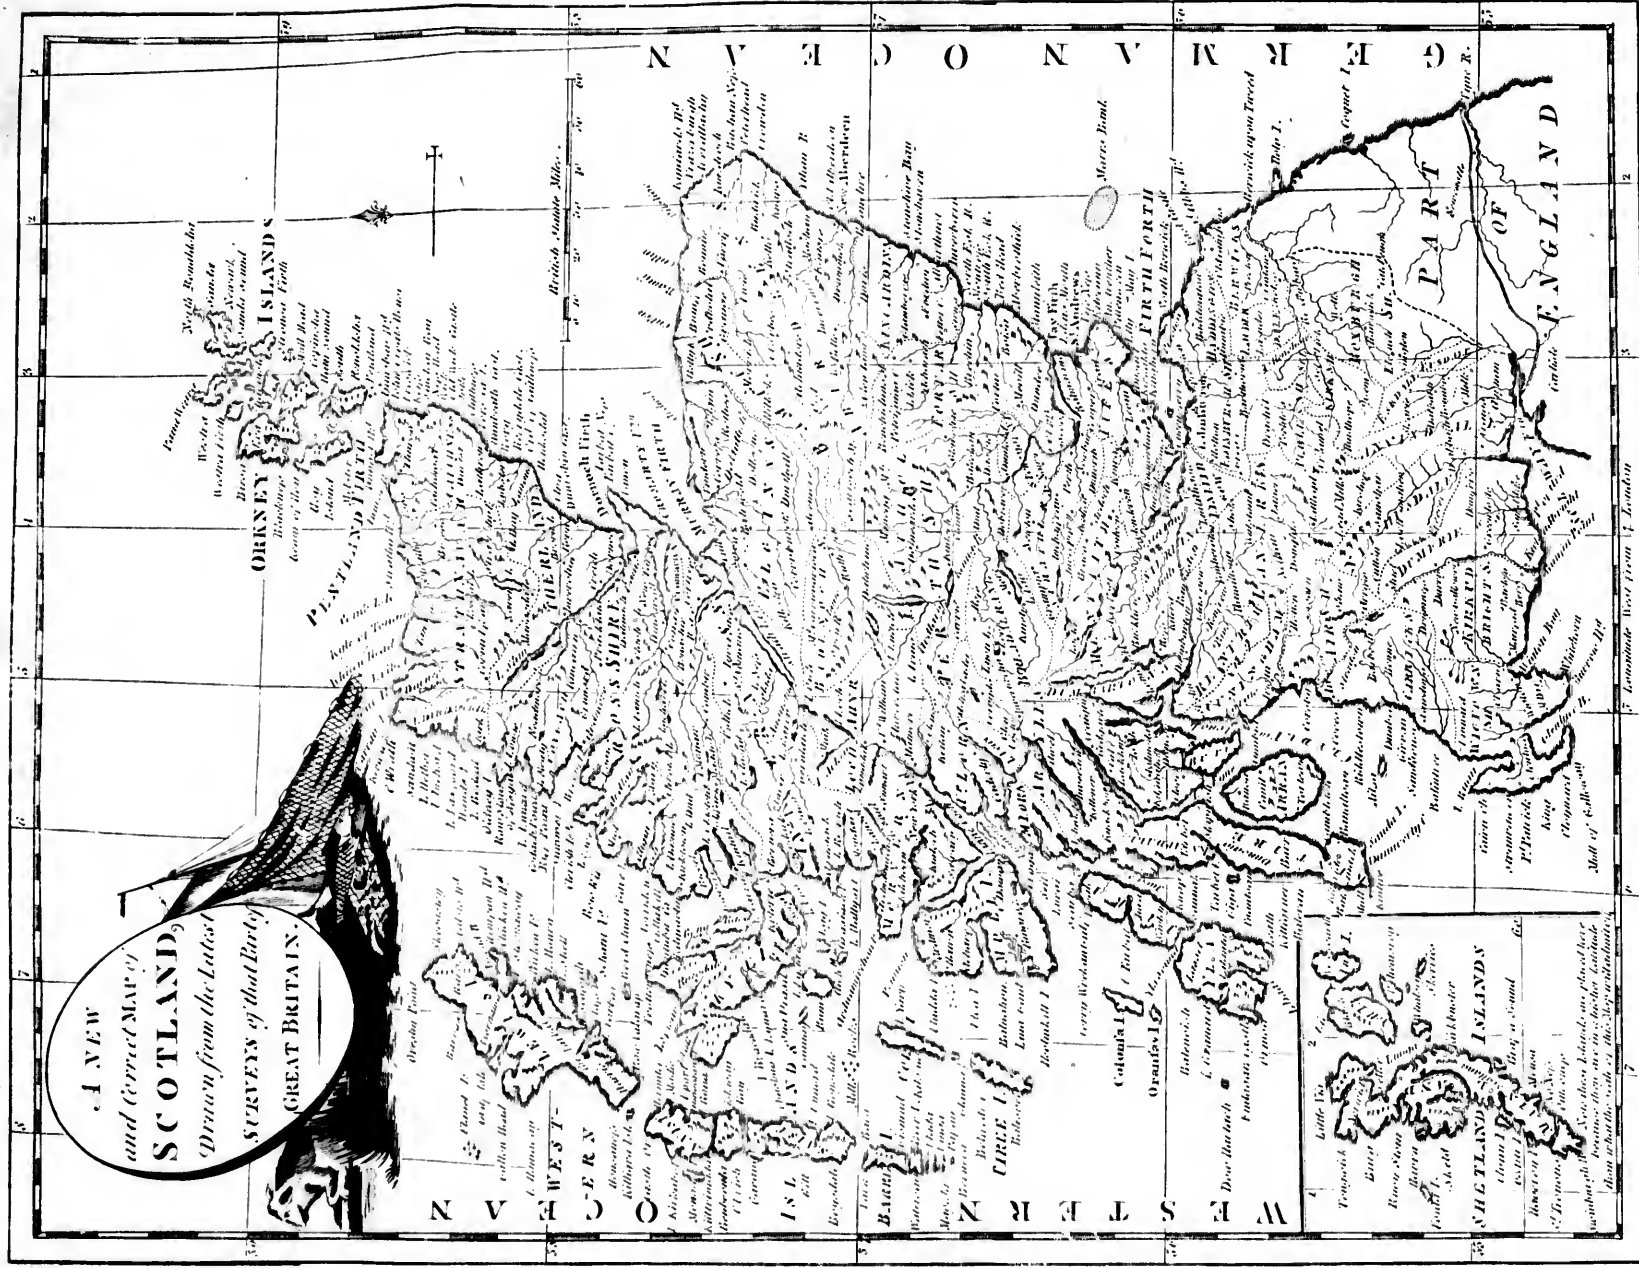

Situation, Boundaries, Divisions, Climate, Rivers, &c. Produce, Population, Inhabitants, Customs, Cities, Fisheries, &c.

SCOTLAND, or NORTH BRITAIN, is situated between 54 and 59 deg. of north lat. and between 1 and 6 deg. of west long. It is about 300 miles in length, 150 in breadth, and contains an area of 27,794 square miles; being bounded on the north by the Deucaledonian Ocean, on the south by England, on the east by the German Ocean, and on the west by the Irish Sea.

This country is termed, by the Italians, Scotia; by the Spaniards, Escotia; by the French, Escosse; and Scotland, by the Scots, Germans, and English. The word Scot is a corruption of Scyth, or Scythian, the Scots having descended from the inhabitants of that immense country called Scythia by the ancients.

Scotland is divided into two parts, separated by the Frith of Forth; Edinburgh is the capital of the southern division, and Aberdeen the chief town of the northern. The northern contains fifteen counties, and the southern eighteen, and these counties are subdivided as follow:

Amounting, in all, to thirty-three shires, which choose representatives to sit in the parliament of Great-Britain: Bute and Caithness, Nairne and Cromarty, Clackmannan and Kinross, choose alternately.

Some modern writers, with less geographical accuracy, divided Scotland into Highlands and Lowlands; an account of the different habits, manners, and customs, of the inhabitants of each; but the division above given was the ancient national one.

Each of the fifteen royal boroughs chooses one representative. These are, 1. Edinburgh; 2. Kirkwall, Wick, Dornock, Dingwall, and Tayne; 3. Fortrose, Inverness, Nairne, and Forres; 4. Elgin, Cullen, Bamsf, Inverary, and Kintore; 5. Aberdeen, Bervie, Montrose, Aberbrothie, and Brechin; 6. Forfar, Perth, Dundee, Cowper, and St. Andrew's; 7. Crail, Kilbrenny, Anstruther East and West, and Pittenween; 8. Dyfart, Kirkaldy, Kinghorn, and Burnt-Island; 9. Innerkythen, Dumfermline, Queen's-Ferry, Culrofs, and Stirling; 10. Glasgow, Renfrew, Rutherglen, and Dumbarton; 11. Haddington, Dunbar, North Berwick, Lauder, and Jedburgh; 12. Selkirk, Peebles, Linlithgow, and Lanerk; 13. Dumfries, Sanquebar, Annan, Lochmaben, and Kirkcudbright; 14. Wigtown, New Galloway, Stranraer, and Whitehorn; 15. Air, Irwin, Rothfay, Campbel-Town, and Inverary.

The parliament of Great-Britain, in 1775, appointed the following proportion of militia to be raised in each shire, viz. Edinburgh 429; Haddington 121; Merse 114; Roxborough 165; Selkirk 19; Peebles 42; Lanerk 388; Dumfries 188; Wigtown 190; Kirkcudbright 100; Air 280; Dumbarton 66; Bute 34; Caithness 105; Renfrew 126; Stirling 76; Linlithgow 80; Argyle 314; Perth 570; Kincardine 109; Aberdeen 551; Inverness 282; Nairne 27; Cromarty 14; Fife 387; Forfar 326; Bamsf 182; Sutherland 100; Clackmannan 31; Kinross 23; Ross 201; Elgin 145; Orkney 183: making, in the whole, 5978.

The air of Scotland is more temperate than could be expected in so northerly a climate. This arises partly from the variety of its hills, vallies, rivers, and lakes; but still more, as in England, from the vicinity of the sea, which affords those warm breezes that not only lessen the natural keenness of the air, but, by keeping it in perpetual agitation, render it pure and healthful, and prevent those epidemical distempers which prevail in other countries. In the northern parts, day-light, at Midsummer, lasts eighteen hours and five minutes; and the day and night in winter are in the same proportion. The soil in Scotland varies, as it commonly does in every other country; the Lowlands are rich, and only want proper culture to produce good crops of wheat and other grain; but the finer particles of earth, necessarily worked down from the mountains, and deposited in the vallies, afford them a vegetative nourishment capable of carrying the strongest plants to perfection; though many vegetables and hortulan produc-

tions do not come so soon to perfection here as in England. The water naturally depends on the quality of the soil over which it passes; but it is for the most part very salutary; and, of late years, some mineral springs have been discovered in this country. The Uplands yield excellent pasture, but there are in them extensive tracts of barren heath.

Scotland, though it enjoys many large and long tracts of ground, fit for all the purposes of agriculture, is in general very mountainous; from east to west it is divided by a chain of these, known by the name of Grants-Bain, or the Grampian-Hills; and there is another chain called Pentland-Hills, which run through Lothian, and join the mountains of Tweeddale. A third distinguished by the name of Lammer-Muir, rising near the eastern coast, runs westward through the Merse; and, besides these, there are a prodigious number of detached hills and mountains, remarkable for their stupendous height and declivity.

This country abounds with rivers, lakes, rivulets, and fountains; the names of the principal rivers are the Tweed, the Forth, the Clyde, the Tay, and the Spey. The Tweed takes its rise on the borders of Annandale, which serves as a boundary between Scotland and England; and, after a serpentine course of great length, discharges itself into the sea at Berwick. The Forth rises in Monteith, near Callendar, passes by Stirling, and, after a course of twenty-five leagues, runs into the arm of the sea called the Frith of Forth, which divides the coast of Lothian from Fife. The Clyde takes its rise from Errick-Hill, in the shire of Lanerk, traverses the shire of Clydesdale, washes the city of Glasgow, widens in its passage to the castle of Dumbarton, and forms the Frith of Clyde adjoining to the Irish sea. The Tay derives its source from Loch-Tay in Breadalbane, and, after a south-east course, discharges itself into the sea below Dundee. The Spey issues from a lake of the same name in Badenoch, and, running a north-easterly course, falls into the German Ocean near Aberdour. Besides these capital rivers, there are a number of smaller streams, that are very deep, and contribute greatly to the beauty and advantage of the kingdom.

The lakes in Scotland are almost innumerable, the inhabitants sometimes giving the name of lake, or loch, to an arm of the sea; which is the case of Loch Fyn, famous for its excellent herrings, it being sixty miles long and four broad. Loch An, Loch Lomond, and Loch Tay, present us with the most beautiful scenes, and their banks, like those of many others, are adorned with woods. Near Lochness, on the top of a hill, two miles in perpendicular height, is a lake of fresh water, about 180 feet in length, unfathomable, and remarkable for never having been known to freeze; whereas Loch Anwyn, or Green Lake, which is not above seventeen miles distant from it, is perpetually covered with ice. The Loch of Spinie, near Elgin, is frequented by large flocks of swans and cygnets, which are sometimes to

num.rou

ca-shells, fullers-earth, numbers of small flowers, the inhabitants call them studious to assign, at this period, it is originally were; but that they are the finest Caledoniaas and an

dry, have been lately Lowlands produce various, viz. wheat, barley, apples, pears, cherries, gooseberries, and currants, and, sometimes, of kitchen roots, like the Scots kail, or colewort, natural to this country, alder, willow, elder, juniper, hawthorn, are covered with furze, cranberry, wild strawberry, of which is called, produces a variety of ferns, rina, dulse, or dulse, tive weed.

are found in great numbers; and the sea supplies water fish. Of late, for the improvement, they are at present, as falls very little, their salmon, in particular, as they can come from the Levant and Southern can, and consequently shall give a more particular under a proper head. Land which are not Lowlands are well stocked with their flesh is not common, have also hares, rabbits, and the hills are little and sheep. Plenty, particularly grow, delicious. Two, particularly and the terminal. The caperkill, esteemed a great delicacy of pheasant, and feed pine branches, from fine flavour, very agreeable.

ceedingly small. For devoured, by important animal, to mend repeated trials, to dege

erate both in size and spirit. The Lowlanders, at this time, make use of a breed which came originally from England.

No computation has ever been made of the number of inhabitants in Scotland that can be depended upon. It is generally said that they amount to a million and a half; but there is great reason to think they are far more numerous. By the records of the army, the only ones that present bear the least appearance of probability, the number of soldiers furnished by Scotland in the American war were 80,000 men, and, considering the number of emigrants which daily leave that nation, we may from thence reasonably conclude, that the inhabitants must greatly exceed the number ascertained; above 60,000 have been raised in the islands and Highlands; so that it is probable they amount to near two millions and a half. The Scots are in general brave, but passionate and vindictive; but, at the same time, sober, industrious, circumspect, and easily conform to any station in life. In their persons, the commonalty are usually raw-boned, broad-featured, lank, and muscular; having long visages, and red hair; they are clean-limbed, and can endure incredible fatigues. Those in a higher sphere, both men and women, are no ways inferior to their southern neighbours, but the Scots have all one distinguishing feature, viz. high cheek-bones.

No people pique themselves more upon descent than the Scots, and this family pride is nourished in them from generation to generation.

The ridiculous family pride, which is perhaps not yet entirely extinguished in Scotland, was owing to the feudal institutions which prevailed there in all their horrors of blood and barbarity. Their family differences, especially among the Highlanders, familiarized them to blood and slaughter; and the death of an enemy, howsoever effected, was always a matter of triumph. These passions did not only reign in the breasts of the common people, but were authorized and cherished by their chieftains, many of whom were men who had seen the world, were conversant in the courts of Europe, masters of polite literature, and amiable in all the duties of civil and social life. Their kings, excepting some of them who were endowed with extraordinary virtues, were considered in little other light than commanders of their army in time of war: for, in time of peace, their civil authority had so little weight, that every clan or family, even in the most civilized parts of Scotland, looked upon its own chieftain as the sovereign. These ideas were confirmed even by the laws, which gave those petty tyrants a power of life and death upon their own estates; and execution generally followed in four-and-twenty hours after the party was apprehended. The pride which those chieftains had of outlying each other in the numbers of their followers, created perpetual animosities, which seldom or never ended without bloodshed; so that the common people, whose best qualification was a blind devotion to the will of their master, and the aggrandisement of his name, lived in a state of continual hostility. The late Archibald, duke of Argyll,

was the first chieftain we have heard of, who had the patriotism to attempt to reform his dependents, and to divest them of those barbarous ideas. His example has been followed by others; and it is highly probable that the Highlanders will be reconciled to all the milder habits of society in a very few years. For an idea of the extreme caution and secrecy with which their mobs are managed, and the fidelity and attachment of the Highlanders to the Stuart family, we need only refer the reader to the affair of captain Porteous in the beginning of the reign of George II. in the former case; and, in the latter, to the defeat of the young pretender at Culloden.

The estates of Scotland, like those of England, being generally confined to the elder branch, the younger sons are obliged to seek that subsistence abroad, which the narrow bounds of their country will not afford them at home. Great numbers of them are in the land and sea service, and prove an honour to both. Education being exceedingly cheap in Scotland, there are few of the inhabitants, let their station be what it will, but have received some learning; and many of them, being eminent scholars, are thereby qualified for the different professions of physicians, surgeons, apothecaries, merchants, and school-masters; in which capacities they are to be met with in most parts of the globe, and, happily for them, they assimilate with the greatest ease and freedom to the manners of the people among whom they are settled.

There are many parts of Scotland where the inhabitants live entirely by pasture, and among these are found numbers who have a natural taste for poetry and music. The Scotch airs are soft, lively, and beautifully simple. For some time it was supposed that this nation was indebted to the famous Rizzio for a reformation in its music; but it has long been proved that the Scotch music is original, and that the finest parts of it was composed long before Rizzio was born.

The Scots generally enjoy a great share of health, the immediate effect of a salubrious air and temperate diet. Their common food is oatmeal, which they sometimes make into a kind of flummery, termed by them sowens; milk, cheese, and a species of soup-meagre, composed of greens, roots, oatmeal, and butter. They very seldom eat butcher's meat, but every family, in tolerable circumstances, kills a cow at Martinmas, which is pickled down, as we do pork, and used occasionally in broth, or boiled with greens. Many of the Scots dishes are peculiar to the country, viz. the haggie, which is the lights, liver, and suet of a hog, or sheep, hashed, seasoned, and boiled in the animal's stomach, so that, when it is served to table, it has the appearance of a full-blown bagpipe. The hodge-podge, a rich soup, composed of beef, mutton, veal, lamb, and fowl, stewed rice or barley, green peas, lettuce, cabbage, turnips, and onions: to all these ingredients they sometimes add a sheep's head and feet, the wool of which is singed off smooth with a red-hot iron. Fish in sauce, which is a kind of soup made with haddocks, or other fish, the head being stuffed with forced meat. Chicken broth, which is made very rich with eggs, and has the

appearance of a spoiled fricassee, but is very delicate to the taste, and nourishing to the stomach. Minced collops, made of the rump of beef, and suet, cut very small, seasoned with pepper, spice, and vinegar, and kept in a close jar, to be fried occasionally for the table. The use of these dishes is still retained by the middling class of people; but those of the higher rank conform entirely to the French cookery. The only bread used by the commonalty in Scotland, is broad, thin, triangular cakes, made of oatmeal, first baked over the fire on a thin plate of cast iron, which the inhabitants term a griddle, and then toasted until they become crisp and fit for eating.

The dress of the Highlanders consists of the brechan, the cuoranen, the truith, the fillebeg, and a flat cap on their heads, which they call a bonnet. The brechan is composed of twelve or thirteen yards of a narrow stuff, wrapped round the middle, and reaching down to the knees; this, in cold weather, is large enough to wrap round the whole body from head to feet, and is often the sole covering they make use of, not only within doors, but in the open air during the whole night. They gird it round their middle with a belt, and it is then called brechan-feal: at other times, it is fastened on the shoulders, and before, with large pins of silver, and other metal. Their stockings, which are short, are tied below the knee; and the cuoranen is a shoe made of a skin with the hairy side outwards, but now seldom worn. The truith were breeches and stockings made of one piece, and formerly worn by the gentry. The fillebeg, likewise called kelt, is a kind of short petticoat, reaching only to the knees, and is a modern substitute for the lower end of the plaid, being less cumbersome, particularly in time of action, when they were formerly obliged to tuck their brechan into their girdle. Most of them have a great pouch of badger and otter skins, which hangs before them, and therein they keep their tobacco and money.

The dress of the women is the kirch, or a white piece of linen, pinned over the foreheads of those that are married, and round the hind part of the head, falling behind over their necks. The single women wear only a ribbon round the head, which they call a snood. The tannic, or plaid, hangs over their shoulders, and is fastened before with a brotche; but, in bad weather, is drawn over their heads. It is common during divine service for the woman to keep continually drawing it forward, in proportion as their attention increases, so that at last the whole face is concealed; perhaps to exclude every external object, that their devotion may not be interrupted. In the county of Breadalbane, many wear, when in full dress, a great plaided stocking, of an enormous length, called ossen; but, in other respects, they are dressed like the women in England of the same rank.

The ancient arms of the Highlanders were the Lochaber axe, now only used by the town-guard of Edinburgh, the broad sword, and target. With the last they covered themselves, with the first reached their enemy

at a considerable distance. But, since the disarming of these arms are scarcely to be met with, owing partly to the force of that statute, and partly to the spirit of industry now rising among them. Bows and arrows were used in war as late as the middle of the last century. The dirk was a species of dagger stuck in the belt, used by the ancient Caledonians.

The ancient sports of the Highlanders, such as archery, hunting, fowling, and fishing, are now for the most part disused. Those retained are the throwing the putting stone, or stone of strength, which occasions a strenuous emulation who can throw a heavy stone the furthest. Throwing the penny-stone is similar to our coit. The shinty, or the striking a ball of wood, or of hair: the game is played between two parties on a large plain furnished with clubs; whoever strikes it first to their own goal wins the match. The amusements by the fire-sides were, the telling of tales, the wildest and most extravagant imaginable. Music was another: in former times, the harp, covered with leather and strung with wire, was the favourite instrument, but is hardly known at present. Bagpipes are supposed to have been introduced by the Danes; the oldest are played with the mouth; the other, played with the fingers only, is of Irish original: the first suited the genius of this warlike people, roused their courage to battle, alarmed them when secure, and collected them when scattered. This instrument is become scarce since the abolition of the power of the chieftains, and the more industrious turn of the common people. Vocal music was greatly in vogue among them, and their songs were chiefly in praise of their ancient heroes. They have still fragments of the story of Fingal, and others, which they sing as they pass along, or when employed in the field.

Some very singular customs attend the courtship of the Highlanders. After privately obtaining the consent of the fair, he formally demands her of her father. The lover and his friends assemble on a hill allotted for that purpose in every parish, and one of them is dispatched to obtain permission to wait on the daughter: if he is successful, he is again sent to invite the father and his friends to ascend the hill, and partake of a cask of whisky, which is never forgot: the lover advances, takes his future father-in-law by the hand, and having plighted his troth, the fair one is delivered up to him. During the marriage ceremony, great care is taken that no dogs pass between them, and particular attention is paid to the leaving the bridegroom's shoe without buckle or latchet, to prevent witches from depriving him, on the nuptial night, of the power of loosening the virgin zone. As a test, not many years ago, a singular custom prevailed in the Western Islands the morning after a wedding: a basket was fastened with a cord round the neck of the bridegroom, by the female part of the company, who immediately filled it with stones, till the poor man was in danger of being strangled, if his bride did not take compassion on him, and cut the cord with a knife given her to use at discretion. But such had been the tenderness of the Caledo-

ian spouses, that neglecting the ir-

On the death of a Highlander, the corpse being stretched
on a board, and covered with a coarse linen wrapper, the
friends lay on the breast of the deceased a wooden dish,
containing a small quantity of salt and earth, in separate
parcels. The earth is an emblem of the corruptible body;
the salt, an emblem of the immortal spirit. All fire is
extinguished while a corpse is kept; and it is reckoned fo
ominous for a dog or cat to pass over it, that the poor
animal is killed without mercy.

Another ceremony used at funerals, is what they call
the late wake. The evening after the death of any per
son, the relations and friends of the deceased meet at the
house, attended by a bagpipe, or a fiddle. The nearest
of kin opens a melancholy ball, dancing and crying vio
lently at the same time; and this continues till day-light,
with the most unseemly frolics among the younger part
of the company. If the corpse remains unburied for two
nights, the same rites are renewed. The coranich, or
singing at funerals, is still in use in some places. The
songs are generally in favour of the deceased, or a recital
of the valiant deeds of his ancestors.

Christianity was planted in Scotland long before Auf
stin the monk established the pope's authority. When the
Reformation was settled there by the preaching of John
Knox, his brethren naturally imagined that they should
succeed to the revenues of the Romish clergy. But the
nobility took care to monopolize all the church livings,
leaving very little for the ministers. Since that time
their stipends have been considerably augmented. None
now exceeds 150*l.* a year, but few fall short of 60*l.*
and none of 50*l.*

The Presbyterian government in Scotland, which took
place after the reformation of Popery, has still continued,
being the form of ecclesiastical government most agree
able to the genius and inclination of the people of that
kingdom. When James VI. succeeded to the crown of
England, it is well known that during his reign, and
that of his successors of the family of Stuart, designs
were formed of altering the constitution of our civil go
vernment, and rendering our kings more absolute. The
establishment of episcopacy in Scotland was thought to be
the point proper, in order to facilitate the execution of
these designs. Episcopacy was accordingly established,
and continued to be the government of the church till the
revolution; when such designs subsisting no longer,
Presbyterian government was restored to Scotland. In
1690, it was established by act of parliament; and was
thencewards secured by an express article in the treaty of
union between the two kingdoms of England and Scot
land.

Among the ministers of Scotland there subsists a
perfect equality; that is, no minister, considered as
an individual, has an authoritative jurisdiction over
another. Jurisdiction is competent for them only
when they act in a collective body, or as a court of judi
cature, and then there is a subordination of one court to

another, or inferior and superior courts. The courts
established by law are the four following, viz. church
sessions, presbyteries, provincial synods, and, above all,
a national or general assembly.

A church session is composed of the minister of the
parish and certain discreet laymen, who are chosen and
ordained for the exercise of discipline, and are called
elders. The number of these elders varies according to
the extent of the parish. Two of them, together with
the minister, are necessary, in order to hold a legal
meeting. The minister always presides in these meet
ings, and is called moderator; but has no other authority
than what belongs to the preses of any other court.
The church session is appointed for inspecting the mor
als of the parishioners, and managing the funds appro
priated for the maintenance of the poor within their
bounds. When a person is convicted of any instance of
immoral conduct, or of what is inconsistent with the
Christian profession, the church session inflicts some ec
clesiastical censure, such as giving him an admonition,
or rebuke: or, if the crime be of a gross and public
nature, they appoint him to profess his repentance in
face of the whole congregation, in order to make satis
faction for the public offence. The highest degree of
church censure is excommunication, which is seldom
inflicted but for contumacy, or for some very atrocious
crime obstinately persisted in. In former times there
were certain civil pains and penalties, which followed
upon a sentence of excommunication; but, by a British
statute, these were happily abolished. The church of
Scotland addresses its censures only to the consciences of
men: and as they cannot, by the method of persuasion,
reclaim offenders, they think it inconsistent with the
spirit of true religion to have recourse to compulsive
methods, such as temporal pains and penalties.

Any person who thinks himself aggrieved by the
church session, is permitted to seek redress, by entering
an appeal to the presbytery, which is the next superior
court. In like manner he may appeal from the pres
bytery to the provincial synod, and from the synod to
the assembly, whose sentence is final in all ecclesiastical
matters.

A presbytery consists of the ministers within a certain
district, and also of one ruling elder from each church
session within the district. In settling the boundaries
of a presbytery, a regard was paid to the situation of the
country. Where the country is populous and cham
paign, there are instances of thirty ministers, and as
many elders, being joined in one presbytery. In moun
tainous countries, where travelling is more difficult,
there are only seven or eight ministers, and in some
places fewer, in a presbytery. The number of presby
teries is computed to be about seventy.

Presbyteries review the procedure of church sessions,
and judge in references and appeals that are brought be
fore them. They take trials of candidates for the mi
nistry; and if, upon such trial, they find them duly
qualified, they license them to preach, but not to dispense
the

the sacraments. Such licentiates are called probationers. It is not common for the church of Scotland to ordain or confer holy orders on such licentiates, till they are presented to some vacant kirk, and thereby acquire a right to a benefice.

It is the privilege of presbyteries to judge their own members, at least in the first instance. They may be judged for heresy, that is, for preaching or publishing doctrines that are contrary to the public standard imposed by act of parliament and assembly; or for any instance of immoral conduct; prosecutions for heresy were formerly more frequent than they are at present; but happily a more liberal spirit has gained ground among the clergy of Scotland. They think more freely than they did of old, and, consequently, a spirit of inquiry and moderation seems to be on the growing hand; so that prosecutions for heresy are become more rare, and are generally looked upon as invidious. Some sensible men among the clergy of Scotland look upon subscriptions to certain articles and creeds of human composition as a grievance, from which they would willingly be relieved.

Presbyteries are more severe in their censures upon their members for any instance of immoral conduct. If the person be convicted, they suspend him from the exercise of his ministerial office for a limited time; but, if the crime be of a heinous nature, they depose, or deprive him of his clerical character, so that he is no longer a minister of the church of Scotland; but forfeits his title to his benefice, and other privileges of the established church. However, if the person thinks himself injured by the sentence of the presbytery, he may appeal to the provincial synod, within whose jurisdiction his presbytery lies; and from the synod he may appeal to the national assembly. Presbyteries generally hold their meetings every month, except in remote countries, and have a power of adjourning themselves to whatever time or place within their district they may think proper. They choose their own preses or moderator, who must be a minister of their own presbytery. The ruling elders, who sit in the presbytery, must be changed every half year, unless they are rechosen by their respective church sessions.

The next superior courts to presbytery are provincial synods; these are composed of the several presbyteries within the province, and of a ruling elder from each church session. The ancient dioceses of the Scottish bishops are, in general, the boundaries of a synod. Most of the synods in Scotland meet twice every year, namely, in the months of April and October, and at every meeting they choose their preses, or moderator, who must be a clergyman of their own number. They review the proceedings of the presbyteries, and judge in appeals, references, and complaints, brought before them from the inferior courts; and, should a presbytery be found negligent in executing any of the ecclesiastical laws against their members, or any other person within their jurisdiction, the synod have power to call them to account, and censure them as they see cause.

The supreme court in ecclesiastical matters is the general assembly, from whose sentence there is no appeal. As they have a power of making laws and canons concerning the discipline and government of the church, and the public service of religion, the king always sends a commissioner to represent his royal person, that nothing may be enacted inconsistent with the laws of the state. The person who represents the king is generally some Scotch nobleman, whom his majesty nominates annually some time before the meeting of the assembly, and is allowed a suitable salary for defraying the expences of this honourable office. He is present at all the meetings of the assembly, and at all their debates and deliberations. After the assembly is concluded, he presents his commission, and delivers his speech. And when they have finished their business, which they commonly do in twelve days, he adjourns the assembly, and appoints both the time and place of their next annual meeting, which is generally at Edinburgh in the month of May.

The general assembly is composed of ministers and ruling elders, chosen annually from each presbytery in Scotland. As the number of ministers and elders in each presbytery varies, so the number of representatives must have a proportion to the number of ministers and elders that compose the presbytery. This proportion is fixed by laws and regulations for that purpose. Each royal burrough, and university in Scotland, has also the privilege of sending a ruling elder: to the general assembly; but all elections must be made forty days at least before the meeting. Their jurisdiction is either consultative or judicial. By the former they have the power of making ecclesiastical laws, by the latter they judge in appeals brought before them by the subordinate courts, and their sentence is decisive and final. One particular which employs a considerable part of their attention, is the settling of vacant parishes. The common people of Scotland are greatly prejudiced against the laws of primogeniture, and the right of patronage. Hence, when a patron presents a candidate to a vacant parish, the inhabitants frequently make great opposition to the presentee, and appeal from the inferior courts to the general assembly. That body is not now much disposed to indulge the parishioners in their unreasonable opposition to presentees. On the other hand, they are unwilling to settle the presentee in opposition to the people, who refuse to submit to his ministry; because, in this case, his labour among them must be useless and ineffectual. The assembly, therefore, generally delay their sentence till they have used all their endeavours to reconcile the parishioners to the presentee; but, if their attempts prove unsuccessful, they proceed to settle the presentee pursuant to the act of parliament concerning patronage. Upon the whole, it appears that, in the government of the church of Scotland, there is an annual representation of the laity as well as the clergy; a great security to the former against the usurpations of the latter.

form religious worship, and to preach to his flock in the language of his country, every Sunday, and on other extraordinary occasions appointed by the church. They likewise examine the parishioners annually. They go to the different towns and villages of the parishes; and, in an easy and familiar manner, converse with them on the essential points of religion; making trial of their knowledge by putting questions to them on these heads. The adults, as well as the children, are catechised; and the minister endeavours, by every power of persuasion, to make up quarrels that may have happened among them, and reconcile the parties.

A society was incorporated by patent, in the reign of Queen Anne, for erecting schools in North-Britain and the Western Isles; which was afterwards established by act of parliament, and a fund appropriated for carrying the design into execution: his present majesty contributes 1000*l.* per ann. to this fund. It has, however, been questioned, whether that lettered education, which renders the Scots respectable among foreigners, and is of the utmost service to many of the natives, may not, upon the whole, be of prejudice to the country, by contributing, in some measure, to deprive it of that class of men who are best fitted for forming and executing the great plans of commerce and agriculture for the benefit of the public. The promoting a similar cultivation of the mind in England among the poorer sort, might probably be of more general utility.

The first principle of the church of Scotland is a parity of ecclesiastical authority among all its presbyters: that it agrees in its censures with the reformed churches abroad in the chief heads of opposition to Popery, but is principally modelled after the Calvinistical plan established at Geneva. This establishment proved, at various periods, so tyrannical over the laity, by having the power of the greater and lesser excommunications, which were attended by a forfeiture of estate, and sometimes of life, that the kirk sessions, and other bodies, have been abridged of all their dangerous powers over the laity, who are extremely jealous of their being revived. It is said, that even that relic of Popery, the obliging fornicators of both sexes to sit upon what they call a repenting-stool, in the church, and in full view of the congregation, begins to wear out; it having been found that the Scots women, on account of that penance, were the greatest infanticides in the world. The power of the Scots clergy is at present very moderately exercised: since the Revolution they have been firm adherents to civil liberty, and the cause of Hanover; and acted with remarkable intrepidity during the rebellion in 1745. They dress without clerical robes; but some of them appear in the pulpit in gowns and bands, after the Geneva form. They make no use of set forms in worship, but are not prohibited that of the Lord's prayer. The rents of the bishops, since the abolition of episcopacy, are paid to the king, who commonly appropriates them to

pious purposes. The revenues of the Presbyterian clergy have been much mended of late years, and if the present expensive mode of living continues in Scotland, it is thought they will be still more augmented.

The spirit of the Presbyterians in Scotland was formerly of a rigid, intolerant, and persecuting nature; but at present it is mild and gentle, and the sermons and other theological writings of many of the modern Scotch divines are equally distinguished by good sense and moderation; but this moderation has been too often interrupted by the fanatics not only of lay seceders but even of regular ministers. There are very numerous in the Lowlands. They maintain their own preachers; and though scarcely any two congregations agree with each other either in principle or practice, yet we do not know that they are disposed to fly in the face of the civil power. In short, on account of the great abuses of patronages, by which many parties have unworthy or incapable ministers imposed upon them, as is the case in England, these successions may be deemed allowed, and even justified.

Learning has flourished in Scotland for 1400 years past. The poems of Ossian sufficiently shew that the muses were no strangers there in the most remote ages. St. Patrick, the celebrated apostle of Ireland, was a native of this kingdom, which became, for some time, a refuge for the learned; especially the little island of Jona, called St. Columb-Kill. The pure Latin style of Buchanan is a sufficient proof that the study of languages was cultivated in his time; and his writings are to this day the most classical of all modern productions. But the destruction of the Scottish monuments of learning and antiquities has rendered their early annals very imperfect, and in many respects fabulous.

Among the modern writers, we may rank Napier of Merchiston, the inventor of logarithms; a discovery, which, in point of ingenuity and use, may vie with any that has been made in modern times. Keil, in his mathematical works, to the clearness of his reasoning, has added the colouring of a poet. Gregory is, of all writers on astronomy, allowed to be one of the most perfect and elegant. Maclaurin, the companion and friend of Sir Isaac Newton, was endowed with all that precision and force of mind, which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary capacities, and for diffusing that light through the world, which Newton had confined within the sphere of the learned. His treatise on Fluxions is regarded by the best judges in Europe as the clearest account of the most refined and subtle speculations on which the human mind ever exerted itself with success. Maclaurin also pursued this new career, and the late Dr. Simson was a geometer no less famous than the former, for having distinguished himself in the sure but almost deserted tract of antiquity, of which his illustration of the ancient geometry is a convincing proof. To these we

may add, in medicine particularly, the names of Pitcairn, Arbuthnot, Mouro, Smellie, Whytt, and others, who deserve a distinguished seat among the literati of Europe. The Scots have been equally successful in cultivating the Belles Lettres. Foreigners who inhabit warmer climates, and suppose the northern nations incapable of tenderness and feeling, are astonished at the poetic genius and delicate sensibility of Thomson. Nor has learning declined since the death of these authors: Scotland can now boast of authors, especially with regard to historical composition, whose labours will be handed down to posterity with applause, and reflect honour on their country.

There are four universities in Scotland, viz. St. Andrew's, founded in 1411; Glasgow, in 1454; Aberdeen, in 1477; and that of Edinburgh; in each of which are a certain number of professors in various branches of literature, moral and natural philosophy, mathematics, astronomy, divinity, &c.

Edinburgh, the capital of Scotland, is built on the edges and declivity of a vast sloping rock, of a great height at the upper extremity, and the sides declining very fast and steep into the plain. The view of the houses at a distance strikes the traveller with wonder; their own loftiness added to their almost aerial situation, gives them an aspect of magnificence not to be equalled in any other part of Great-Britain. These conspicuous buildings, which form the upper part of the high-street, are of stone, and make a handsome appearance: they are generally six or seven stories high in front; but, by reason of the declivity of the hill, much higher backward; one in particular, called Babel, has twelve or thirteen stories. Every house has a common stair-case, and every story is inhabited by a separate family. The inconvenience of this particular structure need not be mentioned; notwithstanding the utmost attention, in the article of cleanliness, is in general observed. The common complaint of the streets of Edinburgh is now removed by the vigilance of the magistrates, and their severity against any that offend in a gross degree; the streets are cleaned early every morning. This unfortunate species of architecture owed its rise to necessity. The turbulence of the times in which it was in vogue, induced every person to get as near as possible to the protection of the castle; hence the houses were crowded together, and, as it were, piled upon one another, merely on the principle of security. The high-street is, in some places, eighty feet broad, well paved, and extends a mile in length, from the castle to the palace of Holyrood-House; but the beauty of it was greatly injured by Luckenbooth-Row and the guant-house, which stood in the middle of it. This city is reckoned to contain upwards of 60,000 souls.

The castle is ancient, built on the summit of a rock, and inaccessible on all sides except where it joins the city. A considerable train of artillery is kept in this fortress, together with a large magazine of arms and ammunition. The regalia of Scotland are also deposited

here, under the most solemn legal instruments of their never being removed. They are fully described in these writings, but never shewn to any body. From this fortress is a very beautiful, diversified, and singular prospect. On the south and east are the meadows, or public walks, Herriot's hospital, part of the town overhadowed by the stupendous rocks called Arthur's Seat and Salisbury's-Craigs, the Pentland-Hills at a few miles distance, and, at a still greater, those of Muirfoat, whose summits and sides are covered with a smooth verdant turf. On the north is a full view of the Frith of Forth, from Queen's-Ferry to its mouth, with its southern banks covered with towns and villages, and terminated by a range of hills bordering on the Highlands, at forty or fifty miles distance.

The reservoir of water, brought from the Pentland-Hills, for supplying the city, is situated in Castle-Street, and deserves notice. It holds near 200 tons of water, which is conveyed to several conduits disposed at proper distances in the principal streets.

The Parliament-Close is a small square situated on the south side of the High-Street. It is a noble quadrangle, in the centre of which is a fine equestrian statue of Charles II. The parliament-house is well proportioned, and now occupied by the courts of justice. Here is the advocates library, founded by Sir George Mackenzie, and now contains above thirty thousand volumes, besides manuscripts.

The Exchange is a handsome modern building, but of very little use, the merchants of Edinburgh choosing to meet and transact their business in the open street, exposed to all weathers, rather than transfer it to the Exchange, though erected for that very purpose. One part of this building is the Custom-House.

The old cathedral, now called the New-Church, is an ancient Gothic structure, and divided into four places of worship: in one the lords of session attend; but there is no organ in this or any other of the Scotch churches; a defect the more surprising, as in the Dutch churches, as well as in the great church of Geneva, where the same religion is established, the psalmody is accompanied with an organ.

The palace of Holyrood-House, situated at the end of Cannongate-Street, was originally an abbey, founded by David I. in the year 1128. It contains a vast number of very fine apartments; those called the king's are in great disorder; the rest are elegant, and occupied by several of the nobility. The gallery is filled with colossal portraits of the kings of Scotland down to the Revolution.

The church or chapel of Holyrood-House, a beautiful piece of Gothic architecture, is now in ruins; the roof having fallen in, by a most scandalous neglect, notwithstanding money had been granted by the government for preserving it entire. Beneath the ruins lie the bodies of James II. and James V. Henry Darnly, and several other persons of distinction.

Herriot's-Hospital is a fine ancient building, founded

by George Herriot, who died that month. It was a place of education for the poor citizens and tradesmen of the city, which are well known for their gay and their other scenes of industry.

The college, or university, is a noble building, founded by James VI. and by the magistrates, who were the first to settle in the town, and who were the first to wear no habits, as in other universities, the professors of different faculties: the school of medicine, and the school of law, are an excellent one, and a magnificent one.

The Royal Infirmary, capable of receiving 1000 patients, is a fine building, and the operations are performed in a well room elegant.

On the north side of the city, which is planned by a magnificent architect, especially those in the city elegant, built in the inconvenient place, the play-house is situated in a polite amusement, and is connected to the centre arch of the city.

The city of Edinburgh, four baronies, a desirable chosen from the city watch, at the quelling small companies, and which is a town, and in a very nothing remarkable, the pier, which is a walk.

nt building, founded
by

by George Herriot, jeweller to James VI. who fol-
lowed that monarch to London, and made a large
fortune. It was built by Inigo Jones, for the main-
tenance and education of poor children belonging to the
citizens and traders of Edinburgh, and is under the
direction of the magistrates of that city. The gardens,
which are well laid out, were formerly the resort of
the gay, and there the Scotch comic poets often laid
their scenes of intrigue.

The college, which enjoys the privileges of an
university, is a mean structure. It was founded by
James VI. and by him put under the direction of the
magistrates, who have the power of chancellor and
vice-chancellor. The students, who are dispersed all
over the town, are about six hundred in number; no
person, except the principal, residing in the college:
they wear no habit, nor are they subject to any regula-
tions, as in other universities. There are twenty-two
professors of different sciences, most of whom read
lectures: the schools relating to every branch of the
medical art, are reckoned equal to any in Europe.
Here is an excellent library founded by one Clement
Little, and a museum given by Sir Andrew Balfour.

The Royal Infirmary is a spacious and handsome
edifice, capable of containing 200 patients. The room
for operations is particularly convenient, and the coun-
cil room elegant.

On the north side of the city lies the New Town,
which is planned with great judgment, and will prove
a magnificent addition to Edinburgh. The houses,
especially those in St. Andrew's-Square, are remark-
ably elegant, built in the modern style, and free from
the inconveniences attending the old city. The new
play-house is situated here, and other buildings for the
public amusements of the age. These improvements
are connected to the city by a very beautiful bridge,
the centre arch of which is ninety feet high.

The city of Edinburgh is governed by a lord provost,
four bailiffs, a dean of the guild, and a treasurer, an-
nually chosen from the common-council. Every com-
pany, or incorporated trade, of which there are here
fourteen, chooses its own deacon. The lord provost is
colonel of the town-guard, a military institution found
no where else in his majesty's dominions. They form
the city watch, and patrol the streets; are useful in
quelling small commotions; are divided into three
companies, and wear an uniform.

Leith, which may be called the port of Edinburgh,
though two miles distance, on the Frith, is a large
town, and in a very flourishing condition. It contains
nothing remarkable, being dirty and ill built, except
the pier, which is very fine, and now a well-frequented
walk.

There are several fine seats of the nobility and
gentry in the environs of Edinburgh, particularly
Dalkeith-House, belonging to the duke of Buccleugh;
Newbattle, the seat of the marquis of Lothian; and
Hopton-House, belonging to the nobleman of that
name.

These seats, particularly the two former, are adorned
with fine collections of portraits of eminent persons,
by masterly hands. And at Roslyn, in the neighbour-
hood of Dalkeith-House, is a beautiful and entire
chapel of Gothic architecture, reckoned one of the
most curious pieces of workmanship in Europe. It
was founded in the year 1410, by William St. Clair,
prince of Orkney and duke of Oldenburg.

Glasgow, in the shire of Lanerk, is situated about
30 miles from Edinburgh, on the descent of a gentle
eminence, and the adjacent plain extending to the
banks of the river Clyde, over which there is a bridge
of seven arches. The chief part of this city is laid
out upon a regular plan, the streets crossing each other
at right angles. The houses, which are lofty, are
built of hewn stone, and, near the cross, or market-
place, supported upon arched pillars, which form a
commodious piazza before the shops, and give an air
of grandeur to the buildings. The streets are straight,
spacious, well paved, and clean; and the whole city is
adorned with a great number of public edifices, among
which are the cathedral, and five or six other elegant
churches, the Tolbooth, town-hall, and several hos-
pitals.

The cathedral, which stands in the highest part of
the city, is a vast pile of Gothic building, dedicated to
St. Mungo, or Kentigern, who, in the sixth century,
was bishop of Glasgow, and lies buried in this church.
This cathedral is ornamented with two spires, one of
which, rising from a square tower in the middle of the
cross, is surprisingly high and beautiful. In the other,
there is a bell of vast dimensions, which, when tolled,
shakes the whole fabric. At present this noble pile is
divided into three separate churches, where divine service
is performed every Sunday. The other churches are all
stately buildings, and some of them erected on the best
models of architecture.

The university of Glasgow forms one of its greatest
ornaments. Every branch of learning is taught by its
own separate regent, or professor, who not only gives
general lectures, but also attends assiduously to the
business of his class, where he explains, imposes tasks,
and examines his pupils. Annually all the individuals
of each class undergo a public examination, in presence
of all the regents; when, if found properly qualified,
after a certain standing they are admitted to the degree
of master of arts. Great numbers of learned men
have been educated in this university, which may cer-
tainly be deemed the most flourishing in Scotland. The
professors, while in the exercise of their functions,
wear black gowns with open sleeves; and the students
are all distinguished by red or scarlet gowns, among
which they are not allowed to appear in public. The
rector of this university, who is always a person of
nobility, or distinguished fortune, is elected annually.
The edifice itself consists of an outward and inner
square, with a lofty tower, and, towards the city, a front
of hewn stone. It was built at the expense of William

Tunbull,

Turnbull, bishop of Glasgow. The inner quadrangle, besides the divinity hall, the old library, and the common hall, which are large and spacious, contains a great number of commodious apartments for the students. The faculty have lately built an elegant library, which is tolerably well furnished with books, manuscripts, and some stones with Roman inscriptions, brought from the wall of Antoninus. Most of the regents reside in an elegant row of houses, a little detached from the college, behind which there is a pleasant garden laid out in walks for the benefit of all the members of the university. Adjoining to this is a botanical garden, well supplied with simples, classed alphabetically in their different tribes.

The town-house, which was built by the citizens of Glasgow, is a very magnificent edifice: and, in the street opposite to it, stands an equestrian statue of king William III. Adjoining to the town-house is the Tolbooth, or public jail, which is a venerable Gothic building.

The work-house and infirmary of Glasgow, are built with elegant simplicity; and the institution is founded upon so excellent a plan, conducted with so much prudence, and proves such an effectual provision for the poor, that there is not a beggar to be seen within the precincts of the city. The number of inhabitants in Glasgow have been computed at 50,000; and, besides its churches, contains eight or ten meeting-houses, for sectaries of various denominations.

Aberdeen, the capital of Aberdeenshire, is situated in the county of Mar, about eighty miles north of Edinburgh, and contains two towns, Old and New Aberdeen. Old Aberdeen, which was formerly the seat of a bishop, and now that of a presbytery, is a small, ill-built, and inconsiderable town. There is a cathedral dedicated to St. Machas, the greater part of which was built by bishop Elphinstone, in the year 1500. The church is of hewn stone, with a lofty steeple, terminating in an imperial crown, with a round globe of stone and two gilt crosses. Adjoining to the church a library is erected, furnished with a valuable collection of books: but Old Aberdeen is chiefly remarkable for a college, founded by James IV. New Aberdeen is the shire town, and though almost joined to the Old, by means of a long village, has no dependence on it. It is a neat, populous, and flourishing city, adorned with three churches; several episcopal meeting-houses, hospitals, a fine wharf, a custom-house, and many other stately edifices, built of hewn stone. The streets are spacious and well paved; the private houses lofty, well finished, and provided with gardens and orchards, which, by being thus intermingled with the buildings, give it at a distance the appearance of a city built in a wood.

The principal public edifice in New Aberdeen is the college, which was originally a Franciscan monastery, founded by George Keith, earl marshal, in the year 1592, and from him called the *Academia Marschal-*

lana. It consists of a principal, four professors of philosophy, one for divinity, and one for mathematics. This, together with the old college, although entirely independent of each other, are termed the university of Aberdeen. Besides this college, there is a grammar-school, founded by Dr. Dune, consisting of a master and three ushers. Here is likewise a school for music, and a library, erected at the expence of the city, well supplied with books, and furnished with mathematical instruments. The other public buildings in this town are, a stone bridge of seven arches, built over the river Dee, at the expence of bishop Gavin Dunbar; a bridge over the Don, consisting of one Gothic arch; the cathedral, dedicated to St. Nicholas; an alms-house; and three hospitals.

St. Andrew's, in Fifeshire, was formerly a most magnificent and flourishing city, and celebrated for being the burial place of St. Andrew, the tutelary saint of Scotland. But at present its only boast is the possession of the oldest university in that kingdom. It was founded, and endowed with many ample privileges, by bishop Wardlaw. At present it consists of three colleges, viz. St. Salvator, St. Leonard, and St. Mary. The first was built by bishop Kennedy, grandson of king Robert III. about the middle of the fifteenth century, and this prelate endowed his foundation with revenues sufficient to maintain four professors of philosophy, a doctor, and bachelor and licentiate of divinity, together with eight poor scholars. There are three silver maces belonging to this college as ancient as the foundation; one of which, weighing seventeen pounds, is gilt and curiously chased. This building was repaired and augmented by Dr. Skene, one of the principals of the college, who likewise founded a library, which by liberal donations soon increased: and a fund was established by the earl of Caillis for the maintenance of a professor of philosophy.

St. Leonard's College was founded by James Hepburn, prior of St. Andrew's, before the Reformation, and afterwards endowed by the earl of Lenox. It consists of a principal, four professors of philosophy, and eight poor scholars, who are maintained upon the foundation. Sir James Scot afterwards established a good salary for a professor of philosophy, and made considerable additions to the library, which in a short time was augmented by a great collection of books bequeathed to it by Sir John Wedderburn, doctor of physic; and it now contains the manuscript of Herdun's *Scoti Chronicon*. The students of this college, who are more numerous than in the other two colleges, shoot annually with bows for the prize of a silver arrow.

St. Mary's, or New College, was founded by the famous cardinal archbishop James Beaton, who was assassinated by Norman Lelty. It consists of two professors, doctors in divinity, and a professor of mathematics. Here the students of the other colleges, having passed through a course of philosophy, may be permitted to finish their education. An observatory is erected in

the college garden by Mr. Gregory, the mathematical professor, who, assisted by a public contribution, furnished it with proper instruments. According to the statutes of this college, the rector, who is chosen annually, must be one of the three principals. The students of all the three colleges are distinguished by wearing different gowns.

The principal fortifications in Scotland are the castles of Edinburgh, Stirling, and Dunbarton, besides which are Fort William, Fort George, and Fort Augustus; but neither of these is capable of sustaining a regular siege by an enemy furnished with a proper train of artillery. They serve as places of arms, and to bridle the inhabitants of the country, on any insurrection; for which purposes they are kept in sufficient repair, and are furnished with garrisons.

Stirling, with its castle, may be considered as a miniature of Edinburgh, being built on the ridge of a hill, or rock, rising out of a plain, with the castle situated at the upper end. Within the walls of the fortress was the palace of several of the Scottish kings, a square building, ornamented on three sides with pillars resting on grotesque figures projecting from the wall, and on the top of each pillar is a statue, seemingly the work of fancy. Near it is the old parliament-house, a vast room, 120 feet long, very lofty, and had formerly a gallery running round it. A considerable battery of cannon commands the bridge, and in this, added to its advantageous situation, its principal strength consists.

Dunbarton-Castle is situated a little to the southward of the town, on a double-pointed rock of a stupendous height, rising in a strange manner out of the sands, and totally detached from all other objects. On one of the summits are the ruins of an old light-house, and on the other, a magazine of powder: in the hollow between them is a large well of excellent water, fourteen feet deep. The sides of the rocks are immense precipices, and often overhang, except on the side where the governor's house stands, which is defended by ramparts mounted with a few cannon, and garrisoned by invaders.

Fort William was erected in king William's reign, on the site of a small fortress, built by general Monk. It is a triangular work, has two bastions, and is capable of admitting a garrison of eight hundred men. It lies on a narrow arm of the sea, called Loch-Yell, which runs some miles higher up the country, where, making a bend to the north, it extends westward 24 miles, towards the isle of Mull.

Fort George is a small but strong and regular fortress, built since the rebellion in 1745, as a place of arms. The barracks are very handsome, and form several regular and good streets; but, since the happy change that has taken place among the Highlanders, it is almost deserted.

Fort Augustus is a small fortress, situated on a plain at the head of Lough-Ness, between the rivers Taarf

and Oich. It consists of four bastions, and barracks for 100 men.

With respect to the fortifications, though they were formerly thought places of great strength, yet it is affirmed by competent judges, that they could not hold out 48 hours, if besieged by regular troops with proper artillery; owing perhaps to the confidence the ancient Scots placed in their own valour, rather than to castles, for the defence of their country—a maxim, which has been deemed more heroic than prudent, as they have often experienced.

The rivers of Scotland are navigable to a very considerable distance from their mouths, and most of the trading towns are situated on their banks, near enough to the ocean to enjoy the benefit of navigation; but there is no art used in any of the rivers in that kingdom; they flow on in their natural channels, and join their parent waters in the ocean. By the navigable canal cut between the Friths of Forth and Clyde, under the direction of the ingenious Mr. Smeaton, the goods imported by the sea-port towns on one side of the kingdom are carried at a very small expence to those on the other; and the advantages of both situations are, by means of this canal, shared in common by both parts of it.

Roman antiquities are found in great numbers in various parts of Scotland; but the most remarkable now remaining, is the pretenture, or wall, originally marked out by Agricola, and finished by Antoninus Pius. Agricola erected a chain of forts, and Antoninus connected them with turf walls guarded by mounds and ditches, some parts of which are still visible. This wall extended from Carron upon the Frith of Forth, to Dunglas upon the Frith of Clyde, somewhat more than 37 English miles in length. The foundation was stone, and it had conduits which at once kept it dry, and supplied the ditch which accompanies it with water. The thickness of the wall, which inclined towards the north, and was, as much as possible, carried along the brows of the eminences, was about four yards. We learn from the inscriptions on this wall, which are still extant, that the whole of the legion called *Secunda Augusta*, and the vexillations of the twentieth and the sixth legions, were employed in completing this pretenture, which, according to the same inscriptions, extended 39,726 paces. It was built while Antoninus Pius was the third time consul. The country people call this work *Graham's-Dyke*, from a tradition that a Scottish warrior of that name was the first that broke over it.

Near the iron founderies, on an eminence above the river Carron, stood that celebrated antiquity, called *Arthur's Oven*, which the ingenious Mr. Gordon supposes to have been a small chapel, a repository for the Roman insignia or standards. Buchanan supposes it to have been a Roman temple, and dedicated to the god *Terminus*. There is no reason to doubt of its being a Roman work; but by whom it was erected, is not certainly

certainly known, though it is generally imputed to Agricola. It was built in the form of the Pantheon at Rome, or the dome of St Paul's at London. It was twenty-two feet in height, and its external circumference at the base eighty-eight feet, and was, upon the whole, one of the most complete Roman antiquities in the world: but, to the mortification of every curious traveller, this matchless edifice is now no more. In the year 1742 its barbarous owner, a Gothic knight, caused it to be demolished, in order to make a mill-dam with the materials, which in less than a year the Naiades, in resentment for the sacrilege, came down in a flood, and entirely swept away.

The coins, urns, utensils, inscriptions, and other remains of the Romans in Scotland, are very numerous; many of them were found at a great distance to the northward of the wall. Roman camps are also found in various parts; but the most perfect piece of military antiquity is that called the camp of Agricola, at Ardoch in Perthshire, near the foot of the Grampian hills. It is generally thought to have been the camp occupied by Agricola before he fought the bloody battle, so finely described by Tacitus, with the Caledonian king Galgacus, who was totally defeated. No less than five rows of ditches, and six ramparts, are still visible on the south side; and of the four gates which led into the area, three of them are still plain and distinct.

Historical monuments of various kinds are found in several parts of this kingdom, erected by the Scots themselves to preserve the memory of some remarkable action or event. At a place called Aberlemno, near Brechin, are four or five ancient obelisks, called the Danish Stones of Aberlemno, having been erected in commemoration of the defeat of that people by the Scots. They are adorned with bas-reliefs of men on horseback, and many emblematic figures and hieroglyphics, now unintelligible, and executed by the rude hand of some untaught artist. But one of the most stately monuments of this kind is a stone near the town of Fortrose in Murray. It rises about twenty-three feet in height above the ground, and is said to be no less than twelve or fifteen below the surface; so that the whole height is, at least, thirty-five feet, and its breadth near five. It is one single and entire stone, adorned with a great variety of figures in relieve, some of them still distinct and visible; but the injury done by the weather has obscured those towards the upper part. This monument has by some antiquaries been attributed to the Danes, and by others to the Scots; but on what occasion, or to commemorate what event, it was erected, is unknown.

Druidical monuments are also found in different parts of Scotland, but none of them equal to Stonehenge on Salisbury-Down hereafter described. Besides these there is a very remarkable barrow in Perthshire, thought to have been formed by the ancient Britons, but when, or on what occasion, is not known. It

exactly resembles the figure of a ship with her keel upwards, and is called by the inhabitants Ternay, perhaps a contraction of "terra navis," the ship of earth.

The columnar rocks, situated between the harbour and castle of Dunbar, may be reckoned among the natural curiosities of Scotland. These rocks form a very surprising stratum of stone, in some respects resembling that of the Giant's Causeway in Ireland: it consists of large columns of red grit stone, either triangular, quadrangular, pentangular, or hexangular; their diameters are from one to two feet, and their length at low water thirty, dipping or inclining a little to the south. They are jointed, but not so regularly or so plainly as those that form the Giant's Causeway. The surface of several that have been torn off, form a kind of pavement, consisting of numbers of convex ends, probably answering to the concave bottoms of other joints, once incumbent upon them. The spaces between the columns are filled with thin septa of red and white sparry matter, and veins of the same pervade the columnus transversely. This range of columnar faces the north, with a point to the east, and extends in front about two hundred yards. The breadth is inconsiderable, the rest of the rock degenerating into shapeless masses of the same sort of stone, irregularly divided by thick septa.

There is hardly in the world a curiosity of the artificial kind, which may be compared to the parallel roads of Glen-Roy Lochabar. The Glen itself is extremely narrow, and the hills on each side very high, but not remarkably rocky. On the declivity of these hills, on both sides of the Glen, are three roads at small distances from each other, and directly opposite on each side. These roads have been measured in the completest parts of them, and their breadth is found to be twenty-six paces of a man five feet ten inches high. The two uppermost roads are pretty near each other, not above fifty yards distant, but the lowest more than double that distance from the nearest to it. They are carried along the sides of the Glen with the utmost regularity, nearly as exact as line drawn with rule and compass. Where deep burns or gullies of water cross these roads, they avoid both the descent and ascent in a very curious manner; so that on the side where the road enters these hollows they rather ascend along the slope, and descend on the opposite side, until they come to the level, without the traveller being sensible of either the ascent or descent. Other small Glens fall into Glen-Roy. The parallel roads surround all these smaller ones; but where Glen-Roy ends in the open country, there are not the smallest vestiges of them to be seen. The length of these roads in Glen-Roy are about seven miles.

There are two other glens in the neighbourhood where these roads are equally visible, called Glen-Gly and Glen-Spean, the former running north-west, and the latter south from Glen-Roy. Both these roads are of nearly the same length with those of Glen-Roy. These

These roads are no earth. There are a few of these paths; but it is not on each side, keeping the roads are inaccessible; but for what purpose is not known. Some of the Druidical religious or other stones would not be designed for the rites of religion, but that they were designed for sacrifices were made from the wood, to the effect being roused, within reach of the shore and below.

In many parts of the coast are to be seen the hills of the Callee, is another, yet a species of different nature.

Among our natural curiosities of white

stones, that are found at Stornalapp, a part from the sea, in Aberdeenshire, is a petrifying cauldron, where water, on rising to the top, quickly converts into stone.

Some caverns that are probably natural, and have been the scene of the above-mentioned, have been generally examined.

Which respect to the road has for some years been Mr. Pelham, an Englishman, in 1745, was the first who made the discovery of the parallel roads in Scotland, which was the object of Mr. Pitt's curiosity. He was called in parliament to give evidence on the matter, and was engaged in the course of the British war to suffer to avoid commerce and manu-

Some caverns that are to be found in Fifeshire, and
are probably natural, are of extraordinary dimensions,
and have been the scenes of inhuman cruelties.
Besides the above, other natural curiosities, belong-
ing to Scotland, which their descriptions and histories;
they generally owe their extraordinary qualities to
the credulity of the vulgar, and vanish when they are
philosophically examined.

With respect to commerce and manufactures, Scot-
land has for some years past been in a very improving
state. Mr. Pelham, when at the head of the administra-
tion in England, after the extinction of the rebellion
in 1745, was the first minister who discovered the true
value of Scotland, which then became a more consi-
derable object of governmental inquiry than ever.
Mr. Pitt pursued Mr. Pelham's wise plan, and jolly
voted in parliament, that he availed himself of the
bravery, good sense, and spirit of the Scots, in car-
rying on the most extensive war that Great-Britain
ever was engaged in; and it may be said, to the hon-
our of the British government, that the Scots have
been suffered to avail themselves of all the benefits of
commerce and manufactures they can claim, either in

These roads are not causeways, but levelled out of the
earth. There are a few small rocks in the compass of
these paths; but it is not known in what manner they
were passed, no vestige of roads remaining; they begin
on each side, keeping the regular line as before. These
roads are inaccessible at the east end, but open at the
west; but for what purpose they were made, cannot
now be known. Some have imagined that they are the
works of the Druids; but as there are no traces of
religious or other structures, or circles of stones, they
could not be designed for any oeconomic purpose, or
the rites of religion. The country people are persuaded
that they were designed for the chase, and that these
terraces were made after the spots were cleared in lines
from the wood, to tempt the game into the open parts,
after being roasted, in order that they might come
within reach of the bow-men concealed in the woods
above and below.

In many parts of Scotland, the traces of ancient
works are to be seen. The hill of Finchaven is one
instance, and the hill of Bergonium, near Dunstaffnage-
Castle, is another, yielding vast quantities of pumices, or
scoria of different kinds, many of which are of the
same species with those of the volcanic Iceland.

Among other natural curiosities, mention is made
of white stones, most of them clear like
crystal, and with great plenty of oyster and other
shells, that are found on the top of a mountain
called Stroma Lappich, in Ross-shire, twenty miles
west from the sea.

Stains, in Aberdeenshire, is said to be remarkable
for a perishing cave, called The Dropping Cave,
where water, oozing through a spongy porous rock at
the top, quickly consolidates after it drops to the
bottom.

Some caverns that are to be found in Fifeshire, and
are probably natural, are of extraordinary dimensions,
and have been the scenes of inhuman cruelties.

Besides the above, other natural curiosities, belong-
ing to Scotland, which their descriptions and histories;
they generally owe their extraordinary qualities to
the credulity of the vulgar, and vanish when they are
philosophically examined.

With respect to commerce and manufactures, Scot-
land has for some years past been in a very improving
state. Mr. Pelham, when at the head of the administra-
tion in England, after the extinction of the rebellion
in 1745, was the first minister who discovered the true
value of Scotland, which then became a more consi-
derable object of governmental inquiry than ever.
Mr. Pitt pursued Mr. Pelham's wise plan, and jolly
voted in parliament, that he availed himself of the
bravery, good sense, and spirit of the Scots, in car-
rying on the most extensive war that Great-Britain
ever was engaged in; and it may be said, to the hon-
our of the British government, that the Scots have
been suffered to avail themselves of all the benefits of
commerce and manufactures they can claim, either in

right of their former independency, the treaty of union,
or by acts of parliament since that period. This is
manifest, from the extensive trade they lately carried
on with the British settlements in America and the
West-Indies, and with all the nations to which the
English themselves trade; so that the increase of their
shipping within these thirty years past has been very
considerable. The exports of those ships are composed
chiefly of Scots manufactures, fabricated from the pro-
duce of the soil, and the industry of its inhabitants. In
exchange for these, they import tobacco, rice, cotton,
sugar, and rum, from the British plantations, and also
the products of other countries, to the immense saving
of their nation. Their connexion and trade with Vir-
ginia hath greatly contributed to the prosperity of Glas-
gow and its neighbourhood.

The military roads, by rendering the Highlands ac-
cessible, have greatly contributed to their present im-
provement, and were owing to the industry of the sol-
diery. They were begun in 1723, under the directions
of general Wade, who forced his way through rocks,
before supposed to have been unconquerable. Many of
them hang over the capacious lakes of the country, and
formerly afforded no other road to the natives, than the
paths of sheep or goats, where even the Highlander
crawled with difficulty, and kept himself from tumbling
into the far subjacent water, by clinging to the plants
and bushes of the rock. Many of these rocks were too
hard to yield to the pick-axe, and the miner was obliged
to have recourse to gunpowder; and often, where na-
ture had denied him footing, and where he was forced
to begin his labours, suspended from above by ropes,
on the face of the horrible precipice. The bogs and
moors had also their difficulties to overcome, but all
were at length constrained to yield to the perseverance
of the English troops.

In some parts the soldiers, in imitation of the Ro-
mans, left engraven on the rocks the name of the regi-
ment to which each party belonged, who were em-
ployed in these works. Nor were they less worthy of
being immortalized than the vexillatio's of the Roman
legions; for civilization was the consequence of the
labour of both.

These roads begin at Dunkeld, are carried on through
the noted pass of Killcrankie, by Blair, or Dalnecar-
doch, Dalwhinnie, and over the Coryarich to Fort Au-
gustus. A branch extends from thence eastward to In-
verness, and another westward over High-Bridge to
Fort-William. From the last, by Kinloch Lven, over
the Black Mountain, to the king's house at Teindium,
and from thence by Glen-Urquhie to Inverary, and so
along the beautiful boundaries of Loch-Lomond to its
extremity.

Another road begins near Crieff, passes by Abertay, and
crosses the Tay at Tay-Bridge, and unites with the
other road at Dalnacardoch; and from Dalwhinnie a
branch passes through Badenoch to Inverness.

Mr. Riddel, in his account of the ancient mode of
fortification.

fortification in this country, observes, that "In Scotland, the most ancient remains of fortifications now to be traced consist of an area, surrounded by a strong rampart formed of earth and stones, and generally situated upon the top of a mountain, where the barbarous inhabitants sheltered their cattle, and in huts or wigwams lodged themselves and their corn, perhaps in a similar manner as the wretched inhabitants of New Holland do at present. At this period, their arms seemed to have consisted of spears and arrows, headed with barbed flints and stone battle-axes, several of which have been found in sepulchral tumuli or cairns

"Upon the Mollach hill, on the estate of Dalswinton, the remains of a fortress, answering this description, still exist.

"I shall say nothing of Mr. Williams's witrified forts, having great doubts whether they are not the effects of volcanoes, but shall pass on to what I conceive to have been the first improvement upon the mode of fortification already described, which are those conical towers, accurately described, first by Mr. Gordon, and afterwards by Mr. Pennant. They must have required more art, and afforded a more comfortable shelter, than the tops of hills simply enclosed with a strong rampart.

"In Glensbeg are still to be seen several of these venerable ruins, as also in Skye; but the largest, and by far the most perfect, is situated in Lord Rae's country, and is called Dun Dornadilla. This building is near fifty yards in circumference, and its inner area twenty-seven feet diameter. On the outside, the wall tapers like a line, but the inner wall is perfectly perpendicular; in the heart of which, are the three distinct tiers of apartments, communicating with each other by rude flights of steps. These apartments are lighted by apertures, which look into the circular court. The door or entrance from without is placed about six feet above the base of the building. What had been the height of this tower when entire it is now impossible to say, but its present remains are about thirty feet high, and built of stones entirely without mortar, which are regularly formed into what masons call course and gage. Tradition ascribes the building of this tower to Dornadilla, king of Scotland, who, according to Ledy, was a great hunter, first established the laws of the chase, reigned twenty-eight days, and died in peace with all his neighbours, two hundred and thirty-three years before the Christian era.

"I am much in doubt whether the use of iron was known in Scotland before the arrival of the Romans. The introduction of this most useful of all metals must have made a very great change in the buildings, arms, and other implements of the Scots: and it is highly probable, that square towers, built with cement, succeeded the conical ones. The most ancient of these are generally to be met with on projecting cliffs overhanging the sea, perhaps intended to repel the invasions, first of the Romans, and afterwards of the savage and barbarous inhabitants of Denmark and Norway.

"Oldwick-Castle upon the coast of Caithness is perhaps one of the oldest square towers in Scotland. It seems to be but a small improvement upon the conical ones before mentioned, and is built of stone and lime. The walls, which are enormously thick, contain small chambers, with narrow stairs of communication between the lower and upper apartments, which are lighted by windows looking into the square area, or middle of the tower. Some small apertures are to be seen high up, upon the outside wall, probably intended to watch the motions of an enemy.

"An improvement in the constructing of square towers next took place, which was covering in the inner area with a strong roof of stone vaulted: and this kind of building was called in Scotland a peel, and in England a keep, or dungeon. Many ancient towers of this kind still remain in Scotland, such as, Dunstaffnage in Argyle, Dunnoly in Lorn, Rothfelm in Bute, Clagg in Isla, Dunvegan in Skye, and others too tedious to mention. Several of these venerable ancient towers were built upon an island in a deep lough, such as Elanftalker in Lochlinne, Kilchurn in Lochaw, the castle of Rive in Galloway, Lochmaben in Annandale, Clouseburn in Nithisdale, and many others.

"It is highly probable the Caledonians learned from the Romans the art of constructing vaulted chambers; which improvement must have made a wonderful change in the comfort as well as stability of their strengths and fortresses. And it is probable the castle of Dunstaffnage was the first that underwent this material alteration of having a tower built, the middle area of which was covered with arches of stone. This place is supposed to have been the residence of the Scottish kings, from the period that Dun Dornadilla was deserted by them, until the capture of Scone from the Picts, which then became their favourite residence.

"As the improvements in the art of war, from time to time, called for additional modes of defence, we find the original tower or peel was aided by strong walls flanked with masonry towers, the gates of which were secured by the portcullis. The barnakin or outer ballium was also added, which was surrounded by a strong rampart and wet ditch. Of this kind were the castles of Down, Borthwick, Home, and many others. And this was all that was necessary before the general use of heavy battering artillery.

"Before James VI. succeeded to the crown of England, the situation of Scotland was such as rendered it necessary for every baron there to have his residence more or less fortified, according to his power and consequence in the country, or according as his castle was situated. If it stood near Edinburgh or Stirling, where the inhabitants were more polished in their manners, and overawed by the neighbouring seat of government, all that was necessary in such a situation was a fortified capable of resisting the cursory attacks of robbers and thieves, who, so near the royal authority, never dared to stop to make a regular incursion, but only pillaged by surprise.

surprise, and, if repulsed, instantly fled. The houses
Dean, Niddry, Melville, Allva, and many others, fell
under this description. But when the feat of a baron
was more remote from the royal protection, as in the
shires of Perth, Ross, or Caithness, then it was neces-
sary, in addition to the ancient peel, to call the aids of
tower walls, turrets with a rampart and wet ditch, to
enable the owner to resist the formidable attack of a
powerful adversary.

"The history of Scotland, so late as the reign of
James VI. affords a number of melancholy instances
of inveterate feuds that raged with unrelenting fury
among the great lords and lesser barons of that period;
and every mode of fortification then in use proved often
of little avail in defending the castle against the storm
or blockade of the enraged and relentless foe. Of this
kind were the castles of Duffus in Moray, Dunrobin
in Sutherland, Dunotter in the Mearns, and a great
many others.

"But the happy period is now arrived, when inter-
nal fortification against the domestic foe is of no use.
The nobles and barons of the land have deserted their
strong and gloomy castles for the more refined modern
houses of the eighteenth century, and the ancient and
venerable remains of the great insecurity of former
times are now fast falling to decay, and shortly scarce a
trace will be left, but in history, of their former ex-
istence."

The most remarkable herring fishery carried on in
the lochs of Scotland, is that of Loch Fyn, which is
above sixty-three miles in length, but in breadth scarce
four; the depth is from sixty to seventy fathoms.
This loch is noted for vast shoals of herrings, which
appear in July, and continue till January. The highest
season of the fishery is from September to Christmas,
when near six hundred boats, with four men in each,
are employed. A chain of nets is used (for several are
witted) of one hundred fathoms in length. As the her-
rings swim at very uncertain depths, so the net is sunk
to the depth the shoal is found to take. The success
therefore depends much on the judgment or good for-
tune of the fishermen in taking their proper depths;
for it often happens that one boat will take multitudes,
while the next does not catch a single fish, which causes
the boatmen to be perpetually inquiring of each other
with regard to the depth of their nets. These are kept
up by buoys to a proper pitch; the ropes that run
through them are fastened with pegs, and by drawing
up or letting out the rope (after taking out the pegs)
they adjust their situation, and then replace them.
Sometimes the fish swim in twenty fathoms water,
sometimes in fifty, and oftentimes even at the bottom.

It is computed that each boat gets about forty pounds
in the season. The fish are either salted and packed in
barrels for exportation, or sold fresh to the country
people, two or three hundred horses being brought
every day to the water-side from very distant parts. A
barrel holds 500 herrings, if they are of the best kind;

at a medium 700; but if more (for sometimes a barrel
will hold 1000) they are reckoned very poor. The late
price was 11. 4s. per barrel, but there is a drawback
of the duty on salt for those that are exported.

The great rendezvous for the vessels employed in the
fisheries of the western islands, is at Cabel-Town, in
Caithyre, where they clear out on the 12th of Septem-
ber, and sometimes 300 buffis are seen there at one
time. They must return to their different ports by the
13th of January, where they ought to receive the pre-
mium of 21. 10s. for each ton of herrings; but this
bounty is said to be very ill paid,—a great discouragement
to the fishery.

The principal salmon fisheries in Scotland are those
of the Tweed, the Tay, the Spey, Castle-Hill, and in
the sand bays below Slains. The salmon fisheries in the
Tweed are very considerable, and bring in vast sums.
They lie on each side of the river, and are all private
property, except what belongs to the dean and chapter
of Durham, which in rent, and tythe of fish, brings in
450l. per annum; all the other fisheries are liable to
tythes. The common rents of these fisheries are fifty
pounds a year, for which the tenants have as much
shore as is sufficient for shooting and landing their
nets: the limits of each are staked; and the fishermen
never fail going as near as possible to their neighbour's
limits. One man goes off in a small flat-bottomed
boat, square at one end, and, taking as large a circuit as
his net will admit, draws it on shore at the extremity
of his boundary, where others assist in landing it. The
best fishery is on the south side. Very fine salmon trout
are often taken, which come up here to spawn from
the sea, and return in the same manner with the salmon.

The chief salmon fishery in the Tay is near Perth,
where great abundance of that fish is taken; 3000
have been caught in one morning, weighing one with
another 18 pounds, the whole capture amounting to
48,000lb. The fishery begins on St. Andrew's Day, and
ends on the 26th of August, old style. The rents of the
fisheries amount to 3000l. per annum. The salmon
fishery in the Spey is very great; about 1700 barrels
full are caught in a season, and the shore is rented for
about 1200l. per annum. Great quantities of salmon
are caught at Castle-Hill, Dunet, Wick, and Thurfo.
The miraculous draught once made at the last place
is still remembered, not less than 2500 having been
taken in one tide within the memory of man. A very
successful salmon fishery has, for some years, been
carried on below Slains. This is performed with very
long nets carried out to sea by boats; a great compass
taken, and the nets hawled on shore. It is remarked of
these fish, that they swim against the wind, and are
much better tasted than those taken in the fresh waters.

On the same coast is a large fishery of sea dogs,
which begins the last week of July, and ends the first
in September. The livers are boiled for oil; the bodies
split, dried, and sold to the common people, who come
from great distances for them.

Near the mouth of the Tay, there was some time since a very valuable fishery for pearls, taken out of the fresh water muscles. From the year 1761 to 1764, ten thousand pounds worth were sent to London, and sold from 10s. to 30s. per ounce. It is said that a pearl was found there weighing 33 grains. But this fishery is at present exhausted, from the avarice of the undertakers of it.

The fisheries of Scotland are not confined to their own coasts: they have a considerable share in the whale-fishery carried on at Spitzbergen; and their returns are valuable, as the government some time ago allowed them a bounty of 40s. for every ton of shipping employed in that article. They also take great quantities of cod on the banks in the north seas, and export it to different parts of Europe.

Several useful manufactures carrying on by the Scots at land are perhaps equally beneficial to those on the sea, particularly their iron, linen, and woollen manufactures. Their thread manufacture is equal to any in the world, and the lace fabricated from it has been deemed worthy of royal wear and approbation. Some years ago the exports from Scotland to England and the British plantations, in linens, cambrick, checks, osunaburgs, inkle, and the like, amounted annually to 400,000*l.* exclusive of their home consumption. The woollen manufactures established in Scotland are also in a very promising way; and their exports of caps, stockings, mittens, and other articles of their own wool, begin to be very considerable. Though the Scots cannot rival the English in their finer cloths, yet they make at present some broad cloth proper for the wear of people of fashion in an undress, and in quality and fineness equal to that called Yorkshire cloth. The Scots have also made vast progress in working the mines, and smelting the ores of their country. They also reap a considerable profit from the coals they export to England, and have lately turned even their stones to account, by their contracts for paving the streets of London.

Many years will probably elapse, before the trade and improvements of Scotland can be brought to maturity: in any event, they never can give umbrage to the English, as the interests of the two people are or ought to be the same. Some of their manufactures, not yet mentioned, are, however, yet in their infancy. The town of Paisley also employs an incredible number of hands in fabricating a particular kind of flowered and striped lawns, which are a reasonable and elegant wear. Sugar-houses, glass-works of every kind, distilleries, and paper-mills, are erected every-where. The Scots carpeting makes neat and lasting furniture; and some essays have been lately made, with no inconsiderable degree of success, to carry that branch of manufacture to as great perfection as is found in any part of Europe.

After all that has been said, it may not be amiss to mention the prodigious disadvantages under which

both the commercial and landed interest of Scotland lies, from her nobility and great landholders having too fond an attachment to England and foreign countries, where they spend their ready money. This is one of the evils arising to Scotland from the Union, which removed the seat of her legislature to London; but it is greatly augmented by the resort of volunteer absentees to that capital. While this partiality subsists, the Scots will probably continue to be distressed for a currency of specie. How far paper can supply that defect, depends upon an attention to the balance of trade; and the evil may, perhaps, be in some measure lessened, by money remitted from England for carrying on the vast manufactures and works now set on foot in Scotland.

There is but one order of knighthood peculiar to Scotland, which is styled the order of the Thistle, instituted, according to some of the Scotch writers, by king Achaius, on his making an offensive league with Charlemagne, king of France, in the eighth century. It consists of the sovereign and twelve companions. They wear a green ribbon over their shoulder, and on their breast an embroidered star, representing St. Andrew, the tutelary saint of Scotland, irradiated, and this motto, *Nemo me impunè læset*, "None shall provoke me with impunity." This order, after laying dormant for many years, was revived by James V. a prince of great taste and magnificence, but dropped about the time of the Reformation, and was again restored to its former lustre by queen Anne.

In the reign of Edward II. there was no difference between the value and denomination of the coins of England and Scotland. About the end of the reign of James II. a Scotch shilling was equal to no more than an English six-pence; and in the reign of Mary, queen of Scotland, was only worth a groat. Soon after the accession of James I. to the crown of England, the Scotch shilling was equal to no more than an English penny; their crowns and marks, which are only imaginary money, fell in the same proportion. A Scotch penny is now rarely met with; and the bodle, by which its use was supplied, though of double the value, begins to be scarce. There are still halfpennies, or babies, current in Scotland; but the English coin is now most common, and the currency in Scotland and England is the same: few make use of the Scotch computation.

As to the laws and constitution of Scotland, the ancient form of government appeared excellently adapted to the preservation of liberty; and it must be allowed, that the power of the king was thereby greatly limited, and that there were many checks in the constitution upon him, which were well calculated to prevent his assuming or exercising a despotic authority: but their government was too much of the aristocratic kind to afford to the common people that equal liberty which they had a right to expect. The king's authority was sufficiently restrained; but the nobles, chieftains, and great landholders, had it too much in their power to tyrannize over and oppress their tenants and the com-

mon people. The voice in parliament, or conclusion of peace, without the consent of the people. The prerogative that he was not elected by the government of the government. James IV. who was elected to him his duties appears by the constitution was rather the laws of Scotland the feudal system of law, and partly from the highest court of the college of justice, lords of session, justice according to the law of this court is not the House of Lords, usually instituted by the French parliament, of the commons.

Every in all matters All matters are determined within the kingdom. The highest court of equity The highest criminal justice court, and the Exchequer in Scotland. These, assisted by the assizes yearly decided by a majority of judges, are obliged to be unanimous. The Scots have, the same power, and the revenue of the king in England, a great part of the revenue, are likewise determined: but certain of the Exchequer in Scotland to the treasury, and the Exchequer in Scotland.

mon people. The king of Scotland had no negative
voice in parliament; nor could he declare war, make
peace, or conclude any other public business of impor-
tance, without the advice and approbation of parlia-
ment. The prerogative of the king was so bounded,
that he was not even intrusted with the executive part
of the government: and so late as the minority of
James IV. who was cotemporary with, and son-in-law
to Henry VII. of England, the parliament pointed
out to him his duty, as the first servant of the people;
as appears by the acts still extant. In short, the con-
stitution was rather aristocratical than monarchical.

The laws of Scotland are now partly deduced from
the feudal system of government, partly from the civil
law, and partly from the laws of nature and nations.
The highest court of judicature in this kingdom is called
the college of justice, and consists of fifteen judges,
styled lords of session, who sit twice a year to administer
justice according to equity, and determine causes ap-
pealed to them from inferior tribunals. The sentence
of this court is not however final, an appeal lying to
the House of Lords in England. This court was ori-
ginally instituted by James V. on the model of the
French parliament, to supply an ambulatory committee
of the commons. It may be considered as a standing
tribunal in all matters of property that lie before them.
All matters are determined by the civil law, unless they
come within the cognizance of the municipal laws of
the kingdom. The lords of council and session act also
as a court of equity.

The highest criminal tribunal in Scotland is called
the justice court, and consists of a justice-general, jus-
tice-clerk, and five other judges, who are lords of ses-
sion. These, assisted by a jury, or pannel of fifteen,
hold the assizes yearly, when all causes are tried, and
decided by a majority of the pannel, as they are not
obliged to be unanimous.

The Scots have, by the articles of union, a third
court, called the court of Exchequer; which enjoys
the same power, authority, privilege, and jurisdiction,
over the revenue of Scotland, as the court of Exche-
quer in England, and all matters and things compe-
tent to the court of Exchequer in one of these king-
doms, are likewise competent to the Exchequer of the
other: but certain powers are vested in the judges of
the Exchequer in Scotland, which formerly belonged
to the treasury, and still appertain to that board in
England.

In the reign of Charles II. the court of admiralty in
Scotland was, in all causes competent to its own ju-
isdiction, declared to be a supreme court. The lord
high admiral is acknowledged the king's lieutenant and
justice-general upon the seas, and in all ports, har-
bours, and creeks of the same; and upon fresh waters,
and navigable rivers, below the first bridge, or within
low-water-mark, so that nothing competent to his ju-
isdiction can be interfered with, in the first instance,
but by the lord high admiral, and the judges of his

court. Sentences passed in all inferior courts of admi-
rally may be brought again before this court, but no
appeal lies from it to the lords of session, or any other
court, unless in cases not maritime. In this court
causes are tried by the civil law, which in such cases
is likewise the common law of Scotland. The office
of lord admiral of Scotland is now little more than no-
minal, though the salary annexed to it is supposed to
be about one thousand pounds per annum. The judge
of the admiralty is generally a person of distinction,
and there are considerable perquisites belonging to him.

The college, or faculty of advocates, are within
themselves an orderly court, having under their subor-
dination a body of inferior lawyers, or attorneys, who
term themselves writers to the signet, because they alone
can subscribe the writs which pass the signet. This
college, in some degree, answers to the English inns
of court, and no candidate can be admitted without a
strict examination.

A sheriff's court is held in every county, in which
he, or his deputy, presides, and administers justice in
all causes civil and criminal. Formerly the office of
sheriff was hereditary; but by a late act of parliament
it is enacted, that all high sheriffs, or stewards, shall
for the future be nominated and appointed annually by his
majesty, his heirs and successors. It is also enacted,
in regard to the sheriff's deputies, and steward's depu-
ties, that there shall be only one in each county, or
stewartry, who must have been an advocate seven years
at least. These deputies are to be nominated by the
king for the term of seven years, with such further
continuance as his majesty shall think fit; after which
they are to enjoy their offices for life, unless guilty of
some great offence.

The baron courts of Scotland, in civil matters, ex-
tend to causes not exceeding forty shillings sterling;
and in criminal causes, to petty actions of assault and
battery. These courts belong to every person who
holds a barony of the king; and they had formerly the
power of life and death; but at present they can only
inflict a fine, not exceeding twenty shillings, or set the
offender in the stocks for three hours in the day.

The commissaries courts in Scotland are similar to
those of the English diocesan chancellors. The highest
of these is kept at Edinburgh, wherein four judges pre-
side, who hear and determine all causes relative to wills
and testaments, the right of patronage to ecclesiastical
benefices, tithes, divorces, &c.

The justices of peace in Scotland possess much the
same power as those in England.

The royal burghs form a sort of commercial parlia-
ment, which meets once a year at Edinburgh, and con-
sists of a representative from each burgh, to consult
upon the common good of the whole. The trade be-
tween Scotland and the Netherlands is subject to their
regulation; and they fix the staple-port, which has been
removed from Dort to Camphere. Their conservator
is nominated by the crown, but then they regulate his
power,

power, approve his deputies, and appoint his salary; so that in fact the whole staple trade is subject to their management.

The constitution of Scotland has varied at different times, according as the power of the king, the nobles, or the commons happened to be most prevalent; but at last it settled in a limited monarchy. The Scots enjoyed their own parliament, consisting of king, lords, and commons, though differently modelled from that of England; but the two nations being incorporated by the act of Union, the Scottish parliament ceased of course, and that kingdom is now represented by sixteen peers, and forty-five commoners, who sit and vote in the British parliament. These peers are elected every parliament from the whole body of the Scotch nobility; and the commons are chosen by the shires and certain boroughs classed for that purpose. The great offices of the crown are still maintained and bestowed upon the noblemen of North-Britain.

By an article of the treaty of Union, the land-tax of Scotland is settled at a certain sum; but the customs and other branches of the revenue, are on the same footing there as in England.

A COMPENDIOUS HISTORY OF S C O T L A N D.

THE ancient history of Scotland, like that of most other nations, is obscured by fables and uncertain traditions. All we know is, that at the time of the Roman government in Britain, that kingdom was inhabited by three different kinds of people, distinguished by the names of Caledonians, Scots, and Picts. The Caledonians were the original inhabitants of the country; the Scots, most probably, were a nation of adventurers from ancient Scythia; and the Picts were the original natives of Britain, and driven out by the Belgic Gauls. Christianity was planted in Scotland about the two hundredth year of the Christian æra, by Donald I.

We have very little account of Scotland till the time when the famous Agricola commanded in Britain. That great general totally defeated the combined army of these northern people, led against him by a powerful prince, called Galdus, or Galgacus.

When the Romans left Britain, in the year 448, the Picts and Scots invaded the northern parts of that country, and practised such inhuman barbarities on the inhabitants, that they called in the Romans to their assistance. Reinforced by these foreign auxiliaries, they attacked, routed their enemies, and drove them back to their own country.

About the year 843, the Picts, who had long subsisted as a separate nation, were totally subdued by Kenneth Mac Alpin, king of Scotland, and obliged to incorporate themselves with their conquerors, by taking their name, and adopting their laws.

Malcolm III. commonly called Malcolm Canmore,

who mounted the Scottish throne in the year 1057, married Margaret, sister to Edgar Atheling, the true heir to the English crown. Alarmed at this alliance, and the popularity of Edgar, William the Conqueror, who then swayed the English sceptre, invaded Scotland at the head of a powerful army, and forced Malcolm to pay him homage. This peace introduced a total alteration of manners among the Scots, in which queen Margaret, at once the pattern of piety and politeness, laboured incessantly. She began with her own court, which the new-modelled, by introducing into it the offices, furniture, and modes of life, which were usual among the more polite nations of Europe. She dismissed from her service all who were noted for impiety and immorality; and charged Turgot, her confessor, under pain of her displeasure, to give her his real sentiments upon the state of the kingdom, after the best inquiry he could make. Turgot's report was by no means favourable to the reputation of the Scots. He informed Margaret, that faction raged among the nobles; rapine among the commons; and incontinency among all degrees of men. Above all, he complained that the kingdom was destitute of a learned clergy, capable of reforming the people by their doctrine and example. This report, however, did not discourage the queen; she soon made her husband sensible how necessary it was for his glory and safety, to second her efforts for reforming his subjects. She represented to him particularly the corruption of justice, and the insolence of the soldiery; and found in him a ready disposition for reforming all abuses. He began the good work, by setting the example in his own person, and obliging his nobility to follow it. But superstition had too great a share in these reformations: Malcolm wanted the riches of his kingdom in founding hospitals, building churches, monasteries, and other ecclesiastical structures, adorning them with vessels of gold and silver, and endowing them with ample privileges and revenues.

Malcolm soon after invaded England, and laid siege to the castle of Alnwick; but before he could reduce it, he was attacked by Robert de Mowbray, earl of Northumberland, at the head of an army, and killed in the contest; and his excellent queen, Margaret, who was then ill at Edinburgh, survived him only four days. These events happened in the year 1093, in the thirtieth year of Malcolm's reign.

Donald VII. the uncle of Malcolm, mounted the throne of Scotland, on the death of his nephew. He expelled all the foreigners out of the kingdom, though in the interest of Edgar Atheling, and obliged them to seek refuge in England. But finding himself unable to defend his territories against the opposition formed in favour of Edgar, Alexander, and David, the brothers of Malcolm, he invited the Danes and Norwegians to his assistance; offering to cede to them the Orkney and Shetland islands, by way of indemnification. The offer was accepted; and Magnus, king of Norway, after

[EUROPE.]

taking possession of the alliance of Denmark, became so insolent, that he complained of becoming a province of William Rufus, who sent, in the year 1103, the late Malcolm's son, Donald, and the Scottish king, Edgar on the throne. Edgar was obliged to retreat, but the Scots soon afterwards, instead of investing the town, repaired to Scotland. He did not long survive, being slain by Malcolm's son, Donald upon the throne. Rufus now sent an army, assisted by the king of France, which obliged Donald to flee. He was not now long after overtaken and brought to prison, where he died. Soon after the death of her aunt Christiana, Margaret was married to Edgar, king of England and Scotland, after a reign of nine years. He died in 1107. Alexander, his son, succeeded himself in the throne. He afterwards applied himself to the study of letters, and died in the year 1124, and twenty-one days before his brother David, who, as we have seen, had been educated in the court of the Conqueror; and who, after a great earldom of Scotland, had been crowned king of Scotland, the year before. He cultivated his studies, and having early foreseen the death of the empress Matilda, he took an oath to succeed her in the throne of England, and to marry her daughter, the empress and his

taking possession of the islands, marched an army to
the assistance of Donald. These barbarians soon be-
came so insolent, that they were detested by the Scots,
who complained that their country was in danger of
becoming a province to Norway.

William Rufus, who then filled the throne of Eng-
land, sent, in the mean time, Duncan, a natural son
of the late Malcolm, at the head of an army, against
Donald; and the Scots, imagining he was come to place
Edgar on the throne, joined his standard. The usurper
was obliged to fly to the islands for protection.
But the Scots soon perceived their mistake; Duncan,
instead of investing Edgar with the insignia of govern-
ment, repaired to Scone, where he was solemnly crown-
ed. He did not however long survive his exaltation,
being slain by Malpedir, earl of Mearns, who replaced
Donald upon the throne.

Rufus now sent Edgar into Scotland, at the head of
an army, assisted by his uncle Edgar Atheling, and
soon obliged Donald to seek his safety in flight; but
he was not now fortunate enough to escape; he was
overtaken and brought back to Edgar, who caused his
eyes to be put out, and condemned him to perpetual
imprisonment, where he died.

Soon after the accession of Edgar to the Scottish
throne, his sister Matilda, who had been carried by
her aunt Christiansa into the monastery of Wilton,
was married to Henry I. by which the crowns of
England and Scotland were strongly cemented. Edgar,
after a reign of nine years and three months, died at
Dundee in 1107.

Alexander, his brother, ascended the throne, and ex-
erted himself in punishing the enormous crimes com-
mitted by his nobility in every part of the kingdom.
He afterwards applied himself to works of piety, and
died in the year 1124, after a reign of seventeen years
and twenty-one days, and was succeeded by his younger
brother

David, who, with his sister queen Matilda, had
been educated in England. He married Maud, the
daughter of Waltheof, by Judith, the niece of William
the Conqueror; and afterwards became possessed of the
great earldoms of Huntingdon and Northumberland; so
that he was, at the time of his accession to the throne
of Scotland, the most powerful subject in England.
He cultivated his family friendship with Henry I. and
having early foreseen the opposition which his niece,
the empress Maud (heirs to the crown of England by
the death of her elder brother) would encounter,
he took an oath to maintain her and her issue in that
succession.

Accordingly when Stephen, on the death of Henry,
seized the crown, he not only gave all her friends an
hospitable reception, but raised an army, at the head
of which he marched into England, seized upon Car-
lisle and Newcastle, and obliged the nobility in the
north of England to give hostages for their fidelity to
the empress and her young son, afterwards Henry II.

He was however soon after obliged to make a peace
with Stephen, and his son did homage for his English
estates.

About two years afterwards he again invaded Eng-
land, where his army committed the most shocking bar-
barities, which neither David nor his son could restrain.
This conduct so exasperated the northern barons against
the Scots, that they marched at the head of an army
against David, and advanced towards Northallerton,
where they erected their famous standard. Its body
was a kind of box placed upon wheels, in the centre
of which the mast of a ship was erected, surmounted
by a silver cross, and round it were hung the banners
of St. Peter, St. John de Beverly, and St. Wilfred:
The English placed the utmost confidence in the for-
tune of their standard, and its supernatural efficacy.
Both armies met on a plain called Catton-Moor, and
after a dreadful contest the Scots were defeated, and
David and his son saved themselves in Carlisle. The
Scottish monarch, however, still continued to be the
principal support of Maud, and, in conjunction with
the earl of Gloucester, would in all probability have
placed the crown on her head, had not her own haugh-
tiness and imprudence frustrated every attempt made
in her favour. After a reign of twenty-nine years two
months and three days, David died at Carlisle, and was
buried with his ancestors at Dumferling, in the year
1153. He was succeeded in the throne by his grand-
son

Malcolm IV. This prince attended Henry II. in a
campaign in the county of Thoulouse, where he gave
sufficient proofs of his valour; but soon after applied
himself to the founding and endowing of religious
houses, and died in the year 1165, being the twelfth of
his reign, and the twenty-fifth of his age. He was
succeeded by his brother

William. He invaded England, and was taken pri-
soner, while he was besieging the castle of Alnwick.
Henry sent him, with other state prisoners, to the castle
of Falaise in Normandy; but afterwards set him at li-
berty, on his doing homage for the crown of Scotland,
and acknowledging that he held that kingdom as a
fief of England. But this was afterwards abrogated
by Richard I. He died in the year 1214, in the 43rd
year of his reign, and the 74th of his age. He was
succeeded by his son

Alexander II. who died in 1249, leaving the crown
to his son Alexander III. a very good prince, who
made the happiness of his people his chief care. He
first married Margaret, daughter to Henry III. of Eng-
land, by whom he had Alexander (who married the
daughter of the earl of Flanders), David, and Margaret.
The last married Hangowan, or, as some writers call
him, Eric, son to Magnus IV. king of Norway. That
princess was delivered of a daughter, named Margaret,
generally called the Maiden of Norway; by whose
death, without issue, all the posterity of William failed;
and the crown of Scotland returned to David, earl

of Huntingdon, brother both to William and Malcolm IV.

Upon the death of Alexander III. John Baliol, great grandson to David, earl of Huntingdon, by his elder daughter Margaret, and Robert Bruce, grandson to the same earl of Huntingdon, by his younger daughter Isabel, became competitors for the crown of Scotland. The decision was referred to Edward I. of England. After a long discussion, Edward awarded the crown to Baliol, who agreed to do homage for it to the king of England. Baliol was accordingly crowned at Scone, and soon after surrendered his crown to Edward, who detained him prisoner in England.

Having thus secured the person of Baliol, Edward obliged the Scots to sign instruments of their subjection to him, and carried off or destroyed all the historical records of their kingdom, taking with him the fatidical stone on which the kings of Scotland had long been crowned, and deposited it in Westminster-Abbey, where it still remains. Enraged at the loss of every thing they valued, the Scots determined to perish rather than wear the chains of the victor. Edward perceiving his mistake, changed his measures; he treated them on the footing of subjects, and projected an union between the two kingdoms. Happy had it been for both had this treaty took place, but the Scots patriots treated it with disdain. They united themselves under Sir William Wallace, one of the greatest heroes of that or perhaps any other age. Under this intrepid leader they performed actions which will be handed down to the latest posterity; but he being only a private gentleman, his success soon caused him to be envied by the Scotch nobility. Violent cabals were formed against him, and his popularity daily declined.

In the mean time Edward prepared another formidable army for the invasion of Scotland. It consisted of 80,000 foot, 3000 horse, and 4000 light armed troops, and was attended by a fleet to supply it with provisions. This army, when joined by the troops already in Scotland, formed an irresistible body. Edward divided it into two parts, one of which, consisting of 40,000 men, he commanded in person. Wallace was at the head of the Scotch army, encamped at Falkirk; but before the English appeared, the general was deserted by Cummin, the most powerful nobleman in Scotland, at the head of the best division of his countrymen. Betrayed by his friends, and abandoned by a large part of his army, Wallace made but a feeble stand against Edward, who obtained a complete victory. Wallace, however, made an orderly retreat, and found means to cross the Carron, along whose banks he marched in safety.

Bruce (who was then but a youth, and had hitherto served in the English army, where he had given proofs of his aspiring genius) appeared on the opposite banks; and distinguishing the Scottish chieftain, as well by his majestic port as by the intrepid activity of his behaviour, called out to him, and desired a short conference. He

represented to Wallace the fruitless and ruinous enterprise in which he was engaged, and endeavoured to persuade him to bend at last his inflexible spirit to submission under superior power and superior fortune. Wallace laboured to convince him of his error in joining with the enemy of Scotland; adding, that as the interests of his country, no more than those of a brave man, could never be sincerely cultivated by a sacrifice of liberty, he was determined, as far as possible, to prolong his freedom, and was desirous that his own life, as well as the existence of the nation, might terminate, when they could no longer be preserved but by receiving the chains of the haughty victor. Fired by these noble sentiments, Bruce determined to pursue the same path of glory, and either free his country from their ignoble state of servitude, or perish in the glorious attempt. Wallace still continued in arms, and performed many gallant actions against the invaders of his country; but being at last betrayed by one of his pretended friends, he was carried to London, and executed as a traitor. Bruce did not live to put his resolutions in practice; he died soon after the battle of Falkirk, conjuring his son, with his last breath, to revenge the injuries of his bleeding country, and support her independence till victory or death should put an end to the contest.

Young Bruce obeyed the dying injunctions of his father, and making his escape from the English court, where he was detained a prisoner at large, repaired to Scotland, and killed Cummin with his own hand, for his attachment to Edward. This murder affixed the seal to a conspiracy already formed by the Scottish nobility: they had now no resource left but to shake off the yoke of Edward, or perish in the conflict. Bruce flew to different quarters, excited his partisans to arms, attacked with success the dispersed bodies of the English, and drove them once more out of the kingdom. Exasperated at this unexpected attack of the Scots, and the death of Cummin, Edward vowed revenge against the whole Scottish nation, and assembled a very powerful army, in order to make the defenceless Scots the victims of his severity. In the mean time he sent Aymer de Valence with a considerable force to check the progress of the insurgents; and that general, falling unexpectedly upon Bruce, at Methven in Perthshire, threw his army into such confusion, that a total defeat was the consequence. Bruce himself, attended with a few of his followers, had the good fortune to escape the dreadful carnage, and took shelter in the western isles. Edward soon after marched his powerful army to Carlisle, in order to enter the Scottish kingdom, and carry his threats into execution: but death put a period to his expedition and his life, after having destroyed, according to the best historians, 100,000 of the Scots. He however conjured his son and successor, with his dying breath, to prosecute the enterprise, and never to desist till he had totally subdued the kingdom of Scotland. His death happened on the 7th of July, 1307.

Bruce

Bruce soon afterwards quitted his retreat in the western isles, where he had suffered inexpressible hardships, and appeared again at the head of a small army of his friends and followers. His first exploit was an important advantage which he obtained by surprise over Aymer de Valence, who commanded the English forces; so that the Scots began to entertain hopes of recovering their independence, especially as the feeble conduct of young Edward had greatly abated the terror of the English arms.

On the other hand, Edward II. perceiving at length the necessity of acting with vigour, accordingly assembled a powerful army, in order to finish this important enterprize by one dreadful blow. He entered Scotland at the head of a numerous body of forces, and advanced towards Bruce's army, encamped near Stirling. His chief officers were, the earls of Gloucester, Hereford, Pembroke, and Sir Giles Argenton. Those under Bruce were, his own brother Sir Edward, his nephew Randolph, earl of Murray; and the young lord Walter, high steward of Scotland. The Scottish general, knowing that he was unable to face the English in the open field, without some advantageous circumstances in his favour, drew up his army near Bannockburn, having a hill on his right flank and a morass on his left. In the front of his army was a wide rivulet, on the banks of which he caused deep pits to be dug, and sharp stakes to be planted in them, and the whole to be carefully covered with turf. These precautions had the desired effect; the English cavalry, eager to engage the enemy, fell into the pits, and were driven off the field of battle, before they had time to rally. This unfortunate accident struck the army of Edward with a panic, and Bruce obtained a complete victory. The Scotch writers make the loss of the English to amount to 50,000 men, and their own to 4000. The flower of the English nobility were either killed or taken prisoners; their camp, which was immensely rich, fell into the hands of the Scots; and Edward himself, with a few followers, were pursued by Douglas to the gates of Berwick, from whence he escaped in a fishing-boat. This great and decisive battle happened in the year 1314, and became a subject of great triumph to the victors.

Bruce was by this fortunate acquisition established on the Scottish throne, and the remainder of his reign was a series of the most glorious successes. He sent his brother Edward into Ireland, at the head of a considerable army, who obtained very great advantages over the natives, but was at last slain in battle. Robert, who knew that the events of war are always uncertain, made peace with England, and died in the year 1328, leaving his country in the greatest prosperity.

David II. the son and successor of Robert Bruce, was a virtuous prince; but his abilities as a king were greatly eclipsed by those of Edward III. of England, whose sister he married. The English monarch espoused the cause of John Baliol, son to the original com-

petitor for the Scottish throne, and defeated David's forces in several bloody battles. That prince himself was taken prisoner at the battle of Darham. After eleven years imprisonment in England, he obtained his liberty, on paying a ransom of 100,000 marks, and died without issue, in the year 1371. By the death of David, the last of the Brucean line, the crown devolved upon the Stuart family, whose chief had married the niece of Robert Bruce. The first monarch was

Robert II. a wise and brave prince. He was an excellent judge of mankind, and always employed generals of the most distinguished abilities. He was fifty-seven years of age when he mounted the throne, and seventy when the first war broke out against England, so that he had very little opportunity of displaying his courage. He died in 1390, and was succeeded by his son

Robert III. a prince of a slender capacity, though extremely innocent and inoffensive in his conduct. But Scotland was at that time very ill inclined to cherish, or even to endure, sovereigns of that character. The duke of Albany, Robert's brother, a prince of more abilities, at least of a more boisterous and violent disposition, assumed the government of the state; and, not satisfied with his present authority, entertained the horrid purpose of extirpating his brother's children, and of fixing the crown in his own family. Accordingly he threw David, his eldest nephew, into prison, and suffered him there to perish with hunger. James, the younger brother of David, now only stood between the tyrant and the throne; and Robert, sensible of his son's danger, embarked him on board a ship, with a view of sending him into France, and intrusting him to the protection of that friendly power. Unfortunately the vessel was taken by the English. Prince James, a boy about nine years of age, was carried to London; and though there subsisted a truce at that time between the two kingdoms, Henry refused to restore the young prince to his liberty. Robert, worn out with cares and infirmities, was unable to bear the shock of this last misfortune, and soon after paid the debt of nature, leaving the government in the hands of the duke of Albany.

James I. being set at liberty in the year 1424, on paying an exorbitant ransom, ascended the throne of his ancestors; and having received an excellent education in England, determined to abridge the overgrown power of his nobility. He was also desirous of recovering the crown lands which had been unjustly wrested from his family during his residence in England. But these attempts cost him his life; some of the chief nobility formed a conspiracy against him, and he was murdered in his bed, in 1437, and the forty-fourth year of his age.

The death of James I. was succeeded by a long minority, attended with all the distractions too common in those events. When the young prince became old enough to hold the reins of government, these

these distractions subsided, and James gave many indications of his inheriting the noble spirit of his great ancestors. Soon after his accession to the throne, the quarrel commenced between the houses of York and Lancaster, and became absolutely incurable but by the extinction of one party. This was too great an advantage not to be seized by James, who hoped now to recover those places the English had formerly conquered. In the year 1460, he laid siege to Roxborough, and had provided himself with a small train of artillery for the enterprize: but his cannon was so ill framed, that one of them burst as he was firing it, and put an end to his life in the flower of his age.

James III. his son and successor, was also a minor. The usual distractions ensued in the kingdom: the queen-dowager, Anne of Gueldres, aspired to the government, and the family of Douglas opposed her pretensions. Nor was the nation greatly relieved when James came of age to take the government into his own hands. Suspicion, indolence, immoderate attachment to favourites, with many other errors of a feeble mind, too plainly mark the reign of this weak prince. His turbulent administration was closed by a rebellion of his subjects, and he was slain in battle, in the thirty-sixth year of his age, in the year 1488.

James IV. who ascended the throne of Scotland, upon the death of his father, was one of the most accomplished princes of his age: he was naturally generous and brave, loved magnificence, delighted in war, and was eager to obtain fame. He at once encouraged and protected the commerce of his subjects, who soon became the rivals of the English. In the year 1502, he married Margaret, eldest daughter of Henry VII. and it was hoped that this alliance would remove all source of discord between the two kingdoms. But this flattering idea was deceitful: James still cherished the fatal error of his family, a predilection for the French. He joined that nation against Henry VIII. led an army into England, and was slain, together with the flower of his nobility, in the battle of Flodden, which happened in the year 1513.

James V. was very young when his father fell in the field of honour, and a minority both long and troublesome ensued. He imitated his predecessors in their attempts to humble the nobility; and the doctrine of the Reformation beginning to gain ground in Scotland, he listened to the instigations of his clergy, and gave way to a religious persecution. In the year 1552, a war broke out with England, and the duke of Norfolk, at the head of a numerous army, entered the Scottish territories, and committed some disorders; but hearing that James was at the head of a strong body of forces, retreated into England. Inflamed with a desire of military glory, and determined to revenge the affronts he had received, James gave the signal for pursuing them, and carrying the war into England.

But his nobility opposed this resolution, and refused to attend him in his projected enterprize. Enraged at this defection, he reproached them with cowardice and threatened them with the effects of his anger. He however determined to pursue his purpose, and entered England at the head of a few forces that adhered to him. He had not advanced far, before his troops were seized with a panic, on hearing that a small detachment of the English was approaching, and fled in the utmost confusion. This disaster deeply affected James, who was of a melancholy disposition, as well as endowed with a high spirit, that he lost all command of his temper. Rage against his nobility, who he believed had betrayed him; shame for a defeat by such unequal numbers; regret for the past, and fear for the future, so wrought upon him that he would admit of no consolation, but abandoned himself wholly to despair, and died soon after, in the flower of his age.

Mary, the daughter and successor of James, was only a few hours old when her father died. She was sent to France when an infant, and married, during her minority, to the dauphin, who died before she ascended the throne of Scotland. This princess, famous at once for her beauty and misfortunes, soon after she obtained the crown of her ancestors, married James Darnly, whose untimely death produced a rebellion in her kingdom. Mary's forces were defeated, and she herself obliged to take refuge in England, where she was detained a prisoner eighteen years by queen Elizabeth, and afterwards beheaded by order of that princess, in the year 1586-7, and in the forty-sixth of her age.

James VI. succeeded his mother on the Scottish throne; and, after the death of queen Elizabeth, ascended that of England, after shewing great abilities for governing in Scotland. By this means the two crowns became united, and the independency of Scotland in consequence destroyed.

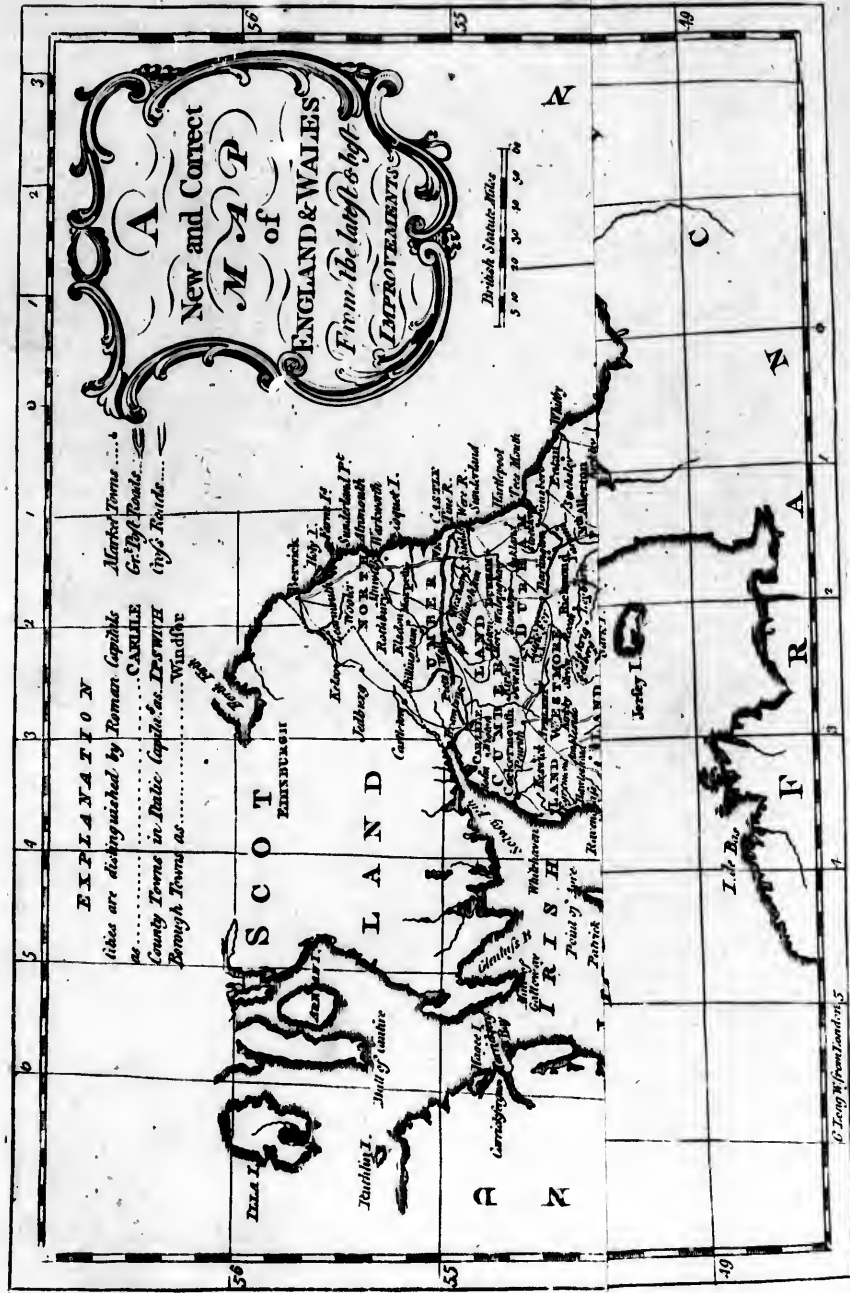

James, after a splendid but troublesome reign over his three kingdoms, left them, in 1625, to his son, the unfortunate Charles I. That prince, by his arbitrary principles and conduct, induced both his Scottish and English subjects to take up arms against him; and indeed, the sword was first drawn again Charles in Scotland. But when the royal party was totally defeated in England, the king put himself into the power of the Scottish army, who at first treated him with respect, but afterwards delivered him up to the English parliament, on condition of their paying 400,000*l.* to the Scots, which was said to be due to them for arrears. However, the Scots afterwards made several bloody but unsuccessful attempts to restore his son, Charles II. who was finally defeated by Cromwell, at the battle of Worcester, in 1651; after which, to the time of his restoration, the commonwealth of England, and the Protector, gave law to Scotland.

C. Dreyer & Sons, London, 1815

At the accession of queen Anne to the crown of England, the Whigs again made application to the Scots, and offered them their own terms, if they would agree to the incorporate Union as it now stands. The majority of the Scots parliament for a considerable time rejected the proposal; but were at length persuaded on to agree to it, partly from conviction, and partly by the distribution of money among the needy; since which the histories of England and Scotland become one and the same.

St. John Sinclair computes the present population of Scotland (1793) at 1,700,000.

The armorial bearing of Scotland is sol, a lion rampant, gules, with a double tressure flowered and counter-flowered; the crest, a lion crowned imperial.

Boundaries, Extent, Divisions, Soil, Climate, Rivers, Produce, Fisheries, Manufactories, Religion, Learning, History, &c.

SOUTH BRITAIN, or that part of Great-Britain called ENGLAND, including WALES, is bounded on the north, by Scotland; on the east, by the German Ocean; on the west, by St. George's Channel; and on the south, by the English Channel, which separates it from France. This part of Great-Britain contains 94,450 square miles. It is about 380 miles in length, and 300 in breadth; situated between 50 and 56 deg. north lat. and between 2 deg. east, and 6 deg. 20 min. west longitude. It is of a triangular form; the Land's End in Cornwall, Dover-Head in Kent, and Caithness on the borders of Scotland, forming three angular points.

England is washed by the sea on all sides, except where it joins to Scotland; which situation renders the country liable to great uncertainty of weather, so that the inhabitants on part of the sea-coasts are often visited by agues and fevers; but at the same time the warm vapours which continually arise from the sea, qualify the natural sharpness of the air, and cause the earth to be clothed with a perpetual verdure. The spring begins in March, and in May the whole country is covered with blossoms. The cold, however, too often continues; so that while the trees display all the pomp of vernal bloom, they, as well as the human nerves, are frequently chilled with the coldness of the atmosphere. However, the situation of England near the sea renders it friendly to the longevity of the inhabitants in general, especially those who live on a dry soil.

In the time of the Romans, the whole island went

by the name of Britannia. The word Brit, according to Mr. Camden, signified painted or stained; the ancient inhabitants being famous for painting their bodies; though some antiquaries do not agree on this etymology. Some derive it from a Celtic word, signifying a level country; but we prefer the common etymology, of its being derived from Anglen, a province now subject to his Danish majesty, which furnished a great part of the original Saxon adventurers into this island.

England has been differently divided at different periods of time. When the Romans first landed in Britain, it was inhabited by seventeen tribes, viz. the Danmonii, Durotriges, Belgæ, Atrebatii, Regni, Cantium, Trinobantes, Juni, Caticuchlani, Dobuni, Silures, Dimetæ, Ordovires, Cornavii, Coritani, Brigantes, Ottadini: but they afterwards becoming masters of it, divided it into the four following provinces: 1. Britannia Prima, comprehending the southern parts of England. 2. Britannia Secunda, comprehending the western parts, and Wales. 3. Maxima Cæsariensis, which reached from the Trent as far northward as the wall of Severus, between Newcastle and Carlisle, and sometimes as far as that of Adrian in Scotland, between the Forth and Clyde. 4. Flavia Cæsariensis, comprising the middle counties. To each of these tribes a certain number of counties were allotted, with their chief cities.

About the year 450, when the Saxons invaded England, and when they were established in the year 582, they divided the island into seven unequal parts, called kingdoms, generally styled the Saxon heptarchy; each leader appropriating to himself the parts he had conquered.

The great Alfred divided England into counties; and, since the Norman conquest, it has been divided into six circuits, each circuit containing a certain number of counties. Two judges are appointed for each circuit, which they visit annually, in order to administer justice to the inhabitants of each respective county, without the trouble and expence that must attend their coming to the capital. These circuits are as follows:

1. HOME CIRCUIT.

COUNTIES.	CHIEF TOWNS.
Essex.....	Chelmsford, Colchester, Harwich, Malden, Saffron-Walden, Bocking, Braintree, and Stratford.
Hertford.....	Hertford, St. Alban's, Ware, Hitchin, Baldock, Bishops-Stortford, Berkhamsted, Hemsted, and Barnet.

COUNTIES.	CHIEF TOWNS.
Kent.....	Maidstone, Canterbury, Chatham, Rochester, Greenwich, Wealdwich, Dover, Deal, Deptford, Feverham, Dartford, Romney, Sandwich, Sheerness, Tunbridge, Margate, Gravesend, and Milton.
Surrey.....	Southwark, Kingston, Guildford, Croydon, Epsom, Richmond, Wandsworth, Battersea, Putney, Farnham, Godalmin, Bagshot, Egham, and Dorking.
Suffex.....	Chichester, Lewes, Horsham, Ryegate, East-Grimstead, Arundel, Winchester, Battel, Brightelmston, New Shoreham, Petworth, Midhurst, and Haslings.
2. NORFOLK CIRCUIT.	
Bucks.....	Aylesbury, Buckingham, High Wyckham, Great Marlow, Newport-Pagnel, and Stuy-Stratford.
Belford.....	Bedford, Amptill, Wooburn, Dunstable, Luton, and Biggleswade.
Huntingdon....	Huntingdon, St. Ives, Kimbolton, St. Neots, Godmanchester, and Ramsey.
Cambridge.....	Cambridge, Ely, Newmarket, Woburn, and Royston.
Suffolk.....	Bury, Ipswich, Sudbury, Leiston, part of Newmarket, Aldborough, Bungay, Southwold, Brandon, Walsworth, Mildenhall, Beccles, Framlingham, Stow-Market, Woodbridge, Lavenham, Hadley, Long Milford, Stratford, and Easterbergholt.
Norfolk.....	Norwich, Thetford, Lynn, and Yarmouth.
3. OXFORD CIRCUIT.	
Oxon.....	Oxford, Banbury, Chipping-Norton, Henley, Burford, Whitley, Dorchester, Tame, and Woodstock.
Berks.....	Reading, Abingdon, Windsor, Wallingford, Newberry, Maidenhead, Farringdon, Wantage, Oakingham, and Hungerford.
Gloucester.....	Gloucester, Tewkesbury, Cirencester, Berkley, Dursley, Lechlade, Camden, Newham, Stow, Tetbury, Sudbury, Wotton, Marlborough, and part of Bristol.

CHIEF TOWNS.

Canterbury, Chatham, Greenwich, Woolwich, Deal, Deptford, Dartford, Romney, Sheerness, Tunbridge, Gravesend, and Milton.

Kingston, Guildford, Epsom, Richmond, Putney, Godalmin, Baginbun, and Dorking.

Reading, Horsham, Ryegate, Arundel, Winchester, Bournemouth, Southampton, Portsmouth, and Havant.

CIRCUIT.

Buckingham, High Wycombe, Great Marlow, Newbury, and Stony Stratford.

Northampton, Northallerton, Wooburn, Dunstable, and Biggleswade.

St. Ives, Kimbolton, and Godmanchester.

Wells, Newmarket, Weymouth, and Royton.

Worcester, Sudbury, Leiston, Ipswich, Newmarket, Aldborough, Southwold, Brandon, Mildenhall, Buntingford, Stow, Markyate, Lavenham, Hadham, Milford, Stratford, and Holt.

CIRCUIT.

Worcester, Chipping-Norton, Burford, Witney, Tame, and Woodstock.

Reading, Windsor, Wokingham, Maidenhead, Wantage, Oakington, and Hungerford.

Worcester, Cirencester, Dursley, Lechlade, Newnham, Stow, Tetbury, Wotton, Marlborough, and part of Bristol.

COUNTIES.

CHIEF TOWNS.

- Worcester Worcester, Evesham, Bewdley, Droitwich, Stowbridge, Kidderminster, Bromsgrove, Pershore, and Tidbury.
- Monmouth Monmouth, Abergavenny, Caerleon, Chepstow, Newport, and Pontpool.
- Hereford Hereford, Lempster, Weobly, Kyneton, Ross, Pembridge, Ledbury, and Bromyard.
- Salop Shrewsbury, Ludlow, Bridgenorth, Bishopscastle, Whitechurch, Wenlock, Wem, and Oswestry.
- Stafford Stafford, Litchfield, Newcastle-under-Lyne, Burton, Penkridge, Wolverhampton, Rugeley, Uttoxeter, and Stone.

4. MIDLAND CIRCUIT.

- Warwick Warwick, Coventry, Birmingham, Stratford upon Avon, Atherton, Aulceter, Tamworth, Nuncaton, and Colehill.
- Leicester Leicester, Melton-Mowbray, Bosworth, Harborough, and Ashby-de-la-Zouch.
- Derby Derby, Chesterfield, Worksop, Ashbourne, Bakewell, Balfour, and Buxton.
- Nottingham Nottingham, Newark, East and West Redford, Southwell, Tuxford, Worksop, Blithe, and Mansfield.
- Lincoln Lincoln, Boston, Stamford, Grantham, Great Grimby, Gainborough, Spalding, Stanton, Crowland, Louth, and Horn-castle.
- Rutland Oakham and Uppingham.
- Northampton Northampton, Peterborough, Brackley, Daventry, Oundle, Towcester, Wellingborough, Thrapston, Kettering, Rockingham, Ferringers, and Rothwell.

5. WESTERN CIRCUIT.

- Hants Winchester, Southampton, Portsmouth, Andover, Basingstoke, Petersfield, Lymington, Ringwood, Ruffey, Aylesford, Christchurch, Newport, Yarmouth and Cowes, in the Isle of Wight.

COUNTIES.

CHIEF TOWNS.

- Wilts Salisbury, Devizes, Marlborough, Malmesbury, Wilton, Warminster, Calne, Cricklade, Trowbridge, Bradford, and Chipping-ham.
- Dorset Dorchester, Lyme, Sherborn, Shaftesbury, Pool, Blandford, Weymouth, Melcombe, Wareham, Winburn, and Bridport.
- Somerset Bath, Wells, part of Bristol, Taunton, Bridgewater, Minehead, Milbourn-Port, Glastonbury, Wellington, Dulverton, Dunster, Yeovill, Somerton, Axbridge, Chard, Bruton, Shepton-Mallet, Crocomb, Frome, Wincanton, Ilchester, and Watchet.
- Devon Exeter, Plymouth, Barnstaple, Bideford, Tiverton, Honiton, Dartmouth, Tavistock, Oakhampton, and Topsham.
- Cornwall Launceston, Falmouth, Truro, Saltash, Bodmyn, St. Ives, Padstow, Tregony, Fowey, Penryn, Kellington, Lescard, Lestwithiel, Helston, Penzance, and Redruth.

6. NORTHERN CIRCUIT.

- York York, Leeds, Wakefield, Halifax, Rippon, Pontefract, Hull, Richmond, Scarborough, Malton, Sheffield, Doncaster, Whitby, Northallerton, Sherbourn, Bradford, Tadcaster, Boroughbridge, Gifborough, Heydon, Pickering, Burlington, Knaresborough, Barnesley, Ripley, Heydon, Thirsk, Yarm, and Wetherby.
- Durham Durham, Stockton, Sunderland, Stanhope, Barnard-Castle, Hartlepool, Anklad, and Darlington.
- Northumberland Newcastle-upon-Tyne, Berwick, Tinnmouth, Morpeth, Alnwick, Hexham, North-Shields, and Wooller.
- Lancaster Lancaster, Manchester, Preston, Liverpool, Warrington, Clithero, Ormskirk, Wigan, Rochdale, Kirkham, Hornby, Hawkthhead, Newton, and Poulton.
- Westmoreland Appleby, Kendal, Longdsale, Burton, Ambleside, Kirbysteven, Orton, Milthorpe, and Brough.

COUNTIES.

COUNTIES.	CHIEF TOWNS.
Cumberland	Carlisle, Cockermouth, Whitehaven, Penrith, Kewick, Brampton, Holm, Egremont, Longtown, Ravenglasis, Workington, and Wigton.

Middlesex and Cheshire are not comprehended in the above circuits; the former being the seat of the supreme courts of justice, and the latter a county palatine. The same may be said of Wales.

COUNTIES NOT INCLUDED IN THE CIRCUITS.

COUNTIES.	CHIEF TOWNS.
Middlesex	London, Westminster, Uxbridge, Brentford, Barnet, Highgate, Hampstead, Kensington, Staines, Enfield, Edgworth, Hackney, & Hampton-Court.
Chester	Chester, Nantwich, Macclesfield, Congleton, Norwich, Frodsham, Stockport, Sandwich, Malpas, Haulton, Middlewich, Sandback, and Knotsford.

Besides the county palatine of Chester, there are two others, Lancaster and Durham; but the two latter are now included in the circuits. The chief governors of all these counties were formerly empowered by charter to administer justice as absolutely as the king himself. There is still a court of chancery in Lancaster and Durham, with a chancellor; and there is a court of exchequer at Chester, of a mixed kind, both for law and equity, of which the chamberlain of Chester is judge; there are also other justices in the counties palatine to determine civil actions and pleas of the crown.

CIRCUITS OF WALES.

NORTH-EAST CIRCUIT.

COUNTIES.	CHIEF TOWNS.
Flint	Flint, St. Asaph, Holywell, and Caerwys.
Denbigh	Denbigh, Wrexham, and Ruthin.
Montgomery	Montgomery, Llanidlos, Llanvillling, Machynleth, and Welch-Pool.

NORTH-WEST CIRCUIT.

Anglesey	Beaumaris, Llanrickmead, Holyhead, and Newburgh.
Caernarvon	Bangor, Caernarvon, Aberconway, and Pulheli.
Merioneth	Bala, Dolgelhe, and Haerlech.

SOUTH-EAST CIRCUIT.

Radnor	Radnor, Prestlin, and Knighton.
Brecon	Brecknock, Bealt, and Hay.

COUNTIES.	CHIEF TOWNS.
Glamorgan	Llandaff, Cardiff, Cowbridge, Swansea, Neath, and Penrice.

SOUTH-WEST CIRCUIT.

Pembroke	St. David's, Haverfordwest, Pembroke, Fishguard, Killgarnie, Newport, Tenby, and Whitland.
Cardigan	Cardigan, Aberllynny, Llanbadarnawr, Llanbador St. Peter, and Tregarron.
Caermarthen	Caermarthen, Kidwelly, Llanidlovr, Llanidlovr, Llanidlovr, and Llanidlovr.

Besides the above fifty-two counties into which England and Wales are now divided, there are counties corporate, consisting of certain districts, to which the liberties and jurisdictions peculiar to a county are granted by charter from the king. Thus the city of London is a county distinct from Middlesex; and the cities of York, Chester, Bristol, Norwich, Worcester, Kingston upon Hull, and Newcastle upon Tyne, are counties of themselves, distinct from those in which they lie. Ely, though not a county distinct from Cambridgeshire, is yet a royal franchise, with a privilege of holding pleas like a county palatine, and has also a chief justice.

IN ENGLAND ARE,

EUROPE.]

By a recent and authentic description of Great-Britain, it is estimated at 500 millions of acres; the value of the produce is reckoned worth 50 millions of pounds sterling per annum, which is about one third of the value of the shipping and goods imported into the country without one penny of duty. The value of manufactures is 20,000,000, which deduct the additions of increase in almost every article. The soil of England, differs in every part, in which the art of husbandry is not the very worst. Many have been drained, and produce excellent, formerly introduced into the country by the English farmers; rye, oats, pease, every year in this some computation. wheat are annual. England. By

By a recent and accurate calculation taken at the desire of high authority, from the evidence of the most authentic documents, the annual value of the island of Great-Britain amounts to twenty-nine millions sterling; the value of the sea thereof is estimated at 500 millions; the value of stock on the said island may be calculated at about five times the yearly value, 145,000,000; the cash of Great-Britain may be reckoned worth 50,000,000; the tonnage of the shipping of the port of London is computed at 178,557, which is about one-fourth of the merchant ships of the island, which then amounts to 714,221 tons, which, at ten pounds per ton, gives 7,142,210; the merchandise and goods imported are computed at five times the value of the shipping, which is 35,711,400; the royal navy without ordnance is valued at 5,000,000; the value of manufactures 20,000,000; plate, jewels, and furniture, 20,000,000; total, 811,835,683l. from which deduct the national debt, with the progressive additions of increasing commerce and population, is a sum almost incredible.

The soil of England, like that of most other countries, differs in each county; but the great perfection to which the art of agriculture is arrived, has meliorated the very worst, and improved the best estates in England. Many of the large moors and marshy tracts have been drained, and now, instead of weeds and tush, produce excellent corn and grass. Many vegetables, formerly cultivated only in gardens, are now introduced into the fields, and raised in amazing plenty by the English farmers. The quantity of wheat, barley, rye, oats, peas, beans, and vetches, produced every year in this country, is astonishing: according to some computations, above 35,000,000 of bushels of wheat are annually produced on the arable lands of England. Nor does any nation exceed this in the productions of the garden, which have come to such perfection, that the rarest of foreign fruits have been cultivated here with success; as a proof of which it need only be mentioned, that London and its neighbourhood, though peopled by about 1,000,000 inhabitants, is plentifully supplied with all kinds of fruits and vegetables from grounds within twelve miles distance. The soil of England seems to be particularly adapted for rearing oak and other kinds of timber; and the plantations of trees round the houses of noblemen and gentlemen, and even of peasants, are delightful and astonishing at the same time.

Though the air is certainly loaded with vapours wafted from the Atlantic ocean, by westerly winds; yet they are so ventilated by winds and storms, that this country is more disagreeable than insalubrious, even to foreigners, and people of delicate constitutions. It is chiefly owing to the variable quality of the air that the seasons are extremely uncertain; but the greatest irregularity, and most unfavourable appearances of them, are not, as in other countries, attended with famine, and very seldom with scarcity. A fortnight,

or at most three weeks, generally make up the difference with regard to the maturity of the fruits of the earth, in backward seasons, and the inhabitants rarely suffer by a hot summer.

The champaign parts of England are generally supplied with excellent springs and fountains, though they frequently contain some mineral impregnation. In some very high lands, the inhabitants are distressed for water, and supply themselves by trenches, or digging deep wells. England contains many mineral wells, as celebrated for their salubrity as perhaps any country in the world. The most distinguished are the hot baths of Bath and Bristol in Somersetshire, and of Buxton and Matlock in Derbyshire; the mineral waters of Tunbridge, Epsom, Harrowgate, and Scarborough.

England contains few mountains, though it abounds with delightful rising grounds, and the most enchanting slopes covered with a smooth turf of the finest grass; which, together with its level plains, meadows, corn-fields, woods and waters, flocks of sheep, and herds of cattle, intermingled in the most agreeable manner, form landscapes equal to the most luxuriant imagination. There are, however, a few mountainous parts; the most noted of which, in England, are the Peak in Derbyshire, the Wolds and Black Mountains in Yorkshire; the Endle and Wulf Crag in Lancashire; the Cheviot-Hill, and Racy-Fall, on the borders of Scotland; Woodbery, and the Malvern-Hills in Worcester-shire; the Brythen, Malagerin, and Wrekin in Shropshire; Cotswold in Gloucester; Dover-Cliffs in Kent; Beachy-Head, and the South-Downs in Sussex; White-Cliff, the Needles, and St. Catharine's, in the Isle of Wight. The principal mountains in Wales are, Snowdon, Plinlimmon, Eitid, Penmallyard, Manuchenny, Dervaddo, Talsern, Carreg Wem, Brong, Trecantle, Moyddon, Keven-y-Gaer, and the Black Mountains.

England is well watered with many noble rivers, which not only fertilize the soil, and beautify the landscape, but add greatly to the improvement and prosperity of commerce. The principal are, the Thames, the Medway, the Severn, the Trent, the Ouse, the Tine, the Tees, the Tweed, the Lower Avon, the Derwent, the Ribble, the Mersey, and the Dee.

The Thames, one of the noblest rivers in the world, rises from different springs in Gloucestershire; and after receiving the Churn, and several small brooks, it runs north east to Lechlade in Wiltshire, where it unites with the Colne, and becomes navigable for barges; thence continuing its course, it receives the waters of the Windrush, passes by Oxford, where it is joined by the Charwell; thence changing its course to the southward, it passes by Abingdon, and proceeds to Dorchester, where it is joined by the Thame. Thus increased, it directs its course to the eastward, passes by Wallingford and Reading, near which it receives the waters of the Kennet and Loddon, washes Henley, Marlow, Windsor, Kingston, and Richmond, in its way to London. After

passing by the capital, it divides Kent from Essex; and widening as it approaches the ocean, falls into the Sea at the Nore, being navigable for large ships from its mouth to London-Bridge.

The principal stream of this river is generally called the Isis, before its junction with the little river Thame; and it is said, that from Thame and Isis, the name Thames or Thames is formed. But notwithstanding this opinion is embraced by writers of great credit, it is undoubtedly erroneous. It has always been called the Thames by the common people from its very source; and in an ancient charter granted to abbot Aldhelm, certain lands bordering on the eastern bank of the river are particularly mentioned, "Cujus vocabulum Temis juxta vadum qui appellatur Summerford;" and as Summerford is in Wiltshire, it is evident that the river was then called Temis or Tems, far above its junction with the Thame. The same thing appears in every charter and authentic history where this river is mentioned, particularly in several charters granted to the abbey of Malmesbury, and some old deeds relating to Cricklade, both of them situated in Wiltshire. The Saxons called it Temese from its source to its mouth; and from Temese, our Tems or Thames is immediately derived.

Formerly there were but few bridges over the Thames, and even those constructed on very bad principles; but both these defects are now in a great measure supplied. London-Bridge indeed is still suffered to remain almost in its primitive condition with regard to the navigation, but the new bridges of Westminster and Black-Friars are built in a different manner: they serve all the purposes of bridges, and add dignity and grandeur to the capital, without giving the least obstruction to the navigation of the river. Besides these, there are many other bridges over this noble stream, in the neighbourhood of London, particularly those of Battersea, Fulham, Kew, Kingston, Hampton-Court, Walton, &c.

The river Medway rises in the Weald of Sussex, but soon after enters Kent, runs N. E. by Tunbridge to Maidstone, where, changing its course to the N. W. it flows on to Rochester and Chatham, about eight miles below which it divides into two streams, one of which runs to the north, till it falls into the estuary of the Thames, and the other directing its course to the eastward, falls into the same estuary: the former is called the West, and the latter the East Swale; while the county included between these two arms of the Medway is called the Isle of Sheppey. First rate ships of war come up to Chatham, and the river is navigable for small craft to Maidstone. Prodigious floats of timber are brought down this river from the woods in the Weald of Sussex, and conveyed to the royal yards of Chatham and Deptford for the use of the navy.

The Severn, esteemed the second river in England, rises on the east side of a vast mountain, called Plinlimmon, situated in the south-west part of Montgomeryshire in North Wales; whence, after a variety of winding, it passes by Welsh-Pool, and continuing its serpentine course, and being augmented with the wa-

ters of several streams, enters Shropshire, passes by Shrewsbury, about four miles below which it receives the waters of the Rodan and the Tern. Thence it continues its course to Bridgenorth, and enters Worcester near Bewdley, in the forest of Wire, about two miles below which it receives the waters of the Stour. Thence increased, it flows on to Worcester; and about four miles below that city is joined by the Teme or Tems. Augmented by the waters of all these rivers, it pursues its course, and enters the county of Gloucester near Tewkesbury, and is there joined by the Upper Avon. From Tewkesbury it continues its course, washes the walls of Gloucester, and falls into that part of the Western Sea called the Bristol Channel. The tide flows up the Severn as far as Tewkesbury, which is near seventy miles from its mouth; and at Newnham, a town twenty miles below Tewkesbury, it has rather the appearance of a sea than a river; the flood-tide runs up with such impetuosity, that at one swell the water often rises above four feet. Vessels of considerable burden pass up to Shrewsbury, and small craft to Welsh-Pool. It is said to be the most rapid river in England, and is very subject to floods, by which the low lands are often overflowed.

The third great river in England is the Trent, which rises from two or three springs in the north-west part of Staffordshire, and, continuing its course to the south-west, is joined by the Thame near the eastern borders of the county. Then directing its course to the north-east it enters Derbyshire near Burton upon Trent, and is soon after joined by the Dove. Near the eastern borders of Derbyshire it receives the waters of Derwent and Erewash, and enters Nottinghamshire near Trumpington, after its junction with the Soar. Augmented by all these rivers, it runs through the whole county of Nottingham, and for some distance divides it from Lincolnshire, passes through part of the latter, and falls into the mouth of the Humber, properly an estuary or arm of the sea, which receives many of the principal rivers of the counties of York and Lincoln. The Trent is navigable to a great distance from the Humber. Small craft pass up this river from its mouth into Staffordshire, but the navigation in many places is but indifferent.

Besides those above mentioned, there are several other noted rivers in England, viz. the Ouse (a Gallic word signifying *water* in general) which falls into the Humber, after receiving the water of many other rivers. Another Ouse rises in Bucks, and falls into the sea near Lynn in Norfolk. The Tine runs from west to east through Northumberland, and falls into the German Sea at Tinmouth, below Newcastle. The Tees runs from east to west on the borders of Scotland, and falls into the German Sea at Bewick. The Eden runs from south to north through Westmoreland and Cumberland, and passing by Carlisle, falls into Solway-Frith below that city. The lower Avon runs well through Wiltshire to Bath, and then, dividing the counties of Somerset and Gloucester, falls into the Severn about six miles below Bristol. The Derwent, which rises in Bor-

rowdale,

Shropshire, passes below which it receives the Tern. Thence it comes and enters Worcester. The Vire, about two miles from the Stour. Thence it flows into the Temese or Tems. These rivers, it pursues of Gloucester near by the Upper Avon. Its course, washes that part of the West. The tide flows up the river is near seventy miles, a town twenty miles, the appearance of the river is up with such impetuosity often rises above four feet. It is said to be the only subject to floods, overflowed.

The Trent, which is the north-west part of its course to the south-eastern borders of the north-east. Upon Trent, and is near the eastern borders of the north-east. The Trent divides it from Lincoln. The Trent from the Humber, its mouth into the sea, in many places is but in-

there are several other rivers (a Gallic word) falls into the Humber. Many other rivers, falls into the sea near the coast from west to east. The Tees runs into the German Sea. The Tyne runs from Scotland, and falls into the North Sea. The Eden runs from the north, and falls into Solway-Firth. The Ure runs west through the counties of Yorkshire and the Severn about five miles, which rises in Bor-

rowdale, runs from east to west through Cumberland, and passing by Cockermouth, falls into the Irish sea a little below. The Ribble rises in Yorkshire, runs from north to west through Lancashire, and passing by Preston, discharges itself into the Irish sea. The Mersey rises in the mountains of Derbyshire, runs from the south-east to the north-west through Cheshire, and then, dividing Lancashire from Lancashire, passes by Liverpool, and falls into the Irish sea a little below that town. The Mersey rises in Wales, and divides Flintshire from Cheshire, falling into the Irish Channel below Chester. A canal cut from Chester, through marshy grounds, is ten miles in length, ships of considerable burden pass up to the quay with safety.

There are but very few lakes, or rather meres in England; the principal are Soham-Mere, Wittlesford-Mere, and Ramsay-Mere, in the Isle of Ely in Cambridgeshire, and Winander-Mere in Westmoreland. Winander-Mere, which is much the largest of those in England, is about three miles in length, and one mile and a half in breadth; but when the fens are overflowed in a rainy season, the whole forms one vast lake, and is 40 miles in circumference. Winander-Mere is the principal lake in England; it is ten miles in length from north to south, and two miles in breadth from east to west. There are several small islands in it; the largest is one continued rock.

In ancient times, England contained no fewer than 100,000 acres of forests; of which the principal now remaining are the forests of Windsor, Epping, Dean, Sherwood, New Forest, Exmoor. There were formerly in this country large woods, if not forests of chestnut-trees, which exceeded all other kinds of timber for the purpose of building, as appears from many great houses still standing, in which the chestnut-beams and roofs remain still fresh and undecayed, though some of them are above 1000 years old. But the whole kingdom is so shaded by woods and plantations as give it almost the appearance of one continued forest.

The most considerable mineral produced in England is tin; and Cornwall has been famous for producing it ever since the Phœnicians traded to Great-Britain. Since the English have found the method of manufacturing their tin into plates and white iron, their mines have become of immense benefit to the nation. An ore, called Mundic, is found in the beds of tin, which was little regarded till, above 70 years ago, Sir Gilbert Clark discovered the art of manufacturing it; and it is said now to bring in 150,000l. a year, and to equal in goodness the best Spanish copper, yielding a proportionable quantity of lapis calaminaris for making brass. Those tin works are under peculiar regulations, by what are called the stannary laws, and the miners have parliaments and privileges of their own, which are in force at this time. The number of Cornish miners are said to amount to 100,000. Free-stone is plentiful in Derbyshire, and marble in the neighbourhood of Plymouth. Immense quantities of coals are dug out of the

pits in Northumberland, Cumberland, Westmoreland, and the bishoprick of Durham. The exportation of coals to other countries is a valuable article, and this trade furnishes a great number of seamen for government service. Northumberland and Cheshire produce a great deal of alum and salt; and the kingdom abounds with fullers earth, which being of the utmost importance to the cloth manufactory, its exportation is prohibited under severe penalties.

The vegetable and animal productions of England are very numerous, and excellent in their kind. Indeed, the improvements in agriculture have been so many, and made in so rapid a manner, that the value of lands, in several parts of England, has been trebled within a few years. Noblemen, and gentlemen of the greatest property in the kingdom, have nobly lent their assistance to the improvement of this useful art. Several societies are founded for the same laudable purpose; and the example, interest, and great weight of the nobility and gentry, have at last, in a great measure, prevailed over the obstinacy of the farmers, lessened their bigotry to the old methods of cultivation used by their forefathers, and rendered them attentive to the dictates of reason, experience, and truth. They are convinced, from ocular demonstration, that agriculture is still capable of improvement, and therefore ready to profit by the discoveries of others: they acknowledge, that those who have deduced the practice of agriculture from the principles of a rational theory, founded on experiments, are better cultivators than themselves. Hence agriculture is every day making large strides towards perfection; and corn, and other useful vegetables, are raised on soils formerly thought incapable of cultivation.

With regard to timber, England seems to be its native soil. It flourishes wherever it is planted; and if the proper care had always been taken for propagating it, we should not hear the many complaints that are daily uttered by shipwrights and others, with regard to its scarcity, particularly that of oak. Nor is the soil friendly to one species of timber only: the ash, the elm, the beech, and the fir, flourish equally with the oak; and besides these, here are plenty of walnut-trees, poplars, maples, sycamores, horn-beams, hazles, willows, birch-trees, and many other species. Prodigious plantations of hops are seen in Kent, Surrey, and Hampshire; and the finest saffron in the world is raised in Essex, Suffolk, and Cambridgeshire. Hemp and flax are also cultivated in some counties, and madder and woad for dyeing, in others. The artificial grasses, particularly lucern, saintfoin, trefoil, cinquefoil, and clover, are now sown to great advantage. The orchards of England, particularly those of Herefordshire, Devonshire, Worcesterhire, and Kent, produce incredible quantities of apples, pears, and cherries; and the cyder and perry made from the apples and pears in some counties, are equal to the French white wines.

In England, gardening is carried to very great perfection:

fection: there is hardly a plant in the known world but may be found in some of the curious gardens of England. Even the fruits of the torrid zone are here brought to perfection. The pine-apple, formerly so difficult to be met with, is now plentifully produced in almost every gentleman's garden in England. Apricots, peaches, nectarines, plums, gooseberries, currans, and raspberries, are so common, that the bare mentioning their names must be sufficient: in short, the English gardeners are such masters of horticulture, that they perform things almost incredible; roses and other flowers, fully and finely blown at Christmas, are not uncommon in some of their gardens; cherries and other fruits, fully ripe, are also produced in that dreary season. The common gardens, even those of the peasants, abound with all sorts of greens, roots, and salads in perfection, particularly, artichokes, asparagus, cauliflowers, cabbages, coleworts, broccoli, peas, beans, kidney-beans, spinach, lettuce, celery, endive, mushrooms, turnips, carrots, potatoes, radishes, leeks, onions, shallots, &c. &c.

Among the animal productions of England, the horse stands foremost. That noble and generous animal is found in this country in great perfection: indeed, all the valuable qualities of the Arabian, the Turkish, the Spanish, and other foreign horses, are united in that of England, owing to the incredible pains taken by all ranks of men, from the prince to the peasant, for improving the species. Vast numbers of horses are bred in England, and so many sold into foreign countries, that their exportation is now become a considerable branch of commerce. The strength, courage, swiftness, and intrepidity of the English horse is so well known on the continent of Europe, that every prince is desirous of having them in his army. Those which draw equipages in the streets of London are often particularly beautiful. The English oxen are large and fat, and their flesh has a delicious flavour, though some prefer that of the small breed of Wales and Scotland. The sheep are of two kinds, one bred on the Downs and upland pastures, and the other in the low lands of Essex and Lincolnshire: the flesh of the former is preferred, and the fleeces of the latter. Wool is one of the most valuable articles of the produce of this country, and constitutes the original staple commodity of England. The fleeces of the Lincolnshire species of sheep are remarkably large, and it has been computed, upon very rational principles, that above twelve millions of fleeces are annually manufactured in England, besides those clandestinely sent out of the kingdom to supply our neighbours.

We must not omit to mention, among the animals peculiar to England, the mastiffs and bull-dogs, as being far superior to those of any other country, both with regard to strength and courage. They will engage any animal, and generally come off victorious. The lion himself is unable to intimidate them; and two of these dogs being, by order of king James I. turned

loose upon one of the most dreadful lions in the Tower, they laid him on his back; but a still more surprising circumstance attending these creatures, is that this innate courage degenerates in foreign countries. Nor is this change peculiar to these dogs; the same is observed with regard to the English game-cocks, so famous here for their ferocity and courage. The rest of the animals of England are nearly the same with those of other countries, as asses, mules, deer, hares, rabbits, hogs, foxes, squirrels, cats, ferrets, weasels, newts, otters, badgers, hedge-hogs, pole-cats, rats, mice, moles, &c.

All kinds of poultry are here in great plenty and perfection, as turkeys, peacocks, geese, swans, common poultry of various kinds, ducks, and tame pigeons. England also abounds in different sorts of wild fowl, as bustards, wild geese, brent geese, wild ducks, widgeon, teal, pheasants, plovers, partridges, woodcock, quails, snipes, landrails, wood-pigeons, hawks, buzzards, kites, owls, ravens, herons, crows, rooks, jackdaws, magpies, jays, thrushes, blackbirds, nightingales, goldfinches, bullfinches, larks, linnets, and a prodigious variety of small birds; among which is the wheat-ear, a bird peculiar to England, the flesh of which is by many preferred to that of the ortolan, and is reckoned a great delicacy.

Few countries in the world can boast of greater variety of fish. The rivers and ponds abound in salmon, trout, eels, pike, carp, tench, barbel, perch, gudgeons, smelts, roach, dace, plaice, flounders, and craw-fish. In some of the lakes or meers of Cumberland and Wales, is found a very delicate fish called a char; it is of the trout kind, and thought to be peculiar to England. The seas which surround the kingdom are full of cod, mackerel, mullets, hake, guard-fish, haddock, whiting, herrings, pilchard, skate, turbot, soles, hallibuts, and, what are preferred to all others by the voluptuous, John Dories, and red mullets. Shell-fish are also found in plenty, as lobsters, crabs, prawns, shrimps, oysters, scallops, cockles, muscles, wilks, periwinkles, &c. The coasts are sometimes visited by whales, and by vast numbers of porpoises; in some parts a few seals are seen upon the rocks, but not frequently. The principal reptiles of this country are adders, vipers, snakes, and worms; the insects are, bees, humble-bees, hornets, wasps, beetles, ants, gnats, flies in great variety, and many other small insects common to other parts of Europe.

The fisheries of England, though capable of being carried on to the greatest advantage, are sadly neglected, notwithstanding their utility has been so often pointed out (particularly by reducing the high price of butcher's meat) and large sums have been subscribed by the nobility, gentry, and merchants. The whale-fishery is, however, prosecuted with advantage, but not with a spirit equal to that of the Dutch, who send more ships to the Greenland seas than all the other nations of Europe put together. ries of Devon and Cornwall, the pilchard fishery is
nursed with great spirit and success; but that for
berings, which might prove a great national benefit,
anguishes to such a degree, that it can hardly be said
to exist. The turbot-fishery, which might also be very
advantageous to the nation, is wholly neglected; so
that the large quantities of that fish, daily seen in the
markets of London, during the season, are caught by
the Dutch on our own coasts, and sold to English boats
sent off for that purpose, which easily accounts for its
scarceness, whereby the lower class of people are entirely
deprived of that agreeable food. Some years ago, in-
deed, there was a pleasing prospect that the herring-
fishery would be carried on with a spirit adequate to its
importance. Large sums were subscribed, a company
was formed, nets were made, buflers were fitted out,
and every method adopted for rendering the attempt
successful; but by some unexpected events, yet un-
known, this national undertaking miscarried, though
some ascribed the failure of it to the expence of bring-
ing the commodity to market. However, we still hope,
that other projects for carrying on this fishery, and
those on our coasts in general, will be formed, to
which every lover of his country will wish success.

With respect to the population of England, politi-
cal calculations must be very fallible; which is owing
to the prodigious influx of foreigners hither, the emi-
grations of inhabitants to America and the islands,
their return from thence, and the great number of
hands employed in shipping. It will appear that Eng-
land must be extremely populous, when we consider,
that the war with France and Spain, before the last,
annually employed about 200,000 Englishmen, exclu-
sive of Scots and Irish, by sea and land, and its pro-
gress carried off, by various means, near that number.
The decay of population was indeed sensibly felt, but
not so much as it was during the wars in queen Anne's
reign, though not half of the numbers were then em-
ployed in the sea and land-service. If, with some, we
calculate the inhabitants from the number of houses
in England, which are reckoned at near a million, and
allow only seven or eight persons to each house, there
will then appear to be seven millions, or perhaps more.
Some, however, will suppose this to be too large a
calculation; and it must be admitted, that England has
been exceedingly drained both of men and money by
the late unhappy and destructive war with the colonies.
Respecting London, the bills of mortality have been
of little service on this head, because about 100,000
inhabitants, at the very gates of that city, do not come
within their cognizance, not to mention the great
number of dissenters, who keep registers of their own
births and burials.

The English, with regard to their persons, are in
general of a proper size, have good shapes, regular
features, and florid complexions. The women are re-
markably beautiful; their elegant shape, their graceful
air; and their delicate features and complexions, form

an assemblage of beauty superior to that of any other
kingdom in Europe. In point of cleanliness, the Eng-
lish excel all the nations in the world. At the same
time, their nerves are so remarkably delicate; that they
are susceptible of the least impression, and are often
very strongly, too frequently mortally, affected by ima-
gination only. They feel the whole weight of the evils
they fear, and sometimes sink beneath the burden of
mental suggestions. Yet, when real danger approaches,
they meet it with an astonishing intrepidity and con-
stancy of mind. Fearless of death, because they prefer
it to slavery, they advance against the enemy in the
field with a noble alacrity, and stand the most violent
attacks with unshaken firmness. With regard to the
English seamen, they are confessedly more active, skilful,
and intrepid, than any other mariners in the world.

This remarkable sensibility of the nerves produces
another particular almost as general as the former; they
feel for every object in distress, and participate in the
sufferings of others. Hence those generous subscrip-
tions, so frequently set on foot, and munificently filled,
for the relief of others. Even their enemies partake of
their benevolence; and the generous instance they gave
during the war in the reign of the late king, of their un-
bounded charity for the support of the French priso-
ners, will be transmitted with applause to posterity by
future historians.

The honour and integrity of the English merchants
in their dealings are known in every part of the com-
mercial world. The word of an eminent merchant is
considered as sufficient for any sum of money; and
many thousand pounds worth of goods are every day
bought and sold on the Royal-Exchange, without any
other security. But this ingenuous method of carrying
on their commerce, too often lays them open to the arts
of designing men. Honest and candid themselves, they
expect to find the same virtues in others, and never
suspect that a fair and plausible behaviour can ever form
the deceitful surface of villany and design, till dear-
bought experience convinces them of their mistake, and
makes them sensibly feel the effects of their ill-placed
credulity.

The works of the English mechanics are superior to
those of the same kind of any other handicrafts-men in
Europe. They are not indeed famous for invention,
but they never fail of improving upon those of others.
Nor is this want of invention general; many of the
English artists excel in both, and some of the most
capital discoveries of the last and present centuries owe
their birth to the inhabitants of this country: among
which may be reckoned the steam-engine, the horizon-
tal watch, the quicksilver and gridiron pendulums, the
artificial magnets, the speculum top, the quadrant for
taking the sun's altitude at sea by reflection, &c. &c.
No people in the world think so closely as the English
upon any subject. Blessed with a clear apprehension,
and fearless of difficulties, they fix the attention on a
single point, and pursue it with astonishing perseverance.

Foreigners have represented the English as cruel, and changeable in their disposition. Perhaps there is little foundation for these censures at present: the former, which was gathered from the encouragement given to prize-fighters and boxers, is turned into another channel; and, with regard to the latter, it seems to have been founded upon a mistake. That the conversation of the English is irregular, will be very readily granted; sometimes it is dull and phlegmatic; sometimes solid, ingenious, and argumentative; sometimes sprightly, replete with wit and humour; and, probably, these diversities in discourse were imputed to a change in sentiment.

Another charge, of a very odious and disgraceful nature, has too justly been brought by foreigners against the English, namely, that of suicide, too frequently the pernicious fruit of the gaming table; and, though this propensity in the English is generally imputed to the air, yet, perhaps, there is another cause which will bid fair for removing the difficulty—the false method of education generally practised. Perhaps there cannot be a more improper method to qualify persons for an active life than ours; though that particular should, from the very genius of the people, and the nature of our constitution, be its chief end. When persons, born with a restless, active disposition, do not find sufficient employment, or are engaged in such as is not suitable to their genius, life becomes a burden; gaming and dissipation are substituted for employment, and the consequences are often fatal to the poor deluded mortals. This is surely a more rational method of accounting for the frequency of that crime, than to attribute it to the peculiar qualities of our air. Why is so fair a plea offered? Why are any reasons offered to palliate so atrocious a crime? Why is the climate arraigned, and Providence blasphemed, to excuse self-murder, upon a principle contrary at once to scripture, reason, and fact? The climate has certainly been always the same, and yet there was a time when that crime was as little known here as in any other country. In the reign of Elizabeth, when all found employment, it was hardly heard of; so that its great frequency is of a very modern date, and may, in a great measure, be ascribed to idleness and dissipation.

It cannot be denied that every day produces strong indications of an alarming change in the manners of the English. A spirit of luxury and gaming seems to have seized, not the effeminate and the idle only, but also the more prudent, and even the commercial ranks of the people; so that it is to be feared the following view of our present situation, drawn by the late Dr. Berkeley, bishop of Cloyne, one of the greatest men this or any other country has produced, is too just. "It must be owned, says that masterly writer, that little can be hoped if we consider the corrupt degenerate age we live in. I know it is an old folly to make peevish complaints of the times, and charge the common frailties of human nature on a particular age. One may

nevertheless venture to affirm, that the present has brought forth new and portentous villainies, not to be paralleled in our own or any other history. We have been long preparing for some great catastrophe. Vice and villainy have by degrees grown reputable among us; our infidels have passed for fine gentlemen, and venal traitors for men of sense, who knew the world.

"We have made a jest of public spirit, and cancelled all respect for whatever our laws and religion repute sacred. The old English modesty is quite worn off, and, instead of blushing for our crimes, we are ashamed only of piety and virtue. In short, other nations have been wicked, but we are the first who have been wicked from principle. The truth is, our symptoms are so bad, that, notwithstanding all the care and vigilance of the legislature, it is to be feared the final period of our state approaches. Strong constitutions, whether politic or natural, do not feel light disorders. But, when they are sensibly affected, the distemper is, for the most part, violent and of ill prognostic. Free governments, like our own, were planted by the Goths in most parts of Europe; and, notwithstanding we all know what they are come to, yet we seem disposed rather to follow their examples, than profit by their errors. God grant the time be not near, when men shall say, This island was once inhabited by a religious, brave, sincere people, of plain uncorrupt manners, respecting inbred worth, rather than titles and appearances; defenders of liberty, lovers of their country, jealous of their own rights, and unwilling to infringe the rights of others; improvers of learning and useful arts; enemies to luxury, tender of other men's lives, and prodigal of their own; inferior in nothing to the old Greeks and Romans, and superior to each of those people in the perfections of the other. Such were our ancestors during their rise and greatness; but they degenerated, adopted epicurean notions, became venal, corrupt, injurious, which occasioned their final ruin."

There is, however, still an innate strength in our constitution, peculiar to ourselves. We are favoured with advantages which no other country ever equally enjoyed; and therefore it will be our own fault, if we do not long continue a happy and flourishing people.

With respect to dress, the custom in England, before the reign of George III. was, to copy the fashions of the French; but so much attention is at present paid to that article of luxury, that the English bid fair, to be themselves the dictators of dress to all Europe, at least with regard to elegance, neatness, and richness of attire. Persons of quality and fortune often appear in flowered and plain velvets, brocades, and embroidery. The ladies in the most costly brocades, satins, and silks, adorned with the finest laces, and glittering with a profusion of jewels. At other times the gentlemen are dressed in a plain, neat suit of superfine cloth, and the best linen. This is indeed the common dress of all persons in general, at least, of those of any property or pretensions to rank above

the vulgar. The

The meanest tradesman appears credit-
ably dressed on Sundays, and most of the common
beggar, are decent in their apparel. The clergyman
is distinguished by his gown and cassock, or a frock
of grey cloth and plain linen. The physicians in
general now dress like other gentlemen, having laid
aside the large tye-perrwig which formerly distin-
guished their profession, and often exposed them to
ridicule. Those who follow the sports of the field
are generally dressed in a light frock with metal but-
tons, a laced hat, a round bob wig, short jockey boots,
and buckskin breeches.

The diversions and pastimes of the English people
may be divided into those of the town, and those of the
country; and again subdivided into such as are peculiar
to the higher ranks of life, such as are practised by the
lower class of people, and such as are common to both.
The diversions of the town are operas, ridottos, maf-
terades, concerts of music, theatrical performances,
and card assemblies, for persons of fashion. The pas-
times of the country, peculiar to the same degree, are
horse-races, stag, fox, and hare hunting. The game
has been taken from the common people a great fund
of diversion, though without answering the selfish pur-
poses of the rich: for the farmers and country people
follow the game in their nests, which they dare not
sell with their gun. A spirit of gaming prevails with-
out violence at a horse-race, that one would imagine
the spectators were actually possessed. Hunting is
the sport of country gentlemen; and those whom the
world distinguish by the appellation of fox-hunters seem
to be infatuated with the diversion. The common
people have likewise their town and country pastimes,
which they enjoy with great eagerness. Among these
are number cock-fighting (that disgrace to humanity),
judgeling, wrestling, duck-hunting, bowls, skittles, or
nine-pins, archery, prison-bars, cricket, shuffle-board,
quoits, divers games of chance, and spectacles of va-
rious kinds, such as tumbling, balancing, vaulting,
leaps of legerdemain, bear and bull-baiting, aff races,
collections of wild beasts, music, dancing, drolls, pup-
pet-shews, and bell-ringing, a Gothic diversion, which
cannot be enjoyed without disturbing several parishes.

Christianity, according to Eusebius, was planted in
England by the apostles and their disciples, and this
country and our heathen ancestors are supposed to have
been visited by the apostle St. Paul, whose diligence,
zeal, and fortitude were abundant. After a long in-
terval of Popish ignorance and superstition, John Wick-
liffe, an Englishman, educated at Oxford in the reign
of Edward III. has the honour of being the first
person in Europe who publicly called in question, and
boldly refuted those erroneous doctrines which had
prevailed so many ages; since his time, the established
religion in England approaches nearer to the primitive
Christianity, being equally removed from superstition
and indelicacy in its worship, and as void of bigotry
as of licentiousness in its practice.

The constitution of the church is episcopal, and it
is governed by bishops, each of whom, as a temporal
baron, has a seat and vote in the House of Peers. The
benefices of the inferior clergy are now freehold;
but in many places their tythes are impropriated in
favour of the laity. The clergy of the church of
England, as to temporal matters, are at present in a
most flourishing situation, because the value of their
tythes increases with the improvements of lands, which
of late have been amazing in England. The govern-
ment of the church is vested in two archbishops, and
twenty-four bishops, besides the bishop of Sodor and
Man, who, not being possessed of an English barony,
does not sit in the house. The two archbishops are
those of Canterbury and York, who are both address'd
by the appellation of "Your Grace." The former is
the first peer of the realm, as well as metropolitan of
the English church. He takes precedence, next to the
royal family, of all dukes and officers of state. Be-
sides his own diocese, he has under him the bishops of
London, Winchester, Ely, Lincoln, Rochester, Litch-
field and Coventry, Hereford, Worcester; Bath and
Wells, Salisbury, Exeter, Chichester, Norwich, Glou-
cester, Oxford, Peterborough, Bristol; and, in Wales,
St. David's, Landaff, St. Asaph, and Bangor. The
yearly revenue of Canterbury is 2682l. 12s. 2d. of
York, 1610l. of London, 2000l. of Durham, 1821l.
1s. 3d. of Winchester, 3124l. 12s. 8d. of Ely, 2134l.
18s. 6d. of Salisbury, 1383l. 5s. of Worcester, 929l.
13s. 3d. of Landaff, 894l. 18s. 1d. of Norwich,
834l. 11s. 7d. of Hereford, 768l. 11s. of Chichester,
677l. 1s. 3d. The rest are from 559l. and upwards, to
131l. and upwards. The bishoprics of London, Dur-
ham, and Winchester, take precedence of all others,
and the rest according to the seniority of their con-
secrations.

Other ministers of the church are deans, arch-
deacons, rectors, or vicars, deacons and curates.

There is a dean and chapter in every cathedral
church. The dean is installed by virtue of the king's
letters-patent; and the chapter consists of a certain
number of prebends.

The state of the inferior part of the clergy, is truly
melancholy, and worthy the consideration of our legi-
slature. The abolishment of dispensations would be
striking at the root of this evil; for thereby a few,
who have interest, are rendered capable of holding
two or three exceeding good livings, besides perhaps a
deanery or prebend. But as it is impossible for one
person to do the duty of three or four, curates are
hired to officiate, whose stipends are so small, that,
far from allowing them to keep up the dignity of
clergymen, they are scarcely enabled to procure the
conveniences of life for their families. This calls
loudly for redress.

Certain privileges are granted to the clergy of Eng-
land, of which the laity are deprived. An ecclesiastic
is totally exempt from serving parish offices; he pays

no toll for his goods in either fair or market; and is likewise discharged from customs, unless he deals largely: he is not to be disturbed or molested in the execution of his function; he is not to be fined or amerced according to his spiritual, but according to his temporal revenues; he is not obliged to serve in war, nor in the courts lect, nor bound to follow the hue and cry; and if a hundred be sued for a robbery, and is taxed to make good the damage, he is to pay no part of the contribution; nor is he affected for watching or warding, or mending the highways.

The convocation is the highest ecclesiastical court; the clergy formerly had the great power in this court, which was always summoned at the meeting of parliament, and continued sitting during the whole session; but having filled the nation with disorder by their violent debates, they were dissolved by royal prerogative in the beginning of the reign of George I. and have not been allowed to sit long enough to transact any business since that period. The convocation is divided into two houses; the higher house, in the province of Canterbury, consisting of twenty-two prelates, the archbishop being president; the lower house is composed of all the deans, archdeacons, and proctors, amounting in all to 166. The archbishop of York may hold a convocation of his own province in the same manner, and, by means of a regular correspondence with the other, debate and determine the same questions which are canvassed in the synod of Canterbury; though the transactions and determinations of one convocation is not determined by those of the other.

The next is the court of arches, so called from the arched church and tower of St. Mary-le-Bow, in London, where it was formerly held; it is the most ancient consistory of the province of Canterbury, and to this, all appeals from the judgment of inferior ecclesiastical courts are usually made. The judge, who is distinguished by the appellation of dean of the arches, sits without any assessors, and determines causes without a jury. He takes cognizance of appeals, in ecclesiastical matters, within the province of Canterbury; and all processes are returnable before him in the common hall of Doctors-Commons. The pleaders and solicitors of this court are called advocates and proctors; the former are doctors of the civil law, and, by the statutes of the court, the pleadings and petitions ought to be both in Latin.

Other ecclesiastical courts are, the court of audience, which has nearly the same authority with the preceding, and to this the archbishop's chancery was formerly joined: the prerogative court, wherein wills are proved, and administrations granted: the court of peculiars, relating to certain parishes, which have a jurisdiction among themselves, for the probate of wills, and are therefore exempt from the bishop's courts: and the court of delegates, which receives its name from consisting of commissioners delegated or ap-

pointed by the royal commission; but it is no standing court. Bishops, archdeacons, and the dean and chapter of every cathedral, have each their respective courts: those of the former are called consistory courts.

The Dissenters from the established religion in England are so numerous, that it would be difficult to mention even the several appellations whereby they distinguish themselves: but the principal sects are the Puritans, or Presbyterians; the Baptists; the Quakers and the Methodists.

The Puritans were originally a sect of rigid Calvinists, who made their first appearance in the reign of queen Elizabeth, when some bishops, many of the laity of distinction, and numbers of the common people, having joined them, the church and state bore the alarm, and endeavoured, in vain, to suppress this schism; for, like all other religious persecutions, it only served to strengthen the evil it wished to remove. At first these Dissenters had no distinct form either of discipline or worship, but every preacher was left to his own discretion. They affirmed, that their scheme of religion was more pure and unexceptionable than any other; and opposed the liturgy and authority of the bishops with great force of argument, alleging that these differed but little from the church of Rome, and they thought themselves obliged to conform to the plan of Geneva. After some time, Cartwright, one of their divines, drew up a body of discipline for them, and this book was esteemed the standard of their public worship. This sect is now better known by the different appellations of Independents and Presbyterians; of whom the latter form the established religion of Scotland, where their tenets have been more particularly considered.

The Baptists, or Anabaptists, sprung up in Germany about the year 1521, and were formerly accused of many inconsistencies and indecencies; but by their confession of faith, published in 1689, they confuted all those aspersions, and plainly proved that they did not differ in any material article from other Protestant Dissenters, except in the single one of baptism, which they maintain infants are incapable of receiving; and when they administer this sacrament, which is only to adults, they plunge them entirely under the water.

The Methodists may properly be distinguished into two classes, the followers of the late Mr. George Whitefield, and those of Mr. Wesley. They received the appellation of Methodists, at the University of Oxford, about the year 1736, from a peculiar method they had adopted there, of living in a very precise, abstemious way, and being much addicted to praying together, reading and expounding the Scriptures, and fasting at particular times appointed by the church. Mr. George Whitefield and his colleagues professed themselves divines of the church of England, and it must be confessed that their doctrines nearly resembled those of that church; but their main plan was, to revive primitive Christianity, and recommend it, both in

and practice, to persons of all denominations.
Their preaching, for a considerable time after their
settling out, was attended with very good effects,
reforming the morals of many of the lower classes of
people: though the zeal of this sect has of late years
very much abated. Mr. Whitefield uttered his discourses
with great fervour and devotion; he did not strictly
adhere to the form of ecclesiastical worship; and, as
he thought that prayers, whether taken from a com-
mon-prayer-book, or poured forth extempore, was a
matter of indifference, he accordingly made use of
both these methods. His followers are rigid ob-
servers of the doctrines of the church of England, and
regard themselves to be Calvinists. But this sect of
Methodists is now divided, some of them acknow-
ledging Mr. Whitefield, and others Mr. John Wesley, or
their leader. Mr. Wesley and his followers held the
Arminian doctrines, in opposition to the Calvinistic,
particularly those of election, predestination, final per-
severance, &c. but they appear still to retain some of
the Calvinistical. Mr. Whitefield died in America,
1770; but the places of worship erected by him
in London, are still frequented by persons of the
same principles, and they profess a great respect for
his memory. Mr. Wesley died in March 1791, and in
his life-time had erected a very large place of worship
near Moorfields, and had under him a considerable
number of subordinate preachers, who appeared to sub-
mit to their leader very implicitly, and who likewise
propagated his opinions, and made proselytes through-
out the kingdom, with great industry. There is also a
small class of Methodists, many years patronized by
the late Countess of Huntingdon: these hold the same
opinions with the followers of Mr. Whitefield. Their
principal chapel near London is in Spa-Fields, where the
church of England service, with some few omissions,
is used. There are some other sects of Methodists in
London, such as Sandemonians, Antinomians, Sweden-
borgians, &c. but their absurd doctrines render them
unworthy notice.

The Quakers were so denominated from certain un-
usual tremblings and convulsions, with which they
were seized at their first meetings. This sect was
founded, during the Interregnum, by George Fox, a
wool-maker, who, being naturally of a melancholy
disposition, and meditating much on the Scriptures,
at length persuaded himself he saw visions, in the
consequence of which he set up for a preacher. In his
doctrine he proposed but few articles of faith; in-
cluding chiefly on moral virtue, mutual charity, the
love of God, and a deep attention to the inward
motions and secret operations of the Holy Spirit, whose
directions were to be waited for in the most profound
silence. The novelty of this doctrine, the genius of
the times, and the great appearance of piety and de-
votion in Fox, soon gained him many disciples, who
were at first guilty of some extravagancies, running
about the streets, and interrupting the ministers
in the execution of their office, for which many of

them were imprisoned. George Naylor, one of their
fraternity, was tried, and whipped for blasphemy, and
excommunicated by his brethren. In time, however,
this fanaticism wore off, and the sect settled into a
regular body, the members of which profess great
austerity of behaviour, a singular probity and upright-
ness in their dealings, an affectation of silence, a great
frugality at their tables, and a remarkable plainness
and simplicity in their dress.

Robert Barclay, a Quaker, in an excellent apology
which he addressed to Charles II. has explained the
system of this religion, in fifteen theses; by which we
find the principal doctrines held by these people are,
that "God has given to all men, without exception,
supernatural light, which being obeyed can save them;
and that this light is Christ, the true light, which
lighteth every man that cometh into the world;" that
"the Scriptures were indeed given by inspiration, and
are preferable to all other writings in the world; but
that they are no more than a secondary rule of faith
and practice, in subordination to the light or Spirit of
God, which is the primary rule;" that "immediate
revelation is not ceased, a measure of the Spirit being
given to every one to profit withal;" that "in divine
worship men and women ought to wait in silence the
motions of the Spirit, before they open their mouths
in prayer to God, or in testimony to the people;"
that "all superstitions and ceremonies, of mere hu-
man institution, in religion, ought to be laid aside; as
also, in civil society, the saluting one another by pul-
ling off the hat, bowing, or the like, and the saying
you instead of *thou* to a single person;" lastly, that
"men and women ought to be plain and grave in
their apparel, sober and just in their whole conver-
sation, at a word in all their dealings, and not to
swear, fight, or bear any carnal weapons."

The Quakers entirely set aside baptism and the
Lord's supper, affirming that "they are Jewish prac-
tices, used as types, or significations of something fu-
ture; which being accomplished in Christ, the figures
ought no longer to be used." They reject all ministry
and ordinances; and any one without distinction of
quality or sex, who is of a sober life, and believes
himself to be moved thereto by the Spirit, is allowed
to preach or prophesy in their meetings. It is dif-
ficult to say what their opinions are in regard to their
doctrinal points of Christianity, though it is said they
acknowledge the three persons that bear record in
heaven, but reject the school-terms of Trinity, Hypo-
stasis, &c. as unscriptural. On the other hand, they
have been charged with denying the incarnation, hu-
manity, and even divinity of Christ; and with alle-
gorizing away the crucifixion, resurrection, and ascen-
sion, of our Saviour. But however this be, nothing
can be better regulated than the assemblies of the
Quakers, of which there are monthly, quarterly,
yearly, and second days meetings; also meetings of
sufferings, and in these the affairs of the whole com-
munity are managed.

The two first of these assemblies are held in their respective counties; to which deputies are sent from particular meetings. Here inquiry is made into the state of each meeting; what persons have violated the rules of the community, who pay tythes, which they esteem repugnant to Christianity, or church-rates; and who suffer for non-payment of either; and accordingly they proceed to approve or censure. Here they excommunicate members, and receive them again into their communion; and here exact registers are kept of all their proceedings. From these meetings, appeals lie to their yearly assemblies, which are always held in London, and consist of three orders or classes, viz. representatives sent from the quarterly-meetings; correspondents for the several counties and foreign countries; and ministers, or preachers. Hither all accounts of what has been transacted in all the monthly and quarterly-meetings are transmitted. Here measures are concerted, and directions given as to the behaviour of their brethren with regard to tythes, rates, &c. and here they compose differences; make provision for their poor; audit the public accounts, and give proper instructions to the deputies, to be observed at their return; and from hence a yearly epistle of admonition is dispatched, to be read in all the monthly and quarterly-meetings: the admonitions contained in these epistles are worthy imitation by the most civilized government. The second day's meeting is a standing committee, consisting of the principal preachers in and near the city, who meet every Monday to settle particular cases and exigencies, which happen between the yearly-meetings. The meeting of sufferings is likewise held every week, and consists of the correspondents for each county. Its business is, to receive and examine complaints from such as have suffered for non-payment of tythes and church-rates, and to procure them relief, either by sending them money, for which they have a settled fund, or by soliciting their cause, or both. Their remarkable charity towards each other is worthy the imitation of those who pride themselves on being more enlightened.

Of late years, the members of this sect have omitted vast numbers of particularities, especially in their dress and stiffness of behaviour, which renders them much more agreeable to the nations among whom they reside; for there are few, when divested of these forms, but are very convertible, and numbers extremely sensible and polite.

After all, the Quakers are universally allowed to be most excellent members of the community, the strictness of their morality makes amends for the oddities of their principles; and the simplicity of their living for the wildness of their opinions. Their oeconomy is admirable; for though none of them pretend to any coercive power, yet their censures are submitted to as implicitly as if they were Romish bigots under an Inquisition. The highest punishment is a kind of excommunication, but which is taken off upon re-

pentance and amendment, and the party is readmitted into all the privileges of their body. The gross sense for which this sect is remarkable, renders their leaders more respectable than those which royalty or power appoint over other communities. This, with the mildness of their behaviour, sobriety, and good industry, have raised them high in the esteem of the legislature, which has even indulged them by admitting of their affirmation, instead of an oath, in civil causes in the courts of justice. Their number in England cannot easily be ascertained. In the beginning of the late reign, they were estimated at 50,000; and I am apt to believe they are increased, though that increase is not perceptible, by their laying aside most of their singularities. See further concerning this people, in our description of Pennsylvania in America, p. 380, 384.

The Roman Catholic religion is still professed by many Roman Catholic families in England, and its exercise under very mild and gentle restrictions. Some of the penal laws against them have been lately repealed, and the Papists now seem to be convinced, that a change of government, instead of bettering, would hurt their situation, because it would increase the jealousy of the legislature; which must expose them daily to greater burdens and heavier penalties: the sensible consideration has of late made the Roman Catholics to appear as dutiful and zealous subjects to any his majesty has.

With respect to free-thinkers, deists, or infidels, there is abundant reason to think that this class of men is much more numerous in some Popish countries than in England. Christianity is so much obscured and disfigured by the fopperies and superstitions of the Romish church, that men who think freely are naturally apt to be prejudiced against it, when they see it in a disadvantageous form; and this appears to be in fact very much the case abroad. But in England, where men have every opportunity of seeing it exhibited in a more rational manner, they have less cause to be prejudiced against it, and therefore are more ready to enter into an examination of the evidence against it. The writings of the Deists against Christianity, instead of being any disservice to it, have, on the contrary, caused the arguments in its favour to be used with greater force and clearness, and have been the means of producing such clear defences of it, as all the acuteness of modern infidels has not been able to overthrow or confute.

The English language is compounded of several others, and more particularly of Saxon, Celtic, French, and Latin, but the former predominate. It enjoys all the properties, without many of the defects, of other European languages. It is more energetic, manly, and expressive, than either the French or Italian; more copious than the Spanish, and more eloquent than the German, or the other northern tongues. nouncing

announcing it; but this chiefly affects the lowest class of the people. Persons of fortune and education in England, also commonly either speak or understand the French, and many of them the Italian and Spanish; the foreign nations find great difficulty to understand the few English, who speak Latin, which may perhaps be owing to their not giving the vowels their proper tone, that of the English and French, &c. being very different in this respect.

England may be deemed the seat of the Muses. Alfred the Great cultivated literature at a period when barbarism and ignorance overspread the rest of Europe; there has there, since his time, been wanting a succession of learned men, who have distinguished themselves by their writings or studies. The industrious and very learned Leland was the first who published a short collection of those learned persons who preceded the reign of his master Henry VIII. among whom he has inserted several of the blood royal of both sexes. Roger Bacon, who lived under Henry III. and died at Oxford about the year 1294, wrote several treatises upon grammar, mathematics, physics, the flux and reflux of the British sea, optics, geography, astronomy, chronology, chemistry, logic, metaphysics, ethics, medicine, theology, philology, and upon the impediments of knowledge. The memory of some noble and royal English authors, who have done honour to learning and the Muses, have been preserved by the Hon. Mr. Walpole. Since the Reformation, England resembles a galaxy of literature; and even cardinal Wolsey, though otherwise a dangerous and profligate minister, greatly contributed to the revival of classical learning in England, and, by his example and encouragement, laid the foundation of the polite arts. Edward VI. during his short reign, did a great deal towards promoting learning in general, by encouraging learned foreigners to settle in England, and, had he lived, would no doubt have cultivated the most useful parts of learning. But during the bloody, bigotted reign of queen Mary, learning, as well as liberty, suffered an almost total eclipse in England. Elizabeth, her sister, who was herself a learned princess, advanced many persons of consummate abilities to high ranks both in church and state. She was, however, too parsimonious respecting those celebrated writers of her time, whose works she admired; but her want of liberality was nobly supplied by her favourite, the earl of Essex, the politest scholar of his age, and his friend, the earl of Southampton, who were generous patrons of genius. Though James I. was no great author, yet his example had a considerable effect upon his subjects; for in his reign flourished those great masters of polemic divinity, whose works are almost inexhaustible mines of knowledge. The second Bacon was by him created viscount Verulam, and lord high chancellor of England; he was likewise the patron of Camden, and other historians, as well as antiquaries; and though he had a very pedantic taste himself, yet English learning,

it must be allowed, is under some obligation to this prince. Charles I. had a taste for the polite arts, especially sculpture, painting, and architecture; he was the patron of Rubens, Vandyke, Inigo Jones, and other eminent artists; and his favourite the duke of Buckingham imitated him in that respect. The earl of Arundel, the great Mæcenās of that age, may stand upon a footing, as to the encouragement he gave to literature, with the greatest of the Medicean princes. Many learned men found their situations so easy under Cromwell; that they followed their studies, to the vast benefit of every branch of learning. Usher, Walter, Willis, Harrington, Wilkins, and many other great names, were unmolested even in those times of distraction. Charles II. was a great promoter of natural knowledge, especially by the institution of the Royal Society. He loved painting and poetry; and though irreligious himself, yet England never abounded more with learned and able divines than in his reign. The incomparable *Paradise Lost*; by Milton, was published in his reign, and, though not read or attended to in proportion to its merit, was far from being disregarded so much as has been commonly supposed: Boyle, Halley, Hooke, Sydenham, Harvey, Temple, Tillotson, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway, flourished in his reign. To these we may add that celebrated architect, philosopher, and mechanic; Sir Christopher Wren; also several excellent English painters. The reign of James II. is chiefly distinguished, in the province of literature by several excellent compositions published by the English divines against Popery. Newton and Locke adorned the reign of William III. By the improvements which learning, and all the polite arts, received under the auspices of queen Anne, her court was put at least on a footing with that of Louis XIV. in its most splendid days. Addison, Prior, Pope, Swift, Bolingbroke, Shaftesbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers, both in prose and verse, need but to be mentioned to be admired: natural and moral philosophy kept pace with the polite arts, and even religious and political disputes contributed to the advancement of learning. Erudition was patronized by the ministers of George I. and the reign of his son, George II. yielded to none of the preceding in the numbers of learned and ingenious men it produced. After the rebellion in 1745, in the administration of Mr. Pelham, men of genius began to taste the royal bounty; since which period, a great progress has been made in the polite arts in England. The Royal Academy has been instituted, some very able artists have arisen, and the annual public exhibitions of painting and sculpture have been extremely favourable to the arts, by promoting a spirit of emulation, and exciting a greater attention to works of genius of this kind among the public in general: but notwithstanding these favourable circumstances, the fine arts have been far from meeting with

with that public patronage to which they have so just a claim.

The English also excel in what we call the learned professions. Their courts of justice are adorned with greater abilities and virtues, perhaps, than those which any other country can boast of: a remarkable instance of which occurs in the appointments for the last 200 years of their lord chancellors, who hold the highest and the most uncontrollable judicial seat in the kingdom, and yet it is acknowledged by all parties, that, during that time, their bench has remained unpolluted by corruption, or partial affections. Even Jefferies, infernal as he was in his politics, never was accused of partiality in the causes which came before him as chancellor. It must, however, be acknowledged, that neither pulpit nor bar eloquence have been sufficiently studied in England; but this is owing to the genius of the people, and their laws. The sermons of their divines are often learned, and many of them sound, as to the practical and doctrinal part; for the many religious sects in England require to be opposed, rather by reasoning than eloquence. The latter is not incompatible with the former, as some even of the clergy have boldly asserted, since true eloquence is the first and fairest handmaid of argumentation; and indeed, the preachers of the English church are not destitute of the graces of elocution; so far from that, no clergy in the world can equal them in purity and perspicuity of language; though I think, if they consulted more than they do the powers of elocution, they would preach with more effect.

On account of the peculiar cast of the English laws, the several pleadings at the bar do not require many of the flowers of speech: the lawyers of this country, however, though they deal little in Ciceronian eloquence, are well versed in rhetoric and reasoning. No nation in the world can produce so many examples of true eloquence as the English senate in its two houses—witness the fine speeches made by both parties in parliament in the reign of Charles I. and those that have been printed since the accession of the present family.

Medicine and surgery, botany, anatomy, chemistry, and all the arts or studies for preserving life, have been carried to a great degree of perfection by the English. The same may be said of music, and theatrical exhibitions. Even agriculture and mechanism are now reduced in England to sciences, and that too without any public encouragement but such as is given by private noblemen and gentlemen, who associate themselves for that purpose. The English hitherto stand unrivalled in ship-building, clock-work, and the various branches of cutlery.

The two universities of Oxford and Cambridge are institutions not to be matched in the world, and were respected even amidst the barbarous rage of civil war. These seminaries of learning can boast of more persons eminent by their erudition, than any other in Europe; and a degree conferred by either is, in foreign coun-

tries, esteemed more honourable than the same degree obtained by any university in Christendom. Their magnificent buildings rival, in splendor and architecture, the most superb royal edifices; the rich endowment, the liberal ease and tranquillity enjoyed by those who inhabit them, surpass all the ideas which foreigners who visit them, conceive of literary societies. Each university sends two members to the British parliament, and their chancellors and officers have a civil jurisdiction over their students, the better to secure their independency. Their colleges, in their revenues and buildings, exceed those of many other universities.

In Oxford, there are twenty colleges, and five halls: the former are very liberally endowed, but in the latter the students chiefly maintain themselves. This university is supposed to have been a considerable place even in the time of the Romans. Alfred built three colleges at Oxford; one for divinity, another for philosophy, and a third for grammar. The number of officers, fellows, and scholars, maintained at present by the revenues of this university, is about 1000; and the number of such scholars as live at their own charge, is usually about 2000; there are, besides, a great number of inferior officers and servants belonging to the several colleges and halls. There are four terms every year for public exercises, lectures, and dissertations, and set days and hours when the professors of every faculty read their lectures; and in some of the colleges are public lectures, to which all persons are admitted. The liberal foundations of the respective colleges have encouraged persons of extraordinary merit to embrace the academical life.

The university of Oxford consists of twenty colleges, and five halls. The colleges are, 1. University, situated near, or on the spot where the colleges or halls which were erected by king Alfred stood: the present structure was begun in 1634, at the expence of Mr. Charles Greenwood, carried on by Sir Simon Benner, and completed by Dr. John Radcliff. 2. Baliol, founded by Sir John de Baliol, about 1269. 3. Merton, founded by Walter de Merton, bishop of Rochester, and high-chancellor of England, in 1267. 4. Exeter, founded in 1316 by Walter Stapleton, bishop of Exeter, and lord-treasurer of England. 5. Oriel, founded in 1324 by Edward II. 6. Queen's, founded by Robert Eglesfield, chaplain to queen Philippa, consort to Edward III. and at her desire. 7. New College, founded in 1386 by William of Wykeham, bishop of Winchester, but finished in 1475 by Thomas de Rotherham, archbishop of York, and lord high-chancellor. 8. All Souls, founded in 1437 by Henry Chichely, archbishop of Canterbury. 9. Magdalen, founded in 1458 by William Patten, alias Wainfleet, bishop of Winchester, and lord-chancellor. 10. Brazen-Nose, founded in 1516 by William Smith, bishop of Lincoln. 11. Corpus Christi, founded in 1516 by Richard Fox, bishop of Winchester. 12. than the same degree of freedom. Their magnificence and architecture are rich endowments enjoyed by those who as which foreigners and many societies. Each of the British parliament have a civil jurisdiction to secure their revenues and other universities. Colleges, and five halls, were founded, but in the latter times. This university has a considerable place even in the built three colleges for philosophy, and a number of officers, selected by the reverend; and the number of charges, is usually a great number of terms every year for examinations, and set days every faculty read in colleges are public and limited. The libraries have encouraged to embrace the gifts of twenty colleges, are, 1. University, where the colleges of Alfred stood; the expense of which was by Sir Simon Radcliff. 2. Balliol, about 1263. 3. Merton, bishop of Rossland, in 1267. 4. St. Stapleton, bishop of Orford, in 1270. 5. Queen's, founded by Philippa, consort of Edward I. 6. New College, founded by Wykeham, bishop of Winchester, in 1362. 7. Thomas Becket, lord high-chancellor, in 1379. 8. Magdalen, founded by William Wainfleet, bishop of Lincoln, in 1428. 9. St. John's, founded in 1526 by Cardinal Beaufort. 10. Christ Church, founded in 1525, but completed

completed by others, and is now the cathedral of the diocese. 13. Trinity, founded by Sir Thomas Pope, soon after the Reformation. 14. St. John Baptist, founded in 1555 by Sir Thomas White, lord-mayor of London. 15. Jesus, begun by Dr. Hugh Price, archdeacon of Rochester, and appropriated chiefly to the Welles. 16. Wadham, so called from its founder Nicholas Wadham, of Somersetshire, Esq. It was begun by him in 1609, but finished after his death, in 1613, by his lady. 17. Pembroke, so called in honour of the first earl of Pembroke, then lord high-chancellor; it was founded in 1624 by Thomas Telfdale, Esq. and Richard Whitwicke, B. D. 18. Worcester, erected into a college by Sir Thomas Cooke, of Ashley in Worcester-shire. 19. Lincoln, founded by two bishops of Lincoln, John Hertiord, formerly Hurl-Hall, but now erected into a college, by patent under the great seal in 1740.

There are libraries for the use of all the colleges; besides which, there are two public libraries, the university library, and the Radcliffe library. The university library is usually called the Bodleian library, from the name of Thomas Bodley, its principal founder. It is a large lofty structure, in the form of a Roman H, and is said to contain the greatest number of books of any library in Europe, except perhaps the Vatican. The original library has been prodigiously increased by many large and valuable collections of Greek and oriental manuscripts, as well as other choice and curious books. The Radcliffe library is a sumptuous pile of building, and was built at the sole expence of that eminent physician, Dr. John Radcliffe, who bequeathed 40,000*l.* for this purpose.

The theatre of Oxford is also a very magnificent structure, which was erected by Sir Christopher Wren, at the expence of archbishop Sheldon. In this edifice are preserved the public acts of the university; and when the theatre is properly filled, it makes a most august appearance; the vice-chancellor being seated in the centre of the semi-circular part, the noblemen and doctors on his right and left-hand, the proctors and curators in their robes, the masters of arts, bachelors, and under-graduates, in their respective habits and places, together with strangers of both sexes.

The university of Cambridge consists of sixteen colleges, four of which are distinguished by the name of halls, though the privileges of both are in every respect the same. These colleges are, 1. Peter-House, founded by Hugh Balsham, prior of Ely, in 1257, who was afterwards bishop of that see. 2. Clare-Hall, founded in 1340 by Richard Badew, and lady Elizabeth Clare, countess of Ulster. 3. Pembroke-Hall, founded in 1343 by Mary de St. Paulo, countess of Pembroke. 4. St. Bennet's, or Corpus Christi, founded in 1344 by the united guilds, or fraternities, of Corpus Christi and the Blessed Virgin. 5. Trinity-Hall, founded about the year 1548 by William Bateman, bishop of Norwich. 6. Gonvil and Caius, founded by Edmund de Gonvil in 1448, completed

by bishop Bateman, and additionally endowed, 600 years after, by John Caius, a physician. 7. King's College, founded in 1451 by Henry VI. and completed by his successors. 8. Queen's College, founded in 1448 by Margaret of Anjou, consort of Henry VI. but finished by Elizabeth, wife to Edward IV. 9. Catherine-Hall, founded in 1475 by Richard Woodlark. 10. Jesus College, founded in 1497 by John Alcock, bishop of Ely, in the reign of Henry VII. 11. Christ's College, founded in 1506 by lady Margaret, countess of Richmond, mother to Henry VII. 12. St. John's College, founded in 1511 by the same lady. 13. Magdalen College, founded in 1519 by Edward Stafford, duke of Buckingham, and in 1544 patronized by Thomas Audley, baron of Walden, and lord high-chancellor in the reign of Henry VIII. 14. Trinity College, founded in 1546 by Henry VII. 15. Emanuel College, founded in 1584 by Sir Walter Mildmay. 16. Sidney College, founded by virtue of the will of lady Frances Sidney, countess of Sussex, by Thomas Radcliff, earl of Sussex, in 1588.

In the university of Cambridge there are 400 fellows, and 666 scholars, with about 236 officers and servants of various kinds, who are maintained upon the foundation. These, however, are not all the students of the university; there are also two sorts of students called pensioners, the greater and the less; the greater pensioners are the sons of the nobility, and of gentlemen of large fortunes, and are called fellow-commoners; because, though they are scholars, they dine with the fellows: the lesser pensioners dine with the scholars that are on the foundation, but live at their own expence. There are also a considerable number of poor scholars, called sizars, who wait upon the fellows, scholars, and pensioners, by whom they are in a great degree maintained; but as the pensioners and sizars are in a state of perpetual fluctuation, their number cannot be ascertained.

Trinity-College library at Cambridge is a very magnificent structure; and in Corpus-Christi-College library is a valuable collection of ancient manuscripts, which were preserved at the dissolution of monasteries, and given to this college by archbishop Parker. The senate-house is also a most elegant edifice, executed entirely in the Corinthian order, and is said to have cost 16,000*l.*

It may be proper to insert here a piece of intelligence, respecting this university, transmitted to London in Nov. 1786. The writer observes, that

"The late Mr. Norris having left 9*l.* a year, for a medal and some books, as a premium for the best prose English essay on subjects appointed agreeable to the directions contained in his will, the Norrisian professor gives notice, that the subject for this present year (1786) is one of those mentioned by Mr. Norris, viz.

"The advantages of the knowledge revealed to mankind concerning the Holy Spirit."

"The essays are to be sent to one of the three stewards,

itwards, who are, the master of Trinity-College, the provost of King's-College, and the master of Caius-College, on or before the 10th day preceding the Sunday in passion week 1787, with the names of the respective writers, sealed up.

"Each candidate to be above 20 years of age, and under 30, must be, or have been, a student of the university, and must produce a certificate, under the hand of the professor, that he has attended twenty lectures in the course of some one year. That essay to which the prize shall be adjudged, must be published by the author within two months from the time of his receiving the medal and books. And any opinion advanced in the essay of a candidate for this prize, contrary (in the estimation of the appointed judges) to the articles of the church of England, with respect to our Saviour's divinity, and the personality of the Holy Spirit, is to disqualify such candidate."

There are three royal academies in England; the first is at Woolwich, established for the study of the military sciences and the mathematics, especially those branches which relate to the attack and defence of fortified places. The second royal academy is at Portsmouth, established for the study of navigation, and the other sciences relative to maritime affairs. The third is called the royal academy of painting and sculpture, established by his majesty Geo. III. who has allotted apartments in Somerset-House for their residence. Besides these, there is a royal observatory erected on the summit of a steep eminence in Greenwich-Park by Charles II. who furnished it with the most accurate instruments necessary in astronomical observations. This observatory has been successively the residence of those celebrated astronomers, Mr. Flamsteed, Dr. Halley, and Dr. Bradley. From the first, the observatory took the name of Flamsteed-House, by which it is now commonly known, and now is, or lately was, in the possession of Mr. Nevil Maskelyne, astronomer to his majesty.

At the head of the institutions formed for the propagation of knowledge, is justly placed the royal society, which consists of a president, council, and fellows, incorporated by Charles II. and vested with various privileges and immunities, for the purpose of cultivating and improving natural knowledge. They are governed by a body of statutes, and hold weekly meetings for making experiments, discoursing on different subjects of natural philosophy, reading papers, receiving letters, and answering correspondents. This is the most famous institution of the kind in the world, and can boast of many illustrious members, whose writings have cast a glorious light on every branch of natural philosophy.

We may consider the antiquities of England under four heads, namely, British, Roman, Saxon, and Danish. Among the British antiquities, Stonehenge in Wiltshire is the chief. It is situated near the summit of a hill, and consists of the remains of two circular,

and two oval ranges of rough stones, having one common centre. The outer circle is 108 feet in diameter, and in its perfection consisted of thirty upright stones, of which there are seventeen still standing, and seven more lying upon the ground, some whole, and others in pieces. The upright stones are from eighteen to twenty feet high, from six to seven feet broad, and about three feet thick; and being placed at the distance of three and a half one from the other, and joined at top by imposts, or stones laid across, with mortises fitted to mortises in the uprights, for keeping them in their due position. Of the imposts, or cross-stones, there are six still standing, each of which is seven feet long, and about three feet and an half thick. The upright stones are slightly wrought with a chisel and somewhat tapered towards the top, but the imposts are quite plain. All the uprights are fixed in a kind of sockets, dug in a chalky soil, with small flints rammed in between the stone and the socket.

The inner circle, which never had any imposts, is somewhat more than eight feet from the inside to the outward one, and consisted originally of forty stones, the general proportions of which are, one half the dimensions of the uprights of the circle every way. Of the forty original stones which composed this circle, there are about nineteen left, and of those only eleven standing. The walk between these two circles is 21 feet in circumference; and from this walk the structure has a surprising and awful effect on the beholder.

At the distance of about nine feet from the inner circle, is the outer oval range, which is supposed to be the principal part of the work, and by most writers is called the cell, and the adytum. The stones that compose it are stupendous, some of them measuring thirty feet in height. This range consists of five compages or trilithons, as they are sometimes called, being formed of two uprights, with an impost at the top like the outer circle; and of these compages three are entire, but two somewhat decayed. The inner oval is composed of twenty stones, each about six feet high; and near the eastern extremity of this oval is a stone of coarse blue marble, about sixteen feet long, and four feet broad, which lies flat on the ground, is somewhat pressed into it, and is supposed to have been an altar.

This work is enclosed by a deep trench, near thirty feet broad, and upwards of an hundred feet from the outward circle. Over this trench there are three entrances, the most considerable of which faces the north-east. At each entrance, on the outside of the trench, there seems to have been two huge stones set up in the manner of a gate; and parallel to these, on the inside, two other stones, of a smaller size. The whole number of stones of which this structure consisted, is computed to be just 140.

The rude magnitude of Stonehenge has rendered it the admiration of all ages; and as the enormous stones which compose it appear too big for hand-carriage, and as Salisbury-Plain, for many miles round

ance affords any stones at all, it has been the opinion
of some antiquaries, that these stones are artificial, and
were made on the spot; and they are inclined to this
opinion, from a persuasion that the ancients had the
art of making stones with sand, and a strong lime, or
cement; but most authors are agreed, that those stones
are all natural, and that they were brought from a
quarry of stones, called the grey wethers, on Marlbo-
rough Downs, near the town of that name, at the
distance of fifteen or sixteen miles from Stonehenge.

The use and origin of this work have been the sub-
jects of various conjectures and debates; and it is an
unfortunate circumstance, that a tablet of tin, with an
inscription, which was found here in the reign of
Henry the Eighth, and might probably have set these
opinions in a clear light, was not preserved; for as the
characters were not then understood by such as were
consulted upon the occasion, the plate was destroyed,
or, at least, thrown by and lost. The common tra-
dition is, that Stonehenge was built by Ambrosius
Aurelianus. Others will have it to be a funeral mo-
nument, raised to the memory of some brave com-
mander, perhaps Hengist, the Saxon general; but this
structure is probably more ancient than the Saxon
times. Somner, in his Antiquities of Britain, con-
jectures it to have been a work of the Phœnicians;
and the famous Inigo Jones, in a treatise called Stone-
henge Restored, attempts to prove that it was a temple
of the Tuscan order, built by the Romans, and dedi-
cated to the god Coelum, or Terminus, in which he
is confirmed by its having been open at top. Dr.
Charleston, physician in ordinary to Charles the Sec-
ond, wrote a treatise called, Stonehenge restored to
the Danes, attempting to prove that this was a Danish
monument, erected either for a burial-place, as a tro-
phy for some victory, or for the election and corona-
tion of their kings. Soon after the publication of Dr.
Charleston's treatise, Mr. Webb, son-in-law to Inigo
Jones, published a vindication of the opinions of his
father-in-law upon this subject.

Antiquaries have agreed, that it was an ancient
temple of the Druids, built, as Dr. Stukely thinks,
before the Belgæ came to Britain, and not long after
Cambyses invaded Egypt, where he committed such
horrid outrages among the priests, and inhabitants in
general, that they dispersed themselves to all quarters
of the world, and some of them, no doubt, came
into Britain. At this time, the doctor conjectures,
the Egyptians introduced their arts, learning, and reli-
gion, among the Druids, and probably had a hand
in this very work, being the only structure of the Druids
where the stones are chiseled, all their other works
consisting of rude stones, untouched by any tool, after
the Patriarchal and Hebrew mode. He thinks such a
transmigration of the Egyptians at that time the more pro-
bable, because then the Phœnician trade was at its height,
which afforded a ready conveyance into this country.

Around this supposed temple, there are a great num-

ber of barrows, or monumental heaps of earth, thrown
up in the form of a bell, and each enclosed with a
trench, from 105 to 176 feet in diameter. These
barrows extend to a considerable distance from Stone-
henge; but they are so placed as to be all in view of
the temple. In such barrows as have been opened,
skeletons, or the remains of burnt bones, have been
found. In one of them was an urn, containing ashes,
some bones, and other matters, which the funeral pile
had not consumed. By the collar-bone, and one of
the jaw-bones, which were still entire, it was judged
that the person there buried must have been about
fourteen years old; and from some female trinkets,
and the brass head of a javelin, it was conjectured to
have been a girl who had carried arms. The trink-
ets consisted of a great number of glass and amber
beads, of various shapes, sizes, and colours, together
with a sharp bodkin, round at one end, and square at
the other. In some barrows were found human bones,
together with those of horses, deer, dogs, and other
beasts and birds; in others, some bits of red and blue
marble, and chippings of the stones of the temple;
and in others were found a brass sword, and an ancient
brass instrument called a celt.

Great numbers of remarkable British antiquities are
found in Wales, particularly in the island of Angle-
sey, the last retreat of the Druids, and where a vast
number of them perished, many of whom were burnt
upon their own altars by Julius Agricola, the Roman
general. Vast numbers of the monuments of these
early ages also still subsist in Cornwall.

Some of these monuments consist of a large orbicu-
lar rock, supported by two other rocks, between
which there is a passage. This sort of monument in
Cornwall and Scilly, is commonly called Tolmen,
which in the Cornish language signifies the hole of
stone. These are supposed to have been deities in the
time of the Druids; and the most surprising monu-
ment of the kind now remaining, is at Men, between
Falmouth and Hellston; it consists of one vast oval
pebble, placed on the points of two natural rocks, so
that a man may creep under the incumbent rock, and
between its two supporters, through a passage of three
feet wide, and as many high; the longest diameter of
the incumbent stone, which points due north and south,
is thirty-three feet, the circumference is ninety-seven
feet, and sixty feet cross the middle; and it is thought
to be at least 750 tons weight. The whole surface
on the top is wrought into basons, and resembles an
imperfect or mutilated honeycomb. Most of these
reservoirs discharge their contents into two principal ba-
sons, one at the south, and the other at the north end
of the rock. There are two other tolmens of the
same structure, though not quite so large, in the Scilly-
Islands, one in St. Mary's-Island, at the bottom of
Salakee-Downs, and the other in the little island of
Northwethel, each of which is situated on the decli-
vity of a hill, near a large pile of rocks.

Another

Another kind of Druidical monuments is found at Karn Boscawen, near St. Burién, about five miles from Penzance. It consists of one large flat stone, one end of which rests upon the natural rock; and the other end on three large stones placed one on the other, in order to raise a proper support for the weight of the horizontal stone. Between this canopy and its supporters, there is an opening seven feet wide at the top, but closing gradually into an acute angle at the bottom. The top stone is too nicely supported to be the work of nature; and the opening underneath is supposed to have been designed for the seat of one of the chief priests among the Druids, from whence he might issue his edicts and decisions, his predictions and admissions to noviciates; and indeed the mind can scarcely frame to itself a scene more striking and awful than this, which consists of vast rocks on either side, the same tremendous appearance above and below fronting an immense ocean.

It was also the custom of the Druids to erect a very peculiar kind of monuments, called by the common people rocking-stones, or logan-stones, some of which are supposed to be natural, and others artificial. Near the southernmost point of the Land's End there is a promontory called Castle Treryn, which consists of three distinct piles of rocks. On the western side of the middle pile, near the top, lies a very large stone, so exactly poised, that the slightest touch will rock it; and yet the extremities of its base are at such a distance from each other, and so well secured, that it is impossible any lever, or indeed any force, however mechanically applied, could remove it from its present situation.

On a rock, adjoining to a place called the Giant's-Castle, in the island of St. Mary, in Scilly, is an area of a circular figure, 172 feet from north to south, and 138 from east to west; on the edges of the rock are nine vast stones still remaining, planted in a circular line; several others perfected the round, but from time to time have been removed. This has been a capital work of its kind; the floor is of one rock, the stones round the edges are of an extraordinary size, and a stone, possibly a rock-idol, makes one of the ring.

Some of these circles have altars in the centre, while the area of others is entirely open, and therefore seems never to have been appropriated to religion. There is one of the former on the island of Irelcaw, in Scilly. The altar consists of one rude stone nineteen feet long, and shelving on the top; round the bottom there is a hollow circular trench, thirty-six feet in diameter, and the brim of the trench formed with a line of rude and unequal stones. Another of these circles is on a high hill called Karn-Menelez, in the wilds of Wendron, not far from Penryn. The altar consists of four flat thin stones, placed one above another; the upper stone is circular, and its diameter nineteen feet; it has a circular trench at the bottom, the diameter of which is thirty-five feet and a half.

This seems to have been appropriated to religious ceremonies; but it must not however be supposed that all the monuments of a circular kind had no other use but those of religion, government, and election, the names by which some of them are still called; the singular construction of others; as well as the particular customs recorded in the history of the ancients will suggest some other very different uses to which monuments of this figure were applied. Where these stone enclosures are semicircular, and distinguished by seats and benches of like materials, there is no doubt but they were designed for the exhibition of plays. There are several theatres of this kind in different parts of Britain; but though this form is best adapted for the instruction and information of the audience, yet as they cannot be supposed, in these illiterate times, to have consulted the delight and instruction of the ear so much as the pleasure and entertainment of the eye, it is not so commonly met with among the remains of antiquity, as the amphitheatrical form, which, being more capacious, had generally the preference of the former. In these amphitheatres of stone, not broken as the circles of erect stones, the Britons usually assembled to hear plays performed, and to see sports and games. Of these circles there are a great number in Cornwall, where they are called *plan au guare*, which signifies a plain of sport and pasture. The benches round were generally of turf, but there are some at Cornwall, which are of stone. The most remarkable monument of this kind is near the church of St. Just, north-west of Penzance, not far from the Land's End; by the remains it seems to have been a work of more than usual labour and correctness. It was an exact circle of 126 feet diameter, the perpendicular height of the bank from the area within is now seven feet; but the height from the bottom of the ditch without, ten feet. The seats consist of six steps, fourteen inches wide, and a foot high, with one on the top, where the rampart is about seven feet high.

There are found in various parts of England another species of monuments erected by the ancient Britons, and called Cromlech, which signifies a crooked stone, the upper surface of the incumbent stone being generally convex, and the whole stone lying in an inclined or crooked position. The situation commonly chosen for this monument, is the summit of a hill, doubtless in order to render it as conspicuous as possible; sometimes it is mounted upon a barrow or tumulus, consisting either of stones or earth; sometimes it is placed in the middle of a circle of erect stones, in which case it is supposed to have been erected on some extraordinary occasion. The elevation of this monument is generally six, eight, or more feet from the ground, though some of them are quite enclosed, and, as it were, buried in the barrow. It is not easy to determine the nation, sect, or religion to which this monument ought to be ascribed, as cromlechs are found in Denmark, France, and Germany, in the

appropriated to religious purposes, however be supposed of any kind had no other use, and election of the name are still called; the same as well as the particular history of the ancient nations, different uses to which they were applied. Where they were used, and distinguished by their names, there is no doubt an exhibition of play, of a kind in different parts of the world is best adapted for the amusement of the eye, in these illiterate times, to the construction of the ear for the amusement of the eye, in the most common form, which, being the preference of the stone, not broken by the Britons usually used, and to see sports and games are a great number in the *plan au guare*, which is the case. The benches are not there are some at the church of St. Julienne from the Land's-end have been a work of correctness. parts of England noted by the ancient British signifies a crooked incumbent stone being the stone lying in an inclined situation commonly the summit of a hill, conspicuous as possible; a barrow or tumulus, earth; sometimes it is a pile of erect stones, in which have been erected on some elevation of this monument more feet from the ground quite enclosed, and so on. It is not easy to determine to which this word, as cromlechs are called in Germany, in the islands

islands in the Mediterranean-Sea, in Ireland, Britain, and the British isles; they are therefore supposed to be Celtic, and are doubtless very ancient, as appears from their simplicity. But however this be, they are sepulchral monuments, as human skeletons, single bones, &c. have been found under several of them.

The Roman antiquities in England consist of a great variety of particulars, as altars, monumental inscriptions, tessellated pavements, baths, camps, military ways, fortifications, arms, coins, fibulae, trinkets, and other particulars. The Roman camps, which are of a square form, and found all over England, are generally so well chosen with regard to situation, and so completely fortified, that it is reasonable to think they were rather the constant habitations of the Roman soldiers, than the temporary stations of a few days. At the same time it is evident from the baths, tessellated pavements, &c. found in different parts; that their officers and magistrates resided in towns or villas. But the most amazing monument of the Romans in England, is the remains of Hadrian's vallum, and the wall of Severus, running parallel to each other from the Solway-Frith beyond Burgh on the sands near Carlisle to the neighbourhood of Newcastle upon Tyne, an extent of sixty-eight English miles. Hadrian's vallum is a rampart of earth with a large ditch to the southward, which seems to have served as a military way. The wall of Severus was built of stone, twelve feet high, and eight in thickness, of such materials, and so disposed, as to render it as solid as a rock: it was strengthened by a deep ditch to the northward, by towers and castella at certain distances, and was accommodated with a paved military way on the south side, though not always parallel to the range of the wall, being in breadth about seventeen feet. Hadrian first raised his vallum, and Severus afterwards built the wall with those castella, for the same purpose of defending the Roman province from the incursions of the Scots and Picts; and that the wall was built by the legionary soldiers, appears from a great number of inscriptions upon stones, found through the whole length of the presenture. Hadrian's vallum reached no further than Newcastle, but the wall of Severus is carried through that town, and ends at Stationary-Fort, near Couzen's-House, about three miles to the eastward, where the ruins of a Roman station and town are still discernible. Large portions of the wall are standing in different parts of Northumberland and Cumberland, as well as the foundations of several castella, which appear to have been sixty-six feet square, built on the south side adjoining to the wall, at the distance of about a mile from each other.

The military ways of the Romans convey a noble idea of the civil as well as military policy of that celebrated people. Their vestiges are numerous, in almost every part of the kingdom. One extended from Dover through Kent to London; thence to Verulam, Dunstable, Stratford, Towcester, Littleburn, St. Gil-

bert's-Hill, near Shrewsbury, then by Stratton, and thence through the middle of Wales to Cardigan. The Hermen-Street, or great military way, passed from London through Lincoln, where a branch of it from Pomfret to Doncaster strikes off to the westward, passing through Tadcaster, and thence to Aldby, where it again joins Hermen-Street. The vestiges of this celebrated road may still be easily traced from Cattle-froth, a village about two miles from Pomfret, to Aberforth. The cause-way in many places is entirely perfect, though it has doubtless been finished near 1600 years. In some spots where it is broken up, it appears to be composed of different materials; the bottom is clay or earth, upon which is laid a bed of chalk; upon that another of gravel; the gravel is covered by a stratum of stone, and is itself covered by another bed of gravel. The course of it is very easily traced over moors and broken grounds which have not been cultivated; but there are few remains on the enclosed lands. The Romans had doubtless communications of this kind between all their stations; but time and neglect, during so many years, have rendered it difficult to trace them in many parts: those however that remain are astonishing monuments of Roman industry. It would be endless to enumerate here the Roman coins, altars, &c. that have been found in various parts of the kingdom, many of which are preserved in the museums of the curious; a prodigious number of them are described by authors who have professedly written on the antiquities of this country; and many have escaped their most assiduous inquiries.

With respect to Saxon antiquities, those found in England consist principally of edifices dedicated to religion, and places of great strength, particularly camps, of which numbers are found in various parts of this country. Several of the cathedrals of England were built by the Saxons, and that of Winchester was the burial-place of several of their kings, whose bones were collected by bishop Fox, and deposited in six large wooden chests. In the British Museum are preserved many specimens of Saxon learning, though it was certainly confined to a few persons. The charters, of which several are still preserved, are written in a neat and legible hand; but the signatures are nothing more than a plain cross, the name and quality of the donor being added by the writer of the charter. Near Wimbledon, about four miles north-east of Kingston upon Thames, is a military work called Benbury, of an orbicular form, where Cheaulin, king of the West Saxons, fought and defeated one of the Kentish generals, in the first battle of the Saxons among themselves. But the most remarkable antiquity of the Saxons, is the rude figure of a white horse, cut on the side of a green hill, a little to the north of Upper Lambourne, in Berkshire. This figure takes up near an acre of ground, and, according to some antiquaries, was made by Hengist the first Saxon king, a white horse being the standard of the Saxons. Others however bring

bring various arguments to prove its having been made by order of Alfred, in the reign of his brother Ethelred, as a monument of his victory over the Danes in the year 871, at Ashdown, now called Athbury-Park, the seat of lord Craven, in the neighbourhood of White-Horse-Hill. Saxon coins have been found in various parts of England.

Danish antiquities so nearly resemble those of the Saxons, that it is difficult to distinguish the one from the other: the camps of both were of the orbicular form; but there is one on the summit of Rook's-Hill, a few miles to the north of Chichester, in Sussex, allowed to have been thrown up by the Danes. It is of an orbicular form, and something more than a quarter of a mile in diameter.

In Essex, Kent, Surrey, and some other counties, are several artificial excavations; but it is not known whether they were made by the ancient Britons, the Saxons, Danes, or Normans. The most remarkable is that under the old castle at Rygate in Surrey. It contains an oblong square room, round which runs a bench cut out of the same rock. Tradition tells us, that in this cavern the barons, in the time of king John, held their meetings.

The most remarkable natural curiosities of England are those found in Derbyshire, and known by the appellation of the Wonders of the Peak. The following are the most extraordinary: Mam-Tor, or Mother-Tower, the name of a mountain in the Peak, which, though it is perpetually mouldering away, and the earth and stones are falling from the precipice above in such quantities, as to terrify the neighbouring inhabitants with their noise, is yet of such an enormous bulk, that the decrease is not to be perceived.

Eden-Hole, near Chapel in the Frith, is a vast chasm in the side of a mountain, twenty-one feet wide, and more than forty feet long. In this chasm, or cave, appears the mouth of a pit, the depth of which could never be fathomed. A plummet once drew eight hundred and eighty-four yards, which is something more than half a mile, of line after it, of which the last eighty yards were wet, but no bottom was found. Several attempts to fathom it have been since made, and the plummet has stopped at half that depth, owing probably to its resting on some of the protuberances that stand out from the sides. That such protuberances there are, is proved by an experiment constantly made, to shew its great depth to those that visit the place, by the poor people attending them, who always throw some large stones down into it, which are heard to strike against the irregularities of the sides with a fainter and a fainter sound, which is at length gradually lost. The earl of Leicester, in the reign of queen Elizabeth, hired a poor man to venture down in a basket, who, after he had descended two hundred ells, was drawn up again; but to the great disappointment of the curious inquirer, he had lost his senses, and in a few days after died delirious. The cavern in which this

pit is found, is contracted within the rock, and water is continually trickling from the top, where it also forms sparry concretions.

Tideswell is another curiosity of the Peak; it is situated near a market-town of the same name. The well is about three feet deep, and three feet wide, and the water, at different and uncertain periods of time, sinks and rises with a gurgling noise, two-thirds of the perpendicular depth of the well. Many conjectures have been formed to account for this phenomenon. Some have thought that in the aqueduct a stone stands in equilibrium, and produces the rise and fall of the water, by vibrating backwards and forwards; but it is difficult to conceive what should produce this vibration at uncertain periods, as what should produce the rise and fall of the water. Others imagine that these regular ebblings and flowings, as well as the gurgling noise, are occasioned by air which agitates or presses the water from the subterraneous cavities; but this does not inform us what can be supposed first to move the air. Many have imagined the spring to be occasionally supplied from the overflowings of some subterraneous body of water, lying upon a higher level, but whether either of these be the true cause of this phenomenon, cannot be determined. There are several springs of this kind in various parts of the kingdom.

Pool's-Hole is a large cave, which is said to have taken its name from one Pool, a notorious robber, who secreted himself here from justice; this is another curious cavern in the Peak, and situated at the bottom of a lofty mountain, called Coitmoos, near Buxton. The entrance is by a small arch, so very low, that such an adventure into it are forced to creep upon their hands and knees, but gradually opens into a vault more than a quarter of a mile long, and, as some have pretended, a quarter of a mile high. It is undoubtedly very lofty, and in appearance not unlike the inside of a Gothic cathedral. In a cavern to the right, called Pool's Chamber, there is a fine echo, though it does not appear of what kind it is; and the sound of a current of water, which runs along the middle of the great vault, being reverberated on each side, very much increases the astonishment of those who visit the place.

There are great ridges of stones on the floor; and from the roof and sides of this vault, water is perpetually dripping, the drops of which, before they fall, produce a most pleasing effect, by reflecting numberless rays from the candles carried by the guides; they also, from their quality, form crystallizations of various forms; like the figures of fret-work; and in some places, having been long accumulated one upon another, they have formed large masses, bearing a resemblance to men, lions, dogs, and other animals. In this cavity is a column, as clear as alabaster, called Mary Queen of Scots' pillar, because it is believed she entered no further. Beyond it there is a steep ascent, for near a quarter of a mile, which terminates in a hollow

a pistol be fired near the queen's pillar, the report will
be as loud as a cannon. There is another passage by
which people usually return. No: far from this place
are two springs, one cold, and the other hot; but so
near each other, that the thumb and finger of the same
hand may be put into both streams at the same time.

The last wonder of the Peak, is a cavern, unac-
countably called the Devil's Arse, and sometimes the
Peak's Arse. It runs under a steep hill, about six
miles north-west of Tideswell, by an horizontal en-
trance, sixty feet wide, and something more than thirty
feet high. The top of this entrance resembles a regu-
lar arch chequered with stones of different colours,
from which petrifying water is continually dropping.
Here are several huts, which look like a little town,
inhabited by a set of people who in a great measure sub-
sist by guiding strangers into a cavern, which opens
at the extremity of this entrance. The outward part
of this cave is very dark; it is also rendered extremely
slippery, by a current of water which runs across the
entrance, and the rock hangs so low, that it is ne-
cessary to stoop in order to go under it; but having
passed this place, and another current, which some-
times cannot be waded, the arch opens again to a third
current, near which are large banks of sand: after
these are passed, the rock closes. Another cavern of
this kind, called Wokey-Hole, is found in Mendip-
Hills, in Somersetshire, near a place of the same name,
about a mile from the city of Wells. It has a very
strong echo.

Medicinal springs abound in England; these are
justly considered as natural curiosities, and have been
already described; but there are others of a different
kind, which must not be passed over unnoticed. Among
these the Dropping Well near Knareborough, in York-
shire, is not the least remarkable. The water, which
is of a petrifying quality, rises from a spring about two
miles distance, and flows mostly in a subterraneous
passage to what is called the Well, or rather Bason,
into which the water falls from a rock about sixteen
feet high. The summit of this rock projects con-
siderably over its base, so that the water does not run
down the sides, out drops very fast from thirty or forty
places of the top, into the well or bason, hollowed in
the ground, every drop creating a musical kind of
tinkling sound. A great variety of petrifications are
found in the bason.

There is a very remarkable fountain, near Richard's-
Castle in Herefordshire, called Bonewell, which is
generally full of small bones, resembling those of frogs,
or fish, though often cleared out; and it is not easy to
conjecture how they are collected here in such quanti-
ties. The Burning-Well at Ancliff, near Wigan in
Lancashire, has been long famous. The water is
cold and without smell; but so strong a vapour of
sulphur formerly issued out with it, that upon the ap-

plication of a candle, &c. the whole surface was im-
mediately covered with a blue flame resembling that
of burning spirits, and very hot. But a vein of coals
which ran under the well having been lately taken
away, this effect has, in a great measure ceased.

We shall now proceed to give some account of the
chief cities and towns in England, with the most re-
markable edifices, public and private.

London, the metropolis of the British empire, and the
first city for trade in the known world, is situated on the
banks of the Thames, about twenty miles from its mouth,
in the latitude of 51 deg. 32 min. of north latitude,
400 miles south of Edinburgh, and 270 south-east of
Dublin; 180 west of Amsterdam, 210 north-west of
Paris, 500 south-west of Copenhagen, 600 north-west
of Vienna, 790 south-west of Stockholm, 800 north-east
of Madrid, 820 north-west of Rome, 850 north-east of
Lisbon, 1360 north-west of Constantinople, and 1414
south-west of Moscow.

London, in the extensive sense of the word, com-
prehends the metropolis, properly so called, together
with the city of Westminster, the borough of South-
wark, and part of Middlesex: but though all these are
included under one general name, they have each a
proper government, and distinct corporations; and
each sends members to parliament. The extent of
London from Hyde-park Corner to Poplar, that is
from east to west, is upwards of seven miles. The
breadth varies greatly, being in some places three miles,
in others two, and in others not exceeding more than
half a mile. The circumference of the whole is about
eighteen miles; and the number of its inhabitants are
computed at one million; the number of houses, from
a calculation made in 1784, amounted to 174,000.
It is delightfully and advantageously situated on the
banks of the Thames, a river, which though not the
largest, is the richest and most commodious for com-
merce of any in the world. London rises from this
beautiful river with a gradual ascent. Nor can any
thing be conceived more beautiful than the surrounding
country, consisting of fertile meadows, rich corn-fields,
large tracts of garden grounds, parks, and elegant vil-
las belonging to the nobility and gentry.

London is governed by a mayor, who has the title
of lord, and is chosen annually; two sheriffs; twenty-
six aldermen; a recorder; two hundred and thirty-six
common-councilmen; and other officers. Westmin-
ster is governed by a high steward; a deputy steward;
a high bailiff; sixteen burgessees, with their assistants;
and a high constable. Both these cities abound in
magnificent structures, whose description we'd re-
quire a volume; therefore a few only of the most re-
markable will be particularly described in this article.

The Tower of London was formerly a royal palace,
but now the chief fortress of the city. It is situated
on the margin of the Thames, and is supposed to have
been erected by William the Conqueror, about the year
1076, when it consisted of that part only known by

the

the appellation of the White Tower, which was rebuilt in the years 1637 and 1638. It is a large, square, irregular stone building, situated near the centre, and consists of three very lofty stories, under which are spacious and commodious vaults, chiefly filled with salt-petre. It is covered on the top with flat leads, from whence there is an extensive and delightful prospect. In the first story are two noble rooms, one of which is a small armoury for the sea-service, containing various sorts of arms very curiously laid up, sufficient for more than ten thousand seamen: besides several closets and presses filled with warlike engines and instruments of death. Over this are two other apartments, one principally filled with arms, and the other with spades, shovels, pick-axes, chevaux-de-frize, &c. In the attic story are kept match, sheepskins, tanned hides, and various other articles. On the top of one of the Towers is a large cistern or reservoir for supplying the whole garrison with water. It is about seven feet deep, nine broad, and about sixty in length. The water which supplies it is raised from the Thames by means of an engine. Near the south-west angle of the White Tower is the Spanish armoury, in which the spoils of the Spanish Invincible Armada, defeated in the reign of Elizabeth, are deposited.

Northward of the White Tower is a noble building, called the Grand Store-House, extending 245 feet in length, and sixty in breadth. It was begun by James II. and finished by William III. who erected that magnificent room called the New or Small Armoury, which is built of brick and stone. On the north side is a stately door-case, adorned with four columns, with their entablature and triangular pediment of the Doric order. On entering the room the spectator is agreeably surpris'd with the sight of arms sufficient for eighty thousand men, dispos'd in the most beautiful order imaginable, all bright and fit for service. Upon the ground floor, under the small armoury, is a large room of equal dimensions with that, supported by twenty pillars, hung round with various implements of war.

To the eastward of the White Tower, is the horse armoury, a plain brick building, rather convenient than elegant. Here the sight is entertained with a representation of several English kings and heroes; most of them on horseback, and some in the same armour they wore when they performed those glorious actions which give them a distinguished place in the British annals.

On entering the Tower, on the left hand, is an office appropriated to the coining of money, and called the Mint, which is managed by several officers formed into a corporation, consisting of a warden, a mallet and worker, a comptroller, the king's assay-master, the chief engraver, the surveyor of the meltings, a clerk of the irons, a weigher and teller, a provost, melters, blanchers, moneyers, &c.

About twenty yards to the eastward of the grand

store-house or new armoury, stands the jewel-office, a dark strong room wherein the crown jewels are deposited. This office is governed by a master, two yeomen, a groom, and a clerk.

At a small distance from the Tower is the Custom-House, erected for the receipt of his majesty's customs on goods exported and imported. It is a large, handsome, commodious edifice, situated on the banks of the Thames, built with brick and stone, and seemingly calculated to stand for ages. The government of the Custom-House is under the care of nine commissioners, who are intrusted with the entire management of his majesty's customs in all the ports of England, and also the superintending of all their officers. Both they and several of the principal officers under them hold their places by patent from the king; but all others are appointed by warrant from the lords of the treasury.

St. Paul's cathedral is allowed to be one of the grandest structures in the world, and is supposed to have been originally founded by Ethelbert, a Saxon king, in the year 610; but in the succeeding reigns sustained numberless alterations and accidents. In 1666, it was totally destroyed by the fire of London. The first stone of the present church was laid in 1675, by that famous architect Sir Christopher Wren, after whose plan the whole structure was finished in 1710. The length of this structure from east to west, between the walls, is 463 feet, and, including the west portico, 500; the breadth of the west front 180; and in the centre, where it is widest, including the north and south porticoes, it is 311; the height from the ground to the top of the cross is 344 feet; the external diameter of the cupola 145, and the internal 100; the outward diameter of the lantern 18; the height of the turret 208; and that of the body of the church 120. It takes up an area of six acres, including the church yard, which is railed round with iron balustrades, each about five feet and a half high. It is built of fine Portland stone, in form of a cross, after the model of St. Peter's at Rome. The expence of rebuilding this cathedral, after the fire of London, is computed at a million sterling, and was defrayed by a duty on coals.

The principal edifice devoted to public worship in the city of Westminster, is the abbey church of St. Peter. This church is in form of a long cross; its length being 489 feet, and the breadth of the west front 66 feet; the length of the cross aisle is 189, and the height of the roof 92. At the west end are two towers; and the nave and cross aisles are supported by fifty pillars of Susssex marble, about twelve feet and a half asunder, besides pilasters. There are ninety-four windows, in the upper and lower ranges, all which, together with the arches, roofs and doors, are in the ancient Gothic taste. The inside of this church is much better executed than the out; the perspective, particularly that of the grand aisle, is remarkably good, and

and the choir, from which there is an ascent by several steps to a superb altar-piece, is paved with black and white marble, and contains twenty-eight stalls on the north side, as many on the south, and eight at the west end. This church has been long famous for being the repository of our illustrious dead, with whose monuments it is crowded.

In the cities of London and Westminster, besides the cathedral and abbey above described, there are 109 parish churches, and an amazing number of chapels belonging to the established religion; 21 French Protestant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c. 33 Baptist meetings; 28 Presbyterian meetings; 26 Independent meetings; 19 Popish chapels and meeting-houses, for the use of foreign ambassadors, and people of various sects; and three Jewish synagogues.

The stately column called the Monument was built of Portland Stone, in 1671, after a design of Sir Christopher Wren, in order to perpetuate the memory of the dreadful conflagration which happened in 1666, and laid almost the whole city in ashes. This pillar was erected near the place where the fire began: it is of the Doric order, 202 feet high, and 15 feet in diameter. It stands on a pedestal, 40 feet high, and 21 feet square, the sides of which are adorned with emblematical figures in alto and basso relievo, representing the destruction of the city, and the relief given to the sufferers by king Charles II. and his brother the duke of York. Within is a spiral staircase of black marble, containing 345 steps, which lead to a balcony, encompassing a cone 32 feet high, supporting a blazing urn of gilt brass.

The Royal-Exchange is justly esteemed a most noble and useful fabric. It was first erected at the sole expense of Sir Thomas Gresham, but that structure being destroyed by the fire of London, the present fabric was erected by parliament in 1669, and is said to have cost above 80,000l. The whole forms a parallelogram 203 feet in length, and 171 feet in breadth, enclosing an area 144 feet long, and 127 broad.

On the spot where Gresham-College formerly stood (between Bishopsgate and Broad-Street) is now erected a noble pile of building for managing the business of the exchange; which office before was held in the Old Jewry.

Newgate having been long complained of as a public nuisance, the city have taken it down, and erected a new prison for the reception of offenders, on a most extensive and excellent plan.

The British Museum is a large and magnificent building, situated in Great Russell-street, Bloomsbury, and formerly belonged to the Duke of Montague; but in the year 1753, the parliament having passed an act for purchasing the Museum of the late Sir Hans Sloane, and the collection of manuscripts of the late Lord Oxford, for the use of the public, twenty-six trustees were appointed and incorporated, in order to provide a repository for these and some other col-

lections, under the title of the British Museum. Montague-house being fixed on for this purpose, the parliament purchased it for ten thousand pounds; and expended fifteen thousand more in repairs, alterations, and conveniences. They paid twenty thousand pounds for the collection of Sir Hans Sloane, consisting of an amazing number of natural and artificial curiosities, valuable remains of antiquity, and a large library. Ten thousand pounds were given for lord Oxford's manuscripts; and thirty thousand pounds vested in the public funds, for supplying salaries for officers, and other necessary expences. This noble collection of curiosities, and excellent libraries, greatly augmented by his present majesty, being chiefly designed for the use of learned and studious men, both natives and foreigners, in their researches into the several departments of knowledge, was opened in the year 1757.

The palace of St. James's is an old building, to which the court removed after the burning of Whitehall in 1697; and ever since that period it has been the royal residence. It was built by Henry VIII. upon the site of an hospital formerly founded for fourteen leprous maids, and dedicated to St. James. This edifice has a mean and irregular appearance when viewed from without, but it contains some excellent and splendid apartments.

The queen's palace, situated on the west side of St. James's park, was originally known by the name of Arlington-House; but being purchased by the Buckingham family, it was rebuilt from the ground in 1703, and called Buckingham-House, till the beginning of 1762, when it was purchased by his present majesty, and presented to the queen. Several alterations and additions have lately been made in the park and gardens. The palace itself has been considerably enlarged, and the apartments decorated with celebrated paintings, executed by the greatest masters, particularly the invaluable cartoons of Raphael, formerly kept at Hampton-Court.

Somerfet-House was originally built by the duke of Somerset, uncle to Edward VI. upon whose attainder it fell to the crown. It was the residence of queen Catharine, dowager of Charles II. and was settled on the late queen Caroline, in case she had survived her royal consort. The apartments are now granted to several of the officers of the court, and its dependents; and lately a considerable part of it has been presented to the royal academy of painting, to which a charter has been lately given by his present majesty.

Other public buildings worthy of notice are the Mansion-House, built at the expence of the city, for the residence of the lord-mayors during their mayoralties. The College of Physicians. The Bank of England. Most of the parish churches, especially that of St. Stephen's in Walbrook. The Banqueting-House at Whitehall, being part of a plan designed by Inigo Jones for a royal palace, but never executed. The Admiralty-Office. The Treasury. The Horse-Guards.

Westminster-Hall, supposed to be one of the largest rooms in England.—It is a Gothic structure 220 feet long, and 70 broad. The coronation feasts of our kings and queens are always held here; as are the courts of chancery, king's-bench, common-pleas, and exchequer. The Adelphi and the Pantheon, are proofs of the present improved taste for architecture; the latter was lately destroyed by fire. There is hardly a house belonging to our nobility, but claims particular attention; while the royal palace, which should certainly be the most magnificent structure in the kingdom, is exceeded in elegance and convenience by the public offices, and the private houses of almost every rich individual.

For the greater dispatch of business, and convenience of the nation, there are three bridges in the cities of London and Westminster, viz. London-Bridge, Black-Friars-Bridge, and Westminster-Bridge.

London-Bridge, which, according to ancient records, appears to have been first built between the years 993 and 1016, was originally of wood, and being burnt down about the year 1136, it was rebuilt of the same materials in 1163. The expences, however, of maintaining and keeping it in repair became so heavy a tax on the inhabitants of the city, that it was resolved to build a stone bridge a little to the westward of the wooden one. This resolution was accordingly executed, and the new structure finished in 1209. It consisted of twenty arches, was 915 feet long, 44 feet high, and 73 wide; but houses being built on each side, the space between them was only twenty-three feet. The narrowness of this passage having occasioned the loss of many lives from the number of carriages, cattle, &c. continually passing and repassing; together with the straitness of the arches, and the enormous size of the sterlings, which took up one fourth part of the water way, and rendered the fall at low water no less than five feet, the magistrates of the city obtained an act of parliament in 1756, for improving, widening, and enlarging the passage over and through this bridge. By this statute they were empowered to demand a toll from every carriage and horse passing over it, and for every barge or vessel, laden, passing through any of the arches. These tolls, however, being found insufficient, were abolished by another act passed in 1758, for explaining, amending, and rendering the former more effectual, and for granting the city of London money towards carrying on that work. In consequence of these acts, a temporary wooden bridge was built, and the houses on the old bridge taken down. Instead of the narrow passage, which was formerly so inconvenient, there is now one of thirty-one feet for carriages, &c. exclusive of the foot-way, which, on each side, is seven feet wide. The walls are secured and adorned with stone balusters, whereon are fixed a number of lamps, which are lighted every night. The passage through the bridge is enlarged by throwing the two middle arches into one, and by several other alterations and improvements;

notwithstanding which, it is still rendered very dangerous, not only by the great fall and velocity of the current, but also by the large banks of sand, thrown up, both above and below bridge, by the violence of the stream.

Under the first and second arches on the north side and the second arch on the south side of London-Bridge are engines, worked by the flux and reflux of the river; by which the water is raised to a sufficient height for supplying many parts of the city and borough of Southwark with that element. But these engines, by greatly abridging the width of the water way, increase the velocity of the current, and consequently the fall of the water; by which the navigation is rendered more difficult and dangerous than it would be, were these obstacles removed.

Black-Friars-Bridge is built from the end of Bridge Street to the opposite shore; it was begun on the 20th of October 1760, and finished in 1770, at the expence of 152,840*l.* to be discharged by a toll upon the passengers. But the toll being lately taken off, it is now a free bridge. This bridge has a free passage through the arches of seven hundred and fifty feet within the banks of the river. The arches are elliptical, and make a very elegant appearance. The ascent and descent to this bridge is extremely easy, the passages both for carriages and foot passengers, spacious, and a sufficient number of glass lamps are properly disposed to render it safe and agreeable to travellers in the night. One great inconvenience, however, attending this bridge is, that the recesses being all uncovered, there is no shelter for foot passengers in sudden showers, from one end of it to the other.

Westminster-Bridge was begun in 1738, and finished in 1750, at the expence of 359,000*l.* defrayed by parliament. It is esteemed one of the finest structures of the kind in the world, it being 1,223 feet in length, and the ascent easy. The foot-way is seven feet broad on each side, paved with broad moor-stone, and raised above the road allowed for carriages, which is thirty feet wide. The piers, which are fourteen, support thirteen large and two small arches, all semicircular, and these, with the two abutments, constitute the bridge. The length of every pier is seventy feet, terminated with a salient angle against the stream. The breadth of the two middle piers is seventeen feet, at the springing of the arches; and the others on each side regularly decrease one foot in breadth, so that the two next to the largest are each sixteen feet, and so on to the two least next the sides, which are no more than twelve feet wide at the springing of the arches. The centre arch is seventy-six feet wide, and the others decrease in width four feet on each side, so that the two next to the centre are seventy-two feet wide, and so on to the least of the large arches, which are each fifty-two feet wide. The two small ones on the abutments are about twenty feet in width.

they give to public charities. Besides endowments of
kind in several parts of the nation, there are, in
near the metropolis, twenty hospitals and infirma-
ries; one hundred alms-houses; eight free-schools;
and a hundred and thirty-one charity-schools; where
wards of five thousand poor children are taken care
of till a proper age, and then put into a method of pro-
viding for themselves.

Among some of the most excellent and beneficial
charities for mental improvement may be reckoned the
Sunday-Schools, which are of immense utility; to
which we may add that instituted by the Philanthropic
Society, for promoting a reform among the most pro-
fligate and abandoned of our indigent youth of both
sexes: they have now upwards of an hundred under
their care, and it is deservedly encouraged and sup-
ported by the benevolent.

In London there are fifteen flesh-markets; one
market for live cattle; two markets for vegetables;
and twenty-three markets for corn, coals, hay, &c.
Thirteen inns of court and chancery, viz. the Temple;
Gray's-Inn; Lincoln's-Inn; Serjeant's-Inn; Symond's-
Inn; Clifford's-Inn; Thav's-Inn; Bernard's-Inn;
Staple's-Inn; Furnival's-Inn; Clement's-Inn; New-
Inn; and Lyon's-Inn. The four first of these are al-
ways called principal inns. Forty-nine halls for public
companies. Three colleges, viz. Sion-College; Gresham-
College, (the lectures are now read in a room over the
Royal-Exchange); and Queen's-College, or Westmin-
ster-School. Sion-College adjoins to St. Alphage's-
Church, London-Wall, and was founded by Dr. Thomas
White, vicar of St. Dunstan's in the west: a college for
the use of the London clergy, with alms-houses for ten
poor men, and the same number of women; which
ground was accordingly purchased, and the college begun
in 1627. He likewise gave 160l. per ann. for ever to
the colleges and alms-houses; 120l. per ann. for the
support of the alms-people; and 40l. per ann. for the
expences of the foundation.

No cities in the world are better, and few so well,
supplied with water, as those of London and West-
minster, at a very small expence to the inhabitants,
when put in competition with the benefit they receive
from it, pipes being laid into their houses. These
pipes are supplied from the Thames, the New River,
or from some ponds at Hampstead. Another advantage
arising from this noble supply of water, is its utility in
case of fires, which too frequently happen in this vast
metropolis; but to prevent the spreading of the flames
as much as possible, plugs are every where dispersed,
the keys of which are deposited with the parish of-
ficers, and as soon as the plugs are opened, there is,
without some extraordinary accident happens, always a
supply of water for the fire engines, which, on such
occasions, are sent by the several companies who insure
houses and goods from fire. These companies are an
advantage peculiar to England. At a very small pre-
mium they insure the houses and effects of any in-

dividual, who chooses to apply to them, from fire, and,
in case of loss, the recovery of the insurance; on
making oath of that loss, is easy and certain.

Several acts of parliament having been passed for new
paving and lighting the streets, &c. the greater part of
the town is now paved and lighted in a very con-
venient, regular and beautiful manner. Foreigners,
who are deprived of such advantages in their own
countries, seem much more sensible of these improve-
ments than the English themselves. The roads alto-
round the metropolis, for some miles, are also lighted
and watched during the winter nights, which render
them at once exceedingly safe and highly commodious
to travellers.

Besides the palaces already described, there are in
England three others, Kennington, Hampton-Court,
and Windsor Castle. The last named is the only fab-
ric that deserves the appellation of a royal palace in
England, and that chiefly through its beautiful and
commanding situation. It is situated about twenty
miles from London, was originally built by William
the Conqueror, and our kings resided in that edifice
till the reign of Edward III. who removed the old,
and built the present stately castle, to which great ad-
ditions have since been made by several of his suc-
cessors; and was entirely completed by William III.
This castle, which stands upon a noble eminence, and
enjoys an enchanting prospect of the Thames and the
adjacent country, is divided into two wards or courts,
with a large round tower between them, called the
middle ward; it being formerly separated from the
lower ward by a strong wall and draw-bridge. The
whole contains above twelve acres of land, and had
formerly towers and batteries for its defence, but have
been neglected many years. Hampton-Court was the
favourite residence of king William. It is built in the
Dutch taste, and has some good apartments, and, like
Windsor, lies near the Thames. Both these palaces
have some good pictures.

The many private seats in the neighbourhood of
London, and all over the kingdom, which are equal,
if not superior, in splendor and expensive decorations,
to the royal palaces, display, in its fullest point of
view, the amazing opulence of the English nation.
At the seat of the earl of Pembroke, more remains of
antiquity are to be found, than are in the possession of
any other subject in the world. But these capital
houses of the English nobility and gentry have an ex-
cellency distinct from what is to be met with in any
other part of the globe, which is, that all of them
are complete without and within, all the apartments
and members being suitable to each other, both in
construction and furniture, and all kept in the highest
preservation; and though the house is generally ele-
gant and costly, yet the principal object of the seat
more frequently consists in its hortulane and rural de-
corations. Villas, open landscapes, temples, all of them
the result of that enchanting art of imitating nature,

and uniting beauty with magnificence. These delightful villas shew both the elegant taste and affluence of the possessors, and spread plenty over the whole neighbourhood.

The two hospitals of Chelsea and Greenwich, the former for decayed soldiers, and the latter for decayed seamen, are charities which reflect immortal honour on the nation to which they belong.

Chelsea-Hospital, sometimes called the Royal Hospital, and at others Chelsea-College, was built by Sir Christopher Wren, under the auspices of James II. and William and Mary. The principal edifice consists of a large quadrangle, open to the Thames. The number of pensioners in this hospital is between four and five hundred; but the extraordinary, or out-pensioners, are between eight and nine thousand: the latter are allowed seven pounds twelve shillings and six-pence per annum; they wear red coats lined with blue, and perform duty as in garrison; and those in the hospital are provided with clothes, diet, lodging, washing, fire, and one day's pay per week, for pocket money. Formerly, every man admitted into this hospital, was obliged to bring proof of his having been disabled in the service of the crown, or having served twenty years in the king's army; but many now enjoy this bounty who are not entitled to it. To defray the immense charges of this charity, the army pays poundage, and every officer and soldier gives one day's pay every year towards the support of it; and when there is a deficiency, it is supplied by a grant from parliament. This hospital is governed by the president of the council, the first commissioner of the treasury, the principal secretaries of state, the pay-master general of the forces, the secretary at war, the comptrollers of the army, and by the governor and lieutenant-governor of the house.

Greenwich-Hospital is situated where a royal palace formerly stood, but being fallen to decay, Charles II. pulled it down, and began this edifice, of which he only lived to see the west wing finished. In the year 1694, William III. appropriated this wing for a royal hospital for aged and disabled seamen; and in the reign of that monarch the other wing was begun, and carried on by his successors till the reign of George II. when it was completed, and is, without exception, one of the finest buildings in the world. The superb hall was finely painted by Sir James Thornhill. The chapel is one hundred feet long, fifty broad, and fifty high; and the ornaments are all white and gold. The number of disabled seamen in this hospital is now increased to 2000 men and 100 boys. To every hundred pensioners are allowed five nurses, who are the widows of seamen, and are each allowed ten pounds a year, except those who attend in the infirmary, who have two shillings a week more. The pensioners are clothed in blue, with brass buttons; are shod, besides their livery, in stockings, shoes, and linen; and, exclusive of their commons, are allowed one shilling a week as pocket-

money: the common warrant officers have one shilling and six-pence. This hospital is governed by the governor, a lieutenant-governor, and other officers.

The endowments of this house are immense. William III. gave two thousand pounds a year towards finishing the buildings. In the year 1738, the late earl of Derwentwater's forfeited estate, amounting to near six thousand pounds per annum, was given to parliament; and, in 1737, a market was opened in the town of Greenwich, under the direction of the governors of this charity, to which the profits that arise from it are to be appropriated. Besides these the several benefactions to this hospital, which appear upon tables, hung up at the entrance of the hall amount to fifty-eight thousand two hundred and ninety pounds.

Having described several of the most considerable buildings, &c. in the capital and its neighbourhood, some attention must be paid to the other principal towns of this kingdom, most of which are distinguished either by manufactures, naval affairs, or convenient situation for the trade carried on with the metropolis, and foreign countries. Among the most considerable of these, are the following:

Bristol is situated upon the river Avon, partly in the county of Gloucester, and partly in the county of Somerset, about one hundred and fifteen miles distant from London, to which it is esteemed second in commercial wealth, and number of inhabitants: the last are supposed to amount to at least ninety-five thousand. The city carries on a very large trade to the West-Indies, Guinea, Holland, Hamburgh, Norway, Ireland, and the Streights. The conveniency of its situation near the Severn and the Wye, has enabled it to acquire the whole traffic of South Wales, and great part of that of North Wales. There are considerable manufactures of woollen stuffs at Bristol, particularly of a species called cantaloons; and there are no less than fifteen glass-houses for the manufacture of drinking glasses, bottles, and plate-glass. Large copper-works are also erected in the neighbourhood of this city.

York is the second city in the kingdom, and its chief magistrate has the title of lord-mayor. The cathedral is built in the Gothic taste, and by some thought to be the finest in England, if not in Italy. It is dedicated to St. Peter. The windows are adorned with glass exquisitely painted with scripture history, and other most curious figures in 117 partitions. In the fourth tower there is a deep peal of twelve bells. The nave of this church, which is bigger than any except St. Peter's at Rome, is four feet and a half wider, and eleven feet higher than that of St. Paul's. The ascent from it through the choir to the altar is by six steps. The entrance of the middle nave of the church at the west door is under the largest Gothic arch in Europe, which binds and supports the two towers. At the fourth end of the cross aisle is a circular window, called the marigold window, from its being stained of that

officers have one third of the town, and the hospital is governed by the king and other officers. The manufactures are immense. Wine is exported a year toward 100,000 casks. In the year 1738, the last year of the late king's estate, amounting to 100,000, was given to the market was opened in the direction of the profits thereof. Besides the hospital, which appears at the entrance of the hall, there are two hundred and nine

the most considerable and its neighbourhood. The other principal manufactures of which are distinguished, naval affairs, or carried on with the most success. Among the most famous are the following:

At Avon, partly in the county of Somerset, there are sixteen miles distant from the sea, a second in commerce, the last are supposed to be 17,500. This is the West-Indies, Norway, Ireland, and the East-Indies, enabled it to acquire a great part of the manufactures of considerable manner, particularly of the East-Indies, there are no less than 100,000, the manufacture of drinking

Large copper-works are situated in the neighbourhood of this city. The king, and its cathedral-mayor. The cathedral, and by some thought to be in Italy. It is dedicated to St. Paul, and is adorned with glass windows, and other ornaments. In the south side of the church are twelve bells. The nave is larger than any except St. Paul's. The ascent to the altar is by six steps. The church is the chief of the church in Europe, and has two towers. At the west end of the church is a circular window, called the eye of the church, being stained of that colour;

colour; and a large one at the north end, consisting of five lights reaching almost from bottom to top, and as they say, at the charge of five maiden ladies. The painting represents embroidery.

The city belongs to neither of the Ridings, but enjoys its own liberty, and a jurisdiction over thirty-six villages and hamlets in the neighbourhood, on the west side of the Ouse, on which it stands. This liberty is called the Ainstly, or county, of the city of York.

Sheffield, a town in Yorkshire, is also remarkable for its steel manufactures, particularly locks and edge-tools of various kinds. Halifax, another town in the same county, is equally famous for the woollen manufactory, which has rendered this place one of the most flourishing places in England. It has been computed that 100,000 pieces of shalloon are made yearly in this town alone; and that one single dealer has traded by commission for 60,000, per ann. to Holland and Hamburg, in the article of kerseys only.

Manchester, the largest village in England, is situated near the conflux of the rivers Ilk and Irwell, about 165 miles from London. It is computed to contain 50,000 inhabitants, and has long been famous for the great manufactures it carries on of velvets, fustians, cottons, tickings, tapes, filleting, linen cloth, and various other articles, too tedious to enumerate, but well known by the name of Manchester goods. Some of the weavers there have looms that work twenty-four laces at a time, an invention for which they are indebted to the Dutch.

Liverpool, situated about 183 miles from London, is of late become a town of considerable trade, and is now, in many respects, the rival of Bristol; for as the merchants of the latter trade chiefly to the south and west parts of Ireland, those of Liverpool have all the trade on the east and north shores; as the former have that of South Wales, the latter have great part of that of North Wales. Bristol has the south-west counties of England, Liverpool has all the northern counties; besides its trade to Cheshire and Staffordshire, by the navigation of the Mersey, the Weaver, and the Dan. It is likewise concerned with Londonderry in the fishery on the north-coast of Ireland, and carries on a considerable trade to all foreign parts, except Turkey, Greenland, and the East-Indies. At the east end of the town there is a wet dock with iron flood-gates, made by act of parliament in the reign of queen Anne, which will contain near 100 sail of ships.

Birmingham, situated 109 miles from London, is a large, well-built, and populous town, equally famous with Manchester for its extensive trade and useful manufactures, which consist of iron and steel small wares, stuff-boxes, buckles, buttons, and other goods of the like kind, which are exported to all parts of Europe. This town has long enjoyed advantages others have never experienced; namely, the assistance of one of the best mechanics England ever produced. This remarkable genius furnished the workmen with 10

many curious and useful engines, that they have carried the iron and steel manufactures to a prodigious height of perfection; and at the same time are enabled to sell them so reasonably, that their productions are purchased in most parts of the world. The assiduity and industry of the inhabitants are also extraordinary: it is no uncommon thing to see a nail-maker on the downs with his portable forge, mounted on a wheel-barrow, tending a large flock of sheep. When these particulars are considered, we shall not be surpris'd that this town has, in a short period of time, carried its trade to such an astonishing height.

Exeter is one of the first cities in England, as well on account of its buildings and wealth, as its extent and the number of its inhabitants. It has six gates, and, including its suburbs, is above two miles in circumference. The trade of this city in ferges, perpetuans, long-ells, druggets, kerseys, and other woollen goods, is very great. Ships come up to the city by means of sluices. There was a long and very ancient bridge over the river Ex, with houses on both sides, except in the middle, but is now about one half taken down, and an arm turned to join it to the stately new bridge built on a line with the fore-street. Exeter has sixteen parish churches, besides chapels, and five large meeting-houses within the walls.

The town of Plymouth is 216 miles from London, at the influx of the rivers Plym and Tamar into the channel, contains near as many inhabitants as Exeter, and is one of the chief magazines in the kingdom, owing to its port, which is one of the largest and safest in England. It consists of two harbours, capable of containing 1000 sail of ships; and is defended by several forts, particularly a strong citadel, of large extent. It is the general rendezvous of ships outward bound; and is very convenient for homeward bound ships to provide themselves with pilots up the channel.

About two miles up the mouth of the river Tamar, in an inlet of the sea, distinguished from Cat-Water by the name of Hamoaze, and commanded by the castle on St. Nicholas Island, is a royal dock for building and repairing ships. Here is a charity-school, four hospitals, and a work-house. Off the entrance of the bay lies the Edystone rock, which is covered at high water, but bare at ebb; where, in 1696, the ingenious Mr. Winstanley built a light-house, which, after standing many violent storms, was blown down by that dreadful one on the 27th of November 1703, when Mr. Winstanley, and all that were with him in it, perished: but another was built in its stead, by the corporation of Trinity-House, by duties on all vessels; but this was burnt down in 1755, the particulars of which disaster are as follow:

An Account of the Destruction of the EDYSTONE LIGHT-HOUSE.

ON the 22d of August 1755, the workmen returned on shore, having finished all the necessary repairs

repairs of that season; between which time and the 2d of December following, the attending boat had been off several times to the Edystone, and particularly on the first of December, and had landed some stores, when the light-keepers made no manner of complaint, and said all was right, except that one or two of the bricks in the kitchen fire place had been loosened by a late storm. What, in reality, might occasion the building first catching fire, it has never been possible fully to investigate; but from the most distinct account, it appears to have commenced in the very top of the lantern, that is, in the cupola.

From whatever cause it originated, it is certain, that when the light-keeper then upon the watch (about two o'clock in the morning of the 2d of December) went into the lantern as usual, to snuff the candles, he found the whole in a smoke, and upon opening the door of the lantern into the balcony, a flame instantly burst from the inside of the cupola; he immediately endeavoured to alarm his companions; but they being in bed and asleep, were not so ready in coming to his assistance as the occasion required.

As there were always some leathern buckets kept in the house, and a tub of water in the lantern, he attempted as speedily as possible to extinguish the fire in the cupola, by throwing water from the balcony with a leather bucket, upon the outside cover of lead: by this time, his comrades approaching, he encouraged them to fetch up water with the leather buckets from the sea; but as the height would be at a medium full seventy feet, this, added to the natural conflagration that must attend such a sudden and totally unexpected event, would occasion this business of bringing up water, at the best, to go on but slow; mean while the flames gathering strength every moment, and the poor man, though making use of every exertion, having the water to throw full four yards higher than his own head, to be of any service, we must by no means be surpris'd that, under all these difficulties, the fire, instead of being soon extinguish'd, would increase; and what put a sudden stop to further exertions, was the following most remarkable circumstance: as he was looking upwards with the utmost attention, to see the direction and success of the water thrown, a quantity of lead, dissolved by the heat of the flames, suddenly rushed like a torrent from the roof, and fell, not only on the man's head, face, and shoulders, but over his clothes, and a part of it made its way through his shirt collar, and very much burnt his neck and shoulders; from this moment he had a violent internal sensation, and imagin'd that a quantity of this lead had pass'd down his throat, and got into his body.

Under this violence of pain and anxiety, as every attempt had proved ineffectual, and the rage of the flames was increasing, it is not to be wonder'd that the terror and dismay of the three men increased in proportion, so that they all found themselves intimidated, and glad to make their retreat from that imme-

diat scene of horror, into one of the rooms below, where they would find themselves precluded from doing any thing; for had they thrown down ever so much water there, it could not have extinguish'd what was burning above them, nor indeed produce any other effect than running down into the room below, and from thence finally through the stair-case, back again into the sea: they seem'd, therefore, to have had no other resource, or means of retreat, than that of retiring downwards from room to room as the fire advanced over their heads.

How soon the fire was seen from the shore, is not very certain; but early in the morning it was perceived by some of the Cawford fishermen, and intelligence thereof given to Mr. Edwards, of Ramsgate, in that neighbourhood, a gentleman of some fortune, and more humanity. This prompt'd him immediately to send out a fishing-boat and men, to the relief of the people he suppos'd in distress upon the Edystone. The boat and men got thither about ten o'clock, after the fire had been burning full eight hours; and in this time the three light-keepers were not only driven from all the rooms, and the stair-case, but, to avoid the falling of the timber and red hot bolts, &c. upon them, they were found sitting in the hole or cave in the east side of the rock, under the iron ladder, almost in a state of stupefaction, it being then low water.

At this time the wind was eastward, and did not blow very fresh, but just hard enough to make a landing upon the rock at the proper landing-place, quite impracticable, or attended with the utmost hazard. It therefore became a difficulty how the men were to be taken off; for the ground swell upon the west side produced so great a surf upon the sloping surface, that no boat could attempt to land there. They, however, fell on the following expedient: having a small boat with them, they moored their principal boat by grappling to the westward, but as near the rock as they dur'd; and then launching their small boat, they row'd it towards the rock, veering out a rope, which they fastened to the large boat, till they got near enough to throw a coil of small rope on the rock; which having been laid hold of by the men, they one by one fastened it round their waists, and jumping into the sea, they were towed into the small boat, and thence deliver'd into the large one; and as they found it was out of their power to do any further service, the boat hasten'd to Plymouth to get the men relieved. No sooner, however, were they set on shore, than one of them made off, and has never since been heard of, which, on the first blush, would induce one to suppose that there was something culpable in this man; and if it had been a house on the shore, one would have been tempted to suspect he had been guilty of some foul play: but the circumstance of its being a light-house, situated so as to afford no retreat in the power of its inhabitants, seems to preclude the possibility of its being done wilfully; as he must know he must perish,

or be in extremity the rest.

Such was the whole of which could be made foundation: not but a storm or hurricane out the fire of the building years from its total destruction the builders never against it.

It remains only man, who received melted lead.

His name was Plymouth; and of a good centise, sidering his time surgeon who attended of Plymouth) that to his recovery, lead, which he not only told E in a very hoarse Aemul, however could scarcely could exist after stomach; much nowing through fatigue and increase he was getting applied.

The man did being either mu sixth day after to be better; he could many things tenth or eleventh worse; and on the freats and spain opening the store peace of lead, d seven ounces and Mr. Smeaton, th to me, as if a p adhered to the co

of the rooms below, was precluded from running down ever so far, and extinguished what would produce any other fire in the room below, and in the air-cave, back again to the shore, to have had no more, than that of the room as the fire ad-

om the shore, is not morning it was perceived by the fishermen, and in the evening, of Rame, a man of some fortune, called him immediately to the relief of the man at the Edystone. The man was at seven o'clock, after the accident, for several hours; and in this time he was not only driven from the shore, but, to avoid the rocks, &c. upon them, he was obliged to cave in the cliff, and to sit almost in a state of water.

ward, and did not have time enough to make a landing-place, quite to the utmost hazard. How the men were to get up upon the west side of the sloping surface, that was the question. They, however, having a small boat, and a principal boat by a rope, as near the rock as they could get, they got out a rope, which they fastened to the till they got near the rock, and by the men, they one by one, and jumping to the small boat, and so on, and as they found any further service, they got the men relieved.

et on shore, than one since been heard of, induce one to suppose that in this man; and if one would have been guilty of some fault, being a light-house, it is in the power of its possessor to prevent the possibility of its being known he must perish,

or be in extreme danger of so doing, at least, with the rest.

Such was the fate of Mr. Rudyerd's building, the whole of which, notwithstanding every effort that could be made, was, in a few days, burned to its foundation: nor could any thing as is here remarked, but a storm or hard gale at south-west, have effectually put out the fire, so as to have saved any material part of the building; which, after a duration of forty-nine years from its commencement, was doomed to inevitable destruction by an element, of which, as an enemy, the builders never thought, and therefore did not guard against it.

It remains only to relate the fate of the unfortunate man, who received so peculiar an injury from the melted lead.

His name was Henry Hall, of Stonehouse, near Plymouth; and though aged ninety-four years, being of a good constitution, he was remarkably active considering his time of life: he had invariably told the surgeon who attended him (Mr. Spry, since Dr. Spry, of Plymouth) that if he would do any thing effectual to his recovery, he must relieve his stomach from the lead, which he was sure was within him: and this he not only told Dr. Spry, but those about him, though in a very hoarse voice. The reality of the assertion seemed, however, then incredible to Dr. Spry, who could scarcely suppose it possible that any human being could exist after receiving melted lead into the stomach; much less that he should be able to bear swimming through the sea from the rock, and also the fatigue and inconvenience from the length of time he was getting on shore, before any remedies could be applied.

The man did not shew any symptoms, however, of being either much worse, or of amendment, till the sixth day after the accident, when he was thought to be better; he constantly took his medicines, and swallowed many things, both liquid and solid, till the tenth or eleventh day, after which he suddenly grew worse; and on the twelfth day, being seized with cold sweats and spasms, he soon afterwards expired. On opening the stomach, Dr. Spry found therein a solid piece of lead, of a flat, oval form, which weighed seven ounces and five drachms. I have seen, adds Mr. Smeaton, the piece of lead since, and it appeared to me, as if a part of the coat of the stomach firmly adhered to the convex side thereof.

Another light-house was erected in 1759, and also burnt down in 1770, and the present finished in 1774.

Gloucester is a well-built, clean, healthy city, situated by the river on one side, a branch of which brings up vessels of a considerable burthen to its walls. It has a beautiful cathedral, five churches, and is well provided with hospitals. The cathedral is an ancient but magnificent fabric, and has a tower, which is one of the neatest and most curious pieces of architecture in England, and a whispering place, as in the cupola
