

AN

+ ILLUSTRATED + WEEKLY + MAGAZINE +

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,
SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruit, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word To BUILD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"Always be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

VOLUME L.—JANUARY TO JUNE, 1886.

OFFICE: No. 46, CATHERINE STREET, COVENT GARDEN, LONDON, W.C.

Ancient Rome in 1855.*

HERE has always been a tendency, almost from the commencement of book printing and engraving, to produce works descriptive of the ancient and other remains of Rome, which

have been welcomed by the public.

The number of such works is great, but not more than is needed by the engrossing interest of the old Roman city's marvels. These works range from the merest impressions of the passing traveller to the most formal class of guide-books; there are works with many illustrations, like Wey's "Rome," not long since published, but with no very reliable text for scientific purposes. There are not a few series of architectural plates, setting forth the remains, more or less carefully measured and drawn, from those by Palladio and Desgodets to the goodly volumes of Taylor and Cressy, the latter being a remarkable book, the best of the many works published by Englishmen. The former, while among the earliest series of published measured plates, is valuable also as showing the benefits to be derived by the student from the study of antique monuments, and it is sufficient to show the source of Palladio's purity of detail. Not a few other examples could be quoted of published monographs of buildings prepared by students in Rome, mostly French, in later years.

The succession of the dates when these works appeared shows the uniformity of interest taken, and of the ever-increasing

demand for more information, while the number that have been produced in this country is commendable to our habits of research.

The tendency being to welcome such works, it would be hard if similar good fortune did not attend upon the latest issue of them all. Under the title of the present notice, and, considering the vastness of the theme, in the small limits of a handy octavo of 512 pages, Mr. Middleton contrives to render a mass of information upon the ancient monuments of the Eternal City. He gives naturally more ample detail of the results of the excavations of recent years. In all he compresses his matter into the fewest words. The work is not a guide-book,—it is not a book of measured plates. There are fifty-seven small wood-cuts (would that there were more) that well illustrate the text so far as they go, for they are clear and concise. In addition, there is a useful little map of Ancient Rome and a map of Modern Rome showing the contemplated changes, and we can be but gratified, on inspecting the position of the new quarter of the city, to notice how well it is kept away from the ancient built-upon portions, where it can grow according to modern needs of population without doing much harm to the ancient monuments. Lastly, there is a plan measured by the author and drawn by him, of the Roman Forum, in which are shown the exact positions of that wonderful gathering together of Temple, Forum, Basilica, memorial column, triumphal arch, and the like. This plan shows the result of the excavations down to the most recent discoveries, and it has the advantage of indicating by tints the principal materials used in the various buildings.

The author's combined architectural and archaeological knowledge enables him to conduct his task with "attention to detail and modes of construction,—points which are

usually passed over too lightly by those antiquaries who are without any practical acquaintance with the actual processes and materials employed in building." Some interesting items of technical information will be referred to as we proceed.

After referring to the various sources of information, such as the references to the classical authors, inscriptions, coins, and Mediæval and modern works, a brief list of the latter being given, the author proceeds to his first chapter, on the materials used in the ancient buildings. But scant justice is perhaps done to Donaldson's "Architectura Numismatica," the plates of which are described as not remarkable for accuracy, and Parker's series of admirable photographs comes in for greater praise, as might be expected, than his confused and rambling books.

The wholesale destruction of ancient remains that took place in Mediæval and later times is referred to,* and it must be a matter of regret for all time that such ruthless havoc was permitted by men who ought to have been the preservers of what had been spared by the hand of Goth and Vandal. Thus, the removal of the side arches of the Triumphal Arch of Gallienus, the stripping of the bronze from the dome of the Pantheon by Pope Urban VIII., and many others, are noted.

The site of Rome is described as a great plain of alluvial and marine deposit, with nine or ten hills of volcanic conglomerate, ashes, sand, and tufa, the traces of volcanic action being of such late date that in many places broken pottery and bronze implements have been found beneath the deposit. Facts such as these, as well as the recent discovery of an Etruscan cemetery, give considerable room for doubt as to the accuracy of the belief in

* "The splendid porphyry columns of the Temple of Venus and Roma were broken up to build the kilns in which the equally magnificent marble columns were burned into lime on the floor of the temple."

* Ancient Rome in 1855. By J. Henry Middleton. Edinburgh: Adam & Charles Black, 8vo, 1855.

the foundation of the city by the Roman race.*

Tufa being so abundant on the actual sites of most of the buildings, it is not surprising that it has been one of the principal building stones employed; but Alban stone, Peperino, Travertine, &c., were all employed. The use of the excellent cement concrete formed by pozzolana and sand has contributed in no small degree to the development of Roman construction, since so many forms capable of being built by its instrumentality would have been impossible had a less hindering material been used. Thus the heavy mass of the vast dome of the Pantheon is formed of this everlasting concrete, as is the core of almost all the most massive walls and vaulting, sometimes cast between boards. Several of these concrete works are faced with brickwork neatly bonded in; arches are formed of carefully-constructed brickwork; and, indeed, the use of brickwork, *opus incertum* and *opus reticulatum*, &c., as a facing to masses of concrete may be studied with profit in these days when the use of concrete has again attracted public attention. The extent to which it was employed in ancient Rome may be, perhaps little known to many who are conversant with the old buildings, who may believe that the apparently solid brick constructions are, in fact, for the most part of concrete. The bricks used in Rome appear to have been stamped from the second century A.D., the stamps continuing to a late date, and these being for the most part readily deciphered, the date of construction can very frequently be determined. No examples of the stamps are given in the book before us, which is to be regretted, for their interest cannot be over-rated.

Precious marbles of all kinds, white statuary, Parian, Athenian, golden Nauidian, green Cipollina, violet Pavonazetto, dull green Porta Santa, blood-red Rosso Antico, and a vast number of others were all pressed into the service of Roman architecture at varying dates, and used for all kinds of decorative purposes, particularly for wall linings. Their mere enumeration must afford an idea of how grandly aglow with colour must have been almost all the ancient buildings, the superb effect of the marble linings being enhanced with glittering mosaic floors and brilliant frescos or other paintings on dome and ceiling and roof. In presence of all that antiquarian research has ever taught of these old glories of colour, it must ever be a matter of surprise that, among ourselves, the seventeenth and later century revivals of classic forms witnessed but the bald, cold outline only, to the entire exclusion of all the old wealth of colour which had ever accompanied it in old times. This is the more remarkable since the first revival in Italy was marked by the development of arabesques in colour, inspired by the study of many ancient works then discovered.

Our author refers to the use of hard granites and porphyries, which could only have been worked by the help of emery or diamond dust. The perfect fitting nature of the blocks of stone forming the wall of pre-historic date, the so-called wall of Romulus, is referred to, and distinct marks of metal tools are to be found on them, sufficient to disprove the belief that the masses were simply split by wooden wedges. The use, however, of iron clamps run into lead, at a later date, and of wooden dovetailed clamps, is curious, as is the mode of fixing the marble facings with iron. "The wall stucco was applied in three or four coats, the whole being often more than two inches thick." The surface was prepared with great care to secure paintings, and was often polished to a surface like artificial marble, the first coat being held on not by a rough surface, but either by nails or small plugs of marble, which were driven into the surface of the wall to be plastered. It is not so stated, but, of course, this would be only for the best work. Interesting notes are given with respect to the course not only of the primitive wall, but of the probable direction of that of

Roma Quadrata, and of those of the Regal period* and of later times, including the position of the gates and the great Agger of Servius. A good cut shows the construction of the massive brick-faced walls of Aurelian, with its bold square projecting towers and its lofty inner arches. Following a brief notice of the various sewers of the city, the construction of which it is suggested was derived from the partly Hellenised Etruscans, is a shorter one of the river embankments, credit being given to Mr. Parker for having first noticed a piece of Etruscan-like wall near the Cloaca Maxima. The Mamertine Prison, alluded to by Juvenal as being the only prison needed in the happy early days of Rome, is shown by plan and section.

Three whole chapters are devoted to the elucidation of the mass of buildings on the Palatine Hill, and these are shown to be of all ages, some being of remote antiquity, but since their discovery and uncovering, exposure to the weather has caused them to crumble rapidly. The foundations are revealed of a temple called that of Cybele, and of Jupiter Stator, and a wooden is given of the curious early altar to the Unknown God, while another renders the ground-plan of the so-called House of Livia, a well-preserved and complete specimen of a Roman house of the time of Augustus. The palace of that Emperor is described, and also those of Caligula, Domitian, Hadrian, and Severus, with the mass of accompanying temples and basilice, a passing reference being given to the supposed Church of St. Maria Antiqua. Doubt is expressed as to its Christian date, there being a marble-lined cistern in the apse where we should have looked for the site of the altar. Several technical points relative to these buildings, which, in some cases, determine their dates, are pointed out; thus, very thin bricks with wide joints are attributed to the end of the second century; some of the paintings are on walls lined with flanged tiles to prevent wet soaking through; and the flutes from the heating furnaces are found to be held together by strong pieces of T-iron.

The Forum Magnum and its adjacent buildings occupy the whole of chapters v. and vi.,—a short history being prefixed showing the rise and progress of its buildings from the time when the site was but an intermediate valley filled at times with stagnant water, or, when dry, when it was the battle-ground of the Sabines dwelling on the hill of the Capitol and the Latins of *Roma Quadrata*. The construction of the *cloaca*, which runs across the site, was the first step towards converting the site into dry ground, but the ponds,—Lacus Curtius and Lacus Servilius,—remained until later. The world-famed buildings of the Forum had their beginnings in remote times, and were frequently rebuilt, as is very sufficiently shown by the excavations, which have revealed the foundations of early times built into those of later date, not in one spot only, but in every direction of the clearances.

A sketch is given of the Church of St. Adriano, which is probably the Curia rebuilt by Diocletian. It is a mass of ancient brickwork, relieved with stucco mouldings, and lined out in blocks. The sketch shows the ancient bronze gates now in the Church of St. John Laterano, the ancient level being about 20 ft. below the present modern surface, showing eloquently enough how great has been the accumulation of earth during the many centuries that have elapsed since Roman times.

The site of the *Rostra* of Julius Cæsar is now determined, and two interesting woodcuts show the plan and a section, while small detail sketches give the way in which the marble face-work was secured to the wall of tufa behind, the marble cornice and plinths being carefully dowelled, the position of the bronze gallery beams being determined by the holes which remain in the tufa wall. The entire width is 78 ft., and there have been two colossal figures at the extremities. The remains which have been uncovered correspond with a bas-relief from the arch of Constantine,

which shows the upper portion of the *Rostra* as well as the adjacent buildings.

Behind the *Rostra* are the remains of a richly-decorated platform, curved on plan, which has been lined with Greek marbles, and the extremities of the curve are the probable sites of the *Umbilicus Romæ*, or central point of the city; and the golden milestone (gilt bronze) inscribed with the names and distances of the towns of Italy. To the right of the *Rostra* is the Arch of Severus, while to its left was most probably the site of the smaller Arch of Tiberius, the Temple of Saturn, with its portico of Ionic columns being behind the latter arch, and the Temples of Concord and of Vespasian behind and beyond the *Rostra*, while above these latter towered the rock of the Capitol. The plan already referred to shows with much clearness the course of the Sacred Way, and the site of the enormous Basilica Julia, with its white marble pavement and treble row of piers; of which, alas! little remains, owing to its being burned for lime in Medieval times. The plan indicates the position of all the buildings surrounding the open part of the Forum, in face of the *Rostra*, the Temple of Castor, the circular Temple of Vesta at some distance away, as well as the bases of the seven honorary columns parallel to the Basilica Julia. A separate cut is given of the basement plan of the Temple of Castor, showing the huge spurs on which the columns were built, and another which will be scanned with much interest shows the plan of the newly-discovered House of the Vestals, and its relation to the circular Temple of Vesta. Its two stories are shown by a section indicating its relation to the Palatine Hill, and the mode of construction of some of its floors on the necks of the huge Amphoræ.

Reference is naturally made to the remarkable discovery of the portrait statues of the Vestals, which are of heroic size, with inscribed pedestals, although unfortunately the latter cannot be identified with the statues. One of the best of the wood-cuts shows a portion of one of these statues to a sufficiently large scale to enable us to judge of the excellence of the workmanship.

Passing reference is made to the sites of the arches of Fabius, the earliest of the triumphal arches, and that of Augustus, and the chapters conclude by reference to the other most recent discoveries in the Forum.* The plan already referred to indicates the singular want of symmetry of the buildings of the Forum, which appear to have been placed in a very haphazard manner, sufficient to show that there never was any preconceived plan for the whole, and that they grew out of the requirements of the times.

Chapter viii. is devoted to the description of the buildings, &c., on the Capitoline Hill, the early walls, and the ancient temple of the Capitol, there being in this section a digression upon the period of Augustus, illustrated by the inscriptions from the temple of Ancyra, which enumerate the works which this emperor erected in Rome.

The Imperial Fora form the theme of the eighth chapter, there being plans of the Forum of Julius Augustus, and Nerva, showing the positions of these buildings, which although of similar destination, yet are adjacent one to another. Another plan shows the Forum of Trajan, entered by the triumphal arch, and having his column at the side of the enormous Basilica Ulpia.

Chapter ix. is devoted to the theatres, &c., the Circus Maximus, the theatres of Pompey and of Marcellus and others, being described, the amphitheatres being reserved for the tenth chapter. In this the Colosseum naturally takes the first place. The baths are treated of in the eleventh chapter, and a plan is given showing the results of the recent excavations at the back of the Pantheon, on the site of the

* Many discoveries made during recent years show that Rome was populous at a very remote and quite prehistoric period.

* A small engraving shows various masons' marks on walls of the Regal period. Many of them are letters of early form.

* It may not be amiss to indicate for the guidance of students who may possess the older works on the Roman antiquities, that the three graceful columns mostly described, in these, as belonging to the Temple of Jupiter Stator, are now shown to have been a part of the Temple of Castor. In like manner, the three angular columns said to be part of the Temple of Jupiter Tonans, are now assigned to the Temple of Vespasian, while the Temple of Concord is called so no longer, but the Temple of Saturn.

Baths of Agrippa. The two buildings line out so exactly that it is difficult to follow our author's belief that they had no connexion. The connexion of plan is not unlike the relation of the Albert Hall to the Inventions Exhibition, and some sort of similar connexion and joint use appears hardly capable of doubt. The Golden House of Nero is described, and a plan is given, while others show the Baths of Titus and of Caracalla. The twelfth chapter describes various other existing remains of Rome; the thirteenth, the tombs and memorial columns. The fourteenth is occupied by the aqueducts and the water-supply, several curious details being given of the plumbers' work of more than eighteen centuries ago, where we may see that four-way pipes, soldered joints, and stop-cocks were in use, as well as soldered lead supply-pipes, which were general.

The book concludes with the fifteenth chapter, which describes the construction of the roads, the bridges, and the wall of the Emperor Aurelius.

The work is a very valuable addition to our knowledge of the ancient buildings of Rome. Its author may be congratulated for having brought to a focus, so to speak, a vast amount of information from various sources into small and readable compass. Of this information it is evident that a large proportion is the result of his own investigations.

AMERICAN PLUMBING: SANITARY SPECIALITIES.

BY AN AMERICAN ARCHITECT.

ENGLISH plumbing was undoubtedly the progenitor of American plumbing. The offspring is lusty, and differs materially from the original, both in the manner and material of which it is composed.

I do not propose to describe all the American specialities, but there are many things which I think would be interesting, if not instructive, to Englishmen interested in building.

But our plumbing is not, properly speaking, plumbing at all, as lead enters into it only to a very limited extent. In the United States, iron soil, waste, and supply pipes are used, to the exclusion (of course, there are a few excep-

and into it are branched the wastes from water-closets and basins, bath tubs, laundry tubs, kitchen sinks, &c. The plan of the house is so arranged that the apartments containing these come over each other in the different stories, and the fixtures are grouped about the soil-pipe, the horizontal branches being made as short as possible. In large houses there are sometimes two or more vertical soil-pipes, so as to avoid the necessity for running long horizontal pipes.

by the city authorities, so that the public sewer will not be impaired. From this connexion to the building salt-glazed terra-cotta pipe is used, commonly 5 in. inside diameter. In the best work these pipes are bedded on concrete, so the alignment will be and remain perfect. In cheaper work the earth is hollowed out under the hubs or bells, so that the length of the pipe will have a solid bearing on the earth. The joints are made with cement and sand in equal parts, and the inside swabbed out, so that

- Soil-pipes and their connexions are manufactured in sizes varying from 2 in. to 15 in. in diameter. Pressure-pipe comes in 12 ft. sections. Well and spigot pipe, 5 ft. long. Durham, 20 ft. Sanitas, 3 ft.

tions) of lead pipes. Branch wastes, where bending is necessary, less than 2 in. (about 5 centimetres) in diameter, are sometimes made of lead.

THE INSIDE SEWERAGE SYSTEM.

The term "drainage system," as this is sometimes called, should only be used to designate agricultural or hand tiles, which drain off pure water. As soil and waste pipes convey sewage, I designate them when in place, as the inside, or house sewerage system.

In America, one vertical soil-pipe is used,

In our cities the sewers are usually placed in the streets, while kitchens, bath-rooms, and water-closets are almost invariably situated at the back of the house. For the above reason the sewer must run beneath the building as the entire site is usually covered in width. The material, manner of trapping and ventilating plumbing is governed by "Plumbing Regulations" or laws in the large cities of the United States. The illustration (fig. 1) shows a house fitted up in accordance with "Regulations" as usually drawn up. The house system commences with the sewer connexion. Here a special fitting is required, usually put in

no hard projections can form on the inside to catch the sewage.

A 4 in. (about 1 decimeter inside diameter) iron pipe is connected with this terra-cotta one just outside of the building line. The iron pipe passes through the wall, an arched opening being left for the purpose. If the wall should settle the pipe will remain intact. Just inside the building is usually placed the σ or \vee running trap (fig. 1). These traps have inspection holes. On the house side of the trap a branch is introduced, running out to the curbing for a fresh-air inlet. This is covered by a grating let into and even with the pave-

ment, if on the side walk, and by a hood if on a grass plat (see detail illustration, fig. 6, C).

The pipe then runs along the wall as shown in the illustration, either supported by hooks built in the wall, or by hangers screwed into the joists. When this sewer-pipe is run beneath the ground, and this is sometimes found necessary, it is usually buried with its simple earth covering. In the best work it is built into a solid mass of concrete, if it is impossible to keep it exposed for its whole length, as it is always best to do.

As shown in the cut, the pipe turns leaving a screw-plugged inspection-hole, and runs vertically until it passes through the roof. Proper fittings are inserted at each story for branch, waste, and vent pipes. Where the climate is as cold as in New York City, a 4-in. pipe where it runs through the roof becomes completely choked up in frost. For this reason the last length of soil-pipe is enlarged from 4 in. to 6 in., and covered with a copper-wire basket (fig. 6, A). Cows of various patterns, and return heads, that were commonly used at the top of a soil-pipe, have been universally discarded for the plain ending shown in cut.

DETAILS OF PIPING.

Cast-iron bell and spigot jointed pipe is the kind generally used in the United States. This pattern is moulded in three qualities or thicknesses, called pressure, extra heavy, and light cast-iron pipe (see fig. 2, C, E, H, I, K). Pressure pipe was originally manufactured for the conveyance of gas or water under pressure, hence its name; but now it is frequently used for the horizontal soil-pipe in the inside sewerage systems of the best houses. The hell is shaped so as to best fit it for caulking, being at least an inch thick on the outside. The cut (fig. 2, H) shows the groove on the inside of the hell into which the lead is driven when the pipe is caulked. This is the best, but it does not have the same number and variety of fittings as the other pipes have. Extra heavy pipe is the kind used where the work is supposed to be good. Light pipe is only used where or when economy is a necessity. Light pipe is often very imperfectly cast, with flaws or holes, thin on one side, thick on the other (fig. 2, E). The latter defect is caused by casting the pipe in a horizontal position,—a method fast becoming obsolete. The bells or hubs are cracked by caulking; joints are made by inserting the spigot end of one pipe into the bell of another. The space between is packed with a hemp gasket or unravelled rope for the height of three-quarters of an inch, being driven down by a chisel made for the purpose. The hell is then filled with molten lead, and it is driven firmly home with a chisel. When properly made this kind of a joint is permanent and effective, gas and water proof, and slightly elastic.

The Sanitas pipe, with flanges cast on the ends of each piece, has been recently introduced into the market by a Boston (U.S.A.) manufacturing company. The flanges are drawn together by screw-bolts (see fig. 2, L and F). A lead washer of the section shown in cut is introduced between the flanges. Being star-shaped, when the bolts are screwed up tightly, the lead washer is flattened, and a good joint formed. A ratchet wrench is necessary where the pipe is put back in an indent or recess.

This method of jointing pipe has not been in the market long enough to have its merits or faults fully determined. While the cast-iron bell and spigot-pipe can be easily cut to suit any length, with the flange-pipe it is necessary to make the space between the fittings suit the pipe. To meet this want short pipes are supplied, only varying 1 in. from each other in their length. Wrought-iron pipe is being used with screw-joints, having been introduced by the Durham Drainage Company, of Chicago. Wrought-iron pipe is furnished in 20-ft. lengths, and $\frac{1}{4}$ in. thickness of metal. A soil-pipe of this kind can extend from floor to floor, even when the pitch is high, without a joint, the pipes and fittings in this system of plumbing standing upon their own foundation, independent of movements in the walls

Fig. 2.

- G. T-branch.

or floors. The screw-joint is one of the best forms, being the strongest, most elastic, and easily made water and gas tight (see fig. 2, G and M). Connecting lead pipe with iron is performed in the manner shown in fig. 2, D, G. A brass thimble is caulked into the bell of the common pipe, or screwed into a fitting of the Durham. The thimble is tinned, and the lead pipe connected with it by a wiped solder joint.

Fig. 5.

Pressure-pipe trap, with inspection holes and fresh air inlet.
 A. Simple running trap, into which a Y-branch or quarter bend must be caulked to make the connexion with the soil-pipe.

B. Shows a running trap with a T Y branch for soil-pipe, a Y-branch for fresh air inlet. The inspection hole has a brass screw plug caulked into it. This forms an excellent and convenient fitting for the purpose.

(dipped) inside and out with metallic paint. Now all the pipe in use is coated with asphalt. When well done it looks as if it were japanned. This is supposed to protect the pipes from oxidation and form a thoroughly durable coating. It has not been in use long enough for its durability to have been tested properly.

Enamelled iron pipes are used to a limited extent. These pipes are coated on the inside with porcelain enamel, and have a pretty and cleanly appearance. The cost limits the use. I think it would be found that the hammering incident to caulking and cutting would break the enamel off.

PIPE FITTINGS.

The common, Durham, and Sanitas pipes have each fittings for the purpose of making bends, branches, connexions with traps, and fixtures. These fittings are for the same purpose, and are practically the same shape, in each case. The difference consists in the bell and spigot flange and screw ends to adapt them for joining with the pipe which they accompany. In the illustration I have only shown those with the common end.

Fig. 3 represents a number of bends in common use. They are found necessary where a line of piping deviates more or less from a straight line. The return bend was commonly put on the top of the soil-pipe after it passed through the roof. It is rarely used for that purpose now. Branch fittings are shown in the cut (fig. 4). They are made suitable for nearly every conceivable branch from one line of pipe to another. Y branches should always be used in soil-pipes. T-branches can be used in vent-pipes. The detailed view (fig. 4) in connexion with the small sectional view (fig. 1) will show the utility of these fittings. Running traps should always, I think, be placed between the sewerage system of the house and the city sewer. In a majority of cases they are so placed. A few men of standing are opposed to the use of this trap. They wish to ventilate the public sewers through the private houses. This article is not the place to discuss the merits of the case, but I will say that it might be a good idea to omit the trap if the plumbing and sewers were all models of excellence,—a state of things to be hoped for, but not expected. The common types of these traps are shown in fig. 5, with their inlets and inspection holes. One is for pressure-pipe with inspection covers bolted on (B), used by the Durham Company. Another (A) has a branch for the house sewer, an inspection-hole with a trap screw caulked into it, and a branch to receive the fresh air inlet. Inspection-covers are sometimes made in the form of plates with hooks intended to screw on to an inclined plane, a worthless cover. The other two mentioned are good. Decreaser, double hubs, hood, and end are shown in the next cut (fig. 6).

In the last few years small simple devices have been introduced for connecting water-closets with the house sewerage system (see fig. 7). The point to be attained is the same in each case. Not many years ago the stability and immobility of the floor was depended on to keep the joint of the closet perfect. As joists shrink and walls settle, the joints often come open. A piece of sheet lead and putty forms a very imperfect joint. The iron connexions consist of a plate cast on in one piece with an eight or quarter bend. On this plate the closet is bolted, cement being introduced between the flange on the outgo of the closet and the plate mentioned. The face of J. L. Mott's water-closet plate is finished with brass, and the end of the fitting is suitable for caulking into the bell of the common cast-iron pipe. The Durham plate is screwed into their fittings. The Meyer-Sniffen plate is for connexion with a lead pipe. A brass-plate through which a lead pipe is introduced, and to which it is soldered, is bolted to the bottom of the closet. This is clearly shown in the accompanying cut (fig. 7).

Iron pipe is supposed, in the United States, to be much better than lead for soil and waste pipes. Neither rats, mice, ants, nails, or umbrellas can make a hole in iron. There are recorded cases where lead pipes have been

connecting with a Sanitas pipe, the edge of the lead pipe is beaten out until it covers the lead washer. An iron ring is placed over it and the pipe screwed tightly down by bolts. Iron thimbles, with lead sleeve cast around them, have been recently introduced to caulk into iron pipe. A few years ago plain iron pipes were put in position without any coating to protect them from oxidation. Then it was the common custom to have the pipes painted

destroyed by each of the above-mentioned causes. The concentration of carbonic dioxide or carbonic acid gas in sewer air seems to have a decidedly hurtful action on lead pipes when not properly ventilated. There are some interesting specimens in the Museum of Hygiene, U.S. Navy Department, Washington, D.C., full of holes, evidently caused by the carbonic dioxide of sewer air.* Sewer air does not act upon iron in this destructive way. I have seen plain iron pipe (neither coated with asphalt nor paint) taken out without being materially damaged, after years of service. Lead pipe, where carried horizontally, is liable to sag and form traps in the pipe, thus cutting off the air and ventilation. Iron pipe can be carried long distances, forming a perfect alignment.†

GLENN BROWN.

NOTES.

FROM the Vestry of Chelsea we have received an interesting report (drawn up by Mr. Mossop, Chairman of the Electric Lighting Committee, and Mr. G. R. Strachan, Surveyor to the Vestry), for presentation to that Committee, on the Provisional Order for which the Chelsea Electricity Supply Company are making application to the Board of Trade, and which, if confirmed by Parliament, will authorise the Company to erect and maintain electric lines and works and to supply electricity within the parish. The maximum price to be charged by the Company is 10d. per unit. With regard to the conditions of purchase, the Committee had already come to the conclusion that a modification of the stringent purchase section of the Electric Lighting Act, 1882, is necessary, if electric lighting is to be secured to the public at the present time. The section, it appears, is known as the "old iron" section, because it is said, by persons interested in these undertakings, to hand over to the local authority the whole of their plant at the value of old iron. The object of the section is, notwithstanding, as the reporters say, a legitimate and beneficial one, "but its terms are calculated to strangle any attempt to induce the public to invest money under it." "When it is remembered," they continue, "that the science of lighting by electricity has made substantial progress since 1882, that some of the then practical difficulties have been overcome, and that it is now possible to offer a better light at a cheaper rate, and yet, that it is almost impossible to raise capital for electric lighting purposes under section 27, it must be conceded that if the object of the section can be secured, and at the same time its terms widened so as to give reasonable scope to investors, a most desirable end will be attained." In this spirit the reporters have had conferences with the promoters, and as a result submit for the consideration of the Committee a clause satisfactory to them, and which they say should not be unsatisfactory to the public. The clause extends the time of compulsory surrendering of the undertaking to the local authorities from twenty-one to thirty-five years.

TO say that the necessity of the railway companies is the opportunity of the public, may, at the first glance, be called cynical. Yet it cannot be doubted that it is on the occasion of their seeking fresh Parliamentary powers, and on these alone, that the powerful, although not too prosperous, carrying companies that quarter the United Kingdom amongst them, show any marked disposition to listen to the complaints of passengers and of freighters. The prosperity of the railway companies is an essential part of the prosperity of the country. The dividends that they now earn are,—it is not for the first time that we express the opinion,—disproportionately small. A comparison of the English and of the French systems of railway, and of the profits of the respective shareholders,

leaves but little room for doubt that it is to the impolicy of the English railway managers that the comparatively pitiful return that they make to their shareholders is entirely due. And thus, while it is in the interest of the public to oppose the granting of any fresh power to any great railway company without obtaining as the price of it an effectual guarantee, that demand is in the interest of the shareholders no less than of the public.

A SHORT announcement made, very recently in the official *Gazette* of Rome appears to be worth attention in England, for it was to the effect that a concession had been given by the Italian Government to Messrs. Armstrong & Mitchell to erect ironworks at Puzzaoli. The reason for this determination was, of course, not stated; but we fear that it is not far to seek, and that it is only one of many unhappy outcomes of the industrial disputes which have gone so far to ruin England. All readers of the newspapers will remember the miserable strike that for so long paralysed work at the Elswick factory; and one can scarcely avoid coming to the conclusion that the proprietors, like others before them, have determined to transfer some of their operations to localities where the tyranny of the British workman is not felt. The industrial history of England can show many of these examples of late years, by which an enormous amount of capital has been taken away from this country to Spain, France, Belgium, Russia, and elsewhere. The worst of it is, that the conceit and wrong-headedness which produce these catastrophes show no signs of abatement, but rather the reverse. A few more years of this sort of thing and England will have no trade or manufactures remaining to play fast and loose with, as it is not to be supposed that capitalists will go on indefinitely losing money to please the Trades Unions and the self-complacent gentlemen who make their fortunes in connexion with them.

COMPETITION between railway companies, carried on as it has been in well-known cases, results in general loss and in ultimate damage to the public service. On the other hand, in the absence of competition, not only are the utmost legal fares and freights exacted and, indeed, exceeded, but facilities of travel, punctuality, civility, and decent carriage accommodation, all suffer. The contrast as to fares, punctuality, civility, and comfort, for example, which exists between the three northern lines, which now have found a *modus vivendi*, and the four or five eastern, southern, and western lines, which but little, if at all, compete with one another, is patent, lamentable, and, in some sort, disgraceful. But, if such be the case under existing circumstances, what will be the case if the London and Brighton and the London, Chatham, and Dover lines are allowed to get in the small end of the wedge of amalgamation, with the probability that the South-Eastern will be attracted to the union before long? Judging by present experience, the public will suffer. Trains will be taken off, fires will be screwed up to the very maximum. Stock that would be condemned at once on the northern lines will be allowed to run till it shakes itself to pieces. Nor do we think that the shareholders will be the better for the fresh start given for a war between the companies and their customers; that is to say, such we take to be the outcome of the Bills now sought if passed without very well-considered guarantees.

THE Pont Neuf at Paris, as mentioned elsewhere in our "letter from Paris," has stultified itself and belied the Parisian proverb, "Solide comme le Pont Neuf," by showing serious signs of giving way and threatening to disappear bodily into the Seine. Great as have been the transfigurations of Paris, so integral a portion of the metropolitan history cannot be left to be replaced by a modern structure, and it is to be hoped that speedy means will be found for strengthening the defaulting piers. This bridge, however, is not the first of its race, the earliest one having been destroyed by fire and the second by a violent storm. The

present bridge, indeed, dates from Henry III. who, accompanied by Catherine de Medici, his mother, and Louise de Lorraine, his wife, laid the first stone in 1578, though the works were interrupted by civil war, and were not completed until Henry IV.'s reign in 1604. For a long time the Pont Neuf was encumbered with tents, occupied as shops and places of entertainment, so that the bridge became the fashionable resort of the Parisians. The statue of Henry IV., put up by his son Louis XIII., had rather a curious history. It was originally cast by Bologna, a pupil of Michelangelo, for the reigning Grand Duke of Florence; but, on his death, nobody seemed disposed to own it, and it was offered by his successors to Marie de Medici, to whom it was shipped off, meeting with shipwreck by the way on the coast of Sardinia. During the Revolution it was pulled down and the present one erected at the time of the Restoration.

THE cold weather which, even in a comparatively mild winter such as the present is experienced, directs attention to the manner in which railway waiting-rooms are warmed. Of all places in the world they require general warmth, and not a mere local glow. But the great majority of waiting-rooms at railway stations are warmed by means of ordinary fire-places. The consequence of this is that only a small portion of the room is warmed, and the fire is surrounded by some have a dozen passengers, whilst the remainder shiver at a distance. We have stated this generally of railway stations, but as particular instances we may mention Willesden Junction, Watford Junction, Crewe, and Chester. Other stations might be mentioned, but it would only cause us to chronicle an uninteresting list of names. It is sufficient to point out that, as opportunity offers, every station waiting-room should be heated with slow combustion stoves; they would add to the comfort of passengers and save the pockets of the shareholders.

WE print in another column a letter from "A Suburban Builder" in regard to a bill of quantities furnished to him, and which he regarded, and we think rightly, as giving very insufficient information in regard to some portions of the work to be estimated. Quantities should certainly give more detail about the work than is given in the portions quoted by our correspondent from the bill of quantities in question. But if "A Suburban Builder" means to set up the principle, as part of his letter rather seems to imply, that a bill of quantities should be so made out as to dispense with any inspection of the drawings and specification, he is going too far. It is impossible that a building of any elaboration of decorative treatment can really be analysed down into a priced quantity list. The drawings of a building exhibit the style of work as quantities can by no possibility exhibit it: the quantities form an authoritative statement and record of the amount of each portion of work. It is too much to expect that they should be so made out as to fill the whole place of drawings and specification in making an estimate; and we should distrust estimates made without reference to the drawings, on however accurate a bill of quantities they might be based.

THE proposed Italian tour of members of the Architectural Association appears to be in process of getting well and efficiently carried out, with the view of making the most of a necessarily brief expedition. The party are to start on April 17th, returning on May 6th, giving two days to Milan, four to Florence, six to Rome, and touching in swallow flights on Piacenza, Siena, Pistoia, and other towns. It will be a scramble, but a very happy one for those who go for the first time, and who have youth and enthusiasm as companions of their journey. By way of preparing to make the most of it the committee have organised a series of meetings at which each of the towns to be visited will be studied beforehand by the aid of books, maps, and photographs,—an excellent idea.

* A very full description and illustrations of these specimens, by the author, appeared in the *American Architect and Building News*, Nov. 7, 1885.

† To be continued.

M. EUGÈNE GUILLAUME, member of the Institut of France, who was formerly Director-General of Fine Arts, has recommenced his Cours d'Esthétique at the Collège de France, and his recent lectures on the influence of the philosophic schools of Greece in the development of schools of art have contributed to maintain the high character of that too little known educational institution. Plato and Zeuxis, Aristotle and Lysippus and Apelles, Plotinus and the artists of the Alexandrine School, have in turn served the eminent Professor with subjects for very thoughtful studies, in which he seems to have established beyond question the parallelism which existed between the philosophic doctrines and the artistic conceptions of ancient Greece.

THE publication, in facsimile, of some of William Blake's extraordinary illustrated manuscript poems, edited by Mr. W. Muir, and published by Mr. Quaritch, of which some books have already appeared, is, we hear, in process of continuation, and the works to be brought out (it is hoped) during the present year are "Milton," "Europe," "The Song of Los," and "There is no Natural Religion." We mentioned the reproduction of the "Book of Thel" some time since. The new reproductions, like the previous ones, are to be confined to fifty copies for subscribers only.

WE are glad to learn, from a letter from Dr. Villiers Stanfor in the *Times* of Wednesday, that a committee has been formed for erecting a monument in Cambridge to the great composer of the "early English" period of music, Orlando Gibbons, who was horn at Cambridge in 1583. Gibbons was, in his way, one of the greatest masters of "tone-structure," and his memory well deserves the honour of such a commemoration in his native place. The proposed site for the monument is opposite King's Parade, and it is proposed that it should be in the form of a statue by Mr. Hamo Thornycroft. No fault can be found with the choice of a sculptor; but considering the unfavourable effect of the weather on open air statues in England, would it not be better to place the statue in the antechapel of King's (where Gibbons was a chorister), where it will be protected from the atmosphere, and where the composer may seem still to hear the voices winding through the vocal mazes of his own "Service in F," dear to all church-musicians? The proposal to place on the pedestal a portrait in relief of Sterndale Bennett (another old King's chorister), which Dr. Stanfor also makes, is unhappy, and has already been called in question. Bennett was too original a genius to be placed as an accessory on the pedestal even of Gibbons; and, besides, the art of the two men had little in common; Gibbons is Gothic, Bennett is Renaissance; for these types of art have their parallel in music, though not in the same chronological periods.

THE DISTINGUISHED AMATEUR.

"He was never suspected to love anybody, nor to have the least propensity to charity or compassion."

Clarendon.

THE amateur architect differs in kind from all other amateurs; for whereas they are content to sit at the feet of the great masters in the arts which they severally affect,—regarding with a becoming reverence achievements which they can never hope to rival,—he thinks lightly of the regular professors of art, holding them to be a stupid and infatuated race, and looking down upon them with a lofty scorn.

In assuming this attitude the amateur architect is distinctly original; for the ordinary amateur is confessedly an imitator. The Hamlet of the book-drawing-room will copy even Mr. Irving's limp, and the tenor of private life embellishes with reminiscences of Mr. Sims Reeves his otherwise artless performances. But the amateur architect is above such weaknesses, and, he be what he may, he is no plagiarist. It may be at once conceded that his works bear no resemblance to those of the architect by profession; that is, when the amateur is so ill-advised as to commit himself to practical work. As a rule, he is content with

the safer position of being the reputed cause of what is good in the works of others, giving out that their successes are due to his inspiration, and their failures the result of the rejection of his guidance. As a man of "words, not deeds," his position is secure, and foolish is the architect who allows himself to be drawn on to the attack. Education of a special kind and a particular experience give the amateur a clear advantage in such encounters over the student or man of business. Of the chivalrous conduct of a disputed question of art or taste he has no idea. He cannot see two sides to any question, and despises the mutual courtesies and concessions which take the edge from such contests. He gives no quarter, and, it is only fair to add, desires none. As was said of an equally distinguished predecessor, he has no "propensity" to charity, unless, indeed, it be to that spurious kind of charity which does think evil, and is very much puffed up.

He is generally rich, and a liberal cheque introduces him to committees charged with the restoration of public monuments. Once these matters quickly assume a warlike tone. He has views, which he expresses vigorously, and his views are, it appears, the only ones which sensible men can entertain. Unfortunately dissentients are dragged into the columns of the leading journal and presented with the alternative of being either rogues or fools. For such exciting word-combats he is excellently equipped, and few, indeed, can long endure the cutting east wind of his ridicule and invective. He convinces no one, it is true, but he silences all, talks the weak ones over and the strong ones down,—and comes out of every fray elate with victory and eager for fresh strife.

But "silly Samson was shorn," and the amateur architect has been known to be so imprudent as to risk his reputation on bricks and mortar. There is no example of a successful amateur architect, Lord Burlington notwithstanding; for no one can say positively whether Kent was not the real author of the works which are connected with the Earl's name. The amateur who builds is lost. All his dialectical skill avails not, nor can he persuade the world that the monstrosities of which he assumes the paternity are works of art. His strong points stand him in no stead, and the bitter tongue, the rankling innendo, the scathing satire, are powerless against the evidence of stone walls. He shows himself as unwise in fighting architects on their own ground as they are in meeting him upon his. His discomfiture is complete, and yet it cannot be contemplated without a degree of regret, for he has redeeming qualities,—undaunted courage, and a frankness in his civilities, the virtues of an open foe. How can abilities of such an order be directed in a useful channel, or be provided with a harmless escape? Their unregulated and unrestrained exercise is plainly harmful. The dabs of the amateur painter may be torn up; the poet's verses have their immemorial use. The tuneless song dies away upon the ear and is forgotten, and one recovers in time from the depressing efforts of the amateur comic reciter. But the works of the amateur architect endure at least for his lifetime and are a weariness to all but himself. So long as he merely wastes his means on a Fonthill or such like folly the result may be borne with a patient shrug; but there have been cases in which the amateur has disgraced the designs of real architects, or, worse still, laid sacrilegious hands on the works of old. In these cases a feeling stronger than that of regret will assert itself.

Could not some island,—Coventry Island, say, or Barataria,—be placed at his disposal? He might build there to his heart's content, and no one but himself be one penny the worse. The new buildings would be removed by the next generation, and there would be no ancient ones to "translate." Failing that, there are moderately unfrequented tracts in the Northern parts of the kingdom where his doings would dismay none but the red deer, and where his hobby could be ridden without public danger.

Upon what theory can one account for the aberrations of genius? Why do men who are great in the career for which they are fitted prefer to appear so very small in careers for which they have no aptitude? The amateur architect of the period is a combatant, and has no single attribute of the peaceful and peace-loving artist. He is an anachronism, and should have been a Border baron in the good old days, the

companion of "Stout Willemondswick" and "Hardriding Dick," and the rest of that pugnacious and impetuous band. In these tamer times his peculiar genius has but a limited scope, and expends itself in acrid words, digging deep into all mankind with a pen for want of a sword. Such abundant energy would be worse than wasted but for the fact that he keeps up a pothier about art before a public who might otherwise not think about it at all. Although his antics have a serious side, he has added considerably to the world's amusement; and at this season of the year we extend him a reasonable measure of goodwill, although he has done all in his power to make "peace on earth" an impossibility, at least for architects.

LETTER FROM PARIS.

THE grand ball at the Tribunal de Commerce was the first of the fêtes intended to console the Parisian population in their numerous troubles. With the Christmas and New Year's rejoicings we have entered on a new phase of the programme, and the Palais d'Industrie finds itself transformed for twelve days into an immense *kermesse* of the gayest and most picturesque aspect. We pass over, as is most suitable, the concerts and theatrical performances and other attractions, to speak of the artistic decoration of the Palais. In order to cover the immense wall surface of the large nave, transformed into a winter garden, the committee asked for the loan from the State of the historic tapestries, and had the good fortune to be seconded by M. Williamson, the curator of the Mobilier National. Here was an incomparable collection of textiles of Gobelins, Beauvais, and la Savonnerie, absolutely unknown to the public, and which was itself a sufficient attraction to the fêtes. This exhibition is an absolute revelation to the art-world, and a great source of instruction to our schools, and of decorative art. The artistic genius of the seventeenth and eighteenth centuries appears here in all its splendour, and one could not but ask, in looking at these tapestries of such rich and yet pure style, these compositions of such power and originality and such warm and harmonious colouring, if modern civilisation, with its mechanical achievements, was not a decadence by the side of these vigorous conceptions of the master-workers of past generations.

While these fêtes are being organised for the profit of hands out of employ, the Municipal Council of Paris is engaging in useless discussions. It is not the part of a great municipality to settle questions of wages, to limit the hours of labour, and fix the price of a day's work,—to make itself, in fact, the promoter of a State Socialism. All one can ask of them is to promote, by their votes, the undertaking of great public works, which alone can bring prosperity to the mere workman, whom Utopian theories do not affect at all.

To the oldest among these the "Union des Chambres Syndicales du Bâtiment" decreed the other day their rewards. As before, at the "Société Centrale des Architectes," we have seen the veterans of the workshop come forward and receive the consecration of a long life of honourable labour. "Let us be united, my old comrades," said the President of the Chambres Syndicales, in a hearty extempore address, "the times of hate and discord are no more,"—an optimistic affirmation which is, unhappily, only the illusion of a generous nature.

Let us mention, in connexion with this subject, the exhibition organised in the Salle des États at the Tuilleries by the syndicate of contractors for public works. In an epoch like our own, where the most gigantic works are undertaken without hesitation, and the impossible has almost disappeared, it is of the greatest interest to study the means employed, and the implements whereby the most difficult operations are realised.

The exhibition referred to does not include the implements themselves, it is true, but plans, drawings, photographs, and models, executed with the finish of jewellery, which permit the public to study in all their details the apparatus and their application. We may mention especially the retrospective exhibitions of implements of the last century,—a saw-mill, models of dredgers, of excavating machines, of draw-bridges, and especially a model of the suspension bridge at Cabyrac (Dordogne), which is a curiosity of the South of France.

On coming out from this exhibition we have ocular evidence that the work on the monument to Gambetta is in full swing. The main part of the work is already completed, and the "ornamentists" are executing the decoration of the pyramid which is to complete the groups in bronze executed after the models of M. Aubé. The monument will be placed in the centre of the Place du Carrousel. As there is also the Monument of the Revolution of 1789 to be erected on the site adjoining the Tuileries, there will be there, with the Arc de Triomphe already existing, a complication of architectural lines which may produce rather an awkward effect, especially if the Administration establishes, as is proposed, a row of porticos along the street of the Tuileries, leading from the Pont Royal to the Rue de Rivoli.

But these are only projects; there is many a slip between the cup and the lip with them. It is the same with the decoration of the Pont de la Concorde, so many times attempted, and which has again come up for discussion. Sandry journals are demanding that there should be placed on the pedestals which ent the parapet at regular intervals, statues of the great men of the French Revolution. This would only be a repetition of what previously existed. But the former statues on the bridge produced so bad an effect that they were removed to the Cour d'Honneur at Versailles. Since then, the Commission de Beaux-Arts has vainly tried many schemes of decoration, especially that of great pylons decorated with allegorical figures. They even put in position, in 1877, models designed by Duc, the celebrated architect of the Palais de Justice; but the idea was abandoned, and we may hope that the "Gloires de la Revolution Française" will not step on the pedestals to obstruct the view of the Seine and of the monuments which border the quays.

We doubted last month, in speaking of the fêtes projected on the Pont Neuf, that the slow but progressive decay of that ancient monument would interfere with a very interesting part of M. Alphand's programme. The city engineers, it is true, maintain that the circulation of traffic can soon be re-established without danger; but the work of consolidation is not making great progress, and the demolition continues while the probable causes of the accident are discussed. Is it the rupture of the pile work or the sinking of the ground which supports the piles? Whatever it is, it is much to be regretted, on both historical and architectural grounds; for the Pont Neuf, from its antiquity, and the recollections connected with it, is one of the most interesting monuments of Paris. Commenced in 1578 by Androuet Du Cerceau, it was completed in 1604, under the direction of Guillaume Marchant. Germain Pilon ornamented it with masks of remarkable workmanship; and two eminent engineers, M.M. Michal and de la Galissière, restored it completely in 1818. To the Pont Neuf belong also the recollection of the Samaritaine, that also celebrated fountain whose carillon rang joyously at all public ceremonies, and especially when the king passed by. Here is a whole world of associations which will disappear unless one can fetter the destructive hand of time.

As this unforeseen event will modify certain portions of the intended fêtes, an electric installation at the Hôtel de Ville has been hastily got up, in view of a grand charity ball.

The decision has been given, a few days since, in the matter of the competitive designs for a monument to Rousseau, of which we have formerly spoken, and the situation for which was not fixed upon beforehand. Voltaire has already his statue on the Quai Malplaquais, on the left of the Institute; why not place Rousseau in the corresponding position on the right? In this way the homage would be conformable to historic traditions, and the two great men, who professed such a violent aversion to each other during life, would continue, after death, to turn their backs on one another.

M. Berthet, who missed the prize in the Étienne-Dolez competition, has obtained it in this case. His work is an honourable mediocrity. The expression is feeble, the modelling correct, cold, without any of those accentuations which give character to a work and raise it to the level of originality. The same commonplace character belongs to the model by M. Larche, who wins the second prize; and, in fact, it is the third premiated design which most attracts us. This is by M. Steiner, whose model is good and without pretension, excel-

lent in anatomy, the draperies broadly treated, and the general effect far more vigorous than the two which have, nevertheless, been preferred.

In speaking of sculpture, we may note in passing that the statue of Claude Bernard will shortly be placed on the top of the flight of steps leading from the Rue des Ecoles to the Place du Collège de France.

There has been much talk lately about the six "Old Masters" offered by subscription to the Louvre, the authenticity and artistic value of which were very doubtful. The close examination to which the conservators of the museum have subjected them has justified this instinctive mistrust, and of this "magnificent donation" the State has retained only three which are "attributed to" Crivelli, Lucas Gassel, and Fra Angelico. The others are utterly appropria-

ble to announce the speedy opening of the Musée de Luxembourg, which forms a symmetrical ensemble composed of the gallery (properly so-called), of the orangerie, and the two other galleries detached from it at the two extremities and slanting on the railings of the Rue de Vaugirard. Between the three blocks of buildings a space is reserved of about 7,000 square metres, adorned with shrubs and lawns, on which are to be placed bronzes and marble statues. In this manner modern art will be "chez-lui," and will have no occasion to demand of the conscript fathers of the Senate a hospitality which they bestow with such a very bad grace.

One cannot address a similar reproach to the Municipal Council of Paris, which, in its rather ill-advised zeal as an inexperienced Mécenas, is again about to lend the Pavillon de la Ville (on the Champs Elysées) to independent artists. We are threatened with an exhibition there which in a way will be interesting, and which, if it coincides with the opening of the Salon, will be in reality an exhibition *des refusés*.

Another exhibition now open at the Galerie des Artistes Modernes, in the Rue de la Paix, is a collection of the pictures and studies of Berchère, the remarkable Oriental artist. The collection will remain on view till the 16th of January.

In continuation of its work of popular instruction, the Administration of Paris is about to place at different points in Paris commemorative tablets to recal the existence or the death of various celebrated persons. Thus, on the Hôtel des Postes, Rue Jean Jacques Rousseau, an inscription will record that here once stood the house of La Fontaine of the fables. Other tablets will mark the house where Admiral Coligny was assassinated (144, Rue de Rivoli), and the theatre where the king's comedians (Comédiens Ordinaires du Roi) played from 1689 to 1770 (Rue de l'ancienne Comédie, No. 14). These commemorations of the past are excellent, and we approve equally the inscription which records, on the Quai de la Conférence, the monumental gateway constructed 1632 by the architect Pidoix, and which was destroyed in 1730. We do not say so much for the revolutionary souvenirs with which the Musée Carnavalet continues to enrich itself.

We may accept the sword of honour, offered by the Directory to Masséna after the Italian campaign. It recalls some national glories and the worth of a general who was surmamed "L'enfant chéri de la Victoire." But, in all conscience, is it worth while to purchase, as is threatened, the bath in which Marat was stashed by Charlotte Corday? Apart from the question of the authenticity of this wretched relic, what interest has it for the history of France? After the fall of the Empire, the first care of the Government was to scatter to the four corners of France the museums of the sovereigns which had been laboriously collected at the Louvre. There were among this collection remarkable works of art and very curious relics. The Republican press, Heaven knows, has been lavish enough of its sarcasms about the trappings of the monarchy, the perquisites of Louis XIV., the "Gibus" of Mary Antoinette, the little hat and legendary grey overcoat of Napoleon; and here are the same kind of vagaries beginning over again without even a shrug of the shoulder: only for the relics of monarchies it is found suitable to substitute a revolutionary frippery, which has not even the attraction of rarity or curiosity. So true it is that in France we keep turning always in the same circle, with the regular routine of a horse in a training yard.

We have again two deaths to register in an artistic obituary. M. Joseph Beaune, historical painter, who has died at the age of eighty-nine, was author of many military pictures at the Versailles Galleries. He was a pupil of Gros, and obtained a second medal in 1824 and first medal in 1827. One of his principal works was a picture exhibited in 1822, representing the death of Henri III. He was born in 1796. The architect Labronste, who is dead at the age of eighty-six, as already mentioned in the *Builder*, was a pupil of Vandoyer and of Hyppolite Lehas. He gained the "Grand Prix d'Architecture" in 1827, and in his later years filled the situation of the Arsenal and of the Collège Ste. Barbe, of which his brother had been the director.

We have mentioned that M. Chaplain, the eminent engraver, had been commissioned by the Municipal Council to execute a medal for a medal commemorative of the Hôtel de Ville. This medal, which is to be presented to the President of the Republic, the members of the Parisian Municipality, and the principal functionaries, bears on its front face a seated figure personifying the City of Paris, and pointing towards the imposing perspective of the new palace. On the reverse, an inscription surrounded with leaves of laurel, gives in relief the names of the two architects of the Hôtel de Ville, M.M. Ballu and Deperthes. These two architects were equally winners of the first premium in the competition, and shared equally the premium, although for the more systematic carrying out of the building it was thought necessary to name one of them, M. Ballu, architect-in-chief. The inscription engraved by M. Chaplain on the reverse of the medal is, therefore, only the legitimate expression of the union of these two architects in a common work, which will remain one of the most remarkable of its age.

Illustrations.

THE NEW HÔTEL DE VILLE AT NEUILLY.

IN Paris, as in London, the current of population sets towards the west.

While the southern and eastern quarters of the city remain stationary, the diametrically opposite *arrondissements* are spreading up to the fortifications, and only await the inevitable abolition of those useless ramparts to extend still further towards the setting sun. This fact alone explains the enormous impulse given during the last ten years to the surveying and building in the 17th *arrondissement*, in consequence of which the present magnificent quarters which cover the plain of Monceaux have risen from the earth, and this is also the reason why Neuilly-sur-Seine, the most Parisian of all the suburban communes, grows more beautiful, more populous, and more extensive every day. The proximity of Paris and of the Bois de Boulogne, the multiplicity of the means of transport, the shady boulevards bordered by elegant villas, have made this pretty suburb into an aristocratic faubourg, and the chosen centre of a numerous foreign colony, in which the English element predominates.

Menced by its situation itself with future annexation by Neuilly, which by no means intends to be incorporated with Paris, has from its own resources, and as a kind of protest, raised a town-hall of an importance far exceeding that of other similar monuments in the suburban zone.

The well-proportioned façade of this town-hall is to be seen in the Avenue du Roule, in the very heart of the Commune. The edifice, which was opened in September last, was, in 1879, the subject of a public competition, in which more than sixty competitors took part. The winner, M. G. André, a pupil of M. Questel's, not being able, in consequence of other engagements, to leave Lyons, where he practises, to come to Neuilly to personally take charge of the work, was replaced by MM. Dutoeq and Simonet, who, while respecting the grand outlines and proportions of the façade of the premiated design, were happily inspired to increase its decorative value by various and skilfully-devised additions.

The principal façade, which is 40 metres (about 130 ft.) long, comprises a centre portion raised on a flight of ten steps and flanked by two great angle pavilions. Three semicircular

arches, filled with wrought-iron grills, give access to the interior and are separated by niches intended to receive statues.

The simplicity of the lines of the ground-floor give value in a happy way to the architectural richness of the upper part, which consists of a Corinthian order, between the columns of which are rectangular mullioned windows. This colonnade supports a frieze, magnificently carved by E. Barrias, the whimsical bas-reliefs of which, consisting of children playing among foliage, surround the angle pavilions for a length of 70 metres. Above is a balustrade, and in the middle of it a clock, which M. Tony Noël has ornamented with two recumbent statues representing the rights and duties of man. On the right and left of the dial are two elegant figures carved by the same artist and symbolical of Day and Night. Of these sculptures we give a separate illustration on a larger scale. Owing to their elevated position it was impossible to get a photograph of the actual work as completed, and our engraving has been made from a photograph of the original model in clay. This was not entirely finished in all details, some of the lesser details being only roughly indicated, but the figures were complete as here shown.

Rising above the centre of the roof behind the clock is a turret, 42 metres high from the ground, and evidently inspired by that of the Hôtel de Ville at Paris.

Mansard roofs surmount the angle pavilions, which are decorated in three distinct ways: in the lower part allegorical bas-reliefs, by M. Charles Gautier, crown tablets intended for the posting of public notices. At the first-floor level composite pilasters flank a large mullioned window, the projecting balcony of which is carried by consoles; above the cornice rises a dormer, with a triangular pediment ornamented with little vases at the angles and on the apex.

The sides of the building are extremely simple. Three tiers of windows (round-headed on the ground-floor, rectangular and with projecting balconies on the first floor, and dormers in the roof) form the only decoration. On the rear façade appear again, with a sobriety that gives further value to the richness of the principal one, the arrangements which we have described, with a central portion facing a large court recessed between two wings which form the pavilions.

The interior of the building is equally well arranged for administrative purposes and for public ceremonials. After mounting the flight of steps at the entrance, one penetrates into a large vestibule decorated with Composite pilasters, and out of which rises a staircase of white stone, the straight, parallel steps of which lead to the reception rooms on the first floor. There one finds the staircase surrounded by a gallery, square on plan, the open balustrade of which is broken symmetrically on each face by the pedestals of a great semicircular arch. The piers of this arch, which is ornamented with a deeply-cut carving, are pierced, each with a smaller opening flanked by pilasters supporting a cornice which receives the transverse arches of the vault. This arrangement is reproduced on the side walls, with blank arcades flanked by rusticated Ionic pilasters. Above is a frieze, decorated with escutcheons, fruit, and interlacing figures.

The gallery is paved with Venetian mosaics, executed by M. Facchina. It gives access at once to the offices of the *État Civil*, to the private room of the mayor, and to the salons, the largest of which occupies the whole of the first floor along the principal façade. It is entered by three doors, with moulded architraves, surmounted by pediments, each with a cartouche and a very rich frieze. This salon has two large chimney-pieces and high wainscotting, the panels of which are decorated with escutcheons, with a monogram composed of an N and two S's interlaced (Neuilly-sur-Seine), which occurs also on the escutcheons of the façade and on the door-handles.

The *Salle des Mariages*, situated in the pavilion on the left of the façade, is decorated with a marble bas-relief by M. Gaudex, symbolical of the family. Here the arrangements made by the architect show evidences of the influence of the feeling of the times; for this apartment is terminated at one end by a great arch draped with curtains, which give to the platform occupied by the mayor a false resemblance to a Jewish Tabernacle, and the effect of a "lay sanctuary" well calculated to rejoice the hearts of the apostles of free thought.

The other pavilion, reserved for the sittings

of the Municipal Council, plays at Parliament *au petit pied* with its semicircular ranges of tables and seats, its raised desk for the President, and even its public gallery, open to all the idlers of Neuilly. This salon contains another bas-relief by M. Gaudex, symbolising the Republic. Let us add that the architects have had the rare good fortune to fall in with a carver, M. Ledru, of the highest talent, who has devoted himself to the work and has decorated the architraves of doors and windows, the arches of the staircase, the cartouches of the façades, and even the chimney-stalks, with carving distinguished by an originality inspired by the best periods of the French Renaissance. One could not too highly praise the finish of all the details of this harmonious building, both within and without.

Thanks to the talent of the architects, to their experience, and the prudence with which they have realised the original project of M. André, the carrying out of the work has not been attended with any of those frequent miscalculations of which municipalities complain, and the total cost has not reached a million and a half of francs, or about 1,200 fr. per superficial metre.

In this figure, it is true, is not included the pictorial decoration of the salons. The reception-rooms, as well as the ceiling of the staircase, offer grand surfaces, well calculated to tempt the brushes of the best artists. Here is matter for important decorative work which the Conseil Général de la Seine will shortly be called upon to give commissions for, either after a public competition or without one. We do not hesitate to say we should prefer the latter mode of procedure.

R. B. FENWICK.

SCULPTURE, GENERAL POST OFFICE, SYDNEY.

THIS group of sculpture forms the decoration of the principal entrance to the new Post-office buildings at Sydney, New South Wales, of which Mr. Jas. Barnett, the Colonial Architect, is the architectural designer. The group here given, however, has been executed in London by Signor Giovanni Fontana. It represents a seated figure of Her Majesty in her robes as Queen and Empress, while beneath are allegorical figures representing Britannia and New South Wales clasping hands.

The group is engraved by Mr. J. D. Cooper, from a photograph.

"CHURCH AND STATE."

THOSE who have visited the ancient towns of the Low Countries and of Northern Germany must have been struck by the way in which the great ecclesiastical and secular buildings are grouped together. On one side of the great square, or principal street, we find the noble cathedral, or collegiate church, the home of piety and religion, on the other we see the great secular building of the town, the "Palais de Justice," the "Hôtel de Ville" or the "Rathhaus," representing the dignity and authority of the secular power. There can be little doubt that it is by no mere accident that these two edifices are so closely associated, and that they were to a great extent intended as a comment on those words of Scripture, "Render unto Caesar the things that are Caesar's, and unto God the things that are God's."

In such times as the Middle Ages, when men were more deeply impressed by external objects than they are in our days,—when an appeal was made directly to the mind by the visible creations of art, by stately buildings, pictures, and sculpture, rather than by books, which few then possessed, or could have read if they had possessed them,—these kinds of association had an immense effect upon the imagination, and did much for the cause of religion and social order.

We are too much in the habit now of regarding such aids to sentiment as somewhat perilous and childish, and of looking upon our mediæval ancestors rather in the light of grown-up babies than as reasoning and sensible men, but it may be doubted whether we have not sacrificed to mere commercial interests those fascinations which noble and dignified art has at all times exercised over the imagination. This is very obvious when we visit any of our English manufacturing towns, for in

to the imagination. We are, however, beginning to see that, after all, beauty and poetry are two necessities of the happiness of human beings, and that man does not exist merely for the purposes of money-making, that there are other things to be thought of besides the commercial prosperity of the community. No one, for instance, can read the description of a manufacturing town given by Charles Dickens in "Hard Times" without a feeling of pity for the human beings whose daily life is passed amongst such appalling hideousness, and a detestation for the men who grow rich upon the toil of the wretched inhabitants, and who, by indifference and selfishness, condemn them to an existence amidst such unlovely surroundings.

A prospect of better things seems to be in view, and the many handsome new town-halls, municipal buildings, museums, picture galleries, exchanges, &c., which are rapidly growing up in such towns as Liverpool, Birmingham, Leicester, Sheffield, and Preston, together with the proposal to erect a stately cathedral in Liverpool, show how much we are in advance of our fathers in this respect. Still more, however, will be required, and greater sacrifices be demanded if the future generations of Englishmen are to become contented, and are really to enjoy the wholesome pleasures of life. We must not only put up handsome buildings in our towns and cities, but those buildings must be erected upon important and noble sites, not hidden away in back streets; and this, no matter what the cost of obtaining such sites may be. The fact is that all our manufacturing towns require to be thoroughly remodelled; they ought to be, and must be, made dignified and magnificent. Why should our manufacturing towns, with fifty times the wealth ever possessed by Ghent, Bruges, Liege, and Louvain, be more remarkable for squalor and ugliness than for grandeur and magnificence?

Unfortunately, our old English cities, beautiful as they often are, do not offer us many examples of municipal or commercial architecture, and the English cathedrals are, in nearly all instances, cut off from the towns by their great "closets." Now, superfluous as this arrangement undoubtedly is, it is one that is impossible to copy at the present day. The ancient English municipal buildings are small, and too unimportant for our present purposes, consequently that proximity and grouping together of vast secular and ecclesiastical edifices, which forms so notable a feature in many Continental towns, is not to be met with in this country; and in order to see what can be done in this way we are obliged to study the Flemish and German cities of the Middle Ages.

The Flemings were, like ourselves, a busy, thrifty, commercial people, not given in any way to highly poetical imaginings, or even to a love of art for its own sake; they were, moreover, an extremely practical people very fond of money, and strongly objecting to part with it: they were perhaps the very last people in Europe whom we should have expected to have made great sacrifices in the cause of art, or to have allowed their convenience to "play second fiddle" to picturesque or elegance; yet they saw the necessity of rendering their towns fair and pleasant homes of industry, and considered it more wise to make them attractive than disgusting and repulsive. It never entered into the mind of a Fleming that a human being could, by any possibility, exist in a place which was only remarkable for dinginess, dirt, and hideousness; and because a man's life was spent in toil and labour, they considered that the surroundings of that toil and labour should be as little repulsive as possible, and that he should enjoy as much of the social decencies of existence as was possible under the circumstances. The consequence was this, that with the most unpromising circumstances they produced such painters as Memling, Van Eyke, and such musicians as Roland Lassus (Orlando de Lasso), and Giaches de Wert, and all their numerous followers. They had their own school of architects, sculptors, and glass-painters, to say nothing of poetry and romance-writers, and thus, notwithstanding their somewhat horrid manners, unattractive external appearance, and habits of turbulence, they have left the world a legacy of poetry, music, and the fine arts second only to that of Italy. Does not this point out to us that, if we want our factory hands, and labourers, the British "proletariat," and even the British rough, to become valuable members

of society, and to benefit the human race by their existence, we must surround them with objects that are humanising and impressive, instead of with repulsive hideousness, dinginess, dirt, and draggletail? If we do not give our working man the decencies of existence he is certain to console himself with the indecencies, and the wonder is not that he is occasionally given to habits of intemperance, but with his dismal surroundings, that he is not in a state of perpetual intoxication; and the more his mind is improved by education the more unendurable must be his disgust with these things and the greater the temptation to blot them out by oblivion and insensibility. We have given the working classes political independence and education, but these will not add to their happiness and contentment unless they are surrounded by those objects which educated men require as food for their minds. Good taste is to a great extent the result of education, but it simply adds to a man's misery to be able to appreciate the squalour which surrounds him without having at the same time power to alter or amend it.

Our drawing is purely a composition, none of the buildings being copied from any existing edifices; though the "Palais de Justice" in general arrangement follows the type common amongst secular buildings in the low countries, and is in the style of the latter part of the fourteenth century. The portion of the cathedral or church shown is supposed to be a western porch with a triangular projection over it, somewhat similar to the end of the north transept at Erfurth, though in this case the porch itself is not triangular. H. W. B.

WHITEHALL COURT.

We illustrate this week a view of the important block of buildings now advancing above the Embankment Gardens on the large site bounded on the east by the Public Gardens facing the Victoria Embankment, on the north by Whitehall-place, and on the west by a new avenue which will lead from Whitehall-Place into Whitehall-yard and thence into Whitehall and opposite the Horse Guards.* The house at the corner of Whitehall-yard, occupied for so many years by the family of Lord Carrington, will be pulled down, and the site thrown into Whitehall-yard, thus forming a wide and grand approach to the new street to be called Whitehall-avenue. In order to form an approach from this new road direct on to the Embankment, a Bill is now before Parliament for the purpose of taking Lord Gage's and other houses, and forming the Horse Guards-avenue. Whitehall-court will adjoin the new National Liberal Club, which is shown at the right hand of our illustration, but in the design of which some modifications have been effected by the architect, Mr Alfred Waterhouse, the two buildings in fact completing the facade shown in our illustration. The architects of Whitehall-court are Messrs. Archer & Green, whose plans provide suites varying from seven to twenty rooms. Each suite will be inclosed within itself; every suite will have a distinct front entrance, and in fact, except that every four suites will be entered from a common landing, they will virtually be separate and complete houses, as distinct as if they were standing side by side with each other in a West-end street. The mansions will be eight stories in height, including the basement, and the Court will be divided into six blocks, each with a front entrance opening upon a central hall. All the tenants, of course, will have access to the terrace. There will be three classes of suites, and the rents will range from 300l. up to 800l. a year, the accommodation given for the latter sum consisting of two entire floors on the first and second stories. From an "Approximate Estimate of Rentals" we learn that for sets of suites on one floor, comprising an entrance vestibule, a hall 10 ft. 6 in. by 10 ft., a dining-room 25 ft. by 13 ft., a drawing-room 20 ft. by 16 ft., one bedroom 23 ft. by 11 ft. 6 in., two bedrooms 14 ft. 6 in. by 11 ft., a servant's bedroom 10 ft. 6 in. by 6 ft., a kitchen 14 ft. 6 in. by 8 ft. (opening upon a service-room), a bathroom 14 ft. 6 in. by 7 ft. 6 in., &c., all the rooms being 10 ft. 6 in. high, the rental will probably be, on the ground-floor, 400l., on the first and second stories, 500l., on the third and fourth stories, 400l., and the sixth, seventh, and eighth

stories, 300l. per annum. The whole of the buildings, including the staircases, will be built of fire-resisting materials, the floors being specially designed to prevent the transmission of sound from one occupation to another. The elevators will be of such construction as to ensure absolute safety in their working. The several façades will be of Portland stone, and the roofs covered with green slates.

STREET ARCHITECTURE, BERLIN.

Up to the year 1870, while Berlin was the capital only of Prussia, modern architecture was completely under the influence of the Academy, an institution for the instruction of the official architects of the Prussian State, in which the pupils were exclusively taught the fixed principles and cut-and-dried rules of Classic architecture, as formulated by Schinkel. The consequence was a succession of public and private buildings destitute of originality, which, albeit professing to be imitations of Schinkel's learned and often refined work, were calculated to bring the whole school of Berlin architecture into discredit. Especially harmful was the indifference displayed with respect to the treatment of material, and the complacency with which the immortal forms of Classic architecture, generally of the age of Pericles, were reproduced in characterless and perishable stucco work. Prussian infallibility overlooked the fact that the architectural schools of the other German capitals, — Vienna, Munich, Stuttgart, Dresden, and Hanover, — were encouraging a careful study of the architecture of

capital many highly-accomplished architects, and thus we cannot wonder that at the present moment a long list of candidates for fame are arrayed against each other, and although, as we have already remarked, their artistic impulses take the most varied form, they are at one in their desire to build what will last, and to take into account the materials with which they have to deal.

The illustration which we give this week affords a good example of the new tendency in Berlin architecture. It represents the business premises of the well-known Nuremberg firm of drawing material manufacturers, Messrs. A. W. Faber, and was the successful design in a competition set on foot by Baron von Faber among the members of the Society of Architects in Berlin. (We append plans of three of the floors of the building.) The architect, Herr Grisebach, belongs to the Hanoverian School, but worked for several years in Vienna under Friedrich Schmidt, and designed a number of private houses in Wiesbaden and Coblenz before settling in Berlin. His style has been largely influenced by his study of German and Belgian works of the sixteenth century. Hence we have a free and judicious architectural treatment, producing a rich yet unobtrusive effect, in striking contrast to the pedantic style to which an exclusive devotion to Classic models infallibly leads.

DESIGN FOR STAINED GLASS: "THE RETURN OF ALSACE AND LORRAINE."

This design, by M. Wagnez, is the one referred to in "Our Letter from Paris" of Nov. 7, 1885, in the description of the stained-glass exhibits in M. Champigneulle's room at the "Exhibition du Travail" held at that period in the Palais d'Industrie. Our able Paris correspondent, in sending us a photograph of the cartoon, expressed his regret at the use of art for the expression of political feeling, with which art has really nothing to do. We concur in his opinion; but the whole design is so spirited, and the group representing France and the two provinces, — the mother-country receiving back her daughters, — is so expressive and so admirably composed, — that we believe all our readers will concur with us in thinking the design well worth publication.

THE FORTH BRIDGE.

We give in this number a series of illustrations of the making and launching of the caissons for the foundations of the piers of this immense work, and two sheets of the working drawings of the iron work, all which are reproduced from drawings made in the engineer's office, and kindly lent by Mr. Baker for a portion of the bridge as it will appear when completed, along with the adjoining coast; this is reproduced from a photograph of the site, upon which the bridge has been drawn to the proper scale, in order to convey an idea of its magnitude in reference to the surrounding country, in which respect it casts into the shade any other engineering work of modern times; and this view will enable readers to understand the complaint which Mr. Baker informed us was made against him by an inhabitant of the district, who objected to his coming there and "dwarfing the hills."

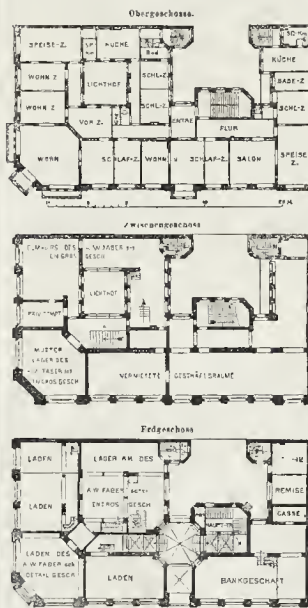

Some of the principal practical details we extract from one of several papers on the design and construction of the bridge, read by its engineer before those who were desirous for detailed information in regard to it.

Five tenders were submitted for the construction and erection of the bridge, the amounts varying from 1,487,000l. to 2,301,760l., and the contract was finally let to Messrs. Tancock, Arrol, & Co., on the 21st of December, 1882, for 1,600,000l., which was within 5,000l. of the estimated cost of the work, as prepared by Mr. Fowler and myself for Parliamentary purposes.

The total length of viaduct included in this contract is about a mile and a half, and there are:—

	2 spans of 1,770 ft. each.
2	" 675 "
15	" 368 "
5	" 25 "

Including piers, there is thus almost exactly one mile of main spans, and half a mile of viaduct approach. The clear headway under

the Middle Ages and the Renaissance, and were making this study the foundation of a more novel and more suitable modern style.

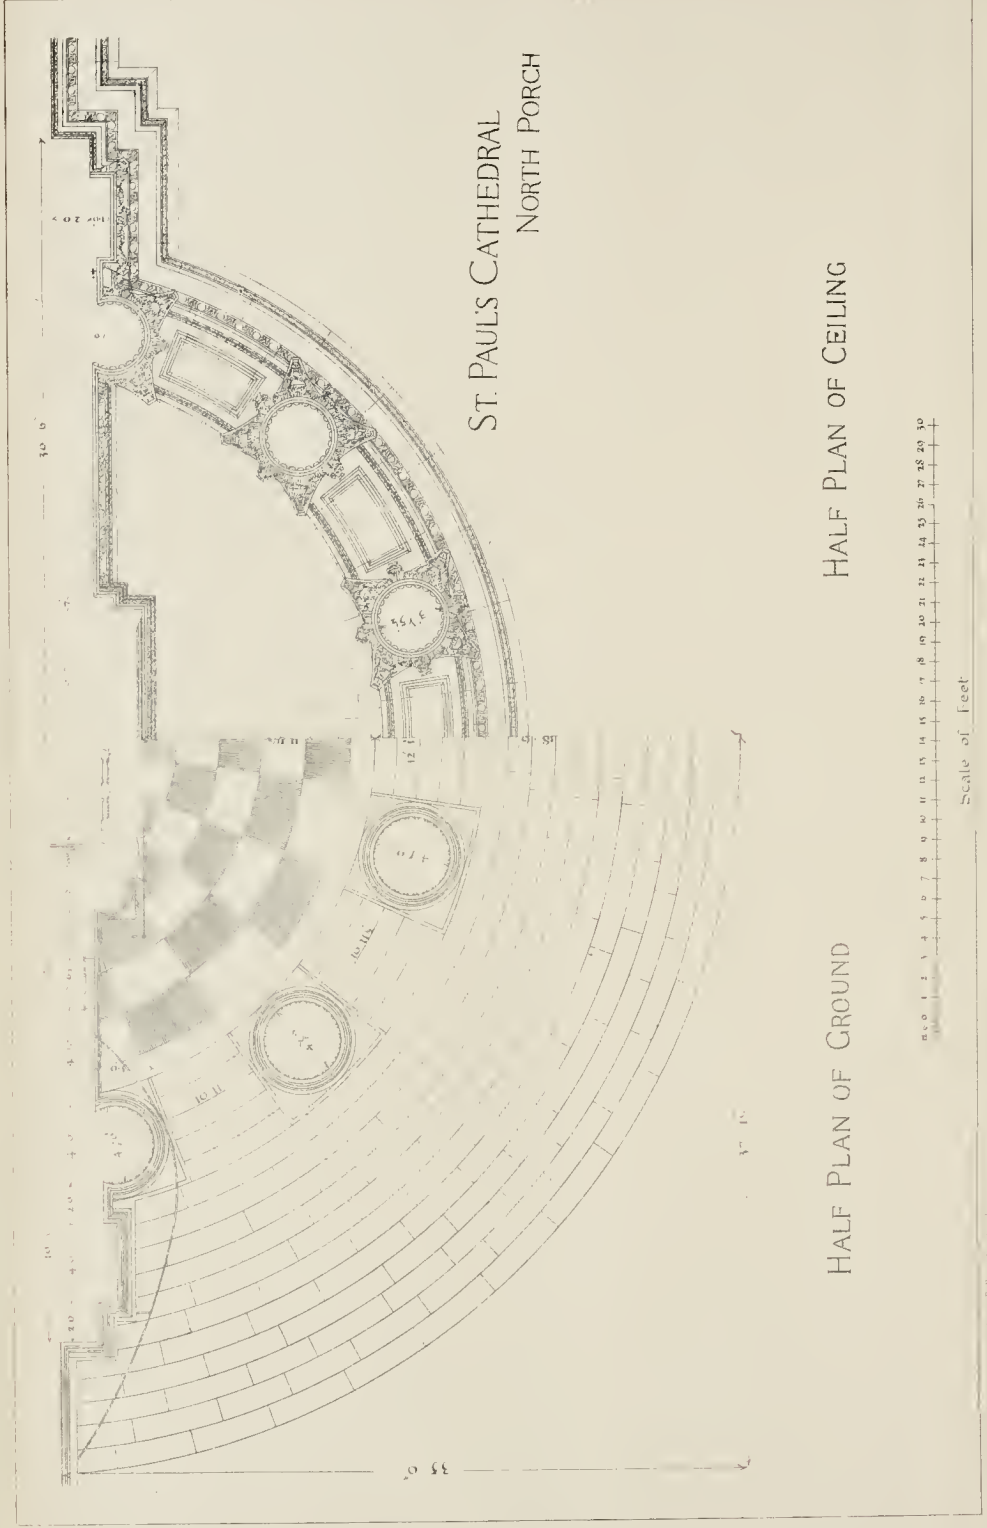

The year 1871 introduced a change for the better. The elevation of Berlin to the capital of the German Empire roused fresh activity in the architectural world, and money being more abundant, architects were enabled to give the reins to their imagination and taste. Now, also, the efforts of the other German schools served as an impetus to that of Berlin.

It was impossible for the Government to remain quite unaffected by the spirit of progress displayed in architecture not designed for the State, and the first official step in the same direction was taken by a complete reorganisation of the Academy, the course of study now comprehending the architecture of the Middle Ages and the Renaissance, under the guidance of such masters of the subject as Otzen, Schäfer, Ende, and Raschdorf.

It must be remembered also that the position of Berlin in the empire had brought to the

the centre of the bridge is 150 ft. above high-water, and the highest part of the bridge is 361 ft. above the same datum. Each of the three main piers consists of a group of four cylindrical masonry and concrete piers, 49 ft. in diameter at the top, and from 60 ft. to 70 ft. in diameter at the bottom. The deepest pier is about 70 ft. below low-water, and the rise of tide is 18 ft. at ordinary springs. In the piers there are about 120,000 cube yards of masonry, and in the superstructure about 45,000 tons of steel.

The caissons, which were built on shore, launched and floated into position, are 70 ft. in diameter at the cutting edge, and taper 1 in 46 to facilitate sinking. At 1 ft. above low water, which is the top of the permanent caisson and commencement of the granite-faced masonry, the diameter is 60 ft. A working chamber 7 ft. high is provided at the bottom of the caisson, the roof of which is supported by four strong lattice girders 18 ft. deep, and cross girders 3 ft. deep spaced 4 ft. apart. An internal skin 7 ft. distant from the external skin, and vertical diaphragms, form pockets which can be filled with concrete at any point where, owing to the slope of the ground and the varying hardness of the silt and clay, a heavier pressure is desired to force down the caisson. Three shafts, 3 ft. 6 in. in diameter, with air-locks at the top, pipes for admitting water and ejecting silt, and other of the usual appliances, are provided. The air-locks for passing out the clay and boulders as designed by Mr. Arrol and myself have, instead of the usual hinged doors, two sliding doors like horizontal sluice valves, across the 3 ft. 6 in. shafts, which are worked by little hydraulic rams, or by hand, and are interlocked like railway points and signals, so that one side cannot be opened until the other is closed. Mounted on the side of the air-lock is a steam engine which, by means of a shaft passing through a stuffing-box in the side of the air-lock and a drum inside, winds up the excavated material in skips containing one cubic yard. The operation of hoisting, opening slides, and discharging is rapidly performed, so the two locks have a large working capacity. A third air-lock, with doors, ladder, and hoist, is also provided for the men.

All of the pneumatic caissons are filled with concrete up to low-water mark, the mixture being 27 cubic feet of broken whinstone, 7 cubic feet of sand, and 5½ cubic feet of cement, which together make a full yard of concrete, having a crushing resistance of about 50 tons per square foot.

Above low water the cylindrical piers, which are 49 ft. in diameter at the top, 55 ft. at the bottom, and 36 ft. high, consist of the strongest masonry, the hearting being flat-bedded Ayrath stone with both horizontal and vertical bond, and the facing Aberdeen granite, the whole set in two to one cement mortar, and built in the dry within temporary wrought-iron caissons. In the shallow piers where the rock is stepped the masonry is carried down to the rock itself, and wrought-iron hoops 36 in. by ½ in. bind the bases of the piers. At the top of all the piers 18 in. by 1½ in. hoops, and midway down 18 in. by ¾ in. hoops, are also built in, and it is believed that these cylindrical masses of masonry are as completely monolithic as can be attained or desired. In each cylindrical pier there are forty-eight steel bolts 2½ in. in diameter and 24 ft. long to hold down the bed-plates and super-structure of the main piers.

Over the piers the arched tubular lower member forms a connexion with the upper bed-plates, the vertical and diagonal tubes, and the lateral and vertical cross bracing, so that considerable thought had to be given to the details at this point. A full-sized model was prepared, and different modes of arranging the junctions were set out and modelled. Finally, it was decided to gradually change the tubular lower member into a box form with one rounded upper member, where it meets the skewback or part over the pier, and by internal vertical and horizontal diaphragms, to make the latter a cellular structure of enormous strength and stiffness, offering facilities for attachments in any required direction. Several layers of plates form the bottom of this skewback, and constitute what may be termed the "upper bed-plate" of the bridge. The "lower bed-plate" consists of similar layers of plates riveted together and bolted to the pier; and the two bed-plates are to slide on each other within certain limits

to be referred to more particularly hereafter. The layers of plates run longitudinally and transversely, to meet the different stresses; and after the edges are planed, the plates are fitted together, clamped between girders, and drilled by special machines through their whole thickness. About 1,000 linesal feet of 1½ in. holes have to be drilled in each bed-plate, which in practice with the eight-drill machine takes about eighteen days, including stoppages. In the upper bed-plates holes about 11 in. square, with corners rounded to a 3-in. radius, are required, in some instances, to clear the nuts of the holding-down bolts, and these are cut readily by a simple tool devised by Mr. Arrol. In other cases, 12-ft. diameter recesses, 2 in. deep, have to be bored for what may be termed a huge key or dowel, which will connect the upper and lower bed-plates, but allow a slight rotation; and this also requires a special tool.

The tension members and cross bracing generally consist of box lattice girders, which are drilled by travelling machines of similar type to those already referred to in connexion with the tubular members. All of the rivets are of steel, having a tensile strength of about 27 tons, an elongation of about 30 per cent., and a shearing resistance of from 22 tons to 24 tons per square inch. It is hardly necessary to state that hydraulic riveting is used throughout. The nuts and washers of the holding-down bolts and some other parts are of cast steel, having a tensile strength of 30 tons per square inch, and an elongation of 8 to 10 per cent.

Owing to the enormous size of the structure elastic deformations which may be neglected in ordinary cases have to be provided for.

Obviously during the early stages of erection, before much weight comes on the bed-plates, the tube will be practically free to expand and contract. Ultimately, when the whole weight of the completed structure rests on the piers, the friction between the two surfaces of the upper and lower bed-plates will probably be sufficient to prevent movement except under extremes of temperature and heavy wind pressure of rare occurrence. The attachment of the superstructure to the piers partakes thus of the character of a safety friction clutch. Movement will not occur under ordinary circumstances, and, if an excessive shock from some unforeseen cause arise on the super-structure, it can only be transmitted to the masonry of the pier through the sliding surface of the upper and lower bed-plates.

Mr. Baker has kindly supplied us with the following notes as to the state of the works at the present moment:—

PIERS.

South Queensferry Main Piers.—Three of the four piers in this group are completed, and the last has been sunk to a depth of 50 ft. below low water.

Inchgarvie and Fife Main Piers.—Seven are finished, and the eighth is carried up above high water.

The Viaduct Piers are all carried up to the height at which the girders are first erected. On the five north spans the girders are built, and are being raised by hydraulic machinery. The operation of building the piers is carried on simultaneously. On the south side seven of the girders are built, but the raising has not been commenced.

SUPERSTRUCTURE.

About 16,000 tons of steel plates, angle-bars, and other forms of material for the 1,700 ft. spans, have been delivered at the shops at Queensferry. There the operations of fitting them together, planing, and drilling are being carried on; and about 10,000 tons are completed ready for erection. The work of erection has commenced at each of the three main piers. At South Queensferry, two of the "lower bed-plates" have been placed in position. At Inchgarvie also two bed-plates have been placed, and the massive horizontal tube between the piers is erected. At Fife, all the lower bed-plates are laid, and the horizontal tubes between the piers, and the complicated mass called the "skewback," resting directly over the piers, is well in hand.

The most interesting events that have happened lately have been the rapid and successful founding and erection of the deep piers for the Inchgarvie group, and the recovery of the South Queensferry caisson, which was wrecked on the 1st of January, 1885.

CHURCH OF ST. ANDREW, WILLESDEN GREEN.

This is a good example of the qualities of picturesqueness combined with solidity and simplicity, for which the churches designed by its architect, Mr. Jas. Brooks, are notable. There is scarcely anything of what is usually called "ornament" in the church and the clergy-house with which it groups in so pleasing a manner; yet the effect of the whole is to produce an architectural picture of no ordinary charm.

NORTH PORCH, ST. PAUL'S CATHEDRAL.

THE three sheets of lithographs, giving the elevation, section, plan, and decorative details of the North Porch of the Metropolitan Cathedral, are reproduced from the set of drawings which gained their author, Mr. F. W. Troup, the Royal Academy Silver Medal for measured drawings of architecture. At a time when the architecture of Wren is so much studied as now, careful drawings of this portion of his great building, of which we believe there is no published illustration on the same scale and of the same accuracy, will probably be valued by many of our readers. We do not, however, profess admiration for all the decorative details, in spite of Wren's name. Festoons and ribbons are not decorative design, in the true sense of the word.

OBITUARY.

Dr. Samuel Birch, F.S.A.—We record with much regret the death of Mr. Samuel Birch, D.C.L., LL.D., F.S.A., Keeper of the Egyptian and Oriental Antiquities in the British Museum, which took place after a short illness at noon last Sunday, at his residence, Caversham-road, N.W. According to the *Times*, Dr. Birch, who had just completed his seventy-second year, was the grandson of Samuel Birch, Alderman and Lord Mayor of London, and eldest son of the late Rev. Samuel Birch, D.D., rector of St. Mary Woolnoth, in the City of London, and vicar of Little Marlow, Buckinghamshire. In 1834, Dr. Birch entered the service of the Crown under the Commissioners of Public Records, where he was the contemporary of the late Sir Thomas Duffus Hardy. In January, 1836, he received an appointment under the Trustees of the British Museum, in whose service he has spent just fifty years. On the retirement of Mr. Barnwell, he became Assistant Keeper of the Department of Antiquities—a miscellaneous mass at that time, including the whole range of Greek, Roman, British, Oriental, and Egyptian archeology, as well as ancient and Medieval numismatics and ethnology. In 1861, on the subdivision of this vast and valuable collection, Dr. Birch undertook the responsible position of Keeper of the Oriental, British, and Medieval Sections. At a subsequent period of further division, his attention was confined solely to the Egyptian and Assyrian antiquities, with which his name will always be associated. We may add that he was one of the founders, and the President, of the Society of Biblical Archeology. He was the author of a long list of works, and had been for many years an occasional contributor to the columns of the *Builder*.

Mr. Thomas Goodchild, F.R.I.B.A.—We record with regret the death of Mr. Thomas Goodchild, which took place a few days since, after a protracted illness. For some years he held the office of Surveyor to the Teddington Local Board. He was elected a Fellow of the Institute of Architects in 1880. His works include the Free Church of England, the Wesleyan Chapel, and the Vicarage (the latter illustrated in the *Builder* for July 3, 1880) at Tooting; and the Vicarage at Hampton. His design in the Bagshot Church competition was placed second, and was illustrated in the *Builder* for March 25, 1882.

Tarnished Silver for Decorative Use.—In reference to our "Note" on this subject (p. 815, ante), we may mention that a specimen panel of the decorative use of this material may be seen at the shop of Mr. Merrick, carver and gilder, 200, Brompton-road.

DISCOVERY OF SCULPTURED FIGURES
AT CLAPHAM.

A VERY remarkable discovery has been made beneath the modern Church of St. Paul, Clapham. This building, a long, flat-roofed mass of brickwork, pierced with two ranges of windows, is conspicuous enough from the elevated position it occupies close to the Wandsworth-road.

It stands on the site of the old parish church of Clapham previously to the erection of what is now the actual parish church on Clapham Common. Mr. J. W. Grover, C.E., F.S.A., having recently delivered a lecture upon the various associations and buildings of old Clapham, was led to test the accuracy of a passing remark in Brayley's "History of Surrey," that certain remarkable monumental figures formerly in the old church had been deposited in one of the vaults. There was also a local tradition that some of the monuments had been stowed away when the church was demolished. Acting upon these data, and with the friendly help and assistance of the Local Burial Board, Mr. G. Aldridge, one of the members of the Board, and Mr. Grover set to work. An old wall was soon reached by their workmen, and this being followed, a flight of steps was found, leading to a vault, apparently extending beneath the present church. All knowledge of this entrance had been lost, the burial-ground being closed. There was nothing to bar the entrance to the vault, and the workmen speedily called the explorers to enter. The vault appeared to be a subterranean museum of sculpture as the lights revealed the contents. In one place, facing them, was a magnificent marble figure of a knight in armour, opposite the figure of a younger man. In the vault beyond was that of a lady of mature years. Beyond was a sitting figure of a young lady in full evening costume with an elaborate arrangement of ringlets. In a small corner was the standing figure of a young child holding a skull. All these were found to be of pure white marble, still clean and but little covered with dust, so that, in some places, the polished surfaces remained. This discovery on becoming known has created a great deal of remark beyond the locality itself, and it may be of interest to render a few notes of the local history, which we now proceed to do. The monuments are described by several old writers who had seen them when they were in their original positions, and the frequency of these remarks attests the interest which they appear always to have obtained.

The parish church of Clapham appears to have passed through the long phases of history which are very much the same in the case of each of these venerable buildings scattered throughout our land in such great numbers. The manor is named at a very early period, since in King Alfred's time it was charged with an annual payment to the monks of Cbertsey of 200 pence. Its owners are mentioned in the time of Hardecant, since the drunken feast which caused the monarch's death was for the purpose of celebrating the marriage of the daughter of its then lord with a Danish nobleman. Domesday Book has its record of the district, but no mention is made of the church,—a circumstance not at all conclusive, as showing that it did not then exist. We know that it was standing in the twelfth century, since the advowson then passed to the monks of Merton Abbey, who appear to have held it until the Dissolution. A chantry was founded here by Thomas Romayne in the fifteenth year of Edward II. Then there are records of more recent additions as follows:—The form of the building, which was probably only a nave and chancel originally, was altered in 1500, when a chapel was added on the north side, close to the west end. A corresponding chapel was added on the south side, called Walter Frost's Chapel. These are stated to have been in the form of western transepts, and that on the north side, at any rate, had a north gable, with a ridge going north and south. It is probable, however, that this projection was not the Atkins Chapel, which was more probably at the east end of the north aisle. A north aisle was added about 1715, by Mr. Hower E. Hower, and a south aisle was erected at the same time at the expense of the parishioners. The building continued in this condition until 1774, when the growing population required still further accommodation, and by an Act of Parliament the new church on Clapham Common was then erected, and constituted the

parish church. The old building was then demolished, except the north aisle, which was retained for burial services, until the erection of the present St. Paul's Chapel on part of the site in 1814, when it was pulled down entirely. The old church was remarkable for a large number of monuments, which are spoken of as being of excellent workmanship. These are described by the old writers already referred to, and the inscriptions are given at length. These will be noted in part as we proceed. The principal monuments were those of Sir Richard Atkins, knt. and bart., and his lady, Rebecca, the wife of Sir Edward Wright, who were represented by recumbent figures of white marble on an altar tomb. They were buried in a vault in the churchyard. Close to them were figures of Henry, the eldest son, and Rebecca and Annabella, their first and second daughters, the monuments having been erected by their parents, there being verses beneath each of them.

As a specimen, that on Annabella, the eldest daughter, who died in 1670, in her nineteenth year, is subjoined. The verses were somewhat similar beneath each of the other two figures, but those now given may be taken as fair samples of the rest:—

"Could Tears have sav'd her precious Life, noe doubt,
A gent'ral Deluge had been pour'd out;
Or could the skill of all the learned have
Prevail'd, but to relieve her from the grave,
Mankind had not permitted so much Worth
(To theyre great Loss) to vanish from the Earth.
She dyed young,—not that she really could
Be Wary of so soon of being good,
But fit for Heaven she without pretence,
Might justly scorn a meaneur Residence."

Messrs. Brayley & Britton, in their "History of Surrey" state, in a footnote, that the above monument was entirely destroyed, and the effigies themselves consigned to sepulture in one of the vaults when the new chapel was built. "Although in a bad taste in regard to dress,—the son, who died at the age of twenty-four, in February, 1677, being represented in a Roman dress, with a flowing peruke, and the daughters in gowns with full sleeves and stiff bodies,—they were superiorly wrought and deserved preservation above ground."

We are indebted to Lysons's "Environs of London," 1792, for information as to the then position of the monuments in the old church. The building had been at that time pulled down except the north aisle (he says the south aisle by mistake). The tomb of Sir Richard Atkins and his wife was at the north-east corner, and it still possessed its curious iron railings and pennons, the armorial bearings being given by Lysons. Adjoining it, on the east wall, was the monument of their three children,—Henry, who died in 1677, aged twenty-four; Rebecca, who died in 1661, aged nine; and Annabella, already referred to. These stone monuments appear to have been grouped into one composition, for Lysons states that their effigies are as large as life, under an arch supported by columns of white marble of the Corinthian order. "The son is represented sitting, in a Roman dress, with a flowing peruke. The daughters are standing, dressed in gowns with full sleeves pucker'd, and plain stomachers."

Reference is also made to many other monuments by the old writers, a few of which may be noted. The tomb of Bartholomew Clerke was on the south wall, and represented himself, his wife, and son kneeling, the whole being in a recess, above being the arms of Clerke and Haselrigge. Dr. Martin Lister's monument was also on the south wall, probably recently re-erected to shut in that side of the north aisle kept up. There were two old brasses on the south wall, that to the memory of W. Tableer having come from the old middle aisle. The monument of W. Hower was on the north wall. Lysons gives the names of several other monuments which were destroyed when the building was pulled down; but he refers to the existence of one to the memory of Sir Lawrence Bromfelde, knight, who died in 1668, and which was then in the churchyard. This appears from Strype to have been a flat stone by the Communion rails.

There is an old view of the remains of Clapham Church, taken from the north east, engraved in vol. 85, part 2, page 489, of the *Gentleman's Magazine*, drawn just before the demolition of this remaining portion to make way for the erection of St. Paul's Chapel. It shows an eastern portion standing like a small chancel attached to a western nave, the latter being, in fact, the north aisle. There is a transept-like

projection at the west end with a gabled roof, the whole of this part being built of brick, having moulded cornices broken around pilaster buttresses, and round-headed windows are in the bays between them.

The eastern building is smaller and evidently of more ancient date, having a three-light window on the north side, with transom and Tudor arches in the heads, the whole being contained beneath a flat moulded label, returned at the angles.

A similar window is shown at the east end, but blocked. This was most probably the Atkins Chapel, for the monuments have been found as nearly as possible beneath it, as far as can be told by an examination of the site and the local surroundings. The view has been taken after the demolition of the nave and south aisle, and it therefore shows only the portion which remained from 1778 until 1814, and the demolition of this part itself took place before the view was published, the editor expressing the hope that the brasses and as many of the monuments as possible may be set up in the new chapel.

We have referred already to the inscriptions on the tombs, and have given a sample of the kind of versification employed. Should the others be required by any of our readers, they can be readily obtained, since they are given in full in the 1720 edition of Stowe's "London," edited by Strype. The Latin inscriptions on Sir Richard's tomb are also printed. These are given again for the most part in the description of the church in the *Gentleman's Magazine*. Strype also gives the armorial bearings on the tomb, and from his further notice we are able to ascertain that the monument of the Dean of Arches was originally on the south wall of the north aisle, and the position described by Lysons, after the demolition of the body of the church, was, doubtless, its original one,—at least, since the erection of the north aisle itself.

Bartholomew Clerke, Dean of Arches, was lord of the manor prior to its purchase by the Atkins family. He died in March, 1588, aged fifty-two. His wife, Eleanor Hazerigge, was represented with him, together with their son. A daughter had been apparently at one time also on the monument, but her figure had disappeared in Strype's time. Both figures were represented kneeling before desks, the Dean being in a red robe.

Dr. Martin Lister, F.R.S., was commemorated with his wife, Hannah. He died February 2nd, 1711-12, having been for several years an inhabitant of Clapham, and bequeathed 5l. for commemoration service for his wife. He was the author of the "Synopses Conchyliorum," published in two folio volumes in 1685, and containing a very good series of accurate engravings of all the shells known in his time, the drawings having been made by his two daughters.

The Wm. Hower whose monument has been referred to was the servant and friend of Samuel Pepys, at whose fine house on the Common Pepys died.

A few days since we paid a visit to the monuments, thanks to a private view, cards of which had been issued by Messrs. Aldridge & J. Collins, members of the Burial Board, and found a stream of people constantly ascending and descending into the vault, the entrance of which is on the north side of the present chapel. The greatest possible interest was being shown in the discovery, and during the two or three hours when the entrance was open over 200 persons were computed to have inspected what had been found. It was, indeed, a remarkable sight to find, on descending, a number of exquisitely-wrought figures standing out so strong and vivid relief from the darkness of the vault. Not to repeat what has been already stated, the following notes may serve to describe what exists:—The figure of the standing knight is that of Sir Richard Atkins, who died August 19th, 1689. He is clad in the 17th century armor of the period, a slash being fully arranged over it from his shoulders, looped around the armour; linen wristbands showing, and the head covered by a large wreath of ringlets flowing down upon the shoulders. It is a recumbent figure, as is attested by a companion figure, Sir Richard's wife, is placed in the adjacent vault, lying upon an ancient leaden coffin. She is clad in a new-fashioned gown, with a stiff-pointed stomacher, a tippet is elegantly arranged over the shoulders.

and the hair is covered with looped drapery. The eldest son, Henry, is in a sitting attitude, clad in Roman scale armour, closely fitting and flexible to the form, the arms and legs bare; he, too, has a large flowing wig. At the end of the vault the sitting figure is that of Annabella, whose epitaph has already been given. The head-dress is something very remarkable. It is carved with exquisite grace, adorned with pearls, while a string of pearls is around the lady's neck. The stomachers are very pointed and very low, the arms are bare from below the elbow joint, the upper part of the arm being covered with drapery. The costume is, in fact, evening dress, very beautiful, but rather remarkable for a funeral monument. A book is held in the left hand. The last figure to be noted is that of a little girl, the Rebecca of the inscriptions. It is a charming little figure, of pleasing expression, clad in a pretty child's dress, with an edging of lace elaborately carved. As the light fell upon the young little face, many of the visitors expressed their opinion that it was the best of the series. The expression of the face in no way prepares us for the skull which is held in the child's two hands. These figures are all life size, and carved in white marble of close grain. They are fine works of art, studied and grouped in an admirable manner; the countenances express such individuality that we have no doubt but that they are portraits to the life. The question naturally arises, Who was the sculptor? There is not a clue to this in any of the old writers consulted. This is, however, the fate of the sculptors of most of the monuments in the old churches around London, the works of art in these, of seventeenth-century date, being in fact, more numerous than ordinary observers may be ready to believe. Certain it is, that those at Clapham may be classed with the best. We observed, with no little interest, that some of the architectural members belonging to one or another of these tombs are piled up in various parts of the vault. There are two moulded ribs, apparently quadrants of a circle, which probably formed the semicircular arch of the three children's tomb, while in another place a white marble slab actually contains the three inscriptions, one of which, taken from Strype, and not from the work itself, we have already given. There are lengths of white marble cornice with flat moldings, lengths of black marble, one or two shields, two or three lengths of scroll work in black or grey, the light did not show which, with white shields, and many corbels and such like, quite sufficient for a skilful hand to put the designs together again.

It is greatly to be hoped that these remarkable works will not be left to the darkness which has hung over them for more than eighty years. The interest taken seems to show very amply that this will not be the case.

The churchyard bears abundant evidence as to the great extent of the monuments so needlessly thrust out of the old church. One of the figures of the Dean of Arches' monument is, we are told, locked up in the heating apparatus; a large marble slab, apparently to the memory of Sir Richard Atkins's father, was recently found underground during some repairs. The tablet to Dr. Lister, and that of his wife, are on the external north wall. But a glance on leaving showed a rather remarkable monument of white marble, built into the north-west wall of the transept, of the large addition only recently made to the church. It is exposed to wind and weather. It is hardly to be credited when we state that this is the monument of William Hewer, the faithful friend of Samuel Pepys. We have already noted its position within old Clapham Church. It was thrust out at the demolition, built on to an external wall when St. Paul's was erected, taken down only recently, but again fixed externally.

A monument has been at last fixed in St. Dave's, Hart-street, to commemorate old Samuel Pepys; cannot something be done to save this of his friend from its most unworthy position?

Cheltenham Grammar School Competition.—The Governors have awarded the first premium of 100l. to the design under the motto and device, "Arms of Pembroke Coll., Oxon," and the second, of 50l., to "Supervision." The first was found by the chairman, on opening the sealed envelope, to be by Mr. Henry Hall, R.I.B.A., London; and the latter by Messrs. J. & E. Conder, London.

THE ENGLISH IRON TRADE IN 1885.

THE hopes,—faint, it is true,—which were raised at the beginning of 1885, of an improvement in the iron trade of this country, have been rudely dispelled by the experiences of the past year. Bad as was the preceding year, the year of which we have just seen the close was worse, and we do not know whether the present generation has passed through one in which the effects of bad trade were felt more keenly, both by employers and employed. In stating this, we have said the worst that can be said of the last twelve months, and it is a redeeming feature of the past year that the distress caused amongst the various branches of the iron trade and the related trades by want of employment has been borne with a fortitude that deserves all praise, whilst the philanthropic and practical efforts made to relieve the ensuing misery elicit commendation in an equal degree. Without inquiring too minutely into the various causes of the depression which has been characteristic of 1885, it may be broadly stated to be due to a diminishing demand on the part both of home and foreign consumers, as well as to a growing competition by foreign manufacturers, a competition unfortunately fostered by want of foresight of British producers. The International Railmakers' Association, for instance, which has been condemned by all independent journals in the trade, received the support of English manufacturers in the vain hope of enabling them to neutralise that competition. Warning voices were raised, but to no avail. It is a grim satisfaction to know that even those who countenanced the movement now see the folly of the manoeuvre, which has opened up markets to the foreigner which were formerly closed to him.

The infalling barometer of British trade, the Board of Trade Returns, fully corroborates what has been stated respecting the state of the English iron trade during 1885. The exports of iron and steel during the first eleven months of last year represented a total value of 20,128,374*l.*, as compared with 22,707,708*l.* in the corresponding period of 1884. As regards quantities, the exports were 2,910,347 tons last year, against 3,267,490 tons in the first eleven months of 1884. The great falling-off in shipbuilding during the past year has contributed in no small degree towards curtailing trade requirements, besides lowering the prices both of iron and steel. When it is considered that the total output of British shipyards in 1885 was reduced to 540,000 tons, as compared with 750,000 tons in 1884, and 1,250,000 tons in 1883, no surprise will be felt that this great decrease has affected the iron trade of this country most injuriously. The chief cause, however, of the prevailing depression in the English iron trade is still over-production. It need only be stated that the crude iron in stock at the present moment in Scotland and Cleveland alone is over 1,500,000 tons, against 1,221,000 tons at the beginning of 1885, and over two and a half million tons in the whole of the kingdom, and it will not need much eloquence to point a moral. The effect of such stupendous stocks upon the market is self-evident, and we can scarcely be surprised if the tendency throughout the past year has been for lower prices. It is true that Scotch pig-iron warrants have been remarkably uniform in value throughout the year, if we except a few trifling fluctuations, and that they are now quoted at nearly the same rate as at the opening of 1885, viz., 41*s.* 7*d.*, against 42*s.* 2*d.* But it is equally true that Scotch warrants are mostly in the hands of speculators, who, by keeping up the prices of the commodity they deal in, have contributed towards the comparative firmness of makers' iron without, however, benefiting Scotch ironmasters. For, owing to the dearth of Scotch iron, the floodgates of competition were opened to Cleveland makers, who have managed to place over 90,000 tons more of cheaper Middlebrough iron in Scotland during the past year than in 1884. No. 3 Cleveland pig was worth, at the beginning of the year, 35*s.* 3*d.*, prompt delivery, and it is now 31*s.* 9*d.*

The rates for crude iron in other parts have been in sympathy with those of the two principal producing districts, and this is true also of the trade in hematite pig-iron. The latter trade, however, notwithstanding the prevailing quietness, has been remarkably steady, no change worthy of note having taken place in quotations from July, 1884, to the end of 1885. An im-

provement in hematites set in about November, owing to the increased consumption of steel for shipbuilding purposes, and the expectation of a better demand from the United States. Whilst touching on the question of the greater demand for steel for shipbuilding, it may be mentioned that, if it had not been for the increasing wants of shipbuilders, the production of steel during the past year would have fallen off much more than it has actually done. From the statistics published of the output of steel during the first half of 1885, we are enabled to estimate the falling-off in the production of Bessemer steel at about 200,000 tons for the whole year, of which nearly the whole will probably be found to be on account of steel rails. The fact that English steel makers have now been producing ship plates and ship angles for some time, and the still more satisfactory announcement that they are going in for the manufacture of steel sleepers, are signs that better things are in store for the British iron trade, and this is, so far, encouraging. It remains to be added with regard to steel that ship plates of that material are now selling at about 6*l.* 10*s.*, against 7*l.* at the beginning of the year, whilst steel angles are fetching 6*l.* 5*s.* compared with 6*l.* 10*s.* Steel rails have been sold throughout the year at the almost uniform rate of 4*l.* 15*s.* for average sections, and this steadiness is ascribed to the operation of the International Railmakers' Syndicate, at the sacrifice, however, as pointed out above, of admitting foreign manufacturers into markets hitherto our own.

Independently of the gradually proceeding substitution of steel for iron, which in the case of shipbuilding amounts to nearly 50 per cent. at the present time, the trade in finished iron has been much curtailed by a slackening demand, both home and foreign. In consequence, prices have suffered, but not to such an extent as might have been anticipated from decreasing inquiry. This, however, is solely due to the fact that prices were already so low at the beginning of the year that they could not decline much more, although manufacturers of finished iron were favoured by the cheapness of the crude material. Prices, however, tended downwards throughout the year, and at its end were about 7*s.* 6*d.* per ton lower than at the beginning. In the North of England, the average rate for iron rails, angles, plates, and bars at the beginning of the year was 4*l.* 18*s.* 11*d.*, or 5*s.* 4*d.* less per ton than that touched in 1879, when it was 5*l.* 3*s.* 3*d.* At the last return presented in the year, in October, the net average price was 4*l.* 17*s.* 2*d.* In Staffordshire the notable value of marked bars was 8*l.* 2*s.* 6*d.* down to 7*l.* 10*s.* in January. This has been the nominal quotation throughout the past year; but as a matter of fact most houses have taken shipping orders at from 10*s.* to 20*s.* below those rates, the depression in value being caused, as in the preceding year, by the competition of the cheaper North Country iron. In Lancashire the rates at which bars were quoted for delivery into the Manchester district were 5*l.* 10*s.* to 5*l.* 11*s.* 3*d.*; they are now 5*l.* 2*s.* 6*d.* to 5*l.* 5*s.*

Reference has already been made to the great decrease in shipbuilding; but as there is no cloud without its silver lining, we are justified in assuming,—and the assumption almost amounts to certainty,—that the reduced production of tonnage will tell in the end upon the freight market; for the loss of ships is constant, and shipbuilding, and through it the iron trade, must ultimately revive from this, if from no other cause. Although not nearly so severely as the other branches of the iron trade, the engineering trades have suffered considerably during the past year. Marine engineers would be the first to feel a falling-off in ship construction; but, if we except locomotive builders and electric light engineers, engineers have had just cause to complain during the past year, a period during which they for the first time really felt the pinch of bad trade. Summing up briefly, it may be said that, taking into account the better outlook in shipbuilding, the revival of trade in the United States, the fact that industrial undertakings have been remiss in replacing old material owing to bad trade, and that long delayed renewals cannot be shirked much longer, the future does not appear nearly so dark as the past year has led people to anticipate. It is a satisfactory sign that English manufacturers are beginning to have their eyes opened by such occurrences as the formation of an international rail syndicate,

Brass Chancel Gates, Church of SS. Peter and Paul, Teddington.—Designed by Mr. Ernest C. Lee, F.R.I.B.A.

the indirect consequences of which will be felt yet for years to come; or the more recent Belgian girder incident, which has taught them that they are for the moment surpassed by foreign enterprise. We trust that they will profit in the future by the severe lesson they have received in the past.

ST. PETER AND ST. PAUL'S,
TEDDINGTON:
BRASS CHANCEL GATES.

THE above church was erected under the direction of the late George Edmund Street, R.A. The gates have been designed to be as far as possible in character with his work. The emblems of the patron saints are introduced with their initials. The brasswork was executed by Messrs. Richardson, Slade, & Ellison, the model for leafage by Mr. Thomas Earp, all from full-size drawings by Mr. Ernest C. Lee, architect.

PROJECTED RAILWAY, TRAMWAY, GAS,
WATER, DOCK, PIER, AND HARBOUR
WORKS.

AN analysis of the 176 private Bills for the Parliamentary session of 1886 shows that of the railway Bills (fifty-six in number) eleven are promoted on behalf of companies proposed to be incorporated for the construction of entirely new lines in different parts of the country. These include a proposed line of railway from Bedford to Peterborough, commencing on the Midland line at Bromham, near Bedford, and terminating on the Northampton and Peterborough section of the London and North-Western line at Overton, in Huntingdonshire; a new line from the East Lincoln Railway, across the Lincolnshire marshes, to the main line of the Manchester, Sheffield, and Lincolnshire Company; a new line from the Eastbourne branch of the London, Brighton, and South Coast Railway to the Lewes and Scaford branch, with the view of effecting more direct railway communication between Brighton, Eastbourne, and Newhaven; a new line from Harrow to Great Stanmore; a new line from the Liverpool, Southport, and Preston line, now in course of construction, to Ormskirk; a new line in Lincolnshire, between Louth, Mablethorpe, and Willoughby; a new line from Woodstock, in Oxfordshire, to the Great Western main line; a new line in the county of Durham, called the West Durham and Tyne Railway; a new line, called the Nottingham Suburban

Railway, intersecting the various suburbs around Nottingham; the Felixstowe, Ipswich, and Midlands Railway, a new line to connect the Great Eastern with the Midland line; and a new line from Portsmouth to Hayling Island, which would cross over a portion of tidal water, and reduce the distance between Portsmouth and Hayling Island as compared with the present route via Havant. As regards existing lines, most of the leading companies have Bills seeking further powers for the construction of additional works, and amongst other new lines promoted by existing companies are those by the Rhyney Company for new lines in Glamorganshire and Monmouthshire; by the Mersey Railway Company for new lines in Liverpool and Birkenhead; by the London and Brighton Company for new lines at New Cross; by the Midland Company for a new line at Hendon; by the Taff Vale Company for new lines in the neighbourhood of Cardiff and Newport; by the Manchester, Sheffield, and Lincolnshire Company for new lines in Lancashire and Yorkshire; and by the Seacroft, Hoylake, and Deeside Company for several new lines in the Wirral district of Cheshire. The London, Tilbury, and Southend Company promote a Bill for powers to construct new wharves, warehouses, and landing-stages at Trobery, near Tilbury; also containing powers to build on land near Tilbury Fort. The London and South-Western Company's Bill contains powers providing for the transfer to the company of the Wimbledon and West Metropolitan Company, and for an extension of time for the construction of the line. The Bill also seeks for powers to the company to construct the unbailed portion of the Kingston and London line; and also powers to purchase houses and lands in the Parish of St. Mary, Lambeth, for widening the line and constructing a new station at Vauxhall. In connexion with the London and South-Western Company's Bill it should be stated that the Wimbledon and West Metropolitan Company likewise promote a Bill to compel the London and South-Western Company to construct so much of the railway authorised by the Kingston and London Railway Act as is situated between the Kingston line and Putney Bridge. It may be stated that the authorised Wimbledon and West Metropolitan line commences at Putney Bridge, by a junction with the Metropolitan District Railway at their Putney Bridge station. It then crosses the Thames by a bridge immediately eastward of the new Putney Bridge, now in course of construction by the Metropolitan Board of Works, and, continuing in a south-westerly direction, it enters Wimbledon Park, which is now being laid out for build-

ing purposes. At this point will be the Southfields Station, whilst some distance further south-west there will be another station at the Wimbledon Park Station, a short distance from the Merton-road, leading to Wandsworth. Continuing from this station the line forms a junction with the main line of the London and South-Western Company near Wimbledon Station. On the completion of this line railway communication between the metropolis and Wimbledon will no longer be confined to the London and South-Western Company.

The tramway projects, promoted by Bills and also by provisional orders, are twenty-three in number, of which seven are undertaken in connexion with the metropolis. These include two Bills promoted by the North Metropolitan Tramway Company, one of which seeks powers for the construction of new lines in Clerkenwell-road, Theobald's-road, Vernon-place, Green-road, Commercial-street, and Levenson-street; White-chapel; and the other for extension of Drayton Park, Gillespie-road, and Blackstock-road, and for the doubling of the line in Goswell-road. The South Metropolitan Company powers to lay down tramways from Clapton to Balham, Footing, and Merton; by another Bill it is proposed to lay down tramways from Cricklewood to Kilburn, and Harrow-road, whilst the North London, the Southwark, Deptford, and the London, Highgate, and Finchley companies all apply for powers to extend their several systems. Amongst these Bills is one seeking powers to lay down several steam tramways in the districts in and around Manchester, Bury, Rochdale, and Wigan.

Gas and water undertakings are repress by twenty-five Bills, and twenty-four applications for provisional orders. Of the entire number of this class of undertakings fourteen present Bills empowering the incorporated companies for the construction of new works, the remaining portion being applications in connexion with the extension of area of existing works. In the Southwark, Vauxhall Water Company's Bill powers are sought for the construction of new reservoirs, Lewisham and West Moulsey, and for building of bridges at Hampton. The London Company's Bill contains clauses empowering the company to sink a well and pumping works at Waltham; also powers to construct an aqueduct, commencing at the main road from Waltham Abbey to West Cross. The Lambeth Water Company seeks for powers to raise further capital.

The dock, harbour, and pier works projected re-represented by twenty Bills and Board of Trade applications for provisional orders. The Southamption Corporation apply for powers to construct a new dock, embankment, and river-wall, and also for powers to divert, deepen, and dredge the waters of the Solent and the rivers Testen and Test. The East and West India Dock Company promote a Bill applying for further capital to complete the Tilbury Docks, and for powers to erect and maintain hotels at Tilbury. The Preston Corporation apply for powers for a deviation of the authorised diversion of the river Ribbles in connexion with the dock works now in course of construction at Preston. Powers are also sought for the construction of new docks and a railway at Cravesend and Northfleet. The proposal is to construct three new docks, including a main dock 380 yards in length, and 300 yards in width, with two branch docks, each 620 yards in length, and 100 yards in width, together with wharves and warehouses surrounding them. The project, if carried out, would absorb a portion of Rosherville Gardens. The entrance from the Thames to the docks would be near the Gardens. The area of the proposed main dock is nearly 24 acres in extent, and the two branch docks 13 acres each, the docks, wharves, and warehouses occupying an area of upwards of 80 acres. The Bill also seeks for powers to connect the docks with the South-Eastern Railway and the Cravesend branch of the London, Chatham, and Dover Railway, by a junction railway with those lines. The Southend Local Board promote a Bill with powers to purchase a portion of the foreshore of the river Thames for the purpose of constructing an embankment; also powers to construct new pier works, seaward, in continuation of the existing pier, together with the erection of refreshment and concert rooms at the end of it. Powers are also sought in the Bill to dredge and deepen the bed of the river. The Swansea Harbour Commissioners apply for powers to construct various new works, including a canal and additional locks. Powers are likewise sought to construct a sea wall and piers in connexion with the Bute docks at Cardiff, whilst the Cardiff, Avonmouth, and Burnham Railway and Steamer Company promote a Bill empowering them to construct new dock works near Avonmouth and Burnham. There is a Bill promoted by the Bristol Corporation for further dock works; also a Bill for the construction of a new bridge over the river Avon at Totterdown, near Bristol; and a Bill promoted by the Felixstow Dock and Railway representatives for powers to charter steam-tugs. A Bill is likewise promoted having for its object the improvement of the river Tyne. There are also applications for powers to construct new piers at Dovercourt, Tynemouth, Newlyn, Shanklin, Brading, and Sandown. Powers to make Channel Tunnel experiments are again sought by the South-Eastern Railway authorities. It may be added as having some connexion with harbour and sea-coast interests that the authorities at Lloyd's promote a Bill empowering them to erect, maintain, and work signal stations; also further powers as regards the collection, publication, and diffusion of intelligence.

There are twelve Bills relating to town improvements,—new streets, widening of existing streets, and increased sanitary powers, being the main features in the several Bills. The Liverpool Bill, in addition to the improvement powers thus sought, contains clauses relating to hospital enlargements, with powers to contribute 15,000*l.* towards the rebuilding of the Royal Infirmary. The Blackpool Corporation, in their Bill, have clauses enabling them to purchase the Blackpool Sea-water Company, and to widen the promenade or carriage-drive in front of the sea.

Amongst the Bills of a miscellaneous character is one promoted by the Lancashire County Justices for powers to construct a railway to the Whittingham Lunatic Asylum. Several Bills of this class have reference to projects affecting the metropolis. The Metropolitan Board of Works promote no fewer than six Bills, all of which may be classified under this head. Their General or Varied Purposes Bill empowers the Board to make several street and other improvements, and also enables the Board to make a staircase to form an access for foot passengers to the footway along the north-eastern side of the South-Eastern Railway bridge at Charing Cross. Authority is also sought in the Bill for further

powers to the Board with regard to the use of subways under streets and other places in the metropolis. Another Bill promoted by the Board seeks powers for the enlargement of Hampstead Heath. The Board likewise promote a Bill empowering them to make further regulations in regard to theatres and music-halls. These two last-named Bills have already been referred to in the *Builder*. Of the three other Bills promoted by the Board, one has reference to the keeping and storage of firewood in the metropolis; another Bill provides for further powers to the Board in reference to Parliament by the Water Companies; whilst the other Bill provides for an alteration in the contributions by the insurance companies towards fire brigade expenses. The Corporation are the promoters of two Bills, one of which empowers them to alter and enlarge existing markets, whilst by the other Bill they apply for powers to purchase lands in Highgate, Hornsey, and Kilburn for forming open spaces. A Bill relating to the Maswell Hill Estate empowers a new company, proposed to be incorporated, to purchase the estate and the Alexandra Park Railway. One of the most important Bills promoted has reference to the purification of the river Lea. The Bill contains powers to compel the Tottenham Local Board to disinfect and purify the sewage matter passing into their works; prohibits effluent water and sewage from their works passing into the river and its tributaries; provides for the diversion of effluent water from such works into the sewers of the Hackney Local Board and the Metropolitan Board of Works; and also further provides for the construction of a sewer to connect the works of the Tottenham Board with the sewers of the Hackney Board. The Kensington Vestry seek powers to construct a depot on land in that part of the parish known as "the Potteries," and to erect "destructors" and other machinery for the destruction and treatment of mud, dust, refuse of streets, and other waste materials of houses. The lands proposed to be purchased for the purpose contain an area of about four acres. The Horse Guards Avenue project for powers to form a new approach to the Thames Embankment, and the Bill promoted by the Charterhouse authorities, authorising the sale of a portion of the property, have both already been noticed in the *Builder*. A company proposed to be incorporated seeks powers for the construction of subways from Cromwell-road, South Kensington, to a point in the Brompton-road, near Knightsbridge—green, and thence to Oxford-street, near the Marble Arch. It is also proposed by the Bill to construct a new street from the north side of the Brompton-road to a point near the Cavalry Barracks, and to widen the Knightsbridge-road, on the south side. The Chelsea Electric Lighting Company promote a Bill empowering them to construct works and to lay down wires and other apparatus in various parts of Chelsea. The Greenwich and Millwall Subway Company promote a Bill for more capital, and for the transfer of the undertaking to the Metropolitan Board of Works. A Bill is likewise promoted with reference to the lighting of the new streets at Hyde Park Corner.

DEPRESSION IN THE BUILDING TRADES.

The following is a statement sent in by the Institute of Builders, in reply to the questions propounded by the Royal Commission on Depression of Trade:—

The following statement relates to the building and general contracting trades chiefly carried on at home. Compared with the periods 1865-70, 1870-75, and 1875-80, these trades have been affected as follows:—During the last five years the imports have increased in volume in proportion, and manufactured goods have increased both in variety and volume. Profit has been reduced from good to vanishing point, the amount of capital invested being larger than in almost any other trade, and of late years vastly increased on account of the costly and varied machinery introduced. The labour employed is also larger than in any other single trade, but the number of men out of work since 1880 has been increasing, and it is at the present time larger than ever. Trade may be considered to have been at its normal level from 1875-80, above that level from 1870-75, and below it from 1880-85, and at

the present time may certainly be described as depressed. The depression began in 1880, and has not reached the lowest point yet. Want of confidence and want of enterprise are its most prominent symptoms. Its progress has hitherto been uniform, but it is impossible to see the future, which, however, looks very bad. The special circumstances to which the existing condition can be attributed, are, too much outlay in speculative building, the existing system of ground-rents and building leases, the recent decisions by which the money lent by trustees on mortgages is limited, and want of confidence. The demand for capital is below the average of the last twenty years, the supply above, and the return on it is below that average. The rate of wages for skilled and unskilled labour is above the average of the last twenty years, both in relation to quality and quantity, and the mechanics have become more specialists, though the average is not so good. No special legislation for the benefit of the trade, apart from the welfare of the community, can be suggested. The present condition of the trade has not been affected by any changes in the relation between capital and labour, but to a very great extent in the hours of labour; it has not, however, been affected by changes in the relations between the producer, the distributor, and the consumer, fall in prices or appreciation of the standard of value, the state of the currency or the banking laws, the restriction or inflation of credit, over-production or foreign competition. It has been affected by the highway laws and taxation of improvements, but not by communication with other markets.

PLUMBERS AND PARLIAMENT.

SIR,—I observed in a recent number of your journal a notice of a dinner given by the Plumbers' Company, where the Worshipful Master stated that the Company were desirous of reforming the trade and were seeking Parliamentary powers.

I do not know what these powers may be, but rumours are rife, and I would suggest that the Company should try to amend some of the difficulties and anomalies which now exist, rather than hedge the trade round with further restrictions or make it a stronger trade's union than it is.

Speaking from a huilder's point of view the plumbers are the most troublesome, and cause more loss and anxiety than all the other trades employed by us.

They begin work at a later hour than other trades.

In the winter they take one hour to dinner, while all the other trades are satisfied with half an hour.

They leave off work half an hour later, thus entailing the necessity of foreman or watchman remaining too.

They do less work and receive more wages than other equally intelligent mechanics.

If the two or three master plumbers who represent the trade on the Court of the Plumbers' Guild will address themselves to practical questions like the above, they will do some good for, and earn the gratitude of, the whole country.

I hear that our Builders' Association wrote to the clerk of the Company last August, asking that it might be represented at any conference, but up to now no answer has been vouchsafed.

Perhaps this is wise, as doubtless the gentlemen, who remind one somewhat of the three mighty men from Tooley-street, anticipated opposition; but if they will only go in for wise and practical proposals, they may depend on the cordial support of the builders, who, by the way, employ by far the largest number of hands. C. A. M. B.

Leeds and Yorkshire Architectural Society.—The following is a list of recently-elected honorary members of this society, viz.:—The Marquis of Ripon; Mr. B. Priestley, M.P.; Mr. S. W. Duncan, Horsforth Hall; Mr. Alderman John Baynes, Mayor of Ripon; Rev. John Gott, D.D.; Mr. John Barran; Professor Bodington, M.A. (Principal, Yorkshire College, Leeds); Mr. J. S. Mathers; Mr. Ernest H. Jacob, M.D.; Mr. H. B. Hewetson, M.R.C.S. Eng.; Mr. W. Irwin (all of Leeds); and Mr. J. M. Barwick, M.A., Yeadon.

"THE ROYAL INSTITUTE OF BRITISH ARCHITECTS."

SIR,—In the discussions now going on for the improvement of the Royal Institute, I have not seen any suggestions for the improvement of the name. Although the name is a secondary matter, it need not be left out of consideration, as I doubt if there exists a clumsier title among any of the other royal societies. The coupling of the words "Institute" and "British" are difficult enough of pronunciation even for a sober man, however they might sound in a hilarious song; and the initial letters which the title obliges a man to use after his name are nothing if not comical. Did ever a man write F.R.I.B.A. after his name with a serious face on? The substitution of the simple word "Guild" for "Institute of British," making the title "The Royal Guild of Architects," would, in my opinion, adequately express the purpose and aim of the Society, and the initials F.R.G.A. would not, I think, conflict with any other royal society. Guilds are associated with trades of which the architect is the master workman in the building trade, and according to Spenser they are "an association of men belonging to the same class, or engaged in kindred pursuits, formed for mutual aid and protection; a business fraternity; and were originally licensed by the Government, and endowed with special privileges and authority." This definition practically expresses the reason *d'être* of the Institute. J. M. MACLAREN.

WHAT IS A BILL OF QUANTITIES?

SIR,—In response to an advertisement in your paper of Dec. 15th, stating that tenders were required for the erection of an Institute at Slough, near Windsor, I duly applied for particulars, and received in due course a bill of quantities (at least, so-called); these were, I presume, prepared by the architect, as no surveyor's name is attached thereto.

The proposed building is of a highly decorative style, both inside and outside, and the quantities do not, to my mind, at all represent the work required to be executed to enable a builder to realise what is required to prepare an estimate. I will instance a few items:—600 yards super. extra to best red pressed brick facing and weather pointing, with neat black joint, face and soffits measured. This has (on reference to the plan) to include small gable, pediment, octagon cut turrets, and a lot more ornamental work.

In "Mason" we have 42,000 cu. bath Cube stone from the Box quarries for external and internal work, except steps, paving, &c., which are to be in York stone as per specification; the whole to be worked to drawings in the best manner, fixed, and cleaned down at completion." Here we have all the stone mixed up in one item; this is all the information given as to mason's work.

In "Carpenter," we have 2,200 ft. cube Baltic red fir in sleepers, lintels, joists, principals, strutting, grounds, &c. This has to include work to curved principals, hammer-beams, and all the difficult construction of a 35 ft. span roof, full of gables, and a high and heavy turret.

In "Joiner," we have 4,370 ft. run 1½ in. moulded and panelled dado, with diamond raised panels, 3 ft. 3 in. high over all, having 4 in. by 3½ in. moulded capping, 5 in. by 1½ in. frieze and 9 in. by 1½ in. skirting, to include all grounds." Not a word about mitres, of which there are about sixty in this item.

There is no bill for "Painter." This is to be priced in the wood and iron work inclusive, and the wood work is to be decorated.

This is somewhat the nature of the bill of quantities, and for this the builder is to add 2½ per cent. for quantities. I should much like to know who would be responsible to the builder in the event of his getting the work on such an unrepresentative bill of quantities, because when the contract was carried out the work would be much in excess of what a builder could be fairly expected to estimate for by this bill. My idea of a bill of quantities is that it should fully express the work without reference to the plan and specification.

I enclose the bill of quantities for your inspection.
A SUBURBAN BUILDER.
December 30th, 1885.

TIMBER MEASUREMENT.

SIR,—I have a trunk of an oak tree which measures 15 ft. long and 9 ft. girth round the middle.

Now, considering this a cylinder, the cubical content is 96 ft. Supposing it squared and the outside neglected, the content is 6½ ft.

If it be considered as slightly tapering,—in mathematical language, a truncated cone,—the two contents will each be slightly greater than those found.

Now, why do the sliding-rule and the tables used by timber merchants make it to be 75 ft.?

I cannot make it this either by taking twenty-five per cent. from the gross measure for waste, or any other way.

Can any of your readers help me?
J. WARDALE.

NON-ACCEPTANCE OF LOWEST TENDER.

SIR,—Referring to Mr. J. Greenwood's letter in your issue of the 26th ult. [p. 914], I beg to say that the Central Association of Master Builders of London has for some time past had under consideration the subject of the non-acceptance of the lowest tender. E. S. HENSHAW,
Secretary of the Central Association of Master Builders of London.

31, Bedford-street, Strand, Dec. 30.

SIR,—In your paper for December 12 [p. 842] there is a letter from Mr. Higgs, justly complaining of the rejection of a tender of his (the lowest by 1½) for some work at a bank, in favour of the next highest one, and we have to ask you to allow us space to bring to the notice of your readers a similar case in which we are the victors.

In November last, we were invited by Mr. C. J. Dawson, architect, of Barking (and Surveyor to the Local Board there), to submit a tender for a malt-store, to be erected alongside the creek in that town, for Messrs. Randell, Howells, & Co., of 25, Mark Lane, City. Having accepted the invitation, and at a time received a copy of the quantities, we, on the 18th of December, sent in a tender, and on the 23rd received a letter from Mr. Dawson thanking us "for the trouble you have had in tendering for the work, a list of tenders for which I append." These were as follows:—

Mowlem & Co.	£4,189	Cumlife	£3,913
Clarke & Bracey	3,889	Nightingale	3,875
Morter	3,493	Smey (accepted)	3,588
Brass & Son	3,383	Rider & Son	3,778

We at once wrote to both the employers and the architect, and the former replied that "they believed they had acted quite within their rights," and the latter informed us that "as Mr. Smith had already commenced the building in question by erecting the most difficult portion of it, viz., the wall next the river" (completed some time since) "and that taking into consideration such work had been unremunerative to him, they thought, as the difference (90¢) was so slight, they could not do otherwise than accept Mr. Smith's tender."

Although the usual clause about non-acceptance of the lowest or any tender was conspicuously absent in both the invitation and also in the quantities, we suppose we have no legal remedy; but it certainly seems monstrously unfair that we should have to waste time and money in making calculations simply for the purpose of checking the estimate of a more favoured competitor. We have communicated with the other builders who tendered to ascertain their views on the subject, and desire, by the medium of your columns, to make known to the trade another instance of a too-frequently recurring custom. We also intend to bring the matter before the Council of the Builders' Institute and the Central Association of London Builders, asking them to consider if any steps can be taken to prevent such treatment in a business already harassed by an exaggerated competition and exposed to enormous risks, difficulties, and annoyances.

THOMAS RIDER & SON.
181, Union-street, Southwark.
December 30th.

VENTILATION.

SIR,—My communication on this matter to *Nature*, referred to in your last issue, was a simple statement that I had tried in practice a system of ventilation strongly recommended by a writer in that paper; and I stated that the system as described was a total failure. I cannot see that either the statement or the result was "curious"; and in reply to your query as to whether I have any fresh-air inlet proportionate to the combined areas of the flue and ventilating shaft, I am happy to say I have not. As these shafts are about 9 in. square each, I should require, for the fourteen rooms the house contains, a fresh-air inlet large enough to run an ordinary hand-cart through, and there would probably be a calmer atmosphere outside the house than inside. To put a sufficient air-inlet in part of the rooms would be useless, as the pull of each flue in the house acts more or less in each and every room. The fresh-air inlet to each room consists of a channel to the outside wall, with ten 1 in. holes opening at the fireplace; this is, of course, in addition to door and window leakages, which are usually the only fresh-air inlets provided.

As flues have to be built with room for accumulation of soot and for sweeping, they are of necessity large; and, if a supply of air, equivalent to the possible demands of a tall 9 by 9 vertical flue, is to be admitted to a room, say 15 ft. by 20 ft., the air in the room would probably not be warmer than outside, and the atmosphere would be about as free from draught as a shady corner in the garden. It is the fact that a sufficient air supply for both flues cannot in practice be admitted to the room, which makes the system as recommended a failure. As I had tried it, and I am pretty certain the writer in the room would probably not be cordoned the fact of its failure in practice. The reason of the failure was, I thought, evident; and, if flues from the ceiling are to be adopted, they

must apparently be accompanied by an apparatus which will deliver into the house an enormous volume of warmed air, as the admission of cold air in sufficient quantities is simply out of the question. Warrington. THOS. FLETCHER.

TALL CHIMNEY CONSTRUCTION.

SIR,—Will you allow me to make two or three practical inquiries respecting the construction of chimney shafts, viz.:

1. What advantages shall I reap by using a portion of Portland cement in mortar, and what proportion of cement to lime and sand is best?

2. Will hydraulic lime give better results than ordinary stone lime?

3. Which would be best to use in constructing flues to carry hot gases to chimney,—brickwork in cement or brickwork in mortar?

I notice in Messrs. Bancroft's work on "Tall Chimney Construction," advertised in the *Builder*, that some builders use ordinary stone lime, some hydraulic lime, and others chalk lime with a little Portland cement added; my object in writing is to ascertain which is best. T. SUMMERS.

CHURCH-BUILDING NEWS.

Althorne.—The Church of St. Andrew, s. Althorne, Essex, has lately undergone some extensive repairs, and, with the exception of the tower, is now in a permanently safe and substantial condition. The principal works have been the rebuilding of parts of the north and south walls of the nave, the insertion of new windows, and a new roof. A monumental brass in the nave floor records that the walls of the church were rebuilt by William Hylkott, who died in 1508. They are of rubble and flint about 2 ft. 6 in. thick, but, owing to insufficient foundations and the fact that the subsoil is clay, they had settled in rather a remarkable way, viz., east and west (not out of the perpendicular), causing large vertical fractures through which the rain and weather entered freely. Indeed, so dilapidated and apparently hopeless was the condition of the fabric that it had been condemned as being beyond restoration and its demolition had even been advised. By means, however, of designs prepared by the architect the most necessary works have been carried out, at a cost of about 350£. The tower, a imposing structure of the fifteenth century, still in a most dilapidated and crumbling condition. Funds are urgently needed for the restoration of this, estimated to cost about 300£. The architect was Mr. H. Hardwick Langton, of London, and the contractor N. Charles Read, of Burnham. The chancel, which was a brick and lath-and-plaster construction has likewise been substantially repaired & improved; the old brickwork which was some has been retained, the walls have been raised and handsome stone tracery windows have been inserted in the east and north and south walls; also a new open timbered roof, the floor raised and tiled, and the interior fitted with choir seating. This work has been carried out at the sole cost of the Governors of St. Bartholomew's Hospital, Mr. Edward Ains and Mr. Langton having been joint architects for this portion of the work. There was a formal re-opening. The works were completed in December.

East Dereham (Norfolk).—The parish church of St. Nicholas, East Dereham, in Wm. was buried the poet Cowper, has been re-opened, after complete restoration of the nave and aisles. The works to the English nave roof comprised removal of the eighteenth-century plaster ceiling and repair of the existing oak roof, and an interior ceiling of pitch-pine boarding and intersecting ribs, and 108 carved bosses of oak. The lead was taken off and entirely re-cast. No plaster has been removed from the north (Decorated) and south (Early English) roofs, and the spandrels of the former have been filled in with new tracery. At the foot of each brace new shields are to be fixed carrying emblems of the saints associated with the Eastern Counties. The old gables which blocked up the north and south aisles and west end of the church have been removed, the celebrated Perpendicular font, which previously in the north transept, has been replaced in its original position near the door. All the windows in this part of the church, including the great west window, have been thoroughly repaired in stonework, and glazed in tinted quarry glass. In this pro-

some beautiful tracery in the windows of the north aisles have been opened out. All the walls have been re-stuccoed, and the south porch,—an excellent piece of work illustrated by Cotman,—has been repaired. The decorative windows were formerly very plain and cold in appearance, but the old plaster mouldings have been removed, and new quoins and inner arches of stone have been inserted, and the windows reglazed. The church has been laid with hot-water pipes throughout on the low pressure system. These have been supplied by Messrs. Jones & Co., London. The former gas-standards have been removed, and ornate (by Messrs. Bradley & Co., of East Dereham) fixed on the top of the columns. The constructive work has been performed by Messrs. Gornish & Gaymer, of North Walsham, and the whole of the works have been completed from the designs and under the superintendence of Mr. Edward Preston Wilkins, architect, of Norwich.

The Student's Column.

FOUNDATIONS.—I.

THE term "Foundations" has received a legal definition. By the Metropolitan Management and Building Acts Amendment Act, 1873, it is interpreted as meaning "the space immediately beneath the footings of a wall." This definition is made for the special purpose of fixing the circumstances under which the use of concrete shall be compulsory within the Metropolitan district, and the smallest quantity of it that will satisfy the requirements of the by-laws made under the Act. We shall see, in due course, how this matter is dealt with on this strictly legal basis. But the subject of foundations cannot, in practice, be so strictly limited. It includes everything that relates to the ground upon which the walls and piers of a building have to stand, and all kinds of preparation that may be required in order to make a bad or indifferent site sufficiently sound and firm for the purpose of being built upon. It is a subject that, beyond most others, requires careful personal observation and experience in order to the formation of a sound judgment in any particular case. Indeed, the student should understand that no written instructions can be of material use to him unless he seizes every opportunity of inspecting excavations and modes of dealing with unsuitable soils in the practical operations of the builder. A good knowledge of geology will be found of great utility, but the following details of the chief kinds of soil in which foundations have to be made may be sufficient as an introduction to the study of the subject.

THE VIRGIN SOIL.

In the open country, the surface soil, to a depth of from 9 in. to 18 in., has been more or less disturbed by plough or spade, and consists of the soil that may be common in the locality, mixed to a very large extent with vegetable matter resulting from the crops that have grown upon it, and with various kinds of manure. Below this depth we find the virgin soil, otherwise called the maiden earth, consisting of matter that has never been disturbed in human history. Whatever may be the nature of this virgin soil, its ingredients have almost certainly been brought, at very remote periods, to their present position, by the action of water. They have been deposited either gently as a sediment in a quiet sea or lake, or heaped together more or less violently by the strong currents of rivers or the breakers of a sea-shore. Sand may have been drifted by the wind just as it is now being drifted on certain of our coasts. Rocks, except a very limited number that have been melted by heat, have been deposited in the condition of soft ooze or of sand, bed upon bed; some interruption in the process, or some thin layer of a different material having caused these horizontal divisions. These beds have gradually become hard, and have usually been tilted up at various angles, broken, and often buckled and twisted into forms and positions of great irregularity. While these movements (caused by subterranean forces acting slowly through long periods) were going on, other beds of gravel, sand, clay, or mud, or of such materials mixed together, have been deposited upon the hardened rocks, and have partaken of the continuing movements of these rocks. Portions of these soft beds have been washed away, and new deposits made over

the disturbed surfaces. Layers of vegetable matter have been formed in shallow water, and have decayed into peat, to be covered up with fresh beds of clay or mud. All these beds are likely to be thick in one place, and gradually to become thin and disappear, or to be cut off suddenly, so that within a small area the subsoil will vary considerably, and soft or spongy layers will be found under others that are comparatively hard and might seem perfectly reliable.

These phenomena can be easily seen and should be carefully studied in ordinary excavations, in railway cuttings, and in sea cliffs, but a very good idea of them may be formed by observing the deposit of debris brought down the channels of a muddy road after a heavy shower. There we may see beds of mud, sand, and gravel sorted according to the size and weight of their particles, and imitating on a small scale by the work of an hour the processes and results that have taken thousands of years to accomplish on the larger scale that we have now in view.

We may now consider these different kinds of subsoil in detail.

Rock as a foundation has a security that is proverbial. If its surface is not level it must be levelled or cut into steps to receive the footings or base of a wall. It is necessary to ascertain that the rock does not consist of a kind of shale that turns to mud when exposed to air and moisture. It is also necessary to see that the whole building stands upon the same kind of foundation, for if some part of it is on a soft and yielding foundation there will be a fracture over the place where the change in the nature of the foundation takes place.

Gravel is upon the whole the most satisfactory of natural foundations. It varies considerably in the size of the stones, their shape, and the proportion of large to small stones. The spaces between the stones are usually filled in with smaller pebbles and sand; a small proportion of clay helps to bind the whole into a solid mass. The rough flint gravels of the London district are of this class, and are very suitable for foundations.

Sand forms a good firm foundation so long as it can be kept in its position. A very slight proportion of clay with the sand makes it stand well in excavations. Sand that is clean and loosely held together may easily be made to slip away from under a foundation if a trench is dug too near to it. Fine sand that lies below the level of the water in the soil will behave very much like a fluid when an excavation is made in it. It is known as "running" sand. If a well is dug in such a stratum near to the foundation of a building the sand may escape into the well so as to undermine the walls.

Clay, when it exists in a thick bed, is very hard, firm, and comparatively dry, so that it can only be dug with difficulty. In that condition it is capable of bearing very considerable weight, but within 4 ft. or 6 ft. of the surface it is so much affected by changes in the degree of moisture as to render it a very treacherous foundation. It swells considerably when wet and shrinks when dry, so as to be intersected by wide and deep cracks. In places where water settles it is pasty, and yields to pressure, and the purer it is the more it is subject to these objections.

Silt is a soft deposit from muddy water, and when it is below the level of the subsoil water is without cohesion or firmness, so that a wall would sink bodily into it. It is found where rivers that carry down large quantities of earthy matter broaden out into a lake or estuary, where the still water can deposit its impurities over a large area. The process is still going on near the mouths of all large muddy rivers, and some of the most important engineering undertakings have been necessary in order to provide foundations in such a subsoil.

Peat is often found lying in strata below the soil in marshy districts. When a heavy load is placed upon it, the water is squeezed out of it, and it becomes compressed so that an artificial foundation must be formed for any building of importance on such a site.

We must remember the conditions under which these beds have been deposited. They are sometimes tolerably level, of uniform composition, and of very great thickness, but frequently they are not only of irregular thickness and inclination, but of different materials mixed together. Thus clay is mixed with sand, making loam, which is more reliable as a foundation than clay alone. The addition of clay makes loamy sand, and loamy gravel, and lime added to clay forms marl,—a compound that is often very hard, but changeable when exposed to air and moisture. To sum up this part of our subject, we may say that, as the result of natural operations, the details of which cannot be precisely known, the soil in which a foundation has to be obtained must always be to some extent uncertain until the excavation is made. Yet a

knowledge of such conditions as are possible, combined with a fair amount of experience, will enable one to judge beforehand of what is probable, and so to be prepared for dealing with the conditions that are found actually to exist.

VARIORUM.

"THE Bernese Oberland: Twelve Scenes among its Peaks and Lakes," by Elijah Walton, F.G.S., with descriptive text by T. G. Bonney, M.A., F.S.A., &c. (London: Published by W. M. Thompson), is a handsome volume, containing twelve plates from the drawings of Mr. Walton, executed in chromolithography by Messrs. Wyman & Sons, giving some of the most striking scenes in the district which it illustrates. The colouring of some of the scenes strikes us as rather "high"; whether this is due to the original drawings, or the reproduction in chromolithography, we cannot say. Some are very successful. The text is better written and of more interest than is usual in works of this class.—"Ye Earlie English Almanack: 1886" (published by Pettit & Co.), is a very pretty little "sham-antique," with old-fashioned woodcuts and page ornaments, and some curious odds and ends of reading. As an antiquarian jest, it is well done, and a good sixpennyworth.—Messrs. Lettis, Son, & Co., Limited, of King William-street, have sent us a parcel containing a varied assortment of their excellent diaries, date-tablets, and housekeeping books. The quarto "Office Diary," No. 1, which is provided with an index, will be found very serviceable; Nos. 8, 9, and 11 are good specimens of the octavo series of the same diary. Nos. 24, 26, and 27 are cheap varieties for the pocket. Lettis's "Rough Diary or Scribbling Journal" is, in spite of its name, a very well-finished diary, the printing, paper, and general get-up being excellent. This diary is folio size, and in one form it is interleaved with blotting-paper. Nos. 35 and 36 are specimens of the same diary in octavo size. No. 37, the "Universal Diary," interleaved with blotting-paper, is a very good and cheap scribbling diary, selling for a shilling. Lettis's "Clerical Diary" and the "Clerical Tablet Diary" are sure to find favour with the clergy, while the "Housekeeper's Books" seem to meet all possible requirements.—"Walford's Antiquarian for January commences a new volume. The first article, on "Brightelmstone" is by the editor, Mr. Edward Walford, M.A., and contains an interesting account of the curious land divisions and subdivisions which formerly obtained, and to some extent still survive, in Brighton. The other contents go to make up a very good number.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7,075, Water Cisterns. R. Pringle.

The inlet pipe is turned up at the end, and provided with a spreader to prevent the disturbance of the deposit. The outlet pipe is fixed with its mouth a little above the level of the inlet. The bottom of the cistern slopes to prevent deposit.

12,888, Bricks and Building Blocks. W. B. Smith.

The bricks are formed so that when laid they cross each other obliquely, each brick bonding with a larger number of others than is usual: in addition to which they may be bound together by tie-rods, or by joggles. They are of about the proportions of an ordinary brick, the difference being that, instead of being rectangular they are oblique angled, and have a hole near each end. Special bricks are made for ends of walls or for the junction of walls meeting at right angles. The bricks are likewise suitable for building straight arches. The invention is applicable not only to bricks, but to other descriptions of building blocks.

13,459, Gully and other Traps. S. Phillips and J. Millier.

The ordinary fixed dip of gully and other traps is replaced by a separate one, which slides in vertical grooves. The grooves are filled with tallow to make them gas and water tight.

14,362, Parquet Flooring, Floors, and Ceilings. F. Guerin.

The strips or boards are formed with grooves in the sides which fit over feathers, through which screws are passed into the joists. The feathers may be made of wood or of metal, or they may be of take the form of T or double I irons, or they may be of metal. A modification is to employ strips or boards having a groove only on one side and pins or dowels on the other fitting into the grooves in the adjacent piece. Where the parquets come next to walls or partitions, the pieces may be let into a strip of wood, the top of which is flush with the surface of the floor. The parquet blocks may be of sufficient thickness, and may be so connected between rolled joists by dowels and pins as to form, at the same time, both a parquet floor and a parquet ceiling. In that case the blocks may be shaped so as to envelope and hide the flanges of the joist.

NEW APPLICATIONS FOR PATENTS.

Dec. 18.—15,545, J. McConachy, Improvements in Ventilators or Air Valves.—15,553, W. Atkins, Improved Door Bolt.—15,554, A. Harris, Ventilation of Sewers.—15,559, H. Townsend, Electric Bell Punched, Pulls, &c.—15,560, J. Arnot, Manufacture of Sunk Slide Flush and Knob Bolts for Doors, &c.—15,577, R. Brown, Improved Batten Nail.—15,587, F. Howcroft, Sash Holder.—15,608, D. & E. Glaisher, Improvements in Movable Partitions, Doors, Window Sashes, &c.—15,609, D. & E. Fastenings are Automatically relieved.

Dec. 19.—15,613, T. Gray, Improvements in Door Locks.—15,650, G. Ayers, Improved Locking Device.—15,677, R. Barker, Reversing Coupling Joint for Water, Gas, and other Pipes.

Dec. 21.—15,684, G. Sowerby, Improvements in Lead Glazing.—15,689, H. Stockman, Improvements in Concrete-mixing Machines.—15,725, G. Tegg, Improved Air and Water Tight Seam or Joint for Constructional Wood and other Work.

Dec. 22.—15,751, W. Joy, Improvements in the Method of Charring Cement Kilns.—15,752, P. Lawson, New Anti-fooling and Anti-corrosive Enamel Paint.

Dec. 23.—15,811, W. Dohring, Apparatus for Cleaning Chimneys, Flues, &c.—15,820, E. Pither, Door Shields or Fluger-plates.

PROVISIONAL SPECIFICATIONS ACCEPTED.

9,090, D. Thomas, Improvements in Screws and Screw Drivers.—10,717, S. Hoesshaw, Improved Fastening for Doors and Windows.—13,497, R. Hunter, Self-acting Stop Lift for Window Sashes.—13,692, C. Parsons, Combined Wood Saws and Slicing Machines.—13,748, E. Horsley, Improvements in Window Fasteners.—13,899, T. Goldsmith, Improved Screw.—14,023, T. Faxon, Attaching Door Knobs to Spindles.—14,113, J. Honeyman, Improvements in Ventilators.—14,294, J. Keith, Improved System for Heating and Ventilating Cellular Buildings.—14,296, W. MacVitie, Adjusting Door Knobs and Handles to Spindles.—14,550, H. Joel, Utilisation of Gas Fittings for the Electric Light.—14,775, R. Legz, Improvements in Stall Boards for Doors and Windows.—14,793, W. Scott Morton, Apparatus for Embossing Canvas for Decorating Walls, &c.—14,907, C. Hodges, Improved Lamp-post.—15,134, A. MacLean and R. Smith, Preparation of Coloured Varnishes.—15,135, A. MacLean and R. Smith, Manufacture of Pigments.—13,228, T. Smith, Manufacture of Comaids, &c.—14,695, C. Carson, Electrical Apparatus for Releasing Door and Similar Fastenings.—14,816, C. Gumpel, Friction Clutch for Holding Window Sashes and other Sliding Frames in any desired position.—14,951, J. Davis, Supporting Vertically-sliding Window Sashes and Shutters in their Frames.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

16,817, R. Adams, Improvements in this Method of Opening and Closing Fanlights, Skylights, Ventilators, &c.—2,396, H. Hunt, Improvements in Kitchens.—2,364, P. Hantay, Improvements in Water-closets, Sinks or Covers.—2,615, W. Hayhurst, Improvements in Cramps for Carpenters and Joiners.—2,859, L. Bickley and J. Winn, Improved Paint Brush.—3,512, E. Summerfield, Adjusting and Fixing Door Knobs to Spindles.—9,422, W. Boulton, Improvements in Decorating Glass.—12,610, R. Mason, Improvements in Windows.—13,688, T. Newey, Door and Window Fasteners.—1,383, H. Gresham, Security Stops or Catches for Windows, &c.—12,191, A. Clark, Window-sash Holders.

MEETINGS.

FRIDAY, JANUARY 1.

Architectural Association.—Mr. E. C. Robins on "Various Theories Concerning the Form and Style of the Temple of Solomon." 7.30 p.m.

SATURDAY, JANUARY 2.

Association of Public Sanitary Inspectors.—Mr. James Bateman, C.E., on "The Pollution of Rural Water Supplies." 8 p.m.

MONDAY, JANUARY 4.

Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Dutch Painters of the Seventeenth Century." 8 p.m.

London Institution.—Mr. Edwin Freshfield, F.S.A., on "Christian Constantinople." 8 p.m.

Victoria Institute.—Mr. W. St. Chad Boswell on "Newly-Discovered Inscriptions with reference to the Migration of Abraham." 8 p.m.

Clerks of Works' Association.—Mr. E. A. Bernays, M.Inst.E.C., on "Portland Cement and some of its Uses." 8 p.m.

TUESDAY, JANUARY 4.

Manchester Architectural Association.—Mr. J. S. Hodgson on "Architectural Ethnography." 7.30 p.m.

WEDNESDAY, JANUARY 6.

British Archaeological Association.—(1) Mr. J. Romilly Allen on "The Sculpture of the Norman Doors at Abbeys, Yorkshire." (2) Mr. J. W. Grover on "The Discovery of the Monuments of the Atkins Family at Clapham." 8 p.m.

Bulkers' Foremen and Clerks of Works' Institution.—Ordinary meeting. 8.30 p.m.

THURSDAY, JANUARY 7.

Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Painters of the French School." 8 p.m.

Edinburgh Architectural Association.—Short papers on Current Topics. 8.30 p.m.

Miscellaneous.

Royal Institution of Great Britain.—Among the "probable arrangements" for the Friday evening meetings before Easter, 1886, are the following:—Friday, Feb. 5th, Mr. T. Pridgin Teale, M.A., F.R.C.S., on "The Principles of Domestic Fire-place Construction." Friday, March 12th, Mr. Reginald Stuart Poole, LL.D., on "The Discovery of the Biblical Cities of Egypt." Friday, March 19th, Mr. W. H. M. Christie, M.A., F.R.S., Astronomer Royal, on "Universal Time." Friday, April 9th, Mr. William Anderson, M. Inst. C.E., on "New Applications of the Mechanical Properties of Cork to the Arts." The other lecture arrangements include the following:—Mr. Reginald Stuart Poole, LL.D., of the British Museum, Three lectures on Naucratis: (1) Relations of the Greeks with Egypt from the Heroic Age to Ptolemaic; (2) The Emporium of Naucratis; (3) The Egyptian Sources of Greek Art. On Tuesdays, Jan. 26, Feb. 2, 9. Prof. Charles T. Newton, C.B., LL.D., M.A. Three lectures on the Unexhibited Portion of the Greek and Roman Sculptures in the British Museum (illustrated by drawings and casts). On Tuesdays, Feb. 16, 23, March 2. The Rev. C. Taylor, D.D., Master of St. John's College, Cambridge. Two lectures on the History of Geometry: the Greeks and the Moderns. On Saturdays, Feb. 27, March 6. Professor Oliver Lodge, D.Sc. Two lectures on Fuel and Smoke. On Saturdays, April 10 and 17.

Christmas at Exeter.—Mr. Councillor Hems (better known, perhaps, as Mr. Harry Hems) invited a large number of poor old men and women to his customary Christmas dinner, which was served in his wood-workers' shop, on Christmas Day. Mr. Hems seems to have been characteristically energetic in administering to the enjoyment of his guests.

Royal School of Mines.—Prof. Warington Smyth, F.R.S., in continuing his lectures in the theatre of the Geological Museum, Jernyn-street, dwelt at length upon the various means adopted for the discovery of displaced lodges. The simplest mode of determining where the continuation of the lodge lies is to assume the generalisation that the lost part of the lodge is lower on the side of the hanging wall of the dislocator, and this is practically the same rule which applies to stratified deposits referred to

in a previous lecture. To this rule, however, as in the case of beds, there are exceptions; but, after paying great attention to these exceptional cases, he found that forty-nine cases out of fifty held good. The exceptions occur where the underlie is very flat, as illustrated in the district of St. Agnes, in Cornwall, where a great number of dislocations occur, and almost invariably have the effect of heaving the lode; and there are instances where one lode has been brought to the surface two or three times; but complications of this kind may be quite unknown in another district. Heaves and displacement may, and frequently do, result from contact with cross courses, which form a plane down which the lode may slip, in which case it is important to know which way to work in order to fall in with the displaced lode again. Miners call these cross-courses guides, because, by following them, veins coming in contact with them may be met. Mr. Henwood, in some reliable observations, concludes that of a very large number of lodges which he examined 22.7 per cent. were intersected by cross-courses and not heaved; the proportion heaved to the right hand 51.1 per cent., and to the left hand 26.2. Those heaved to the side of the greater angle were 63.5 per cent.; to the side of the smaller, 12.9; and the mean distance of the throw was 16.4 ft. This statement fully establishes the fact that the relations of right hand and left hand, of smaller angle and greater angle, cannot be adhered to invariably, and that they are applicable only to a particular mine or particular district.

Objection to Builders.—On Wednesday last at Stratford Petty Sessions, Mr. Joseph Elliott, builder, of 5, Haveward-road, High-street, Tooting, was summoned at the instance of the Woodford Local Board for unlawfully laying certain building materials,—mortar and other things,—upon the footpath in Chelmsford-road, Woodford, and allowing them to remain a longer time than necessary. Mr. Martin, the clerk to the Local Board, appeared for the prosecution. Mr. Holloway, the road surveyor to the Woodford Local Board, was sworn, and said that in consequence of receiving complaint from persons who said that they had run into mortar in Chelmsford-road he went to the road where the defendant was engaged in erecting certain houses. There he found the path completely blocked up with mortar, sand, and brick. He requested the person in charge of the operations to remove them, but the obstruction was there after that time. Mr. J. D. Hooper, town surveyor to the Local Board, said he cautioned defendant as to obstructions of this kind, and they had remained some time after such caution; but it was all removed on Defendant admitted that he had carted sand across the path, but said it was removed as soon as possible, and never caused an obstruction for more than a couple of hours. A little mortar might have been made on the path. The Bench said this was practically a plea of guilty. They should impose a fine of 40s., and 1l. 10s. 6d. costs.—Daily Chronicle.

Virginia Water.—The description of the insubstantial condition of the lake of Virginia Water in our issue of December 12th, by resident on the spot, surpasses anything that should have thought possible within the Royal Park at Windsor under the immediate supervision of the Ranger and Deputy-ranger appointed to superintend the Royal Estate. Royal and Crown property are not subject to the local authority, as specially appointed officials are presumed to render further supervision unnecessary. But if the condition of the lake of Virginia Water is a fair example of the way these duties are discharged, the time may come for an alteration in the existing order of things. It is not to be expected that his Royal Highness Prince Christian, who holds the position of Ranger of the Forest, should issue severe or sewer-impregnated lakes. Such duties are not expected of Princes, for the like Caesar's wife, are above suspicion. The office is a sinecure for the maintenance of princely dignity. But there are deputies responsible for the discharge of these duties for the protection of the health of Her Majesty and the rest of the Royal Family, as well as the general public, who, by the sanction of the Crown, use the lake at Virginia Water as a summer recreation. Royal water parties should also there, to the risk of health and life the account given by our correspondent only half as bad as he represents it to be. *Lancet*.

Heating and Ventilating.—Some of the most recent applications of the Abolus Water spray Company's system of heating, cooling, and ventilating, are at the following buildings: School of Science and Art, Lincoln; the convent of St. Lawrence's Sisterhood, Belper; age-green and West-green Board Schools, Otterham; St. Barnabas Church, New Hummerston, Leicester; Priory Chapel, College Walk, Maidstone; New Docks Offices, Bristol; Union-hall, Stratford, E.; New Liberal Club, Birmingham; and the Staffordshire Bank, Union-street, Birmingham.

Rugby.—The east window of the south aisle of Hillmorton Church, Rugby, has been filled with stained glass representing figures of our Lord as the Good Shepherd and SS. Peter and John, with canopies and other ornamental detail, designed and executed by Messrs. F. Holt & Co., Warwick.

Medieval Bricks.—The introduction in Germany of facing bricks so marked and constructed as to be readily divided into halves and quarters has induced Herr W. Narden of Cassel to point out in the Deutsche Bauzeitung that the idea had already been perfected during the Middle Ages. The observations made by Herr Narden during the restoration of old brick edifices have led him to this conclusion. The economy of this method is urged by him in support of its more general adoption.

Foreign Building Hints.—In a recent number of Science pour Tous, a recipe is given for the artificial colouring of white marble or alabaster. A good blue is obtained by a solution of borax, in which indigo and azotate of soda have been dissolved; red, by borate of soda, any red colouring matter, and nitric acid; black, by nutgall. If marble thus treated becomes tarnished, it may easily be put to rights by drying it in a stove for one or two days.

A new varnish for iron and steel is described in Industria e Invencciones, as being obtained by dissolving sulphur in a warm essence of turpentine, and laying it on the article to be treated with a brush. When the essence is evaporated, there remains upon the surface a light film of sulphur, which becomes permanently fixed after being exposed for some time to the flame of a spirit-lamp. The varnish is of a deep black, and very durable.—The French Consul at Baku reports the discovery of a new and valuable wood in the forests of the Caucasus. Its qualities are,—great beauty of colour, and its property of hardening in the air, and never decaying, while it weighs three times heavier than oak, and is very easy to work. It will probably be in great request with cabinet-makers, turners, and coachbuilders, and its price is 15 francs the quintal, or about 12s. the hundredweight.

Reforms Needed at Kew.—It is not unwell known that in the course of the next few years we will be considerably modified by the overruling powers. There can be no objection to the distinctions that are maintained by certain palisades, and whether a tract of ground is called "garden," or "park," or "arborescence," of little consequence, provided the public have access thereto at reasonable times and seasons, and good keeping makes good work for the student and good entertainment for the pleasure-seeker. As to what shall be understood by "reasonable times," there will be differences of opinion. It may safely be predicted that the day is not far distant when the gardens will be opened at an earlier hour than is at present, and that some gates now kept locked will be thrown open. But the new Director, appointed by the Government to whom he is responsible, will have to maintain a firm stand against the petrine of the residents of the district and the local papers in which their special interests are protected,—the doctrine that, by reason of the distance, the residents have claims superior to those of the public at large. An occasional outbreak of clamour, backed by the abuse of the local press, has to be endured by the Director, and Sir J. D. Hooker is shown how unreasonable demands should be resisted, and the claims of science made to triumph with the growing desire of the public for the free enjoyment of park and garden scenery. It is, we think, doubtful if the plant-houses could be opened at an earlier hour than is at present because of the peculiarities of the daily work; but there can be no great difficulty opening the gates at ten instead of twelve on week-days, and an outlet to the Old Deer Park would be a boon of great value in times of general holiday.—Gardener's Magazine.

PRICES CURRENT OF MATERIALS.

Table with columns: Timber, Tonnage, Price (£ s. d.). Includes items like Greenheart, Teak, Sequoia, Ash, Birch, Elm, Fir, Dantia, Oak, Pine, Lath, St. Petersburg, Waincoat, Deals, Riven, St. Petersburg, Spruce, Fir, New Brunswick, Batens, Flooring Boards, Cedar, Honduras, Australian, Mahogany, St. Domingo, Mexican, Tobacco, Honduras, Maple, Rose, Bahia, Box, Turkey, Satin, Porto Rico, Walnut.

Table with columns: Metals, Tonnage, Price (£ s. d.). Includes items like Iron-Pig, Bar, Welsh, Staffordshire, Sheets, Slabs, Hoops, Nail-roads, British, Best selected, Sheets, India, Australian, Chili, Yellow Metal.

METALS (continued).

Table with columns: Metal, Price (£ s. d.). Includes items like Lead-Pig, Spanish, English, Silesian, Ordinary brands, Banca, Billiton, Straits, Australian, English ingots, Zinc, English sheet.

OILS.

Table with columns: Oil, Tonnage, Price (£ s. d.). Includes items like Linseed, Coconut, Copra, Palm, Rapeseed, Cottonseed, Tallow, Lubricating.

Table with columns: Turbentine, Price (£ s. d.). Includes items like American, Tax, Archangel.

TENDERS.

Table listing tenders for alterations and additions to premises at St. Augustine's-place, Bristol, for Messrs. J. Smith & Son, Mr. Henry Williams, etc. Includes names like Ridewood & Wright, H. A. Forse, Walters & Son, etc.

BRONDESBURY.

Table listing tenders for dwelling house in Salisbury, for Mr. W. H. Coles. Includes names like Keyes, Head, & Co., J. Boyce, Higgs & Hill, etc.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

COMPETITIONS.

Table with columns: Nature of Work, By whom required, Premium, Designs to be delivered, Page. Includes New Wing to Buildings, East London Hospital.

CONTRACTS.

Table with columns: Nature of Work, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes Alterations, Granite Spalls, Completing Four Large Shops, Roadmaking, Stores and Materials, Water Supply Works, Brick Saver, Kerbing, Removal of Dist. Dirt, Alterations, Erection of Urinals, Wood Paving, Main Drainage Works, Sewage Works, Erection of New National Schools, Wharf, New Dock Wall and Sewage Works, Painting Station at York, Extension of School, New Lunatic Asylum, Boundary-Walls, Abutments, Ironwork for Bridge.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom advertised, Salary, Applications to be in, Page. Includes Assistant Surveyors, Building Inspector.

HORNSEY.—For alterations and additions to Roden, Hornsey-lane, for Mr. R. T. Broome. Messrs. H. Parkin & Co., architects and surveyors, Crouch End Station.—

Gladwell & Sons, Stroud-green (accepted).....	£93 0 0

The Liverpool Cathedral Scheme.

THE collection of drawings which is now on view in Liverpool will, we think, satisfy the most previously sceptical persons that there are great possibilities in the site which has been selected, and which we have always said was the best, taking architectural and practical considerations together, among such of the possible sites as have been suggested and discussed. Two sites have been suggested which would have been superior in an architectural point of view. One was that of a river site on the quays; an idea which architecturally was calculated to excite the wildest enthusiasm, for a building of the highest class would have produced an effect, in such a position, almost unrivalled. Practically, it would have been rather out of centre; and it appears that the space was not to be had, being wanted for other purposes. The other suggestion we refer to was that of Mr. Seddon, which was strongly supported by some gentlemen in Liverpool who took a warm interest in the subject, that the new cathedral should be placed with its western façade on the line of street called Commutation-row, rather above and facing St. George's Hall. This idea was illustrated in our pages about a year ago, by a drawing specially made by Mr. Brewer (*Builder*, Feb. 14, 1885), showing the façade of Notre Dame at Paris, with spires added, as it would appear in that position. That this site would be architecturally superior to the one selected there is no doubt. The cathedral would have been less cramped, and would not have interfered with the view of St. George's Hall from any point. It is all built over, however, and we presume that the cost of acquiring the property and paying compensation would be very considerable. The idea, however, may still be worth keeping in mind.

The site selected (or at present to be regarded as selected), west of St. George's Hall, and now occupied by a church of little architectural interest, and its church-yard, is somewhat cramped, and in shape and proportion it is not very well suited to the usual Medieval type of cathedral plan. But it is what may be called a rather suggestive site. Its very shape, rather wide than long, appears to suggest a departure from precedent in planning, or, at least, from the precedent usually accepted in modern English churches, that of the long and narrow Medieval nave. Such a departure we should regard, if fitly carried out, as a distinct gain. We have no wish to see a nineteenth-century cathedral built as a mere reproduction of the main features of a thirteenth or fourteenth century one. The temptation to take this course, considering how the Medieval cathedral is endeared to us by association, is no doubt very great; but modern church worship, unless from the point of view of a small section of Churchmen who are as archaeological in their religion as in everything else, is essentially different from Medieval church worship; and it should be the business of a modern cathedral architect to produce a fine building which may at the same time express the feeling and the requirements of modern worship. The site selected for the Liverpool Cathedral gives him a natural lead in this direction, since it is too short for the Medieval type in its full proportions. The great fall of the ground towards the west is another of the suggestive incidents in the site; it creates a difficulty in some respects, but it almost compels a bold and effective treatment of the western façade. The principal drawback is the too close proximity into which the east end of the cathedral will necessarily be brought to St. George's Hall, and the stopping out, to a great extent, of the view of the west flank of that building. If we remember right, the opinion was advanced by some one, in the multitude of discussions which have taken place on the subject, that the obscuring of the said west flank would be no loss; but that shows a very inadequate appreciation of Elmes's building. St. George's Hall is, of course, a building most unsuitably designed and planned for its purpose; its value now is mainly as a modern treatment of Greek materials; but in this respect the western colonnade, with its square columns and its screen,—Greek in detail, Egyptian in arrangement,—is one of the most original and effective portions of the design. It will not be entirely shut out by any of the cathedral designs submitted; but its continuity and perspective will be much abbreviated.

Considering all these conditions: the squareness of the site, the proximity of a great modern Greek building, the Classic tendencies of the principal surrounding buildings, our own idea, as we have before indicated, would have been a design based on the suggestions of Wren's first design for St. Paul's, with a great dome and a wide central area, approached by a *pro-naos* rather than nave; the dome space itself forming the *naos*, or the chief part of it. The opportunity of realising Wren's fine conception, never (to his grief) carried out, with finer and purer treatment in detail than Wren's pseudo-classicism can be accounted, struck us as what might be regarded as a

godsend to inspired architects, anxious for a new path to fame. *Dis aliter visum*; the selected competitors think otherwise. Messrs. Bodley & Garner give, as a distinct reason against a Classic treatment, the consideration that a Classic cathedral would not detach itself sufficiently from its surroundings. "There is great danger," they say, "that a group of buildings, arranged as they must be very closely, and designed in the same style, should be confused together. The cathedral must, of course, be the most important in every way, but it would not occupy the place of honour, which is already taken by St. George's Hall; and we think that it would be difficult, if not impossible, to prevent the latter appearing a part of the former. Of course the group would, architecturally, be very fine." Surely the admission in the last sentence is important enough to outweigh the previous considerations; but the argument is altogether a curious instance of the difference between architecture now and architecture when the Medieval cathedrals were built. Then, the cathedral was naturally in the same style as any buildings adjoining it, and there was no fear about their being "confused together." It must be admitted, however, that in the present state of ecclesiastical feeling it is probable that cathedral architecture founded on Classic models would have little chance of acceptance, and one cannot expect competitors to overlook that factor in the case.

The three designs by the architects invited to compete, Messrs. Bodley & Garner, Mr. Brooks, and Mr. Emerson, have each distinct individuality in the way in which the building is treated. Mr. Brooks selects the style of the latter portion of the fourteenth century, as illustrated in such buildings as Beverley, Fountains, Lincoln, &c., both as free from the more elaborate detail which might be injuriously affected by the atmosphere of a city like Liverpool, and also because the more severe detail of this comparatively Early Gothic style harmonises better with the lines of the Classic architecture adjoining: which is perfectly true. The plan is the Medieval plan pure and simple, with the square crossing at the intersection of nave and transepts, only that the choir is shorter than the typical Medieval choir (which is, of course, quite in keeping with the purposes of a modern cathedral), and the nave is short for its height and the scale of the building; but this is inevitable from the conditions of the site. The principal external effect is concentrated on the west end, where are two lofty towers with spires, set out north and south beyond the line of the aisles, and having between them a great flight of steps leading into three deeply-recessed and cavernous porches, Continental rather than

English in character. This is a grand and monumental piece of architectural composition, the whole width of the towers flanking the steps and forming an *appui* for the triple porch: one bay of the nave arcade is sacrificed for it, but the effect is worth the sacrifice, and the alternative design showing a side access by flights of steps entered through the towers, and giving an additional length to the nave within, is far inferior in effect, and not to be thought of in comparison with the other treatment. The nave piers are very lofty; the main line of the piers runs right through the ground-floor arcade to the springing of the triforium arcade, which thus becomes in reality the main arcade, giving a great look of height to the nave; at the same time the piers are gripped and steadied in the centre of their height by the lower tiers of arches and the floor of the triforium, which is not a mere arcaded passage, but a great gallery as large and lofty as the ground-floor aisles. The central external feature is a lantern only, an octagon with turrets at the angles, and entirely subordinate to the western towers. The eastern termination is a semicircular apse, which, as Mr. Brooks says, "gets over the difficulty which might arise from the awkward line which might be produced by a square-ended building in close proximity, but not at right angles with it"; and we may add that, the northern termination of St. George's Hall being semicircular, we get here the interesting incident of the juxtaposition of the Gothic and the Classic apse. The general style of the design is such as we are all familiar with already in Mr. Brooks's work; broad masses of masonry in the walls and buttresses; simple and severe treatment in the windows and other details; an entire absence of anything like trickery or mere pretentiousness; these are the qualities we all know in Mr. Brooks's churches, and they are equally manifest in this, the largest design he has ever made.

These characteristics will be apparent in the perspective view of the exterior, which we publish this week; but we are not professing now to do more than give a general idea of the characteristics of the three designs, reserving more detailed comments for future numbers, when we shall give further illustrations of each design. Messrs. Bodley & Garner adopt a rather later Gothic style, that of the Early Decorated period, with geometrical tracery. Their design is pure English Gothic, and remarkable for grace and elegance externally. In the plan they have adopted the fine expedient which distinguishes Ely Cathedral, of the expanded octagonal space at the crossing; but, in place of being content with a mere lantern over it, they have raised the centre feature into a great octagonal tower in two stages, crowned by a spire, the whole rising to a height of about 450 ft. The west end has two towers with spires, about 270 ft. in height, the idea being to repeat on a larger scale the composition still existing at Lichfield, and which was intended and perhaps originally carried out in other English cathedrals. The internal arcades are of great mass and solidity, as will be evident from the view of the interior which we give in this number; the authors observing in their report that in a modern cathedral the question of the convenience of seeing and hearing in the side aisles need not be taken into account, as the centre aisle alone is likely to be used for actual worshippers, the side aisles being for passage and for the reception of monuments. They "think it desirable to insist on the absolute necessity of a very large space for this purpose, as the number of memorials becomes so very greatly increased in the course of ages that, unless there is very considerable room left, the church becomes greatly encumbered and disfigured." The authors consider that the building approaches too closely to St. George's Hall, and wish that the site should be somewhat extended westward; or they suggest that more space may be gained by reducing the scale of the building, without alteration of the design. To our thinking, this might be done even with improvement to the design; for the fact is the scale of the parts is rather over-large, and the

design, in the geometrical elevations, does not convey the idea of its actual size. With the exception of the very original and bold treatment of the central feature, this design is an orthodox English Gothic one of very pure type, and if this be the object it could not be more completely carried out. Mr. Bodley has in former times designed churches, like that at Tuebrook, near Liverpool, of which it might be said that when the hand of time has passed over them, it might become very difficult to say whether they were genuine Mediaeval work or modern reproductions, so completely has the spirit of Gothic been mastered in them.

Mr. Emerson's elaborate and masterly report is a complete essay on the architectural function of the cathedral, illustrated by a number of small views of various cathedrals, and of cities with their cathedrals, showing how the great building takes its place in relation to the whole aggregation. To this we shall hope to do full justice at greater leisure. Here we can only mention generally that Mr. Emerson considers that the spirit of modern worship demands an area as unbroken as possible, and every facility for congregational worship. He adopts a plan based on the Mediaeval division into centre and side aisles, nave and choir, but employs a rather short nave and a very large octagonal centre space at the crossing, covered by a large dome. In regard to the dome, Mr. Emerson remarks that the cathedral of a great city requires something more massive than a tower and spire to assert itself in the general view, and illustrates, his point by views of the domes of St. Peter's and St. Paul's with a portion of the city adjoining, and a general view of Florence showing the mass of the dome as the central and conspicuous object. The argument may be pressed too far, but there is certainly something in it, and as to the suitability of a dome as the central feature for this special site, we have already expressed ourselves to the same effect. In regard to style, Mr. Emerson adopts, as he says, an early phase of Gothic, bordering on Romanesque; but, as will be seen from the view we give, it is Gothic "with a difference." There are reminiscences of India about it, with which country the author of the design has been much connected architecturally. The treatment of the west entrance, however, is derived from Peterborough, and certainly no finer model could be taken. The great porches are flanked by western towers, which Mr. Emerson, like Mr. Brooks, sets out beyond the line of the aisles, to give greater breadth to the front. In spite of the Gothic or quasi-Gothic detail, the main lines of the design, except the towers, are rather Classic than Gothic, and partly suggest a regret that the whole building was not frankly Classic. This, however, is only a passing impression, which may be modified on the more careful consideration which the boldness and originality of the design certainly call for.

We have confined ourselves purposely, as we have implied already, to giving a general idea of the *motif* of each design, with a typical illustration of each; reserving more detailed consideration of them. Their authors will not quarrel with us for thinking that their labour of months is not to be fairly dissected, criticised, and disposed of in a few hours.

The Proposed School of Forestry in Edinburgh.—The Report of the Select Committee on Forestry states that it was found impossible to conclude investigations during the past session, and recommends that a committee on the subject should be appointed in the next session of Parliament. On the general subject of the proposed Forest School, Colonel Pearson, in examination before the committee, expressed himself in favour of a Chair of Forestry at the Edinburgh University, but he further stated that he had no actual faith in lectures in the school unless illustrated by practical instruction. Regarding the extent or scope of the school, Mr. Threlton Dyer, in reply to Sir Edmund Lechmere, said he would make the school applicable to India and the colonies as well as to our own country.

AMERICAN PLUMBING: SANITARY SPECIALITIES.*

BY AN AMERICAN ARCHITECT.

Plumbing Fixtures.

LINKS, bath-tubs, water-closets, wash-basins, &c., are called with us plumbing fixtures.

Water-closets are generally a copy or at least of the same class as closets in the old country (England). The Bramah, the Jennings, the Brighton, and hopper closets have their counterpart in this country, varying only in slight and unimportant details. Closets in which the discharge is caused by syphon action are novelties which the United States have produced.

The Dececo was invented by Geo. E. Waring, jun. The Tidal Wave and Cascade

were invented by J. E. Boyle. They are emptied by syphon-action. The Dececo (fig. 8, A) has a very sharp water seal at the bottom of the bowl. The closet is set over a weir placed beneath the floor. The first discharge fills the weir to the partition, when the outlet forms the long arm of a syphon. In this way the contents of the bowl are syphoned every time the bowl is used. From its shape it is necessary that this closet should be filled to within a short distance of the top of the bowl before the necessary syphon-action then empties the closet can take place.

The weir-chamber below the floor is ven-

* Continued from p. 6.

much like the objectionable English D-trap in form. There is no opportunity for a vent-pipe in the trap of the Dececo, as it would prevent the syphon-action. This closet is, however, neat and cleanly, and is manufactured in one piece of earthenware.

The Tidal Wave has a double trap. An air-pipe runs from the space between the traps, up and through the tanks that supplies the closet with water. This air-pipe is governed by a valve which opens only when acted on by a pressure from below. In this way the vent-pipe does not interfere with the formation of the vacuum necessary before the closet could be operated by syphon-action. When two-thirds of the service box has run off, the vacuum is broken, and the remaining third of the water fills the bowl, and leaves it in proper form to be again discharged by the syphon. The bowl (see fig. 8, B) and its double traps are formed

Fig. 9.
A and B. The Sanitas.
C. J. L. Mott's waste and overflow.

in one piece of earthenware. The lower trap is ventilated, or has a place for connexion with a vent-pipe at the usual place. The closet must be supplied from one of Boyle's patent tanks or cisterns.

The Cascade Closet (fig. 8, C) is a modified form of the tidal-wave closet. The outlet is directly beneath the centre of the bowl. The closet does not require as much space, and can be set so as to face in any direction.

In practice, it is found to be an excellent form of closet. This closet requires a trap beneath the floor, and the joint between it and the closet must be absolutely tight, or the closet will not operate.

It is fast becoming a common practice in this country to dispense with all wooden paneling, boxing, and casing around water-closets, bath-tubs, and wash-basins.

The water-closet seat rests on brass, nickel plated, or iron legs, leaving the closet visible, and allowing no concealed or dirty places to exist. In the best work the floors and sides of the bath-rooms are cased with glazed tile; and the room is kept warm by the furnace, hot-water, or steam heating apparatus. Bath tubs are put on legs when made of iron or porcelain, and make a sanitary tub.

Bath tubs in the United States vary little from bath tubs in England.

The market is supplied with tubs made in sheet copper tinned, iron (plain, painted, zinc coated, and enamelled), and in solid porcelain. The copper tubs, being the cheapest, are the most generally used.

They come tacked into a wooden form or box. This kind of closet requires a wooden casing to make it presentable.

The overflow runs into the waste-pipe on the tub side of the trap. As a sediment collects in this concealed overflow, a standing overflow is now used sometimes, similar to the overflow shown in the "Sanitas" wash-basin (fig. 9, A and B). Bathtubs are invariably supplied with hot and cold water.

Wash-basins are simple bowls, the overflow connecting with the waste-pipe just above or between the bowl and the trap. There are numerous patent overflow and waste pipes, but

F. The common G-trap, with vent attached. The dotted lines show the different forms in which it may be obtained.

they have been but little used in practice. I illustrate two of the most simple and best patented devices which are finding their way into use (see fig. 9).

The Sanitas basin (fig. 9, A and B) has a standing overflow which forms the plug for the waste-pipe of the basin. By this contrivance the concealed overflow, as well as the common plug with its dirty chain, are removed. The plug or overflow can be easily removed and cleaned. It is raised or lowered by the small lever shown in the detail cut. The J. L. Mott basin illustrated (fig. 9, C) also has its overflow through the plug, but in getting rid of the chain, a part of the waste-pipe and the overflow are left to collect sediment. There is little opportunity of cleaning them as they are concealed.

The same firm manufacture an oval basin designed to allow greater freedom in the use of the arms in washing the face and neck.

Kitchen Sinks are used of iron (plain, painted, galvanized, and enamelled), steel, and porcelain. Zinc-coated, or galvanized iron as it is called, is the kind most commonly used in this country. They vary in size from 12½ in. by 16½ in. to 20 in. by 48 in. Solid porcelain sinks are used in the fine houses, but are too costly for houses of moderate price.

Hotels and large residences have or use grease-traps beneath the kitchen sink. These traps are put in beneath the sink to catch the grease from the kitchen utensils and dishes and prevent it from passing into the sewerage system. It is liable, on reaching the cold pipes, to congeal and give considerable trouble. The majority of them are merely large catch-basins, but Tucker's grease-trap is surrounded by a cold compartment, so the fatty matter will be quickly cooled and deposited. When full, the compartment can be lifted out and the grease removed. Commonly the simple O trap is used.

Pantry Sinks are commonly made of planished copper, but in fine work solid porcelain is sometimes used. From the danger of breakage it is questionable if the copper sink is not the best for the purpose, although the porcelain ones are the most easily cleaned and the most pleasing to the eyes.

Urinals vary little from those used in England. Lipped urinals are the most common as well as the most desirable form. The most desirable method of flushing them is from a tilting tank, which empties its contents every time it fills. The length of time it takes to fill is governed by the supply-cock. It can be made to empty once every hour or once every day. Urinals are rarely used in private houses.

Closets, protected by porcelain safes, or so arranged that all the wood-work can be lifted from the bowl, are used in dwellings in the place of urinals. Urinals proper can only be found (with a few exceptions) in hotels and railway stations. In them a constant stream of water is kept running.

Tanks or Cisterns.—The plumbing regulations in a majority of the American cities require the use of separate tanks to supply water to flush the closet. This is a sanitary regulation to prevent the direct connexion between the water-supply main and the closet. Water has been known to have been drawn from the closet at a faucet opened below. There are tilting and syphon tanks, lever, plug, and service-box tanks, waste-preventing plugs, and service-boxes; in fact, hundreds of tanks differing slightly from each other, about the same kind and style as in England. They are manufactured of iron, lead (sheet and cast), and copper. Wooden lead-lined tanks have less resonance, and thus make less noise when water is discharged from them than do iron tanks. For this reason they are again coming into use after having been totally abolished for iron tanks.

Space does not allow for illustration and description of the different varieties of tank;

suffice it to say, that a before-and-after wash-trap is usually the kind adopted. The before-wash moistens the sides of the bowl, and prevents the adhesion of fecal matter. The after-wash carries everything through the trap into the sewer. The before-wash is produced when the seat is pressed down, and the after-wash is brought into play when the seat is relieved of pressure.

Traps.—Between water-closets and the soil-pipe, 4 in. or 3½ in. \mathcal{O} or ∇ traps are invariably used in the United States. The trap is porcelain, and forms a part of the closet in a large number of cases. When made in connexion with the closet, it sets above the floor.

The traps placed beneath closets are like the illustration (fig. 5 C, p. 5 ante). Under sinks, bath tubs and wash-basins, and laundry tubs, 1½ in. or 2 in. \mathcal{O} or ∇ are usually used (see fig. 10, F). Plumbing regulations require these traps to be ventilated. Grease-traps are rarely put under kitchen sinks, except in large public houses. A number of patent water-seal and mechanical traps are used to a greater or less extent under basins, baths, &c. I illustrate the kinds which have had or are having the most extended use.

The large English \mathcal{O} and pot traps are never used in this country, as they are supposed to accumulate and retain waste matter instead of discharging it into the soil-pipe. Not many years ago it was common to place leaden \mathcal{O} traps under closets. As it was a common occurrence for servants, and possibly other careless people, if the traps became in any way clogged, or if they wished to get any uncommonly large object through the trap to punch holes in them with sticks.

For this and other reasons mentioned in connexion with leaden pipe, iron traps are invariably used under closets. Small traps for wash-basins, baths, &c., are usually made of lead.

The subject of trap ventilation has been a bone of contention for some years in this country. Sanitarians a few years ago were unanimous in their advocacy of trap ventilation. It was claimed that thus trap syphonage, or the destruction of the water seal, was prevented, whether caused by vacuum, or momentum of the water, or by back-pressure of gases. This was supposed to have been an undisputed fact, and municipal plumbing regulations have invariably inserted a clause requiring trap ventilation. Mr. Geo. E. Waring, jun., and Mr. J. Pickering Putnam claim that it is not only useless, but wrong to ventilate traps. Both these have monetary interest in appliances which do not require ventilation, the sale of which is injured by the aforesaid regulations. This creates a natural doubt in the minds of those interested, unfortunately, for fear that their opinions are unknowingly biased by their pockets. E. S. Philbrick, Dr. John S. Billings, Henry C. Meyer (editor *Sanitary Engineer*), and others, assert that trap ventilation is the proper thing.

I am now carrying on an exhaustive series of experiments to determine these and other disputed questions in plumbing, under the auspices of the Museum of Hygiene, United States Navy Department.

The traps illustrated in fig. 10 are the different kinds usually used in connexion with wash-basins, bath tubs, and sinks.

The simple \mathcal{O} and ∇ are the kind most generally used, made of lead (fig. 10). As shown in the illustration, the vent-pipe is enlarged, so no deposit can take place in it.

The "Sanitas" trap is professedly anti-syphon. It consists of an \mathcal{O} trap, with a glass compartment and separator let into the side. This trap holds quite a body of water, and the waste water has a tortuous passage in going through it (fig. 10, D and E).

The "Bower" is a mechanical valve, the ball being presumably able to resist any back pressure of gases. The ball floats. The bottom of the trap is glass, so any collection of sediment can be easily seen and removed.

The "Cudell" and "Bermor" traps both have a ball valve that takes its seat by gravity. The illustrations show their form and mechanism. They are easily taken apart, and the inside is always visible.

The tendency now is to use simple \mathcal{O} traps, making them as small as the waste-pipe; in some cases smaller. The manufacturers are now making the outlets from wash-basins, bath tubs, &c., as large as the waste-pipe, so the pipes and traps will be efficiently scoured by the action of the water. This completes a running account of American methods of a house sewerage system. GLENN BROWN.

PROTECTION FROM LIGHTNING.

ABOUT two years ago we drew attention to this subject,* and pointed out the urgent necessity for a more general system of protection than exists in this country, and as we have reason to fear that very little improvement has taken place since that time, we are glad of the opportunity of the publication of a new edition of Mr. Anderson's work on "Lightning Conductors"† to revert to the same topic. The summer of 1884 pointed the moral which we attempted to draw in a very striking manner, for the records which Mr. Symons collected show that in the months of July, August, and September of that year no less than twenty churches, one hundred and twenty-two houses, twenty-one barns or sheds, forty-two chimneys, and eleven factories were struck by lightning in the British Isles, the damage being estimated at over 10,000l. It is somewhat surprising, and not altogether creditable, that such a state of things should exist at a time when we are congratulating ourselves upon the enormous advance that has been made in electrical science, which is undoubtedly the most striking feature in the scientific history of the last few years. Notwithstanding all this, one cannot fail to be struck with the thinly-veiled spirit of fatalism which characterises all accounts of lightning accidents which are given in the public press, showing that the public mind needs a very considerable amount of awakening on this subject. It is not too much to say that every account of damage to a building by a stroke of lightning might justifiably be followed by the words printed in large type,—“This accident might have been prevented”; and no opportunity should be lost of insisting upon this truth until its general acceptance becomes assured.

The work under notice is a very full, clear, and without extremely interesting treatise on the subject of lightning-rods, giving the history of their invention and gradual spread, with a résumé of the scientific principles upon which their proper action depends. Since the systematic study of meteorology has been scientifically carried on, we have been able to gain a tolerably clear knowledge of the nature and formation of thunderstorms, but we are still only on the threshold of our knowledge of one of the greatest mysteries in nature, viz., the magnetism of the earth, which modern investigations show to have a very potent influence upon all terrestrial phenomena. The magnetism of the earth is constantly changing in intensity, and every now and then great magnetic storms take place, the cause of which is still quite unknown; but these storms are attracting the close attention of scientists in various parts of the world, and the observed facts seem to point to a close connexion between them and the condition of the sun. Whether fuller data will show any connexion between the occurrence of a thunderstorm at one particular spot and the magnetic condition of the earth at the same place, cannot yet be decided, but it is quite possible some such connexion may be found to exist. Records have been kept at various stations showing both the hour of the day and the season of the year when thunderstorms are most frequent, and it is proved clearly that they occur chiefly during the time when moist, warm, currents of air are ascending from the ground. For instance, in south-eastern Europe thunderstorms chiefly occur in summer between noon and five p.m., whereas in Iceland they are

winter and nocturnal phenomena. It is certain that, the earth being a great storehouse of magnetic energy, the minute particles of vapour which are carried up by the ascending currents of moist air are charged with electricity, and these combine to form electrically charged cloud masses. The tendency of electricity is to accumulate on the surface of any conductor, and when thus accumulated, a charge of the opposite kind of electricity is induced on the surface of any other conductor within range, and thus the electricity of the clouds is frequently discharged between themselves. When, however, the clouds lie low, they and the earth react upon each other, the cloud being drawn down towards the earth, and the electrical density on the approaching surfaces of each increasing every moment until it becomes so great that the dielectric between them, i.e., the air, is ruptured and the lightning flash occurs. The opposing electricities are endeavouring to get at one another, and if an easy path be offered to them they will take it quietly, and there will be no disruptive discharge. The true object of a lightning-conductor is to afford this easy path between the earth and the cloud.

There are two general systems adopted for the protection of buildings from lightning, that of Gay-Lussac, which is in use in France, England, and the United States, and that of Melsens, which is chiefly employed in Belgium. The former consists in the use of a small number of conductors of large sectional area, the rods towering above the topmost point of the building; the latter is on the principle of covering the building with a number of rods of small size forming a network, each rod being connected with each other and with the earth.

The French Government have instituted several inquiries into the protection of buildings from lightning, the first of which resulted in a report drawn up by Gay-Lussac in 1822, and, with few modifications, this still forms practically the basis of the whole science of lightning-rod construction. A careful abstract of this report is given in an appendix to Mr. Anderson's work. The only real point in which Gay-Lussac was in error was in his over-estimating the area of protection of a rod. He considered the protected space to be a cylinder whose radius was twice the height of the rod. Experience has shown that this must be very materially reduced, and the generally-received opinion is that the space protected would be represented by a cone whose apex is the point of the lightning-conductor, and the radius of whose base equals half the height of the rod. This space is less than that quoted in the report of the Lightning Rod Conference, where it is laid down that the radius of the base of the cone of protected space is equal to the height of the rod; but there was evident, some hesitation about this recommendation, and we are of opinion that, if absolute safety is to be ensured, this rule should be altered. The best shape for the point of the terminus has been the subject of much discussion, but as experiment and observation have both shown that the action of a stroke of lightning is distributed and not concentrated in one point, the modern practice is to supersede the original terminal point by several small ones in the form of an aigrette. M. Melsens goes much further than most electricians in multiplying his terminal points. He covers his roofs with a network of wires with terminal aigrettes at every pinnacle and projection, and at several points along the ridge, all connected together, a practically forming a closed circuit. On the Hotel de Ville at Brussels there are over 500 clusters of points. Of course, if all the wires, &c., were of copper, the cost would be very great; but M. Melsens claims that using iron wire of about 6 millimètres diameter is very much cheaper than the cost of protection, and we are sorry Mr. Anderson did not give some further detail on this point. Of course, where cost is not an object of consideration, copper wire or tape is the best kind of conductor that can be used; but as copper is about ten times as expensive as iron, it is not a costly an article for use on a large number of buildings that specially need protection, although copper is a much better conductor.

* See the *Builder*, January 20, 1884.

† *Lightning Conductors; their History, Nature, and Mode of Application*. By Richard Anderson. F.C.S., F.G.S. Third edition, revised, rearranged, and enlarged. London: E. & F. S. Spon, 1885.

electricity than iron, yet as the specific heat of the two metals is approximately the same, copper of equal conductivity is heated more than iron because of its smaller mass per foot run. M. Melsens' experiments have proved more than this, for he has shown that if a powerful current of electricity be passed through wires of copper and iron one-tenth of a millimetre in diameter, the iron will stand while the copper will be fused. For this reason it is not wise to use copper of less than three-eighths of an inch in diameter; but M. Melsens uses iron wire of about a quarter of an inch in diameter with perfect safety.* It used to be considered that prominence was the special element of danger to a building, but isolation is equally so, and the probability is that a small farm-house or barn standing by itself in a hollow, especially if the neighbourhood be damp, is specially liable to be struck. The cheapness of the Melsens system is its great recommendation, and the inventor has published details of cost which show that small buildings can be efficiently protected at a cost of about 2d. per square metre of surface, while the elaborate system adopted at the New Palais de Justice in Brussels cost only 6½d. per square metre.

Whatever system of protection be adopted, there are three points of absolute importance:—(1) That conductors should be continuous for their entire length; (2) that all prominent masses of metal in a building should be brought into connexion with the conductors; and (3) that the conductors should have ample communication with damp earth. The first condition of continuity is, perhaps, best fulfilled by using the solid copper tape which was invented some years ago, and which is made in lengths of from 200 ft. to 400 ft., according to its weight per foot. When joints are necessary, it is not sufficient that the two adjacent ends of the rod should merely touch,—which state of things has been responsible for many accidents,—but the ends should be placed in close contact for about 6 in., and, in the case of circular rods, if the contiguous ends are filed so that the surfaces in contact are square so much the better; they should then be bolted together and covered with a mass of pewter solder. The second condition of safety is to connect all prominent masses of metal used in the construction of a building with the conductor, and it would certainly be better that the connexion should be at two points. This condition was not laid down by Gay-Lussac, because iron was not largely used in buildings at his time, but if the metal in a building be not connected with the conductor it is extremely probable that even if a portion of the lightning discharge takes its proper course, part of it may leap across from the conductor to the metal and do considerable damage. The third condition of adequate earth contact is the most important of all, and has been the most neglected. It has been stated that in order to transmit to moist earth an electric current with no more resistance than it meets with in traversing an iron rod of one square centimetre sectional area, the earth contact ought to consist of an iron plate 492 yards square. Of course, these theoretically perfect conditions cannot be practically complied with, but it should always be borne in mind that the superficial area of the underground portion of the conductor should be made as large as possible, and that in dry localities some artificial means of keeping it damp should be resorted to. Several means of securing extensive contact with moist earth are described by Mr. Anderson. In towns the gas and water mains afford an excellent earth, and it is calculated that by this means the earth contact of the conductors fixed to the Hôtel de Ville at Brussels is no less than 330,000 square yards. In country districts where mains are not available the conductor should always be laid in a trench and packed round with broken coke or charcoal, and should terminate if possible in a pond or some running water. It should never be forgotten that an artificial one tank or reservoir is not an earth at all. Now, if the carrying out of certain well-known conditions will ensure the safety of a building

from lightning strokes,—and, apart from scientific testimony, the fact that many manufacturers are willing to guarantee the security of buildings fitted by them with lightning rods, is fairly good evidence that this is the case,—what is the cause of so many accidents occurring to buildings even when they have been furnished with rods? Simply that no systematic arrangements exist in this country for periodically inspecting and testing lightning-rods. Mr. Anderson lays great stress upon the necessity for this regular inspection, and it is impossible to insist upon it too strongly. We do not believe that any conductor which has been fixed for five years, and not inspected and tested in the meantime, would be found perfect at the present moment. The conductivity of a lightning-rod may be impaired in many ways. A lightning stroke may have passed harmlessly and yet have caused damage to the pointed terminals. In the case of iron, rust may have corroded the points. Artisans at work on the roof may have carelessly cut off the connexion with the gutter and other ironwork; new metal-work may have been introduced in such a way as to offer a readier path for the electric current than the conductor itself; alterations in the drainage of the neighbourhood may have converted a good earth into a bad one,—these and a thousand other simple accidents may have completely altered the conditions which existed at the time when the rod was first fixed, and it may often happen that these alterations cannot be discovered by mere inspection, but only by a test conducted by an experienced investigator, with the help of a galvanometer. Both the continuity of the conductor and the earth resistance should be tested, and the accurate determination of the latter is sometimes a rather complicated piece of work. What is the maximum earth resistance compatible with safety is a moot point. Mr. Anderson says that in France a resistance of 25 ohms is considered safe; but a correspondent of the *Electrician* says that we ought never to be satisfied with a higher resistance than 2 ohms in dry weather, and in most cases it would not be difficult to get a result as low as this, but the special circumstances of each individual case must be taken into account. The great point is that some competent person should be appointed by Government to test periodically the lightning conductors of all public or semi-public buildings, such as factories, workhouses, or schools, with authority to compel the proper authorities to make good any defects that may be discovered. The cases which have come under the writer's personal notice prove that the risk which the inmates of such buildings run is enormous, and it is undoubtedly increased by the fact that the buildings are supposed to be secure from danger. In most cases the fancied security could be made real at very small cost, and were such an inspector appointed, the saving both to life and property in a single year would repay a thousandfold all the expenses of the appointment. In this respect, as in many others, we should do well to take a lesson from our neighbours across the Channel. As Mr. Anderson very justly says:—"It is lamentable to think that although the periodic inspection of lightning-conductors has been admitted long ago to be a necessity in many countries on the Continent of Europe, we as yet have taken no steps whatever to realise it." May we hope that with a new Parliament some steps will be taken to alter this lamentable state of things?

Lectures at Exeter Hall.—We hear that the evening lectures at Exeter Hall, by Mr. Gribble, on "Science of construction," given in the Educational Section of the Young Men's Christian Association, have been so well received that the Committee have arranged with him for the delivery of two courses, advanced and elementary, on Mondays and Thursdays, from half-past seven to half-past nine, p.m. The subject for the opening lecture, on the 11th inst., is stated to be the Cannon-street Station Roof. Those who are desirous of attending such lectures should send to the secretary, Exeter Hall, London, for the syllabus.

TWO DOOMED LONDON CHURCHES: ST. THOMAS IN THE ROLLS AND HOLY TRINITY, MINORIES.

It appears that the Bishop of London is proceeding, under the Union of Benefices Act, with a scheme of his predecessor in this See, for de-consecrating four more London churches. These are the churches of St. Olave, Jewry; St. Katharine Coleman, Fenchurch-street; St. Thomas in the Liberty of the Rolls; and Holy Trinity, Minories, in the Liberty of the Tower. To the former two edifices and their history we have already adverted in our columns.* The Rolls Chapel marks the site of the *Domus Conversarum* which Henry III., in 1233, gave up to the use of such Jews as embraced Christianity. But the rigorous enactments of his successor on the throne left few Jews for conversion, and to them the new faith was scarcely presented from its most attractive side. The house was accordingly given (1377) to Thomas Burstal, clerk, our first *Custos Rotulorum*. For nearly two hundred years the clergy supplied occupants for that honourable office; in 1534 Thomas Cromwell was appointed Master. This present generation has seen one of our greatest judges,—himself an unconverted Jew,—preside over the Rolls Court. The existing chapel was built in 1617-20, at a cost of 2,000l., and, according to Pennant, edit. 1790, by Inigo Jones. The echoes of Dr. Donne's consecration sermon, of Burnet's, Atterbury's, and Butler's eloquence, have long died away. But within its flint walls, encumbered from time to time with record-chests, are preserved a valuable set of monuments. Chiefest of all is one in a style infrequent in this country, but familiar to us at Bologna and Florence, and ascribed by Walpole and Vertue to Torregiano. It commemorates Dr. John Young, Master of the Rolls temp. Henry VIII. There are others to Sir Edward Bruce, Master of the Rolls to James I. who advanced him Earl of Kinloss, and ancestor to the existing noble bones of Elgin and Ailesbury; to Sir Richard Allington, of Horseheath, co. Cambridge (1561), and to Sir John Trevor, Speaker, whereof the simple inscription, "Sir J. T., M.R., 1717," fails to recall how he had to put the question to the House that he himself be pronounced guilty of bribery and corrupt practices. A large west window contains good specimens of stained glass, comprising the arms of Sir Robert Cecil and Sir Harbottle Grimston. Most of the surrounding houses (since replaced) were built when Sir Joseph Jekyll on entering office took up his residence here. He contributed 3,500l. towards the expense for ten of them, saying he "would have them built as strong and as well as if they had been his own inheritance." Next, northwards of the Rolls, stood Symonds' Inn, wherein Richard Carstone, of "Beak House," had chambers.

To destroy Holy Trinity Church, together with its more venerable neighbour the Sieve Tavern,† will finish the demolition in the Minories which has accompanied the construction of the railway from Aldgate to the Tower. As rebuilt in 1706, of brick, and at a cost of 700l., the church can boast of but slender architectural attractions. Nevertheless, it stands a useful landmark, inasmuch as in its northern wall may yet be traced some vestiges of the Convent owned by the Poor Sisters of St. Clare. The Nuns Minoreesses had been established here by Blanche, Queen of Navarre, second wife of Edmund, first Earl of Lancaster, and founder of that distinguished house.‡ To their charge Edward I. committed the heart of his mother, Eleanor of Provence (who died at Ambresbury 1291); and Dean Stanley reminds us how Edmund's tomb in

* See the *Builder* for December 16th, 1882; and October 20th, 1883.

† Northern side of Church-street. Already in part dismantled, this interesting structure is well-nigh as old as the more celebrated Fountain Inn which, standing hard by, was pulled down in 1795. A good view of the Fountain will be found in the *Crow's Pennant*; and a model thereof in "Old London," South Kensington, No. 19.

‡ Both Peter Cunningham and John Thoms, followed by many less careful inquirers, wrongly connect Holy Trinity, Minories, with the adjacent Priory of Holy Trinity without Aldgate.

* Of course there must be a large number of rods of this size.

Westminster bears the roses,—misnamed "of Provence,"—which, carried thither by the Crusaders, he brought to England from Provence and adopted as the Lancastrian badge. In the convent churchyard were interred Henry Waleys, oftentimes Lord Mayor in the end of the thirteenth century, a benefactor to these as he was to the Franciscans at Grey Friars, Newgate; and Elizabeth, widow to Sir Henry Bourchier, who by her marriage with Thomas (Howard), first Duke of Norfolk, was mother to the Viscountess Rochford, Anne Boleyn's mother. Here, too, were buried some bones from Culloden field. The *Sorores Minores* borrowed their style, as also their rule and the colour of their habit, from the Franciscans, or *Fratres Minores*, whose founder was a fellow townsman of their own, St. Clara. Dame Elizabeth Salvage, last titular abbess, surrendered the convent to Henry VIII. in 1539. The site was afterwards occupied by a colony of gunsmiths and founders,—the deformed Mulcibers whom Congreve pictures as forging "those stays of steel, which arm Aurelia with a shape to kill."

After the Dissolution this property passed in turn to several persons of quality, including the Bishops of Bath and Wells (in lieu of their Strand "inn") and the Greys.* Henry Grey, Duke of Suffolk, held it by patent of Edward VI., 1552; but, within a few months, he conveyed it to his two brothers, Lords John and Thomas Grey, and one Mr. Medley. On the Duke's attainder and execution (1554) it reverted to the Crown until the Restoration, when a new residence was built on the ground, and called the King's, for what reason, says Pennant, is unknown. Meanwhile the convent precincts had been formed into a separate parish, with a church especially appropriated to the inhabitants of the Close. "The church," writes Strype, "pretends to privileges, as marrying without licence." This franchise was probably a survival of an exemption granted by Boniface VIII. as early as 1294. The font comes from the old church. Around the fountain was built Haydon-square, where until lately stood the homes of Newton and Hogarth. In the old church, too, was buried (1633) Cornelius Deibel, who may justly claim to share with Fontana the honour of having invented the microscope. Extending over five acres the parish is extra-municipal, but lies within the Tower Liberties. It takes so much out of Portoken Ward as is covered by the space bounded by Church-street, the Minories, and Haydon-street, together with the space occupied by Haydon-square, and the depot (with part of the branch line) of the London and North-Western Railway Company. A Roman burial-ground to the east was site of the Convent-farm whereat Stow in his youth would buy "many a halppennyworth of milk. . . . always hot from the kine." One Goodman let out the land for pasture and then for garden plots. On Goodman's Fields were subsequently built Prescott, Ayliffe, Leman, and Maunsell streets, whilst the Clothworkers' tenor-grounds gave a name to Tenter-street. Charles II. granted the King's House to Colonel William Legge, who attending Charles I. to the scaffold, was there charged by the king that he should bid the Prince of Wales to remember the faithfullest servant that ever prince had. His fidelity was further rewarded with several lucrative and honourable offices. Colonel Legge lived here until his death in 1670.† Elevated to the peerage, December 2nd, 1682, his eldest son George was the celebrated naval and military commander in the service of kings Charles II. and James II. But falling, together with his party, at the Revolution, Lord Dartmouth was deprived of his high employments, and committed to the Tower. There he died on the 25th of October, 1691. His only son, William, was advanced Viscount

Lewisham and Earl of Dartmouth, September 5th, 1711, and his descendants for a long while retained a right of sepulture in the vault which was built beneath the floor of this church by their ancestor, Colonel William Legge. At Holy Trinity Sir Philip Sidney's remains were laid in state, and thither came the Grocers' Company on horseback to take the body to St. Paul's.

In the year 1839 a decapitated head was dug up from the southern or parish chancel vault. When first found this singular relic retained all its teeth, the eyes, and ample traces of a ruddy beard. For twenty years past the head,—originally tanned, it is believed, by deposit in oaken sawdust,—has been shown as that of Lady Jane Grey's father, the Duke of Suffolk, of whom we speak above. Moreover, some authorities would fain discern in its well-preserved features a likeness to those of that nobleman as prefigured by Lodge's portrait, engraved after the original at Hatfield, and of which a replica belongs to our National Portrait Gallery. Others have claimed it for the Duke of Monmouth. The Legges, we gather, are satisfied that this head, which clearly bears marks of having been clumsily severed, belongs to no member of their family. In a recent communication to *Notes and Queries* (Oct. 17, 1885, 6th, s. xii.) the Rev. E. M. Tomlinson, vicar, discusses this point. After showing that, if of date earlier than 1706, the head must have been interred in the earth, he states that he finds no clue as to its identity in the registers, which begin with the year 1566. He goes on to propound a theory, and upon what are apparently tenable premisses, that it is the head of Edmund de la Pole, Earl of Suffolk,* whom King Henry VIII. caused to be executed in 1513. There is evidence that this Earl of Suffolk, his wife, and his daughter were all buried in St. Clare Convent, and that the daughter had taken vows there. A tradition exists that the pious daughter, anticipating Margaret Roper, induced her sister nuns to join her in proceeding to the Tower, there to ask that the head of the duke (*sic*) of Suffolk might be delivered to her care. Duke her father never was; and at the date of Henry Grey Duke of Suffolk's execution, the Minoreesses had ceased to be. Still it is by no means improbable that the decapitated head is a relic of the De la Poles who, descended from William, "king's merchant" to Edward III., are famed alike for their successes as for their misfortunes.

NOTES.

THE snowstorm of Wednesday morning found the local authorities of the metropolis, as usual, for the most part quite unable, or unwilling, to cope with the difficulties which it interposed in the way of street locomotion. Making due allowance for the heaviness of the fall, and for the circumstance that it continued during all the busy hours of the morning, it is inexplicable to us why more vigorous efforts could not have been made on Wednesday afternoon to clear at least the main roads and streets of the metropolis of the slush which then covered them, and which was then easily removable. But, so far as our observation went, it was only in the City proper that anything was done in this direction. The frost of Wednesday night added to the miseries of pedestrians and horses in those localities where helpless inability or easy indifference had been the attitude of the "authorities." Take the case of Holborn as an instance. On the "Viaduct" and in all that part of Holborn within the City boundary, traffic on Thursday morning was conducted with tolerable safety and facility, because the City street authorities had done something on the previous day to clear the roadway. West of the City boundary, however, and especially between Gray's Inn-road and Chancery-lane, the snow had been left to itself up to one o'clock on Thursday, and the struggles of the long-suffering horses were painful to witness. The "masterly inactivity"

of most of the metropolitan vestries and district boards on these occasions ought to give a fresh stimulus to the London Government question. Such scenes as were to be witnessed in some of the main thoroughfares of London on Wednesday night and Thursday morning are emphatically a disgrace to a civilised capital. The breaking of several of the overhead telegraph and telephone wires added to the discomforts and dangers of pedestrians.

THE Schliemann Museum at Berlin is about to receive substantial additions. After protracted negotiations, the German Ambassador at Constantinople, Herr Radoivsky, has succeeded, on behalf of Dr. Schliemann, in buying back from the Turkish Government the pottery and other objects discovered in the excavations of 1878, 1879, and 1882, at Troy. Part of these, it will be remembered, fell by contract to the Turks. Dr. Schliemann intends to undertake the cost of such restorations as are necessary, and will then hand them over to the section of the Kunst-Gewerbe Museum, which has for some years borne his name. It is matter of universal congratulation that a collection of so great importance, and most unhappily sundered, should thus be brought together under one roof.

IT is proposed to hold a conference in some conveniently central room in London about the end of February to discuss the question of emigration, with the view of ascertaining what is the exact state of the labour market in the colonies; what workers are really required, and stand a chance of finding employment if they emigrate; what accommodation is provided for emigrants on the voyage; and at the depôts; and what have been the actual results of sending young females to the colonies. A circular which has been sent to us with this announcement states also that the Committee desire all information on the subject from any who will give such information to the secretary. The circular, however, does not give the name or address of the secretary, which is rather unbusinesslike. The subject is of the greatest importance.

BY good fortune the site of the ancient Etruscan city of Vetulonia seems to have been placed beyond a doubt; it proves to be actually about five miles further north than geographers have hitherto placed it. Signor Falchi, in excavating at Colonna (in the province of Grosseto), has lighted on what he considers to be incontestably the burial-ground of the city. So far all the tombs which have been excavated give evidence of the custom of cremation. The objects found in the tomb point to a very remote antiquity. The majority of the vases are undecorated, but where any design occurs it is of the very early geometrical class. A few objects of bronze have been discovered, arms, fibule, &c., but metal on the whole is scarce. A paper by the discoverer appears in the "Notizie degli Scavi," pp. 95-152, and a few sketches of the objects found.

WE print elsewhere the first half of Mr. Robins's paper on "The Temple of Solomon" (read before the Architectural Association on the 1st inst.). The paper was an exceedingly interesting one, and was remarkable as being very fully illustrated, and the plans of the many writers who have conjecturally "restored" the Temple being exhibited on the walls. The paper elicited a lively discussion, Professor Kerr leading off with a speech in which he stoutly maintained that Solomon's Temple was, and could only have been, a wooden structure. Inferentially he expressed something akin to contempt for the theories of the archaeologists who had devised "restorations" of the Temple, most of which were in stone and more or less partaking of the character of Greek or Egyptian temples. Mr. Robins, in concluding his paper, expressed his general concurrence with Mr. Fergusson's views. Mr. Stannus, in the course of an interesting speech, referred to the ability with which Mr. Fergusson had treated t

* John Clerke, who succeeded Wolsey in that see, was buried here 1540.

† *Fide* the registers. "Colonel William Legg of the Bed-chamber, and Leftenant of his Majesties Ordnance, was buried in the vault of the chancel, Oct. 20th, 1670." He died October 13th of that year; see also Collins's *Parish*, 124; on his monument in the church the year is given as 1672.

* Nephew to Edward IV. and younger son to William, first Marquess and Duke of Suffolk, who was beheaded at Dover.

question in his "Temples of the Jews," and expressed his great regret,—a regret which all our readers will share with us,—that that able writer, who has done so much to throw light on obscure points in the history of architecture, is dangerously ill.

It seems that the town of Brunswick, not satisfied with the ousting of the ducal family who have reigned there for over seven hundred years, are seriously contemplating the destruction of their ancient castle,—one of the six or seven buildings in Germany in which may still be seen the general arrangements and some of the architectural details of the residence and fortress of one of the practically independent nobles of the twelfth century. The projected Vandalism is of especial interest to Englishmen, from the fact that Queen Victoria is a member of the Guelph family, whose ancestral home it is proposed to demolish to make way for a new street. The original foundation of the castle dates back to the dark ages before the twelfth century, and is attributed to Dankward, a descendant of Wittekind, after whom it was called Dankwarderode. In the twelfth century it passed by right of his wife to the Emperor Lothair, and through his daughter Gertrude, who married the Duke of Bavaria and Saxony, to the Guelph family. It was Gertrude's son, Henry the Lion, who, about the year 1166, erected what, notwithstanding all additions and alterations, may be regarded as the existing building, and placed the world-famed Brunswick lion upon his pedestal in the courtyard, facing the flight of steps which led to the great hall of the castle. For the next hundred years Dankwarderode was the centre of all that was great and splendid in the land, second only to the Burg of the Emperor himself, the scene of constant hospitality and of frequent festivities; but its history subsequently to the death of Albert the Great in 1279 is a sad one. Belonging by arrangement to all the scattered branches of the family alike, jealousy prevented its being long inhabited by any; it was unrepared, for that which was every one's business was no one's, and so ruinous had the castle become by the sixteenth century that a fire which took place at that period seems to have hardly made matters much worse. It, however, aroused Duke Julius in 1539 to undertake a scheme for the restoration at least of the great hall, a scheme which, through the jealousy of the other branches of the family, and the opposition of the town, was only very partially carried out in his lifetime, and was subsequently abandoned. This was fortunate as far as the historical interest of the structure is concerned, for the preservation of the Romanesque remains did not enter into the scheme. In 1700, and again in 1763, restorations of a more or less history-destroying character were carried out. Then came the period of the Westphalian rule in Brunswick, during which the castle was fitted up as a barrack; in 1867 it was given up to Prussia as a building used for military purposes; and in 1873 became, on the same grounds, the property of the German Empire. Another fire in this year destroyed the southern part of the building, and the rest, including the great hall, was sold to the town in 1878 to be pulled down to make way for new streets. The scheme has been vigorously opposed by the artistic and archaeological world in Germany, and especially in the neighbouring learned little town of Wolfenbützel, and has not yet been carried out; but, as has happened more than once or twice in similar circumstances in England, the united opinion of all who are capable of forming one's is in danger of being contemptuously set aside by those in authority in Brunswick.

So far as we are aware no action has been taken by the City authorities and the other bodies concerned to stop the erection of the warehouses at the eastern end of St. Paul's Churchyard, to which we have referred on two or three recent occasions. If the whole of the site of the St. Paul's School building cannot be thrown into the roadway it would, at any rate, certainly be desirable to set back the

building-line a few feet, for the roadway is so narrow here that there is no room for a footpath on the side next the Cathedral railings. We are informed, however, that an arrangement has been come to for a mutual modification of their respective designs, by Mr. Delissa Joseph, the architect of the six warehouses now being erected upon the larger portion of the site of the School, and Mr. Frederick Heming, the architect of the three warehouses building upon the remainder of the site, whereby, we are told, "the whole frontage of over 240 ft. will be harmoniously treated as one imposing façade."

AMONG the discoveries reported during the excavations at Pompeii for 1885, the first place is undoubtedly taken by a mosaic, with a design representing doves drinking at a fountain. The mosaic is closely analogous to the well-known slab in the Capitoline Museum which goes by the name of "Pliny's doves." On a white slab stands a bronze basin supported by three lion's claws; it is filled with water. Three doves are already drinking; they stand perched on the rim of the basin; a fourth has just alighted; its wings are still outstretched; two others are standing beneath on the white marble slab. In the Capitoline mosaic, it will be remembered, all four doves are perched on the bowl, one only is actually drinking. The find of mural paintings this year is of no special interest.

THE railway traffic receipts for the month ending on the 27th of December, 1885, do not afford a very cheerful outlook for the half-year's dividends. On four lines, viz., the Great Northern, the London, Chatham, and Dover, the London and South-Western, and the Metropolitan, the aggregate increase in the gross receipts for the half-year (with four days' income yet to be added) has been 46,500*l.* But against this has to be set an aggregate decrease, on the sixteen other main lines generally brought forward for comparison, of nearly 570,000*l.*; making a net deficit in income of 523,000*l.* on a gross income of a little over 31,000,000*l.* The main fallings off which go to make up this deficit are, on the Great Western Railway, 105,000*l.*; on the London and North-Western, 110,000*l.*; and on the North-Eastern, 128,000*l.* It remains to be seen how far this decline in income is balanced by economy in expenditure. Against this, however, has to be reckoned the demand for interest on additional capital brought to account in the half-year. Roughly speaking, while our railway income ought, in a normal state of affairs, to show an increase of about 3½ per cent. in each year over its predecessor, the outcome of the last half of 1885 shows a decline of about 1¼ per cent. on the income of the corresponding period in 1884.

THE *Berliner Philologischer Wochenschrift* reports an archaeological discovery on the Acropolis at Athens, which seems almost too good to be true. It is said that a colossal brazen statue has been found representing a female figure draped with a girdled chiton, and extending the right hand in the attitude of one taking a solemn oath. With the statue was found a plinth of terra-cotta, on which is carved in very deep relief the figure of a man in armour, wearing a helmet. Traces of colour are still observable on the surface. Above the head of the warrior is the word KALOS in very archaic characters. From the same paper we learn that the excavations carried on in Bœotia have been rewarded by interesting discoveries. Two colossal lions, of archaic style and excellent preservation, have been found; also an archaic xoanon of Apollo and some inscriptions from which it may be safely inferred that near to the temple of Apollo Ptoos, the site of which has already been discovered, there was also a shrine sacred to Athene. Of the temple of Apollo Ptoos considerable architectural remains, among which are some coloured fragments, have been found. It was this temple that was seen by Pausanias, it will be remembered, in his wandering round Akraiphna.

TWO or three correspondents have addressed letters to us, for which we cannot find space, in regard to the letter by Mr. Maclaren in our last number [p. 64], about the advisability or possibility of changing the style and title of the "Royal Institute of British Architects," and shortening the array of letters indicating membership; but only one of the suggestions made is much to the point. This is, that the word "British" should be omitted. It is not used by the Institution of Civil Engineers, nor by the "Royal Institute" or "Royal Society" of Water-Colour artists, and it certainly appears superfluous. The letters "F.I.A." are suggested by one writer as preferable to "F.R.I.B.A.," but these are already appropriated, and stand for "Fellow of the Institute of Actuaries." "F.R.I.A.," leaving out the "British," is not unreasonably long, and sufficiently explanatory. We are distinctly in favour of the suggestion to omit "British." It is, no doubt, "greatly to our credit" that we are British architects, but there is no need to be always proclaiming it.

THE TWO LOAN EXHIBITIONS.

THERE can be no doubt that the chief interest in regard to the two principal loan exhibitions of paintings is this year centred at the Grosvenor Gallery. The constantly-increasing popularity of Sir John Millais, as the most representative English painter of the day, has been emphasised and brought to a head, so to speak, by this very large collection of his works, which is crowded with eager and mostly enthusiastic spectators. We have the same complaint to make about the hanging which we have made in regard to previous exhibitions of a single painter's works at the Grosvenor. The system of hanging, if system it can be called, is simply stupid. As in former cases, there is not the slightest attempt to arrange the works chronologically, or in regard to phases of style; they seem to be arranged according to the size and proportion of the frames. The scene from Keats's "Isabella," which is the most remarkable of the works of Millais's pre-Raffaëllite period, and one which every one wishes to see, is placed at the extreme end of the small gallery, where, owing to the crowd and the cramped access, it is difficult to get to it at all. Looking at the paintings in regard to style and feeling, the jumble is more extraordinary and gratuitous than even if we regard the chronological arrangement. An arrangement of the paintings chronologically, as we have remarked before in regard to similar collections, would have given the exhibition a far higher interest, and even an educational value for the public, who could (such of them as go to a picture exhibition for more than mere amusement) have thus traced the steps in the change and development of the painter's style. An arrangement according to style, subject, and "aesthetic" generally would have had a special interest of another kind. The present arrangement is, as we have said, merely dependent on the size and shape of the frames, an absurdity for which the only possible excuse is the way in which the wall is cut up into sections by pilasters. Let architects who have to build picture-galleries for large annual exhibitions, where a number of pictures of constantly varying shapes and size have to be provided for, bear this hint in mind. When the Grosvenor Gallery was first instituted it was understood that it was to be for small and select exhibitions, and in such cases, where the entire wall space was not wanted, the division of the wall into compartments was suitable enough. But when it comes to making a large collection of the works of "the Reynolds of the nineteenth century" (or of "the Millais of the eighteenth century"), then the architectural divisions of the wall are a great inconvenience, and interfere with the proper and sensible arrangement of the works. A gallery for constant successions of exhibitions of various characters should have its walls entirely unencumbered by permanent architectural decorations. As Dr. Johnson is made to say in "Rejected Addresses":—"That which is permanent cannot be removed, for if removed it soon ceases to be permanent." If the pilasters at the Grosvenor Gallery would cease to be permanent it would, perhaps, be better for the hanging.

The paintings here collected, forming the most representative exhibition of their author's

work which has yet been seen, are as remarkable for their variety of aim as for their variety of power; in the case of the paintings dating from thirty to thirty-five years back it would be difficult for any one seeing them for the first time to believe that they were by the same artist who painted the later works. To those who have followed the work of Millais year by year at successive exhibitions, of course, "The Huguenots," and the other works of that date, have always remained as an impression, surviving in the mind as a background to the long array of portraits which have made the later fame and success of the artist. It is curious and very interesting to meet them again face to face with the artist's recent works; curious to think of the dislike, derision, and anger with which they were regarded on their first appearance, of the intensity of which Mr. Stephens has opportunely reminded us by citations of some criticisms of that time, in his copious and interesting notes to the catalogue. To-day there is a kind of murmur going about, among the throng at the Grosvenor Gallery, of regret that the artist had abandoned his earlier aim and method for his later style, and enthusiasts look fondly at the works of the pre-Raffaellite epoch, and shake their heads with a sigh over the lapse of one who began as an ideal and imaginative artist. But this reaction is not much more halanced or reasonable than the attacks which were made on these works when they first appeared. We share the regret so far as this, that we could have earnestly wished that an artist who showed at that early age so much imagination and such intense interest in telling an ideal story, should not have given his matured powers more often to subjects of this higher class, and with the same earnestness and enthusiasm. But it is a mistake to characterise these early works as showing an intensity of expression and of artistic purpose superior to that of Sir John Millais's later works. There is as much intensity and concentrated purpose in the portraits of Mr. Gladstone and Mr. J. C. Hook as in any of the early works, and a much greater style. In pictures like "Lorenzo and Isabella" there is most strenuous determination to paint the whole thing as thoroughly as possible, but it is a mass of brilliant parts rather than a whole, so far as painting is concerned. As a realisation of character it is, however, a most remarkable work, even in relation to the present fame of its author. So also is that odd creation, "Ariel Inring Ferdinand." No one after first making the acquaintance of this painting could go back to the scene in the "Tempest" without feeling that he had got a new and more vivid perception of Shakspeare's weird fancy. Ariel, floating backward before Ferdinand, seems to draw the prince after him, and the attitude of the latter, with his hands hollowed over each ear, as if to catch a whisper, is a stroke of true genius; it makes us feel how vague and mystical is the sound of Ariel's song. The shortcoming is in the prince himself, whose face is simply a realistic portrait, not an ideal of the character, one of the odd perversities of "the pre-Raffaellite brethren," who were realistic exactly where idealism was specially demanded. "The Huguenot" retains its old hold over the spectators, but we have always considered this work over-rated, in comparison with others from the same hand. It is a wonderful piece of painting, but it does not express the real situation. A tender lovers' difference of some kind it is, but not a matter of life and death; there is no such stress of feeling in either countenance. We should even say that its great popularity is partly owing to the fact that it touches only such a pitch of feeling as the average or popular mind can rise to without difficulty.

Among the portraits which form by far the larger portion of the collection, are some which are below the artist's real level; but these shortcomings we take to be, in a kind of inverted way, among the evidences that he has the same intellectual interest in his art as when he was an "earnest" P.R.B. Sir John Millais paints his best when his subject interests him. Looking round at his gallery of portraits, it seems as if we could say almost with certainty in which of the sitters the artist was interested, and whom among them he cared little about painting. Whenever the subject of the portrait is a remarkable man, one of strongly defined character and personality, the portrait is sure to be remarkable too. Where the artist has been at work on a commonplace subject, he paints carelessly. This we take to be the true

explanation of the great contrast in execution between one painting and another in this remarkable collection. As to the artistic *moralis* of painting a thing (or a person) when you do not care for it,—well, that is a very large subject, which we will pass over just now.

Among the portraits which Sir John evidently did care for are, besides the two splendid ones of Mr. Gladstone and Mr. Hook before mentioned (the latter of which would have stamped its author a great painter if he had done nothing else), "Mr. Bright" (99), the "Duchess of Westminster" (which for true grace of ladyhood even Reynolds could not have surpassed), "the Marquis of Salisbury" (82), "the Earl of Beaconsfield" (84), "the Earl of Shaftesbury" (72), and "Sir James Paget" (103). All these are masterpieces of character in portraiture, giving not merely the outer physique of the sitter, but forming a kind of pictorial comment on his life; the "Marquis of Salisbury" seems the embodiment of the higher Toryism, the "Earl of Shaftesbury" of evangelical religion.

Among the later works of the painter which treat more or less ideal subjects, the finest is the large painting of "The Knight Errant" (41), which impresses us more than when we saw it at the Academy; the light and the situation are better for it, for one thing. The nude figure and the man in armour are equally fine as illustrations of two problems in painting, and the expression of the knight's face gives a nobility of meaning to the whole which raises it quite above the ordinary category of "nude studies." Not far from this the eye is caught by one of the most remarkable little bits of painting in the collection, the head of the rabbit in "Orphans" (43). The child is exquisite, but the rabbit fairly draws our attention, by the power with which the character and expression of the animal, and the texture and the fur, are rendered, without the slightest giggling, or over-finish. "The North-west Passage" (60) asserts its power as fully as ever, as a grand painting of a figure of vigorous and energetic age. "Stella" and "Vanessa" (16 and 24) are two of the artist's greatest successes in ideal character; the style is wonderfully broad and powerful, and the figures very true to the ideal of Swift's two unhappy friends. Among the landscapes the first of all, "Chill October" (21), which came as a revelation to the artist's admirers, remains still the most poetic work of this kind which he has produced; but, on comparing it with "Over the Hills and Far Away" (17) we find the latter, which was regarded with some disappointment on its first exhibition, the more powerful work of the two; the foreground is a wonderful piece of realistic truthfulness, though there is less feeling in the painting than in "Chill October." Among other works which surprise us into an admiration which we had not felt on their first exhibition, is the large group of portraits of three Misses Armstrong, as they were then (two of the ladies, fortunately for two men at any rate, have changed their name since then), who were exhibited at the top of the large room at the Academy in 1872, under the title "Hearst or Trumps" (83). The over-large mass of crushed crinoline which occupies the lower part of the canvas is unfortunate in effect, and created a prejudice against the picture when it appeared; but then that was partly the ladies' fault for wearing crinoline; the full broad painting of the three fine young heads, the grace, the dignity, the admirably-contrasted character and manner in each of them, combine to make this a great picture, if only the lower portion of the canvas could be cut off.

We might expend much more time very pleasantly in going over other characteristics of this collection, so remarkable as the work of one man, but have not space to say all we could wish to say. We may quit the exhibition with the remark that Sir John Millais, at least, does not suffer under that severe test, the collection of a great number of his works in one gallery, and that most of those who study his paintings in this "collected edition" will have a higher estimate of his powers than ever, in spite of some hastily-painted and not very fortunate works among the later portraits.

The exhibition at Burlington House has been voted a failure in some quarters, but we do not see how this can be said of any exhibition which contains some superb Reynolds's and a whole room full of Turner's water-colours, and one of the finest Constable's in existence

("Stratford Mill" 158). Of course, one cannot expect the wealth of old masters in England to be absolutely inexhaustible, but Sir Joshua Reynolds seems almost to be so. Every year there come out some works of his not seen before at these exhibitions, and which seem as fine as anything he ever painted. The two loading examples this year are "Miss Fleming" (154) and "Lady Worsley" (157), both the property of the Earl of Hereford. The first is a full-length figure in profile, standing in, or, rather, walking slowly through, a landscape, with that natural ease of manner with which Reynolds animated his portraits. The small delicate head is beautifully painted. The other represents a very dashing young lady in a kind of regimental uniform, with a riding-whip in her hand, and a black hat and feathers. Another beautiful work by Reynolds is the portrait (head and bust only) of "Mrs. Abington as Roxolana" (33), in the act of raising a curtain to come on the stage. In the same room is one of the numerous portraits of "Nelly O'Brien" (19), and one of the most charming in expression and pose of the head; Nelly might have been a saint, if beauty and sweetness of expression could have made her so. The picture is the property of Mrs. Cooper. In this first room is a small collection of the works of "Wright of Derby," which serves to show that he attempted other things than the clever effects of artificial light by which he is best known; it shows also that these were the things he could do best. His portrait of his sister (44) is, however, a fine work. Stothard's gay but hard little painting, "Sans Souci" (22), in the same room, is, we are sorry to say, covered with a whole network of cracks, and does not seem long for this world. A landscape by Reynolds, by the way (42), is a sufficiently unusual incident to be mentioned; it is a pleasant little painting.

Among the Dutch paintings in the second room the best are Jan Steen's "Afternoon" (86) and Ostade's "Interior of a Public-house" (97); there is a larger Jan Steen (90), an interior occupied by various more or less dissolute figures, but not painted with his highest finish or brilliancy; a good Snyders (81), for those who care for Snyders, of whom we are not, and an exquisite moonlight scene by Van der Neer (88).

The large room contains what purports to be one of the original repetitions by Titian of his well-known "Venus and Adonis" subject (109); it looks like an original. One of the most striking works in the large gallery is a picture which at once proclaims itself as Velasquez's "The Water-seller" (119), a picture in the painter's inimitable and powerful style, of a man in a brown robe giving water to a boy. This is a thoroughly good Velasquez, though not of so much interest in subject as some of his. Among other works not previously mentioned in the large gallery, are Reynolds's effective but stately portrait of "Mrs. Hall as Euphrosyne" (147); Gainsborough's "Lady Brisco" (150), not a very good Gainsborough; Constable's "The Hay-wain" (153); and Turner's "The Pilot Boat" (156), one of the early and brown Turners.

Among the early Italian paintings in the fourth gallery, the two gems are two works by Botticelli, "The Virgin and Child" (191), and his remarkably beautiful profile head, "La Bell Simonetta" (196). There are other works of artistic and historical interest in this part of the collection, including a fine portrait of Henry VIII., by Holbein (184), and we may return to this portion of the exhibition, but must close our memoranda for the present.

The Bombay Screen.—We learn from Bombay that the carved screen which is intended to be placed round the Bombay exhibit at the Colonial Exhibition in London this year is rapidly approaching completion. The work has been executed at the establishment of Mr. Winchbridge, at Gowalia Tank. The total cost of the screen is estimated at 16,000 rupees, which is considered a very moderate sum for work on such an elaborate scale. The material employed is unpolished Bangalore teak. The carved portion is an imitation of the ancient models found at Surat and Ahmedabad, the stone carving of the latter mosques being reproduced in wood. The designer of the screen is Mr. J. Griffiths.

THE RIGHT TO AN EXTRAORDINARY AMOUNT OF LIGHT.

It is to be regretted that the law upon the above subject is not in a settled state, because it is a matter of much importance to many who have valuable businesses in our great towns to know what their rights are if the light to their premises is diminished. In ordinary cases, it is well known there must be a substantial diminution of light in order to give the owner of the dominant tenement a right to legal relief. But where light is used to an extraordinary extent for the purpose of a particular business, it is obvious that a less amount of obstruction may put an end to the business altogether. Is then the owner of the servient tenement in such a case as this to be in a worse plight than if he had obstructed the light to a dwelling-house or to a building which only required a normal amount of light? It is unfortunate that as full and satisfactory a reply to the question cannot be given as is desirable. The law may, however, to a certain extent be definitely laid down, and it is as follows, putting it into the form of a legal proposition. The owner of a dominant tenement has a right to an extraordinary degree of light necessary for a particular purpose when such an amount has been openly and uninterruptedly enjoyed for twenty years. So far as the first part of that proposition goes the law is plain and is supported by several judicial decisions, but these to a certain extent qualify it. In *Lanfranchi v. Mackenzie*, decided some years ago by the late Vice-Chancellor Malins, the judge laid it down that such a right as above expressed was good against all persons who had reasonable knowledge of such uses. This, it is obvious, very considerably diminishes the extent of the above proposition and only allows the right to prevail against a limited class of persons. But the general principle on which a right to light is gained in ordinary cases is by a twenty years' enjoyment, irrespective of any knowledge on the part of the owner of the servient tenement or of any one else. The mere open and uninterrupted enjoyment creates the right and therefore it is a little difficult to see why there should be a distinction between the use of light for ordinary and for extraordinary purposes as regards creating a statutory right to it. Hence we are inclined to think that the right is valid whether persons know of it or not, so long as the enjoyment is open and uninterrupted. But the late Vice-Chancellor Stuart gave relief in the case of an obstruction of light used for an extraordinary purpose after eight years' enjoyment, and the same has been done in Ireland in the case of a seed merchant who had used a room for sampling seeds for seventeen years. But it is here again difficult to see why a person who has a special use for a room with a strong light should be in a better position than a person who only uses one for ordinary purposes. In both these cases to which we have referred, there was, no doubt, a right to a substantial amount of light, but that again seems to be no sound reason why a right to a still greater amount of light should be grafted on the other right in a shorter period than is required for obtaining a statutory right under ordinary circumstances. If this legal doctrine is sound, the result is that if A builds opposite a counting-house or a bank in the City, and slightly darkens the rooms, he has done no legal and actionable wrong. But if he happens to have opposite to him a diamond merchant or a silk merchant, who requires a strong light for sampling there, his building may be stopped, because though he has thereby only slightly diminished the light of the dominant tenement, yet he has obstructed it sufficiently to interrupt the particular business which requires an unusual amount of light. Therefore, the view of Vice-Chancellor Malins that twenty years' user of an extraordinary amount of light is required seems the soundest in law and most consonant with general convenience. We have a strong doubt, indeed, whether it is altogether advisable that there should be any right to an extraordinary amount of light obtainable by the owners of dominant tenements to be favoured above others to the disadvantage of the general body of building owners. Moreover, the balance of convenience seems to be in favour of allowing a person to build if he only slightly disturbs a man's light, and for the person who requires an extraordinary amount of light to move elsewhere. The conflicting interests of

the owners of the dominant and servient tenements are always difficult and often impossible to reconcile. In the case of granting interlocutory injunctions to prevent the continuance of buildings which obstruct the light of another building, the Court always regards "the balance of convenience," and if we apply the same test to this point now under discussion, it will compel most persons to say that there should be no right to an extraordinary amount of light. Meanwhile, however, the law says that such a right can be gained, but judicial decisions differ as to the manner in which it can be acquired, and until some authoritative decision of the Court of Appeal the question will remain a doubtful one.

ANTIQUITIES OF MALVERN.

The little affection in the title of this book* may well be forgiven for the sake of its really valuable contents and for the tasteful manner in which, to the credit of local industry, they are offered to the public. Every one knows more or less of Malvern and its Priory Church, which stand in picturesque prominence upon the slope of the Worcestershire beacon. But Mr. Nott, who has lived for thirty-five years beneath the shadow of the Priory and has already published some valuable notes upon its ancient stained glass, has a good deal to tell which has not hitherto been told, and, while professing no literary skill nor archaeological learning, he has displayed quite sufficient of both to make his modest little history both interesting and valuable.

The historic memories of Malvern centre in its Priory which owed its foundation to the sagacity of Wulfstan, the last Saxon Bishop of Worcester. Instead of encouraging his neighbour Aldwin, a hermit of Malvern chase, to follow the fashionable pietism of the day and spend himself and his substance on a pilgrimage to Palestine, he bade him serve God at home and not seek Him at Jerusalem. The fruit of his advice was the establishment of Malvern Priory (taking the place of a smaller monastery) at the end of the eleventh or very beginning of the twelfth century. It was, therefore, almost coeval with Wulfstan's cathedral at Worcester, which Aldwin must have seen rising in the plain below.

It is scarcely necessary to say that the Norman building is not now to be seen in its entirety, but the church, which, with the gateway and refectory is all that remains of the Priory, possesses a good many of its original features. Of these the most important are the massive arches and pillars of the nave. "Plain though they are, there appears to have been at some period an intention to ornament them, as will be seen from the respond of the north-east pillar adjoining the tower. There a beginning at ornamentation was made, and on the third arch westward traces of zig-zag ornament are faintly marked out." Why these designs were not carried out we are unable to say, nor have we any means of ascertaining whether in the chancel and the other parts of the old church which have been reconstructed the same absence of detail prevailed. Undoubtedly the church underwent many alterations in the Transition and Decorated periods, but the great change in its character was effected in the fifteenth century, when the passion for Perpendicular work was at its height. Mr. Nott considers that the cause for the practical reconstruction of the church at that date is to be found not in the influence of a prevalent fashion, like that of "restoration" in these days, but in some unrecorded disaster in which the centre tower fell, and by its fall destroyed or irretrievably damaged the eastern portion of the church. He quotes Professor Willis's remark that it is some "proof that a tower is not Norman if it has not fallen," and that "this falling was a way they had got into and they could not help it." Of course, it is abundantly true that a good many Norman towers have fallen, and that a good many more, e.g., Canterbury and Wells, would have fallen but for timely intervention; but these admissions come a long way short of evidence that the Perpendicular architects at Malvern merely availed themselves of an unsought opportunity. Be that as it may, they certainly made good use of it. The tower was carried up to its present lofty height, the parvise added, the great east window inserted in the

* Some of the Antiquities of "Moche Malverne" (Great Malvern), by James Nott. Malvern: J. Thompson.

now-built choir, the transepts widened, the aisles of the choir vaulted, and the walls of the chancel panelled throughout. In fact, the Priory Church received from the hands of Sir Reginald Bray very much the same impress as was left by the same architect upon his better-known works,—St. George's Chapel, Windsor, and Henry VII.'s Chapel, Westminster Abbey.

With the dissolution of monasteries the glories of Malvern Priory departed, and at the close of the eighteenth century the church was in a deplorable condition. In 1788 it was described as being in "too ruinous a state to be used with safety," and an anonymous contributor to the *Gentleman's Magazine*, after depicting, in bitter terms, the worse than neglect which prevailed, went on to describe the havoc committed by the children, "whose recreation consisted in throwing stones at the numerous windows, all full of the finest stained glass." Not much was done to remedy matters during the next forty years, and A. W. Pugin reports, in characteristic language, what he saw when visiting Malvern in 1833. "A few years ago a meeting of the fashionables in Malvern was called to subscribe towards the repairs of the dilapidated building, and by the help of raffles, &c., a few pounds were collected. Two hodfins of mortar were got to repair the church, and the remainder of the money expended in putting in a window of the aisle the arms of the subscribers in stained glass, with their names in full,—a monument of their folly and arrogance. The very millions in which the glass is placed, are rotten and falling. The church itself is in dreadful repair; fall it must, and all that is to be hoped is that in its fall it may annihilate those whose duty it was to have restored it; but of this we may be sure, that if it falls while there is a congregation within its walls, it will clear some away that ought to be got rid of, for such a set of lounging idlers as the fashionables of Malvern are only to be matched at Brighton or Cheltenham." Here Pugin rather unfairly ignores the honest efforts which the then vicar, Dr. Card, was making to retrieve past neglect. What he did was done substantially, though neither tastefully nor correctly, and he really set the example which succeeding vicars, living in happier times and aided by larger knowledge, have followed. The marvel is that, in spite of ignorant destruction and ignorant restoration, so much that is beautiful has survived, and that Malvern Priory Church can still show a wealth of stained glass and ancient paving tiles scarcely to be surpassed elsewhere, and no lack of those varied architectural features which make our ancient churches a constant source of interest and pleasure.

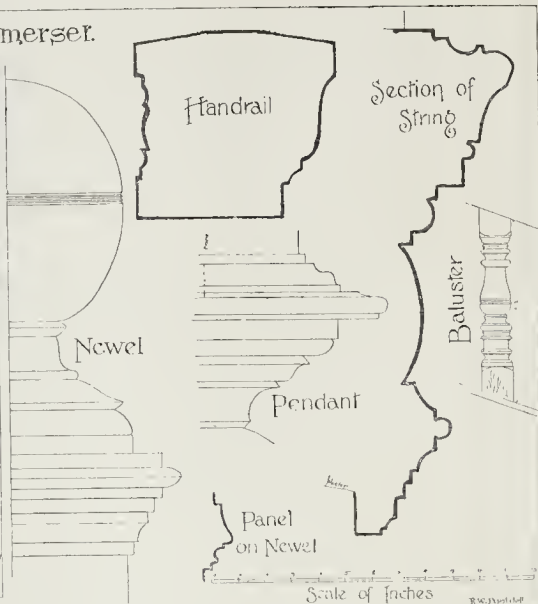

COMPETITIONS.

Basinstoke School.—The School Board have recently invited six architects to submit designs for the new schools to accommodate 1,400 children. On receipt of the plans, it was decided to ask Mr. Roper, of John-street, Adelphi, to advise the Board upon them. This he has done, and recommended the adoption of the design marked "1885," as showing the greatest knowledge of school planning and most suited to the purpose. The author is Mr. Charles Bell, F.R.I.B.A., of London, and the Board have accordingly instructed Mr. Bell to prepare the requisite contract drawings forthwith. The estimated cost is 9,000l.

The Birmingham General Dispensary.—The plans for the proposed new branch building in connexion with the Birmingham General Dispensary have been selected by the committee appointed for that purpose. Messrs. Dempster & Heaton, of Corporation-street, in a limited competition, have been appointed the architects of the new building, which will be at the corner of Stratford-place and Moseley-road, near the old branch, which is at the Stratford-road, corner of Stratford-place. The new premises, which were urgently needed to meet the increased number of patients, will be erected on a site, the area of which is 765 square yards, with a frontage of over 100 ft. to the Moseley-road. The design of the building will be in the Jacobean style, freely treated. The front of the building will be of pressed red brick, with Kenilworth stone dressings, whilst the tower will be almost entirely built of Kenilworth stone. The roofs will be covered with plain red tiles.

"Sir Frederick Leighton, Bart."—We are very pleased to notice the new honour which has been bestowed upon the President of the Royal Academy of Arts.

DESIGNS FOR THE LIVERPOOL CATHEDRAL.

IOR remarks on the three designs for this proposed cathedral, published among our illustrations for this week, see the first article in this number.

NEW ENGLISH CHURCH, BERLIN.

This building, which was consecrated by Bishop Titcomb on November 21st, the birthday of her Imperial Highness the Crown Princess, is situated in the gardens of the Monbijou Schloss at Berlin. While many other German cities have long had churches where large English congregations worship, the colony in Berlin has hitherto had to be content with a room in this same Schloss, which was originally intended for the ante-room to the theatre. It was mainly through the exertions of the Crown Princess during her last visit to England that funds were collected for the erection of the present church, and, by her influence, the site was presented by the Emperor. Her Royal Highness has also shown the keenest interest in the work, and, during the progress of the building, has been in frequent communication with the architect, Professor Raschberg, of the Berlin Architectural School, best known here by his work on German Renaissance.

The church is built of rock-faced granite rubble work, with dressings of sandstone from Schleswig; and the roofs are covered with parti-coloured slating, except those of the bell-turret and porches, which are shingled. Inside, both the walls and roof, which is open-timbered, are covered with colour decoration in black, red, white, and gold; the gangways are paved with tiles presented by Messrs. Minton, who also gave those for the dado which surrounds the chancel. The seating and furniture is of oak. The organ, by Herr Sauer, of Frankfurt-on-the-Oder, is placed in the chamber on the north side of the chancel, while the vestry and royal pew are on the south of the church.

The total cost has been about 300,000 marks, or 6,500*l.*; and sittings are provided for 300 worshippers.

It is to be regretted, from the point of view of almost every interest concerned, that a German architect should have been employed to erect an English church,—the distant situation of which only made it the more desirable that it should be peculiarly English, and the more difficult to make it so. But Herr Rasch-

berg may fairly be congratulated on having succeeded quite as well as could have been expected in a most difficult task, that of erecting a monumental building to satisfy tastes and requirements, presumably quite strange to him, in a style probably foreign alike to his own tastes and previous studies.

"RESTORATIONS OF SOLOMON'S TEMPLE."

The two pages of plans, sections, &c., are given in illustration of Mr. E. C. Robins's paper, of which we print the first half this week (see p. 103).

THE CHARTERHOUSE.

The Bill to authorise the sale or lease of the Middlesex estate of the Governors of Sutton's Hospital in Charterhouse has been printed. The preamble recites the Charter of the ninth year of the reign of King James I., granting full power, licence, and lawful authority to establish at or in a house called the late dissolved Charterhouse, besides Smithfield, and other premises, one hospital house, or place of bidding, for the sustentation and relief of poor, aged, maimed, needy, or impotent people, and also one free school for the instructing, teaching, maintenance, and education of poor children or scholars. The foundation of the hospital and school was established and confirmed by an Act of Parliament of the third year of King Charles I. By another Act of Parliament, of the thirty-third of King George II., powers were given to the Governors to grant building leases of certain portions of their lands and estates, but this Act did not include the lands used in connexion with the hospital and school. The Charterhouse School Act of 1867 empowered the Governors to sell the school and the several residences in connexion therewith, and to acquire a new site for the school. This arrangement, as is well known, has been carried out, and the school removed to Godalming. An application has been made to the Charity Commissioners for a scheme for the more beneficial disposition of the endowments and revenues of the hospital, and to that end for the removal of the hospital and the establishment of a system of out-pensions in lieu thereof.

These objects, it is recited, cannot be effected without the authority of Parliament, and it is therefore proposed to take powers to enable the Governors to dispose of their land, or any part thereof, or to grant building or other leases for terms not exceeding ninety-nine years, provided

that no such sale or exchange shall be made without the consent of the Chancery Division of the Supreme Court or of the Charity Commissioners. The Governors may further pull down and remove the buildings on the site of the hospital, and may form streets or roads or open spaces subject to the same consent as before. The burial-ground of the Charterhouse is proposed to be laid out as an open space, and power is given to hand it over to the Corporation of the City of London or the Metropolitan Board of Works. This burial-ground, which was the cemetery of the monastery, was closed by Order in Council in 1854, together with a number of other metropolitan graveyards.

Clock.—The Episcopal Church of St. Margaret, Fergue, diocese of Aberdeen, has been presented, at the sole cost of Mr. J. Morrison, of the British College of Health, with a clock of superior design, specially constructed by Mr. J. W. Benson. The new clock has two coppe-dials of 4 ft. diameter, strikes the hours on a bell of 11 cwt., and is fitted with Graham's dead-beat escapement and all recent improvements. The additions to the tower necessary for the reception of the clock were planned by Mr. J. Duncan, Thrieff.

THE TEMPLE OF SOLOMON.*

THE architectural form and style of the Temple of Solomon is a subject of inquiry interesting to all students of Biblical antiquities and literature. Much learned discussion has been expended upon it, and many volumes written to establish the views of their authors, some of whom have allowed their imaginations full play, making their wishes father their thoughts, and so have described a building or series of buildings, the like of which the world never saw for size, costliness, and general magnificence.

I propose to give some of the leading theories propounded chiefly by eminent architects, and to indicate also what appears to me to be the most reasonable hypothesis, the most probable form and style of architecture of that first building of which scarcely one stone remained upon another, even in the days of Herodotus, the Father of History.

The Jews were not a building people, and have left no native monuments but what are the result of forced labour in foreign lands. In this they were not singular, for their immediate neighbours, the Tyrians and Sidonians, have left no monuments either at home or abroad. Tyre, Sidon, Jerusalem, Basbec, Palmyra, Carthage, possess no architectural antiquities anterior to Roman times, except, perchance, vast masses of masonry, the retaining walls of imposing platforms upon which were reared those structures which have since disappeared.

The two great authorities on the subject are, of course, the Bible itself and the Jewish historian, Josephus. The first of these sources of information is the more reliable as regards the Temple of Solomon.

Josephus was well acquainted with Herod's Temple, and may be trusted in his description of that remarkable series of buildings, except, perhaps, as regards their height. Into his account of Solomon's Temple he imports his knowledge of Herod's, and gives to Solomon the credit of much that belonged to a later age. His example in this respect has been followed by subsequent writers and expositors, and thus there has been much idle speculation which could never have arisen had the 6th chapter of the 1st of Kings been the accepted authority for all subsequent restorers.

Take one curious example, viz., an illustration given in Stackhouse's large Bible, dated 1810. The observer is referred to the 6th chapter, 1st Kings, for an explanation of the plate, but the real key to it is to be found only in Josephus's "Antiquities of the Jews," viz. by the addition of stairs and terraces mentioned in Chronicles, but considerably multiplied in number. The Temple proper rises above all, and is four times the height given in Kings, the whole being designed in the Roman manner of many centuries later. That the Jewish historian's style has favoured such theories as this, a single extract will suffice to show:—

After stating all that is given in Kings he goes on to say, that having built the Temple beyond the wall of the court surrounding the house in the form of a quadrangle, "Solomon erected for a great and broad cloisters which were entered by very high gates, each of which had its front exposed to one of the four winds enclosed by golden doors. But he made that Temple which was beyond this a wonderful one indeed, and exceeds all description in words; nay, if I may to say, is hardly believed upon sight, for when he had filled up great valleys with earth, which, in account of their immense depth, could not be looked on when you hended down to see them without pain, and had elevated the round 400 cubits (600 ft.) he made it to be in a level with the top of the mountain on which the Temple was built."

Now, as a matter of fact, since ascertained by modern explorers, the lowest stone of the oldest wall of the present Temple area stands in the rock itself, and the summit of Mount Moriah is but 163 ft. above the rock upon which the lowest stone rests. That is to say, Josephus has quadrupled the height in his own description above quoted.

In short, this historian gives full play to his imagination whenever he can safely do so, in speaking of the depth of valleys since

filled up, or the height of towers since levelled with the ground. He rarely contradicts the sacred Scriptures, but rather omits or supplements them, or else takes advantage of some verbal discrepancy or peculiar mode of expression to introduce his own notions, whenever it serves his purpose so to do, or tends to exalt the glory of his people Israel.

Of Jewish religious structures, of course the earliest was the tent of the Tabernacle, the plan of which was divinely revealed to Moses at Sinai, and was never subsequently departed from; so that when Solomon built his Temple, in the year 1013 before Christ, he did not alter the general disposition in any manner, except that he donned every dimension. And thus the Holy of Holies became a cube of 20 cubits or 30 by 30 by 30 ft., and the Holy place became 20 by 40 by 30 cubits or 30 ft. wide by 60 ft. long by 45 ft. high, and so on.

The Temple which Ezekiel saw in vision, 575 years before Christ, was identical in its dimensions with that of Solomon. Additional courts and passages were added, of which Canina and Fergusson have each made a restoration, shown on the drawings.

The Second Temple, as it is called, or Zerubabel's (before Christ 520), which was built by the Jews on their return from the Captivity, likewise corresponded exactly with Solomon's building, but was shorn of its decorative splendour.

The Third and last Temple, erected by Herod, twenty years before Christ, is thus described by Mr. Fergusson:—"In this we have a perfect illustration of the architectural history of the country. The priests restored the Temple itself, not venturing to alter a single one of its sacred dimensions, only adding wings to the facade, so as to make it 100 cubits wide, and, it is said, 100 cubits high, while the length remained 100 cubits as before."

At this period, however, Judaea was under the sway of the Romans, and under the influence of their ideas the outer courts were added with a magnificence of which former builders had no conception.

An area, measuring 600 ft. each way, was enclosed by terraced walls of the utmost lithic grandeur, on these were erected porticoes unsurpassed by any we know of. One, the Stoa Basilica, had a section equal to that of our largest cathedrals, and surpassed them all in length; and within this colonnaded enclosure were ten great gateways, two of which were of surpassing magnificence. The whole making up a rich and varied pile worthy of the Roman love of architectural display, but in singular contrast with the modest aspirations of a purely Semitic people."

But I do not propose to enter upon the discussion of Herod's temple at all. The arguments in favour of Mr. Fergusson's views are great and manifold, and they are given in extenso in his splendid work on the "Temples of the Jews," to which I must refer you.

The important explorations in and about Jerusalem, which have been carried on since 1864 under the auspices of the Palestine Exploration Fund, are speedily coming to a close, without having revealed anything which materially militates against the views of Mr. Fergusson, Mr. Lewin, or Mr. Thrupp, who all agree that Herod's temple and associated courts extended to 600 ft. a side, and were situated at the south-western corner of the sanctuary or Haram area.

Solomon's Temple may have occupied the same area, as Mr. Lewin thinks, or much less, as Canina and Fergusson think; while it is most probable that Solomon's palace occupied the south-eastern corner, where are situated the sub-structures, commonly called Solomon's stables.

The majority of the drawings which I exhibit were prepared by me in the year 1858, and since that period I have been interested in observing the progress made in the elucidation of this subject, which, however, has resulted in the illustration of but few examples anterior to Roman times.

The great work, entitled "The Survey of Western Palestine," is being published, and therefore I have thought it a fitting time to have my "say" on the matter and to recall the earlier labours of others in the same field, so far as they throw light upon the main object of my inquiry, viz., the form and style of art employed in the construction of Solomon's Temple.

It will be desirable, however, to pass, very

rapidly, in review the more important facts brought to light by the excavations of Captain Warren at Jerusalem.

Upon the Ordnance Survey of Jerusalem, made by Captain Wilson in 1845, I have tinted the famous enclosure called the Noble Sanctuary. It is described by Captain Warren as a raised plateau, measuring about 1,500 ft. from north to south, and about 900 ft. from east to west,—which is sustained by a massive wall, rising on the exterior from 50 ft. to 80 ft. above the present level of the ground.

The general level of this plateau is about 2,420 ft. above the sea, but toward the east, at the Golden Gate, it is not filled up to this general level by some 20 ft. or so. Almost in the centre of this plateau is an irregular four-sided paved platform, rising some 16 ft. above the general level of the plateau. About the centre of this platform the sacred rock appears, over which is built the celebrated Dome of the Rock, ascribed to the Moslem chief Abd-al-Melek,—but claimed by Mr. Fergusson as the Church of Constantine, erected over the Holy Sepulchre,—which Mr. Fergusson believes to have been in this position and to have been without the walls in Herod's time: a question upon which I express no determinate opinion till I have myself visited Jerusalem, but, in the meantime, as I stated in my letter from Rome to Mr. Barry (when President), which was published in the "Transactions" of the Institute of British Architects, there exist in Rome at this day circular temples strongly corroborative of Mr. Fergusson's contention.

Each of the three temples, as already observed, must have occupied the same site, which all admit was contained within the area of the present Noble Sanctuary.

Some authorities, says Captain Warren, as M. de Sauloy, Sir Henry James, the Comte de Vogüé, supposed the whole sanctuary to have been occupied by the Temple and its courts, at least, in Herod's time.

Mr. Williams supposes 950 ft. square of the northern portion was thus occupied.

Messrs. Kraft, Robinson, Barclay, Kiepert, and Porter think the Temple, and its courts must have stood upon the southern portion of the sanctuary on a square of 925 ft. or thereabout.

Messrs. Tobler, Rasen, and others suppose the Temple to have covered a space about 600 ft. a side,—nearly co-incident with the present raised platform in the centre of the sanctuary, upon which site now stands the Mosque of Omar.

Captain Warren claims this position for the site of Solomon's Temple.

But I incline to the theory already referred to as that of Mr. Fergusson, Mr. Lewin, and Mr. Thrupp. And I think with them, that the successive temples occupied the south-western corner of the sanctuary,—while Solomon's Palace occupied the south-eastern corner. At all events, the most ancient remains are to be found in the walls at the southern end of the Haram area.

The result of the explorations adjoining the southern and eastern walls is as follows:—

The noble sanctuary enclosure being considered too sacred to be meddled with, especially by sacrilegious hands, shafts had to be sunk by Captain Warren at a distance of more than 20 ft. from the walls to reach the rock; horizontal galleries or tunnels had then to be driven therefrom to the base of the walls, which were founded on the rock, and appear to have been carefully wrought with drafted edges, and at one time to have been exposed to view.

I exhibit an enlarged drawing of this process, taken from Captain Warren's hook, and also enlarged drawings of the elevations of the southern and the eastern walls, taken from the volume entitled "The Recovery of Jerusalem."

The lie of the rock is given below the accumulated earth above it,—showing the depth from which the walls spring, and from the carefully-dressed edge-drafted and hvelled masonry, it is reasonably conjectured that the whole of the wall was originally visible.

It will be observed that at the Triple Gate in the southern wall,—the rock rises to the sill of the gateway, and towards the east it inclines to the old bed of the river Kedron,—some 211 ft. in depth, or 107 ft. below the lowest stones of the wall at the south-eastern angle; and on the west side of the Triple Gate the rock descends to 30 ft. below the gateway to the old bed of the Tyropean valley, and rises again towards the upper city, being some 30 ft.

* A paper by Mr. Edward Cookworthy Robins, F.S.A., entitled "A Review of the various Theories respecting the Form and Style of Architecture of the Temple of Solomon," read before the Architectural Association on January 1st, 1886.

higher at the south-western angle, beyond which is shown the base of the pier which sustained the western side of Robinson's arch,—under the pavement of which is a drainage channel cut in the rock.

Below the present level of the ground are three successive pavements, showing the gradual filling up of the valley, upon the lowest of these pavements the fallen voussoirs of the arch have been discovered lying.

From the examination of this south wall, in nine separate places, there appears to be no doubt, says Captain Warren, that the whole of the stones below the present surface are bevelled or marginally drafted (though the faces are not all equally finely dressed) and that they are *in situ*—

The courses of the great stones return along the western wall to Wilson's arch, passing the Wailing Place of the Jews, where some of the finest masonry is visible in what is called the Jews' Quarter.

Wilson's arch is about 600 ft. north of the south-western angle on the western wall, and marks the extent of Herod's Temple in this direction.

The restoration or reconstruction, or original foundation of the south wall by Herod,—from the double gate to the south-western angle seems a probable circumstance, prior to the erection of the Stoa Basilica, which extended to the triple gate, a distance of 600 ft., and marks the extent of Herod's Temple on the southern side towards the east,—thus confirming the correctness of Josephus's horizontal measures, who stated that the area occupied by Herod's Temple was four square of a stadium each side, or 600 ft. square.

This portion of the Haram area has a solid substratum. Beyond the triple gate the levels are raised on comparatively modern piers and arches, below which Captain Warren has discovered other passages and vaults, which lead him to surmise that the floor of the upper series of vaults rests on a lower range of piers and arches; but to what extent this may be the case has not yet been ascertained.

It is unnecessary for my present purpose to do more than indicate the position of Solomon's Temple itself. The courts surrounding it, doubtless, varied in succeeding times. Mr. Fergusson cannot stretch them so far even as the present south and west walls. Mr. Lewin, however, claims the whole of the Haram area as we now find it, not only for Herod's time but also for the Solomonic era; yet, as aforementioned, restricting the area of the Temple proper and its more immediate courts to the square stadium at the south-west corner; and he asserts that the rest is included in the statement that "Solomon built Millo," by which he caused the defilement of the ten tribes who afterwards revolted under Jeroboam.

Canina provides a little over 600 ft. by 300 ft., and Mr. Fergusson considerably less.

Much of the eastern wall of the inclosure has evidently been the work of comparatively recent times, since the remains of former buildings are built into it, and the stone on which Mahometans believe that the prophet will sit to judge the world, is the end of a column, so treated, which projects from the face of the wall, not far from the Golden Gate, which belongs to the fourth century after Christ.

These remarks, having reference to the site of the Temple, will clear the way for what is to follow, viz., a comparative analysis of the various special designs made by different architects to illustrate the probable form and style of architecture employed by Solomon in the erection of the Temple building itself.

The theories of modern antiquaries may be conveniently divided into three classes.—

Firstly, The African, or those which assume that the Temple was designed on the model of Egyptian edifices, or in the Egyptian style.

Secondly, The European, or those which assume that it partook of the forms and design peculiar to Grecian architecture.

Thirdly, The Asiatic, or those which assert that it is to Phœnicia, Assyria, Babylonia, and Persia, we must look for the style of architecture employed.

In this cursory analysis of these several theories I shall endeavour, as far as I can, to describe each view in the spirit of the author's intention, the plans on the walls fully illustrating the same.

Firstly, *The African.*

Professor Hosking, in his *Treatise on Archi-*

ecture, prepared for the "Encyclopædia Britannica," thus expresses his opinion:—

"We think that the probability is great that the Temple was built in the Egyptian style, as far as the Jewish ceremonial would permit, and certainly the descriptions of its distribution accord better with that of an Egyptian than of a Grecian Temple.

The pillars Jachin and Boaz,—which are said to have been set up before the Temple,—correspond exactly in relative situation with the obelisks at the Temple at Thebes."

I have sketched a portion of an Egyptian Temple, showing the position of the obelisks with reference to the entrance,—but they do not answer to the description in Kings,—and it appears to me that the very names of the Pillars are sufficient to indicate their position as chief supports.

"Jachin, wherewithal it is established, and Boaz, in the which is strength." Akin to the pillars of Philistia, which sinewy Samson clasped in his fatal embrace.

Canina's Design.

The late Commandatore Canina of Rome took the Egyptian side of the question, and many years ago published a small folio work on the antiquities of the Jewish nation.

I have copied several of the geometrical drawings given in illustration of his views, to which I have added a perspective view to give full effect to what is certainly the most rational representation of the Egyptian temple (see lithograph plate in this number).

Canina agrees with Professor Hosking, that the two pillars were outside the porch of the Temple. Yet he does not suppose them to have been obelisks, but forms them into a portico in front of the porch.

The nets of checker-work and wreaths of chain-work for the chapters, which were on the top of the pillars, seven for each chapter, with two rows of pomegranates, 100 in a row, he supposes to have been in part the pattern of the capitals of the brazen pillars; and not a brazen network overhanging the lily-work of the chapters, these he disposes in another way,—placing them in the cornice of the entablature connecting the two columns in his design, thus forming a porch or portico in front of the porch which alone is described in Kings.

Probably this view is based on the 19th verse, "And the chapters that were upon the top of the pillars were of lily-work in the porch four cubits." Whatever these four cubits may refer to (which Mr. Fergusson originally ascribed to the intercolumniation, but which seem to me rather to refer to their diameter, elsewhere described as two cubits in circumference), it can hardly apply to the height of an entablature, or things so opposite as the supports themselves and the thing supported. And with reference to their position it is expressly stated that the chapters, which were of lily-work, were in the porch, and not outside of it.

The height of the true porch Canina rightly makes the same as the sanctuary, but he has increased the length of the sanctuary by the thickness of the wall separating the oracle therefrom; whereas, in every description in the Bible, the whole length of the house is given as threescore cubits, and the separation of twenty cubits for the oracle was afterwards made.

The description in Kings, 21st verse, is, "Solomon overlaid the house within with pure gold, and he made a partition by the chains of gold before the oracle, in which bronze columns may have been introduced to carry the additional height of the end wall of the sanctuary.

Canina's arrangement of the chambers round the house I think most correct. Neither their number nor their length is given in Kings or Chronicles, though the former gives their width and height, while the latter does not mention them at all.

Ezekiel, in his vision of the restored Temple, tells us that "the side chambers were three, one over another, and thirty in order," that is, thirty in all on the sides of the house, besides those at the end of the oracle.

Our ingenious friend, Josephus, finding that the phrase "thirty in order," might be translated "three and thirty times," or thirty times three, says there were thirty chambers on each floor, in all ninety chambers,—it mattered not to him how small they were in plan, for what they lost in length he quadrupled in height.

The Count de Vogüé has been misled by him and so was Fergusson in his earliest design.

The cubit measure is variously taken as 1 ft. 3 in., 1 ft. 6 in., and 1 ft. 9 in. long; but the successive Temples must have used the same measure. If the second Temple was built 2 cubits of 1 ft. 6 in. long, the first Temple was the same, the walls of the former being based on the foundations of the latter.

The letter of the adversaries of the Jew, addressed to Artaxerxes, during the rebuilding of the Temple in Ezra's time, favours this assumption thus:—"Be it known unto the King that the Jews which came up from the rebellions and the bad city, and have set up the walls thereof and joined the foundations," literally, "sewed together the foundations," showing that they already existed, although the superstructure was burned to the ground by Nebuchadnezzar, at the time of the Captivity, who also carried away the Brazen Pillars after he had broken them into fragments.

Thrupp's Theory.

Canina's restoration would not appear to be appreciated as it ought to be by those who favour the Egyptian theory, and in 1855 a work was published by the Rev. Mr. Thrupp, of "Ancient Jerusalem," containing some singular speculations on the probable form of the Temple. I have enlarged the plan given in his book.

Mr. Thrupp starts with the settled conviction that Solomon's Temple was like unto the Egyptian fame, that a parallel may be found in the Jewish Temple for nearly every peculiarity of the Egyptian. He details the several characteristics of the former, and endeavours to establish their coincidence with the latter. The body of the Jewish Temple he likens to the sekos of the Egyptian, and the chambers surrounding the house of the former to the galleries encompassing the latter.

In the Jewish porch he sees the prosekos of the Egyptian type. To obtain the necessary height, he adopts the 120 cubits given in Chronicles, while, to gain the required width he resorts to his imagination, and says:—"The interior length of the portico of Solomon's Temple was 20 cubits, the same as the interior breadth of the sanctuary; but," he continues, "it may have been prolonged by lateral chambers or porticoes rising to the same height with it, and may thus, like Egyptian porticoes, have externally outflanked the body of the mosque." In the pillars Jachin and Boaz he finds traces of the Hall of Columns; but as he dares not attempt to add the one, no place is left for the other, so that the unfortunate pillars are lost altogether.

The Court of the Priests he converts into propylon, surrounding it with pillars in the first place, and with chambers in the second.

Finally, he recognises the large pyramidal towers in front of Egyptian temples, in an imaginary eastern front to the Court of the Priests.

The Count de Vogüé's Design.

The latest resuscitation of the Egyptian style, as the type to be followed in restoring Solomon's Temple, is by the Count de Vogüé, the author of the "Syria Antiquities," who has published a work on "Jerusalem and Temples." His design for the Solomon's Temple throws little light on the subject.

His main façade consists of a large Egyptian propylon, with an opening in the centre 20 cubits square, in which arc situated the Pillars Jachin and Boaz, the ornamentation of the capital containing the lily work and pomegranate. The porch is 10 cubits deep by 20 wide, 60 cubits high, while the rest of the massive propylon appears to be solid, except where staircases to the chambers occur on each side.

He adopts Josephus's number of chambers, forming a series of dark closets. He makes the Holy of Holies a cube 20 cubits, but the height of the Sanctuary reduced from 30 cubits to 17 cubits, by the introduction of an upper chamber, and the light is admitted to the Sanctuary, any more than to the Holy of Holies.

Secondly, *The European.* Prof. Wilkinson's Design.

Passing to the second section of the subject we come to consider the views entertained

advocated by the accomplished author of the "Prolusiones Architectonicas."

"The chief object of the present essay" (says Professor Wilkins in his essay entitled "The Temple of Jerusalem the Type of Grecian Architecture") "is to show the influence produced on the Arts by the commencement and accomplishment of this great enterprise, and the example it afforded to the architects of the ages immediately following, as yet unskilled in architecture, and wanting some type of great authority for their guidance."

"If we compare," says he, "the plan and proportions of the Syrian Temple with those of some of the earliest examples of Grecian origin, such, for examples, as those at Paestum and Egina, a resemblance will be found to exist that can only be attributed to the adoption of the same principles by the architects of Palestine and Greece" (see Illustrations).

On the assumption that the Jewish cubit was equivalent to 21.888 in., the extreme length of Solomon's Temple, by a little stretching, is made, in his restoration of it (see Plate), to agree with that of the Temple of Paestum within 2 in., and to be of the same width within 3 in.

To achieve this result, however, passages have been introduced to eke out the thickness of the walls of the house, and the end chambers are made deeper than the side chambers.

But these narrow passages in the thickness of the walls serve a double purpose; they are substituted for the "windows of narrow lights." There being commonly no windows in ancient Grecian temples, Professor Wilkins has felt it incumbent upon him to show that none necessarily existed in Solomon's Temple; and he quotes a passage from the Odyssey, where the same word is translated "intervals," interpreted by him to mean "narrow passages in the thickness of the walls."

To make the total height agree with the usual proportions of a Grecian elevation, he considers the length and breadth of the house, as given, were internal dimensions, and the height was an external measure. By this arrangement he contrives to make the sanctuary, and the oracle and the porch, of equal external height, whereas the first is distinctly stated to be 30 cubits high, the second 20 cubits, and the third is not given at all in Kings, and is exaggerated in Chronicles by the curious multiplication of the height of each of its sides.

By adding 5 cubits for the roof, and 5 cubits for a raised floor, and deducting this from the 30 cubits given as the height of the sanctuary, it is made to agree with the internal height of the oracle. By further adding 2 cubits to the height of the side chambers, these also are made to fall in and range with the rest, and the general conformation is complete. In the number of chambers he follows Josephus, and provides thirty on each floor.

We now come to the celebrated pillars in the porch, but where are their chapters of lily work and pomegranates? As no early Grecian capital was ever 5 cubits deep, these also had to be got rid of; and as, moreover, an entablature and pediment was indispensable to make the resemblance complete, the learned Professor proceeds to provide them in the following ingenious manner.

He first gives a translation from the Septuagint, which runs as follows:—"And he made two epithemata of molten Brass, to place them upon the capitals of the columns, 5 cubits was the height of one epithema, and 5 cubits was the height of the other epithema." And then explains that the architectural term epithemata, translated chapters in our version, properly means round numbers placed over the capitals, and not only the whole entablature, but the pediment of a building also; and that the words in Kings translated, "Upon the tops of the pillars," should be rendered "Upon the capitals of the columns."

Mr. Fergusson has also taken advantage of this suggestion, since he has needed arguments to support his latest idea, viz., the likeness of the pillars and their appurtenances to the Indian bra.

Now, we have all heard it said that the Doric order originated in the petrification of wooden stems of construction, and that the pediment grew out of the sloping timbers of the roof; he triglyphs being suggested by the ends of the tiebeams; but Professor Wilkins believed that neither wood nor stone was the material of the original type, but molten brass.

As for the brazen network and pomegranates

encircling the chapters, these he suspends from the epithemata, and to them refers the origin of the guttae in the Doric and Corinthian orders.

Then as to the "lily-work of the chapters," he suggests that this was an ornamental fascia, resembling the painted ornament so frequently found in Grecian temples; and in this way every distinctive peculiarity of Solomon's Temple is merged into that of a succeeding period, of which it is proclaimed the type.

Hakewill's Design.

With passing remarks upon the views of Mr. Hakewill, as published by him in 1851, we will conclude this notice of the European side of the question (see Illustrations).

Mr. Hakewill follows up Professor Wilkins, but is much less scrupulous than he, and wonders that the learned Professor "should have so clearly seen and proved the fact of the resemblance with the Greek temples, and yet following Vailalandus and Le Roy, should have suffered the question of chambers, in reality, so to mar his theory, as to leave no resemblance in his illustration."

Therefore, suiting the action to the word, he defines the word "chambers," in our translation, to really mean "defined and limited space"; and the word "window" to stand for "means of light," and sweeps the side chambers and the narrow passages, substituting a peristyle of columns for the outer walls, with a wooden screen formed against them inside, which he continues all round the building, and even in front of the porch, and then very naively remarks, "The close similarity between this and the universal form of the Greek Temple is too obvious for remark." *

THE POLLUTION OF WATER SUPPLIES.

At the January meeting of the Association of Public Sanitary Inspectors, held on Saturday evening at No. 1, Adam-street, Adelphi, an important paper, on the "Pollution of Rural Water Supplies," was read by Mr. James Bateman, C.E., Surveyor of the Eveleigh and Pewsey (Wilts) Local Board, before a large audience of inspectors and visitors. The Chairman of the Council, Mr. G. B. Jerram, presided. The paper was illustrated with plans drawn to a large scale, showing the defective construction of existing cesspools on the farms of a district which supplies London with enormous quantities of milk daily, and exhibiting improved forms of cesspools effectively ventilated.

Mr. Bateman, in his paper, admitted that the question of water supply was one for the engineer rather than the sanitary inspector, but held that at the present day the latter official should know enough of hydrostatics and mechanics to report upon and suggest at least temporary remedies, in pressing cases of failure or contamination. Sanitary science was almost totally unknown in the rural districts, and the provisions of the Public Health Act of 1875 were, in the lecturer's opinion, totally inadequate. Villagers whom he could name depended almost exclusively upon a well in a churchyard for their drinking-water; and last summer, this failing, they were compelled to travel a distance of five miles for the water required for domestic purposes. The samples on the table were fair specimens of that obtained from the domestic wells of the whole town of Pewsey, an unpolluted well being a rare exception. They were contaminated with sootage from manure heaps, pigsties, privies, and land dressings generally. The earth-closet system, as a remedy, had been a failure, in his experience,—the tenants being unable, and the sanitary authorities unwilling, to incur the expense of making it effective. The present depressed state of agriculture almost precluded the hope that anything would be done to remedy these serious defects by private individuals, but it was imperative upon sanitary authorities, the custodians of public health, to supply one of the first essentials of healthy life,—a pure and wholesome water. In many other counties of the west, besides Wilts, the water supplies were equally scanty, foul, and filthy, and, in some districts where the cloth manufacture was carried on, the streams themselves were highly polluted, the Rivers Pollution Act seemig to be more

* To be continued.

honoured in the breach than in the observance. Of the Green Pump at Calne Professor Stoddart had reported as follows:—"The water is of a yellow-brown colour, full of suspended matter, consisting of iron dust and partly of flocculent organic matter, with infusoria and bacteria." The Abyssinian tube-wells had been tried in some places with partial success, but in no case within the lecturer's experience had an adequate supply been reached. He did not say the system was at fault, and he thought a better result would have been obtained had Messrs. Legrand & Sutcliffe, or other persons as competent as they, been employed to sink wells. The Rivers Pollution Act scarcely went far enough. Penalties were only inflicted where new drains were turned into the water-courses, but the old drains went scot free. The volume of sewage was being added to every day by the connexion of new drains, and one of the most valuable sources of water supply was thus becoming more and more contaminated. The question had an important aspect for Londoners. A large tract of country extending between Reading and Trowbridge, the Kennett and Avon Canal, and the Berks and Hants extension of the Great Western Railway, which formerly was exclusively devoted to corn-growing, had been turned into pasture land, the corn farms becoming dairy farms for supplying milk to the various milk companies of London. The farmer had altered the character of his farming, but he forgot then to change the noisome surroundings of his homestead. The hollowed centre of the farm-yard formed a gigantic cesspool, filled up with the manure of the pig-styes, stables, and stock-sheds, and the rotting mass was constantly churned up by the passage of cattle over it. The rain-water from all the roofs discharged itself into the mass, which became by constant accumulations a large pool of most offensive liquid sewage that in time filtered through into the well, from which the supply of water both for cattle and man was exclusively drawn. The most scrupulous cleanliness was observed in the cow-houses and the dairy. In the course of a tolerably long experience the lecturer had never detected a sour or dirty churn, and the refrigeration of the milk and its carriage were carefully carried out, but it could not be wondered at that the tenants were subject to diphtheria or that the medical profession should be occasionally baffled by the outbreak of diseases of mysterious origin. The first of the remedies he would recommend was the placing of the cowhouses under the inspection of the sanitary officer instead of under that of the county police. The police were an excellent body, but not qualified for an important duty demanding a really technical training. There should also be a stricter supervision by the metropolitan dairy companies, and a determined opposition to the reception of milk from any hut those farms which had been certified by the sanitary authority as being properly drained and having a pure, wholesome, and sufficient water supply. Until that became law there must be periodical outbreaks of disease.

In the discussion which followed the Chairman, and Messrs. Boulter (Bexley), Poulson (Chelsea), Alexander (Shoreditch), Middleweek (Kensington), Rumball (Barnet), and Dee (Clapham) took part.

THE ALBERT DOCK.

The enormous trade of the Port of London makes everything connected with the development and extension of its stupendous docks a matter of wide and really national interest. One of the most powerful of these dock companies owns the London and St. Katherine and the Victoria and Albert Docks, as well as the Cutler-street Warehouses and the East Smithfield Railway Depot; and has invested in these vast undertakings a capital of over ten millions of money, upon which, even in these times of commercial depression, and in these gloomy days of the shipping trade, a dividend of over three per cent. is earned and paid.

The tendency of all the new dock extensions is progressively towards the sea. The Victoria Dock was the first step down the river, and by that work a great head of the Thames was avoided. The direct extension from that fine shipping haven was the enormous Royal Albert Dock, opened for the admission of ships in 1880. By this vast engineering work a broad peninsula was cut across, and another head of the Thames

avoided, vessels entering the new dock 11 miles down stream. The particular locality of a dock in respect to the trade and warehouses of the City has very important bearings on its influences as well as on its own returns of profit and its commercial success. And as the various dock enterprises now in execution are brought so far towards completion that the trade and traffic with them are commenced, many features of value are brought out in strong relief. This is particularly striking in the present instance of the Albert Dock. Its distance from London is not too far for cartage or lighterage. City merchants have already found that, once their goods are loaded in their vans, it is cheaper and more expeditious for their horses to draw them the whole journey than to re-load into barges or on to the railway trucks. Again, in the case of wool, the total annual importation amounts to about 1,100,000 bales, of which the London and St. Katherine Docks and two wharfers take one million bales. As the warehouses at these docks are handy for merchants to inspect and sample the goods, it is of the greatest advantage to the Dock Company to have their warehouses remain the customary depôts for this commodity. The easy distance between the Victoria and Albert and the older London and St. Katherine Docks permits of barging between them. The trade brought already by the large Australian and other steam-ship lines is of great magnitude, and it is of the highest importance to facilitate the arrival and departure of the immense vessels now employed in the ocean-carrying trade. Hitherto, both entrance and exit have, since the opening of the Albert Dock, had to be conducted through one and the same channel, the outgoing ships having the precedence of coming out on the flowing tide. The original design of the Albert Dock provided two locks from the river into the outer or Galleons Basin; and it was the engineering works of the second entrance that a large party of practical visitors were on Monday last invited by the chairman and directors of the Dock Company to inspect. The Act of Parliament authorising these new works was passed in May, 1884, and the entire undertaking, it is expected, will be completed early in the spring of the present year. The new works consist of an extensive enlargement of the Galleons Basin, giving an additional water space of some fifteen acres, with two additional berths for the largest steamship liners; a second entrance from the Thames by means of a lock 550 ft. long and 80 ft. wide contiguous with and parallel to the existing entrance, but with this difference, that the new lock has a depth of 36 ft. below Trinity high water, or 6 ft. more than the present one. Besides this there is, branching off from the new entrance into the river, a very fine landing-stage with a river-front parallel with the shore extending for a length of 1,120 ft. down the Thames, and having a depth of water alongside of 27 ft. at low water. The passenger traffic between London and the Albert Dock is carried on by four trains an hour each way between the Galleons Basin and Fenchurch-street, and amounts to an annual total of over two millions of passengers. The railway lines are being carried right on to this river wharf, so that passengers may have the facility of landing as soon as the ship arrives at the pier, and then taking train on the spot, save some notable time by proceeding immediately on their forward journey, over what they would be able to do if the dock or the basin had to be entered. Equally well facilities of latest embarkation be afforded by the river wharf, as well as opportunities of discharging at the earliest, or despatching light or perishable goods at the latest, moments. There is one very valuable feature in the construction of this river-wharf, viz., its division at intervals by walls of concrete and brickwork as a protection from fire. The river shore inside the wharf has also been thoroughly well embanked. The excavation for the lock has been made in clay, peat, sand, and gravel, and over 500,000 cubic yards of soil have been removed and deposited on the company's land.

The great sumpt for the drainage of the engineering works has been carried down to a depth of nearly 60 ft., and enters the chalk. The pumping is effected by four 24-in. pumps, throwing out 1,000 gallons per minute. The lock and basin walls are of concrete, faced with vitrified bricks, the quoins and cills and copings being of Cornish granite. There are three pairs of iron lock-gates,

which are being built in position, and those will be opened and closed by hydraulic power. The roller-paths are made of cast steel. The invert of the lock is formed of seven rings of bricks strengthened by concrete, and under the entire lock there pass four culverts for the conveyance of drainage and the service of the gas pipes and electric wires.

The works have been designed and carried out by the General Manager and Consulting Engineer, Colonel Martindale, C.B., R.E., and Mr. Carr and Mr. Thomas, the Company's Engineer. The execution of the lock has occupied a little over eight months, and stands for rapidity of accomplishment, probably the first in speed of any such work on record. The perfection of the construction reflects the greatest credit upon all concerned.

The works have been protected from influx of the river by a copper dam across the mouth of the lock-entrance, whilst at the rear they have been defended against the water in the basin by a concrete wall 20 ft. thick at its base and 530 ft. long. This wall is in process of being blasted away; the final coup it is intended shall be given by about a thousand shots fired simultaneously by electricity.

LONDON DRAINAGE.

MEDICAL OFFICERS AND ENGINEERS.

In the current number of "The Asclepiad," a book of original research in the Science, Art, and Literature of Medicine, preventive and curative, and which is written entirely by Dr. Richardson, F.R.S., there appears an article on the drainage of the metropolis, headed "Under London: a Prospect for Radical Reconstruction."

The main points raised in the article are:—
The advocating of a dual system of removal for sewage and storm-water by the introduction of iron sewers, for the sewage, to be inserted in the existing sewers, which are proposed to be used for storm waters only, and the application of an exhaust in lieu of water as a sewage carrier.

The remedies for existing evils are drastic. The word-picture is dramatic, being written in that forcible and lofty English which attracted so much attention to the same author's "City of Hygeia."

Dr. Richardson makes complaint that the existing state of the drainage question is due to the interference of engineers in matters medical, in the following words:—

"If our engineers had kept to their own splendid department of science, instead of assuming the position of doctors of health, or if the latter had been stancher at the first, all the present trouble might have been saved. By reverting to their true positions and functions, both can make a magnificent amende."

A reply to the article has been addressed to Dr. Richardson by Mr. Ellice-Clark, M. Inst. C.E., of which we print the first part:—

"To B. W. Richardson, esq., M.D., F.R.S."

Dear Sir,—I have read your article, "Under London," in "The Asclepiad," with that interest and attention which not only the importance of the subject must command from sanitarians in general, but also with that desire which is possessed by myself, in common with most municipal engineers, to advance the present system of removing the refuse of great cities, and to bring the practice of that removal nearer the ideal of the more advanced professors of preventive medicine, of which you may be deemed the foremost.

You will pardon me, if the remarks which I presume to make on your paper, are prefaced with a dilution upon the inferential conclusions drawn from the statement, that engineers trespass upon the work of doctors of health.

A knowledge of the facts as they exist in provincial towns enables me to draw different conclusions to those you appear to hold on this subject. If you take those great centres of population, where the doctors of health have as complete a knowledge of preventive medicine as can yet be obtained, you will find that, so far from the engineer having strayed over the border of his own professional area into that of preventive medicine, too often the reverse has been the case.

No doubt, there are examples of municipal engineers undertaking work which properly belongs to the municipal doctor, but this interference on both sides depends very largely upon individuals. Nor must it be forgotten that while the Borough Engineer has had an existence of nearly half a century, the creation of the Medical Officer of Health is comparatively recent. In the latter's absence, the municipal engineer was, from the very exigencies of the case, compelled to intermix some of the well-

known facts and theories of preventive medicine with those of engineering, in public reports, in order to prove the necessity of sanitary works to those who governed, and who too often were special pleaders for the *status quo ante*.

It is not to be wondered at, that with that deference and admiration which high attainments must command from all thoughtful men, and which brethren of appreciation, have been ungrudgingly given by engineers to many eminent men in your profession, who have brought the study of preventive medicine to its present standard, that it is no exaggeration to say more than seventy-five per cent. of those who have been called upon, often reluctantly, to fill the office of Doctor of Public Health, have not only had no technical knowledge of their work, but there was until lately, no literature out of which a knowledge could be built up; and while the medical schools continued to ignore the claims which this branch of the profession had upon them, it was by no means astonishing.

One may venture to think that such an interference as you describe is inborn of the practice of all sciences which are still in their infancy.

Probably had not the Doctor practised Sanitary Engineering and the Engineer practised Preventive Medicine, the pre-eminence of England,—such as it is,—in public health matters, would as yet be an unaccomplished fact,—certainly, it would have not attained anything like the standard of efficiency it has at the present time.

It may be that the time has now arrived when this practice of engineering by doctors and of doctoring by engineers, should cease, although an intimate acquaintance with a majority of the local officials of this country does not hold out the hope that this desirable consummation can yet be brought about, with advantage to the community. Indeed, it cannot be so until the State insists upon every doctor of health and every engineer of health proving fitness, by a test examination, of the necessary qualifications for their respective offices.

It would appear incredible, were it not demonstrated to every-day understanding incessantly, that men should be appointed to offices requiring special and complete knowledge in special and complete brains, without any test whatever as to their possession of even the elementary principles of such special knowledge, or of such special brains. No one would be accused of exaggeration by those who know, if they should be appointed to those offices, at the inception of their public employment were in the former case.

This statement is not made by way of reprisal,—it, alas! applies equally to my profession and your own. Municipal engineers would indeed be living in that metaphysical stratum a fool's paradise, in which they are accredited by the public, as the outcome of their work in the most practical of all the professions, if they made any attempt to place all their existing order on a high platform of efficiency.

We know too well how these appointments are made, and by whom, and how often sinister influences are brought to bear to secure the services of those who are miserably incompetent, so that their employers may have some excuse for ill payment, and we should raise a false issue if we declared that competent men now filled every office.

The will not, however, prevent us from seeing ourselves in a shade of light only a little darker than that in which others see us, and of endeavouring to raise the now much too low standard of efficiency in the rank and file of the municipal engineering army.

These remarks are intended to apply to provincial places and not to the metropolis. To many of us unfortunates provincials it is news to hear that there is any friction between the engineer and the health doctor of the overgrown and still-growing Babylon. In the first place, we were not aware that municipal government had reached such a high stage that there was any individual who had committed to his charge the task of directing the practice of preventive medicine for the metropolis; and if conflict there be between professors of public hygiene and engineers, it must be outside the charmed circle of chief officials. That there are great, grave, and deplorable defects in the administration of municipal engineering in London, we provincials are well aware, and that there is ample room for the complaint of doctors of health any wet week in London makes filthily apparent; and you may like to be advised that we do not set a higher value on the metropolitan sanitary engineers' work than it brings in the open market of public opinion.

Such a conflict as you assume is being waged between engineers and medical men in London is well understandable when it is remembered that London has in reality no municipal government,—that is, no municipal government as it is meant by that term in the provinces. It would be strange, indeed, if there was not conflict of opinion, eye, and conflict of practice, between officials themselves, and between officials and outsiders in such a disintegrated, hotch-potch medley of government as misrules London.

Looking the question apart from local considerations there now exist, except in the isolated cases named, no reasons why Captain Engineer and Captain Doctor should not each sail his own ship on his own course. The line of demarcation between

Two Egyptian Chairs

the work of sub officials at all points is not very clearly defined,—but sufficiently so to keep each ship out of collision. It only requires that mutual forbearance between individuals, without which success cannot be attained in any walk of life. We believe, at all events, so far as the provinces are concerned, not only has the 'magnificent amendé' of which you speak, been made, but that as complete harmony prevails as is practicable where matters mundane are governed by erring humanity.

Brighton." E. B. ELLICE-CLARK.

Dr. Richardson's article is well worthy of perusal by all municipal engineers. "The Asclepiad" is published by Longmans.

TWO EGYPTIAN CHAIRS.

THESE two chairs, which are in the British Museum, are here reproduced from drawings by Mr. J. H. Eames. The larger one has a very purpose-like and remarkably modern appearance, and both, except the seat portion, are in wonderful preservation, considering their age.

THE FORTH BRIDGE.

SIR,—There is a correction of a personal nature in your otherwise very satisfactory notice of the Forth Bridge works in last week's issue [p. 10] which I should like to make. The name of my partner, Sir John Fowler, K.C.M.G. (now on his way to Australia in search of more sunny skies) should have preceded my own as chief engineer of the work.

B. BAKER.

Westminster, January 2, 1885.

QUANTITIES.

SIR,—It is impossible silently to pass over the anonymous letter from "A Suburban Builder," contained in your last issue [p. 64]. The items referred to are maliciously misquoted and understated, and, were it not for their misleading character, would have been passed over with the contempt they deserve. I may state that great stress was laid by the committee upon the tenders being in for the first week in January, so, owing to short time for preparation, abbreviation had to be adopted; still, the only part of the bill mentioned by your correspondent that exception might be taken to is the last, viz., the mitres to dado being omitted, and a glance at the drawings would suffice to explain their number. The latter are fully detailed and figured, and with the specification no competent builder need have any difficulty in thoroughly understanding the work in the minutest detail.

Answering the items in detail, the first has reference to facings; here "faces and soffit measured" has been tacked on to the real clause, to render it absurd, though it is borrowed from the following item, which reads, "rough arches, face, and soffit measured." The gables and ornamental work quoted are not in this item, as a glance at the elevations would show where they are distinctly written on as *terra cotta*, and a price allowed for the same at the end of the bricklayer's bill, of 70L, fixed complete.

The mason's bill is abbreviated. Your correspondent does not add, as the quantities state, that a tender has been received to execute the whole item fixed and cleaned down complete for 5s. per cubic foot, this being from a first class mason used to my work, and after a careful study of the drawings, it being at the option of the contractor to quote lower if so disposed, or leave this item at the figure stated.

The carpenter's bill is again misquoted. All the extra labour to roof timbers has been taken separately, as would be found on a proper study of the bill, and the curved ribs to principals are taken in superficial feet in an entirely separate item, likewise the turret; and surely the dado is sufficiently described for an intelligent joiner to estimate from, especially as it is fully detailed on the drawings.

HENRY A. CHEERS.

OWNERSHIP OF DRAWINGS AND SPECIFICATIONS.

SIR,—Having lately prepared for a client sketches of a house he proposed building, he approved of the sketches and had the working drawings and specifications completed, and got estimates for carrying out the work. Expense was never named, and after the offers were got, the cost was far in excess of what he was prepared to spend, and the work was abandoned.

A charge was made for the preparing of the sketches, working drawings, and specifications, which was taken exception to, and, after some correspondence, a compromise was effected,—as it was perfectly evident that no more could be got,—thus reducing the charge to considerably below the usual percentage.

The client now asks for the plans and specifications, three days after a discharge was given.

I shall be glad if any of your readers can inform me, through the medium of your valuable paper, (1) to whom do the sketches belong; (2) to whom do the working drawings and specification belong,—to the client or the architect?

SCOTLAND.

NON-ACCEPTANCE OF LOWEST TENDER.

SIR,—In your issue of the 2nd inst. (p. 64), I read that several of the first class builders in London are somewhat dissatisfied with the mode and matter with which their tenders are at times treated. Messrs. Rider & Son especially complain that although their tender was some 90L. below the next, yet they were not accepted on the grounds of the explanation given by the clients.

While sympathising to the utmost with the builders who are put to unnecessary loss of time and enormous expense, which must be the case in getting out the cost of these large jobs, yet I have often felt how the various branches of the trade which the builders have to deal with are treated, as compared to the builders themselves.

What I specially mean to call the attention of your readers, and especially of the builders themselves, to, is that when manufacturers are invited to estimate for their goods along with probably a dozen or twenty competitors in the same line of business, they very rarely have any other satisfaction than that of spending quite as much of our valuable time and incurring quite as much expense as the builders themselves do.

While admitting that the builders are probably

overtaxed by letters from the manufacturers hacking up their estimates and asking for the order in a variety of different ways, and likewise their representatives waiting upon them with a desire to secure the order, yet my opinion is that they have themselves to blame for thus allowing themselves to be so troubled.

There are many who issue post-cards or circular letters, thanking the manufacturers for having quoted, and regretting at not being able to accept their tenders. This, as a rule, ends the matter so far as the builder is concerned. But the manufacturer is quite as anxious to know who his competitors are, and at what prices the order has been accepted, so that they may go into the matter with a view of finding out wherein the discrepancies are; but, unfortunately for the manufacturers, the builders will never tell them the one thing nor the other, so that the builders themselves are on a better footing than the manufacturers; and I should just like to get this question answered by some of the builders themselves as to why they should object to send a list of the tenders to the manufacturers in the same open way in which they are dealt with by the architects. I do not go into the detail of the fairness or unfairness of your correspondents in any particular case, as I know there are architects and architects, as there are builders and builders; but we are now dealing with those builders who are worthy of the name, and not with what are termed the jerry-builders of London.

At one of the recent dinners of the Clerks' Benevolent Institution a very worthy man made a speech to the effect "that if the merchants that were present that evening would take his advice and only supply goods to the respectable builders of London, and figure the jerry-builders, their masters (meaning the respectable builders of London) would not only make more profit, but that they, as builders' clerks, would most probably be in the receipt of higher wages," &c. This I considered a very sensible speech, and one which a merchant could but endorse; if the respectable builders of London would not encourage merchants whom we have an equal right to term jerry-merchants.

R.

THE LONDON PAVILION MUSIC-HALL.

SIR,—In your description of the London Pavilion you state that the lifts are fitted by Messrs. Goddard & Co., of High-street, Peckham. This is an error, as we supplied the lifts in the Pavilion proper.

R. WAYGOOD & Co.

TIMBER MEASUREMENTS.

SIR,—In reference to the letter on this subject in your last [p. 64], the principle upon which the calculations of the sliding scale and timber measurers' tables are given appears to be as follows.

If the sectional area of a piece of square timber be 4 ft. superficial, each side will be 2 ft. across, and a cord meeting round it 8 ft. long, of which the side or parallel diameter is one-fourth, and the cord twice doubled would give the side from which to obtain the area.

It is clear that a circular piece of timber of the same diameter must have a less sectional area than the square one, from the loss of the corners. To ascertain the difference, the practical measurer assumes that a cord applied to a circular piece of timber will, as with a square piece when twice doubled, give the proper side (quarter-girth it is called) from which the area, and thence the cubic content, is to be derived.*

Thus, in the case in question by your correspondent, J. Wardale, the length being 15 ft. and the quarter-girth 2.25 ft., which squared gives 5.0625 ft. as the sectional area, the cubic content of the piece comes out 75.9375 ft., or, in "Hoppus," 75' 11" 3" (15' x 5.0625 = 75.9375 ft.).

GODALMING.

SIR,—Since writing last week, I have looked through the preface to Hoppus's "Measurer,"—one which I am told is well used,—and I find there that he published his tables partly to correct the errors of existing tables; e.g., he says, "In Keay's tables this erroneous rule is given for measuring unequal-sided timber or stone: add the two sides together and take the half thereof for the true square, or take a fourth of the girt of the four sides." His observation on this is, "a greater fallacy could scarcely be asserted."

He is quite right. But after this censure of Keay, one is surprised to find his own direction for measuring round timber,—"With a line gird the piece in any place, then double the line twice, and you have one-fourth of the girt for the side of the square," i.e., the square which is equal to the cross section of the piece of timber.

Surely, Mr. Keay might cry out at this, "Shall the blind correct the blind?" Why, to say that one-fourth of the circumference of a circle is the side of

* Then the practical measurer is a blockhead, as so-called "practical" men often are. But see Mr. Wardale's letter following.—Ed.

Ancient Chest, St. John's Church, Glastonbury.

the square, whose area is equal to that of the circle, is as great a fallacy as that of poor Mr. Keay!

In fact, he has exposed Mr. Keay's error, and fallen into as bad a one himself.

The error is a palpable one to any one possessing the smallest knowledge of mensuration.

And yet timber sellers have gone on for the last eighty years selling 100 ft. of timber as if it were 86 ft.

J. WARDALE.

CHURCH-BUILDING NEWS.

York Town (Surrey).—York Town Church has just received an internal addition in the shape of a new vestry screen in carved English oak. It is in the Early English style, and has ornamental moulded panels in its lower part, whilst surmounting the transoms there are arcades of nine bays, above which is pierced tracery. A bold cornice, with pattern in the hollows, carved in the solid, surmounts the whole. There is a door in the centre: the door furniture is of wrought iron. This screen has been designed by Mr. Arnold H. Hoole, architect, of London, and executed by Mr. Harry Hems, of Exeter.

Norwich.—From the *Norwich Argus* of the 26th ult. we learn that a new reredos of carved oak has just been erected in the well-known Church of St. Peter Mancroft, at an entire cost of nearly 1,000l. This reredos is of the entire width of the sanctuary (that is to say, nearly 18 ft.), and in height it is 16 ft. The work, which is Perpendicular in style, consists in the main of two series of niches, one above the other. There are nineteen of these niches on the top tier, but there are a lesser number underneath, as the two doors that lead into the eastern vestry are also incorporated in the design. The ancient doors have been retained and embraced in the new design, and with steps of polished Devonshire marble, and groined and canopied heads, now form good features. The niches are all groined, and take an ogee line. They are richly moulded and carved. The reredos has a bold cornice running from north to south, surmounted by a pierced and carved cresting. At intervals crocketed pinnacles rise above this, but otherwise it is continued across in an unbroken line. It is stated to be the intention to fill all the niches with sculpture, but at present only some of these statues are in place; others, however, are in hand. Mr. John P. Seddon, architect, of London, designed the reredos, and the carrying out of the work was entrusted to Mr. Harry Hems, of Exeter.

The Student's Column.

FOUNDATIONS.—II.

MADE GROUND.

EARTHY material that has been deposited by human hands is commonly known as "made ground." We may include under this general heading all kinds of materials that are met with above the natural virgin soil.

Town Sites of any antiquity are always covered, more or less, with the rubbish of former buildings and the refuse of houses and workshops. In the City of London the original clay and gravel are covered up with soil containing in its lowest parts remains of Roman occupation. Above this is found Medieval and finally modern refuse, rising to a height of some 18 ft. in the oldest parts of the City. Until streets were properly paved and regularly cleansed, the hard materials thrown from the

houses, together with the stone used in repairs of the roadways, were continually raising their level. It has been roughly estimated that the City has risen one foot for every century of its occupation. Ashes and charred woodwork form a large part of the material found under the houses. The upper portion of this made-ground,—that which is immediately beneath the walls of the buildings,—is generally dry and tolerably firm, having become compressed by their weight. The lower portion below the level of the sewers is wet, soft, and unsound. On the site of the Old Wallbrook, where the mud and rubbish brought down by the stream underlie the refuse of the town, it has been necessary to go down 45 ft. in order to get a firm foundation for an important building.

On the outskirts of a town all hollow places, such as old brickfields, places from which sand and gravel have been dug, and natural depressions of the soil, have been used as rubbish-shoots, and are filled up with town refuse, consisting partly of vegetable matter. In some parts of Finchbury there is a depth of 22 ft. of such ground. Refuse-heaps from mines and manufactories reach greater heights and fill up deep valleys, acquiring in time, and aided by the percolation of water, a degree of solidity according to the nature of the material.

Whether the soil in which a foundation has to be obtained is natural, or the result of such operations as have been described, it is the business of the architect to form in the first place some approximate idea of the work that will be required, having regard to the nature of his building, and to the means at his command. When the work is begun he has to watch the excavations so as to determine the depth to which it is necessary to go, and the modifications that may be required in his original ideas in order to meet the ascertained nature of the ground. The object is to get, if possible, an unyielding foundation, but, as that is seldom obtainable in the strict sense, he will be satisfied if the settlement of the ground below the building is so small as to be imperceptible. Even if the settlement is so great as to be distinctly measurable it may be of no consequence if it is uniform over the whole area of the site. Nevertheless, in towns where buildings adjoin each other, and indeed have party walls in common, it is necessary to take such measures as shall prevent any perceptible settlement, and the mischief to which it would give rise.

EXAMINATION OF THE SITE.

The first notion of the nature of the subsoil of a site will generally be gathered from those who are acquainted with the locality. A builder will have a good knowledge of the soils in his district. An excavator will have a very special knowledge of the soils in which he is accustomed to dig. It is a mistake to neglect this experience which is ready to hand. Nevertheless in cases of any importance one or more trial-holes, according to the extent of the building, or the uncertain nature of the soil, should be dug to the depth of 4 ft. or 5 ft. In ordinary cases, where no underground basement or cellar is required. Below the bottom of the trial-hole the ground may be further examined by means of an ordinary pickaxe,—still better, by a large crowbar. If it is desired to extend the examinations several feet through a doubtful soil, a long, thin, round iron rod, with a large ring handle formed on its upper end, will be

found most useful. The use of such implements by one whose hand has acquired some delicacy of perception by practice will give pretty clear indication of any changes in the character of the soil as they penetrate with more or less resistance into the ground. On carefully drawing up the bar or rod, we can judge by the dirt or dust adhering to the point whether it has been in contact with such matters as brick rubbish, chalk, gravel, or clay. However valuable such examinations may be, they can only be of their full value to the person who actually makes them. To one who is accustomed to "ground work," the sensation experienced on dropping down on the feet to the bottom of a trial-hole or trench will tell whether the ground is loose, or sodden, or firm. For deeper investigations than such as can be made by hand, the apparatus used for boring will show the nature of the subsoil, foot by foot, to any required depth. If a well has to be made, and this is often necessary before deciding whether a house shall be built on a particular spot, all the information that is required may be got by that means. The natural level of the water in the ground will be ascertained at the same time, and it is important to know whether the foundation will be in tolerably dry earth or in a wet, pervious soil, which will cause some trouble in the excavations. But, whatever may be the nature and the extent of such preliminary trials, it is well, especially in the made ground of a town site, to be prepared for the contingency of a worse soil being found than these partial examinations indicate. The provision in a contract of as much additional excavation and concrete as can reasonably be thought prudent, will prevent the embarrassment which would otherwise be felt on the sudden discovery of unsatisfactory soil when the excavations are being made.

SOILS THAT ARE BAD AS FOUNDATIONS.

We have seen that such subsoils as rock and compact gravel form the best natural foundation, requiring only to be properly levelled to receive the footings of a wall. All other subsoils may be considered unsatisfactory in a greater or less degree. In follows:—
1. **Soils that are simply compressed** by a heavy load becoming firm when the full load has been put upon them. Made ground that has not become thoroughly consolidated generally yields in this way, particularly if the materials of which it is composed are soft or loosely packed or full of water that is driven out by pressure. The top soil of all ordinary sites will also yield in this way owing to the disturbing operations to which it has been subjected; but, as a rule, the virgin soil, deposited by water in its present position, does not compress very materially.

2. **Soils that squeeze out** under a load, escaping like a paste or thick fluid. Clay,—besides its liability to swell with moisture and to contract from dryness,—will squeeze out in this way when it is wet. When the wall of an ordinary building has its footings deep in compact clay unaffected by water no mischief may result, but if the clay becomes wet it will be forced aside from the part immediately under the wall and the projecting footways will be broken or tilted up, so as to become useless for their purpose. A soil that consists of wet silt or mud may be so soft as to be incapable of bearing a wall, which will, therefore, sink while the soil which it displaces is forced up so as to raise the surface of the ground adjacent to it.

3. **Soils of irregular composition** along the course of the same wall. Where the natural soil suddenly changes, owing to beds of different materials cropping up to the surface where a site extends from higher ground down to the margin of a stream, and where the ordinary variations of made ground exist, this kind of foundation has to be dealt with. Upon an old building site such irregularities have to be specially apprehended.

Manchester Architectural Association.

The last general meeting of this Association was held on the 5th inst. at the Diocesan Buildings, Mr. L. Booth (President) in the chair. Mr. J. Spencer Hodgson (Vice-President) read a paper on "Architectural Ethnography," to which we may return. A discussion followed, in which Messrs. Meo, Talbot, and the chairman took part.

Books.

Architecture, especially in Relation to our Parish Churches. By the Rev. H. H. BISHOP, M.A. London: Society for Promoting Christian Knowledge.

The illustrations were equal to the text this would be a very good book, for it is well written and shows something more than a superficial acquaintance with the subject. But the woodcuts have not been made for the work, and consequently do not fit it. Many of them are of very indifferent quality indeed. We renew a long-severed acquaintance with many of Birket Foster's charming drawings, and have nothing but admiration for them as pictures, worn to death as many of them evidently are. But as elucidations of our native ecclesiastical art they are of but little value. Indeed, the pictorial side of that art has been kept almost exclusively in view: there is not a single plan, nor any deliberate effort to deal with the interior arrangements of our parish churches, and the changes which they have undergone to adapt them to a changing ritual. The (probably) Roman Church at Brixworth is described, but not illustrated, nor is the well-known church of St. Martin at Canterbury, nor the more remarkable church in Dover Castle, while many of the very numerous illustrations illustrate nothing in particular. This is annoying, because the book deserves a few specially-prepared drawings, and a few would make what is now, at least, obscure to the general reader, fairly intelligible. A table of the names of the several periods and their dates should be added, and a glossary would be an improvement. The author has evidently imbued himself with the spirit of Ruskin, as the following extract *appropos* of thirteenth-century work will show. "It speaks clearly of work done by one who rejoiced in it, and delighted to see that it was good. And since the creation of the world no noble work has ever been done otherwise, or ever can be." And the following, whether original or not, shows the writer to have a firm grasp of the essentials of Gothic architecture. "Look at such a doorway as that of Adel Church, Yorkshire. How rude and irregular in its workmanship! You may find that no two points of its zig-zags are exactly of the same angle or of the same projection. Each is roughly worked out of its own separate stone, and takes its chance of being equal to the others. And as the stones happen to be of unequal width, so are the ornamental points upon them. This is why our modern attempts at Norman have failed; for the mason of the present day feels he 'cannot make it bad enough,' and it becomes ridiculous when measured out with modern compasses and worked to smoothness by modern tools." The above and similar passages show an insight not met with generally in popular works on art. The popular element in the book is perhaps its least satisfactory feature, and the various dissertations on the hearty and superiority of a particular phase of religious faith, and the implied shortcomings of other creeds, might have been omitted.

The enormous number of churches referred to in the course of the work,—many of them apparently personally examined by the author,—is surprising; and, in so far as we are able to test it, so is the general accuracy of his multitudinous descriptions. We are disposed to think that the dog-tooth ornament was elaborated from the earlier "nail-head," and not from the "fing down and undercutting of the Norman zig-zag, where the zig-zag points meet upon an edge"; but that is a detail.

On the whole, we are very favourably impressed with this little work; but we should like to see the mass of information which it contains as to the idiosyncrasies of our numerous parish churches systematised, and the over-worn woodcuts give place to some suitably-chosen and architecturally-drawn illustrations.

Easements and Rights of Light. By JOHN HOLDEN, F.R.I.B.A., F.S.I. Manchester. 1885.

This is the reprint of a paper read before the Manchester Architectural Society. It can scarcely be considered as an essay, it is simply a collection of some of the cases concerning the right to light with a few comments, and short-cut and analysed. So far as it goes the paper is well done, and may be of some use to architectural students who desire to form an idea of some of the leading cases in regard to the right

to light. It has, however, this drawback,—it has not the completeness of a regular legal collection of judicial decisions, nor the literary and professional interest of an essay on the easement of light. Nor are the cases classed under one particular head, or arranged in chronological order. The references also are extraordinarily erratic, being the first one and then another set of legal reports without any rule. The most that can be said of this paper is that such cases as are printed are accurately analysed.

The Queen Eleanor Memorial, Waltham Cross, with Historical Notices of "Ye olde Foure Swannes Hostellerie, A.D. 1266," and other Places of Interest in Cheshunt. By WILLIAM WINTERS, F.R. Hist. S. (Churchyard, Waltham Abbey).

As the season advances, we would strongly recommend those of our readers who want an object for their walk or ride to pay a visit to Cheshunt, and, under Mr. Winters's able guidance, inspect the beautiful Eleanor Cross (restored by Mr. C. E. Ponting), the Four Swans Inn (formerly the Manor House), and Waltham Abbey, with its numerous points of interest. Mr. Winters deserves much credit for the unsparing diligence with which his researches have been prosecuted, as well as for their happy result.

Über Antike Steinmetzzeichen. Fünf-und-vierzigstes Programm zum Winkelsmanns Feste der Archäologischen Gesellschaft zu Berlin von OTTO RICHTER, mit drei Tafeln. Berlin: Rurner. 1885.

DR. OTTO RICHTER does good service to the history, and more especially to the exact chronology of ancient architecture by his monograph on the "stonemasons' marks" of antiquity. The subject of these marks has, as regards classical masonry, received as yet far too little attention. Isolated instances have, indeed, been noted. More than fifty years ago Mazois, in his "Ruines de Pompei," published a series of Pompeian stonemasons' marks, and since then, from time to time, attention has been called to the marks on the masonry discovered at Samothrace, on the foundations of the Caserem at Alexandria, and especially to those on the Severian and Palatine walls at Rome. The recent discoveries by the Prussians at Pergamos and by Dr Schliemann at Troy have brought to light new "marks." A systematic treatment of these marks was much needed, and this want Dr. Richter supplies. He gives us an introductory chapter on the geographical distribution of these "stonemasons' marks"; then a detailed account of the marks found at Rome, Pompeii, Perugia, and Dyx; and, finally, a chapter on the origin and significance of these marks. Three beautiful lithographed plates give facsimiles of the marks *in situ* on the masonry, and some isolated instances. The monograph appears on the fifty-fourth "Programm" of the Winkelsmann anniversary at Berlin.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

5,542, Slate-grinding Machine. G. Walker. Working across the surface of a horizontal revolving table are two chains or sheets, one on each side of the centre line, and running over the chain wheels, whose spindles are carried in girders extending across the revolving table, and resting at their ends on a fixed platform. Loose rollers are provided for the purpose of giving additional pressure to the slates. There is also a trough for collecting the spent sand and water. The slates are passed on one after another between the chain and the revolving table, and are carried forward by contact with the former, the grinding being effected by sand and water. After having passed across the table once the slates are placed under the other chain, which runs in the opposite direction, and traverse the table a second time.

11,308, Railway and other Carriages. W. Wainwright.

Carriage bodies as usually constructed harbour dirt, and require frequent painting. The present invention is designed to obviate this. Panels are fixed to the framework of the body inside and outside the carriage are made of sheet metal, and coated externally with a surface of nickel or silver. The borders of the panels may be provided with metallic beads or mouldings. The door-pillars and frames may also be made of metal coated if desired. An additional advantage is obtained by the better diffusion of light from the bright surfaces in the interior of the carriage.

12,046, Setting off Angles and Distances. J. Hermann.

This instrument is used for setting off points whose relative positions have to be obtained very accurately. The work is clamped to a platform on a wheel divided into 360 teeth, carrying a collar divided into 360 teeth, and clamped to the wheel as required. The toothed wheel is free to turn on an arbor fixed to a platform attached to a V-slide so as to be capable of rectilinear motion, the extent of which is indicated on a scale. Some point is chosen as origin, and the work is then clamped, so that the centre spindle comes exactly over this point. Zero being shown on the various scales. By advancing the V-slide, and turning the toothed wheel according to the given co-ordinates of the points to be obtained, the work is moved into positions for the points to be marked by the centre spindle.

13,457, Staircase Treads, &c. J. Whately. Plastic indiarubber is placed in the perforations of a metal grating, and fixed in its place by vulcanising. It is generally most convenient to place two gratings one over the other, fill the interstices as described, and then remove the upper grating, which produces a mat or a tread suitable for stairs, halls, passages, &c.

NEW APPLICATIONS FOR PATENTS.

Dec. 24.—15,847, D. Howell, Improvement in Casement Window-stay.—15,856, J. S. Thompson and W. Thompson, Improvements in Slate or Glass Roofing.—15,860, H. Doulton, Improvements relating to the Joints of Stoneware Pipes.—15,868, F. Gandy and N. Frere, Improved Closet Pan Disinfectant.—15,870, W. Lea, Improved Hot-air Heating and Ventilating Stove.—15,877, J. Dejaiffe, Process and Apparatus for Dressing, Polishing, and Squaring Stone, &c.—15,880, E. Palmer, Improvements in Open Trough Water-closets and Urinals.

Dec. 28.—15,931, R. White, Improved Vacuum Blower for Stoves.—15,937, H. Ker, Improvements in the Preparation of Timber for Flooring and Match-boarding.

Dec. 29.—15,975, P. Nisbet, Improvements in Hand-boring or Drilling Tools for use in Quarries, &c.—15,997, E. Laporte, Ornamentation of Varnished Surfaces.

Dec. 30.—16,012, J. Keuljon and J. Conlong, Improvements in Water-closets.

Dec. 31.—16,065, G. Bishop, Improved Firebricks, &c.—16,069, J. Gorry, Improved False Grate for Kitchen and other Domestic Fire-grates.—16,076, B. Finch, Improved Sanitary Pipes and Joints for same.—16,080, E. Johnson, Open Grates and Stoves for Saving Fuel and Consuming Smoke.—16,090, J. Hunt, Improvements in the Method of Producing Wall-coverings, Roofing, &c.—16,096, H. Haddon, Improvements in the Construction of Terraces and Flat Roofs.

PROVISIONAL SPECIFICATIONS ACCEPTED.

13,757, C. Hollingrake and W. Stanfield, Improvements in Hot-water Apparatus for Domestic and similar purposes.—14,794, R. Anderson, Apparatus for Ascending Chimneys, &c.—15,991, W. Collins, Jointing Cast-iron or other Rain or other Water Gutters.—17,070, T. Ray, Method of Fixing Hollow Metal Bars, &c., in Ladders, Gratings, &c.—13,247, H. Headland, Improved Pot for Preventing Down-draught.—13,595, A. Brookes, Improvements in the Manufacture of Artificial Stones or Marbles.—13,741, D. Baker, Improved System and Construction of Ventilating Flues.—13,541, H. Ashley, Improvements in Cooking Stoves.—14,518, W. Ryan, Soldering Iron.—14,222, J. Taylor, Improvements in Saw Spindles.—14,253, C. Garlick, Improvements in the Construction of Stench-traps for Drains.—14,321, W. Hucklebridge, System of Glass Roofing.—14,457, E. Verity and Others, Improved Pivot and Weather-bar Arrangement for Swing and Reversible Windows, Doors, &c.—14,584, E. Wright, Improvements in Saws.—14,743, A. Howell, Sash Fastener.—14,760, G. Haydon, Escutcheons for the Keyholes of Street-door and other Locks.—14,825, E. Breunen, Improvements in Window-sash Fasteners.—15,214, J. Hancock, Ornamenting Surfaces in Imitation of Inlaid Woods.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

1,778, J. Tomlinson, Improvements in the Manufacture of Plaster or Cement.—1,862, J. Wilesmith, jun., Securing Door, Cupboard Knobs, &c., to their Spindles.—2,775, W. Donald, Manufacture of Refractory Materials, Bricks, &c.—5,188, A. Lake, Illuminating Combination Tiles.—13,205, E. Dredge, Improved Apparatus for Cutting Wood, &c.—14,518, J. Ward, Improvements in the Manufacture of Artificial Rock-work and Ground.—14,545, A. Benn, Improvements in Water closets.—2,469, J. Clifton and W. Eglin, Folding Seats and Tables.—2,751, S. Hurst, Sash Fasteners.—2,856, E. Collier, Attaching Knobs to Spindles.—3,458, G. Stephens, Improved Process for Ornamenting Glass.—4,014, F. Wiltsgrove, Stop or Bolt for preventing the further opening of Windows, Shutters, Sliding Doors, &c., when partially open.—13,689, W. Keller, Improvements in the Manufacture of Cement or Mortar.—13,958, Improvements in Kitchen or Room Fire Grates.—14,353, J. Peckover, Improvements in Stone Sawing Machines.—14,731, J. Murples, Improvements in Marking, Cutting, and Mortise Gauges.

MEETINGS.

FRIDAY, JANUARY 8.

University College.—Professor Newton, C.B., on "Greek Inscriptions." 4 p.m.—Professor Charles Graham on "Chemistry in its Relation to Engineering and Architecture." 3 p.m.

MONDAY, JANUARY 11.

Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Art in England." 1. 8 p.m.
 Surveyors' Institution.—Discussion on Mr. Wells's paper on "Farm Crops." 8 p.m.
 Inventors' Institute.—8 p.m.
 Leeds and Yorkshire Architectural Society.—Mr. W. M. Fawcett, F.S.A., on "Points in the History of Collegiate Buildings."

TUESDAY, JANUARY 12.

Institution of Civil Engineers.—Mr. F. J. Rowan on "Gas-Producing." 8 p.m.
 Society of Biblical Archaeology.—Anniversary meeting. 8 p.m.

WEDNESDAY, JANUARY 13.

Society of Arts.—Mr. W. H. Ablett on "Museums for Trade Patents." 8 p.m.
 Civil and Mechanical Engineers' Society.—General meeting. 7 p.m.
 Liverpool Engineering Society.—Mr. A. J. Maginon on "A Strange Failure on Steel Boilers." 8 p.m.
 Institution of Civil Engineers of Ireland (Dublin).—Mr. James O'way on "The Port and Harbour of Waterford." 8 p.m.

THURSDAY, JANUARY 14.

Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Art in England." 11. 8 p.m.
 Society of Antiquaries.—8.30 p.m.

FRIDAY, JANUARY 15.

Architectural Association.—Mr. Lewis F. Day on "Stained Glass." 7.30 p.m.
 Society of Medical Officers of Health.—Dr. Swete on "The Suction of Sewer-gas into the Water-supply, a fertile Cause of Enteric Fever." 8 p.m.
 Institution of Civil Engineers (Students' Meeting).—Mr. R. E. von Lenzke on "The Graphic Method of Determining the Flow of Water in Pipes." 7.30 p.m.

Miscellanea.

Associated Carpenters and Joiners of Scotland.—During the present week a conference of delegates connected with the Associated Carpenters and Joiners of Scotland has been held in Glasgow. The delegates, who number over a dozen, were gathered from centres as widely apart as the north of Scotland and the south of England. In the United Kingdom there are 101 branches of the Society, 91 being in Scotland, nine in England, and one in Ireland. The membership on the rolls at the end of the past year showed an aggregate of 4,534. During that period the income amounted to 5,988*s.* 12*s.* 11*d.*, and the expenditure to 6,260*s.* 15*s.* 10*d.* In spite of the demand thus made upon the funds, the assets still ran up to 8,720*s.* 12*s.* 2*d.* The conference has had in view the revision of the rules, and this involves some important matters, such as the vexed question of out-of-work benefit. On the occasion of the preceding conference, held six years ago, when, as now, trade was greatly depressed, the vote against the scheme was decisive, being almost two to one.

Inland Navigation in Siberia.—M. Sibirskioff, the enterprising St. Petersburg merchant, who, in conjunction with Professor Nordenskiöld, had for several years past been making efforts to open a shipping trade with the coasts of Asia on the Arctic Ocean, has at length been compelled to abandon the project in its original form. The experiences of the last two seasons have induced him to substitute, in place of the sea route, another method of reaching the chief rivers of Siberia. He has projected a canal, which is now under construction, with a view to connect the two rivers Obi and Yenisei, whilst other preparations on an extensive scale are proceeding upon the Angara, in order to render navigation practicable from the two stations on Lake Baikal and the Yenisei. If these plans can be carried out, they will enable various kinds of produce to be conveyed by water throughout Siberia, the Lena being already in communication with Lake Baikal. Thus, the total distance which it will be necessary to traverse by land between St. Petersburg and the Obi will only be 170 versts, or 112 miles. It may be added that in connexion with this new commercial route preparations have already been made for the cutting of a road from Petchora right across the Ural Mountains to the river Obi.

Greek Archaeology.—At University College, London, Professor Newton will deliver in the Second Term a course of three lectures on Greek inscriptions, followed by three on Greek Myths illustrated by Fictile Vases and other Monuments. The dates of the lectures are Jan. 5th, Jan. 22nd, Feb. 5th, Feb. 19th, March 5th, and March 19th.

Water Supply of Walton-le-Dale, near Preston, Lancashire.—At the monthly meeting of the Walton-le-Dale Local Board, held on Monday last, the 4th inst., a report upon the progress of the new works of water supply was presented by the engineer, Mr. William Wrennall, of Liverpool. From it we learn that the branch heading, which was yielding water at the face, has been continued during the past month; and the work all through has proved to be very successful in procuring water. This heading has now been cut to a length of 105 ft. from the main heading, the last 68 ft. having been driven during the past month. The cutting is in a direction parallel to the large fault which crosses the main heading, and follows close to it all the way. The rock roof of the cutting terminates at the fault, and as the dip of the strata is towards the fault, the heading is in the favourable position to receive, as it is continued, all the water which the rock contains. The strata has been mostly wet, and in places some large streams of water have been tapped, which have added very considerably to the total yield. The quantity pumped at the present time is about 190,000 gallons per day, as against 145,000 gallons per day reported last month. There is also every probability, from the knowledge now acquired of the favourable position of the present cutting, that further water may be procured as the heading is continued to be extended. The total length of headings cut up to the present time is 220 yards. We are informed that the Local Board constructed works of water-supply to their district some four years ago. The pumping station is situated in the adjoining township of Brindle. A well 8 ft. in diameter, was sunk to a depth of 110 ft., and a bore-hole was continued from the bottom of it down to a total depth of 537 ft. from the surface. The yield from these two sources was, however, found to be considerably less than had been anticipated, and after some two or three years' pumping the supply proved to be quite inadequate for the then requirements of the district, and especially during the late dry seasons. Under these circumstances, the Board some twelve months ago called in Mr. Wrennall, to advise them in the matter, and under his direction the works are now being carried out.

Works on Mediæval Costume, &c.—Mr. Bernard Quaritch, of Piccadilly, sends us a list of works on Mediæval costume, illuminated ornaments, antique alphabets, furniture, ancient arms and armour, and architecture, by Messrs. Henry Shaw, F.S.A., Joseph Strutt, J. R. Planché, Sir S. B. Meyrick, and other writers. The list will appear in our next issue.

Iron, Hardware, and Metal Trades' Pension Society.—The thirtieth annual hall of the Iron, Hardware, and Metal Trades' Pension Society will take place at Willis's Rooms, early in February, under the presidency of Mr. Jonathan Pearson, a member of the firm of R. H. & J. Pearson, of London.

Royal School of Mines.—Prof. Warrington Smyth, F.R.S., in resuming his lectures upon mining in the Lecture Theatre of the Geological Museum, Jernyn-street, commented upon the importance of a thorough knowledge of geology in all cases where the discovery of mineral is the object in view. Practical knowledge holds good only so far as certain districts are concerned, and if such knowledge only is brought to bear upon other localities, very grievous mistakes, and consequent waste of capital, are always likely to ensue; indeed, it would be easy to point to recent cases where the prejudices of miners in this respect has led to such results. The only means to obviate possibilities of this kind is to familiarise ourselves with the recognised laws laid down by geologists, and to study the various conditions under which deposits are met with in the field. In cases where coal is the object of search, the miner too frequently presumes that a certain district will produce coal because the soil consists of a coaly clay, or because limestone and sandstone exist in the immediate neighbourhood, or because the wells and springs deposit a quantity of ferruginous matter. These appearances all accompany the occurrence of coal, but not always. The evolution of carburetted hydrogen or fire-damp from the surface of the ground often leads to unfortunate conclusions. Such evolution occurs in large volumes sometimes, so that it affords artificial light or heat, as in the case of the fire-wells in China, and again in Hungary, where the main galleries in some of the mines are lighted by the carburetted hydrogen so

derived. But cases are not infrequent where the evolution of this gas does not proceed directly from coal, as from some of the later formations in which the Americans have sunk bore-holes and wells for the purpose of extracting petroleum. Again, in the case of salt, where the occurrence of salt springs is supposed to indicate the presence of salt; but this is not true, as in sinking through the sandstone of the coal-measures, the water is found to be notably salt. A knowledge of the geology of the subject may often meet all these objections in so far as it affords the necessary information requisite for a clear conception of the origin of phenomena which may exist under certain conditions, but which are not exclusively confined to such.

A Remarkable Factory Chimney.—The Mechernich Lead Works, near Cologne, have now a chimney of the following dimensions:—

	Fe. In.
Depth of foundations.....	11 6
Length of each of the four sides of ditto.....	36 1
Height of basement.....	31 10
External diameter at base.....	24 7
External diameter at top.....	11 6
Internal diameter.....	9 10
Height of column alone (of round form).....	397
Total height.....	441 7

This chimney occupied rather more than a year in construction.

Hull.—An orphan asylum at Hull is now almost completed, the architects for the work being Messrs. Smith & Brodrick, of Hull. Wood block flooring is being laid by Messrs. Geary & Walker, of Manchester, on their patent system.

Partnership.—Mr. Sidney Young and Mr. W. B. Brown, who have for several years occupied joint offices at No. 5, Henrietta-street, Covent-garden, have recently entered into partnership.

The Surveyors' Institution.—The Students' Preliminary Examination, 1886, will be held at the Institution on the 19th and 20th of January, commencing at ten o'clock each day.

Newcastle-on-Tyne.—A new Wesleyan Chapel has recently been opened at Byker. It has been built as a substitute for an older chapel in Shields-road, Byker, which has proved too small, and, like it, will be known as the "Bainbridge Memorial." The new chapel has sittings for 300 adults, capable of being increased upon occasion to upwards of 1,000. There is a lecture hall adjoining, which will accommodate from 300 to 350 persons, and there are five vestries or classrooms allocated to various purposes, also a ladies' cloak-room, lavatory, &c. In plan the chapel consists of a nave with side aisles and shallow transepts, the extreme internal dimensions being 98 ft. by 55 ft. 6 in. by 40 ft. high. There are galleries all round the interior, that for the choir and organ being behind the platform in an apsidal recess. The edifice is built of stone in the Early English style of Gothic architecture, and has a handsome tower at the north-east angle rising to a height of 90 ft. from the ground. The internal fittings are of pitch-pine. The general contractors are Messrs. Greason & Stockdale, of Gateshead, who executed the carpenters' and joiners' work, and entrusted the masons' work to Mr. T. H. Hutchinson, and the ironwork to Messrs. Bainbridge & Crimson, also of Gateshead; the lead glaziers' work to the Gateshead Slate and Glass Company; the slating to Mr. John Hewitson; the plastering to Mr. Thomas Wallis; the plumbing to Mr. R. Herron; and the ordinary glazing, painting, and varnishing to Messrs. A. Robertson & Son, all of Newcastle. The gas-fittings have been supplied by Messrs. T. Thomson & Co., of Manchester; the lecture-hall seats by the North of England School Furnishing Company; the lighting conductor by Messrs. Henry Walker & Son, of Newcastle; and the warming and ventilating apparatus by Messrs. Dinning & Cooke, of Newcastle. The buildings are warmed by hot water on the low-pressure system, arrangements being made for the admission of fresh air warmed by passing over coils of pipes, while the tower is utilised for ventilation, and forms a powerful extracting shaft for the vitiated air, tests by the anemometer showing that the air inside the chapel is changed three times an hour. The clerk of works is Mr. James Grant, and the architects are Messrs. Oswald & Son, of Newcastle, whose design were selected in competition, and under whose personal supervision the whole of the work have been carried out, the total cost, including site, being about 6,300*l.*

An Old Publishing House.—On Saturday afternoon a party of guests inspected the new building which has been erected at the corner of St. Paul's Churchyard and Ludgate-hill, for Messrs. Griffith, Farran, & Co., successors to John Newbery, who published the "Vicar of Wakefield" for Oliver Goldsmith, the house being known in those days as "The Bible and Sun."

Table with columns: TIMEER (continued), £. s. d., and £. s. d. listing various building materials and their prices.

Table with columns: METALS, £. s. d., and £. s. d. listing various metal products and their prices.

Table with columns: PRICES CURRENT OF MATERIALS, TIMEER, £. s. d., and £. s. d. listing various materials and their prices.

Table with columns: OILS, £. s. d., and £. s. d. listing various oil products and their prices.

TENDERS.

Table listing tenders for Bethnal Green school, including names like F. Sargeant, F. & F. J. Wood, and others with their respective amounts.

Table listing tenders for Bethnal Green shops, including names like Higgs, S. Pritchard, and others.

Table listing tenders for Burgess Hill, including names like J. E. Barnes, W. Bryant, and others.

Table listing tenders for Christchurch, including names like G. Strickland, S. White, and others.

Table listing tenders for Faversham, including names like G. Dawson, Deane & Son, and others.

Table listing tenders for Gamston, including names like J. Robertson, Lyman & Kild, and others.

Table listing tenders for Gravesend, including names like Elake, Nightingale & Sons, and others.

Table listing tenders for Hull, including names like Samuel Musgrave, Jackson & Son, and others.

Table listing tenders for Islington, including names like Godden, Straines & Son, and others.

COMPETITIONS AND CONTRACTS.

Epitome of Advertisements in this Number.

COMPETITIONS.

Table listing competitions with columns: Nature of Work, By whom required, Premium, Designs to be delivered, and Page.

CONTRACTS.

Table listing contracts with columns: Nature of Work, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, and Page.

KING'S LYNN.—For the erection of new hotel and stables, at South Lynn, for Messrs. Eyre & Co. Mr. D. Clack, architect:—
 W. Jarvis £1,043 0 0
 R. Dyer 980 0 0
 R. Fayers 973 0 0
 Barden Bros. 968 0 0
 W. H. Brown 938 0 0
 J. Leach (accepted) .. 938 0 0
 P. H. Dawes 925 0 0
 [All of King's Lynn.]

LEWISHAM.—For enlargement of the schools, Lewisham Bridge, for the School Board for London. Mr. T. J. Bailey, architect:—
 Godfrey & Son £2,278 0 0
 Stephenson 2,169 0 0
 H. L. Holloway 2,125 0 0
 E. C. Howell & Son 2,096 0 0
 Lacey Bros. 2,089 0 0
 F. & F. J. Wood 2,080 0 0
 T. Oldrey 2,077 0 0
 W. Shurmer 2,070 0 0
 Patman & Fotheringham 2,170 0 0
 Wall Bros. 2,659 0 0
 Scriveners & Co. 2,069 0 0
 J. Crover & Son 2,063 0 0
 Atherton & Latta 2,049 0 0
 Kirk & Randall 2,036 0 0
 Stimpson & Co. 1,993 0 0
 J. R. Hunt 1,917 0 0
 W. Johnson 1,883 0 0
 S. J. Jerrard 1,883 0 0

LEWISHAM.—For the erection of new workroom for Mr. Ostro, Lee High-road, Kent. Mr. H. T. Bonner, architect, High-street, Lewisham:—
 Jerrard £556 0 0
 Robson 502 14 0
 Kennard Bros (accepted) .. 495 0 0

LONDON.—For erecting and completing St. George's House, Eastcheap. Mr. Delessa Joseph, architect, Basing-hall-street:—
 Perry & Co., Tredegar Works, Bow (accepted) £21,250 0 0

NORTHAMPTON.—For the erection of a new Wesleyan School Chapel, with wood block-flooring, Kingsley Park, Northampton. Mr. H. H. Dyer, architect:—
 Walls £869 0 0
 Jolly 789 0 0
 Mitchell 739 10 0
 Reynolds & Son 709 0 0
 Tresson 589 0 0
 Green Bros. 587 0 0
 Dunkley 585 0 0
 Woodford & Son 579 0 0
 Haurin 577 0 0
 Clayton Bros. 571 0 0
 G. Fisher 570 0 0
 Bassford 557 13 0
 G. White 557 0 0
 Hickman 553 0 0
 J. B. Clark 553 0 0
 Heap 545 10 0
 Sonater 524 0 0
 O. Tompkins (accepted) .. 472 10 0
 [All of Northampton.]

Vauxhall.—For casing iron work, at Barrett & Co.'s factory, Bond-street, Vauxhall, with concrete. Mr. E. Rawlings, architect, Victoria-street, Westminster. Quantities supplied:—
 F. Stant & Co. £2,385 0 0
 C. Drake & Co. 1,764 0 0
 Hitchens & Co. (accepted) .. 1,374 5 6

WORTHING.—For building mortuary for the Worthing Local Board. Mr. Walter Horne, architect and town surveyor, Worthing:—
 W. Staobridge £158 12 0
 Bridger & Son 120 0 0
 T. Stear 112 7 0
 A. Crouch 101 10 0
 T. H. Churcher 100 0 0
 Sweeney & Son 97 19 0

B. Cook & Co., Battersea (accepted)	2,842 0	3,090 0 0
W. Nicholls	—	2,860 0 0

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than Four p.m., on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

J. E. & W. A. J. P.—L. C. R.—L. T. G. K.—R. P. C. (not practical) would make matter worse as soon as the snow melts. J. O. (we doubt if any good purpose would be served by publishing your statement of expenditure in the matter.—W. H. T. (we do not know of any such publication).
 All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, but not necessarily for publication.
 We are compelled to decline pointing out books and giving addresses.
 NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
 We cannot undertake to return rejected communications.
 Letters or communications (beyond mere news items) which have been duplicated for other journals, are NOT DESIRED.
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other ordinary business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

THE INDEX and TITLE PAGE for Volume XLIX. (July to December, 1885) will be given as a supplement with our next Number.
A COLOURED TITLE PAGE may be had, gratis, on personal application at the Office.
CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also
READING CASES (cloth, with strings, to hold a Month's Numbers, price 2s. each); also
THE FORTY-NINTH VOLUME of "The Builder" (bound), price 12s. 6d. each, in Twelve Shillings and Sixpence, will be ready on the 13th inst.
SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.
SITUATIONS VACANT, PAINTERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.
 Six lines (about fifty words) of matter 4s. 6d.
 Each additional line (about ten words) 6s. 6d.
 Terms for Series of Trade Advertisements, also for special Advertisements on front page, Compositions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.
SITUATIONS WANTED.
 Four lines (about thirty words) of matter 5s. 6d.
 Each additional line (about ten words) 6s. 6d.
PREPARATION IS ABSOLUTELY NECESSARY.
 * * * * * Stamps must not be sent, but all small sums should be transmitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent Garden, W.C. to
DOUGLAS FOTHERBISH, Publisher.
 Addressed to No. 46, Catherine-street, W.C.
 Advertisements for the current week's issue must reach the Office before THREE O'CLOCK ON FRIDAY.
 The Publisher cannot be responsible for DRAWINGS, TESTS, and MONIALS, &c., left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same, must reach the Office before TEN O'CLOCK ON WEDNESDAY mornings.
PERSONS Advertising in "The Builder," may have Replies addressed to the office, 46, Catherine-street, Covent Garden, W.C., free of charge. Letters will be forwarded if addressed in envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.
 "THE BUILDER" is supplied punctum from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. Foreign, to all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOTHERBISH, Publisher, No. 46, Catherine-street, W.C.

The Late James Fergusson.

AMONG those names in the history of architecture which are memorable rather in connexion with the study and critical elucidation of the subject than for practical achievements in the

art, there are few more remarkable, few that will have left a more decided impress on the architectural thought and work of their own and of succeeding generations, than that of the clear-sighted student, historian, and critic whose death all architectural England is this week regretting. He was a brilliant representative of a class of intellect which finds its pleasure and its purpose in life not in practice, but in theory; not in carrying out actual work, but in drawing together all the information available in regard to the chosen line of study: in seeing and enabling others to see in what directions its boundaries can be extended, how its ideal can be heightened and perfected, and what are the lights which the history of the past sheds upon the problems of the present and future.

The place which Fergusson takes, and will, we think, long continue to hold, among those who have contributed to the elucidation of the subject which was his chief study, is almost unique. He is as important a writer on architecture in the modern world as Vitruvius was in the ancient world, but in a quite different sense. Vitruvius, though he was condemned by circumstances, and, perhaps, partly by his own idiosyncrasies of character (as hinted at by himself), to advise others rather than to make architecture of his own, was by education and learning a practical architect, more interested, in fact, in the practical than the artistic side of his profession, in regard to which latter his perceptions were not a little narrowed by mere scholastic pedantry. Fergusson always disavowed any claim to be an architect, in the strict sense of the word, and, in fact, understated his own perceptions and knowledge on practical points. But he possessed that power of taking a broad view of the whole subject, of perceiving the historic and aesthetic relations between architectural works widely separated in time and distance, which was the best possible qualification for the most important work which he has effected, the presentation of the history of the known architectural styles of the world in one comprehensive survey. Speaking not long since of architectural works for students, we mentioned this "History of Architecture"

as standing alone in the literature of the subject. There are theoretical works on the principles of architecture which are equally broad and comprehensive in their aesthetic view; but there is none which combines, with this breadth of perception and critical insight, the multifarious illustration and criticism of all the known styles of architecture. Such a work, of course, would have been impossible for any one except in modern days, when increased facilities of communication and increased means of producing and collecting architectural illustrations, from all parts of the world, enable a writer in his study to survey architecture "from India to Peru." But it would have been equally impossible, even with all these modern advantages, to produce such a work as this, not to mention the various other studies of special points into which Fergusson entered, without that dogged perseverance and persistence in labour, that "infinite capacity for taking pains," which has been sometimes described as the most essential element of genius. The list of works, besides the chief and central one, which Fergusson has left behind him, would be a tolerably long one even if they represented only so much good literary composition and thoughtful theorising. But considering that almost every one of them deals with some subject requiring special and laborious investigation to lay the basis of the conclusions arrived at, it will be recognised that there can have been few harder and more untiring workers than their author, among the men of this generation.

Fergusson was the second son of Mr. William Fergusson, M.D., who saw a good deal of service in the early part of the century as a military surgeon, became an Inspector-General of Military Hospitals, and appears to have held enlightened and advanced views, for his time, on many questions of military and civil hygiene, and wrote on such subjects with the terseness and perspicuity which are characteristic also of his son's writings on architecture. James Fergusson, who was educated at a school at Hounslow, was intended to be, and for a time became, a working partner in a mercantile house at Calcutta with which his family were connected. The ancient architecture of India, then almost unknown ground, attracted a great deal of his attention during his residence in the country, and he finally, having made some money in his business, gave his attention to the study of architecture. His first important work was his illustrated hook on the "Rock-temple of India," dedicated to the Royal Asiatic Society, and the result was a personal investigation and study of that remarkable and then little known series of monuments; a hook which at once threw a new light on the subject

(perhaps we need not say a "new" light, for, in fact, there was little or none before), with which his name has been ever since connected. In his preface to this work he remarks on the confusion of ideas which prevailed as to the date and the architectural classification of these monuments, which, by any who had referred to them at all, had been constantly connected with those of Egypt, although, in fact, there was little resemblance architecturally, and Egypt had almost ceased to exist as a country before these works of the Indian peninsula were executed. With his peculiar turn for method and classification, he set about investigating the special characteristics of these works, distinguishing the special architectural forms and the special objects which marked out one class of structure from another; and it is an early instance of his power of seizing on and bringing out the latest resemblances of the architecture of various styles and countries, that he from the first described the Buddhist Chaitya caves as the "churches" of the region, as distinguished from the monasteries (Vihara), and even described their various parts in terms borrowed from English ecclesiology. The whole of Fergusson's subsequent architectural work, especially the "History of Architecture," is full of these suggestive comparisons between types of building usually regarded as far remote from one another, architecturally as well as topographically; this power of seeing essential resemblances beneath accidental distinctions of detail, which often enabled him to throw such a vivid and unexpected light on the meaning and *motif* of an architectural monument. It was two years after this that the hook appeared which always remained his own favourite among his writings,—*"The True Principles of Beauty in Art,"*—a book which had absolutely no literary or commercial success whatever, and which has had, up to this day, we imagine, but few readers. It would have found a more congenial soil in France, or, perhaps, still more, in Germany. It is an exception among Fergusson's writings in being a work of pure thought, not of study; it is a metaphysical treatise, in fact, though not called by any such alarming title; and John Bull has never taken kindly to speculations of this kind. Burke's essay on the "Sublime and Beautiful," which had once a kind of success, would probably have not received so much notice had it not been for the fame which Burke subsequently gained in another department of intellectual effort, better understood of the people. Besides, Burke hardly attempted to teach anything on the subject, or to lay down serious propositions; he only speculated and reflected in well-turned periods. Fergusson set himself to lay down a complete theory of the relation of art

to science, expressed in formulated tables in which the various arts, from cooking up to poetry, were assigned their proper places in the scale of intellectual effort and intellectual pleasure. Whether any propositions on such a subject will ever gain universal acceptance or be regarded as scientific truths, may well be doubted; but the book is one which no thoughtful reader will go through without finding matter for most interesting reflection in it. What Fergusson considered the central point in it, the central point of his intellectual life, in fact, was the broad distinction which he laid down on it between art and science. "Science is knowledge of all nature does without man's intervention; art is knowledge of all those modifications that man works on nature's productions." The passage in which he describes the occurrence of this idea to him, and the effect which it had on his view of the whole subject of knowledge, is worth quoting here:—

"In early life my mercantile pursuits kept me too close to the desk to have time for society, and I having no taste for the ordinary amusements of my fellow-labourers, I sought my only distraction in reading. Like most young men, the science that charmed me most was metaphysics; but I read also a good deal of chemistry and geology; tried hard to understand crystallography; and puzzled my head with problems of mechanics and astronomy; in short, I thought my book on science my limited means would allow, and more with reference to the price than the contents, and, as was to be expected, soon read my head into a chaos, from which I vainly attempted to escape. I struggled long and hard to classify the ill-digested mass of incoherent facts with which my brain was filled, but for a long time in vain; till this division into sciences and arts broke upon me, and all became clear. It came upon me like a flash of lightning. From that time I never had any difficulty, however various my reading might be. Every new fact found at once its appropriate pigeon-hole in my brain;—nothing came amiss to me; and I am convinced that if I have two ideas more original or more worth recording than my neighbour, I owe it to the happy inspiration of that hour.

This idea once broached, I was not long in constructing tables to represent it, and these were substantially the same as those now offered. As my knowledge increased, I continued to improve them, of course; but I have never had cause to doubt the correctness of the principle or of the base on which they were originally constructed."

The appearance of the "Rock-cut Temples" in 1845 had been followed two years later by the beautifully illustrated work, entitled "Pictresque Illustrations of Ancient Architecture in Hindostan," which seems to have been intended to give a popular interest and illustration to a subject which he had previously treated in a manner more especially addressed to architects and archaeologists. It is an illustration of the activity of his mind, and the variety of subjects to which he gave his thoughts in earlier days, that in the same year as the publication of the "True Principles" he published a tolerably elaborate work on "A Proposed new System of Fortification," a subject in which he was much interested. In the same year, also, he read a paper before the Institute of Architects on "The History of the Pointed Arch," and published a small work, not much more than a pamphlet, on the British Museum, the National Gallery, and the Record Office, suggesting improvements in the planning, arrangement, and architectural design of those buildings, or, at least, showing where the architectural design might have been improved while yet there was time. His remarks on this part of the subject show that at this period he had already adopted those strong views as to the futility of expecting anything good to come out of mere architectural precedent, which he maintained throughout his life, and which are exhibited, with amusing directness, in this little book, as when he recommends that the forty-four columns should be removed from the British Museum "and be made use of to erect a peristyle temple in one of the parks."

The great work now known as the "History of Architecture" first appeared in 1855, as a two-volume hook under the title the "Handbook of Architecture." Even in this form it was a very large work, embracing an immense amount of research and labour, and a great success as supplying a form of text-book of the subject that was much wanted. But the

author soon perceived that more might be made of it, and ten years later it re-appeared in two much thicker and more fully-illustrated volumes as "The History of Architecture." The section on Indian architecture, as a subject on which the author had special knowledge, had occupied a rather disproportionately large space in the first edition; but this subject was now withdrawn altogether from the book, to re-appear in 1876 under the title of "History of Indian and Eastern Architecture," forming the third volume of the "History of Architecture." But previously to this, in 1862, another and remarkably interesting volume had appeared, the "History of Modern Architecture," which forms to all intents and purposes a fourth volume of the history. The division of subject here suggested is significant. Fergusson was the first to see clearly that since the days of the Renaissance, when architecture became an effort to reproduce the styles of former ages, or to work on their lines and suggestions, the art had entered on an entirely new phase, different from any which to our knowledge it had gone through before. He has succeeded in impressing this idea on his generation, so that it is now accepted as a commonplace and a matter of course by many who forget, or who never recognised, to whom they were indebted for it. Considering Fergusson's strong opinion as to the futility of architectural reproductions, his criticism on the productions of the modern period is singularly fair and well balanced. Recognising that the path taken by the architects of the modern era is essentially a false one from his point of view, he can, nevertheless, give full credit to the talent and partial originality of the architecture of this period, and do justice to genius though exhibited under what may be regarded as a mistaken system. What he does not seem to recognise is the comparative impossibility of reviving the old system and the old feeling. We are weighed now with a thousand precedents thrust upon us through our modern familiarity with styles of past ages and distant countries. We can never again work out our own original bent with the straightforward faith and ardour of those who knew no style but their own, and had no precedents and examples to disturb their singleness of aim.

We can only find space to mention the remainder of Fergusson's architectural works. An early production was his first essay on the "Topography of Jerusalem, with a Restored Plan of the Temple," published in 1847, a subject which was a favourite one with him always, and to which he returned in 1878 in his more elaborate work on the "Temples of the Jews." Of his views on the architecture of Solomon's Temple a good deal has just been said in Mr. Robins's interesting paper on the subject, the second portion of which is given in another column of this number. In 1851 appeared his work on "The Palaces of Nineveh and Persepolis Restored," and in 1862 a volume on the restoration of the Mausoleum at Halicarnassus. In 1872 he published a remarkably interesting work on the "Rude Stone Monuments" of the world, giving a comprehensive view of this subject as he had done of architecture in general in the "History"; this was followed in 1877 by a smaller work especially devoted to the consideration of the monuments of this kind in the Orkneys. In 1880 appeared a sumptuous work on the "Cave Temples of India," undertaken by him in conjunction with Mr. James Burgess, and illustrated from drawings made by the latter gentleman and his assistants during the progress of a survey in India. In 1883 appeared one of his most interesting works, "The Parthenon: an Essay on the Mode in which Light was introduced into the Temples of the Greeks and Romans," in which he summed up the reasons for his long-adopted opinion on this point, in favour of what may be called a "clearstory" method of lighting, by openings through the roof admitting light to a range of vertical windows; not skylights. Fergusson's views on this subject are well known among architects and archaeologists, and considering how little actual fact there is to go upon, he may be said to have established them with a probability which is next door

to certainty. His treatment of this subject is an admirable example of clear and logical reasoning.

Among the papers which Fergusson read before the Institute of Architects, and which are embodied in their Transactions, the following may be mentioned:—"The Architecture of Southern India" (January 7, 1850); "The Architecture of Nineveh" (March 10, 1851); "The Architectural Splendour of the City of Bejapore" (November 27, 1854); "The Great Dome of Sultan Mohammed's Tomb at Bejapore" (December 11, 1854); "Notes on the Site of the Holy Sepulchre" (1861); "A Mode in which Light was introduced into Greek Temples" (November 18, 1861); "The Erechtheum" (February 14, 1876); supplement to the same (June 23, 1879); "The Temple of Diana and the Hypoethrum of the Greeks" (January 22, 1877); and "The Temple of Diana at Ephesus" (June, 1883), the latter in relation to Mr. Wood's famous discovery. On many of these papers he bestowed a great amount of thought and care; they were often the first presentation of ideas to be subsequently worked out in a more detailed and elaborate manner; and the reading of some of them marked some memorable evening at the Institute.

There is no doubt that in one or two cases Fergusson's ingenuity in suggesting new solutions of perplexed problems in archaeology carried him a little too far; and his theses about the site of the true Constantinian Church of the Holy Sepulchre has certainly not proved itself, although the reasoning with which it was supported was so ingenious and interesting, as so admirably drawn out, that every one would regret not to have had it. In regard to this and some other of his favourite theories, I showed something of that defect which was attributed to Macaulay, and which seems indigenous with Scotchmen of ability, of being "too sure of everything," and once having formed a theory, he stuck to it through opposition, and conceded nothing to any or in some cases, however, this hard-headed persistence gained its end thoroughly, and opinions which were at first regarded as very questionable were finally carried by sheer dint of hammering at them till he drove them home to people. Another defect which may be mentioned in his critical dealing with architects is, curiously enough, of an exactly opposite nature to this; it is that of being too much of an enthusiast. If the judgments on remarkable buildings in history, with which the "History of Architecture" abounds, be compared, the reader will be surprised to find many different works of different periods have been desired to regard as superior to anything or almost anything else that had been done; the writer's enthusiasm for the object of his admiration at the moment carried him away, regardless of what he said in the same terms elsewhere about some of the buildings. This is a fault very easily pardoned; it certainly makes a book more pleasant to read than one in which he is always apt to hold the balance of a cold criticism. The adverse criticisms in the "History," the reason why this or that building is wholly or partially a failure, are always worth reading; even we differ from the author, he always sets thinking.

Fergusson's assiduity of study did not prevent him from giving much time to social life. His labours were carried on with unwearied punctuality during the earlier portion of his London day, up till about four in the afternoon. A few minutes only were allowed for lunch in the middle of the day, and with the exception the morning labours were regular and uninterrupted. Those who had the privilege of occasionally consulting him during working hours about some architectural question would find him there, seated in an admirably-arranged library, occupied over solution of some new point in archaeology, contriving a suggestion of his own for the means of carrying out some newly-proposed public improvement. From the cabinets placed about the room, photographs and drawing buildings and architectural details from all quarters of the earth were forthcoming, to

up or illustrate any point on which the visitor might ask for information, or adduce a theory of his own. Fergusson was, in fact, an eminently business-like man, and without this quality he could never have got through the work he did in the way he did it. During the period when he acted as architectural adviser to the Office of Works,—a position which for a short time held, until he found it was to degenerate into a merely nominal one, such as he could not consent to hold,—he spent much trouble in improving and refining on the official architecture. When, however, it was claimed in official quarters that a certain building, which was by no means admired, had been passed with his approval, he was careful to distinguish, and in a dry letter addressed to this journal he acknowledged that he had done his best to improve certain elevations which he had found already drawn out, and hoped he had succeeded, but what his real opinion on the design was, he added, "is known only to yours faithfully, Jas. Fergusson." We share in the regret that has been elsewhere expressed, that his remarkable combination of critical insight, business habits, and absolute honesty of purpose, were not more systematically utilised by the Government in obtaining advice and assistance about many projects on which they have often very much needed such advice. We believe it was mainly owing to him that the Wellington Monument was ever so far completed as now, when it wants only its crowning equestrian group; we are sure it was not owing to him that it was placed in its present absurd position. It was also, we believe, owing to his persistent opposition that the wild scheme of internally veneering St. Paul's with marble, with an accompaniment of mosaics in the Byzantine style, was never commenced; completed it never would have been under any circumstances.

Though, as we have said, deprecating any claim to be considered as an architect, Fergusson had one building carried out from his designs, the picture gallery for Miss North's paintings at Kew, which was very successful in fulfilling its aim, and in which his idea of the Greek method of temple-lighting was put into actual practice.

Fergusson died at the age of seventy-eight, an age which would hardly have been credited to him by those who knew his eagerness in the pursuit of every new architectural topic, and the general impression of vigour and mental energy which his measured but incisive conversation left on his hearer. He spent a long life of labour over a peculiarly fascinating subject, he has left a noble record of steady work behind him, and done much to lighten and direct the studies of many others in the same field.

SEWAGE PURIFICATION.

BY JOHN C. THRESH, D.S.C.(LOND.), F.C.S., ETC.

DURING the past twenty years an immense amount of time and money has been expended in devising and testing methods of sewage purification, and the results have been altogether out of proportion to the efforts. Most unfortunately much energy has been wasted by the unscientific researches of numerous experimenters leading them to erroneous conclusions, thus placing impediments in the path of progress. Men, who neither by training nor education are adapted to undertake original investigations, are to be found enthusiastically experimenting, perfectly at random, in the hope of ultimately being by a lucky accident the discoverer of a successful solution of this great sanitary problem. Such men are encouraged by the fact that no scheme is too absurd to obtain a trial; in fact, in certain quarters it appears to be a *sine quâ non* that a system must on the face of it be impracticable to ensure its being tried. So many promising plans when practically tested have been found wanting that corporations are to be found who will, as a forlorn hope, try anything, however preposterous. In many places heavy burdens have been placed upon the ratepayers in adopting systems of sewage purification which very

little investigation by an expert would have shown to be impracticable. In other cases, badly-devised experiments, only capable of giving fallacious results, have been undertaken and reports published which have proved eminently misleading and mischievous.

It is hopeless to expect that any one system of treating sewage by precipitation can be devised applicable alike for small and large towns, agricultural, mining, and manufacturing districts. Before any scheme is adopted it should be most carefully investigated as to its suitability for that particular locality; first of all in the sanitary laboratory of the town or district (and every town and district should have such a laboratory for the use of its officer of health, who, as well as being a medical man, should be a chemist), and afterwards, if it gives promise of success, let it be tried on the largest possible scale. Although a process may give fairly satisfactory results when tried on a small scale in a laboratory, it does not of necessity follow that it will prove practicable when applied to the whole sewage of a town; but, on the other hand, it is useless expecting satisfactory results on a scale of any magnitude from a system which does not succeed in the laboratory. For these reasons, then, the first experiments should be made by a chemist, and unless he reports very satisfactorily as to the results it is folly to proceed further. As a matter of fact, it is far easier to ascertain the effect of precipitants and deodorisers when working with small quantities (a few gallons) of sewage, than when experimenting with large quantities. In the former case the character of the raw sewage and of the effluent is readily ascertained; in the latter this is most difficult, the strength of the sewage flowing into the tank varying considerably from hour to hour, and generally it is possible to obtain a sample of effluent which can be relied upon as representing in composition the whole of the contents of the tank. Usually, on the large scale, it is necessary to examine many samples both of the raw and treated sewage, collected at different periods of the day, and in different seasons (wet and dry). The results being reliable, and the cost in chemicals and in labour, within reason; answers can be given to the following questions, which would enable a sound conclusion to be arrived at as to whether the system could safely be adopted.

1. Does the process remove all the suspended matter in the sewage?
 2. Does it remove any considerable portion of the dissolved putrescible matter?
 3. Does the sludge deposited permit of being readily removed, pressed, and dried, and what is its manurial value?
 4. Can the matter added to the sewage possibly be deleterious if ever used slightly in excess of the actual requirements?
- A typically perfect process would not only remove all suspended matters, but also all the putrescible soluble impurities, and yield a sludge containing the whole of the constituents of the sewage possessing manurial value. The materials used would also be inexpensive, and destitute of all noxious properties, save to the very lowest forms of animal and vegetable life. We seem as far as ever from discovering a process thus efficient, but no process should be adopted unless, after a fairly-conducted trial, the results allow of answers being given to the above questions which, with regard to our present state of knowledge, can be considered satisfactory.

A paper, published in your issue of the 26th ult., by Mr. Conder, C.E., illustrates, in a striking degree, the fallacious manner in which experiments on sewage purification are frequently conducted, and the very slender basis required by an honest enthusiast whereupon to found statements of an extraordinary character. The paper contains an account of an experiment which he says was "a practical success," demonstrating the "most important results of his new and powerful method of disinfection."

The experiment was made with a sewer in which the flow is said to be "extremely irregular, varying from almost nothing to sixty gallons per minute, the latter volume being in great

part due to the waste water of a large brewery." No statement is made as to the flow during the experiment, nor do samples appear to have been taken from time to time of the untreated sewage. Into this sewer at some distance from its outlet the purifying agent was allowed to flow at a uniform rate. Before commencing the experiment (but how long before is not stated) a sample of sewage was taken from the end of the sewer, and certainly such a sample of water-carried sewage was never heard of before, since on analysis it was found to contain 11.3 per cent. of solid matter, *i.e.*, 7,910 grains per gallon. After allowing the disinfectant to run in for a few hours the effluent was found to be "clear and bright." Now, a worse stream than this with such a varying flow could not possibly have been selected for the experiment, and we know nothing of the quantity or quality of the sewage treated. The sample collected at some time prior to the experiment must have been the mud deposited at the mouth of the sewer during a period when little fluid was flowing through, since ordinary sewage sludge only contains from 10 to 15 per cent. of dry solid matter. If we are to suppose that this was the constitution of the stuff flowing down the sewer, and which by the treatment was rendered "clear and bright," the result certainly appears miraculous. Is it not more likely, however, that, during the experiment, the large brewery flushed the drain? If not, the result is so incredible that it must admit of some other explanation than that of the action of a few grains of ferrous sulphate.

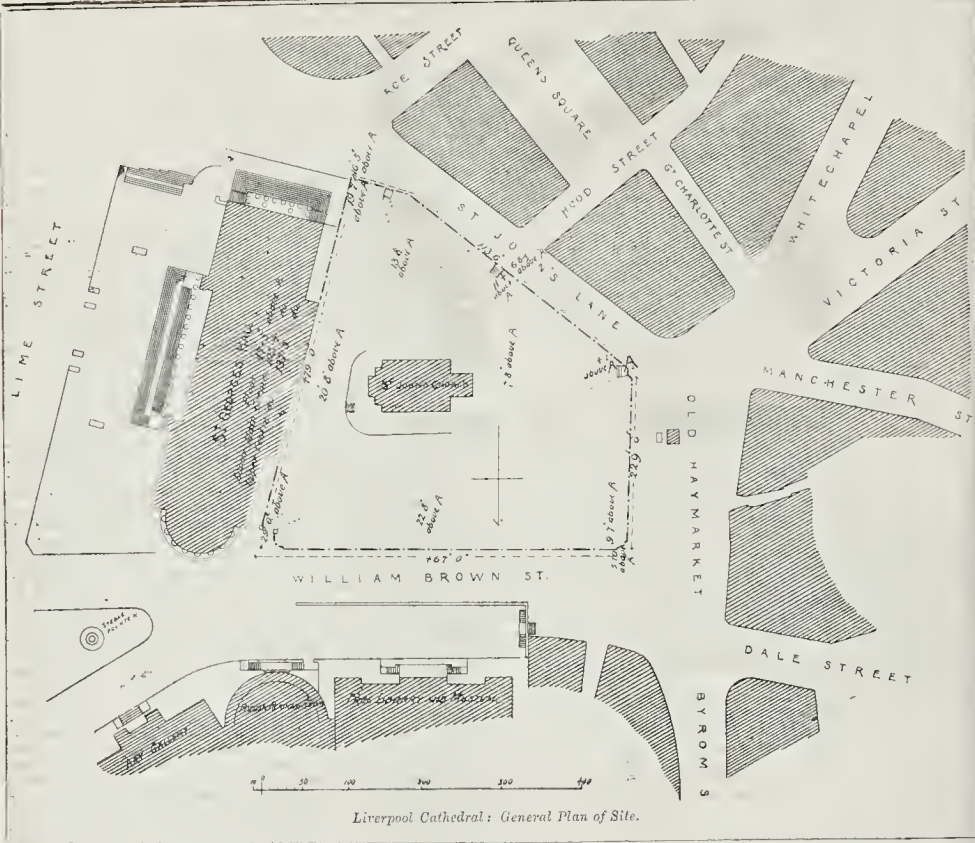

Again, as an example of what may be advanced as a fact, without a shadow of proof being adduced, take the following sentence from the same article:—"The weight of the putrescible matter resolved and escaping as non-combustible gas is a little more than that of the chemicals added." This certainly is a discovery of a marvellous property possessed by the chemicals employed, a property entirely overlooked by the numerous chemists who have investigated the action of salts of iron on sewage waters. Before giving it credence, however, we should like to know the nature of the experiments upon which so startling a statement is based. The climax is, however, reached in the sentence following the one just quoted:—"Thus there is no sludge." Surely such an inference from such premises was never before drawn.

As Mr. Conder has alluded to my correspondence with him through the columns of the *Manchester Guardian*, I may add that in answer to his claim,—that the mere addition of a small quantity of ferrous sulphate to the foulest sewage would cause it to become sweet and clear, dissipate a portion of the organic matter in the form of gas, and precipitate the remainder in a dense pulverulent form,—I showed that such results were diametrically opposed to those of all previous experimenters, and that I had carefully repeated the experiments he described with several different samples of sewage, and in all cases found the results most unsatisfactory, little or no purifying action taking place. I also pointed out the unsatisfactory character of the experiments he then recorded.

Even in experimenting with sewage scientific method cannot safely be ignored; where it is the result can only be disappointment and pecuniary loss.

Norwood.—A handsome rearedos has been erected in St. Luke's Church, Norwood. The structure, which stands about 18 ft. high, is of richly-carved alabaster and marble. In the centre is a large cross with censuring on either side, the "Agnus Dei" being in the centre of the cross. Above is a large gabled canopy, flanked with pinnacles and supported on corbels and twisted shafts with carved capitals, &c. The style is Gothic, of a Venetian type. The walls of the Sanctuary have also been lined with a dado of alabaster and marble. The work has been executed by Mr. N. Hitch, of Harleyford-road, Kennington, from designs prepared by Mr. Alfred Bickerdike, of Adam-street, Adelphi, W.C. The interior of the church was remodelled some years ago by the late Mr. G. E. Street.

Liverpool Cathedral: General Plan of Site.

MR. BROOKS'S DESIGN FOR LIVERPOOL CATHEDRAL.

propose in this and the two following numbers of the *Builder* to give in succession the main features of each design in our illustration pages, together with such passages of their authors' reports on them as may be necessary to fully explain their views. In the present number we give reproductions of as many of Mr. James Brooks's numerous drawings as we can find space for at one time. These include the plan of the ground-floor and the triforium plan, the north and south elevations (the west front having been already shown in the view we published last week), and the two large views of the interior, looking east and west respectively.

The accompanying block plan shows the site as it now exists, with the small church of St. John standing in the centre of it. The area is at present the old burial-ground or church-yard, a fact which has been adduced against its use as a site for the cathedral, and is the only argument against the site, perhaps, which is at all practically a serious one. The same difficulty has had to be faced before, however, in similar cases, and is not insurmountable, though considerations both of sanitation and sentiment will necessitate great care in the preparation of the site for its intended purpose. The east and north sides of the site, as will be seen from the figures, are the highest portions of the ground, which falls rapidly from east to west. St. George's Hall flanks the east boundary, and opposite to the northern boundary, at the further side of the street, is the group of buildings in Classical style which has gradually risen up there,—the Free Library, the Picton Reading-room, and the Walker Art Gallery.

Mr. Brooks places his church at the northern boundary of the site, as shown in his small

block plan subjoined, leaving the ground to the south of it clear, except for the line of subsidiary buildings which skirts a portion of it, and which is commenced from the lower level, the upper story of these buildings being on a level with the cathedral floor, or nearly so. This is a very good position for the subsidiary buildings, which thus form a kind of enclosure to the cathedral precinct, and they are kept as low as possible in order to allow of a view of St. George's Hall from Manchester-street. This object, however, will only be very partially realised, as indeed was evident in the exterior perspective we published last week.

The leading idea in regard to the proportions of the design has been to attain height, combined with a certain degree of horizontality. The site being short and surrounded by large though not very lofty buildings, the object has been to gain distinction and effect by making the cathedral rise above these horizontal-lined buildings, at the same time preserving a certain degree of horizontality by the ranges of windows, string-courses, parapets, &c., so as to harmonise to some extent with the horizontal lines of the adjacent buildings. This is Mr. Brooks's own statement as to his *motif*, and the partial horizontal effect which he describes is no doubt recognisable in the elevations we publish this week; but the geometrical elevation is a little deceptive in this respect, and the mass and projection of the buttresses, when seen in perspective, will cut through these horizontalities to some purpose; and in the west front vertical lines are certainly predominant. Though we think this point has been a little overstated in the report, however, there is no doubt that the choice of an early and severe form of Gothic does render the building a less violent contrast to its Classical surroundings than would otherwise be the case, and this is what is mainly intended. A building in an

ornate Gothic style would clash curiously with the lines of St. George's Hall. But, after all, one cannot escape the incongruity by much. Look at the plain masses of masonry which constitute Mr. Brooks's buttresses, and compare them with the St. George's Hall Corinthian columns. There is not much use in trying for congruity between features which come, so to speak, from the opposite poles of architectural aesthetics.

In regard to the arrangements of the plan we now proceed to give some extracts from Mr. Brooks's report, omitting some of the points which have already been embodied in our remarks here and in the previous number:—

Plan (generally).—I place the cathedral itself on the extreme northern boundary of the site adjoining William Brown-street, having three of its principal entrances on that side. The western end is on the extreme west boundary of the site next the old Haymarket, and in the event of the present block of buildings on the west side of the Haymarket being pulled down for city improvements, a new street, forming a continuation of Dale-street might be carried up directly to the west front which will form a magnificent object at the end of this portion of the new street. Gateways are provided in St. John's-lane for entrances to the Cathedral, and thence a carriage-drive communicates with the south doorway of the transept. Opposite these doorways I would suggest the creation of a monument, on the base of which should be inscribed the names, so far as can be ascertained, of deceased persons whose remains have been interred in St. John's Churchyard; the termination of this monument to be in the form of a churchyard cross. By such a monument a record will be preserved on the spot of the names of those once interred there. Provision is made in one of the western towers for a clock-chamber, and in the other for a belfry and ringing-floor. Staircases and passages in the wall give access, as in the old examples, to all parts of the building at different levels. This is a useful provision, as by this means all parts can be approached without ladders, thus affording convenience for ventilation and repairs.

Ground Plan.—The principal object which I have

Plan, showing Position of Mr. Brooks's Design on the Site.

kept in view in designing my plan has been to obtain as great a breadth as will secure space for the accommodation of a large congregation, and so contrived that when assembled there shall be as little obstruction as possible to the sight. For this purpose aisles are added to the transepts, as well as to the nave and choir, thereby giving a very large and open space in the centre of the cathedral, and enabling a large body of people to be seated within sight and hearing of the preacher. This large and but little-obstructed space, lighted, as it will be, from a lofty central lantern, will produce, I firmly believe, a great and imposing feature in the building. The nave is intended to be 50 ft. wide, with north and south aisles each 25 ft. 6 in. wide; the north and south transepts, also the choir, will be of the same width as the nave, and each will have aisles corresponding in width with the nave aisles. The great width of the choir,—viz., 50 ft.—gives an opportunity of providing ample accommodation for bishop, dean, canons, chorists, and congregation, such as is found in Westminster Abbey, St. Paul's Cathedral, London, and most other cathedrals in England. Eastward of the choir-gates are gates provided on the north and south sides for communicants to pass into the aisles on their return from the altar-rails without going through the choir and thus causing confusion. The choir has an apsidal end, as it has been already remarked, and an ambulatory or passage surrounds it, connecting the north and south sides, and giving access to a chapel for occasional services, on the south side, without the necessity of crossing the choir. On the north side of the choir-aisle are vestries for the bishop, dean, canons, and chorists, together with a muniment-room for the cathedral archives. Owing to the great fall that exists in the land between the eastern and western boundaries, it has been a matter of much study to fix the level of the nave floor. Considering the importance of the thoroughfare on the north side,—viz., William Brown-street,—I have decided to make one of my chief entrances from it, and to so fix the level of the nave floor that access to the building should be obtained by as few steps as possible; thus, at the easternmost door the floor will be two steps above the pavement; at the central door it will be six steps; and at the westernmost door it will be eight steps above the same level. Having settled the position of the nave floor, my next endeavour was to arrange the approach at the western entrances. To effect this I have brought forward the two western towers to the extreme western boundary of the site, and have placed them wholly outside the nave and aisle walls, by this means gaining a very great breadth for the design, and causing the facade to occupy the whole frontage of the site next the old Haymarket; this arrangement will allow of the towers, if desired, being erected after the main portion of the structure is completed. The steps are disposed within the limits fixed by the towers, and are so divided that there will be an interval of landing between every six or seven steps, and that the ascent will be rendered as easy as possible for so great an elevation; this arrangement is likely to give considerable breadth of effect. A spacious baptistry is provided on the south side at the western end of the building, and entered from the south aisle. It is placed in a semi-detached position, and leaves the western end of the cathedral quite free for worshippers, and from its position it will form a picturesque feature on the outside of the building. The wall-space beneath the windows of the aisles is a part of the structure to which I wish to direct your attention, as it is generally occupied by arcades, which are of no particular use. These I propose to divide into recesses for the reception of memorials of dignitaries of the Church, bene-

factors of the Church, and men of eminence generally.* I have also designated other parts of the building to receive sculptured memorials, but these will be more fully described with the plan of the triforium.

Crypt Plan.—A crypt is rendered necessary in consequence of the very great fall from east to west, and extends from the extreme western boundary of the site to the transept walls. Though permission is given by the instructions to place the chapter-house, Consistory Court, diocesan offices, and choir school in the crypt, I have not thought it desirable to do so, but have provided for all these in another position, and they will be described hereafter, with their respective plans. The appropriation of the crypt to such a purpose as that to which the crypt of St. Paul's Cathedral in London is devoted would seem to be a very suitable employment of it.

Triforium Plan.—This plan shows an arrangement for accommodating an additional number of worshippers to that provided on the ground-floor, in a triforium over the aisles of nave, choir, and transepts, which is of the same width as that of the corresponding aisles at ground-floor level; these are all well lighted, as will be seen by a reference to the plan. Particular occasions may arise,—festivals, for instance,—in a large city like Liverpool, when this additional accommodation may be very desirable. Access is obtained by spacious staircases in the angles of transepts, and at the western end of the nave. The external surfaces of the parapets next the nave, choir, and transepts appear to be specially adapted for the reception of sculptured memorials of deceased persons of eminence. The position of the organ in a building of this magnitude is a subject which requires careful consideration. It should be well raised above the floor of the choir, and a vaulted ceiling over it contributes largely to the diffusion of sound from the instrument. As the result, therefore, of a successful experience, I contemplate placing the organ in the triforium on the north side of the choir, some of its pipes being also placed in a bay of the north transept at the same level, and providing a separate staircase for its approach near the vestries.

Subsidiary Buildings.—These buildings are intended to form the enclosure of the site next St. John's-lane, and are two stories in height. The lower story, which is on the same level as that of the paving of the crypt, and which is delineated on the crypt plan, consists of the Diocesan offices, Cathedral Surveyor's office, and choir school, together with two large gateways. All these buildings are entered from the public street, and in addition the diocesan offices are connected with the lowest store of the tower of the cathedral and the vestibule beneath the baptistry at the crypt level. The upper story of these buildings consists of a chapter-house, Consistory Court, private rooms for the bishop and the judge, and muniment-room. These floors are on the same level as the paving of the nave, and communicate with the cathedral by means of a cloister terminating with the baptistry.

North Elevation.—It will be seen from this drawing that the great central feature is the transept, having three large well-recessed portals, and these I have treated as the chief entrances from a leading thoroughfare. Westward of this transept the lowest range of window is intended to light the crypt, the next tier of windows will light the aisles, the third tier lights the triforium, while the highest are the clerestory windows. These tiers of windows are designed to give the greatest quantity of light to

the interior, and at the same time to add the feature of horizontality to which I have already referred, and which is intended to harmonise with the horizontal lines of the adjacent Classic buildings. At the north-west angle of the building is one of the large towers, and at the intersection of the nave, choir, and transepts a lantern is placed, rising to a great height, and occupying a prominent central position, as will be seen from the views which illustrate this report. This lantern will throw a very large amount of light on the floor of the cathedral. On the east side of the transept are the vestries, of two stories in height, having a separate external entrance, and communicating directly with the choir-aisle.

South Elevation.—The whole of this front is within the Cathedral Close, and its main features are the transept, side chapel, and baptistry. The same arrangement of windows, with the same object, has been observed on this front as well as on the north front. The use of the deeply-recessed doorways, such as is employed on the north front, has not been adopted on this front on account of the difference of aspect, and also because of the comparatively private nature of the approach.

As to the Construction.—A building of the importance of this now under consideration, and designed for so distinguished a city as Liverpool, should be constructed of materials of the most durable and lasting character, both as regards resistance to the weather and capability of supporting great weight. The materials for the walls should be of wrought or cut stone, both externally and internally; and with regard to the kind of stone, I should recommend the use of Irish limestone, which is as durable a material as could be employed for all parts of the building up to the top of the plinth. I think the same stone should be used for the piers of arcades, as its resisting powers are well known, and when wrought with a finely-picked or sanded face, its colour is most agreeable. For other portions of the building might be used such stones as Darley Dale, Hollington, the stone used at St. George's Hall, and several other stones; but, before deciding on the definite use of any particular stone, it will be well to ascertain if any one quarry could supply the requisite quantity of material for so large a fabric. For the external covering of the roofs it is intended to use lead.

The ceilings throughout are to be vaulted and groined in stone. At this place I should like to give reasons why buildings of this nature should be vaulted. (1) With a vaulted ceiling the atmosphere is less affected by the heat of summer or by the cold of winter than by any other construction. (2) With a vaulted ceiling, if from any accident the fittings took fire, the injury would be limited by it, and prevented extending to the roof; or, on the other hand, if the roof were accidentally to take fire, the destruction would be confined to this part of the building alone, as, in fact, was the case a few years ago at Canterbury Cathedral. (3) With a vaulted ceiling, a much more imposing and dignified effect is obtained than is possible with timber construction. (4) Vaulted ceilings constructed as I have designed these are by far the best for acoustic purposes, as, for instance, may be observed in the case of Westminster Abbey, which has an apsidal end. This latter circumstance has also had some influence with me in adopting the apsidal termination for the choir of this building, as an example founded on that of Westminster Abbey, whose acoustic properties are so well known, cannot fail to recommend itself.

As to the Cost.—Having gone carefully into the cost, and given due consideration to this part of the subject, and having had, moreover, a long experience in church building, many of my churches being of considerable magnitude, I am of opinion that the munificent sum provided for this work will be sufficient for the purpose, and my views are confirmed by the opinions of others who have gone with me into this matter. I have also employed Mr. John Young, a London quantity surveyor, who has for upwards of twenty years prepared quantities for the various churches and other works which I have erected during that period, to take out the quantities of the floor area, and the cubical contents as required by the instructions, and he reports the following result:—The floor area within the walls available for worshippers is 40,610 square feet, and in addition to this area there will be in the triforium 17,070 square feet, making a total of 57,580 square feet. The cubical contents of the building, calculated above the principal floor level, and including walls and projections, such as buttresses, &c., are as follow:—

Nave, aisles, choir, transepts, chapel, vestries, and baptistry	6,242,678 feet.
Towers and spires	1,099,182 "
	7,341,860 "
Subsidiary buildings calculated from the ground level	434,508 "
Grand total of cubic feet	7,776,368 "

Mr. Brooks wishes us to mention that since sending in his report he has added to it a statement pointing out that of the area of 57,580

* We may remind our readers that an arrangement similar to this is carried out, though not quite with the same continuity and completeness, in Bristol Cathedral, both in the original work, and in the modern nave added by Mr. Street.

square feet mentioned above, there is a clear and unobstructed space of 11,500 square feet within 100 ft. of the pulpit, and beyond this 100 ft. there is in the nave, aisles, and triforium 4,500 square feet, making a total of 15,000 square feet where the congregation can both see and hear the preacher.

In a future number we shall be able to give some further illustrations of this fine design. We may here point out, however, that the lantern which is shown over the crossing is, as will be seen when we have space to give the longitudinal section along with other drawings, entirely open from the church up to the groining immediately at the base of the pyramidal roof. It is divided into stages, in the first of which the square becomes an octagon, with squinches formed on an original principle, the soffits being groined from shafts attached to the face of the walls. The stage immediately above this consists of an arcade, and the two upper stages are divided by shafts carrying groined vaulting, and pierced with two windows in each stage, thus enabling a large flood of light to be thrown down, and to illuminate the whole central area.

The two interior views, that looking westward especially, show very clearly the manner in which, as we have before observed, great height is gained for the main arcade, and its lines towards the nave carried up continuously, while at the same time the intermediate arches carrying the upper aisle (for such it is rather than triforium in the ordinary sense) furnish a system of huttingress in the centre of height of the piers, obviating the necessity for increasing their mass to such a degree as to encumber the floor area too much. The practical gain of space in these upper aisles thus becomes at the same time a constructional advantage; design, convenience, and construction going hand in hand, as in all well-regulated architecture they should do. Granting that the Mediaeval type is to be adopted, we think all will concur with us in thinking that this interior is a very fine example of the style, and, as far as one can shake off the recollection of the difference between Gothic as an original style and Gothic as a reproduced style, it may fairly claim to be equal to some of the finest Mediaeval work. The exterior we do not so unreservedly admire in some points. The outline of the lantern might be improved; the western towers appear to us to need a little more diversification of treatment and a little more spread of outline in the lower portion. They form, to our eyes, rather too straight and vertical a line for a tower which is to culminate in a lofty spire. An Italian campanile on a great scale, which is crowned by a square lantern stage, or by only a small and subsidiary spirelet, gets much of its effect from its severe and almost chimney-like straightness, soaring right up at one bound, as it were, to the cornice. But we always feel that a tower which is crowned by a large and lofty spire should evince pyramidal leanings (if one may thus play on the word) in its own lines; the outline of the tower should seem to suggest the spire composition before the spire is arrived at, and the spire should have a natural and spontaneous fulfilment of a tendency to pyramidal composition from the base. It may be replied that this would not be so well in keeping with the period and style of Gothic adopted; and as a matter of precedent certainly it would not. The question is whether a modern architect should not attempt to make a better precedent. We forget what Roman general, when those nuisances the "augurs" told him a certain day was an unlucky one to fight on, replied, "Then I will make it a lucky one"; but the story has an application to many matters. Is a certain architectural treatment, superior in itself, "not in keeping" with the general precedent of the style adopted? Then make it in keeping. It must be observed, however, that the western towers look much better in perspective than in elevation, as indeed every tower ought to.

In regard to the plan of the church, it appears to us to be as good a compromise between practical requirements and architectural effect as can well be realised if the Mediaeval plan be adopted. This form of plan arose out of con-

ditions and feelings in regard to public worship and church polity totally different from those which now for the most part exist. To make such a plan a really practical one for modern worship is quite impossible. But practicability is not everything in a cathedral. Architectural effect and impressiveness are a very important part of the objects of such a building, and a cathedral which sented all the worshippers in the most commodious manner for hearing and seeing, and left them totally unimpressed by any dignity or effect in the architecture, would have fulfilled only half its purpose. Association, again, is strong in these matters; stronger perhaps than in anything else. We are, as Tennyson perhaps rather bluntly puts it, "the fools of habit" in religious ordinances and surroundings, and the form of building which has impressed on one as a church exercises a certain glamour over us; we cannot feel so fully "at church" in a building of another shape and of other associations; or so at least many of us think. In regard to the position of the organ, in the triforium gallery on the north of the choir, this is the best which Mr. Brooks's plan will give, and a better one than is found in many churches and cathedrals, for the combined purpose of general effect and of supporting the choir. A side position of this kind is not the place to hear a large organ from, however, and nothing will make it so. A large nave organ at the west end, and a smaller one contiguous to the choir, is the ideal arrangement. We certainly concur with Mr. Brooks in what he says about the superior safety, solidity, and architectural completeness of a vaulted roof; a large Mediaeval church is not complete with a timber roof. But we cannot follow Mr. Brooks in his remarks about the acoustic properties of a vaulted roof, or the "well-known acoustic qualities" of Westminster Abbey, any more than we have sometimes been able to follow the sermon in the abbey. The fact is, when you come to build a cathedral of this shape and size and construction, you may as well leave acoustics out of the question, and let people hear as well as they can, and meditate on the architecture if they cannot. The building will produce plenty of echo, no doubt, as Westminster Abbey does; but echoes are not acoustics. A vault, with its broken-up surfaces, however, no doubt returns less concentrated echo than a dome of the same material.

Whether the Liverpool cathedral should be a Mediaeval building or not depends on such a variety of considerations and influences that it is difficult to form any opinion one way or the other. It is easy enough to know what one's own predilection would be,—we have already intimated our own; but it may be reasonably urged that a cathedral should promote the greatest happiness of the greatest number of those who are to use it. Whether a modern Gothic cathedral is the form most likely to effect this end, we should feel it very rash permanently to predict. We confess to a doubt on the subject. But if it is to be supposed that it will do so, there is no doubt that the design before us has very high claims.

NOTES.

HE New-Year opens gloomily for our great industries. The Iron Trades Employers' Association have given notice that, in consequence of the depressed state of trade, and the high cost of production, the wages of all classes of workmen in their employment will be reduced about 7½ per cent. on the rates paid in the early part of 1879. Notices to this effect, to come into operation during the present month, have been given at Manchester, Liverpool, Birkenhead, Glasgow, Barrow-in-Furness, and in the Tyne and the Wear Valleys. The Committee of the Masters' Cotton-spinning Association have decided on another reduction of 5 per cent., following within three months on a similar reduction, only acceded to by the operatives after 25,000 of them had been on strike for twelve weeks. The employers state that trade has not improved since the last reduction. The master shipbuilders on the

Tyne and the Wear gave notice, a month ago, of a reduction of 10 per cent. in time wages, and 12½ per cent. in piecework prices. The notices expired during the past week. The whole of the men engaged in shipbuilding on the Tyne struck work on the 6th, and those on the Wear were expected to follow. Much distress already prevails in the shipbuilding centres, which will be thus intensified. It is announced in a New York paper that a considerable part of the business hitherto carried on by Messrs. Marshall & Co., of Leeds, is to be transferred to the banks of the Connecticut. The flax and hemp hands in Yorkshire are "absolutely dying out," in consequence of the departure of the trade to Lille and Ghent "where there are longer hours and better wages." The wool and woollen trade of Leeds is flagging. The worsted trade of Bradford is fairly prospering. Depression prevails in the building trade at Leeds. The exports of Hull and of Goole have increased since the opening of the Hull and Barnsley Railway, but it is not clear how far this increase is at the expense of other parts. The year opens badly for the trades of Yorkshire, and the greatest distress already prevails in some districts of the county.

THE sinister importance of this week's news from the heart of the iron manufacturing district is not to be disguised. On the 5th of January it transpired that a leading firm at Wolverhampton had lost a good South American order for axes, owing to German underselling. It was further stated that Wolverhampton merchants are now ordering wire and nail iron and screws at German make at greatly under Birmingham manufacturers' prices. Some little time back it was announced that Messrs. Nettlefold were about to abandon works on which they have spent 120,000*l.*, at Wellington, Salop, in order to transfer the scene of their screw-making industry to the neighbourhood of Newport, Monmouthshire. The present news shows that such a movement, intended to save the cost of railway carriage had a substantial reason; but it is far from evident that the saving that to be effected will be enough to enable English firms to maintain the command of the market for these articles of produce. On the contrary, it appears that German manufacturing prices are now so low as to be under corresponding English prices, even when the former are weighted by the cost of sea and land transport from the German workshops to the centre English market of Birmingham.

A CORRESPONDENT last week raised a question as to the ownership of drawings and plans prepared by an architect. Whether they belong to the architect or the building owner must, however, depend on the terms of the agreement between the two. It is possible for the architect to stipulate that the property in the drawings shall remain his, or for the building owner to require them to belong to him. It would be to the advantage of all parties if this were done in all cases, and the payment varied accordingly. Where no stipulation of this kind is made, we believe that "the eye of the law" the property in the plans or drawings remains in the building owner. For the architect has been employed to prepare drawings and plans for him, and merely for his temporary use. He may use them or burn them; he may use them immediately or at some future time. Indeed, the more the question is looked at from a practical as distinguished from a purely legal point of view, the more obvious does it appear that the legal is also the practical rule. But that we have stated the legal rule, we have no doubt if we are not mistaken, this question arose in regard to the Houses of Parliament, with result not favourable to Sir C. Barry's contention.

SIR B. SAMUELSON'S recent Report on the railway rates of Germany, Belgium, and Holland, as compared with those of this country, is most useful and instructive, and presents many features of interest. The agitation of last year has resulted in more lig

being thrown upon this subject than all the Commissions of the past, and this exhaustive Report, which bears every evidence of careful research and reliability, must rank among the most valuable contributions to it. A large number of comparisons are made and tabulated in a concise and clear form, showing at a glance the difference between the Continental tariffs and our own. It appears that on many classes of traffic we are paying twice as much as the Germans and Dutch, and almost three times as much as the Belgians; though, in a few cases, presumably where our managers have found it quite impossible to maintain excessive rates, there is but little difference. The moral drawn by Sir Bernard is that the Continental rates are founded on intelligible principles, while ours are not. The principle here seems to be "what the traffic will bear," a system necessarily giving rise to many injustices and anomalies. There are insuperable objections to State control for our lines, but the interests of the different companies might be rendered more of a mutual and less of a competitive character by making the management more central; and it is evident that there are many expenses of administration which would be obviated by some such arrangement. But from whatever cause it arises this heavy excess in freightage handicaps our trade so severely in competing with the countries dealt with in this report that it is high time that some alteration should be effected.

It appears from a paragraph in the *Venice Times*, an English paper published in Venice and edited by an English architect,* that an attempt is about to be made to re-unite the scattered portions of the tomb of the Doge Dandolo. At the present time the sarcophagus which contained the body is lying in the cloister of the Seminario; the arch which formerly covered it remains in the Archivio di Stato, where the monument was originally erected, and the painted spandrel of the arch is now in the sacristy of the Church of La Salute. The tomb will probably be re-erected in the Church of SS. Giovanni e Paolo, which, in return, is to give up the sculptured group belonging to the monument of Vettor Capello, which is also dispersed, but is to be put together and re-erected in some other place.

MR. R. W. CRAWFORD, the Chairman of the East Indian Railway Company, has issued a pamphlet with the motto,—

"... Super et Garamantas et Indos, Proferet imperium,"

from the *Aeneid*, in which he advocates the construction of what he calls a grand chord line from Barrakur, near Calcutta, to Moghal Serai, on the south bank of the Ganges, opposite Benares, a distance of 469 miles. The line was fully surveyed in 1850, and the details were so far worked out as to form the basis of a preliminary contract, but the Government of the day preferred the circuitous line following the valley of the Ganges, which has been carried out, and now forms the East Indian Railway. The proposed line would shorten the journey between Calcutta and Benares, and every place to the westward of the latter city, by about sixty-seven miles, and would reduce the cost of transport by that distance on all goods from all stations in the North-West to Calcutta. The line would pass very near the Kurburbar coal-fields, and would shorten the route for coal to the North-West by ninety-two miles, and reduce the cost of transport to the extent of 2s. 8½d. per ton. A short connexion between Gya and Sherghotty would give an alternative route of 364 miles between Patna and Calcutta, via Sherghotty, instead of 333 miles by the direct line and to the extent of an additional run of 26 miles under Patna and its allied stations independent of any mischief that might occur to the exposed portions of the main line near Suckiesera. Mr. Crawford deprecates the carrying out of the design for the docks to be built at Kilderpore at an estimated cost of three millions sterling, which, if the estimates be not exceeded and

the work he successfully completed, will involve an annual charge of 150,000l. upon the trade of the port at a time when so much has been done and so much remains to be done in the way of relief in other quarters.

FROM the Report of the Surgeon-General of the United States Navy for 1885 it appears that at the Museum of Hygiene in Washington, in connexion with the Navy Department, a complete system of iron and lead pipes, with fixtures, is being erected on the outside of the building from the ground to the roof, with an observing station at each of the three stories, for an exhaustive series of experiments covering all the topics in dispute pertaining to trap siphonage and the utility of the mechanism of water-closets, traps, water basins, baths, sinks, &c., as well as to numerous ones on which there are no reliable data, together with microscopical and chemical tests of the action of sewer air and different waters on pipes and tanks. These experiments will be conducted by Mr. Glenn Brown, the "American architect" whose account of American sanitary apparatus we have just been publishing, and he will report on the results through the returns of the Navy Medical Department.

A COMMITTEE of the Edinburgh Town Council have had under consideration a proposal by the Lord Provost that steps should be taken for the erection of new municipal buildings for the city, the present buildings having become inadequate to the requirements of the municipality. The Lord Provost appears to be in favour of the present site, in the High-street, with additions thereto from adjoining property. Other members of the Council were in favour of a site in the new town. It was agreed that inquiry should be made and a report obtained as to the capabilities of the present site, and as to the accommodation required by other public bodies located elsewhere in the city which it would be desirable to concentrate in the new buildings. There is no doubt that the present site is admirably fitted for a picturesque and effective public building, but if a Town Hall is to form part of the scheme the site will be found a most inconvenient one. At all events, we trust that wherever they may be placed the new buildings will be worthy of the city.

THE old palace known as the Römer, at Frankfort, contains in its principal apartment, the Kaisersaal paintings, representing the portraits of all the German emperors from Charlemagne down to the break up of the German Empire in the year 1806. The formerly free and Imperial city of Frankfort, although shorn of much of its ancient greatness through its annexation to Prussia, still takes the utmost pride in the Römer Palace, and the treasures it contains. The municipal authorities of the city have accordingly determined to continue the practice of former times, and to add to the thousand years' series of Imperial paintings in the Hall of the Emperors, a portrait of the first emperor of the new dynasty. The work of restoring the ancient edifice of the Römer has already been taken in hand, and, as soon as this portion of the work is complete, certain alterations and fresh decorations are contemplated. The pictures already in the palace entirely cover the walls of the Imperial Hall, and, accordingly, it would have been necessary to enlarge the building in order to accommodate the portraits of the monarchs of the New German Empire. Instead, however, of making any addition to the edifice, it has been determined that the new dynasty shall be represented in the Imperial Hall, not by portraits, but by statues. It has been proposed in the Frankfort Council that the cost of placing the statues of all the German emperors of the future in the Imperial Hall shall be defrayed by the city, and that the statue of the Emperor William shall be erected there without delay.

IN the *Builder* for February 21st of last year we published a review of the new edition of "Tredgold's Carpentry" edited by Mr. Tarn, pointing out some serious, and in some cases

quite inexplicable, inaccuracies in the work. We are glad to say that we have received from Messrs. Crosby Lockwood & Co. a revised copy of the new edition, accompanied by a letter stating that in consequence of our remarks they had had the work most carefully read, and had corrected the errors pointed out by us, as well as some others which were discovered on the second reading, and they have now issued the book afresh, free from these errors. The publishers have taken a very spirited course, and one highly creditable to them, in thus acting.

PLUMBING PROBLEMS.*

SUCH is the title of one out of a batch of books on sanitary subjects which has reached us from across the Atlantic. It is in the main a reprint from the *Sanitary Engineer* of questions addressed to that journal, with the editorial replies and comments thereon. This selection from a multitude of miscellaneous queries is illustrated by diagrams, and it pretty well covers the whole field of sanitary work as applied to domestic wants. The American houses are noticeable for the extent and completeness of their arrangements for warming,—a necessity of the rigorous climate,—and the inventive intellect of our cousins has been exercised in this direction, running into every variety of contrivance and expedient. An American house of the first class is, in this respect, a very complicated piece of engineering, and the provision for its working and the precautions against accident are proportionately numerous. A plumbing specification,—which strikes us as the least excellent portion of the book,—follows the section on water supply, and the whole concludes with reprints of the New York, Brooklyn, and Boston plumbing laws, which have been devised to avoid the employment of incompetent workmen, and framed so as to embody the latest conclusions of the science of sanitation.

The American nomenclature differs slightly from that in use in this country; water-closets, lavatories, &c., are "fixtures," down-pipes are "leaders," and a "back-boiler" is a "water-back,"—the term "boiler" being reserved for what we should call the circulating cistern. The irrepressible American humor shows itself even in the serious treatment of this dry subject (if we may so describe a subject in which water plays an important part); to a matter-of-fact essay on the emptying of a water-closet trap by capillary attraction, caused by the presence of a "duster," the following "moral" is appended,—"Avoid complicated fixtures, and preserve all textile fabrics for paper stock, instead of putting them down the drains!"

One of the most useful sections of the work is that on what are called "by-passes." It deals with a subject which is, indeed, at the root of all efficient internal drain ventilation. By a by-pass is meant such an arrangement of "fixtures" with a common trap, the attempt to ventilate which provides the foul air with an open path into the room. The rule for the prevention of this defect is given thus:—"Water should never pass through more than one trap in reaching the house-drain." If water, after passing through the trap of its own fixture, then passes through the trap of another fixture, and both traps are ventilated, there is sure to be a by-pass."

The accompanying diagram explains what is meant. It is evident that the plumber has provided, according to his lights, for the due relief of the head of each of the syphons, and if the upcast current were strong and continuous all would be well, for any foul air which might accumulate in the syphons would ascend as shown by the arrows. But alterations in temperature always render a reversal of the direction of upcast currents possible, and it is evident that a strong attraction might induce the currents in the escape-pipes along the lines indicated by the dotted arrows, and thence, by the w.c. apparatus, into the house. An "open path" is provided and would, no doubt, be occasionally followed.

It is obvious that by somewhat similar arrangements of "fixtures" to that shown in the diagram a great variety of "by-passes" are possible, and "as a rule there will be as

* Plumbing Problems; or, Questions, Answers, and Descriptions relating to House Drainage and Plumbing, from the *Sanitary Engineer*. With 136 illustrations. New York and London: The Sanitary Engineer, 1885.

* Mr. W. Scott, late Travelling Student of the R.I.B.A.

many 'by-passes' less one as there are traps through which one discharge has to pass in reaching the house-drain."

The examples given show that unintelligent and dishonest workmanship are as common in America as with us, and they also show that a desire to do the right thing very often ends in disaster through ignorance of sanitary principles. Much practical editorial wisdom is scattered throughout the book, and finds expression in such apothegms as "it is more important to have intelligent workmen than expensive appliances." In fact, the whole tenor of the work is in the direction of the simplification of appliances and the arrangement of them on scientific principles.

There is truth in the remark that plumbing is not often enough the subject of drawings. It is left to description and to specifications, which are by no means always specific. "Fixtures" are to be properly trapped and ventilated, and joints to be properly made, &c. Modern plumbing, as the writer justly says, is of too much importance to be done, except as all other important

collapse sometimes occurs. The stop cock on the main is closed, and the water drawn off from the boiler, and a collapse is the consequence. But this kind of accident is perhaps inevitable, and must be borne with as beyond cure. It is fortunately not very common, and, by no means disastrous, as is the blowing up of the water-back.

The New York regulations for plumbing works recommend that all soil and other vertical pipes shall be carried up in a special shaft, which should also serve as a ventilating-shaft. It should be 2 ft. 6 in. square, and be accessible at every story, with a grating at each floor strong enough to be stood upon, and covered at the top by a louvered skylight. It is further recommended that the services should be concentrated as much as possible, and not unnecessarily scattered over the building. Both these points are attended to in English work; and, indeed, it is difficult to see in what respect the American architects have improved upon our home methods. The conditions under which they live have compelled them to adopt more

constructive work is done, viz., in accordance with carefully-prepared detail drawings.

A schedule of the *desiderata* for the perfect drainage of a house scarcely differs at all from the English practice. It is not, however, provided that the sink and other wastes shall discharge over open trapped gullies outside the house, nor can it be seen from the very numerous diagrams in the book that what is in England now considered an essential of perfect drainage is so regarded in America. On the contrary, the typical specification provides for connecting all such wastes immediately with the house-drain by 2-in. cast-iron pipes with syphon traps under the "fixtures."

The treatment of hot-water circulation in houses is very copious and interesting, and numerous examples are explained and illustrated. The custom of placing the boiler on the same level or near it as the "water-back," which is fast gaining popularity in England, was first attempted in America, and it and its allied appliances have been brought in that country to great perfection.

The elaborate system of warming such palatial residences as those of Mr. W. K. Vanderbilt and Mr. Cornelius Vanderbilt, in New York, are carefully described, and present an evidence of much originality and ingenuity of arrangement, too complicated and various to explain without the help of diagrams. The annual risk to life which we experience from the bursting of kitchen-boilers is not escaped by the Americans, whose "water-backs" have the bad habit of occasionally "blowing up," notwithstanding all the precautions taken to provide against the danger.

Frost is, of course, the cause, and many expedients have been suggested and tried to prevent the consequences of frozen pipes. The Editor of the *Sanitary Engineer* distrusts spring taps and fusible plugs. "People who blow up water-backs," he says, "have very little knowledge, and would not know what to do if told that a water-back was frozen." He recommends one which is too strong to explode at all, or one which will explode at a comparatively low pressure, and so minimise the resulting damage. It is not gratifying to have to record this recommendation as the only practical solution of a question which touches the public safety. There is evidently room for a contriver of safety water-backs.

It is also found that with the vertical boilers, which have superseded our circulating cisterns,

extensive and elaborate measures in certain directions, but, on the whole, the English and the American practice are identical.

It is pleasant to note the *entente* which exists between the sanitarians of the two countries, and the readiness with which the excellence of English sanitary systems and appliances is recognised by our American cousins.

CHRISTIAN EMBLEMS IN ARCHITECTURE.

The cross "carefully imprinted alike on the habitations of the living and the receptacles of the dead" will be uppermost in the minds of all who may glance at this heading.

So much in request was this great emblem of our faith at the Crusades, and so eager was each warrior to bear it on his shield, that the ingenuity of the heralds was taxed to produce it in forms innumerable, and its varieties are more than two hundred, and some accounts even go up to three hundred, and one old writer laments, "You bring me so many crosses that I be weary of them."

The plain Latin cross is the usual form in our churches; that is, with upright limb of greater length than the cross-piece; while the Eastern church uses the Greek form, with all the limbs of same length.

St. Andrew is always accompanied by the X-form of cross on which he was condemned to be crucified. St. Philip carries the T or Tau cross, and sometimes it is represented as a double one, but not often.

We hail St. George by his shield with the red cross, and overcoming the dragon.

We know St. Peter by the inverted cross, calling to mind the form his martyrdom assumed. St. Jude also carries the cross reversed, but of the "Tan" shape.

St. Alban (the youthful martyr) carries a sword in one hand, and a cross "crosslet" (or crossed at the ends of the upper limbs) in the other.

We must not forget St. Patrick with the X-cross (or "saltire") in form as St. Andrew's, but with the colours (when shown) reversed, the former red on a white ground, and the latter white on a red ground. We find them in our "Union Jack" with that of St. George.

Occasionally we find the Latin cross upon three steps, known as "Faith, Hope, and Charity," or that of Calvary.

The Patriarchal Cross is less familiar; it is distinguished by having two cross pieces or horizontal bars.

We learn from "The Calender of the Prayer-Book" that the crucifix was first represented with Our Saviour's bust at the head or foot of the cross, and the Lamb in the centre, and that afterwards Christ Himself was represented, clothed, but not nailed; and then came the present form, with Our Lord fastened to the cross with the eyes open, and later on (from the tenth to the eleventh century) sometimes dead.

In the Greek Church, and most of the early examples, one nail fastens the feet together. In the modern Roman Church it is usual to place the feet separated, and use four nails. Formerly the figure was robed, and with a regarvoun, but later examples show the crown of thorns, with only a cloth around the loins.

From the same source we gather that "the crucifix soon came to be regarded as an indispensable part of church furniture. Large representations (often with the additional figures of St. Mary and St. John) were placed over the chancel-screen (thence called the rood-loft, as the crucifix was called the rood) as well as over the church doors. The crucifix placed on the altar was generally of gold or silver, and adorned with precious stones."

Another writer observes—"The Latin cross from its form, speaks more directly of the Atonement, representing more faithfully (probably) the very instrument on which Our Lord suffered. The Greek cross, we read, rather as the emblem of Christianity in general, the religion of the Cross, expressed by its four equal arms, extending its benign influence over all the four quarters of the world."

The emblems of the Trinity are largely represented in ecclesiastical architecture in various forms, such as two triangles interlaced, or three circles intersecting each other, or a triangle within a circle; also the device setting forth its doctrine, which is met with on brasses and now and then in windows. Foreign artists did not scruple to produce representations of the Trinity in person, but such instances are rarely to be seen in England. Three is interlaced in the form of a triangle is another method of symbolising the "Mystical Three-
One."

The emblems of the four Evangelists meet our gaze at every point, and are of great beauty and significance. Matthew is known by the angel, because his writings bear testimony to the *human nature* of our Lord. Mark, with his winged lion, will be familiar to every one as the "historian of the Resurrection"; the lion is an emblem of this important part of our faith from the old tradition that his young wing brought dead into the world, and licked into life a few days after. The winged bull of St. Luke is an emblem of sacrifice, and the apostle speaks chiefly of our Saviour as priest.

But the eagle of St. John will be the best known of the four emblems, for its constant use as a letter, for which the ornamental wing so admirably adapts it. It is said that St. John goes beyond all other writers in contemplating the divinity of the Saviour, so that eagle soars far above the range of the feather tribes, and gazes with undisturbed eyes upon the noontday sun.

The dove is constantly met with, and represents the Holy Ghost, and sometimes it is hovering over the waters; and again we find it with a branch in its mouth, suggesting the return to the ark, and in this conjunction coming to us an emblem of peace to the world at large.

St. Paul with his sword (the instrument of his martyrdom), St. Peter with his key or keys, and St. Stephen, holding a stone in his hand (some stones in his lap), hardly need referring to, so familiar must they be to all church-goers and we pass on to speak of other saints perhaps less known.

We shall recognise St. Agnes by her lamb, St. Blasius by his iron comb, with which he was tortured, St. Ambrose by his bees (signifying eloquence), St. Augustine by his archbishop's mitre changed with crosses, St. John the Baptist by his raiment of camel-hair. St. Martin never be mistaken, as he sits on horseback dividing his cloak to share it with a beggar. St. Swithin "comes home to us," as no other saint can, as the rain falls thickly around him.

St. Margaret stands on a dragon while throwing a spear into his mouth, and St. Ann will be recognised as teaching the Virgin Mary to read. St. Laurence bears the gridiron, the instrument

of his terrible death, and St. Bartholomew the knife with which he was flayed alive.

St. Giles (the patron of cripples) has a fawn leaping up to him, and St. Michael is generally sword in hand overcoming the Evil One. St. Denis carries his head in his left hand (recording the miracle performed at his death) and a pastoral staff in his right; while St. Faith is known by her brazen bed on which she was half roasted before being beheaded. St. Simon generally carries a fish, and St. Jude a boat, in allusion to their callings. St. Leonard bears chains and fetters, and sometimes a book also. St. Hugh of Lincoln caresses a swan with one hand and holds in the other his bishop's staff.

St. Catherine will be readily recognised by the wheel that bears her name, and sometimes she is treading underfoot the Emperor Maximian, and holding a long sword.

St. Lucy carries a pair of eyes on a plate, and bears the palm branch of martyrdom. St. Nicholas is standing by a tub, from which he is bringing back to life some young children, who had been killed and salted down for eating during a dreadful famine.

St. Jerome holds a lion by the paw, and in this instance the animal represents solitude, and must not be taken for that of St. Mark.

Our Saviour is frequently represented as the Good Shepherd and carrying a lamb on His shoulders. The Lamb of God or Agnus Dei bearing a flag is considered the Christian emblem of purity.

The fish (the Greek word for which contains the initials of the names and the titles of Christ) is one of the very earliest of our Christian emblems, and fishes in general represent chastity.

The letters X and P conjoined are very familiar, and form the monogram of the name of Christ in the Greek and are to be found in the catacombs of the early Christians at Rome; the Vesica is also supposed to be typical of the same thing, but the letters I H S are the more usual monogram, being the three first letters of the Greek word for Jesus.

LETTER FROM BRUSSELS.

BELGIUM is a country, it seems, favourable to the growth of all kinds of societies; it has been said that three Belgians cannot meet without forming a society, and truly, from what is to be seen here, one might conclude that this joke is nearer the truth than one believed.

In point of associations, Belgium possesses numerous archaeological and historical societies which are scattered through the length and breadth of the land, and which study with ardour its archives, its libraries, and its museums. These studies have hitherto been carried on simultaneously in different parts of the country, without having any common meeting ground to give unity to the work, and to arrange the immense quantity of documents already collected.

The Belgian Academy of Archaeology has found that it would be desirable to group all these separate elements in one federation, modelled upon the French Society for the Preservation of Monuments, founded in 1834 by M. de Caumont. The Belgian societies were therefore invited to meet from the 27th to the 31st of August last at Antwerp, to discuss the basis of the new institution.

The meeting was exceedingly well attended, and ended in the foundation of the federation and the adoption of statutes. We shall therefore have annually in Belgium a congress of archaeology and history which will take place successively in each of the great cities.

As we think, the Congress of Antwerp did not give us all that we had a right to expect from a scientific point of view. The greater part of the session was taken up with the discussion of the statutes of the federation. Several very important essays, however, were read. We may particularly mention that of M. Vandengheyn upon the Aryans, that of Professor Kürth upon the rights and duties of archaeological societies, that of M. Alfred Bequest, Conservateur of the Namur Museum, upon the organisation of provincial museums, and, lastly, that of M. Claes, archaeologist, of Antwerp, who gave an account of his researches in the excavations occasioned by the rebuilding of the quays on the Scheldt at Antwerp. This last gentleman exhibited to the members of the Congress a collection of objects of all kinds

found in the Scheldt and brought to light by the dredgers. He had specimens of the arts and industries of nearly all European nations, from the Middle Ages up to our own time.

Numerous propositions again were made, notably one tending to the acquirement by Government of the ancient Meat Market of Antwerp, dating from the fifteenth century, and the ruins of the Abbey of Villers, which include very remarkable structures of the twelfth and thirteenth centuries. These edifices are at present the property of private persons, who have the right to demolish them without its being in the power of any one to oppose them. The Congress also expressed a wish to see the numerous popular country songs brought together in one collection, as well as a list of the "noms de lieux" of different villages. There is really quite a study to be made of this last point, for it involves the bringing to light of the names of fields and of the inclosures which are so plentiful in the villages, an analytical examination of which would be most interesting on account of the comparisons that might be made. Let us note, in conclusion, that the assembly expressed a wish to see an album published of Flemish objects of art of which the authors and dates of execution are known. This would create a series of typical plates of the highest interest, which would without doubt be received with pleasure by the archaeologists and artists throughout the country. That which had been done in this way in England, particularly the work of the Rev. Fred. Creery, "Facsimiles of Monumental Brasses," was spoken of in eulogistic terms. M. Reuseus, professor at the University of Louvain, was elected president of the congress, assisted by a committee of patronage appointed by the Belgian Government. The next congress will take place at Namur in 1886.

We believe that the new institution is destined to further the progress of the science of archaeology in Belgium, a country of which it may well be said that it is a veritable museum.

ACTON SEWAGE AND THE METROPOLITAN BOARD OF WORKS.

THE Metropolitan Board of Works have evidently set their face against all applications from suburban local Boards for connexion with the Metropolitan Sewage System. The Acton Board, for probably the eleventh time, has appealed to the central authority, and to its engineer, Sir Joseph Bazalgette,—who happens to be consulting engineer to the Acton Local Board,—to save the latter from the expenditure of nearly 20,000*l.* in the construction of an effluent sewer to the River Thames in connexion with that parish's new drainage system. Sir Joseph Bazalgette has once more replied that the sewage or the effluent water from the Acton works cannot be allowed to enter the Metropolitan system; and he can suggest no other means of its disposal than by an independent covered sewer with an outfall into the River Thames. It must be admitted that proximity to the Metropolitan sewerage system has proved a serious disadvantage to some of the outlying suburban districts. Several years before the formation of many of the western district local Boards, the Metropolitan Board of Works issued notices, and laid a sewer of sufficient size apparently,—5 ft. in diameter,—for the extension of their system to Acton and Enlery; but the Metropolitan Board of Works, from some cause which does not seem to have been explained, stopped these works of extension when they came to the borders of the Acton parish. But Acton seems to have lost much more at that time than the advantage of a connexion with the Metropolitan system; the Central Authority quietly diverted to their system the Stamford Brook, which had been, it seems, from time immemorial, the sewage outfall of Acton to the River Thames. This diversion would have been a great benefit to Acton if it had been allowed to continue to run its sewage into the central system; but the Metropolitan Board soon applied for an injunction to restrain the Acton Local Board from discharging sewage into their old outlet. In the case tried, the Metropolitan Board were to a large extent successful, as they obtained an injunction, which, though it did not prohibit the Acton Board from putting the sewage of houses then in existence into the central system, it prevented the Acton authorities from disposing of, in this way, any fresh

sewage which came from houses built subsequently to the issue of the injunction. This was tantamount to complete exclusion; for the Local Board could not frame and carry out a new drainage scheme only for new houses scattered over all parts of the parish. Therefore the construction of a scheme for the whole of the parish with new sewers is proceeding. Through the very large powers of the Metropolitan Board, which can divert and assimilate, as it were, to its own system, the original river outfalls of the outlying suburban districts, the Acton Board is now compelled to construct an effluent sewer through Chiswick to the Thames, and pay, of course, that neighbouring parish and many private owners compensation for doing so. The plight in which the Acton Board now finds itself no doubt warrants the extension of some sympathy towards them; but, as some of the members have remarked, the parish should not have been asleep at the time steps were being taken to deprive it of its ancient outfall to the River Thames. It may be observed, however, that Acton seems to have special claims to the consideration and aid of the Metropolitan Board, not only because of this deprivation of outfall, but because the Acton Board are willing to pay a reasonable sum annually for the privilege of disposing of its sewage by means of the Metropolitan system, and to divert to the Thames a large quantity of the rain-water which passes through the water-course in question into the central system, and which adds unnecessarily to the cost of pumping at Barking.

OBITUARY.

Mr. James Ferguson, F.R.S.—We announce with much regret the death of this distinguished writer on architecture, which occurred on Saturday last, at his residence, Langham-place, in his seventy-eighth year. In our leading article this week we have referred at some length to the principal points in his remarkable career. The funeral took place on Thursday, at Highgate Cemetery, and was attended by the Right Hon. Sir A. H. Layard, G.C.B.; Mr. John Murray, F.S.A., of Alhambra-street; Mr. T. H. Thornton, C.B., C.S.I., and Major-General Sir Frederick Goldsmid, C.B., K.C.S.I., representing the Royal Asiatic Society; Mr. A. B. Mitford, C.B., of H.M. Office of Works; Mr. F. C. Penrose, M.A., Surveyor of the Fabric of St. Paul's Cathedral; and the undermentioned representatives of the Royal Institute of British Architects, viz.:—Mr. Ewan Christian, President; Mr. Alfred Waterhouse, R.A., Vice-President; Mr. Octavius Hansard, Member of Council; Mr. J. Macvicar Anderson, Hon. Secretary; Mr. William H. White, Secretary; Mr. Wyatt Papworth; and Mr. Hugh Stannus. Letters were received from Major-General Sir Henry Rawlinson, K.C.B., Sir Edward Colcbrooke, bart., and Sir F. Burton, of the National Gallery, expressing regret at their inability to attend.

Mr. Thomas Albert Waring died on the 6th inst. at his residence, Sutton, Surrey. Originally a pupil of the late Charles Tyrrell, he formed a link between the old and new generation of surveyors. A correspondent writes of him that "though an expert draughtsman, colourist, and student of the Royal Academy, increasing practice early led Mr. Waring into prosaic facts. Probably his knowledge of property law generally, and all the details connected with glebes, was unrivalled. No man was more esteemed for his amiability and for his willingness to impart information to the younger race of professional men. Mr. Waring married a daughter of the late Mr. James Brown, of the firm of Boulton & Watt, and leaves no issue; he retired some years ago from the firm of Waring & Nicholson, No. 55, Parliament-street, of which he was the senior partner."

Tickhill, Yorks.—The large west window of Tickhill Church, which consists of ten chief lights and lofty tracery, has just been filled with stained glass through the munificence of the Misses Alderson, of Tickhill. The window is so arranged in design as to illustrate the entire book of Genesis, from the Creation to the death of Joseph, and it has been designed and executed by Messrs. Powell Brothers, of Leeds, who are also the artists of the five-light east window.

Kirby Hall.—South-East Corner of Inner Quadrangle.

Illustrations.

MR. JAMES BROOKS'S DESIGN FOR LIVERPOOL CATHEDRAL.

THE whole of our lithographic illustrations are this week devoted to Mr. Brooks's design for the proposed cathedral at Liverpool. For an article on the subject, see p. 116, ante.

KIRBY HALL.

The accompanying sketch of the courtyard of Kirby Hall has been forwarded to us by Mr. Henry Drury, as an illustration of an old house which will be of interest in connexion with Mr. Goch's paper on "English Houses of the Seventeenth Century," recently read at the Architectural Association, and printed in our columns. Concerning the building, Mr. Drury writes:—

"This fine example of English Renaissance was built for Lord Chancellor Hatton by John Thorpe, whose plan (preserved in the Soane collection) bears the quaint inscription 'Kerby wherof I layd ye first stone A.D. 1570.'"

The north side and the outer quadrangle were altered by Inigo Jones about the year 1640 in the Italian style, and compare unfavourably with the delicacy of the earlier work. With the exception of a few rooms inhabited by an old servant the mansion is in ruins, having been dismantled about forty years ago. The sketch represents the south-east corner of the inner quadrangle with the central entrance leading into the large hall, and shows its condition in the autumn of 1854."

The Architectural Association.—In view of the proposed Italian excursion, a meeting will be held on Tuesday, the 26th inst., at 9, Conduit-street, at half-past six p.m., when the subject discussed will be "Florence."

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

THE twenty-seventh annual report of this Society congratulates the members upon the continual growth and the unceasing activity of the Society, and expresses a confident hope that the exertions of the Council in the future may both maintain and increase the services of the Society in the cause of art. The main object of the Society is to promote and to increase an intelligent love for the fine arts which adorn and which enoble life. The Society affords a meeting-place for professional artists and for the non-professional but art-loving public. It works chiefly, at present, by means of exhibitions, by means of lectures, and by means of *conversazioni*. The programme for the coming session includes the following items:—Thursday, February 4th, lecture by Professor Kerr on "The Art-Septicism of the Day"; Thursday, February 18th, lecture by Mr. Geo. C. Haité, on "The Tendencies of Modern Art"; Thursday, March 4th, lecture by Mr. W. Cave Thomas, on "The Proportions of the Human Frame"; Thursday, March 18th, Mr. Herman Merivale, on "The Drama of the Day"; Thursday, April 15th, Mr. E. P. Loftus Brock, F.S.A., on "Old Engravings of the Italian Schools"; Thursday, May 20th, Mr. G. A. Storey, A.R.A., on "The Moissoniers in Hertford House"; Thursday, June 24th, Mr. T. H. Maguire, on "The Importance of the Fine Arts to Humanity."

The Indian and Colonial Exhibition.—We are informed that Mr. Sam Deards, of Harlow, has secured the contract for glazing the new buildings at the forthcoming Indian and Colonial Exhibition, South Kensington, for Messrs. Lucas Bros., with some 10,000 ft. of the "Patent Victoria Dry Glazing." Mr. Deards has also been commissioned to erect a large conservatory for the Natal Government for their exotic plants and palms.

THE INSTITUTION OF CIVIL ENGINEERS.

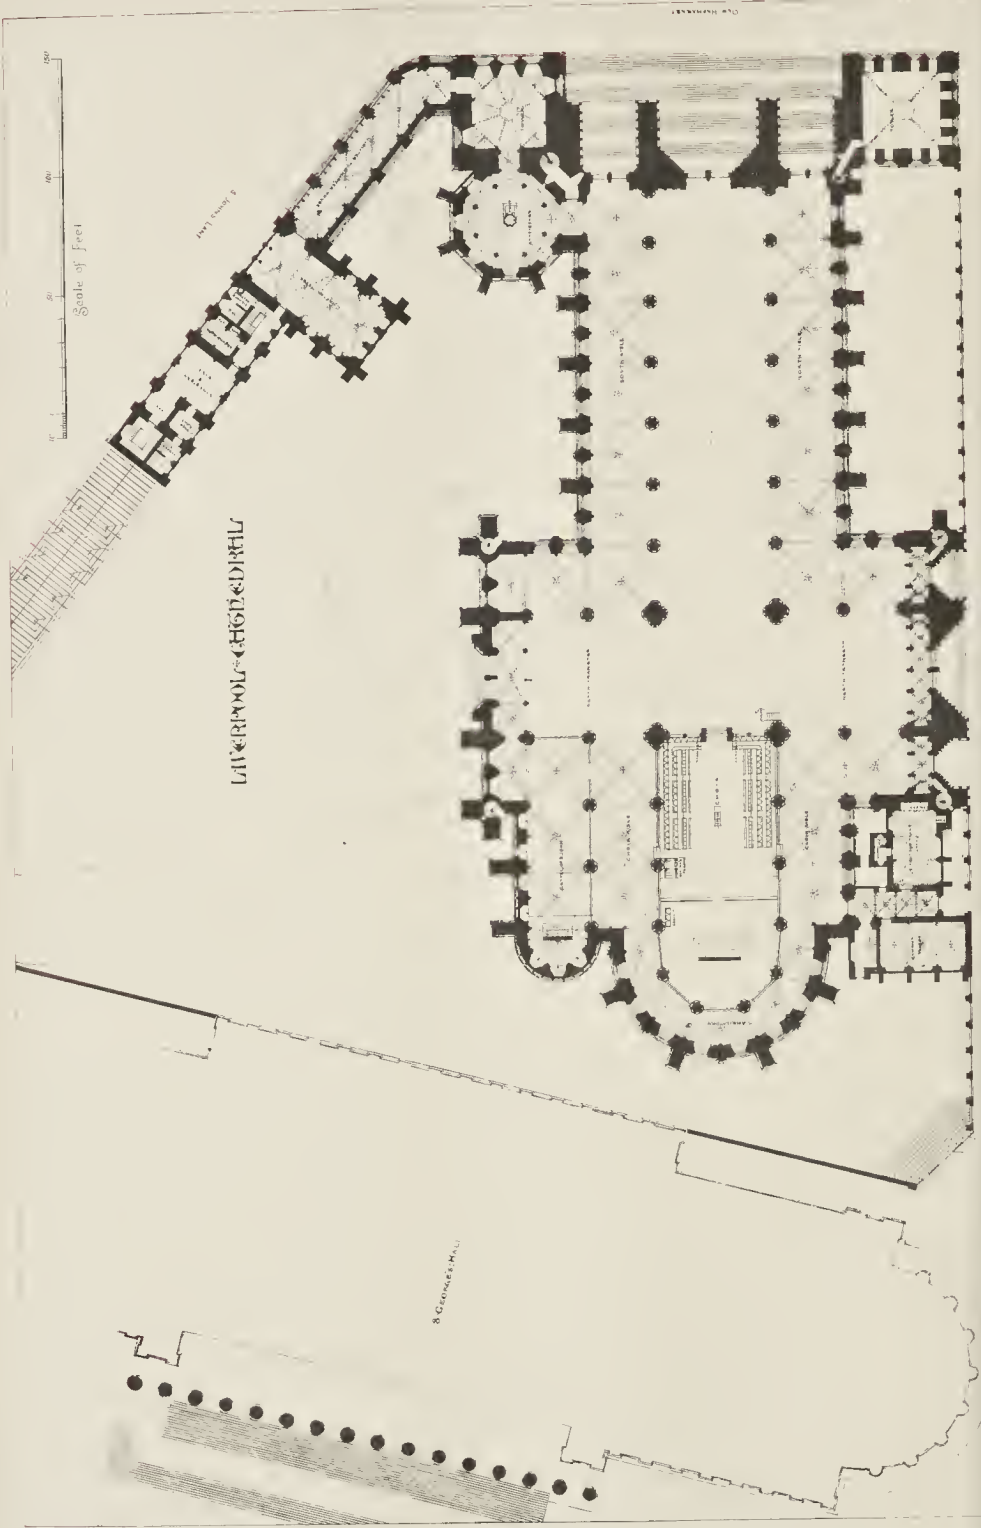

At the ordinary meeting on Tuesday, the 12th of January, Sir Frederick J. Bramwell, F.R.S. (President), in the chair, it was announced that the following nine *Associate Members* had been transferred to the class of *Members*:—William Armitage Brown, Thomas Penn Gaskell, George Andrew Hobson, Walter Pitt, Charles Edward Robinson, William Henry Scott, Henry Francis Sneyd-Kynnersley, William Horon Stool, and Lewis Gordon Tyrrell.

At the same meeting it was reported that the following sixteen candidates have been admitted as *Students*, viz.:—John George Parkley, Arthur Howard Benham, James Bruce-Girdle, Charles Robert Brady, Ernest Canning, Alfred Chatterton, B.Sc.; Thomas Cecil Daniell, Walter John Easton, Charles Frederick Vernon Ford, John Russel Fears, Arthur Edwin Trevillion Lees Harold Medway Martin, Wb. Sc.; Walter Edward May, John Clarkson Phillips Maynard, Philip William Rygato, B.A., B.E.; and James Nasmith Sibthorpe.

The monthly ballot resulted in the election of one *Honorary Member*:—Jean Charles Adolpho Alphan; of three *Members*, viz.:—The Hon. Emmanuel Lewis Galizia, Thomas Monro, and Thomas Forth Rotherham; of thirty-nine *Associate Members*, viz.:—Harvey Bagnall, B.A., Valentino John Stuart Bloomfield, Harry Bundred, Walter Longley Bourke, William Henry Brinckman, S. Ud. Inst. C.E., Thomas Canning, Arthur Carey, David George Phillips Davies, William Dawson, Stud. Inst. C.E., Ernest Augustus Pawcins, John James Constant Fernan, James Glover, B.A., Andrew Eaton Gray, William Hellier Hutchinson, William Hutchinson, Robert Edward Jones, William Kingston, George Maxwell Lawford, John Randall Mann, Harold Morse, George Tod Ogilvie, Stud. Inst. C.E., Thomas Cassinet Palmer, Stud. Inst. C.E., William Penman, Thomas Sydney Palfrey, Henry James Price, Alfred Bassoms, James Stafford Ransome, Stud. Inst. C.E., David Campbell Rattray, Hunt-on Reah, Thomas Blair Reynolds, Stud. Inst. C.E., Hugh Savage, George Herbert Shaw, Wb. Sc., Stud. Inst. C.E., Edward Stables, Stud. Inst. C.E., George Richardson Strachan, Robert Henry Taylor, Gilbert Kennedy French, Walter Frederick Winter, B.A., Stud. Inst. C.E., James William Welch, and John Wilborg; and of two *Associates*, viz.:—Henry Dulton, and William Hunter, J.P., F.G.S.

TRIFORIUM PLAN

THE TEMPLE OF SOLOMON.*

The Evidence of Josephus.

BEFORE we turn our attention to the third or Asiatic section of the subject, it may be desirable to notice some of Josephus's exaggerations, because of the use made of them to the prejudice of the simple description given in the sixth chapter of the 1st of Kings.

As already noticed, the Jewish historian affirms that the Temple was not 30 but 60 cubits in height, or twice the height given in Kings; and, not content with that, raises another Temple of equal dimensions above it, and thus the total internal height is made 120 cubits, or 180 ft.

The side chambers he also makes four times the height given in Kings. He speaks of no windows, but he gives the correct height to the pillars, though Chronicles seems to double that given in Kings; but they are three times mentioned as 18 cubits high,—twice in Kings and once in Jeremiah.

I have drawn to scale the description in Josephus. Its incongruity is obvious, and needs no comment.

Mr. Fergusson notices Josephus's propensity to double every dimension he can without detection. I have shown, and proceed further to indicate, where he has quadrupled them, as in the quotation made at the opening of the paper, in reference to the height of the enclosure walls above the valley.

The Book of Kings gives the height of the sanctuary and of the oracle, of the side chambers, and the pillars in the porch, the chapters and the cherubim, the length of each wing, and the distance between their extremities; but the height of the perch itself is not specially stated, but no one has made it less than the sanctuary, though he might very reasonably have done so.

The Book of Chronicles makes no mention of the height of the sanctuary, the oracle, or the cherubim, and the side chambers are omitted altogether; but every height that is mentioned is stated in such a way as to double or quadruple the measures given in Kings. For instance, the pillars are stated to be twice the height given in Kings, but, as suggested by Mr. Fergusson, and by Professor Wilkins before him, it is possible that Chronicles gives their united height in one measure, and I think this highly probable; at all events, let us apply this rule of interpretation to the other apparently exaggerated dimensions, and see the result.

In the 11th verse, 3rd chapter, we read, "And the wings of the cherubim were 20 cubits long." If the description had ended here, it would also have been opposed to the record in Kings, which states them to have been 5 cubits long; but just as the height of the pillars was multiplied by their number, so the length of the wings by their number.

Again, in the 13th verse, it is said that the wings of the cherubim spread themselves forth 20 cubits, or twice the width given in Kings. But in this case the explanation is given, and it is added, "One wing of the one cherub was 5 cubits, reaching to the wall of the house. The other wing was likewise 5 cubits, reaching to the wing of the other cherub," &c.

Thus, when giving the length of the wings of both cherubim, the united length of the whole four wings is given in one dimension,—a peculiar mode of expression, and calculated to mislead, where no explanation is given, as in the case of the pillars. But when taken singly a correct single dimension is given, which, in every case agrees with the Book of Kings, as in the case of the chapters, of which it says, "And the chapter that was upon the top of each of them was 5 cubits," the same as in Kings.

Let us apply the same rule of interpretation to the 3rd verse, 3rd chapter, of Chronicles, "And the porch that was in front of the house, the length of it was according to the breadth of the house 20 cubits, and the height was 120, and he overlaid it with pure gold."

That is to say, the height of each side of the porch which he overlaid with pure gold was 30 cubits. By adding together the height of each side of the porch, just as we added the two pillar heights and the four wing lengths, we get the figure 120 cubits as the result.

In this way the Book of Chronicles would seem to confirm the Book of Kings, and ought not, therefore, to be quoted in opposition to it.

Now, I think, it is not improbable that Josephus took advantage of this peculiar mode of expression, and invented the upper house, which is nowhere mentioned in the Bible, to elevate it to the height of the porch seemingly posed, really did build a talar, or an upper chamber to his Temple, additional plausibility was given to the notion, and his chance of detection decreased in like proportion. We may rest assured that none of the Jews would take the trouble to prove that the Temple of their greatest sovereign was less glorious than he stated it to be.

As a set-off to this exaggeration, he makes the cherubim only half their real height, or five cubits; but this was too much to give up without taking something in return, so while the Bible says they were made of "olive trees," Josephus declares they were of "solid gold!" The author of the article on Jerusalem in the "Encyclopedia Britannica" has also given too indulgent an ear to the story of Josephus, and in the "Biblical Atlas," published by the Religious Tract Society, the same errors are repeated and circulated.

Adopting the larger cubit measure of 1 ft. 9½ in., it is stated that, "A porch extended along the whole eastern front of the house, which rose to the height of 210 ft. At its entrance were two great pillars, 60 ft. in height."

In fact, it is affirmed that the porch, of which the whole internal depth was 10 cubits, rose to a height exceeding by several feet the hall of fire crowning the Monument of London; and this, be it remembered, was entirely overlaid with pure gold!

It is correctly stated, however, that the Oracle or Holy of Holies of Solomon's Temple, like unto the Tabernacle, had no light, neither windows nor candlestick, and if it had had the one it would also have had the other. But "the Lord had said that he would dwell in thick darkness."

The sanctuary was lighted by ten golden, seven-branched candlesticks during the night. The necessity for windows of some kind during the day is made obvious by the fact that the candlesticks were not lighted till the evening, and remained alight only till the morning.

The command first given in Exodus is repeated in Leviticus as follows:—

"Aaron shall order it from the evening until the morning before the Lord continually," that is, continuously; every successive evening they were "to bring the pure olive oil beaten for the light to cause the lamp to burn."

Thirdly. *The Asiatic.*

Mr. Fergusson, in his "Asiatic Inquiry into the true Principles of Beauty in Art," published in 1849, makes the following remarks:—"If we take the whole breadth of Asia, from the Indus to the shore of the Ægean Sea, there does not exist in that vast, and at one time highly civilised, tract, one single remain of an ancient native temple. There are remains of the palaces of Babylon, and Nineveh and Persepolis, and tombs in thousands, hoth cut in the rock and structural. But of temples we only know that a temple or pyramid of Belus existed at Babylon, one dedicated to Hercules at Tyre, and a small temple at Jerusalem, concerning which we are entirely left to the verbal descriptions in the Bible."

The attempt to explain the peculiarities of the Jewish Temple by a reference to Egyptian art, Mr. Fergusson is convinced will be found to be a mistake, for he says, "There is no feature in the whole history of the Jews, ancient or modern, so remarkable as their persistence in their own singular nationality. Nothing can be more strikingly distinct than the difference between the Jewish and the Egyptian institutions.

The former never used a hieroglyph, either as a letter or the representative of a thing; on the contrary, from the very first we find them an alphabetical people, despising symbolism in all its forms, and their religion, so far from being polytheistic, or of admitting of animal worship like that of the Egyptians, was the simple and sublime monotheism of the pure Semitic races from the earliest times to the present day.

There are few things, however, in their Temple and few symbolical expressions in the Bible, which may not be explained by a

reference to the sculptures of Nineveh and Persepolis, or the general modes of art or expression current upon the Euphrates" (see illustrations in last week's number).

In this early work to which I have referred, Mr. Fergusson restored the plan and section of the Temple as he then imagined it, which was not unlike that of Canina's restoration, except that he took the height given for the sanctuary as the external instead of the internal, in which, I think, he was wrong. He also diminished the thickness of the walls, and supposed the side chambers to have been open or closed galleries encircling the house, and continuing on either side in line with its face to the front, at which point he makes the following remarks:—"When we come to the porch or eastern façade the difficulties are so great that I question if they will ever be quite explained. The width of the porch was 20 cubits, the same as the house, its depth 10 cubits. The height is not given in Kings, but in Chronicles it is called 120 cubits. And the same book makes the height of the two pillars 35 cubits, while the book of Kings says they were only 18 cubits, showing that the one authority used the whole linear dimensions of the two objects instead of giving the height of each, which may also help us to the fact that there were two towers of 60 cubits each."

I have already shown that no real contradiction exists between the two books, but that Chronicles is confirmatory of Kings in every particular.

Mr. Fergusson proceeds to show that the raised platform upon which the Temple stood was remarkably similar to those which supported the buildings at Persepolis and Passargarde.

At Passargarde the platform occupied the declivity of a hill, exactly as the platform of Solomon's Temple did, having one bold and broad face rising from the plain, and two lateral ones sloping back till they met the level of the hill. The similarity in area and the remarkable resemblance in the masonry was to be observed, while the perplexing points in connexion with the chambers or cells surrounding the house, seemed to him almost set at rest since the exploration of the Palace of Darius, which brought to light the chambers surrounding the inner room.

But there remains to be noticed one peculiarity, which Mr. Fergusson believes to have existed and to have formed an essential part of the fabric, and here Mr. Fergusson shall speak for himself. He affirms that "The Temple at Jerusalem had an upper story of wood,—a talar, in short,—erected over the lower one in stone. It is true," says he, "the Bible does not mention it, but Josephus does, and with such circumstantial evidence to support it, that I conceive there can be little or no doubt about it. He first mentions it in describing the Temple as built by Solomon, and after saying 'it was 60 cubits long, 20 broad, and 60 high,' he adds, 'on the top of this was another edifice of the same dimensions,' so that the total altitude was 120 cubits." Mr. Fergusson confesses that the object the Jews had in its construction is not very evident, nor the purposes to which they applied it, and I have already exposed the incongruity of Josephus's suggestions. In his concluding remarks in 1849, Mr. Fergusson says that, "All analogies drawn from any Egyptian buildings have failed, and those derived from Classical architecture only serve to show how men may deceive themselves on such a point. An Assyrian Temple would, of course, be the best illustration, but still that is found the Persepolitan may suffice, and indeed leave very little to be desired."

In a subsequent work, entitled "The History of Architecture," Mr. Fergusson gives a plan of Solomon's Temple, which differs from his former one, as illustrated in the "Principles of Beauty." In this new plan he not only adds the chambers, instead of galleries, but places a double row of pillars to support the roof, after the Assyrian and Persepolitan examples. He says nothing about the talar, or the two towers, 75 ft. high, but concerning the internal columns, observes, "No pillars are mentioned as supporting the roof, but every analogy, as well as the constructive necessities of the case, and the fact of the existence of the two pillars in the porch, would lead us to suppose they must have existed,—four in the Holy of Holies and eight in the pronaos." (See illustrations in last week's issue.)

Mr. Fergusson does not say whether these

* Continuation of a paper by Mr. Edward Cookworthy Robins, F.S.A., entitled "A Review of the various theories respecting the Form and Style of Architecture of the Temple of Solomon," read before the Architectural Association on January 1st, 1886. See p. 104, ante.

internal pillars were of bronze or cedar, but he says, "We must recollect that this was the bronze age of architecture. Homer tells us of the brazen house of Priam, and the brazen palace of Alcinoos. The treasures at Mycenæ were covered internally with bronze plates, and in Etruscan tombs of this age metal was far more essentially the material of decoration than carving in stone or any of the modes afterwards so frequently adopted. The altar of the Temple was of brass, and the molten sea supported by twelve brazen oxen. The bases, the lavers, and all the other objects and implements in metalwork were in reality what made the Temple so celebrated, and comparatively little was done to the mere masonry, by which we should judge of a Christian church or any modern building."

The latest opinions of Mr. Fergusson, after studying the subject on the spot, are given with his usual exhaustiveness and fulness of illustration, in that remarkable work published in 1878, entitled "The Temples of the Jews," wherein he treats the whole subject from the Tabernacle in the Wilderness to the glorious Temple at Jerusalem, built by Herod about a century before its final overthrow.

The only illustrated works at all comparable with Mr. Fergusson's are those of Canina and Count de Vogüé. And, while admitting the grandeur of the Herodian Temple by the latter (which requires the whole area of the modern Haram area for its display, and the summit of Mount Moriah for the site of the Sanctuary itself, tempting one to wish it might be true), it is based on fancies which do not appear to me fairly deducible from the premises, as I have already shown.

Mr. Fergusson states his case very clearly in the new volume, and maintains his view that the Temple of Solomon was the petrification, as it were, of the Tabernacle extended to double the sizes, the total length being 90 cubits by 45, including the stone walls which did not exist in the Tabernacle. The verandah in the Tabernacle becoming the series of small chambers surrounding the Temple three stories in height.

He now thinks there were but five chambers on each side, and three at the end on each story, making thirty-nine in all; the total height of the chambers, including the thickness of the roofs, being about 20 cubits, or about the same height as the Holy of Holies, so that they did not obscure the windows of narrow lights required for the upper portion or clear-story walls of the Holy Place.

Constructional reasons, as well as others, give colour to his addition of internal pillars to support the roof, in the spaces between which the bases, lavers, tables, and candlesticks were placed, five on each side.

Mr. Fergusson now suggests that the pillars were not of bronze, but were the "pillars of almsgiving trees," which Solomon made for the house, and from which Hezekiah took the golden shields to give to the Assyrians. Mr. Fergusson was not the first, however, to suggest the internal pillars; while reading in the British Museum many years ago I stumbled on an old sketch-book containing a drawing, entitled "Young Wilkins's first Sketch of the Plan of the Temple of Solomon"; it was dated 1805. I have given it among my illustrations, the pillars are shown with the tables between them. In the restoration, as I have imagined it, I have made them take their position in line with the cherubim which stood on either side of the Ark, as indicated in Canina's design, and centering with Jaclin and Boaz in the porch (see illustrations in last week's issue.)

Mr. Fergusson still thinks that the 120 cubits given as the height of the porch in Chronicles, was only a duplication of the real height, from which he argues two towers 60 cubits high each, occupied by stairs which project on each side of the porch and give access to the chambers and to a room above the Sanctuary, which he thinks may have existed, and which he calls a talar, similar to that which Josephus describes, and which is so conspicuous a feature in Mr. Fergusson's restoration of the Temple of Herod. But he has only made this upper chamber 15 cubits high, not 60 cubits, as Josephus enjoined.

With reference to the pillars in the porch, called Jaclin and Boaz, Mr. Fergusson has hit upon an original interpretation of great ingenuity, which is one of the curiosities of his latest work; he now thinks it as absurd to imagine that they were huge bronze pillars

with exaggerated capitals, as that they were bronze obelisks, and prefers to consider them as detached from the front of the building, forming a screen or gateway like the vine-bearing screen described by Josephus and the Talmud as existing in front of the Temple of Herod, a design for which he offers, based on the Japanese and Indian torii, like those forming gateways to the Great Tope at Sauchi.

"My impression is," says Mr. Fergusson, "that the frontispiece prepared by Hiram for Solomon's Temple consisted of two pillars of bronze, placed 12 or 14 cubits apart, and probably not more than 1 cubit in diameter, and that they had capitals 3 cubits in height and on them were placed two beams or frames of bronze each 5 cubits in height. The Septuagint calls them 'epithemata,' which cannot be construed as capitals, but may reasonably be applied to such a beam."

In this way Mr. Fergusson finds space for the net-work and chains and pensive work, and the 400 pomegranates, 100 in a row. But, nevertheless, the porch itself is denuded of its columns.

It is curious to observe how the Grecian architect Wilkins, and the Indian architect Fergusson, respectively interpret the word epithemata, each seeing just what he wants to see and establishing its probability, but neither is supported by King's; and the resolution of the problem is yet to seek. Nevertheless, I must frankly confess that the more I study Mr. Fergusson's arguments in favour of his latest restoration, the more difficult it becomes to resist the logic of his conclusions.

Mr. Lewin takes the Asiatic side, and gives unqualified adhesion to the views expounded by Mr. Fergusson on the point of style of architecture.

Personal Conclusions.

For my own part I think with them, that it is to Asia and not to Africa or Europe we must look for the true architectural type. Nor, indeed, for the form and arrangement of the plan, this was emphatically Jewish, but for the style and forms of art adopted in details and accessories.

I think with them, that whatever was the character of the arts in Tyre, the Temple of Solomon partook of that character.

A Tyrian architect and Tyrian artisans were employed in the design and construction of the buildings at Solomon's own request, for he expressly stipulates with Hiram, the contemporary king of Tyre, that Hiram's servants should be with his servants, "For thou knowest," says he, "that there is not among us any that can skill to hew timber like unto the Sidonians."

Thus the style of art prevailing at the period in the capital of Phœnicia would, doubtless, be stamped on every part, and we are interested to know what may have been the style peculiar to Phœnicia, if indeed it was peculiar to it, seeing that there are no remains of native art existing which can be safely depended upon. What, in short, was the type of Phœnician architecture?

I think that they were not indebted to the Egyptians, but rather that they drew their ideas of art from the regions whence they migrated, and with which they held important commercial relations. Their own traditions affirm that they came from the shores of the Persian Gulf, and settled on the eastern shore of the Mediterranean sea, and immediately undertook distant voyages. Their literature has a close affinity with the Hebrew, and to them is attributed the invention of letters and their introduction to Greece.

In the Rev. Mr. Kenrick's work on Phœnicia, published in 1855, he says:—"The recent discoveries at Nineveh have brought to light inscriptions in the Phœnician character, along with others in the Cuneiform, proving an intercourse between Phœnicia and Assyria in the flourishing times of the empire of Nineveh."

Their religion, too, was closely allied to the Sun and Planet worship of the Persians, Assyrians, and Babylonians, and their Temple arrangements must have been very similar. The Jews came from Northern Mesopotamia, and the Phœnicians from Southern Mesopotamia, and both practised the rite of circumcision.

Hiram was ever a lover of David, but Pharaoh was a jealous rival, whose ambition was only temporarily satisfied by the matrimonial alliance with Solomon; and it seems scarcely probable that Hiram would have taken the same interest

in the work, if Solomon's temple had been a mere reproduction of an Egyptian fane. In Solomon's time Tyro and Sidon had reached an unparalleled pitch of commercial greatness, and Mr. Kenrick observes, "The friendship of Hiram was essential to Solomon in carrying out his own commercial enterprises."

On the north, Solomon's reduction of Hamath, his building of Baalath and Tadmor in the Wilderness, considerably increased the facilities of traffic already existing between Damascus and the Euphrates, the Tigris, Nineveh and Babylon.

The artists Hiram furnished to Solomon, for the construction and adornment of his Temple and palace, represented the skill of the nation; comprehended every branch of art, working in gold and silver, in brass and iron, in purple and blue, in stone and timber, in fine linen and in the engraving of precious stones.

Phœnicia had inexhaustible supplies of cedar and fir. Hence it was natural that wood should be the prevailing material of Phœnician architecture, whilst it was almost banished from that of Egypt. All the internal work of Solomon's Temple, instead of sculpture, was carved work, of olive wood, cedar, and gold.

"The characteristic ornaments were of native origin," says Mr. Kenrick. "The pomegranate is not an Egyptian fruit. The gourd, whose swelling fruit supplied the place of the egg-moulding in Greek sculpture, was a native of Palestine. The palm and the Lily belong quite as much to Phœnicia as to Egypt. Nevertheless, within the limits of Phœnicia itself the only architectural remains which can be clearly referred to that people are foundations of walls, which from the bevelling of the joints are supposed to be Phœnician."

The closest approximation to what Phœnician art may have been, appears to be realised only in the remains of Assyrian and Persian art. Acting upon this theory, first expounded by Mr. Fergusson, I, many years ago, linked together in the sketches before you various architectural details, gleaned from the examples at Nineveh and Persepolis, adapting them to the requirements of the Temple of Solomon; but, of course, the design is but a suggestive compilation, a sort of inductive solution, yet another example in this study of architectural comparative anatomy, which I have purposely left unaltered, except as regards the internal pillars, the only addition to my original design (see illustrations).

The age of the Assyrian palaces has been variously estimated; some of them, however, are admitted to be from six to thirteen centuries before Christ; while the Persepolitan examples arose subsequently to the accession of Cyrus to the Persian throne in 550 B.C.

The points of similarity between Assyrian and Persepolitan art are sufficiently well known, especially since Mr. Fergusson completed his remarkable restorations of the former by the latter, yet I have sketched a sculpture or two to illustrate the fact; for instance, the celebrated four-winged figure of Cyrus at Passargarde, with its inscription, "I am Cyrus the Archæmenian," contrasted with one of the four-winged figures of Assyria from the Khorsabad Palace. Also the winged bulls in the hall of the Xerxes at Persepolis, contrasted with a winged bull from Nimroud. The identity of the style is obvious.

The walls of Persepolitan buildings, however, were not like the Assyrian palaces, cased in sculpture of alabaster slabs, but only the door posts and lintels, and window openings. The wooden roofs of both Assyrian and Persepolitan palaces have perished, but in the latter the stone pillars sustaining the same remain in great numbers, and of various design, which may reasonably be supposed to have been first employed and brought to perfection in the timber pillars of Assyrian buildings, an adaptation of which I employed in restoring "Jaclin and Boaz." Hiram may have executed some thing akin to them in bronze, just as the Persepolitans afterwards did in stone.

The arrangement of these pillars in the porch of the Temple is precisely similar to the Persepolitan, the brazen network and pomegranate encircling the capitals and hanging over the Lily-work, being most probably an original device of the Sidonians, so celebrated for their work in brass, unless we accept Mr. Fergusson's ingenious theory of an independent gateway "Toran."

With respect to the side chambers, I Vibara at Adjuntah, and the palace of Dari.

as restored by Mr. Fergusson, make these cells appear not so singular after all; and possibly they formed a series of strong rooms wherein were stored the various utensils required at the sacrifices and services of the Temple, which must have been stowed away somewhere, and may be referred to by David, when speaking of the "Treasures and upper chambers and inner parlours thereof." Doubtless it was in one of these that Hilkiah found the book of the Lord in the reign of Josiah.

In the construction of the platform upon which the Temple and its courts were reared, the vast number of workmen must have been chiefly engaged. The outer portions of the raised platform being sustained on artificial constructions carried up from the rock at the base of the hill. The similarity in the masonry of the retaining walls of the platform, which is supposed to be visible at the south-eastern angle, and at the Wailing Place and elsewhere, to those existing at Passargard and Persepolis, and all Assyrian buildings, is very remarkable.

The courts of the Temple, as restored by Canina, cover an area of about 600 ft. by 400 ft. Mr. Fergusson thinks this much more than Scripture warrants as existing at the time of the dedication, at all events, who gives about 450 ft. by 350 ft. only to Solomon's time, but reaching in Herod's time to 600 ft. square. It is very probable that Solomon and his successors made many subsequent additions and improvements, but it is extremely doubtful whether the phrase, "Solomon built Millo," can possess the wide meaning given to it by Mr. Lewin, who claims the whole haram area, 1,500 ft. by 950 ft., as belonging to Solomon's time.

The court of the priests, the middle court before the house, and the great court surrounding them are each described in Chronicles, and seem to indicate no more, than Fergusson or Canina have shown.

Mr. Lewin, in his "Siege of Jerusalem," p. 255, says, "The space thus enclosed by Solomon for the outer Temple was a square, each side measuring a stadium. The dimension which the outer temple preserved to the last; within this square was another raised platform, and within that another platform still, upon which was the sacred edifice itself. These successive terraces were in imitation of the Assyrian style of architecture, which, at that time, prevailed more or less over all Syria, and particularly at Tyre."

It is said that Solomon made "a brazen scaffold 5 cubits long and broad, and 3 cubits high, and set it in the midst of the court, and upon it he stood and kneeled down on his knees before all the congregation of Israel." Therefore, the inner courts can only have been then enclosed by low walls, if any at all, else how could he have been seen by "all the congregation."

I have already referred to Canina's restoration of the brazen utensils, which were, doubtless, not dissimilar to those depicted on the arch of Titus.

I have only now to draw your attention to the details of Assyrian and Persepolitan architecture, which I pieced together in composing the design exhibited, which, as I have said, was made by me some twenty-eight years ago, and though it does not solve the problem, it remains as a record of an early attempt to do so.

The doors and windows are from the palaces at Persepolis. The upper and crowning members of the cornice are from the tomb of Baris. The lower members from the Pavilion in the Khorsahad sculptures; the similarity of the arrangement of which with the porch of Solomon's Temple is remarkable. The lower cornice is from the bas-relief El-tell-Arnarna, and from the stylobate of the Temple at Khorsahad. The enrichments are from the pavement and other details from ornamental pottery at Kouyunjik. The pillars are from Persepolis, with adapted capitals and network, &c., complete, *apropos* to which are the lines with I close my paper:—

"Godliness with contentment, these be the pillars of felicity.

Jachin, wherewithal it is established, and Boaz, in the which is strength.

And upon their capitals is Hy-work, the lotus fruit and flower.

Those fair and fragrant types of holiness, innocence, and beauty.

Great gain pertaineth to the pillars, nets, and chains of wretched gold.

And they stand up straight in the Temple porch; the place where glory dwelleth."

The President (Mr. R. Pink) in inviting discussion on the paper said that it was a most interesting one, illustrated as it was by the many drawings on the wall, and it showed evidence of great research and study.

Professor Kerr said that the subject was a very interesting one, and one which every architect of intelligence at some period of his life might expect to speculate upon. The idea that those in the room had probably derived from Mr. Robins's description of the various designs was that the Temple was a structure of stone, more or less ornamental, elegantly designed and covered in with a roof, used as a place of worship, and being surrounded with great courts in which the people assembled. Now in the time of David, the Jews were still almost entirely nomads, but David settled in Jerusalem, where he built a house.

In order to do this, he sent to Tyre, where the arts were in something like an advancing condition, there being no arts amongst the Hebrews. By the help of the Tyrians, therefore, he constructed that house. Now, there were two historical types of house-building. One was the Gothic hall, which was covered in by a roof, and the other was the Eastern Court, which was primarily an enclosure by a wall. The house which David built was an enclosure of this kind, with timber buildings inside. Although David desired to build a temple for the worship of God, he was not permitted to do so, because he was a man of war, and it was left to his successor to carry out the work. Solomon proceeded to build a temple. He afterwards built a palace for himself, the plan of which they pretty well understood to be a more court-yard enclosing a Hall of Justice and certain chambers, which, however, were scarcely used for a residence, in the present sense of the term. When Solomon proceeded to build his Temple to God he sent a message to Tyre in something like these terms:—The Tyrians far excel the Hebrews in respect of the hewing of timber. The Temple was, therefore, very much of a timber structure. It would have been surrounded by a plain wall of stone, or the stonework might merely have been the foundation of the enclosure. It was on a small scale, but it was the best that the people of the time could think of, and more than they could accomplish, because they had to go to their neighbours to get it done, and when it was finished it was no doubt very highly esteemed. This was about 1,000 years before Christ.

When the Temple was built, Solomon built his own house; and then again he went to Tyre, and engaged men who were skilled in the hewing of wood. They collected trees, and converted them into timber, and carved them, but the carving must have been very rude. The Jews were subsequently carried captive to Babylon, where they remained for many years, but they afterwards returned under the command of Zerubbabel, who was a priest,—not a king,—and then the second Temple was built, 500 B.C. That Temple was not now in question, and he did not know that they really understood so much about it as they might do, except that it was merely a sort of reproduction of the old one, but with different dimensions. That Temple was destroyed by the Romans, and a third temple was built called Herod's Temple. That Temple was a piece of Roman architecture, there was no doubt. With regard to Solomon's Temple, one of the drawings on the wall made it a Greek temple, while another drawing gave it as Egyptian. He contended that it was neither the one nor the other. He advised his hearers, when they came to study any science, that they should dismiss from their minds, imperatively and for ever, everything like wonder or surprise, or astonishment or any such emotion, which was in a degree temporary aberration of mind. They must look at the matter perfectly plainly, frankly, dispassionately, and coolly, or they would never arrive at a scientific conclusion. He would impress upon those present that in dealing with all buildings of remote Asiatic history, they must remember that they were dealing with courts and not with covered huts. In conclusion, he proposed a hearty vote of thanks to Mr. Robins for his paper.

Mr. Bickman seconded the motion, and said one point that had been brought out was that there was much more of timber construction in the Temple than they had been accustomed

to suppose. Those designs showing great masonry columns and magnificent bases of stonework were probably a little beside the mark.

Mr. R. Phené Spicers remarked that there was absolutely nothing remaining of the buildings which those illustrations and restorations were intended to show. The natural tendency in all ages had been to restore buildings to a certain extent in the style with which one was most familiar. It was difficult to imagine how any one could have proposed such restorations for the Temple in question. The style given by Mr. Robins represented a much later style than was supposed to exist in the time of Solomon; he had taken his principal elements from some 500 years B.C. There was no doubt that the first efforts of any nation to make an architecture for themselves must have been of the very simplest and ordinary kind. In his opinion not only workers in wood, but masons were brought from Tyre to construct the Temple, the latter of whom made the sub-structure. At any rate, the architecture of the Temple was of the slightest possible kind, and it must have been in wood covered in metal plates.

Mr. Stannus expressed the interest which all must feel in anything which tended to throw light on the topography, plan, or style of the Jewish temples. Some years ago he had the honour of drawing the plan of Herod's Temple for Mr. Fergusson, for the fine book to which Mr. Robins had referred, and he had then gone through all available authorities on the subject. By taking these three groups, (a) the Bible and the "Wars" for the historical incidents, (b) the Middoth and the "antiquities" for the plan, and (c) the existing site for the topographical facts, he believed it was possible to arrive at a very probable restoration for Herod's Temple. Then we might work backwards, through Zerubbabel's, to the one under discussion,—Solomon's.

Mr. Stannus went through the arguments showing that Herod's Temple enclosure was a square of 600 ft. at the south-west angle of the Haram, and that the "Mosque of Omar" could not have been included in it. Further, he supported Mr. Fergusson's theory that this mosque is the Church of the Holy Sepulchre, erected by Constantine over the burial-place of the Lord; and in reference to the change of its locality from the Haram area to the site of the Church of the Holy Sepulchre, in the town of Jerusalem (for the benefit of pilgrims after the Haram was closed against Christians), he reminded the members of the Association how in Verona the demand of visitors for the tomb of Juliet had created the supply. Another instance of possibility of change was that of the American, who wished that the birthplace of Shakespeare might be "moved up nearer to the metropolis." Having once settled the position of the altar and the Temple walls in Herod's time,—which he thought could be established within very small limits of variation,—he contended that, since these points were identical in the successive rebuildings, it was easy, by working from the central axial line, to plot out the position of Solomon's Temple on the site. As regards the style, while agreeing with Professor Kerr that too much advance in architectural refinement was not to be expected from a people recently emerged from a migratory life, he thought it was clear that the outer walls were of hewn stone, and not merely of wood, as suggested by the learned Professor. From the sixth chapter of Kings we learn the house was built of stone, and wainscoted with cedar panelling, so that no stone was visible inside. The wood was easily carved, and would lend itself to the Assyrian style of decoration, and the lavish use of gold is also more Assyrian than Egyptian. The Phœnicians, who were the carriers for the world, acted as the connecting links. And the Hebrew nation was really of the same family as the Arabs, Chaldees, Phœnicians, and Assyrians, as is seen by analogies of language; hence there was more sympathy and more likelihood to be similarity of style between Jews and Assyrians than with Egyptians. He concluded by thanking Mr. Robins for his exhaustive treatment of the subject, and the very complete collection of illustrative diagrams, and he expressed his regret, in which he was certain all would share, that the serious illness of Mr. Fergusson was likely to prevent his taking any interest in what had been said that evening.

The vote of thanks was then agreed to, and Mr. Robins briefly replied.

ARCHITECTURAL ETHNOGRAPHY.

The following is a summary of Mr. J. Spencer Hodgson's paper on this subject, read before the Manchester Architectural Association on the 5th inst., as briefly mentioned in our last:

Ethnology, while constituting a complete and most interesting study of itself, is, as applied to Architecture, the means of bringing before us what effect the religious, political, and social influences had upon the development and typical characteristics of architecture by the earlier races of mankind. As the object of introducing this subject is not to write an essay on ethnology, but to render the history of architecture interesting and intelligible, it will be desirable to avoid all speculation as to the origin of mankind. All that is necessary will be to point out the typical features of the four great building races,—the Turanian, the Semitic, the Celtic, and the Aryan. Prehistoric man has been divided and arranged into three great groups or periods. The first was called the Stone age, from the rude race who then peopled Europe having no knowledge of the use of metals. All the cutting parts of their implements were formed of flint or hard stones. The second, the age of Bronze, from the people having a knowledge of the use of copper and tin, from a compound of which their weapons and tools were formed. The third, the Iron age, from the people having a knowledge of the use and properties of this metal. The typical Turanians in the old world were the Egyptians,—in the modern, the Chinese and Japanese; and to these we are, perhaps, justified in adding the Mexicans. No Turanian race ever rose to the idea of a God external to the world; their government was a despotism. This race never distinguished itself in literature. As architects they were unsurpassed, and in Egypt alone have left monuments which are still the world's wonder. From the fact of their gods having been kings, and after death still only considered as influencing the destiny of mankind, their temples were exaggerated palaces. Even more sacred, however, than their temples were their tombs. They possessed an extraordinary passion for coloured decoration, and an instinctive knowledge of the harmony of colour. In sculpture they were not so fortunate; it was not sufficient that a god should be colossal, he must also be symbolical; he must have more arms and legs, or more heads, than common men; he must have wings and attributes of power. In science they most distinguished themselves in engineering, their artificial irrigation works being remarkable. The Semitic races principally developed themselves in the small tract of country between the Tigris, the Mediterranean, and the Red Sea. The great distinguishing tenet of this race, when pure, is and always seems to have been in the unity of God, and his not having been born of man. Their government was never quite republican; when in small nuclei it was what is generally called Patriarchal. In larger aggregations the difficulty of selection made the chiefship more generally hereditary. Possessing a complete alphabet their literature was far in advance of the Turanians. No Semitic race ever erected a building worthy of the name; neither at Jerusalem nor at Tyre or Sidon, nor at Carthage, is there a vestige of Semitic architecture. When Solomon proposed to build a temple at Jerusalem, though plain externally, and hardly so big as an ordinary parish church, he was forced to have recourse to some Turanian people to do it for him, and by a display of gold, silver, and brass ornaments to make up for the architectural forms he knew not how to apply. Painting and sculpture were absolutely forbidden to the Jews, because they were Turanian arts, and their practice might lead the people to idolatry. Music alone was the one æsthetic art of this race. The Semitic races seem always to have been of too poetical a temperament to excel in mathematics or the mechanical sciences. The Celtic race seem to have crossed the Bosphorus, and following the valley of the Danube, threw off a branch into Italy, where they penetrated as far south as Rome, while the main body settled and occupied Gaul and Belgium, whence they peopled Britain. No Celtic race ever rose to the perfect conception of the unity of the Godhead. Despotism was generally their form of government. Their theology required temples almost as grand as the Egyptians, and without their intervention we should not have possessed in modern times a church worthy of

admiration. In the art of wedding music to verse this race is only equalled by the Semitic. The Aryan race seem to have settled themselves in the country between the Indus and the Jumna, about 3100 B.C. The principal branch migrated westward, and first appeared prominently in Greece, next in Rome, and lastly in Northern Europe. They seem to have believed in the one great ineffable God. Here, their possessing a complete alphabet their literature was more advanced than that of the earlier races. They excelled in the useful rather than the artistic arts. In pursuing this subject we find the one grand and fundamental principle that guided the earlier races to such a high state of perfection in the architectural art was based upon the golden rule, "Truth," which is such a marked contrast to the present age of shams.

MESSRS. STEVEN BROS. & CO'S NEW PREMISES.

MESSRS. STEVEN BROS. & Co., the well-known architectural ironfounders, have recently acquired new and very extensive premises at No. 4, Upper Thames-street, immediately opposite the Times Office. Here, under the direction of their manager, Mr. Ritchie, they have fitted up convenient offices and a number of very large show-rooms, the fittings having been carried out from the designs of Mr. James Weir, architect. The premises extend from Thames-street to the river front, and are provided with lifts worked by hydraulic power supplied from the mains of the Hydraulic Power Company. The passenger-lift is by Messrs. Waygood & Co. The ground-floor is mainly appropriated for warehousing and packing purposes, and contains a very comprehensive and varied stock of rain-water and hot-water fittings, ranges, stable fittings, and other goods of the kind. The first floor contains a large stock of railings, balconies, balusters, &c., in all possible sizes, shapes, and varieties of design. On the second floor is a showroom of large dimensions, where register and other fireplaces are shown fitted with chimneypieces of all styles of design and in all materials,—in marble, stone, wood, and iron, and ranging in price from a few shillings to hundreds of guineas. To the rear of this, on the same floor, is a showroom for goods of a cheaper class, the arrangement here being a series of bays, whereby access to the numerous patterns is easily obtained. On the third floor is an extensive display of kitcheners, cooking-ranges, and other domestic appliances,—several ranges 9 ft. and 12 ft. wide being on view. Behind is a showroom for constructional ironwork, railings, gates, staircases, verandahs, stable fittings, and numerous specimens of ornamental ironwork. Smaller rooms above the showrooms contain brasswork, tiles, and sundries, each department being arranged in the way most suitable to the requirements of the business. To prevent the noise which inevitably accompanies the delivery of goods from affecting the work of the counting-house, a small portion has been separated from the general office, and is styled a "forwarding office." Every part of the premises has been utilised, even to the basement, where excellent arrangements prevail for the storage of cast-iron baths and fittings and other goods, down to tins, elbows and bends in the rain-water goods department. The establishment forms, indeed, an exhibition on no mean scale, and one which will be found well worth visiting by architects, builders, and owners of house property who may be in search of iron goods.

EMPLOYERS' GRACE.

HAINES V. CRACE.

This case was tried recently in the Marylebone County Court, and is of some importance to builders and others whose work involves the use of such a movable scaffold, as is ordinarily used in house-painting, namely, "steps," boards, and trestles, which are moved or re-arranged at brief intervals as the work progresses.

The plaintiff, Haines, a journeyman painter, brought an action for a claim of 100*l.* against Mr. J. H. Crace, the decorator, of Wigmore-street, under the following circumstances. Haines was at work with other painters in the kitchen of a club, and engaged on preparatory work, when the trestles which supported the board on which he stood, slipped off the top of an oven on which they had been

planted, and which proved to be greasy. It was shown in evidence that the plaintiff, another painter, and a labourer had between them arranged the trestles and boards. But the plaintiff contended that it was the duty of the foreman of the job to have seen the risk, and to have had the scaffold altered. He also contended that, although he himself had a hand in the erection, the labourer was responsible, and was the foreman's delegate in the matter. The plaintiff further endeavoured to convince the jury that painters were not expected to move their trestles, but that this was the labourer's duty.

Mr. Crace, as defendant, showed by his own evidence, and by that of independent witnesses, as well as that of foremen and painters in his employ, that whereas "fixed scaffolding" of poles, &c., is erected by labourers or "scaffolders," the painters themselves do, as a matter of course, shift their own trestles, &c., with or without labourers, and that a painter's labourer's duty is to wait on and assist, as they may require, the gang of painters to which he may be attached; that, as a matter of fact, painters more often work without labourers than with them if there be no fixed scaffold.

The defendant and witnesses also showed that it was frequently necessary to shift trestles several times in an hour or two, and that no work could progress in a room until the foreman had to approve each removal of trestles in every room.

The judge, in summing up, put three questions to the jury (stating that it could only be through the foreman that liability could have been incurred):—

1. Was it the foreman's duty to superintend the placing of the trestles?
2. Could the foreman to have discovered that the trestles were not properly placed?
3. Did the foreman exhibit negligence in the matter?

The jury answered all three questions in the negative. Verdict for the defendant (Mr. Crace). The plaintiff subsequently moved for a new trial, but the application was refused.

STREET IMPROVEMENT CASES.

A CASE of some interest to owners of property came before the Brentford County Court on Friday last, as showing the extent and nature of the liabilities of owners for the paying of the cost of private street improvements incurred by a Local Board.

The Chiswick Local Board sued an owner, Mr. J. H. Hall, for the recovery of 29*l.* of its apportioned costs in the making-up of Armadale-road, Chiswick, under the 15th section of the Public Health Act, 1875. The defendant resisted payment on the ground that the Board had actually invited tenders and contracted for the work before the expiry of the statutory notice calling upon the owner to make up the road.

His honour, Deputy-Judge Cooper Wythe, held that no matter what preparations or facilities the Board made before the expiry of the notice for the carrying out of the work, they did not deprive the owner of the right to do the work himself before the notice had expired.

The defendant pleaded further that a previous surveyor had led him to understand that since tenders had been invited there was no use in his making up the road.

Mr. Finnis, the solicitor to the Local Board, disputed this, and asserted that, as a matter of fact, the work was not commenced until six weeks after the expiry of the notice.

His honour gave verdict for the Local Board for the full claim, together with interest and costs.

The Board also sued the same defendant for 13*l.* in respect of private improvements in Swanscombe-road, Chiswick, in which the old question as to the flank wall was raised.

The defendant contended that an allowance should be made to him in respect of the improvements at a flank wall, asserting at the same time that the costs in such cases should be apportioned among the whole of the owners in the street.

His Honour said that that question had been decided over and over again. The 15th section of the Act was clear enough on the point that a flank wall is held as a frontage in regard to the payment of private street improvements.

"PLUMBERS AND PARLIAMENT."

SIR,—With reference to the letter of your correspondent "C. A. M. B." in your issue of the 2nd inst. [p. 63], will you grant me space to inform him that the action of this company is solely directed to securing, as far as may be practicable, greater efficiency in the character of the work done by plumbers in general, and in no case do the company aim at hedging the trade round with restrictions, as he suggests.

The course which the company have taken throughout has been based upon the resolution of the late Congress of Metropolitan and Provincial Plumbers, as it has been governed as much by consideration for the journeyman as for the masters, who are heartily invited in a common desire to check the execution of improper or "scamped" work, as it is called

in the common interests of honest tradesmen and the public.

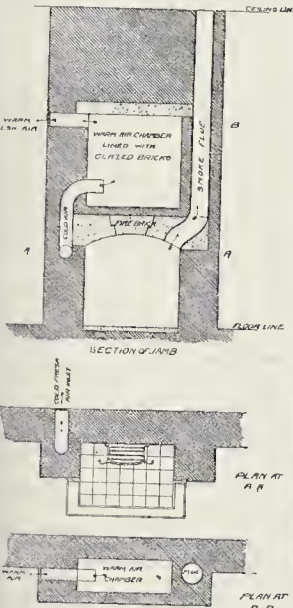

I should add that the company have throughout sought for, and, to a considerable extent, they have secured the cordial sympathy and active co-operation not only of builders, but of architects and others immediately concerned in house-building, who fully recognise the object we have in view is one of vital importance to the health of the community.

I may further add that I have no knowledge of the communication from the Builders' Association being received as mentioned by your correspondent, but I can assure him that we should be very glad to see that Association represented on the General Council, for in no sense do we desire to pursue a policy of exclusiveness, but on the contrary, we court the opinions and desire the co-operation of all who are prepared to take a broad view of the subject, and join their efforts with ours to work out a reform which is admitted on all hands to be one of national importance.

GEORGE SHAW,
Master of the Worshipful Company of Plumbers.

VENTILATION.

SIR.—The question of ventilating rooms with fresh warmed air has very often of recent years been brought before the public, but I do not think the system shown in the diagram I enclose has been illustrated.

Your readers will notice the arrangement is very simple: the heat, instead of passing up the chimney, impinges on the fire-bricks, and thus the air in the chamber above, which is lined with glazed surface, is warmed, and the outlet for this warmed air into the room is also shown. In summer the air unwarmed could be admitted through the same openings.

I have pleasure, therefore, in sending you this diagram, which, I may mention, has been adopted with success in a few instances. It may interest your readers, and I send it as a suggestion to be improved upon.

BANISTER FLETCHER.

Weymouth.—A colossal marble statue was unveiled on Wednesday, the 13th inst., at Weymouth, by Mr. R. N. Howard, the Mayor, in honour of Sir Henry Edwards, one of the representatives of Weymouth in the House of Commons from 1866 to 1885, when the town ceased to be a Parliamentary Borough. The sculptors are Messrs. W. & T. Wills, of London, and the cost of the work is 800 guineas.

TIMBER MEASUREMENT.

SIR,—In my letter inserted in your last impression (p. 107) I made no comment on the facts of Mr. Wardale, his supposed discovery being a matter of common knowledge among English timber merchants and measurers,—but merely answered his inquiry as to the principle on which I presumed the tables and scale to which he alluded were based. Your editorial note, however, induces me to trespass a little more on your space than I then thought necessary.

In the days when sheriffs of the City of London were seriously required to count hobnails and worry tallies as a crowning test of arithmetical attainments, it can hardly be wondered at that the rustic "hewers of wood and drawers of water" should fail to perceive what you designate them as blockheads for not perceiving, or that their erroneous but convenient method of measuring round timber, or logs, should have grown into a general custom, which there was not sufficient inducement for the more enlightened dealers in timber of the present century to depart from.

George Crutkshank's fox was misled by a name when he robbed the tailor's workshop instead of the farmyard; but your correspondent can hardly believe that the astute land agents and timber merchants of the last eighty years have been unconsciously fleeced all that time, to the tune of 20 per cent., by a deceptive measure.

Neither the grower nor the first purchaser is deceived, and therefore not injured; and after "conversion" of the stuff by the merchant, the string's occupation is gone.

The grower sells by string measure; the merchant estimates and purchases by the same, and, if he sells in the log, sells by the same; so that I fear that the last paragraph in Mr. Wardale's second letter will have no more effect on the trade than will, in time, the information which I now impart (in strict confidence), viz., that that last hamper of '47 which he had from Messrs. Binn & Sellarman, invoiced as in quarts and pints, is quite 25 per cent. short of the nominal quantities,—but may he enjoy it none the less!

A word for poor Hoppus. I am not concerned in the *discordia fratrum* between him and Mr. Key; but may I ask of what use would have been a set of tables based on a principle, however correct, which had never obtained since timber became a marketable commodity? He found a "practical" custom in use throughout the land, and framed his tables in accordance therewith.

GODALMING.

SIR,—The general practice in measuring round timber twenty years ago, when I had some experience in the Berkshire woods, was precisely as described by your correspondent "Godalming," and in accordance with the rule given by Hoppus, viz., to gird the tree, and double the line twice for the quarter girth, which may be designated B.

If we take the instance given by Mr. Wardale, of a trunk 15 ft. long and 8 ft. in girth, the above method will be found to supply a happy medium between the other methods mentioned by him. The first of these, which we will call A, "considering it a cylinder, the cubical content of which is 96 ft., though strictly correct, gives far too much for practical purposes, as, when the tree is cut up into planks or scantling, there must be very considerable waste.

The other method, which may be called C, viz., reckoning only the exact square contained in the circle, giving 61½ ft. cube, errs in the opposite direction; this amount is too little, as the four outside or segments are wrongly treated as if they were wholly useless.

The following diagram illustrates the three methods, and proves that the middle one, B, yields

a fair result, viz., 75 ft. 11 in. cube; as the small segments make up for the trifling loss at the four corners of the square. When converted into planks or scantling and measured up as such, the net result would prove to be in almost exact accordance therewith.

HENRY STAINES.

* * The question brought forward in the previous correspondence was to ascertain actual cubical contents of the trunk. This, and the question of ascertaining roughly the amount of workable timber, have been rather confounded together by the various correspondents.—Ed.

THE CLAPHAM STATUES.

SIR,—I have received the inclosed letter relative to the discovery at Clapham with permission to publish same. I shall feel obliged if you will insert it in your valuable paper.

THOMAS MILBOURN,
Hon. Sec. Surrey Archeological Society.
"3, Bank Buildings, E.C.
Jan. 8th, 1886.

Sir,—Much of late in the various papers of the day, in reference to the discovery of monuments at Clapham. I, when a boy, resided there, and about fifty years back, a large boiler was being taken into the chapel, to warm it. On passing over this said vault, the entrance broke in, and I, with two or three other boys, got a wax taper at night, and got into the vault, which was full of coffins, besides the statues, which broke in on touching them. A week or two after, a mason in Manor-street cleaned the sculpture, and it was lighted up with candles, and some hundreds visited the vault; so that your friends there must not think themselves Belshazzar or Lazarus, for I think I was the one; and if our friends look close to the young lady's face, they may find some plaster of Paris there still, for we tried to take a cast, but failed. In Cooke's 'Surrey,' you will find an account of the said marbles.—I am, sir, yours respectfully,
T. BROWNE."

THE EXAMINATION IN ARCHITECTURE.

SIR,—It has been announced that the next Examination in London to qualify for candidature as a associate of the Institute, will be held at No. 9, Conduit-street, on March 22nd, and the following days of that week.

Notwithstanding the wide circulation which, through the medium of the Architectural Association and provincial societies, has been given to the pamphlet containing the programme of the examination, advice to candidates, and list of books (which pamphlet can be obtained by any student on application to the Secretary of the Institute, and has been printed in full in the *Kalendar* issued at the commencement of the session to every member), I hear occasionally that some intending candidates are desirous of obtaining further information for guidance in their studies.

Being most desirous to assist in advancing this examination,—on the success of which much of the future prosperity of the profession and the Institute depends,—I shall be happy to receive here, by *previous appointment only, fixed by me*, any gentleman who actually intends to offer himself for examination, either in March or at a subsequent period, and to answer his reasonable inquiries, and to give him such advice as my experience as Chairman of the Board of Examiners may enable me to afford.

I earnestly hope that those students who have hesitated to come forward, from any doubt as to the nature of the Examination, will not fail to seek a conference with me.

ARTHUR CATES.
No. 7, Whitehall-yard, Jan. 13, 1886.

PROVINCIAL NEWS.

Barrow-in-Furness.—The high-level bridge which is being constructed by the Furness Railway Company and the Corporation of Barrow-in-Furness to give better communication between the town of Barrow and the extensive docks and ship-building and other works on Barrow Island is rapidly approaching completion. The corporation portion of the bridge extends from Duke-street to the south

side of Hindpool-road, and has necessitated the purchase and removal of much old property, and as this was also some of the worst in the town its removal is by no means to be regretted. The bridge, with its approaches, extends from Duke-street to Michaelson-road, the total length being about 500 yards. The corporation portion of the work consists of an approach 80 ft. wide and 184 yards in length, and a skew wrought-iron bridge, 60 ft. in width and of 50 ft. span, over Hindpool-road. A considerable length of the roadway of the approach is carried on segmental brick arches of 24 ft. span, built in

Portland cement mortar to a gauge of one of cement to three of clean sharp sand. The iron bridge has six main wrought-iron plate girders, each 3 ft. 4 in. deep, with cross girders and wrought-iron floor-plates, covered with cement concrete, on which will be laid the wood pavement to form the roadway. The footways are partly carried on brackets springing from the two outside girders. The parapet plates are of cast-iron, on which are cast geometrical patterns, standards being fixed at every 4 ft. 6 in. to receive the plates and divide the parapet into panels. On the centre panels of the parapets are cast the armorial bearings of Mr. John Fell, the Mayor of the Borough at the time the work was commenced. Under each main girder where it rests on the abutments are brackets, those under the outside girders, however, being much larger and of a more striking appearance than are the intermediate ones. The four large brackets have the borough arms cast on them. The general design of the bridge over Hindpool-road has been carefully got out to harmonise as far as possible with the railway company's work designed by Mr. F. Stilman, C.E. The abutments on each side of Hindpool-road are built of white limestone from Stainton Quarry in the immediate neighbourhood, and have been boldly treated, the whole presenting a very substantial and effective appearance. The abutment on the south side has two openings, one giving access to the subway leading to the town wharf, the other to the railway and arches at the back. The abutment on the north side has an opening which forms an entrance from Hindpool-road to the brick arches and interior of the abutment; these it is intended to utilise as stores, for which purpose they are admirably adapted. The corporation approach and bridge have been designed and carried out under the direction of Mr. Fox, Assoc. Mem. Inst., C.E., the Borough Engineer. Mr. John Fell, of Leamington, is the contractor, and has, under the constant and careful supervision of Mr. Cutler, Student I.C.E., assisted by Inspector Shaw on the ironwork, carried out the works in a satisfactory manner. It should be mentioned that the whole of the ironwork was manufactured and erected for Mr. Fell by Messrs. Westray & Copeland, of Barrow.

Lynnmouth.—At a meeting of the Lynn Local Board of Health, on December 28th, the Board decided to instruct Messrs. Davison & Davison, civil engineers, of Lynnmouth, and also certain works with a view to provide a convenient bathing-place.

Oldham.—Buildings for the use of the Salvation Army in Oldham are about to be erected in Union-street. The accommodation comprises a large main hall to seat 3,000 persons, and which is approached from the street by a short flight of stone steps on to a corridor which runs at right angles, right and left to two staircases, one on either side. Access is also gained from here to the main floor, constructed with a good fall to the speaker's platform. The staircases are the main public exits from a deep gallery extending round the entire length, thereby intersecting the speaker's platform, which is stepped up from the floor-line. As the site is at the corner of two streets no difficulty has been experienced in providing light and air. By the side of the large hall is a smaller one, intended to be used for week-night services, and capable of accommodating 800 persons. This is approached from Union-street by a wide corridor between the main hall and a large shop which stands in front of the small hall. Behind this hall and connected with the main hall is a large catering room, bandsmen's room, &c. The front of the buildings is of red brick with stone dressings, with a tower running up each side of the main hall, finished with battlements. Tudor-Gothic is the style adopted. The entire block covers an area of 12,250 square feet, and the estimated cost is 4,500. Mr. E. J. Sherwood, of London, is the architect, and the work will be carried out under his superintendence.

Dunlish.—The Local Board of Dunlish have decided to obtain the opinion of Mr. James Lemon, C.E., of Westminster and Southampton, as to the best means of disposing of the sewage of the district.

Basingstoke School Board.—We are asked to state that the assessor in this competition was Mr. F. W. Roper, of Adam-street, Adelphi,—not of John-street, as stated last week.

The Student's Column.

FOUNDATIONS.—III. ARTIFICIAL FOUNDATIONS.

FELL means at the command of the architect for providing a good foundation in the unsatisfactory soils, which have already been mentioned, resolve themselves practically into three classes:—

1. Modes of spreading the weight of a wall over a large area, so as to reduce the load on each superficial foot of ground, as by footings, concrete, &c.

2. Modes of sinking or reaching down through a soft soil to a harder subsoil, on which the weight may be carried, as by piling.

3. Such expedients as ramming the surface of the ground or the bottom of a trench to consolidate it; arching or bridging over bad parts of the foundation; and the utilisation of lateral pressure by means of beds of sand or of sand-piles placed under the walls.

Footings, in one form or another, are amongst the most ancient means used for spreading the weight of a wall, as the large feet of the camel distribute its weight so as to enable it to travel without sinking over the surface of dry sand. In the foundations of ancient stone walls the lower courses often spread considerably with rather high steps of slight projection, finishing at the top of the plinth, which satisfies the eye that some such means of obtaining increased stability exist. The cracked and dangerous condition of many of our old brick buildings is due to the omission of any kind of projections beneath their bases,—a deficiency very poorly made up by the use of ties and bond timber to keep the tendency to fracture within limits. In a brick wall the footings are, in modern practice, and, indeed, by such law as exists, made to project by regular off-sets in each course from the base of the wall downward, so that the bottom of the lowest course is in breadth double the thickness of the wall. Where the soil is at all unsatisfactory, the lowest projection of the footings should be made in two courses, so that the lower course may not be broken or tilted in the way that has been mentioned above. Unless care is exercised in the supervision of the work, the worst and smallest pieces of brick are often put in the lowest course of footings, so as to render that course not merely useless, but a means of breaking up the courses above when weight comes on the wall. Materials of the fullest size should be used in footings, so that the joints in the projecting courses should be as far from the outside as possible. Where concrete cannot be used, the spread of the footings may be increased by putting more off-sets and more courses in each of the off-sets, so as to obtain gradually a sufficient breadth of foundation.

The simplest means for spreading the weight of a wall beyond the extent of the footings is to lay pieces of timber, 4 ft. or 5 ft. long, across the line of the intended wall as the sleepers are laid under a line of rails, but so as to be close together. Upon them planking is fixed, which will carry the footings or the base of the wall. This plan is only suitable for buildings of moderate weight or of temporary character, and if the timber is not put below the level of the water in the soil it will rapidly decay. On a boggy site, where the surface soil is thin, it may be the best material that can be made available. In the case of the tower of a very large church which had shown signs of weakness, it was found that the piers had been built upon trunks of oak trees laid side by side upon a subsoil of soft mud, so as to form a sort of raft. This had decayed in the end, but it had been in that position for 500 years.

Large slabs of hard stone, such as are used for paving, have been used with good results in the worst cases of foundations in made ground that was expected to settle considerably and in an irregular manner. But the use of concrete has in recent times superseded all other means of obtaining wide foundations, at least as regards buildings of any great size and importance.

Concrete in general may be looked upon either as an artificial stone or an indurated gravel. It most resembles rocks of the class called "breccias" or "conglomerates" which consist of gravel or fragments of stone reunited into a solid mass. During the last half-century it has been rapidly superseding other materials and contrivances for obtaining secure foundations, and it may be expected that its employment in the walls, floors, stairs, and roofs of

buildings will become more extensive as the manipulation of it is better understood. In the Student's Column for January 17th, 1885, p. 119, will be found a description of concrete when it has to be used for the most important objects, and under the best conditions.

We have to deal with it here simply as a means of spreading the weight brought down by a wall or pier over a greater area. So used, it may be assumed that it will be placed on a hard subsoil; for there would be no object in placing it upon a good one. In discussing the comparative merits of different materials, we should not forget that in the great majority of cases the worst of the materials in ordinary use would be so great an improvement upon the natural foundations, that they would probably effect the desired object.

It becomes, therefore, an important practical question whether, in any particular foundation, the material most readily available will be of ample strength for its purpose rather than whether it is the best conceivable material for walls, floors or roofs. We shall see that gravel or sand placed in trenches, even without any cementing material, may have an important utility.

The materials generally available for concrete are burned chalk (known as burned ballast), gravel, slag from iron furnaces, broken flints, broken stone.

Experiments in crushing concretes made of these materials with cement place them in the above order,—the weakest being the first-named. Upon a town site broken bricks form an important item in materials for concrete; chinkers, broken pottery, and any description of "hard core" are also useful when they are easily obtainable. Let us see what are the qualities of a good concrete for use in foundations.

Concrete consists of two things,—the "aggregate," which is of such materials as those just named and the cementing medium. The point of prime importance is that the aggregate shall consist of pieces varying in sizes, from the largest down to the smallest, which should be—let us say,—a coarse sand. These must be capable of being so packed that they leave no vacant spaces the cementing material combined with the sand filling up all intervals between the pieces and covering each piece with a thin coating. The size of the largest pieces would be of no importance if they could be evenly distributed, but, practically, pieces of 2 in. or 3 in. in diameter, as a maximum, are the best, as we shall see.

The cementing materials may be a lime that is slightly hydraulic so as to "set" in the moisture of a trench, such as the "grey stone" lime used in the London district made from the beds of the "lower chalk" at Dorking and Mersham—"Fat" limes consisting of pure carbonate of lime, such as is made from the bed of the "upper chalk," and is known in London as chalk lime,—very white and useful for plaster—is of no use for concrete or mortar as it will not set when exposed to damp. If the ground is very wet,—but not otherwise,—the blue lime which sets best under water, being naturally rendered hydraulic by a slight admixture of clay may be used with advantage. In cases where quick-setting is important, and in the very rare cases where the greatest strength obtainable is required, Portland cement (which is composed of chalk burned with the mixture of a due proportion of alluvial clay) is the best material that can be employed.

The proportion of cementing material specified is usually one part to six of the aggregate. It is highly improbable that such a strength is kept up in practice, unless where the ingredients are carefully measured, which they should be in all cases of importance. If one part in eight is specified and used, that will probably be found sufficient for all ordinary cases,—and with lime,—but cement, besides being more costly, is more easily "killed" by admixture with dust or dirt and if it is deemed necessary to use it the stipulated proportion according to the cleanliness of the aggregate should be kept to with accuracy.

The mixing is generally done on a temporary plank floor. For accuracy, it is best to have a bottomless frame or box, 3 ft. square or 18 in. high, holding half a yard of aggregate. When this is filled level to the rim, a similar box, containing, say, one-sixth of that quantity may be placed on the top of the aggregate as filled with the cementing material. On lifting first the small box and then the large one, the whole will lie in a heap ready for mixing.

Having been well turned over dry, water should be added regularly and in moderate quantity, without drenching, so that the whole will form a semi-fluid mass when it has been again turned over and placed in the harrow. If, now, this is dropped into the trench from a height no

greater than such as will make it flow by its own weight so as to fill up every part of the trench, without being trimmed or regulated by hand, it will be packed as well as the nature of the particular aggregate can admit of. The filling in must be done regularly, so as not to raise the level of the concrete more than about 18 in. in any one course, following on afterwards with other courses till the required depth is obtained. If the full depth should be more than 18 in., and the concrete should be thrown in so as to fill it up at once, advancing along the trench with a steep fall at the place where each load is deposited, the larger pieces will roll down the slope, causing an irregular composition, the poorest quality being at the top. If the concrete is thrown down from a considerable height, the larger pieces will sink down and separate from the smaller pieces. All pieces of sizes greatly exceeding the ordinary pieces are likely to separate themselves in this way. Round, smooth pieces, as in gravel, will separate themselves (under such conditions) more easily than angular pieces.

But gravel is the material which, when put in the trench in a proper manner, will flow most easily and become packed so as gradually to fill every part of it without further manipulation, and the stones will so arrange themselves that no places are left void. It is, besides, of ample strength for all ordinary purposes, and is, therefore, the most eligible material for use. To judge by inspection of the heap whether the gravel is suitable, it is necessary to see that there is a large proportion of stones of the full size, a considerable admixture of smaller gravel, and plenty of sand, so that the aggregate shall lie in the mass without hollow places. When the proportion of cementing material is added it will be sufficient to fill up the spaces between the grains of sand that are packed between the pieces of gravel so as to make a coarse mortar, and the larger pieces will be completely surrounded with a composition that will more or less quickly become hard and firm. The adhesion between the cementing material and the gravel will be as tight as compared with the case of broken stones where the rough surfaces unite closely with the lime or cement; but in a trench, and subject only to the dead pressure of a wall, this matter is of less importance. If the sand is too abundant in the heap it is easy to sift out a portion for use in mortar. If the larger ones are too few the deficiency may be supplied by broken bricks. Every part of the long process by which gravel has been formed in the river or along the shore has tended to make it flow and pack more closely, a point which is greatly in favour of a material which is, besides, easily available.

Burned ballast varies very greatly in quality. When hard, with a good proportion of large pieces, and free from much dust, it makes a very good, firm concrete. It should be well settled in the heap before mixing, because of its porous nature and dryness. Broken bricks, broken stone, and other materials not naturally mixed with sand, require to have a sufficient proportion of coarse sand and gravel added to them to fill up the voids in the aggregate. It is quite possible to fix the proportions in which such mixtures should be made in order to produce good concrete; but this can only be done by making experiments with each kind of material, and, indeed, with each sample, that it is proposed to use. It is constantly

needful to judge, and at once to decide whether the composition of concrete is such as to be satisfactory. This can only be done with confidence after a sufficient experience gained by watching the mixture of different materials, seeing that they are properly placed

in the trench, and, when possible, inspecting the same concrete after it has had ample time to become set.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

3,814, Drain Traps. W. H. Tylor.
To carry up the ventilating openings of traps to the surface of the ground, several forms of extension pieces are to be employed, combined together as may be found necessary. In separating traps, a partition rises slightly above the outlet, which outside the trap turns upwards in order to retain a proper level of liquid in the trap. The inlet turns downwards into the liquid, and may be flattened at the end; in front of it is an angle-plate for separating the fat. The trap is provided with a removable cover, and the outlet with a hand hole.

11,247, Excavating Grab. H. J. Coles.
The bucket segments are of the ordinary construction. Their frame is continued upwards in the form of a trunk on which slides the cross-head, and down which the lifting-chains pass. Catches are provided that lock the cross-head to the trunk, when the grab is at rest. These catches have weighted tail-pieces to cause them to fall into slots prepared in the trunk to receive them. Suspended from the crane jib is a frame with hanging books. These are arranged to hold the flange of the cross-head, so that when the chains are slackened the trunk sinks, and opens the grab. At the moment that the catches fall into their slots, a tapered head on the trunk bears against the flange of the hanging-books, and disconnects them. The grab can then be lowered open. When the buckets reach the ground, the rods press upwards by means of lugs against the tail-pieces, and so release the catches; the segments then close, and the operation is repeated. Two lifting-chains are used attached to the frame of the bucket. They pass round sheaves on the frame, and so up the trunk to the jib.

13,422, Imitating Stained Glass. A. M. F. Caspar.

A suitable design is copied on the surface of a glass sheet of any kind by attaching to it variously shaped cardboard strips coated to imitate gold or lead, &c., with a strong adhesive, which may be white-lead coloured to match the strips. To imitate the solder employed with the lead strips for stained glass, bronze powder is mixed with spirit-varnish (such as copal dissolved in alcohol) dropped on the cracks and brushed slightly over while damp with light bronze powder. After drying the colours are floated or painted on the reverse side of the sheet to the cardboard strips, any superfluous colour being removed by draining, or by a rag dipped in methylated spirits, a coating of mastic varnish and cardboard strips corresponding to those upon the reverse side may be applied over the colours. Some parts of the sheet may be ground to resemble frosted glass by the use of damp sand and a glass muller.

NEW APPLICATIONS FOR PATENTS.

Jan. 1.—15, M. Golightly, Turn Button or Fastener for Securing Doors, Window-sashes, and Casements.—19, W. Carr, Apparatus for Preventing Concussion in Water Pipes, &c.—30, E. Jones, Combination Shovel, Riddle, and Sieve.—31, W. Joy, Utilisation of Waste Heat from Cement and Lime Kilns.

Jan. 2.—54, W. Hilder, Lowering and Raising the Upper Halves of Sliding Window Sashes, &c.—59, O. Stevens, Improvement in Dry Gasolins.—78, C. Wells, Improved Decorative Material for Walls and Floors.—78, C. Watkins, Improvements in Graining Tools.

Jan. 5.—142, J. Brown, Cross Ventilation of Sewers.—145, J. Ferguson, Improved Material for Fireproofing Internal Surfaces of Buildings.—153, O. Elphick, Apparatus for Discharging Water from Flushing Cisterns.—157, J. Bennison, Apparatus for Curing Smoky Chimneys and Preventing Down

Draught.—175, H. Haddon, Improvements in Ventilators, Chimney, and Smoke Stack Cowls.—179, B. Everal, Connecting Door Knobs to the Roses of same.—189, J. Mackenzie, Improved Method of Securing Metal Sash Bars in Roofs and Other Structures.—201, R. Hellyer, Sewer and Impure Air Burning Apparatus.

Jan. 6.—210, J. Hargreaves, Improvements in Gullies.—215, C. Homer, Improvements in Window Sash Fasteners.—228, G. Hardingham, Improvements in the Construction of Lattice Bridges.—229, J. Hendra and W. Gooding, Improved Construction of Treads of Stairs, Door Steps, Landings, Floors, &c.—235, J. Frazer, Self-adjusting Apparatus for Cleaning Windows.—247, R. Bowman, Improved Water-waste Preventer.

Jan. 7.—255, W. Gallon, Improved Mode of Constructing Stone or Concrete Piers or Breakwaters.—J. Barry, Improvements in Pipe Tongues, Wrenches, or Spanners.—274, S. Jackson, Improved Traps or Syphons for Urinals, Wash-basins, Sinks, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

14,151, A. & J. Childs, Raising and Lowering Window-sashes and Shutters.—14,707, M. Chaboche, Improved Stove or Fireplace.—14,866, R. Somers, Improvements in Fireplaces.—14,874, R. Best, Improvements in Central Light Caselles.—15,185, T. Carder, Improvements in Kilns.—15,195, E. Coldwell, Apparatus for Burning off Old Paint.—15,298, J. The Japanese Village.—Last week Mr. James C. Humphreys, of Albert Gate, appeared to a summons to answer the complaint of the Metropolitan Board of Works that he had infringed a section of the Building Acts by keeping open Humphreys' Hall as a place of public resort and entertainment under the authority of the licence granted by the Magistrates without obtaining the certificate that the building was completed in accordance with the requirements of the Board of Works. Mr. Besley, who appeared for the Board, said that penalties were claimed in respect of three days, December 3rd, 14th, and 23rd, on which dates the public were admitted to Humphreys' Hall, and where entertainments were given. Mr. John Hebb produced the regulations made under the Act of 1878. Mr. Humphreys had not been granted a certificate for Humphreys' Hall. Witness showed that the exits provided were altogether different to those shown on the approved plan. In the opinion of witnesses they were insufficient. There was considerable danger from fire. He had seen the Japanese smoking in their shops, and in some of the huts there were braziers of live charcoal. The Magistrate fined the defendant 50l. in respect of each day stated in the summons,—150l. in all. Out of this sum 25l. costs was allowed, on Mr. Besley's application.

MEETINGS.

MONDAY, JANUARY 13.
Royal Institute of British Architects.—Business Meeting (for Members only). 8 p.m.
Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Art in England." Reynolds. 8 p.m.
Society of Arts (Cantor Lectures).—Professor H. S. Hele Shaw on "Friction." (1.) 8 p.m.
Liverpool Architectural Association.—Mr. J. M. Hay on "St. John's Sites its Fitness for a Great Cathedral." 7 p.m.
Architectural Section of the Philosophical Society of Glasgow.—Mr. Charles Geay, on the "Combined Decorative Arts of Glass and Colour."
TUESDAY, JANUARY 19.
Institute of Builders.—Second Ordinary General Meeting. 2 p.m.
Institution of Civil Engineers.—(1) Discussion on Mr. F. J. Rowan's paper on "Gas-Producers." (2, time permitting), Mr. C. E. Stromeayer on "The Injurious Effect of a Blue Heat on Steel and Iron." 8 p.m.
Statistical Society.—Dr. Robert Gillen on "The Progress of the Industrial Classes." 7:45 p.m.
Manchester Architectural Association.—Mr. J. Margaret on "Fifteenth and Sixteenth Century Work in the Valley of the Loire." 7:30 p.m.

WEDNESDAY, JANUARY 20.
Society of Arts.—Captain Douglas Galton on "Mechanical Motors for Tramways." 8 p.m.
British Archaeological Association.—(1) Mr. H. Syer Cumming on "The Old 'Trader's' Sign" in Westminster Hall." (2) "Notes by the Late Rev. D. M. Haigh on Barnack Church," communicated by the Rev. Canon Argles. 8 p.m.
Sinclair Assurance Association.—(Parker's Museum).—Professor T. Roger Smith on "A Damp House." 8 p.m. (admission free).
Royal Institution Society.—Annual Meeting. The President (Mr. A. H. Scott, F.R.S.) will deliver an Address. 7 p.m.
Builders' Foremen and Clerks of Works' Institution.—Annual Meeting of Members. 8:30 p.m.

THURSDAY, JANUARY 21.
Royal Academy of Arts.—Mr. J. E. Hodgson, R.A., on "Art in England." Gauntheroch and Romney." 8 p.m.
Society of Antiquaries.—Mr. W. H. St. John Hope on "Examples of Medieval Mazers." 8:30 p.m.
Parker's Museum.—Mr. B. F. Granhaan on "The Working of the Separate Sewage Systems." 8 p.m.
Society for the Encouragement of the Fine Arts.—Conversations at the Piccadilly Galleries. 8:30 p.m.
London Institution.—Professor John Perry on "The Distribution of Electric Power." 7 p.m.
York Architectural Association.—The Rev. Newton Mack on "Classic Architecture and Modern Church Building." 7:30 p.m.
Edinburgh Architectural Association.—Professor G. Baldwin Brown, B.A., on "Sir Christopher Wren." 8:30 p.m.

FRIDAY, JANUARY 22.
University College.—Professor C. T. Newton, C.E., on "Greek Inscriptions." II. 4 p.m.

Miscellaneous.

The Late Dr. Birch.—The anniversary meeting of the sixteenth session of the Society of Biblical Archaeology was held on Tuesday night at its rooms in Conduit-street, Prof. C. T. Newton, G.B., D.C.L., one of its vice-presidents, being in the chair. In opening the proceedings of the evening, the chairman alluded to the great loss which the society had sustained by the death of Dr. Samuel Birch (President of the Society), whose wide acquirements, profound and varied scholarship, and unconquerable industry had been of the highest possible value to its prosperity and usefulness. For forty-six years, Mr. Newton said, he had known Dr. Birch; and during the greater part of that period had been shoulder to shoulder with him at the British Museum. He hoped the society might be able to find a worthy successor, under whom, and under the influence and memory of Dr. Birch's noble example, it might successfully prosecute and amplify the studies upon which it had entered under his guidance. Canon Beechey, who said the Society of Biblical Archaeology was almost exclusively the creation of Dr. Birch, moved that a vote of condolence should be passed to Mrs. Birch on the death of her husband. The motion was passed unanimously. Sir Henry Layard was elected President of the Society.

Assessment Appeals.—We understand that Mr. Penfold, Messrs. Fuller & Fuller, and Messrs. Hedley have been instructed by Messrs. Nye, Greenwood, & Moreton, acting as solicitors on behalf of the Assessment Committee of Fulham Union, the Overseers of St. Saviour's, the Overseers of Christchurch, the Governors and Guardians of St. Mary (Newington), the Governors and Directors of St. Mary Magdalene (Bermondsey), and the Overseers of St. George-the-Martyr, to assess the values of various properties in the parish of St. Mary Abbott's, Kensington, in connexion with the different appeals by the above bodies against the totals of the gross and rateable values of the valuation list of the parish of St. Mary Abbott's, Kensington.

British Archaeological Association.—At the meeting of this Association on the 6th inst., the chair was taken by Mr. S. Tucker (Somerset Herald). Reference was made to the congress to be held in the autumn, under the presidency of the Bishop of Durham, the head-quarters to be some town in the diocese. The Rev. Scott Surtees reported some curious discoveries at Dinsdale-on-Tees, where the old ancestral house of the Surtees family is found to be built upon portions of the castle in Norman times, the site being surrounded by earthworks of prehistoric times, although afterwards used by the Romans and Saxons, a paved roadway for the former people having been traced up to a curious underground structure called a blast-furnace for iron ore. A large number of portions of pottery of all ages have been found, also a stone cell, with the cutting-edges still perfect. Mr. Loftus Brock, F.S.A., exhibited a series of rubbings from sixteenth-century brasses, mostly from churches in Hertfordshire and Bucks. A paper was then read by Mr. Roskilli Allan, C.E., F.S.A. (Scot.), on the "Sculptures of the Norman Doorway at Alne, Yorkshire." This doorway is on the south side of the church, and it consists of two orders of arched stones neatly sculptured, there being figures of animals on the outer order, having Latin names above them. These have been identified by the lecturer as having been taken from a Medieval Bestiary, with spiritual explanations more or less apparent. Thus at Alne we see the fox, who is represented lying as if dead, for the birds to approach him. The fox represents the devil. Calendus is a white bird which can tell whether a sick man will live or die, supposed to be symbolical of Christ. Terobolem are two mystical stones which emit fire, found in the East, supposed to symbolise the fond of man and woman, or that of Christ for his Church. At Alne, two figures, a man and woman, are shown surrounded by flames. Aspidio, the whale, acts as destructively to a ship as does the fox to the bird; he also represents the devil. A large number of old MSS. were passed in review by the lecturer, and the analogy of representation at Alne shown to be identical. Mr. De Gray Birch, F.S.A., pointed out the resemblance of one of the figures to the Harpy of the Egyptian monuments. The concluding paper was by Mr. J. W. Grover, F.S.A., on the discovery of the Atkins monumental figures in the mortuary-vault beneath the site of the old church at Clapham. After tracing the history of these works, he referred to his discovery of them, and suggested means for their being brought up to the light of day. Letters were read from General Pitt Rivers and others, and Mr. Atkins spoke as to the great amount of local interest taken in the discovery, of which a full account was given in the *Builder* a fortnight ago (p. 60).

Electric Lighting at Hatfield House.—On the occasion of the county ball given by the Marchioness of Salisbury at Hatfield House on the 6th inst., the following arrangements were made for the lighting by electricity of the house and grounds. The principal rooms, galleries, and grand staircase were illuminated by upwards of 900 Swan's 20-candle-power lamps, the principal power for these lamps being derived from two water-wheels on the river Lea, which is a mile and a quarter distant from the house. The machinery used for generating the current consisted of two Siemens alternating machines, one sixteen-light "Brush" and one Siemens direct current machine, the latter being driven by a 18-horse-power Otto gas engine. The terraces and approaches to the house were lighted by six Clark-Bowman arc lamps, the current for these being supplied by an H. Gramme machine, driven by a traction-engine near the house. The lighting was in every respect a thorough success, and gave great satisfaction, there being not the slightest interruption to the working during a period of sixteen hours. The whole installation was carried out by Mr. Shillito. It may be remembered by our readers that the Marquess of Salisbury has been a pioneer in the matter of electric lighting and the use of electricity, and that his lordship has utilised this agent in a variety of novel ways by the transmission of electrical power, such as for grinding corn at farms situated at some distance from the water-power, pumping water, and driving the ventilating apparatus at the house, driving the lathes and saws in the workshops, pile-driving, dredging, and cutting weeds in the river, &c.

Lectures on Sculpture and Architecture at the Royal Academy.—The following lectures on Sculpture will be delivered by Mr. A. S. Murray to the students of the Royal Academy of Arts on the dates mentioned, viz.:—"Early History of Bas-Relief," Thursday, Jan. 28; "Principles of Bas-Relief as observed in the best age of Greece," Monday, Feb. 1; "Later History of Bas-Relief in Greece," Thursday, Feb. 4; "Bas-Relief in Rome," Monday, Feb. 8; "The School of Pastiche in Rome," Thursday, Feb. 11; "A Comparison between Polykleitos and Lysippos," Monday, Feb. 15. In Architecture, the following lectures have been arranged for, viz.:—By Mr. G. F. Bodley, A.R.A.,—"English Architecture of the Middle Age," Thursday, Feb. 18. By Mr. G. Aitchison, A.R.A.,—"Architectural Education," Monday, Feb. 22; "Mouldings," Thursday, Feb. 25; "Style and Composition," Monday, March 1. By Mr. W. Watkiss Lloyd—"On the Theory of Proportion in the Art generally, and particularly in Architecture," Thursday, March 4; "An Exposition of the Theory of Proportion in Architecture as understood and applied in detail by the Architect of the Parthenon," Monday, March 8.

Tilbury Docks Arbitration.—This arbitration, which was commenced in July, 1885, reached its sixty-seventh sitting on Saturday last. The proceedings arose out of the original contract for the construction of the new Tilbury Docks, Sir F. Bramwell, President of the Institution of Civil Engineers, being the arbitrator, assisted by Mr. J. A. Radcliffe, as legal assessor. Messrs. Kirk & Randall, the original contractors for the works, are the Plaintiffs; and the East and West India Docks Company are the Defendants. The amount claimed by the contractors is over 600,000L. The Attorney-General (Sir J. Webster, Q.C., M.P.), Mr. J. Fletcher Moulton, Q.C., M.P., Mr. C. A. Cripps, and Mr. B. Wallis are counsel for the plaintiffs; the Docks Company being represented by Mr. E. H. Pollard, Mr. Kenelm Digby, and Mr. Midway. The plaintiffs concluded their case at the sixty-third sitting, about forty having been occupied by the Docks Company's counsel in cross-examination of the plaintiff's witnesses. Three of the four days were taken up by the Docks Company's Counsel with arguments on legal points arising out of the plaintiffs' case. The arguments the arbitrator (without calling on the plaintiffs to reply) disposed of on Saturday last by a decision adverse to the Docks Company, contentious upon all the points raised by the case. This the Docks Company declined to do, on the ground that they preferred to appeal to the Divisional Court against the arbitrator's ruling, for which application Sir Farrer Herschell, Q.C., is retained.

Constantinople.—The church built at Constantinople by the Society for the Propagation of the Gospel in Foreign Parts (the funds of which were raised by contributions from all classes of the British nation), in memory of British soldiers who fell during the Crimean War, has just had the east window finished with stained glass. The centre circle contains the head of Christ, after Guido Reni, the outer lights representing the Apostles and the symbols of the four Evangelists. There are two pressed circles under the window, which are filled with mosaics, representing the heads of St. Paul and St. Matthias. The whole has been designed and executed by Messrs. Mayer & Co. at a cost of 250L.

Messrs. Doulton's New Buildings.—We understand that Messrs. Doulton & Co., Messrs. Yongg & Co., after obtaining tenders from several builders for the erection of factories, &c., are carrying out the works themselves.

Nineteenth Century Art Society.—Monday, the 25th inst., has been appointed the reception of Works of Art intended for the Spring Exhibition of the Nineteenth Century Art Society, at the Conduit-street Galleries.

Institutes of Builders.—The Annual General Meeting of the Institute of Builders will be held at the Offices on the 19th inst. at two o'clock p.m.

Unstable.—A three-light Munich stained glass window has just been erected in All Saints Church, near Carlisle, representing in the centre light the Assumption, and the side lights containing the scenes of Barzillai entering King David and Mason lodging the Apostles. The work has been designed and carried out by Messrs. Mayer & Co.

Table Ware from Slag.—An American contemporary reports that the slag resulting from the smelting of copper, gold, and silver ores at Argo (Colorado) is now being used for the manufacture of beautiful table ware. The colours are a kind of spray of onyx and opal finished in waves throughout the ware. The colours, it is stated, are under perfect control, the slag containing a larger percentage of material necessary than can be found in slag elsewhere. The slag is melted at an intense heat, then poured into vats of agitated water, then re-melted, and poured into moulds either with or after an acid mixture, which causes the metal to flux pretty generally with added materials. The result is said to be a metallic glass with the strength of light cast-iron, which may be moulded into any form of table ware,—bowls, cups, tumblers, &c.,—with the most beautiful sprays of onyx stone colours upon a general background of opal.—Iron.

Royal School of Mines.—Prof. Warrington Smyth, F.R.S., in continuing his lectures on mining in the Theatre of the Geological Museum, Jernyn-street, considered the various prejudices which have long existed in the minds of miners forming various schools of opinion of a very remarkable kind. Some men considered that lodes are more likely to occur on those hill-sides facing the sun or a large body of water; a few believe that plants and trees have a special liking for particular classes of mineral, and this fact may be considered as being reliable indications of favourable localities; a number place confidence in the manner in which snow lies upon the ground, believing that it will not lie on the backs of the lodes in the same way as in the country around because of a greater temperature in that particular part, owing to the presence of decomposing pyrites; the difference in the colour of grass is considered another indication; and, lastly, there is an opinion held pretty largely in some districts, though not sufficiently appreciated in others, that the position of some classes of lode may be found by a tolerably acute sense of smell, the presence of pyrites giving rise to sulphurous acids and other gases. He had noticed this peculiarity in connexion with lodes in the county of Wicklow, in the west of the county of Cork, and in Cornwall, where the odour is especially noticeable when the sun was shining brightly after a tolerably heavy shower of rain. Further, on the backs of certain lodes, in particular conditions of weather, a series of cornuciations of light may be seen playing like a lambent flame. This has led to the discovery of lodes. It was a common thing to see these phenomena on Wheal Buller, thirty or forty years ago, but they have ceased since the lodes were exhausted. The explanation is to be found in the decomposition and recombination which are known to be going on in the surface of these lodes, and especially to the occurrence of phosphates and arsenates. In conclusion, he referred to the popularity which the "divining rod" has obtained in various places, for the discovery of lodes. It is a forked twig, held in a certain position in the hands while walking over the country when the pointer is supposed to go down on the approach of a lode.

PRICES CURRENT OF MATERIALS.

Table with columns: MATERIALS, £. s. d., £. s. d. Includes entries for Greenheart, B.G., Teak, E.I., Squoia, U.S., Ash, Canada, Birch, Elm, Fir, Dantsic, Oak, Canada, Pine, Canada red, yellow, Lath, Dantsic, St. Petersburg, Wainscot, Riga, Odessa, Deal, Finland, 2nd and 1st, St. Petersburg, Riga, St. Petersburg, 1st yel., 2nd, 3rd, Swedish, White Pine, Canada, Pine 1st, 2nd, 3rd, Spruce 1st, 2nd, 3rd, New Brunswick, Batters, all kinds, Flooring boards, sq. 1 in.—Prepared, first, second, Other qualities.

TIMBER (continued). Cedar, Cuba, Honduras, Australis, Mahogany, Cuba, St. Domingo cargo av., Mexican, Tobacco cargo av., Honduras cargo av., Maple, Bird's eye, Ross, Rio, Bahia, Box, Turkey, Sasin, St. Domingo, Porto Rico, Walnut, Italian.

METALS. Iron—Pfr in Scotland, Bar, Welsh, in London, in Wales, St. Staffordshire, London, Sheets, single, in London, Hoops, Nail-roads, COPPER, British, cks. and ingot, Best selected, Sheets, strong, India, Australian, Beech, Chili, bars, YELLOW METAL.

METALS (continued). LEAD—Pfr, Spanish, English, com. brauds, Sheet, English, STRAINER, Silesian, special, Ordinary brands, TRIP, Banca, Billiton, Straits, Australian, English ingots, ZINC, English sheet.

J. Bloomfield, Tottenham	[Engineer's estimate, 10,152.]

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

R. R. R. (next week).—W. and W. (one of the Tenders sent in below our mark. We publish nothing under No. 100.)—R. P. (photograph received).—A. E. A.—W. M. E. & E. C. Co. (amount not returned).—W. E. (two letters).—H. D. (letter).—P. & Co. (miscellaneous last week). All communications of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline printing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications. Letters or communications (through more newspapers) which have been declined for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE BUILDER, 46, Catherine-street, W.C. Business letters and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

THE INDEX and TITLE PAGE for Volume XLIX. (July to December, 1885) was given as a Supplement with our issue of January 9th.

A COLOURED TITLE PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (Clubs), with Strings, to hold a Month's Numbers.

THE FORTY-NINTH VOLUME of "The Builder" (bound), price Twelve Shillings and Sixpence.

SUBSCRIBER'S VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six Lines (about fifty words) or under 4s. 6d.

Each additional line (about ten words) 0s. 6d.

Terms for Series of Trade Advertisements, also for special advertisements on local papers, Competition, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about ten words) or under 2s. 6d.

Each additional line (about ten words) 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Current-generals, W.C. to DOUGLAS FOURDRINER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTS, & SPECIMENS, &c., left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent Garden, W.C. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum (Postpaid). To all parts of Europe, America, Australia, and New Zealand, 26s. per annum. To India, China, Ceylon, &c., 29s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Malmesbury.

N the course of his "Laborious Journey and Serche for Englandes Antiquities," Mr. John Leland went from Cirencester to Malmesbury. He went all by "cham-payne grounds," through corn and grass, till he came to the stone bridge over Newnton Water, where the cattle love to cool their feet and drink deep draughts of the bright stream, and so up the narrow road between its high banks, and through the East Gate into the town. He was much impressed with its strong natural position, standing on the top of a great slaty rock and almost surrounded by water. "For Newton Water cummth a 2-miles from North to the town: and Avon water cummth by Weste of the town from Lukington Village a 4 miles, of and meate aboute a Bridge at South Est part of town, and so goith Avon by South awhile, and than turneth flat West toward Bristow." Some time before the two streams actually join they seem inclined to do so and approach each other within a "burbol-shot," but then recede again to enclose the hill upon which Malmesbury is built. "Nature," says Leland, "hath dikid the town strongly." Man took advantage of the work begun by Nature, and already in very early times pitched upon this spot as a stronghold. Legend says that a certain British king, Dunwallo, surnamed Molmutius, first built a castle here, 642 years before Christ, which castle was called Caer Bladon. But this tremendous antiquity cannot be authenticated. The place, however, seems to have been known by its British name of Caer Bladon, and charters announce themselves as "dated publicly on the river Badon." Presently the name became Ingelburne, and remained so for a long time, till a certain Scottish (or, as some say, Irish) monk, Maïldulph, being too closely beset with thieves and robbers in his own land, set out, as many of his compatriots have since, to seek his fortunes in England. He wandered about the country, "thinking where God would dispose of him," and at length was attracted by the pleasantness of the wood under the hill on which the ancient castle of Ingelburne stood. He asked and received permission to establish himself in it as a hermit. Presently, "being here destitute of necessaries, he chose to himself scholars to instruct, to improve the meanness of his subsistence by their liberality." The school grew famous, and with it its founder, Maïldulph: so much so

that the town of Ingelburne gradually ceased to be so called, and was known as Maïldulphesburg, or the city of Maïldulph, and this, philologists tell us, became contracted into Malmesbury.

Among Maïldulph's scholars the most noted was Aldhelm, one of the great men of his age. He founded the monastery at Malmesbury, as well as one at Bradford on the same Avon that flows half round Malmesbury. Of this latter monastery there still remains the Saxon church, one of the few authentic examples of that ungainly style. St. Aldhelm's fame was not posthumous merely. His epistles to the students at Cologne, Paris, and other distant places established his reputation as a holy man, though they have long disappeared. He was, too, the first Englishman who wrote in Latin and taught his countrymen to write Latin verses. Here we may behold dimly, through the mist of centuries, by the side of Newton Water, the *fons et origo* of many a schoolboy's misery. After a long and laborious life the pious Aldhelm died, Bishop of Sherborne in Dorset, in the year 709, and with him was quenched one of the few bright lights that helped to illumine the Dark Ages. His memory was long preserved by a great fair, held on the Feast of St. Aldhelm, which brought together such great crowds that it was one of "the bragges of the town," says Leland, "that the tounne kepith a band of harnessid men to se peace kept."

The monastery was by this time fully established and in possession of a church, in one of the chapels of which, or in a small adjoining church, according to Leland, occurred one of the most remarkable events in scholastic history. One John Scot, who taught Greek to the youth of Malmesbury, was actually A.D. 883 slain by his scholars with their pen-knives or "table pointelles"—surely the most tragic fate that ever overtook a pedagogue. There is still a school taught in part of the ancient abbey, but it is marked neither by the lofty learning nor the startling episodes of John Scot's time. Over the south porch, and approached by the old corkscrew staircase, is a parvise in which a score or two of little children imbibe the rudiments of knowledge, and rise with true rustic awe when the sound of their shrill voices floating through the narrow window leads the wondering stranger into their midst.

In course of time, the possessions of the monastery or abbey grew enormously, one of its most notable benefactors being King Athelstan, who, in addition to valuable mundane gifts, bestowed on it "several presents far exceeding all human treasure," namely, a piece of the true Cross and of the Crown of Thorns. So much did the monks revere this

monarch's memory, that a feast was established in his honour, which is observed to this day. His tomb is also pointed out in the abbey,—the only one that has survived the ruin of the Dissolution; but the merest tyro can tell at a glance that the tomb is centuries later than the king it commemorates.

All these celebrities had passed away long before any part of the existing building had been begun. It is generally supposed that Roger, Bishop of Sarum, caused the church to be built,—the same Roger who beautified the old cathedral, long demolished, which stood in the fortress of Old Sarum. Malmesbury Abbey was, in its prime, a large and magnificent place; one of those which, perhaps, from their very vagueness, best convey an impression of the enormous wealth and splendour of the Church before the Dissolution. When we recollect the number and beauty of the cathedrals and abbeys still remaining, and remember that quite as many, and those of equal pretensions, were destroyed at the dissolution of the monasteries, we begin to realise what the country must have looked like at the beginning of the sixteenth century. Malmesbury Abbey Church was cruciform on plan, with a great tower at the crossing. Only part of the nave is left now, six bays out of the nine being roofed, and used as a parish church. They are in the solemn and majestic style of the earlier half of the twelfth century. The grim and relentless lines of true Norman work had softened a little. There is still the rugged strength and the massive construction, but graced by something of the suppleness of Early English. It is all allied to the majesty of barbarism, and the savage tooth still grins out from some of the arches. The splendour and the barbarism culminate in the south porch,—one of the finest things of its kind in all England. The doorway is rather over 7 ft. wide, recessed in an arch of eight bold orders, spreading on either side to a distance nearly as great as the width of the door itself. Three of the orders are carved with historical subjects, the rest with the formal interlacing patterns characteristic of the period. The historical subjects embrace the customary events from the Bible, treated with the customary realism and the usual stiffness of pose and drapery. There is no ingenuity of light and shade, none but the most elementary rhythm, but it is magnificent, with the magnificence of the time when kings lived in splendid squalor, and the mightiest barons could neither write their own names nor read any one else's.

Leland was struck with the aspect of the church, "a right magnificent thing" with a steeple,—a "mighty high pyramis,"—that stood at the crossing, and was a mark to all

he country about. It had fallen, as we gather, then in memory, at the time he wrote. Already then, in 1540, the king's commissioners had condemned the church to ruin. The abbot's lodgings were occupied by the loons of one Stumpe, a wealthy clothier; nay, his weavers were at work in the very chapel where John Scot was stabbed to death by his pupils, but the six bays of the nave that were still entire he had secured and caused to be made into the parish church. He had bought the abbey church and its precincts as well as Charlton and other of the monastery's lands from the king, who soon afterwards, being in the neighbourhood hunting, paid Mr. Stumpe a visit. That gentleman, hardly accustomed to such honours, was caught by the monarch and his hungry retinue with an empty larder. But he was equal to the occasion, and ordered his many weavers to fast for the rest of the day, and send in their dinners to him. With this homely fare, of which the quantity was more commendable than the quality, he gave his royal highness a satisfying meal, and the whole party left much pleased with their entertainment. Mr. Stumpe, the wealthy clothier, affords an example, of which there are many others, of the alliances formed in old times between families devoted to trade and those boasting a lofty descent. His son, who married a daughter of Sir Edward Baynton, became the progenitor of many of the earls of Suffolk and Berkshire, the family which still retains Charlton and its beautiful mansion, built some sixty or seventy years after Stumpe first bought the property. If noble families did not then actually engage in trade themselves, they very frequently allied themselves to those who did, and we must look to later years for evidence of the scorn supposed to be felt by "blood" for trade.

Stumpe deserves to be gratefully remembered, if only for preserving so much of the abbey church. The six bays that are left are enough to show how fine a building it must have been. In addition to the great central "pyramis" of a steeple, Leland mentions a square tower at the west end, but it may reasonably be doubted whether, from its great height, he did not mistake the square ruined corner of the church itself for this tower. It seems difficult to reconcile his statement with the actual state of the ruins at the west end. There are remains of a great Perpendicular west window, over a west door of the same character as that to the south porch, but not so fine, and many of the existing windows are of the Decorated era, as well as the vaulting over the nave, which shows that great works must have been undertaken in the fourteenth and fifteenth centuries; but the principal claim of Malmesbury Abbey to the high place it holds lies in its Norman nave. The church seems to have fallen to ruin very rapidly after being condemned by Henry VIII's commissioners. Leland describes it as ruinous, though many of the domestic buildings still existed then, and were occupied by Mr. Stumpe's looms. A very bad drawing in Dugdale's "Monasticon," of 1682, shows hardly anything more than we see now; but since its palmy days the foundation has sadly dwindled. In the churchyard once stood a castle, built by Roger of Sarum; but this was soon pulled down, to allow the monastery to extend. Leland says there were three churches in the churchyard,—the abbey church, the old parish church (St. Paul), and the little church in which John Scot was slain. The latter has quite disappeared, while of the old parish church only the tower and spire remain, the body having been taken down before Leland's visit. The tower is now the campanile to the remnant of the abbey church, so that it is observed that the parish church is in one parish and its bells are in another. They are not, however, the old bells of the abbey, of which there are said to have been ten in the central tower and two in the western, if it ever existed. One of the ten was called St. Aldhelm's bell, and was rung during thunderstorms, in order to scare away the evil spirits who brought the lightning and thunder. Alas! for those picturesque old times. How much more hold must storms have had on men's

imaginings when they believed them to be the work of devils actually at that moment careered through the sky, scared, it was to be hoped, by the sonorous tones of the St. Aldhelm's bell, which boomed out through the hills of the tempest.

Truly, of all the glories of the great abbey, not many are left to-day. The six bays of the nave roofed in and preserved; the south porch, with its wonderful doorway; remains of the three ruined bays at the west end; one of the arches of the central tower; and a fragment of the south transept. All the choir, all the north transept, all the cloisters, all the abbot's dwelling and domestic offices, are gone, save what may have been worked into the house standing a little way from the east end, built in Elizabeth's times, out of the old materials, and covering cellars of the early work of the abbey. The two subsidiary churches are gone, as also are several chapels and hospitals in various parts of the little town, which once made Malmesbury rich in architectural interest. Its walls, too, are gone, and its gates; but at the south-east end of the town are the Corporation Almshouses, which form part of the ancient hospital of St. John of Jerusalem. It was here that Stumpe entertained Henry VIII. with his weavers' victuals. A doorway walled up serves to attract the notice of the seeker after antiquity, but there is little else to see.

One feature there is in Malmesbury that deserves investigation as well as the abbey, and that is the market cross, "made all of stone and curiously vaulted for poore market folkes to stande dry wheu rayne cummith." It is octagonal on plan, with a great pier at each angle, and from pier to pier an arch. The vaulting is carried by a central column, which is taken up above the roof to receive a flying buttress from every pier. Eight canopied niches surmount the junction of the flying buttresses, and above them the structure terminates in a crocketed cupola, the whole forming one of the best and most perfect specimens of a market cross still extant.

Some two miles away from the town is Charlton House, an interesting specimen of Jacobean architecture, built by the wife of the Earl of Suffolk who caused the mighty mansion of Audley End to be erected. But apart from the special attractions of this house, Malmesbury offers, on its own account, much to interest the traveller. Its ruined abbey, its market cross, and the tower of St. Paul's, exhaust the list of its notable features, but the whole appearance of the place is quaint, built as it is on a hill sloping away on every side, and on some sides so steeply as to give, without the need of any architectural effort, a vigour and piquancy to its cottages seldom met with among the easy undulations of England.

MR. EMERSON'S DESIGN FOR THE LIVERPOOL CATHEDRAL.

WE give this week views of the interior of Mr. Emerson's design for the proposed Cathedral at Liverpool, and of the exterior from the south-west, showing the design of the western facade. The south-east view is given in our publication of the 9th of this month. To these are added the longitudinal section, the south elevation, and the plan. We have some further illustrations to give in a future number; but the selection here made, combined with the view we published on the 9th, is sufficient to convey a full idea of the main aspect, arrangement, and character of the design.

As will be seen, the design differs much in style and composition from the usual ideal of an English church or cathedral. The able report which accompanies it deals at considerable length with the reasons for the special features in plan and design. The report deserves special mention before we proceed to consider the design itself, for it goes into the whole question of the relations of a modern cathedral design to its site and surroundings and its objects, commencing from the question of the general impression to be produced by the cathedral as a portion of the *comp-d'ail* of the

city in which it is erected. Mr. Emerson's remarks on this subject, and also on some points connected with the internal treatment, and the relative effects and proportions of parts resulting from different arrangements of plan, are very suitably and pointedly illustrated by small views reproduced from photographs of Florence, Rome, London, Rouen, &c., with their cathedrals forming central objects in the view, and similarly produced views of the interiors of some existing cathedrals. The whole report shows that the author has gone into the project from almost every point of view, and given the most careful and thoughtful consideration to it.

We proceed to sum up or reprint from this report such passages as are most necessary in order to fully explain the author's own views, our object being to give each competitor's statement of his own case in his own words, before offering any independent comments on the design and on the views embodied in the report. Some portions of the report, however, will be sufficient to give the substance of its *raisonné*, without quoting the text in full, as architectural readers will sufficiently understand what is aimed at without all the detail of explanation which it is desirable to lay before a mixed committee.

In regard to the style to be adopted, Mr. Emerson expresses the opinion which we have already expressed, that the long Mediaeval type of church cannot be adequately carried out for a first-class cathedral within the limits of the site selected; but he adds to this the argument, that in a large city the mediaeval type of church does not present sufficient mass to hold its own in the general view of the town. He illustrates this from distant views of London and Paris:—"Westminster and Notre Dame stand out with no special prominence, while St. Paul's and the Pantheon impress the eye at once. In Edinburgh the new cathedral, even where one can command a full view of it, looks unimportant, not to say unimposing, and from the city it is scarcely seen at all." It should be remembered, however, that this last, though bearing the title of cathedral, is not of the usual cathedral scale; it is only a large parish church.

"To secure the effect of mass, a treatment differing from the long and narrow Mediaeval one is necessary, and imperatively called for in the case of the Liverpool Cathedral.

I consider the pyramidal form of grouping, with the grand domical central feature, to be the best—1st. Because its mass, in combination with its height, gives the greatest attainable grandeur and impressiveness.

2nd. Because it best ensures the execution of a plan essentially adapted to the modern requirements of the cathedral service.

Liverpool itself, indeed, may be said to have no distinctive cathedral associations; but the people are English, and have memories which connect themselves with the beautiful Mediaeval churches of the country. Accordingly, while, to suit the city and the requirements of our modern service, a new departure is desirable, and should be made, the architecture, out of respect to the sentiment of the people, should follow the principles and express the feeling of our grand old Gothic cathedrals.

To effect this combination, and design a cathedral which shall be worthy of the second city in the British Empire, has been my aim in the plan I have submitted.

Style of Architecture.—Some might think that the surroundings demand a Classical or Renaissance treatment. To my mind a style of building based on this idea would be a great mistake artistically. The scale of St. George's Hall is enormous; and a cathedral of similar architecture, holding its own in respect of detail, would require to rival St. Peter at Rome in magnitude; and this would only overwhelm the Hall, a building which the cathedral should enhance and not extinguish. A further argument reason why a classical architecture should not be adopted is, that it is pagan and un-English in its origin, while Gothic is Christian, and, moreover, our national style of architecture; and, whatever may be done in the matter of our civil or municipal buildings, surely our religious edifices ought to preserve the Christian character that they have born for ages. The style to be adopted should be a harmonious contrast with the surroundings, an edifying, not annihilating. It should be broad, simple, and dignified. Such a style is to be found in a very early phase of the Gothic, when it had shaken itself free from the trammels of Classic art. The east end of Canterbury Cathedral may be referred to as a notable example of many. This accordingly, is the style which I have adopted. It will be found at once good for a simple broad exterior, suited to the atmosphere of Liverpool, and

capable of a rich interior in keeping with its magnitude; and that it may be made to vie with the best work of the Greek artist is shown by the detail, at Arles, Lech, Pithers, Fontfroid, Ferigneux, Anroulme, Toulouze, &c., which we have in the Gothic approach to the Classic feeling found in North work, and which is exceedingly beautiful. The contrast of the early Pointed arches and the detail with the surroundings, would be the most harmonious and the best, and by reason of the difference in character would do away with any sense of competition with the adjacent buildings, such as another Classical erection alongside of them could not fail to suggest.

Plan.—As the mystery affected by the religious bodies in the Middle Ages, and which enforced their separation from the congregation and partial concealment by choir-screens, &c., no longer exists, and modern feeling demands that the largest number shall be admitted to see and hear the services that are specially intended for their benefit, without being impeded by large piers, it is necessary that the construction be such as to ensure an extensive unbroken area in the interior. Respect, on the part of the architect, for this demand is not only in accordance with all that has been written and said during the last few years on the necessity for churches being suited to modern requirements, but also with the fact that on the Continent within the last two centuries over 1,000 churches have, for this reason, been erected on this principle and surmounted by domes. I have, therefore, added to the nave and transepts, of the great width of 53 ft. from centre to centre of the arcade walls, an open space in front of the choir and pulpit of about 9,000 superficial feet, exclusive of the accommodation in three galleries, containing 1,200 superficial feet. This is after the plan at Ely. Some would think that a nave of, say, 70 ft. span would be better than the one I have proposed. It would certainly not, for three reasons:—1st. By the plan submitted, nearly 1,400 persons can be accommodated in the unbroken area within 100 ft. in front of the pulpit, exclusive of the gallery accommodation; whereas in a nave of the Basilica type of say, 70 ft. wide, only 1,000 could be accommodated within 100 ft. of the pulpit; and, in a nave of 50 ft. wide of the same type, only 710 could be accommodated within the same range, — a calculation which, of itself, clearly shows the enormous advantage of the open area. 2nd. The best proportion for height and stateliness is that the height should be about twice the width; more gives a contracted effect, while less is unimposing. Thus a nave of 70 ft. span would require to be 140 ft. high, which is too much; whereas, if of only the ordinary height of, say, 90 ft., or 100 ft., it would be oppressive. 3rd. If we got a height and width as 70 ft. and 140 ft. were maintained, the constructional difficulties would be disproportionately increased. The abutments necessary to resist the thrust of such high and enormous vaults would be too cumbersome and costly.

The remarks just made in reference to proportion of height and constructional difficulty apply with as much force to this open space as to the nave. A Gothic vault over such an area of, say, about 100 ft. diameter, and of proportionate height, would require abutments out of all proportion, and be excessively expensive. If, in order to take advantage of the external walls for abutment, it were vaulted at about the same height as nave and transepts, the effect would be crushing and oppressive in effect on account of its lowness, and besides, it would be very bad for acoustics. A Gothic dome, on the other hand, properly constructed, is self-supporting, and has no thrust, and but little tensile strain. It can, moreover,—an important point in regard to economy,—be erected without centering, which a vault cannot. Again, were such an area roofed by a ribbed vault, its chief internal charm, viz., the impression of vastness, would disappear, as the divisions would render it easily measurable to the eye, and therefore unimposing. This is apparent at Ely. A dome is imposing internally in proportion to the inability of the eye to measure it, as, e.g., in the Pantheon, in St. Peter's, in Sta. Maria del Fiori, in St. Sophia, and in the Gol Gomuz. This property gives it vastness; and grandeur is unattainable without a sense of vastness. For decorative purposes, also, the unbroken surface of a dome is more susceptible of a majestic treatment than the cells of a ribbed vault. A dome, therefore, internally, is the best artistically. If a precedent be required for the introduction of a dome to Gothic architecture, the magnificent examples of Sta. Maria del Fiori and the Baptistories at Pisa and Florence may suffice, without mentioning inferior instances in Italy, Germany, France, and Spain. Moreover, the beautiful Mohammedan domes so common in the East are practically Gothic. They are so in principle and feeling, and are supported on Pointed arches.

DETAILS OF THE ARRANGEMENT OF THE PLAN, AND THEIR REASONS.

Four points in the plan call for especial remark:—1st. The reasons for the octagon, and the relation of the dome to the nave. 2nd. The triapsidal arrangement at the east end. 3rd. The western porch and the position of the western towers.

4th. The apsidal ends to transepts.

1. The Reasons for the Octagon, and the Relation

of the Dome to the Nave.—One charm of Gothic cathedrals is found to lie in the aisles; the vista in many of them is delightful. In a cathedral church, moreover, meant to accommodate thousands, aisles are a necessity. They are necessary, not only for congregational purposes, but to give ample passage-room without disturbing the congregation during the service, as well as to yield artistic effect, and to supply space for tombs and monuments. In a domical church, however, when the dome is over a square space and on four legs, aisles become impossible without great expense and waste of room. The piers necessarily become so large that they block the aisles. The waste of room that results when aisles are added outside the piers is shown notably in the Pantheon at Paris, where two rows of columns occupy the useless space behind the large piers; although this blocking of the aisles with the waste of room is less important in a Roman Catholic church, the recesses behind the large piers being utilisable as chapels, or as at the Oratory, Brompton. St. Paul's, London, notwithstanding its stately dignity and beauty, is somewhat marred by two causes:—1st. The nave is too narrow to proportion to the dome; and, 2nd, the circular arches to the pendentives under the dome spring uncomfortably and unconstructurally. This is because, circular arches being necessitated by Italian architecture, a regular octagon under the dome was unavoidable; and this reduced the width of the nave. By a Gothic treatment these faults are avoided. In the plan submitted, by reason of the irregular octagon, a wider nave than St. Paul's is obtained, and one in proper proportion to the dome, which is less than St. Paul's; while all the arches of the octagon under the dome spring properly. The octagon is 103 ft. across diagonally. Though a large open area and grand central feature, at the crossing somewhat encroaches on the length of the actual nave, the vista from west to east remains the same, and has the advantage of increasing the general picturesqueness. Externally, by a pyramidal group (in favour of which I have before given my reasons), the shorter nave is advantageous; and under any circumstances the one has extra length shown on Plan B, No. 6, is all that is desirable to lengthen a church of this plan, either for congregational purposes or for artistic effect. The system of cross-pendentive arches under the dome has, apart from its picturesque and varied lines, several other great advantages:—1st. It has acoustic advantages. 2nd. The dome and its pendentives are brought well into scale with the nave. To effect this has always been a difficulty in domed churches. It is generally overcome, as at St. Peter's, by making the nave enormous in width, height, and detail. But this is fatal to impressiveness as having a dwarfing effect on the church, the eye being thereby deceived as to the size. This is notorious at St. Peter's. In St. Sophia, scale is obtained by the juxtaposition and contrast of the smaller arches. This is one reason why galleries are introduced in the alternate sides of the octagon. They have three small arches each, and can be utilised to accommodate the organ and extra musicians, or for seats on extraordinary occasions. These galleries are not necessary constructionally, and, if thought desirable, only those on each side of the choir for accommodation of the organ need be retained. 3rd. By the pendentive system adopted, the principle of construction of hanging the weight inside renders a less cumbersome external abutment necessary. 4th. The angle of the slender face of the vault is most advantageous for decorative purposes, by bringing the subjects without distortion within an easy angle of vision. Internally the subdivisions of the octagon and cupola become smaller as they ascend, till in the cupola they cease altogether, and the cupola offers simply a grand surface for decoration. This prevents the eye from easily measuring it, and gives a sense of vastness. The nave shown is 53 ft. from centre to centre of arcade, and 97 ft. high. This is somewhat wider than that of any of our English cathedrals. The width of the nave and the space at crossing makes the plan at first glance look short; and, were the octagon regular and the nave only 40 ft. wide, the church would, on paper, look rather longer; but for the acoustics, convenience of seating, and general effect of spaciousness, there could be no comparison. A narrow nave, moreover, is unsuited to modern services. Referring to the mourning service in Westminster Abbey to General Gordon, the *Pall Mall* said:—"The Dean gave a suitable address, but the greater number of those present could not join in the services."

The Trijorium.—This is so arranged that a passage-way is provided all round the church, and that to the nave and choir is an actual gallery, which might be of use on special occasions, access being obtained from the staircases in the large piers to the dome. It is also well lighted, and gives access to a shallow gallery over the west entrance. It is carried round the recesses above the galleries at the alternate sides of the octagon.

II. Reasons for the Triapsidal Arrangement at the East End.—An apsidal east end is necessitated by the proximity of St. George's Hall. Internally, with the usual form of apsidal end choirs, the bays and arcade arches become attenuated; they look small, unimportant, and wanting in dignity, compared with those of the nave. This is most apparent when they are viewed from the extreme

west end of the church. The perspective diminished them still more. Witness the effect in Westminster Abbey, Notre Dame, Amiens, Cologne, Chartres, and Bayeux. Externally, a forest of flying buttresses and pinnacles is entailed by the plan of the vaulting consequent on the narrowness of the arcade arches. The result is a want of repose and breadth; but the triapsidal arrangement adopted avoids these faults. Internally, three stately main arches or bays are obtained in scale with those of the nave, and the smaller arches become subsidiary. They do not clash with the main arcade, and they give scale to the larger parts. Externally, only four large flying buttresses and turrets are needed, as all the weight is brought to only four points of support. One advantage of this arrangement, on this particular site, also is, that it enables the ambulatory to be lessened in width with perfect harmony. This gives the greatest possible internal length from the west wall to the altar. Another point is that greater variety of effect is obtained than in the somewhat monotonous ordinary apsidal plan. Externally also the circular lines harmonise well with the round ends of St. George's Hall and the Picton Reading-room. This will be obvious from the perspective view.

III. Reasons for the West Porch and the Position of the West Towers.—It has been said that the entrances to most Gothic cathedrals resemble holes into beehives. This is true of the English cathedrals, excepting Peterborough and Lincoln. This feature cannot fail to strike those who are acquainted with the magnificent lofty entrances to Oriental buildings. I have adopted the idea of the Peterborough porch:—1st. For the sake of grandeur. 2nd. Because the more elaborated doorways are thus protected from the weather. 3rd. Because, as the site slopes from east to west, there must be flights of steps either at the corners, as on Plan A, No. 5, or on the west front, as on Plan B, No. 6 [the plan published in this number]. In either case a porch or narthex is necessary. For, in the first arrangement, a passage of some sort is needed to obtain entrances into the centres of the nave and aisles at the west of the church, and, in the other, the steps landing close to the doorways without a porch would have a very poor effect. By the arrangement shown on Plan B, carriages could drive through on state occasions to the west door. The reason of placing the towers outside instead of at the ends of the aisles is threefold:—1st. To avoid the painfully contracted effect produced by two tall towers immediately flanking the nave, as in the case of the cathedrals at Cologne, Chartres, Rouen, Brussels, Lichfield, York, the abbey at Westminster, and numbers of others. 2nd. To obtain a grand spreading west elevation with the dome well visible in the rear. 3rd. Because in the view from either side of St. George's Hall, as in Perspective A, No. 19, the whole length of the nave is seen, whereas one bay would be hidden by the towers if they immediately adjoined the nave. The greatest effect of length is thus obtained. The cathedral of Cologne is a notorious example of how a long church can be spoiled both on the west facade and side views by the towers immediately flanking the nave.

IV. Reason for the Apsidal Ends to Transepts.—This arrangement has been adopted for acoustical reasons, and also to obtain the full effect of the length of the nave externally. Square transepts would hide more of the nave in the side view. Abnormally wide transepts arranged to supply an accommodation equivalent to that of a large central area would be disastrous on this site to the external effect in shortening the length of the church. A further reason for the apsidal ends to transepts is that the roof-vaulting works in so much more happily than it does with square ends.

The Choir and Sacarium.—The general arrangement of the choir and sacarium speaks for itself. The altar is placed a little in advance of the arch over the centre apse. It is 6 ft. 6 in. above the floor of the nave, and more steps might easily be added at the entrance to the choir, if thought desirable. Gates on either side near the altar rails provide exit for the communicants. The Bishop's throne is situated on the south side, in the centre of the bay. The choir accommodates eighty men and boys, including clergy stalls. A simple choir with only a few figures round the sacarium, and an iron screen, is shown in Section A, Nos. 17 and 12. An alternative arrangement, enriched with a sculptured screen separating the ambulatory from the sacarium, and with canopied figures on the large piers, is shown in Drawings B, No. 17a, and B, No. 18, and by the perspective view of the interior. [The section which we publish shows this more enriched design.] This richness in a church of such magnitude seems necessary as a focus, and gives scale to the interior views.

Mourning Chapel.—This is provided on the north side of the choir, and will seat about 120 persons. It has a side door for early services.

The Organs.—Fine organs are often spoiled for want of proper accommodation being at first arranged on the plan. Space for the large organ is provided in the gallery on the north side of the choir; or it might be divided and occupy the galleries on either side. The organist and choir would be placed between the large piers on the north side, immediately behind the choir-mon. The modern appliances in relation to organ-building

render connexion between the keys and sound-producing portions of the organ a matter of the greatest care, and that without the introduction of any very visible construction or casing extending from one to the other. The position of the organ here, with the circular form of recessed gallery behind it, and the great height and curved vault above it, would most advantageously show the choir-organ would be placed opposite the Bishop's throne in the choir, also connected with the general clavier by pneumatic or electric action. This arrangement, by which both organs could be played from one console, would render the effect which is so highly appreciated in many large Continental churches, possible for the first time in this country, namely, the possibility of accompanying the choir with the soft choir-organ, and the responses by the congregation on the grand organ under the dome.

The Font.—This is placed on the south side of the nave, between the first two piers of the arcade. A baptistry has not been provided, as it seems hardly needed in an English cathedral; moreover, modern feeling seems to demand that the rite should be celebrated in view of the whole congregation. Nevertheless, were a baptistry desired, it could easily be arranged, as shown by the dotted lines on the plan, where it would occupy the width of one bay of the nave, and a depth equal to the width of the tower.

The Pulpit.—This is placed under the dome, adjacent to the large pier on the north side of choir-steps.

Lighting.—The windows are all wide and high, and the lower windows are kept free from tracery. Mosaic is provided for walking all round the building at the level of the sills of the aisle and clerestory windows, so that repairs, &c., may be effected without trouble or expensive scaffolding. Gas or electric light might be used for artificial lighting, and might, for the most part, be effected by an arrangement of hanging lamps.

The Vestries.—The Bishop's, Dean's, Canon's, and Choir-man's vestries are situated on the south side of the ambulatory. The choir-boys' vestry is below at the crypt level. It is well lighted, and also forms the choir-school. It is approached by two staircases; the one near the priest's entrance from the cloister; the other from the aisle on the east side of south transept. The boys would join the men in their vestry by means of those stairs before entering the church. Ample space for presses to accommodate the vestments is supplied, and safes for church plate. Lavatories are provided for the clergy and the choir; for the former at the upper level; for the latter at the crypt level. Above the Dean's and Canon's vestries a large room is supplied, which might form a library or a supplementary vestry, and might also afford extra space for vestments. It is connected with the choir-house, to which it might form an ante-room. It helps the scale of the church, and masks the west side of St. George's Hall; but its omission would not affect the general aspect of the design.

The Chapter-house.—This is provided over the Bishop's and choir-men's vestries and is approached by a grand staircase from the east side of the south transept aisle. It is also, as before stated, in connexion with the room available for a library over the Dean's vestry, and may be approached from the priest's staircase. This is a convenient position and arrangement for both private and public or professional meetings.

The Crypt.—The crypt proper follows the general plan of the church. It is lighted by windows on all sides. There are also windows under the east dwarf walls between the sacrum and ambulatory below the choir-floor level, and circular lights are obtained in the floor of the church. These would be Hyatt's lens lights, masked by ornamental bronze or iron grilles flush with the surface of floor. A large opening under the centre of dome, also filled with a movable grille and glass, would allow for the lowering of tiers. An entrance is obtained under the west porch by an unobtrusive door.

The Consistory Court, the Diocesan Office, and the Mincing Lane.—These are placed on the south side of crypt, near each other, though with separate entrances, and also with access from the church. All have good direct light. The open space by the consistory court would answer as a waiting-room on the elections of prebends or other meetings. On the north side under the transept the heating apparatus is placed. The heating would be by high pressure and small pipes, in channels formed in the thickness of vaults over crypts. Also space is provided for a hollow-room for organ. The hollows would be worked by either gas or hydraulic engines.

Sub-Crypt.—A sub-crypt is supplied under the nave only.—1st. To place in it the human remains found in the churchyard, which might be perfectly sealed up in brickwork set in cement. 2nd. Because, at the west end, part of it would be above ground, so that very little excavation is needed, and the stone obtained would possibly be used.

Seating.—This church will seat 3,000 persons, exclusive of the aisles, and the seating would presumably be chairs. The aisles would accommodate about 430 extra.

CONSTRUCTION.

The Walls.—The church would be faced with stone externally and internally. The walls would be hearted with cement concrete, the facings being

bound together by frequent through stones and courses of solid masonry.

The Roofs.—Nearly all the churches that have been destroyed by fire have been so in consequence of their having timber roofs. I therefore propose fireproof roofs; and, indeed, no difficulty is to be found in finding a covering would be formed of a plain concrete barrel vault, strengthened with brick arches over each pier. In the lower parts of the vaults the concrete would be composed of an aggregate of considerable weight. Approaching the apex it would be of much lighter specified weight. The thick portions would be lightened by voids formed by the introduction of light earthenware pipes. These vaults would, in the lighter parts, be of no great thickness, and would obtain extra tenacity and fibre by embedding a network of copper wire in the concrete. I have before one of the largest modern public buildings in India I structured the roofs entirely with vaults to the exclusion of timber. These barrel vaults might be covered externally with either lead or copper, or thin terra-cotta tiles fitting into grooves formed in the upper face of the vaults. Concrete being slightly porous a covering would be needed. In slightly respects this is a simple adaptation of the Roman method of forming stone roofs. The lower vaults, viz., those seen from the interior, are of ordinary construction, and might be filled in with either bricks, stone, or chalk. If these were likely to be decorated with mosaics, bricks would be better than the others. If it should be decided that mosaics are not to be used, then either stone or chalk would answer the purpose. The crypts would be vaulted with bricks and concrete. The double vault is necessitated partly for external effect of height and partly for structural reasons. It places so much material on the hanches of the lower vaults that their oblique thrust becomes a vertical weight, and, by the weight on the hanches of the superior barrel-vault, the thrust on the flying buttresses is reduced to a minimum.

The Dome.—The pendentives are small and thick, lower parts of the dome, to about one-third of the height, would be constructed of masonry and concrete. Above this, it would be of purposely made bricks of light specific gravity, and of such a form that the dome would be created without any centering. Those used for the outer surface of the dome would be grooved so as to fit the light terra-cotta tiles with which I would propose to cover the dome. The proportion, construction, curves, weight, and thicknesses of this dome have been carefully arranged and determined, and the accurate calculation of weights, thrusts, and strains have been made, in conjunction with one of the most eminent dynamic authorities in England. Access is arranged to all parts of the building, viz., windows, roofs, galleries, domes, and spires, for surveying purposes and repairs. The floors of the church generally would be of stone, and with marble pattering under the domes, but wood blocks might be used for the flooring if desired.

Acoustics.—This subject is of the greatest importance in connexion with a large church suited to modern requirements, but unhappily very little is really known concerning it. This, however, is certain, that echo and reverberation are caused by sound being reflected from the surfaces of the confined spaces. In churches these effects mostly result from bald unbroken wall spaces, bad proportions, piers with flat surfaces, horizontal ceilings, and square-ended transepts, unless the transepts be of such length that the voice, decaying before reaching the end walls, is not strong enough to be unpleasantly reflected. It has been unjustly said that domes are always bad for sound, and St. Paul's is frequently instanced as an example. I maintain that a dome is not necessarily bad for sound, and many Gothic churches have more reverberation and echo than many Italian churches with cupolas. The acoustic qualities depend upon the arrangement. Domes of no great height, on square piers, or over spaces confined by flat walls and without large voids like a nave or transept, into which sound may escape, are undoubtedly had as far as echo and reverberation are concerned. This is notably shown in the Pantheon at Rome, the Reading-room at the British Museum, London, the Picton Reading-room, Liverpool, Napoleon's Tomb at Paris, the Taj Mahal at Agra, and numbers of the Italian and Indian domes. In these the voice cannot escape, and is reflected backwards and forwards from the flat surfaces. That a low dome was worse in its acoustic results than a high one, is proved by the fact that the reverberation in the first gallery of St. Paul's is much greater than on the floor level, while in the Whispering Gallery the echo is extraordinary, as the name denotes. The Picton Reading-room is also a local example of this. In fact, to avoid reflection (i.e., echo and reverberation), sound must be either lost in a void, or absorbed by drapery, or deflected and shattered on the confining surfaces. In the plan submitted, to give practical effect to the principles above stated,

* The low domical surface of the ceilings of many theatres does well enough because its resonance is great by reflecting sound quickly, while at the same time echo is prevented by the draperies and numerous tiers of boxes and galleries all round, reaching to the ceiling, and the large audiences at different levels. These adjuncts evidently cannot be introduced into churches.

all lengthened plain surfaces of wall have been avoided, the dome is of great height, and the nave and transepts form large voids into which sound can escape. The large piers supporting the dome are circular on plan, by which means the direction of sound would simply be changed without reflection. The alternate sides of the octagon have semicircular recesses behind the arches, broken by galleries, by deeply-recessed windows, and by double tracery. The pendentives are constructed with a great variety of curved surfaces at different angles, and broken by projecting arches and ribs. Above the pendentives two galleries break the height, also a tracered arcade in front of the deeply-splayed windows. The dome itself is of such a height, that any reflection of sound taking place, in spite of the arched of the west wall is broken by projecting columns and a gallery. The roofs too are groined.

In regard to the question of decoration, Mr. Emerson observes that there may be one of two systems adopted: first, the church may be treated as a stone interior, with only some carved enrichments, stone figures and canopy work, and stained glass; or, secondly, it may be decorated with colour and mosaics, to which end, "which is far grander and nobler," the surfaces suitable for decoration, such as the spandrels of arches, the soffits of vaults, the pendentives, the large arches, and the capitals are left plain to receive mosaics; but in that case coloured marbles and alabaster, &c., should be introduced in the lower portion of the interior; and the author points out that any such scheme, if contemplated, should be considered and arranged for from the first. "It was the omission, at the beginning of the consideration of the character of the decoration to be adopted in St. Paul's that has rendered the decorative treatment so difficult a problem now; and, however this may be treated, it will always cause the lower part of the building to bear a somewhat unsatisfactory relation to the future mosaics on the dome and roof." Mr. Emerson adds that he has thought out the internal architecture in such a way that it might form either a simple monotone church, or be suitable for an elaborate scheme of coloured decoration.

In regard to the cost, Mr. Emerson has commissioned Messrs. Welch & Atkinson, surveyors, to take out the quantities and make an approximate valuation. They find the cubic contents above the nave floor to be 7,394,107 ft. and estimate the cost, including the necessary approaches but exclusive of the residences, at £67,000.

We must not omit to mention an important modification of the site which is proposed by Mr. Emerson. The site on the northern side forms a platform above the steep slope of William Brown-street, the Free Library standing on a similar platform to the north of the said street, which slopes down between the two retaining walls. Mr. Emerson's suggestion is to raise the street to the level of these platforms, making one area of the whole, and carrying down the line of street from this raised area on a gently-sloped bridge to a point in Dale-street, further westward. In conjunction with this alteration, the old buildings of the triangular space facing the west front of the cathedral to be cleared away, and a great space formed in front of the cathedral, which would be reached by a grand series of steps from the lower level. This would also admit, if desired, of the whole cathedral being moved further west, so as not to be in such close contiguity to St. George's Hall. Something like this idea, we may observe, appears to have been already suggested by a Liverpool architect, Mr. L. F. G. Evans, in a letter to the *Liverpool Abolition* of November 1, 1884, a copy of which has been sent to us. It would undoubtedly be a very fine improvement to the site, but it would cost a good deal of money, though not more, from an architectural point of view, than it would be worth.

We have omitted from the text of Mr. Emerson's report (from considerations of space) such portions only as seemed rather necessary for fuller explanation to the committee than for enabling our readers to under-

stand and appreciate his views. The full and thoughtful manner in which he has gone into the subject will be quite apparent from a perusal of the foregoing columns. The design as a whole is unquestionably a remarkably bold and original one; it has the merit, so unhappily rare in modern architecture, of being a departure from mere precedent, an effort to think out a design in a form suitable to the special circumstances of the case, and to combine into one whole hints derived from various buildings of various styles. This departure from ecclesiastical precedent has already, we observe, been made the subject of local attacks emanating from the Medieval church party, who apparently think it the greatest merit of a modern cathedral that it should resemble an ancient one. The reasonableness of this view, as we have before suggested, depends on whether the cathedral is to be regarded as huilt for a church which is to remain established on Medieval lines of thought and sentiment, and ritual, or whether it is to be regarded as the abode of a modified modern worship, suited to the spirit of the present day. Both views are held strongly by many persons on the two sides of the question, and it is not within our scope to express an opinion as to what ought to be, or is likely to be, the course of the English Church in the immediate future. All we wish to point out is that objections to this design for not being on the orthodox Medieval pattern only hold good on the theory that the church is to remain on the orthodox Medieval pattern. In regard to the purely architectural view of the matter, the design appears to us to be a striking, grand, and original one in its main idea and composition. Where we think it partially fails is in a want of homogeneous effect when considered in detail. Externally the whole impression (leaving detail out of consideration) is rather Classic than Gothic. Internally, Gothic feeling is predominant to an extent which the exterior hardly prepares us to expect, except when we confine our attention to special details. The author refers to Peterborough, but he does not realise anything like the massive unity of effect of that unique façade, and the minaret-looking turrets do not combine happily with some other features of the front. The treatment of the buttresses round the dome, on the other hand, is very fine in effect; it is the Gothic buttress and pinnacle cast into a form suited to combine with and support the broad mass of the dome-form. The style of a good deal of the more Gothic detail strikes us as rather heavy. We cannot help feeling that the architect might have done more justice to his very bold conception if he had treated what is in reality a Classic composition with a more Classic form of detail; in fact, that it means to be a Classic design, but somehow or other has worked itself out Gothic.

Referring to one or two special points in Mr. Emerson's report, we fully agree with him that a pyramidal composition is the best for the site. The objections to adopting a fully Classic style we do not think entirely to the point. To say that it is "un-English" might be met by the reply that so is the author's own design, but this objection is only of force in regard to the unsuitability of Classic detail to this climate. It requires modifying for our atmosphere, an experiment which has not been made as often as it might and ought to have been. That Classic is "Pagan," and Gothic "Christian" is an argument that has often been urged, apparently in forgetfulness as to the respective dates of Christianity and Gothic architecture. The earliest Christian Church architecture was Classic, or put together out of Classic materials. If "Christianity" means the Medieval church, the statement is correct, but only on that understanding. Putting aside the question of climate and its effect upon detail, Classic forms of architecture are more in harmony with modern Christianity, and modern English life and sentiment, than Gothic. In all that is said under the head of plan in Mr. Emerson's report we entirely concur, as well as in what follows in regard to "the reasons for the

octagon, and the relation of the dome to the nave," and especially in the opinion that a narrow nave is unsuited to modern services. The reason for the triapsal arrangement of the east end also appear to us to be, architecturally, perfectly sound: the increased dignity of effect from the larger and wider main arches thus obtained round the apse is evident enough in the interior view which we publish to-day. The author gives the same reason for planting out the western towers beyond the line of the aisles which Mr. Brooks gave for his similar treatment; to obtain a spreading west front, and avoid cramping the church up between the towers, as at Cologne—a crucial example, where the west end seems all towers. The proposal for an entirely fireproof roofing over the vault is much to be commended. We ought long before this to have adopted in modern vaulted buildings, with all the new resources of mechanical means and material, something more monumental and homogeneous than placing a wooden bonnet over a vaulted roof to preserve its surface. In regard to the question of acoustics, Mr. Emerson has seized upon the most important point when he observes that echoes are really and most prominently felt from unbroken surfaces which are comparatively near; but it must be observed that distant surfaces, though echoing less strongly, have the compensating disadvantage that they return the sound at a longer interval after its origination, and, therefore, cause more confusion so far as they are heard; nor do we think domes at a considerable height are quite so harmless in this respect as Mr. Emerson maintains. But, as we have said before, cathedrals are not built for acoustics; all we can do is to make them as little objectionable in this respect as possible. It may be laid down as a general truth that architecture in the highest sense and acoustics in the highest sense are things incompatible. One or the other must give way.

We can easily understand that Mr. Emerson's design may be something of a trial to the architecturally as well as to the ecclesiastically orthodox mind. It is not what they expect or are used to. It may be admitted that the design is not so coherent nor so refined in detail as it might be. But it has the great merit of force and originality, for which many defects of detail might be forgiven; and it is very ably planned for the site and for what we take to be the real requirements of a modern cathedral.

NOTES.

THE Report on the iron trade of 1885, by Messrs. Bolling and Lowe, states that prices and wages are now at the lowest point known for five-and-twenty years. The exports of all kinds of iron and steel, which in 1874 were 2,487,162 tons, rose to 3,496,352 tons in 1884. But only 24 millions sterling were received for the larger quantity, against 31 millions for the smaller, showing a fall in the average price per ton from 14s. 4s. in the former year to 7s. 2s. in the latter, or a diminution of one-half in the return of this great industry. Exports to the United States have slightly increased in quantity during 1885, as compared with 1884, owing to a demand for old materials and for hæmatite. But this result has been attained at a reduction of 25 per cent. in price. Exports to the Continent of Europe are everywhere barred by hostile tariffs. Coal, the mainspring of mechanical work, has been exported in larger quantities, but, like iron, at lower prices. The figures for the first eleven months of 1885 were 21,994,865 tons exported for 9,843,162l., against 21,685,801 tons for the price of 10,095,808l. in the corresponding portion of 1884. Iron ship plates are now quoted at the unprecedentedly low price of 4l. 10s. per ton. A remarkable feature of the ship-building trade is the increase in the proportion of sailing vessels built, a class of craft which a year or two ago seemed likely to disappear from the seas. The question of the balance between cost of wages and cost of coal, which, rightly regarded, is the determinant of the lowest cost of railway transit, as affected by speed, is thus being reconsidered by ship owners. In favour of the steamer, how-

ever, it must be noted that triple-expansion engines have fulfilled the most sanguine expectations of their working, and have secured an economy of 20 per cent. on the two-cylinder compound engine.

BY the Highgate and Kilburn Open Spaces Bill, which is now before Parliament, it is proposed to give power to the Ecclesiastical Commissioners to convey to the City of London certain lands known as Gravel Pit Woods at Highgate, in the parish of Hornsey, and certain other lands at Kilburn, in the parish of Willesden, by way of gift, for the perpetual use of the public as open spaces. The land at Highgate consists of about 69 acres, and is bounded on the east by Southwood-lane, and on the western side by the Great Northern Railway's Edgware, Highgate, and London line, and the Alexandra Park Branch Railway. The land at Kilburn contains about 30 acres, and forms part of a much larger area belonging to the Commissioners. It is bounded upon the north-west by the Tottenham and Hampstead Junction Railway, on the north-east by Salisbury-road, on the south-east by the London and North-Western Railway, and on the south-west by Chamberlayne Wood road. Approach roads to these open spaces are proposed to be formed and maintained by the Commissioners until taken over by the Local Authorities, but the Corporation are not to be liable for the cost of paving or lighting these roads. The Corporation are empowered by the Bill to raise a sum not exceeding 15,000l. for the purposes of the Act, and are further to be permitted to dispose of a sum of 20,000l., with accumulations now in their hands as the residuary legatees of the will of the late Mr. William Ward, who left the whole of his real and personal estate (in addition to a legacy of 20,000l.) to the Corporation for the erection or maintenance of some institution or the creation of some fund for the benefit of the poorer classes. The Bill proposes to declare that the maintenance of these lands as open spaces would be such a benefit, but it is open to doubt whether this was within the scope of the testator's intentions.

THOUGH the Home Office inquiry respecting the condition of the dwellings of the working classes in Mile End does not reveal much that was not hitherto known, it is satisfactory to find that attention is being directed to the subject. The hamlet of Mile End, although it undoubtedly contains a large number of insanitary dwellings, is, we fear, not much worse in this respect than some other districts of the metropolis. We say this with regard both to ordinary house or "cottage" property and the so-called "model" dwellings which are reported as "unfit for human habitation." We have on previous occasions called attention to the sanitary dangers inherent to large blocks of tenements in flats unless the buildings be properly planned and constructed, and possessed of adequate means of light and air. These dangers were well pointed out by Mr. P. Gordon Smith, the Architect to the Local Government Board, in a paper read at the Sanitary Congress at Leicester last autumn, of which we gave a report at the time (see *Builder*, Sept. 26, 1885, p. 442). Mr. Gordon Smith's experience, irrespective of his official position, entitles his opinion on such a subject to great weight. The subject was also discussed at a recent meeting of the Association of Public Sanitary Inspectors, and the sanitary evils of badly-planned and constructed dwellings in flats were pointed out with much force by experienced officers. For town dwellings the "flat" system has undoubtedly many advantages, but unless it is to fall into disrepute (for which we should be sorry) in future buildings of the kind sanitary conditions at least equal to those of the best buildings of their class must be strenuously insisted upon by the public authorities, and private or corporate speculators anxious for good dividends must not be allowed to minimise those conditions below certain necessary and practicable standards.

At the business meeting of the Institute of Architects on Monday, the proposition moved by Mr. Lacy W. Ridge, "that it is undesirable to maintain the disability to take out quantities under which Fellows now labour in consequence of the declaration made by them under By-law XXI," having been duly seconded and a good deal discussed, was negatived by a large majority: a decision in which we entirely concur. The resolution does not properly represent in its wording the real state of the case, as what is objected to is not the taking out of quantities, but the acting as quantity surveyors for other architects, or rather for the contractors employed by them. The position is not in accordance with the professional dignity of Fellows of the Institute, and quantity-taking is no part of architecture, nor is it necessarily even a part of architectural practice, though every architect should understand it. Mr. Phene Spiers's resolutions tending to the equalisation of the Fellows' and Associates' subscriptions were finally left as suggestions merely, and not formally put; and Professor Kerr's motion, of which notice had been given,—"That the Council be requested to call a special general meeting under the By-laws LXXI, LXXII, and LXXIII, to consider the expediency of suspending the By-laws regulating the process for electing the Council so far as to admit of a ballot of the Fellows, and, if possible, of the Associates, being taken by voting-papers without personal attendance, as part of the said process of election on the next occasion," was dropped for want of time. Much talk and little done. The drawings of the Pugin Student, Mr. Bidlake, which were hung in the room, were much and deservedly admired. They consist of sketches from Lincoln and the neighbourhood. The President referred to the death of Mr. Fergusson in a few words which we have given in another column.

THE fourth article in the current number of the *Edinburgh Review* will be found well worth attention in these times of commercial depression. The writer, at the outset, implies that the Joint Stock Companies Acts have, on the whole, been a curse rather than a blessing, and the facts he adduces certainly go very far to support that view. He shows, by extracts from the "Report of the Select Committee on the Companies Acts, 1862 and 1867" (published in 1877), and from other Blue Books and Parliamentary papers, how the provisions of the Acts have been abused by company-promoters. Although the Acts were passed in the belief that joint-stock adventures would prove beneficial to the community, to trade, and to the investment of capital, their abuse has no doubt, as the writer says, ruined large numbers of credulous persons, contributed to the depression of trade, and led to the loss of an enormous amount of capital. With regard to practicable remedies for the abuse of the Acts, the writer says:—

"It would not be very difficult to introduce changes in the existing law which could go far to check the worst of these abuses, without interfering with the legitimate objects of association, which are sometimes highly beneficial. We see no reason why a heavy stamp duty should not be imposed on the articles of association or on registration, without which they should be invalid. This duty might fairly be fixed at 2½ per cent., and it should be assessed on the nominal value of the company. That would amount to 25l. on every 1,000l. of nominal capital,—not an unreasonable charge on a sound undertaking. Such a tax would at once extinguish all those ephemeral schemes professing to start with an enormous capital, of which not one-tenth part has been paid up or has any real existence, and when paid it would afford some guarantee of the solidity of the enterprise.

But the responsibility of directors is the key of the position. Even if the liability of shareholders is limited, we see no reason that the liability of directors should be so. They are the managing partners in the concern. They know its resources and its exigencies. They have the power to incur debts and issue debentures. If directors were personally liable for the transactions they conduct, as trustees for the body of shareholders, who know nothing of the details of management, and if they were compelled on their election to give some sufficient evidence of their own ability to meet the engagements they contract, the whole fabric of 'bogus boards' and men of straw would be swept away."

In conclusion, the writer remarks that the French law on the subject is in some respects superior to our own; and he expresses the hope that the subject may receive early attention at the hands of the new Parliament, "if it is able to accomplish any good work in the shape of practical legislation; for, although such matters are less exciting than political debates and party divisions, they are infinitely more useful and important to the nation."

NOTHING is more indicative of general progress than activity in the building trade, and as such a condition is not usual when rents have a downward tendency, it is evident that the advance in rents which is said to be taking place at Berlin augurs well for the future prospects of building industry in that city. It is possible that those interested in the growth of the German capital may be forming an exaggerated idea of its probable development, but the tendency of opinion in this direction is indicated by an estimate referred to in the *Deutsche Bauzeitung*. According to this calculation, the population of Berlin will probably amount, in 1890, to two millions, and ten years later to double that number. Building has not yet, however, displayed that activity which might have been looked for under these circumstances, but it is expected that an early revival is assured, one indication of a better state of things being a reduction of the number of forced sales of real property, from 783 in 1878 to 140 in 1885. The present advance in rents would seem to be practically a return to those paid before 1878, the official statistics showing, in the years 1878-1880, reduced valuations in 30,333 cases, against increased valuations in 2,750 cases, while in the years 1882-1885 the total of increased valuations was 31,302, against 8,547 in which a reduction was notified. The movement in each case was progressive, the number of increased valuations in 1885 being 14,956 against 8,452 in 1884. The number of unoccupied houses has, meanwhile, diminished by more than a third. It is instructive to compare the number of houses erected in 1875-1878 (2,255) and in 1879-1882 (948) with the movement of rents, as described above, and when the facts are taken into account that the annual increase of population has augmented from 31,480 in 1875 to 42,000 in 1885, it will be seen that the new buildings for 1883-1885 (842) are in number sufficiently below the average of the eleven years under review to account for the increase of rents to which reference has been made.

WITH reference to the proposed application of compressed air, to be supplied from a central station as a motive power, now contemplated, it will be useful to bear in mind the real cause of the failure of the atmospheric system of railway propulsion, which was taken in hand by Mr. Brunel in this country, and by M. Eugene Flachat in France. There were, no doubt, mechanical difficulties with the longitudinal valve; but there is good reason to think that they would ultimately have been overcome. The true, and insuperable difficulty was not mechanical, but physical. As the air in the main was rarified by the action of the air-pumps, the heat of the earth rushed in, and raised the temperature of the rarified air, raising its tension at the same time. Thus the air-pumps were actually engaged in pumping out the endless supply of terrestrial heat; and, indeed, at some of the stations on the South Devon line, the cylinders became nearly red hot. There was no dealing with this state of things. In the case of compressed air the reverse action must, to a considerable amount, take place, and the first question as to the economy of this very elegant mode of communicating power will have to be settled after thermometric experience has been obtained. It will be well to give timely attention to a feature in the case as to which Nature will not fail to assert her laws.

THE revenue of the London, Brighton, and South Coast Railway for 1885, instead of showing the normal increase of about 70,000l. over the previous year, shows a falling off of

56,000l. For the half-year the decrease of revenue has been 34,000l., to which has to be added an increase of 14,000l. in charges on capital. On the other hand, there has been an economy of nearly 22,000l. in working expenses, including the reduction of Government duty, showing a net difference of 28,000l. to the bad, which falls on the ordinary and deferred stock. The dividends proposed are at the rate of 3l. 2s. 6d. per cent. for the half-year on the undivided ordinary stock; 3l. 10s. on the preferred ordinary stock; and 2l. 15s. for the whole year on the deferred ordinary stock; carrying forward a balance of 5,900l. At the corresponding period of last half-year the dividends were respectively 5l. 10s. and 3l. for the half-year, and 3l. per cent. for the whole year. The dividend on ordinary stock, of which 1l. 5s. per cent. was paid in 1885, thus averages 4l. 7s. 6d. per cent. for 1885, against 4l. 10s. for 1884, and on the deferred ordinary stock the decline is from 3l. per cent. to 2l. 15s. per cent. for the year.

THE results of burning naphtha for the locomotives on the Trans-Caspian Railway, as compared with the only other fuel then available,—wood—have lately been published. They are to the effect that the work done costs only one-fourth as much by the use of the former as compared with the latter fuel. The amount is given in the Russian dimensions of sajeens, poods, versts, and kopeks, which are unfamiliar to the English reader. The difficulty of rendering them in English equivalents is increased by the arbitrary and shifting value of the rouble, as it is not stated whether silver or paper roubles are used. If we assume the latter to be intended, and if we value it at 2s. (a halfpenny more than the last quotation we have seen), the price given as 7 kopeks per pood is equal to 0.0466 per pound for the naphtha. The consumption, 64 poods per verst, is equal to 3,480 lb. avoirdupois per mile. The price per mile, cited as 457 roubles per verst, comes thus to about 15d.; while for wood, with a consumption of 442 cubic feet, the cost amounts to 9s. per train mile. These figures, if they do not bear out the statements of the extraordinary results to be obtained from the use of petroleum refuse, at all events show what gigantic efforts Russia has been making for the establishment of the Trans-Caspian lines of railway.

ON Saturday, the 16th, there was opened at the Ecole de Beaux Arts in Paris an exhibition of the designs of the late Auguste Joseph Magne, architect, and honorary Inspector-General of Public Works, who died in July, 1885. The drawings exhibited include the design for a cathedral, which gained him the second "Grand Prix" in 1838; the drawings for the *Eglise* of St. Bernard, the *Théâtre de Vaudeville*, and of various public markets which he constructed in Paris, and those of the *Théâtre d'Angers*. There are also designs for sepulchral monuments, and some water-colours of great interest. A biographical notice by M. Lucien Magne accompanies the catalogue.

AT the last celebration of the "Winckelmannsfest" in Berlin, Dr. Robert laid before the Archaeological Society the full programme of the great work on Greek and Roman sarcophagus reliefs which is to be published by the Institute. He also showed a few specimens of the plates of the first volume, which, it is hoped, will appear in the course of the present year. The work, it will be remembered, was projected long ago by Dr. Jahn, and begun by Friedrich Matz; retarded for a while by his early death, it is now carried on under the excellent editorship of Dr. Conze and Dr. Robert. According to Dr. Robert's account it has been found possible to draw a clear line of demarcation in that usually debatable borderland of Greco-Roman and Roman work. In the Greek work each sarcophagus is conceived as an architectural whole and the design of the relief is superadded, a decorative ornament. In the Roman work, influenced as it was by Etruscan style, the sense of architectural condition is wholly lost, and

hence the design of the relief is no longer decoratively treated. All the sarcophagi are classified under four heads. The first and most numerous class are decorated with scenes from daily life (the *vita communis* section, as Dr. Robert calls it), scenes of marriage, hunting, palestra, death and burial, and the like. Secondly and thirdly come mythological scenes, i.e., secondly, mythology proper, scenes from popular cycles, such as the Trojan war, myth of the Argonauts, labours of Herakles, also symbolic myths, Meleager, Adonis, Alcestis; and thirdly, mythologic-decorative scenes, where the meaning is more or less subordinate to decorative intent. Fourthly come designs purely decorative.

AT Naukratis the Egyptian explorers have been rewarded by finding a colossal statue bearing the name "Aam," which, as the name is geographical as well as personal, would seem to denote that the place was a Libyan name of importance. The explorers of the Greek necropolis have, for the most part, lighted only so far on a number of objects in terracotta, which have served to decorate coffins; the coffins themselves, being of wood, have perished. It is noticeable that part of the necropolis seems to have served as a burying-place for dead animals, whose bones, found in great quantities, are much corroded by the damp earth. The boundary-walls of the temples of the Dioscuri and that of Aphrodite, have not yet been completely laid here but four pillars belonging to the Dioscuri temple have been discovered, which are interesting from the fact that they are made of unburned clay, and decorated with painted figures of oxen. Some painted terra-cottas have also been found, which seem to have served as a lining to the walls. In the Aphrodite temple a number of votive vessels have been discovered, of the local fabric. A short account appears in the *Philologische Wochenschrift* of January 16.

IN Dr. Loewy's "Altes Stadtrecht von Gortyn und Kreta," the public have before them for the first time a full and circumstantial account, with an intelligible rendering and commentary on the famous Gortyna inscription. The discovery is of exceptional interest to the general public, as well as to the specialist, as the inscription is so long and so excellently preserved that it presents us with a large portion of the legal code of Crete. Minoan, the mythical conqueror of Crete, ruled so well in the upper world that, after death, he was promoted to be judge over "the strengthless heads of the dead" in the shades below, and the legends of his government, we are sure, contain some kernel of historical fact in the economy of the early island politics. The inscription is full of curious and detailed information about the relations of buyer and seller, slave and master, and contains minute enactments as to divorce, and thus incidentally gives a lively picture of ancient life and manners, and in many points forms a commentary on the legal speeches of Athenian orators.

A STUDIO which has just been established in High-street, Notting Hill, is likely to be of some service to those who for any purpose require original designs in the Arabian or Persian styles or in that mingling of them called "Turkish," and who, while wishing for the real thing, do not want the trouble of sending abroad for it. The manager employs a staff of Armenian artists, the chief of whom claims to have been the principal designer of decoration for the Palace of the Sultan Abdul Aziz, at Constantinople. Some of the designs already produced are of considerable merit, and a collection of the best, which is to be issued, will certainly be interesting. We must not omit to add that the execution of the designs is also undertaken, and that many are applicable to metal-work and embroidery.

ARCHITECTS who have competed for the Fulham Vestry-hall, the designs for which we noticed some time ago, are beginning to

ask when they are to hear the result. The inquiry is the more pertinent, as we understand that Mr. Currey's award has been made. If so, why are not the results published? Is this to be a new tale of johhery?

THE LAST OF TAVISTOCK ROW; OR, NEW FLOWERS IN AN OLD GARDEN.

"I've had to-day a Dozen Billets-doux
From Pops, and Wits, and Cits, and Bow-street Beauz;
Some from Whitehall, but from the Temple more;
A Covent-garden porter brought me four."
DARBY (Epilogue to "King Arthur";
spoken by Mrs. Bracegirdle).

FOR a longer period probably than any similar open space in London, Covent Garden has been used for purposes but little different in kind from those it originally served. Fruit and flower dealers and their porters traffic in what they term "the garden,"—its site identical with that of a pleasure and herbarium enjoyed by the monks of Westminster. Situated by the ancient prebendal manor of Rngmere, it lay between Queen Matilda's hospital for lepers,—endowed with a sub-manor of St. Giles, which was separated out of Rngmere,—and the little village church dedicated to St. Martin. In 1222 was enacted the Primate's decree for readjusting the boundaries of St. Margaret's parish. As early as that date we have mention of the area by name of Frère Pye Garden. Yet so retired and remote was this spot that it scarcely comes again within the range of topographical inquiry until the sixteenth century. Henceforward we may clearly see to how significant an extent the local names of this quarter are eloquent of subsequent changes. Eastwards of the Convent Garden* we find a Via de Oldwiche or Aldwych, running to Aldwych Cross in the now Broad-street, St. Giles's; and without its western wall a thoroughfare which, for long after the establishment of St. Martin-in-the-Fields as a distinct parish (1535), was called West Church (now St. Martin's) lane. A by-way, mentioned in 1612, through the Elms Close or Seven Acres to the north, marked the course of the modern Long Acre.† But the Abbot of St. Peter's,—whom, by the way, W. S. Landor, in his "Imaginary Conversations," strangely confuses with a lady abess and her cut salad,—had perforce to surrender his garden, together with other possessions; and at the Dissolution this ground passed into Henry VIII's hands. His son granted it to the Protector Somerset.

Reverting to the Crown at that duke's attainder, it was regranted, in conjunction with the neighbouring seven acres, to John (Russell) first Earl of Bedford of that house, in May, 1552, who converted most of the land into pasture-ground. It was either that nobleman or his son, Francis, who built in the Strand, and opposite to their former home, the Bishop of Carlisle's "inn," what Strype describes as "a large but old-huilt house, having a great yard before it for the reception of coaches, with a spacious garden, having a terrace-walk adjoining to the brick wall next the garden." The front yard was entered from the Strand. The "brick wall next the garden" is the southern wall of Covent Garden. Two plans are before us,—the one of circa 1680, the other of 1690. Bedford House (it was constructed mainly of wood) extends from the Strand to the southern side of Maiden-lane, covering the present Southampton-street.‡ Northwards lies the house garden, having an additional plot or smaller garden to the east. This entire garden blocks the eastern end of Maiden-lane; towards the east it is separated from the stables by a passage, which corresponds with the later Tavistock-court. The stables are entered in the south-western corner by a way, leading from the courtyard, which has since been supplanted by Tavistock-street; they have also a gate at what was then the elbow of York and Charles streets. This latter street has since been prolonged southwards (as Wellington-street), over the site of the gateway, which faced northwards, and the adjacent part of the

* The corruption "Covent Garden" is employed in two inquiries, quoted by Peter Cunningham, of respectively 9 and 29 Elizabeth; and in a lease from Francis Earl of Bedford to Sir Wm. Cecil (Lord Burghleigh), of 7 Sept., 1570. Yet in Chamberlayne's "Notitia," 1728, we read Convent Garden.

† Hart-street, Covent garden, was formerly styled Elm-street.

‡ In a plan, Strype's Stow, 1720, this is named Bedford-street; and the lower portion of Bedford-street, as now, is named Half Moon-street.

stable-yard. The court-yard has another approach, from the end of Exeter-street, since Denmark-court. In the plan of 1690, the gardens have three rounded projections, of which two turn out of the northern wall, the other to the west behind Maiden-lane. It is plain, then, that the Russells' garden did not reach westwards to beyond Southampton-street. About 1630, Francis, fourth earl, laid out the market square,—three acres,—with its Piazzas, from Inigo Jones's designs. The northern and eastern blocks were of red brick, with pilasters, and with dormers in the fourth story; the arcade of stone. From a comparison we have made of several views, it would seem that the dormers were removed for an attic floor about 1825; the premises between James-street and the New Cluh (*antiqué* "Evans's"), that are being prepared for the Bedford Hotel, give a fair presentment of the original elevation, as shown in Sutton Nicholls's and J. Maurer's views of 1720 and 1753 respectively.

To Francis's eldest son William, advanced Duke of Bedford May 11th, 1694, King Charles II. granted a charter of right, in freehold, to hold a market here for fruit and vegetables; the charter being subsequently confirmed by two regulating Acts, 53 Geo. III., c. 78, and 9 Geo. IV., c. 113. Strype mentions the appearance, within four years later, of the grove or small grove of trees, most pleasant in the summer season, henceforth which they used to hold market. This avenue lay just along the northern garden-wall of Bedford or Russell House. But on the demolition of the house in 1704 hoth wall and avenue disappeared too, and the erection of Tavistock-row on their site forced the dealers further into the square. Soon afterwards the stalls gave way to the booths and even two-storied dwelling-houses, but only along by Tavistock-row, which we see in the old prints; and it is not before 1754 that we find the square generally covered by the market. The central Corinthian column with dial and sphere at top is stated to have been set up in 1668, according to the churchwardens of St. Paul's accounts, as quoted by Peter Cunningham. It certainly figures in a little print: John Seller, *excudit*, in the Grace Collection, to which a date (1640) is assigned, and which has all the air, including the costume and certain local details, of that date; though it may have been introduced into a later state of the plate. It does not appear in Hollar's view of 1640. The column was taken down in 1790, and its golden ball was subsequently placed in the garden of John Kemble's house, No. 89, Great Russell-street, Bloomsbury.

In Covent Garden-square Hogarth lays the scene of his "Morning" (1738), the picture that was exhibited a few months ago at Burlington House, and his "Rich's Glory." The latter view taken from opposite to Tom's Coffee-house in Russell (then Great Russell) street. The print, sold for 6d., was speedily suppressed, probably owing to its figure of Pope, who is testifying in a most unmistakable manner to his contempt for the "Beggars' Opera" and Rich's triumph. The former shows the portico of St. Paul's, and the Dutch elevation (since altered) of Lord Archer's house,*—the Paddy Green's of a few years ago. But here Hogarth fails of his customary accuracy. He puts Tom King's Coffee-house before the church portico, where the Westminster hustings used to be set up. But King's real station was in the south-east of the square, opposite to Tavistock-row, and close to that of its equally notorious compeer, Mrs. Butler's "Finish." Hard by, too, in this corner was established Powell's Punchinello, of whose counter-attractiveness the under-sexton of St. Paul's makes plain in Steele's No. 14 of the *Spectator*, the 16th of March, 1711,—"I have placed my son at the Piazzas to acquaint the ladies that the hell rings for church, and that it stands on the other side of the garden; but they only laugh at the child." These ladies, by the way, would pay 2s. 6d. and 1s. 6d. for admission, and were enjoined not to wear masks or riding-hoods. So much of the eastern or Little Piazza as stood between Russell-street and Tavistock-row was destroyed by fire on March 20th, 1760. At its angle with Russell-street (southern side) had stood the celebrated Mrs. Duhois' (afterwards the Three Chairs) tavern. This was next occupied by Small's and subsequently Rigg's Bagnio, the cupping-house known as Hummums. In

* Built for Edward (Russell) Lord Orford, victor at La Hogue. The view is reversed in the prints.

Little Piazza lived Thomas Southerne, author of *Oroonoko* and the *Fatal Marriage*, and friend of Dryden, Pope, and Gray; and, next door to the King's Arms tavern, Dr. Berkeley, bishop of Cloyne, to whom Swift's "Vanessa" bequeathed 8,000*l.* It was to the old Illuminists that Dr. Johnson's wife went to learn what she might about the apparition of Cornelius ("Parson") Ford, nephew to Dr. Johnson's mother, who, as Johnson says, died there 1731. The days of the new Illuminists likewise are numbered. It is at this date being demolished for completion of the Flower Market-house, which was recently erected over the old site of Bedford House stables. Moreover, it is in contemplation to supply additional market buildings for the sale of flowers and herbs, where the garden of Bedford House formerly stood. So Tavistock-row also, its front much modernised of late, has at length gone, the last house to fall being one that remained until three or four weeks ago. This was the dismantled house; Maurice, the book-dealer's, being No. 13, wherein have lived Zincke, the famous enchanter and miniature painter, and Nathaniel Dance. In that house, too, Dr. Wolcott began, under the *nom de plume* of Peter Pindar, his literary career with his once popular "Lyric Odes to the Royal Academicians" (1782-6), and wrote *inter alia* "The Pilgrims and the Peas," "Bozzi and Piozzi," and his satirical attacks upon the Royal family. At No. 4 in the Row, north-west corner of Tavistock-court, Lord Sandwich, when purchasing some neckcloths,* first saw Miss Reay, who met with her tragical fate at Hackman's hands as with two friends, she was awaiting her coach in the Piazza after a performance of "Love in a Village" at Covent Garden Theatre. In that same house Charles Macklin, whom Murphy happily named the black-letter copy of Macbeth, passed the close of his lengthened life, having been a constant visitor for more than thirty years at the Antelope in White Hart-yard close by; and in the adjoining house (No. 5) lived and died William Vandervelde the younger; and Thomas Major, engraver to the Court and the Stamp Office, who in 1781 furnished in twenty hours a perfect substitute in brass of the Great Seal that had been stolen from Lord Chancellor Thurlow's in Great Ormond-street. For our readers' convenience we have used above the four cardinal points of the compass, but, in point of fact, Tavistock-row faced to north-west-by-north.

SOME LESSONS FROM OLD GLASS.†

The difference between stained and painted glass is one mainly of terms; for painted glass is almost invariably stained also, and stained glass painted. Indeed, in those of absolutely unpainted work the term technically used is *leaded glass*,—which again is not so absolutely discriminative as it would be if painted glass, too, were not (as I have said), for the most part, more or less leaded. It is, in fact, the more or less of paint which makes the term "painted" applicable to coloured windows generally; although, correctly speaking, it may be said best to describe the windows of the worst period.

The Early Gothic windows are clearly only a carrying further of the idea of *mosaic*. They are merely mosaics of translucent glass supplemented with paint. This supplement of painted detail was added probably from the very first, the strict mosaic of differently tinted bits of glass having been most likely even then used mainly (as it is now) for the sake of economy.

Yet there was something to be done in purely mosaic glass, or glass mosaic,—much more than was ever attempted. The pity is that economic considerations, rather than artistic, have regulated its development, or, more properly speaking, ruled its degradation.

It may be taken for granted, notwithstanding the abstract character of savage ornament, that mankind naturally prefers pictures to anything in the nature of ornamental design. And no one would think of denying that this bias has led to a higher form of art than any mere pattern-work. But it is nevertheless to be regretted that the branch of art called "fine" has been cultivated practically to the exclusion of art ornamental, which has been so generally adopted for the strict purpose of saving only

that that has come to be thought almost its *raison d'être*. To apply this to the subject in hand, the aspiration towards figure-design leads immediately to the use of paint on glass, and so to a neglect of the capabilities of another sort that lie in mere glazing. They have never been tested. I maintain that even in figure-work, if only on a very large scale, and at a sufficient distance from the eye (as for example, in the clearstory of lofty cathedrals), splendid results might be obtained without any use of paint whatever. None but those who design for glass can realise how little the coarse lead-lines, cunningly disposed, interfere with the actual forms of the design in glass. The amateur does not suspect the amount of leading in the windows he admires, and would scarcely believe, if he saw the cartoon first, that the leads would be so little noticeable.

The difficulty in designing for a building of great size is to be bold enough (witness the recent experiments at St. Paul's), and the leading necessary in absolutely mosaic figures would compel the artist to be bold,—bolder, perhaps, than he would otherwise dare be. The windows immediately under the dome of St. Paul's suggest a position where leaded figure-work would be all that one could wish. At that distance from the eye, and the scale necessary at such a height, the folds of drapery might obviously be leaded up in any variety of shades that was desired, and even the fest finis might equally be glazed up. Imagine the cartoon of a head "blocked in" after the broad effective French manner made familiar to us by M. Legros,—the shadows, that is to say, laid in as masses of broad flat tint; it would be a very simple thing to glaze up these masses in the right shades of glass, and the lead lines bounding them would, at that distance, be inappreciable, if, indeed, they were to be detected. I remember that in the windows at King's College Chapel at Cambridge, which are comparatively near the eye, the heavy saddle-bars in the upper lights have about the value of an ordinary lead-line, whilst the lead-lines themselves go practically for nothing. You will, perhaps, be the reader to believe in the possibility of what I suggest if you think of the way in which the tesserae of ordinary mosaic are lost in the general effect of colour. It seems almost impossible, when one sees it near the eye, to persuade oneself that such brutality of line as the mosaicist uses can be made to produce so delicate an effect.

However, it is not very often that there is an opportunity for figure-work on the scale necessary to its satisfactory execution in pure glazing, and, where there is, no committee (every big thing new is controlled by a committee, more or less incompetent by its very constitution) would be likely to venture on the experiment. What there is ample opportunity for is mosaic ornament, which is so much more amenable than figure design, and by means of which the richest possible effects of colour might be produced at a cost comparing with the common painted work, which has a way of always advertising its own cheapness,—only it would take more brains to do it. I do not mean to say that those who resort always to paint have no brains; but they economise them, as they do when they give in their adherence to traditional and worn-out types of glass design. They are, indeed, far too clever to admit,—what they must as artists own to themselves,—that their orthodoxy is the doxy of the tradesman sustained by a very present fear of profits falling off.

The more I see of old glass,—and I have studied it at home and abroad for the last twenty years,—the more I see how much there is in it to admire and wonder at, and the more I realise how ill-advised we are in copying it. We can gather from it, first and last, nearly all that is needful to know about the treatment of glass,—but the one thing for which it affords neither pretext nor precedent is the mock antique.

The art of glass-painting followed the course of contemporary art, up to its exaltation and down again to its decline, from good to better, and from bad to worse; and from almost every phase through which it passed there is a lesson to be learned, but to adopt any one phase, even though it were the best, as our model, and to limit ourselves to the imitation, affectation, or reproduction of that period, seems to me out of the question.

The contemplation of old work inspires me at least with a desire to do something too, but something different. The thought of how

beautiful it is, is followed immediately by the reflection how impossible it is for us to repeat it without insincerity; and the regret that we cannot go and do that any more is tempered by the consolatory conviction that, thanks in no small degree to it, we can do something that is also worth doing, and which they did not do.

Apart from any personal objection to imitation (and I admit that mine is very strong), it seems to me that neither the earlier mosaic nor the later pictorial glass can be taken by us as an adequate "authority," and this not only because we live in our own century, and must march in step with it, but because neither is enough. The early work does not go far enough in the direction of technique, whether in respect to composition, drawing, or painting; and the later windows go too far in the way of ignoring the better principles of glass-painting taught us by the earlier craftsmen. To put it in other words, the thirteenth-century glass is too crude in its conception, too rude in execution, too entirely out of touch with the modern notion of art; the later work, with all its technical perfection, falls far below the ideal of a workmanlike use of the capabilities of glass.

We cannot conceivably limit ourselves to glass such as now forms the glory of many a Gothic cathedral, nor can we entirely dismiss all that from our minds and be content with Cinquecento picture windows. To fuse the two styles into one is, very likely, impossible; but it is possible, it seems to me, to deduce from both principles which shall guide us in producing something as good as can be done, without overmuch perplexing our minds as to the style by name of which it shall be labelled. If it is really after the manner of glass it will not be found wanting in style.

Very bad things have been said, and I am one of those who have said hard things, of Renaissance glass; but that was in the days when I was bitten with the belief that every good thing was included in the styles called Gothic. I am less rabid now that I am older, and have seen more and thought more, and I want to persuade you too that there are qualities in later styles which are worth our admiration and respect, and that we shall not reach the highest level in our art,—architecture, glass-painting, or whatever it may be,—without having learned something from all of them. There are few that can teach us only what to avoid. The tide of popular enthusiasm has turned now away from Gothic; but under no circumstances can the glass-painter ignore it, for the later styles will not teach him all his trade.

It will always depend very greatly upon our immediate purpose whether there is more to be learned from one style or another. The earliest glass will be useful to us, mainly as a guide in church work, and that especially on a fairly large scale; in a building, that is to say, in which the object is to shut out or greatly to subdue the light, and where the dimensions of the building and the scale of its detail are such that the simple forms of the glass do not appear proportionately coarse. Some of you will remember an earnest attempt that was made, not so many years ago, to introduce into the homes of the nineteenth century a rude and rigid form of Gothic furniture, with the result that it looked like Hodge in the drawing-room,—loutish, clumsy, out of place. The would-be reformation was not nearly thorough enough.

A similar incongruity occurs wherever the unmitigated forms of Early Gothic glass are inserted into windows of buildings other than reproductions of thirteenth-century churches. Thank Heaven, we have not yet suffered from domestic dwellings after the Early Gothic manner, rub floors and all. What, I wonder would Baron Huddleston say to a really Mediaeval court of law?

In churches, halls, and other large public buildings, we might, as I have said, not only model our practice upon that of the first glass-painters; but we might even out-Goth the Goths, and make mosaic glass that was more purely mosaic than anything they have left it us.

So far as big, bold, simple work is concerned so good; but there ends the adequacy of the primitive models. In the windows of the smaller chapels of a cathedral, or in the windows of an ordinary parish church, and most especially in domestic windows, which are now assuming some importance in the glass-painter's calculations, mosaic will not of itself suffice.

* J. Cradock's "Memoirs," vol. i. p. 117; he, though, places the shop in Tavistock-street.

† A paper, by Mr. Lewis F. Day, read before the members of the Architectural Association on the 16th inst.

We must go for inspiration to Renaissance glass or Transition work, or, at any rate, to the very latest phase of Gothic, to work, that is to say, not much earlier than about the year 1500.

The very perfection of glass-painting, as such, is attained in cinque-cento windows, such as those at St. Gudule at Brussels. The breadth, the dignity, the monumental character of their design, is unsurpassed, the drawing is the very best that Flanders at that time afforded, and the painting is something in the nature of a *tour de force*. (Therein, in fact, is its weakness). To have seen such work, and to have appreciated it, is to be incapable ever afterwards of going back to the ideal of thirteenth-century art. It is not as if our whole choice lay between the two. If I believed that, I, for my part, should be disposed to toss up the whole thing in despair.

It is not only in the matter of painting that this glass, and much other of the period, stands superior, but, as I have said, in drawing, and often in design. There is nothing in early work to compare with the large spirit in which it is conceived. There is often a simplicity and straightforwardness about the composition that is not to be excelled. In fact, the composition of some of the windows in the Chapel of the Holy Sacrament is of a naivety that one would be disposed to attribute rather to a designer of the thirteenth century than to Michael Coxie or his master, Bernard Van Orley, who had studied in Italy to such purpose that his paintings have been passed off as the works of Raffaele.

These are, of course, superlative examples. The later glass-designers had not all that admirable self-restraint, that sense of fitness, that supreme quality of style, in short,—far from it. But, for all that, there are generally to be found in windows of the early sixteenth-century qualities, more or less pictorial, which we cannot at this period of the world's wagging do without. That men who lived before us knew not of them and were content, will not help us.

Why, then, can we not follow these later lights? Are we so much greater than they? No, but we have seen what their neglect of the qualities most characteristic of glass led to; we came after the event, and it is easy to be wise.

The error of their ways lay, in a word, in too exclusive a reliance upon painting. How far they were ignorant of the nature of glass, and how far only impatient of the restraint it would have imposed upon them, may be open to dispute. It is certain, however, that the painters of this period (who, by the way, were painters, and not glass-painters by craft) sought to do in glass just what they would have done on canvas; and, if the truth must be told, some of them very nearly did it, but never quite. The result is in no case all that it might have been on canvas; and I contend that it might easily have been finer had they relied more upon glass and what could be done in it. The wonderful degree of success reached by force of art, in spite of the material used, makes us wonder what such men might have done had they known, had they cared, more about glass.

The unfortunate effect of depending upon the use of paint in glass is most conspicuous in the windows of later date, when the decadence was already far advanced. You see it, on a vast and gradually declining scale, at Gouda; and you see it very manifestly in the windows ascribed to the pupils of Rubens in the south chapel at St. Gudule itself, where during great part of the day colour is eclipsed. But the evil exists, not altogether latent, in the splendid windows in praise of which I have said so much. Take, for example, the deeply-shaded soffits of the canopy arches, against which the golden swags tell so splendidly: it cannot be doubted that if that coffering had been leaded up in browns and "pot-metal" yellows, instead of being so heavily loaded with paint, a richer quality of colour might have been obtained. So also with the canopy work altogether, if the shaded portions of the masonry had been glazed in shades of deeper-tinted glass (as was actually done, here and there, in work of about the same period, by men more thoroughly imbued with the traditions of Mediæval glass-painting), the gain in translucency and brilliancy would have been very considerable; and surely it is translucency, brilliancy, and richness of colour that one can least afford to sacrifice on glass.

A glass-designer has, so to speak, to think

in glass; and the men of the Renaissance, being more painters than anything else, did not sufficiently think out their thought in the language in which it was ultimately to be expressed.

The vice of over-painting was inherent from the very first in the art of glass-painting, growing with its growth, already by the time of its culmination deeply rooted, so that we can point to no one period as being absolutely the best in the history of glass-painting. With the most perfect technique we have the fault of obscurity already strongly marked. If we go back to the period previous to the development of the evil, we find that we have gone back too far for perfectly-developed technique.

But if we can define no period, we can point sometimes to specimens in which the happy medium seems to have been as nearly as possible found,—where the painting has been carried to the highest point without undue sacrifice of the translucency which is so indispensable in what is, after all, only translucent mosaic painting.

Delight in shadow seems to be partly a national characteristic. Certainly it was developed in the Netherlands at a period when elsewhere there was a much stronger feeling for colour, and it was there, of course, that the school of *chiaroscuro* *par excellence* arose. Glass-painting of the sixteenth century is inevitably pictorial; but there are pictures and pictures, glories of colour, and marvels of light and shade. It is only in proportion as the painters' ideal is one of colour that it is capable of realisation in glass,—and by colour is meant not colour in the subtle sense of, for example, a Reynolds (who failed very conspicuously at New College), but in the sense of the early Florentine and Venetian painters; of the men so much in love with colour that they hesitate to sacrifice anything of its beauty for the sake of qualities, equally beautiful may be, but less dear to them. We find, accordingly, in France a quantity of early sixteenth-century glass, quite pictorial in its aim and yet not going far beyond what may be done, and well done, in the material. It is inferior to such works as that at Brussels only in largeness of design and strength of execution; in colour, which is of most account, it is sometimes superior. Indeed, it affords, on the whole, a type of old work most fit for our guidance in pictorial glass of modest aim and moderate dimensions. Its pictures are always decorative in design and glowing with jewel-like brilliancy of colour, not obscured by heavy painting, but modelled often with a delicacy reminding one rather of sculpture in very low relief than of the pronounced light and shade of pictures, which pretend to be "real" in proportion as they are lacking in the qualities most beautiful in art.

It is by no means only in coloured pictures that this quality of delicate, and as I think adequate, modelling is observed. One meets with windows in grisaille (there are some beautiful specimens at Chalons-sur-Marne) which fulfil in transparency exactly the part of sculptured bas-reliefs on a wall. I have a vivid recollection also of some medallion heads, in one of the châteaux on the Loire, painted very thinly on ordinary sheet glass, which reminded me more of some of Holbein's tinted drawings than of anything that I know of in glass. Here, if you like, is something on which we might find a treatment of domestic window panes.

The later Swiss glass, heraldic or what not, is, in like manner, most suggestive, although it is usually on too finikin a scale, even for the purpose to which it is applied. But nowhere can we learn better what can be done in the way of delicate manipulation and finish in glass-painting, than from those same medallions and heraldic panels, to be found in nearly every Continental museum of any importance. There are some superb specimens in the museum at Lucerne. The Swiss colour, however, is inclined to be crude, even where enamel has not been resorted to in order to evade the necessity of leading,—an evasion, by the way, which may be said to lie at the root of all evil in glass.

A beautiful feature in the best French glass, as seen, for instance, at Rouen, is in the groggle sky tint, on which is painted, with some minuteness and much delicacy, the background of the subject, architecture, landscape, or, it may be, the sea. This is going beyond what is necessary in glass, or, perhaps, desirable; but there is not much fear of its revival to any

great extent. To be tolerable it must be done as it was done; that is to say, so well that only the designer himself could be the painter of the glass,—a practice much to be desired, but scarcely to be hoped for in these days; when the applied arts have practically no existence apart from commerce, and penny-wisdom rules that the artist's design shall be executed by a cheaper, and presumably, therefore, inferior, artist. One thing we might learn from the old glass-painters is,—to treat our art as an art, and not as so much manufacture.

The Renaissance glass in Italy is much of it, of course, earlier in date than that of other countries, which goes far to account for its individual character. The art was never very largely cultivated there, for obvious reasons; and what there is said to have been executed to a great extent in France and Germany; but the design is Italian, markedly so, reminding one far more of contemporary Italian paintings than of old glass elsewhere.

It must be obvious to any one, on the slightest reflection, how well fitted are the paintings of the Italian masters of the fifteenth century for reproduction in glass. The love of simple forms and pure, bright, beautiful colour evinced in them, can find more adequate expression than ever in the medium of glass,—so much so that one is almost tempted to marvel (until one calls to mind to what extent Italian chiroches were at the same time picture-galleries) that they did not more commonly adopt it.

The pictorial quality of Italian glass was more decorative than that of the French glass spoken of, partly no doubt because it was earlier,—and probably the happiest mean of all is found in it between the glass-like and the pictorial. This is a mental note that others have made before me. The first of modern glass-painters has drawn something of his inspiration at that source. Mr. Burne Jones, whose treatment of glass is so workmanlike as it is original, would doubtless confess some indebtedness to the teaching of certain old windows at Florence and elsewhere in Tuscany. There are hints, both as to treatment, colour, and design there which no other glass affords.

I said both as to treatment, colour, and design, and I may add that what was said of the inadequacy of any one historic type as our model in the treatment of glass holds good, and that even more emphatically, with regard to colour and design.

Because the early figure glass was mostly deep in colour, are we to have no figures in grisaille? Because the later glass was best when it was delicate and silvery in tone, are we to have no rich windows any more? Because the medallion subjects of the thirteenth century were diminutive in scale are we to have no larger pictures ever? Because the Cinquecento pictures were spread over the entire window, are we to give up all idea of framing smaller subjects in ornament? And as to that ornament, are we to choose, once and for all, between the forms of this or that period, between the formulas of design adopted in one or other of them?

It is very true that in times past the artist worked pretty much on clearly-defined lines, which can be traced very distinctly in his work, and mark the period of its execution. But there was a good deal in that that was more fashion, only more respectable than the fashions of our own day because it was less ephemeral. Strip off all that unmeaning and unnecessary surplusage, and you will find that the naked principles underlying the work of the various periods are not nearly so dissimilar as they at first appeared. Once unveiled, they are, indeed, seen to be not only of one kind, but of one family, the later only a development, for better or for worse, of the earlier,—in certain directions, and up to a certain point, decidedly for the better, and from a certain point very much for the worse.

To follow the development of glass design would be to follow once again (and once too often) the well-worn course of the styles, which succeeded one another in glass much as they did in sculpture and the rest of the allied art which go to make up architecture,—only always a little in the rear of architecture. The essential thing is to note how the succeeding fashions of design fitted in with the conditions of glass-painting, what the art gained from them, and wherein they were misapplied,—in fact, their influence, good and bad, upon glass-painting.

The design of the glass has always depended more or less upon the shape of the window

opening. The proportions of the Norman round-arched windows, or of the Early Pointed lights, almost of itself suggested a good broad border to the glass. And it happens that in the Renaissance, again, when windows of somewhat similar shape occurred, a somewhat similar use of the broad border recurs also.

The Early notion of breaking the space within the border into medallion pictures, with intermediate mosaic of geometric or foliated ornament, is in direct pursuance of early Christian tradition. There is a painted ceiling in the Romanesque Michaelis Kirche at Hildesheim (there is a photograph of it here), which might have been used straight off as the design for an early window. And you see very much the same kind of thing in the little enamelled tryptichs of Byzantine workmanship. But the use of the medallion form is by no means confined to the first Gothic period; it survives in some shape or other to the very end of glass-painting. The cartouche of the Rococo is only a degraded medallion form.

With narrower lancet-lights came narrower borders, the medallions being sometimes allowed to cut over them. This constitutes a new departure in design, carried further in Decorated glass, in which it was sometimes quite a feature in the composition, as in the fourteenth-century windows at Freiburg. Our eyes once opened to the usefulness of a device of this kind, we cannot, in reason, shut them to the facilities it affords, whatever the style we adopt.

But even in the thirteenth century there were men to whom that was not liberty enough, and we have accordingly,—as, for example, at Augsburg,—groups of lancet-lights treated as one window, the medallions, of great size, extending across the three lights, giving all possible scope to the figure-painter. The result is effective enough; and an occasional break in the monotony of Early design is welcome. How far such a practice should be followed may be open to dispute. But I think it would be more than hard to deny the artist such a licence altogether.

This opens up the whole question as to the desirability or permissibility of transgressing in glass-design the limits of a single light. The glass-painter is bound to respect, and, in the main to follow, the form of the window-frame. But the architect,—assuming him to be, humanly speaking, faultless (*quod est*, in every individual case, *demonstrandum*),—is compelled sometimes, by reasons of construction or other equally imperative conditions, to adopt a window shape not just what he would have chosen had he had nothing to think of but the effect of his window from the inside. In such a case it is within the province of the glass-designer to bring it to something like the proportion he would have preferred. A broader or narrower border, for example, a horizontal division, or the introduction of any strongly-marked shape, will make all the difference in the apparent proportions of a window.

Already, in very early glass, the designers sometimes took upon themselves to contradict, so to speak, the window shape in the design of their glass; that is to say, they would divide a too-broad window into two, and treat the halves as separate lights with borders of their own, and perhaps the semblance of a quatrefoil or so by way of tracery in the window-head. (This occurs, I remember, at Bourges.) Or again (as, for example, at Poitiers), they would include two lights in one design, with a border only on the outer side of each, the ornament or subjects enclosed extending across the two.

In the second Gothic period, when windows were divided into many tall and narrow lights, it was the almost invariable custom to cross the constructional lines of the window with the lines of the glass. This was, doubtless, with the full concurrence of the architect, who very likely reckoned upon some such filling to complete his windows. At all events, they seem to stand in need of that banded treatment adopted in Decorated glass, to hold the lights, as it were, together. The use of horizontal bands of subjects in colour across the window, alternating with bands of ornament in grisaille, proved a very satisfactory solution of the difficulty of treating a tall window of Decorated or Perpendicular type; and its use does not end with those types.

In the earlier instances each subject was completed within the width of the light, only its weight and colour connecting the one with the other. But it was only a short step from

that to bridging over the space of two or more lights (or, perhaps, the whole window) with a canopy enclosing a single subject, so affording space for figures on a much larger scale than was any otherwise possible,—on a scale, in fact, as large as the lights allowed. The later Gothic glass-painter took just what space he wanted for his subject. In a five-light window, for example, he would, if it suited him, carry one subject through two lights and another through the remaining three, allowing himself equal licence as to the height of his subjects, a practice rather perplexing to the eye accustomed to some sort of symmetry in arrangement. We attach, perhaps, too much importance to symmetric composition in glass, which seems much more necessary on paper than in actual work. In my experience many a window which has attracted me by its interesting distribution of colour has proved to be devoid of symmetric balance, although I had never felt the want of it until I came to analyse the design.

Still the confusion which results from a recklessly haphazard distribution of subject is to be avoided. It is no uncommon thing in old windows for the sky which forms the background of our subject to get hopelessly mixed up with the sea in the front part of its neighbour; distant landscape is interwoven with foreground grass; and the meaning of it all is only to be unriddled by a painful effort, incompatible with pure enjoyment of the beautiful colour of it all.*

SEWAGE PURIFICATION.

Sir,—In attacking my paper as to sewage purification at Guildford, Dr. Thresh repeats his assertion that my results are diametrically opposed to those of all previous experimenters. But he carefully avoids any reference to the exact quantitative results obtained by Mr. G. M. Taylor, C.E., F.C.S., which have been published in various journals, and which were cited in the paper in question (*Builder*, vol. xlix., p. 887). Thus when, after the expression of general doubts as to which it is not necessary to discuss the details, he says that I have not adduced "a shadow of proof" as to the resolution and escape of the putrescible matter, he omits to say that he has before him a statement to that effect from a competent analyst, who is a member of an engineering firm second to none in authority as to matters connected with water supply and purification. I leave Dr. Thresh's doubts to be confronted with Mr. Taylor's definite statements.

The establishment of Government-paid chemists in every town, as proposed by Dr. Thresh, would no doubt be an excellent thing for the members of his profession. How far the result would be equally advantageous to the country it may be time enough to inquire when there seems any probability that such a step towards the endowment of science is about to be taken. As far as candour in treating any discovery that does not emanate from themselves is concerned, Dr. Thresh does not afford the most brilliant promise, as, in his letter to the *Manchester Guardian* of 1st December, he represented my dose of 100 grains of sulphate of iron in one gallon passing through my tank as being 100 grains in every gallon of sewage.

I must also add that unless Dr. Thresh has published something which I have not seen, his statement "I showed . . . that I had carefully repeated the experiments he described with several different samples of sewage," is incorrect. My first letter on the subject was published on October 1st. Dr. Thresh's criticism appeared on October 3. It contains not a word about repeating my experiments, for which, indeed, there would hardly have been time in the interval.

Allow me, without further comment, to reply to the four questions very pertinently put by Dr. Thresh.

"1. Does the process remove all the suspended matter in the sewage?"

Answer.—Yes. In the very strong domestic sewage on which, as being always almost perfectly identical in its strength, our main series of analyses has been conducted, the whole of the suspended matter, and 29 per cent. of the matter in solution, is removed by the process.

"2. Does it remove any considerable portion of the dissolved putrescent matter?"

Answer.—Yes. It removes it all.

"3. Does the sludge deposited permit of being

readily removed, pressed, and dried; and what is its nominal value?"

Answer.—There is no sludge. The analysis of the precipitate gives 11.56 grains of mineral matter, and 15.84 grains of organic matter, precipitated from a gallon of sewage. This precipitate contains no slime, no lime, and no clay, and does not entangle water in the form of sludge. The costly procedures of pressing and drying, which form part of Dr. Thresh's "typically perfect process," are thus rendered unnecessary.

The mineral elements of potash and phosphoric acid are not removed by my process; and while the albumenoid ammonia is greatly reduced, the free ammonia is increased, so that any value present in the sewage is obtainable in a convenient form.

"4. Can the matter added to the sewage possibly be deleterious, if ever used slightly in excess of the actual requirements?"

Answer.—The only result of an overdose will be the deposit, as in the case of the purification of the water of the river Nethe at Artwerp, of a small quantity of oxide of iron, when the metal has fully performed its work of purification. The presence of a small portion of this substance is said, by the chemical text-books, to be advantageous to vegetation.

Fully agreeing with Dr. Thresh, that "in experimenting with sewage scientific method cannot safely be ignored," I enclose Mr. Taylor's analysis, which distinctly proves the above points, and remain, your obedient servant,

FRANCIS R. CONDER, M.Inst.C.E.

P.S.—Dr. Thresh might, with advantage, have added a fifth query, viz.—"Has it any effect on the main cause of diphtheria and typhoid fever, namely, sewer gas?"

Answer.—It destroys sewer gas in its nascent state.

Illustrations.

LIVERPOOL CATHEDRAL.

DESIGN BY MR. W. EMERSON.

THE views, plan, and geometrical drawings of this design, given in the present number, are fully referred to and described in the article, and the quotations from Mr. Emerson's report, in another column.

DESIGNS FOR STAINED GLASS.

These designs, reproduced from drawings by Mr. Lewis F. Day, are introduced here in connexion with his paper on the subject recently before the Architectural Association, and reported in another column. The paper being, very long one, however, we are unable to find space for the whole of it this week, and special references to those plates occur near the end of the paper in the portion not yet published. The first of them illustrates an ideal taken from marble wall panelling, the central panel of coloured marble being represented by a patch of red made up of flames and diamonds. The other illustrates the application of purely ornamental design to glass, without the introduction of figures.

"What is a Bill of Quantities?"—I refer to a letter under this heading, in our issue of January 2, on which we commented at the time, it appears that we have unwittingly allowed an injustice to Mr. Cheers, the architect of the Slough Public Institute, which was the building for which the quantities referred to were made out. The quotations made by our correspondent, the "*Suburban Builder*," were correct as far as they went, but he did not notice that a sum was named in a separate portion of the bill of quantities for the terra-cott details, and a price per cube foot given which would be accepted for the mason's work name in the general clause quoted by our correspondent. This is not exactly "taking out quantities," certainly, but it is quite a different thing from what was implied by the "*Suburban Builder*," that no further information had been given as to the work named in these general clauses. The woodwork always was given much more fully than was stated in his letter. The "*Suburban Builder*" does not seem to have looked at the quantities carefully enough before making his protest, which was at a events a good deal stronger than the circumstances called for. We had not an opportunity of seeing a copy of the "Bill" again till this week, or we should have referred to the matter before.

LIVERPOOL CATHEDRAL COMPETITION. DESIGN BY MR. W. EMERSON, F.R.I.B.A.

ST. SAVIOUR'S, SOUTHWARK, PARISH GRAVEYARD, AND THE DISUSED BURIAL GROUNDS ACT, 1884.

On January 15th last Vice-Chancellor Bacon gave an important judgment upon the effect of this Act in preventing the erection of buildings on disused burial-grounds. We gather that by an Act of 1883 for abolishing church-rates in St. Saviour's parish, Southwark, the ancient graveyard; at the junction (north-east) of Redcross and Union streets, and otherwise known as the "Cross Bones," was transferred from the parish wardens to trustees for certain parochial purposes specified in the statute. The ninth clause thereof enabled these trustees to sell and grant building leases of any land so vested in them. In the following year was passed an Act for the prevention of building over grounds of this character. In the fifth section, though, of this Act of 1884 exception is made of "any burial-ground which has been sold or disposed of under the authority of any Act of Parliament." In May last the St. Saviour's Rectory trustees offered for sale what they described as "valuable freehold building land in Union-street, Borough, occupying the large area of about 18,000 ft², adapted for a builder, contractor, timber-yard, &c." They further set forth that: "notwithstanding Section 3 of the Disused Burial Grounds Act, 1884, which renders it unlawful to erect any buildings upon any disused burial-ground except for certain purposes, the vendors believe that they are entitled to sell the property comprised in the particulars as building ground." They based their belief, presumably, upon the terms of the fifth section of the Act of 1884, which we have quoted. It would seem that Messrs. Thomas and George Oylor bought the land for 2,300l. But, having made their purchase for building purposes they felt unable to complete it, inasmuch as the Act of 1884 forbade them to build. A summons in chambers having been taken out by the vendors under the Vendor and Purchaser Act, 1874, the Chief Clerk adjudicated in their favour. The summons was adjourned into court. There, after arguments heard for either side, it was decided that whereas the parish Act of 1883 was not a sale or disposition within the exception of the Act of 1884 (clause 5), and whereas when the Act was passed in 1884 neither the trustees nor anybody else had power to build over this land, the purchasers were entitled to the objection they had taken. So the summons was dismissed with costs.

The ground in question,—marked by no headstones, neglected, and recently a builder's yard,—belonged formerly to the diocesan estate of Winchester see. It had been used as a place of interment for the unfortunate inmates of the Bankside stews that lay between Bear Garden and Chink Prison. Sir William Walworth, *temp.* Richard II., held the stews as lessee under the Bishop of Winchester, whose "fin" stood hard by, westwards of Montague Close. Shakespeare makes the Duke of Gloucester to allude to the grant of licences by the bishops, in upbraiding Cardinal Beaufort,—at that time Bishop of Winchester,—with the words: "Thou that giv'st whores indulgences to sin." "Winchester Goose," moreover, formed a vulgar term of reproach. The "Cross Bones" served as a burial-ground for more than three hundred years, but has not been so used since October 31st, 1853, when two interments took place, which were solemnised with all the formalities observable in the case of consecrated ground. It is on record that during the Great Plague as many as six hundred bodies were deposited here within one week. About the year 1708 the Bishop leased the ground, and this for the first time, for three lives, for the purposes of burial. The next lease bears date June 5th, 1820, being for three lives and sixty-one years, at a rental of 65l. per annum. But before the later lease expired the wardens enfranchised the ground for a sum of 3,388l. On November 8th, 1854, they leased the land for a term of years; the lessee transferred it to another, who converted it into a builder's yard and paid 50l. a year, the vestry thereto consenting.

National Association of Master Builders. The half-yearly meeting of the National Association of Master Builders of Great Britain will be held at Derby on Tuesday next, the 26th inst.

THE LATE MR. FERGUSSON.

At the business meeting of the Institute of Architects last Monday, the President, in reference to the lamented death of Mr. James Fergusson, said:—

"It has once again become my sorrowful duty to announce to you from this chair the decease of a distinguished member, past Vice-President, and Royal Gold Medalist of our corporate body, Mr. Fergusson."

Few men of our profession have done more valuable work than he, the historian of our art; and few, if any, have achieved a more world-wide reputation by the labour of the pen. Such men, unfortunately, are rare; and however much some of us may have differed from his views as to the art we practise, we cannot but honour and admire the enthusiasm with which he worked, and mourn the extinction of the light his labours were qualified to shed on subjects of great importance in art and archaeology.

It is not for me to dilate on the very interesting career and numerous works of Mr. Fergusson; that has been done by others, and may hereafter be supplemented by those better acquainted with him than myself; but I think it is only right that, as your President on this occasion, I should mournfully and publicly acknowledge the great loss we have sustained by the passing away of so distinguished a contributor to the literature of our art, and of a man so highly esteemed, not only by ourselves, but by many of kindred pursuits in the path of literary and artistic work.

The Council thought it right that the Institute should be represented at the funeral, and several gentlemen were consequently present, together with both our secretaries, Mr. Waterhouse, and myself, to pay to his memory our last tribute of appreciation and respect."

OBITUARY.

The Late Mr. William B. Colling.—A member of the profession has just passed away whose abilities entitled him to have taken a more prominent position than fell to his lot. We refer to the late Mr. William B. Colling, who died on Sunday last at the age of 72, from the combined effects of an attack of bronchitis and other ailments. Mr. Colling was one of three brothers who all inherited more or less the abilities of their father. His younger brother, the late Wallis Colling, was clerk of works at the Royal Courts of Justice under the late Mr. Street, having in a similar capacity superintended the erection of Montague House, Whitehall, and other important works, for the late Mr. Burn. As the author of "Art Foliage" and "Gothic Ornaments," Mr. James K. Colling,—now the only survivor of the three brothers,—is well-known. In early life William B. Colling was the associate of the present President of the Institute, Mr. Ewan Christian, and of the late Sir G. Gilbert Scott. Having studied at Norwich and London, in the offices, we believe, of Brown and Habershon respectively, he entered the office of the late Mr. Burn in 1846 as confidential assistant, which position he continued to occupy first with Mr. Burn, and afterwards with Mr. Macvicar Anderson, up to the time of his death. Unbroken confidence and mutual esteem characterised this long connexion of forty years. Seldom indeed have faithful services been so ungrudgingly and so devotedly rendered. Mr. Colling's natural powers were of a high order, and such as, if backed by a greater amount of ambition and self-confidence, must have brought him to the front. He was an excellent draughtsman, and was well versed in the theory and practice of architecture and the cognate arts. His leisure was devoted to his favourite studies of music and languages, in both of which he was a proficient. The only works which Mr. Colling carried out from his own designs, as far as we are aware, were a memorial tower at Guernsey, which he won in competition; and "Hendrofollan," a country house, which he erected in Wales for Mr. Dillwyn, M.P.

Mr. Joseph Mayer, F.S.A., died at Behington, Cheshire, on Monday night, in his 83rd year. He was formerly in business in Liverpool as a goldsmith, and was well known as a collector of antiquities and as the donor of valuable gifts to the Corporation Museum of Liverpool. In consideration of his munificent gifts Mr. Mayer's statue by Fontana was placed in St. George's Hall.

ARCHITECTURAL SOCIETIES.

Architectural Association.—The seventh ordinary meeting of the present session was held on Friday, the 15th inst., at Conduit-street, Mr. C. R. Pink (President) in the chair. The following new members were selected, viz., Messrs Henry L. Marks, W. G. Wallis, R. H. Fowler, Percy J. Treadwell, Harold A. Barnett, E. Stanley Walters, John Hutcheson, Thomas W. Ketchie, and Walter Tarrant. Mr. L. F. Day then read a paper entitled "Some Lessons from Old Glass," of which we print the first portion of this week (see p. 156). A discussion followed of which we defer our report. The Chairman, before closing the meeting, referred to the recent loss sustained by the profession in the death of Mr. James Fergusson. Not to speak of the great work he had carried out in architecture and archaeology, architectural students owed him a debt of gratitude for the "History of Architecture." This was not merely a most valuable text-book, but was also one of the most critical works of any country of any branch of art.

Liverpool Architectural Society.—At the meeting of this Society held on Monday evening last Mr. Thomas Mercer, President, in the chair, Mr. James M. Hay read a paper, illustrated by drawings, entitled "St. John's site,—its fitness for a great cathedral; design of a great cathedral,—its fitness for St. John's site." In his opening remarks Mr. Hay mentioned that these drawings had been prepared months ago, and he had only waited till the competition designs had arrived and were laid open to public view before bringing them forward. He then proceeded in terse and humorous terms to combat all the objections that had been urged against this site, expressing his belief that the real secret of it all arose from the prevalent feeling of the incongruity of placing a Gothic building in close proximity with a structure of such a severe Classic style as that of St. George's Hall. The cathedral must be Gothic, and of an old stereotyped plan, then he sympathised with the objection.

A Gothic building there would be an esthetic blunder. The genius of the place demands that it should be Classic. Admit that, and the site becomes the finest in Liverpool, although the whole city were pulled down in search of a better. In the course of his paper Mr. Hay made a suggestion in regard to the disposal of the proposed cathedral with respect to St. George's Hall, to which we have referred on another page. Some discussion followed, and reference was made to a memorial from the Council of the Society which was read at the meeting of the Town Council last week. The memorial expressed the opinion that the specimen sculpture panel on the east front of St. George's Hall was out of harmony with an inferior to the high standard of the architecture, and suggesting that no step be taken to continue the sculpture without further consideration.

COMPETITIONS.

The Great Northern Central Hospital.—The committee of this hospital, in April last, invited six architects to submit plans in competition for the proposed new hospital in the Holloway road. In response to their invitation five sets of plans were sent in on the 18th of September last, one of the invited architects having declined to compete. The designs were referred to a building committee, comprised of several gentlemen specially acquainted with hospital arrangements and of members of the medical staff, who were assisted in technical points by Messrs. Howden, Heath, & Co. surveyors. The committee, after having carefully examined all the designs, decided to award the first place to those bearing the name "Thought." Upon opening the envelope, the authors were found to be Messrs. Keith You & Henry Hall, 17, Southampton-street, Bloomsbury, who have accordingly been appointed architects of the new buildings. The drawings of the competing architects will be on view the out-patients department of the present hospital, in the Caledonian-road, for a fortnight from the 23rd of January inst.

The Vacant District Surveyorship.—The meeting of the Metropolitan Board of Works this Friday, the 22nd of January, the business will be the election of a District Surveyor for the Western Division of the City of London, in the room of Mr. Rawlinson Parkin, deceased.

INSTITUTE OF BUILDERS.

The second annual general meeting of the Institute of Builders was held at the offices, 31 and 32, Bedford-street, Strand, on Tuesday last, the following report being presented:—

"In submitting their second Report to the members of the Institute, the Council are pleased to be able to state that the arrangements contemplated at the time the last Report was presented have been carried out, and they have, in conjunction with the Builders' Accident Insurance, Limited, and the Central Association of Master Builders of London, secured the whole of the first floors of Nos. 31 and 32, Bedford-street, Strand. This has enabled the Council to throw open a Library and Reading-room, and they feel confident that the facilities thus afforded for mutual intercourse will cause a large increase of members, although the number to be admitted is limited.

An inquiry into the cause of the depression of trade and industry having been instituted by the Government, a copy of the questions propounded by the Royal Commission appointed to investigate the matter was forwarded to the Council, and such of the questions as applied to the building trade were very carefully considered by them, and replies sent in.

The Council regret to announce the resignation of Mr. Leonard J. Alton, who for several years acted as secretary of the Builders' Society, and afterwards of the Institute, as he felt he was not able to undertake the secretarial duties on the removal of the Institute to the new building.

Under the Articles of Association the President (Mr. Stanley G. Bird), one of the vice-presidents (Mr. J. Howard Colls), and the treasurer (Mr. George Pucknett, J.P.), one of the auditors (Mr. Geo. Bart, Jun.), and four members of the Council (Mr. Wm. Brass, Mr. Edward Conder, Mr. Arthur G. Lucas, and Mr. Joseph Randall) retire, but are eligible for re-election.

The meeting then proceeded to the election of the officers, who, with the exception of the Council, were all re-elected; the members of the Council being Mr. R. Neill, Jun. (Manchester), Mr. J. H. Trollope (London), Mr. Wm. Hill (Gosport), and Mr. Joseph Randall (Woolwich).

THE PROGRESS OF THE WORKING CLASSES IN THE LAST HALF-CENTURY.

This was the subject of an elaborate paper, read by Mr. Robert Giffen, LL.D., at the meeting of the Statistical Society on Tuesday evening last. In concluding his paper, Mr. Giffen said:—

When the increase of earnings from labour and capital is compared, it is found that the increase from capital is from 100 to 400 millions only, or about 100 per cent.; the increase from the "working" of the upper and middle classes is from 150 to 320 millions, or about 100 per cent.; and the increase of the income of the manual-labour classes is from 171 to 550 millions, or over 200 per cent. In amount the increase of capital is about 210 millions; to labour of the upper and middle classes, 166 millions; and to labour of the manual-labour classes 179 millions,—a total increase of 755 millions. The general conclusion from all the facts is, that what has happened to the working classes in the last fifty years is not so much what may properly be called an improvement as a revolution of the most remarkable description. The new possibilities implied in the changes which in fifty years have substituted for millions of people in the United Kingdom who were contending on the brink of starvation, and who suffered untold privations, new millions of citizens and fairly-well paid labourers, ought, indeed, to excite the hopes of philanthropists and public men. From being a dependent class without future and hope, the masses of working men have, in fact, got into a position from which they may effectually advance to almost any degree of civilisation. Every agency, political and other, should be made use of by themselves and others to promote and tend the improvement. But the working men have the game in their own hands. Education and thrift, which they can achieve for themselves, will, if necessary, do all that remains to be done. Whatever else is to be done will be done all the more easily if education and thrift are practised. I am not now speaking theoretically. I know from experience, and from intimate acquaintance with working men themselves, using the words "working men" in a popular sense, what can be done on very small means. It will be a shame to English working men if they cannot,

with comparatively ample means, raise themselves to the standard of education which Scotch peasants have long since been able to reach with what, until recent years, were very narrow means. In conclusion, let me point out that in the near future there is a very serious difficulty impending; the difficulty, in fact, is already upon us. Since I wrote two years ago prices have further declined, which would seem to give working men even a greater advantage than they had then, but this decline is due to causes, as I have believed, which necessarily involve a fall in wages and profits. Wages and profits must to some extent be adjusted to the changed prices. Hence in the present paper the present time I have spoken of has been rather that of two years ago, when my former paper was written, than the actual present. If I were to take account of the most recent changes in prices, I should also have to take account of the most recent changes of wages, which are all in a state of transition. What I have to suggest to all concerned is that the fall of prices, considering the length to which it has gone, is a phenomenon which working men should carefully study in their own interest, and that they should be prepared to some extent for a reduction in money wages. What concerns them is not "money" wages, but "real" wages. It is quite possible that in a period when money wages are falling, along with all other money values, their real condition may improve, because the fall in money wages is less than the fall in the money prices of the principal commodities which they consume. It has been a great convenience in the present inquiry that prices at the end were obviously much the same as at the beginning, or rather less, so that there could be no question as to the change in money wages indicating a corresponding real improvement. But this very convenience helps to impress on my mind the conviction that we have entered on a period in which all comparisons of that sort are already extremely difficult. The question is not one which working men or any other class can avoid.

In the discussion which followed, Messrs. Harris, Jeans, Leone Lovi, Benjamin Jones, David Chadwick, Stephen Bourne, Rowland Hamilton, and Major Craigie took part. The conclusions drawn by Mr. Giffen were contested in certain particulars.

Mr. Giffen, in the course of his reply, said that, as to rent and house accommodation being dearer than formerly, the evidence which he gave in his former paper on that point proved conclusively to him that, taking the country all over, the chief cause of the increased rent demanded had been the improvement in houses and in the accommodation they contained.

THE CLEANSING AND VENTILATION OF SEWERS.

At the meeting of the Metropolitan Board of Works this Friday, the 22nd inst., a report will be presented by the Special Purposes and Sanitary Committee, as to the cleansing and ventilating of sewers, recommending:—

1. That any old and defective, disused, or partially disused sewers which may remain in any part of the metropolis should be disconnected from the present sewerage system, cleansed, and filled up; and that, where necessary, pipe or other proper sewers should be substituted.
2. That stringent measures be taken by the Board, and by the Vestries and District Boards, (a), for preventing road-sweepings passing into sewers; (b), for preventing the discharge into sewers, from manufactories and other places, of impure substances, such as chemical refuse or trade dirt, or of hot water or steam, so as to be the cause of nuisance.
3. That the most important requirement for keeping sewers in satisfactory condition is a supply of water sufficient in quantity to carry the sewage in suspension through the sewers.
4. That whenever the supply of water in sewers is insufficient for cleansing the sewers, effectual provision for cleansing such sewers should be adopted by flushing or other means.
5. That one of the most effectual methods of flushing would be by means of water simultaneously discharged into house drains, as such a simultaneous discharge would flush branch sewers, then local sewers, and finally main sewers; that such a method of flushing can be effectually carried out by householders flushing their house drains periodically and simultaneously at stated times; that a great number of householders would probably be willing to co-operate with the authorities in improving the condition of the sewers in their district in this way; and that it is desirable that the several Vestries and District Boards should intimate upon what days and at what hours householders should flush their drains.
6. That provision near the heads of branch sewers, for flushing such sewers from their commencement, is to be desired.
7. That the practice of flushing the courts, alleys, small streets, &c., in poor districts, in summer, is to be highly

recommended as a desirable method of flushing sewers and improving the sanitary condition of the districts.

8. That next to effectual cleansing, one of the most important safeguards against nuisance and danger to health from sewers is the dilution of the gases therein by a constant and plentiful supply of fresh air to the sewers by means of effective ventilation.

9. That the ventilation of sewers in the metropolis, by means of ventilating shafts leading to gratings in the centre of roadways, has been the cause of complaint owing to the imperfect manner in which the system has been carried out, the ventilators being deficient both in size and number.

10. That the surface ventilators to the recently-constructed sewers have ordinarily been placed at a distance of from 50 to 60 yards apart, with air-openings in the gratings equal to 60 square inches; and that the number and size of many of the ventilators on other sewers in the metropolis should be increased.

11. That the amount of ventilation afforded by large special ventilating shafts is in no way commensurate with their cost, and that the adoption of such shafts, with or without fire heat, or the connexion of sewers with factory shafts, can only be adopted in very exceptional circumstances. Where shafts with fires are used, the sewer gases should be allowed to pass into such shafts over as well as through the fires, otherwise the amount of ventilation afforded will be very much limited.

12. That pipe ventilators of large section, and constructed with bends and without angles, can be used with great advantage in addition to, and not in substitution for, surface ventilators, wherever the consent of owners and occupiers can be obtained to such ventilators being affixed.

13. That the Committee are of opinion that the ventilation of the sewers of the metropolis may be improved by altering the construction of many of the surface ventilators as previously recommended, and by carrying up large pipe-ventilators at convenient points wherever practicable.

14. That the use of charcoal or other appliances for deodorising gases in sewer-ventilators is undesirable, as such appliances do much harm by obstructing ventilation, are costly and troublesome, and are quite unsuitable for general use over a large sewerage system.

15. That during the cold and wet seasons the arrangements suggested in the report for providing ventilation will be sufficient, as putrefaction proceeds so slowly at low temperatures, and when the sewage is diluted with large volumes of fresh water, that the foul matters pass from the sewers before material quantities of offensive gases are generated.

16. That during dry and hot weather the foregoing recommendations respecting the flushing and cleansing be carried out so far as practicable, especially in sewers having only a small flow of water.

17. That in addition to these precautions, a system of deodorisation during the summer be arranged for the main sewers on the plan adopted by the Board during the past summer (see pages 23 and 24 of the report); that Local Boards be requested to adopt a similar system with local sewers, and to use all their influence to induce householders to employ in their house-drains suitable deodorising agents during periods of high temperature and drought.

18. That manufacturers and others discharging refuse into the sewers be compelled to so treat their waste water (by such process as they may deem fit, but to the Board's satisfaction), that it shall have no greater deodorising power than average household sewage.

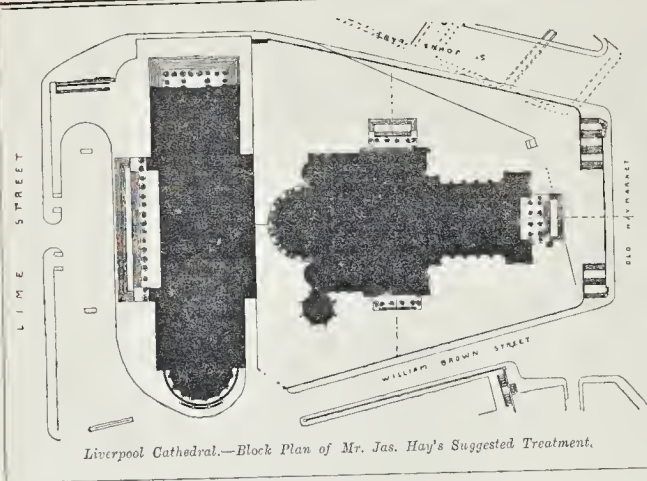

19. That the Committee are not prepared to recommend the Board to exercise the powers given by the 33rd section of the Metropolitan Management Amendment Act for making by-laws for the guidance, direction, and control of the Vestry and District Boards, and other persons in relation to the maintenance, cleansing, ventilation, &c., of sewers, until it is shown that the suggestions made in the report have not been voluntarily adopted.

We may return to the subject next week.

Royal School of Mines.—Prof. Warrington

Smyth, F.R.S., in continuing his lectures upon mining, in the theatre of the Geological Museum, Jernyn-street, spoke at length upon the considerations necessary before venturing to re-open a mine after it has once been abandoned, and particularly the different systems in vogue of estimating the value of the workings. It is necessary that the lode should be tested at a great number of points, and no reliance placed upon the select few. Some of the most monstrous impostures brought before the country have been due to a lode having been tested at one or two convenient points, and then statements made on the assumption that the lode throughout would be of the same character. The correct course is to take fair and average samples of the lode from a great number of separate spots, build them up into a circular pile, cut it through by cross trenches, mix one of the quadrants obtained, and proceed as before, till we get a last sample for examination, which may reasonably be considered a fair average of the whole. Even in a slate-quarry, the blasting of a few pieces of rock, in which the cleavage seems perfect, is not sufficient to show the real value of the mass. Nothing but the actual working of it can do so. In the case of mineral deposits there is often a considerable cover of gossan, which renders superficial trials of little value, in which case preliminary operations soon merge into actual mining. The true character of a lode can only be obtained by running levels through a considerable length of ground, and frequently a depth of thirty or forty fathoms; sometimes sixty or eighty fathoms have to be reached, before profitable returns may be expected, in which case it is evident that little can be done without sufficient capital and plant.

* See Builder, p. 63, ante.

Liverpool Cathedral.—Block Plan of Mr. Jas. Hay's Suggested Treatment.

THE LIVERPOOL CATHEDRAL. A NEW SUGGESTION.

At a meeting of the Liverpool Architectural Society on Monday evening last, elsewhere mentioned, Mr. James Hay read a paper in illustration of a design which he had made for a cathedral for the site now recommended. The accompanying is a block plan showing his proposal for the placing of the cathedral, with its main axis at right angles with that of St. George's Hall, and centrally with the latter building, so that the two buildings would form an architecturally-connected group, the cathedral being, of course, Classic in its architecture. We can say nothing of the design, which we have not seen, but this idea of the treatment of the plan is unquestionably a very fine one, and well worth consideration.

PROJECTIONS BEYOND THE BUILDING LINE.

GREENWICH DISTRICT BOARD OF WORKS V. HOILE.

At the Greenwich Police-court, Mr. Alfred Hoile, builder, of 40, Colfe-road, Forest Hill, was summoned before Mr. Marsham, at the instance of the Greenwich District Board of Works, for erecting certain buildings in Malpas-road, Brockley, beyond the general building line as defined by the Superintending Architect of the Metropolitan Board of Works. An order to demolish was asked.

Mr. Morton Smith, counsel for the Board, said the houses and shops were commenced in June last. A plan was deposited with the Greenwich Board, who thereupon obtained a certificate from Mr. Vulliamy fixing the building line. The defendant erected the houses as he had begun them, however, and there was no doubt they exceeded the building line.

Mr. Glen, who appeared for the defendant, raised an objection to the certificate of the Superintending Architect being put in without Mr. Vulliamy being put in the box.

Mr. Marsham, however, admitted the certificate. After some formal evidence, Mr. Glen submitted, first, that the buildings having been roofed in at the date of the certificate no proceedings could be taken against the builder. They were completed, within the meaning of the Act, so far as the builder was concerned, and any proceedings must be against the owner or occupier. He further submitted that the Board were precluded from proceedings, because they had not, as required by the Act, given notice of objection within fifteen days after the defendant had deposited his plans. It was only after the completion of the building that his unfortunate client knew that he had transgressed.

Mr. Morton Smith said the defendant was warned in July by Mr. J. N. Smith, the Board's engineer, that if he built where he had placed his footings he would exceed the building line.

The defendant denied that any such conversation took place.

Mr. Glen, in continuation, submitted that, before adjudicating, his Worship must have proof that both parties were heard before the Superintending Architect. Another point was that the Superintending Architect had treated the land in question as vacant ground, whereas there was a School Board building previously upon it and projecting beyond the line of the buildings now complained of.

Mr. Vulliamy, who had been subpoenaed by the defence, stated that when he made the line of building, he was not made acquainted with the fact that there was any building on the land previously.

Mr. Smith said the school was a temporary iron building, for which a licence was granted by the Metropolitan Board of Works.

After hearing the evidence, Mr. Marsham said the only question seemed to be whether the Board ought to have given notice.

Mr. Smith contended that the 76th section of the Act 18 & 19 Vic., cap. 120,—the one under which it was directed that notices should be given by the District Board within fifteen days,—related only to drainage and the construction of drains.

Mr. Marsham, who had taken some time to consider his decision, and had viewed the *locus in quo*, said he had no doubt that the section related to the drains alone, and that it was not necessary for the District Board to give fourteen days' notice of objection. When the Act in question was passed, the whole matter of building lines was in the hands of the vestries, but now the Superintending Architect fixed the line, and the whole procedure was altered. He made an order for the demolition of the houses, with 5*l.* costs.

A case for a Superior Court, on the point of law as to notice by the District Board, was applied for and granted.

THE EXAMINATION IN ARCHITECTURE (INSTITUTE).

SIR,—Will you allow me to object very strongly to the letter from Mr. Arthur Cates published in last week's *Builder* (p. 143)? If there be one principle of administration more fixed than another with reference to official "exams," it is that there shall be no private intercourse between examiners and examinees. Now, I understand Mr. Cates's letter to indicate, in the first place, that the exam. for the admission of Associates is something like a failure; and as he advertises himself to be "Chairman of the Board of Examiners" I am disposed to suggest that it may be very much his fault.

I took an opportunity a fortnight ago, when sitting (on thorns) with the Council on the Charter inquiry, to challenge the policy of the examiners (which I referred to adversely as the policy of Mr. Cates) in not publishing the past examination questions in the way that is customary; and I was supported by Professor Roger Smith, and, I think, Mr. Waterhouse, amongst others present. I fear our remonstrances must have made no impression, for within a few days out comes this letter. At the same time, at last Monday's quarterly election of members, not a single Associate was put up. Then, when I look into the new "Kalendar" of the Institute, I must confess that the programme of the work for the exam. completely takes my breath away. Nearly a hundred books are catalogued as representing part of the reading required, while the explanations further given appear to cover the work of a long lifetime. And all this for the test to be applied to a youth of one-and-twenty, to prove that he is up to the average of his contemporaries—all that the Institute is entitled to require. Then, I am prompted to ask, by what official authority or permission Mr. Cates advertises himself as

"Chairman of the Board of Examiners"? I do not see his name in the "Kalendar" in any such important capacity,—for important, and indeed all-important, such an office would be. If it were proposed at a general meeting to confer upon any person whatever that title formally I for one should certainly object most earnestly. What would it mean? Nothing less than Grand Gatekeeper of the Guild! And most emphatically so if a personage with such a sounding appellation were to be allowed to whistle all the candidates to the feet of Gamaliel in the way now done. I know something about exams. by this time, and I happen besides to be the sole survivor of those by whom the "Voluntary Examination" of the Institute was organised many years ago, with a success which leads me to ask again and again (and I never get a answer) what has become of it. I may take leave, therefore, to advise the young men who go to Mr. Cates, but to memorialise the Institute instead, and demand a proper understanding as to how far the state at the Institute just now exists in the same. I quite agree with the writer of this letter, but venture to suggest that the question should be taken up by the builders themselves, who undoubtedly employ the largest number of men in this particular branch.

Where is the Central Association of Master Builders, which, as representing the builders, should take up and deal with matters so important to its members?

It is well known to all who have much to do with plumbers that their class prejudices are very great, and that some of these are not to the interest of the community at large; for instance, it seems unreasonable that they should work different hours to all other trades employed upon a building, & this in the short winter days, when the use of a facial light is an absolute necessity; of course they do little or no work in this half hour, but it only makes the danger and risk of fire the greater, and it is to be feared that plumbers are responsible for many losses in this way.

"PLUMBERS AND PARLIAMENT"

SIR,—The very sensible letter upon this subject in your issue of the 2nd inst. [p. 63], signed "C. A. M. B.," suggests that the Plumbers' Company, who are making laudable efforts to improve the technical knowledge of the members of the trade, should also endeavour to reform various anomalies now existing in the same.

I quite agree with the writer of this letter, but venture to suggest that the question should be taken up by the builders themselves, who undoubtedly employ the largest number of men in this particular branch.

Where is the Central Association of Master Builders, which, as representing the builders, should take up and deal with matters so important to its members?

It is well known to all who have much to do with plumbers that their class prejudices are very great, and that some of these are not to the interest of the community at large; for instance, it seems unreasonable that they should work different hours to all other trades employed upon a building, & this in the short winter days, when the use of a facial light is an absolute necessity; of course they do little or no work in this half hour, but it only makes the danger and risk of fire the greater, and it is to be feared that plumbers are responsible for many losses in this way.

SIR,—In reply to Mr. George Shaw's letter in your last issue, I beg to enclose a copy of a letter addressed to him, and which up to the present has been acknowledged.

The letter was posted on August 20th, 1885, but having been returned by the Post-Office authorities, was, I presume, delivered by them in due course of post.

Since I wrote the *Worshipful Master*, the office of this Association have been removed to Bedford-street, Strand, W.C.

E. S. HENSHAW,
Secretary of the Central Association of Master Builders of London.

(CONT.)
"Central Association of Master Builders of London, 27, King-street, Covent-garden, W.C. London, 20th August, 1886."

SIR,—A statement delivered by you at a meeting of the *Worshipful Company of Plumbers*, held on 29th June last, having recently been placed in my hands for perusal, I gather from a remark that the co-operation of other trades connected with house-building is sought. It occurs to me to suggest that at least one representative from this Association, and likewise from the National Association of Master Builders of Great Britain (Mr. W. Knowlton, Secretary), might be a desirable addition to the Council.

It is to be hoped that it would also be to the advantage of the Council to have a representative from the Institute of Builders; of this, Mr. L. J. Maton, 21, Carver-street, E.C., is the Secretary.

I am, Sir, your obedient servant,
E. S. HENSHAW, Secretary
To the *Worshipful Master* of the Plumbers' Company,
6, Lawrence Pountney-lane, E.C."

LIMITS AT NO. 4, UPPER THAMES STREET.

SIR,—In reference to your notice of Mr. Steven Bros.' new premises, No. 4, Upper Thames-street, E.C., in last week's issue [p. 124], Mr. Steven Bros. authorize us to ask you to mention we supplied, in addition to the hydraulic press lift mentioned in your notice, hydraulic gear and crane, all three being worked by pressure of steam from the London Hydraulic Power Co., Palmouth-road, S.E.

R. WAYGOOD & CO.

"TWO DOOMED LONDON CHURCHES."

Sir,—I have been waiting for some other and better-informed person to correct an error in your issue for January 9th, in regard to the notice of the consecration of two out of the four of the London churches. You state that one of the four is "St. Thomas in the Liberty of the Rolls," and then proceed to give an account of "The Rolls Chapel," which is altogether another place. St. Thomas in the Liberty of the Rolls (and which is to be pulled down shortly) is a church built by the lawstationers of Chancery-lane some fifty years or so ago (the incumbent of which is a Mr. Moran), and is situated in Bream's-builidings, Chancery-lane, and is from every point of view a very different place in interest to the Rolls Chapel situated in Rols-yard. I trust you will kindly insert some notice of this correction, as I dare say there are numerous other readers of your interesting paper who would share my very great regrets at any interference by the Goths and Vandals of this destructive age with such an edifice as the Chapel of the Rolls.

J. ALLEN ATKINSON,
The Grandson of one of the contributors
to the building of "St. Thomas in the
Liberty of the Rolls."

. The mistake arose, not from want of knowledge of the facts, but from an oversight in revision and condensing of the article, and the omission of some portions of it.

THE SNOWSTORM AND THE VESTRIES.

Sir,—With reference to the above, both the vestries and their surveyors have recently perceived a fair amount of obloquy at the hands of a generally unthinking public. I do not for a moment wish to exonerate from blame those to whom it is due, but a consideration of the figures below will prove the unreasonableness of the complaints of many persons whose object in life is attained when they see their names in the local papers in connexion with a complaint. Indeed, many persons obtain a great deal of cheap popularity by this simple means who otherwise would be unheard of and unknown. With regard to the recent snowstorm, the figures relating to the amounts to be dealt with, and the attendant expense, are simply appalling.

According to the figures given by Sir Joseph Bazalgette, when addressing the Institution of Civil Engineers as President, in 1878, the mileage of the metropolis streets exceeded 1,700, the width between the channels being 30 ft.; if we add 18 ft. for the footways, and allow for the increase since that date, the superficial area will certainly be not less than 4,500,000 square yards. My own observations proved that the recent fall was equal to a depth of 3 in., when compressed as ascertained, the quantity to be dealt with amounted to no less than 4,500,000 cubic yards. Allowing for the distance to the available tips, it would be difficult for a cart to deal with more than 20 cubic yards per diem, and 225,000 horses and carts and drivers would be required, costing, at 10s. per diem, 112,500l., and 50,000 filers and sweepers, costing, at 3s. 4d. a day, 75,000l., if the snow were cleared in one day.

That it is impossible to do so must be at once conceded; indeed, it is exceedingly doubtful if all the snow could be cleared in twenty days, and it allows that carting can only be practised to a very limited extent, and that should be in the direction of freeing the principal thoroughfares, crossings, &c., from snow. In my district,—Wimbledon,—the above, and although every man that offered his services was engaged at 4s. per diem, twenty was the maximum number available. What is really required is the cordial and hearty co-operation of all the occupiers. If the rather lax regulations were so framed that the obligation to free from snow the footways adjoining all premises within a reasonable time were compulsory as regards the occupier, and a penalty for non-compliance were not only provided, but means for its enforcement, so, since the police courts are wholly inadequate to deal with the enormous number of cases that would at first assuredly arise, each good would result. The footways being clear, one gang should clear the snow from the channels to ensure the flow of all water resulting on a possible thaw, while another should clear the middle of the streets, the snow being thus heaped in parallel rows along the sides of the roadway, and temporary snow-ploughs may with advantage be utilised for the street clearing. By these means the foot and road ways may be rapidly put in good condition for both vehicular and pedestrian traffic. Of course, the surveyor's efforts will be in the direction of the principal thoroughfares, and the amount of work he will perform will depend on the number of men and carts available; but, as regards the footways, there is no reason why all should not quite free from snow within a few hours after the cessation of any fall.

WM. SANTO CRIMP,
Assoc.-M. Inst. C.E., F.G.S.

Wimbledon.

"Art Criticism" was the subject of a paper Mr. G. C. Haite, read at the Richmond bazaar last week.

PROVINCIAL NEWS.

Gateshead.—Messrs. John Davidson & Sons have, as an addition to their present mills, built a new roller mill on the site of some warehouses, and, on digging for putting in the foundations, a part of the old wall for the defence of the town was found in a very perfect state with its arched doorways and secret covered way leading to the river. The new building is five stories in height, built with red bricks and stone dressings, the interior being lined with white glazed bricks. The several floors are carried on rolled iron girders, supported on cast-iron columns, which rest upon a deep foundation of concrete and inverted arches. The whole of the interior woodwork is dressed and painted with Asbestos fire-proof paint. The several floors are filled with the latest improved machinery for the manufacture of flour by Mr. Harrison Carter, of London. The engine-house is 50 ft. long by 26 ft. wide and 30 ft. high, with open-timbered curved ribbed roof, surmounted by a lantern light. The walls are finished in Keene's cement with framed pitch-pine dado. Two horizontal engines, each 300 horse-power, are laid upon immense blocks of concrete, 12 ft. deep. They were supplied by Messrs. Wood, Bros., of Sowerby Bridge. The whole of the buildings are lighted with the electric light, by Messrs. Clark, Chapman, Parsons, & Co. The work has been carried out by Mr. Walter Scott from designs by Mr. Richard Cail. Messrs. Donkin & Nickoll, engineers, supplied the ironwork, Mr. W. H. Wilson acting as clerk of the works.

Cheltenham.—The President and Council of Cheltenham College have commissioned R. L. Birelton, sculptor, to prepare a memorial tablet, with medallion portrait in white marble, of the late Rev. T. A. Southwood, M.A., to be placed in the chapel next to that of the late Major Pierson, by the same sculptor.

Calne.—A large clock has just been erected at the Town-hall. It strikes the hours, chimes the quarters, and shows time on one 5 ft. dial. There is automatic apparatus to turn the gas up and down. The work was carried out by John Smith & Sons, Milland Clock Works, Derby.

Oxford.—According to the *Oxford Chronicle* the fall of Osney Bridge has brought with it a series of complications, the solving of which, it is now almost certain, will take place in the law courts. The local board, at their last monthly meeting, accepted a tender from Mr. Charles Bossom, of Oxford, to erect for 477l. a temporary timber bridge over the River Thames, from Russell-street to East-street, Osney, according to plans prepared by Mr. W. H. White, M.Inst.C.E., Engineer to the Board. This work has been undertaken under an arrangement between the Board and the County Bridge Committee, the cost to be ultimately borne by whichever of the two bodies named is proved to have been chargeable with the maintenance of Osney Bridge. As it is probable the temporary bridge may have to stand a long time, it will be of a substantial character, and suitable for all traffic, except traction engines and the like. The supports in the river portion of the bridge will consist of three rows or "piers," each of six 12 in. square piles, varying in length from 18 ft. to 22 ft., driven 6 ft. into the river bed, each row to have two pairs of wallings and strong diagonal braces.

CHURCH-BUILDING NEWS.

Stevenage (Herts).—Holy Trinity Church, Stevenage, has been enlarged. The church was built about twenty-five years, from Mr. A. W. Blomfield's design, and consisted of nave and chancel, Early Decorated in style. The additions comprise another nave and chancel on the south side, being about 16 ft. longer east and west, and joined to the original building by an arcade of three arches.

London.—For some months past important external works have been in progress at the ancient church of St. Giles, Cripplegate. The upper portion of the south frontage, containing the clearstory, was, until lately, faced with brick. This has now been replaced by Kentish rag-stone. As refaced, the clearstory is now surmounted by battlements. Portions of the south aisle frontage below, and the west end frontage of the north aisle, the stonework of which was found to be decaying, have also undergone restoration, as well as the old octagon tower at the south-

east end, containing the staircase entrance to the galleries of the church, which were some time since altogether removed. The old tower consecrated no longer serves any practical purpose, but it was, nevertheless, decided to retain it, refacing the brickwork of which it was constructed with Kentish rag-stone and battlements, uniform with the reconstructed clear-story. A row strong-room for the safe deposit of muniments and registers belonging to the church has been erected, adjoining the south-east entrance. Messrs. Dove Bros. have carried out the works, under the supervision of Mr. Edmund Woodthorpe, architect.

Kenn.—The parish church of St. Andrew, which Mr. H. Woodyer restored some time ago, possesses a particularly fine old roof-screen of carved oak, and of fifteenth-century date. A new roof, with sculptured figures of the suffering Christ, and of the Virgin and St. John, has recently been placed thereon. The cross has foliated ends, and is about 9 ft. high. It has been erected by Mr. Harry Hems, of Exeter.

Hebburn-on-Tyne.—Funds are being raised for the erection of the new Church of St. John the Evangelist. The late Mr. Ralph Carr-Ellison, J.P., of Dunston-hill, Whickham, and of Hedgeley, promised 1,000l. towards this church. To assist in the work, Mr. John Ralph Carr-Ellison, J.P., has offered a site at Hebburn Hall of more than half an acre, in part walled in and drained, and a long wing of a substantial building thereon for conversion into the new church. Hebburn Hall is situated in the new parish, and it is a building of great antiquity, and of archaeological and historical interest. The Committee have gratefully accepted Mr. Ellison's assistance. The plans of the Church are prepared to seat 550 persons, and they are designed by the architect, Mr. F. R. Wilson, of Alnwick, author of "The Churches of Lindisfarne," in the Geometric Decorated style.

Southport.—The new Church of St. Philip, Southport, will be opened by the Bishop of Liverpool next week, its consecration being deferred for a period. The structure, which is situated in Scarisbrick New-road, is built in the style known as Geometrical Gothic, of Early English type, and comprises nave, north and south aisles, chancel, transepts, clergy and choir vestries, and organ-chamber, and will afford accommodation for 800 worshippers. The architect is Mr. R. H. Tolson, of Manchester, the contractors being Messrs. William Brown & Sons, of Salford.

Anstale.—The new chancel-screen which has been provided for this church is of oak, and is divided into five bays, the centre one being fitted with polished brass gates. The lower portions of the sides of the screen consist of cusped arches, supported by small columns, surmounted by circles containing carved sexfoils and traceried mouldings. Springing from the floor, and dividing the lower panels into bays, are buttresses and trifolium columns, which support the crocketed gables. At the intersections are placed figures of two of the Evangelists, above which are canopied pinnacles, each gable being filled by a hold arch, with cusps and carved spandrels, and the apex with a cinquefoil, surmounted by figures of angels. Immediately above the richly-carved centre arch is a niche containing a figure of St. Michael, the patron saint of the church, and this again is surmounted by an elaborate cross. At the sides of the centre gable are figures of the two other Evangelists, under crocketed and gabled canopies, above which are figures of angels on carved pedestals. The work has been executed by Messrs. Jones & Willis, of London and Birmingham.

The New Street from Piccadilly Circus to New Oxford-street.—The Works and General Purposes Committee of the Metropolitan Board of Works have resolved to recommend to the Board that the new street above indicated be named "Piccadilly-road"! If this absurd appellation be adopted it will be productive of great inconvenience. The same Committee have decided to recommend the Board to grant a site for a bronze statue to the late Lord Shaftesbury ("subject to the design of the pedestal and statue being approved by the Board") "at the circus west of Dudley-street which has been lately formed at the junction of the new thoroughfare from Piccadilly-circus to New Oxford-street with the proposed new street from Charing Cross to Tottenham-court-road."

The Student's Column.

FOUNDATIONS.—IV.

By the by-laws in force in the metropolis (under the Act of 1878) concrete in the trench is required to be, at least, of the thickness of 9 in., and to project 4 in. beyond the footings in each side, unless the subsoil is a natural bed of gravel, where none is required. For a foundation on soft made-ground or on boggy soil this is inadequate; but it is the most that it has been thought right to fix as a minimum requirement. In the case of a 3-in. wall, with proper footings, the concrete will measure 26 in. in breadth, or very nearly three times the thickness of the wall,—an enormous advantage, certainly. In general practice the concrete is made

to project 6 in. beyond the footings, and the depth is regulated by the nature of the soil. When the bottom of the trench is considered to be sufficiently sound (a matter to be judged of, as has been said, by the light of experience, which cannot be acquired too soon), the question whether the concrete shall be carried up to a greater or less height must depend mainly on the relative cost of concrete and brickwork of their respective widths. In the common case of a wall one brick and a half in thickness, the area of the bottom of the concrete will be nearly three times the area of the wall, and piers of 1 ft. 6 in. and 2 ft. 3 in. will stand on ground of about seven times and five times their respective areas.

It is important to see that the bottom of the trench is as clean as possible, being free from any soft mud that may have been allowed to fall into it, and particularly from mud formed by water having been allowed to stand in the trench. When it is evident that water will rise in the trench as soon as the concrete has been deposited, the lime used should be blue lias rather than any ordinary kind, which is not capable of setting under water. Pumping should be kept up so as to keep the water below the level of the concrete until it is deposited in the trench, but not so as to draw away the water through the freshly-deposited material which would remove a large proportion of the lime. If it is necessary to deposit the concrete under water, more care is required to use good hydraulic lime, to mix the concrete with less water, and to drop it quietly into its place.

The application of concrete where the subsoil is of irregular composition, and the mode of using it in underpinning, remain to be considered.

Soils of Irregular Composition.—Referring to preceding observations on the virgin soil and on made-ground, it will be seen that the soil in different parts of the same site may vary considerably, so that the artificial foundations that might be suitable for one part of a building may be insufficient in depth or in breadth, or may even be unsuitable in kind for another part. We have, therefore, to contend with this difficulty in addition to that which might be caused by the nature of either of the soils if it extended over the whole site. Made-ground whether, as a whole, soft or hard is generally of irregular composition. On such a soil it is best to increase the amount of concrete both in its breadth and in its thickness, so that weak parts of the soil may be bridged over and the effect of any sudden transition from one kind of soil to another may be spread, and also extended along a considerable length of trench.

On an old site it is very common to meet with wells, or cesspools, or holes out of which clay or gravel has been dug. When these occur along the course of a trench they are sometimes filled up with concrete which, if the hole is narrow and deep, is wasteful and may be mischievous. For if the general foundation is compressed to the slightest extent by the weight of the build-

ing, it is not merely useless to make a small portion of it unusually firm, but that portion may cause fracture in the wall by refusing to yield to the same extent as the rest. Such holes may be filled with hard rubbish, and the concrete may be run over them, a relieving arch being thrown over the spot in the brickwork above the footings as a precautionary measure. Wider holes into which it is necessary to carry down the concrete should (unless they are very shallow) have the transition from the shallow to the deep foundation made by steps. If old walls are met with, or the large boulders that sometimes occur in ordinary soils, or if the point of a rock sticks up through a soil that may be expected to subside somewhat, it will be a question whether the obstacle is one that can be easily removed or whether it is better to throw an arch over it. By so doing, the building will be made to rest entirely on the yielding foundations, for which provision has been made.

Where part of a wall has to be built upon rock, and there is an abrupt transition to some soft stratum, the trench should be carried down through this stratum if by that means concrete can be laid upon a harder bottom, or upon a deeper part of the rock. When it is necessary to continue the wall upon the softer stratum without such deep foundation, concrete of extra width and thickness is required, but if the building is of considerable weight fracture of the wall is very likely to occur over the place where the foundation passes from the rock to clay or even to gravel. It is much better that an abrupt change such as this should happen under an opening in the wall, and the wider the opening is the less will be the danger to the building through differences in the amount of settlement. Where the opening is very wide, as in a bridge, there may be no ill effect from such difference in foundations; whereas, if it should happen under a pier the structure might be very seriously damaged.

In the sketch section, on page 65, a bed of peat is shown to "chin out" gradually so as to lie like a wedge upon a bed of gravel. It is very common to find an instance of a soft bed of clay silt or made-ground getting rapidly thinner as the ground beneath it rises. A heavy building placed on such a stratum will heel over, whether it has concrete below it or not, owing to the greater amount of compression of the soft bed on the side where it is thickest. A similar result may be experienced from a bed which is of uniform thickness becoming softer (as it is very likely to be) on that side of a building which is nearest to a stream. From one of these causes or the other a very large proportion of the most important buildings that stand on these soft foundations in the lower parts of England, Holland, and Italy, show a distinct and, to those who see them for the first time, an alarming deviation from the perpendicular. But when the extreme amount of compression has been effected, the subsidence is stopped; and, if it has not gone so far as to lead to the serious injury of the building, there may be no further danger. The best known instance of this is the Leaning Tower of Pisa, which was begun in 1174, and not completed till 1350. As it rose it began to lean over, and as each new story was added an attempt was made to build it upright. The limit of this one-sided subsidence was not reached till some time after the eighth and last story was put on. It overlays its base 13 ft. in a height of 179 ft., and has probably long been stationary. The worst of the two Leaning Towers of Bologna, built early in the twelfth century, overhangs 8 ft. 6 in. Dante, in the "Inferno," written 200 years afterwards, makes use of the fearful appearance of this tower to one who stands under it in describing the effect produced in his mind by the vision of a giant that stooped over him. In the sixteenth or seventeenth century Guido painted these towers looking very much as they look now. At Dordrecht and at Delft, and in the neighbourhood of Venice, the towers lean very perceptibly, but the movement seems to have been arrested long since. The tall factory chimneys that stand on any of these treacherous foundations usually lean over, and it is sometimes necessary to cut out some of the lower courses on one side in order to restore them to the upright. The prevalence of strong winds from one quarter may bring about this result by throwing extra stress upon the soil on one side of such a structure.

Books.

How to Select Properly before Purchasing and How to Ascertain its Correct Value
By JOSEPH HENRY MCGOVERN. Liverpool: Gibbert G. Walmisley.

HIS work is little more than an expansion of a section of a well-known surveyors' handbook. As it is possible by dilution to obtain a gallon of son from a cubic inch of the compressed article so, out of a few pages of Hurst, with seasoning of Banister Fletcher, it is possible to make a volume of McGovern. There is, perhaps, no harm in this. The nutriment is there, and, to some mental constitutions, the concentrated form is not the most convenient or whole some. It is recorded of a certain Government clerk that he had the art of making a *procès* of a given subject longer than the original documents. The author of this work runs him very close, for he almost succeeds in making the headings of his chapters as long as the chapters themselves, allowing for difference of type. The professed object of the book is to show an unbelieving public that a surveyor's valuations have a "mathematical basis" and are not arrived at by "rule of thumb"; that they are the result of a careful weighing of the conditions of each problem in detail and not mere guess-work. The author, accordingly, exhibits the processes by which, in given instances, his results are obtained. There is nothing new in the system pursued, but we are glad to note that he has the courage to put the deductions collectively at something like the real proportion they bear to the rack rent, a point in which a too sanguine view of the subject often invalidates otherwise careful calculations.

When Mr. Mark Twain sent a portrait drawn and engraved by himself, to his Holiness Pope Pius IX., the Cardinal Secretary assured the artist in a courteous note of thank that "there was *nothing like it* in the Vatican, and the compliment was duly printed among other equally flattering testimonials. The steward of the Earl of Derby was present with a copy of a previous work by Mr. McGovern, and, while opining that it contained valuable information, admitted frankly that he had "read it," and this is also duly chronic'd by the gratified author. "These be thy honours!"

Houses and Building Societies: How to buy or how to sell, and how to manage Property so
By the Author of "Secrets of Success,"
London: Simpkin, Marshall, & Co.

The name of the author of this little volume transpires in the reading of it, and an advertisement at the close thereof announces it the manager of a prosperous Building Society. It is not surprising, therefore, that the book questions sets forth the merits of these societies—and we would be the last to underrate that—with an intimate knowledge of their work and a desire that their many virtues should be better known. The little volume is in its original matter, and in a larger measure a petition of the speeches and writings of others. Nothing that can be said for building societies is omitted, whilst such little drawbacks as are attached to them in common with every other human institution, are kept out of prominence. It is doubtful whether the author's object will be assisted by adducing as evidence the beneficial working of "an old-established society" instances of such a very uncharacteristic as some of those quoted by him.

W. A. bought a property which brought a net rental (after making the usual deduction of 5H. per annum, for 305L. W. A. was fortunate, but if M. or N. expects to go do likewise we fear he will be kept waiting. W. E. obtained property worth 320L. for 500L. and P. S., D. F., &c., were almost equally lucky.

We submit that for practical purposes should be shown how property may be profitably acquired at the normal rates through the agency of a Building Society, and that these "sporting" achievements tend to demoralise rather than improve the character of the thrifty souls who are the main support of such societies.

We should hardly have expected to meet such a hook with the antiquated fallacy that you open the lower sash of a window then will come in, but if you open the top sash heated air will go out. Try it.

The Suburban Cottage: its Design and Construction. By W. B. TUTTILL, A.M. New York: William T. Comstock.

We have much pleasure in directing attention to this book, which is nearly all that a book of the kind ought to be. The author is quite master of his subject, and gives the world the benefit of his knowledge in a concise, lucid, and unadorned manner. After setting out the desiderata of an American suburban villa to cost 1,500, or 1,600, he takes the reader carefully and frankly through the whole process of planning, design, and construction, beginning with the preliminary sketches, and completing a scheme, only to compress and cut it down afterwards, as usual, alas! to the prescribed figure. The arrangement of the several apartments, &c., is an American, and not an English one, it is true; but there are points about the plan which strike us as of doubtful propriety anywhere. In the first sketch for the house the pantry is without external light, and is wedged between a water-closet, a kitchen, and a laundry. It would be difficult to persuade us that this is quite right. In the reduced, and in some respects improved plans, the position of this apartment is amended somewhat, but now the kitchen has no less than six doors (it had four in the first sketch), to which we must demur. There may, of course, be "exquisite reasons" for this, although we cannot imagine them. It is a critic's humbly to criticise, but with this preliminary grumble our occupation is gone; for, with the exception of the questionable recommendation that all joints in lead pipes should be "wiped" as has hitherto been the practice, we have really no difference with the author. There is much in his book which may be usefully noted by English architects, and while English authors may imitate with advantage his clear and perspicuous style, English publishers may take some useful hints from the attractive manner in which American books are presented to the reading public.

NEW APPLICATIONS FOR PATENTS.

Jan. 8.—299, J. Revill, Electric Indicators for House Bells.—307, A. White, Lavatories.—346, C. Wells, Closed Fireplaces.
 Jan. 9.—364, J. Hyde, Sash Fasteners.—373, H. Copland and J. Gilmour, Formation and Construction of Harbours, Piers, and Breakwaters.—394, J. Stanley and J. Todd, Boilers for Heating Public Buildings, &c.—400, W. Madge and J. Penrose, Water-waste Preventer.—407, G. and S. Jennings and J. Morley, Flushing Cisterns.
 Jan. 11.—411, B. Sutcliffe, Hand Planing and Thickening Machines.—432, A. Henderson, Sinks and Lavatories.—440, S. Joubert, Chimney-top or Ventilating Shaft.—441, J. Pullar, Apparatus for Opening and Closing Hinged or Pivoted Windows, Ventilators, &c.—447, H. Peters, Portland Cement.
 Jan. 12.—488, W. Youtton, Butts of Hinges.—492, A. Bonit, Locks.—494, A. de Boischevalier, Polishing Plate Glass, Marble, &c.—502, J. Jex Long, Open Firegrates.
 Jan. 13.—517, J. and A. Bidwell, Cement.—521, J. Hicken, Automatic Door Opener.—522, W. Green and Others, Kitchen Ranges.—525, W. Morrison, Cooking Ranges.—538, R. Somers, Fireplaces.—547, H. Green, Door Bolts.—550, K. Weise, Partile Roofing.—554, G. Bolton, Cowl and Ventilator.—559, J. Wragg, Fastener for Windows, Doors, and Shutters.—561, J. Stanley, Smoke-consuming Fireplaces.
 Jan. 14.—587, T. Brattan, Hanger Attachments for Sliding Doors.—591, T. Bradford, Disinfecting Apparatus.—616, J. Howie, Drying Chambers.

PROVISIONAL SPECIFICATIONS ACCEPTED.

13,762, E. Hinkel, Locks.—13,788, G. Wyatt and W. Ballard, Hinged Sliding Sash.—13,821, W. White, Locks and Latches.—15,064, G. Porto, Hot-air Stoves.—15,168, J. Gilson, Cooking Ranges and Stoves.—15,308, E. Horsley, Window Fasteners.—15,364, E. Colton, Encaustic Tiles.—15,404, P. Koral, Glazing.—9,588, E. Haynes, T. Ford, and J. Sletley, Fasteners for Window-sashes.—12,565, W. Allen, Self-igniting Water-closets.—14,525, J. Gordon, Syphon Drain Traps.—14,812, P. Trieb, Machines for Cutting, Dressing, Turning, Planing and Shaping Stone.—14,901, H. Rushbury, Door Locks.—15,007, W. Storey, Firegrates.—15,050, A. Coke, Electric Thief Detector.—15,519, H. Bonnycastle and T. Jones, Refractory and Non-conducting Bricks, Blocks, Tiles, Slabs, and Pipes.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.
 2,232, G. Oulton, Soldering Irons.—339, J. Lorrain, Heating, Cooling, and Ventilating.—3,130, J. E. & F. B. Rendle, Structures for Horticultural Purposes.—3,216, E. Ormerod and W. Horne, Cements.—4,748, A. Reddy, Rock Drills.—15,035, W. Scott Morton, Domestic Fireplaces.—15,252, P. Justice, Furnaces for Burning Limestone.—660, T. Clapham, Kitchen and other Firegrates.—2,283, H. Cleave, Lath Backing for Plaster Work.—3,289, N. Thompson, Connecting Lead and other Soft Metal Pipes, &c.—3,801, R. Keates, Dies for Ornamental Tiles, Bricks, Slabs, &c.—16,036, D. Doyen, Door Checks or Closers and Annunciators.—14,064, H. Mathey, Cement and Lime.

A Social Evening at Tunbridge Wells.—On Saturday evening the employés of Messrs. Beale & Son, the well-known builders, &c., of Frant-road, were entertained at dinner, provided at the Swan Hotel, by the liberality of Mrs. and Miss Mills, in order to celebrate the completion of their new residence, "Cranwell House," Lower-green, by the firm. The house has been erected from the designs and under the superintendance of Mr. Herbert Coley, architect. Mr. L. S. Beale occupied the chair, and Mr. S. Beale the vice-chair, and a very pleasant evening was passed.

MEETINGS.

FEDAY, JANUARY 22.
Metropolitan Board of Works.—Election of a District Surveyor for the Western Division of the City of London. 12 noon.
University College.—Professor C. T. Newton, C.B., on "Greek Inscriptions." II. 4 p.m.
MONDAY, JANUARY 23.
The Worshipful Company of Plumbers invite a meeting of the Plumbing Trade of London, to be held at the Guildhall, to confer as to the Registration of Plumbers, &c. 3 p.m.
Surveyors' Institution.—Discussion on Mr. Edward Smith's paper on "The Copyhold Enfranchisement Bill, 1881-82." 5 p.m.
London Institution.—Mr. Frederic Harrison on "Paris as a Historical City." 5 p.m.
Society of Arts (Cantor Lectures).—Professor H. S. Hule Shaw on "The Friction of Fluids." 8 p.m.
Inventors' Institute.—Mr. William Johnson on "Brick-making Machinery, Bricks, and their Manufacture." 8 p.m.
Lectures and Yorkshire Architectural Society.—Mr. C. Pebody on "The Architecture of the Thirteenth and Nineteenth Centuries."
Dunedin Institute of Architecture.—Mr. W. Stephenson on "Egypt and its Monuments." 7 p.m.
TUESDAY, JANUARY 23.
National Association of Master Builders.—Half-yearly meeting, to be held in Derby at 2.30 p.m.
Royal Institution.—Mr. Reginald Stuart Poole on "Naufragata." 8 p.m.
Institution of Civil Engineers.—Mr. C. E. Stromeor on "The Injurious Effect of a Blue Heat on Steel and Iron." 8 p.m.
Architectural Association.—Meeting of members interested re Italian Excursion. Discussion on Florence. 8.30 p.m.
WEDNESDAY, JANUARY 27.
Society of Arts.—Mr. Henry Davey on "Machinery in Mines." 8 p.m.
Civil and Mechanical Engineers' Society.—Mr. R. Harkness Twigg on "The Safety of Life and Property at Sea." 7 p.m.
Liverpool Engineering Society.—Mr. G. L. Burton, Assoc. M.Inst.C.E., on "Modern Milling, with special reference to the Carter Process." 8 p.m.
THURSDAY, JANUARY 23.
Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "The Early History of Bas-Relief." 8 p.m.
Society of Antiquaries.—The Rev. F. J. Heales on "Roman Remains from Willoughby, Lincolnshire." 8.30 p.m.
Society of Telegraph Engineers and Electricians.—The President, Prof. D. E. Hughes, F.R.S., will deliver his "Inaugural Address." 8 p.m.
London Institution.—Professor John Perry on "Telepherage." 7 p.m.
FRIDAY, JANUARY 29.
Architectural Association.—Mr. A. Beresford Pite on "Cathedral Facades." 7.30 p.m.
Institution of Civil Engineers (Students' Meeting).—Mr. J. Evelyn B. Atkinson on "Electrical Measuring-Instruments." 7.30 p.m.

Miscellaneous.

The Registration of Plumbers.—The Worshipful Company of Plumbers, being desirous to take steps for giving effect to the recommendations of the General Council who have been considering the best means of securing the greater efficiency of plumbing and draughting work in dwelling-houses, have, as will be seen by an advertisement in this week's *Builder*, convened a meeting of the London plumbing trade, to be held at Guildhall on Monday next, to consider the question of registration, &c. The recommendations of the Council will be found in the *Builder* for August 8, 1885, p. 185.

Accident to a Church Tower.—Extensive restorations have been going on at the parish church, All Saints, Kingston-on-Thames, since August last, under the direction of Mr. Pearson. On the 2nd inst. an alarming accident occurred. It had been intended to raise the north and south arches of the tower, as the east and west one had previously been raised; an arch for the south side was built in before Christmas, and immediately after Christmas the workmen proceeded to take down the walling between the new and the old arch. No sooner, however, was this done than a crack appeared in the south-east pier of the tower, which showed an unsuspected weakness in that part. The tower was shored up for Sunday, and the next day Mr. Pearson came down and pronounced that the idea of raising these two arches must be abandoned. He gave directions as to the shoring-up of the tower on that side while the damage to the pier was being repaired. This is now being carried out, and Mr. Pearson has confidence that the pier will ultimately be made very much stronger than ever it has been before.

A New Pulpit of Caen Stone, embellished with three carved figures of Our Lord, St. Peter, and St. Mary Magdalene (the latter being the patron saint of the Church), was presented to the Parish Church of Lillington, near Leamington, at Christmas. The work was executed by Messrs. Jones & Willis.

RECENT PATENTS.
ABSTRACTS OF SPECIFICATIONS.
 13,636, Window Sash Fastener. F. Howcroft.
 A bracket on the upper sash carries a hook which works on a pivot in such a manner that the point projects when the window is closed and prevents the lower sash rising. To open the window the hook is pressed back, but a stop prevents it from going too far.
 14,333, Asphalt Pavements. J. Stanfield.
 The top layer is made of comparatively fine stone shippings, sand, &c., mixed with tar or pitch and creosote or other oil, and is well rolled. The surface is then painted with a mixture of mineral or oak pitch, or both, creosote oil, and finely-powdered alkali or spent gas-lime, or the like, the consistency of this varnish being varied according to the size of the stone to be employed for the final dressing; the varnished surface is entirely covered with stone or other material chosen so as to give any colour desired, larger sizes of stone, if employed, being laid by hand, and the interstices filled with smaller sizes, and is well rolled in order to imbue the dressing in the varnish, any excess of stones being swept off.
 16,734, Slates, Tablets, &c. J. Willoughby.
 Sheets of iron or steel are made suitable for riting upon by oxidising the surface. The sheets are placed in a furnace, and while at a high temperature are subjected to the action of superheated steam or air.
 15,976, Fireplaces. E. R. Hollands.
 In grates where the burning fuel is lifted by a rake passing between the bottom bars and fresh fuel fed beneath it, the bottom front bar is supported by a frame with a horizontal flange round the inside, forming a tray. The frame is supported by a pivot at each end, about which it may swing, in order to close the aperture through which the ash fuel is fed into the grate. It is retained in a close position by a weighted finger, which hinges beneath it as it is lifted, and which, being raised by the poker, allows it to fall into its normal position.
 15,161, Embossing Canvas. W. S. Morton.
 For decorating walls, &c., the canvas, prepared successive steeping in boiling water and size, is then into the pattern upon a mould plate of metal or the like, the deeper cavities in its backing being filled with paper pulp, or similar material. A paper backing pasted and beaten on, covered with sawdust, and pressed. The sawdust is then removed, and the mould placed upon a heated metal castor, again covered with sawdust, and heated until the canvas is dry and ready for use.

Liverpool Engineering Society.—The first ordinary meeting of the twelfth session was held at the Royal Institution, Colquhoun-street, Liverpool, on Wednesday, January 13th, Mr. Coard S. Pain (President) in the chair. A paper was read by Mr. Arthur J. Magnus, M. Inst. N.A., entitled, "A Strange Failure of Steel Boilers." Since the introduction of steel for marine boilers, much has been written and disclosed about the strange freaks of the material, but as far as can be traced no similar cases of failure to those described in the paper have been experienced. The peculiar nature of the failure consisted in the steel plates commencing, in two steamers (after a period of two and a half years' satisfactory working), to crack spontaneously some days after steam had been let down, without exhibiting any special reason for so doing; and as they continued to occur each time the vessel came into port, at one time in the combustion chamber plates, at another time in the furnaces, and so on, it became evident that some change was taking place in the material. Some extensive mechanical and chemical tests were made on strips from the cut-out portion of the plates (given in the appendix to the paper), but as they threw no light on the matter, and the cracks continued to occur, it became a matter for serious consideration whether the boilers, or at least the interiors, must not be condemned, and as no previous cases had occurred, considerable difficulty was experienced in coming to a decision as to what course to take. It was eventually decided to have new boilers altogether, and the wisdom of the step was soon afterwards confirmed, as it was found that the flaws given when cutting off the rivets cracked and broke the shell, furnace-fronts, and other plates in a most unusual and alarming manner. As the failure of the material in these boilers reveals the unpleasant fact that it is possible for steel to be used in a manner which may afterwards become treacherous, notwithstanding the extensive tests and rigid inspections now made, it will be interesting to obtain some satisfactory reason for the unaccountable change which undoubtedly took place, but as mild steel is now generally conceded to have passed beyond the tentative state, the owners of these steamers decided to again have steel boilers, but of the Siemens-Martin manufacture instead of the Bessemer.

The Charterhouse.—At the meeting of the Metropolitan Board of Works on the 15th inst., the Parliamentary Committee presented a report recommending the Board not to petition against the Bill promoted by the Governors of the Charterhouse for the sale or other disposal of the Middlesex estate of the Charterhouse, but in consequence of a letter addressed to the Board by the Holborn District Board calling attention to the Bill, and asking the Board to take such steps as they may think proper to secure the land as an open space or recreation-ground for the use of the public, and forwarding a copy of the report of the Medical Officer of Health for the District on the subject, the matter was referred back to the Committee for further consideration. The Society for the Protection of Ancient Buildings have presented a memorial to the Governors, in which they suggest that the buildings should be utilised as a picture-gallery or some similar purpose, and that the grounds should be thrown open to the public as a place of recreation.

Lectures on Forestry at the City of London College.—Professor Boulger, F.L.S., is in progress of delivering a course of ten lectures at this College on "Forestry," with special reference to the examinations of the Surveyors' Institution. The course commenced on Jan. 13. It is intended to give practical demonstrations in the country during the spring. The syllabus embraces the consideration of climate and trees, land suitable for arboriculture, the drainage and other preparation of the land, nurseries and their management, planting operations, thinning and maintenance, felling and barking, timber measurement, exploitation and management of coppice, the distinctive characters of the various British timber trees, &c.

The Portland Cement Trade.—Messrs. Matheson & Grant's "Engineering Trades Report" for January says that the Portland cement trade, the factories for which are mainly situated in the London district, is in a very depressed condition; both home and foreign orders are much below the average of the last two years, and some of the factories are working short time.

The Surveyors' Institution.—More than 100 candidates have, we are given to understand, sent in their names for this year's examinations. Of this number forty-five are candidates for the studentship of the Institution,—their examination taking place during the present week. The remaining fifty-seven candidates will shortly offer themselves for examination in professional knowledge with the view of qualifying for the Professional Associateship or Fellowship of the Institution. The number of the candidates would have been still larger this year but for the effects of the new rule requiring, as a condition of admission to the examinations, proofs of satisfactory performance of practical and responsible duties in a surveyor's office under the hands of their employers. The whole body of candidates is nearly equally divided between the three branches of land agency, valuing, and building surveying.

The Menzel Exhibition at Berlin.—One of the principal attractions in Berlin, during the past few weeks, has been the exhibition of the works of Herr Menzel, which are now on show in the salons of the Royal Academy of Fine Arts in that capital. The fête commemorative of the seventieth birthday of the artist, in connexion with this exhibition, passed off in the most brilliant manner. The German Emperor sent his felicitations in an autograph letter. The Prince Imperial, the German Chancellor, and several other great dignitaries, as well as all the most eminent representatives of literature and art in Berlin, presented their congratulations in person to the artist, at his private residence. In the evening Herr Menzel dined with the Crown Prince. On the opening day the exhibition was visited by the Crown Prince and Crown Princess, Herr Goslar, the Minister of Education, and likewise representatives of the other Ministries. From Breslau a deputation of the Town Council waited upon Herr Menzel, to present him with the honorary citizenship of that town.

New Water Towers at the Wandsworth County Lunatic Asylum. The fire which took place about two months since at the Surrey County Lunatic Asylum, near Wandsworth Common, has led to the erection of two water-towers, and the laying down of additional water-mains for use in case of future outbreaks of fire. The tower on the east side of the asylum buildings occupies a site about 20 ft. above the ground-level of the several ward blocks, is 22 ft. square at the base, and is 60 ft. in height to the point where it is surmounted by the tank. The tank has a capacity of 22,000 gallons. The tower is faced with stock and red brick, with string-courses and quoins at the angles in blue Staffordshire brick. The tank was designed by Mr. Macknochie, C.E., of the Surrey Commercial Docks, and manufactured by Messrs. Stothart & Pritt, engineers, Bath. The tower on the west side of the buildings is also 22 ft. square, but of less altitude than that on the east side, being 40 ft. in height to the platform level, the extreme height, including the tank, which will hold 10,000 gallons of water, being 52 ft. This tank was constructed by Messrs. Sband & Mason. The water to supply the two tanks will be pumped up from three wells within the ground by engines of 20-h.p. As an additional safeguard in case of fire, seventy-nine hydrants have been laid down, forty-one of these being in the asylum buildings. The whole of the hydrants were supplied by Messrs. Sband & Mason. Two external staircases have also been erected at the main asylum buildings. A new block of buildings has also been erected for the accommodation of an increased number of inmates. Mr. F. Iles, architect to the asylum committee of magistrates, designed the towers and other works, which have been carried out by workmen in the employ of the county authorities, under Mr. Iles's superintendence.

The Inventions Exhibition.—Invention asks:—"Can the statement now put forward in a contemporary be true, that the Inventions Exhibition, though it was not expected to draw so much money as its predecessors, has resulted in a loss so large that the surplus from former exhibitions has been nearly absorbed? The receipts must, after all, have been magnificent, and it is strange news that the last South Kensington show has left so heavy a loss. It would be as well if the accounts were promptly published, and in a more detailed form than those of previous exhibitions."

Sanitary Assurance Association.—Prof. T. Roger Smith, F.R.I.B.A., lectured on "A Damp House" at the Parkes Museum last evening (Wednesday), when there was a large attendance, and Sir Joseph Fayrer, K.C.S.I., President of the Association, presided. Prof. Roger Smith, in his lecture, said that damp was the enemy of the English climate, and pointed to the importance of taking every precaution to keep damp out of our houses. Damp from the soil should be kept back by means of asphalt and other impervious materials in the walls, and, indeed, over the whole area within the walls of the house. He advocated hollow walls, and particularly urged the great importance of using the best materials in house building. In addition to dampness from without there were sources of dampness from within. Tanks of water under floors were objectionable, and a fruitful source of dampness of the worst kind was defective drains. The combustion of gas in any large quantity charged the air with moisture. He recommended any one who had a damp house to leave it, but if that was impossible, then the house should be thoroughly examined, and defects made good in the most thorough way. Any half measures were a mistake. He said, "Shun a damp house; he runs a great risk who lives in it. He does a good work who turns a damp house into a dry one." A most interesting discussion followed, in which Mr. H. Rutherford, barrister-at-law; Mr. E. C. Robins, F.R.I.B.A.; Mr. T. M. Rickman, F.R.I.B.A.; Mr. Thos. Blashill, F.R.I.B.A.; and the Chairman took part, the Chairman remarking that damp was the most fruitful source of disease in India. The meeting terminated at a late hour with votes of thanks to Professor Roger Smith and Sir Joseph Fayrer.

The Aeri Filter.—Under this title a filter patented by Mr. J. Mallie, is being introduced in England by the House Sanitation Company. It is claimed that the Aeri filter not only clarifies the water, but also retains the germs, animalcules or organisms held in suspension therein, whereby the water after passing through the filtering medium will be rendered physiologically pure without being deprived of the salts and air necessary for its digestion. The water in this filter is also in contact with the water of air under pressure which becomes absorbed by and highly aerates the water, and renders it very digestible. The filter is very readily connected to water-supply pipes leading from cisterns. It is easily taken to pieces and refitted, and readily cleaned by plunging in boiling water, and brushing, so as to destroy and remove all dangerous germs or microbes arrested therein, the frequency of cleaning depending on the quantity of water used, and the degree of impurity (usually about two months). The filtering medium is inclosed in a protective transparent, thick glass casing, and is also provided with a safety-valve arranged to shut off the supply in the event of the filter becoming broken, whereby all danger of flooding is avoided, as well as the admixture of unfiltered water. The filtering action operates in an outward direction through the pipe from a cistern containing water under pressure (at least 10 above the level of the filter), percolates through the porous surface to the outside.

Earthenware Cisterns.—Messrs. J. Duckett & Son, of Burnley, inform us that they have succeeded, by a new process which they have patented, in producing earthenware cisterns of a much larger size than have hitherto been made. They have just made, and successfully burned, a cistern of the size of 7 ft. 8 in. by 3 ft. 7 in. by 3 ft. 6 in. The great difficulty in the way of large cisterns of this material to prevent the clay warping and cracking during the burning; and this difficulty the patent state that they have been able to get over the process they employ. If so, the improvement is an important one.

Messrs. Doulton & Co.'s New Building. With reference to a paragraph in our issue (p. 146), referring to certain tenders for installing some premises which had been destroyed by fire, Messrs. Doulton & Co. wish to say that the report which they received from their architects, Messrs. Waring & Nichol was that the firm whose tender was the lowest had made an error in calculation, and required an increased price. Under these circumstances and with the advice of their architects, Messrs. Doulton felt they were at liberty to take a course they might deem advisable.

Science and Art Department.—We have received from Colonel Donnelly the Calendar and General Directory of the Science and Art Department for 1886, published by Eyre & Spottiswoode, from which, at the cost of 1s., a complete statistical statement is to be obtained of the working of this now immense ramification of official artistic instruction all over the kingdom.

Royal Meteorological Society.—The annual general meeting of this Society was held on Wednesday evening at the Institution of Civil Engineers, Mr. R. H. Scott, F.R.S., President, in the chair. The secretary read the report of the council, which stated that the past year had been one of great activity, as the eight committees which had been appointed had met frequently and had done much for the advancement of meteorology. The number of Fellows on the roll of the Society is 537. The President (Mr. R. H. Scott) then gave his retiring address. The officers and council for the ensuing year were then elected, Mr. William Ellis, F.R.S., being the new President.

The F.R.A.S.E. Tunnel Railway was formally opened for passenger traffic on Wednesday last by H.R.H. the Prince of Wales. In the Builder for February 26 last year we gave views of the stations at James-street, Liverpool, and at Birkenhead, both of the buildings having been carried out from the designs of Mr. G. E. Grayson, architect. We will give some further particulars about the new tunnel and railway next week.

Railway Coupling Trials.—The trial of safety couplings promoted by the Amalgamated Society of Railway Servants will (through the kindness of Mr. C. Scotter, General Manager of the London and South-Western Railway) take place at the Nine Elms Goods Yard, London, S.W., on a date yet to be fixed. As the number of wagons placed at the Society's disposal is limited, it is obvious that a selection must be made by the committee entrusted with the arrangements; and in order that this may be done, the Society asks inventors desirous of competing to forward to the office of the Society, not later than January 30th, drawings, specifications, or models of the couplings they desire to have tested. Preference will be given to such as retain the kind of draw-bar hook at present in use.

Paving Apportionments.—At the Worship-street Police-court on Wednesday last, Mr. Hannay gave judgment in a number of apportionments taken out by the Hackney District Board of Works against owners of house property in Amherst-road, Hackney, for the recovery of rates made under an apportionment for paving works, in accordance with the Metropolitan Local Management Act. A very large amount of money was claimed by the complainants, the expenses having been incurred under peculiar circumstances. In the year 1877 certain paving work was executed by the District Board of Works in the road named, and the cost, about 1,000l., was charged on the rates. In consequence of recent decisions of the High Court, the metropolitan vestries had decided that they had been wrong in so charging the costs on the general rates, and these proceedings were taken to recover the rates. Mr. Hannay's decision was to the effect that the Board had in question was a "new street" in the meaning of the Act, and that he was unable to uphold the resolution of the Board that it was a new street, and required paving, and that the Board themselves being fully responsible for the resolution. He considered the orders made for should in justice be made, and accordingly made the orders for payment. He granted a case for the consideration of a Superior Court.

THE INDEX and TITLE-PAGE for Volume XLIX. (July to December, 1885) was given as a supplement with our issue of January 9th.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (Cloth), with Straps, to hold a Month's Numbers, price 2s. each; also

THE FORTY-SIXTH VOLUME of "The Builder" (bound), price Twelve SHILLINGS and Sixpence.

SUBSCRIBER'S VOLUMES, on being sent to the Office, will be bound at a cost of 2s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS.

SIX LINES (about fifty words) or under 4s. 6d.
Each additional line (about ten words) 6s. 6d.

TERMS for Series of Trade Advertisements and artistic Advertisements on front page, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR LINES (about THIRTY words) or under 2s. 6d.
Each additional line (about ten words) 6s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

Stamp must not be sent with advertisement, and strongly recommended that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS.—ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

PERSONS advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent Garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.—"THE BUILDER" is supplied under from the Office to retail in any part of the United Kingdom at the rate of 12s. per annum. To all parts of Europe, America, Australia, and New Zealand, 20s. per annum. For India, China, Ceylon, &c., 25s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

The Water Supply of some Great Cities.

THE pure inland seas and mighty rivers of North America afford to the inhabitants of that quarter of the world an unstinted supply of water, for all purposes of navigation, cultivation, mechanical power, and domestic use.

The Mississippi River alone drains an area of more than ten times the extent of the United Kingdom. The surface of the water of Lake Superior, at a level of 628 ft. above the sea, covers an area larger than that of the whole of Scotland. The length of the inland navigation, from the Straits of Belle Isle to Fond-du-Lac, at the head of Lake Superior, is 2,384 statute miles, and from the same point of starting to Chicago, on Lake Michigan, almost exactly the same distance; while the ocean navigation from Belle Isle to Liverpool measures only 2,234 statute miles. The Ohio River, from which the great city of Cincinnati derives its water supply, has a mean annual flow of 150,000 cubic feet per second, and is 4,000 ft. wide when it falls into the Mississippi, nearly 1,100 miles above the mouth of the latter river. Lake Michigan, on the borders of which has risen the most rapidly-developed of all the great cities of the New World, namely, Chicago, has an area of 23,000 square miles. It is 320 miles long, 100 miles broad, 628 ft. above the level of the sea, and is said to be 100 ft. deep. The Croton River, at a distance of 33 miles above New York, is raised by a dam to a height of 166 ft. above mean-tide level at that city, and its waters, led thence in an aqueduct, flow at a level which provides for the supply of 90 per cent. of the area of that city by gravitation. Thus, whether we regard abundance and purity of water, or natural facilities for its distribution by gravitation, every imaginable form of convenience to the dweller in cities for the supply of his need of this great necessary of life is offered by nature in the United States. Nor is there any part of the surface of the globe in which the skill and perseverance of man have been more efficient in making the best of the gifts of nature.

It is thus of no small interest to the residents of older and more densely-populated countries, especially in those localities where the rapid increase of population has attained such a density that the citizens could not be supplied with enough water from the skies above them, even if every drop that fell over the districts in question could be caught and

stored for use, to ask what the genius of the American engineer has done to supply the need of the urban population of the chief great cities of that continent from the inexhaustible stores of its lakes, rivers, and running and falling waters.

In the United States exist (or existed at the date of the last census) but ten cities of each of which the population exceeds 200,000 souls. In the United Kingdom, excluding the metropolis, there were also, at the date of the last census, only ten cities of each of which the population exceeded 200,000 souls. On the Continent of Europe twenty-four capitals and great seaport towns exceed that population; but neither are the data so well ascertained, nor the conditions so distinctly characteristic, as is the case with the cities of the United States. The 3½ million residents of our ten great centres of population, and chiefly those of the metropolis, who form a yet larger body of water consumers, may well look with interest to the outcome of the experience of 5 millions of townsmen (in 1880, 4,855,000), of kindred race, placed amid the unfailing waters of North America.

Of these great cities, three, viz., New York, Brooklyn, and San Francisco, have laid out in the aggregate about the same sum that has been expended in the London waterworks, in order to obtain the advantage of a supply by gravitation, for an aggregate population little more than half that of London. Boston also depends on gravitation, drawing its supplies from the Sudbury river, and the Lakes Cochituate and Mystic. Philadelphia pumps to reservoirs, from the Schuylkill and the Delaware rivers. Baltimore depends partly on gravitation and partly on pumping, taking its supplies from Jones's Falls and Gunpowder Rivers. St. Louis and New Orleans pump to reservoirs from the Mississippi, as does Cincinnati from the Ohio. And Chicago, as original in its mode of procuring water as in so many other features of its masterly engineering, draws its supply from the pure water of Lake Michigan, through a tunnel of two miles in length under the bed of the lake, fed through a down-pipe at the end in a depth of 32 ft. of water. Alone among these great Western cities, Chicago (owing to its low level) adopts the old-fashioned English mode of pumping to a stand-pipe. Of all the ten cities, the cost at Chicago is the lowest, whether as regards outlay of capital in proportion to the number of inhabitants, or working cost per million of gallons. On the other hand, so freely is the water dispensed in Chicago, that the daily delivery averages 109 gallons per inhabitant. It is of interest to take note of the growth of the city which, so far as present information goes, has

at once the cheapest and the most copious water-supply in the world, although, owing to the liberality with which it is dispensed, the annual cost per inhabitant is higher than that in either New York or Philadelphia.

The population of Chicago, which, in 1830 was seventy persons, became in

1840	4,583
1850	29,963
1860	112,170
1870	285,977
1880	503,185

Language fails to add to the force of these figures. From 1870 to 1880 the increase has been nearly sixty souls per day.

The waterworks of Chicago, as they existed at the date of Sir Charles A. Hartley's visit in 1873, were described by that engineer in a paper communicated to the Institution of Civil Engineers in the following year. It was found, Sir Charles says, by careful borings, that a bed of compact blue clay, at least 100 ft. thick, underlay the thin crust of silt and sand which formed the bottom of the lake. On this bottom, at the distance, as before said, of two miles from the shore, was formed an artificial island to serve as the locality for a shaft at the lakeward end of the tunnel. For this purpose a crib or timber frame, of a pentagonal plan, 90 ft. in diameter, 40 ft. high, and with walls 25 ft. thick, was constructed on shore, towed to the selected spot, and filled, in fifteen prepared compartments, with 6,000 cubic yards of stone to sink it to the bottom of the lake. The top of this structure, when settled into place, stood 5 ft. above the water, and in the centre of the mass was a sort of open well, of about 30 ft. in diameter. Within this framework, which contained 50,000 cubic feet of whole 12-in. timbers, a column of seven cast-iron pipes, of 9 ft. in diameter, and of a total length of 63 ft., was sunk through the clay to 31 ft. below the bottom of the lake. The clay was excavated within as the pipe sank, and the tunnel was started from below to meet that previously commenced from the shore. This gallery is nearly circular in section, being 5 ft. 2 in. in depth, and 5 ft. in width, and consists of two rings of brick in cement, 8 in. thick. It was started from each end, the lake end being commenced eighteen months later than the work from the shore. The land shaft is sunk to 70 ft. below the level of the lake, and 77 ft. below that of the ground, so that the tunnel has a landward fall of 7 ft. in the whole distance. The two excavations met at about one quarter of the distance from the crib to the shore.

Four steam-pumping engines were provided for the service of the city, but at the commencement of 1873 a new double-beam engine was started as a relief. This, which is said to

be the largest pumping-engine in the United States, has two 70-inch steam cylinders with 10-ft. stroke, and works two pumps of 57 in. diameter, delivering 36 millions of gallons of water in twenty-four hours. If worked together with the other engines there is a combined capacity of 75,000,000 gallons per twenty-four hours. A standpipe, 140 ft. above the level of the lake, is protected by a stone tower 170 ft. high. The pumps are considered to force the water to a height of 132 ft., but in the daytime the delivery is said not to rise higher than the second story of the houses. The water is supplied through thirty-eight miles of mains, the largest of which have a diameter of thirty-six inches.

The power of delivering a daily supply of water equal to half of that now demanded by the wants of 4,000,000 of Londoners was not, however, enough to slake the thirst of Chicago. A second intake-shaft and tunnel were in progress at the time of Sir Charles Hartley's visit in 1873, and a land tunnel, 7 ft. in diameter, was pierced for four miles westward of the lake, in order to supply a second set of pumping works to accommodate the extension of the city. By the year 1880, as we learn from Mr. J. J. R. Croes, the author of "Statistical Tables of the Water Works of the United States," the sum of 1,868,000*l.* had been expended on the water-works of Chicago, the annual revenue from water rentals amounted to 206,000*l.*, and a mean quantity of 1093 gallons per head of the population was daily supplied.

With this enormous volume of water, and with the simplicity of arrangement which the unlimited supply and the low level of delivery render possible, it is not matter of wonder that the working cost of water delivery in Chicago is by far the lowest in the world. In the nine years ending in 1872 the cost of delivering a million gallons of water varied from 52*s.* to 32*s.* In 1882 it had fallen to 22*s.* But the revenue of the works amounted, in the last-named year, to 10,267 per million gallons, and the cost per inhabitant, owing to the copious nature of the supply, was 26 per cent. higher than that incurred in the same year by the inhabitants of London.

While Chicago is thus the cheapest of the great cities of the West in the procurement, if not in the sale, of water, the lowest cost per inhabitant occurs in New York. We must, indeed, make exception in favour of San Francisco; but the figures stated with regard to the latter city are in some respects so anomalous that we await the result of inquiries made in the United States on the subject before quoting them to our readers. Of nine of the ten cities, certainly, New York is at the same time the cheapest, and the only one that supplies water at a less rate per inhabitant than the average price in London. Yet the capital laid out on the New York waterworks is 5,84*l.* per inhabitant, while that in Chicago is only 3,73*l.* per inhabitant, and the working cost per million gallons is nearly twice as much in New York as in Chicago, while the revenue is only about 3 per cent. more.

The water supply of New York is provided by the construction of a dam across the valley drained by the Croton River, about six miles from its mouth, which raises the water to a height of 40 ft. above the original level at that point; or to 166 ft. above the mean tide level at New York. From this dam to the Harlem River, which is crossed by an aqueduct containing eight arches each of 80 ft. span, and seven arches each of 50 ft. span, runs an uninterrupted conduit of stone and brick masonry, set in hydraulic cement, of thirty-three miles in length, including a tunnel through rock. The Harlem Aqueduct was built to carry two cast-iron pipes, each 4 ft. in diameter, at the level of 108 feet above mean tide; but a 7½ ft. diameter pipe of boiler plate was laid down in their place. The masonry conduit is continued for two miles from the Harlem Bridge. Then the Manhattan Valley is crossed by syphon pipes, and two miles more of conduit and aqueduct brings the water to the receiving reservoir at New York. This reservoir, formed in two divisions, has an area of 31 acres, and a capacity of 150

millions of imperial gallons. It is connected with a distributing reservoir of an area of 4 acres, a depth of 36 ft., and a capacity of 20 millions of imperial gallons; an additional receiving reservoir of an area of 106 acres, and a capacity of 1,000 million gallons; and a new storage reservoir in the Croton Valley, of three times the last-named capacity, raises the combined capacity of the whole of above indicated reservoirs to 4,570,000,000 gallons. And yet another reservoir in the Croton Valley was in course of preparation, at the time referred to, with a capacity of 3,700,000,000 gallons; the object being, in case of the occurrence of long droughts, to provide for 82 days' consumption of the city, at the rate of 100 gallons per head, irrespective of the minimum daily flow of the Croton River, of 27,000,000 gallons.

For the supply of the higher section of the city, north of the Manhattan valley, a high service reservoir is constructed, into which water is pumped by steam from the aqueduct near Harlem Bridge. And the very highest points are fed from a tank supported on a tower, near the last-named reservoir, at a height of 300 ft. above the sea. In 1882 the ordinary daily consumption of the city was 95,000,000 American, or ordinary wine, gallons of water; and the high service supply amounted to a further quantity of 11,605,630 American gallons. The cost of the works has attained the large figure of 7,000,000*l.*, or 5,84*l.* per inhabitant. The annual revenue was 343,000*l.*; or 5*7s.* per head, and the working cost was 70,000*l.*, or only 1*14s.* per head. The daily supply per inhabitant was 74 imperial gallons.

An instructive comparison of the two opposite methods of supply by gravitation and by direct pumping is afforded by the statistics of the water supply of Chicago and of New York. In the former, where 3,73*l.* per inhabitant has been laid out in the works we have enumerated, the cost of pumping to the height of 132 ft., and of the entire distribution, amounted (for an annual volume of 20,124 millions of gallons) to the incredibly low figure of 1*11s.* per million. In the latter, where one-tenth only of the supply has to be pumped for about the same lift as at Chicago, the working cost for the delivery of 32,425 millions of gallons in the year 1882 was 2,18*l.* per million. The sum of 5,84*l.* per inhabitant had, as before said, been laid out on the works. If we allow the whole price of pumping and distribution at Chicago as an extra charge on the proportion of the New York supply that has to be pumped, we have a cost of 2,07*l.* per million gallons for the working expenses of the gravitation supply, including the maintenance of its large reservoirs, forty miles of aqueduct, and its other works, against a cost of 1*11s.* per million for direct pumping; and this, too, with coal costing 28*s.* per ton.

It is thus evident that it is altogether idle to attempt to prescribe the cheapest method in which the water-supply of any given locality can be effected without due consideration of all the features of the case. It is, of course, clear at the first glance that, other things being equal, it is cheaper to supply water by gravitation than by pumping, independent of the extra strength of pipes and fittings that is required in the latter case. But the cost of the storage works has at the same time to be taken into account; and that both as involving interest on money and cost of maintenance. The interest on the New York gravitation-works, if taken per head of the population supplied, is, as we have shown, to that on the Chicago direct pumping works, as 5,84 to 3,73. But this is not all. The maintenance of these noble works, together with all the other working expenses of supply, raises the working cost at New York to nearly double that at Chicago.

Perhaps the nearest approach to a comparison of the same nature between towns of a certain magnitude in England is afforded by the cases of Worcester and of Plymouth. In the former city the water of the Severn, running through the place, is pumped to a reservoir, at a cost of 7,067 per million gallons. In the latter, from works first constructed in the reign of Queen Elizabeth, the waters penned

up in a mountain valley are conducted through a leet, or open channel, of some twelve miles in length, into reservoirs for distribution, close to Plymouth. The average cost is returned at figures that do not work out to more than 1,41*l.* per million gallons. Here the cost of maintenance is very low, and comparatively little has been done to aid the resources provided by nature herself. With these two localities as instances of the cheapest water-supplies in England may be compared the supply of Kingston-upon-Hull, where the water is drawn from two artesian wells, and pumped into service-reservoirs of a capacity of about two days' supply of the town. Here the working cost comes to 7,34*l.* per million gallons, which is close upon that at Worcester. For the Kent Company, among those of the metropolis, which also relies on pumping from springs, the cost comes to 8,95*l.* per million gallons. It is readily intelligible why cost should be higher in the last case than in the two former; but the comparison tends to show that the cost of our urban supplies is, for the most part, very closely approaching the minimum possible under the physical features of the case. The cost to the consumers, in the exceptionally favourable case of Plymouth according to the figures given in the Return of Urban Water-supply (265, 1879), is at the rate of 7,01*l.* per million gallons, which is a lower figure than that in either of the great cities of the United States. Water is sold by meter at Plymouth for 2*d.* per 1,000 gallons, which is equivalent to 3,33*l.* per million. The rate outside the borough are 50 per cent. higher than within, averaging 3,33 per cent. on the rental. But the question of the amount of rate legally chargeable is always liable to some complication, that any statement of it conveys little information, if compared to the mode of application which we have followed, viz., rate of cost per million gallons, and rate of charge per inhabitant; the two figures being connected with each other by the rate of daily supply. Correcting the population given in the Return of Urban Water Supply by the increase from 1871 to 1879, the cost of water per inhabitant at Plymouth is 2,4 shillings per annum, and the daily supply is 46 gallons per head.

MESSRS. BODLEY & GARNER'S DESIGN FOR LIVERPOOL CATHEDRAL.

WE give this week two of the external views of Messrs. Bodley & Garner's design for the proposed cathedral, that from the north-west, showing the grouping of the whole building in accordance with the great central feature, and that showing the western facade. To these we add the elevation of the east end and the outside of the building, and the plan. Of the interior perspective of the nave, from the crossing, which is the finest and most effective of all the drawings by which the architects have illustrated their design, we gave a reproduction in the *Builder* for January 9th.

The following is the full text of the architects' report, which is a short pamphlet only:—

"In sending the accompanying designs for the new cathedral at Liverpool, we beg to offer the following observations upon them as a report.

The building of a new cathedral for the City of Liverpool offers an architectural opportunity such as has not occurred in England since the erection of St. Paul's Cathedral, in London, in the time of Charles II. We think that no trouble or expense ought to be spared in order to make this present work as great a success as Sir Christopher Wren's noble church is admitted to be. We do not think that, in the abstract, it would be well to adopt a revived Italian style, which was the one almost universally employed in Sir Christopher's time, but we would rather advise the national style, in which our cathedrals, except this one, are erected, and which is so intimately connected with an Englishman's idea of a cathedral. Sir Christopher himself, in almost all his works, and notably at St. Paul's, shows great leaning towards these ideas, and we would rather advise the national style, in these days, would have designed such a work in the English rather than in the Italian manner. How far a proposed site may affect this question shall be considered later.

After the question of style, the plan and general arrangement of the cathedral have to be considered.

Here, again, it will be useful to refer to the Cathedral of St. Paul as the principal cathedral of great size and magnificence which has been built for the Church of England since the Reformation. Although the style of the old English cathedrals seems to us the best to adopt for a new one, yet, in many respects, they are unsuitable as models, on account of the different wants and requirements of the present day. We do not, therefore, advise an unreasoning imitation of their plan or arrangements, but rather an adaptation. In one particular, namely, the large circular space under the dome at the entrance to the choir (so suitable for receiving a large congregation who can easily see and take part in the service), and so convenient, also, for assembling them around and in the immediate neighbourhood of the pulpit, St. Paul's offers an excellent model. Fortunately one of our old English cathedrals shows how this useful feature can be adopted in the national style, and in the octagon at Ely we have the same arrangement, treated most successfully in the English manner, by the celebrated Alen of Walsingham.

This, however, was not a building designed *de novo*, but merely an adaptation of an existing church. In the present case we have the advantage of an entirely new design, and we think that the octagon we propose, with its eight nearly equal arches, would produce an interior effect which has not been obtained, as far as we know, in any cathedral yet erected in the world.

We think that the three spires would make a fine group. Lichfield is the only one of our cathedrals which, at present, possesses them, but they existed at many other English cathedrals two centuries ago, as at Lincoln and elsewhere, and may be considered as having been generally contemplated, if not executed. They could, however, be postponed if funds did not allow of their completion.

We must remark that, in our opinion, solid and massive piers to the nave are essential both to appearance and stability, and that their existence, in our design, should not be considered as a defect, because the use of the aisles, for congregational purposes, is out of the question in a church of this magnitude; and they must be considered as alleys or passages, and places for the reception of monuments, — a most essential part of a modern cathedral. We think it desirable to insist on the absolute necessity of providing a very large space for this purpose, as the number of memorials becomes so greatly increased in the course of ages, that unless there is very considerable room left, the church becomes greatly encumbered and disfigured; as is the case in Westminster Abbey, for instance.

We have kept the instructions to avoid elaborate and minute detail carefully before us; and we trust that the Committee will consider that our design does not err in this direction, the quantity of ornament being inconsiderable, compared with the dimensions of the building, and the size of the ornaments themselves being, in reality, very large. They are, in fact, larger than usual, though the small scale of the drawings makes it impossible to show this clearly. We should be quite willing, however, to simplify the design still further, in execution, if it should be thought desirable. We would, however, draw attention to the fact that the sides of the large and massive buttresses are plain ashlar, and these, of course, do not appear on the elevational drawings. This would give a much greater appearance of solidity and plainness than might be supposed.

With regard to the dimensions of the church, we feel strongly that the cathedral church of so immense and populous, and at the same time so wealthy and important a city as Liverpool, should not be inferior in any way to the church of any other city in the Kingdom. We have, therefore, designed a cathedral of the first class, and its height to the apex of the vaulting, 110 ft., is greater than any other church in England, though, of course, less than many foreign cathedrals. The style we have chosen is that of the early fourteenth century, and is of strictly English character. We cannot but think that the beautiful manner of our English architecture should be employed for this, which will be the most important ecclesiastical building that has been planned for many generations in England.

The general internal arrangements of the church do not seem to call for much remark. We think it essential that a passage should be kept all round the east end on account of visitors to the monuments and cathedral. We have placed the great organ at the west end, where it would be well heard, when played as a musical instrument merely; it might also be used on occasions when a large congregation was gathered in the nave. And a smaller organ, over the stalls, would accompany the choir. This organ would be played from the stalls.

In the planning of vestries, &c., we have indicated the general position and arrangement, but this could of course be modified to suit the practical requirements of the place. We should be happy to confer with the Committee on this point.

We have now to consider the requirements of the site, the nature of which presents a somewhat difficult problem.

On the plan supplied to us by the Committee the space allotted to the cathedral is not, in our opinion, quite sufficient. The church we have designed is, indeed, contained within its limits, and one bay of the nave could be omitted if necessary, but we feel

that it approaches too closely to St. George's Hall, and that it would be most desirable to move it a little westward. The building could be slightly reduced in scale without alteration of the design, and so more space be gained if it is thought desirable. We have indicated this on a suggestive plan for the re-arrangement of the site, and there does not seem to be any difficulty in the way, as there is a large open space in front of the site already, which is now occupied by the weighing-machine. Of course it will be necessary to remove this, as it would not do to have this just at the west doors of the new cathedral. But we think also that the removal of the mean and unsightly modern houses at the west end is merely a question of time, and that a plan for the rearrangement of this portion of the town will form a part of the cathedral scheme. In our present plan, however, we should only require about 25 ft. or 30 ft. more, and this the open space at the west end easily affords us.

Another difficulty consists in the abrupt slope on which the building is to stand. We have arranged the necessary steps under the western porch, thus avoiding the difficulty of a long flight of steps between the carriage-road and the building, which, in wet weather, would be a serious inconvenience. The north transept we have also placed close to the road. We should recommend that an avenue of trees be planted, where we have shown it on plan, and that the rest of the ground be turfed and laid out with shrub, the levels being made out by terraces and steps, which could be made to look very well.

Although we feel the advantages of the present site, and that it would be quite possible successfully to grapple with its difficulties, we think it should be a matter of careful consideration whether another site should not be selected, as the one proposed is certainly very confined. Another objection, and a still stronger one to our minds, is the fact that the cathedral will stand half way up the hill which is crowned by the fine building of St. George's Hall. It will be difficult to give proper prominence to the one building without, in some degree, detracting from the dignity of the other, as they are in such close proximity.

This brings us to the consideration of how far the present site must affect the choice of style. Surrounded as it is by a series of unusually fine buildings of the Classic style, it becomes at once a question how far they should influence the style of the cathedral. We have no doubt at all that, for the reasons stated at the beginning of this report, a new cathedral should be English rather than Italian; but we also think that it is extremely important that the different uses to which the buildings are dedicated should be at once struck at. There is great danger that a group of buildings, arranged as they must be very closely, and designed in the same style, should be confused together. The cathedral must, of course, be the most important in every way, but it would not occupy the place of honour, which is already taken by St. George's Hall; and we think that it would be difficult, if not impossible, to prevent the latter from appearing a part of the former. Of course, the group would, architecturally, be very fine.

With regard to the nature of the material, we should be inclined to advise the use of the local red sandstone for the interior; using some harder stone, such as Dumfries, where required. The exterior would require a stone carefully selected for its properties in resistance to the smoke and chemical action, spoken of in the instructions. We should advise Portland, or one of the best hard stones of the north. This is a matter which ought to be carefully gone into by an examination of the various stones used in Liverpool, in order to ascertain which best resists the action of smoke and weather.

In conclusion, we beg to say that, if entrusted to us, this very important work should have our best attention.

We should be glad to confer with the Committee, and to offer any explanation of the design."

There is less temptation to indulge in *pros* and *cons* about this design than about the last one we illustrated, because the view of the problem adopted by the authors is a very simple and straightforward one, being merely to build a Mediaeval cathedral in pure Mediaeval style, and on the old lines. The only point of novelty in the design is the treatment of the crossing, which is, it is true, adapted from Ely in its main idea, but is novel in regard to the proposal to raise not only a much more lofty lantern, but a tall spire, over the octagon. To do this it has been necessary to occupy the angles of the octagon with very massive piers, which, when the congregation extends beyond the area of the octagon, must very much militate against seeing and hearing over a great part of the space lying outside it in the nave and transepts. In judging of this, however, it is right to bear in mind that the authors distinctly decline to regard the question from a utilitarian point of view. Their object, as is evident from the passage in their report where they justify the massiveness of the nave piers, is to produce a fine Gothic interior, the

aisles not being regarded as for any purpose except as ambulatories, and as a space for the reception of monuments. Looking at the question from what may be called the Mediaeval point of view, this is of course perfectly logical. In another passage, indeed, the authors speak of the old English cathedrals as being unsuitable as models, on account of the different wants and requirements of the present day, and as demanding adaptation rather than imitation. But we must candidly confess that we fail to see where the "adaptation" comes in. Here is a long narrow Mediaeval nave of what may be called the processional type of church; and the octagon at the crossing cannot be called an adaptation, as it has been anticipated at Ely, to which precedent the authors especially refer, in terms which form a curious example of the way in which architecture is regarded now. "Fortunately," they say, "one of our old English cathedrals shows how this useful feature" (the space under the dome in Classic churches) "can be adopted in the national style," referring to the precedent of Ely. We should have thought the word would have been "unfortunately," and that the architects would have regretted, on the principle of *perant qui ante nos nostra dixerunt*, that Alan of Walsingham had been beforehand with them.

Messrs. Bodley & Garner, however, are fully entitled to their claim to have given a new and very fine treatment of Alan of Walsingham's idea. They have, as they say, the advantage of an entirely new building in which to work it out, whereas the octagon design at Ely was a modification of an existing building, not fully prepared in plan and foundation for such a treatment; and they are justified in saying that their central octagon, on eight lofty arches of nearly equal span, will produce an interior effect which has not been obtained in any other cathedral in the world. Some idea of it may be obtained from the interior view referred to, in the *Builder* of the 9th inst., and its construction will be seen when we have space to give the longitudinal section, which we are unable to find room for this week. There is ample verge of strength in the piers for the weight of the immense lantern (90 ft. in diameter to the exterior of the buttresses), and sufficient for the spire over it; but the superposition of the spire is a somewhat bold piece of construction, and would, at all events, require great care and calculation in carrying it out. The constructional spire, of course, starts much lower than the visible spire, — in fact, nearly from the base of the lantern where it clears the roof, but the thrust at the angles there would be very great (unless ties were employed, which is an undesirable way of bandaging up a building), and the mass of the buttresses is relatively rather small. No doubt it could be built, but it looks a little risky. The general outline and proportion of the central lantern and spire we think very fine; and both in this and the western towers the spires rise naturally as the culmination of a pyramidal composition, as we prefer to see them.

In presenting a design such as this, Messrs. Bodley & Garner, of course, put out of consideration the question of suitability to the adjoining buildings. Their idea is to make the cathedral contrast entirely with these; to give a vertical and pyramidal composition rising from among a mass of horizontal buildings. This is a treatment which has its *raison d'être*, and may be regarded as quite open to acceptance; though our own predilection would lean towards a treatment harmonising the structure with its surroundings. Generally the architecture of the design is an able and scholarly representation of the very beautiful phase of English Gothic selected. The interior is the most powerful portion of the design; the exterior, in spite of its great scale, impresses us as rather graceful than powerful. The treatment of the choir internally owes a good deal to suggestions, or more than suggestions, from Lincoln. The architects have shown themselves fully aware of the value of deeply-recessed porches at the entrance, and the detail of these porches, as will be seen in a drawing we will give hereafter, has been

worked out with the perfect knowledge of and feeling for that style of Gothic which might be expected from its designers. The question whether a pure imitation of Mediæval architecture and of a Mediæval cathedral should be adopted on the present occasion depends upon a number of considerations, some of them ecclesiastical rather than architectural, which we have already endeavoured to indicate. Upon purely architectural grounds we cannot but feel, as we said some years ago in regard to Truro Cathedral, that it seems to us a matter for regret that a modern cathedral should be built merely as an imitation of an ancient one, and with no attempt to work out new ideas and materials in a new form. We should be inconsistent with what we have always felt and expressed as to the need for progress and an endeavour after originality in modern architecture, if we adopted any other view; but we say this in full recognition of the admirable way in which the authors of this design have treated it from their own point of view.

We have not thought ourselves in any way called upon, in the remarks we have ventured to make on these three designs for such an important work, to express any decided opinion in favour of the adoption of one or other of them. The committee have an excellent adviser in Mr. Christian, and one whose fairness and impartiality may be depended upon; and, if we have any decided opinion in favour of one more than another, we prefer to leave it to be read between the lines. We have endeavoured to do justice to the fine points in each, and to draw attention to some of the considerations in regard to site, practical suitability, and æsthetic, which appear to us to be of special importance.

NOTES.

Printed in our last number (p. 181) an important report of the Special Purposes and Sanitary Committee of the Metropolitan Board of Works, containing a large number of recommendations with respect to the cleansing and ventilation of sewers. In general scope these recommendations are commendable and likely to be productive of much good if adopted. We say this without unreservedly supporting every detail, but we think it very doubtful whether the local authorities will be able to secure the intelligent co-operation of householders in the way indicated in the fifth paragraph. The report was presented to the Board at its meeting on the 22nd inst., and the Chairman of the Committee (Mr. Alfred Pocock) was proceeding to move its adoption *en bloc*, when one or two members urged that the matters dealt with were of such importance that before the Board sanctioned the recommendations of the Committee the report should be referred to the various vestries and district boards of works for their opinion. After some discussion, it was decided to postpone the consideration of the report for six weeks, so as to give time for eliciting the views of the various local bodies in question. Seeing that these bodies are upwards of forty in number, what chance is there of unanimity of action in regard to such important matters of sanitary administration as those dealt with by the report?

LORD HENNIKER'S Railway Rates Committee has lost no time in discussing the course of action to be taken during the present Session, and will request the President of the Board of Trade to receive a deputation. The intimation conveyed in the Queen's Speech of the intention of the Government to deal with this matter was regarded as satisfactory and encouraging, and it will be interesting to see what success will attend the efforts of the Government to deal with a question which their predecessors have been unable to solve. The same subject occupied the attention of the Nottingham Chamber of Commerce at their meeting last week, when Mr. J. E. Ellis, M.P., while denouncing the Rates and Charges Bills of last year in no measured terms, urged that

Imperial legislation on the subject was imperative. When this matter was about to come before the House twelve months ago it was remarked by the *Times* that the railways had hitherto acted very much according to rule of thumb, but that, on the whole, rough equity had been done. Even if the latter part of this statement be true,—and there are many who would not allow that it is so,—it must still be admitted that such a state of things is not at all satisfactory, and that there is no guarantee for this questionable equity in the present uncertain state of the law. It is certain, however, that the subject is much better understood than at this time last year, and we may look forward to practical results when it is again before the House.

IN another column we report the result of the election of District Surveyor for the Western Division of the City of London, rendered vacant by the death of Mr. Rawlinson Parkinson. The appointment has fallen to Mr. Hugh McLachlan, to whom we offer our congratulations. He had been a candidate of long standing for such an appointment, and on previous occasions had been all but successful. The election which took place on the 22nd inst. was a little more exciting than usual, for it was rumoured that the son of a well-known member of the Board was likely to get the appointment, although this was only his second application. A proposal to vote by ballot on the six candidates selected from the thirty by the preliminary voting was negatived, and the voting proceeded in the usual way. The fact that the candidate in question received the highest number of votes in the preliminary voting was not reassuring, but when the second vote was taken it was evident that the majority of the members of the Board were not about to perpetrate an injustice. From the fact that the favoured candidate who has thus early obtained so good a place in the voting holds the certificate of competency granted by the Institute of Architects, it may be assumed that, technically, he is fully qualified to hold such an appointment, which we hope he may one day obtain; but we trust that the members of the Board will recollect that before this gentleman's turn comes there are other candidates considerably his senior, both in age and in length of candidature (to say nothing of experience) who merit consideration.

THE Plumbers' Company have, as will be seen by a report which appears on another page, succeeded in enlisting the earnest support of the plumbing trade of London in favour of the movement for the registration of all competent plumbers, whether masters or men. Although it is intended that the work of registration shall be confined to the City of London and seven miles round in the first instance (those being the limits imposed upon the action of the Company in its Charter), facilities for registration will be extended to all the large provincial towns with as little delay as may be. Pending the completion of these arrangements, however, it will be competent for plumbers from any part of the United Kingdom to be registered in London upon proof of their fitness. Although the meeting of the trade on Monday last was called at a very inconvenient hour for working men, the operative plumbers of London were well represented, but it was stated that, in consequence of the importance of the question, some of them had to leave their work to attend the meeting, "at the peril of the sack." Representatives from the provinces expressed the eagerness of the provincial plumbers to take part in the movement, and these expressions were repeated at the meeting of the General Council held on Wednesday afternoon, the Lord Mayor in the chair. From the resolutions adopted at both meetings it will be seen that there is some prospect of an early commencement of the work of registration. In the course of Wednesday's proceedings, Mr. Philip Magnus quoted some figures which showed that since this question of registration was mooted by the Plumbers' Company, the number of students of the technology of

plumbing has considerably increased. Mr. Magnus also referred to the excellent work, in the shape of technical education for plumbers, which has been initiated and carried on for some time in Dublin, by Mr. Maguire, of that city. Although the classes established by Mr. Maguire were originally intended solely for the benefit of his own workmen and apprentices, he has, in a very liberal spirit, extended their benefits to other workmen. It is satisfactory to see the masters and men of the plumbing trade vying with each other in promoting sound plumbing,—a branch of building work which, as the Lord Mayor observed, concerns us all, very closely. Mr. George Shaw, the Master of the Plumbers' Company, has succeeded in enlisting the help of many well-known architects and sanitarians in this important movement.

THE question of a name for the new street from Piccadilly-circus to Bloomsbury was discussed at the meeting of the Metropolitan Board of Works on the 22nd inst. The proposal of the Works and General Purposes Committee to call the street "Piccadilly-road" was strongly opposed and ridiculed by some members of the Board, as it deserved to be. Equally absurd was the suggestion to call the new street "Piccadilly-east." It was pointed out that the new street ran north-east from Piccadilly-circus, and that, if any street in the vicinity was to be called "Piccadilly-east," that street was Coventry-street. To both names it was objected that the new street, cutting as it does through somewhat squallid neighbourhoods, had nothing in common with Piccadilly. The name "St. James's avenue" was suggested by Mr. Bonthron, the new representative for St. James's; a better name than this would be "Soho-avenue." Ultimately, the question was referred back to the Committee for further consideration. Now seeing that the Board at the same meeting decided to grant a site for a statue of the late Lord Shaftesbury in the centre of the circus which is to be formed at the intersection of the new street with the new street which is to be made from Tottenham Court-road to Charing-cross, we think, with a correspondent of the *Times*, that the street may well be called "Shaftesbury-avenue." In this way, mean while, will be found for perpetuating the name of the distinguished philanthropist in that of the new street, which, it should be remembered, for part of its length passes through a district (viz., S. Giles's) in which he took great interest.

AN important paper was read before the East India Association, on Wednesday last, by Mr. Henry Stanley Newman, on the subject "Water Storage and Canals in India: How far they are Preventive of Famine." Mr. Harris, the Under-Secretary of State for India, presided, and in his address congratulated Mr. Newman on the exhaustive manner in which he had treated his subject, and in which he himself greatly sympathised, though he was unable to coincide with all the statements made. He added that he considered the lecturer had not appreciated all the difficulties with which the Government of India was beset owing to the limits which were assigned to their borrowing powers, and the jealousy with which the House of Commons viewed expenditure in India, when he attributed to them failure in the vigorous prosecution of irrigating works. It was, of course, the duty of the Secretary of State to exercise a rigid scrutiny of the projects submitted to the Home Government for sanction, and that, rightly or wrongly, could only approve such as in the judgment of the Council appeared likely to advance the interests of the country without unduly adding to the burden of taxation which, in the opinion of those best qualified to judge, had nearly reached its possible limits.

FROM a report which is given in another column, we are glad to see that the Metropolitan Board of Works has at length shown a disposition to recognise the fact that there is a method of building walls with concrete, and to make by-laws to regulate, instead of regarding it as an unwarranted

and illegal proceeding. The determination comes rather late in the day, and seems to have been forced on the Board by the refusal of a magistrate to uphold the action of the Board's officials against a man who had dared to build in concrete,—a case on which we commented at the time.

IN the *Century Magazine* for February Mr. M. G. Van Rensselaer contributes an interesting article on recent architecture in America, illustrated by some very well-executed woodcuts. We recommend it to the notice of readers interested in architecture, professional or lay. There is plenty of evidence in the illustrations of the progress of a desire for originality and picturesqueness in architectural treatment in the States. Suggestions seem to be taken at present from the architecture of all times and countries, not always with the best judgment; but these elements may be harmonised in time into something like a distinct American style. In some cases, as in "Mr. Tiffany's House, Madison-avenue," there seems rather too obvious an effort to pose as "rough" and "picturesque." Certainly no one would imagine this was a town house in an entirely modern city; but it is better than being commonplace, at any rate.

A DISCOVERY of great importance to the chronology of vase-painting has just been made at Athens, and is reported in the *Ἐφημερίς ἀρχαιολογική*. Among some architectural remains, which are certainly of pre-Parthenon date, have been found buried certain fragments of pottery bearing the familiar signatures of the two famous potters, Hieron and Duris. It will be remembered that the vases bearing these signatures have been, so far, found exclusively in Italy. The great interest of the discovery lies, of course, in the fact that it fixes securely the date of the potters. Dr. Klein, in his brilliant essay "Euphronios," dated the whole group of potters connected with Hieron and Duris between 490 and 440 B.C., and here come the fragments themselves to give certainty to his conjecture. The same journal publishes some interesting fragments found in the excavations at Epidaurus. Among them a young warrior; a head, probably of an Amazon, but much damaged; some figures of Nike, which have evidently surmounted acroteria, and, therefore, of great interest in connexion with the question of the Nike of Pæonios; two standing figures of Æsculapius; and a relief of a seated Æsculapius which Dr. Kabbadias (the new inspector of antiquities) thinks is a rough copy of the chryselephantine statue of Æsculapius in the sacred grove at Epidaurus. Pausanias, it will be remembered, saw the statue, and describes it as "seated on a throne, and holding in one hand a staff, and with the other laid on the head of a dragon. A dog is represented at the foot of the statue."

THE Comptoir d'Escompte of Paris is sending M. Thevenet, an engineer, to China, to offer to the Chinese Government, on behalf of a syndicate of bankers, a loan of 800,000,000 fr. for the construction of 2,000 kilometres of railway. The resulting price, of nearly 26,000l. per mile, is about that of an average mile of railway in France, where the gross revenue averages 10·6 per cent. on capital cost. With the dense population of China better results may be expected on well-selected and well-constructed lines.

THE *Bulletin Epigraphique* (v., No. 4) reports the discovery of a long lost relic,—the so-called "stone of St. Thomas of Canterbury." It has turned up suddenly in the sacristy of the Domkirche of Siena. It is a gem about 3 centimètres long and 3 broad, and to it is attached a bit of parchment bearing the words, "De lapide super quem sanguis beati Thomæ Cantuariensis effusus est"; but the odd thing is that the gem itself bears the inscription, "Severi Anicetrum . . . spodium," which stamps the gem as the signet of a Roman oculist; so St. Thomas à Becket only allowed the relic with a second association.

UNDER the rather ambitious title of *Les Lettres et les Arts*, Messrs. Boussod, Valadon, & Co. (the successors of Goupil) publish in Paris a new illustrated review, commencing with the present year, and which includes illustrations, prose articles, poetry, and musical compositions. Among the contributors are M. Edouard Pailleron, who contributes a lively little story of the literary effort of two young "Poètes de Collège," who sent off their first manuscript play for the opinion of the greatest French poet, with the brief address, "Victor Hugo—Ocean" (this was in the poet's Jersey days); M. Ch. Gounod, who writes a very interesting disquisition on sacred and secular music, to accompany an illustration of M. Dubufe's fine diptych picture "La Musique sacrée et la Musique profane"; M. Widor, who contributes a musical setting of a poem of Sully-Prudhomme's; and M. Jules Simon, who writes an interesting and thoughtful article on "Les Logements d'Ouvriers." The review is beautifully printed, with fine type and wide margins,—a "revue de luxe," in fact, but its great merit lies in the illustrations, which in beauty of execution, for work of this kind, could not well be surpassed. The new "Revue" does not aspire, we imagine, to occupy the rank of the more weighty periodicals; but from an artistic point it is a charming publication.

THE "Ereia" states that a new Central Museum is to be begun at once at Athens, and is to be reserved exclusively for such antiquities as are found within the limits of Athens itself and its immediate surroundings. Whether it is proposed in connexion with this new museum entirely to rearrange the already-existing museums, such as the Acropolis Museum and the Patissia Museum, and the collections of the Archaeological Society, is not yet stated. It would obviously be of advantage, both to students and archaeologists, if the distinctly Attic remains could be kept together. It is proposed that the museum should also contain Attic inscriptions and casts of Athenian antiquities in the possession of other nations.

THE Art-Union of London has issued to its subscribers this year, in lieu of the usual plate, a handsome edition of Scott's "Bridal of Triermain" (oblong folio), with fourteen plates, from sketches in black-and-white by Mr. Percy Macquoid, R.I. The illustrations are reproduced in a very effective manner, but we cannot much admire the designs, which strike us as mostly very theatrical in style.

OUR American contemporary, the *American Architect and Building News*, in its issue for January 2, comments on a supposed act of injustice on our part to Messrs. Osgood, the publishers of a portfolio of Mr. Richardson's designs for Harvard University Law Schools, in not giving their name when we mentioned and reproduced some of the designs. It is a mere misconception. We were not aware that it was a publication sent for review by the publishers; we supposed that the architect, Mr. Richardson, had sent us a portfolio of his designs, and we asked his permission to reproduce two or three of them to show what was doing in American architecture, which he gave. Of course any book or publication sent for review by an American publisher would be duly credited to the firm that sends it.

THE collection of new French and Dutch pictures at the Goupil Galleries, in Bond-street, includes an immense picture by Benjamin Constant, covering nearly a whole side wall of the gallery, entitled "Justice in the Harem," and as remarkable for splendid colour and general power as for the sheer brutality of the subject. It represents a heap of more or less naked bodies of women who have been slaughtered, and whose blood lies about the floor of a gorgeous Moorish interior, and trickles into the basin of the fountain in the middle of the floor. For what sort of public are pictures of such hideous subjects,

on such a scale, painted, and who buys them? There are several good works by Bouguereau, among them one, "An Echo from the Deep," a well-nourished nymph kneeling in a sea-cave, and holding a shell to her ear, which as a piece of drawing and painting of the figure, is very fine, but has not a touch of sentiment; Bouguereau seems to reserve all his sentiment for his peasant subjects, and leaves us more realism just where we look for idealism. "Loups-de-Mer" ("Sea-Dogs"), a large interior with figures of seafaring men, by Madame Demont-Breton, is a fine thing, a little in the manner of Israels,—rather too large, however, for its subject. There are one or two good landscapes.

THE so-called "Salon Parisien," which opened its second year's exhibition a few days ago at the gallery in Bond-street, exhibits less ability, and even more vulgarity, than last year, and the promoters have fairly succeeded in degrading art to the level of a "peep-show." The only things we saw there with any pleasure were two water-colour studies by M. Duhufe, junior, for decorative paintings, which are very charming, and worthy to be in better company.

METROPOLITAN RAILWAYS AND OTHER SCHEMES.

THE Bills in Parliament affecting the metropolis are much fewer in number this session than they have been for some years past, and seem to indicate that capitalists are seeking some other means of investment than railway or building schemes. The total number of these Bills is only thirty-one, as compared with fifty-seven last year, and fifty-five in the preceding year.

Three short lines of railway are proposed to be constructed within the metropolis, viz., the Bexley Heath Railway, which is about a mile and a half long, and two new junctions about a quarter of a mile long, near the New Cross Station of the London, Brighton, and South Coast Railway. There are eight new tramways about twenty-two miles long, two of which are proposed to be laid from the Archway Tavern, Holloway, to Finchley, along Highgate Archway. The South Kensington and Knightsbridge and Marble Arch Subway and Knightsbridge Improvement Company propose to construct an underground railway, or, as it is the fashion to call it, a subway, about a mile and a half long from Exhibition-road, South Kensington, under Hyde Park, to Oxford-street, near Park-lane, and to form two short streets near Knightsbridge Barracks.

By the Horse Guards Avenue Bill it is proposed to construct a new street from Whitehall to the Victoria Embankment. The house at the corner of Whitehall-yard, until lately the residence of Lord Carrington, and illustrated in the *Builder* more than a year ago [see vol. xvii., pp. 200-201], is proposed to be removed, and the site thrown into the entrance to the new street, which will be between 89 ft. and 84 ft. wide at its western end, and for the remainder of its length 60 ft. wide. (For a plan of the proposed street see the *Builder* for Dec. 5 last, p. 803.) Power is reserved in this Bill to enable the Metropolitan Board of Works and other public bodies to enter into arrangements for carrying out the whole or any part of the works.

Two small street improvements, for widening Cold Harbour-lane, Camberwell, at its junction with Denmark-hill, and the extension of Manton-road to Rodney-street, New Kent-road, are included in the Metropolitan Board of Works (Various Powers) Bill. The Board also propose by the same Bill to provide a more direct communication between the Victoria Embankment and the Charing-cross foot-bridge by means of a flight of steps adjoining the Charing-cross Station of the Metropolitan Railway.

The Corporation of the City of London propose to convert the Central Fish Market into a market for fruit, flowers, vegetables, fish, meat, poultry, corn, hay, and other produce, and have introduced a Bill into Parliament for that purpose and for enlarging the existing market.

The Southwark and Vauxhall Water Company have re-introduced their Bill for the construction of a new service reservoir at Honor Oak-hill. This Bill passed the Committee of the House of

Lords last Session, but did not reach the second reading in the House of Commons.

A Bill has been deposited for the enlargement of Hampstead Heath by the acquisition of Parliament-hill, Parliament-fields, the Elms, and East Park Estate, comprising an area of about 27½ acres. It is proposed that the land shall be purchased by the Metropolitan Board, and power is given to enable the City and any of the Vestries or District Boards to contribute towards the cost of such purchase.

The Greenwich and Millwall Subway Company propose to take powers to raise further capital and to transfer their undertaking to the Metropolitan Board of Works.

THE SPANISH AND PORTUGUESE SYNAGOGUE, BEVIS MARKS.

At the well-nigh universal celebration which ushered in the 8th of Heshvan, 5645 (on Sunday evening, October 26th, 1884), being the centenary of the late Sir Moses Montefiore, the principal service in London was that which was held by the Rev. Dr. Hermann Adler, delegate Chief Rabbi, and others in the Spanish and Portuguese Synagogue, Bevis Marks.* An elder thereof since 1814, Sir Moses had belonged to this, the Sephardic, congregation for eighty years; and in their temple he was wont to offer up prayer before setting forth upon his several journeys to relieve his brethren abroad. The congregation claims to be the oldest in Great Britain, and to lineally represent the small band of Jews who, led hither by Rabbi Manasseh ben Israel, after his escape to Amsterdam from the Inquisition at Lisbon, were established here under Cromwell's favour (1655). It is on record that the Jews abroad had offered to Cromwell a sum of 500,000*l.* for a safe return, and certain privileges,—the latter to comprise the use of St. Paul's Cathedral for their own place of worship. But since 800,000*l.* was stipulated for, the negotiations fell through. Some writers date their general re-admission from the Restoration. According to their own chronicle the first Portuguese synagogue was built in King street, Duke's place, in 1656,—the existing synagogue was erected in Bevis Marks, and the learned Dr. Nieto appointed Chief Rabbi, in 1701. With an interior more imposing, though less capacious than that of its neighbour, the Great Synagogue,† this structure, whilst possessing no striking architectural beauties, is a pleasing specimen of red Queen Anne style; and is said to contain a beam presented by that sovereign. The fine central candelabra, of old Dutch work, should not be overlooked. Its registers and vestry-room walls carry the names of Disraeli, Ricardo, Bernal, Lopez, Aguilar, and others that have contributed to the making of our history; besides some of purely Jewish note, such as Nieto and Abendano, the Rabbimists, with the Abarbancels who claimed descent from the royal line of David. Amongst the lists of those who have served as *Parnassim* is that of Benjamin Disraeli, with date 5577,—1817 A.D. He was probably Lord Beaconsfield's grandfather. About that time his son, Isaac, succeeded from the congregation, and eventually from the communion, owing to a rupture on this very question of assuming office among the *Parnassim*. The oft-disputed date of his son Benjamin's birth stands in the register under date 1804, which can be taken as deciding the matter. We may here mention that, whilst his reckoning does not quite tally with our own, a correspondent, who should be well informed on this point, tells us that the synagogue is at this date exactly 204 years old.

But the poorer members of this community are gradually driven further eastwards; for their wealthier co-religionists a Spanish and Portuguese synagogue has been provided in (No. 57) Bryanstone-street, Bryanstone-square. It is contemplated to remove the synagogue and schools into the remoter East of London. The trustees,—albeit, so we learn, not unanimously,—have invited tenders for taking the property, either in whole or in portions, on building lease for eighty years from Lady-day next. The premises, being freehold and within the City, include Nos. 10, 11, 13, and 14, Bevis Marks; and Nos. 1, 2 (the girls' and the infants' schools and the almshouses), and 2½ (the

* Mrs. Rachel Prussac, a Jewish lady, aged 103 years, was present.

† Established (1891) in St. James's (prior Duke's) place for German, with whom are now amalgamated the Polish, Jews. The present building dates from 1780.

Jewish baths), Heneage-lane.* Covering an area in all of, say, 20,580 superficial feet, the ground lies north-east by south-west at the angle of Bevis Marks and Heneage-lane (facing an end of Duke-street), with frontages thereto of about 128 ft. and 208 ft. respectively. James-court, opening out of Bury-street, to the south-west, is a *cul-de-sac*, but could be converted into an additional approach; the frontage here is nearly 90 ft. An open courtyard surrounds three sides of the synagogue which, on the fourth side, abuts at right-angles against Heneage-lane. Access is gained thereto by the schools in the lane, and through the gates and cart-way between Nos. 10 and 11, Bevis Marks. We should observe that the City Commissioners of Sewers have agreed to acquire a slip of the now sites in Heneage-lane in order that this thoroughfare may be widened to a uniform width of 24 ft.

SOME LESSONS FROM OLD GLASS.†

It has been contended that to carry the picture, or whatever it may be, across the lights of a window is a practice altogether indefensible. But to confine the design of each separate light within the mullions is, in many cases, to insist either upon subjects on a very small scale, or upon single figures, standing each in its own little niche. Now the standing figure scheme, with its rows of saints ranged in solemn order round the church, is a very satisfactory one, and may, as in the clerestory at Bourges, be even imposing in its effect. It did good service, from first to last, throughout the Gothic period; and will serve for all time. But it is not all-sufficient; and one may surely aspire sometimes to subjects on a similar scale. Such subjects were evolved very naturally out of the forgoing scheme of single figures in separate lights. Two such figures might obviously bear some more particular relation one to another than that of a series of prophets, apostles, evangelists, or what not. They might represent (as they sometimes did) the Virgin and the angel Gabriel; and thus we have, almost as a matter of course, an "Annunciation" subject in two lights. If this chanced to be enclosed in a two-arched canopy, with a central shaft bisected by the intervening mullion, no reasonable objection could be taken to such an extension of the subject.

Very often there was no such obvious acknowledgment of the stonework; but in any really decorative composition the mullion is acknowledged, by the very grouping of the figures and the arrangement of the accessories. It would be hard lines, having once seen what breadth and largeness of style may be gained by over-stepping the limits of a single light, to have to go back to the rigid system of what may be called the separate-cell treatment. The mullion is to be acknowledged, but that is not to say that it is in every case to be emphasized by the glass-painter. It must be remembered, too, that in the actual window the mullion is a much less formidable division than it appears on paper.

The rightness or wrongness of it all lies in the way the thing is done. There are compositions in plenty which are quite unjustifiable as window designs, the work of men who did not care, perhaps who did not know, enough of glass to concern themselves greatly about mullions, any more than they bothered their heads about leads and saddle-bars. But in the hands of men bred up in the exercise of this particular craft, and who had always before them the effect of their design in the glass, it has been shown abundantly possible to produce a window in which the design is carried across a number of lights, and where the effect is not impaired by the mullions,—for the simple reason that they have been duly taken into account. If they do interfere with the design, then the design is in fault. That seems to me the simple test of the fitness of the proceeding. Let those who can distribute their design, whether ornament or figure-subject, over as many lights as they please.

There is one practice of the pictorial glass-painters which seems to me not rashly to be followed. They were in the habit of filling the

window with a picture without any border or margin whatever to separate it from the stonework. Some sort of framing to the subject appears, however, to be absolutely necessary. For the actual mouldings framing the window go for nothing in the effect of the glass; the stonework tells only as shadow; and any design, therefore, which counts upon the masonry to frame it is bound to be disappointing in the glass. There are some windows in the Laurentian Library at Florence, by Giovanni da Udine, which illustrate very forcibly this defect. Relying upon the rather elaborate, canopyleike, stone-framing of the windows he has simply treated the glass as so many panels, which he has painted with his usual grotesques and arabesques, glazed after the manner of the period, quarry-wise. In the drawing of the elevation this was, no doubt, all very well; but the glass has simply the appearance of being unframed.

Some sort of frame is as necessary to it as to a picture,—the nature of that framing is another question. It is in many, if not most instances, desirable that it should have some architectresque character; but that is not to allow that it should be architectural. The over-arching canopy I look upon as a weak device of the architect (I had almost said of the Enemy), either because the artist was compelled by the master-builder to provide some sort of architectural setting to his figures, as in the funny little pent-houses which figure in the earliest glass, or because, as in the stupendous structures in the latest windows, the designer was an architect and must needs find room for architecture even in his glass.

It is a matter almost of course that, in making attempts in a comparatively unaccustomed direction, we should resort to the familiar expedients and devices which have served us so well under other circumstances: see how in her attempts at decoration the lady amateur resorts straightway to drapery, and all manner of derivatives from dress-making and millinery in which she feels herself at home.

The architect, inasmuch as he is an artist, produces something artistically fine, however ill-advised; but his architectural forms in glass are a misapplication as perverse as the flimsy feminine expedient of upholstery in house decoration.

The Early Gothic canopy in glass is to me childish. The Decorated canopy is a misproportioned monster, dwarfing the poor little figures it is supposed to honour. As to the Perpendicular canopy, which more nearly approaches the forms of stonework, or (as in Germany) those of metal-work, it is some times marvellously beautiful in effect, framing jewelled pictures in a setting of silvery white. But this effect is due largely to the quality of the white glass so abundantly employed; at night, I believe, be equally arrived at by the use of ornament of more intrinsic interest and beauty. Certain Renaissance canopies,—soon I remember al. Rouen and some in Italy,—coast practically of arabesque ornament, just sufficiently taking the form of a canopy to be classed under that head. These are as satisfactory, they are unlike the common type of canopy, they are successful, that is to say, in proportion as they are un-architectural.

The huge altar-like structures of the late glass-painters, the finest of which are those of St. Gudeule, are effective at a quite exorbitant expense of light and brilliancy. The men were capable of designing them, could surely have obtained this much, and more, by means less open to objection.

The ready resort to the cheap expedient of the architectural canopy, seems to me to imply not a lack of invention, then at least a disinclination to take the pains to invent.

The framing cartouche of the seventeenth century, again, scarcely commends itself by results in glass. It depends for its force too much upon shadow to be of any great use to the glass-painter.

I would plead for the more abundant use of ornament as a frame for figures,—and, indeed for ornamental design with little or nothing else. I am bound to confess that, apart from any significance or beauty of form in figure work, it is usually more interesting than much ornament,—if only on account of its greater variety and unexpectedness of colour masses: it is so much easier in figure design to keep clear of that monotony in which repeated ornament is perilously inclined to fall. Indeed, the difficulty with figure

* Slow says that Thomas Heneage and Sir Thomas, his son, held, since Bury Abbey was dissolved, the property here, which passed from the Bassetts to the abbots of Bury. Hence Bury's, or Bevis, Marks.

† Continuation of a paper, by Mr. Lewis F. Day, read before the members of the Architectural Association on the 15th inst. See p. 158, ante.

would be rather in observing symmetry of colour, were it needed.

The question arises whether this sameness is as inseparable from purely ornamental design?

I think not. But it is not easy to avoid a certain monotony in ornament pure and simple; and then the economy that is effected by frequent repetition of the same forms is a temptation, not perhaps irresistible, but seldom altogether resisted. Still less easy is it to say shortly how to get variety and interest of colour apart from figure design, which, so far as drawing is concerned, is in many windows thrown away. So far as its meaning is concerned, one might express enough of thought, even without figure-work or with very little of it; and, moreover, we are concerned now with the beauty of glass as it appeals to the eye: its sentimental, historical, or intellectual interest is a thing apart.

Ornament, undoubtedly, has a way of being too ornamental, or, I should say, too formally ornamental. It is difficult so to distribute it that its order shall not be too apparent, its symmetry too exact. The scheme of design that one can take in at a glance is too obvious to arouse any interest. There is nothing in it

tion which, with all its gush about "decorative art," does not in its heart care one single straw about ornament, merely for the sake of economy; and, that being so, the minimum is, of course, to be spent upon it. Figures if possible, good or bad; if not that, then birds and flowers perhaps; but as for ornament, who cares or knows anything about anything? It is so much padding. Yet it seems to me that architects at least, who must know something of it, might more often adopt glass of ornamental character,—not on account of its cheapness, but because, for the price of indifferent figure-design, they could get, if they but took the pains, good ornament; and because, whilst good figure-work is, and must be, exceptional, bad figure-work is even less endurable in the eyes of an artist than bad ornament.

The form of ornament adopted in glass must be, of course, in harmony with the surroundings of the window; but it need not, therefore, be in imitation of any past period. Good Renaissance glass in Gothic churches, and in Gothic windows, too, does not strike us as being out of place. The mistake that is made in modern attempts at "style" is in copying without selection the examples of that style, faults and all. Every vice is condoned by the

myself to such forms. Whatever is convertible into good glass seems to me fully to the purpose. I would glean ideas from whatever country and whatever period they were to be gathered, and take a hint from woodwork, inlay, tapestry, mosaic, embroidery, damask, or whatever else might be suggestive of an effect worth rendering in glass. On the walls are two or three studies in the way of "translation" into glass. There is one showing large pieces of varied ruby glass, framed in white, something after the manner of the marble wall-panelling of Venice. I do not see why we should not take advantage of the beautiful variety of colour which often occurs in a sheet of glass. Another sketch (see lithograph in last week's issue) is based on a somewhat similar idea, in which the central panel of coloured marble is replaced by a patch of red made up of flames and demons,—the kind of thing one would not dream of submitting to a sober "client,"—but it amused me to do it. Then there is a scrap of ornamental glass (fig. 1), taken this time almost literally from old Spanish embroidery.

The adaptation of a panel (fig. 2) by Peter Flötner (designed presumably for engraving on metal) is meant to show how it lends itself to a kind of glazing in which the leads form, as it were, the skeleton of the design, and are lost in it. This kind of thing almost suggests itself, it is so obvious.

There is a certain common kind of modern work based on the same idea, in which the leads are made to form the stems and stalks of rather conventional foliage, with leaves and flowers springing from them. This is in theory so simple that one wonders almost that such was not from the beginning the ordinary basis of ornamental design. But the scheme is not so simple in execution as it seems. There occur, most likely, other leads not forming part of the design, and when some of the glazing lines are meant to count and others not, the result is slightly distracting.

It is, no doubt, possible to invent designs which include all the leads necessary for the purposes of construction; but that is by no means an easy solution of lead-line difficulty. It demands very great cunning in design, and it can be better done by the adoption of purely ornamental forms (such as Flötner used or the Arabs from whom his inspiration was derived) than with floral forms, which leave the designer so much less free.

Time fails to touch on the suggestiveness of Oriental art. There is something very significant in the Arabian treatment of coloured glass, to say nothing of Eastern pottery, metal work, jewellery, and lacquer. The Italians of the fifteenth and sixteenth centuries had the wit to borrow freely from all manner of fabrics introduced into Italy from the East. And it was from thence they derived the idea of geometric tessellated mosaic, the form of which, being also ready-made to the glaziers' hand, they reproduced again very judiciously in glass. (There are instances of this at Assisi and elsewhere.)

But, after all, it was little enough of their energies that the great Italians devoted to the cause of glass-painting. One can imagine very many ways in which nineteenth-century Renaissance windows might be designed, inspired altogether by the work of the fifteenth and sixteenth centuries, and yet in no wise following the lines of the glass-painters of that period, who were more or less off the track of glass-painting,—what they might have done had they known or cared more about glass, but what they certainly did not do.

There, if we seek an ideal, is one worthy of the best of us.

The Chairman (Mr. C. R. Pink, President) in opening the discussion, having referred to the decay of ornamental art, said Mr. Day had several times mentioned the mosaic treatment of glass *versus* painted glass, and there was a great deal to be learned on that point, leading up as it did to the importance of lead outlines in stained glass. With old painted glass, much of the admiration which it evoked was due to the texture and quality of the ancient material. Until lately it was impossible to obtain any with the old texture and quality. In Winchester College Chapel could be seen a fine series of windows, but although, in general design, excellent fac-similes of the antique work, the result was disappointing, and was attributable, he believed, to the want of

Fig. 1.—Translation of Old Embroidery Pattern into Glass.

Fig. 2.—Showing adaptability of a Panel by P. Flötner to Glazing.

to keep up our expectancy. Now in figure-work we are sure to find patches of unforeseen colour which give point and interest to the underlying scheme. The patches of the ornamentist are apt to be mere spots, recurring with irritating frequency and regularity.

A good scheme of colour is usually simple enough as it first occurs to the artist's mind. But he is a very simple artist who lets it too easily be seen in his finished work. It is the business of art to disguise the artifice, so that it takes time and patience to unravel all the secret of the colour whose charm one can feel from the first. And this process of mystification is much more difficult in ornament than in figure design, where the very nature of the subject suggests innumerable deviations from any set scheme of colour. (So also the introduction of coats of arms, and all manner of heraldic devices, is a never-failing source of variety and interest of colour.) But because it is difficult to get variety enough in mere ornament, it does not follow that it may not be done. I am convinced it might very well be done, and would be, if the artist were not always so tightly bound by the consideration of price.

Because ornament can be executed more cheaply than figures, it is adopted by a genera-

stylist, if only it is of the period. And because the Renaissance glass-painter happened not sufficiently to consider the nature of the material he employed, that is taken as an adequate reason why modern glass of Renaissance style should err in like manner. It is not a mere fancy of my own that the forms of a period may be adopted without following always the faulty manner of that period. Renaissance ornament in glass is sometimes glazed in a manner as strictly mosaic as any thirteenth-century glass could be; but this kind of thing is not "typical" enough for your imitator of the sixteenth century. If it is asked, is it then the exceptional instances that we should take for our example? I answer, yes: the best is always exceptional.

For my part, I would glaze up coloured work invariably, of whatever period, much as the early glass-painters did, without ever affecting any of their rudeness. In grisaille, on the other hand, and especially in domestic work, I would, except in very large windows, model my practice more upon the later artists, whilst avoiding their heavy painting and the florid forms of the debased period in which it was their misfortune to live. Because the men of one period borrowed the forms of stone or metal-work I would not on that account restrict

colour and texture in the glass. Now-a-days, however, it was possible to obtain glass of the old texture, and he might instance an excellent example, "shining with shapen shields," which was exhibited at the Health Exhibition, in the small Guildhall of Old London. Mr. Day had given wise advice as to the course of study to be pursued by the decorative artist in stained glass. He had insisted on the importance of cinquecento glass, and had dwelt upon the beautiful windows in St. Gudule, at Brussels. The lecturer had also maintained that much might be learned from decorative art of every kind and date, though that of the sixteenth century was the best on which to base one's work. A great deal had been already done by Mr. Day and others to show that a new departure was possible. As an instance of this he might mention the magnificent St. Cecilia window by Mr. Burne Jones in Christ Church, Oxford, which showed good colour and drawing, with modern feeling, and yet with just the amount of conventionalism required in stained glass. Those who took part in last year's Excursion would also recollect some of Mr. Burne Jones's works at Middleton Cheney, which also showed the possibilities of new departures, though on old lines so far as sound and good.

Mr. William White, F.S.A., proposed a vote of thanks to Mr. Day for his interesting and exhaustive lecture. Mr. Day showed that he had applied his thought to all the details and principles, and the many paradoxes he had laid before them. These paradoxes struck one with great force when the defects and beauties combined in the same windows of the various periods were pointed out. The great leading feature Mr. Day had brought before them was that the exaggeration of fine-art painting in a window was wholly and entirely misapplied. The chief object of stained glass was to give grand effects of colour, but not in the style of fine-art painting, where one studied the picture, rather than enjoyed the satisfaction which good colour imparted. As shown by Mr. Day, he believed there was a large field open for the rising generation, and he hoped that those who took up the work would carry it out upon the lines which had been laid down that evening. It might not be so remunerative as some branches of art, but any one who thoroughly succeeded in painted glass would never find lack of employment so long as there was any feeling of admiration for art.

Mr. Leonard Stokes seconded the vote of thanks, adding that he was a little confused as to Mr. Day's remarks regarding the styles of glass. Most architects followed pretty closely the lines of the old work in the buildings they executed, and should not the same course be pursued in regard to the glass? Mr. Day, however, seemed to think that any style of glass would do in any type of building. He agreed with the lecturer that brilliancy, depth of colour, and transparency were most desirable in glass; the modern stuff was often dull and insipid, but if more white glass was used beautiful silvery effects would be produced, very suitable for our town churches. He had observed that when the sun shone through modern glass it cast its colours on the pavement, whereas the old glass gave no colour. This could be seen very clearly in the Chapter House at York, where all the windows but one were old. When the sun shone through the old windows it simply produced a white or general patch, whereas the new one threw a distinct colouring on the pavement.

Mr. White remarked that in inspecting a Kentish church some twenty-five years ago, he found some antique glass which cast a distinct pattern upon the pavement, although there was none of the colour of the glass itself, but merely a sort of neutral and almost complementary tint.

Mr. A. C. Bulmer Booth understood that the leading-up was the chief element in the labour. He remembered seeing two windows brought from Cairo by Sir Frederick Leighton, which were badly damaged in transit. The design of these windows was of a floral nature, the glass being made up in plaster. The windows were reproduced, and proved very charming, but the main point about them was that the greater portion was plaster, with but a small proportion of glass.

Mr. Stokes inquired whether Mr. Day objected to the use of enamel? He had seen very excellent effects produced in modern glass by its use.

Mr. G. H. Blagrove dealt with the cost of leading. A few years ago he perpetrated some designs in stained glass with patterns burnt in for domestic work, and he was desired to use as little leading as possible, because the proprietor of the house considered that it obstructed the light. He, therefore, had to make his designs in as large pieces as he could manage. In the end the cost was greatly enhanced from the risk incurred in firing the large pieces, so that it far outweighed the labour of leading.

Mr. Hampden W. Pratt remarked that Mr. Day, who was a worker in this as well as in other fields of decoration, had always treated things in a broad light. His desire had been that they should get out of the old grooves, and that as they advanced in decorative matters they might draw lessons from the past, taking advantage of the better means at their disposal to reproduce the old effects. In the last few years there had been a departure from the early archaic character of art, especially in church work. Mr. Day had shown that they could get what was appropriate without having recourse to archaic and crude forms in figure-work.

The vote of thanks was then put, and carried by acclamation. Mr. Day replied, and added that, although he could not pretend to speak precisely as to the question of cost, he could say that if one had money to spend, it would go a long way in glazing. Common painting was as cheap as glazing, and nasty into the bargain; but elaborately glazed work might be done for a sum inconsiderable in the decoration of a church. As to the styles, he must not be supposed to mean that any style of window would do in any style of church. Personally he would confess that style did not trouble him much, and the architect would sometimes please him better if he bothered himself less about it; but that was his own affair. Suppose they set themselves the task of doing as the old fellows would have done? Did they affect any style? Not a bit of it. If they were fourteenth-century men, adding to thirteenth-century churches, they did not attempt to do thirteenth-century work. They took care, however, as every artist naturally would, that what they did should harmonise with the general character of the work added to. With regard to the whiteness of the light coming through, he had wondered whether it was in any way due to refraction as it passed through the old glass, which was riddled with holes and decayed like an oyster-shell. Indeed, old glass was like old wine, a great deal better the longer it was kept. As to the Eastern windows, the Arabs simply pierced small holes in the plaster, and filled in the glass, but, so far as his experience went, it was crude in colour. It was helped by the depth of the setting, but the material was faint and poor. Of course, something could be done with enamelling, but it was dangerous that he thought it better not to recognise it. The root of all evil was the shirking of the lead lines, and the chances were that any man who coquetted with enamel was on his way to the bad.

THE SURVEYORS' INSTITUTION.

PRELIMINARY EXAMINATION 1886.

Of the candidates who presented themselves at the Preliminary Examination of the Institution, held on the 19th and 20th instant, the following satisfied the Examiners:—

Bagot, H. F.	England, W. F.	Michelmors, H.
Bell, J. B.	Elton, C. W. S.	Oakley, J. H.
Bateman, A. C.	Grimes, R. F.	Saunders, C. H.
Bushell, E. J.	Grover, A.	Stainton, F. C.
Booth, G. W.	Haslam, D., jun.	Tilly, H. D.
Bowker, H. W.	Harding, F. A.	Tyler, J. W.
Brady, R. H.	Hawker, C. J.	Watney, D.
Bridgford, L. A.	Jessett, C. E. V.	Watson, R.
Cambridge, W. J.	Lynam, W. V.	Wheeler, C. T. O.
Chapman, G. H.	Martin, H. G.	Wilson, W. E.
Collins, A. C.	Melrose, F.	Wordley, A. G.
Davy, H. T.		

Lambeth.—A handsome brass eagle lectern has just been presented to the Parish Church of St. John, Waterloo-road. It is of Classic design, with richly foliated capital, and chased and engraved pedestal. The bird stands on a ball. The work was carried out by Messrs. Jones & Willis, of London and Birmingham, under the direction of the architect, Mr. Chas. Henman.

* Passed at head of list.

THE REGISTRATION OF PLUMBERS.

A MEETING of the plumbing trade of London, convened by the Court of the Plumbers' Company, was held on Monday afternoon in the Sewers Court at the Guildhall. Mr. George Shaw, the Master of the Plumbers' Company, occupied the chair, there being a large attendance of masters and journeymen.

Mr. W. R. A. Coles (hon. Secretary to the Congress of Plumbers) read the resolutions of the General Council formed to give practical effect to the resolutions of the Conference of Metropolitan and Provincial Plumbers, held on the 31st of July last, with a view to secure greater efficiency of plumbing and draining works in connexion with dwelling-houses. These were published with the report of the Conference, given in the *Builder* for August 8 last, p. 185.

The Chairman congratulated the meeting on having assembled to discuss a subject which was so interesting to all of them, and another step in the movement which commenced in October, 1884. At the previous conference all the chief questions affecting the efficiency of the plumbing trade, and the causes of and remedies for its defects, were discussed. Those meetings were representative of the whole United Kingdom, so that there was a general discussion and expression of opinion before anything was decided upon. The matter had been repeatedly and carefully considered by the Plumbers' Company, and a Council had been elected consisting not only of representatives of the plumbing trade, but of gentlemen associated in sanitary matters, architects, engineers, builders, medical officers, and others. They had felt the necessity of having as many sides of the question represented as possible, and this was the more necessary as the plumbers' craft held very much the same relation to the general trades as the medical profession held to the other professions. Any work unskillfully performed by doctors or plumbers brought in its train evils which they all wished to see lessened, and it was the desire of all plumbers that bad plumbing should cease to exist. They had no merely personal or special trade objects to serve, because that which would be of advantage to the plumbers themselves would also be of advantage to the public. The General Council included also masters and journeymen, and representatives of both Houses of Parliament, as well as the Director of the City and Guilds of London Institute for the Advancement of Technical Education, to which body they must look for help in spreading the benefits of that class of knowledge. With such a Council it was reasonable to look forward to a general uplifting of the plumbers' craft, to the common benefit of its members and of the community at large. The proposed scheme of registration embraced London and seven miles round, but this was not intended to be the limit of its operations, which they hoped eventually to extend throughout the whole length and breadth of the country. An important matter to be decided would be the form of examination to accompany the registration, and which was necessary for securing men qualified to carry out any class of work in connexion with the craft. At present, it was open to any man to undertake the duties of a plumber without giving sufficient evidence of qualification, and that was a state of things not tolerated in any other profession or trade involving the security of the life and health of the public. The Chairman concluded by moving:—

"That the Plumbers' Company open a Register of Plumbers (Masters and Journeymen) on the basis of the resolutions of the General Council."

Mr. Lammas thought there should be a central institution in London, with branches all over the country.

Mr. Webb approved of the principle of registration.

Mr. Soper said he lived in a district in which the New River Company had lately enforced their requirements in connexion with a constant supply. This had led to the removal of a good deal of old work, much of which was of a grossly incompetent character, and this showed the necessity for plumbers being registered.

Mr. Timms was in favour of registration, not only for the protection of the public, but also for the advantage of the workmen themselves. If the tradesmen were registered, it would put an end to the employment of men who called

* See *Builder*, Oct. 4, 1884, p. 472; and Oct. 25, 1885, p. 553.

themselves practical workmen, but who often were not plumbers at all.

Mr. Johnston agreed that there were a lot of "messers" about, though a great many good workmen were to be found. Unfortunately, builders were often satisfied with "low-money" men. He was in favour of registration.

Mr. Lyne, representing the Kensington, Notting-hill, and Chelsea Plumbers' Society, wished to know what sort of examination was proposed? The majority of journeymen plumbers had been educated at the national schools, before the passing of the Compulsory Education Act. Would the examination be both practical and theoretical?

The Chairman replied that it was not desired to have an over-scientific examination. It should be mainly practical, at the same time including certain theories that had been too much lost sight of. It was not expected that men who had made their position, and who had all along been looked upon as good tradesmen, should be subjected to a scientific examination. They would rather look to such men for assistance and counsel in raising the craft to a higher level than it had hitherto reached.

Mr. Lyne complained that the hour of holding the meeting prevented a large number of journeymen from attending.

The Chairman remarked that it was impossible the whole of the trade could be present.

Mr. Lyne also complained of the shortness and want of publicity of the notice of meeting.

Mr. Coles said he had personally sent notices to every firm of plumbers that appeared in the Post-office Directory.

Mr. Firth added that all the Society men of London had received notice and were well represented.

Mr. Shelley (Kingston) said he was one of the sufferers by bad plumbing, and was greatly in favour of registration. He only wished the area could be extended to twelve miles.

Mr. Reekie wished to see all journeymen registered. There had been registration on a small scale, the New River Company having registered master plumbers. (Hissee, and a voice:—"That is a monopoly.") Plumbers had been compared to doctors, who had the authority of the law to help them, and unless the plumbing craft could invoke the same authority registration would not carry much weight with the public. The great difficulty would be the registration of masters.

The Chairman remarked that it was the object of the meeting to get a kind of leverage by which they might eventually secure a power like that now possessed by the medical profession.

The resolution was then agreed to unanimously.

The Chairman next moved,—

"That the names and addresses of Plumbers registered be published weekly during the months of March, April, and May, in the chief technical and daily news papers, and periodically afterwards as the Plumbers' Company may desire."

It would be needless, he said, to have the names registered unless the public were able to refer to some list for properly-qualified plumbers. To do this certain expenses must be incurred, which should be met by those who had the advantage of being enrolled. When once an area was established it would be easy to extend the work throughout the length and breadth of the kingdom.

Mr. Gilbert inquired if a workman were compelled to do low-class work, under an unscrupulous master, might not his certificate be endorsed or even cancelled?

Mr. W. Scott Moncrieff, M.I.C.E., considered the last remark was of so much importance that Mr. Gilbert should submit it in writing to the next Council meeting. Such questions should be carefully considered by the Council, and the difficulties that arose dealt with.

Mr. Thomerson asked if it was intended to include master builders on the register? At the East End they suffered much from small jobbing builders who employed "tinkers."

The Chairman thought there could be no objection to include builders if they were also practical plumbers.

Mr. Lyne.—How many journeymen plumbers are on the Council at the present time?

The Chairman.—Something like eight or ten working-men, but there is no reason why you should not add to their number.

The second resolution was then agreed to.

The Chairman next moved:—

"That four masters and eight journeymen plumbers be chosen from this meeting to assist the General Council

and the Plumbers' Company in preparing a form to be filled up by plumbers applying to be admitted to the Register."

Mr. Lyne asked for the names of the members of the Council.

The Chairman said it was not intended that the Council should be simply composed of plumbers; indeed, it would not be proper that it should be so. Unless there were men of all branches on the Council, they would never secure that public support which they had a right to look for. Plumbers must understand that a one-sided bargain seldom gave universal satisfaction. The Council comprised such names as Earl Fortescue, the Lord Mayor, Dr. Cameron, M.P., Mr. George Godwin, F.R.S., Mr. Ewan Christian (President of the Royal Institute of British Architects), Sir James McCarell Hogg, M.P., Mr. Penrose, Professor Corfield, Dr. Vacher, and Mr. Ernest Hart. These gentlemen had no personal object, but desired to assist in a movement which they believed to be a good one. They were in reality going out of their way somewhat to associate themselves with the scheme in order to make it a success; therefore, it should not be looked at merely from the plumbers' point of view.

Mr. Lyne said he did not object to the names the Chairman had given.

Mr. Webb suggested that delegates of the different societies might be elected hereafter.

Some discussion then ensued, in which Messrs. Reason, P. J. Davies, James Sanders (Newport, Mon.), and others took part, and twenty names were proposed. On being put to the vote, the following twelve gentlemen were elected, viz.,—Messrs. Titmas, Clegg, Sanders, and Hume (masters), and Messrs. Firth, Browning, Stevens, Corawall, Gilbert, Lyne, G. Taylor, and Tarrant (journeymen).

The resolution, with the addition of these names, was agreed to.

The meeting then took into consideration the question of the fees to be payable for registration.

The Chairman remarked that they did not wish more than would cover expenses, but the fees should not be fixed so low as to give an idea that registration was not of some intrinsic value.

Mr. Clarke proposed that journeymen should pay 11. in two instalments, 10s. on registration, and 10s. on receipt of certificate,—and that the masters should pay 5l.

Mr. Webb moved, as an amendment, that the masters pay two guineas, and the men 10s. 6d., with smaller annual payments to be determined by the General Council.

Mr. Weymouth moved that the masters pay one guinea and the journeymen 5s.

Mr. Simpson thought that it would be well to have only a registration fee, as an annual subscription would entail the cost of collection.

The Chairman said it was essential to be in touch with those who held certificates, otherwise they might be misused.

Mr. Lyne considered that 5s. annually for the journeymen should be enough, and unless they derived some advantage it would be too much.

The Chairman said he was much surprised that the advantages of the movement should be valued at so low a figure. If the subscription were reduced to 5s. they would be intimating to the public that the movement was not much appreciated.

A Journeyman, speaking from the back of the room, said he did not think it would be right for the Plumbers' Company to enrich itself at the expense of the poor workmen!

The Chairman said he was utterly astonished at such a remark. Did not the last speaker know that the Plumbers' Company had spent hundreds of pounds in connexion with this movement?

On being put to the meeting, Mr. Webb's amendment was carried, and on being put as a substantive motion it was resolved,—

"That the fees payable for registration shall be 2l. 2s. for master plumbers, and 10s. 6d. for journeymen plumbers."

A vote of thanks to the Chairman closed the proceedings, which had lasted more than two hours.

Mr. S. Stevens Hellyer writes:—"I was at the meeting of the plumbing trade at Guildhall, held to consider the proposed scheme for registering plumbers, and I was prepared to speak upon its value, but finding that there was no lack of speakers to support the movement I was content to remain silent. I hear, however, that in some quarters it was con-

sidered my silence was due to a want of sympathy with the object of the meeting, and in order to remove any such misapprehension I beg to hand you herewith a speech I had prepared for delivery on the occasion, which you may think worth while to insert in your next issue." The MS. in question is as follows:—

I confess that I have but little sympathy with class legislation, holding as I do the opinion that to give exclusive rights and privileges to any body or bodies of men, to the exclusion of others who may be equally, or even more entitled, is injurious to the true interests of the country. But this movement,—the registration of plumbers,—however advantageous it may become to the trade, is absolutely for the country's welfare,—is, in fact, for the good of all, except, perhaps, doctors and grave-diggers; but the latter we need not trouble about, for in stopping their supplies, their own feet are kept out of the grave; and as for the doctors, they have shown, by the great interest they have taken in sanitary matters, that they are willing and generous enough to aid sanitarians and plumbers in making the homes of the people more healthy.

Notwithstanding all that has been said and done in the last eight or ten years to enlighten plumbers generally, and to arouse them to a proper sense of their duty, the trade, though much improved, still remains in a deplorable state, and it is high time that some strongly-constituted authority, like the one now being formed, should come forward in the name of the Law, and say to Ignorance, "So far shalt thou go, and no further"; should say to the men,—ignorance of the science of sanitary plumbing, and but bunglers in its art,—“We will no longer allow you, by your want of knowledge and by your inefficient workmanship, to endanger the health of the community, and bring discredit upon the trade.” And I contend that there is no hardship in this, for “England expects every man to do his duty,”—the plumber as well as the sailor.

Before medical men are allowed to practise upon human life, they have to be duly qualified, and it is only right and proper that plumbers, upon whom the health of the community so much depends, should be equally compelled by law to fully qualify themselves for their duties. The time is now ripe for legislation, and the great hand of the law must be brought to bear upon the men who, dead alike to their own true interests and to the needs of the times, execute works under the name of plumbing which ought to shame even tinkers in the trade. The craft, Phoenix-like, must arise from its dead past and take up its true position, and that is “second to none” in the building trades. So important is this trade, that the health and happiness of our homes are largely dependent upon its workers. We speak of the “ills of life,” but let us complete the sentence and say, “the ills of life are greatly added to by bad plumbing, and had drainage.”

The great hindrance to the growth of sanitary plumbing knowledge is the general plumber,—the man all over the country who professes the knowledge of many trades. As the dancing girl, who has to represent the dances of many nations, withdraws from the public gaze for a moment to change her costume, so instantly reappears in another character, so those men have but to go into their shops to change their aprons and a tool or two, to come out again, now as a painter, and then as a glazier; now as a bell-hanger, and then as a gas-fitter; and, last of all, as a plumber. Such men,—but tinkers in the old system of plumbing,—know little and care less about the new system. Enclosed behind a twenty or thirty years' practice of “How not to do it,” they are not tractable to the new method of “How to do it.” But the movement must advance, and any impediment in the way must be removed, as George Stephenson's railway-engine would have removed the “coo.” Some may say, to this allowing of the inefficient plumber, “It's all very well; but though these men are utterly incompetent to execute sanitary plumbing, they have rights and interests, and must live.” Well, I would rather help than injure them, but others have rights and interests, and equally want to live. And all that is now asked is, that such men, wherever they may be found, shall no longer remain content with themselves,—content with their “rule-of-thumb” requirements,—but shall educate themselves up to the requirements of the age,—shall, in fact, qualify themselves for their duties. And we say that no man who is deficient either in skill in his craft or in the principles on which his work should be done, shall be allowed any longer to write the name of “Sanitary Plumber” on his signboard to mislead the public.

In order to encourage men, and to embrace as large a number as possible in this movement for the registration of plumbers, I would make the portal to its outer court very wide. I would allow any man in the United Kingdom, upon satisfactory proof of his skill in the trade, to become in some way associated with this registration, the ability to do the work being the first great requisite of the journeyman. But even a man, in addition to the ability to do the work, can give intelligent reasons for what he does,—when, in addition to the knowledge of its art, he possesses a fair knowledge of its science, he ought to take a higher grade, to be allowed, as proposed, to use the letters “R.P.”—registered plumber,—at the end of his name, and this might be considered

as the middle court. Then, in order to stimulate the men in the lower grades to larger and fuller studies, and, to elevate the trade generally, there should be a higher grade still,—an inner court,—for the men who, in addition to the knowledge requisite to gain admission to the lower or middle courts, possessed a more complete knowledge of the science of sanitary plumbing; men who can plan and direct the plumbing and draining work of a house in accordance with the principles laid down by the best authorities. And this grade might be distinguished by its members being allowed to use the letters "R.S.P."—registered sanitary plumber. The elevation of the trade to its rightful position is a noble work, worthy the best energies of its best men, worthy the resources of the Plumbers' Company; and every true well-wisher of the craft must wish Mr. Shaw success in his endeavours to establish a system of registration. We must not all see alike on many points, but I think we must all be agreed that the trade wants lifting up, and as registration is to be the lever let each one bring his weight to bear upon it; and then, with such a unity of purpose, it will not belong before the trade is lifted out of its present distrust and ignorance, and made to stand in a position of trust, dignity, and power.

A meeting of the General Council was held on Wednesday afternoon in the Library Committee-room, Guildhall, the Lord Mayor in the chair, when a report embodying the resolutions of the foregoing meeting was presented, and it was resolved that the twelve members nominated by the meeting of the plumbing trade be added to the Council, together with a number of other gentlemen. After considerable discussion, the following resolutions were also agreed to, viz.:

"That the form to be filled up by plumbers applying to be admitted to the Register be settled by the Court of the Plumbers' Company, assisted by three members of the General Council and the members nominated by the Plumbing trade of London."

"That the General Council defer fixing the amount of the annual payment to be made by plumbers admitted to the Register until further information is obtained as to the expenses which the system will involve."

"That the registration, in the provinces, of plumbers, and the organisation of Provincial Boards of Examiners of Plumbing Work, be deferred for future consideration, pending the opening of the system in the London district; but that the extension of the system to the provinces be not long delayed; and that provincial plumbers be allowed to register in London pending the formation of provincial boards for registration."

"That the General Council consider 'the means of increasing the number and efficiency classes of practical instruction for plumbers throughout the country.'"

Another resolution was passed, affirming the desirability of promoting legislation with the view of securing a more efficient examination of plumbers' work in new buildings, and leaving it in the hands of the Council to take such steps in that direction as they might deem advisable.

ARCHITECTURAL SOCIETIES.

Manchester Architectural Association.—At the meeting of this society on the 19th inst., Mr. J. Murgatroyd, Past-President of the Association, addressed the members on the subject of "Fifteenth and Sixteenth Century Architecture in the Valley of the Loire." The address was illustrated by numerous photographs, some of them of large size, showing most beautiful and interesting architectural detail, carving, &c., and also by a few pen-and-ink sketches made on the spot by Mr. Murgatroyd. By means of a map of France to a scale of 30 miles to an inch he pointed out the physical features of this portion of that country, and then rapidly sketched the historical facts connected with England's former close relationship with France, and particularly with Touraine, and described to his audience his route from Paris through Chartres, Le Mans, Tours, Saumur, Chinon, Azay le Rideau, Amboise, Chenonceaux, Blois, Chambord, and the return through Orleans.

Edinburgh Architectural Association.—At the fortnightly meeting of this Association, held on the 21st inst., Mr. G. Washington Browne, President, in the chair, Professor Baldwin Brown read a paper on "Sir Christopher Wren" in the course of which he dwelt on the importance of the work of Wren to the modern student. The Medieval revival had passed, and Wren's churches could now be estimated without prejudice. They had now come to see that there is no salvation in special styles, that all styles were good when used with a right sense of their fitness for the purpose in hand, and that beyond and above all questions of this style or that there were the great universal

* The three members of the Council elected were Mr. Philip Magnus, Mr. Hardcastle, and Mr. Francis Chambers.

truths of art, to which, if their work conformed, it mattered comparatively little in what particular style it was planned. Wren's work was modern, and was done under modern conditions. His buildings had little to aid them in the way of beauty of material or ornament, in associations or surroundings. He worked without the aid of a tradition of style, and without artificially-trained subordinates. His success was due to his own native genius, his sense of grace and of proportion, and his direct, simple, business-like method of work. His life had for modern architects both encouragement and warning,—encouragement, because he did great things under the unpromising conditions which were much the same in their own time as in his; warning, because it was impossible to follow in Wren's footsteps without something of the true artistic spirit of the master.

Dundee Institute of Architecture.—At the meeting of the Dundee Institute of Architecture, Science, and Art held on the 21st inst., Mr. W. Stephenson gave a lecture on "Ancient Egypt and its Monuments." Mr. Jas. Maclaren, President of the Institute, was in the chair.

OBITUARY.

Mr. Henry Masters.—The death is announced of Mr. Henry Masters, architect and surveyor, Bristol, who died at his residence, Meridian-place, Clifton, somewhat suddenly, on the 19th inst., in the 65th year of his age. Mr. Masters devoted a great deal of attention to sanitary subjects.

Mr. David Fraser, the senior partner in the firm of Messrs. J. Fraser & Son, granite merchants and polishers, Aberdeen, died at his residence, Broadford House, Aberdeen, on Sunday last, from a fit of apoplexy. The funeral took place on Thursday, at St. Peter's Cemetery, Aberdeen, being attended by at least 300 of the leading inhabitants and those in the granite trade.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

THE sixteenth half-yearly meeting of the National Association of Master Builders of Great Britain was held on Tuesday, the 26th inst., at the Bell Hotel, Derby, the President, Mr. W. H. Cowlin, in the chair. The report and balance-sheet were read and adopted, the retiring officers being all re-elected.

The report shows that sixty local associations are in connexion with this Association, and that the state of trade throughout the country is in a very depressed condition, intimations of a reduction in wages in several districts being reported.

The meeting was largely attended, representatives being present from London, Liverpool, Manchester, Birmingham, Hull, and other large centres.

In the evening the Derby builders entertained the Council and other friends at dinner, the chair being taken by Mr. Walker, the President of the Derby Builders' Association, who was supported by the Mayor of Derby.

On the following day a large party were, by the kindness of the managers, escorted over the wagon and locomotive works of the Midland Railway Company by Mr. Walker, where a most instructive day was spent.

COMPETITIONS.

Proposed Town-hall, Motherwell, N.B.—At a meeting of the Commissioners on Monday last, a design for the proposed new town-hall, burgh offices, &c., was decided upon. Fourteen architects had been invited to compete, four of whose designs had been laid aside as exceeding the stipulated cost, leaving ten under consideration. The first premium was awarded to Mr. John B. Wilson, A.R.I.B.A., of Bath-street, Glasgow, and it was agreed to adopt his design and instruct him to proceed with the work at once. The second premium of 25*l.* was awarded to Mr. H. B. Steel, of Glasgow; and the third of 10*l.* to Messrs. Wilson & Stewart, also of Glasgow. The adopted design provides a town-hall seated for over 1,200 persons, lesser hall, and concert-room, Burgh Engineer's and Town Clerk's offices, two public offices, committee-rooms, &c., fire-engine store, caretaker's house, &c., the estimated cost being about 6,000*l.*

Proposed Municipal Buildings at Christchurch, New Zealand.—At a special meeting of the

Christchurch City Council, held on the 6th of the design of Mr. S. Hurst Seager, A.R.I.B.A. was selected from amongst those of other competitors for the contemplated Municipal Buildings. Mr. Seager proposes to use terra-cotta very largely in the exterior of the building.

Proposed Baptist Chapel, Egrement, Cheshire. The building committee of the Falkland-road Baptist Church in October last invited five selected architects to submit plans in competition for the proposed new chapel, school, &c., to be erected on the site at the corner of Falkland-road and Brighton-street. On the 8th of December four sets of plans were received. The committee, who were assisted by technical points by Mr. Wm. Parslow, F.R.I.B.A., having carefully examined the designs, decided to award the first place to those bearing the motto "Fides," the author of which proved to be Mr. James S. A. Mercer (Messrs. F. & Holme), Westminster-chambers, Liverpool.

ELECTION OF A DISTRICT SURVEYOR.

At the meeting of the Metropolitan Board of Works, on the 22nd inst., the first business proceeded with after the confirmation of the minutes of the previous meeting was the election of a District Surveyor for the Western Division of the City of London, in the room of Mr. Rawlinson Parkinson, deceased. There were thirty candidates, who were reduced to show of hands to six, viz., Mr. S. F. Clarkson, 23 votes; Mr. W. J. Hardcastle, 29 votes; Mr. H. McLachlan, 33 votes; Mr. M. L. Sandell, 34 votes; Mr. W. L. Spiers, 29 votes; and Mr. H. W. Stock, 32 votes.

A proposal to vote by ballot on these selected candidates was lost. The voting, therefore, proceeded in the usual way, with the following results:—

	Second	Third	Fourth	Fifth	Sixth
	Vote.	Vote.	Vote.	Vote.	Vote.
Clarkson, S. F.	23	19	28	19	1
Hardcastle, W. J.	21	21	22	15	—
McLachlan, H.	39	31	31	31	—
Sandell, M. L.	20	20	18	—	—
Spiers, W. L.	19	—	—	—	—
Stock, H. W.	23	18	—	—	—

Mr. McLachlan was therefore declared to be duly elected, and he tendered his thanks to the Board.

Illustrations.

LIVERPOOL CATHEDRAL.

DESIGN BY MESSRS. BODLEY AND GARNER.

THIS week our lithographic illustration are all devoted to Messrs. Bodley & Garner's design for the proposed Cathedral at Liverpool. They include external views from the north-west and west, and the east and south elevations. In addition we give a plain explanatory article, see p. 190 of this number.

The Forth Bridge.—A testimonial in the form of a handsome gold watch was, on the 21st inst., presented to Mr. P. W. Meik, resident engineer, who has during the last three years represented Sir John Fowler and Mr. Baker on the Forth Bridge Works, this period being the whole time that has been occupied in the construction of the foundations. The presentation took place in the presence of most of the subscribers, including Mr. Arrol and Mr. Phillip partners in the firm of Tancock, Arrol, & Co. (contractors for the bridge). Mr. A. Symon, chief inspector of the works, was deputed to present the watch to Mr. Meik on behalf of the subscribers, and spoke warmly of the reg. which they all felt at the termination of a professional connection with the Forth Bridge Works, and hoped that in his future professional career he would meet with great success, always feel as comfortable about the soundness of the work as he now could about the foundations of the Forth Bridge. Mr. Carey spoke on behalf of the engineer's staff, Mr. Arrol on behalf of the contractor's staff, Mr. Middleton on behalf of the foremen, the latter presenting Mr. Meik with a handsome paper weight made from piece of the foundation rock of the Inch Gar pie. Mr. Meik, in responding, said he had not been on an undertaking where there had been more pleasant relations between those employed than on the Forth Bridge.

* There being a tie here, these two names were voted upon in order to decide which of the two should be retained for further voting. This vote was as follows:—Clarkson, 21; Stock, 16. Mr. Clarkson's name was therefore retained.

THE MERSEY RAILWAY.

We briefly mentioned last week (p. 187) the opening of the Mersey Tunnel and Railway for passenger traffic, and now give a few particulars of the undertaking in addition to those which we gave in our number for March 15, 1884 (p. 365), where the method of executing the work will be found described, together with sections showing the method of draining the tunnel. In addition to the railway tunnel a parallel driftway was driven by the Beaumont boring machine for the purposes of ventilation. This ventilation heading is 2,300 yards in length, and is connected with the railway tunnel in eight different places by means of cross cuts, which, being provided with suitable doors, enable the air to be conducted to the fans from a number of points. The ventilation is effected by means of four Guibal fans, two on the Birkenhead and two on the Liverpool side of the river. One, 30 ft. in diameter, is placed in Hamilton-street, Birkenhead, to ventilate the length of tunnel between the Central or Borough-road Station and Hamilton-square Station, and is throwing 186,000 cubic feet of air per minute. The fan at Shore-road is 40 ft. in diameter by 12 ft. in width on the blades, and this draws the air from the tunnel at the centre of the river through the ventilation heading up to the fan itself. According to the *Liverpool Daily Post*, the principle aimed at in the scheme of ventilation is that fresh air shall enter the stations, and travel inwards in either direction into the tunnel to the respective fans, thus keeping the platforms as free as possible from smoke. The fans at Liverpool are similar to those at Birkenhead. That of 30 ft. in diameter ventilates the portion of the tunnel between James-street and the Central Station, whilst that of 40 ft. draws its air from the tunnel at the centre of the river. The quantity of air thrown by all four fans is about 600,000 cubic feet per minute, so that the entire air of the tunnel is changed every seven minutes. The fans and fan engines have been constructed by Messrs. Walker Brothers, of Wigan. An ingenious improvement has been introduced into these fans, which consists of a A-shaped regulating "shutter," by which the air passes in a continuous current into the chimney instead of intermittently, as formerly the case, thus rendering the fans noiseless.

The deep underground stations at James-street and Hamilton-street (of which illustrations appeared in the *Builder* for Feb. 28, 1885) are connected with the stations at the street level above by large hydraulic lifts, which may in a way be looked upon as vertical branch railways. In each of these stations there are three lifts, each capable of raising 100 passengers at a time, and as the time occupied on the vertical journey will be about one minute, it will be possible when all arrangements are completed, to raise a heavy train-load of 300 passengers from below to the surface in one minute. Each lift consists of an ascending-rope, 20 ft. long, 17 ft. wide, and 8 ft. to 10 ft. high, constructed with handsome panelled sides of teak and American ash, and lantern roof surrounded by mirrors, with a central gas lamp. There are seats on each side for those who care to rest during the short journey. This cage is supported on a very stiff frame of iron girders, riveted to a central forged steel cross, which, at its centre, is fitted to a hollow steel ram, 18 in. diameter, which rises and falls in a very strong hydraulic cylinder, suspended in a boring sunk beneath the tunnel level. The lifts at James-street rise 76 ft. 6 in. and those at Birkenhead 87 ft. 6 in. In a tower at each station, at a height of about 120 ft. above the pavement, a supply-tank, holding 10,000 gallons of water, will be placed, and at a depth of about 60 ft. below the pavement is a waste-tank of similar capacity. When any lift has to ascend, the attendant in the cage, by means of a hand-rope near the door, opens a valve, so that the water pressure from the upper tank presses on the bottom of the 18 in. ram above mentioned, and the lift will then rise rapidly. On reaching the top, it automatically reverses the hand-rope, and comes to rest with perfect quietude, though the total weight in motion, when a lift is fully loaded, is about 28 tons. For descending, the hand-rope is pulled in the opposite direction, and the starting-valve then opens, to allow the ram to force out the water beneath it into the waste-tank above mentioned. All the working parts are made enormously

strong in proportion to the loads upon them, and all connexions are so guarded that if any detail should fail there is something else to take up its duty. The hydraulic pumping machinery is fixed on a floor in a room between the upper and lower looking-hall in each station. In the engine-room at James-street there are three marine boilers, and three pairs of Messrs. Easton & Anderson's patent duplex pumping-engines, each of which is capable of raising 30,000 gallons of water per hour from the waste-tank below to the supply-tank in the tower above. These engines are also so connected that they can supply the lifts direct, either acting in unison with the supply-tank, or without such tank at all. At present they are working direct without any supply tank, as the towers for receiving them are not yet completed. A very ingenious arrangement of interchangeable valves and pipes in the engine-room enables any main pipe, pumping-engine, or lift, to be shut off readily, without disturbing any other part of the whole system. The lifts were severely tested by General Hutchinson, of the Board of Trade, on the 29th of December, with a load equal to about 140 passengers concentrated on one side of each cage, and they stood these tests most satisfactorily, and ascended and descended with the least loads. The whole of these hydraulic appliances have been designed and constructed by Messrs. Easton & Anderson, of London, under the supervision of Messrs. Brunlees & Fox, the engineers of the railway. Mr. Rich, one of the partners in the manufacturers' firm, has devoted the greatest personal attention to the strength and security of every detail, and the work of erection at the stations has been carried out by Mr. C. R. May as their resident representative.

With regard to the Mersey Tunnel itself, we are informed that it is lined with Staffordshire blue bricks, supplied by Mr. Joseph Hamblet, of West Bromwich. The white and other coloured glazed bricks, of which an immense number were used, were all supplied by Mr. J. C. Edwards, of Anston.

Concerning the stations it may be added that all the booking-halls, waiting-rooms, &c., in connexion with the four stations have been laid with patent wood block-flooring, supplied and laid in his preservative composition by Mr. Roger Lowe, of Farnworth, near Bolton. The glass and zinc roofing has all been executed by Mr. T. W. Helliwell, of Brighouse, on his patent systems.

Messrs. Waddell & Son were the general contractors, Mr. Prentice being their resident representative.

NEW BY-LAWS FOR CONCRETE-BUILDING IN THE METROPOLIS.

At the meeting of the Metropolitan Board of Works on the 22nd inst., the Building Act Committee brought up the following report:—

"Your Committee have had under consideration the question of the power of the Board to regulate, by new by-laws, the use of concrete in buildings. Your Committee reported, on the 2nd of October last, the decision of the magistrate, dismissing a summons which had been taken out by the District Surveyor in respect of certain artisans' dwellings in Zee-street, Southwark, and the Board then authorised the Solicitor to give the District Surveyor the necessary legal assistance upon the appeal. Upon further consideration, the Solicitor has thought it inexpedient to proceed with the appeal, and your Committee have had before them the general question of the power of the Board to deal with concrete buildings. The Board has jurisdiction in the matter under the existing by-laws, which were sanctioned in 1879, so far as the foundations of houses and buildings are concerned; but the Solicitor is of opinion that the Board has at present no power to make by-laws as to concrete buildings generally. Your Committee have therefore prepared, in conference with the officers, new by-laws relating to concrete walls, together with clauses as to the duties and remuneration of the District Surveyors in connexion therewith. Printed copies of the proposed by-laws have been forwarded to the members of the Board, and your Committee now submit them for approval, and recommend that they be approved by the Board, and he sent to the Home Secretary for confirmation; also, that a copy of such by-laws, together with notice of the Board's intention to apply for confirmation of the same, be advertised; and that copies of such by-laws and notice be delivered at the office of the Royal Institute of British Architects and of the Institution of Surveyors, as required by the 18th section of the Act."

* For a report of this case see *Builder*, Sept. 19, 1885, p. 429.—Ed.

BRICK-MAKING MACHINERY AND BRICK MANUFACTURE.

This was the subject of a paper by Mr. William Johnson, of Leeds, read at the meeting of the Inventors' Institute on Monday evening last. We extract some portions of it:—

Brick-making machinery may be divided into two distinct classes, the pugging or plastic, the what is called semi-dry, but ought more properly to be called dry process,—and the semi-plastic process. There are some clay that will give most satisfactory results by one of the processes, whereas in the other they will be an entire failure; and the failures which have been experienced with machinery arising from endeavours to work the material by process unsuitable to it.

Brick-making machine manufacturers have invariably confined themselves to one class, and being able to point to every satisfactory result in their anxiety to do business have urged their speciality upon purchasers for whom, on account of the peculiarity of their material, it has been totally unsuitable, and has therefore been a failure.

As a brick-manufacturer by birth, I may say and also having been connected with brick-making in its various branches all my life, I have had an experience of the varying character of clays, and the necessity there is for their having a treatment peculiar to themselves, having witnessed many failures and great losses. I never contemplated myself having a genius for invention until I had a series of continuous losses for the space of seven years in brickwork, which I commenced through the impossibility of getting machinery that would work material profitably. I tried one machine after another, all the best known, and of the most expensive kind, but in each case with the same result,—continued loss. I tried every expedient I could think of, and eventually succeeded, at entirely overcame my difficulties.

I at once cleared the whole of my machinery out regardless of its cost, and replaced it with my own inventions, which, I need not say, has given me an ease of mind to which I had long been a stranger, and also turned my loss upon working into a handsome profit.

The Advantages of the Various Processes.—In the plastic system of brick-making, there are scarcely any kinds of brick-making material which cannot be successfully worked, and where there is any doubt of the success of the other processes, I always advise this. But the cost of production by the dry and the semi-plastic system is 40 per cent. less, which makes it very desirable to adopt one of the latter where the material is favourable, as profit, after all, is the great consideration.

There are comparatively very few clays unsuitable to the dry process, where it is desired to obtain a firm and non-absorbent brick, and indeed this process is fast drying out on account of the porosity and looseness of the brick produced, and must of necessity decline more and more. But the semi-plastic has many advantages over the previous two, the bricks by this process being less porous and stronger, and having a greatly increased breaking strain even over the plastic material, and with the extra recommendation being produced at 40 per cent. less cost labour. Most kinds of clay can be worked this system, and where its advantages understood it must be adopted. The material for it must be naturally dry enough to allow being made into bricks in a stiff and firm condition; the clay, if out of shale, marl, or of a hard refractory nature, must be reduced to a granulated state, or if it be a strong bituminous material it may be prepared by horizontal crushing rollers. Succeeding so as I had with my inventions, I patented it and decided to manufacture and sell them.

I notice first my improvements in plastic brick and tile-making machinery. By a special arrangement of wings or cutters in the ram and the mode by which I provide for tal the backward pressure, I have very considerably reduced the power for driving, I have fully doubled the pugging or kneading power of the machine. I have also acquired the sole control of a patent die, which in kind of clay will insure a perfectly-formed column of clay being delivered. By these improvements the air is thoroughly expelled which accumulates in the clay during work and a well-formed and strong brick is produced. *Semi-Plastic Machinery.*—One of my pat-

is for preparing the clay, and the two others have reference to making and pressing the bricks. In my system for semi-plastic brick-making two machines are used. In the view of two or three persons to whom I have represented these, it has seemed to them a needless complication and waste. My reply to this is, that, as a brick-maker, and having had an experience with all the best machinery in use, my experience has been that in combining the two processes of making and pressing in one machine too much has been attempted and not accomplished, and in ninety per cent. of the machines now at work combining these, a second machine has had to be added for finishing the bricks. It therefore appeared to me an entire and needless waste to complicate a machine which greatly added to the cost in wear and tear, and in working, in order to gain a result which the experience of years had proved to be practically impossible. By "impossible" I mean to produce the desired quality of bricks that would be commercially profitable. The great weight of material to be dealt with for a small result of value is a consideration of much importance. It is easy to make a picture, both on paper and in iron, but the vital question is the amount of profit it will yield; engineers will say that the combination of the two processes is possible in one machine. I allow this, but it will be got at the sacrifice of profit. Therefore, having these facts before me, I started out with the object of accomplishing the result desired by two processes instead of one, and designed a very simple arrangement of machine by which I could form a dense and square brick, which was then passed by the attendant boy within reach of a second machine, which took hold of it and delivered it finished in the best possible form. The brick-making machine is provided with a hopper, into which the ground clay is delivered. The bottom of this hopper constitutes a feed-box, one side of which is formed by a die cylinder, which rotates intermittently. By the action of this cylinder the clay is kept in continual agitation, and is prevented from sticking or clogging. Within the feed-box there works a reciprocating ram, which at each forward stroke forces a portion of clay into a die or mould in the cylinder. The action of filling one mould propels the previously formed brick out of the diametrically opposite mould of the cylinder, and delivers it on a table. The ram is worked from a crank, and is so arranged that its stroke can be regulated to give the exact pressure that is required, according to the nature of the clay under treatment. The crank shaft is driven by a spur wheel and pinion from the first motion shaft, upon which are the pulleys which receive the belt from the engine. The mould cylinder is rotated intermittently by an arm worked by a crank pin on the outside of the main spur wheel. The other end of the arm operates a kind of ratchet wheel, consisting of a pair of discs, between which it rests, and our studs or pegs. For each revolution of the crank shaft the cylinder is turned one-fourth of the revolution. When required by the special nature of the clay, the hopper and feeding-ram arrangements can be substituted by a pugging arrangement for feeding the mould. The brick pressing and briquette machine mainly consists of a very solid powerful hearing standard, which supports a balance lever beam, which is alternately lifted and depressed by connecting-rod from the crank-shaft. The short end of the lever works a ram die, which is kept vertical by travelling in a grooved head on the face of the standard connected with the lever by a simple parallel motion gear. In this manner an enormous leverage with least friction is obtained. The ram comes down on mould in the centre of a planed table; the pressed brick is then raised from the die by a lever worked from a cam on the crank-shaft, and is then pushed forward by an arm which operated by an eccentric on the same shaft. The pressure can be increased or reduced at will to suit all kinds of clay in an arrangement of detached plates being slid underneath the mould heads. The labour or attendants attend three hoes to these machines, one attend the hopper, keeping it full of the mud clay, one to pass the bricks to the second machine, and one to load the bricks as delivered out the second machine on to the row or wagon to be taken direct to the kiln. Some slight alterations I adapt the pressing chine for making bricks by the dry process. There has hitherto been a great prejudice

against bricks made by machinery for fire-resisting purposes, on account of their being too close and compact; but I believe that with my improvements this objection is fully met,—that I can retain the openness or light compactness of the brick, which is thought to be necessary for resisting intense heat. Only recently a patent has been taken out for the manufacturing slate *débris* into bricks for building purposes, which promises to give considerable commercial value to an article that hitherto has only been an expensive encumbrance to the slate-quarrying trade. This material makes up into a most dense brick, with a crushing strain of double the weight of one made from ordinary clay, and is, therefore, specially adapted for engineering purposes. The bricks, so far, have been made by the dry process, but it fails to bring out the advantages which this material gives for the purpose of brick-making. The patent semi-plastic machinery is specially calculated to meet this difficulty, and at the same time reduce the actual cost of their manufacture very considerably.

There is also an important manufacture which I believe is destined to expand and grow year by year. I refer to the manufacture of white and coloured glazed bricks; these have been made, so far, by hand-labour only. The reason assigned for this is that the quality requires to be so high, that it is impossible to obtain it other than by the most careful hand-work. I am satisfied that with the improvements I have introduced, this work can be done equally well, and at fully one-tenth of the cost of hand-labour in forming the brick.

Bricks enter so largely into our most important enterprises, these employed in their production are so large a community, and there is such a large amount of capital invested in their production, that I claim for bricks an interest equal, if not exceeding, that of many of the subjects which engage the attention of thoughtful men.

IS A TIMBER STAGE A BUILDING?

Messrs. ALLEN & SONS, builders and contractors, of Palmerston-road, Kilburn, appeared before Mr. De Rutzen, at the Marylebone Police-court last week, on an adjourned summons taken out by Mr. Thos. Blashill, District Surveyor for Hampstead, for, in or about July, 1885, not enclosing a timber-stack with walls or brick or other incombustible material.

Mr. Blashill conducted his own case; and Mr. T. C. Earle defended.

Mr. Blashill said the defendant had erected a building of two stories in height for the stacking of timber. The erection was about 72 ft. by 32 ft., and had a number of posts fixed into the ground. The first-floor was of wooden joists, and the floor-boards properly tied. The cover or roof had on it zinc with rolls, and, in fact, had all the appearance of the roof of an ordinary building. The question was whether or not the structure was a building within the meaning of the Act? He contended that it was, because there was everything which would constitute a building, except that it had no walls.

In cross-examination, the complainant said it was true that he called the structure a timber-stack in his notice to the defendant, but he now called it a building.

The Magistrate asked, if all the timber was removed from the structure, would that which was left be a building?

To which Mr. Blashill replied that it was an ordinary place with ordinary roof.

Mr. Earle, in addressing the Magistrate on the case, submitted that there was no distinction between this case and other cases where it had been held that a timber-stack was not a building within the meaning of the Act, and that the matter of there being a roof did not affect the question at issue. He then cited the case of *Harris v. Pinner*, in deciding which Mr. Justice Chitty was reported to have said that "any ordinary person with a reasonable knowledge of the English language would not interpret the words in the Act to mean an erection known as a timber-stage." He contended that the Act should be interpreted in its largest sense, such as Mr. Justice Chitty had interpreted it. The Act did not give any definition of what was a building, and therefore he urged that the words of the Act should be understood in their ordinary sense, and, were that done, he was certain that no person would venture to call Messrs. Allen's timber-stack a building.

The Magistrate said he regarded the case as one of some importance to the public, and he would therefore hear Mr. Blashill again on the subject.

The complainant then said that he relied upon the wording of the Act, that a building must be enclosed by walls. The structure in question was, in every sense, a building, with floors and roof, and, in fact, complete in every way except that it was

without walls. It was no ordinary skeleton structure. Referring to the zinc cover, he contended that it was similar in every respect to an ordinary roof with rolls and hips, and was not originally made for storing on, to which purpose it had latterly been turned to account.

Mr. Earle then called Mr. J. Allen, the defendant, who said he intended when putting the structure up to store hard woods, such as oak and mahogany, on the zinc roof. He had already put some up, and intended putting more there. The object of stacking timber was to dry it by the air having full play on it in a covered place, but were walls to be put up and the air kept out his (defendant's) object would be frustrated, and the stack would be useless. As to the floor being covered with boards, that was only done for the convenience of the workmen going round stacking the material, and to prevent their falling through the joists.

In giving his decision, Mr. De Rutzen remarked that he had once before given a decision on the subject of timber-stacks and although there was a difference between that and this case, still it helped him on the present occasion. Looking at the case before Mr. Justice Chitty, and having regard to the scope of the Building Act and the Prescription Act, he should hold that the erection in question was not a building, and the summons would be dismissed. The matter was of some public importance, and he should be glad to grant a case for appeal if one was asked for.

THE EXAMINATION IN ARCHITECTURE.

SIR,—I have no intention of entering into a personal controversy with Professor Kerr, and therefore am content to leave the observations in his letter of last week [p. 182] unnoticed; but the interests of intending candidates render it necessary that the misleading statement, "nearly a hundred hooks are catalogued as representing part of the reading required," should not be allowed so to pass without comment.

In the application paper to be sent in by each candidate he is required to select one period with the architecture of which he will be expected to show a thorough acquaintance; the "list of selected books" is intended to enable him to ascertain the best and most accessible standard works on that particular subject, to the study of one or more of which he will then apply himself. Thus, should he select Greek, his attention would be directed to Stuart and Revett, Wilkins, Cockerell, Penrose, &c. Should he have preferred a Medieval period, he would select from the list under that head books as would best satisfy his requirements, and obviously would not need to trouble himself about the others further than from such as may be accessible to him to acquire such knowledge of the other styles as may be desirable.

The Examination is intended as a test of the knowledge the candidate may possess of the professional subjects set out in the programme; the sources from which that knowledge has been obtained may be widely various, and, from whatever source obtained, a reasonable acquaintance therewith will carry the candidate through.

Although the wider range of study indicated by the "advice" is most desirable, candidates whose chief source of book knowledge has been "Gwillt's Encyclopædia" have passed creditably, and have expressed their appreciation of the "list of selected books" as useful for guidance in their future studies, rightly considering that passing the Examination was not the conclusion, but rather the commencement of earnest study.

The limit of age for admission to the Institute is, according to the Charter, twenty-one years, but it is not expected that many candidates will offer themselves at that age. In paragraph 1 of the "Regulations and Programme," the candidate is recommended not to enter himself for examination under the age of twenty-three years. Some have come forward before this age,—even soon after attaining twenty-one years,—and passed well, but at twenty-three the Examination should be passed with comparative ease.

Different opinions are held as to the expediency of publishing the examination papers, some thinking such a course as likely to mislead rather than to assist; as the subject has been under consideration, and some course will probably be adopted which will be satisfactory to future candidates.

I may take this opportunity to express my regret that steps have not as yet been taken to establish a preliminary examination for younger students (such as existed in connexion with the Voluntary Examination). Its necessity is be-

gining to be admitted; its consideration will, I hope, at no distant day, come before the Council, and a scheme be submitted for adoption by the Institute. Then, following this, student classes connected with the Institute, and under the guidance of the Architectural Association, and of local societies, could be formed in London and the provincial centres; the young pupil at his entry into the profession, whether in London or the provinces, would be brought into direct relation with the Institute, and follow the course of study prescribed by it, which would lead naturally from student to "Associate," and then, in due time, to "Fellow."

The Institute would thus surely bring within its influence and enrol among its members the great body of the profession throughout the country. It would soon become really the Institute of British Architects, and the status of the profession would be materially improved.

With reference to my letter in your issue of the 16th inst., I can only repeat the offer therein made, and assure intending candidates that whatever reasonable assistance and advice it may be in my power to afford to them will at all times be freely given, and with much pleasure.

ARTHUR CATES.
7, Whitehall-yard, S.W., January 25, 1886.

SIR,—It is with great surprise that I read in your issue of last week a letter on this subject from one whose name is familiar to most students in architecture, and who, presumably, in his professional capacity, is interested in their welfare.

My surprise is the greater when I recollect that but a few weeks ago Professor Kerr so ably championed the cause of the younger members of the profession during the consideration of the new Charter of the Institute, thereby winning their gratitude, which I, for one, sincerely hope is not misplaced.

The ingracious language of the letter towards the action of one who has for so long identified himself with the educational works of the Institute seems to me singularly inopportune, for, however opinions may differ as to Mr. Cates's line of action, I think none who know anything of him, either in public or private, will question the unselfish and, indeed, generous spirit of the offer made by him as a member of the Examining Board.

That the advice of a successful professional man is valued, is evidenced by the fact that several young fellows have already, to my knowledge, consulted Mr. Cates on the Examining question since the publication of his letter, and my advice to others is that they should do the same.

There having been of late a very general wail in all parts of the country on the discursiveness of the ordinary architectural education, surely any advice from one having wide experience, and who is constantly meeting professional men with the most varied practice, should be welcomed rather than repelled.

I hardly like to suggest that Professor Kerr fears there may be here an encroachment on the special functions of the professor in the Chair of Architecture at King's College, and a certain jealousy as the source of his complaint, but it seems to me the policy of the Examining Board, as criticised, is merely a side issue.

Professor Kerr comments on the number of books recommended for study. These, it will be found, are classified under different heads, and as to certain subjects but one section is taken up by the candidates at the examinations, the number is at once reduced materially. Surely, anyone will see the utility of a wide selection of books, when the loan collections are limited, and, to many, certain of the more costly standard works almost inaccessible.

I, for one, would wish Professor Kerr more enjoyment at the stances of the Charter Committee, but cannot help thinking that if he evinces the same spirit on those occasions as he does in his letter, the rest of the Committee cannot sit on a "bed of roses."

FRANCIS HOOPER.
No. 1A, Craig's-court, London.

"PLUMBERS AND PARLIAMENT."

SIR,—Your correspondent "F. M." [p. 182] will see from the letter addressed to the Plumbers' Company, written at my suggestion by Mr. Henshaw, that the sneer he has been pleased to use at the Central Association of Master Builders was quite uncalled for.

The Association watches with the keenest interest all questions likely to affect the trade, but does not consider it wise, for the sake of superficial effect, to dabble in a noisy and ostentatious manner in matters which are being dealt with by others.

If representatives from this Association can co-operate usefully with the Plumbers' Company in accomplishing an improvement in that particular branch of the building trade, which

I think they can, we shall be happy to do so, but if the Company are indifferent to any help we can afford, I think, speaking for myself, that is no valid reason for our opposing one of the old City Guilds from exercising their proper vocation and setting a good example to the other guilds to do likewise.

Whether their seeking legislative interference is wise or not is, to my mind, a very moot question. I should have imagined that they can, as a guild, render all the assistance that the trade needs in the way of examination and granting certificates without power from Parliament.

It is obvious that now the public are so keenly alive to sanitation they will recognise the importance of having properly-qualified workmen to carry out the most important part of sanitary work.

From the tenour of Mr. Shaw's letter in your issue of the 16th inst., I infer that the communication of our Secretary has been overlooked. Whether that he so or not, he will see, from the tone of the correspondence which has taken place on the subject, how desirable it is that the inconvenience pointed out by the "C. A. M. B." should be considered and provided for in any new arrangements which may be agreed upon.

F. J. DOVE,
President of the Central Association of Master Builders of London.

SIR,—Your correspondent, "F. M.," asks a very pertinent question. "Why do not the Masters' Association take up the matter of the hours worked by the plumbers?"

I would point out to him that the Association is hampered by two parties who would combine to frustrate its efforts. I find on inquiry that on Nov. 23rd, 1874, after much arrangement and negotiation, a conference was held, at which, however, only two representatives of the plumbing trade attended, to discuss the hours worked by plumbers, arising out of a strike. A torrid discussion it was found that no action could be taken, through the unwillingness of the master plumbers to disturb the relations, although then strained, existing between them and the men. In fact, a courteous, but so decidedly firm, opposition was shown to take any steps at all, that the matter was dropped.

With regard to Mr. Shaw's letter, I cordially agree with him in a desire to increase the efficiency of the plumbers' trade, for it must be admitted that there is plenty of room for it. It is strange that this very virtuous resolve on his part has been delayed so long; but still more strange,—in fact, it is a coincidence,—that the strengthening of the Company by a large influx of working plumbers (I suppose to make it look more representative), this alliance with experts and architects, should be simultaneous with a growing practice on the part of architects to make plumbers' work, in builders' contracts, a provisional amount, the result being that some architects employ their own plumbers, and the British public has to pay accordingly for the privilege. Not having seen Mr. Shaw's scheme, I cannot, of course, "recognise" "his object." I dare say it is a very good one, and I would ask him to take us into his confidence, and to divulge what it is.

Mr. Henshaw's letter answers Mr. Shaw's remarks as to his desire to co-operate with the builders. I would only remark that I have made inquiries, and can find that only the late Master of the Tylers and Bricklayers' Company was invited to a dinner, not to the conference.

C. A. M. B.

SEWAGE PURIFICATION

SIR,—Chemists, Engineers, Sanitary Authorities, and all those who are engaged upon the science of sewage treatment, as well as the general public, should feel indebted to Dr. C. Thresh for his excellent article published in your journal [p. 115, ante] on "Sewage Purification."

The four tests and general formula laid down by him are exceedingly to the point, and I am desirous of endorsing his views, namely, that all therein demanded must be satisfactorily met by any method of sewage treatment, or it is quite unworthy of adoption.

As Public Analyst for the Borough of Guildford, I believe I am reliably informed when I state that no real and serious idea of adopting Mr. Conder's process was ever entertained by the authorities of that town. I am very glad that Dr. Thresh has taken upon himself to publish the particulars of the trials made, seeing that so much was claimed and so little done. Articles appeared in various organs enlarging upon the wonderful discovery made by Mr.

Our correspondent will be able to inform himself on the subject if he will read the report of the plumbers' conference which appears on another page.—Ed.

Conder, that small quantities of ferrous sulphate produce marvellous effects upon sewage, and it would appear from them that all those who are now labouring in this field of research may cease to work, and consider the great problem as completely solved by that gentleman.

ARTHUR ANGELL, Ph.D., F.I.C., &c.

TIMBER MEASUREMENT.

SIR,—I thank "Godalming" and Mr. Staines for their letters [p. 143, ante]. But I am not quite sure that all timber measurers know so much about the subject as they do. If I had found it so, I should probably not have troubled you with a letter. Certainly, one to whom I showed my calculation (put as clearly as possible), replied, "It can't be done so. The content is 75 ft. 11 in." (i.e., according to his tables).

Another, steward to a large estate, replied, "I am very pleased with Hoppus's measurement of timber. These seemed to me to show ignorance of the subject."

A gentleman connected with H.M. dockyard said, "We never measure asp." Of course he spoke only of oak; but Hoppus's tables are for all timbers therefore, it is not asp he deducts 20 per cent. "Godalming," in his first letter [p. 137, ante], shows how Hoppus may have been led into the mistake; but I think it would have been more creditable to a compiler of tables if he had tested carefully, before assuming, that a rough-and-ready rule which has been proved false for a rectangle held good a circle. To use it seems that Hoppus was a blockhead. "Godalming" reminds me that the called quart bottles hold only a pint and a half. I remember public attention being called to this fact some years since, and I often now see bottles stamped "Imperial quart," so that the public see if they keep their eyes open.

I agree with Mr. Staines that Mr. Hoppus's measure is a fair mean between the gross content and the squared timber; but Hoppus does not use this, and I see no reason to think he meant. Besides, why do we want a mean? In such a matter, let us have either one thing or the other, and not the mean, which is neither.

Hoppus's rough measure might do in the days when the crowning test of arithmetical knowledge was "Godalming" tells us; but surely it is not suited for an age when many a Board school can show its inaccuracy. It is quite as convenient to use tables founded on truth as on error.

Of course, the trade may know that Hoppus gives 20 per cent. under the actual content, and is value accordingly; and if correct tables were substituted for the present ones, prices might have to be adjusted; but it seems to me that it would be more satisfactory both to buyer and seller to do this than to continue to deal on a false system of measurement, which ought long since to have been given up.

J. WARDLAW.
* This letter was sent too late for appearance in our last issue.

British Archaeological Association.

the meeting held on the 20th inst., Mr. G. Wright, F.S.A., in the chair, several interesting objects of antiquity were exhibited, various members, among which may be named a series of drawings of Moulton Church, Northants, by Mr. E. Law, showing recently discovered window, apparently Saxon date, over the arcade of the nave aisle, which is of early thirteenth-century work, the window having existed previously an older wall. Foundations have been discovered of a still earlier church which had a 14 ft. wide and a chance. Mr. Loftus Br. F.S.A., pointed out that the present church of the existing church still occupied the same position as that of the first small church erected on the site. While the building has been rebuilt several times and greatly enlarged, the position of this arch had never been altered. The first paper was by Mr. Sver Cuming, F.R.S., on the old traders' signs in Westminster Hall. For fully a century and a half the signs were employed as a sort of bazaar, the signs being rented by booksellers, law stationers, sempstresses. The danger of such an occupation was pointed out, the magnificent hall has barely escaped destruction in consequence, and on February 20th, 1630-1, it was actually destroyed by the burning of the little shops. Reference was made to many old authors, and quotations relating to the sale of wares were quoted, the anomaly of these sales close to the Courts of Law being dwelt upon. There is a drawing by Gravelot, about 1735, which shows the arrangement of the courts being at the end of the Hall, and a line of shops or stalls on each side. The second paper was on the History of the Church at Barnack, communicated in notes by the late Rev. — Haig to Rev. Canon Argles. Both papers were read by Mr. W. De Gray Birch, F.S.A.

The Student's Column.

FOUNDATIONS.—V.

WHEN a building of considerable weight has to be erected on a site that is known to be, to some extent, unsound, the whole site is sometimes covered with concrete, and that is usually an effectual precaution. But there is a case in which a large building that was erected upon a bed of concrete 5 ft. thick has gone over rather considerably, owing, as it seems, to the greater thickness, or perhaps the greater softness, under one side of the site, of the marshy subsoil on which the whole building stands. Such cases show the utility of examining the soil under several parts of a site; and, as it is impossible to calculate the extent to which such settlements may go, it is best where great irregularity exists to sink through such a soil to something that is more solid and reliable. When a building leans to a considerable extent the question whether it is dangerous or not is one for those who know the nature of the subsoil and are familiar with the effects produced by such irregularities as have been indicated. The existence of these irregularities is generally a matter of notoriety locally, but an acquaintance with geology renders one better able to judge of this matter with such help.

A soft subsoil underlying a thin layer of hard former soil occurs where the silt or mud of a former lake or estuary has become covered with a bed of clay. This bed will, according to its thickness, support a building of more or less weight, and this can best be judged of by reference to other buildings in such a locality. Where the clay is 4 ft. or 5 ft. in thickness a very considerable weight may be placed upon it, so long as the surface is not cut into or disturbed. In some places it is the practice to refrain from removing even the turf from such a site, the brickwork or concrete being put directly upon it, as evidently appears to have been done in beginning the walls of many of our old churches. An instance of failure is usually more instructive than one which has resulted in success. An architect who was building, for the first time, on such a site, being determined to form his foundation in the manner to which he was accustomed, ordered nearly or quite through the stiff upper stratum in order to make the trenches for concrete. As the walls and piers of his church rose they sank down more or less according to their weight, so that wide cracks appeared at their junctions. The bed of clay actually existing would have carried such a building very well, though it would not have carried a heavy tower, for which a more solid foundation would have had to be found below the bed of silt by piling or otherwise.

When a tower or other structure unusually heavy is part of the same undertaking with a building of ordinary size, and the nature of the ground is such that the foundations for the two structures must be made in different ways, they should be built separately, even if they must be in close contact, in which case they should not be united until they have had time to settle, each to the extent due to its weight and foundation; but it is better to build the tower of a church or the chimney of a factory quite clear of the lower building when the soil is of such limited capacity for support. In the parts of Italy the campaniles, or bell-towers, were usually placed at some distance from the churches, and the same arrangement has been carried out in this country, in both ancient and modern times, though not always for the reason above named.

In the construction of large chimney-shafts extensive works are commonly undertaken in order to provide foundations, unless they can be built on the solid rock. Concrete beds of such dimensions as 30 ft. in diameter and 5 ft. or 6 ft. in thickness are provided with the object of spreading the weight and also diminishing the risk of inequalities in the subsoil. But where serious inequality exists the site is unfit for a building of this kind, as no means exist for precisely calculating the effect of such inequality, or can the evil that may result be remedied with any degree of certainty. One of the most serious disasters of recent times was due to the sinking of a large chimney partly over the disused shaft of a mine which had been filled up, at without the use of sufficient means, otherwise to render the whole area of the foundations uniform.

An architect who is at liberty to exercise his

own judgment will, by choice, avoid placing a tall building upon a soft or irregular site, and will spread his design over a wide area rather than get the required accommodation by means of several stories. If that could always be done there would be but little art in the formation of foundations. The great use of such art is found in dealing with problems that are difficult, and are imposed upon us by a masterful necessity. Yet it may be said of the use of concrete on such soils and for such purposes as come within the experience of architects that the matter is well within the powers of any one who will take reasonable trouble and use good ordinary judgment. With all that may be laid down as to the proper composition of concrete and its proper application, it is very rarely indeed that an instance of failure occurs in a foundation that has been designed and carried out on the system in everyday use. It may be strongly suspected that, where the concrete is sufficient in quantity, but of very bad composition, its sufficiency as a foundation is due to a principle altogether different from that which is aimed at by us when we try to make a trench of concrete act as a rigid bar fitted to and carried by the bottom soil.

A trench of sand formed in a very soft or spongy foundation will, in such a position, be a better support than a bed of solid concrete, for the effect of it is to spread the weight of a wall over the sides as well as upon the bottom of the trench. It is necessary, however, that the soil shall be so retentive as to prevent the escape of the sand from the trench. The sand acts under these conditions very much like a fluid. Some notion may be formed of its effects by recalling to mind the accidents that occasionally happen through the muzzle of a gun getting stopped with a little sandy earth, when it is made to burst upon being fired, owing to the pressure of the soil against the inside of the barrel, instead of being forced directly out of the muzzle. The same thing may be studied experimentally by burying in loose sand any small disk with a string attached to its centre, and noting the force that is required to draw it up owing to the pressure being exercised, not only on the sand immediately above, but upon an inverted cone of sand spreading out as it rises upwards from the disk. The same principle has been applied in making foundations in soft ground by driving down in many places under the walls a model of a pile and then carefully withdrawing it and filling the cavity with clean sand. Though there is no reason to doubt the result of these operations, they are probably never actually brought into use in this country, but we may see by their means how concrete, which might be so very slightly cemented as to crush, would, in its disintegrated condition, act by pressure on the sides of the trench. Indeed, there is no doubt that a trench or a bed of clean gravel would, in proportion to the roundness and smoothness of its materials, act in the same way as a trench or bed of sand. It would, however, be well that any one trying this experiment should try it with a building of some capacity for accommodating itself, as a timber-framed building would do, to any slight movement in the sand or gravel, while it was gradually settling down tight into the trench.

Separate Sewage Systems.—At the Parkes Museum of Hygiene, Margaret-street, Regent-street, on the 21st inst., Mr. R. F. Grantham, M.I.C.E., delivered a lecture on "The Working of the Separate Sewage System." The chair was occupied by Professor W. A. Corfield, M.A., M.D. (Oxon), who briefly introduced Mr. Grantham. The lecturer commenced by referring to the opinion expressed by Sir Joseph Bazalgette in 1865, in a paper on "The main drainage of London," in which he objected to the theory of separation of rain water as impracticable in the case of London. While, having regard to the opinion held at that time, and to the general knowledge of the subject, it was impossible to deny the soundness of the reasoning upon which the present system of sewerage London was more than twenty years ago carried out, yet the system of separating the rain water from the sewage has been steadily gaining ground, until the Royal Commissioners on Metropolitan Sewage Discharge, impressed with the difficulties of the complete carrying out of the separation theory, advised that some middle course might have been found.

MEETINGS.

SATURDAY, JANUARY 30.

St. Paul's Ecclesiastical Society.—Annual meeting. 2-30 p.m.

MONDAY, FEBRUARY 1.

Royal Institute of British Architects.—(1) Announcement of Royal Gold Medalist. (2) Mr. Wyatt Papworth on "The late Professor Donaldson's connexion with the Institute." (3) A short Memoir of the late Professor Donaldson will be read by Mr. E. A. Grainger. 8 p.m.

Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "The Principles of Bas-Relief as observed in the best age of Greece." 8 p.m.

Society of Engineers.—Inaugural address by the President, Mr. P. F. Nursory. 7-30 p.m.

Society of Arts (Lectures).—Professor H. S. Hale Shaw on "The Mechanical Applications of Friction." 8 p.m.

Architectural Section of the Philosophical Society of Glasgow.—Mr. James Cairns on "The Planning and Sanitary Requirements of Farm Steadings." 8 p.m.

TUESDAY, FEBRUARY 2.

Society of Biblical Archaeology.—Mr. I. W. Simpson on "The Tower of Babel and the Birs Nimrod Suggestions as to the Origin of the Mesopotamian Tower Temples." 8 p.m.

Royal Institution.—Mr. E. Stuart Poole on "Nauclatis." II. 3 p.m.

Institution of Civil Engineers.—Discussion on Mr. C. E. Stoney's paper on "The Injurious Effect of a Blue Heat on Steel and Iron." 8 p.m.

WEDNESDAY, FEBRUARY 3.

Society of Arts.—Mr. George Simonds on "Artistic Bronze Casting." 8 p.m.

British Archaeological Association.—The Rev. C. Collier on "The Excavations now in progress at Winchester Cathedral." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting. 8-30 p.m.

Institution of Civil Engineers of Ireland.—Mr. W. E. Maguire on "Technical Education for Artisans." 8 p.m.

THURSDAY, FEBRUARY 4.

Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "The Later History of Bas-Relief in Greece." 8 p.m.

Institution of Mechanical Engineers.—Annual General Meeting: "Description of Tensile Tests of Iron and Steel Bars, by the late Mr. P. D. Bennett, of Tipton." 7-30 p.m.

Society for the Encouragement of the Fine Arts.—Professor Kerr on "The Art of Sculpture of the Day." 8 p.m.

Parkes Museum of Hygiene.—Dr. G. A. Heron, on "How it is shown that living things cause some of the diseases of man." 8 p.m.

Royal Archaeological Institute.—The Rev. J. R. Boyle on "The Crypt of St. Wilfrid's Church, Ripon." 4 p.m.

Edinburgh Architectural Association.—Mr. Frank W. Simon on "Wood Carving, with special reference to Germany." 8-30 p.m.

FRIDAY, FEBRUARY 5.

University College.—Professor C. T. Newton, C.B., on "Greek Inscriptions." III. 4 p.m.

Royal Institution.—Mr. T. Fridgin Teale on "The Principles of Domestic Fireplace Construction." 8 p.m.

Institution of Mechanical Engineers.—Annual General Meeting continued. 7-30 p.m.

SATURDAY, FEBRUARY 6.

Association of Public Sanitary Inspectors.—Mr. T. Buckworth on "The Sale of Food and Drugs Acts." 6 p.m.

Election of an Associate of the Royal Academy.—At a general assembly of the Royal Academy, held on Wednesday evening, Mr. J. Seymour Lucas, painter, was elected an Associate.

Miscellanea.

Panama Canal.—The Paris correspondent of the *Times* informs us that M. de Lesseps has started off, with a staff of delegates from the principal chambers of commerce, engineers, and secretaries, to examine into the present state of the Panama Canal works, and place himself in a position to reply to the criticisms that have been made upon it. We fear there is little doubt that things have been represented in too *couleur de rose* a manner; but M. de Lesseps is of a sanguine temperament, and perhaps has been himself deceived in his calculations. At all events we shall be very glad to hear that he is able to refute his adversaries. M. de Lesseps is now eighty, and informed the *Times* correspondent that he "could not die before opening his second canal," and we are very much disposed to believe him.

St. Paul's Ecclesiastical Society.—In the seventh annual report of this society, to be presented at the annual meeting to-day (Saturday, Jan. 30) the council congratulate the members upon the position and prospects of the society. Ten meetings have been held at the Chapter House since the last report, and the following papers have been read:—By Mr. H. Rounnie Gough, on "Some Ecclesiastical Antiquities, English, Irish, Scotch, and Welsh"; by Mr. Arthur Taylor, on "The History of Stained Glass"; by Mr. Charles Browne, on "The Ecclesiology of the Roman Catacombs"; by Mr. Somers Clarke, on "Some Churches of North Germany"; by Mr. E. F. Loftus Brock, entitled "Some Notes on London Churches"; by Mr. G. H. Birch, on "The Ecclesiology of Paris"; by Mr. W. H. St. John Hope, on "Medieval Chaises and Patens"; by the Rev. C. L. Acland, on "The most remote Church of Great Britain"; by Mr. Spenser Nottingham, on "The Common-sense Use of the Church's Plain-Song"; and by Mr. H. Rounnie Gough, entitled, "An Architect's Views on Modern Church Building." The following afternoon visits were made during the year:—To the churches of St. Giles, Cripplegate, and St. Sepulchre, Snow-hill, where papers were read by Mr. G. H. Birch; to Merton Abbey, and the Churches of Merton and Morden, under the guidance of Mr. Arthur J. Style; to the old and new parish churches of Chelsea, and to Chelsea Hospital Chapel, which were described by Mr. Somers Clarke; to Chaldon, where Mr. J. G. Waller read a paper on the Wall-painting, and Merstham, where Major Heales read a paper; and to Hester and Cookham, under the guidance of Mr. Montague Hepworth. Excursions were also made to Chichester, where Mr. Gordon M. Hills received the members, and acted as guide; and to Peterborough, where the Rev. W. D. Sweeting conducted. The balance-sheet shows the financial position of the society to be satisfactory. There are now 329 members on the register.

A New Metropolitan Police-Station.—A new police-station has just been erected in Trinity-road, Upper Tooting. The building has a frontage to Trinity-road 58 ft. in length, with a return frontage in St. Nichol's-road 54 ft. long. It is faced with red brick and Mansfield stone, and contains three floors. The apartments on the ground-floor consist of the inspector's office and private rooms, the charge-room, writing-room, waiting-room, and cells. The first floor contains the officers' day-room, mess-room, and dormitories for unmarried members of the force, the second floor also containing similar dormitories and bath-rooms. The building and exercise-yard occupy an area of about 10,000 ft. Mr. John Bntler, architect to the Metropolitan Police authorities, designed the buildings; Messrs. Carless & Co., of Richmond, being the contractors, and Mr. John Roberts general foreman of the works.

Wrought-iron Casements and Frames.—Messrs. Burt & Potts, of York-street, Westminster, have sent us their new illustrated catalogue of the excellent wrought-iron casements and frames manufactured by them. These casements are absolutely water-tight, and have stood the test of long experience. Section No. 9 may be particularly recommended. The catalogue will be found very useful for reference both by architects and builders.

Paving.—The tender of Wilkes's Patent Metallic Paving Company has been accepted by the Great Eastern Railway for paving the whole of the platforms at their Norwich Thorpe Station, upwards of 5,000 square yards in extent.

The Local Government Board and "the Mortlake Scheme."—The inhabitants and owners of property in the district of Kew Gardens and the neighbourhood have sent a memorial to the Local Government Board urging it to refuse its sanction to the sewage scheme which the Richmond Vestry and the Rural Sanitary Authority of Richmond are promoting for the drainage of the parishes of Richmond, Kew, Barnes, Mortlake, and Petersham. Objection is taken principally to the site, known as the "Mortlake Site," of the proposed sewage works, and, as the memorial sets forth, on the following grounds:—"1. The establishment of sewage works in the immediate vicinity of a large and rapidly-growing residential district, covered to a great extent by houses of considerable value, would become a great nuisance, and considerably depreciate the value of property. 2. That the proposed site is, owing to the nature of the land, from the best opinion that the petitioners have been able to obtain, altogether unsuited for sewage works. 3. That owing to the proposed works being only a quarter of a mile from Kew-gardens Railway Station, the popularity of the gardens will diminish, and the pleasure of many thousands of visitors will be seriously affected if the proposed works are erected. 4. That the selected site for the sewage works is identical with that which Parliament has rejected. 5. That several alternative, better, and less costly schemes have been prepared for dealing with the sewage, which are not open to the serious objections of the scheme selected by the Richmond Vestry. 6. The site selected for the sewage works by the Richmond Vestry is one adjoining a most attractive part of the river Thames, which, if the works were established, would be irretrievably injured." Notwithstanding the opposition which the announcement of the adoption of the scheme has aroused, the Richmond Vestry has resolved to proceed with the matter; and a Local Government inquiry will be held, at which not only the representatives of the inhabitants of the above-mentioned districts, but counsel for the Duke of Devonshire, one of the owners adjoining the site, will be present to oppose it.

An "Immense" Granite Slab.—America is, as everybody knows, the land of "big" things, and every day, almost, we hear of fresh marvels of bigness. As our contemporary *Iron* remarks, it can be "no easy task to separate from the main ledge a slab of granite 354 ft. long, 3 ft. to 4 ft. thick, and 11 ft. wide. But this, it appears, has been accomplished at the Flynt Granite Quarries, Monson, Massachusetts, and by the means usual in all quarries for separating slabs or blocks from the main ledge. A row of wedges were set, several hundred in number, and the workmen, beginning at one end, gently and carefully tapped the wedges, moving by degrees down the line until the other end of them was reached, when the same operation was repeated. In this manner, by careful and patient application, aided by favourable conditions of the weather, the slab of the above phenomenal size was successfully separated from the main rock." We are informed that the value of this immense slab, "if it could have been transferred safely to one of the large cities of the United States, at not too great a cost, would have been several thousand dollars. It seemed almost sacrilegious that it was necessary to cut it up into smaller blocks for transportation, and to finally use it for ordinary building purposes: but it had to be done. The possibility of getting out a slab of such size without breaking it shows that the grain of the Monson granite not only runs evenly, but that it possesses great tenacity."

Free Lectures to Artisans.—A second course of eight free lectures to artisans and others connected with the building trade is announced to be given on Wednesday evening, at eight o'clock, at the Carpenters' Hall, London Wall, on "Matters connected with Building." The first of the course will be given on February 17th, by Mr. Thomas Blashill, F.R.I.B.A., when the subject will be: "Timber; its growth, seasoning, and preparation for use." Tickets, admitting to the course and naming the subjects, may be obtained at the Hall after February 2nd.

Royal Academy of Belgium.—Sir Frederick Leighton has been elected an Associate of the Royal Academy of Belgium in place of the late Mr. Louis Haghe, and Mr. A. Waterhouse has replaced the late Mr. Donaldson in the section of Architecture. —*Athenaeum.*

Royal School of Mines.—Prof. Warington Smyth, F.R.S., in continuing his lectures upon Mining, in the theatre of the Geological Museum, Jermyn-street, discussed the various considerations necessary before entering upon operations in detail. The matter of partnership and the conditions under which the miners may be removed are necessary preliminaries; then comes the matter of machinery, and the nature of its power, and if water, whether it can always be obtained upon the spot, or whether it will be necessary to collect it in reservoirs, or convey it for a long distance by the means of carriage to or from the mine, and the probable necessity of forming new means of communication; together with the yield of timber in the neighbourhood for working of the mine, as well as other fuels for smelting operations when necessary. The matter of water then becomes an important item, and, in the connexion, the skill of the men in the district and proximity of their dwellings, and the possible necessity of erecting temporary barracks. Then management must be considered, as nothing is easier than to spoil good mine by bad management, and when mine has been thrown into bad shape, it is very difficult to get it into good form again. Lastly, the provision of stores and the accommodation of them is necessary, so that a mine may not have to travel long distances in order to get a wheel repaired. If the value of workings is estimated without taking all the points into consideration, the financial outlook will be a poor one.

The Iron, Hardware, and Metal Trade Pension Society.—The forty-third annual general meeting of the Iron, Hardware, and Metal Trades' Pension Society was held at the offices of the Institution on Wednesday last. Mr. Robert Henry Pearson, Vice-President and Treasurer, presiding. The president, trustees and London, Birmingham, Sheffield, and Wolverhampton committees were severally re-elected with the addition to the Birmingham committee of Mr. Wm. Tonks, and the following gentlemen were elected vice-presidents and vice-presidents respectively:—Vice-Presidents: Mr. J. Smith, of Barrow-in-Furness; Mr. R. W. Moss, Southwark; and Mr. Henry Gallimore, Sheffield. Vice-Presidents: Sir Henry Bessemer, F.R.S. and Mr. W. G. Ainslie, London. At the seventh general election of pensioners, which subsequently took place, the successful candidate were:—John Stones, Sheffield, 578 votes; William Cooke, Sheffield, 379; William James Portishead, 357; William Smithers, London, 277; Mary Ann Durham, London, 1,924; and Mrs. Ann Wilson, Birmingham, 1,521. Lord York, being the highest unsuccessful candidate, received the gratuity of five guineas presented at each election by the Falkirk Iron Co.

The Green Dragon Tavern, Fleet-street has just been rebuilt. The building is 76 ft. in height from the street-pavement level, and contains six floors. The ground floor is faced with red Aberdeen polished granite pilasters and columns, the materials of the upper parts of the facade consisting of Portland & Corseshill stone, the last-named materials forming the most prominent feature. Above the ground floor there is a bold cornice, with a balcony the foot of the first-floor windows. At the angle of this floor there are pilasters, whilst the centre is a large elliptical arched window, and on each side smaller arched windows. The second floor has a central bay window, which is continued upwards to the third floor, and surmounted by a balcony. The fourth and fifth floors are entirely faced with Portland stone. Messrs. Frond & Keogh, of Hart-street, Bloomsbury, are the architects, and Messrs. Colls & Sons, of Moorgate-street and Cambwell, were the contractors.

The Ancient Agrigentum.—In the *English Illustrated Magazine*, Mr. H. D. Tyndal writes a pleasant article on a month in Sicily touching on its architectural remains, but with any special knowledge. Some of our fellow-travellers knew still less, however, as relates how a young Englishman informed a bride, as they approached the station, that "Girgenti is the ancient Agrigentum." "Y dear," replied the lady, demurely; "but who is the ancient Agrigentum?" and got no reply.

The Hygeian Rock Composition.—Mr. William White, of Abergavenny, patentee of this composition, announces to Messrs. Haward Bros. & Co. have opened a depot for its sale at Manor House Wharf, X Blms.

American Exhibition (in London), 1887. - We learn from the Journal of the Society of Arts that it has been arranged that this Exhibition shall be opened on Monday, May 2, 1887, instead of May 1, 1886. The Executive Council were prepared to carry out their original intention, but have yielded to the strongly-expressed opinion that it was undesirable to hold the American Exhibition in the same year as the Colonial and Indian Exhibition.

The Maintenance of Cathedral Fabrics. The Edinburgh Review for January contains an article on the Report of the Royal Commission appointed in 1879 to inquire into the Condition of the Cathedrals of England and Wales. The Report is very freely criticised by the reviewer, who finishes, however, with an expression of entire concurrence with the opinion of the Commission that the preservation of the cathedral fabrics is the primary claim on the funds of the Ecclesiastical Commission which are derived from them. We quote the concluding lines of the article:-

"The only defence of a practical kind that was made last winter for not attempting a real restoration of the grand old Norman tower of Peterborough Cathedral, which was coming down if it had not been taken down in time, and for which the architect had discovered enough of the original features, was that it would cost more than had been subscribed (20,000*l.*) and was thought likely to be subscribed in these bad times, when the richest man in the diocese, if not in England, only gave 100*l.* If the Ecclesiastical Commissioners had recognised what this very mild-spoken Commission in Cathedrals at last ventures to call their primary duty, that difficulty could not have been pleaded by the obstructives. The absolutely necessary work would have been done out of general cathedral funds, and what may be called the architectural luxury of a grand restoration of the tower to its original state would have been covered by the subscriptions; for which it was said by the Dean, who coming in while there was a chance of the proper thing being done. So we spoil a great cathedral or ever for want of 20,000*l.* to restore it as it was its best days, and would have been still hunted for 'colleagues.'"

PRICES CURRENT OF MATERIALS.

Table listing prices for various materials including timber, iron, and other building supplies. Columns include item names, quantities, and prices in £, s., and d.

Table listing prices for various metals including iron, steel, and other building materials. Columns include item names, quantities, and prices in £, s., and d.

Table titled 'METALS (continued)' and 'GILS' showing prices for various metal types and grades. Columns include item names, quantities, and prices in £, s., and d.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.

Exptote of Advertisements in this Number.

COMPETITIONS.

Table listing competitions with columns for Nature of Work, By whom required, Premium, Designs to be delivered, and Page.

CONTRACTS.

Table listing contracts with columns for Nature of Work or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, and Page.

PUBLIC APPOINTMENTS.

Table listing public appointments with columns for Nature of Appointment, By whom Advertised, Salary, Applications to be in, and Page.

TENDERS.

Table listing tenders for various construction projects in locations like Batham, Dalston, Bethnal Green, Bristol, and London. Columns include project details, contractor names, and amounts.

LONDON.—For building a front block of offices and chambers at No. 63, Lincoln's Inn-fields, London, W.C. Mr. William Simmons, architect, Long Acre. Quantities by Messrs. Nixon & Haven, Dartmouth-street, Westminster.—

Table with 3 columns: Item, A, B, C. Includes items like Ansdell & Co. (Westminster), W. Glady (Westbourne Park), Drake & Co. (Battersea Park), W. Marriage (City), J. Chappell (Finsbury), John Bottrill, Reading, Mark Gentry, City, etc.

LONDON.—For rebuilding No. 162, Aldersgate-street, for Mr. Woolf Hyman. Mr. J. D. Mathews, architect.—Kilby & Gayford (accepted) £2,760 0 0 [No competition]

Table with 3 columns: Item, A, B, C. Includes items like LGNDON.—For repairs to Nos. 272, 274, and 276, Hackney-road, for Mr. Matthews, Messrs. Gordon & Lowther, surveyors, etc.

Table with 3 columns: Item, A, B, C. Includes items like LGNDON.—For alterations to the Marquis of Arglesea Public-house, Devonshire-street, Lisson-grove, Mr. R. A. Lewcock, architect, Bishopsgate-street Within, etc.

LGNDON.—For proposed chambers, 36, Maiden-lane, Covent garden, W.C. Mr. W. Stair, architect.—Ferry & Co. (accepted) £3,750 0 0

Table with 3 columns: Item, A, B, C. Includes items like LUTON.—For the alteration and addition to the Crown Inn, Market-hill, for Mr. S. L. Seckham, Northampton, Mr. W. J. Pearson, architect. Quantities not supplied, etc.

Table with 3 columns: Item, A, B, C. Includes items like NORTHFLEET.—For the erection of new Board schools, for the Northfleet School Board. Mr. A. L. Guy, architect, etc.

Table with 3 columns: Item, A, B, C. Includes items like NORWICH.—For dwelling-house, shop, and workmen's rooms in Queen-street, Norwich, for Messrs. W. Todd & Co., Mr. E. P. Willius, architect, Norwich. Quantities by Messrs. Vinal & Kennedy, Goldford street, Russell-square, etc.

PUTENEY.—For shop-fronts at Putney, for Mr. Sawday. C. Jeffrey, Hatton-garden (accepted) £195 0 0

STOKE NEWINGTON.—For alterations to No. 1, Truman's-place, Stoke Newington. Mr. R. A. Lewcock, architect, Bishopsgate-street Within.—

Table with 3 columns: Item, A, B, C. Includes items like WALTER (Suffolk).—For the erection of Foresters' Hall and two shops, with dwelling-houses under, at Walton, Suffolk. Messrs. T. Orr & Son, architects, Ipswich. Quantities not supplied, etc.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than four p.m. on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON." F M.—H. G.—G. F. T.—W. F. (the writers of the letters you refer to were not "interested parties"). T. C.—C. G.—W. L. B.—J. H. B. (illegible)—Shops, Harleiden (list received, but without reader's name). All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications beyond new news-items which have been duplicated for other journals, are NOT DESIRED. All communications regarding advertising matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON." THE INDEX and TITLE-PAGE for Volumes XLIX. (July to December, 1885) was given as a supplement with our issue of January 9th. A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also READING CASES (cloth), with strings, to hold a Month's Numbers, price 2s. each; also THE FORTY-NINTH VOLUME of "The Builder" (bound), price Twelve Shillings and Sixpence, will be found at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE and GENERAL ADVERTISEMENTS. Six lines (about 175 words) or under 3s. 6d. Each additional line (about ten words) 3s. 6d. Terms for Series of Trade Advertisements: Also for special Aliver tments on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED. FOUR lines (about THIRTY words) or under 3s. 6d. Each additional line (about ten words) 3s. 6d. PREFRIMENT IS ABSOLUTELY NECESSARY. * * * * * Stamps must not be sent, but all small sums should be remitted by Cash, in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FORDRINDEN, Publisher.

Advertisements for the current week's issue must reach the office before THREE O'CLOCK on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same, must reach the Office before TEN O'CLOCK on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Replies addressed to the office, 46, Catherine-street, Covent Garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamp to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to reside in any part of the United Kingdom at the rate of 3s. per annum. For all parts of Europe, America, Australia, and Zealand, 5s. per annum. To India, China, Ceylon, &c. 10s. per annum. Remittance payable to DOUGLAS FORDRINDEN, Publisher, No. 46, Catherine-street, W.C.

Best Bath Stone, for Winter use. WESTWOOD GRGUND, Box Ground, Combe Down, Corsham Down, and Farleigh Down, Dried. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [AD]

Box Ground Stone is the best for use in all exposed positions being a well-known and tried Weather Stone 50,000 ft. cube in stock. P I C T O R & S O N S, BOX, S.O., WILTS. [AD]

Doubling Freestone. The stone from these quarries is known as the "West Bed," and is of a crystalline nature, and doubtless one of the most durable stones in England. It is of the same crystalline nature as the Chelney Stone, but finer in texture, and more suitable for fine-moulded work. HAM HILL STONE. Greater facilities have been provided working these quarries, and the stone can be supplied in large quantities at short notice. Prices, and every information given, application to CHARLES TRASK & SON, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent — Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [AD]

Doubling Free Stone. For prices, &c., apply to S. & J. STAFF, HAM HILL STONE, Quarry Owners, & BLUE LIAS LIME and Lime Merchants, Stoke - under - Hill (Ground or Lump), Ilminster. [AD]

Ham Hill Stone! Ham Hill Stone! For Ham Hill Stone of best quality and workmanship, apply to JOHN HANN & SON, Quarry Owners, Montacute, Ilminster. Established 1837. Agents, MATTHEWS & GEARD, Albion Wharf, Regent's Park Basin, N.W. [AD]

Asphalte.—The Seyssel and Metallic L Asphalte Company (Mr. H. Glenn), Office, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and mill rooms, granaries, tun-rooms, and terraces. [AD]

Asphalte. Seyssel, Patent Metallic Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [AD]

EVERY DESCRIPTION OF SEASONED WOODS and VENEERS IN EXTENSIVE QUANTITIES. B. J. HUDSON & SONS, Millbank Sawmills, Grosvenor-road, S.W. Whitfield-street, W.; And Store-street, London, W.C. Telephone No. 3,152, and Private Wire connecting Business Premises. [AD]

BANNER EXHAUST VENTILATORS.

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &

HIGHEST PRIZES at all the most important Exhibitions

BANNER SYSTEM OF SANITATION and SANITARY APPLIANCE

WERE AWARDED AT THE

International Health Exhibition, 1884, One Gold Medal, Three Silver Medals, and One Bronze.

New Light on the East Frieze of the Parthenon.

FEW months ago (*Builder*, Oct. 3, 1885, p. 452) we had occasion to speak in detail of Dr. Loeschke's new and ingenious interpretation of the so-called Thalassa and Aphrodite of

the western Parthenon pediment: this theory of Dr. Loeschke's was avowedly a development of what we may call the "topographical" theory. We then expressed our conviction that this topographical school of interpretation, built as it is on a simple and natural basis, was likely to stand the shock of adverse criticism. We are now interested to find that from Professor Duhn, of Heidelberg, a weighty authority in all archaeological matters, there comes additional evidence to the soundness of the "topographical" principle,—evidence the more remarkable because it is in a sense undesigned. "Topographical" interpretation arose with the necessity in relation to pediment compositions. Professor Duhn now applies it to the elucidation of the long-disputed twelve gods of the eastern frieze. The full weight of his testimony we can only appreciate by following his argument somewhat in detail.

He approached the subject with no *a priori* predisposition to one school of interpretation, nor, indeed, as he tells us, with any desire to revolutionise the complete scheme of attribution: he was simply troubled by difficulties as to the received attribution of one particular figure, the one which goes by the name of Poseidon. The slab containing the Poseidon (for so, provisionally, we must call him) is, it will be remembered, not in the British Museum at all, but stands still on the Acropolis, not *in situ*, but in the small Acropolis museum. Special interest attaches to it because of its excellent state of preservation. Not only the figures and drapery, but the faces of this slab, are still clearly cut, so that the character of the persons intended should, it seems, be here if anywhere unmistakable. The head of the "Poseidon" figure is, indeed, clearly characterised, but how? The hair is short, well combed, neatly confined by a band, the beard well trimmed, the whole appearance compact and orderly, the expression of the face with the widely-opened eye quiet and benevolent. In order to call this benign and peaceful figure Poseidon, archaeologists have been driven to shifts. Mrs. Mitchell (*"History of Ancient Sculpture,"* p. 338), following the traditional explanation accounts for the unwonted aspect

of her "Poseidon," writes thus,—“We see first Poseidon, the ruler of the seas, his head bound about with a sacred fillet, and his locks falling as though wet and clinging to his neck. The strongly-developed forehead, the arched upper lid almost touching the eyebrow, as well as the widely-opened lower one, give the god an air of self-sufficiency; but his attitude is not that of easy repose: leaning forward, as well becomes the stormy-sea god, he seems to force himself to reserve and quiet.” Now, all this is not even “*ben trovato*.” If Phœidas had meant Poseidon he would have characterised the stormy god of the unruly sea in plain, straightforward fashion, according to traditional treatment, and not have left him to pose as the wolf in sheep's clothing. What the traditional figure of Poseidon was is happily clear enough. We have only to pass in review the representations of Poseidon in Overbeck's “*Kunst Mythologie*” to see that in more than fifty monuments that remain to us his characteristics are uniform,—he is an unruly form of Zeus; he has the leonine hair of Zeus, only tangled in disorder; his beard is rich and full, but unkempt; specially we note that at the sides of the temples and at the back of the neck the hair falls long and free. In the “Poseidon” figure of the frieze, the hair at the back of the head is short and curled; not indeed so close-cropped as modern fashion prescribes, but still short enough to show that the Greeks of the time of Phœidas felt that civilised man should not conceal, with a disorderly tangle, the junction of head, neck, and shoulders. Fortunately for comparison, Dr. Overbeck figures this so-called “Poseidon” on the same page with a collection of undoubted Poseidon heads; the contrast of the nape-hair growth is thus rendered very striking. It is a curious instance of the way in which it is possible to accumulate facts without focusing thought into the clear vision of generalisation, that Dr. Overbeck never misdoubted the Poseidon attribution.

If not Poseidon, who then is the figure? No doubt the Zeus-like type of the face and hair misled the first interpreters. It could not be Zeus, on the ground of family likeness; it must then, they argued, be his brother Poseidon. But there remains a third alternative. Zeus had a grandson, late-born in time,—a gentle, civilised god, in fashion and feature much resembling himself,—Asklepios (*Æsculapius*), the god of healing. In works of ancient art, especially in the reliefs recently discovered in large numbers, and now preserved in the annex of the Acropolis museum, we find Asklepios thus characterised as a milder Zeus, and, indeed, in two of the reliefs (published *Mittheilungen*, ii. Taf. 14, 15), the head of Asklepios bears the closest analogy to the head of the so-called Poseidon. The

uplifted hand has been usually restored with a trident, for which we must now substitute the simple citizen's staff. Asklepios was, of all gods, most human, because most pitiful: he dwelt as a man among men.

But the most interesting part of Prof. von Duhn's theory is yet to come. The attribution of Asklepios suggests a wholly new view of the entire assemblage of the twelve gods who await the coming of the procession, a view which yet falls in, in a very conclusive and convincing way, with all that has been so far *certain* in former explanations. We have been beginning of late to see that this concourse of gods was not fortuitous, and still more that the twelve were not chosen on the mere ground of rank. In an assemblage that awaits the coming of the Panathenaic procession we must have gods not so much of higher Olympian rank, but of long-standing local prestige. Among the twelve some few are decided beyond doubt. No one questions that Zeus heads the left-hand group, and that by his side, with her attendant maiden, Hera is seated; nor can it be doubted that opposite Zeus on the right hand is Athene; the bearded figure next her, seated and leaning on a staff is by most archaeologists allowed to be Hephaistos; not only did he set free the goddess at her birth, but in their quality as artificers they are the male and female counterpart of each other, and had a common festival, the Chalceia; their joint son, Erichthonios, founded the Panathenaia. Thus we have the four central deities firmly fixed; Zeus and Hera correspond to Athene and Hephaistos. With this attribution Prof. von Duhn nowise interferes,—he rather confirms it by lending to it a new unity and significance. He emphasises a point with respect to it that other archaeologists have dwelt on but little, or not at all. The two centre groups are spaced off, clearly and evidently, from the remaining four gods seated at either side. This must have had a meaning, and Prof. Duhn takes the simple and obvious, but hitherto wholly neglected meaning, of actual *topographical* remoteness. The two centre groups of gods are gods worshipped actually on the Acropolis; the remainder spaced off are, according to his simple view, gods who have temples on the slopes *adjacent* to the Acropolis,—gods more remote from the centre, but nearer to the oncoming procession which they await.

Now, turning to the right side of the remoter gods, let us proceed with Prof. Duhn's attribution; one figure about which there can be no dispute sits at the end of the assembly,—Aphrodite with her son Eros,—this may serve as a test of the probability of his line of interpretation. We ask at once, had Aphrodite a shrine on any slope adjacent

to the Acropolis? Assuredly in ancient times, one reared by Phaedra for the love of Hippolytos,

*πίτραν παρ' αὐτὴν Παλλάδος κατόψιον
γῆς ἔρπον ναῶν Κίπριδος ἰγκαθίστατο
[ἔρπον ἔρπον ἔκδημον.]*

In the time of Pausanias there seems to have been a shrine to Aphrodite Pandemos worshipped conjointly with Peitho and Themis. The temple of Themis, Dr. Köhler thinks, has been made out in the recent excavations on this side of the Acropolis; no traces of the shrine of Aphrodite have as yet been brought to light. The last figure of the seated gods to the right is, then, certainly Aphrodite. The next is either Themis or Peitho, whose shrine was adjacent; which of the two Prof. von Duhn does not attempt to decide. We pass to the two seated men. The first to the right is, we have seen, Asklepios, and his shrine, the Asklepieion has been laid bare for us close to the Themis temple by the excavations in 1876-78. This is not the place to enter into details of this discovery, now familiar to every archaeologist; the inscriptions and reliefs given back to us by this discovery have left us a lively picture of the ancient medical world. Asklepios then was in very deed and truth standing on the south slope of the Acropolis by the side of Aphrodite, and watching the procession as it came in sight. By his side is a young, beautiful god. According to Prof. Duhn's method, we must ask, what god has a shrine adjacent to the Asklepieion? The answer is easy: close to the terrace of the temple of Asklepios is the temple and great theatre of Dionysos. It is he who, near neighbour and close friend, is seated quietly talking to the great physician. The remoter right-hand group are then the gods whose shrines lie on the southern slope, interested in, but not absolutely implicated with the cults of the Acropolis proper. Turning to the left-hand remoter group, Professor von Duhn sees in them the divinities whose shrines are on the northern slope; they seem to fall also naturally into their places. Next to the Asklepieion is the great hill of the Areopagos, and so the youth, carelessly clasping his right knee, turns out to be, as most archaeologists have supposed him to be, Ares; near to the Areopagos, recent excavations have shown, was the Eleusinion, so the full matronly figure next to Ares is naturally Demeter. To the very foot of the Areopagos extends the Agora, with its local gods, Apollo Patrosos and Hermes Agoraios,

and Hermes, without doubt, it is who closes the seated assemblage to the left; his flat cap on his knee has long left this attribution without doubt.

Thus, an interpretation of one isolated figure, started by an almost technical difficulty, revolutionises, or perhaps rather re-creates, our whole feeling towards this eastern portion of the frieze. A more or less fortuitous concurrence of gods becomes an assembly of keenly-interested actual spectators, and becomes also a topographical setting to the Panathenaic procession. So suggestive and so exceedingly happy and easy is the solution, that we are tempted to feel it is too good to be true, and yet, as with all true things, conviction grows by contemplation.

Professor Duhn's paper appears in the "Archaeologische Zeitung Zahrgang," xliii., 2nd Heft.

RAILWAY GOODS CLASSIFICATION.

It was stated in the House of Lords during the debate on the Railway Bills last year, that the Railway Clearing House Classification (which would be the basis of the revision of freight charges on goods) contained no less than 2,300 different articles. In the new edition for 1886 this number is still further increased, and there are now upwards of 100 pages, simply classifying goods, but giving no actual rates, nor indicating in any way how the rates in any of the classes are arrived at. The Bills prepared by the companies last year so far improved upon this system as to place side by side with the classification a table of the maximum rates to be applicable to the various classes at per ton per mile. Unfortunately, the improvement was limited to the mode of publishing the tariffs, the proposed classification and scale of rates being open to such serious objection as to lead to the abandonment of the measures altogether.

This side of the subject was glanced at in our article of March 7th last, reviewing the arguments for and against these bills, and it is again brought into prominence by Sir B. Samuelson's report on the railway tariffs of Germany, Belgium, &c. It is clearly shown that, however deficient the Continental systems may be in the matter of speed and accommodation, they manage much better in regard to tariffs than we do at home. We have often heard told that we were at a disadvantage in regard to rates and charges when compared

with these countries, but this has never before been so fully demonstrated. In Belgium the traffic is classed under four heads, and in Germany seven, the whole of the tariff arrangements being published in a concise and handy form. A table showing actual charges in all the various classes gives traders the advantage of being readily able to ascertain for themselves the carriage on any description of traffic for any distance. This, with us, is simply impossible, either under the antiquated Acts which nominally fix the classification of goods or the Railway Clearing House bill, which does so in reality, for the rates have been made in such a haphazard fashion that we have no principle to guide us in making an estimate. For instance, the rates in each of the five classes for a distance of 200 miles is something like the following:—(1) 35s., (2) 40s., (3) 50s., (4) 60s., (5) 75s. Now it by means follows that the rates between all places 200 miles distant from each other agree with these figures, though it is difficult to see why they should vary. Some will be found under others over this average, whereas with a system like that described by Sir B. Samuelson there would be no such variation. The most inexplicable thing in connexion with this subject is, that the relation of one class rate to another seems to be subject to no rule whatever. Take for example the figures just quoted, by which it will be seen that the third-class rate is 25 per cent. higher than the second. One would naturally suppose that, whatever other variation there might be in the rates, the third-class rate would always bear the same proportion to the second. But it is not so, respective rates hearing an entirely different proportion in different cases. The first and second class rates between half a dozen different points may be the same, and yet all the rates be entirely different, and so on. This necessitates estimation being provided with a book of rates containing some 200 pages, where a mileage table of scale of rates would answer the purpose, and in the absence of any guiding principle the rate can be estimated either by proportion otherwise, even when in possession of the rates by which one might expect to be able to calculate, but the rate-book must be referred to in every case. It cannot be denied that this is a great disadvantage, and would be so, however reasonable the charges might be; for traders ought to be in a position to calculate freightage as easily as any other expense. Nor should we have been any better off in this respect had the old

been superseded by the measures brought in last Session, for the sums per ton per mile given in the latter were obviously too high in many cases to be taken as a basis for the rates, and would not have been enforced. They were intended more as maximum figures beyond which the companies should not go, but on which they could rely to enforce any rates which came below them. This may be taken as proved by the fact that it is claimed that they seldom exercise the full powers conferred by the existing Acts, while the maximum rates provided by the latter are lower in many instances than those given in the Bills of 1885. The uncertainty in which the rates were left by these measures was increased by the proposal to add terminal charges,—indefinite and varying,—to the mileage rates. The terminals in the States visited by Sir B. Summerson are fixed sums prescribed in the same manner as the mileage rates, and are, moreover, very moderate. In England they are fluctuating and uncertain, and would have remained so under the proposed new regulations, as the latter were to confer upon the companies the right to add to the prescribed rates "a reasonable sum" for these services. Although the clause provided for the publication at each station of its own terminals, and admitted of appeal to the Railway Commissioners when considered to be excessive, it could not be regarded as satisfactory. The views of the Companies and their customers as to the reasonableness of their charges, differ very widely, particularly now that it is seen how excessive they are when compared with those of other countries, but for all that many people would pay and protest rather than go to the expense of contesting the charges.

The rates in the various classes under the scheme formulated last year,—computed, as before, for 200 miles,—would be as follows:—(1) 29s. 2d., (2) 37s. 6d., (3) 45s. 10d., (4) 53s. 2d., (5) 66s. 8d., these figures being exclusive of the terminals. The latter, according to a statement published by the Railway and Canal Traders' Association, vary from 6d. per ton to 12s. 4d. These amounts were ascertained in the case of *Berry v. London, Chatham, and Dover Railway*, when it was stated that at a small country station they ranged from 6d. per ton in the lowest to 4s. 2d. in the highest class, while in the case of a London terminus the relative amounts were 1s. to 12s. 4d. These figures serve to illustrate the uncertain nature of these charges on our lines, while on the Continent the trifling variation that exists is governed by the distance the traffic is conveyed, and is, therefore, quite easily understood. There is this much to be said in favour of the Railway Clearing-house classification, that it is very comprehensive. It is imperative that it should be so; or it is an understood rule that anything not enumerated shall be charged at the fifth, or highest rate. This is the explanation of many of the discrepancies observable in railway accounts. A builder will, perhaps, have two consignments of enamelled slates in one month from the same place, and find one lot charged half as much again as the other, though both weigh the same. The class in which the traffic placed is third, and that rate would be charged if the contents of the case were specified on the consignment note; whereas, if this was omitted, the highest rate in force could be applied. With regard to inconsistencies in the classification itself, perfection is not to be expected in dealing with such a multitude of articles. But it would hardly be supposed that anomalies to which attention has been drawn seven or eight years ago would be allowed to remain unaltered. Yet, in commenting upon this subject in 1878, the late Mr. Parsloe pointed out that whereas garden rollers were in Class 1, field rollers were in Class 3; that umbrella-sticks were in Class 3, and walking-sticks in Class 4, and several other cases.

An examination of the present classification shows that the whole of the articles enumerated by Mr. Parsloe are still in the same classes as they were when he exposed this "distinction without a difference." The anomalies

were all kept up, too, in the schedules which Mr. Oakley of the Railway Association assured us had been compiled with so much care and deliberation last year. Perhaps, after all, to persist in having these inconsistencies remedied would only lead to the favoured articles being "moved up," and it may, therefore, be advisable to let well alone.

It may be noticed, in conclusion, that by the Bills of 1885 it was proposed to raise various articles higher in the classification. Straw, for instance, was to be advanced from class 3 to class 5,—and a glance at the example rates given will show that this would mean an increase of nearly 50 per cent.—and timber and deals were also advanced a class. A correspondent to the *Times*, writing under the name of "Sugar," remonstrated very strongly against these alterations, and we notice that all the articles he named retain their old places in the new classification.

NOTES.

THE subject of the insufficiency of the present House of Commons to accommodate its members has been brought forward again in a letter from Mr. Mitchell Henry in the *Times*. Mr. Henry says, and correctly, that the only alternative is the construction of a new House, though he rather over-estimates the importance and thoroughness of the report of the Committee of 1868 on the subject. The plans appended to that report are of considerable interest and value, but the report itself is a good deal occupied with evidence of an inconclusive and unsatisfactory nature, and illustrates principally the difficulty of arriving at any precise expression of opinion from those who were regarded and examined as "experts." The plans then submitted by Mr. E. M. Barry provided for a nearly square house, only with the angles canted off, over the Commons Court, which was to seat 419 members on the floor and 150 in the galleries. Mr. Mitchell Henry proposes a similar but larger house over the Star Court; in both cases the present House of Commons to form a lobby to the new one. A grand lobby or entrance *salon*, with the access to the main chamber on one side of its length, will be an awkward affair from an architectural point of view. The subject demands careful consideration; but we may observe that if it is intended to provide accommodation for all existing members simultaneously they must all be on the ground floor. Members in a gallery are almost as good as out of the House, for purposes of joining in the debate. The theatre form, we believe, will be found the best for giving accommodation without too much extending the area of the house; and though we do not want the "tribune" system, still, as all members theoretically address the Speaker, the arrangement of a semicircular theatre with the Speaker at the centre is sufficiently in accordance with facts. In connection with this subject we observe that the *Times*, as usual, avails itself of an opportunity to sneer at architects, implying that "Sir Charles Barry's costly building" stands condemned, because, forsooth, the house is now too small for its needs. The building was planned in reference to the then existing numbers and habits of attendance, and it was a point of practical wisdom to get as small a house, for acoustic reasons, as would give the necessary accommodation; and as to wanting "better ventilation," the House of Commons is one of the best ventilated rooms in the kingdom, only M.P.'s never think themselves well enough used.

EVERY English architect, we imagine, will approve of the recommendation of the Council of the Institute of Architects, that Mr. Charles Garnier should be offered this year's Royal Gold Medal. If it is the case, as was suggested at the meeting, that it is, strictly speaking, the turn for the presentation of the medal to an English architect, it is no less true, as Mr. P. Anson observed, that the claims of M. Garnier to such a compliment from his

professional brethren in England have been long and, to our thinking, most unaccountably forgotten.

THE modernisation of Rome, deplorable as it is in many respects to the lovers of its ancient grandeur, is, at all events, yielding some rich harvests in the way of antiquarian remains. Another mausoleum has just been discovered in the quarter of Testaccio, not unlike the one that was recently exhumed at Palazzuolo. On the principal facade is inscribed the name of the person to whom it was erected, viz., Servius Sulpitius Galba. At first it was thought by archaeologists to have belonged to the Emperor Galba, but this could scarcely be, as that ruler was greatly detested by the populace, and when he died his body was cut to pieces, and his head carried through the streets at the end of a lance. The mausoleum might, however, have been the property of an ancestor; for there was a Servius or Sergius Galba, who was Consul B.C. 144, and who was said by Cicero to have been the best orator of his day. It is intended to re-erect this building in an adjacent locality, to be called the Piazza Sulpitius. A short distance from Frascati is the old abbey of Grotta Ferrata, celebrated for some magnificent frescoes by Annibale Caracci and Domenichino, which have been allowed to fall into decay. These the Government propose to restore to their former beauty. Caracci's frescoes are more than ordinarily interesting; for he introduced his own portrait into the group, as also those of Guido and Guerino, his fellow-workers; and in addition to these, he contrived to immortalise his mistress in the same composition, by painting her as a page in the train of Otho III. A very curious fresco has been discovered also, during some alterations in the Via Firenze, forming the decoration of a kind of catacomb in which was celebrated the worship of Mithra,—the twenty-seventh building dedicated to that god which has been found in Rome. It is not unnatural that such should have been the case, seeing that Mithra was the principal Providence who was responsible for all increase and fertility in the world. The fresco is supposed to represent Mithra, who is depicted as a young man in a Phrygian bonnet and red tunic, in the act of sacrificing a bull. To turn to things of modern date, a fine mosaic has just been placed in the American church, from the designs of Mr. Burne Jones, the subject being a very large-sized figure of Christ blessing the earth. Four fountains issue from the throne into a crystal sea, allegorical of the universality of the Christian faith.

WE are glad to observe that the suggested design for the Liverpool Cathedral by Mr. Jas. Hay, of that city, which was brought forward at a meeting of the Liverpool Architectural Society, and the block-plan of which we published a fortnight ago [p. 182], has been hung in a room in the Walker Art Gallery, adjoining that in which the invited designs are hung: a very proper compliment to a clever and energetic local architect. Examination of the drawings, however, leads to the conclusion that Mr. Hay has rather overstepped the line in his endeavour to combine the features of several styles. Externally, he has Classic porticos intended to repeat the design of St. George's Hall. Above the western facade the towers rise in square masses from the purely Classic haement on either side of the portico, and when they get to a certain height in the air they break out into Gothic pinnacles and spires. This is very cleverly managed, and, in spite of a certain hardness and wiriness in the Gothic detail, it is more successful and less *bizarre* in appearance than might have been imagined. But in the lower portions of the design, the interposition of purely Gothic traceried windows between the large and purely Classic pilasters most assuredly will not do: no eye can accept this; and when on turning to the longitudinal section we find a purely pointed Gothic nave leading to a "St. Sophia" dome not very happily treated in its union with the substructure, we feel that this is not "fusion" of styles, but simply discordant juxtaposition.

The plan is the strong point of the design; it is more distinctly a Protestant Cathedral plan than any of the others; but it would never bear carrying out in the way suggested. We may observe that the exhibition of the cathedral designs seems to be attracting great interest, and is full of visitors of all classes. Last week it was thrown open for working-men in the evenings, and on Saturday evening 800 working-men visited the gallery.

THE millennium of peace which weak-minded individuals believed to have been inaugurated by the era of universal exhibitions, appears to be as far off as ever, if we are to judge of the increasing tendency to erect fortifications everywhere. Even Switzerland, which one would think was sufficiently protected by its own rugged mountain chains, is seriously contemplating the fortification of the St. Gothard Pass and Railway, and also of the Furca and other passes, making the little Alpine village of Andermatt a central garrison, and shutting off the mouth of the tunnel by a thick iron door. In our own direction, too, the French are exercised (a not uncommon incident) by a report that we are about to erect defences on the Ecrehoux, a little group of rocks only a few acres in extent, about five miles from the Jersey coast facing France. To those who have ever seen these same islets, it is ridiculous to fancy that any fortifications placed thereon could be a menace to Cherbourg, as our neighbours pretend, as the only possible use that could be made of them would be to command the passage of a fleet between Jersey and the Brittany coast. It is the more absurd inasmuch as the real menace to Cherbourg is, of course, the island of Alderney, where millions have been wasted in constructing fortifications that were pronounced to be useless, even before they were finished. More public money has been thrown away in the Channel Islands than in any other part of the world, considering their limited area. In addition to Alderney, a very large amount was spent in a useless extension of works underneath Elizabeth Castle in Jersey; while, in the same island, the long breakwater and pier at Fliquet Bay, opposite Cartarets, will for ever remain as an example of engineering incapacity and public works muddle on the largest scale.

THE Great Eastern Railway, in spite of a decline of 1,815*l.* in the published receipts to December 27, has maintained the rate of dividend of the last half of 1884, carrying forward a balance of 21,000*l.* in place of a balance of 18,637*l.* The directors of the Metropolitan Railway report an increase of 2,904*l.* in the income, and a decrease of 2,297*l.* in the expenditure, for the half-year, the totals given being 320,163*l.* and 126,277*l.* respectively. This shows the low co-efficient, for an English line, of 39·4 per cent. of working expenditure. The Manchester, Sheffield, and Lincolnshire Railway, with a decrease of 13,479*l.* on a half-year's receipts of a little over a million, divides at the rate of 3½ per cent. per annum, with 2,400*l.* to be carried forward, against 4 per cent. per annum in 1884, when 2,980*l.* was carried forward. As nothing was paid for the first half of 1885, the distribution for the whole year is thus only 3½ per cent., against 4½ per cent. for 1884. The directors of the London and South-Western Railway, with an increase of 14,600*l.* in the revenue for the half-year, recommend a dividend at the rate of 6½ per cent. per annum on the ordinary stock of the company, carrying over a balance of 5,842*l.* This compares with 6½ per cent. for the second half-year of 1884, with a balance of 11,930*l.* The directors of the Great Northern Railway, with an increase of 26,600*l.* in the revenue for the half-year, are asking for 184,000*l.* pre-preference 4 per cent. debenture stock, involving an additional annual charge (if taken at par) of 7,340*l.* on their net revenue. The North-Eastern Railway Company, with a decrease of 128,000*l.* on a half-year's income of 3,125,000*l.*, propose a dividend at the rate of 6½ per cent. per annum against 7 per cent. for the corresponding period in 1884.

AT the meeting of the Metropolitan Board of Works on the 29th ult., upwards of twenty designs and tenders were received "for the construction of a vessel capable of conveying from the sewage outfalls in the Thames out to sea 1,000 tons of sewage sludge." This is a proposal to which we have several times referred. It may be remembered that the Board, in inviting tenders for the vessel, stated that in the event of the Board not accepting any of the tenders, "a premium of 500*l.* will be given for the design which may be selected as thoroughly suitable and the best," such design in that event to become the property of the Board. The amounts of the various tenders were not announced, the whole of them, with their accompanying specifications and drawings, being referred to the Works and General Purposes Committee and the Engineer for consideration and report. We mention the subject now because we think it advisable to call attention to the somewhat lax manner in which the majority of the Board acted on the occasion in question. The advertisement inviting tenders, designs, and specifications to be sent in was explicit as to the date, yet at the meeting when they were received it was actually resolved to give an extension of time till the following Monday to one firm who applied for it by letter. Mr. Jones and Mr. Phillips strongly protested against this proposal, which they characterised as being grossly unfair to other competitors; but on the proposal being put to the vote, there were only nine dissentients. So that, as matters stand, the competitor who was three days late in sending in his design will have the same chance of success as those who, at whatever inconvenience, sent in their designs at the stipulated time.

THE Society for the Protection of Ancient Buildings has recently addressed a memorial to the Governor of Bombay calling attention to the condition of the numerous historical buildings in that Presidency, and in particular to the celebrated tomb of Mahomed (the Gol Gumbaz) at Bijapur, which Mr. Fergusson pronounced to be the most extraordinary and complex example of dome construction yet attempted anywhere. It appears that the Government grant for the preservation of the monuments at Bijapur is only about 1,000 Rs. (100*l.*) a year, a sum which is evidently insufficient for the purpose, and the Society urges upon the Governor the need for a liberal increase in this grant. There seems to be some doubt as to whether this money is always judiciously expended, the Curator of Ancient Monuments, in his Report which was recently presented to Parliament, referring frequently to works of restoration, renewal, and renovation with approval. The most urgent need at Bijapur appears to be the preservation of the cornices of the buildings, which are of the most delicate and fragile construction, and the details of which have been evidently copied from woodwork, the stonework being fitted together with mortises and tenons. These cornices are gradually perishing from the action of the weather, and their proper protection and conservation are matters which should seriously engage the attention of the Indian Government.

WE have received a little pamphlet, entitled "Hints for Land Transfer and a State Land Bank." Such a publication is interesting as showing how public opinion is beginning to take up the land question. But this pamphlet also shows how useless it is to discuss this great question inadequately. We are all agreed that we wish to be able to transfer land cheaply and quickly, but we cannot do this by means of hints, however sagacious. What those who have studied the subject should do is to formulate really elaborate and well-thought-out plans, which may have a material bearing on the issue before the country. There are few subjects in regard to which the details are more perplexing, and the object in view plainer. The author of the pamphlet in question would establish a State Land Bank "for the purpose of receiving sums of money on deposit from the investing public, at fair

interest, and lending out the same at small profit on freehold mortgage security." As the number of would-be lenders on freehold mortgage security at moderate interest is even now quite sufficiently large for the wants of borrowers, we fail to see what good will be done by a State Land Bank.

MR. G. C. CUNNINGHAM, M.Inst.C.E., has laid before the Institution of Civil Engineers a valuable study "on the Energy of Fuel in Locomotive Engines." The mode of investigation adopted has been the comparison of the duty done by a locomotive with the fuel consumed. The results, taken from four Canadian and American railways, are tabulated; and while they possess a certain independent value are such as to show that further research may here open a new and very important field of discovery. The chief defect of the table is the want of a reduction of the fuel consumed into the two elements of the frictional resistance, and of that due to gravity overcome. The outcome of the table shows an average consumption of 0·98 lb. of coal per ton of passenger train, and of 0·273 pounds of coal per ton of freight train, per mile; the difference being attributed to the much higher rate of speed of the former. Of the Canada Southern Railway the average of the whole line is said to be equal to a gradient of 5 ft. to the mile, raising the resistance to haulage from 9 lb. per ton, due to friction on the level, to 11 lb. per ton. The fuel consumed in the freight trains is 0·15 lb. per gross ton moved one mile; exclusive, apparently, of the weight of the engines. This is equal to 0·1225 pounds of coal per mile for resistance to running friction alone, independent of gravitation. It is desirable to show how closely this result fits with those due to the gradients of the other lines; one of which rises to a consumption of 0·37 lb. per ton per mile. That there is ample room for improvement is shown by the statement that only 3½ per cent. of the theoretic energy liberated by the consumption of the coal is actually utilised. This remark, however, seems to overlook the work done in the movement of the engine themselves. Of course it would be idle to expect that any useful data on the subject should be accessible on the English railways.

WE have received the first two numbers of Dr. Dresser's "Modern Ornamentation," which is intended to supply art-workmen with designs and hints for designs in their various trades; at least this is one object prominently put forward in the prospectus, as we have before mentioned. The designs are the work of a thoroughly-practised hand, who is material from many different styles at his fingers' ends, as is illustrated in the plates already published, which are certainly sufficiently diverse in style and motive, and perhaps rather diverse in value also. What we take to be the author's own style, more especially, is exemplified in plate 3, with conventionalised what-are-they?-standing on a leg, with rosettes for eyes, amid conventional scrollwork of spiky and angular proclivity; this, and some others of a similar bearing, ingenious, no doubt, and show facility of pencil, but we do not think the taste of the first-rate. They look "knowing," a quality we do not like in ornament. However, it is "Modern Ornamentation," and "modern" these undoubtedly are. In plate 7 Dr. Dresser has given one of those examples of ornament with a meaning in it, in a circular panel called "Night," which he has been fond of play with before, and which represent a veiled ornament that might be more worked than is. Plate 4 shows some charming patterns derived from Persian models, and plate 9 a number of suggestions in one page, borders, &c., most of which are good. But cannot admire much the style of some of the work, although the drawing is admirable, the principle of each design consistently caught. The plates have been very well photographed by Messrs. Kell.

NO decision has yet been arrived at with regard to the Fulham Vestry Hall competition. We are informed that the Committee have disagreed with Mr. Curry's award, and are in favour of giving the premiums to three designs other than those selected by Mr. Curry. This, we understand, was in accordance with the recommendation of a sub-committee appointed by the Committee to go into the subject in detail. The recommendation was adopted by the Committee, and brought before a full meeting of the Vestry, who referred the subject back to the Committee for re-consideration. We hear that the Committee are to give their final decision this Friday evening, Feb. 5th, and that their report will come before the Vestry on Tuesday evening next. From what we hear, the "tale of jobbery" of which we have already expressed forebodings is likely to be fulfilled unless the members of the Vestry as a whole are very vigilant. Some ugly things are being whispered as to the way in which the affair is to be "arranged." We can hardly believe what we hear; but before the Vestry ratifies the decision of the Committee we hope it will make full inquiry as to some of the allegations which, as we are informed, are rife in the neighbourhood.

LETTER FROM PARIS.

CONTEMPORARY art has suffered a great loss in the person of Baudry, who was a man not only of great talent but of high and generous character, despising the rivalries of artistic coteries, and employing his powers upon subjects in the region of pure idealism. When his reputation was made, instead of devoting himself to coining money, like too many of his contemporaries, he sacrificed everything to art, and gave ten years of his life to the decoration of the Opera House. It was, so to speak, at the point of the sword that he conquered each step upward in his artistic career; and when he, the son of a poor old sabotier in a Breton village, came to Paris to study, the subvention which the Municipal Council of Roche-sur-Yon allowed him just prevented him from starving. He pushed on his course, however, with perseverance and tenacity; gained the second "Prix de Rome" in 1847, the "Grand Prix" in 1850, and then became at the Villa Medici the inseparable friend of Chas. Garnier. He was made Chevalier of the Legion of Honour in 1861, officer in 1869, member of the Institute in 1870, and Commander in the Legion of Honour in 1875, and obtained, four years ago, the "Grande Médaille d'Honneur" for his design for a ceiling painting, "La Glorification de la Loi," intended for the Cour de Cassation.

Among his works, we may recall his "Jean Baptiste," "La Supplice d'une Vestale," "La Fortune et l'Enfant," "Charlotte Corday," "Amphitrite," "La Perle et la Vague," the portraits of Madeleine Brohan, of Beulé, Guizot, and Chas. Garnier, and also the curious and little-known decoration of the Hôtel Paiva, in the Champs Elysées. But his great work, and that by which he will be remembered, is his decoration of the Opera House, which the action of gas and smoke had blackened and rendered almost invisible. Thanks to his friend Garnier, the work is to be carefully cleaned, and will re-appear, it is hoped, in all its details. It would have been a consolation to poor Baudry, before quitting the circle of friends who surrounded him with such affection and respect, to have known that his great work was to be restored, thanks to the care of another great artist, so as to remain as a permanent evidence of his genius.

There was an illumination of his work in the Opera House on the evening of his funeral, and the audience thronged into the foyer to indulge their admiration. There was a great charity fête at the opera that evening, of which a word may be said, and in which architecture played its part as well as music, drama, and dance; artificial architecture, be it understood, consisting of decorations intended to place before the spectators the idea of the history of the theatre from its origin till the eighteenth century.

In a piece imitated from Eschylus, the organisers of the fête endeavored to show in the first instance the Greek theatre, its entrances and decorations. The chorus were here, no doubt, and various details were given

with more or less of archaeological probability, but the architecture presented in no way realised the ancient Scene as described by Vitruvius, and which, with the help of the existing remains of various theatres, might certainly have been realised. The same partial fidelity and absence of real knowledge was shown in the presentation of the Roman theatre. We say nothing of the theatre of the Middle Ages, consisting of a few hoards put on trestles. The whole was unfortunately a superficial kind of attempt. The scene which took the public, in this series, was that of the Théâtre du Marais under Louis XIII., in which "local colour" had been respected, and for which the Mobilier National had lent some of the decorations which had once been used by the "Comédiens du Roi."

An interesting evening, in spite of criticism, and one which produced 100,000 francs for the benefit of the poor; and M. Alphonse, the indefatigable organiser of these charity fêtes (which are to continue to the 16th of May), is to be congratulated on the result so far. In view of the historic processions which are to defile through Paris on the 7th, 8th, and 9th of May, there is some talk of having a public competition at the École des Beaux Arts, for the designs from which the costumes of corporations and the allegorical cars will be made. This idea has caused great excitement among the pupils of the school.

It is to be regretted that the same piety towards the works of the departed artist which M. Garnier showed to those of Baudry does not prevail in all cases. Recently, the work at the Church of the Sacred Heart at Montmartre was suspended, by the order of the Cardinal Archbishop of Paris, under the pretext that the continued rain rendered the suspension necessary. This was a pretext, and the truth is that M. Daumet, the successor appointed by M. Abadie to carry on the work, has apparently desired to put something of his own into it, and has commenced to carry out a modification of the plans of his predecessor. He wishes to increase the height of the building, to raise the walls 4½ metres, to give to the cupolas the usual form of those of the seventeenth century, to replace the clock-tower designed by Abadie by a construction destitute of character; and, in one word, to put on one side the original conception in order to replace it with his own. Thereupon follows an energetic opposition of the Committee, the veto of the works, and the constitution of a jury of arbitrators composed of M. M. Bailly, Vaudremer, and Garnier, to settle the question. The judgment of this jury was very decided. It was, in effect, that the design of Abadie had been selected from among seventy-seven designs submitted in competition; that his idea must be respected by his successor, who was, in fact, his testamentary executor, bound in consequence to carry out his last wishes and to realise his grand conception. M. Garnier also expressed his opinion that the design as left by Abadie was a superior one to the proposed modification. The arbitrators thought there was no necessity to modify the subdued effect of the lighting of the choir, which M. Daumet wished to illumine holdly, while Abadie wished for the rich gloom and shadow of St. Marc or St. Front. But in thus recalling the new architect to respect for the deceased artist and his work, the arbitrators wished also to bear testimony to the ability of M. Daumet, who was most worthy, for his former works and his known professional erudition, to attach his name to the completion of the basilica of Montmartre.

Reference has already been made in the *Builder* to the exhibition of the designs of the late M. Magne, which were got together by his son, M. Lucien Magne. In this very interesting exhibition we notice the design made by Magne in 1871, in the competition for the Hôtel de Ville. As an artist much in love with the elegant forms of the Renaissance, Magne would have respected religiously the façade of Boccador, which he showed raised on a large flight of eighteen steps, like a jewel in a setting. The idea is that of an artist. It leaves to the monument its harmonious proportions; while in the design of Ballu, the architectural mass a little injured the impression of the fine detail. We may remark also in that collection the design for the Église St. Bernard, a building of great excellence, and studied with great care.

This exhibition recalls us for a moment to Baudry, in honour of whom some great artistic

manifestations are talked of. Besides an exhibition of his works, both those belonging to the State and those in private hands, whose owners are all ready to lend them, there is talk of lighting the foyer of the Opera House by electric light and admitting the public generally.

When these lines appear the exhibition of water colours of the French School will have opened its doors in the Galerie Petit. We must, however, leave to our next letter our impression of this brilliant and popular exhibition, the opening soirée of which draws every year the elegant "all Paris" of "first representations." By the side of a collection in which are mingled the graceful "society pictures" of Heilbuth and Madeleine Lemaire and L'Amé, the sporting scenes of J. L. Brown (like the blare of hunting-horns), the poetic landscapes of Gazin, and the marvellous drawings of Detaille, the neighbouring exhibition of M. Berchère, 5, Rue de la Paix, may appear a little *monocorde*. One must pay tribute, however, to those conscientious studies of a painter who goes straight to nature, and whose talent is especially adapted to the rendering of that melancholy calm of Oriental landscape. There is in this little exhibition a charm and an impression of sincerity which is very attractive, and which proves that, in spite of his age, M. Berchère's talent has always remained poetic and youthful.

It is also in the Rue de la Paix that there is to be opened an exhibition of works offered to the committee formed to erect a monument at Nancy to the memory of Claude Lorraine. There are more than 200 works of art,—pictures, statues, drawings, engravings,—signed by the best names among certain contemporary artists, and which are to be sold by lottery for the profit of the undertaking. Among the finest contributions is a portrait of the landscape painter Français, by M. Bonnat.

The annual exhibition of the "Mirlitons," the artistic club of the Place Vendôme, is also open. It had, as always, a great social success. A great many portraits this year, among which are specially to be noted that of Cabanel, painted by himself, and that of M. de la Borde, the Academician, by M. Bonnat; a military scene, entitled "Sous Bois," by M. Protais; a "Revue," by M. Detaille; a curiously-realistic scene, by M. Gerver, "Le Bal d'Opéra à 5 h. du Matin"; a fine piece of still life, by M. Philippe Rousseau; two busts by M. Franceschi; two terra cottas, by M. de Saint-Marceaux, &c. These selections indicate, as will be seen, an exhibition of a high class, which fully merits its continually-increasing success.

There is talk of the candidature of M. Meissonnier for the Senate; but in the absence of any proof to the contrary, this may probably be regarded as a *force d'atelier*, and we shall not see the painter of the infinitely little enter on this new career of ambition. Unhappily we have still present in our minds the varnished boots and silk attire in which "Colonel" Meissonnier was tricked out during the siege of Paris. These recollections make us dread another relapse. There is also talk, and the matter is nearly decided, as to some statues commemorative of national glories; at Paris, statues are proposed of General Chevert; of the chemist, Nicolas Loblanc; of Denis Papin; and of Henri Martin. The execution of this last has been entrusted to M. Marquet de Vasselot. At Tours there are to be statues erected to three eminent medical men,—Trousseau, Bretonneau, and Velpeau. Times are so bad, and the situation of artists so lamentable at present, that in spite of our repugnance to this multiplication of posthumous heroes in statuary encumbering the public ways, one must applaud the Government for attempting to find work for all. The general stagnation which has affected art as well as industry has been the subject of an interesting lecture by M. Paul Haag, engineer-in-chief to the Department of Roads and Bridges, at the "Société Centrale des Architectes." M. Haag, who had taken for his text the metropolitan railway scheme and the re-opening of public works in Paris, wished to show that the two questions were intimately connected, and in constructing a metropolitan railway, not in tunnels as in London, but on iron viaducts over some of the streets, they would be giving a great impetus to the various branches of building industry. The arguments of M. Haag are plausible, but, as the Municipal Council and general public opinion have long ago pronounced against the creation of an open railway above the streets,

the conclusions of the lecturer may be classed among Utopianisms.

As to the re-opening of public work, nothing much can be done till Parliament has passed a decisive enactment in regard to the Exhibition of 1889. The actual pre-occupations of the Cabinet are, unfortunately, not of a nature to hasten the solution of that question. It is already late in the day, and what work there is to be gone through, and what transformations to be made in Paris, to prepare it for this approaching demonstration! The prolongation of the Boulevard Haussmann; the enlargement of the Carrefour Montmartre; the continuation of the Rue de Rennes to the Seine; the construction of a new bridge over the river between the Rue de Rennes and the Palais Royal; and all this without counting the Bourse de Commerce, the transformation of the Quartier des Halles, the metropolitan railway, and the immense works of the Exhibition itself. There will be no want of work, at any rate, and the "crisis" will be at an end,—if only the Chambers will consent to go to work in earnest.

In the meantime, we are restricted to consolidating the Pont Neuf, which has been reopened for traffic. Centerings are being constructed under the arches that have shown signs of failure, and when this is done, the second pier and the second and third arches from the left bank will be rebuilt piece by piece.

The new works for the Musée Guimet will probably be commenced in the spring. We believe we have already mentioned that the city was going to present a site to the State for it. With this object the Municipality have bought a piece of ground of about 4,000 metres in extent near the Trocadéro, adjoining the Rue Boissière, at the price of a million francs. Here will be constructed the building to which will be transferred the curious Oriental collection which M. Guimet had got together at Lyons, and which he offered as a free gift to the Ministry of Public Instruction.

We have to record the death of M. Léon Gancherel, an engraver of great merit and artistic director of the journal *L'Art*. Gancherel was born in Paris in 1816, and had obtained successively a medal of the third class in 1853, one of the second class in 1855, medals at the *Salons* 1859, 1861, and 1863, and the Cross of the Legion of Honour in 1864. He was a conscientious artist, whose example and instruction have formed a large proportion of the modern engravers and etchers.

We have also lost recently a painter of merit who was known for his military scenes,—Eugène Louis Ginain. He was brother of the eminent architect of the Church of Notre Dame des Champs, and other buildings. The two brothers had lived long in close and affectionate union. The deceased artist received a decoration in 1878. Much sympathy has been expressed and shown towards the surviving brother by the many friends who deplore and share in the loss which he has sustained.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifth ordinary meeting of this Institute for the present session was held on Monday evening. Mr. E. P. Anson (Vice-President) occupied the chair, in the absence of the President through indisposition.

The Proposed New Charter.

Professor Kerr asked when the members might expect the report upon the draft of the new Charter?

Mr. Macvicar Anderson (hon. secretary) thought it would be necessary to have another meeting of the Charter Committee to draft the report before it could be submitted to a general meeting, as it would scarcely be courteous to a general meeting to send out the draft Charter in a crude form without giving the reasons for the alterations.

Professor Kerr said he hoped there would be no further delay. The minority report was ready, and waiting for an opportunity to be delivered.

In reply to a further question by Professor Kerr, Mr. Macvicar Anderson said that the report of the Committee on Departmental Action had been received, and was to be printed in the next issue of the "Proceedings."

The Architectural Examination.

Professor Kerr, under by-law 69, gave notice of his intention "To direct attention at the next ordinary meeting to certain proposals published by Mr. Arthur Cates in the professional journals of 23rd January last, and addressed to candidates for the Associateship; and to ask by what authority from the Council, or from any general meeting or otherwise, such proposals were so published."

The Charterhouse.

Mr. Hebb inquired if the Council had taken any action in regard to the Bill introduced by the Governors of the Charterhouse for the purpose of building on their estate? He understood there was a reference to the Committee on the Conservation of Ancient Monuments, and the meeting might like to have some information as to whether any progress had been made.

The Chairman said the subject had received careful attention on the part of the Committee on the Conservation of Ancient Monuments. The matter had been reported to the Council, and steps would be taken in reference to the proposed works at the Charterhouse. It seemed to him, however, that, though not all, yet the greater part of what was interesting to the public would be preserved intact. He had, moreover, the authority of the Registrar of the Charterhouse for saying, as a sort of guarantee for the continuance of the group of buildings, which though not very ancient, was so picturesque and full of interest, that it was proposed to dedicate that portion as a residence for the Bishop of London.

Mr. E. C. Rohius having referred to the desirability of continued efforts on the part of the Institute to secure the widening of St. Paul's Churchyard,

The Chairman said that the President was in correspondence with the civic authorities on the subject.

Studentships.

The Chairman said it was his pleasing duty to present to Mr. J. B. Gass, Associate, the holder of last year's Godwin Bursary, the medal which their excellent friend, Mr. George Godwin, had provided for each recipient of the Bursary. Mr. Gass, as they knew, had done very useful work in America, which, he hoped, would be as permanently useful to himself as it had been interesting to this Institute. The Chairman then presented the medal to Mr. Gass.

Mr. W. H. Bidlake, M.A. Cantab., who won the Pugin Travelling Studentship last year, next came forward to receive the Pugin Medal. In presenting it the Chairman said he had never seen a more beautiful set of drawings than those submitted by Mr. Bidlake.

The Chairman also announced the awards of the Travelling Studentships for the current year, viz., to Mr. Henry D. Walton, 6, Moore-street, Cadogan-square, the Pugin Travelling Studentship; and to Mr. G. J. Oakeshott, 45, Sloane-square, the Aldwinckle Travelling Studentship. This studentship had been very generously given by Mr. T. W. Aldwinckle, a well-known London architect, whose good example, he hoped, would be followed by other members of the profession. Mr. W. T. Oldrieve, of 1, Stanhope-place, Edinburgh, an Assistant-Surveyor in H.M. Office of Works for Scotland, had gained the Godwin Bursary, but there had been no competitors for the Owen Jones Travelling Studentship.

The Royal Gold Medal.

The Chairman.—The Council propose to submit to Her Majesty the Queen the name of M. Charles Garnier, Hon. and Corresponding Member, and a member of the Institute of France, architect of the New Opera House at Paris, as that of the recipient of the Royal Gold Medal for the year. To my mind the Paris Opera House is one of the noblest of modern works; its design is grand, its details are most carefully studied, and it is most gorgeous and magnificent.

Professor Kerr.—Nobody could for one moment hesitate to grant the Gold Medal to M. Garnier, but is it not the turn of an Englishman this year? Are we entirely exhausted?

The Chairman.—We are not exhausted, but last year it was not given to an architect, but to an archaeologist. The names of English architects also were under consideration, but seeing that we have not awarded the Medal of late to a

foreign architect, the Council fixed upon so distinguished a man as M. Garnier, who probably ought to have had the Medal before.

The late Professor Donaldson.

Mr. Wyatt Papworth then read a paper entitled "The late Professor Donaldson's Connection with the Institute." Mr. Papworth commenced by referring to his family's early connexion with the Institute, and his own first recollections of it. In 1834, Mr. Donaldson and other architects attended a meeting to consider the expediency of forming an Architectural Society. The scheme seemed somewhat crude and ill-digested, and Mr. Donaldson suggested the propriety of forming a more extended association. After various meetings a well-digested scheme was drawn up and adopted, the Institute of British Architects being inaugurated on the 15th of June, 1835, with Lord De Grey as president, and Mr. Donaldson as one of the vice-presidents. Two of the earliest subjects of his active mind were the Institute motto, "Decorum urbanum civium," and the design for the Institute medal. At that time it was essential to have a paper ready for any unexpected vacancy, and Mr. Donaldson was always prepared for an emergency. In 1835 the Institute published a pamphlet, entitled "Questions upon various Subjects connected with Architecture, for the Purpose of illustrating Uniformity of Observations, and Intelligence in their Communications to the Institute." No one who perused the paper could doubt who had compiled the manuscript, and the suspicion of its being by Mr. Donaldson was confirmed by the preface, signed by him. Also, to further the formation in the library of a series of the printed editions of the father of the profession, he compiled "Particulars relating to the Manuscripts of Vitruvius preserved in various European Libraries," a valuable contribution on the subject. In 1836 he contributed a considerable number of papers on Italian and other subjects. In 1838 his name appeared on the Committee appointed to consider the subject of public competitions for architecture designs, and in the same year he was one of a deputation appointed on behalf of the Institute to negotiate for the junction of the Architectural Society with the Institute, which was accomplished in 1842. In 1839 he resigned the post of honorary secretary, becoming Honorary Secretary for Foreign Correspondence. On his retirement the members presented him with a silver centrepiece of the value of 100 guineas, making him at the same time a life member. In 1842 he was appointed Professor of Architecture at University College, and in 1842-4 he was one of the vice-presidents and Honorary Secretary for Foreign Correspondence of the Institute, in 1844 holding the latter post only. In 1846—while retaining this post, he had also a seat on the Council, and for 1849-50 was one of the honorary secretaries for some time. In 1851 the Royal Gold Medal was awarded to him. Later on he prepared a paper on the Royal Tombs in Westminster Abbey, mentioning that advisers of the Sovereign should see to the restoration of these ancient memorials. The result was an address to the Queen on the subject of the preservation of these tombs, and in 1855 a certain sum was voted for the purpose, though it would be difficult to say what that amount, and what had been done with it.

In 1859, Professor Donaldson retired from the post of Hon. Sec. for Foreign Correspondence. His relations with distinguished foreign architects enabled him to do a great deal for the student, and a letter from him was a passport to all the chief foreign architects of Europe. Most of the Honorary and Corresponding Members up to that period were introduced or nominated by him, and the correspondence was kept up by him. In the winter of 1860, the Professor went to Egypt, and on his return explained to the Institute the wonderful discoveries made by Mariette Bey. At the annual meeting in May 1863, Donaldson was elected President in succession to Sir Wm. Tite, and he also delivered his second opening address for the session on 1864-5. On January 15th, 1866, a testimonial medal, bearing his portrait, was presented to him by some of the members, on his retirement as Professor of Architecture, after filling the chair for twenty-three years. The residue of the fund founded the Donaldson's Silver Medal. In 1868-9 he made a journey to Syria and Palestine, and read several papers before the Institute. In 1867 he had accepted the post of Honorary Secretary for

Foreign Correspondence, and acted as one of the honorary secretaries for home duties, which lasted till 1871. His portrait was presented to the Institute by subscription, and placed over the chair as a lasting memorial, not only of Donaldson's presidency, but also of respect and esteem. Donaldson presented the Institute with the gold chain and badge, Mr. John Whichcord being the first President invested with it. He attended the annual meeting on May 23rd, 1881, at the contested election for President, on which occasion he refrained from voting. He also read a paper on the Mariette excavations, though then eighty-six years of age, and that was his last appearance at the Institute. In the course of the paper, Mr. Papworth enumerated Professor Donaldson's many contributions to the Transactions of the Institute, and referred to his liberal gifts of money. The paper concluded as follows:—"For the period I have gone through, or nearly forty years of it, Donaldson was the life and soul of our Institute. He had been the founder, for all others owned themselves his coadjutors. He continued to be its prime mover; for all accepted his leadership to the last. His opinions were not always our opinions, but his policy was our policy, because his heart was our heart. When he left us our blood ran still. Throughout the civilised world his name is still our name, and his fame our fame. He made the influence of English art felt abroad. That influence, administered by his hand, was ever generous; expressed by his genial lips, luminous in his bright and earnest eyes. Well may we be proud of him; for all his pride was in us, and when this filial homage is conveyed by our Transactions, not only to every English-speaking community throughout the globe, but to the great cities and academies of the world, the universal brotherhood of our profession will rejoice in the remembrance and regret the loss of a colleague so worthy of its approbation and applause. In all Europe there is not a Society of Architects which has not in him lost a member. His activity as a correspondent was irrepresible, his enterprise omnipresent, his earnestness provoked earnestness everywhere, his unwearied industry compelled everywhere industrious response. But it was in our own hall that he was truly at home. Who can forget the irrepresible charm of his manner, lighting up the whole assembly with sympathetic lustre, the overflowance of his loquacity maintaining a continual flow of anticipation, the unaffected pleasantry of his wit and his humour never breaking bounds and inspiring all,—that guileless adoration of his art which regarded its great monuments like the great stars of heaven and the knowledge of their secrets as the one thing worth living for? If he announced a book it became a gift of price; if he exhibited a specimen or a relic it became a curiosity that everybody must inspect with interest; if he introduced a visitor it was to claim for him distinction and the welcome of a friend; if he administered a rebuke, or even resented an injury, it was done with a simple-minded dignity and an unoffending authority all his own. But what was the particular excellence of Donaldson's policy in this Institute and on its behalf? Its liberality, its essential reliance upon every one's good sense and good feeling; its trust, its frank acknowledgment and unreserved encouragement of individual opinion. Every architect of fair fame who came into this room was to him a man of intelligence and honour; his very feelings leaned to virtue's side, even his implisiveness the *perferendum ingentium Scotorum*. Who does not remember the graciousness of it, its indignation without anger, its self-assertion without self-conceit, its frown passing in a moment into a smile? In a word, who that has taken Donaldson by the hand, can forget how kind and true and honest was the grasp? Fertile as nature is in producing men for the time, when such men pass away, the feeling may well be excused that we shall never look upon their like again."

Mr. Edward A. Gruning followed with "A Short Memoir of the Late Professor Donaldson." Mr. Gruning gave an interesting account of the birth and parentage of the Professor, and of his early days. His first building was a church at Brompton, which he obtained in competition. This could not be called a success as a specimen of Gothic, but the days of the Gothic revival were then young. Donaldson competed in 1840 for the rebuilding of the Royal Exchange, then recently burned down. [His drawings

were exhibited on the screen.] His design was selected as the best of the first class, and he always felt that he should have been entrusted with the work. Mr. Gruning then enumerated Professor Donaldson's works, which, for one so numerous, were neither very extensive nor numerous. His last work was the re-building of the Scottish Corporation Hall, in Crane-court, Fleet-street, after its destruction by fire, and this was completed in 1880, when he was eighty-five years of age. The paper next referred to his many appointments, and stated that as Professor of Architecture he must be well remembered by many of the profession. Donaldson always paid great attention to the preparation of his lectures, and was most anxious to have them copiously illustrated, the illustrations being at the service of the students for the purpose of home study. Of his private pupils, only two were now alive, viz., Mr. J. P. Seddon and Mr. Gruning himself. Donaldson was always at the call of any member of his profession wanting advice or assistance, as many a now prosperous architect could well testify. He died on the 1st of August, 1885, being then only two months short of ninety years of age.

Mr. Hebb remarked that he had had the advantage of being a fellow-student with Mr. Gruning under Professor Donaldson, and could bear the most sympathetic testimony to the manner in which he managed to conciliate all his pupils, and to interest them in their work. Even as an old man he was always interested in the young, and ever endeavouring to further the interests of architecture in all its developments. He was a man who above all things worked probably more for others than for himself. Had he taken a more selfish view of life he would doubtless have had another career, but he chose to devote himself more particularly to the interests of architecture. Mr. Hebb concluded by proposing a vote of thanks to the readers of the papers.

Mr. C. Forster Hayward, F.S.A., seconded the vote of thanks. As a student he had always felt that nothing could have been more congenial to the feelings, and have given a young man a higher conception of the art he intended to practise, than the lectures and illustrations of Professor Donaldson. He was always interested in youthful effort, and assisted many in making a start in life.

Mr. James Brooks said that Professor Donaldson prepared his lectures and drawings with great care, and took the utmost interest in young men. A more genial, painstaking, and lovable disposition than his never existed.

The Chairman added that the first time he became more intimately acquainted with Prof Donaldson was something like forty years ago, when he (the speaker) read a paper before the Institute on the restoration of one of the Athenian temples. He was also intimately associated with the Professor during a short visit to Brussels, and a more congenial companion it was impossible to conceive. At one time he was the life and soul of the Institute, and he managed to bring it prominently before the attention of foreign architects. On the whole he believed the concluding remark of Mr. Papworth's paper was justified, that it would be difficult, if not impossible, to look upon his like again.

The resolution was then carried by acclamation, and the meeting adjourned to the 15th inst, when Mr. Alexander Beazeley, M. Inst. C.E., will read a paper on "Swedish Building Law."

The Report of the Special Committee on Departmental Action is published in the number of the Institute's Journal of Proceedings for the 4th inst. The Committee have arrived at the following among other conclusions, viz.:-

1. That the principle of Departmental Action promises to serve various highly useful purposes, in providing the proper organisation for the action of the members at large, as a public body, in the interest of the Art, Science, Literature, and Practice of the profession.
2. That the Departments may, for the present, be four in number, taking the names of "Art," "Science," "Literature," and "Practice" respectively; it being probable that most of the work in question might be without difficulty divided between such four Departments, each being administered by a standing Committee acting under proper By-laws of this Institute.
3. That the Examination work of the Institute ought to be separate and distinct from each departmental organisation, and placed in the hands of a Special Examination Board as at present; but that the several Departmental Committees might probably be consulted with advantage respecting the nomination of the members of such Examination Board.

Each Departmental Committee is, it is proposed, to consist of twenty-one members, viz.,

ten Fellows and six Associates, and five members of the Council, to be elected annually. Each is to elect its own chairman, vice-chairman, and honorary secretaries. It is proposed that the work appropriated to the existing "ordinary committees" appointed by the Council may be divided amongst the four Departmental Committees, with the exception of finance and the adjudication of medals and prizes.

NEW BY-LAWS FOR CONCRETE-BUILDING IN THE METROPOLIS.

The following is the draft of the new by-laws proposed to be adopted (under the provisions of the Metropolis Management and Building Acts Amendment Act, 1878) with regard to concrete-building, which were referred to in our last (p. 216, ante). The Board announces its intention of asking the Home Secretary to confirm them:—

METROPOLIS MANAGEMENT AND BUILDING ACTS AMENDMENT ACT, 1878, SEC. 16. ADDENDA TO BY-LAWS.

2A. Description and Quality of the Substance of Walls.

Whenever concrete is used in the construction of walls, the concrete shall be composed of Portland cement, and of clean Thames or pit ballast, or gravel or broken brick or stone, or furnace clinkers, with clean sand, in the following proportions, viz.:—One part of Portland cement, two parts of clean sand, and three parts of the coarse material, which is to be broken up sufficiently small to pass through a 2-in. ring.

The proportions of the materials to be strictly observed, and to be ascertained by careful measurement; and the mixing, either by machine or hand, to be most carefully done with clean water, and, if mixed by hand, the material to be turned over dry before the water is added.

The walls to be carried up regularly and in parallel frames of equal height, and the surface of the concrete filled in; the frame to be left rough and uneven to form a key for the next frame of concrete.

The thicknesses of concrete walls to be equal to the least thicknesses for walls to be constructed of brick-work, prescribed by the 12th section in the first schedule of the Metropolitan Building Act, 1855.

Such portions of concrete party-walls and chimney-tacks as are carried above the roofs of buildings to be rendered externally with Portland cement.

3A.—Duties of District Surveyors.

It shall be the duty of each District Surveyor, on receiving notice of the commencement of any house, building, or other erection, or of any alteration or addition, or on his becoming aware that any house, building, or other erection, or any alteration or addition is being proceeded with, to see that the provisions of the foregoing By-laws are duly observed (except in cases where the Board may have dispensed with the observance thereof), and to see that the terms and conditions upon which any dispensation may have been granted, are complied with.

4A.—Fees to be Paid to District Surveyors.

There shall be paid to the District Surveyor, in respect of his supervision of every building constructed wholly or in part with concrete walls, a fee one-half more in amount than the fee to which he would be entitled under the Building Act for new buildings or additions. No additional fee is, however, to be charged in respect of any alteration to a concrete building.

A MODERN IRONWORKER'S FORGE.

The first Saturday afternoon visit of the current session of the Architectural Association was made on Saturday last, when, on the invitation of Mr. Alfred Newman, a large number of members visited his works at Archer-street, Haymarket, to see the various processes for working wrought iron. Mr. Newman had very kindly arranged to keep the men at work on Saturday afternoon, and had each forge labelled so as to illustrate the different kinds of forging that are employed to produce the work for which he is so well known. The forges were labelled "Leaves, Heads, and Masks," "Setting and Welding," "Flattening and Fulling," "Scrolling and Foliated," "Spirals and Pike heads." At the first forge Mr. Newman showed the difference between malleable iron and wrought iron by heating a piece of the former red-hot and striking it with a hammer. It flew to pieces at once. The wrought iron being heated in a similar way was only bent about, and, as was explained, became tougher the more it was worked. At the forge some masks were made while the members were present, similar to the very striking bull-dog gas-brackets de-

signed for the Duke of Hamilton, for Easton Hall, by Mr. Binyon, several examples of which were shown in the collection of finished work which had been laid out for the members to see. The second forge showed the processes of setting and welding, several large iron bars being joined together during the afternoon. The smiths at the third forge were engaged in widening out the ends of bars of iron and cutting notches in them for the purpose of making the small dowel used in connecting certain parts of the work together. The fourth forge was being used for making the scroll-work so largely used in wrought-iron designs: the iron, being heated to a dull red, was bent round a special model fixed in an iron case. The last forge was devoted to the manufacture of the wire spirals and leaves, which are so delicately worked, thus affording an example of the wide scope of design to which wrought iron adapts itself.

In addition to the work being executed, a very interesting series of finished work was exhibited; amongst others were two wrought-iron panels for the Marquis of Londonderry, designed by Mr. F. B. Wade. These were beautiful specimens of ironwork, both as regards the design and execution. A very quaint design, by Mr. Binyon, for a gas standard to a newel-post at Easton Hall, exhibited the crest of the Hamilton family, the salamander being surrounded with gas jets on the cap of maintenance. A triangular wall lamp for a country fire-engine station, and several pendent lamps, were examined. Mr. Newman's large collection of old ironwork also afforded a very good opportunity for the study of this interesting form of art-work.

That the opportunity of seeing the actual execution of the various operations was considered a privilege to be eagerly sought after was shown by the large attendance of the members, and the interest they took in the work, and there is no doubt that an afternoon spent in this way is most valuable for showing the difficulties, as well as the possibilities, of working in iron and carrying out the designs of architects, and it is to be hoped that the example set by Mr. Newman may be followed by other art manufacturers, as familiarity with the process of manufacture cannot but improve the character of the designs prepared, for a knowledge of the difficulties to be met with in dealing with different materials would often prevent the production of designs which it is impossible to carry into execution as originally shown.

Mr. Colvin and the Cambridge Slade Professorship.—Mr. Colvin's resignation of his chair at Cambridge is matter of regret, but hardly of surprise. It became, in truth, inevitable when the Slade Professor accepted the custody of the Department of Prints and Drawings at the British Museum, and its occurrence from that moment was merely a question of time. The Keeper's duties are too engrossing, his responsibilities too heavy and too serious, to permit the existence of divided aims; and it says much for Mr. Colvin's energy, and much for his faculty of hard work, that he should have carried on the labours of his double charge so long. He has held the Slade Professorship for thirteen years (since the January of 1873, in fact), and during his tenure of office he has impressed upon the work of the chair a very definite tendency and a very well-marked direction. The place, as he has conceived it, is a place apart. It is small wonder Mr. Colvin's classes were popular, not only among the undergraduates, but with the general Cambridge public. Of their efficiency there is an abundance of proof. One of Mr. Colvin's pupils, Mr. W. Martin Conway, whose study of Reynolds and Gainsborough we recently reviewed, has lately been appointed Professor of Fine Art at Liverpool; another is Miss Jane Harrison, an accomplished lecturer and teacher, and author of a work so sound and scholarly as "The Myths of the Odyssey," and the excellent "Introductory Studies in Greek Art"; a third and fourth, Mr. Ernest Radford and Miss Julia Cartwright, are known, the one as a lecturer in connexion with the University Extension movement, the other as a writer on the art and men of the Italian Renaissance; while a fifth and sixth, Miss E. A. Gardner and Mrs. A. H. Smith, are now in charge, for the Egyptian Exploration Committee, of the excavations and researches at Nankratia.—*Saturday Review.*

Illustrations.

LIVERPOOL CATHEDRAL DESIGNS.

WE give this week the majority of the fine series of drawings by Mr. Jas. Brooks which are hitherto unpublished. The large view from the north-east is taken from the platform street in front of the Free Public Library, and shows the portion of St. George's Hall immediately adjoining the cathedral, and its proportions and scale relatively to the new building. The view serves to bring out in an effective manner the simplicity and solidity of treatment adopted in the design. In the south-east view the interior of the cathedral precinct is shown, and the subsidiary buildings in connexion with it. We give also elevations of the east and west ends, the latter showing a portion of St. George's Hall in elevation in the rear; but it must be observed that in perspective St. George's Hall could not be seen from any accessible point of view over the residential buildings and cloisters to the extent to which it is shown in this elevation. The reproductions of the sections, though to a small scale, are sufficient to show the constructional balance of the building, and the ample solidity of the buttressing.

ARCHITECTURAL SOCIETIES.

Leicester Society of Architects.—The annual general meeting of members of this society was held on the 29th of January, when the following officers were appointed for the year 1886.—President, Mr. J. B. Everard. Council, Mr. R. J. Goodacre, Mr. J. Goddard, Mr. J. Tait, Mr. J. Berradale, Hon. Sec., Mr. W. Jackson. **York Architectural Association.**—On the 28th ult. an interesting lecture was delivered in the saloon of the Victoria Hall, York, by the Rev. Newton Mant, vicar of Sledmere, on "Classic Architecture and Modern Church Building," in the course of which he dwelt on the importance of the work of Wren as evidenced in some of the City churches. At the close, on the motion of the President, Mr. A. Pollard, seconded by Mr. B. Priestley Shires, a hearty vote of thanks was accorded to the lecturer.

SOCIETY OF ENGINEERS.

THE first ordinary meeting for the present year of the members of the Society of Engineers was held on Monday evening, February 1, at the Town Hall, Westminster. The chair was first occupied by the retiring President, Mr. Charles Gandon, who presented the premiums of books awarded for papers read during the past year. These were to Mr. W. Newby Colam for his paper on "Cable Tramways," and to Mr. J. B. Redman, M. Inst. C.E., for his paper on "Tidal Approaches and Deep Water Entrances."

The retiring President then introduced the President for 1886, Mr. Perry Fairfax Nurse, who proceeded to deliver his inaugural address. After thanking the members for having elected him to the chair, the President referred to the satisfactory position of the Society, and reviewed its work during the past year, summarising each paper read, and supplementing some by subsequent information upon the same subject. In like manner he reviewed the visits made to engineering works during the vacation. After noticing the leading scientific events of the year, he directed attention to the comparatively insignificant effects produced by the engineer in works done by blasting operations as compared with the gigantic dislodgments effected by nature in the development of analogous forces. He gave particulars of several extensive blasting operations, including the two bravest on record at Hell Gate, New York, in 1876 and 1885 respectively. He also gave by way of comparison, statistics concerning many earthquakes and volcanic upheavals, some 7,000 of which it was computed had taken place within historic times, and from the effects of which many millions of human beings had perished, the physical character of vast tracts of land having been transformed. Passing on to consider the present advanced state of engineering science and practice, the President observed that we were rather prone in the present day to exult ourselves at the expense of the ancients, whom we were wont to consider as possessing no science whatever according to the modern acceptance of the term. But he pointed out

that, although text-books of the ancients and other similar evidence had not been bandied down to us, yet in many instances which named a large amount of scientific skill and knowledge had been manifested, although of different character from that of the present day. The works of the ancients, he said, were distinguished for their massive grandeur, and were typical of brute force; those of the moderns for elegant lightness and delicacy of detail, indicating a higher and more refined culture, which aimed at economising material and power. The President then proceeded to point out that many modern engineering inventions and scientific discoveries had been foreshadowed in the past, and some even definitely described. From the long interval between the prediction and the fulfilment he drew a lesson of patience and unresting, but not restless, perseverance in our work, finally pointing out that the progress of science was very far from being measured by its material achievements. It had given standards of truth at once absolute and accessible, and great as had been its material rewards, its moral rewards would be greater still.

At the conclusion of the address, Mr. J. A. Church, Past-President, proposed a vote of thanks to the President, which was seconded by Professor Henry Robinson, Vice-President, and cordially passed.

Having acknowledged the same, the President announced that the Council, upon his proposition had nominated Professor Francis Elgar, LL.D., F.R.S., of the Glasgow University, an honorary member of the Society. He also stated that the Council had, upon his motion, instituted "President's Premium" of Books, which would be awarded annually, in addition to the other premiums awarded by the Society for papers read during the year. He then made a gratifying announcement that, at his request, Sir Henry Bessemer (honorary member) had kindly undertaken to present to the Society an annual premium of books, to be designated "The Bessemer Premium." He then proposed that the best thanks of the Society be given Sir Henry Bessemer. The proposition was seconded by Mr. W. Barns Kinsey (member of Council), and carried with acclamation.

OBITUARY.

Mr. John Goad, the sole partner of the firm of Messrs. J. & E. Goad, marble quarry and statuariers, of Stonehouse, Devon, was found dead in bed on the morning of the 23rd ult. He was sixty years of age, and died of heart disease. Mr. Goad was a native of Plymouth, and served an apprenticeship as a granite mason at the Laira Granite Works, outside Plymouth. He worked on the Plymouth and Harwich Breakwaters and at Dover Pier. Subsequently he became foreman of the Alderman Docks, and then, after a time, returning to his native town, started business as quarryman and statuary in partnership with his brother, who died suddenly in June, 1877. Mr. Goad carried on probably one of the largest marble businesses in the kingdom, and it was from his quarries that the Devonshire marbles so largely used in the new Oratory at Brompton were taken. Mr. Goad leaves four sons and two daughters to mourn his loss. The interment took place at the Plymouth Cemetery on the 28th ult.

Mr. Robert Warren Best, architect, Exeter, died on Monday night, after a short illness, in his fifty-seventh year. Mr. Best was formed in partnership with his brother, but for some years the firm has been known as Messrs. B. & C. Commin. He had long enjoyed an extensive practice, and held several public appointments.

Liverpool Cathedral Illustrations.—We have been surprised by the appearance in the pages of a contemporary of two of the illustrations of the Liverpool Cathedral designs, viz. the interior view of Messrs. Bodley & Garner, and the interior (looking west) of Mr. Brooks, which are evidently reproduced from the plates appearing in our issues of 9th and 16th ult. respectively. For some reason, best known to themselves, our enterprising contemporary thought it to adopt this course without acknowledgment. This method of obtaining illustrations is highly flattering, no doubt, to ourselves, but as to its propriety we will leave our readers to judge.

CATHEDRAL FAÇADES.*

CATHEDRAL design to-day is a matter which is exercising to a great degree the critical faculties of every architect, and all our minds are falling back upon recollections and studies of the great churches of bygone times for standards of judgment and comparison; as well as to obtain darts and stones wherewith to assail the declared enemies of our long cherished and precious ideals. But our subject was chosen and the occasion of its discussion determined in peaceful times; no special interest attached to it then, no war-hatchets were being furnished to stimulate public excitement, and nothing much had been said or written to arouse that flame of enthusiasm which now is so keenly burning within us for the victory of one or another of the competing masters. Our simple purpose is to study some ancient cathedral façades for the encouragement of our imaginative qualities, that we may derive lessons from them which may be useful in our ordinary work of design, and that they may teach us how, readily to see, and hold to take advantage of, the opportunities which may be offered us of doing great and good architectural work in whatever buildings or designs we may be occupied with.

We are accustomed to regard cathedrals as buildings that do not in the ordinary sense of the terms possess a front, sides, and a back. In this country they are, as a rule, planted in ample precincts round which the spectator roams, enjoying the variety of grouping and picturesque and effective massing of towers and transepts, flying buttresses and pinnacles, gables and roofs, obtained by the use of that most artistic arrangement of plan, the cruciform placing of nave, transepts, and choir. The crossing lantern tower thus really becomes not only the central object of interest, but is depended upon to give the cathedral idea of majesty and beauty to the church; in fact, the lantern tower makes the cathedral; and its importance is so well understood in England that the cathedral tower has become to us the idea of the city that surrounds it, and which owes her place among the cities of the realm to its presence in her midst. Turner the painter's remark that the dome of St. Paul's made London, is simply the expression of a sentiment that each one is conscious of, and though London of Ven's time would not know London of to-day, we feel brothers of the men who built, gazed upon, and loved the St. Paul's Cathedral that we know, while their immediate forefathers, who knew it not, but revolved around another exquisite cathedral lantern as their sun, seem almost mythical, indistinct and distant from us the inhabitants of Pompeii or Herculaneum. The great skill and judgment with which the towers of the cathedrals were chosen has a great deal to do with the way in which they dominate the surrounding country. The cities were built in their shadow, and came to them not only for benefits the church was able to bestow, but so on account of the advantages of the readily-chosen spot in the centre of the fertile plain, or upon the commanding cliff. Remove St. Paul's from Ludgate-bill to the arroy side of the Thames, and it would become almost as unimportant in the London landscape as its neighbour Bedlam. Salisbury or Canterbury Cathedrals, removed from the hearts of their well-watered plains to the crown of one of those hills which surround their basins, would lose immensely, not only in charm and beauty, but also in dignity and power. Take Lincoln or Durham from their proud cliffs to any more gentle and accessible eminences, and their whole counties will seem to lose crowns. From many and various points of view a cathedral group has its influence and beauty. It has no need of a front, in the casual sense of the term, for that involves sides and a back. Its position and site demand that eminently the building must be the centre in which the circumference of the city life revolves, and from which radiate the roads of the county; though differing in almost every other architectural particular, our English cathedrals seem in the closest relationship to the dome of St. Paul's in possessing their front, sides, or back. In foreign cathedrals we find (where lantern towers are exceptional) that the chevet, with its unapproachable picturesqueness and grace, is by its own force, the chief object of interest.

A paper by Mr. A. Beresford Pite, read at the meeting of the Architectural Association on the 29th ult.

The radiations of the flying buttresses practically defy the competition of other parts of the building, and the western is but the end of the cathedral; the point where interest concentrates, where the greatest skill has been expended, and where every part is made to share the beauty of the whole is behind at the back. Surely, then, it seems anomalous to talk about the front. At every angle of vision we have beautiful grouping and perspective. If the front is the face of the building, the countenance which gives it character and beauty, at home we have it in the majestic brow of the lantern tower, and abroad in the vivacious beauty of the chevet. But neither the central lantern towers, with their groupings, nor the chevets, can be described as façades.

Cathedral façades in England, from the circumstances with which we have been dealing, are exceptions to the prevailing principles of cathedral design. In each case that we shall consider the building shares with its fellows throughout the country national peculiarities of site, the same cruciform plan, central tower, and the full interest of every portion. The great difference that distinguishes them from other cathedrals is the treatment of the west front.

The orthodox west front of an English cathedral consists of the end of the nave with its gable, a great window and porches, the side aisles being generally masked by towers, which group effectively with the central lantern. To such west fronts the term façade cannot be applied to distinguish them from the transept and eastern fronts, as they are designed on the same principles, and composed of similar gables, windows, porches, and occasionally flanking towers. Thus these fronts group together, each obtaining and using features from its neighbour, and the towers bear as important relations to the north and south elevations as to the west front. In all these respects the west fronts of Lincoln, Peterborough, and to a certain degree, Salisbury cathedrals differ from all others, as they bear no direct relation to their groups of buildings, to which they are merely attached, and are practically of no service. These are exceptions not of eccentricity, but of intellectual power; they are constructed ornamental façades, to be seen from a fixed point of view. Distinct architectural compositions, as complete in themselves as framed pictures, which they further resemble in possessing fronts and backs but without sides. Freed from contributing to the work of the edifice; to a great extent without constructional restraints; having no internal thrusts to resist by external appliances; they stand uniquely interesting as monuments of architectural idealism. No underlying rule of ritual inspires the imagination of the beholder; without history to relate of chapter or canon, or ceremony to emphasise and shroud in dim religious life; they stand before us purely as the emblems of their designers' dreams of beauty, grandeur, and mystery; and as exponents of their belief in the manifold powers of their art to impress and delight the beholder of the House of God.

Two of these three façades, those of Peterborough and Salisbury Cathedrals, are wholly the work of their individual architects, while at Lincoln an Early Norman front was expanded into the façade by an architect of the same thirteenth century which witnessed the erection of all three. These façades, unlike lantern towers, octagons, or chevets, were not produced by series of logical architectural developments and evolutions, but solely are the achievements of the determined originality and genius of their designers, who, let us remember, by the way, were probably unable to draw elevations to a small scale of any use or comprehensiveness.

Though these three erections are embraced within the narrow limits of that century when Gothic architecture has reached its purest and most Classic development, they widely differ in conception and treatment, while possessing very interesting links with each other. In each, ornamental sculpture and decorative architectural forms are used as materials; light and shade is sparingly introduced, and perspective and grouping are avoided; there is an absence of any false representations of the building behind, a fault not uncommon in Italian cathedral façades; breadth and dignity are sought by the use of severely simple lines of great magnitude; rhythm is obtained by judicious repetitions, the horizontal tendency is preferred

to the vertical; and withal there is adjunction to the concealed masses of the buildings beyond. These three cathedrals only in England can be said to be illustrations of the principles of pure façade design, the great majority of fronts that remain being simply elevations of the ends of their cathedrals; but among them there are notable variations from the rule, of which Wells is a deeply interesting instance that we cannot include in our present consideration. Ely stands by itself in composing the flanks of the western transepts, with the great tower and fine angle turrets, into a great façade of striking dignity and beauty; but it has little in common with the underlying principles of the group of three façades we have taken, as all its effects are produced by a masterly treatment of essential parts of the cathedral. The western towers of Lichfield and Durham enter into the composition of their respective buildings in a way which precludes their consideration as distinct fronts. York, Canterburly, and Westminster all exemplify what we can describe as the accustomed principles of cathedral design.

Ahead, however, the western front is constantly made the subject of special design. The façades of Continental cathedrals form too great a subject to be fully taken into consideration in a paper without extended and comprehensive study, but we will refer among them to three great French west fronts which contain rich food for reflection and digestion. In earlier times to the great cathedral era the architects of the Romanesque period were most assiduous and fertile in their imaginative compositions for western façades, of which St. Pierre, Angoulême, furnishes a most piquant example. In the cathedral of Notre Dame, Paris, we have a very beautiful instance of the value of a wise use of liberty in design. The west front expresses the end of the church in a simple manner with great simplicity and breadth; an open arcade, however, is carried across the nave wall to connect the towers for the purpose of masking the gable of the roof behind, and thus procures that due relation of horizontal to vertical lines which is the peculiar charm of this front, bestowing that exact balance and just proportion which make it uniquely perfect among Gothic cathedrals. The means used are so simple that we wonder why the idea has not been followed again and again. How many fronts and designs for fronts are broken up and spoiled by unseemly gaps between the nave gable and flanking towers? Height and breadth are both secured for the whole façade by this open arcade, which lightly and gracefully lifts the nave wall above the gable, and with its strongly-accentuated cornice links the twin towers together. I know of no façade (for this courageous treatment places the front among examples of façade design) that can compare with Notre Dame of Paris for exquisite simplicity of line and majestic elegance of proportion. We should also notice how well the height of the towers is adjusted to the side views of the cathedral in which they play an important part. It is instructive to compare this façade with that of Amiens, where the nave gable is masked with a similar arcade, which, however, stops between the towers, and in spite of the great height of the front, all its superb magnificence of detail, and the unusual grandeur of all its parts, we fail to be impressed with the same lofty sense of grace and beauty as at Notre Dame. Of these towers the late Mr. Street, in remarking upon the comparative effects of height in English and French cathedrals, says: "The towers of the west front of Amiens only look like towers when seen from the west front. When seen from the side in connexion with the church, they shrink into mere turrets." A somewhat similar design to these two instances has been adopted by the architect of Rheims Cathedral; a much larger arcade than either those at Paris or Amiens crowns the west front and stretches across the towers, like Notre Dame, just below the light and graceful triforces, the arcade rises from a strongly-accentuated stringcourse, but instead of being finished under a pronounced cornice above, is crowned by an array of pinnacles and gables, among which appears the nave gable properly decorated for the occasion. The upper portion of this façade is more successful than the lower stories, which are too much broken up; the unequalled wealth of sculpture that has been lavished upon it scarcely tells as it might, for lack of broad enclosing lines and surfaces. We must not pass away from Rheims without observing the transept gables and towers, which form separate

fronts of great beauty and simplicity of design, as the ornament here is very successfully restrained and richly massed, the effect of the caryatide arcade beneath the gable being superb. One cannot but reflect how much more majestic and satisfactory these fronts are than the western façade, with all its gorgeousness and scale.

We have taken these three French cathedrals into consideration because in each of their fronts ornamental arcades were added to obtain lines for the purpose of gaining the special effects of designed façades, and in so doing the customary limits of cathedral design were passed, and those of more imaginative composition entered upon.*

FATAL FALL OF WALLS IN HOLLOWAY-ROAD.

Last Saturday afternoon the front walls of several houses in the Holloway-road, which were in course of demolition, were blown down, killing five persons. At the inquest held on Wednesday.

George Nutt, a carpenter, said he was employed by Mr. Heath, builder, of Liverpool-road, and had charge of the work of pulling down the old houses in question. He was assisting in this work on Saturday. The houses were two stories high and had shop-fronts, and some of them had iron girders. By Saturday last the roofs had been removed, as well as the back walls and most of the upper story. He left shortly after noon. Mr. Heath had not then visited the place since the preceding Tuesday. The witness added that he had erected hoardings round other similar works, and he did not know why a hoarding was not put up in the present instance. Replying to the foreman, the witness said he did not think it was necessary to fix more shores. By the Coroner.—He was sure the party-walls were bonded into the front, but whether the front wall was bonded into the first adjacent old house which remained, he could not say. Usually when old buildings were pulled down the practice was to clear away floor after floor in regular order; but in the present case his orders were to leave the front wall intact.

John Heath, builder, Liverpool-road, said he arranged with the surveyor to the Tu'well Estate to pull down the old premises in question and take the materials. He began the work just after Christmas. He had not visited the place since last Tuesday week. He was not aware that it was incumbent upon him to inform the District Surveyor or the Local Vestry's Surveyor of Highways of his intention to demolish the houses. A licence was required for the erection of a hoarding. It was his intention to leave the front wall standing as a barrier until the site was utilised for the erection of new buildings, when a hoarding would have to be provided. He did not keep the wall standing in order to profit by its being utilised as an advertising station.

Mr. George McDonald, the District Surveyor, said that if the wall in question had been reported to him as dangerous, it would then have been his duty to see to the safety of the public. Personally he should have shored the wall up, but it might reasonably have been deemed to be safe as it was.

Mr. Charles Higgins, Surveyor to the Islington Vestry, deposed that in the case of buildings about to be erected, the builder must give notice to the District Surveyor as well as the local Surveyor of Highways; but there was nothing in the Metropolitan Local Management Act requiring notice to be given of any intention to pull down an old edifice.

Mr. H. H. Collins, District Surveyor for the Eastern Division of the City of London, said that the remains of the party-walls of the houses in question showed that the walls were not properly tied together.

The jury returned a verdict of Accidental Death, adding, however, the following rider to the verdict:—

"The jurors are of opinion that the work of the demolition of these houses should not have been left in the hands of two men,—a carpenter and a labourer,—without the close superintendence of the builder, who, the jury consider, should have visited the place more frequently. They further believe that had he properly inspected the premises, and seen the condition in which the wall was left, this would have led to the proper shoring of the wall in front, in which case probably the present catastrophe would have been averted. Further, they recommend the Metropolitan Board of Works to procure powers so that the District Surveyors shall have control over the pulling down of old houses as well as the erection of new ones."

The Aylesbury Dairy Company, of St. Petersburg-place, Bayswater, and elsewhere, has succeeded in acquiring a reputation for good milk and dairy produce, which it supplies under what we believe to be unexceptionable sanitary conditions, Mr. W. Bassie, C.E., being the Company's inspector of farms and dairies. As will be seen by an advertisement in our present number, the Company is about to issue shares and to take up a portion of its unissued capital.

* To be continued.

PAYMENT FOR QUANTITIES.

M'LACHLAN AND ANOTHER v. GRANT.

This action, which has been tried before Mr. Baron Huddleston, in the Queen's Bench Division this week, was brought by the plaintiffs to recover a sum of 120*l.*, which they alleged was due to them from the defendant upon a bill of quantities and other preliminary expenses connected with the proposed building which the defendant contemplated erecting under the direction of the plaintiffs as architect and surveyor respectively. The defence was ultimately reduced to a question of amount. The following particulars of the case are taken from the *Times* report:—

The plaintiff M'Lachlan is an architect, and Cuckson, the other plaintiff, was the surveyor employed to assist the former in taking out the quantities. The defendant conducts a large school for ladies in South Kensington. It appeared that in 1884 she was desirous of building a large college for ladies, to accommodate 800 pupils, at Kensington. The plaintiffs' case was shortly as follows:—Miss Grant had consulted him upon the subject of the building, and engaged him, after some negotiation, to prepare the preliminary plans, &c., for the proposed building. He had told her that his suggestion that the cost would be about 2,000*l.* was too little, and had all along insisted that 5,000*l.* would be nearer the cost. The plans were prepared, submitted to, and approved by Miss Grant, and the question of quantities discussed. The plaintiffs' case was that she knew that these were to be taken out by him in order to obtain the builders' tenders which she desired. No special bargain, it was said, had been made as to what these should cost, and the plaintiffs' case was that, therefore, they were entitled to be paid a fair price for the work, and also the cost of lithographing them, viz., 20*l.* This price of quantities, it was submitted, was 2 per cent. upon the lowest *bona fide* tender. Tenders had been advertised for, and seventeen were sent in by different builders, and the lowest was 4,832*l.* for the first sixteen, while the seventeenth was 3,263*l.* But it was submitted that this latter tender was a bogus one, and that this being so, the sixteenth tender, viz., 4,832*l.*, was practically the lowest tender, and the one upon which the plaintiffs were entitled to their 2 per cent. commission. Mr. M'Lachlan altogether denied Miss Grant's contention, viz., that he had given her to understand when she had consented to the quantities being taken out that their cost would be a mere trifle,—about 1 per cent. He stated that she must have been mistaken, for he never mentioned, nor could he have ever mentioned, so small a percentage; it was unheard of in the profession, where the percentage varied from 1½ to 2½ per cent., according to the class of work. It was further urged that it was Miss Grant's own fault that the work had not gone on to completion, as she refused all the tenders as too high, and had made out an estimate for herself, which came to 2,300*l.* but which, as the learned Judge pointed out, did not estimate for stairs or drains,—two very essential adjuncts to a house. Miss Grant's case was that she was only bound to pay the plaintiffs 1 per cent. on the lowest of the seventeen tenders. The lowest of these, Williamson's, viz., 3,263*l.*,—which the plaintiffs alleged was not a *bona fide* tender, the defendant, however, called Mr. Williamson to prove it, and he stated that he could have done this at a profit for that figure. At the conclusion of the case,

Mr. Baron Huddleston proceeded to sum up, and in the course of his remarks he said that he had always considered the manner in which architects were paid was most unsatisfactory, for their being paid 5 per cent. upon the total cost made it to their interest to run the builder's expenses up as high as possible. His Lordship thought it would be a very great advantage if the society which governed that profession would make some alteration in such an invidious system of remuneration.

The jury, without retiring, found for the plaintiffs for 120*l.*, the full amount claimed.

GOVERNMENT TENDERS.

Sir,—Having written last year on the subject of Government tenders, and the desirability of the various departments being asked to communicate to persons tendering a list of the tenders received, it may be well that your readers should be informed that the Metropolitan Board of Works and the Receiver of the Police have kindly agreed to and commenced this practice. The former have also arranged that such tenders shall be opened in the presence of the parties tendering, and this was first done in the case of the fire-engine station at Stoke Newington in November last.

Her Majesty's Office of Works has not yet consented to do so, but it is to be hoped that they will soon be induced to follow the above examples and conform to the almost universal practice of architects. The change of Government gives an opportunity for the Central Association of Master Builders to lay the matter before the new First Commissioner, and urgently request a favourable decision.

H. S.

THE EXAMINATION IN ARCHITECTURE.

Sir,—It is interesting to find that the hope entertained by such a representative of the Institute as Mr. Cates should tally with those that I ventured to indulge in when serving of the Institute "long" Committee, under the chairmanship of the late Mr. T. H. Wyatt, namely, that there should be a closer connexion between the Institute and the Association, was then considered unneeded by both bodies; but the next Institute Committee, under the auspices of Mr. Charles Barry, took,—perhaps unconsciously,—the first step towards it by abolishing the Institute "Student class," thus throwing the entire educational work upon the Association.

This work has been taken up with the characteristic energy of the younger body, while the Institute has given great facilities for the prosecution of the work by throwing open its fine (but draughty) library to the members of the Association, and by giving its President a seat on the Council.

And now Mr. Cates advocates students' classes connected with the Institute and under the guidance of the Association. Should the closer bond be drawn, it need not imply any loss of the glorious liberty of the junior members who could continue to hold their ordinary meetings unawed by the seniors.

As a matter of fact, however, the Association has, perhaps for administrative reasons, diluted the fine old system of mutual help and criticism which made the Class of Design of twenty years ago the most enjoyable thing in the profession. Now, Visitors are appointed to criticise the works submitted at all the numerous classes, and are not paid for their responsible services, which seems hardly fair to them, while lecturers and other instructors do receive a fee.

A closer connexion with the Institute might improve the visiting system, and leave room for the system of mutual instruction as well, and it always appeared to me that the one comprehensive body might gain some advantage in every rung of the ladder when each becomes the step to the one above it.

A very simple examination,—for which a principal could prepare his pupil at the cost of a few minutes a day,—might well limit membership to those who could show some capacity for becoming architects, such as by setting up simple elevation and section of a given object, by pointing out the palpable distinctions between any two styles of architecture, or by any other simple evidence of an appreciation of form.

A PAST-PRESIDENT OF THE ASSOCIATION.

THE REGISTRATION OF PLUMBERS.

Sir,—I have read with much interest the account of the meeting convened by the Plumbers' Company [p. 196, ante]. I cordially sympathise with the Master in his laudable endeavour to increase the efficiency of the plumbers, and I have no doubt that, if carried out with a due regard to existing interests, it may be productive of good. I have no wish to discourage their efforts, but I cannot help thinking that the Company do not go far enough. It is very well to register the existing plumbers, but not one word is said in the report about educating the future race. Surely, sir, this quite as important, if not more so, than registration; in fact, so much so that it ought to be overlooked, and I would submit that a question of educating or apprenticing young plumbers is worthy of the consideration of the Worshipful Company. My views on this matter are pretty well known in the trade, for I have written and spoken much on the appropriate question. The Tybers and Bricklayers some years ago determined to "increase the efficiency of the bricklayers, and to that end offered premiums to working masters to take boys and to thoroughly instruct them in the mystery of the trade, and, on the whole, the scheme met with fair success. I should like to see Plumbers' and other companies follow in the wake, for I am convinced that the old system is the proper one. You cannot have good workmen unless they have been properly trained. The National Association of Master Builders, four years ago, keenly alive to the great and pressing necessity for improvement in the workmen, issued a circular to the whole of the trade throughout the United Kingdom calling on them to take steps to revert to the old system.

of apprenticeship. This applied to plumbers as well. They also issued a memorandum of suggestions as to premiums, &c., with a form of indenture. This is now being very generally acted upon in the provinces. I cannot but regret that Mr. Shaw has not asked builders to assist in his conferences, as suggested by Mr. Henshaw, as I see that two of your correspondents state that the builders employ by far the largest number of plumbers. Therefore the thought occurs,—What is to be the sad fate of the master builders and those men who cannot register? For, to judge by a remark made by the chairman, there is a sort of doubt as to their admittance. He "thought there could be no objection to admit builders" on certain conditions. It is almost certain from this remark that the Plumbers' Company are not very eager to hold out the hand to builders, although Mr. Shaw says in his letter that they are. Plumbers must remember that they have been having "a rare good time of it" of late, but this sanitary craze will not always be as fashionable as at present. By and bye perhaps the public may employ builders again, although they may not be registered, and notwithstanding their being only "messers" and "tinkers."

STANLEY G. BIRD.
28A, Upper George-street, Feb. 3.

"PLUMBERS AND PARLIAMENT."

SIR,—I am glad to learn from the President, from whom holding that position for several years must be an authority upon the subject [see p. 218, ante], that the Central Association of Master Builders still continues to take an interest in the affairs of the building trade. No one, I am sure, would think of accusing the Association of "dabbling in a noisy and ostentatious manner in matters which are being dealt with by others." May I ask what the "matters" may be, and who the "others" are? Surely the President is not alluding to the Plumbers' Company, who are clearly satisfied to go their own way, and evidently do not require the assistance of the Association.

No, sir; it is the apathy and inactivity of the Central Association of Master Builders that I take exception to. There are many important questions at the present time affecting the building trade which should be taken up and discussed, and, if considered expedient, dealt with by such an Association. One, and not the least, is the question of plumbers working different hours in the winter months from all other trades.

The fact is that, although we possess a so-called Central Association, the members of the building trade do not stand by each other, and his is one of the main difficulties of any reform being carried out.

F. M.

THE NEW STREET FROM PICCADILLY TO NEW OXFORD-STREET.

SIR,—Your "note" of last week [p. 192] encourages us to believe that the Metropolitan Board of Works will not adopt for their approach from St. James's to St. George's, Bloomsbury, any designation like to Criterion-avenue, "Rocadere-drive, or Pavilion-walk,—indicative of each of these may be to the Local Board and Vestry orders of mind.

Here is opportunity of commemorating,—as, indeed, in such a thoroughfare should be commemorated—the topographical associations of its course. The new street traverses the ancient manors of Bloomond and St. Giles, component parts of the more ancient and yet prebendal manor of Ruggemere. If this last be deemed to be too archaic, St. Giles too "low," and Bloomond's Bury or Bloomsbury too commonplace, an equally applicable alternative remains, viz. the good old local name of Soho to a street that passes along and in portions crosses over the actual site of Soho-fields, which were known under that style long before the Duke of Monmouth yielded the day at Sedgemoor.

W. E. MILLIKEN.

SIR,—I see that the new street now being made connect Holborn and Piccadilly is in search of a name. I beg to suggest, through your valued paper, that it be called "Giles-way" or "St. Giles-way." This would be distinctive and short,—both great

recommendations,—indicative of the locality through which it passes, and altogether appropriate.

I enter into no argument to enforce my proposal, the grounds for it being so self-evident.
February 2nd, 1886. E. O. W.

SEWAGE PURIFICATION AT GUILDFORD.

SIR,—I do not complain that the patentees and advocates of any of the existing methods of producing sewage sludge should do their best to prevent investigation of a process which is shown by competent chemical analysis to "produce marvellous effects upon sewage"; to such an extent, indeed, as to raise the fear that "all those who are now labouring in this field of research may cease to work." But the public, to say nothing of myself, have a right to expect that these gentlemen should adhere to truth in their criticisms.

Mr. Arthur Angell, in the *Builder* of this day's date, makes a mis-statement when he says that "Dr. Thresh has taken upon himself to publish the particulars of the trials made." I am not aware how Dr. Thresh, who was not present at any one of them, could have done so; and a reference to his paper in your columns discloses no undertaking or attempt of the kind.

With regard to the other statement made by Mr. Angell, in assumedly an official capacity, I have to request you to publish the two following letters to and from the proper representative of the Urban Sanitary Authority of Guildford.

FRANCIS R. CONDER, M.Inst.C.E.
Guildford, January 30, 1886.

[COPY.]

Guildford, 3th Jan., 1886.
To Henry Peak, Esq., Borough Surveyor, Guildford.

SIR,—Allow me to call your attention to a statement signed "Arthur Angell" without date, printed in the *Builder* of to-day, to the effect that "no real and serious idea of adopting Mr. Conder's process was ever entertained by the authorities" of Guildford.

In face of the courteous attention which I have received from the Mayor and other authorities of Guildford, your self included; of your report of 8th December last; and of the operations now in progress; I have to ask on what authority the above statement has been made, in the name of "the Public Analyst for the Borough of Guildford."—I have the honour to be, Sir, your obedient servant,

FRANCIS R. CONDER, M.Inst.C.E.

[COPY.]

Dear Sir,—Replying to your note calling my attention to a statement in to-day's *Builder*, by Mr. Arthur Angell, to the effect that "no real and serious idea of adopting" your process of sewage purification "was ever entertained by the authorities of this town," I will only remark that that gentleman can have no grounds for his assertion; as instructions were given by the Mayor and Committee to afford you a full opportunity to experiment at the town's expense.

The adoption or otherwise of your system will, I presume, depend on the final results which you are able to show; but I should be sorry to feel, with Mr. Angell, that the authorities are simply trifling with you in the matter, and intentionally wasting the ratepayers' money in paying for the said experiments.—I am, dear Sir, yours faithfully,

HENRY PEAK,
Surveyor to the Guildford Urban Sanitary Authority,
3, Market-street, Guildford, Jan. 30, 1886.

To F. R. Conder, Esq., M.Inst.C.E.

CHELTENHAM GRAMMAR SCHOOL COMPETITION.

SIR,—Complaints have, I hear, been published that some competitors have, on the return of their address envelopes, found that they have been opened and reclosed. I have also myself received several such complaints, some of them worded with so little courtesy or reasonableness that I have no wish to be brought into direct communication with the writers. Will you therefore kindly allow me to explain what happened with respect to these envelopes?

The several van-loads of packing-cases, as they arrived last summer, were placed in a separate room at the school, and given into the charge of one of the first firms in Cheltenham to unpack and hang, in such a way, that when desired, each set of plans might be restored to its own case. As the process of selection proceeded, the same firm unhooked and repacked the discarded plans. Last of all, the plans selected for the assessor were packed and sent to him. On the return of these the award was made, and the envelope belonging to the premiated designs were opened by the Chairman before the Board. All the other envelopes were, at that time, unopened, but attached to the respective packing-cases ready to guide their return. The Governors were, of course, at perfect liberty to open them after the award, but it occurred to me that competitors might prefer to send address-cards, not necessarily disclosing their names, and to have their address envelopes returned unopened, and I advertised accordingly.

I waited a few days until a good hatch of address-cards had come in, and then sent them to the packers with orders to send off the packages to which they related. I intended these as a first instalment, but the packers thought these were all the address-cards, and that where there were no such cards, the address was to be obtained in the usual way by opening the envelopes. Directly I found this had been done, I ascertained that no one but the packer employed had seen the envelopes opened, and then ordered them at once to be reclosed; and the process of return has since been carried out in batches as the address-cards have come in. Many competitors have not written yet.

That is the whole mystery of the case. I am very sorry for the mistake (which, however, is of little practical consequence, as scarcely one competitor has, in fact, been desirous not to reveal his name), but I can assure all competitors that it occurred at least a fortnight after the making of the award, previous to which every envelope was intact.

Should any of the more irritable and suspicious of the persons who have written so rudely to me require anything beyond this statement, it might, I think, occur to them that if there had been any tampering with the envelopes which it was desired to conceal, a voluntary proposal to return them unopened would never have been made.

Would you further permit me to say how much I regret the impossibility of reporting to, or discussing with, so large a number of professional gentlemen the opinions formed on the relative merits of their varied and skilful designs, and to ask competitors (with whom I have the greatest sympathy) kindly to have a little consideration in their turn for the endless worry and thankless trouble which an open competition entails upon

THE HON. SEC.

Cranley Lodge, Cheltenham,
January 30, 1886.

SWINDLING BUILDERS.

SIR,—The superscription to this letter may sound at first severe and uncalculated for, but the sequel will, I think, justify the epithet.

As a warning to business firms who put reliance in references before opening accounts with strangers, I beg you will allow me to relate how I have unwittingly become the victim of a speculating builder.

One of this genus, hailing from a southern suburb, called on me to purchase constructional ironwork for some buildings he was about to erect on land he had taken direct from the freeholder, who was to advance money in the usual way, under the direction of a reputable firm of surveyors.

Not knowing the builder, I asked him for cash or satisfactory references, and he, proffering the latter course, gave me the freeholder's surveyors' and another apparently respectable name. My inquiries of the surveyors led me to consider that I was not incurring any unusual risk, and the builder solemnly engaged to pay cash on the usual 10th of the month.

The ironwork was delivered to the buildings, and signed for by the builder himself, but when the pay-day arrived he made all sorts of plausible excuses, which culminated in rounds of abuse upon being pressed for payment, and on making inquiries in the neighbourhood I found that the ironwork was never used in the buildings at all, but was soon after delivery reloaded and carted away, no one seems to know where, and timber beams used instead. I should say that timber was specified, but the builder said he would use iron as likely to make a better job, and assist the letting or selling of the buildings at a better price.

I at once issued a summons from the Lord Mayor's Court, returnable in eight days. The builder took no notice; judgment was signed, with no result; and on an execution being put in his house, it was found that he owed more rent than it was likely his goods would realise under the hammer, and consequently the sheriff withdrew.

I cannot attach any moneys payable to the builder, because the surveyors say that, although he may draw money on account by permission, no money is yet legally due, as the buildings are not up to the requisite height, and, besides, there are a number of "stop orders" to be satisfied.

I must now either give up the chase, or "prove means" to the Court's satisfaction before a judgment summons can issue, but which I despair of doing under the circumstances.

I have since found out that the second reference, whom I unfortunately did not see, for the reasons above stated, is actually the man who is acting as the builder's manager!

Surely, sir, this is a distinct fraud, although my lawyer says it is not. Anyhow, if not a legal fraud, it is certainly a moral,—or, rather, an immoral one, of the worst type.

Lawyers are now so indifferent about pursuing matters of this kind, as under the "new rules" they cannot make good costs, that they advise clients to put up with the first loss as the least, rather than fight out a really good case. I have experienced this many times of late.

Possibly the builder I refer to may read this; if so, I trust he will feel a little remorse, and, at least, abstain from making fresh victims.

AN IRONMAN.

The Student's Column.

FOUNDATIONS.—VI.
UNDERPINNING.

THE operation of underpinning, in which concrete is almost invariably employed, generally consists in putting a new foundation under a wall or pier which has shown signs of failure through insufficient foundation. It is also carried out in the cases,—very frequently happening,—where an additional story has to be put under the building on one side, or each side, of a wall, without rebuilding the wall. The kinds of soil that have been mentioned in reference to ordinary foundations are equally likely to be found when it is a question of underpinning. If the ground is quite satisfactory, the new foundations may be simply such as would be put if the wall were being newly built. If it is not perfectly reliable the concrete must be made wider in the trench so as to secure greater spread of footings, and, if by going deeper a better foundation can be obtained, the cost of doing this in a case of underpinning should be incurred, although it might not be necessary if the wall were then to be built; for the damage that may result from even a small settlement is a sufficient reason for increased expenditure. If the foundation is very bad, it may be a question whether the idea of underpinning should not be abandoned and the wall rebuilt on an artificial foundation that can be more easily put in as a whole than in parts.

Underpinning is, however, not only a very frequent operation, but one that is almost invariably carried out without gross failure, to say the least, and its success is due to the care usually taken in employing the best workmanship and materials.

The general principle on which walls are underpinned, is to arrange the work in sections of 3 ft. to 4 ft. in length, to select, as far as possible, those parts that are the weakest, as shown by their signs of failure, and to deal with them in the first instance. It may generally be assumed that those parts of a wall that are sound will carry the superstructure during the short time required for re-building a piece that is only just long enough to give room for a man to work. The places to be first dealt with are selected so that, by putting in alternate lengths, or by leaving two or three lengths between those which are first underpinned, there is enough of the old foundation left to carry the wall above, and when the new pieces of foundation have had time to become firmly set, the intermediate pieces may be dealt with in the same way. When the wall is in a tolerably good condition, the operation is simple and safe. Portland cement concrete is used, and hard bricks of good shape laid in Portland cement made up with clean sand in the proportion of two parts to one of cement. Great care must be taken to pin up the new work tightly under the old wall using tiles or slates if necessary, and the work must be carried on with sufficient deliberation to allow the concrete and brickwork to set.

But questions of underpinning are generally complicated by considerations of support for the dead weight of the wall or of the resistance to the outward thrust of a building that, for the time, is standing without the support from the adjoining structure which it has hitherto had. Thus, shoring and underpinning go together, and it is necessary to consider here so much of the larger question of shoring as has special application to this subject.

It is of the first importance that a wall which is being underpinned should not sink at all during the operation, or at least not in an appreciable degree. If that should happen to it, the result will be seen in fractures at the junction with adjoining walls, in distinct cracks along the cornices or junctions of ceiling and wall in each room in the building, and derangements in the level of floors, perhaps even in the slope of roof gutters. In order to support any heavy load the best mode (that is the mode which will be least liable to accident and most economical of material) is to put a strut or prop directly under it. If this cannot be done the best thing is to get a sufficient beam under it, which beam is supported by struts or props. The work may be done in a third way, by putting the prop obliquely as in a raking shore. But unless there is something solid within the building, at the point where the head of the raking shore comes against it, any settlement in the wall which throws weight on the shore may

cause serious damage owing to the thrust which will be brought to bear against the wall by the head of the shore. Such shores are not, therefore, suitable means of support for heavy weights unless they are placed at points where they meet the resistance of a cross wall or a strong floor. When a raking shore is expected to carry any serious weight it should be made out of "half timber," or at least of "die square" stuff,—that 12 in. by 6 in. or 7 in. by 7 in. or stronger, as deals or planks are useless for such a purpose.

It is also specially important that a building should not bulge outwards while its wall is being underpinned. This may be prevented by the use of a raking shore, which is often the only possible expedient, but is subject to the objection just named. The best thing to use is a flying shore,—that is, one which is placed horizontally from the building requiring support to some building opposite to it, thus "flying" across vacant ground or a public way. If the span is not very great a few scaffold-poles judiciously placed and made tight will give all the resistance to outward thrust that is required.

The shoring being fixed, the underpinning is to be begun. It will be of the full length of the piece of new foundation that is to be put in and of a

width that will give room for the workmen. If the wall above is so bad that the short length that is dealt with will not do without support, a strong "needle" must be put through it at a convenient height above the base of the wall, taking care that the brickwork close above the needle is sufficiently sound. If there is no brickwork sound enough for this purpose the wall should not be underpinned, but rebuilt. Usually a piece of "whole timber," 12 in. or 14 in. square, is put through the wall, each end being wedged tight up from a sill lying parallel with the wall on each side of it, or the ends of the needle may be propped up with short stout pieces of timber from such sills. But it is better to use as needles short lengths of rolled iron joists, for one such joist, 12 in. by 4 in. or 12 in. by 6 in., will require a hole not more than a third (or at most half) of the width of a timber needle. The execution of the work in several sections as above described presents no difficulty. When a new basement story has to be formed by means of excavating and underpinning (or a sub-basement, as is not infrequently done), the matter requires greater care, particularly as all the walls round the site have to be dealt with. There is a strong disposition in such a case to dig out the soil from the new story in

the first instance, leaving, perhaps, just so much as is thought to be necessary to carry the feet of a few shores. By this plan the excavation is got out of hand, and more ready access is obtained to the base of the wall than by the slower process of sinking shafts. This should never be permitted, as the earth so removed provides the best means of obtaining support for shores while new foundations are being built. The work should be done wholly by sinking shafts against the surrounding walls until the whole is finished, and an isolated mass of earth remains in the middle of the site. This is called the "dumpling," and it can be removed when the underpinning has been done. One instance of mismanagement will illustrate these observations, and teach. In a case where a sub-basement had to be formed, the work was begun by putting up raking shores made of 9-in. deals, resting upon the bottom of the original basement. As much of the earth as could be removed without digging very close to the feet of the shores was then excavated down to nearly the bottom of the sub-basement. The shores soon showed by bending that great weight was being brought upon them, the lumps of earth began to yield, the partitions in the adjoining house became broken from the party-wall, and the doors in them became tightly fixed. More shores were then put together with flying shores, as it was by this time obvious that an accident was imminent. The wall sank bodily some few inches, causing large expense to the builder, which fortunately was the extent of the mischief.

It has been shown by some experiments that concrete swells in setting, and this has been thought to be an advantage in underpinning. But any perceptible expansion would be injurious as a settlement. If the concrete is made of good stones in close contact, and the cementing material is well slacked, there will be no expansion,—which is the best thing that can happen.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

4,063, Gully Trap. J. Phillips.

The gully tank is provided with a cast-iron top having a hinged grate, and at one end a rectangular overflow pipe, dipping into the tank to form a trap. The overflow pipe discharges into the head of a drain connected directly with the sewer. Over the top of the hinged grate is an inspecting box, having a hinged lid, and the pipe itself is provided with a removable air-tight cover. The cast-iron top is bedded on thick tarred felt, or in cement.

9,207, Mats, Staircase Treads, &c.

Into the perforations of a metal grating are fixed indiarubber blocks, which may be formed of wood scraps, &c. Or indiarubber strips are bound and screwed together with wood or other strips.

11,533, Window-sash Fastener. J. Parker.

A catch is pivoted on a plate, which is fixed to the window-frame in such a manner that it fits forward when the lower sash is closed, and presses on a plate on the meeting-rail which secures the sash. A screw fixed on a swinging plate at the side of the sash-frame prevents rattling.

15,032, Fireplaces. J. Wostenholme.

The side and back of the solid fire-clay fire-basket of open slow combustion stoves are provided with a number of holes leading from an air-chamber made either in the back of the fire-basket, or between the side and the back plate. Air supplied to the chamber through the under part of the stove is heated, a passing through holes made in the side of the stove, mingles with and assists the combustion of the gases arising from the fuel.

16,979, Copying Drawings. J. Schenckhofer.

A slate colour is produced on paper by a solution of iodine and potassic oxide. The drawing is then copied on the coloured paper with a bleaching liquid, consisting of a solution of hyposulphate of soda. The drawing thus produced is used as a negative to print from on sensitive paper.

17,003, Enamelled Metal Work. W. E. E. H. Simpson.

The design, when of large size, instead of being produced in rectangular sections, as is usual, is divided into pieces of a convenient size along lines corresponding to the principal outlines in the figure. The shading is emphasised by the free use of reposed work, which is hammered up before enamel is applied. In cases where the metal is soft and the relief high, it may be hacked with cement.

17,043, Water Crane. Ransome & Rapier.

The jib of the crane is hotted on to a basin ceiling, with trunnions on each side working in bearings in an outer basin, which terminates at the bottom of a hollow pivot. This pivot allows for a

UNDERPINNING FOR NEW BASEMENT.

width that will give room for the workmen. If the wall above is so bad that the short length that is dealt with will not do without support, a strong "needle" must be put through it at a convenient height above the base of the wall, taking care that the brickwork close above the needle is sufficiently sound. If there is no brickwork sound enough for this purpose the wall should not be underpinned, but rebuilt. Usually a piece of "whole timber," 12 in. or 14 in. square, is put through the wall, each end being wedged tight up from a sill lying parallel with the wall on each side of it, or the ends of the needle may be propped up with short stout pieces of timber from such sills. But it is better to use as needles short lengths of rolled iron joists, for one such joist, 12 in. by 4 in. or 12 in. by 6 in., will require a hole not more than a third (or at most half) of the width of a timber needle. The execution of the work in several sections as above described presents no difficulty. When a new basement story has to be formed by means of excavating and underpinning (or a sub-basement, as is not infrequently done), the matter requires greater care, particularly as all the walls round the site have to be dealt with. There is a strong disposition in such a case to dig out the soil from the new story in

zonal motion of the jib and the removal of the residual water when the jib is tipped up. The jib is counterbalanced by a weight hanging inside.

10,950, Portland Cement. W. Smith. Calcareous sands are mixed with clay or shale or other combination of silica, alumina, and iron oxides in suitable proportions. The mixture is powdered, made into any suitable shapes if desired, or dried, calcined, and finely ground.

10,394, Ventilating Greenhouses. C. Lawrence. Chambers for the inlet, or inlet and outlet of air, are formed of wire-gauze along the sides or ends of the greenhouses. Openings to these chambers occur at equal intervals along the outside, provided with shutters by which the inflow or outflow air may be in some degree regulated. The top, bottom, and ends of the chambers are inclined to each other for directing the air. Any form of ventilator may be used which allows air to pass out, but prevents its return. In addition to the ventilator a valve shutter, controlled by a hanging chain, may be applied to an opening in the roof communicating with a similar chamber.

16,409, Kitchen Ranges. J. McJ. Shaw. A flange projecting downwards is cast or fixed to the hot-plate of kitchen-ranges on one or both sides of the fireplace, so that when an open fire is being used, some of the gases may be directed round the oven instead of passing directly to the chimney. Other plates are fixed to this flange parallel to the front of the range to prevent cold air entering the flues surrounding the oven.

16,902, Hoists, J. W. Styles. The chain or rope is attached to the largest of two barrels on the same shaft. An independent rope is connected to the smaller barrel, and carries a counterweight. On the rim of the large barrel a brake-strip is arranged, and a coiled spring may be enclosed beneath them to assist or supersede the counterweight.

MEETINGS.

SATURDAY, FEBRUARY 6.
Association of Public Sanitary Inspectors.—Mr. T. Buckworth on "The Sale of Food and Drug Act." 6 p.m.
MONDAY, FEBRUARY 8.
Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "Bas-Relief in Rome." 8 p.m.
Surgery Institution.—Mr. H. B. Hans Hamilton on "Rights of Foreclosure." 8 p.m.
Society of Arts (Cantor Lectures).—Professor H. S. Mele Shaw on "The Methods of Reducing Friction." 8 p.m.
 Leeds and Yorkshire Architectural Society.—Mr. A. W. Blomfield on "Church Architecture, Past and Present." Inventors' Institute.—8 p.m.
TUESDAY, FEBRUARY 9.
Royal Institution.—Mr. R. S. Poole on "Naucratis." III. 3 p.m.
Institution of Civil Engineers.—(1) Discussion on Mr. Stromeayer's paper on "The Injurious Effect of a Bline Heat on Steel and Iron;" (2) time permitting, Mr. L. F. Vernon-Harcourt on "The River Seine." 8 p.m.
Royal Victoria Hall (Penny Science Lectures).—Mr. J. M. Thomson, F.R.S.E., on "Dirty Water, and How to Cleanse it." 8.30 p.m.
WEDNESDAY, FEBRUARY 10.
Civil and Mechanical Engineers' Society.—Mr. Cole Adams on "Railway Stations." 7 p.m.
Society of Arts.—Mr. Bennett H. Brough on "Mining Industry at the Buda-Pest Exhibition." 8 p.m.
Liverpool Engineering Society.—The Chevalier Charles de W. Steers on "The Panama Canal." 8 p.m.
THURSDAY, FEBRUARY 11.
Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "The School of Pasiteles in Rome." 8 p.m.
Society of Telegraph-Engineers and Electricians.—Prof. D. E. Hughes, F.R.S., on "The Self-induction of an Electric Current in Relation to the Nature and Form of its Conductor." 8 p.m.
Society of Antiquaries.—8.30 p.m.
St. Paul's Ecclesiastical Society.—7 p.m.
FRIDAY, FEBRUARY 12.
Architectural Association.—Mr. H. D. Appleton on "The Practical Survey of Works in Progress." 7.30 p.m.
Institution of Civil Engineers (Students' Meeting).—Mr. A. S. B. Oakley on "Gold-mining in the Wyeand, Southern India." 7.30 p.m.
SATURDAY, FEBRUARY 13.
Architectural Association.—Visit to houses being erected in Collingham-road, South Kensington, from the designs of Messrs. George & Peto.

Miscellaneous.

Board Schools, Wednesday.—In response to an invitation, a number of architects have submitted designs in competition and under motto for New Schools at King's Hill, for the Wednesday School Board. From amongst the designs sent in, the Board, after careful consideration of the whole, made a selection of three, and subsequently decided to adopt the design bearing the motto "Experience." This design was found to be by Mr. E. Pincher, architect, West Bromwich. The other two selected designs were respectively by Mr. Cossins, of Birmingham, and Mr. Brevitt, of Darlington. The buildings are to accommodate 600 children, and will be proceeded with at once.
The New Bridge at Battersea.—At the meeting of the Metropolitan Board of Works on the 29th ult., a report was presented from the Bridges Committee, submitting contract drawings for the construction of the new bridge over the Thames at Battersea, and recommending that the same be approved and lithographed, and that copies and prints thereof, and of the specification, be prepared, for the purpose of obtaining tenders for the execution of the works. The report was agreed to.

The Surveyors' and Auctioneers' Clerks' Provident Association.—The annual report of this Association for the year ending 31st December last has reached us. The figures in the balance-sheet show that the Association is in a sound financial condition, but the committee regret that there is only a nominal increase in the membership. Six members have joined during the year, but, as five have become disqualified or left, the net increase is one. The distribution of the members is as follows:—sick fund, 26; life assurance fund, 22 (including one member's wife); superannuation fund, 9; benevolent fund, 6. In order to remove some difficulties which the past two years' experience has shown to exist, the committee propose, at the forthcoming annual meeting, to submit for approval alterations in the rules having for their object:—(1) The transfer of surpluses from any of the five existing funds to any others which may be insufficient, and (2) Permitting the relief to any assistants not being members of the Association, or to their widows and orphans, subject to well-defined regulations. The President of the Association is Mr. Daniel Watney, and the Secretary is Mr. L. Edmondson (Messrs. D. Smith, Son, & Oakley), 10, Waterloo-place, S.W., who will be pleased to give further information as to the objects of the Association.

The Belgian Competition in Rolled Girders.—The Belgian and German ironmasters continue to compete severely with English makers for the trade in rolled iron girders. Finding that Middlesbrough makers are getting their products more and more into the market, the foreigners are accepting lower prices than before, and for the large sizes their quotations, delivered to engineers' works in Mid-England, are sensibly under those of native manufacturers. The heavy rates charged by the railway companies for conveyance between the North of England and Staffordshire,—30s. for lots under two tons,—mitigate considerably against the native girders when needed by Staffordshire engineers. The Belgian iron is conveyed from the Thames to Birmingham for much less money. Messrs. Dorman, Long, & Co.'s quotations for lots of five tons and upwards, f.o.b. Middlesbrough works, are:—Plain rolled joists, 18 in. deep by 7 in., by 7 in., 7l.; 16 in. by 6 in. by 6 in., 4l. 15s.; 14 in. by 6 in. by 6 in., and 12 in., 10 in., 8 in., by 3 in. sizes, all 4l. 10s. Rolled joists with flanges are 6l. to 6l. 5s.—*Mining Journal.*

Raffety, Thornton, & Co. (Limited).—This company has been formed for the purpose of acquiring the well-known business of timber merchants carried on for many years successfully by Messrs. Raffety, Thornton, & Co. The prospectus (which is printed in full in our advertisement columns) says that Mr. W. J. Raffety, the senior partner, is retiring from the concern, and in order to replace his capital and further develop the business, the two remaining partners, Mr. C. I. Thornton and Mr. A. V. Raffety, have decided to invite public subscriptions to a Limited Joint Stock Company. Mr. C. I. Thornton and Mr. A. V. Raffety, who have had the sole management of the business for the last three years, have agreed to continue their services as heretofore as joint managers. The business will be taken over by the company as a going concern, free from all liability, as from January 1st, 1886, so that no interruption shall occur. The vendors will receive no cash payment whatever for the goodwill, &c., the consideration for the same being solely the allotment and issue to them of 16,500 fully-paid shares.

Chubb's Locks.—In the Chancery Division of the High Court of Justice, before Mr. Justice Chitty, this week, a motion was made by Messrs. Chubb & Sons, the well-known firm of locksmiths, to commit to prison W. H. Chubb, an ironmonger at West Bromwich, for breach of an undertaking given by him in 1881, in an action brought against him by the plaintiffs to restrain him from selling or advertising for sale goods marked as "Chubb's patent." It appeared that plaintiffs, in 1882, having removed their principal lock manufactory from Wolverhampton to the neighbourhood of London, the defendant had recently issued circulars, advertising for sale "Chubb & Co.'s patent locks, Wolverhampton," where, however, he had no place of business. Mr. Justice Chitty said he had no alternative but to send the defendant to prison. His lordship added that in a week's time the defendant might move for his release, and the plaintiffs intimated that they would not oppose it. Costs were given to the plaintiffs.

Building in Brooklyn in 1885.—The report of the Brooklyn Commissioner of Buildings for the year ending December 1st, 1885, shows that the building activity during that period was very great, the total number of buildings for which "permits" were granted being 3,902, the estimated cost of constructing them being 19,000,000 dols. (3,800,000L.). Building proceeded most actively along the line of the elevated railway, but there was also a large increase in the residential district bordering upon Prospect Park. Nearly one half of the buildings erected were private dwellings—houses, 677 of them being designed to hold two or more families, and 465 being tenement-houses. The number of buildings actually erected in 1885 (January 1st to December 1st) was 3,665, at a cost of 18,187,587 dols.; in 1884, 3,050, at a cost of 14,370,714 dols.; in 1883, 2,688, 12,096,681 dols.; 1882, 2,375, 10,386,769 dols. It is expected that the current year will witness a very large increase in the erection of new buildings, and that the population of Brooklyn may soon reach a million. It is further anticipated that one or more new bridges will have to be built shortly to supply increased facilities for reaching Brooklyn from New York.

The Turner Monument.—Fresh from adoration of the Turner drawings at Burlington House, we turned into St. Paul's Cathedral, to worship at the tomb of the great water-colourist. We were wonderstruck to find that our former recollections of the statue erected to his memory had vanished. Here was no ideal representation, as we imagined, of the man, but a feeble figure stretching out his arms in a most inanimate manner. A closer inspection revealed the reason. From the effigy's right hand had been broken off both ends of the pencil or brush which it once held, from the left the palette or note-book which it once grasped. From the weight of the statue above the ground it was evident that this injury could not have been caused by the wantonness of an outsider; it could only have arisen from the carelessness of the cathedral authorities, upon the removal of the organ which, some years ago, was reared hard by. This disfigurement must have long ago come to their knowledge, and should have been long ago made good by them.—*Art Journal.*

Snow Ploughs and Scavenging Machines.—Why, asks *Invention*, is so little attention paid to snow-ploughs and scavenging-machines by our makers of machinery? A Berlin firm, it is stated, is doing a large trade in machines of this kind, and has received orders from many Continental cities. Even if our own municipal authorities disdain the employment of machinery in street scavenging, our manufacturers might do a good export trade with more enlightened foreign cities.

Propose a Ship Canal from Cleveland to the Ohio River.—American architects and engineers are at the present time discussing the question of building a ship canal from Cleveland to the Ohio River, by way of the Muskingum River. Several of these professional gentlemen made a series of explorations recently, and they state, as the result of their examination of the ground, that such a project is feasible, but its execution will, at all events, be a somewhat difficult task. The estimated cost of the construction of the canal is 10,000,000 dollars, or about 2,000,000L. sterling.

A Non-Registered Plumber debarred from Collecting Money for Work done in New York.—A decision was rendered on the 9th of the present month by Judge Kelly, of the Sixth District Court of this city, in the case of William C. Poole against William H. Hyde, junior. The suit was brought to recover under a contract for plumbing and other repairs to the dwelling-house, No. 54, East Eleventh-street. The main defence was the non-registration of the plaintiff as a master or journeyman plumber in accordance with the provisions of Section 1 of Chapter 450 of the Laws of 1881. The fact of non-registration was admitted on the trial. The attorney for the plaintiff contended that as the Act prescribed its own penalty for violation in Section 6, the plaintiff should not be debarred of his recovery, because it would inflict a different penalty from that prescribed in the statute. The defendant's attorney represented that the defence offered was not in the nature of a penalty, and that a plaintiff cannot recover for work prohibited by statute. Judge Kelly sustained the defence.—*New York Sanitary Engineer.*

A Large Gas-holder.—The largest gas-holder on the Continent has just been completed for the Imperial Continental Gas Association at their gasworks at Erdberg, near Vienna. It exceeded in size by but few English and American gas-holders, its cubic contents being 2,825,000 ft. (80,000 cubic metres). It consists of two parts,—the water-tight pit sunk into the ground, and the bell, covered by an iron Schwedler cupola roof. Its total height, 202 ft., its diameter 209 ft. The roof, consisting of forty trusses and weighing 100 tons, was constructed on the ground and lifted to its ultimate position by forty screws. The iron work was supplied by the Witkowitz Company (Bohemia). The total cost of the gas-holder is 75,000L.

Diminished Death-rates.—The marked improvement in the health of the country generally, and especially of the urban population, which has taken place since the beginning of the present decade, was fully maintained during last year. In the ten years 1871-80 the death-rate in the large towns dealt with by the Registrar-General in his weekly returns averaged 240 per 1,000. During the past five years of the current decade, 1881-85, the rate of mortality in these towns has not exceeded 215 per 1,000, which implies that upwards of 110,000 persons have survived, during the last five years, in these towns, who would have died had the death-rate of 1871-80 since prevailed. It may be stated that in England and Wales during the same period of five years the saving of life, as the result of the reduction of the general death-rate of the country, is estimated at about 388,000. The rate of mortality in London during 1885 did not exceed 197 per 1,000, and was the lowest on record.—*Sanitary Record.*

Sir Stamford Raffles' Status at Singapore.—At Singapore, the model of the recently completed statue of Sir Stamford Raffles is shortly to be erected at a prominent spot on the Esplanade. The work has been executed by Mr. Woolner, and is stated to be a very successful likeness. Sir Frederick Weld, the Governor of the Straits Settlements, has promised to inaugurate the statue as soon as the pedestal is completed. This portion of the work, which is also designed by Mr. Woolner, it is proposed to make of granite.

Rolled Iron Stanchions of Cruciform Sections.—It will be remembered that some months ago the use of cast-iron columns or stanchions was interdicted, in Berlin, in consequence of several accidents having occurred through their failure to carry the loads which were put upon them. Hitherto, it has only been possible to supply their place by built-up structures of angle, channel, and joist iron, a combination with plates. Now, however, according to *Engineering*, Mr. Hugo Sack, of Duisburg, has designed and patented a rolling-mill for rolling cruciform sections of large dimensions and of any desired distribution of material.

London and County Banking Company. The Directors, in their report for the half-year ending 31st of December last (submitted at the annual meeting held on the 4th inst.), state that the net profits amount to 167,713L. 11s. 6d. This sum, added to 52,400L. 17s. 7d., the balance brought forward from last account, produces a total of 220,123L. 9s. 1d. Out of this the Directors recommended the payment of a dividend of ten per cent. for the half-year. The report and balance-sheet will be found in our advertising columns.

The Certificate of Award, Invention Exhibition.—Published as a supplement to the *Journal* of the Society of Arts at last week is a plate giving a *facsimile* of the certificate of award of a gold medal for articles exhibited at the recent Inventions Exhibition. About 80 per cent. of the whole of the design represents Music and Art,—Mechanics and Engineering, which comprised about 80 per cent. of the Exhibition, being represented by a man with sledge-hammer about to begin work, with naked foot on an anvil which is about one-third the proper height.—*Engineer.*

Grimeby to London by Raft.—The Grimsby correspondent of *Timber* writes:—"As a novelty in the shape of timber-carrying I notice Messrs. Bennetts & Co. have despatched a large raft of pitch-pine logs under tow of a powerful steam-tug, the destination being London. Grimeby to London by raft is quite new departure."

The New Cardiff Exchange was opened on Monday last. It has been erected from the designs and under the superintendence of Messrs Soward & Thomas, architects, Cardiff. We intend to illustrate the building shortly, when we will give further particulars.

The Cathedral of Lausanne.—It is announced that the committee which has been for some time past engaged on the artistic restoration of the Lausanne Cathedral, has taken up the active prosecution of that object. At a recent conference it was decided to commence operations as soon as possible on the southern façade. The committee has likewise resolved at once to take steps to arrest and prevent the rapid decay which has manifested itself in certain portions of the edifice. The assistance of artists is also being secured to effect the exact reproduction of the sculptures, the windows with their glass work, as well as the principal porch, and other parts of the building, in the restoration of which there is more than usual difficulty.

Royal School of Mines.—Prof. Warrington Smyth, F.R.S., in continuing his lectures, in the theatre of the Geological Museum, Jernyn-street, upon mining, dwelt at length upon M. Sommeiller's operations in tunnelling through the Mont Cenis. For upwards of three miles there was no opportunity of using air-shafts, because of the excessive depth to which they would have had to be driven, amounting to 500 fathoms in some places. Only two working faces were, therefore, possible, and from the nature of the ground passed through, and with three shifts, not more than five to eight fathoms per month could have been got through by ordinary hand-labour, taking thirty years to complete the tunnel. The accumulation of the interest of the capital employed in the enterprise would have rendered the expense excessive, and the undertaking almost impossible for a commercial company. The greatest rapidity of driving was, therefore, in essential condition to be fulfilled. M. Calla-ton suggested compressed air; but the source of the power to be thus transmitted to the working places would ultimately be so far removed as to render its efficiently doubtful. The idea was carried out with success, however, the compressed air being used to work perforators invented by Mr. Bartlett, an English engineer, but improved by M. Sommeiller. The principle upon which these perforators worked was that of the boring tool in connexion with the piston of a small cylinder, with only a few inches stroke, and capable of giving a large number of blows per minute. The perforators in question were worked at a velocity of from 140 to 180; and this was capable of being raised to 250 or 300. After long experience, it was found that much more progress was made in hard ground by a large number of small blows than a less number of heavier blows. The success resulting from the use of these perforators, worked by compressed air, is no proof that they could be adopted with advantage in mines; there is a great difference between having a large railway apital at your back, and the aid of two States, and having only the moderate capital of a mining company to deal with.

Table with columns: Timber (Country), £. s. d., and £. s. d. Includes entries for Cedar, Honduras, Australian, Mahogany, St. Domingo, Mexican, Tobasco cargo, Honduras cargo, Maple, Bird's eye, Rose, Rio, Bahia, Box, Turkey, Sasin, St. Domingo, Porto Rico, and Walnut, Italian.

Table with columns: Metals (Type), £. s. d., and £. s. d. Includes entries for Lead-Pig, Spanish, English, com. brands, Sheet, English, Silesian, special, Ordinary brands, Basas, Billiton, Straits, Australasia, English ingots, Zinc, and English sheet.

Table with columns: Iron (Type), £. s. d., and £. s. d. Includes entries for Pig in Scotland, Bar, Welsh, in London, in Wales, Staffordshire, Sheets, single, Hoops, Nail-roads, and Corrugated (British, cks. and ingt., Best selected, Sheets, strong, India, Portland, Chile, bars, and Yellow Metal).

Table with columns: Metals (Type), £. s. d., and £. s. d. Includes entries for Linseed, Coconut, Copra, Palm, Lagos, Palm-nut Kernel, Rape-seed, Cottonseed, refined, Tallow and Oleine, Lubricating, Turpentine (American, in cks., and Archangel).

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS. Epitome of Advertisements in this Number.

Table for Competitions with columns: Nature of Work, By whom required, Premiums, Designs to be delivered, and Page. Includes Public Library, &c. at Folkestone Town Cncl.

Table for Contracts with columns: Nature of Work, or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, and Page. Includes New Streets Works, Kerbing, Tar-paving, Works and Materials, Mortuary Chambers, Main Drainage Works, etc.

Table for Public Appointments with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, and Page. Includes Surveyor and Rating Surveyor and Valuer.

Table for Prices Current of Materials with columns: Timber (Type), £. s. d., and £. s. d. Includes entries for reanbaart, B.G., Oak, B.L., Spruce, U.S., Canada, etc.

Table for Tenders with columns: Name, Amount, and Status. Includes BERMONDSEY, CLERKENWELL, and others.

Table for Tenders with columns: Name, Amount, and Status. Includes CHISLEHURST, FELPHAM, and FULHAM.

HARROW GREEN.—For the erection of a Wesleyan Mission-room. Mr. E. J. Sherwood, architect and surveyor, Queen Victoria-street, London:—
 W. Gillingham, Leytonstone £260 0 0
 E. Norwood, Leytonstone 465 10 0
 A. Reed, Stratford 450 0 0
 W. T. Searle, Leytonstone 430 0 0
 W. Grear, Stratford 384 0 0
 R. Lister & Co., Leytonstone 383 0 0
 J. Oliver, New Southgate 370 0 0
 North Bros., Stratford 368 0 0
 F. J. Corhead, Leytonstone 340 0 0

LEYTONSTONE.—For the erection of "Salvation Army Barracks," Leyton-road, for General Booth. Mr. E. J. Sherwood, architect. Quantities by the architect:—
 R. Lister & Co., Leytonstone £1,017 0 0
 W. T. Searle, Leytonstone 1,004 0 0
 A. Reed, Stratford 998 0 0
 W. Grear, Stratford 967 0 0
 North Bros. 960 0 0
 Lobb & Oliver, New Southgate 876 18 2
 F. J. Corhead, Leytonstone 864 11 0

LONDON.—For alterations to No. 16, Finsbury-circus, and pulling down and rebuilding 7 and 7a, Eldon-street. Messrs. Davis & Emanuel, architects, Finsbury-circus. Quantities by Mr. Fredk. Downing, Whitehall-yard:—
 G. S. Williams & Son £3,607 0 0
 John Mowlem & Co. 3,457 0 0
 Colls & Sons 3,440 0 0
 E. Lawrence & Sons 3,130 0 0
 J. & J. Greenwood 3,120 0 0
 John Grover & Son, Wilton Works, Islington (accepted) 2,983 0 0

LONDON.—For fittings, &c., to warehouses in St. Mary-axe, for the Egyptian Cigarette Co. Mr. H. J. Newton, architect, Queen Anne's-gate, Westminster:—
 Godden £387 0 0
 Burman & Son 387 0 0
 Cook 389 0 0

LONDON.—For sundry fittings at Nos. 465 and 467, Oxford-street. Messrs. T. Chatfield Clarke & Son, architects:—
 F. Sage & Co. £559 0 0
 Hall, Biddall, & Co. 625 0 0
 Drew & Cadman (accepted) 619 0 0

LONDON.—For sundry drainage works to No. 8, Chesterfield-gardens, May-fair. Messrs. T. Chatfield Clarke & Son, architects:—
 A. Bush (accepted) £1,465 0 0

MILWALL.—For rebuilding workshops and stores, for Messrs. Stephen Smith & Co., Millwall. Messrs. J. & R. P. Clarkson, Great Ormond-street, architects:—
 Macey & Son £2,195 0 0
 J. H. Johnson 2,123 0 0
 W. J. Hoak 1,967 0 0
 Riddall 1,787 0 0
 Salt 1,649 0 0
 Limn, Millwall (accepted) 1,569 0 0

TOTTENHAM.—For the erection of St. Mary's Church, Tottenham. Mr. J. E. K. Cutts, architect:—
 Dove Bros. £7,283 0 0
 Morier 7,254 0 0
 Nightingale 7,180 0 0
 Brass & Son 6,883 0 0
 Tyerman 6,325 0 0
 Stephens & Bestow 6,285 0 0
 Lather Bros. 6,270 0 0
 L. H. & R. Roberts 6,196 0 0
 Dobson 6,159 0 0
 J. Holloway 6,150 0 0

WHITECHAPEL.—For erecting a block of dwellings in Wentworth-street, Whitechapel. Mr. E. Hoole, architect:—
 John Mowlem & Co. £8,688 0 0
 Patman & Fotheringham 8,455 0 0
 Lather Bros. 7,932 0 0
 Williams & Son 7,859 0 0

WHITECHAPEL.—For alterations and repairs at 81, Leman-street, Whitechapel, for the Ford & Sons' Shelter. Mr. Lewis Solomon, architect, New Broad-street:—
 Roberts £213 0 0
 Buxton 302 1 0
 Triggs (accepted) 275 15 0

WILLESDEN.—For completion of St. Andrew's Church, Willesden. Mr. James Brooks, architect:—
 Morier £8,800 0 0
 Howard 8,843 0 0
 Turtle & Appleton 8,770 0 0
 Higgs & Hill 8,693 0 0
 Lather Bros. 8,693 0 0
 Dobson 8,425 0 0
 Kilbey & Gayford 8,009 0 0

WOLVERHAMPTON.—For the erection of three houses, Crammore-road, for Mr. T. R. Adams. Mr. Joseph Lavender, architect, Darlington-street, Wolverhampton. Quantities by the architect:—
 £235 0 0
 Bradney & Co. 9 8 0
 H. Gough (accepted) 784 7 4
 J. Jones 761 0 0

Schools, Northfleet.—Messrs. Balsam Bros., of Shenton-street, Old Kent-road, write to say that their tender for this job should have been 3,800, but that there was an error in cast of summary.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than *Four p.m.* on THURSDAYS.

TO CORRESPONDENTS.

A CLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

COLOUR CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (Cloth), with Straps, to hold a Month's Numbers, price 2s. each; also

THE FORTY-NINTH VOLUME of "The Builder" (bound), price twelve shillings and sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, and GENERAL ADVERTISEMENTS. Six lines (about 1125 words) or under 4s. 6d. Each additional line (about 100 words) 0s. 6d.

TERMS for Series of Trade Advertisements, also for special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR lines (about THIRTY words) or under 2s. 6d. Each additional line (about 100 words) 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

* * * Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent Garden, W.C. to

DOUGLAS FOURDRINER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS to DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street Covent Garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient postage to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied in paper from the Office to readers in any part of the United Kingdom at the rate of 12s. per annum. To all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Best Bath Stone, for Winter use. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, and Farleigh Down. { Snimmer Dried. }
RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [ADV.]

Box Ground Stone is the best for use in all exposed positions, being a well-known and tried Weather Stone, 50,000 ft. cube in stock.
PICTOR & SONS, BOX, S.O., WILTS. [ADV.]

Doubling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarry is respectfully solicited, and Architects and others are CAUTIONED against inferior stones. Prices, delivered to any part of the United Kingdom, given on application to **CHARLES TRASK & SONS,** Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMSON, No. 16, Craven-street, Strand, W.C. [ADV.]

Doubling Free Stone For prices, &c., address S. J. STAPLE, Quarry Owners, Stone and Lime Merchants, Stoke-under-Lymington. (Ground or Lump). [ADV.]

Asphalte.—The Szeysel and Metallic Asphaltic Company (Mr. H. Glenn), Office, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and mill-rooms, granaries, tun-rooms, and terraces. [ADV.]

Asphalte. Szeysel, Patent Metallic Lava, and White Asphalte. **M. STODART & CO.** Office: No. 90, Cannon-street, E.C. [ADV.]

EVERY DESCRIPTION OF SEASONED WOODS AND VENEERS EXTENSIVE QUANTITIES.

B. J. HUDSON & SONS, Millbank Sawmills, Grosvenor-road, S.W. Whitefield-street, W.; And Store-street, London, W.C. Telephone No. 3,152, and Private Wire connecting Business Premises.

MICHELMORE & REA Manufacturers of

CHARLES COLLINGE'S PATENT COLLINGE'S PATENT HINGE LEVER, SCREW, & BARREL BOLTS. Self-Acting "FALL DOWN" GATE STOPS, and IMPROVED GATE FITTINGS of every description. 36A, BOURGHO ROAD, LONDON, S.E. 1.

BRABY'S PATENT GLAZING.

GLASS SET FREE,
 ALLOWING EXPANSION AND CONTRACTION, AND PRECLUDING BREAKAGE.
 ABSOLUTELY WATERTIGHT. PAINTING AND PUTTY SUPERSEDED
OVER THREE MILLION FEET FIXED.
 DRAWINGS AND PRICES ON APPLICATION.
 - MODELS AND SECTIONS ON VIEW. -

Discoveries at Winchester Cathedral.

FOR some time to come the attention of architectural students and antiquaries may be with advantage devoted to certain works of some magnitude which are now being carried out at Winchester Cathedral by the Dean, aided by his colleagues, and supported by local subscriptions.

It will be remembered by many of our readers to whom this famous cathedral is known, that it occupies the southern side, so to speak, of a large open area, planted more or less with trees, the most conspicuous of which form the fine shaded avenue which leads almost direct from the high street of the city to the main western door of the sacred pile. This open area has a perceptible slope citywards down to the north side of the cathedral, and a cursory inspection only a short time since would have convinced an ordinary spectator even that a great amount of earth had been allowed to accumulate along nearly the whole length of the building. At the west front, too, the ground is more or less uneven, giving the appearance to the path as if it had been cut through the soil to receive its recent level, while some curious remains of walling opposite the west front had a buried look plainly telling of the rising of the ground. This aspect is no creation of recent years, for it was noted at the beginning of the last century by Dr. Milner, who spoke of the ruins referred to, to refute the then asserted belief that they were the remains of a portion of the church said by tradition to have been built by the ubiquitous King Lucius in Roman times!

Old views of the cathedral also show the extent to which the ground had risen, for the singular Norman doorway which opened externally on the west front of the north transept is shown as being covered well up to the springing of its semicircular arch.

The Dean's work is altering all this buried appearance. A body of excavators have been at work for many weeks removing the earth from the cathedral walls down to the original level, and also making many improvements in the somewhat dreary expanse of open ground already referred to, many judicious works of planting and re-arrangement being carried out at the same time. The benefits are threefold: not only is the building kept free from the damp rising from the accumulated earth, but its appearance is greatly enhanced. Fully 1 ft. of earth have been already removed from

a great portion of the walls, the effect of which is to materially increase their apparent height, of essential benefit since the design of the cathedral is so long for its height.

In addition, the kindly feeling which has prompted the carrying out of these works at the present time of distress and scarceness of work, is beyond all praise.

This open ground on the north side has always been spoken of by old writers as the ancient cemetery of the cathedral, remarkable for the erection in it, in Saxon times, of another large monastic church side by side with the cathedral, and called, in contradistinction, the New Minster. The existence of two churches close together is a matter of much curiosity, since it is so different to that of a parish church adjacent to a monastic minster, or to the grouping of several small detached chapels around it; both of which arrangements are common enough, and readily explainable from the usage of the times. To have in a city two large monastic establishments at some little distance from each other is not unfrequent, particularly on the Continent, but an instance of it may be cited at Canterbury, where St. Augustine's Abbey was at no great distance from the cathedral.

Here, however, a few feet only divided two large churches parallel to each other. The appearance must have been not unlike that which exists in our own day at Erfurth, where two fine churches are placed so close together as to present an architectural group of great interest, although the benefit of the position may be open to question.

The old records are precise enough as to the state of things which existed here at Winchester, as well as the earlier events attendant upon the foundation of the monastery. Thus we are told by Ingulph, Leland, and others, that the intention of founding was King Alfred the Great's, although it appears by earlier chroniclers that the completion of the work was effected by his son King Edward the Elder, the year 903 being named in the Saxon Chronicle as the date of the consecration.

King Edward translated the remains of Alfred and his Mother, Queen Alswitha, into the church immediately after its completion, and it appears to have been his intention to place St. Grimbald, the Frankish mass priest, over the establishment of secular canons attached to the church, but his death took place in the year of consecration. The dedication was to the Holy Trinity, St. Mary, and St. Peter. We learn from William of Malmesbury that the site was so valuable that a mark of gold was paid for every foot of ground upon which the building was erected, while Radbourne states that the site extended to

1,884 ft.,—whether in length or in area is not very clear, but the former may be supposed, particularly if the return boundaries be included. King Edward's charter tells us that the area consisted of three acres and three virgates, and we learn from this document what is mentioned by the writers already quoted, that King Alfred planned the foundation of the church and partly executed it, the completion and endowments being Edward's.

Evil days were in store for the monastery. Its occupants took the side of King Harold. Twelve of the monks and twenty soldiers followed their Abbot Elwy, who was a brother of Earl Godwin's, to the field of Hastings whence they never returned. The displeasure of William the Conqueror against the abbey was felt for many following years, and the more so since the king was close at hand. He appears to have erected a palace at the north-west of the cathedral, probably on the site of that of the early Saxon kings, this being, perhaps, included in the vacant ground remaining to be excavated. The further history of New Minster closes, so far as its original position is concerned, by a record of its being taken down and removed to the Hyde meadows in 1110, or 1111, as the date is given by various chroniclers. At this time the relics of King Alfred and his queen were removed to the new church, where they remained until they were scattered by spoilers apparently in recent years, long after the dissolution. The cause of the removal is tersely stated. It was the discord between the occupants of the two Minsters. The bells of one were rung while service was going on in the other; the choral services themselves interfered with those in the adjacent church; and we are constrained to believe that the occupants did not possess any of the blessedness promised to those brethren who dwell together in unity.

The knowledge that the site of King Alfred's foundation was covered by the accumulated earth close to the cathedral naturally prompted the Dean to have some tentative excavations made, with the view of testing the accuracy of the old records. Accordingly the ground was trenched northwards from the cathedral. At a distance of 26 ft. 5 in. from the north transept the workmen came upon a massive wall, about 4 ft. in thickness, and 3 ft. below the ground. This was soon found to be of considerable extent, running parallel with the north wall of the cathedral, and justifying the belief that it was actually the southern wall of King Alfred's church. This belief is most probably correct. The wall has been traced eastward, and uncovered for about 70 ft. or 80 ft. in length, and it is found to continue for the whole of its extent of the same uniform appearance and thickness. Following its course

westward, it is found to return at right angles, as if for the west front of the building; but here only the rough concrete of the foundations, about 10 ft. below the present level of the ground, are to be met with. This has been followed for about 25 ft., but the termination has not yet been reached. The wall is solidly, but roughly, built of local rubble, put together with fairly good mortar. There are numerous fragments of Roman brick built up in the wall, and the excavators have found a great quantity of Roman pottery and brass coins, mostly of the later emperors. The workmen are still at work on this most interesting site, the intention being to follow the indications of the walls from end to end, with the view of recovering the entire ground-plan. This work is likely to prove of considerable value; for, apart from the interest derived from opening up to view the outline, so to speak, of King Alfred's foundation, the importance of having revealed to us the actual design of a Saxon minister of large size cannot be over-estimated in relation to the history of art.

The results of the excavations along the north wall of the cathedral are of considerable interest. The ancient plinth of the building has been exposed to view entirely around the north transept. As is well known, the first of the Norman bishops, who rebuilt the cathedral entirely. The exact date is well recorded, for we hear of the beginning of the work in 1079, and its completion in 1093, in which year the monks removed from their old monastery to the new one thus prepared for them, the shrine of St. Swithin being brought into the new church. On the following day the demolition of the old one began and was completed within the year, except one porch and the great altar which were left standing. The work is, therefore, amongst the earliest which the Normans erected, and it is a valuable study. Its roughness and entire absence of ornament give no little reason to the belief for so long a time held by the antiquaries of the beginning of this century that this portion of the cathedral was of Saxon and not Norman date. Increased knowledge of Early Norman work enables us now to recognise in it all the characteristics of this date, while we may in this same building trace in the works which brought it to completion the modification of the Norman style by the introduction both of ornament and moulding. Interesting as the study of the work has always been, it is now greatly enhanced, for the walls are now seen standing on their original base, which is as perfect as when laid by the old masons 800 years ago. The base consists of a boldly-chamfered plinth, which extends from point to point of the principal projections and does not break around the smaller pilaster buttresses. The old masonry is in perfect condition, having the diagonal tool-marks which are so sure a sign of Early Norman work. The joints are wide and the stones are of the moderate size so usually found at this period.

The work is very similar to Lanfranc's work at Canterbury, so far as it remains at the latter cathedral; the original plan of these two Norman buildings, which were in progress at the same time, having many points in common. One illustrates the other, and with the advantage that what is lost by removal at Canterbury exists at Winchester.

On removing the earth accumulated around the door in the west wall of the north transept, it was found to be of good proportions, and to go down to the plinth level. It has now been entirely cleared. The position of this door is remarkable. A doorway of Norman date exists on the west side of the south transept of the little cruciform church of Old Shoreham; but it is to be doubted if one in this position exists in any other cathedral. Much speculation has been occasioned as to its use; but may it not have been to give a direct entrance to the Norman king and his court? If the old tradition is correct, that the palace was to the north-west of the cathedral, its position would be one of necessity. The excavators were rewarded in an unexpected way during the progress of their work at this point. On removing

the rough filling-in of the doorway, two or three charming pieces of sculpture more or less broken were found. Attention being called to these discoveries, more of the walling was taken down, and fragment after fragment came to light. These consist of heads and portions of the figures of saints, carved with remarkable delicacy and skill. There is one figure with a hand upon a hook; another with the name Dorothy, in old English spelling, and many others. Several fragments of architectural panelling have been met with, and a singular portion of a Purbeck marble column worked in the form of a twisted knot. These fragments show clearly enough the fate of the numerous shrines which once adorned the cathedral, while the remains of the figures account for the many vacant niches, which are apparent in the chantry chapels, which have been preserved to our time almost unimpaired.

The excavations in the crypt will, it is hoped, be the most interesting portion of the work, the intention being to remove the whole of the accumulated earth. This crypt, apparently entirely of Wakylyn's work, is one of the most interesting of our early crypts remaining. At present it is encumbered with about 3 ft. or 4 ft. of earth, either placed there to prevent the rising of water or for purposes of convenience. A trial hole was made some time ago, and the base of one of the massive circular columns was found at the depth named. This was watched for some months, and no water having been found to percolate into it, it is considered that the excavations can be continued with safety, the main drainage of the city, recently accomplished, having, it is hoped, brought about this happy result. The increased appearance and effect to be given to this fine crypt, by nearly 4 ft. being added to its height, is expected to be very great; while the bringing open to view the whole height of the columns, and their curious early bases, will render the work of additional importance as an example of the earliest Norman work extant.

The progress of the excavations, too, may be expected to reveal some ancient features at present buried. The grave of Prior Silkstede has already been brought to light.

REPORT ON SEWER VENTILATION.

THE Report of the Special Purposes and Sanitary Committee to the Metropolitan Board of Works, on sewer ventilation, reminds one that there is no finality in sanitary matters more than in other branches of science. It is only a very few years since charcoal disinfectors or filters were to do everything for us in the way of disinfecting and purifying the air escaping from sewers and drains, and now the charcoal system is reported on all hands as practically a failure, not because charcoal will not in the first instance perform what was promised for it, but because it soon becomes saturated with the moisture in suspension in the sewers, and loses its deodorising power, and the constant changing and reburning of it would be too troublesome and costly in a large system of sewerage. The Report charges against charcoal also, on the ground that the placing of a charcoal tray in a ventilator amounts to closing that ventilator. This can hardly be said to apply to the arrangement which has been tried at Croydon, and, we believe, elsewhere, of a spiral series of trays, between which the air was passed, so as to afford contact with the least amount of mechanical obstruction. This system is reported as having been tried at Croydon for ten years (the charcoal being replaced every three weeks), and finally disused on account of the difficulty of keeping the charcoal dry, and therefore efficient, and also "because it obstructed the ventilation of the sewers"; but we cannot think there can be much in this latter objection in the case of the spiral trays arrangement. The charcoal tray, with only a passage for the air by percolation between the particles, is, of course, another matter, and is, undoubtedly, a serious obstruction to ventilation.

The Report is a rather rambling and un-

practical document. It assumes the possibility, for instance, of the majority of householders in a district entering into a covenant to flush the drains simultaneously, at stated intervals, so as to do it with more effect,—an idea which suggests a very imperfect acquaintance with human nature from the householder point of view. The principle is also suggested that a sewerholder is morally bound to be a kind of sewer ventilation agent, even to the extent that if he puts in an intercepting trap, he ought to be bound to supply a ventilator to the sewer to compensate for the loss of the former ventilation into his own premises. There is a touch of unintentional satire, what may be called sanitary satire, in this, which is rather amusing. On the other hand, the householder who was formerly content to draw the sewer air directly into his house, as a part of the order of nature, has now, under the influence of the preachers of the gospel of sanitation, become so wary that he kicks obstinately against the proposals of the Board to carry up ventilating pipes from the sewers against the walls of his house to a point above the roof. The caution of the householder, under his present sanitary education, is not to be wondered at; that it may be carried too far, however, is shown by the answers to questions scheduled in the Appendix, where, in reply to the question "Have vertical shafts or pipes been used in your district for ventilating the local sewers?" the Vestry of St. George's Hanover-square reply that the prejudice against them is so great that it could only be done in isolated cases, and that in one case where such a pipe was put up, the occupier of a house in another street, who could see this pipe from his windows, complained in the strongest manner of the nuisance occasioned by it, and the danger to his family, and threatened legal proceedings, long after the pipe, though still visible, had been disconnected from the sewer!

The Report groups the possible methods of ventilating sewers under three heads:—(a) Surface ventilation by shafts leading from the crown of the sewer to the surface of the road; (b) by large separate shafts, factory chimney shafts, and smaller shafts, in all of which fire or other heat is the motive power; (c) by pipes or shafts without heat. In regard to system *b* it is perfectly effective, but, unfortunately, the great cost it would entail in the erection of chimney-shafts and in fuel would place its general adoption in a large sewerage system out of the question, and the utilisation of the heated current of factory shafts, beside that such shafts are not numerous enough and not always where they are wanted, is met with the same difficulty as that just touched on in regard to the shafts up the sides of buildings,—the great objection of most owners of factories to allow their shafts to be utilised in this way. The conclusion of the committee is that this system can only be usefully applied, with proper regard to economy of cost, at a few points in a system where there are special difficulties of ventilation or special cases of deserving very efficient ventilation; and this is the only reasonable conclusion that can be come to on the evidence.

In regard to ordinary pipe ventilation, this has been tried to a greater extent than many persons are aware of, generally to mitigate the nuisance arising from ventilating openings along the roadway. It is stated by the Commissioners of Sewers that 137 pipe ventilators have been constructed in the City, but that these "had not helped materially in reducing the nuisance from surface ventilators. In twenty-two of thirty-seven other districts in the metropolis, pipe ventilators have been to some extent used, and the total number of such ventilators provided by the local authorities in London appears to be 582, of which Lewisham has 149, the City 137, and Wandsworth 100. In twelve districts the pipe ventilators are reported as having abated nuisance especially when used in connexion with surface ventilators. In five districts the pipe ventilators, it is stated, have not abated nuisance. Fulham states that the pipes have not materially abated nuisance, as in certain artesian districts they are inoperative. St. Saviour's

Southwark, states that the ventilating pipes had to be abolished, as they were a nuisance to the inhabitants."

In Bethnal-green and in the Strand district it was impossible to obtain the consent of the owners of property to the erection of pipe ventilators, and Hampstead and St. James's state that they can give no decided opinion whether such ventilators have abated nuisance. Lewisham has the largest number of pipe ventilators of any district, but the report from that district gives no certain opinion, only observing that "where the surface ventilators have been removed the complaints have of course ceased."

In regard to surface-ventilation the efficacy depends upon the number, size, and construction of the ventilating-shafts, and the general evidence taken on this head points to the conclusion that in many cases these are too few and far apart, and that nuisance would be diminished by increasing their number, and thus dividing the up-draught and rendering it less concentrated. The distance from each other at which the ventilating-shafts are placed varies in different parts of the metropolis from 17 yards to 600 yards. Twenty-nine districts report that it would be advantageous to increase the number of surface-ventilators, reporting variously in favour of distances of 20 to 50 yards apart, 60 to 80 yards, 80 to 100 yards, 100 to 150 yards; and one district says "not less than 200 yards apart." It may be taken as the result of present evidence that it is better to have a considerable number of ventilators in a given length than to have them at long distances apart; the possible nuisance in the latter case occurs at fewer points, but it is considerably intensified at those points.

Now it must be observed that the Report fully recognises the indubitable fact that one of the principal causes of nuisance arising from sewers lies in want of sufficient water-carriage and consequent stagnation. Having admitted this, and having stated that "the Committee are of opinion that the first and most important matter in connexion with sewers is the provision of water for flushing the sewers in dry seasons," it is somewhat surprising to find that in another part of the Report it is seriously proposed that the Board should apply for Parliamentary powers for the compulsory erection of pipe-ventilators in connexion with houses and other buildings. This is one of the examples of the illogical character of the Report. It is admitted that the only advantage of pipe-ventilators is to remove the effluvia further out of reach; that such ventilators, unaided by heat, act no better for their main purpose than surface ventilators (the evidence seems to show, as might be expected, that in some states of the weather they may be even less efficient); that pipe ventilators would be a real source of danger or annoyance to the occupants of houses unless they can be kept at a considerable distance from windows and other openings; and that the main cause of these being any nuisance at all is insufficient flow; and yet with all these admissions the Committee propose to apply for powers to compel the erection of pipe-ventilators. We venture to think that, on the evidence of their own Report, they have no chance of obtaining such powers, and that they are unnecessary and might be very liable to abuse.

A confusion of ideas seems to have dictated also the paragraph in regard to the conditions of temperature in sewers and its effect on the ventilation. "When the temperature of the air of the sewer is lower than that of the external atmosphere, and no other influence is at work, the colder atmosphere of the sewer, being heavier than the external air, remains in the sewer; but when the outer air becomes older and consequently heavier than the air in the sewer, it presses down through some of the openings to the sewer, and drives out the warmer and lighter air through other openings. This is noticeably the case on cool evenings in wet, dry seasons, at which time the nuisance from sewer ventilators is probably at the worst. It is, therefore, necessary to provide in sewers as, in all other ventilation, inlets for the cold air as well as outlets for

the warmer air." Considering that in this case the flow is assumed to be sometimes one way, sometimes the other, it is probable that the air will make its own inlets and outlets; but perhaps for the greater convenience of the air, the committee would have the ventilators labelled, like the approaches to a railway booking-window, "In" and "Out."

Again, after having distinctly stated that the real desideratum for preventing nuisance is sufficient and rapid water-carriage, the Committee, nevertheless, proceed to enlarge in their report on the value of permanganic acid for deodorising the contents of the sewers in hot weather; whereas what is really needed, according to their own showing, is an extra supply of water. In fact the report gives the idea of having been compiled by several persons, each with his own idea of the best treatment, which he takes opportunity to enforce in his own special paragraphs.

As to the question of the provision of ample water-carriage, the Report alludes to one method of using water in dry weather, so as to make it do double duty, for cleansing above and flushing below. "In the summer months the paved surfaces of the whole of the courts and alleys in the Holborn district are periodically washed with water taken from the company's mains. In this way not only are the surfaces of the courts and alleys kept clean, but the sewers below are well flushed out also." The Committee think that, if a similar course were taken in other districts, a large part of the nuisance from sewer-gas would be removed, in addition to the sanitary benefit in other respects. This is one of the most practical suggestions in the Report. In general, the difficulty of adequate and frequent flushing, or of keeping up a full and rapid flow in the sewers in dry weather, is in the cost of the water. Special means for the storage of rain water, to be used for adding to the volume of water in the sewers when requisite, seems the most practicable alternative. The initial cost would be considerable, but it might prove economic in the long run. In violent storms the sewers are nearly choked with water, and get well flushed at the time; but if the water thus allowed to run away could be stored and distributed for more frequent use, it would be turned to much fuller advantage.

Generally, the conclusions to be gathered from the facts stated in the Report are that a more rapid flow and a greater number of surface ventilators would almost entirely remove the sewer-ventilator nuisance, and that the rest of the recommendations in the Report are not much to the purpose, and in some cases almost cancel each other.

NOTES.

THE recent case of McLachlan and Cuckson v. Grant, in which an architect and a surveyor sued a lady for a sum due to them for taking out quantities, would not have been noticeable except for the judge's observations in regard to the payment of architects. For as to the merits of the case it was simply a dispute as to the amount due. But Baron Huddleston expressed, as has often been done before, his opinion that the way in which architects are remunerated by the payment of five per cent. on the total cost of the work is very unsatisfactory. He also expressed a wish that the Royal Institute of Architects would take the matter into their consideration. Of course there are low-class practitioners among architects as among lawyers, and in each profession these members of it will run up bills unnecessarily against their clients. But it is as unreasonable to suppose that the bulk of the profession overcharge their clients as it would be to say that the bulk of solicitors make up improper bills. On the other hand, there is no doubt that the existing method of remuneration prejudices the architectural profession in the eyes of the public, and inclines them to dispense as much as they can do with the services of architects. In principle the system is not a good one, for the plans of a

house which costs 2,000l. may be as troublesome as those of one which costs 4,000l. It may be observed, however, that the Institute of Architects has really no more power than the Incorporated Law Society has on its part to fix the amount of remuneration due to its members. Any architect may charge by a fee, instead of by 5 per cent., if he pleases.

IN the same case referred to above, Baron Huddleston also went out of his way to remark that he should hold, until he was overruled, that an architect has no right to employ a surveyor to take out quantities without the consent of his client. This was a purely gratuitous piece of information, inasmuch as the question of the employment of a surveyor did not arise in the case, the only point being the amount of commission to be charged for the quantities. It may be as well for the learned Baron to inform himself as to former decisions on the subject; and if he will turn to Scott's Reports, vol. vi., p. 1, he will find that his opinion is opposed to that of four judges, namely, Chief Justice Tyndall, Justice Parke, Justice Collier, and Justice Bosanquet, who held that an architect has the right and power, without notice to his clients, to pledge his employers' credit to a surveyor for the quantities, and that in so doing he is acting as their agent (*Moon v. The Guardians of Witney Union*). There was another case (*Wright v. Attenborough*), in the Court of Exchequer, before Mr. Baron Martin, of a similar character, in which the plaintiff recovered (*Builder*, vol. xiii., p. 489).

IN reference to the construction of the dome in Mr. Emerson's design for the Liverpool Cathedral, which is, we believe, admittedly adopted from that of the tomb of Mahmoud at Bejapoor, and the Junna Masjid at the same place, a correspondent writes:—"Careful measured drawings of the tomb of Mahmoud and other buildings in Bejapoor have been made by Mr. Cumming, C.E., under the superintendence of Capt. Hart. They are published in a folio volume, entitled 'Architecture at Bejapoor' (John Murray, London, 1866), and are well worthy of careful examination. The book is in the library of the Royal Institute of British Architects. Whilst writing the above, may I venture to ask what the plan is of the intersecting arches in Mr. Emerson's design? They surely must be in a vertical plane as in the two Indian examples, and cannot follow the curve of the dome. The interior perspective published in your journal seems to show the latter; for the wall immediately over the great arches is circular. This would be an impossibility, for the intersection of the eight great arches must form an octagon in plan. A triangular soffit is thus left between the octagon and the circle, which is covered in the Mahmoud tomb by placing brackets of varying projection underneath (see plan). If Mr. Emerson's dome were carried out, surely the walls and balustrade immediately over the pendentives would have to be octagonal, with the circular dome springing from behind, unless the same expedient of placing corbels under the soffit were adopted. In either case the internal effect would be materially altered."

A POINT of some interest has been decided in the recent patent case of Otto v. Steel, in which the question of the novelty of the invention of the well-known gas motor engines was raised. One of the objections to the novelty was that Otto's invention had been anticipated in a treatise by a Frenchman named Beau de Rochas. The only publication of the work, using the word publication in the legal sense, was that in 1863 a copy of the book was placed in the library of the British Museum. But Mr. Justice Pearson held that there was not a sufficient publication to invalidate a patent. It was not published (again using the word technically) in such a way that there was a reasonable probability that any person who wished might get knowledge from it. It had not, in the opinion of the judge, become

"part of the public stock of common knowledge." Of course, in each separate case it must be a question whether a book has become part of the public stock; but English inventors will, at any rate, derive comfort from the knowledge that their inventions are safe, although some foreign work which contains the same idea is reposing on the shelves of the British Museum.

AN international competition is advertised in the Italian papers for a design for a new west front to the cathedral at Milan. No fewer than fifteen premiums are offered, of a total value of 3,000*l.* The designs will be adjudicated upon by a jury of architects of different nationalities.

MR. HICKMAN, M.P., speaking at a meeting of the Wolverhampton Chamber of Commerce, on Friday last, gave his opinion as to the causes of the successful German competition in the iron and steel industries. He considers that one reason for the low prices of German manufactures is the low rate of wages and the longer hours made by the operatives of that country. They have another great advantage in the railway rates, which the speaker declared to be even lower than stated in the report to which we alluded in our article on this subject last week. He strongly favoured the proposal to construct a canal from Birmingham to London, for steamers of 120 tons burden, expressing his opinion that the cost of conveyance would thus be reduced 50 per cent. Several other canal schemes are being promoted, and the competition between land and water conveyance is likely to be carried on more vigorously than ever in both directions. Mr. Hickman brought a strong charge against the railway companies for excessive charges, and the preferential rates in favour of foreign produce in October, 1884, and a writer in the *Railway Official Gazette* of that month, commenting upon his paper, made the following remarks:—"Obviously the rates need revision, as the heavy traffic from the hardware districts is being carried in a much greater degree than heretofore by means of the canals; and, without taking a gloomy view, it is far from unlikely that on many such waterways steam haulage will set up a real and fresh competition with our railways, which it will be difficult to again completely overcome." Another thing which cannot be without significance to the companies is the removal of works to the ports, with the avowed purpose of avoiding the heavy railway charges. Messrs. Nettlefold, for instance, have now officially confirmed the report that they are about to remove their extensive steel and wire works to Newport, Monmouthshire, on this account.

WITH regard to the recent lamentable accident at Holloway (see p. 253, *ante*), we are glad to see that the recommendation of the coroner's jury, to the effect that the Metropolitan Board of Works should endeavour to obtain powers enabling the District Surveyors to supervise the demolition of old buildings as well as the erection of new ones, was brought before the Board at its last meeting, and referred to the Building Act Committee for consideration and report. Attentive observers must often have felt the necessity for more adequate precautions in the conduct of demolitions, and not only in the interests of the public at large, but for the safety of the men engaged in this often dangerous work.

THE celebrated arcade, called the Galleria Vittorio Emanuele, at Milan, designed by the late Professor Mengoni, and opened in 1867, has (according to *Il Politecnico*) fallen into a lamentable state of dirt and disrepair, and it is in consequence proposed to restore it. A discussion has arisen as to whether the original elevation of the interior shall be retained, substituting stone or some similar material for the plaster and cement in which the original design was executed, or whether a new and more simple design should be adopted for the interior in order to avoid future deterioration of the surface from dust and damp. The

Milanese Society of Engineers and Architects recently passed a resolution to the effect that the Society was persuaded of the urgent necessity of a permanent and complete restoration of the arcade, and expressed the hope that such restoration should be carried out on the principle that the present architectural and decorative features should be respected as far as possible, introducing only such changes in the materials and workmanship as will, without altering the character of the building, render the interior facade absolutely durable and secure, and facilitate its being maintained in a simple and economical manner.*

AN ingenious means of making good damage done by water getting under a lock-floor, without using coffer-dams and laying dry the dock, has been successfully tried on the Zuid-Beveland Canal, and is quoted in the "Foreign Transactions" published by the Institution of Civil Engineers. The lock in question rests on a pile foundation, supporting a timber floor on which the brickwork walls are built. The natural soil consists of fine running sand. For some time the earthen backing to the lock walls was found to be giving way, and considerable silting up had taken place in the canal bed, just outside the lock chamber. A hole was found in the apron of the lock floor, and there was a hollow underneath the floor itself. This was at first filled with puddled clay, but it had all been washed out again shortly after, and the sinking of the ground continued. Coal tar was then pumped down through a tube near the apron, at the upper side of the lock-chamber. This passed under the floor to the lower side, showing that continuous hollows existed under the lock-floor. An unsuccessful attempt was made to fill these by forcing down water and sand. It was then discovered that the timber piling was attacked by teredo worm, and that even the floor was not free from it. In 1882 it was determined to fill the hollows with concrete, of one part Portland cement to five parts sand. Eight holes were bored through the lock floor, and the concrete was forced down through a tube so as to completely fill the space between the original soil and the underside of the floor. Thirty-seven metres cube of concrete was the quantity used, and this formed a hard mass underneath the floor. The traffic was only closed about seven weeks, and the cost of the work amounted in all to 177*l.*

THERE were 786 kilometres of new railway opened for passenger traffic in Germany in 1885 against 875.5 kilometres in 1884 and 916 in 1883. Of these, 580 kilometres were State railways and 206 kilometres were in private hands. The increase for the year is about 2½ per cent. on the length of lines previously open. The net return on the German railways averages 4.3 per cent. per annum, the co-efficient of working cost being 57 per cent. It will thus be seen that the main aim and outcome of the German lines is the facilitation of transport. The average cost of a mile of German railway is about 21,234*l.*, against 42,017*l.* for a mile of railway in the United Kingdom. The gross receipts of the German lines amount to 10 per cent. on capital against 9.15 per cent. in the United Kingdom. But the Saxon railways, constructed at about the same average cost per mile, earn 11.9 per cent. gross revenue, and net 5.1 per cent. on capital.

ACCORDING to the official Year-Book of the Church of England, the funds raised by the voluntary contributions of societies and institutions organised and administered by the Church of England alone, during the last twenty-five years, amount to the large sum of 81,570,000*l.* This does not include bequests and voluntary offerings of which the Church of England is only a partial recipient, in conjunction with other religious bodies. And there is a large contribution from private sources which it has been impossible to bring

into account. Out of the sum above stated, no less than 35,175,000*l.*, or upwards of 42 per cent., has been devoted to church building and restoration, building of parsonage-houses, enlargement of burial-grounds, and endowments of benefices. From this sum all grants from church societies and corporations are excluded. The published return does not divide the total under the heads above given. But however large be the allowance due to the last two heads, the allocation of a sum probably considerably in excess of a million sterling per annum to the purpose of building and restoration is certainly a matter of interest to both the architect and the builder.

THE accounts of the London and North-Western Railway Company, of which the published receipts for the half-year showed a decrease of revenue to the amount of 110,000*l.*, on a total of 5,000,000*l.*, show a balance sufficient to admit of a dividend at the rate of 7 per cent. per annum, against 7½ per cent. for the corresponding part of 1885, and 8 per cent. for that of 1884. The Great Northern Railway, with an increase of 26,000*l.* on a revenue of a little under 2,000,000*l.*, maintains its dividend, at the rate of 6 per cent. per annum, declared for the corresponding half of the previous year. The Great Western Railway Company, with a decrease of 105,000*l.* on a revenue of 3,600,000*l.*, divide at the rate of 6½ per cent. per annum, against 7 per cent. at the corresponding period of 1885; carrying forward a balance of 40,000*l.* instead of one of 35,400*l.* The accounts of the North London Railway Company show a balance sufficient to admit of a dividend at the rate of 7½ per cent. per annum. With these railway dividends should be compared the generally prosperous accounts of the tramway companies, and the 10 per cent. per annum dividend, with 1*l.* 6s. per cent. bonus, free of income tax, of the London General Omnibus Company.

EXTENSIVE changes are taking place in Rome. The embankment of the Tiber is being continued; the extension of the Via Nazionale to the river is being carried out, as well as the new street uniting the Via Angelo Custode with the Corso. This latter street when finished, will make a continuous and nearly straight line of communication between the Corso near the Piazza Colonna and the new Spithoever quarter and the new buildings at the Ludovisi and the Porta Pia. 200 new workmen's quarters is in progress at Monte Testaccio, a locality which will be remembered by students in connexion with the German artists' festival. Extensive building operations are also going on outside the Porta Pia, on the Prati di Castello and on the waste ground between the Lateran and the Church of St. Maria Maggiore, which are rapidly changing the aspect of these parts of the city.

IN the last number of the *Revue Critique* M. Homolle gives an account of the result of the new explorations carried on at Delos. We are glad that the glory of completing what years ago they began is to belong to the French Government. The remains of a Mediaeval city have been laid bare, and the discovery in the field of classical archaeology, though not so sensational as those of the previous enterprise, are still full of interest for the history of the "island schools." Fifty fragments of marble sculpture have been found, besides terra-cotta and small bronzes. To these have to be added 224 fragments of inscription some dating as early as the fifth century B.C. none later than the first century B.C. They contain funeral inscriptions, dedication decrees, and choragic lists. One of them, six hundred lines long, and the whole, when edited, are sure to throw much light on the politics and commerce of the Cyclades. On individual monument we must note, a sculptured vase, signed by the maker Iphikates Naxos.

THE excavations carried on in the Roman arena at Paris have just been rewarded with very interesting results. An artificial watercourse in excellent preservation has

* Interior views of the building were published in the *Builder* for April 25, 1883, and February 4, 1884, and a view of the entrance was published in our pages on July 4, 1885.

been laid bare, which evidently served the purpose of filling the circus with water on the occasion of mimic sea-fights. Enough of the structure of the door-posts remained to show that the entrance was closed by a door of extraordinary strength, which would indeed be needed to stem the force of the water. The hole which held the door-hinge is clearly made out. The excavators have further come upon a number of the seats for the spectators, and also on some fragments of a slah on which were inscribed the names of the dignitaries,—inhabitants of the ancient town of Lutetia, who had a right to seats of honour.

THE *Kölnische Volkszeitung* reports also an important Roman discovery. Within the precincts of the Roman castrum at Bonn a bronze statue of a "Victory," standing on a globe, has been found. The type is already familiar, the style of the workmanship is reported as belonging to the best Roman period. With the statue was found a splendid gold medallion set with rubies. Both of the discoveries are now in the private collection of Professor Weerth at Bonn.

THE collection of drawings by Mr. Herbert Marshall at the Gallery of the Fine Art Society, illustrating "the Scenery of London," is one of the most admirable and interesting of the smaller exhibitions now open. Mr. Marshall's fine and pure style in water-colour is known to all who are interested in contemporary art, and the subject of the picturesque of London architecture he has almost made his own, combining a fine sense of effect with a knowledge of architectural forms such as is not often found among painters who deal with architectural subjects. It is true that here and there we find drawings in which the attempt at special effect has rather obscured the truthfulness of the view. For instance, we should not at a glance have recognised the view entitled "South Kensington" (67) as a representation of the precise point selected; it does not convey the impression of the place at once; and the same may be said of a few (but only a few) others. Among those which are particularly good as combining effect with local truth are "Emmanuel Hospital" (18), "Lambeth, Early Morning" (19), "Whitehall" (21), "The Approach to Westminster" (24), "St. Giles, Cripplegate" (28), and "Sunrise in Broad Sanctuary" (84). A very effective drawing is that of "The Tower and River from Wrightson's Warehouse" (64), giving a point of view not, of course, familiar; looking over the tower and the river from a height. "St. Bartholomew the Great" (85) is a view specially interesting at the present moment. The collection shows how much of picturesque grouping exists in London, and on every ground it is an exhibition which none who are interested in London architecture, and in good and sound water-colour art, should miss seeing.

SIG. GIACOMO BONI, a young Venetian architect, whose researches with regard to the foundations of the caupanile of St. Mark at Venice were recently noticed in these pages, has been recently elected a Corresponding Member of the New York Academy of Science.

SIR JOHN SAVILE LUMLEY, the British Ambassador at Rome, delivered a lecture on the 26th ult. before the British and American Archaeological Society at Rome, on the Galley of Tiberius on Lake Nemi, the

"Nemi navel'd in the wooded hills"

of Byron, and the scene of Ernest Renan's romance "The Priest of Nemi." Frequent attempts have been made to discover the remains of the galley or ship or floating island, which is traditionally reported to have been sunk in a storm, but the only result has been pieces of timber, tiles, enamelled plates, and ills, which have been brought up from time to time by the divers employed. The lecture was well attended, and was received with frequent applause.

AT Messrs. Dowdeswell's Gallery in Bond-street is a collection of water-colour drawings by Mr. James Orrock, illustrating "the country of Scott," on the English and Scottish Border. Mr. Orrock's style is rather limited in its range of effects, but he possesses, as we have remarked before, a special gift in the representation of atmospheric effect under certain conditions: his rainy skies are full of rain and wind, his sea-coast scenes smell of the sea. A great deal of his characteristic power is illustrated in this collection of drawings.

WE have received from M^{me}. Palladiense, of New Bond-street, some very excellent reproductions of pictures and studies of cattle by Verhoeckhoven, an artist whose animal paintings are full of character and power of drawing.

IN reference to the elevation of Sir Edmund Beckett to the peerage, the *Times*, in giving its usual short biographical sketch of the new peers, after mentioning some things for which Sir Edmund Beckett is justly distinguished, adds "and he is an authority on ecclesiastical architecture." This extraordinary statement has been copied into newspapers all over the country. We presume the gentleman who does this work for the *Times* wishes to be accurate. It is a pity that he did not inquire from some authentic source of information before making this statement. Sir Edmund Beckett is not and never was an authority on ecclesiastical architecture. No person who does understand the subject would care a button for his opinion on it. His reputation in this respect rests solely upon the fact that he writes letters to the *Times* asserting that he is an authority, and that a number of dances are silly enough to believe him.

CATHEDRAL FAÇADES.*

THE rapid glance that we have taken at the work of these architects will enable us to realise the huge burden of originality which is expressed in the façades of our three English examples at Lincoln, Peterborough, and Salisbury. We will consider Lincoln first, as the fact that we see the front crowned by twin towers may seem to give it some points of comparison, though not of likeness, with the French façades; and, further, because it is certain that the designer of Peterborough, and probably also the Salisbury architect, observed and studied the Lincoln building.

The Norman Front of Lincoln.

The original west front of Lincoln Cathedral was built in Norman times by Remigius, and consisted of five semicircular arches of graduated heights; four of them remain as they were built; the centre one, which corresponded to the section of the Norman nave, having been replaced with a pointed arch when the front was expanded. The two outermost arches cover apsidal recesses like bays niches, and deeply recessed beneath the three central arches are the celebrated doorways, unrivalled at home for the delicacy and beauty of their sculpture. A little above these doorways the piers are crossed by a frieze of most interesting Early Norman bas-reliefs; but beyond this the front exposed its stony bare walling up to the delicate ornamental arcade

*Continuation of a paper by Mr. A. Beresford Pite read at the meeting of the Architectural Association on the 25th ult. (see p. 251).

above the arches. Then came three enriched Norman gables, which were returned to the north and south, where they still exist behind the screen; and above all rose the two very beautiful later Norman towers, dedicated to St. Mary and St. Hugh. This original front must have formed a charming and picturesque group with its quaint disposal of plain and ornamental surfaces, bold light and shade, picturesque gables, and beautiful towers. The architect who would disturb all this must be bold to audacity, and possess some loftier and new ideal to replace this most satisfactory early front. The cathedral as we now see it was built from St. Hugh's choir westward, seemingly a tacit acknowledgment to the claims of the front to preservation; and though wider than the nave of Remigius it was still thought best not to disturb the west end, but complete the work against the eastern faces of the towers. Thus a bay of the Norman nave has been left between the towers; but the vault was rebuilt at a greater height, and with it, the central arch of the front. Two large and beautiful chapels were erected in the position of western transepts on either side of the nave, thus adding width to the front. When these works were completed, it was decided, in the episcopate of the celebrated Bishop Grosstete, that the Norman front, with all its impressive beauty, was not of sufficient scale and grandeur for the cathedral now in contemplation; but the front was too good and too well loved to be pulled down and replaced; and thus it remains to us, a striking instance of the preservation of an ancient building by those ruthless destroyers of historical monuments, the unrivalled architects of the thirteenth century; an exception to all their known methods of procedure.

The Façade Expansion.

The architect, whose was the task of dignifying the west front of Lincoln Cathedral, set about his task without hesitancy or fear; he conceived that this was an occasion which released him from all bonds of known precedent. The cathedral was practically complete, and a front had to be added commensurate with its importance. If he ventured to remove or efface the ancient front in obedience to his instincts, displeasure and perhaps dismissal would ensue. So, instead of enriching and decorating the bare Early work he decided to build upon and around it. He first removed the Norman gables covered with a curious diamond pattern that crowned the arches in front of the towers, and reared upon the delicate intersecting arcade, another of his own period, of very fully developed Early English design. This arcade reached up to the base of the new nave roof, and finished beneath a string that surmounted the central arch. The nave roof was terminated by a very fine enriched gable, and from its base line a massive Decorated parapet extended northwards and southwards in an unbroken horizontal line to the turrets which bound the façade. From behind this parapet the Norman towers, their faces covered with delicate arcading, almost piteously peeped, scarcely rising to the height of the gable that mushroom-like had sprung up between them. The architect's coup de main had reduced them to mere cyphers in the composition, as his façade was to consist of a central gable and long horizontal parapets of the severest outline, terminated by great octagonal turrets. The towers were not wanted in his ideal, and though not destroyed, were for a time extinguished.

Here we must remark what is an interesting Nemesis, if the architect had no ulterior intention of raising the Norman towers. Bishop Grosstete also prepared the base for a magnificent lantern, two exquisite stages of which only are his work, and there he had to leave it. The

next architectural generation raised upon it the unrivalled central tower, to complete the composition of the cathedral, which now possessed, besides the façade, the angel choir. There can be little doubt that such a lantern as this was conceived at the same time as the façade, though delayed an epoch in its execution. But did the architect dream that the spirits of those Norman towers of St. Hugh and St. Mary, whose light he so rudely sought to extinguish in days gone by, would again rise from behind his screen, drawn upwards from their sleep to the honourable and necessary function of balancing his now realised central tower? For we find that the erection of the elegant Perpendicular belfries upon the Norman towers followed the completion of the lantern, re-asserting their importance and dignity above the façade. This, we are conscious, is not detrimental to the success of the composition. An original designer is often apt to over-insist upon the emphasis of his particular idea, and Groslet's architect seems to have been so convinced of the power and dignity of an unbroken horizontal sky-line as to have overlooked the demands of the completed building for an imposing western group.

The circumstances of site and manner of approach are important considerations in façade design, and must here be dealt with. Lincoln Cathedral is situated on the edge of a great cliff, to which it presents its south elevation, and from which no direct approach can be gained. There was sufficient open space at the eastern end of the building to insure proper perspective for its grouping; but at the western end the precinct boundaries are close upon the church. No gradual view could be obtained of this front, which was practically invisible till the spectator had passed beneath the Exchequer gateway, and found himself within a few yards of the nave door, immediately opposite. No side view could be obtained to give the front perspective; the only view was a sheer elevation. This fact must have powerfully directed the architect's ideas to a façade without perspective or large features, for he spread a great curtain wall across the end of the church, and covered it with rows of small arches, whose size could be easily grasped by the eye, and whose repetition in regular tiers gave relief and leisure to the mind, while a company of statues enriched the upper arcades. The façade was expanded sufficiently not only to cover all the buildings of the west end, but also to occupy the whole plane of vision. Neither the transept, galilee porch, nor central tower can be seen till the corner of the front has been passed. The great width of the façade is a very interesting matter for thought, for other reasons besides those which we have just been considering. It was probably determined to obtain as good a proportion as possible for each half of the front, as it was only viewed from its central axis. All its horizontal lines between the parapets and ground are divided at the central recess. Each half of the façade is, therefore, proportioned to itself; but the entire expanse is too long, and requires the central group of towers and gable to give it dignity.

Though vastly differing in effect and treatment from the Lincoln front, the façade of Peterborough Cathedral is connected with it by such strong links, and by so many important points of resemblance, that the former might at first sight be thought to be the prototype of her neighbour, both in idea and execution. The resemblances, as we shall see, point distinctly to a close study of the Early Norman front of Remigius at Lincoln, and have but few points and qualities in common with the contemporary work of the thirteenth century. The architect of Peterborough Cathedral west front, shares many sympathies with the early Norman designer. They both appreciate the power of lofty arches, and the poetry of their continuous lines; both love the mysterious shades of the recesses, and also value the rhythm and lightness of the repeated crowning gables; both throw their façades forward in front of their buildings in an unbroken plane, obtaining grouping and distance, as well as massiveness and grandeur, by raising towers in the rear; both men also return gables against the north and south sides of the towers. These evidences of the appreciative study of successful Norman work by the thirteenth-century architect are most interesting, and mark him as a man with a truly great mind. With his work before us we feel that the designer of the Peterborough façade was possessed

with the loftiest order of genius; his conception stands alone in its mysterious, solemn impressiveness; the mind never seems to tire of trying to unravel the secret of its poetry and grace. Is it not idle to call it unrivalled? All through the ages till now men have wisely kept out of the lists of its competition, and left it alone in solitary wonderfulness. The genius of similar capacity has not yet appeared or can be looked for; and if the designer of Peterborough had conceived another façade, would not his genius have led him to leave this work unrivalled? Lofty architectural conceptions are not to be produced nowadays, by the reproduction of great ideals already attained, but only by following the instincts of the heaven-bestowed measure of the gift of design. Let not the beholder think the great arches possess the secret of success alone, for the spirit of Peterborough will laugh his arches to shame. If he would have arches for arches' sake, let him go to Rome and copy Caracalla's Baths, which he may be able to understand better than those of Peterborough.

Among the grounds upon which we can compare the west front of Peterborough with Lincoln, is its site and manner of approach. The cathedral precincts are reached through a gateway central with the front, from which it is separated by a square enclosed green. On entering, the eye is immediately filled with all the extent and glory of the façade; the suddenness of the *coup d'oeil* is in astounding contrast with the stately serenity with which this wonderful façade rises out of the earth; we are filled with an exciting enthusiasm for the triumph of the poetry of its arches over the prose of walls, and are charmed with the graceful lightness of its crowns of pinnacles and gables, and of towers and spires which set at naught the restraints of the horizontal line. Compare these effects with those obtained by the Lincoln designer of this period, where, when facing the building, he sought with huge breadth of wall and severe simplicity of line to impress the beholder; for the contrast is complete.

The striking beauty of pointed arches of great size in full view, can scarcely be appreciated when seen in the single span of a cathedral vault, or in a nave arcade, however lofty, as only one arch is completely viewed at a time. For this reason we can partly account for the special interest of the central pointed arch in the Lincoln front, which is displayed in an open field of wall. The magnificent pointed arch in the centre of the Peterborough façade is such a one as would span the nave, the width of which is reproduced in its piers, enriched with all the beauties of thirteenth-century mouldings, bands, and carving. We must not stay to speculate upon the reasons which here determined that the Norman nave should be retained, and all effort concentrated upon the façade,—exactly the opposite counsel to that which prevailed at Lincoln. We are contented, though probably the architect viewed the lumpy old Norman nave which he had to retain with jealous contempt, for, instead of being restricted within the narrower confines of internal nave architecture, this supreme genius was set free to build the façade, and in so doing he has amply revenged himself upon the Norman nave.

The peculiar qualities and mysteries of nave architecture have been bestowed upon this façade. Observe the lowering shadows of his vaults upon the walls beyond, behind which rise the towers external to this nave; the clustering shafts and piers of his grand crossing arches; the refined internal surface arcading and doorways, in his aisle walls; the lofty, graceful windows inclosed in delicate interlacing arches; and the very perfect grouping;—all the beauties of nave architecture are here, in hitherto unattained grandeur and scale, while the vaulting shafts spring up with pinnacles and spires to the blue vault of heaven.

We must now hurriedly pass on to the west front of Salisbury Cathedral, which resembles the later work of the Lincoln façade, being a curtain wall flanked by turrets; the nave gable is brought on to the centre of the front, and alone breaks the horizontal sky-line. The architect was, however, entirely without any restraint of site, the ample precincts offering unequalled opportunities for varying groups and piles, of which the best advantage was taken on behalf of the central spire, round which the building most beautifully groups.

This fact makes the reason for the choice of a façade for the west front, a matter of some mystery. There was no foreshortened building to be hidden, as the cathedral has no important direct road in front, nor was there a ruler work to be surpassed or adapted. The façade is practically contemporary with the whole scheme, and must have been adopted from purely fanciful reasons. The fact that the arcades have been filled with sculptured figures can scarcely be taken as an indication that opportunity was required for such a display, which could only be afforded by a façade; for we do not find that the arches and niches are designed specially for this purpose, as a glance at the Lincoln tier of arches shows. The end of the nave is brought fully to the front with a majestic gable, great triplet window, and porches below which give direct access to the nave; and buttresses are placed on each side to resist the thrusts of the nave and triforium arches. Half arches spring from the outer shafts of the triplet window to the buttresses. Large windows light the side aisles, and also have repeating halves that penetrate the buttresses, and above each of these are two windows to light the triforium. Within the simple and dignified lines of this façade, we find a most extraordinary freedom reigning, that must be called licence. As far as possible all continuous lines have been broken up, though the front is not in any way recessed; neither the great band of diamond ornament, or any of the arcades connect the wings of the façade with each other, and there are definite variations in the setting out of the arcades to prevent vertical lines from ruling the composition; the necessary buttresses which we have observed are covered by the arches, niches, and sculptures, so that when seen in façade elevation, their vertical lines should be as unobtrusive as possible. The very bold and striking band of quatrefoils inclosed in diamonds is broken at the centre bay, and a portion suddenly appears above the window, to be broken again over the middle arch. The arcades which enrich the turrets are allowed to return into the wall anywhere, and anyhow, as if all points of view except the front were occasions for recklessness. The side aisle windows are allowed to break up the magnificent band of figure which would have brought the whole front together, and done much to heal its weaknesses. The details are as beautiful as any other work of the thirteenth century; but there is such a loss of rhythm and continuity of line that we are inclined to think it all wasted. And the windows, too, which light the interior, seem, by their repeating arches, to desire to share the work of covering the front with arcades.

The two methods of façade design which came under our notice in considering the three French cathedrals, reappear at Salisbury,—viz., the proper expression of the interior of the building upon its exterior, and the desire to take advantage of the opportunities of producing grand and imposing façades by the freer use of architectural forms. Purely imaginative design inspires the later work at a façade, and is the motive of the whole Peterborough design, where the architects' courageous treatment of their respective fronts released them from the duty of incorporating the internal arrangements within their façades. But at Salisbury this powerful handling was lacking, and the successful French method of compromise apparently unknown throughout of; with the result that we find the elements at war. The imaginative parts of the architect seem to cry piteously, "See what we have done here if we had fair play. The nave windows,—how they have broken up the boldly-designed band of diamond and quatrefoil ornament! These aisle lights,—how they split up our family array of figures into mere handfuls! And these wretched buttresses, how they tumble up and down to the detriment of everything!" And, almost dog-in-a-manger-like, we hear the voice from interior remarking that "if they want a façade they must manage it without interfering with comfort." And this hopeless discord will go on till the façade is pulled down, or, as there is too much light for the interior, the window is blocked up.

We must conclude our consideration of the subject by taking leave of Salisbury as an instructive example of the difficulties and dangers attendant upon the design of a cat-

dral façade; which must deepen our appreciation of the tact with which the French architects arranged the difficulties of their fronts into successful compositions, and stimulate our enthusiasm for the bold originality, and the fine imagination, with which the architects of Lincoln and Peterborough stepped away from all hindrances, and triumphantly erected their magnificent cathedral façades.

The President, in opening the discussion, said that although the subject was one not at all easy of treatment in a short paper, yet Mr. Pite had handled it in a very thoughtful and critical manner. The first point touched upon was the effect of the central tower, which gives the utmost importance to the general design. In the case of Durham and Lincoln, one saw the combination of commanding position and of happy design; while in the case of Salisbury or Gloucester there was poor position for the cathedral, with excellent outline. Winchester, again, was poor both in general lines and position. There, it must be admitted, however, that Wykeham never finished his work, or he might have put a large central tower to balance the composition. The fact remained that at a short distance from the town, the cathedral, though large, was quite lost. The west front of Winchester was, perhaps, the simplest form of elevation-design that could be found, the lines of the sloping aisle and nave roofs being exhibited in the façade in a commonplace way. Lincoln, Peterborough, and Salisbury possessed, however, real *façades*, which had practically little to do with the buildings behind them. They were there for architectural effect and their own impressiveness. He believed they were all agreed that the west front of Peterborough was the finest in England. With regard to Salisbury Mr. Pite was right in what he said. From the eastern point of view it could not be called satisfactory, and the detail was not worked out in anything like a masterly manner. The west front of Wells Cathedral, although, perhaps, designed too much with the one view of giving a large field for the sculptor, was, at the same time, beautiful and suggestive. Tewkesbury and Dunstable were examples worthy of study. Turning to foreign façades that of Strasburg Cathedral stood foremost in the mere impressiveness of its first effect upon the spectator. At the same time they could not do better than accept Mr. Pite's opinion, that the best west front they could possibly study was that of Notre Dame.

Mr. W. J. N. Millard thanked Mr. Pite for showing the members his method of study, not bothering himself with the details, but going right to the root of the matter, and finding out the original design. It was uncommon for young students to take so broad a view of the subject. He proposed a vote of thanks to the lecturer.

Mr. Leonard Stokes, in seconding the vote of thanks, remarked that he had been rather struck by one point in the paper. Mr. Pite, on a former occasion, came to the conclusion that the plan of Peterborough Cathedral looked best upon paper when hung up on end. Now, however, the conclusion had been arrived at that Peterborough west front was the finest of any English Cathedral, and he agreed with Mr. Pite that it was a long way beyond any of the others in conception and completeness of scheme. He was afraid that Mr. Pite was going to praise Salisbury, which to his mind was hardly satisfactory. Notre Dame, on the other hand, was most satisfactory, the old architecture owing much of its beauty to the effect of the horizontal lines displayed in the design.

Mr. H. W. Pratt thought that Mr. Pite had brought this old subject before them in a somewhat new light. He had done well in limiting his remarks to three French and three English cathedrals. Great stress had been laid upon the west front of Peterborough, the effect of which, on passing through the gateway was that of vastness, leaving eventually the impression that there was a want of skill about it when looked at in connexion with the rest of the building. It seemed, therefore, a mistake to place the façade of Peterborough before the student as an example of what a west front should be. He did not know whether Mr. Pite considered it legitimate to design buildings in confined situations as façades, or in open situations where they could be seen all round, treat-

ing the façade as a façade in itself. When one had roamed about Italy, and seen how much the façade was thought of, and how shabby the back part was, one got sick of the fine fronts. He should be sorry if any one went away with the idea that in designing large buildings, he should study the main front so much, and not the perspective, the grouping, and the success of the building lines. In Gothic work the *raison d'être* was to keep the whole thing together, and not have one part independent of the rest of the building, while the exterior should represent not only the interior, but also the plan. In the case of Notre Dame the horizontal bands being carried straight through the façade, seemed to cut off the upper part of the towers from the building, and he rather preferred the carrying up of the vertical lines of the towers from the bottom. At Salisbury Cathedral the bands were not carried right across the façade, but still the effect was very good, as the connecting lines were carried across sufficiently by the eye.

Mr. F. G. F. Hooper remarked that Mr. Pite, in his treatment of the subject, had taken him by surprise. He thought that questions would have been raised with regard to the balance of parts, the fenestration, proportions of the doorways, and so forth. The illustrations before them contrasted strangely with each other with regard to the proportions of the doorways, and it would be an interesting matter for discussion to compare the several entrances. It had been said that the doorways of Notre Dame were like the entrances to bee-hives, and these were in contrast to the three great arches of the west front of Peterborough.

The resolution was then put, and very cordially received.

Mr. Pite, in returning thanks, asked if he was stating something awful in saying that no great architect had really accomplished a grand imaginative work without having what was called a "sham" in it? He did not like the term "sham"; it was a miserable word. To call the façade of Peterborough Cathedral a "sham" was positively intolerable. In spite of Mr. Pratt's special pleading, he could not agree with him as to the west front of Salisbury Cathedral. It was too much to say that the towers of Notre Dame were cut off, as they were in one plane with the rest of the front.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the Association was held, on the 4th inst., in the Professional Hall, the President, Mr. G. Washington Browne, in the chair. After the usual preliminary business, Mr. Simon read a paper on "Wood-carving, with special reference to Germany." Remarking that the art had been practised from the earliest ages, he proceeded to trace its development from the rudely-carved handles of implements in the stone age, and of its application to domestic utensils in the ages immediately succeeding that. According to Pausanias, the statues were carved in wood, and this material continued to be so employed down to the Middle Ages, many examples still remaining in the cities of Germany, France, and England; but the art has long been applied to the interior decoration of churches, houses, furniture, &c. Referring to Germany, where it had reached its fullest development, especially in the numerous afterpieces of the fifteenth and sixteenth centuries, Mr. Simon observed that of the various schools, the Swabian claims pre-eminence, with Ulm as its chief centre, where the celebrated carvers, Jörg Syrlin, the elder and younger, executed numerous beautiful works, especially the choir stalls in the Cathedral of Ulm, Augsburg, also an important seat of this school. Its influence spread far into Switzerland and Bavaria. The lecturer referred to the works of Michael Pacher in Austria, and those of the celebrated Veit Stoss. The latter belonged to the Nuremberg school, but for a while was resident in Krakow, in Poland, where he executed a large altar-piece in the cathedral between 1477 and 1484. Other masters of this school were then mentioned, with a notice of medallion portraits executed in wood; some of them, of great merit, being in the Louvre in Paris; and the hope was expressed that the art may yet be restored to the place in public estimation which it formerly occupied. At the close of the meeting, a hearty vote of thanks was awarded Mr. Simon for his paper.

TECHNICAL EDUCATION FOR ARTISANS IN IRELAND.

IN a "Note" a fortnight ago (p. 192) reference was made to the mention by Mr. Philip Magnus at the Plumbers' meeting of the useful work which has been carried on in Dublin for some time past by Mr. W. R. Maguire. By a coincidence, Mr. Maguire read a paper on "Technical Education for Artisans" at the general meeting of the Institution of Civil Engineers of Ireland, held in Dublin on Wednesday, the 3rd inst. The paper included a comprehensive view of what has hitherto been done at home and abroad in the way of providing technical education for artisans. "Real technical education" was defined by Mr. Maguire to be "that which applies the principles of the natural sciences to the practice of the mechanical arts and industries connected directly with the future careers and occupations of the students." The following extracts from the paper have special reference to the needs of Ireland in this matter:—

"It seems to be most important to the future prosperity of Ireland that facilities for technical education, in the industries suited to our circumstances, should be offered to all who may be competent to profit by it, that our country may be given a supply of properly-qualified technical teachers, and that a more abundant and suitable supply of young people may be presented for technical training.

In any scheme of technical education for artisans in Ireland, there may be five grades or sections properly defined for consideration and arrangement:—

1. Primary education outside, but leading up to the point where lads of fourteen are fitted to commence a course of technical training.
2. Daily secondary technical education for persons who can afford to devote time for two or three years to a complete system of technical education, to fit them as foremen, managers, builders, with use of laboratories and workshops.
3. Evening technical education for apprentices and artisans engaged at their work by day, with lectures, and use of laboratories and workshops.
4. Technical art education, as applied to manufactures, and technical teachers, with lectures, demonstrations, and opportunities for original research in laboratories.
5. Higher technical instruction for original research in laboratories.

In all these grades proper and ample provision should be made alike for male and female education.

In Ireland the want of technical instruction is greater than in England or Scotland, because we want here to recover lost and to create new industries. It is well also to bear in mind that the classes for whom this special education is so urgently required are not able to pay for it, are not likely to clamour for it, and when it is provided, may need considerable inducements to cause them to accept it at first, and for some time. So that unless the State, the municipalities, or individuals, singly or in groups, will voluntarily urge on and assist the establishment of such institutions, and will maintain them even in the face of much discouragement, we may be sure that our Irish industries will remain at a low ebb.

The primary education of the children of artisans, farmers, and the lower middle classes in Ireland is almost exclusively under the National schools system.

The primary education of children of all classes, apart from questions of social position, which, by the way, are more considered in Ireland than in any other country in the world, might with advantage be the same in degree and in kind for all children up to the age of twelve; here the kind and degree of education must necessarily begin to differ, for some children must soon after be earning their living, while others, whose parents intend them for higher industrial or commercial pursuits, or for professions, will continue their education for many years. For children of artisans up to twelve or thirteen years of age, we may be content with the National schools, provided always that rudimentary drawing, elementary geometry, and the use of ordinary tools be included in the compulsory curriculum of that system of education. If the National Board will revise their class-books, to afford better rudimentary instruction in science, and will furnish their children with instruction as well taught as their reading, writing, spelling, and arithmetic, the children will be placed in the very best possible position, and with the requisite knowledge to enter the technical day schools or night classes.

In recommending the teaching of the use

Old University Buildings, Glasgow.

of tools to young children, let it be quite understood that such teaching is simply intended as useful discipline for the eyes and hands, an exercise for the senses of sight and touch, to quicken the perception of form, size, roughness, straightness, and measurement, and to encourage general handiness; but not to teach any handicraft, not to occupy any of the time required for other studies, and not to have any bearing upon the terms of apprenticeship.

The teaching of the use of ordinary tools to ordinary children at an early age would have a very important and useful effect, especially on the Irish nature; it would tend to break down absurd class distinctions; it would teach that there was nothing derogatory in handwork; it would tend to abolish the stupid idea that the clerk at his desk is in a higher grade of life than the artisan at his bench; it would show that a steel file was as noble a tool as a steel pen, and even less liable to create mischief in the world; it would most surely have a tendency indirectly to develop tastes which would turn many likely youths to honourable and well-paid manufacturing industries, instead of to the over-crowded, badly-paid, drudgery of clerkship.

In concluding his paper, Mr. Maguire thus recapitulated the requirements of technical school promoters in Ireland:—

- 1st. That primary education in the national and other schools in Ireland be remodelled and made compulsory.
- 2nd. That technical schools, as described, be established in every city and town in Ireland, to prepare young artisans for their trades, both in day schools before they engage in actual work, or, as continuation, evening schools during their apprenticeship term.
- 3rd. That the apprenticeship customs be encouraged and re-established, with clauses in indentures to compel apprentices to attend evening technical schools.
- 4th. That employers support and encourage technical schools, and employ only such artisans as show the desire for technical improvement by attendance on technical classes.
- 5th. That the State aids liberally with funds the efforts made to establish and maintain primary, intermediate, and higher technical education, through the length and breadth of the land.
- 6th. That the artisans and apprentices should themselves appreciate and take advantage of the benefits offered by technical schools.

In other times, added the lecturer, success in manufactures and commerce was greatly due to

local advantages, but now, owing to the progress of engineering, industrial competition has become one of intellect, and the best educated nation, as well as the best educated artisan, will henceforth be the most prosperous. This paper has been written in the hope that it may, in some degree, tend to show the greatness of the need for the technical education of Irish artisans, and may thus far help to supply that need, and secure the resurrection and future success of our lost and languishing industries."

THE PROPOSED CATHEDRAL AT LIVERPOOL.

A MEETING of the Cathedral Committee was held at the Walker Art Gallery, on Tuesday, for the purpose of further considering the design sent in by the architects. The bishop of the diocese occupied the chair, and there were present Sir W. B. Forwood, Mr. Arthur Earle, Mr. W. Bartlett, Rector Stewart, the Rev. John R. Eyre, Mr. Alfred Turner, the Rev. S. Wilkinson, and Canon Warr.

It was moved by Sir W. B. Forwood, seconded by Canon Warr, and resolved:—"That Mr. Ewan Christian be invited to inspect the plans of the competing architects and furnish the committee with his report thereon at the earliest possible moment."—*Liverpool Post*.

Extensions at Woolwich Arsenal.—Several new buildings of a large and costly character are being erected at Woolwich Arsenal. They include a new torpedo factory, which will cover about an acre of ground. The brickwork contract for this building has been taken at 7,000*l.*, and in clearing the ground for it, a large timber-built storehouse has been removed bodily on rollers across a roadway, and on to a vacant piece of land one hundred yards distant. The cartridge factories are likewise being enlarged, and new stores and workshops are being erected for the Royal Gun Factories and the Royal Carriage Department, whilst a second main is being laid down for hydraulic purposes between the Royal Arsenal and Shooter's Hill.

OLD COLLEGE BUILDINGS, GLASGOW.

This interesting old building, in which the business of the more ancient of our two great Scotch Universities was conducted for about two centuries and a quarter, stands in the High Street of Glasgow, and is at present used as a railway station. The *profanum vulgus* through its courts and *carmina non prius audita* shrill against its grey walls.

To meet the ever-growing requirements of *Alma Mater*, the University migrated in 1870 to the beautiful pile of buildings erected in the west-end of the city by the late Sir Gilbert Scott, and the old buildings have suffered a partial demolition, which is soon to be completed. It is, however, satisfactory to be able to record that the principal gateway in the façade, with which so many historical associations are connected, and which yet recalls many a student's prank and many a student's triumph to the memory of the present generation, is to be preserved and re-erected as a gateway to the grounds of the new building.

The old college was commenced in the thirteenth century of the seventeenth century, and, after many struggles with the adverse times and the solicitation of subscriptions from all classes of the community, was completed about 1660. The original subscription list, which is still preserved, is headed by King Charles I. with a donation of 200*l.*, entered in his own handwriting, dated at Seton in 1633, and a note is added that this sum was paid by the Lord Protector in 1654.

Mr. Billings, in his "Baronial and Ecclesiastical Antiquities of Scotland," in which there are five valuable and interesting sketches of the buildings, says of the general style of the edifice that it is a mixture of the English Elizabethan with the peculiar architecture which Scotland borrowed from France in the seventeenth century. It has the balconies, the tall rectangular chimney stalks, corner turrets, and the variously-decorated window tops of the former; while the narrow rocket-topped towers of the latter, polygonal or circular, are conspicuous in the quadrangle. The massive

Andover, on the remarkable excavations now in progress at Winchester Cathedral, under the direction of the dean, and referred to at length in another column of the *Builder* this week. About 5 ft. of earth is being removed from the base of the cathedral walls, and search for the site of the new minster has been rewarded by the discovery of the wall, apparently of the south side of the church, which stood parallel to the cathedral. The ancient crypt of the latter is also being cleared out. An old record of ancient earthworks at Alfriston and Wolstonbury was then read, prepared by Mr. A. Cope.

ROYAL SCHOOL OF MINES.

PROFESSOR WARINGTON SMYTH, F.R.S., in continuing his lectures upon mining, in the theatre of the Geological Museum, Jermyn-street, devoted his attention to the various means by which ground of a watery or loose character may be driven through. After commenting upon the ordinary method of *spilling*, he directed attention to the Thames Tunnel as being one of the most instructive pieces of work of the kind, the history of which ought to be studied by the student with every care. Two failures had already taken place in an attempt of a similar kind, one at Gravesend in 1799, and the other at Rotherhithe in 1804. The second one had been carried 923 ft., and to within 150 ft. of the opposite shore, but difficulties of an insuperable character were then met with, and the work was abandoned. Brunel, the engineer of the Thames Tunnel, sank a shaft 50 ft. in diameter 150 ft. from the river on the Rotherhithe side. He effected this by constructing on the surface of the ground a substantial cylinder of brickwork of 50 ft. diameter, the walls of which were 3 ft. in thickness, and 42 ft. in height, and then by raising the earth from the interior was enabled to sink the whole structure to a depth of 65 ft., when a smaller shaft 25 ft. in diameter was put down. By this means he was able to pass through the bed of gravel and sand 26 ft. deep, full of water, of which geologists had advised him to beware, and which, in fact, had rendered the second attempt previously referred to impracticable at the last moment. At a depth of 63 ft. the horizontal excavations for the body of the tunnel was commenced. The whole area of the excavation, which was 38 ft. in breadth, 22 ft. 6 in. in height, and the base in the deepest part of the river 76 ft. below high-water mark, was constantly covered and supported by an iron shield. The shield consisted of twelve great frames, lying close by each other, and which frames were 22 ft. in height and 3 ft. in breadth. They were divided into three stories, thus presenting thirty-six chambers or cells for thirty-six workmen. While the miners cut down and secured the ground in front the bricklayers were simultaneously engaged in carrying forward their work.

Illustrations.

LIVERPOOL CATHEDRAL DESIGNS.

WE give this week a view of the central western porch of Messrs. Bodley & Garner's design, a view in the choir, and the two principal sections. The longitudinal section shows the seating of the great central spire. The view in the choir shows how very closely the architects in this portion of the building have followed the suggestions of Lincoln Cathedral.

We may observe that in one of the exhibited drawings the architects have introduced an alternative leaflet, cutting off the large spire and showing the great lantern only. The effect, though very different in regard to the whole balance of the composition, is perhaps not inferior to that of the spire, and does away with all idea of constructional risk. In a future number we will give the remaining longitudinal elevation in this form, so that our readers can judge of the effect.

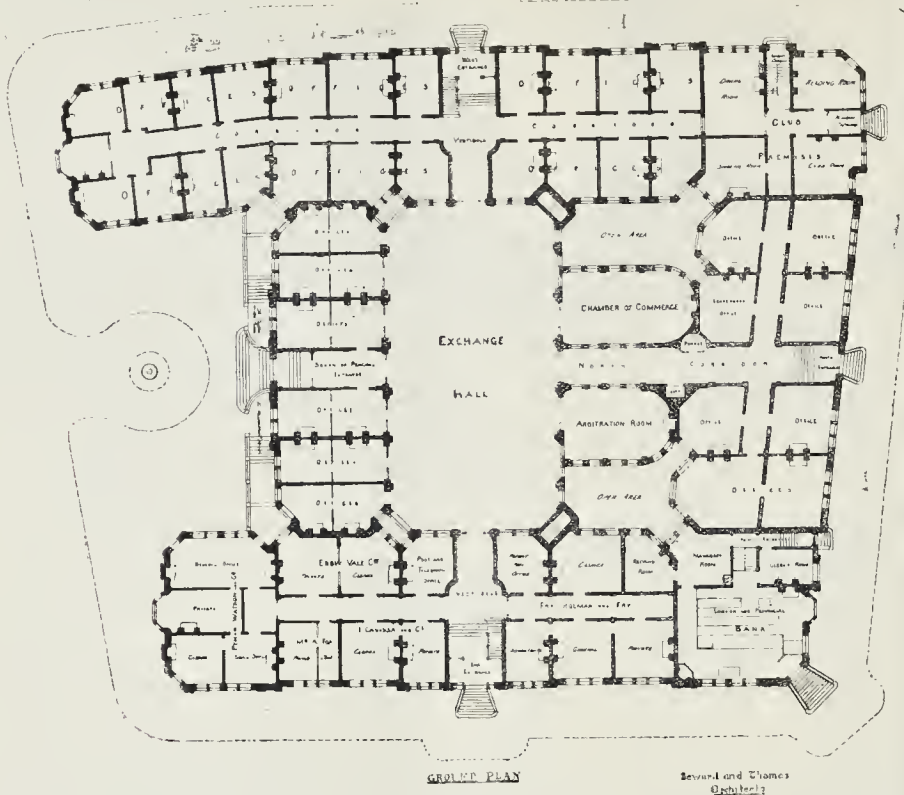

We should observe that the lithographs of the longitudinal section and the view in the choir are somewhat deficient in clearness of definition, owing to the fact that they had to be photographed at the Liverpool Exhibition under very disadvantageous light. As the defect is from causes beyond the lithographer's control, we think it better to give the illustrations, merely explaining the cause of their partial defect.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

At the meeting of this Association on the 3rd inst., the chair was taken by Mr. Geo. R. Wright, F.S.A. It was announced that the Bishop of Durham had suggested July 26th for the commencement of the congress, to be held in the county of Durham, under his presidency, and that the council had agreed to the date named. Visits will be paid to Durham city and cathedral, Raby Castle, Finchale, Dinsdale, and many other places. Mr. Loftus Brock, F.S.A., exhibited a collection of ancient engravings of German and Flemish towns, mostly of sixteenth-century date, showing the system of Medieval fortification, fortified bridges with tower and barbican, and many interesting details of early arrangement. Among the number was a bird's-eye view of the Abbey of Einsieden. Eton church, Northants, was described by Mr. J. T. Irvine, and illustrated by some well-executed drawings. Mr. Earle Way reported the recent discovery of a series of brick arches, the basement of a portion of the Duke of Suffolk's palace in the Borough, Southwark, which were revealed during some works of rebuilding on the site. A large number of fragments of pottery were exhibited, but these indicated the earlier occupation of the site by some Roman building, since they were the work of that people. A paper was then read by Mr. Brock on behalf of its author, the Rev. C. Collier, of

stair, with its stone balustrade, surmounted by curious old carvings of the Scottish lion and unicorn, mentioned by Mr. Billings, has been removed to the new building at Gilmorhill. The sketches show the principal façade, with its arched gateway and sombre windows, and a doorway and turret top in what was the principal quadrangle. There are also some details of the richly-ornamented window-tops, and of a curious old leaden ribone from the front of the building.

Highgate School.—The roof to the apse of the school chapel, which is dedicated to St. Michael and All Angels, has just been richly decorated. The surface which has been treated is divided by curved ribs from the apex into five compartments, which are each subdivided into three panels. The lower and largest tier of panels is filled with figures in groups of three, representing St. Michael, supported on either side by the other Archangels, with the Virtues, Principalities, and Powers, all being painted in colours on a gold background. The panels above are filled with constellations in raised plain gold radiating from the apex. The ribs, mouldings, and cornice are picked out with gold and colours. The work has been executed by Messrs. Heaton, Butler, & Bayne, of Garrick-street, under the supervision of Mr. G. Pemberton Leach, architect, of Conduit-street.

The Exchange Buildings, Cardiff.

THE NEW EXCHANGE, CARDIFF.

The new Cardiff Exchange, as we briefly stated last week, was opened on the 1st inst. It has been erected by a limited liability company on a site in Mount Stuart-square, from plans prepared by Messrs. Seward & Thomas, architects, Cardiff. We give a view and plan.

At starting, considerable difficulty was anticipated in meeting with proper foundations for so extensive a building, but it was not until actual trial shafts had been sunk by the builder, Mr. Burton, of Cardiff, to whom the contract for the first part had been let at 25,550*l.*, that the true state of affairs in this respect was ascertained. The site was then found to be composed almost entirely of the alluvial mud which prevails in that district. The substratum was here found to be about 30 ft. in thickness, and of the consistency of butter. In certain places, also, the ground had been honey-combed and filled in with slag from the old Cardiff Glass Works, which existed about half a century ago on that portion of the moorlands now occupied by Mount Stuart-square and its surroundings. Few more serious problems could present themselves to everyone concerned than to erect a large building upon such ground as this, and a solution of the difficulty was regarded, not only with anxiety, but interest.

After considerable deliberation, the directors agreed to the proposal of the architects to excavate the mud until the gravel was reached. When this had been accomplished it was obvious that, owing to the large number of buildings in close proximity, it would be dangerous to proceed in the customary manner with trenches for foundations, so the plan adopted was that of sinking a series of shafts, but these had necessarily to be very small, owing to the treacherous nature of the surrounding mud. Concrete was then filled in, and upon

the piers built thereon were constructed massive arches, on which the whole building has been erected.

The present block, which covers the eastern part of the quadrangle, is formed by a centre pavilion and two wings covered by Mansard roofs, surmounted by lantern lights, which transmit daylight into the corridors traversing the building. The eastern block contains a large central hall, 100 ft. in length, 50 ft. in breadth, and about 50 ft. in height, which has been opened as the Cardiff Exchange. A broad flight of stairs leads up to the centre of the building, from the vestibule of which corridors lead on the right and left to suites of offices. The Exchange Hall is entirely surrounded by galleries giving access to the offices which flank it. These galleries are constructed on iron cantilevers. The roof is carried on massive semi-circular ribs of iron, the spandrels of which are decorated with volutes and scrolls of iron. An effective design of pilasters and arches covers each end wall of the hall, and the tympana of pediments in the upper part or filled with figure designs in *sgraffito* work. The designs are emblematic of Commerce and Industry. They are the work of Mr. Wormleighton, of Cardiff, as also is the carving throughout the building. The floor is covered with a design arranged in large panels of Maw's styles, with a margin containing prismatic pavement squares, giving light to a corridor in the basement. Small moveable offices, constructed in oak with tinted glass panels, made from the architects' designs by Messrs. Lewis & Lewis, Cardiff, will be placed on each side of the hall.

As stated above, the general contractor was Mr. C. Burton, of Cardiff. The wrought-iron roof-principals were supplied and fixed by Mr. A. D. Dawson, of London; the heating apparatus is by Messrs. James Allen, Sen., & Son, Glasgow. Messrs. F. Whitfield & Co. supplied the strong-room doors in the bank basement; and Mr. S. Evans, of West Smithwick, exe-

cuted the lead glazing, to the architects' design. Mr. J. Woodman, Cardiff, laid the gas mains, which are taken under the different corridors' false ceilings, with branches to the different suites of offices, and has supplied most of the fitting. The main staircase is of Stuart's "Granitic" stone, with an ornamental cast-iron balustrade, by Macfarlane & Co., who also supplied the railing to the galleries around the Exchange Hall. The handrail of the staircase is in teak, and those to the galleries in pine, all handsomely moulded to special design. Messrs. Cordingley supplied the plaster enrich frieze panels in the hall; whilst the ornaments were specially designed and modelled by Mr. Wormleighton.

The false ceilings under corridors above referred to are utilised for the telephone-wiring, as also for the zinc pipes by means of which foul air from the different offices is conducted to a central ventilating extraction-shaft, 70 ft. high, which is heated by an iron flue-pipe from the boiler, assisted by a series of gas-jets, which will be lighted when the heating apparatus is not at work. The whole of the works under contract No. 1 have been executed in about 18 months to the satisfaction of the architect, Messrs. Seward & Thomas. Mr. F. J. Veall acted as architects' assistant and clerk of works since the commencement, and Mr. W. Williams was the contractor's foreman.

All the principal offices are occupied, and since the opening on the first inst. a large amount of business has been transacted daily in the New Exchange, which will doubtless find a great convenience.

The contract for the southern block, now found of erection, has been let to Mr. F. Lock, of Cardiff, for 5,300*l.* This work has been in progress about two months, and is expected to be finished by October or November. It will comprise an addition to the restaurant premises, rooms suitable for coffee-tavern purposes, and suites of offices.

[St. Paul's Cathedral Approaches.]

As Proposed by Mr. de Lisle.

ST. PAUL'S CATHEDRAL APPROACHES.

The annexed plans represent the present state of the approaches contiguous to the east end of St. Paul's Cathedral, and the plan proposed for modifying and improving them, in a pamphlet by Mr. Edwin de Lisle,* who, in asking us to call attention to this suggestion for the treatment of the approaches, adds the following remarks:—

"Starting with the idea that ultimately all the buildings round the cathedral should agree with the parallax of Wren's noble temple, which is present is only the case with the Chapter House, it is urged that a line drawn from 42, St. Paul's-churchyard to the Church of St. Augustine and St. Faith is the true line of departure to the east end, with a view ultimately to carry a noble and almost straight thoroughfare from Martin's-le-Grand to Queen Victoria-street, wide, airy, and direct to the Old Change, and backing up the part of Old Change, adjacent to the site of St. Paul's Schools, I calculate that only 2,200 ft. of building ground would be lost in this spot, valued at about 45,800l. The circular building at the S.E. corner being valued at 70,000l., a straight road, of a good width and parallel to the transepts of St. Paul's, might thus be made for an approximate cost of 115,800l. This would, of course, spare the way for widening Old Change right to Lambeth-hill. Such an arrangement would involve the addition of no less than 11,700 square feet to the garden at the south-east end of the cathedral. It would entail the loss, possibly, of some 3,000 square feet at the northern angle of the north-east garden; but the large trees might be made to stand in a causeway, as they do in Piccadilly, and the digging round the garden need not be higher than it is in Leicester-square, the whole square and the cathedral would have the appearance of being a lovely garden, especially if the suggestion of adorning the windows and balconies with banks of flowers and grasses were carried out.

The next most practical feature in this scheme is the widening of Paul's Chain and Cannon-street to the width of Bennett's Hill. Such an improvement as this would decidedly benefit the owners of the property on either side, no compensation would be necessary, it is just to say, for disturbance,—20,000l. It is to cover the whole cost. The Commissioners of Sewers might certainly look upon merely as the removal of a scandalous nuisance, and by one stroke give a fine view of north-east campanile, and at least one good approach to St. Paul's from Queen Victoria-

THE PRINCIPLES OF DOMESTIC FIREPLACE CONSTRUCTION.

This was the subject of the Friday evening discourse at the Royal Institution on the 5th inst., the lecturer being Mr. T. Pridgin Teale, M.A., F.R.C.S., who is already known to most of our readers as an investigator in this important field of applied science, and as a writer on sanitary subjects.

Mr. Pridgin Teale, at the outset, referred to the appropriateness of the use of the lecture-theatre of the Royal Institution for a lecture on this subject, seeing that Count Rumford, the founder of the Institution, devoted a great deal of attention to the study of the subject, which was particularly referred to in the prospectus of the Institution as "a very important part of the useful information to be conveyed in the public lectures of the Royal Institution." Correct principles, said the lecturer, have been habitually, and, until the last few years, almost universally, violated, and the rules so ably worked out, so earnestly and forcibly advocated by Rumford, have lain dormant, lingering here and there, chiefly in old-fashioned houses, and almost forgotten. Three evils result from the prevalence of bad principles in construction:—1. Waste of fuel and loss of heat. 2. Excessive production of soot and smoke. 3. Large addition to ashpit refuse by cinders, which are really unburned, and therefore wasted, fuel. These are matters of national concern, and it has been during the last four years to endeavour to convince the public that it is the interest no less than the duty of every householder, to burn his fuel on correct principles, and to do his part towards the diminution of those evils. Heat is wasted in three ways,—either by combustion means rapid escape of heat up the chimney; or by imperfect combustion of the gases which are generated during the burning of the coals; or by escape of heat through the iron sides and back into the space between the range and the brickwork and its top into the chimney. The greatest offenders are the ordinary register grates. Iron all over, back, and sides, and above to the chimney, and imperfectly filled in, or not filled in at all, with brickwork. The heat escapes through the iron to this chamber, and thence is lost. Another fault is that the "register opening," in other words the "throat of the chimney," being immediately above the coal, submits the burning fuel to the full concentrated force of the current to the chimney, converting the fire into a miniature blast-furnace.

The second result of faulty construction in fireplaces is "Undue production of smoke and soot." Smoke and soot imply imperfect combustion, and to this two defects in a fire mainly contribute,—one, too rapid a draught through the fire which buries away and chills below burning point the gas rising from the heated fuel. The other defect is too cold a fire, i.e.,

too small a body of heat in and around the fuel, so that the temperature of the gases is not raised to a point at which they will burn.

A few years ago the prevalence of unusually dense fogs roused the metropolitan public to a sense of this great evil. The Smoke Abatement Society was formed, and under its auspices exhibitions of smoke-consuming apparatus and improved fireplaces were held in London and Manchester. Beyond the fact that certain grates were pronounced to be good in point of economy, and moderate in the production of smoke, and that the public has been led to take an interest in and inquire into the relative value and economy of various patent fireplaces, there has been but little advance in the education of the public in the principles which lie at the root of the whole question.

A third result of bad construction is the "production of cinders." With good coal, cinders are inexcusable. They are unconsumed carbon,—coke,—and imply a faulty fireplace. If thrown into the ashpit, as is the case in 99 times out of 100, they are shameful waste, and more than waste, for they entail a great cost for their removal. The town of Leeds pays about 14,000l. a year for the scavenging of the streets and the emptying of ashpits. Nearly every house in Leeds supplies in the way of cinders at least twice as much ashpit refuse as it might do, were the fireplaces properly constructed. The ashpit refuse of Leeds is burned in a "destructor," and the cinders in the refuse provide not only heat enough for its reduction to a mineral residue, but spare heat for driving two 60-horse power engines, and for consuming a reasonable amount of pigs, &c., killed by or on account of disease.

These three great evils, evils affecting not only individuals, but the community, waste of fuel and heat, production of soot, production of cinders, are a direct result of the violation of the correct principles in fireplace construction.

Let us next inquire what are the principles which promote good combustion in an open fireplace,—i.e., what are the conditions which are essential to enable fuel to give out to a room "good money's worth in heat." That such a result may be obtained, fuel must burn well, but not rapidly. Two things in combination are essential to the combustion of fuel,—a supply of oxygen, and a high temperature,—i.e., plenty of heat around the fuel. If fuel be burned with a hot jacket around it, a very moderate amount of oxygen will sustain combustion, and if the supply of oxygen be moderate, combustion is slow. Burn coal with a chilling jacket around it, a rapid conductor like iron, and it needs a fierce draught of oxygen to sustain combustion, which means rapid escape of actual heat, and also of potential heat in unburned gases and smoke, up the chimney. This is the key to the whole position; this is the touchstone by which to test the principles of fireplace construction.

Few people probably realise the exact conditions of combustion, which may be well illustrated from the process of manufacture of coal gas.

The Nineteenth Century Art Society.—On Monday, the 13th inst., has been appointed for private view of the Spring Exhibition of the Nineteenth Century Art Society, at the Conduit Galleries, and the Exhibition will open public on Monday, the 15th inst.

* *Journal of the Royal Society of Arts*, London, 1885.

In the manufacture of gas, coal is raised to a high temperature, and the gases are driven off by roasting the coal in an oven from which air, i.e., oxygen, is shut out. The gases are conducted away, cooled, purified, and stored for future use in a gasometer; the combined carbon and mineral residue, being non-volatile, is cooled down before being exposed to the air, and is sold as coke. Here we have a striking proof that high temperature in fuel does not of itself imply combustion. If air were admitted to the red hot coke, or to the gases as they escape in their heated condition from the furnace, they would burn. But when coke has become cold, and the gases are cold, as in a gasometer, no amount of oxygen will of itself start combustion. The distinction from all this is, that complete oxydation, i.e., good combustion, is possible only when the fuel and gases are at a high temperature, and that high temperature of fuel does not produce combustion until oxygen is introduced; therefore we can have a high temperature of fuel without rapid combustion, provided we control and limit the supply of oxygen. My attention was first directed to the question of waste of fuel at the time of the coal famine some twelve years ago. I read in the *Times*, and acted upon the suggestion, made, I believe, by the late Mr. Mechi, to economise coal by inserting an iron plate on the grid under the fuel so as to cut off all draught through the fire. This undoubtedly induced slow combustion, and economised fuel, but the fire was dull, cold, and ineffective. The plan was abandoned. It taught me, however, the fact that combustion could be controlled by cutting off the underdraught, but I did not then see why combustion was spoiled. The reason was that the under-surface of the fire was chilled, and the fuel lost its incandescence owing to the rapid loss of heat through the iron towards the open hearth chamber. To some persons even now "slow-combustion stoves" are an abomination, and are supposed to be synonymous with bad combustion. The next stage in my fireplace education was the adoption of the Abbotsford grate. I thereby learned that the reason why an Abbotsford grate was an advance upon the iron plate lay in the fact that the solid firebrick bottom stored up heat and enabled the fuel to burn more brightly resting upon a hot surface,—not upon a cooling iron plate. But Abbotsford grates, and the other class of grates with solid firebrick bottoms, the "parson's" grates, have disadvantages. They are apt to become dull and untidy towards the end of the day, and do not burn satisfactorily with inferior coal. There is a better thing than a solid firebrick bottom, and that is the chamber under the fire closed in front by an "economiser." Some five years ago I made, somewhat accidentally, the discovery that the burning of coal in an ordinary fireplace could be controlled and retarded by the adoption of a very simple and inexpensive contrivance, applicable to nearly every existing grate, and that this result could be attained without impairment of, and often with increase of, the heating power of the fire. This contrivance, which I have named an "Economiser," was simply a shield of iron, standing on the hearth, and rising as high as the level of the grid at the bottom of the grate, converting the hearth space under the fire into a chamber closed by a movable door. The effect was twofold. The stream of air, which usually rushes through the bottom of the fire, and causes for a short time rapid combustion at a white heat, was thereby cut off, and the air under the fire was kept stagnant, the heated coal being dependent for its combustion on the air passing over the front and the upper surface. The second point was that this boxing up rendered the chamber hotter, and this increased temperature beneath the fire-grate, i.e., under the fuel, added so materially to the temperature of the whole, even of the cinders coming into contact with the iron grid, that the very moderate supply of oxygen reaching the front and upper surface of the fuel was sufficient to maintain every portion in a state of incandescence. Moreover, I observed that combustion was going on at an orange, not at a white, heat. Let us contrast a white with the orange heat. A white heat in a fire means rapid combustion, owing to the strong current of air, oxygen, which passes under the grate, through the centre of the fire, and up the chimney. As soon as the heat of the fire has been rapidly burned away at a white heat, the fuel cools; the iron grid cools also; and the cinders in con-

tact with the grid are chilled below combustion point. They then cease to burn, and the bottom of the fire becomes dead and choked. The poker must now be brought into play to clear away the dead cinders, and to re-open the slits in the choked grid. New coal is added to the feeble remnant of burning embers, with no reserve of heat in the iron surroundings; and in time, and perhaps very slowly, the fire revives, and rapid combustion sets in afresh under the influence of the renewed current of oxygen passing through the heart of the fire. An orange heat means that the coke, i.e., the incandescent cinder, is burning with a slowly applied stream of oxygen, a degree of combustion which is only possible when the coal is kept warm by the hot chamber beneath, and by a reasonable limitation of loss of heat at the back and sides by firebrick, either in contact with the fuel, or, at least, close behind the iron surrounding it. This effect is seen, partially, in the grates with solid firebrick bottom, but far more perfectly in the grates with the chamber closed by the "Economiser."

This hot chamber has the following effects:—The incandescent coal remains red hot from end to end of the grate until nearly all is consumed, thus maintaining a larger body of the fuel in a state to radiate effective heat into a room. The cinders on ceasing into contact with the iron grid remain red hot, and so continue to burn away until they fall through the grid as a fine powder. This allows the fire to burn clearly all day long almost without poking. When the fire is low, and new coal is added, the reserve of heat in the hot chamber is such that the addition of cold fresh fuel does not temporarily quench the embers, and the fire is very quickly in a blaze after being mended.

Having made the discovery by the observation of a grate supplied to me with an "Economiser," the value of which, I suspect, was hardly appreciated by the makers, I applied "Economisers" one by one to all my grates, kitchen included. The result surpassed my expectations. There was a saving of at least a fourth of my coal. The experience of many friends, who at my advice adopted the system, confirmed my own results. It was, therefore, clear to me that I was bound to make widely known a discovery which was fraught with such a benefit to the public. My chief aim hitherto has been to persuade the public to apply the "Economiser" to existing fireplaces. After steady exertions for four years, some impression has been made on the inertia of the public, and extensive trials of the "Economiser" are taking place in many parts of the country. To-day, however, my aims are more complete. It is my wish to advocate not one principle alone, although that is the cardinal one, but to urge all the best principles which enter into the construction of a really effective fireplace, and to induce those whom it may concern to replace bad by an entirely new construction, right in every point. The rules of construction which I shall lay down have been arrived at entirely by my own observation of what appeared to be the best points in various fireplaces. It was, therefore, no loss a satisfaction to me than a surprise to discover, on reading Rumford's work in preparation for this lecture, that nothing which I have to advocate is new, but that every principle, and the "Economiser" is hardly an exception, was advocated no less enthusiastically by him at the very commencement of this century.

Rule I.—"As little iron as possible."—The only parts of a fireplace that are necessarily made of iron are the grid on which the coal rests, and the bars in front. The "Economiser," though usually made of iron, from convenience in construction, might be of earthenware, and so would be more perfectly in harmony with this rule.

Rule II.—"The back and sides of the fireplace should be of brick, or firebrick." Brick retains, stores, and accumulates heat, and radiates it back into the room, and keeps the fuel hot. Iron lets heat slip through it up the chimney, gives very little back to the room, and chills the fuel.

Rule III.—"The firebrick back should lean over the fire, not lean away from it," as has been the favourite construction throughout the kingdom. The lean-over not only increases the power of absorbing heat from rising flame,—otherwise lost up the chimney,—but the increased temperature accumulated in the fire-back raises the temperature of gases to com-

bustion point, which would otherwise pass up the chimney, unconsumed, and thus be lost. Rumford discovered accidentally the value of this "lean over," and at once realised its immense importance. He does not, however, seem to have carried out his intention of working out for general adoption this form of back. Of recent years "lean over" backs have been re-invented and sparingly used. The "Milner" back, invented by a Lincolnshire clergyman, and adopted by Barton & Co., is excellent. It burns fuel well and gives out a great heat. But it is extravagant in consumption unless controlled by the "Economiser." Captain Douglas Galton saw the virtue of the "lean over," and adopted it in the grate which goes by his name. The "Bee-hive" back was the same in principle and very good, and having a very small grid, was economical. The "Rifle" back, adopted by Xelson & Sons of Leeds, gives an admirable fire, little short of perfection; but observation shows that the "tall" flame extends far beyond the bend, and is, therefore, soon lost as a heating factor, the heat being wasted in the chimney.

Rule IV.—"The bottom of the fire, or grate, should be deep from before backwards probably not less than 9 in. for a small room nor more than 11 in. for a large room." This is a corollary to Rule III. We cannot possibly have the back of the fireplace overhanging the fire when there is a shallow grid. If for no other reason than the demands of the "lean over," depth of fire-space is essential. But there is gain, thereby, in another direction. It affords plenty of room for the burning fuel to lie down close to the grid, and away from swift air currents, and prevents the tendency of the fire to burn hollow.

Rule V.—"The sides or 'coverings' of the fireplace should be inclined to form one of the sides of an equilateral triangle." The working out of this rule has cost me much thought and experiment. It was worked out more or less empirically with a view to attain certain objects, and, having attained them, I discovered that I had unwittingly selected the sides of an equilateral triangle. It is of some importance, and may be of interest, to tell how the question arose. In my earlier fireplace the sides or "coverings" were parallel to each other, and had the defect that they radiated most of their heat from one to the other, not into the room, with the probable result that much of such heat would eventually escape to the chimney. It was clear then that the sides must be set at an angle with the back, so as to face towards the room. But at what angle? My first experiments were determined by the shape of the corner bricks which were in the market. These determined the inclination of the sides to be such that, if prolonged, they would meet at a right angle. This is the angle laid down by Rumford as the angle of selection, but as the largest angle admissible in a fireplace. This angle, however, brought me into difficulties with my "lean over" by the openness of the angle made the back, as it ascended, spread out so rapidly that what was gained in width was lost in height. Moreover my critics objected to its appearance as ugly. What then should determine the inclination of the sides? The point was thus determined. Seeing that a heated brick throws off the greatest amount of radiant heat at a right angle with its surface, the "coverings" should at such an inclination to each other that a perpendicular line from the inner margin of one "covering" should just miss the outer margin of the opposite "covering." Where "coverings," as in my earlier attempts and Count Rumford's fireplaces, are at a right angle to each other, this perpendicular line misses the opposite margin by several inches. It was clear, therefore, that the inclination might be made more acute. Guided by this idea, and having determined the principle on which the shape of the grate should depend, an inclination arrived at which turned out to be an angle of 60°; i.e., the inclination of the sides of an equilateral triangle.

Rule VII.—"The 'lean-over' at the back should be at an angle of 70°." Commencing the level of the top of the front bars, it should extend almost to the throat of the chimney, which, as a rule, will be about 28 in. from the hearth, or 16 in. from the top of the fire, should extend so far forwards that the angle where it recedes towards the chimney should be vertically over the insertion of the cheek of the fire-grate. This will be from 3½ in. to 4

from the front of the fireplace, according to the size of the grate.

Rule VIII.—“The shape of the grate should be based upon a square described within an equilateral triangle, and the size to vary in constant proportion to the side of the square.” For a moderate room, 8 in. determines a very useful size; for larger rooms, 9 in., 10 in., or even 11 in., may be necessary. An area of grating of 100 in. in the square of the corners would give a grate fireplace large enough for a room 20 ft. by 25 ft. This rule secures sufficient depth from front to back, and a constant proportion between depth and width, whatever be the size of grate. Whenever a grate proves too large for a room, and in summer, when a smaller fire is needed, the size should be reduced in width by fire-bricks, the full depth being retained.

Rule IX.—“The slits in the grating, or grid, should be narrow, perhaps $\frac{1}{4}$ in. for a sitting-room grate and good coal, $\frac{3}{8}$ in. for a kitchen grate and bad coal.” When the slits are larger, small cinders fall through, and are wasted.

Rule X.—“The front bars should be vertical, that ashes may not lodge, and look untidy; narrow, perhaps $\frac{1}{2}$ in. in thickness, so as not to obstruct heat; and close together, perhaps 1 in. apart, so as to prevent coal and cinder from falling on the hearth.”

Rule XI.—“There should be a rim 1 in. or $\frac{1}{2}$ in. in depth round the lower insertion of the vertical bars.” The object of this is to conceal the ash at the bottom of the fire, and to enable the front cinders to burn away completely by protecting them from the cold air. This rim contributes greatly to tidiness, and, as a rule, will prevent the need of any sweeping up of the hearth during the day.

Rule XII.—“The chamber under the fire should be closed by a shield or ‘Economiser.’” This has been already spoken of, and described is the central principle which enhances greatly the value of all the rest.

Rule XIII.—“Whenever a fireplace is constructed on these principles, it must be borne in mind that a greater body of heat is accumulated about the hearth than in ordinary fireplaces. If there be the least doubt whether wooden beams may possibly run under the hearthstone, then an ash-pan should be added, with a double bottom, the space between the two plates being filled with artificial asbestos, slag-wool, $1\frac{1}{2}$ in. in thickness.”

Rule XIV.—“A fireplace on this construction must not be put up in a party-wall where there is no projecting chimney-breast, lest the heated brick should endanger woodwork in a room at the other side.”

TIMBER MEASUREMENT.

Sir,—As you surmise, we have got into a Comely Error, and it will take a little space to put matters straight.

1. Mr. Wardale asks (p. 61), “Why do the sliding-rules and the tables used by timber merchants use 16 [his out half] to be 75 ft.?”

Neither of them does anything of the kind. The original inventor of the principle of the sliding rule, Lord Napier, the discoverer of logarithms 300 years ago says virtually, “Give me the correct side of a piece of equal-sided stone or atmospheric air, or of any other substance, and its length, and I will, by rule, enable you to arrive at its cubic contents without the trouble of multiplication.”

2. I say (p. 143), “He [Hoppus] found a practical custom in use throughout the land, and framed tables in accordance therewith.”

It is not probable that he did so. The tables are only the sliding-rule reduced to print (for printing-house convenience, no doubt), which was of old only intended for angular surfaces; but Hoppus, being Surveyor to the London Assurance Company, was necessarily unacquainted with and accustomed to the practical, though ignorant, method of measuring round timber by string in use throughout all the country districts of his experience. He took the existing mode of obtaining the “side” as he found it, and simply said, “You will get the same result more fully from my tables than from the sliding-rule or application.”

3. What was the poor man to do (even if he knew no error, which I doubt)? Was he to take his pen and scrip, and tramp through the length and breadth of the land,—a sylvan Peter the Hermit, preaching a crusade in favour of a correct measurement, which he never could have made intelligible, except to possible practice? All Hoppus’s risks show him to have been a rule-of-thumb and incapable of detecting spontaneously the error which his tables helped to make easy. He says, in his “Practical Mensuration” (London), says, “Multiply the square of one-fourth of

the circumference or quarter girth by the length, and the product will be the content, according to the common practice” (sic italics).

He makes no further remark, but gives Rule 2:—“Multiply the square of one-fifth of the girth by twice the length, and the product will be the solidity nearly” (sic italics).

There is 21 per cent. difference between the two measurements, which Nesbit must have known to be common knowledge amongst all whom it concerned, and therefore he calls no especial attention to the anomaly. The contents can be obtained from the tables by his first incorrect rule; but where is your “side” for the second, correct?

It would take more space than would be justifiable to show why an alteration from the one-fourth girth measurement is barely possible; and I do not see any benefit to arise from such alteration, could it be made general. Nobody buys timber trees in the rough who does not know what he can make of them in conversion, measure how you will; and that regulates the price per foot cube.

Now take Mr. Wardale’s own case. An unhappy destiny has saddled him with a large oak butt. I assume that he wants to dispose of it; but it is not a thing to be offered generally, or to be sent to the nearest market like a sack of potatoes; he must, therefore, apply to a timber merchant to buy it.

If the timber merchant offers him 2s. 6d. a foot for it in the ordinary way, without any express stipulation on the part of the vendor, and the latter accepts, the merchant will take the measure by the one-fourth girth method, and custom will bear him out in it. If the vendor stipulates for the strict geometrical rules, the merchant will give him only 2s.

If hewing up and caliper measure are insisted on, our friend will get only 1s. 6d. The parties may, therefore, toss up for the measure and make their minds easy.

GODALMING.

[Finis coronat Hoppus.]

* * * We will act on the hint of “Godalming’s” audacious pun, and consider the correspondence closed.

“PLUMBERS AND PARLIAMENT.”

Sir,—In order to make my meaning perfectly clear to the conveniently obtuse intelligence of “F. M.,” allow me to inform him that I consider it is “dabbling in a noisy and ostentatious manner in matters which are being dealt with by others” when “C. A. M. B.” dictates to the Plumbers’ Company the course they should take instead of that which they are taking for the benefit of their trade,* and when “F. M.” has recourse to the press to obtain information which, if he is a member of the Association, as I presume he is, he could have obtained from the Secretary,—and can still obtain if he be so inclined,—respecting the work of the Association, which is altogether at variance with, and contradictory to, the assertion made by him in your last issue.

He may have some crude notions floating in his brain of schemes he thinks would benefit the trade. Why does he not submit them to the test of discussion? Is he nervous as to the result of their being found impracticable; or are they of such a character that the self-interests of builders would be touched? If the latter, he appears to know full well the reception they would meet with. At the present time a great effort is being made to obtain redress for one of our members. This entails some amount of sacrifice, and it is amusing, but at the same time regrettable, to hear the excuses which are put forward by some of the members in order to wriggle out of their share of moral responsibility.

Having had the honour of occupying the position of President for three years, which is one year longer than the recognised time, I may fairly claim to know something of the advantages which have accrued to the trade by the action of the Association during that time, and of which I would gladly furnish you with a list were it not contrary to the rules of the Association to do so. They are, however, of a character such as a President may well be proud of as having occurred during his occupancy of the office. An example of what we are doing appears in the letter of your correspondent, “If S.,” p. 252.

I hope my successor, when appointed, will be able to furnish a better record; but, if it be as good, the trade will have much reason for satisfaction.

I think that I shall not be transgressing the rules of the Association by stating that a not inconsiderable benefit has been secured by the

* Correspondents who write anonymously can hardly be called “ostentatious.”—Ed.

manner in which the matters of difference which have from time to time cropped up between masters and men have been met. Had we desired popularity, such matters could easily have been fanned into a flame; but we preferred peace, and the consequence is that more amicable relations exist now than have been the case for years.

The Association is still without any overture from the Plumbers’ Company as to co-operation; therefore, as we do not wish to force their hand, the Association or Builders’ Institute will have to take into consideration, as well as they, the question of certifying plumbers as competent, being careful, however, not to put a stumbling-block in the way of a most desirable object.

F. J. DOVE,
President of the Central Association of Master Builders.

Sir,—From long experience of the inconveniences arising from the working hours of plumbers being diverse from those of the other trades engaged in building operations, I quite agree with your correspondent “F. M.” that this matter should be dealt with, and I cannot but think that the Central Association of Master Builders exhibits a want of generalship in not taking up this question, now that so many matters affecting plumbers are under discussion.

It would, I feel certain, be a great benefit to the employers and all those in charge of building works, could the hours of labour be made uniform for all trades, and they would owe you a debt of gratitude if such a result should arise from the discussion carried on in your columns. C. E.

* * * This correspondence must now close.

NEW BY-LAWS FOR CONCRETE BUILDING IN THE METROPOLIS.

Sir,—With reference to the above, I beg to state that since you embodied a letter of mine in a leader in your valuable paper of October 2, 1885, I have erected in and about Southwark buildings in Portland cement concrete to the value of over 100,000*l.*—some of these large warehouses let for as much as 1,000*l.* per annum, and stored with seed from floor to ceiling, to the height of 60 ft. This, I think, is allowed to be one of the most severe tests a building can have, and which my buildings have stood for several years without the slightest fracture.

In 1884 and 1885 I erected in Zear-street, Southwark, two blocks of artisans’ dwellings, one containing seventy, the other eighty, rooms. These, as well as the warehouses mentioned above, have all been built of London refuse (viz., broken bricks, stone chippings, slag and clinkers from furnaces and gas retorts, broken York flags, &c. and paving, with a small proportion of Thames sand).

There is more than enough of this refuse to erect buildings for the London poor. Why should it be carried miles out of the metropolis at a great cost as rubbish?

Why should we be forced to build houses of bricks when we have at our command abundance of this hard and incombustible material, procurable at little or no cost, with which we can erect walls known and proved to be less impervious to the atmospheric changes of our climate, than any other material that can be used for walling? Why do the Metropolitan Board, when at last forced to acknowledge concrete as a building material suitable for wall construction, seek by means of new laws to stamp it out? They do not come to see, or try to find out, if what has been done is bad; but make a new law which shall enforce the use of one-third more cement. This is certainly a prohibitory law.

The Metropolitan Board is a body elected to assist the public, not to stand in the way of the advancements of the age, because they will not give themselves the trouble to find out that which is good for them to know.

Fifteen years ago, I, after twelve months’ delay, obtained from the Metropolitan Board the first licence for the erection of a concrete building granted in London. That licence ordered that the proportion of cement used should be one to eight, and it is in these proportions that all my work has been done. The walls stand wonderfully against all the steel tools and sledge-hammers that can be brought against them when alterations have been required, which I should be very pleased to show you, or any members of the Metropolitan Board, at any time. The proposed new by-laws state that the cement used shall be in the proportion of one to five, which means that this valuable London refuse shall still be carted away or carried out to sea, and shall not be used for building purposes.

Why is the system not more generally adopted? Because it is to the interest of so many connected with the building trade to stamp out that which is cheap and inexpensive. With labourers instead of bricklayers, and London refuse instead of bricks, no one has any idea how cheap walls may be erected.

Another great reason that this class of building has not advanced as the merits of the material would warrant, is the dreadful ordeal of red tape the

poor builder has to go through. For fifteen years I have been bound in this red tape, and when at last I break through my bonds by the decision of the Magistrate at the Southwark Police-court, on Sept. 9th, 1885 (published in the *Builder* of Sept. 19th, 1885), the Metropolitan Board attack me afresh with new laws, which, if passed, simply mean the stopping of concrete building in the Metropolis, and of the solving of the great problem "Housing the London poor."

H. GOODWIN.

P.S.—The Peabody Dwellings at Bermondsey are entirely of concrete.

The Student's Column.

FOUNDATIONS.—VII.

RIGHTS OF ADJOINING OWNERS.

IT will be convenient to consider in this place the effect that the vicinity of land or buildings, the property of other persons, has upon the foundations of a new building.

It appears to be thought by many persons that, in building on a town site where the owner desires to make the most of his land, he may put his footings or even his concrete partly upon his neighbour's land. It has even occurred that an owner has acted upon a belief that he can assume the willingness of his neighbour to allow a party-wall to be built upon the boundary line of the properties, and to pay in due time one-half the cost. However prudent or convenient that course may be to an adjoining owner in many cases, it must never be assumed that he will consent to it, and the foundation must, in the absence of a clear arrangement to the contrary, be made entirely upon the land of the building owner. A 9 in. wall built with footings and concrete, as required in the metropolis, will thus stand 8½ in. away from the boundary line, and that space will be wasted as also will a similar space adjoining it on the ground of the adjoining owner. There is, in fact, a waste of 2 ft. 2 in. in comparison with the result obtained by agreeing to build one 9 in. party-wall, and this consideration is usually sufficient to bring about an agreement between the parties.

But apart from considerations of waste of space, it is imprudent to build close up to your neighbour's land if it can be avoided, so that a house that is not intended to be built with its side walls made into party-walls should be kept well away from the boundary of the adjacent property. The adjoining owner may decide upon making a deep excavation on his land, either for building or for obtaining materials, and he may go to the full limit of his land so long as he does nothing that would cause his neighbour's land to fall in. But he is not bound to take any extra precautions that are rendered necessary by the extra weight of a new house on that land.

If you dig close to your neighbour's land you must take care that you do not let it fall into your excavation, nor any old house that is upon it.

A heavy building built upon a soil that is somewhat soft will by compressing the soil lower the foundation of an old house that stands near to it so as to cause the walls to crack. It is, therefore, advisable in such a case to carefully form the foundation on a deeper and more solid stratum, so that no settlement may occur. If, in order to do this the water has to be pumped out of the deeper excavation, this is very likely to cause subsidence and consequent damage to the building of an adjoining owner; but the law does not give him any remedy for the consequences of the abstraction of subsoil water. Foundations, like all other works, must be done according to law, and the above hints may prevent legal difficulties by inducing foresight and preventing works that are in dangerous proximity to adjoining property being done without proper consideration and advice.

Deep Foundations are required in exceptional cases, and in providing them ample space to execute the exceptional works is desirable. Where it is necessary to obtain a solid foundation in a stratum lying so deep below the surface that the building of walls in the ordinary way would be too costly or difficult, the work may be done in one of three ways. If the depth is not very excessive walls with very large openings may be built; for greater depths piers may be built at intervals along the course of the walls, but for very great depths some form

of piling, a process quite distinct from anything that has been here described, must be used.

Walls with wide openings are put where the foundation has to be obtained, at about the depth of one story lower than the lowest story that is to be made useful in the building. The object is economy in brickwork, against which has to be set the cost of constructing the arches above the openings, and the inverted arches beneath them. The arches above the openings will be constructed with the ordinary precautions as to the relation of rise to span, and as to abutments, or girders may be used instead of arches. The arches below the openings are commonly made to a sweep of about one-third of a circle. The resistance of the earth against the end of each wall is a considerable advantage in the matter of abutment, but some sufficient abutment is as necessary for an inverted as for any other arch; therefore the piers at each end must be sufficiently large and the arch must not be too flat. The object of these inverted is to spread the weight of a building over the whole length of the foundation of its four walls, as the soil may not be so satisfactory as to justify reliance upon it if great weights should be thrown on particular spots.

Building upon piers is carried out by sinking a small number of shafts under the angles, and at wide intervals, along the course of the walls, and carrying up concrete and brickwork to the level of the floor of the lowest story. Arches may be turned from pier to pier, with the ordinary precautions, and subject to the risks incidental to arched construction; but iron girders should as a rule be put (with or without relieving arches), so as to prevent the dangers of outward thrust. If the girders are buried in wet soil, cast-iron, in such a situation, much more durable than wrought-iron. Sometimes the piers are carried up as high as the top of the lowest story, or the story above that, as in the cases where there is a basement below the ground-floor, and the piers are carried up to the level of the first floor. The walls that are necessary to enclose these stories may be built as thin as possible, and carried on a foundation of ordinary depth, if that should seem sufficient to carry them. In putting in the concrete for these piers (and all piers that have to carry considerable weight), great care must be taken to see that the bottom of the excavation is free from dirt or soft mud, as this would squeeze out under pressure, and the pier would sink to a very appreciable extent. In all such works, and, indeed, in all works that are below the level of the ground, it is highly desirable to build the brickwork in cement, or at least in hydraulic lime mortar.

In order to avoid the necessity for such deep foundations, the expedient, which has already been alluded to, of covering the whole site of a building with a substantial thickness of concrete, is sometimes adopted, and usually with success. But as there will probably be some settlement over the whole site, it is important to ascertain that the soft soil is pretty uniform in thickness throughout, or the building may settle down more on one side than on the other. If that seems a likely result, it is better to adopt some form of deep foundation that will be entirely reliable.

CHURCH-BUILDING NEWS.

Hernant.—It has been decided to build an entirely new church for the parish of Hernant, in the diocese of St. Asaph, and Mr. Lawrence Booth, F.R.I.B.A., of Manchester, has been commissioned to prepare the necessary plans and designs with a view to an early commencement of the work. The Earl of Powis, Sir Watkin W. Wynn, Mr. Bamford Hesketh, and other influential landowners, are giving their support to the movement, and Sir Watkin has promised to lay the corner-stone.

Bamber Bridge (Lancashire).—It is proposed to considerably enlarge and improve St. Saviour's Church, Bamber Bridge, near Preston, Lancashire, by erecting a new chancel, north and south transepts, organ-chamber and vestries, to take out the present square pews from the nave, and place new open pitch-pine benches, and to effect many other important improvements internally, from designs prepared by Mr. T. Harrison Myres, A.R.I.B.A. (Myres, Veveers, & Myres), of Preston, at a cost of over 3,000l.

Brockham.—An oak record, subscribed for by the parishioners, has lately been unveiled in

Brockham Church, Surrey. The subject, which occupies a space of over 7 ft., is the "Last Supper," the figures being in high relief. The work has been designed and carried out by Messrs. Mayer & Co.

Liverpool.—St. James's Church, Marsh-lane, is an important addition to the churches of Liverpool, and was solemnly opened on Sunday the 7th inst., after being some eighteen months in course of erection. It succeeds a smaller church, which has had to be removed, to give place to the extensive works of the Lancashire and Yorkshire Railway Company, and affords sitting accommodation for over 1,000 people. It consists in plan of a nave and aisles with tower and entrance at the south-west corner, a baptistry at the end of the north aisle, chancel and side chapels, with stone-vaulted ceilings, and a range of confessionals adjoining the tower and south aisle. On the south side are choir and clergy vestries, communicating with a commodious clergy-house. The total internal length is 148 ft., and the total breadth across the aisles within, 64 ft. The style is founded on a careful study of English church architecture of the Early Decorated period, dating about the middle of the thirteenth century, and the aim of the architects has been, while keeping closely to the character of the style, to design a building in every way suited to modern requirements, and to its individual position as town church in a very populous district. With this view the external details are simply and broadly treated, and no ornamentation is avoided, and its lofty proportions and a long unbroken ridge from east to west make the church a landmark amongst the surrounding buildings. The materials are local red sandstone, and the roofs are covered with green Westmoreland slates. The nave has an arcade of six lofty arches, carried on alternately circular and octagonal columns, 25 ft. high. Above a coupled clear-story windows of two lights each, and the church is well lighted by windows in the aisle walls, placed at a good elevation above the floor, and by two five-light geometric windows in the nave and chancel gable walls, the sills of which are about 30 ft. from the ground. The nave has a panelled and arched ceiling, with massively moulded beams and rafters, the space between being plastered, and the floors are laid with 2-in. pitch-pine flooring, the chancel steps and footpaces being of encaustic tiles, Messrs. Carter, Johnson, & Co., of Worcester.

The interior proportions of the church are the principle of the width and height formed by the sides of an equilateral triangle. The heating is by low-pressure hot-water pipes, by J. C. Seward, of Preston, due care having been given to the subject of ventilation. The plans and details of the church have been prepared by Mr. C. Hadfield, of the firm of Messrs. Hadfield & Son, Sheffield, the preceding church of St. James being one of the earliest works of the late Mr. E. Hadfield. The contractor was Messrs. G. Woods & Son, Stanley-road, Bootle, for whom Mr. Bishop was foreman, and William Haworth acting as clerk of the works.

John Hunter's House.—*Nature* publishes three small illustrations of some of the portions of John Hunter's house and grounds at East Court, concerning which Dr. B. W. Richardson writes:—"The first drawing supplies the key to the house looking into the meadow, in which view the house is, I believe, never to be seen. It was when Hunter lived in it. The same sketch is that of the Lions' House or barn, situated at the end of the meadow at the back and to the right of the house, but quite visible from the windows. The Lions' House, as it may be seen, is a raised mound of earth. The rests upon an arched structure, which, at the time of my last visit, was in an excellent condition, although ever since Hunter's time it has been a cowhouse, and has done nearly a century of useful service. At the top of the mound there is a little wall, of a circular shape enclosing a small open space. The third sketch illustrates the famous copper in which the infant was boiled to a skeleton. The spot above the copper up to the flue from the boiler is covered in, but two doors open in front at the mouth of the copper. The whole of the structure has remained in good preservation. The sketches are selected from views by Bertram Richardson has taken during the autumn, as part of a series of homes birthplaces of illustrious men."

RECENT PATENTS.
ABSTRACTS OF SPECIFICATIONS.

10,393, Ventilators. C. Lawrence and T. Wintour.

Relates to ventilators provided with wire gauze or other perforated surfaces, and consists in disposing the said surfaces in a direction inclined, preferably at an angle of about 45 per cent., to the surfaces to which they are applied, such latter surfaces preventing any direct through passage of the air.

13,213, Paving Blocks. A. Pimm.
The blocks, square or rectangular in cross section, are formed with a hole running through them longitudinally. From the surface, openings communicate with these internal passages, which are intended to serve as drains for run-water. They are doweled or bolted together, either over the whole surface of the road or over only a portion, forming wheel-tracks. They may be made of iron, concrete, or any sufficiently hard material. Specially formed blocks are used for flanged wheels, like those of tram-cars; in this case, if the groove is made in the centre of the block, strengthening ribs are cast underneath it. Large flat blocks, having a number of parallel holes running through them side by side, are made for use between the wheel-tracks. The blocks may also be made reversible.

16,057, Cupboard Turn. J. Rhodes.
The cupboard turn is fixed by passing the slotted spindle through the door, and putting on first the washer, then the tongue fitting the square portions of the spindle, and finally the slotted cap, which, when screwed to the door, holds the tongue in place.

15,670, Drainage Flooring for Stables, &c. A. Ward.
The floor of the stable or stall slopes from the manger to the front, and also towards the sides, where longitudinal channels are provided, communicating in front with another channel, which may run the whole length of the stables.

16,192, Ventilating Billiard and other Rooms. J. Anderson and McNeil.

A flue in or near the ceiling is provided with branches or inlets at various parts, and opens to a chimney or upcast shaft. Within this flue, or attached to it, is a second flue also opening to the chimney, and provided with inlets having dome or cone shaped ends placed above the gas or oil burners employed for lighting the room. The product of combustion, in passing through the second flue, heat the air in the first flue, and thus produce an outflow of warm air from the room.

NEW APPLICATIONS FOR PATENTS.

Jan. 29.—1,319, J. Picketock, Draught, Rain, and Snow Excluder.—1,322, L. Detmer, Portable Electric Burglar Alarm.—1,325, R. Hunter and W. Joffatt, Cooking Ranges.—1,332, E. Hill, Supporting Window Sashes.

Jan. 30.—1,351, H. Holland, Preventing Down draughts in Chimneys.—1,372, J. Watson and H. orwood, Dog Grates, Fireplaces, and Stoves.—408, W. Webb, Ventilating Sewers, &c.

Feb. 1.—1,414, J. H. Hating, Glass Tiles.—1,416, J. Fletcher, Fasteners for Doors.—1,452, J. Shepherd, Opening, Closing, or Adjusting Fanlights.—453, L. Sepulchre, Reflectors.—1,457, A. Tomkins and F. Cracknell, Heating Kilns.

Feb. 2.—1,491, R. Jenkins and J. Cox, Enamelled Moulded Plaster.—1,498, T. Crampston, Electric Heaters.—1,513, T. Spoiligh, Joiner's Bench Hooks.—534, A. Clark, Combination Locks.—1,546, A. ew, Pipes for Sewers, Drains, &c.—1,553, W. ke, Rock Drilling Tools.—1,557, W. Lake, Door teches.

Feb. 3.—1,604, E. and A. Ashby, Cement Kilns.
Feb. 4.—1,650, E. Cameron, Halfcast Nail.—754, A. Gold, Hinges.—1,658, C. Smith, Mechanical valves.—1,693, T. Melvin, Floor Cloths and Tiles.
1,664, T. Wright, Socket Coupling for Pipes.

PROVISIONAL SPECIFICATIONS ACCEPTED.

5,112, J. Armistead, Ventilating Rooms, &c.—423, C. Clarke, Socketed Pipe Joints.—15,485, Smith, Heating Stoves.—15,630, L. Platanauer, &c.—1,536, J. W. Thompson, Slate or Glass Roofing.—15,877, J. DeWitt, Dressing, Polishing, Squaring Stone.—16,012, J. Kenyon, & J. Cong, Water-closet.—16,076, B. Finch, Sanitary es and Joints.—69, R. Stevons, Dry Gearing.—5, J. Mackenzie, Securing Metal Sash-bars in 54.—228, G. Hardingham, Lattice Bridges.—229, J. M. and W. Gooding, Stair Treads, Door Steps, orings, &c.—523, J. Smith, Automatic Electric Alarm.—15,625, F. Collins, Self-acting Bolt.—15,751, Joy, Charging Cement Kilns.—153, O. Elmhick, charging Water from Flushing Cisterns.—157, Bunnison, Curing Smoky Chimneys.—175, H. dan, Ventilators, Chimney and Smoke-stack es.—10, J. Hargreaves, Gullies.—247, R. Dow, Water Wash Preventer.—233, J. Barry, Pipe gs, Wrenches, &c.—405, H. Eohring, Locks.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.
275, T. Oakley, Domestic Fire-grates.—4,413, Pope, Securing Sliding Window-sashes and ters.—5,094, S. Sutcliffe, The Hearts and Cheeks of Grates, &c.—5,264, E. Clowes, ges.—15,545, J. McConachy, Ventilators or Air

Valves.—15,685, J. & T. Jennens, Pattern-maker's Cup Dowels.—1,131, H. Walker and J. Clark, Dust Bins.—4,668, W. Wilson, Ornamenting Wall Papers.—1,327, D. Rogers & Son, Fire-grates.—3, J. McKay, Disinfecting Apparatus.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

FEB. 1.
By HORNE, SON, & EVERSFIELD.
Haversham-square, Grosvenor-place—Profit rental of 228l. for three years..... £470
Lambeth, Wandsworth-road—Rent charge of 100l. for 21 years..... 1,240

FEB. 2.
By DEBENHAM, TAYSON, & CO.
Berthamptonstead, Hertis—The residence called "White Hill," and 2½ acres, freehold..... 3,500
By SEDGWICK, SON, & WEALL.
Watford—61 to 67 odd, St. Alban's-road, freehold..... 785

FEB. 3.
By TOWN & SONS.
Mile End-road—9 to 15 odd, Willow-street, 4½ years, ground-rent 5l. 6s..... 710
By A. & A. FIELD.
Cambswell—24 and 26, Tindal-street, 74 years, ground-rent 8l..... 350

FEB. 4.
By GEORGE HEAD & CO.
Harewood-square—3, Melbury-terrace, 23 years, ground-rent 25l..... 555
By DOUGLAS JOHNS.
South Lambeth—9, Thorpe-street, 46 years, ground-rent 5l..... 300
By WILKINSON & SON.
Brighton—41, Sussex-square, freehold..... 1,760

MEETINGS.

SATURDAY, FEBRUARY 13.
Architectural Association.—Visit to houses being erected in Collingham-road, South Kensington, from the designs of Messrs. George & Peto.

MONDAY, FEBRUARY 15.
Royal Institute of British Architects.—Mr. Alexander Bealey, M. Inst. C.E., on "Swedish Building Law." 8 p.m.
Royal Academy of Arts.—Lectures on Sculpture: Mr. A. S. Murray on "The Works of Polykleitos and Lysippos." 8 p.m.
Victoria Institute.—The Rev. Canon Isaac Taylor on "The Hittite Monuments."—8 p.m.
Architectural Section of the Philosophical Society of Glasgow.—Mr. John Rennie on "Hydraulic Machinery for Buildings."

TUESDAY, FEBRUARY 16.
Royal Institution.—Professor C. T. Newton, C.B., on "The Unexploited Portion of the Greek and Roman Sculptures in the British Museum." 3 p.m.
Institution of Civil Engineers.—Mr. L. F. Vernon-Harcourt on "The River Seine." 8 p.m.
Manchester Architectural Association.—Paper by Mr. J. S. Crowther. 7.30 p.m.

WEDNESDAY, FEBRUARY 17.
Carpenters' Hall, London Wall.—Mr. Thos. Blashill on "Timber, its Growth, Seasoning, and Preparation for Use." 8 p.m.
British Archaeological Association.—Mr. J. Romilly-Allen on "Pre-Norman Stones at Keysham and Halton, Lancashire." 8 p.m.
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting. 8.30 p.m.
Society of Arts.—Prof. George Forbes on "Some Points in Electrical Distribution." 8 p.m.

THURSDAY, FEBRUARY 18.
Royal Academy of Arts.—Lectures on Architecture: Mr. G. F. Bodley, A.R.A., on "English Architecture of the Middle Ages." 8 p.m.
Society for the Encouragement of the Fine Arts.—Mr. G. C. Haile on "The Tendencies of Modern Art." 8 p.m.
Royal Institution.—Professor Chandler Roberts-Anstey, F.R.S., on "Metals so affected by small quantities of Impurity." 3 p.m.
Society of Antiquaries.—8.30 p.m.
York Architectural Association.—Mr. A. B. Burleigh on "Sanitary Engineering." 7.30 p.m.
Edinburgh Architectural Association.—Mr. W. Scott Morton on "Colour." 8.30 p.m.

FRIDAY, FEBRUARY 19.
University College.—Professor C. T. Newton, C.B., on "Greek Myths illustrated by Fictile Vases." 4 p.m.

Miscellaneous.

Croydon Street Improvements.—The Corporation of the new borough of Croydon having advertised for designs and estimates for widening the three principal streets in the centre of the town, adjoining the Town-hall, twenty-four competitors entered the lists, and the result has been announced as follows:—First prize, 100l., has been awarded to design marked "Fortuna," by Mr. J. M. Beydon; second prize, 50l., to design marked "Ad Rem," by Messrs. J. D. Hayton and W. F. Potter; and third prize, 25l., to design marked "Tria juncta in uno literatim."

Birkbeck Institution.—Mr. J. D. Cogan will deliver a lecture on Wednesday evening, February 17th, at the Birkbeck Institution, Chancery-lane, entitled "Pottery and Porcelain." The lecture, which will be historically and practically illustrated, will commence at eight o'clock.

Obituary.—We announce with much regret the death of Mr. Thomas Fraser, aged 72, a surveyor and clerk of works, who was killed on the North London Railway on the evening of the 5th inst. He was an old member of the Provident Institution of Builders' Foremen and Clerks of Works.—The death is announced of M. Loison, the well-known French sculptor, which took place suddenly last week at Cannes. The deceased artist, who was formerly a pupil of David d'Angers, executed a considerable number of works, several of which were purchased by the French Government.

The Earthquake as a Restoring Power. We are so in the habit of regarding the earthquake as an agent of destruction, that it may sound paradoxical to assert that the phenomenon is surpassed by no other as a regenerative and restorative agent. Yet this is strictly the case. But for earthquakes, our continents would continually,—however slowly,—diminish in extent through the action of the sea-waves upon their borders, and of rain and rivers on their interior surfaces. "Had the primeval world been constructed as it now exists," says Sir John Herschel, "time enough has elapsed, and force enough, directed to that end, has been in activity, to have long ago destroyed every vestige of land." It is to the reproductive energy of the earth's internal forces that we are alone indebted for the very existence of dry land. To the same cause, undoubtedly, we owe the gradual process of change in the configuration of continents and oceans which has been for ages and still is in progress,—a process the benefit deriv'd from which cannot possibly be called in question. Our forests and our fields derive their nourishment from soils prepared, for long ages, beneath the waves of ocean; our stores of coal and of many other important minerals, have been in like manner prepared for our use during the long intervals of their submergence; we build our houses, even, with materials many of which owe their perfect adaptation to our wants to the manner in which they have been slowly deposited on what was once the bed of ocean, and compressed to a dus solidity and firmness of texture beneath its depths.—Mr. R. A. Proctor in "Knowledge" for February.

Ancient Egyptian Textile Fabrics.—Herr Theodore Graf, of Vienna, who brought from Egypt the celebrated papiri, afterwards purchased by the Archduke Rainer, of Austria, has recently completed a fine collection of ancient Egyptian textile fabrics of wool and linen. He has obtained no less than 300 different specimens, which are all in an excellent state of preservation. They were procured from sepulchres, and represent the result of many years of labour in collecting and cleaning them. Every specimen is stitched upon a sheet of cardboard, and is protected from dust, &c., by fly-leaves. The size of the robes ranging from a foot square upwards. One of the largest and finest is an entire Roman toga, which is believed to be the only complete article of its kind that has been preserved from antiquity. The collection not only comprises many varieties of woven cloth, but also specimens of knitting, crevel, and needlework.

The Ventilation of Sewers.—There never will or can, we are convinced, be a final settlement of this issue until the absurd theories and devices of those who confound the behaviour of gas and vapour with that of water, and whose judgment is vitiated by other fallacies, have been utterly cast aside and abandoned. The particularly ridiculous notion that sewers can be ventilated by an arrangement which amounts to the construction of an inverted syphon,—the pure air to be drawn at the mouth of a low-level pipe, and the foul air ejected at the open mouth of a high-level pipe,—is probably one of the most mischievous and obstructive of prevailing misconceptions. As a matter of fact, there is only one way of effectually ventilating close drains and sewers, and that, happily, is an easy one. Pipes, which ought to be not less than 4 in. in diameter, as perpendicular as possible, and protected by a cowi at the summit, should be carried up from the drain or sewer to a point well above the level of the roofs of adjacent houses, and placed far away from chimneys. By means of these pipes the sewers may be properly ventilated. Sooner or later low-level or "surface" ventilators will be prohibited. We believe that to the agency of such apparatus, as disseminators of sewer gas, is to be ascribed much of the sickness which prevails in many localities.—Lancet.

Sanitary Assurance Association.—The fifth annual meeting of the Association was held at the Offices, 5, Argyll-place, Regent-street, on the 8th inst. Sir Joseph Fayer, K.C.S.I., F.R.S., in the chair. The secretary, Mr. Joseph Hadley, read the annual report and balance-sheet. The report mentioned that "The properties inspected during the year have, as usual, been of the most varied character, including cottages and residences of every class in London and the country, also mercantile offices, trading premises, and institutions of a public character. In every case of first inspection the sanitary arrangements have been found to be more or less defective; but with newly-built property there has been a marked improvement, necessitating fewer alterations to secure the sanitary certificates." The income of the year was 4621. 1s. as against 3101. 17s. 9d. in 1881, and after meeting all liabilities, a balance was carried forward. Sir Joseph Fayer proposed the adoption of the report. Professor Roger Smith, in seconding the motion, said that it was very satisfactory to hear of the improvement in newly-built property. This seemed to imply that the demand for houses with good sanitary arrangements was on the increase. Lord Fortescue, Dr. Danford Thomas, Lieut.-General Burne, Mr. Mark H. Judge, A.R.I.B.A., Mr. Andrew Stirling, Dr. Stevenson, and Mr. Kennett-Barrington spoke in support of the report, and it was adopted unanimously. Sir Joseph Fayer and Mr. Henry Rutherford were re-elected, and Mr. Henry Currey, F.R.I.E.A., was elected member of the executive council. Sir Joseph Fayer was re-elected President, and Professor Roger Smith was re-elected Vice-President of the Association for the ensuing year.

The Æolus Waterspray Ventilating Company have sent us three sheets of designs for casings for turret ventilators. The designs accord with various styles of work, and while hiding the naked unsightliness of the ventilators, the turrets are so planned as not to interfere with the effectiveness of ventilation. The sheets will be found useful for reference. The Company have just received instructions to apply their complete system of heating, cooling, and ventilating to the Mary-street Memorial Schools, Taurin; to the Church of St. Barnabas, New Hamberstone, Leicester; and to the Conservative Club, Birmingham.

The New Street from Piccadilly-circus to New Oxford-street.—The Works and General Purposes Committee of the Metropolitan Board of Works have decided to recommend the Board to name the new street from Piccadilly to Bloomsbury "Shaftesbury-avenue." As we have already observed (see p. 192, ante) there will be a certain appropriateness in the selection of this name, seeing that the Board has already granted a site in a prominent part of the new street for the erection of a statue to the late Lord Shaftesbury.

The Committee of the School of Art Wood Carving, which is now carried on at the Technical Institution, Exhibition-road, Kensington, have made arrangements to reduce the fees in the classes to students connected with the carving trade, thereby giving them an opportunity of advancing themselves in the knowledge of their business by studying under proper supervision and instruction a higher class of work than generally falls to the lot of apprentices and improvers in the workshop.

Northumberland Avenue Hotel.—The American Elevator Company have just been awarded the contract for the hydraulic elevators for the Northumberland Avenue Hotel. They are to be four in number, and of the Standard hydraulic type. The water is to be furnished by means of a Worthington steam-pumping engine, so that the cost of working all four of these elevators will be simply the cost of fuel necessary to work the pump.

Wellington (Somerset).—Messrs. Bussell & Gibbs have just finished a series of stained leaded windows for the new woollen warehouses of Mr. Egerton Burnett. They consist of heraldic achievements in rich colours on a tinted ground, with coloured borders. They will be on view for the next few days at Messrs. Bussell & Gibbs' establishment, Wells-street, Oxford-street.

At St. Mary's Abbey, Mill Hill, a turret-clock, by Mr. J. W. Benson, of Ludgate-hill, has been erected by order of the Lady Abbess. The new clock shows time on a copper dial, 2 ft. 6 in. in diameter, striking the hours and chiming the quarters on two hemispherical bells.

Rating of Mining and Manufacturing Machinery.—The system adopted by many unions in the rating of the machinery at mines, iron, and other works, has long been looked upon as a serious grievance, but the trouble, annoyance, and cost of appealing have prevented those so taxed from appearing in court to test their liability. In some cases the plant and engines of all kinds, as well as the buildings, are valued and assessed. At works where there is a large expenditure of steam the engines are taxed for rating purposes, and this, as a rule, has been submitted to, for the reason already given. But we are glad to find that a change is now being made for the purpose of testing the question as to whether certain machinery is liable to be rated or not. The question, very properly, has been taken up by a most influential body, the Iron Trades Employers' Association. The appeal, in which the nominal appellants are Sir Joseph Whitworth & Co., of the Openshaw Works, near Manchester, will, of course, be fought out to the far end, regardless of expense, funds for that purpose being raised principally by the Lancashire members of the Association. The appeal was opened at the Salford Court of Sessions, when it was stated that the overseers had assessed the works on the rateable value of 8,327l., and this included all the machinery which increased the value of the works as a going concern, and such as might be let in the event of their being transferred or sold. On the part of Sir Joseph Whitworth & Co. it was contended that the light machinery and tools, which might be considered movable, were not assessable, but only that portion which constituted the first motive power and was thoroughly affixed to the free-hold. It was stated that the appellants were most anxious to have the case taken to the House of Lords for an authoritative and final decision. The result will be looked forward to with no ordinary interest by mine-owners and large users of steam power throughout the country, more especially those connected with the iron and engineering industries.—*Mining Journal.*

Conservation of Water.—Mr. Tarbotton, the Borough Engineer of Nottingham, in his report attached to the Report of the Water Committee for 1885, observes:—"Another point is the conservation of the water. I have so repeatedly referred to this, that I need not now enlarge upon it. I do not mean, for a moment, the restriction of delivery; for the contrary, the most reasonable and proper supply in all directions; but there is a great tendency on the part of the public to disregard the value of water, and the cost of obtaining it. Taps are allowed to run, in many cases, half their power; in multitudinous instances to dribble, and the aggregate of all these means a serious waste. I believe the waste inspectors are doing their duty, and there is a very vigilant inspection of all fittings, but still there is much loss which might be prevented. If the public would aid the Committee, by individually reporting defective fittings at the Water Office, either by a simple post-card, or by calling, they would contribute greatly to their own benefit. All taps are re-leathered at the cost of the department, and the effect of allowing water to escape without being properly used is to damage the houses externally and internally; to produce personal nuisance; to cause a wasteful expenditure of money, and to increase the cost of public water supply. There is no doubt that those who cause wanton or mischievous waste should be persistently punished, under the powers which the Corporation, with other corporations and companies, fully possess."

Building at Clapham.—There are few portions of the metropolitan suburbs where building has been going forward at a greater rate during the last few years than in that part of Battersea and Clapham in the immediate locality of Clapham Junction. It is computed that no fewer than 6,000 houses and shops have recently been erected in the neighbourhood. These are now being further increased by a large number of new residential buildings which are in course of erection on the St. John's Hill Estate. This estate, which extends from the foot of St. John's Hill, opposite Clapham Junction, to Battersea Rise on the south, and to a portion of Wandsworth Common on the west, and stretching to the boundary grounds of the Freemasons' Schools, was sold about twelve months ago for 16,000l., and will shortly be covered with between four and five hundred houses.

The National Providence League for promoting universal insurance against destitution in sickness, infirmity, and old age is doing good work in calling attention to the subject of thrift, and the lessons of the present time of depression are likely to go a long way in enforcing attention to its proposals. In the Reporter, the quarterly organ of the League, there is a great deal of interesting matter bearing on the subject, including an address by Mr. James S. Raudell (of the well-known firm of Raudell & Saunders), who is a member of the Central Council of the League. Mr. Raudell, in commencing his address, invited attention to the great effort in thrift that was being made, evidenced by the 92,000,000l. in the savings banks, by the large yearly contributions paid to friendly societies, and by the amounts paid to the industrial life insurance and burial societies. The savings of the industrial classes are large and important, and he expressed his regret that the large amounts invested in friendly societies and insurance societies did not work out for them the benefit to which the self-denial exercised entitled them. He maintained that the inadequacy of the present organisation was evidenced by the numbers who, notwithstanding all their thrift and self-denial, in their old age gravitated to the workhouse. Mr. Raudell set before the meeting the organisation proposed by the Rev. Canon Blackley, that everyone should secure themselves against pauperism, and urged that the ages eighteen to twenty-one were those when a minimum provision for sickness and old age should be secured; that this minimum provision would place each individual worker on a better platform for advancement in life; that the world then be in a better position to secure to themselves further protections, either by entering on sound friendly societies with payment arranged on the honest basis of the members having all they pay for, or other sound investment of their savings; and concluded with the observation, that in the organisations proposed by the Rev. Canon Blackley stability is assured.

Dunfermline.—The new High School at Dunfermline was opened on the 5th ult. Messrs. Holme & Mercer, of Liverpool, are the architects, and Mr. W. Swinton fulfilled the duties of master of works. The contractors for the various works were:—Mr. George Dick, for mason's work; Mr. A. Rolland, for plumber and gasfitter's work; Messrs. M'Uinn & Lax, for slater's work; Messrs. A. & I. McGregor, for plasterer's work; Messrs. Bennett & Son, for ironwork; Mr. A. Lowe, for glazier's work;—all of Dunfermline; Messrs. Stuart & Co., Edinburgh, for granolithic work; Messrs. Robinson & Son, Edinburgh, for heating work; Mr. Roger Lowe, Farnworth, for wood block flooring work; Mr. Hooper, Glasgow, for ornamental glass work; Mr. Stevens, Leecroft, for ventilation extractors; Mr. H. Thompson, Birkenhead, for gasfittings; Mr. James Ross, Liverpool, for grates and stores; and Messrs. Bonnar & Sons, Dunfermline, for ornament ironwork, railings, gates, &c. The carving was done by Mr. W. Neilson, Edinburgh. The designer was Mr. A. Lawrie, George-street, Edinburgh. A view of the school was published in the Builder for Nov. 14 last.

Association of Public Sanitary Inspectors.—At the usual monthly meeting of the Association, held on Saturday last, a paper was read by Mr. Buckworth (St. Saviour District Board) on the legislation relating to preparation and sale of "Food and Drug." The paper concluded by pointing out that a public analyst was now far more in request than formerly. A discussion followed, in which the Chairman (Mr. Jerran, C.E.), and Messrs. Rains, Alexander, Fisher, Hall, and others took part. Most of the speakers complained of the Act as rendered almost inoperative through the leniency of magistrates, who inflicted ridiculously small in amount; and some of them were of opinion that officials other than sanitary inspectors should be charged with duty of carrying out the Act.

"A Large Gasholder."—We are asked mention that the gasholder for the Imperial Continental Gas Association's works at Epsom is a "triple-lift telescope," and that it has been designed and is in course of construction by Messrs. C. & W. Walker, of Newport, Salop. The tank and the building which will cover the holder are already completed.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS; Epitome of Advertisements in this Number.

COMPETITIONS.

Table with columns: Nature of Work, By whom required, Premium, Design to be delivered, Page. Includes Public Library, Municipal Buildings, Folkestone Town Council, Sunderland Corporation.

Selvidge, Leicester, 6d. 1s. 3d.; E. Tempest, Kightly (York) 6d. 1s. 1d.; B. W. Ward, Whetstone (Leicestershire), 7 1/2d. 10d. * Accepted.

LONDON.—For repairs and decorations at St. Stephen's Church, Coleman-street, City. Mr. J. Ebenezer Saunders, architect:— Colls, £347 0 0; Smith, 275 0 0; Heaps (accepted), 247 0 0.

A Substitute for Glass.—We have received a sample of a new material, which is easily applied to framed roofs or windows, in lieu of glass, and which has just been introduced. It consists of wire gauze of 1/2 in. mesh, coated with elastic varnish to cover the wires and close the meshes. The varnish can be tinted without affecting its transparency, and we are informed that roofs constructed with it are not liable to expansion and contraction like glass roofs. Two factories for its manufacture have been erected at Willenden, by Messrs. North & Son, of London-road, Southwark, and St. Bride-street, Ludgate-circus. We are informed, in answer to inquiries, that the varnish is not soluble by rain, nor liable to crack by the heat of the sun. It is said to have been used with satisfactory results, and so satisfied are the patentees of the enduring qualities of the material, that they are laying down extensive plant for its manufacture. It possesses the advantage of being much lighter than glass.

PRICES CURRENT OF MATERIALS.

Table with columns: Timber, T. S. D., S. D., S. S. D. Includes items like reheart, B.G., oak, U.S., ash, Canada, fir, Dantsic, etc.

METALS.

A Book on Tapestry.*

F a previous century is to be regarded as the period notable for the publication of encyclopaedias and dictionaries, the present will surely be remarkable for the immense mass of books issued to in-

form people about art in all its numerous ramifications. Savary and Roland de la Platière attempted to bring into the compass of half a dozen portly folios all that had to be known in regard to commerce and industries, including among the latter those which nowadays are termed art industries. *Autres temps autres mœurs*, one may indeed say, when one glances over the materials for separate lists of books on art industries, each section of which is separately dealt with in hundreds of books. The production of these, many of them copiously illustrated by means of all the new processes of chromo-lithography, photogravure, engraving, and etching is astounding. Old information, raked out from unsuspected sources, is presented in new guise, and, hit by hit, a chain of history is forged to be handed down to posterity, and so to connect it with the misty past.

Thoughts like these occur to one on turning over the leaves (upwards of 500) of M. Jules Guiffrey's "Histoire de la Tapisserie," which has just been published at Tours, printed in good clear type, with all the charm of crisp definition common to the excellent typography of Messrs. Mame et Fils. The illustrations, or the most part, consist of impressions from delicately-cut blocks made from photographs of well-known, little-known, and typical samples of tapestries. Besides these, there are some four capital coloured plates, done in chromo-lithography, of hangings preserved in the Hôtel de Cluny at Paris, in the Cathedral of Angers, and in the Mobilier National at Paris. The accompanying text in which M. Guiffrey sets forth his history, is divided into long chapters. The first treats of tapestry before the fourteenth century, of which, according to the special sense of the title "tapestry," there are few traces. Next our attention is concentrated upon the important influence brought to bear upon the development of the industry by the Burgundian dukes of the French kings. In chapter III. we find a brief survey of the manufactures of tapestry during the fifteenth century which flourished in France and Burgundy, under which

Histoire de la Tapisserie depuis le Moyen Age jusqu'à nos Jours. Par Jules Guiffrey. Tours: Alfred Mame et Fils, Éditeurs, 1885.

classification come Flanders and Brabant, and all that important district which includes the homes of the Van Eycks and Memling, whose characteristic drawing and colouring subjected innumerable imitators and influenced the preponderance of fifteenth-century tapestry designs. Allusion is also made to the tapestry-making centres in Italy, Spain, England, Germany, and Switzerland. From the ruin of the Arras manufactories until the adication of Charles V., in 1555, forms another period. This is followed by one leading to the establishment of the Gobelins, Beauvais, and Aubusson factories. Then comes the decline of designs for tapestry, which occurred after the reign of Louis XIV. And the tenth chapter, in the meagre number of manufactories to which it relates, demonstrates a still further decline in the practice of the process.

The book is dedicated to the eminent artists who maintain the "glorious traditions" of the Gobelins manufacture of tapestry. For these gentlemen M. Guiffrey claims a superiority; at the same time admitting that sufficient recognition has not heaped up to the fact that much fine work came from Artois and Flanders workmen long before the Gobelins factory was established. But these, in his zeal for the glory of France, he feels he has the right to claim as members of the one French family whose triumphs he sings. Thus a strong flavour running through his book is the assertion of a French monopoly in the art of tapestry making. This is certainly rather detrimental, and tends to obscure a calmer and more comprehensive survey of the circumstances which gave birth to this particular form of art industry, and somewhat needlessly makes the author appear as a prolix writer whose patriotic feelings supervene over those which one expects to direct an impartial historian, prepared, however, to make allowances for absolute statements that France alone has been the cradle of the art-industry, that she of all countries has inherited and cherished an uninterrupted practice of the art for six centuries, and that the reputation and superiority of her tapestries must be acknowledged as supreme, the reader of M. Guiffrey's History will find an abundance of information of a valuable character.

Following conventional lines, M. Guiffrey dips into periods of antiquity and glances at the important part which European relation with the East has played in the development of art in our continent, and thence proceeds to the oldest specimen of tapestry, the chief portion of which is now in the Museum at Lyons. This specimen, from the style of its pattern, probably dates from the thirteenth century. In it we have a series of repeated circular hands inclosing a group of apocalyptic beasts; and the one a winged griffin with lion tail

and haunches; the other, beneath it, a chimerical hull. A small fragment of the border, a repeating four-branched scroll with a mask in the centre, is in the Kensington Museum.

At this point, one looks for a description of what constitutes tapestry as distinct from other textile productions made in a frame and having a warp and a weft. But Monsieur Guiffrey never once descends to so small a matter, so that when one encounters the reference to the first *haute-lisse*,—high warp or perpendicular frame,—and where it can have been used, the want of some concise explanation of this technical term is very apparent. Perpendicular and horizontal weaving-frames are to be found in use by various savage tribes, such as the modern Central African and the Mexican or Peruvian, whose degree of civilisation is lower than that of the peoples of France, England, and Germany in the thirteenth century. Weaving by this time had been brought to a high state of perfection in these countries, while for a thousand years previously the good people of Flanders had prospered as weavers. Hence the recorded use of a perpendicular frame or a horizontal frame at this period does not strike one as having much importance as directly bearing upon the origin of tapestry-making. In later times, the terms *haute-lisse* and *basse-lisse* have been appropriated to tapestry processes, but saving this appropriation the terms *haute* and *basse lisse* are equally applicable to ordinary weaving-frames, and both sorts of frames may have been contemporaneous in European employment during the thirteenth-century. Besides the weavers, of whose early history a good deal is known, a number of craftsmen known as *tapisseries* are mentioned in early records, and their name at once connects them with what would seem to be their probable productions, namely, *tapisserie*. Of the *tapisseries* there were two classes, *tapisseries sarracinois* and *tapisseries noires*. The former possibly did work in the manner of the Saracens, whilst the latter did *notre*, or our work,—that is to say, a style of work in contradistinction to that of the Saracens. But it is to be observed that both classes have the same generic name of "tapisserie." Now, the "tapisserie" was, no doubt, the maker of those coarser fabrics which served as carpets and covers to cushions, hangings for curtains, and such like; and the appropriate method of making these articles may have been derived from the East, where carpets and rugs were long in use before French, English, or Flemings came to perceive their necessity as articles of comfortable use, or capable of rich decorative effect.

And now, looking to the actual method of making tapestries, either in a *haute-lisse*

or a *basse-lisse* frame, one sees that in its essential features of twisting various threads around warp threads, it closely resembles carpet-making. It is not, therefore, difficult to understand that an Oriental carpet imported into Flanders or France may have been sufficient suggestion to the dexterous weavers in inducing them to attempt an imitation of it. Instead of one carpet several probably came over; some, no doubt, with returning Crusaders, others in the ordinary way of trade, and hence imitations in method of work may have been simultaneously attempted at various places.—Rhenish towns, Flanders, Paris, and elsewhere, even London itself. A slight sketch of a theory like this might very well have engaged M. Guiffrey's facile pen, but he is somehow bent upon throwing cold water upon such commonplaces. He finds a register dating from 1294 in which records of carpets (*tapis à griffons*) are given as the property of a Count of Flanders at that time, but all he can say thereupon is in the shape of a question, "Sagit-il de tapisseries proprement dites ou d'étoffes décorées d'un dessin riguliers?" and this, too, when he has never given us an explanation of a *tapisserie* proprement dite.

In writing the history of an art it seems to be of the first importance that some clear outlines should be given of the particular art in regard to the process or craft as well as to the decorative effect which is aimed at in the exercise of the process. Undoubtedly the numerous illustrations in the book under discussion indicate many phases of design in its relation to tapestries. But here again one seems to want a closer and more compact suggestion of the way in which styles of design have linked themselves together, and how ideas set forth in one material have been repeated in another.

A leading feature, in the tapestries of what is usually considered the best period, is the rendering of figure subjects, expounding some religious or secular events or stories. The same character of expression is traceable in carvings, sculptures, paintings, and engravings produced at the same period. But the actual producer of the cartoons from which early tapestries of the fourteenth and fifteenth centuries are made, is rarely named. The names of the workers,—the *tapisseries*,—are of more frequent occurrence, but, beyond the antiquarian interest attaching to them, there is not much to engage useful thought in the mention, for instance, of Jehan, le tapisserie de Paris (1308), of Jehan Bouilli, d'Arras, and Jehan Hucquedieu, *tapisserie sarrazinois*, of rather later date. M. Guiffrey has collected a good deal of information about one Nicholas Bataille, a distinguished tapestry-maker, who appears as the undoubted maker of a suite of six tapestries figured with subjects from the Apocalypse, some of which are preserved to this day at Angers in the cathedral. His name occurs in connexion with those of many of his royal patrons, particularly Duke Louis I. of Anjou. Brother of Charles V. of France, this Burgundian duke was remarkable for his taste for the arts, and at one time Nicholas Bataille was his *valet de chambre*. It is in the relations of details like these concerning the patrons of the art, and the tapestry-makers themselves, that M. Guiffrey's book may be said to teem. Besides this, we have many references to the transference, by sale or gift, of numerous sets of hangings; as, for instance, when in 1395 three pieces are presented to the king of England by the Duke of Burgundy, and again when the "Romance of the Rose," wrought in tapestry, is given by Duke "Philippe le Hardi" to his brother the Duke de Berry.

It would be interesting to classify the subjects of these earlier tapestries. We frequently meet with episodes,—such as the "History of the King of Cyprus in search of Adventures," the "Conquest of Eabylon by Alexander the Great," the "History of Charlemaigne," the "History of Bertrand du Guesclin," of "Hector of Troy," of "Parceval le Gallois,"—the hero of the Holy Grail,—"Miracles of Saints," Biblical incidents, "Esau and Jacob," the "Passion," "History of Judas Maccabeus," "History of the Twelve Apostles and Twelve Prophets," and hundreds of similar stories,—

more or less reflecting the chivalric, warriorlike, and religious temper of the times. Such as these are produced and reproduced over and over again, but from whose pencils the original designs came there is no apparent means of discovery. One main fact asserts itself, and that is the vast output of these decorative hangings. Paris and Arras, according to Monsieur Guiffrey, appear to have been the more thriving and industrious centres. That their productions were principally transcripts, in the matter of design, from the compositions of the early Flemish School of Painters, seems also to be established. At the same time there were factories in Flanders, at Brussels, Tournai, Lille, and elsewhere, whilst at Prague, in the fourteenth century, Charles IV. set up a factory under French *tapisseries*. Of England, M. Guiffrey has little to say, excepting that she seems to have made no effort to produce tapestries in the fourteenth century. Nevertheless, in 1344, Edward III. passed an Act regulating the manufacture of tapestries, whilst in 1392 the Earl of Arundel disposed, by will of the tapestry hangings in his castle, which had been recently made in London in blue, with red flowers. These instances, which point to the organisation of the industry as likely to have taken place early in the fourteenth century, are mentioned by M. de Champeaux, another more modest writer on the subject, but are quite ignored by M. Guiffrey.

From the commencement of the fifteenth century onwards the evidence of the general making of tapestry in the northern portions of Europe is supported by many records, and it would seem that, from the middle of the fifteenth century to the commencement of the sixteenth, the more stupendous and splendid tapestries were made. Of these we have excellent engravings in M. Guiffrey's book, and it is scarcely to be wondered at that in a plethora of materials he should not have made some detailed mention of the many fine tapestries extant in England. At Coventry, Hatfield House, Hampton Court, and at the South Kensington Museum he would have found some most notable specimens,—amongst them a series of great hangings illustrative of the Triumphs of Petrarch, which we noticed in April, 1884. Like other subjects, various editions of these Triumphs were put forth by the tapestry-makers of different times, and recently a set of Petrarch's Triumphs, dating at least fifty, or even a hundred, years later than those at Hampton Court, have been lent by Lady Henry Somerset, for exhibition at South Kensington.

Notwithstanding that France has probably produced many more tapestries than any other nation, it seems that the gems of the art, stately in composition, finely drawn, and rich with sumptuous harmony of colour, have emanated from Flanders, in comparison with which the worsted and silk pictures from Gobelins and Beauvais cannot be discreetly named.

With the advance in the painter's skill to depict subtle effects of aerial perspective, atmosphere, and such like, the formality and flatness of drawing and composition, which so admirably lent themselves to great surface ornament, declined; and tapestry, after the middle of the sixteenth century, became a tame competitor with the painted canvas, striving to imitate the smallest nuances of tone and colour, which flowed from the painter's brush, so pushing aside real regard to the appropriate use of the material. Instead of hanging freely, the later tapestries came to be strained on panels and used as flat mural decorations. The fine borderings of well-arranged clustering flowers, fruits, and leaves, were superseded by woven imitations of the great, moulded frames of pictures, and the straggling *ornouls* of Louis XV. Examples of these occur in the latter portion of M. Guiffrey's work. We have, however, probably said sufficient to show that whilst the book may not have answered our expectations in giving us food of a technical and æsthetic kind, it nevertheless abounds with varied historical facts interesting in themselves, quite apart from their association with the intrinsic elements of the art of tapestry-making.

NOTES.

AFTER a fruitless existence, extending over eight years, the Lower Thames Valley Sewerage Board has just held its final meeting. It has, as all the world knows, failed in the object for which it was formed, viz., the designing and carrying out of a combined scheme of sewage disposal for the districts, embracing twenty parishes, of its constituent authorities. It has, moreover, spent over 40,000*l.* in the effort, and has nothing to show for the money but something under 300*l.* worth of furniture in the offices which it has occupied at Kingston. It seems generally admitted that the failure arose not from the impracticability of the object aimed at, or from any disproportionately large expenditure likely to be involved over that which would necessarily be incurred in the construction by the different composing authorities of distinct schemes, but rather from the keen and formidable opposition excited by the proposal to bring the sewage of twenty parishes to any one spot on the banks of the Thames and treat it there. The idea of this combined Board ran counter to the theory which regards sewage works, however perfect and however efficiently managed, as a necessary evil, which ought to be and can be best borne and dealt with by each parish separately. Several of the authorities of which the defunct Board was composed are already busy in the consideration of separate schemes in which large sums are about to be spent. The project of a comprehensive combined scheme for the Thames Valley, to which some eminent engineers have given a considerable amount of time and thought, seems destined to be in abeyance for some years to come. It is obvious that it would require some strong overruling power,—nothing less than a compulsory Act of Parliament, in the passing of which no account had been taken of local feeling or ideas,—to band together again these Thames Valley authorities for a purpose similar to that which the late Board attempted in vain, and at enormous cost, to carry out.

THE recent announcement that the International Exhibition of last year has declared a loss, all the more serious inasmuch as it has swallowed up the savings of former exhibitions, is a pretty sure sign that these undertakings have been carried to an unreasonable extent. If true science were at the bottom of these things, any loss that resulted might well be put up with; but everybody knows that under the gilded pill lies amusement, pure and simple, and that the South Kensington Exhibitions are in reality, for the majority of those who frequent them, very little above the status of the Crystal Palace, the Albert Palace, the Aquarium, and other places of popular resort. A ten years' course of exhibitions was commenced by the late Sir Henry Cole, but it broke down ignominiously at the end of the third year; and the same fate will probably overtake any extension of the system after the Colonial celebration that will be opened next May. Probably very few people would regret their discontinuance, except those who make their money out of them, and we feel sure that the shopkeeping and manufacturing community would give a unanimous vote against their resumption,—at all events, for a considerable time. The day when we could show the world that we were superior to all competition is long past and gone, and there are now many other nations who have taken leaf out of our book, and who know well how to use it with advantage to themselves. It is doubtful, indeed, whether the Exhibition mania has brought any real and abiding profit to those who have been compelled to take part in it, and who have had for many years to pay a species of blackmail in the shape of large fees for space and carriage, besides experiencing a very decided hindrance to the steady progress of business. Viewing recent exhibitions even in the light of mere entertainments, they are seldom financial successes, and when we look around London and note the dismal plight in which these undertakings are without exception, struggling to keep clear of bankruptcy, it must be conceded that the whole thing is very much overdone.

THE Metropolitan Board of Works, at its meeting on the 12th inst., spent about an hour in discussing the nomenclature of the new street from Piccadilly-circus to New Oxford-street, and a very amusing discussion it was. The Works and General Purposes Committee (as we stated in our last would be the case) presented a report recommending that the new line of thoroughfare be named "Shaftesbury-avenue." There were several amendments. The first one was that the name of the thoroughfare be "Ashley-street," on the more than questionable ground, adduced by the speaker, that if it were desired to commemorate the life's work of the late Lord Shaftesbury, it would be better done by the name "Ashley-street." This amendment was rejected by a very large majority. Mr. Selway (who at a previous meeting of the Board suggested the name "Piccadilly-East,"—a name as absurdly inappropriate as "Piccadilly-road," the original recommendation of the Committee) moved that the new thoroughfare be called "Dudley-street," on the ground that by the adoption of that course the old name of a part of the line of new thoroughfare would be retained; though, as was pointed out by another speaker, within living memory Dudley-street was called "Monmouth-street." This amendment, however, was negatived, as were others, one of which was that the street be called "Shaftesbury-street," thus holdly contravening the Board's By-law as to the naming of new streets. Another amendment was that the street should be called "St. Giles's-street," but this met with little support, one member saying that such a name would seriously depreciate the value of property in the street. In the course of the discussion, objection was taken to the term "avenue" by one member, because he said it could only be applied to "arborescent passages," and by another because it was American, or, as he put it, that it savoured of "Yankee Doodle." Ultimately the recommendation of the committee that the street be named "Shaftesbury-avenue" was agreed to by a large majority.

IN reference to our article last week on the discoveries at Winchester, the Dean of Winchester writes that he thinks it unlikely that the "New Minster" would have been built on the southernmost line of their territory, and that the remains laid bare are those of a Saxon church preceding the present Norman cathedral. He has just taken the dimensions, which are 157 ft. by 55 ft. There are no buttresses on the outside. The Dean's opinion that the Palace of William the Conqueror was placed due west of the New Minster and close to the High-street; in fact, here the map in the "Annals of Winchester" places it. He adds:—

"We have not found Prior Silktede's remains. There have been three bodies discovered,—(1) in the very centre of the Lady Chapel, a layman, his coffin without nails, and tarred outside (indicating, probably, removal from a distance). The body was in winding-sheet of linen, and was entirely packed in hay, which remained perfectly sound. The hands are down by the sides, not crossed or on the chest. No jewel, ring, crozier, or other indication. It was in a place of great honour, and is a real puzzle. (2) Bishop Courtenay, in the crypt. (3) A bishop (not Prior Silktede), who lies under a great stone, with matrix of a splendid fifteenth-century brass, of a bishop, not a prior."

AS will be seen by a paragraph in another column, the scheme for the registration of tumbers initiated by the Plumbers' Company will commence on the 1st of March. In connexion with the announcement of this fact in our daily papers, two of those journals,—the "Standard" and the "Daily Telegraph,"—have, in adding articles published this week, waxed eloquent upon the shortcomings of plumbers and the consequent discomfort of householders. Scarcely both the journals named impute part of the blame for bad plumbing to District Surveyors, but the writers seem to be quite acquainted with the real duties of District Surveyors, which consist simply in seeing that the structural requirements of the Building

Acts are carried out, in order to secure stability and to diminish the spread of fires when they break out. District Surveyors, in their official capacity, have nothing to do with the plumbing or sanitary fittings of the buildings which they are appointed to oversee. It goes without saying that in the articles referred to, architects and clerks of works are, directly or by implication, blamed for bad plumbing in the houses of the people. The writers of such articles as those mentioned are evidently unaware of the fact that with the great majority of houses architects and clerks of works have nothing whatever to do.

THE Fulham Vestry-hall competition has again remained unsettled, the Vestry having, as mentioned in another column, carried an amendment to recall Mr. Currey and ask him to give further explanation as to his award. The whole matter appears, if half the reports circulated are true, to be very discreditable to some of those concerned in it. Architects, it is said, have been writing to Vestrymen, giving their names and asking for support in a competition which is nominally conducted under motto and on impersonal grounds. Vestrymen have been "nursing" their friends among the competitors. These kind of sub-plots are, unbappily, not uncommon in connexion with architectural competitions, but they seem to have found a congenial soil at Fulham, and to have flourished exceedingly. We hope the names of those architects who have attempted to get an unfair advantage over others by divulging their names and by personal canvassing will be made known.

THE designer of a public monument is naturally desirous that his work should be placed where it may appear to the greatest advantage. It is generally supposed that the most conspicuous position is the most desirable one, but an artist will prefer a spot where the new erection will most effectively group with the surroundings. A question of this nature has arisen between the local authorities in Edinburgh and Dr. Rowand Anderson with reference to the exact spot upon which the Buecleuch Memorial is to be placed in County-square. The commonplace idea would be to erect the memorial in the centre of the square, but Dr. Anderson conceives that were it placed about 24 ft. west from the doorway of the cathedral the Memorial could then be placed facing to the west instead of the north, and would thus have the advantage of sunshine; it would also group more effectively with the cathedral, with which it assimilates in style, and would not form a harsh contrast with the Signet Library and County Buildings, which it would be apt to do were it placed in contiguity with either of them. The cathedral authorities object that if the proposed site were occupied by the memorial, the view of the great west doorway would be obstructed. This would be the case to some extent, but it might probably enhance rather than detract from the value of the doorway, which, like most Gothic features, is not most effective when viewed right in front. A similar objection was taken to the placing of the restored Market Cross at the east end of the cathedral, but it is found that, although it partially obstructs the view, the choir gains rather than loses by its proximity. Dr. Anderson was requested to prepare a perspective, showing the memorial upon the site proposed, to be submitted to a subsequent meeting.

THE death of Prince Torlonia at Rome is an incident well worth recording in any journal devoted to industrial affairs, because he represented a type of all that was most useful and necessary to a country, like United Italy, that is working its way steadily to a rapidly-improving condition of material prosperity. The Torlonias, who are now the wealthiest family in Italy, were really of French extraction, their name being Touloron, and their birthplace Auvergne, in France. The grandfather of the Prince settled in Italy and there introduced the manufacture of needles and lace, acquiring, during a tolerably long

life, a considerable fortune. The late Prince wisely determined to lay out a good portion of this in land, and eventually became the largest landed proprietor in the kingdom, being, no doubt, assisted in the matter by his having been in a position to lend money at various times to the Government, and by his having obtained the monopoly of tobacco, an income in itself. But Prince Torlonia spent his huge fortune as loyally as he made it, not only in unbounded charity, but in private and public works, on a scale such as had never before been undertaken, even with all the resources of the State. Of these the most magnificent was the drainage of the ancient Lake of Fucino, 50,000 acres in extent, a work which had been conceived by Julius Caesar, begun by Claudius Nero, continued by Trajan and Hadrian, and again attempted by Frederick II. and Alphonso of Arragon. The present enterprise was commenced in 1854 and terminated in 1876, no less than 1,725,000*l.* having been spent in the *emissarius*, canals, roads, and plantations. Unfortunately this vast outlay does not seem to have repaid itself so far, within the ten years that have elapsed since the whole was finished.

MR. MOON'S very plain speaking at the half-yearly meeting of the London and North-Western Railway Company, on the 16th current, should be pondered by all persons interested in railways. The earnings in the last half-year of the passenger trains, he said, were the worst they had ever had. They were less, per train mile, than had ever been earned on the line, and in addition to that, a train mile in 1885 meant something very different from a train mile in 1864. For example, the limited mail train weighed 55 tons in 1864. In 1874 it weighed 75 tons. In 1884 it weighed 165 tons. The Scotch mail train weighed 256 tons, driven at a pace never attempted twenty years ago. Thus, the work done per train mile was prodigiously increased, and yet the earnings per train mile were less. There had been a falling-off of 80,000 first-class passengers, of 160,000 second-class passengers, and of 350,000 third-class passengers, following on a decline of 250,000 of the last in the first half of 1885. Shareholders will thus fully concur in the hope expressed by the Chairman that "they would not be required to create any more capital for a year or two." Perhaps before they consent to do that, they may even ask for a debtor and creditor account of the low-priced mineral traffic.

MANY of our readers will see with regret the announcement of the death, on the 12th inst., at St. Augustine, Florida, of Mr. Randolph Caldecott. Mr. Caldecott was of a delicate physique, with a tendency to consumption, which was counteracted from time to time by a residence in Italy and the South of France during the most rigorous months of the year. Mr. Caldecott was as delightful personally as he was in his drawings, and all who knew him will remember with regret his gentle manners, and the quaint, old-world character of his conversation, which resembled very much his drawings in its humorous simplicity and entire absence of affectation.

AN important acquisition has been made by the French nation in the shape of the monument known in Jerusalem by the name of Qbour-el-Molouk, which has been for many years the subject of keen anxiety to French antiquaries. It is believed to have been the resting-place of the kings of Judah, and, as long ago as 1851, M. de Saulcy made some excavations here, and sent to the Louvre a fine sarcophagus-lid which was said to have belonged to the tomb of David. In 1864, the same explorer proposed to M. Isaac Pereire to join him in acquiring the ruins, and this was carried out after long and troublesome negotiations. Considerable building operations have taken place since, and a large wall built round the tomb, from which several remains of great interest have been extracted. The tomb has now been offered to and accepted by the State, and an inscription is

being put up recording the circumstances and the names of the donors and those connected with the works, such as M. De Saulcy, M. Pereire, M. Patrimoine, the French Consul at Jerusalem, and M. Mauss, the architect.

THE *Ἐπιγραφή Ἀγαθολογική*, iii., 4, publishes a very interesting inscription, which gives back to us a sculptor of the fourth century B.C., who has hitherto been but a name. The inscription is engraved on a square block of Pentelic marble, built into a wall close to Beula's gate, in the Athenian Acropolis. The base originally supported a statue dedicated conjointly by two women, part of whose names only remains. Fortunately, beneath the dedication, the sculptor's name is complete, Πάνδιος ἐποίησε: "Pandios made it." Oddly enough, all that literature tells us of this sculptor Pandios is a note by Theophrastus, in his "Hist. Plant.," ix., 13-4, in which he says that the sculptor Pandios went mad from eating the fruit of a plant while he was working in the sacred enclosure of Tegea. But just this mention of Tegea suggests to archaeologists that this very Pandios may have been at work there with Scopas, who was employed to rebuild the temple of Athene Alea; that temple which Pausanias noted as so "large and worthy to be inspected," and of the pediment sculptures of which, from the hand of Scopas himself, we have a few melancholy fragments.

ARE those of our readers who are London ratepayers aware of the nature of the little Bill which has been introduced into Parliament by the Metropolitan Board of Works? If not, we commend it to their consideration. It simply authorises the Board to make, or to oppose, any applications to Parliament that they may think proper "with respect to the supply of water in or near the metropolis"; and to defray the cost "as expenses of the Board." Viewed from the standpoint of the solicitor or the engineer who desires large schemes and long Parliamentary struggles, nothing can be more cheering; but how as to the ratepayers? The general outcome of the policy of the Metropolitan Board of Works, whether as regards their repeated and unsuccessful attempts to introduce a water supply of their own, or as regards their sturdy resolution to continue the pollution of the Thames, has hardly been such as to incline the ratepayers to make over to the uncontrolled pleasure of this body the right to expend any sum they please in fighting as to water supply for the next twenty years. Yet this,—with no limit, indeed, as to time,—is what the Bill proposes to authorise.

WE are glad to learn that a systematic attempt is to be made, by the co-operation of the Prince of Wales and the Mayors and principal authorities of the kingdom, to assist artisans in the provinces to visit the Indian and Colonial Exhibition, with due regard to economy. The exhibition will contain so much that will be valuable and suggestive in regard to art-workmanship, that it is to be hoped that a great number of those engaged in artistic handicrafts, more especially, may be enabled to see and study it. We will print the detailed proposals in our next.

IF, after the unhappy occurrence of the death of the poor boy who was run over the other day close to the Metropolitan Railway ventilator in Queen Victoria-street, the Railway Company do not take immediate steps to lower the ventilator, at least so far as to allow the drivers of vehicles to see crossing passengers, they will incur a very heavy responsibility in view of the recurrence of such an accident, which is by no means an unlikely contingency. It may be urged, no doubt, that if passengers exercised the precaution of not crossing close to the ventilator they would be in no danger of being run over; but it is impossible to reckon on the supposition that every person crossing at the spot should always hear in mind that there may be a vehicle unseen on the other side of the erection. It is necessary for public safety in a crowded city that drivers should be able

to see the roadway and passengers to see the vehicles; and the interposition in the middle of a street of a great erection which entirely blocks out drivers on one side of it from passengers on the other side is undoubtedly an element of public danger which ought to be removed without delay.

THE last number of the *Journal* of the Hellenic Society contains, with other interesting matter, an essay by the late Mr. Fergusson on "The Tomb of Porsenna," advocating the views which he had before set forth as to the probable form of this extinct monument, as consisting of a central and four angle steles on a square podium, with a *petasus* or umbrella-like canopy over the whole. Mr. Fergusson infers from analogy the former existence of a numerous class of tombs or monuments on this model, and even suggests that the Taj Mahal, with its large centre pavilion and four smaller ones, may be a survival or development of this early form.

THE Burlington Fine Arts Club have in their lower room a small but very interesting collection of engravings from the works of Turner, specially intended as illustrative of the water-colour drawings now in the Burlington House Exhibition. A good many of these are shown in two or more stages of their execution. In some cases the earlier proofs are touched upon by Turner, and one, that of Derwentwater, hears on the margin of the trial proof the direction, in Turner's writing:—"More bold work; full of stones, large and small. N.B. The how not so advanced by rock." Occasionally we seem to see how the "Turneresque" effect of the scene developed little by little, as in the four plates of the "Chain Bridge over the Tees," where the catalogue notes, in regard to the third impression, "later trial proof, with rays of light added"; that which was at first a wild mountain scene in the ordinary light of day having become in the third stage a shimmer of sunlight rays crossing the picture in a manner, on the whole, more after Turner than after Nature. In the fourth and last proof, the deep gloom of a crevice on the left of the view is lighted up by two or three birds in flight, showing white against the darkness behind.

THE exhibition of the "Nineteenth Century Art Society" in Conduit-street is rather better than some previous collections under the same title, though we still entirely fail to see the suitability of the name for an exhibition which does not contain a single work by the most eminent artists of the day, and which does not even represent any special tendency in contemporary art, beyond the exhibition of two or three "impressionist" works not of a very marked type. Miss Ruth Canton's terra-cotta mask of "Azrael" is fine. Among the exhibits may be mentioned "A Young Turk" (52), by Mr. Murray Cookesley; a fine study of Sea (76), by Mr. Shaw; "On the Derwent" (80), by Mr. E. H. Holder; portrait of the Rev. Jervis-Edwards (203), by Miss Alice Miller; "The Thames at Sutton" (386), by Mr. T. J. Soper; and a "Derbyshire Dale" (447), by Mr. F. Dixey, a fine and impressive evening study in water-colour. Miss Staepole's large portrait of a young lady (152) is an obvious attempt to repeat Mr. Herkomer's brilliant experiment last year in the portrait of Miss Grant, not very successfully.

SIR JOHN MILLAIS'S new picture, "Bubbles," now on view at Messrs. Arthur Tooth & Sons' Gallery, represents a little boy in a dress of green velvet, seated, and with his face turned upward, watching the rise of a large soap bubble which he has just blown. The child's bead shows a light blond complexion and hair, and the flesh is painted in the artist's finest manner, but surely the head is large for the body, even making every allowance for the proportions of childhood. As a piece of colour the work is very pleasing, and it is noticeable that the attention of the child is really fixed on the object which is supposed to interest him, which is not the

case in some of the artist's child-pictures, where the accessory objects seem to have been put in as afterthoughts, without reference to the expression or direction of the countenance.

THREE large pictures by Mr. Long, representing the Story of Jephthah's Vow and its consequences, are now on view at 168, New Bond-street; the first showing the daughter with her maidens; the second and largest, Jephthah meeting his daughter on his return; and the last, the body of the daughter laid out on a funeral pile. Almost as a matter of course, all the pictures are up to a certain limit well painted and composed; and there is all that can be said about them. They are what we call "family Bible pictures" on a large scale, and represent the art of respectable commonplace.

WE must enter a protest against a new form of exactness practised on architects entering into competitions, which appears to be gaining head, viz. the system of demanding a deposit of money before supplying them with the instructions to competitors. At first it began with a guinea; the Fulham Vestry demanded two guineas, and supplied wretchedly imperfect plans and instructions; and now, in the advertisement for a competition for new Municipal Buildings for Sunderland, published in this and in our last issue, is an obliging offer to communicate to architects the terms on which they may compete, on the deposit of 5*l.* Consider what this means. Not one word is said in the Sunderland advertisement about time, premiums, or any other condition of the competition. Until the architect sees the conditions he cannot possibly tell whether they are such as he would consider fair or just, or whether it is worth while for him to go in for it at all; and to obtain this necessary information he is to deposit 5*l.*, which will be forfeited unless he sends in a design. Considering the imperfect and blundering manner in which conditions of competition are frequently drawn up, it is utterly unreasonable to invite architects to spend 5*l.* in discovering whether the competition is one in which it is worth their while to go into; and we hope the members of the profession will decline to comply with the ingenious request of the corporation to present them with so many five-pound notes on speculation.

THE UNEXHIBITED SCULPTURES IN THE BRITISH MUSEUM.

GREEK MONUMENTS, CHIEFLY SEPULCHRAL.

PROFESSOR C. T. NEWTON, C.B., delivered the first of a course of three lectures on the unexhibited sculptures in the British Museum, on Tuesday afternoon last, in the theatre of the Royal Institution, Albemarle-street. Here remarked comparatively few people were acquainted with the contents of the Blue Books and Annual Reports laid before Parliament concerning the British Museum, but those who were acquainted with them would know that the Trustees of the Museum had been continually clamouring for more space during a period of nearly fifty years. A certain portion of the required space they had at length obtained, but, he grieved to say, it was far from sufficient for the proper exhibition of the treasures of the Museum, and not nearly sufficient for the needs of the Department of Greek and Roman Antiquities, of which, until very recently, he had the honour of presiding. A portion, and a very important portion, of the sculptures of the British Museum was at the present time buried in the basement of the building, which had been aptly called the "sepulchral harem." As some of his hearers would know, he had, in time past, in other countries and under other conditions, been fortunate enough to be a discoverer, but in those days it never occurred to him that his last task in connexion with the British Museum would be to re-discover many of the sculptures which, purchased with grants of public money during the early part of the present century, had been described and engraved at the expense of the Trustees, and were known and referred to by every school of archaeology in Europe,—and known better, too, he was sorry to say, by foreign publicists than by the people of the

country. It never occurred to him when he was digging up sculptures in Asia Minor that he should afterwards have to reveal their very existence to the British public by delivering these lectures. The screen was covered with a number of drawings of a particular class of sepulchral sculptures, nearly all of which, interesting as they were, were immured in the dark basement of the British Museum, unseen, uncares for, and blackening year by year by dust and the smoke-laden air of London. It was for these unhappy prisoners, waiting for a release which never came, that he confidently invited the sympathy of his audience, for he was convinced that the latter did not include any of the pretentiously ignorant people who scoffed at these remains as being unworthy of notice. It would be very difficult, within the limit of an hour's lecture, to give an adequate idea of the quantities of sculpture which were now buried in the basement of the Museum. There were, however, three main classes, viz., (1) the Greek sepulchral reliefs, mainly from the Elgin collection; (2) the Roman sepulchral reliefs, mainly from the Townley collection; and (3) a number of what might be called stray sculptures of very great interest in their several ways. In addition, the basement contained a large number of stones bearing Latin inscriptions. In the present lecture he would only deal with a comparatively small portion of the great buried collection. He had thus briefly described, namely, the Greek sepulchral reliefs, reserving his notice of Roman sepulchral sculptures for his subsequent lectures. With regard, then, to the Greek sepulchral reliefs or monuments, he would say that they consisted, in a large proportion, of stela. It would be asked, "What is a stela?" Students of ancient history who had read their Thucydides or Grote would need to be reminded of the noble passage of the funeral oration of Pericles over the Athenians fallen in war,—“It is not only by the record of the stela in their own country, but by the unwritten record in all countries that their memory is preserved. Of illustrious men all earth is the tomb.” Those who did not care to turn to Thucydides might see those noble words, graven in their original Greek, on the base of the monument erected to Lord Falkland near Newbury. Now, the illustrious men whose memories were preserved to us in Greek history had no doubt their monuments, and monuments of the highest interest, at Athens. Those monuments, alas! we do not possess. But the monuments we do possess were the monuments of a number of people less distinguished in history,—of Athenian citizens, who in their several walks of life were supporters of Pericles and their great Athenian generals. Many of those monuments bore representations of the domestic life of the citizens. There were several varieties of the Greek stela. The most common was a long and narrow strip of marble, sometimes simply inscribed, but frequently sculptured, sometimes the top of the stela was carved into the beautiful floral ornament which the Greeks called the anthemion; immediately below that came the name of the person commemorated, and on many stela the figure of the person was sculptured in relief, sometimes within a sunken panel. A peculiarity of the stela was its extreme narrowness in proportion to its height. Possibly that form of monument was in some degree necessitated by the law of Solon, who regulated the size of the sepulchral monuments in Athens, and the length of the inscriptions upon them. In some instances the stela were crowned with pedimental forms. Sometimes they were sculptured in the form of a vase, called a kythos. Some of these were very elaborately sculptured, but in low relief, so that the subjects might not interfere with the line of the “vase.” Some specimens of this kind of stela were in the basement of the British Museum,—some having lost their necks and some their feet. Then there was another variety, namely, that of the heroon type, so called from their resemblance to the façades of a heroon or small temples which abounded on the mountain sides of Lycia. These, then, were the principal varieties of stela. But there was another form of sepulchral monument which he had not yet named, but of which there was a very important class, many examples in the British Museum, viz., the form in which there was a relief set in an oblong frame. Now came to a very important question, viz., at what the meaning of these sculptured reliefs? Did the figures represent the dead as

they were supposed to appear in another world, or as they appeared in life? Or, were some of the figures representative of the living, and others of the dead? These were questions on which a great deal had yet to be written. The Austrian Government, who took an enlightened view of the duty of a Government in the encouragement of archaeology, years ago projected a great scheme for publishing the whole of the Greek sepulchral monuments, with the view of facilitating the interpretation of their meaning. On this head he referred his hearers to two interesting reports, one published in 1874 and the other in 1875, by Professor Gonze, now of the Museum at Berlin, but then of the Austrian Academy. At that time the Austrian Government sent commissioners into all the countries where these Greek sepulchral monuments were known to be, as well as to Athens and in the country round about it. The Museums of London, Paris, Leyden, and Berlin, as well as private collections, were visited by the commissioners, who caused the whole of the sepulchral monuments which they found to be photographed. When the Commissioners came to London it was his (the lecturer's) duty to drag the whole of the sepulchral monuments from their hiding-place in the basement of our national museum, in order that they might be photographed. That was a work involving a considerable expenditure of time and labour, and, of course, of money. However, we might hope that the result of all that labour would be that archaeologists, instead of writing papers on the subject based upon imperfect deductions from a limited number of examples, would be able to take the clear and large view of the subject which would result from a true induction from a large number of examples. The lecturer then went on to point out, by reference to the drawings exhibited on the screen, that many of the figures in relief may be assumed to depict some incident in the life of the person commemorated, or some incident typical of his calling or vocation. One of the examples of which a drawing exhibited was a relief, in which a horseman was plunging a spear into his prostrate foe. This relief, as the inscription upon it showed, was to commemorate one of the five horsemen who fell at the battle of Corinth, somewhere about 334 B.C. Another relief exhibited an Athenian youth seated on the back of a horse that was rearing, the rider being represented as gently caressing the animal to keep him quiet. Behind was a figure on foot. The inscription on this monument was metrical, the two first lines reading,—

“I many joys in youth with mates in years
Once shared. Now earth-born, earth again become.”

These examples were amongst those found in the celebrated street of tombs in Athens,—the Agia Triada, discovered in 1863. Other reliefs were of a domestic character, some of them representing apparently such subjects as a lady seated and attended by her handmaidens; figures reclining at a banquet, &c. Some of these reliefs were figured in Mrs. Mitchell's able history of ancient Greek art, in which was a whole chapter devoted to the consideration of these Athenian sculptured monuments. Mrs. Mitchell's remarks on the subject were well worth reading. Many of the family groups depicted on these sculptured monuments were regarded as representing leave-takings between the living and the dead, and that was a theory which had many adherents. It was a theory to which he, the lecturer, was more or less inclined. The latest German light on the subject was contained in the large catalogue of the wonderful collection of casts which had been brought together in the Museum of Casts at Berlin. In the new edition of that catalogue, published last year, the archaeologist Wolters expressed his conviction that these sculptured groups were in no instance meant to represent leave-takings between the living and the dead, but were simply representative of domestic affection among the Athenian families, and related to real life. Wolters was an archaeologist whose opinion was entitled to great respect. These reliefs were of the fifth and fourth centuries B.C., and were a faint echo or reflection of the art of Pheidias and Praxiteles and their immediate followers or contemporaries. It might be asked, “Why are all the faces of these figures so monotonous and so similar in character?” That question was a very interesting one in the study of Greek art. The fact was that the Greeks were opposed to the realistic representation of public men on their monuments. Their whole theory was that

the individual should be merged in the State, and that individual likenesses should be very much discouraged if not absolutely forbidden. It was this which accounted for all the faces of the figures on the frieze of the Parthenon being similar. There were people who believed that the ancient Greeks were all possessed of ideally perfect and regular features, but he (the lecturer) utterly disbelieved such a thing. He believed that there was just as much variety between the faces of man and man, and woman and woman, as there was amongst ourselves. One proof of that was to be seen in their masks, which represented an infinite variety of expression of feature,—a variety which could only have been obtained from the faces of the people. With regard to the oblong reliefs, the lecturer recommended his hearers to peruse an article by Mr. Percy Gardner, in a recent number of the *Journal of the Hellenic Society*. In conclusion, the lecturer referred to the Cheronian Lion, a cast of which, taken at the instance of the British Museum some years ago by a *formatore* sent out for the purpose, at a cost of 70*l.*, was hidden in the Cimmerian darkness of the basement of the British Museum. It was quite possible for this work to be restored, and he was surprised that the Greek nation did not restore so interesting a monument of their ancestors. Finally, the lecturer referred to the destruction, by the agency of the lime-kiln, of the tomb near Bargyia, in Asia Minor, which consisted of a basement crowned, like the lion tomb at Onidus, by a figure of Scylla, half-woman, half-dog, of which a cast is in the British Museum. The lime-kiln had much to answer for in the destruction of ancient monuments in barbarous countries. Even in this highly-civilised country, General Wade, looking for materials to make a military road from Newcastle to Carlisle in the early part of the last century, could find nothing so convenient for the purpose as the great Roman wall, which was, up to his time, nearly perfect with all its towers and battlements.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The sixth ordinary meeting of this Institute for the present session was held at Conduit-street on Monday last, Mr. Alfred Waterhouse, R.A. (Vice-President), occupying the chair in the continued indisposition of the President.

Architects' Remuneration.

Professor Kerr asked whether the attention of the Council had been drawn to the remarks made by Baron Huddleston on the architects' commission of five per cent. His lordship was pleased to say that he considered this mode of payment objectionable, and thought the Institute of Architects should take up the matter. Baron Huddleston's opinion was entitled to peculiar attention, because, when at the Bar, he was a very successful advocate, and no one understood better the way in which a jury would look at any question of a commercial character. It seemed, however, that he had mistaken the principle on which the commission was charged to be that of payment on results. The Council might think it advisable to issue some sort of declaration on the subject, as the same remark was frequently made by persons of less importance. The schedule of charges prepared under the presidency of Sir William Tite was not understood to constitute rules laid down by the Institute. It was rather a declaration of custom arrived at after a careful investigation by persons qualified to enter into the matter. This schedule had been revised from time to time, but never altered in principle, and it still stood as a declaration of the custom of the profession from a somewhat early period. It was also a principle such as was adopted in America, France, and Germany, and no one had since suggested a better system. In some cases it was not remunerative, while in other cases it was more than remunerative, and then special conditions were made in the schedule to reduce the amount. The practical question was, whether architects, as a matter of fact, were found to be inclined in any shape or form to run up their clients' expenses for the sake of their shilling in the pound. As a public officer of twenty-five years' standing, he had come across architects and builders of all kinds and

he had found the former, as a rule, were a great deal too careful, being more troublesome to the District Surveyor than builders upon questions affecting expense. The real grievance was that architects did not stand by the schedule as regards each other, but would sometimes exercise surprising ingenuity in explaining away the schedule to the disparagement of their professional brethren. The Council might take the matter into consideration, and a carefully-prepared declaration might be issued in answer to the challenge from the Bench.

Mr. Charles Barry thought the meeting must appreciate Professor Kerr's object in bringing the matter forward, to clear the profession from anything like false aspirations. But what he had said was the most conclusive series of reasons why the Council should take no notice of the matter. As the old proverb said: "*Qui s'accuse s'accuse.*" It was well known that this pestilent heresy, which at one time was very prevalent, had considerably decreased. That it would entirely disappear was too much to hope, because there were always men who could not believe good of others.

Mr. Henry Dawson agreed that the prejudice was dying away, and the judges had invariably of late years allowed the justice and reasonableness of the five per cent. He remembered two cases before Lord Coleridge, where his lordship distinctly stated that custom was to be respected, and directed the jury to find accordingly. That being so it would be well not to take any notice of Baron Huddleston's expression of opinion.

The Chairman said that the general feeling of the meeting seemed to be that no action should be taken by the Council. The more people knew of architects the more fully would they realise that they were never prompted by a desire to augment their own fee at the expense of their clients. The subject then dropped.

The Architectural Examination.

Prof. Kerr next brought forward the matter of which he had given notice at the last meeting.* Since the system of examination had been established for the admission of Associates, fewer candidates had come forward than had been expected, and on the last occasion none had presented themselves. It was natural in such a state of things that an idea should be prevalent, that the Examination was practically a failure. Candidates who had been rejected complained that the Examination was too severe, eccentric, and complex, while even those who had passed made a similar complaint. A singular thing, which had alarmed a good many, occurred on the last occasion, when the Asphit Prize was refused. When they remembered Mr. Asphit and the object he had in view in establishing that prize, no one could suppose it would have been his wish to reserve it, to the dissatisfaction of the young men rising up in the profession. He (the Professor) was always suspicious on the refusal of any prize of the kind, and he expressed his dissatisfaction at the time. Then it was complained that the Examination papers were not published. It was the universal rule to show examinees what work they had to do, that the Examination papers of the previous year should be published; but in this case not only were the questions not published, but the publication was intentionally withheld. The programme to which the young men were referred was chargeable with great complexity, discursiveness, and exaggeration throughout.

Mr. Charles Barry rose to order. What Professor Kerr was stating was extremely interesting, but he (Mr. Barry) submitted that this was too large a matter to be discussed without notice at a non-business meeting.

Professor Kerr complained that just as he was about to open the question Mr. Barry, as usual, called him to order. (Mr. Barry, "Not as usual.") The examination extended practically over a whole week, and covered the history of architecture, mouldings, sanitary science, plans, &c., besides an oral examination on the last day, and advice to candidates was also given. The list of books was stated to contain what was absolutely to be read more or less by the examinee, and extended to 187 volumes, besides encyclopedias. Of these, forty-four volumes were in the French language, six in the German, and twenty were Italian. Any one who would go into the matter would be astounded at the range of the Examination, and would not be surprised that it should be

considered a failure. The Examination ought to be a contest, not for admitting candidates, but for excluding those who were unfit. They had no right to exclude from this guild any one who was twenty-one years of age, and an architect properly so-called, while the Examination should go no further than to prove that the young man was really an architect, and not one of those youths whom they found practising in surveyors' offices. It was under these circumstances that Mr. Cates had taken a step which he ventured to think was entirely out of order, and at the same time most dangerous. Mr. Cates asked the young men to come to his place of business by appointment, to receive from him assistance and advice. Any one who knew much about academical examinations must be aware that it was contrary to rule to allow the examiners and examinees to confer privately, and no university man would listen to such a proposal for a moment. But the practical objection was this, it brought to bear upon the examination a principle of individualism and a study of the peculiar idiosyncrasy of mind exhibited by the examiner. As an old academical hand, he knew the dodges resorted to by students, and he would formally ask by what authority Mr. Cates had advertised these invitations.

Mr. Robert Walker rose to a point of order. He submitted that although Professor Kerr had a right to put the question, he was hardly in order in raising the whole matter of the Architectural Examination. Referring to the Professor's letter, which appeared in the *Builder* of the 23rd ult. (p. 182), he thought there were one or two expressions in it which might be called in question, and which ought not to have been used. There had been some difficulty in starting the Examination, and a notice was put in the "*Kalendar*" of the Institute, that Mr. Cates would be ready to see any young men who might be in need of advice in regard to it. Therefore, while Professor Kerr was in perfect order in asking this question, he ought to have done so in a proper manner, and without writing to the *Builder* in the way he had done.

Mr. Macvicar Anderson (hon. secretary) said that so long ago as 1877 By-law 14 was enacted, whereby it was provided that in March, 1882, an Obligatory Examination should take place, the object of which was to supersede the Voluntary Examination held up to that time. In 1879 a special committee was appointed to consider the best means of carrying the by-law into effect. On May 3rd, 1880, that committee's report was adopted by the Institute, and a committee appointed later by the Council to consider the whole subject. This committee held nine meetings, and recommended that Mr. Cates should be requested to act as chairman for 1880 and 1881, which was approved by the Council. Mr. Cates had, therefore, acted as Chairman of the Board of Examiners not only in London, but in Manchester and Glasgow. They would see in the *Kalendar* of the present year that any student desiring special advice would be received by the Chairman of the Board of Examiners by previous appointment, who would assist him to the best of his power. Professor Kerr had objected to this course, but others were of a different opinion. Besides, Mr. Cates was not, technically speaking, an examiner, as he neither set the papers, nor marked them in London. On the other hand, it was a great advantage that students in difficulty or doubt on many questions, should be able to receive from so experienced a man advice and assistance. So strongly did the Council feel this that they had that afternoon passed the following resolution in reference to Professor Kerr's notice of motion:—

"The Council approve the action of the London Chairman of the Board of Examiners (Mr. Arthur Cates) in having given publicity to the 'advice to architects' already approved by the Council, and published in the *Kalendar* of 1880-6; and cordially thank him for the action he has taken, also for the zeal, usefulness, and ability with which he has always interested himself in the advancement of architectural education."

That was the answer to Professor Kerr's question, but he would have scantily performed his duty to one who had rendered invaluable service to the Institute, did he not take the opportunity of expressing his individual opinion. Professor Kerr had not been present at any of the examinations held by the Board under the by-law, and was therefore not in a position to speak with authority on the manner in which they were conducted. He (the speaker) had attended several, and had been struck with the wide and extensive range of knowledge displayed

by Mr. Cates, and he would say deliberately that the Institute owed that gentleman a deep debt of gratitude for having conducted the examinations. Professor Kerr had inquired what had become of the Voluntary Examination, but this had been superseded, as could be seen by reference to the minutes. Considering what Mr. Cates had done for the Institute, it was cruel that any action should have been taken by a member such as that taken by Professor Kerr.

Mr. Aston Webb, as one of the recently-appointed examiners, said that in order to put the young men in the way of preparing for the Examination, various means had been proposed by the Board, and it was with that view that the advice to candidates was drawn up.

Mr. Dawson thought that in any future announcements, inserted by Mr. Cates as Chairman of the Board of Examiners, they should be distinctly stated as being "on behalf of the Board of Examiners."

The Chairman considered that the members were indebted to Professor Kerr for having elicited the valuable remarks of the Hon. Secretary. He would not add a word as to the amount of indebtedness they were under to Mr. Cates for what he had done in connexion with the Obligatory Examination. He would, however, carry away the conviction that he should send to Mr. Cates any young men in whom he had an interest, who were preparing for the Examination.

Professor Kerr said his desire was that the Examination should not be a failure.

Mr. Barry added that the figures of the Voluntary Examination in nineteen years were as follows:—Class of Distinction, 3; Class of Proficiency, 43; Preliminary, 52. In the four years from 1882 to the present time 96 had presented themselves, and 64 had passed.

Swedish Building Law.

Mr. Alexander Beszeley, M.Inst.C.E., then read a paper on "Swedish Building Law," of which the following is an abstract:—

The Building Law of Sweden was defined by a Royal Ordinance (1875), and building regulations were then framed by the municipal authorities of each town. An abstract of the ordinance in the several chapters was as follows:—The first referred to the regulations, building committee for each town, and fines for breaches of the ordinance or regulations. The second contained sixteen sections, dealing with building plots, streets, squares, quays, &c., together with the general laying-out of towns, of which authorised plans are prepared, and no new districts are allowed until the plans of them have been approved by the Crown. The third, sections 17-28, referred to the subdivision of building plots, the maintenance of boundaries, levels, yard-spaces, building lines, sanitary ordinance, and number of stories permitted to dwelling-houses; sections 29-33 dealt with corner buildings, external painting, cellars, dwelling-rooms, churches and other buildings intended for the assemblage of large numbers of people; sections 34-36 with fireproof walls, roofing, chimneys, fireplaces, and precautions against fire; sections 37-41 included application for permission to build, duties of the building committee as to building-lines, sanitary arrangements, and surface-drainage, &c., and also referred to Government buildings. The fourth dealt with the responsibility of persons building without leave from the committee, the levying of fines and various legal proceedings arising upon the regulations; it also related to the employment of architects, their responsibility, that of the building owner, and the duty of the provincial governors to see the ordinance and regulations duly enforced. The building regulations, based upon the ordinance, varied much in different towns, and were therefore dealt with by the speaker in a general way under the principal heads, any great diversity being noticed. The heads were:—Building Plots, Streets, Projections upon or over Streets, Yards, Foundation Walls, Height of Buildings and Thickness of Walls, Fireproof Walls, Chimneys and Fireplaces, Doors and Gateways, Windows, Floors and Ceilings, Entrances and Stairs, Roofs, Gutters, &c., Concrete Buildings, Timber Buildings, Theatres, and the Inspection of Buildings. A building plot with frontage less than 49 ft. and area less than 2,847 ft. 9,483 square feet was not allowed to be rebuilt until it had been decided whether it should be purchased by the town for improving the dimensions of other plots; plots of greater

NEW HOUSES AND FLATS AT KENSINGTON.

VISION OF THE ARCHITECTURAL ASSOCIATION.

The second Saturday afternoon visit for the present session of the Architectural Association to buildings in progress was made last Saturday, by the kind permission of the architects, Messrs. George & Peto, and Messrs. Peto Bros., the builders, to the houses in course of erection in Collingham-gardens. There were four houses visited, each in different stages of progress, from one which was just ready for the roof (one principal being fixed) to the last house which was finished fit for occupation. The houses are being built with thin Acton red bricks, with Donlon white terra-cotta dressings, the roofs being covered with Ashton & Green's green Westmorland slates, which are graduated in size from the eaves to the ridge. The houses, which are of interesting and quaint design, decidedly Flemish in character, were carefully studied by the members. The plan of each varies, a feature in all the houses being made of the entrance-hall, which is approached by a lobby from the front door, the staircase being placed in an adjoining space slightly screened off the hall; a very picturesque treatment is obtained by this means. The reception-rooms are so arranged as to have angle nooks or large recesses, with mullioned windows breaking the straight line of the walls. The rich detail of the wooden panelling, staircases, mantelpieces, and ceilings was especially noted. All the reception-rooms have high wooden panels, some in wainscot and some painted. The mantelpieces are principally carved oak; in one of the entrance-halls the mantel-piece is of Ham Hill stone. One of the houses contained a very interesting ceiling executed in selenitic plaster, carved *in situ*, the plaster being put up about a yard at a time, the pattern being transferred to the plaster and carved before the plaster set. Most of the other ceilings are elaborately panelled. Some of the hall ceilings are of wood. All the windows have clear glass lead-light glazing, the casements being hung to wooden frames set inside the terra-cotta mullion. The buildings form a pleasant relief to the regulation pattern stucco fronts which abound in the immediate neighbourhood.

The members passed from Collingham-gardens to the blocks of flats being built from the designs of Messrs. Flockhart & Wallace, in the Earlsfield-road. Mr. Wallace met the party and conducted them over the buildings. The buildings are arranged so that two complete flats occupy each floor, approached by an ample staircase of Wilkes's Eureka concrete, which is placed in a recess open and carried up to the roofs. The flats consist of two reception-rooms, five bedrooms, kitchen, bath-room, stores, &c., with separate coal and wine cellars in the basement for each flat, and box-rooms in the roofs. The kitchens have communication with a lift for delivery of stores, and a dust-shoot, and are arranged with good entrance-halls and well-lighted passages. The rooms average 16 ft. square; each flat has a fireproof floor. There seems to be a good demand for this class of building in the neighbourhood of Kensington, all the flats in the finished blocks being let and occupied.

SEWER VENTILATION.

Str.—In the abstract of the report of the Committee of the Metropolitan Board of Works on sewer ventilation, which appears in your issue of the 13th inst., it is stated, with reference to the use of charcoal in the sewers of Croydon, that it had been tried and finally abandoned in consequence "of the difficulty of keeping the charcoal dry, and therefore inefficient."

I wish to point out that, in the course of my experience, I have largely used charcoal for sewer ventilation, and was the inventor of the spiral arrangement which has been extensively used in the application of charcoal for deodorising the air escaping from sewers. In the case of Croydon, where for ten years I was in charge of the works, and for four years subsequently was a member of the Urban Sanitary Authority, there is not one particle of evidence to show that charcoal ever impeded the ventilation.*

* On reference to our article, it will be seen that we expressly stated our own conviction that the spiral tray arrangement would not impede ventilation.—Ed.

The charcoal was removed from the sewers upon the joint recommendation of the Medical Officer of Health and the Surveyor, in a report presented to the Croydon Local Board in February, 1876, on the utility of charcoal in sewer ventilators, when they stated with regard to the ventilators that "the best consist of circular spiral wire trays, on which the charcoal is placed and kept fairly dry at all times. In the others, the charcoal is laid upon flat wire trays, placed zig-zag in the ventilators, and in most of these the charcoal gets saturated with the wet of the roads, and is rendered useless for the purpose for which it is intended. In the parish there are 245 of the spiral ventilators, and 460 of the others." Then they recommend that the charcoal should be removed, as, in their opinion, the ventilation would be improved thereby, and they went on to state that "an offensive ventilator indicates an imperfect sewer, and the true remedy is to alter the condition of the sewer, and not to seek to render its emanations harmless by charcoal." I may mention that at this period, beyond the large number of ventilators upon the public sewers,—the number in the report representing one to every 200 yards of sewers,—every house in the district had one or more ventilating pipes communicating with the house-drain; the latter communicated with the sewer without the intervention of a trap, so that the house-drain ventilators served also the purpose of ventilators for the public sewers, the total number of openings for ventilation by this means being equal to one opening in every 12 yards of sewer.

Since the removal of the charcoal from the ventilators in Croydon, thousands of pounds have been expended in improving the sewers, providing flushing arrangements, and enormous quantities of disinfectants are regularly applied in these open ventilators, so that when there are not stinks arising from decomposing matter, the nose reminds one of their presence by the powerful odour of the disinfectants. Neither has the removal of the charcoal from the ventilators in Croydon been attended with any success from a sanitary point of view. There have been more complaints of the nuisance arising from the unprotected ventilators in any one week since the removal of the charcoal, than there were in the whole of the ten years while the charcoal was in full use in the sewers. The vital statistics of the year 1873, when charcoal was in full use in the sewers of Croydon, are far more favourable than those of the year 1885. It should be observed that in the case of Croydon a great alteration has been made in the system by the interposition of a trap between the sewer and the house-drain, which, when supplied with a proper air-opening, is no doubt an enormous sanitary advantage and security to the inhabitants of the house; but it cannot be overlooked that the trapping of these house-drains, in the case of Croydon, has greatly diminished the amount of previous ventilation, which seems to have been overlooked by the Sanitary Authority, as no adequate provision has been made in substitution of the large amount of ventilation which has been stopped so far as the public sewers are concerned.

I may add that I have no interest whatever in advocating the use of charcoal, as the ventilators which I invented are open to any person to manufacture or use, but I can safely say that I have found charcoal most efficacious in preventing noxious effluvia escaping from open ventilators. It appears, however, that the Local Government Board have set their face against the use of it, and have, in more than one instance which has come under my notice, recommended its removal from the ventilators; but after a trial of the absence of the charcoal the authorities have been only too glad to again revert to its use, without any evil consequences, but with the greatest possible advantage in preventing the escape of noxious air. I do not wish to be understood to say that charcoal will meet all the difficulties of sewer ventilation, or that it is the only mode by which air escaping from sewers can be dealt with, as with the advance of scientific knowledge there cannot be the slightest difficulty in effectually dealing with the question of the ventilation of sewers if the money is forthcoming for the purpose; but in many small districts which cannot afford a large expenditure of money, the use of charcoal is simple and efficacious.

BALDWIN LATHAM,
M. Inst. C.E., F.G.S., &c.

frontage were not so subject to compulsory sale. Side-walks were not to be broken into by carriage-entrances, &c., but the gutter was to be properly bridged where necessary to allow vehicles to cross the side-walk, which was to be from 5 ft. to 7 ft. 9 in. wide in streets, and 9 ft. 9 in. on squares and open public places. The minimum width of roadway must be from 17 ft. 6 in. to 23 ft. 5 in. If ground were not wholly occupied by a building, the yard-space must equal at least from one-fifth to one-third of its area. In new quarters, buildings were not to exceed 66 ft. in height, excepting churches and other public buildings. Openings in fire-proof walls were, in some Regulations, absolutely prohibited, and in all cases subject to stringent conditions. Dwelling-houses were not allowed to have Mansard roofs, roofs were to be covered only with tile, slate, metal, or other approved fire-proof material. Straw bedding to tiles was prohibited. A trap-door, sheathed with metal, must be provided in every roof, and a ladder always under it. Theatres must be situated at least 40 ft. within the boundary of their own ground on all sides; or else 10 ft. within the boundary, with fire-proof walls not less than 1 ft. 5 1/2 in. thick, having but one opening, if necessary, at the ground-level for exit. The inspection of new buildings was to be performed by one of the Building Committee and the Town Architect. The drawings of each intended building must be examined, as also the proposed site. Inspection during the progress of building had to be made at eight stages, and notice given to the Building Committee when each stage was reached. Mr. Beazeley concluded by referring to matters pertaining to light and air.

In the discussion which followed, Mr. Edmund Woodthorpe said that in Mr. Beazeley's long paper much useful matter had been described which might with advantage be introduced into the Metropolitan Building Act. There were many difficulties as the way of carrying out in London an Act which was already arbitrary enough. Mr. Beazeley's own Act gave many powers, but the Swedish law seemed to give more, and appeared to be a very wholesome and sensible way of dealing with buildings in a timber country. He proposed a vote of thanks to the reader of the paper.

Mr. Charles Fowler seconded the vote, and added that two of the reservations mentioned might well be adopted in this country. One was that building in a city should be required to satisfy taste, and the other was that chimneys should be reasonably ornamented. The Swedish Regulations also with regard to easements seemed better than our own provisions.

Professor Kerr asked Mr. Beazeley to add to his paper what was the prevailing nature of buildings in Sweden. In that country it appeared that an old building, when excessively out of repair, had to be demolished. In England, on the other hand, property was so sacred that a man had a right to retain what he pleased on his land.

Mr. Robert Walker remarked that the paper showed that in Sweden the owner of the property must employ an architect or be responsible himself. Unfortunately in London the district surveyor could not catch the sinner, and the property fell under the mortgage or the owner, there was no remedy against the builder.

The vote of thanks having been put and read,

Mr. Beazeley, in replying to Professor Kerr, said that the materials generally used in Sweden were brick and stone, and for fuller information he would refer to a paper read by him nearly three years ago, on domestic buildings in Southern Sweden.* In remote districts nothing but timber was used. Repairs were amounted to rebuilding or reconstruction were never done upon old buildings, which were not in accordance with the building regulations, but only such small repairs were done as were necessary to keep them in habitable condition for the time being. In general, the greatest care was exercised in the building operations, and only those who had studied in well could see how at every turn they were urged against the danger of fire, which seemed to be the great dread of the Swedish people. The convenience of the private owner to give way in Sweden to the general safety and convenience of the whole population.

* See Builder, April 28, 1883, p. 553.

"THE PRACTICAL SURVEY OF WORKS
IN PROGRESS."
ARCHITECTURAL ASSOCIATION.

The ninth ordinary meeting of the present session was held at Conduit-street on the 12th instant, Mr. C. R. Pink (President) in the chair.

The following new members were elected:—Messrs. A. B. Clement, Horace L. Field, Edward Boehmer, Arthur E. Bartlett, George Bridge, Charles H. Daniel, T. A. Allen, Alfred A. Webbe, Robert Reid, E. C. Thomas, and Arthur E. Vickers.

A vote of thanks was accorded to Mr. Alfred Newman for kindly permitting the members to visit his forges.

Mr. Herbert D. Appleton then read a paper on "The Practical Survey of Works in Progress." At the outset he spoke of the responsibility which the architect ought to feel in being the sole arbitrator between the builder and employer as to the correct carrying out of the specification and drawings. If he were asked for a motto, he would suggest one based on the well-known advertisement, "If you ask for Somebody's Starch see that you get it," for architects were, perhaps, too often in the habit of asking for "the best" of everything in their specifications; but did they always, when the works were being executed, see that their clients always got it? Although most contracts stipulated that the contractor was to be responsible for the proper setting-out of all work, the architect should take the earliest opportunity of checking the setting-out, as no work which had been pulled about and adapted was so sound as that which had been correctly carried out from the start. After arranging with the builder as to what parts of the site might be used for the storage of materials, and the disposition of any temporary workshops or sheds that might be necessary (taking care, if the ground sloped, to have the water for the builder's use laid on to a point below the building, so that in the not unusual event of waste of water through the tap being left running the water would not soak into the foundations), the next point to be dealt with was the important one of the foundations. Of course, the greatest amount of care should be exercised in settling whether the best foundation possible had been obtained. In judging this, experience was everything, and every opportunity should be taken of gaining this experience by noting every section that was made,—such as when main sewers are laid through towns, for instance, or on the occasion of any other excavation, a careful note being made of the various strata exposed. It would be of great service if it were possible, by paying a small fee, to see a record of the sections made by the various boards of works in forming their sewers. As had often been said, the streets of London formed a most valuable school of practical experience in building if architects only availed themselves of the opportunities which the constant re-building and alterations afforded. During the dry weather last summer great damage was done to the houses on the southern side of London built on the clay, owing to the serious settlements caused by shrinkage. The question as to the depth that foundations in the clay should be carried was a very difficult one, and in his (Mr. Appleton's) opinion, in most instances of buildings on the clay the foundations were not carried deep enough. It would be interesting to note the depth to which the surface-cracks that appeared each year penetrated, and whether there was any movement in the clay below those cracks. It had been suggested that when clay overlaid gravel there was a constant washing of the clay into the gravel through such cracks, and that the landslips that could be seen, for instance, in the neighbourhood of One Tree-hill, Sydenham (where tons of clay fell every year), were caused in that way, the accumulation of debris at the foot of the hill not being enough to account for the mass of clay that had fallen. In clay districts it was usual to allow concrete to be made of burned ballast, but the advisability of this was very doubtful, the clay-ballast being so uncertain in character, some of it going back to clay after a few years had passed. The precaution of coating cement before using it should always be adopted. The next step in the building was the brickwork. The selection of the bricks was often a difficult task. Autumn and spring made bricks were said to be better than bricks made in the

summer, as the latter, being dried more quickly before being burned, were liable to flake. If the facing-bricks were of different quality to the other bricks care should be taken to get bricks to match the facing-bricks as nearly as possible in size, so that the work might settle evenly. Care should be taken to see that the heading bricks used for facing were tailed in, and not snapped. In building hollow walling, it was very difficult to make the bricklayers work with a lath, to keep the cavity clean, and the utility of the hollow space was often destroyed by the quantity of mortar that was allowed to drop which, collecting on the iron ties, conducted the wet and thus destroyed the value of the hollow space. In very few cases that he (Mr. Appleton) had noticed was any care taken to preserve the iron ties from rusting. What would be the strength of hollow walls some fifty years old when the ties were rusted through it was difficult to imagine: perhaps the two parts of the wall would continue to bang together for old association's sake even then. As a rule, red bricks were very porous, and in certain parts of the walls it was difficult to keep the damp from spreading. For that reason it was always advisable to put a damp course in the chimney just where the chimney came through the roof. This should always be formed of slats in cement. In all the cases of chimney-stacks blown down by the wind that he (Mr. Appleton) had noticed, the failure had always been, such as a stone band or string-course, and that was a point to be borne in mind in designing chimney-stacks. Parapets to party-walls of red bricks should always have a hard stone coping to prevent wet soaking down. There was another point that should always be looked closely to in brickwork, viz., to see the walling kept well flushed up. Grouting was apt to make the facing in a mess, but it was a capital method for making solid work. It was very essential to keep the work going up equally all round, so as to prevent unequal settlement and cracks. This was difficult to do when there was stonework or other materials to be built in, but these should be ready as wanted. The effect of frost on brickwork in progress should be borne in mind, and the work should be stopped in frosty weather. If the sun was bright during the day and the frost sharp at night more damage was done than when the weather was more uniformly cold. The coke-brace concrete blocks and lintels, which were much better than the wooden lintels, wood-bricks, &c., should be made under cover during very cold weather, as the frost greatly affected them. In cleaning down the walls when the scaffolds were struck the facing should never be scrubbed with a brick,—a very favourite method with the bricklayer. It would be very useful if a simple formula could be devised for enabling architects to readily test the chemical composition of mortar. In regard to the stonework of a building, the principal points to be looked after were the hedging of the stone on the natural quarry-bed, and the working of the bedding-joints so as to make the stones bed perfectly level. In bedding stones the cement should never be brought to the face, but a thin strip of stone-dust mortar should be put on the edge, to prevent the cement staining the stone with efflorescence. In hedging stone piers the beds should always be worked perfectly level. Some masons, to produce a fine joint, would work the bed slightly hollow, the general result being that the stone flushes,—i.e., it splits off at the edges. For piers Mr. Appleton preferred lead all over. Some architects used strips of lead and fine mortar, but he could not help thinking that a mistake, and he thought a great fault in modern stonework was the attempt to produce a fine joint. In fixing wooden principals on stone corbels or shafts, the wood should not be dowelled to the stone, for the constant vibration of the roof had a tendency to crack the stone, and he had known two instances of corbels falling from that cause. The timber in a building was always a difficult thing for a young architect to judge. A very useful manual, called "The Timber-Merchant and Builder's Vade-Mecum" gives the timber marks. The principal source of trouble was, of course, shrinkage. That was a thing which it was almost impossible to guard against, and on that account he (Mr. Appleton) always tried to use as few wooden partitions as possible, and in the construction of these he looked carefully to the way in which they were braced. They should, whenever possible, cross the

joists; if they ran parallel, they should rest on bridging in preference to bearing on a single joist. There was a notion that partitions were well able to carry themselves and a floor or two besides. If that was the intention of the designer of the building the partitions should always be detailed, and not left to the builder to trust. Iron was taking the place of wood for wall-plates, the joists being notched on the iron plate, and, no doubt, forming a capital tie to the walls. As soon as the roofs were covered the drains should be put in. Cement joints should always be made, and the pipes hedged on concrete. The fall should be even throughout, except just in front of the syphon, where the fall should be increased. The architect himself should always check the fall of the drain, and take nothing for granted. The minimum fall for house-drains was 1 in. in 10 ft. The quality of the drain-pipes should be looked to, the London-made goods being the best. In plastering, the best plan was to run all the lines. Bad plaster-work was one of the most unfortunate things with which a house could be afflicted, especially for the ceiling-work. There seemed to be an idea amongst some that the sand for plastering need not be so clean as that used for mortar; but that was a great mistake. It was also essential that there should be no salt in the sand. Plastering should be carefully watched, to see that the work was not made too thick; 2 in. was the usual maximum thickness allowed. The plastering should be carried down to the floor behind skirtings, as it would stop vermin. The joinery-work being always prepared at workshops, it was necessary to visit these, to see the work being prepared. When the doors were roughed out they should never be stacked against a wall, as it rendered them liable to warp. In most specifications all the joinery is described as "yellow deal"; but pine panels stood best, and were therefore most to be commended, except where the work was required to be stained. The plumbing and hot-water service should be set out on a detail drawing. This would be a useful drawing for reference if anything went wrong. In sanitary plumbing he always preferred to have a plumber who could be trusted, and he thought that this work should always appear in a separate trade from that of the constructive plumbing. As a general principle it was best for the pipes to be arranged with the idea that it might happen that at some future time they would want looking at. The pipe-casings might appear rather obtrusive, but they saved a great deal of damage if anything had to be got at. Hot-water service should be arranged in preference to circulating cistern fixed below in preference to placing it in the roof, but it would be as well to see that the cistern was clean before the manhole was fastened down, for he had heard of an instance where a family suffered from lead poisoning through the plumber fastening the manhole down with a quantity of red lead in the cistern; of course it was the last place that was thought of, and it cost 120l. to dislodge. Gas-pipes should never be fixed between stud partitions, as very serious accidents had happened from the space in stud partitions getting full of gas and exploding. In glazing the quality of the glass should be checked. Plate-glass edges should be blacked and the glass sprigged. Lead light glazing was rarely water-tight, and required well supporting with bars. In making-up the grounds and laying out the garden the architect (if he had the direction of this work) should take care to carry the land drains with a good fall from the house; these drains should not be connected with the rain-water system without passing an inspection-box, as they frequently became choked with roots, and through these pipes the roots got into the glazed drains. Having thus noted a few of the points that occurred in surveying a building in progress Mr. Appleton said the point he wanted to raise for discussion was:—"What was the best way of obtaining experience in judging materials and workmanship?" That was knowledge which could not be obtained from books or in an office, and could only be picked up on the works. The question of the number of times a building should be visited must, of course, depend on the nature of the work, but, as a rule, the visits ought to be sufficiently numerous that no part of the work was covered up without its having been seen by the architect, and after each visit, a note should be made of the progress of the work up to the date of the

survey, the number of workmen employed, the value of the work done, and of any alteration made. The latter should also be noted on the office drawings if they involved a change of plan or elevation, and on the specification if they involved questions of material. The report should also note any detail drawings that should be prepared to keep the work going in proper sequence, and should include a reference to the time remaining for completion up to the date fixed in the contract. If any allowance should be made on account of the weather, that also should be noted in the report. In some concluding remarks Mr. Appleton referred to the great value of the Saturday afternoon visits of the Association to works in progress, and urged the value of the practice of committing to writing a description of what was seen, and gave some useful hints for the keeping of a "common-place book," and for the writing of specifications. As to the latter he urged exactness and fulness. "Do not," he said, "be afraid of making the specification too detailed; a little trouble at the beginning saves a world of anxiety at the end. Mean what you say, and know what you mean and want."

The Chairman, in opening the discussion, referred to Mr. Appleton's paper as one of the many valuable benefits the members had received from him, and when he remembered their hon. secretary's multifarious duties, he could scarcely conceive how the time could be spared for the preparation of such a paper. Dealing with visits to buildings in progress, there were, of course, the students' visit and the architects' business visit. For the student he would emphasise the advice that he should observe everything, noting or sketching every detail possible, and conferring with the master workman on all occasions. There were many phrases in specifications which were not clearly understood by young architects, and he would, therefore, advise the student to take the first opportunity of finding out what they really meant. Turning to the architects' business visit, it was essentially necessary that sometimes no notice should be given of the time. Then, as soon as he got on the works, he should mount the scaffolding; and, thirdly, when he had made up his mind on any point on which a difference of opinion existed, he should not then further argue the matter. The number of visits must vary with the class of work, but they should certainly be made at the commencement of each important stage of the building operations; while it was important that each class of material should be examined before being used. Dealing with the materials, he testing of cement and lime was a difficult matter, but it was an important point that they should be as fine as possible. To avoid mortar howling it should be seen that the lime had been slaked a day before use, and that the labourer did not leave unslaked lime scattered about. As to timber, his experience was that what was imported got worse and worse every year. Timber with dart shakes should be rejected, but sometimes a mistake might be made about timber being sappy by looking only at the dark colour of the outside wood. It was important to keep the deals and timber out of the sun. Spotty timber was nearly always bad, and might produce dry-rot. He knew an instance where within four months of the erection of a building, the whole joinery was destroyed to a height of 4 ft. from the ground-floor. Not all knots were bad; but dead knots were very bad indeed. In putting timbers into a building, hardly one would be jointed without a camber, and in putting the joints or beams it was important that the timber should camber upwards. Protecting work should be protected; this was often disregarded, the labourer coming afterwards, scraping plinths and strings, and tearing and destroying the surfaces. With regard to hodding stone columns, he knew an architect who had iron rings made the exact diameter of the column. A soft mortar bed was spread within the ring, which was 1½ in. wide by ¼ in. thick; the ring was then taken in, the stone laid, and the joints afterwards laid in.

Mr. S. F. Clarkson proposed a vote of thanks for Mr. Appleton. There was a stage, he considered, in setting out the work where checking was injurious. As to the foundations, trials seemed a most rational arrangement, because sites were sometimes hollow, and walls had to be carried down to a great depth. The

question of intercepting land-water was a difficult one, and occasionally required some ingenuity. As to hollow walls, he agreed with what had been said about iron ties; there was no reason why a piece of wrought iron galvanised should not last a couple of generations. The best way to clean out the core was boldly to leave openings about 18 in. wide, at intervals.

Mr. J. A. Gotch seconded the vote of thanks, adding that the paper was of so encyclopædic a character that, by the time it had reached the plumber, he had forgotten what had been said about the builder. Hollow walls, he agreed, conveyed sound, and that sometimes of an unpleasant description, and if Mr. Appleton had told them of some cure, he would have merited their deepest gratitude. At the same time they should avoid putting a hollow wall between two adjacent houses, and if they had done so the best course to pursue was to fill up the hollow with dry sand. As to joints, he knew many stone-built houses in Northamptonshire where one had to look closely to see the joints. Returning to the question of hollow walls, he was somewhat sceptical as to the amount of moisture which went down.

Mr. Cole A. Adams said that the paper reminded him of the charming book entitled "Round the World in Sixty Days," covering as it did so much ground in so short a time. In regard to hollow walls, in the South of England he had found the 9 in. part put inside instead of outside. He did not believe there was that great objection with regard to transmission of sound which had been referred to; though hollow partitions between the rooms were sometimes disastrous. To prevent the sound coming through, the plaster should be carried down to the floor, thus preventing sound, draughts, and vermin, and also the spread of fire. Partitions to be sound-proof should on the quartering have a fillet nailed, and on this should be rendered a coat of plaster.

Mr. C. H. Brodie could not agree that the thin part of the wall should be outside, especially in such a climate as ours, where heavy rains were followed by severe frosts.

The Chairman here remarked that the Ecclesiastical Commissioners would not allow the 4½ in. part of the wall to be put outside.

Mr. Brodie thought that tie-bricks were better than iron-ties, but it was important to see that the workmen put them in properly. As to flues, he believed a 9 in. by 9 in. was quite big enough. Every pupil, before finishing his time, should serve a certain period on a building, and he knew an office where this was done, with the happiest results.

Mr. Clark thought Mr. Appleton had not touched sufficiently on the importance of seeing that the damp-course was effective. Two courses of asphalt should be laid on as the walls were being built. For window-sills he had used a large quantity of teak, which cost about the same as oak.

The vote of thanks was then passed by acclamation.

Mr. Appleton replied, and added that he was rather in favour of a 14 in. by 9 in. flue, corresponding as it did with the flue linings.

COMPETITIONS.

Birmingham Law Courts.—According to the *Birmingham Gazette*, at a meeting of the General Purposes Committee of the Town Council, held on Monday last, a report was presented from the Assize Courts Sub-Committee, embodying a report from Mr. Waterhouse, R.A., the consulting architect, with reference to the above competition. The following are the numbers and mottoes of the sketch-plans selected by Mr. Waterhouse, and approved by the sub-committee for the second competition:—14, "Two Judges of Assize," 86, "Law and Order" (Design A), 88, "Via Una," 103, "Terra-cotta," 121, "Sincerity" (Elevation No. 2). The report of the sub-committee was approved, and the authors of the selected plans—whose incognita will be preserved—will be requested to send in finished drawings on or before the 1st of June next. The sketch-plans of the unsuccessful competitors will be immediately returned to them.—At the meeting of the Birmingham Town Council on Tuesday, Mr. Brinsley asked the Mayor if it was possible that all the plans for the proposed new Assize Courts sent in for competition could be exhibited. He thought if such a course could be adopted it would please the townsfolk. The Mayor said

it had been found inconsistent with that fairness which they wished to show towards all the competitors to exhibit the plans because the competition was not a final one; it was only an interim competition, and it would not be fair to give the competitors an opportunity of inspecting each other's work.

Birmingham Workhouse Infirmary Competition.—Mr. Victor Scruton, secretary of the Birmingham Architectural Association, writes, in reference to this competition,—"The following notes may be of interest to intending competitors:—1. No professional adjudicator or referee has been appointed. 2. A local architect, who has already done a great deal of work for the Guardians, was appointed to prepare block plans for the proposed buildings, and to arrange other preliminaries in connexion with the competition for which he has been paid the sum of 300l. 3. The gentleman referred to in Clause 2 would have been appointed architect for the buildings, but for the casting vote of the chairman, and it may be presumed he will be a competitor."

Fulham Vestry-hall.—Mr. Henry Currey, the advising architect in this matter, some time ago made his award, after examination of the sixty-four designs sent in. His award was:—First, "Light and Air"; second, "Beta"; third, "Montgomery." As we have already stated, the committee having charge of the matter disagreed with this award, and at length, after much delay, last week submitted a report recommending that the premiums should be allotted to the authors of the following plans:—First premium, "Clavins"; second premium, "Truth"; third premium, "Beta." On the matter coming up for discussion Mr. Davey moved a reference back to the Committee, and that Mr. Currey be asked for an explanation as to the inclusion, in his selection of plans, of one which could not be erected on the site. Mr. Dyer, in seconding the motion, mentioned that he had been at variance with the Committee, and, together with Mr. Mellroy, had declined to vote. Mr. Currey had stated that none of the plans could be carried out for the sum stipulated, 20,000l. If modifications were to be made, it ought to be done all round. While they were quarrelling Mr. Currey should have been called in to advise the committee. Other plans were not considered because the authors had no friends. Ultimately the matter was referred back to the committee, and Mr. Currey was requested to attend the meeting and give an explanation.

Reform Club, Heaton Chapel.—Twelve sets of designs have been received in a limited competition for a Reform Club at Heaton Chapel, near Manchester. The selected design is the work of Messrs. Darbyshire & Smith, architects, Manchester. The cost is estimated at 2,725l.

Croydon Street Improvements.—In reference to a paragraph under this heading in our last (p. 289), we have to mention that the first prize was awarded to Mr. J. M. Brydon, F.R.I.B.A., of Cambridge-place, Regent's Park, N.W., and not to Mr. J. M. Beydon, as was stated, owing to a misprint.

St. Clare Estate, Walmer.—A scheme for the laying out of this estate, by Mr. W. Pope, of London, has been selected in public competition out of fifty-three competitors. The estate is now being developed for residential purposes. Its situation is said to be a very good one, being elevated, well timbered, and picturesque in character, and commanding uninterrupted views of the Downs, the Glen, Walmer Castle, and neighbourhood, and within a few minutes' walk of the sea. It is to the enterprise of Messrs. W. & T. Denno, the owners of Walmer, that the first portion is now under development.

OBITUARY.

Mr. James Green.—The *Manchester Courier* reports the death of Mr. James Green, architect, Todmorden, which took place on the 10th inst. Mr. Green was sixty-four years of age. He was the architect of the Accrington Town-hall and other public buildings.

Mr. Shakspeare Wood.—An English sculptor long resident in Rome, died a few days ago.

Mr. William Lee.—The death is announced of Mr. Wm. Lee, who a few years ago carried on an extensive business as a builder in Bristol, and who leaves behind him in various parts of the city many evidences of his skill and enterprise. He was fifty-nine years of age.

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to photograph in advance architectural drawings which are intended for the Royal Academy Exhibition of this year, with a view to their being illustrated in our pages during the continuance of the Exhibition; and we will, if desired, forward such drawings direct to the Academy from the office of this journal, but we cannot be responsible for procuring them and returning them at the close of the exhibition.

It must be understood that we can only accept for this purpose drawings of a high class, and such as have a reasonable prospect of acceptance at the Academy.

Illustrations.

LIVERPOOL CATHEDRAL COMPETITION.

DESIGN BY MR. W. EMERSON.

WE give this week the west elevation of Mr. Emerson's design for the Liverpool Cathedral, on the fine and original quality of which we have already commented in previous numbers.

DECORATIVE DESIGN: "PEACE AND PLENTY."

This illustration is reproduced from the drawing by Mr. R. A. Bell, which obtained for its author the prize for decorative design at the last Royal Academy students' competition. The original drawing, which was one of the most attractive things in the last exhibition of students' work, was purchased by Mr. E. Pfeiffer, of Mayfield, Putney.

WAREHOUSE, MANCHESTER.

This illustration, from the architects' drawing, represents a warehouse which was built not long since in Manchester, from the designs of Mr. Muirhead and Mr. Wallis Baldwin. The materials are brick and terra-cotta.

SCHOOLS AT CLAYGATE FOR THE THAMES DITTON SCHOOL BOARD.

THESE schools, which were won in open competition, give accommodation for 300 children,—110 boys, 110 girls, and 80 infants. They are built in local red bricks and covered with "permanent green slates," the two residences in the centre having half-timbered gables. The boys' and girls' school-rooms are each 45 ft. by 20 ft., and each has a class-room of 34 ft. by 20 ft. The rooms are plastered to the collar, and are 12 ft. 6 in. high to the plate, and 18 ft. 6 in. in centre of room. Each school has separate entrance, with hat and cloak lobby, and lavatory with Stiddler's tip-up basins. There is a covered playground in the rear and offices fitted with Moule's earth-closets and passage at back and dry earth store. The whole of the school-rooms, class-rooms, and lavatories have a dado of white glazed bricks, 4 ft. high, and are paved with Parmenter's patent pitch-pine blocks, laid herring-bone-wise on a bed of concrete. The playgrounds are an acre in extent, and have been levelled and gravelled on burned ballast and clinkers. The schools are enclosed on two sides by a 6 ft. cleft-oak pale fence, and on the front and side by dwarf walls and iron railing.

The whole of the works have been most satisfactorily carried out by Mr. Piller, of Teddington, under the superintendence of the architect, Mr. Richard J. Lovell.

DETAILS FROM STAPLES INN.

THESE details, which have been measured expressly for us, form an interesting example of the elegant and piquant variations on Classic types to be found in English Renaissance work.

Liverpool Cathedral Illustrations.—Just before the rising of the Court, on the 18th inst., Mr. Hadley, Counsel on behalf of the proprietors of this journal, applied *ex parte* for an interim injunction to restrain the printers and publishers of the *Building News* from publishing copies of these designs taken from plates published by us. Mr. Justice Kay gave leave to serve notice of motion for injunction with copy of the writ in the action.

FREE LECTURES TO ARTISANS AT CARPENTERS' HALL.

TIMBER: ITS GROWTH, SEASONING, AND PREPARATION FOR USE.

The first of the present series of free lectures was delivered on Wednesday evening, by Mr. Thomas Blashill, F.R.I.B.A., who chose as his subject, "Timber: its Growth, Seasoning, and Preparation for use." Mr. John Foot, a member of the Court of the Company, occupied the chair, and the attendance was very large.

The lecturer commenced by describing the growth of endogenous and exogenous trees, their bark, wood, and pith. For work of importance, timber should be taken from the heart-wood of a sound tree. The grain should be close and straight, and it should be free from large or dead knots or blemishes. Some of the chief defects found in logs were cup-shakes, star-shakes, and heart-shakes. If the latter were merely found straight across the butt, and running up the log in a perfectly straight direction, they did no great harm. The tendency of the trunks to twist was very curious, and most trees were subject to it more or less. The Spanish chestnut twisted so violently that by the time it was seventy years old it was badly torn by shakes, and decayed at the heart. The best ages at which trees could be felled were, for oak, 100 to 200 years; Scotch pine and Norway spruce, 70 to 100; larch, ash, and elm, 50 to 100; and poplar, 30 to 50. Winter was the most favourable season for felling, as the tree was then most free from sap. Oak was usually felled in the early spring,—the worst season, because the bark, which was valuable, was then full of sap. Teak was harked three years before being felled, and it shrank less than any wood in ordinary use, though it was said that this method rendered the wood of teak more brittle.

Seasoning was the gradual drying of the whole log, so that the shrinkage of the outer part should not be so rapid as to cause it to split and tear open before the interior had time to part with its moisture. If timber had to be seasoned without artificial help it should be stored over a dry surface, free from vegetation, well-packed off the ground, with free access of air, but not exposed to much wind. When squared it should be stowed under cover to give shelter from rain, sun, and wind. So treated, oak would require as many months as the side of the log measured in inches, while fir would take half that time. The timber should then be cut into plank or large scantlings, and be still further exposed to the air, being so stacked that it could not warp or twist. When cut to the sizes in which it was required to be used it was again stacked till fully seasoned. Finally it should be brought into a dry, warm room or shop till fit for joiner's work. After being wrought it must stand in the shop for a few weeks, until it assumed the average condition of dryness permanently maintained by wood in our moist climate, and might then be finished off. If a round or square piece of wood had to be thoroughly dried it was best to bore a hole through the heart that the air might have access to the interior and make it keep pace with the outside, so that the shrinkage should be nearly equal all through. The length of time occupied by this natural process of drying, with the consequent expense, has induced many inventors to propose drying by artificial means. The most ancient method was that of drying in the smoke of wood fires. Besides drying it more rapidly than by the gentle warmth of a room, the bitter deposit from the smoke was supposed to protect wood from insects. There was an old patent,—that of Langton,—by which the sap was extracted from the green timber in a vacuum cylinder under heat, but the length of time and cost prevented its use. Other systems of the application of considerable heat, with the condensation of the extracted moisture, were subject to the grave defect of causing irregular shrinkage, with splitting of the wood; and though the cracks thus made closed again to a great extent, the mischief done to wood intended for many important uses was incurable. For the use of the carpenter, it was unfortunate that hark timber and deals seldom got any seasoning beyond the time requisite to convey them from the forest to the building, and during their stay in the docks. Such timber, if closed up from the air, near to moist walls or new pugging, would quickly develop dry rot even in the upper

floors of a house. Deals should have a year or two of open-air seasoning, being stacked with spaces between them, and afterwards gradually dried as required for use in the joiner's shop. Dry walruscut from Riga and Odessa was cut into thicknesses and stocked for three, four, or five years, being placed on end, as the sap was supposed to run down more easily. Planks were stacked horizontally with space between them. Such woods as mahogany, black walnut, ash, birch, and maple were treated similarly, but for a shorter time. In all cases the ends of timber required protection from sun and wind, as they dried more rapidly than the other parts. The old method was to keep timber in water for a fortnight after being felled. A good deal of the sap was thus dried, and it became more durable, but not so strong. Steeping it for a longer time injured it, particularly if floating, and only partly covered by water. Boiling and steaming timber was almost abandoned, the effect being to wash out the sap, as in steeping. A fresh plan of steaming had lately been introduced, and was considered by some to be efficient. There were many purposes for which the strength of wood was of less consequence than dryness, or the least permanence of the same degree of dryness. The sap had also been extracted by the air-pump, but this plan did not seem to have been much practised. The ordinary means of drying were by keeping up heat in a drying room, and generally by the use of waste steam from machinery. When wood was cut up into small scantlings, the drying could be hastened in this way, but the further the heat was raised beyond that of an ordinary room, the greater was the risk of irregular drying and over-drying. There was a new process for seasoning boards by means of dry cold air, which was passed through a furnace, cooled, and then made to circulate through the piles of wood, so that in a few hours all boards were dry. One or other of these processes would probably be found far satisfactory as to be useful for a great variety of purposes. The best makers of caliche work and musical instruments were exceedingly shy of artificial seasoning. The woods used by organ builders, such as mahogany, black walnut, birch, red, yellow, or white deals, were stacked under cover, or carefully packed for the free access of air. Hard woods required from two to four years and soft woods from one to two years of seasoning, after being cut to sizes. Even the workshop must not be too warm, for as organs were generally placed in buildings not uniformly warmed, there was more danger that the wood would swell than shrink after the work was done. The common sense of the question of seasoning was sufficiently obvious. Wood must not be dried so quickly that it would be made unseasoned by cracks; and it must not be dried much as to absorb fresh moisture and swell when exposed to the atmosphere. It was not merely a question of time, but rather of judgment, the object being to see that the timber was gradually reduced in scantling as it dried, and so treated as to temperature and stacking as neither to split nor get out of shape. Two important points should here be considered. Except Holland, European country was so subject to damp these islands, while even in Holland the weather was not so changeable. In no count, too, was timber used with such needless regard of the ordinary precautions for seasoning. One might travel over the Continent without seeing a door divided vertically by a munt which was an English peculiarity. The pan of Continental doors were, therefore, more than twice the width of ours, yet he had hardly seen one that had shrunk in the least degree, which he attributed to careful seasoning. Seasoning, more than to lose from something less than one-fifth to more than one-fourth its weight, while other woods varied so more. Teak and pitch-pine lost very little weight, but other species that would curl up the pores must on no account be put under wood insufficiently seasoned, though when they might be serviceable by preventing absorption of moisture. If the wood was of sap decay would take place much quicker when painted than if left uncovered. One of the most important questions, especially with regard to the soft woods, was the prevention of decay. It was desirable, if possible, to give the sap wood of all trees the durability naturally to the heart wood. In elm and a few other

woods the sap was equal in durability to the heart. In an old tree natural decay began at the heart. When in use in a building, timber generally decayed, either by rotting, through becoming sodden with wet, or by dry-rot, caused by slight moisture, warmth, and want of ventilation. For the prevention of decay the Kyanising process, consisting of the application of corrosive sublimate by soaking, was effectual. Burnett's process consisted in enclosing timber in a large iron vessel, from which the air was extracted, so as to empty the pores of the wood. A solution was then admitted, and a very heavy pressure applied by means of air pumps, so as to drive the liquid into the substance of the wood, which was thus rendered proof against the effects of moisture. Doubtless by the use of such machinery ordinary timber might be made useful for purposes for which it was not now considered fit on account of its perishable nature. It did not seem that much was required to make our resinous woods durable when exposed to the atmosphere. In Switzerland and other countries where fir wood was plentiful, houses that had stood at least 400 years showed hardly any signs of decay. Complete exposure to the air, combined with the dryness of the ordinary atmosphere, was in itself a great preservative. Beech timber was useless in construction, as a building in which it was employed would be destroyed, chiefly through the attacks of insects, in a few years. But beech would last many years as a weather-boarding for such a building. In the Indies such insects as the white ant destroyed all woods that were not bitter, especially soft woods. When furniture was sent from England it might be partially protected by a coating of red lead, but if the insects got into the substance they honeycombed it before any-one knew that they were there. It was therefore advisable to impregnate the wood with some protective solution by means of such machinery as had been mentioned. The essential oils, such as turpentine, had been recommended, but they were inflammable. Corrosive sublimate, arsenic, and other poisonous solutions of that class seemed most suitable. Creosoting was effectual both as against decay and against insects, but it spoiled timber for all the best and finest purposes. The protection of wood from fire was a most important question, particularly as recent experience seemed to show that iron or stone could not be depended upon. A heavy wooden beam would resist fire longer than any other beam or girder, and the same applied to staircases. Such liquids as tungstate of soda could be forced into the substance of all wood where fire was to be guarded against. Outward applications seemed to be effectual in experiments tried on a small scale. To sum up the whole class of questions connected with seasoning,—timber was wanted that would not shrink after being brought into use; that would not warp or twist out of shape; would not decay through damp, or be destroyed by insects. Wood might also be indurated, that being the result of polishing and varnishing to some extent. Upon the whole it was desirable to encourage all means of treating wood so that it might possess some of the advantages commonly attributed to iron and stone. In cutting up timber for use the question of its grain as developed by the annular rays was of very great importance. The shrinkage being greater in the newer layers of wood it must be cut so that this irregular shrinkage may be of no disadvantage in use. A plank taken out of the middle of a log would shrink at its sides more than in the middle. The boards cut out to right and left of this plank would curl outward from the centre of the log. If a log was cut into four quarters the part of each quarter furthest from the centre would shrink the most. Nothing required so much care in converting as oak timber in which the medullary rays had so much influence. In order to show the beauty of the grain as well as to provide wainscot boards true in shape it was necessary to get the boards as far as possible to radiate from the centre to the outside of the log. If this was done, the medullary rays were cut through in many places so as to show the silver grain. One method for doing this perfectly was shown in books, though he had never heard of its being done in practice, the great expense and waste in sawing being an effectual obstacle. He had always had English oak "quartered," and then the boards had been sawn from alternate sides of each quarter,—a method which

insured at least eight perfect boards, and twice as many very good ones in regard to beauty of grain. Wainscot oak from Riga and Odessa came to this country with two slabs taken off the opposite sides, and a cut clean through the centre; or else it had the slabs taken off and a plank taken out of the middle. When partly seasoned the plank had the centre part taken out, as the part around the pith was likely to be unsound. Then each of the side logs was cut up into boards, several of which would go pretty nearly along the line of the medullary rays and show the silver grain. Oak timber, as used in the beautiful Gothic timber roofs of the Middle Ages, and as still used in important parts of wooden ships, required to be not straight, but bent. This bent timber was known as "compass" timber when it was 5 in. and upwards out of the straight in a length of 12 ft. and was more valued on that account. Ash timber did not appear to have any sapwood, all the wood being of the same colour, and there were foreign timbers with the same peculiarity. It appeared, however, that the worms found out the sapwood, so that it had the usual defect. In elm timber the sapwood was reckoned as good as the heart. The timber did not improve by seasoning, but should be used green, and even kept wet until wanted for use. When used in flooring, he had known the oldest elm boards shrink considerably if merely taken up and planed. The important uses of the finer kinds of wood when cut up for veneers must not be overlooked. The fact that veneer was much abused was no argument against its legitimate use. It should only be used in panels, so that the framing would be of solid wood, of good plain colour, to set off the beauty of the panelling. The most beautiful veneers were still cut with the saw from 10 to 16 to the inch; and knife-cut veneers were also very largely used. By steaming large logs of timber, and putting them in a lathe, the knife would pare off a continuous sheet from the thirtieth to the one-hundredth part of an inch. In concluding his remarks the lecturer insisted on the importance of the subject he had brought forward. Other gentlemen would follow him, who, happier than he, would be privileged to discourse upon the great subjects of beauty and fitness in the use of timber. That evening, however, they had been nearer to the beginning of the subject, and unless that was properly stated, no art of man, could entirely remedy the mischief, or give to the world the benefits art was able to confer.

The following are the remaining lectures of the course:—Feb. 24th, Prof. Corfield, M.A., on "Water Traps"; March 3rd, Prof. Kerr, F.R.I.B.A., "A Cossip on the Philosophy of Building Materials"; March 10th, Mr. T. Chatfield Clarke, F.R.I.B.A., on "The Architecture of City Buildings"; March 17th, Mr. John Slater, B.A., on "Concrete"; March 24th, Mr. H. H. Statham, on "The Fine Art Aspect of Woodwork"; March 31st, Mr. James Doulton, on "Terra-cotta"; and April 7th, Mr. Banister Fletcher, M.P., F.R.I.B.A., on "The Influence of Architecture on Carpentry."

LIVERPOOL CATHEDRAL DESIGNS.

Sir,—Referring to the remarks by a correspondent, given in your last issue, concerning the construction of the dome in Mr. Emerson's design for the Liverpool Cathedral, if the writer had looked at the plan and sections in the copy of the report on the design, which is also in the Library of the R.I.B.A., he would have seen that the walling above the intersection of the pendentive arches in the octagonal plan, while the halustrading is circular, and the triangular soffits he refers to filled by niches, figures, and columns.

M. N.

The Proposed Birmingham Ship Canal.

At an influential meeting of traders held on Wednesday, at the Council House, under the presidency of the Mayor (Alderman T. Marineau), Mr. Keeling's project for improving the canal communication between Birmingham and the Western ports was further considered. The scheme, which was referred to in a "Note" in our last, was explained to some length by Mr. Frank Impey, received a considerable amount of support, and ultimately, on the motion of Mr. A. Hickman, M.P., a committee was appointed to investigate in detail, and to report it to another meeting.

ST. PAUL'S CATHEDRAL APPROACHES.

Sir,—There is great danger of this important question being decided on a false issue.

We have appeals to sentiment and a claim for public convenience; if the same were sound and the public convenience really the proposal could not be opposed, but both are factitious.

A great point is sought to be made of the narrowness of the roadway east of St. Paul's Cathedral; true, it is narrow, and I am informed that the Mercers' Company effected a successful encroachment at their last rebuilding by throwing an arch over the pathway. This can be withdrawn, but is the roadway needed at all!

If public convenience be really consulted, if the sentiment of throwing open the cathedral to the spectacular view be really desired, the proper course is to begin on the north side. It affords a direct passage from Cheapside to Ludgate Hill, and should be open to vehicular traffic. What, in the name of common sense, is the rationale of the present line of traffic, needlessly forced all round St. Paul's, which, folly, because it is perpetrated, affords a ground of argument for the still greater folly now in contemplation.

If money is to be spent, let the outlay be effected for a solid advantage and *bona fide* necessity, viz. to save a quarter of a mile or so, in travelling south by west from the City, which is lost in time to passengers and sunk in labour of cattle and for no good at all. But need money be sunk in this fanciful plan? I say, no. For, if the cathedral railings be set back a sufficiency, as it is possible, a carriage-way would be opened without trespassing on the house frontages at all; the present steps to the north gate entrances are very awkward, but might very easily be adjusted with a view to the proposition under consideration. There remains the question of traffic east of the cathedral. I assume that it is infinitesimally small. At present vehicles from St. Martin's-le-Grand circumnavigate St. Paul's *via* the east passage, because they cannot get north, and such traffic would gain most of all by the course suggested; what remains after this is to be distinguished as the Royal Exchange is centre of an enormous traffic and open on three sides only; it is, therefore, open to consideration whether a footway for traffic east of St. Paul's would not suffice, and the remaining traffic from Cannon street to the Post Office, by Old Change. One of the objections to my plan is that the shopholders north of St. Paul's would consider themselves injured by the intrusion of a general traffic. On this point I take leave to note that steps are in progress to widen the Sessions House; before it is too late I would plead for a footway from Amen Corner straight into the Old Bailey. There is much vacant ground in Amen-court, a strip of which, alongside of Stationers' Hall, would take us to the unoccupied wagon-yard of Messrs. Lavings; if the City authorities mean to build over it, they might leave us a covered way. This would carry off all business traffic of pedestrians, and leave the St. Paul's pavement much relieved, so affecting any lower full measure to contemplate the heavy oils and satins.

A CRY FROM PATERNOSTER-BOW.
Feb. 12, 1886.

ARCHITECTS' POWER TO EMPLOY SURVEYOR.

Sir,—It may interest your readers to know that the view you favour in last Saturday's "Notes" was also affirmed in the Court of Session in Scotland, in the action "Black v. Cornelius," 1879, in which it was held that an architect is a general agent of his employer for all purposes necessary for the carrying out of the works, and that, consequently, he has authority to employ a surveyor to take out quantities without any special consent from his client. Baron Huddleston is, therefore, in opposition not only to the English, but also to the Scotch precedents.

A. R. PRENTICE.

HELP FOR THE UNEMPLOYED.

Sir,—The distress now prevailing among the unemployed must be my excuse for asking you to insert this letter. Some of the workmen in my employ having expressed a wish to assist their out-of-work brethren, and knowing from experience how ready the employers are to help each other in cases of necessity, I formed a committee at my head office here, and the following arrangements were made.

Posters were distributed to my various works, &c. stating that a weekly collection would be made to the pay-table by each of the foremen, assisted by representative workmen by the men. The first of these was made last Saturday, and I am glad to say realised a very satisfactory amount. It is proposed to continue this for five weeks, by which time, with better weather, the distress will, we hope, be lessened. The men are invited to report to the committee through their own representative all cases of want which come under their personal notice. These, after examination, will be forwarded with the amounts collected, to the London Bible and Domestic Female Mission, 2, Adolph-terrace, Strand.

the honorary secretary of which most excellent invitation has kindly consented to distribute in money or otherwise, as most applicable, to deserving cases; those above referred to taking precedence. This Society has a large number of workers distributed over the whole metropolitan area, and their constant contact with the working classes gives them every opportunity of judging as to the necessities of those for whom the fund is intended.

My object in entering into these details is that the employers of other firms (where they have not already done so) may be induced to do likewise.

JOHN T. CHAPPELL.

149, Lupus-street, Pimlico.

THE "ECONOMISER."

SIR.—Mr. Priddin Teale may feel interested in knowing that the "Economiser" which he advocates so strongly, and which is the "central principle" of his treatment of fireplaces, has been in use for many years in the South of England, and with good results.

The idea of this movable shield, closing in the space under the fire front, occurred to me nine or ten years ago, when I had two of them made, and applied them to existing stoves in the Isle of Wight; so I am five years ahead of Mr. Teale in his discovery; but shall not be surprised to hear that I have been anticipated by others in so obvious an improvement of the old-fashioned grate.

L. C. RIDDETT.

The Student's Column.

FOUNDATIONS.—VIII.
PILE FOUNDATIONS.

PILES, though of very common use in engineering works, are seldom employed in the foundations of ordinary buildings. They are, however, amongst the oldest building appliances known, and their durability is very far beyond what might be supposed.

They are found under the pre-historic lake wells that have been dug up chiefly in Switzerland. They were used by the Phœnicians in harbour works in North Africa, as may still be seen. Oak piles in very good preservation are found in waterside works of Roman date, and Medieval specimens taken up from under the piers of Old London Bridge seem as hard as horn. In Venice such works as the walls of the Arsenal and the Tower of St. Mark's stand on close piling. In the sixteenth century the Dutch were quaintly described by Erasmus as a people living on the tops of trees like crows. If the mud and bog and sand that form the ostensible support of a Dutch town could be quietly withdrawn, the full significance of this description would become apparent. At Amsterdam, the Palace, a seventeenth-century building of the largest class, stands on more than thirteen thousand piles driven 70 ft. into the earth. Whether from some degree of decay in the fir timber, of which piles are usually made, or, more probably, from overloading, large buildings have at times sunk down very considerably into the mud. At Dordrecht the tall chimneys of seventeenth-century houses incline outwards over the footway to an alarming extent, and are evidently prevented from falling only by iron ties. It is, indeed, the invariable custom of those who build in the treacherous soil of the Low countries to use such ties, and they form a very conspicuous and ornamental feature in Dutch architecture. We may hesitate to assume that the subsidence which is often very evident in the decay in the piles; for, unless they have reached a firm foundation, they are likely to sink little by little as long as the building stands. Decay, indeed, is often observed in those parts which are above the permanent level of the water in the soil, but it is seldom possible to examine the condition of piling below that level. Some of the fir piles taken up from the foundations of old Westminster Bridge were as sound as when driven 120 years ago. Upon the whole, we may consider that oak and elm have, when submerged, a durability that is equal to any requirement, and that fir, when similarly placed, has also very great durability, the extent of which is not so well known.

The simplest way of using piles is to drive them into the ground stakes of as large size as can be forced down by the blows of a heavy mallet. These stakes should not reach down to the earth they will consolidate the surface soil as to give a better support to a light structure than it would have without them. The simplest method in use for driving piles of the

dimensions of trees is that known as a "ringing engine," from some likeness to the mode of ringing bells. A rope is carried through a pulley that is fixed above the pile, and a heavy weight is suspended by it. When the weight has been raised some three or four feet by the united efforts of about a score of men, who pull at the rope by means of separate cords that are attached to it, they let it drop suddenly upon the head of the pile. In this way two rows of common round fir piles may be driven closely along the line of a wall so that stout planking may be fixed upon them to receive the brickwork.

The "monkey-engine," which is in common use for driving piles made of squared timber of full dimensions, is arranged to drive with a much lighter ram falling from a greater height. Thus, a ram or monkey will be made to fall 10 ft. or 15 ft. It is raised by a small windlass turned by two men, and when it has reached the required height it is released by self-acting gear, slides down the upright guides in which it works, and falls on the head of the pile. Rams arranged in a somewhat similar way, but raised by steam power, are made of a ton weight, and capable of working with a fall of more than 30 ft.

In the "steam ram," which is an adaptation of Nasmyth's steam hammer, there is a return to the principle of a heavy weight falling through a small space. The weight in this case is from one ton to one and a half, and the ram will deliver sixty blows per minute, this being by far the most rapid and efficient means by which piles in large numbers can be driven, though other systems have their advantages in special cases. A heavy ram falling through a short distance is better than a light ram with a long drop, as the shock is not so great, and there is less danger of injury to the head of the pile. The reason of this is evident if we consider that the light ram, in order to produce a given result, must cause the pile to assume a quick motion instantaneously, while the heavy ram, falling much more slowly, will press the pile down comparatively gently. In the latter case there is some approach to the effect of the actual load that the pile will have to bear. Piles may be driven into soft mud, in which they will stand and carry a load, chiefly by virtue of the resistance caused by the friction between them and the semi-fluid mass in which they stand. But this can never be considered a satisfactory result, for when the permanent load comes on such a pile it will in time, by steady, persistent pressure, gradually overcome the resistance of the soft earth, and this will then yield, although it would not yield to the momentary shock of the pile-driver.

Books.

The Arts in the Middle Ages and the Renaissance. By PAUL LACROIX. English Edition, revised and re-arranged by W. ARMSTRONG, B.A. London: J. S. Virtue & Co.

The first English edition of this work appeared sixteen years ago, and was reviewed by us at considerable length,* and its various merits fully admitted. But a great deal has happened since then, and it can scarcely be said that the present edition stands in the same relation that its predecessor did to our knowledge of the arts whereof it treats. It is nevertheless an interesting, and in many respects a useful work. It professes to embrace "all the arts from the

* See the *Builder* for March 20, 1876.

fourth to the latter half of the sixteenth century," and to be in fact not only a history of the arts themselves but of the epochs in which they were developed. It is obviously impossible to bring an adequate treatment of so vast and complicated a subject within the compass of less than 500 large-print pages. Architecture is disposed of in thirty-five pages, sculpture in thirty-one, painting in twenty-six, which is sufficient evidence that only a very cursory glance is given to those important arts and the epochs which they adorned. Architecture is the greatest sufferer; and the author is sensible of the fact. Its history demands, he says, either a short epitome or a thorough investigation. He has given us neither, and it is to his treatment of the minor arts that the real interest of his work attaches. The chapters on Gold and Silver Work, on Playing-cards, on Music and Musical Instruments, show great research, and are both instructive and entertaining, and the same may be said of the chapters on Bookbinding, Printing, and Manuscripts. Heraldry, which played so important a part in the arts of the Middle Ages, is unaccountably omitted. The book is an assemblage of odds and ends of information on a great variety of subjects connected with the arts, great and small, and it is little more; but it has its place and use, and will, no doubt, continue to find a wide circle of readers. The illustrations, over 400 in number, show little or no deterioration, and the paper, type, and general get-up of the work leave nothing to be desired.

Spon's Architects', Builders', and Contractors' Pocket-Book of Prices and Memoranda. 1886. Edited by W. YOUNG, Architect. Thirteenth edition. London and New York: E. & F. N. Spon.

A book which has reached its thirteenth edition scarcely needs commendation. This one is surprisingly full of useful information, which is no less remarkable for its general accuracy than for its amount and variety. The author asks for suggestions calculated to improve it. Here are a few. The table of cost per cubic foot of public buildings should state whether the measurements are all on an identical basis, and how the buildings have been measured, and give dates of erection. Without this the value of the information is much reduced. The table of comparative prices of builders' work in 1703 and 1876 might be usefully extended to include a column for 1886; and if other dates could be interpolated the interest in the progressive growth of prices would be greater, and the statistics of more practical value. The section on valuation of leasehold property is incomplete because it does not specify what it is that is to be multiplied by the given number of years' purchase, viz., the net profit rental, nor how that net rental is to be arrived at. The subject should be omitted altogether or treated in reasonable detail. We have no fault to find with the prices generally, which are fair. The schedules of manufacturers' goods might in some cases be amended, e.g., the list of water-closet apparatus is confined to valve and pan closets, and omits all reference to the various forms of wash-out closets, which are every day becoming more generally used.

The Acts of Parliament do not comprise the Metropolitan Building Act as such, although all that need be known on the subject is given under "Thickness of Walls." The alphabetical arrangement of the contents is a convenient one. There is a good index, and (rare virtue in a book of this kind) the handiness of the little volume has not been impaired by advertising sheets. It is a book for which every architect should thank the author.

Lockwood's Builders' and Contractors' Price-Book. 1886. Edited by FRANCIS T. W. MILLER, Architect. London: Crosby Lockwood & Co. 1886.

ALTHOUGH merely entitled a "Price-Book," this work comprises short introductory essays on the several building trades and the measurement of builders' work, and includes a form of building contract, the Metropolitan Building Act, and numerous tables. This is a donkiful form of composition, and one not to be indiscriminately commended; for the qualifications necessary for the essays do not necessarily extend to the prices, and the knowledge of the prices of builders' work does not necessarily warrant its possessor in dealing with the theory and practice of construction.

As a rule, a price-book had better be a schedule of prices merely, and a work on the building trades be unhampered by questions of cost. In the present work the section on concrete construction contains statements which passed unchallenged twenty years ago, but which now require some modification. Concrete roofs are not water-tight unless protected by cement or asphalt. Concrete walls are not good non-conductors of sound, and so on. Moreover, the cons should be given with the pros, and the unfortunate property which a concrete wall has of cracking from top to bottom, like a china plate, on the least inequality of bearing, being without the elasticity of a jointed construction, should be touched upon if the subject is to be treated at all.

The prices strike one as high, and as based upon a contractor's standard, rather than upon one which an architect would adopt. But the book contains a vast amount of information of a miscellaneous kind, and is well indexed.

James Nasmyth, Engineer. An Autobiography. Edited by SAMUEL SMILES, LL.D. A new edition. London: John Murray. 1885.

We reviewed this book at considerable length on its first appearance, and its reappearance, now that a new edition has become necessary, has given us fresh pleasure. The subject of it came of a remarkable and variously-gifted family, and his plain, unvarnished account of his forerunners and their lives has all the charm of a work of fiction with the added interest of being true. A little comfort at the present juncture may be sucked from his graphic account of the attempted building of the Fort at Inversnaid by his great-grandfather, whose work was brought to an abrupt close by Rob Roy and his wild companions in a way which resulted in the death of the courageous builder. The state of Scotland in 1703 was not unlike the state of Ireland now. It is, therefore, not beyond hope that Ireland may hereafter be as peaceful and happy as Scotland now is. The many beautiful drawings and designs embellishing the work show James Nasmyth to have been no less gifted as an artist than he proved to be eminent as a man of science and an engineer.

The Combined Number and Weight Calculator. By WILLIAM CHADWICK, Public Accountant. London: Crosby Lockwood & Co. 1886.

This bulky volume, the result of an immense amount of patient labour, gives upwards of 250,000 separate calculations "showing at a glance" (we quote from the title-page) "the value, at 421 different rates, ranging from one-sixty-fourth of a penny to 1l. each, or per cwt., and 20l. per ton, of any number of articles con-secutively from 1 to 470." Thus, has a builder to use 23 tons 7 cwt. of any material at 3l. 16s. 8d. per ton, he has only to turn to Mr. Chadwick's page, headed with that price (and which also gives prices per lb. and per cwt.), and run his eye down the column till he gets his amount, 89l. 10s. 2d. The use of such a work is not to be reckoned in regard to occasional and isolated calculations, but to cases in which a large number of varying amounts of materials, some at fractional prices, have to be priced with as little delay as possible. Each page also, besides giving prices per a given weight, gives them per so much an article. Thus, if instead of calculating so much per ton, our contractor or manufacturer has to price 407 articles at 3s. 9d. each, he will run his eye down the numbers column, instead of the tons and cwt. column, and will find his 80l. 10s. 2d. opposite No. 467. The same column of numbers is made also applicable to prices per cwt. The prices for single articles or cwt. increase by a 4d. each page, and those of tons of course, by 10d., in the bulk of the work; the earlier pages, however, advance by smaller fractions, commencing at 1/4 of a penny per article. The volume is likely, we should imagine, to be very useful to contractors and estimators, not only in the saving of time but of brain work in repeated calculations. It is one of those books in the production of which virtue may be said to be his own reward, for they seldom bring fame or pecuniary return to their authors, who have to be content with the consciousness of having done something practical for the convenience of others. Mr. Chadwick concludes his preface by saying that he will be very thankful for any suggestions that may lead to the improvement of the work in future editions.

The Strength and Proportions of Riveted Joints. By BINDON B. STONEY, LL.D. London: E. & F. N. Spon.

The author of this work has done excellent service in collecting together and presenting in a portable form a good deal of that vast amount of information on various questions of riveting that lie scattered so widely in the Transactions of the most scientific and technical societies and institutions. The problem of joining iron or steel plates by means of rivets involves so many different considerations of varying complexity that the amount of experiment and research necessary to establish a sound theory of riveting must be enormous. Although much yet remains to be done, much has already been accomplished in this direction. Dr. Stoney casts a wide net, and the copious references he gives to the sources from which he quotes add particularly to the value of his book.

Some Particulars of the Municipal and Sanitary Works of Blackburn. By J. B. McCALLUM, Borough and Water Engineer. Blackburn: Printed by J. Janson.

The author has put together a few disjointed notes on the Sewage Water and Gas-works of Blackburn. These are bound up with various plans and "ink-photo" illustrations, and form the volume indicated above. The Blackburn corporation, under pressure exerted by the Rivers Pollution Commissioners, have established sewage farms some distance outside the town. The yearly loss on one of these farms is about 600l., but on another there is an annual profit of 900l., which is a little over 1 1/2 per cent. on the first cost of 70,000l. The total expense of these irrigation works has been 129,328l. The particulars given are far too meagre to enable the book to be of much practical value to any but those who have a previous knowledge of the district and the work done.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

15,266, Casement Stay. A. B. Milne.
A rod is pivoted to the casement, a thumb-screw passes through a clip into a plate on the window-sill. The clip can turn on the thumbscrew when the window is opened, but grips the stay when the screw is turned.

15,355, Wall Ventilator. T. S. Ellis.
The ventilator consists of an L-shaped box, which gives the incoming air an upward direction. In a portion of the box may be placed any suitable device for filtering, perfuming, heating, disinfecting, or cooling the air as it enters the room. The ventilator may be opened, partially opened, or closed, by a shutter or valve, which is also arranged to slide upwards clear of this portion of the box when access to the latter is desired.

9,357, Kilns. L. Williams.
In the body of the kiln is constructed one or more fire-clay columns, with apertures. These apertures are fitted with iron or fire-clay boxes, in which are faced bars or bricks. Combustible gas is led into a tube within the column, thence into the column through openings, where it mixes with air which is forced into the annular space between the columns and the tube. The mixed gases pass through the apertures, and are ignited, thus burning the lime, bricks, &c.

16,709, Chimney Cowl or Ventilator. J. White.
On a central shaft or tube are fitted a number of radial webs or ribs. The lower ends of these webs are closed by a conical case or plate, and the upper ends are partly covered by another conical case, between which and the tube an air-space is left. The wind passing through induces an up-draught in the shaft. In some cases a curved or conical web or plate is provided, fixed between the plates, so as to form a double set of passages for the wind.

NEW APPLICATIONS FOR PATENTS.

Feb. 5.—1,691, J. W. Helliwell, Zinc or Metal Roofing.—1,706, J. & A. Cooke, Syphon Cisterns for Flushing Water-closets.—1,742, J. Bauer, Pipe Cutter.—1,744, T. Hare, Floorings, &c.

Feb. 6.—1,762, J. Wilson and Others, Break-waters.—1,765, J. Chapman, Weatherproof Tilt.—1,787, W. Lake, Screw-threaded Nails.

MEETINGS.

MONDAY, FEBRUARY 22.

Royal Academy of Arts.—Lectures on Architecture, by G. Aitchison, A.R.A., on "Architectural Education," 8 p.m.
 Storeys' Institution.—Mr. Wm. Woodward on "London remodelled," 8 p.m.
 Inventors' Institute.—8 p.m.
 Liverpool Architectural Society.—Mr. A. G. White on "A Few Points in Practical Plumbing," 7 p.m.

TUESDAY, FEBRUARY 23.

Royal Institution.—Professor C. T. Newton, C.B., on "The Unexhibited Portions of the Greek and Roman Sculptures in the British Museum," II. 8 p.m.
 Institution of Civil Engineers.—Discussion of Mr. L. F. Vernon-Harcourt's paper on "The River Seine," 8 p.m.
 Builders' Clerks' Benevolent Institution.—Annual meet. 8 p.m.

WEDNESDAY, FEBRUARY 24.

Carpenters' Hall, London Wall.—Professor Corfield on "Water Traps," 8 p.m.
 Society of Arts.—Prof. W. C. Urwin on "The Employment of Autographic Records in Testing Materials," 8 p.m.
 Civil and Mechanical Engineers' Society.—Mr. B. Sington on "Wave Motion," 7 p.m.
 Institution of Civil Engineers.—Mr. A. Wharton details on "Bricks and Masonry Arches," 8 p.m.

THURSDAY, FEBRUARY 25.

Royal Academy of Arts.—Lectures in Architecture, by G. Aitchison, A.R.A., on "Mouldings," 8 p.m.
 St. Paul's Ecclesiastical Society.—Mr. J. P. Seddon on "A Series of Architectural Monuments," 7.30 p.m.
 Society of Antiquaries.—8.3 p.m.
 Society of Telegraph-Engineers and Electricians.—Prof. E. Hughes, F.R.S., on "The Self-Induction of an Electric Current in Relation to the Nature and Form of Conductor," 8 p.m.

FRIDAY, FEBRUARY 26.

Architectural Association.—Visit to the New Buildings, St. John's College, and the Offices of the London School Board. Members to meet at the College, Victoria Embankment, at 2.30 p.m.
 Royal Institution.—Rev. C. Taylor, D.D., on "The History of Geometry," 3 p.m.
 St. Paul's Ecclesiastical Society.—Visit to St. Paul's Cathedral, 2.15 p.m.
 Edinburgh Architectural Association.—Visit to Museum of Science and Art.

SATURDAY, FEBRUARY 27.

Architectural Association.—Visit to the New Buildings, St. John's College, and the Offices of the London School Board. Members to meet at the College, Victoria Embankment, at 2.30 p.m.
 Royal Institution.—Rev. C. Taylor, D.D., on "The History of Geometry," 3 p.m.
 St. Paul's Ecclesiastical Society.—Visit to St. Paul's Cathedral, 2.15 p.m.
 Edinburgh Architectural Association.—Visit to Museum of Science and Art.

Miscellaneous.

Fatal Accident at the Proposed Shippers' Exhibition, Liverpool.—A disaster occurred on Tuesday afternoon at the Exhibition Building. The erection of an iron framework of the building is being pushed forward as speedily as possible, with a large number of men employed upon the work. The northern transept was in a tolerably advanced condition, a number of pillars having been erected and a good deal of the framework of the roof fixed. From some cause not explained, this portion of the building collapsed, and a number of men were working upon it, and fourteen men were so much injured that they had to be removed to the Royal Infirmary. One of them has since died.

English v. American Locks.—American lock-makers will have to look out, for, according to invention, thanks to the introduction of machinery in the English lock trade, and to other methods of improvement, American competition is rapidly becoming of less account, and now it has been determined by English makers to turn the tables upon the Americans and commence a vigorous competition with them in the Australian colonies, India, and China. It appears that the Americans have gained a stronghold in those markets with a cast-iron door lock, which has a cast-iron easing and ornamental designs, and which has the advantage of possessing a reversible bolt. The metal parts of this lock are made to template. It is now stated that a firm of Willenhall lock manufacturers have resolved to make locks in exactly similar class, and to offer them in the quantities in the markets referred to.

The Health Exhibition, 1884.—Although the Health Exhibition has been closed for several months, the Diplomas of Honour and Special Certificates have not yet reached the exhibitors to whom they were awarded.

Amouth.—Mr. J. Wm. Trounson of Penzance, has been appointed the architect for the new Wesleyan chapel and new school buildings, and has received instructions to proceed with the necessary plans forthwith.

The Grant Monument.—In the American Congress, the Committee on Military Affairs has reported favourably regarding the proposed vote of 500,000 dols. for the erection of a monument in New York to commemorate the achievements of the late General Grant. The appropriation will remain unavailable until the voluntary subscriptions to the Monument Fund have reached the sum of 250,000 dols. The Bill received the unanimous support of the Military Committee, and it is anticipated that the House will very shortly take further proceedings in the matter. The question of the locality will in all probability provoke considerable debate, in consequence of many of the members considering that the monument ought to be erected at Washington.

New South Wales Timbers.—Probably no country in the world possesses finer or more durable hardwoods than New South Wales. According to the Immigration Agent for the Colony, her pines and cedars, valuable though some of them may be, yield the palm to those of other lands; but her ironbark and blackbutts rank, for durability and strength, second to none on the globe. Singularly enough, all the principal hardwoods used in the Colony are myrtaceous trees, that is, members of the great Myrtle family, which, according to Professor Balfour, is divided into five tribes, containing seventy-five known genera, and upward of 1,800 species. Members of this great family are natives chiefly of warm countries, as South America and the East Indies, although many are found in more temperate regions. Some of the genera, such as the eucalypts, are peculiar to Australia, although they have been successfully transplanted in Europe and the East, and in the Campagna at Rome, on the borders of Portugal,—where they have been planted by the *agrycoloni* for the making of casks,—and even on many of the hill stations of the Pranjap and Madras the wandering Australian may recognise the tall, rough stem, leek-green leaves, and strong perfume of the sylvan denizens of the sunny south. Eucalypts, which constitute at least three-fourths of New South Wales timber-producing trees, furnish us with the bulk of colonial hardwoods. Ironbark, blackbutt, blue-gum, stringybark, swamp mahogany, tallow-wood, and yarrab, all belong to the same remarkable genus, although they differ from one another in many ways, and in none more so than in their rate of growth, the blue-gums and blackbutts being very rapid growers; while the ironbark and box take a very much longer time to mature. The remainder of hardwoods are principally angophoras, or "apple-trees," most of which are subject to "gum-veins"; tea-trees, tristanias, and syncarpis, better known as turpentine trees, but all members of the myrtle family, and all growing in the open forest, and very rarely in the bush or the scrub.

Sewer Ventilation.—A patent has recently been taken out by Mr. Malvin, of Harrogate, for a method for exhausting gas from sewers, and for consuming or deodorising and dispersing of such gas. The plan provides for the diversion of a town's sewers into sections by the fixing of automatic doors. The sections are to be isolated, and each furnished at a suitable spot, with a chimney or shaft and a furnace, which shall be as nearly as possible smokeless. An upcast shaft from the sewer is to be connected with the ashpit under the furnace. After passing through the fire, the gas is conducted to a reservoir, where it encounters a spray of water designed to lay any solid particles which may have been produced by the action of the fire, so as to prevent their emission into the atmospheric air. The sewer gas, after passing through the fire, is taken by the current up the chimney, and delivered at a considerable altitude above the street.—*Lancet.*

The Durability of Sandstone.—An interesting discussion lately took place in connexion with the use of sandstone from local quarries in the restoration of the Kilian tower at Heilbronn. The municipal architectural officials, acting upon the advice of Professor Beyer, of Ulm, had decided upon employing Oberkreben sandstone, the cost of which (including transport from the North of Germany) would be double that of the Heilbronn quality. The matter was brought before the municipal council; and the opinions of Herr Von Egle, of Stuttgart, and Professor Beyer being officially given in presence of that body regard-

ing the properties of the two descriptions of sandstone. From a statement in the *Deutsche Bauzeitung* it would seem that the Heilbronn stone was considered suitable for internal work, but not for positions exposed to the influence of the weather; while the Oberkreben stone (chosen after much deliberation for the cathedral at Cologne) justified its higher cost by its tenfold durability as compared with the other variety. The Berlin testing-station had certified that the Heilbronn stone offered a thorough resistance to the weather, but this fact, as well as the assertion that its quality was better than formerly, did not alter the views expressed by the experts; the discussion resulting in a resolution being passed which gave Professor Beyer freedom to act according to his judgment. This was, however, coupled with a recommendation that Heilbronn stone should be used in those portions of the building for which it might be considered suitable.

Work for the Unemployed.—Very extensive tracts of country belong to the Government, and produce very large returns under the name of "Woods, Forests, and Land Revenues," which are managed by a department of the Government known as the "Woods and Forests" at a cost of somewhere about 22,000l. a year. There are several commissioners, who receive 1,200l. a year; a solicitor, 1,500l. a year; clerks and other officers, 900l. a year. Such salaries should represent service on very large monetary returns, and so it will be found to be. At the end of one financial year there was a cash and stock balance amounting to more than 600,000l. at the disposal of this department for permanent improvements. The extensive tract of Government property, stretching from Windsor Park to Aldershot, admits of very great permanent improvement. The larger portion of it is unreclaimed. To trench some portions and plant with Scotch fir and larch would bring some return for expenditure. To drain the low-lying marsh districts around Bagshot Park, Wellington College, the Royal Military Colleges, and the Camp at Aldershot, would effect a great sanitary improvement, even if confined to those portions of these districts which actually belong to the Government. Here, then, is abundance of work for the unemployed, and 600,000l. available in one department of the Government to pay for it, with the prospect of a real permanent improvement to Government property and increased sanitation where it is much needed.—*Lancet.*

The Iron, Hardware, and Metal Trades' Pension Society.—The Thirtieth Annual Ball in aid of the funds of this charity took place on Thursday, last week, at Wilks's Rooms. Mr. Jonathan Pearson, of the firm of R. H. & J. Pearson, assisted by a numerous staff of stewards, representing every branch of the metal trades. Thirty years ago the hall was inaugurated by Col. Stedall, J.P., the present President of the Society, with the view to afford not only an additional source of income, but as a means also of bringing together under the most pleasing auspices the numerous friends of the Institution. Through this channel an aggregate of 1,895l. has accrued to the general funds.

Durability of Larch.—According to a writer in the *Gardeners' Chronicle*, the wood of the Swiss larch tree,—which often attains colossal dimensions, it being by no means rare to meet with trees 80 ft. in height, with a trunk 6 ft. in diameter,—withstands the influences of air and water equally well. In the Canton of Valais there are many chalets, constructed of larch, dating from the fourteenth century; the wood is entirely blackened by the sun, but it is as firm and sound as recent timber.

Science and Art Department.—The Archbishop of Canterbury has promised to deliver to the students of the Metropolitan Drawing Classes, the "Queen's Prizes," awarded by the Science and Art Department, South Kensington. The meeting will take place on Friday, March 5th, at eight o'clock, in the Memorial Hall, Farringdon-street. These classes, which are held in twenty-four centres, consist of about 800 working men, who are taught, in evening classes, the principles of drawing and construction, as applied to the building and engineering trades. Each class is under the management of a Local Science Committee. Mr. W. Busbridge is the superintendent of the classes.

Architectural Examinations at the Institute.—The following, extracted from the "Journal of Proceedings of the Institute," is of interest at the present moment:—"A Register is kept at the Institute, containing the names of all those who have passed the Voluntary and Obligatory Examinations. During twenty years (1861-1881), from the commencement to the end of the Voluntary Examination, when twelve examinations were held, forty-three candidates passed, and of these twenty-nine are now Members. During four years (1882-85), since the present Obligatory Examination came into existence, sixty-eight candidates have passed, out of ninety-six persons who have applied to be examined, and, of the sixty-eight, sixty-four are now Associates, one has not offered himself for membership, and three are deceased after having been admitted Associates. In the Voluntary Examination, a certificate was granted, but passing the Obligatory Examination simply entitles a man to become a candidate for the Associateship. In the Voluntary Examination, a candidate had to pay a fee of four guineas to be examined, and, if, having passed, he afterwards wished to become an Associate, he had to pay a further (entrance) fee of three guineas; a young man who enters for the Obligatory Examination pays a fee of three guineas, which, if he passes, is placed to his account as his entrance-fee should he be elected an Associate within eighteen months from the date of his passing."

Sir Richard Mansel's Estates at Wimbledon.—Amongst the properties offered for sale at the Auction Mart last week were the estates of Sir Richard Mansel, at Wimbledon, the estimated value of which is stated at 80,000. The estates consist of freehold ground-rents and building land, the ground-rents amounting to about 882l. per annum, and the rack-rents producing upwards of 5,200l. per annum. Messrs. Walkin & Lee conducted the sale, the property being offered in forty-four lots. The first nineteen lots offered consisted of freehold ground-rents and building-land in Wimbledon Hill and Worple-road, together with the sites of a church and school shortly to be erected in Mansel-road. The ground-rents were on leases for terms expiring in from eighty to ninety years. The competition was active, the prices offered for the several lots representing not more than from three to four per cent. return on the sums bid, but all the lots were withdrawn as being below the reserve. Five ground-rents, amounting together to 671. per annum, were sold for 1,740l.; a ground-rent of 11. per annum, with reversion in sixty-six years, realised 551l. whilst another ground-rent of 12s. per annum for a similar term, secured upon five houses, the annual rental of which now amounts to 370l. per annum, was sold for 500l. A ground-rent of 130l. per annum, secured upon the Wimbledon Collegiate School, with reversion in seventy-one years, the total area, including the garden and grounds, being nearly 11 acres, was sold for 5,000l. As indicating the value of building land in some parts of Wimbledon, a building site near Wimbledon Hill, containing four acres, was bid up to 2,800l., whilst for another site known as The Grange, at the south end of Wimbledon Common, containing nearly 7 acres, 8,000l. was offered. The aggregate sum bid for the forty-four lots submitted was upwards of 53,000l.

A Safety Benzoline Lamp.—Mr. William Hardy, jun., of Thistleton, Oakham, has invented and patented a new benzoline lamp which possesses several merits. It is globular in form, weighted at the lower part so as to be self-righting. It is also claimed for it that it is unspillable and self-extinguishing. It is manufactured by Messrs. Snell & Brown, of Birmingham, and only costs a shilling. If the use of this lamp by those who burn benzoline becomes general, the fatalities which so often result from the use of that illuminant are likely to be very materially diminished in number.

The New Home and Infirmary for Sick Children, Lower Sydenham. was opened on Saturday last by Viscount Lewisham. The Home provides cots for fifty children. Special votes of thanks were passed to Mr. Tolley, the Honorary Architect; to the Medical Officers, and to Mr. Aste, the Honorary Secretary.

Appointment.—We are informed that H.R.H. the Prince of Wales, Executive President of the Colonial and Indian Exhibition, has appointed Messrs. Chubb & Son as makers of strong-rooms, safes, and locks to the Royal Commission.

The Registration of Plumbers.—At a meeting at the Guildhall last week, under the presidency of the Master, of the joint committee of the representatives of the Plumbers (masters and journeymen) of London, the decision of the Conference of Metropolitan and Provincial Plumbers, held at the City and Guilds of London Central Institute, in October, 1884; of the general council subsequently formed to give practical effect to the resolutions of that conference; and of a meeting of the plumbing trade of London assembling at Guildhall on the 25th January last, that the registration of plumbers (masters and journeymen) is essential to the due protection of the plumbing trade and the public against the serious injuries which are caused to the public health and to the true interests of the plumbing trade by plumbers' work being carried out by dishonest and unqualified persons, was approved. The registration of the plumbers of the London district is adopted as a preliminary step to the extension of the system of registration throughout the kingdom by means of local organisations. Pending the establishment of local registers, provincial plumbers may register their names in London, if desired, on the same conditions as the plumbers of the London district. The register will be opened by the Plumbers' Company on the 1st March. The fees payable on admission to the register are 2l. 2s. for master plumbers, and 10s. 6d. for journeymen.

Royal School of Mines.—Prof. Warrington Smyth, F.R.S., in continuing his lectures on "Mining," in the Theatre of the Geological Museum, Jernyn-street, considered the question of dry rot as affecting timber in underground situations. He said that the matter of prime cost of timbering, and particularly of its maintenance, often becomes serious, and various devices have been put forward with the object of obviating the difficulty. The effect of the atmosphere may be very considerable in some situations, heaviness and a great degree of warmth being exceedingly prejudicial to the preservation of timber. Dry rot cannot always be detected on the surface. The timber, therefore, requires to be scooped or tested by a tammer, and it is very important that this test should be occasionally employed, and any affected part removed at once. When decomposition of mineral substances is going on in the neighbourhood, the timber should be protected by much greater exposure to air currents than would be necessary in ordinary circumstances. A constant supply of fresh air and water, the latter being allowed to trickle down the timber, will preserve its full strength for a long time. In some situations, pipes with small holes, or rose jets, are arranged so as to discharge a stream of water upon the timber, and this has been found to answer well. Anything is better than allowing the timber to become alternately wet and dry, or cold and hot. Considerable attempts have been made to preserve timber by chemical means, but, where timbering was of a temporary character, the advantages derived would not counter-balance the expenses.

The Surveyors and Auctioneers' Clerks' Provident Association.—The annual general meeting of the members of this Association was held on Saturday last, at the Auction Mart, Tokenhouse-yard, Mr. D. Watney, the President, being in the chair. The report and statement of accounts for the past year were received and adopted, and the officers re-elected for the current year. In order to extend the usefulness of the benevolent fund, an addition was made to the rules so as to enable relief being granted, under exceptional circumstances, to clerks in distress, not being members, and to their widows and orphans. The accounts show that the Association is in a good financial position, there being a fund of 1,500l. invested in Consols. It is earnestly hoped that the assistants in the joint professions will show a much greater interest than heretofore in the success of the Association by becoming members, and thus avail themselves of the benefits provided solely for them. The secretary is Mr. L. Edmondson, 10, Waterloo-place, Pall-mall, S.W.

Perry & Co., Limited, Birmingham.—The dividend recommended by the directors in their report, to be presented at the annual meeting on Tuesday next, is 10 per cent. for the year, the same as that paid for the last two years. £3,000 is placed to reserve fund, being the same amount as for the preceding year.

The Sanitation of Dwellings.—The subject was considered, in connexion with the fifth annual report of the Sanitary Assurance Association, at a meeting of the members at No. 9, Conduit-street, on Tuesday evening. The chair was occupied by Captain Douglas Galton. Mr. Brudenell Carter, F.R.C.S., moved a resolution declaring that measures for improving the sanitary condition of dwellings should receive continued support. Dr. Farquharson, in seconding the motion, alluded to legislation on this subject, and expressed the opinion that compulsory steps should not be lost sight of in any future steps that might be taken. It would be far better, he thought, if instead of having, as under the present Act, to go to a court of law, which was a very expensive process, and in which one might not be successful, there was a clear-cut, drastic provision introduced, by which those who sold or let houses should have them in a proper sanitary condition, or if they were in default, that a cheap and efficient remedy should be open to the victim for any danger or expense he might thereby have been put to.

TENDERS.

BETHNAL-GREEN.—For sanitary works at Bethnal Green Lunatic Asylum. Messrs. Tolley & Son, architects.—

COLCHESTER.—For building house, conservatory, ices, and bonndary-wall, for Mr. H. Leaning, Colchester. J. Leaning, Poaltry, architect.—

COLCHESTER.—For alterations and fitting up new at the High-street Wine and Spirit Vaults. Mr. J. W. T. architect.—

CROYDON.—For alterations to house, "Clydesdale," Park Hill-road, Croydon, Surrey, for Mr. R. Haddock. Mr. R. W. Price, architect.—

DARENTH (Kent).—For the extension of the School and Asylum for Imbeciles at Darenth, near Dartford, Kent, for the Managers of the Metropolitan Asylum District. Messrs. A. & C. Harston, architects, Leadenhall-street. Quantities supplied.—

DORKING.—For construction of outfall and sewage disposal works, for the Local Board. Messrs. Smith & Austin, engineers, Hertford and Westminster.—

Contract No. 2.—Drainage and Filtration Works. J. W. & J. Neave, recommended for 2,325 0 0. L. Bottoms, 2,968 0 0. J. Harrison, 2,696 5 0. Wm. Nicholls, 2,265 18 6. Peill & Sons, 2,533 17 5. Mark Putney, 2,610 0 0. John Mackey, 2,432 8 0. J. Edmondson, 2,296 14 6. C. Killingback, 2,293 6 9. Wm. Cunliffe, Barking (accepted) 1,910 10 0.

DUNSTABLE.—For the erection of the Dunstable Grammar School, for the Trustees of Ashton's Charity. Mr. E. R. Robson, F.S.A., architect.—

HORNSEY.—For new mortuary buildings at Hornsey, for the Hornsey Local Board. Mr. T. de Courcy Meade, engineer and surveyor.—

HORNSEY.—For new shop-front and repairs at 46, Strong Green-road, for Mr. Wm. Earl. Mr. Wm. Smith, architect.—

HULL.—For converting the central portion of Hull Royal Infirmary into an administration department, altering and enlarging the south-west wing for medical wards, erecting tanks and mains for Porter-Clark's water-softening apparatus, and reconstructing the drainage of the establishment. Messrs. H. Saxon Snell & Son, architects, London.—

ISLINGTON.—For alterations and repairs at 103, Upper-street, Islington, for Mr. S. Wood. Mr. William Smith, architect.—

KENLEY (Surrey).—For additions to house, new billiard-room, &c., for Mr. C. J. S. Joyce. Messrs. C. & F. Rutley, architects.—

LAMBETH.—For alterations to the Crown public-house, High-street, Lambeth, for Mr. A. White. Mr. H. I. Newton, architect, Queen Anne's-gate.—

LONDON.—For the erection of residences, Cork-street, Piccadilly. Mr. Geo. Wyatt, architect.—

LONDON.—For the erection of a block of offices adjoining the New Synagogue, Leadenhall-street. Messrs. N. S. Joseph & Smith, architects.—

LONDON.—For alterations, &c., at the Marquis of Anglesea public-house, Lisson-grove. Mr. R. A. Lewcock, architect.—

LONDON.—For alterations to the premises, 114 (formerly 109), Stoke Newington-road. Mr. B. A. Lewcock, architect, Bishopsgate-street Within.—

LONDON.—For alterations to The Jolly Butchers public-house, Old-street, St. Luke's. Mr. R. A. Lewcock, architect, Bishopsgate-street:—
 Ivory £1,674 0 0
 Pringle 1,050 0 0
 Steel 1,012 0 0
 Shurmer 581 0 0
 Anley 515 0 0
 Man 505 0 0
 Jackson & Todd 849 0 0
 Walker 534 0 0

LONDON.—For alterations to the Cambrian Stores, Castle-street, Leicester-square. Messrs. Williams & Son, architects:—
 Jeffries £245 0 0
 W. Shurmer 349 0 0
 Jackson & Todd 297 0 0
 R. Marr 277 0 0

LONDON.—For alterations, &c., at the Duke of Clarence public-house, Sawwell-street, Hackney-road. Mr. Edward Brown, architect:—
 Metcalf £615 0 0
 Lovell 585 0 0
 R. Marr 487 0 0
 Hawkins 458 0 0
 W. Shurmer 456 0 0
 Palmer & Co. 423 0 0
 Salt 419 0 0

MILE-END.—For covered sheds, &c., at the Peacock public-house, Cambridge-road. Messrs. Williams & Son, architects:—
 Haarle & Son £119 0 0
 W. Shurmer 117 0 0
 Jackson & Todd 85 0 0

 J. T. Chappell 2,975 0 0
 E. Conder 2,898 0 0
 N. Fortescue 2,784 0 0
 W. Shepherd 2,739 0 0
 Outwater & Son 2,653 0 0
 Ashby Bros. 2,660 0 0
 Mark Gentry (accepted) 2,620 0 0

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than Four p.m., on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

R. C.—Veritas (your letter is rather strange than the subject calls for).—H. J. W.—G. S. S.—E. J. H.—R. C. (no space).—T. B.—J. H. W.—G. H.—N. V. (it is really a legal question, depending on the terms of the contract. As regards the matter, it appears arbitrary and unusual to hold over so large a proportion of the moneys due. It is a common thing to retain about 10 per cent. of the contract amount till some time after the completion of the work).—B. W.—J. M.—W. O. (if we can get the information you seek, we will give it next number).—J. M. B.—"Pat Justitia."—J. & R. P. (too crude).—R. S. B. (we know nothing about "Soldiers' Works" as a statue in words is not by any means what we notice if we want the name of the artist who designed and modelled it. Do you produce sculpture by machinery at your works?).

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, but necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

Letters or communications (beyond mere notices) which have been duplicated for other journals, are NOT REPLIED TO.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHERS, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

CHARGES FOR ADVERTISEMENTS.
 SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS, TRADES, AND GENERAL ADVERTISEMENTS.
 Six lines (about fifty words) or under 4s. 6d.
 Each additional line (about ten words) or over by 6s. 6d.
 Terms for Series of Trade Advertisements, also for special Advertisements on front page, Complicated Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.
 FOUR Lines (about THIRTY words) or under 2s. 6d.
 Each additional line (about ten words) or over by 6s. 6d.
 PREPAYMENT IS ABSOLUTELY NECESSARY.
 * Stamps must not be sent, but all usual sums should be remitted by Cash in Registered Letter or by Money Order, payable to the Post-office, Covent-garden, W.C., to DOUGLAS FOURDRINER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY morning.

PERSONS Advertising in "The Builder," may have copies addressed to the Office, 46, Catherine-street, Covent-garden, W.C., free of charge. Letters will be forwarded if addressed in envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.
 "THE BUILDER" is supplied direct from the Office to readers in any part of the United Kingdom at the rate of 12s. per annum. To all parts of Europe, America, Australia, and New Zealand, 26s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Indian Famines and Preventive Remedies.

TWO important papers have lately been brought before the public on the above subjects. The lecture under the title "Historical and Recent Famines in India," was delivered at the Society of Arts, last week, while that on "Preventive Remedies" was read some few weeks previously at the East India Association. In reviewing them together it will be more convenient to transpose the order in which they were delivered, and consider first the paper on Famines, of which Mr. Danvers says there have been fifty-two, extending over a period of from 2,300 to 2,400 years, and of which, at least, as far as any records can be traced, thirty had occurred in the historic period, and twenty-two within the last 100 years. The accounts of the early famines are but meagre; but the effect of that which occurred in 1396 is said to have spread over twelve years, and the sufferings of the people seemed to have obliterated from their minds every idea of government and subjection to authority. The famine of 1629-31 is conspicuous as the first regarding which any really definite information has been handed down. During it money could not purchase bread, and a prodigious mortality ensued; disease followed famine, and death ravaged every corner of India. Destitution reached such a pitch that men began to devour one another. There was large emigration, and once fertile lands retained no trace of productivity. Taxes of every description were remitted for 10 years, and revenue to the extent of three-quarters of a million sterling had to be remitted. 1768-70 a very extensive famine raged throughout Bengal. The whole country became so parched up that no food could be produced, the highways and fields are said to have been strewn, while in the cities the streets and passages were choked with the lying and the dead, about one-third of the inhabitants having perished in this calamity. During the present century the years 1806, 1833, 1837, 1854, 1865, and 1876-78, were deemed mournfully memorable in various provinces in India by very extraordinary visitations of drought; the two latter, known respectively as the Orissa and Madras famines, were especially calamitous, and involving great loss of life and revenue. The Famine Commissioners calculated that at least ten millions human beings, besides innumerable cattle, had been sacrificed during the famines of the

current century, and twenty-three millions sterling lost to the Government revenues.

Mr. Danvers's paper, bears evidence of careful and painstaking research, and deals with the subject in plain words, free from any sensational gloss, and, indeed, were it not for the few gleams of light introduced at the end of his lecture, it might really be a question whether India, after all, is the brightest jewel in England's crown, and whether this country has faithfully discharged its duty to its great dependency. It is with a sense of relief, then, that one turns from what Mr. Danvers truly calls "this record of drought, dearth, destitution, disease, and death," to Mr. Stanley Newman's paper, entitled "Water Storage and Canals in India: How far are they Preventive of Famine?" This portion of the question has for many years offered a fruitful theme for discussion, the interest in which, renewed after each successive calamitous visitation, has, when the disasters connected with it have passed away, gradually subsided again, while the good intentions then aroused have well nigh disappeared on the road where such intentions are said to go. Famines in India are calamitous not only to itself, but, more or less, affect all those countries which trade with it, especially Great Britain. Stagnation or dislocation of trade inevitably follows them, in some directions possibly more than in others, but all the great famines in India have in a greater or less degree prejudicially affected its commerce with this country, owing to the impoverishment of the people diminishing their ability to purchase our manufactures, while the enhanced prices of their own products extinguish the small margin of profit obtainable by our own merchants; and hence, for a time, commercial relations become so disorganised as to lead, in some instances, to financial disaster. Hence, the prevention of famines in India is a problem possessing vital interest for England, and it is a source of wonderment, not only that statesmen responsible for the well-being of our great dependency are not more keenly alive to the necessity of pushing on measures to mitigate, if not to avert, the consequences of such dire visitations, but that the commercial community most nearly affected by them ever relaxes its efforts to urge on both the Home and Indian Governments the paramount duty of substituting a steady and comprehensive series of works for the spasmodic and isolated proceedings which have hitherto characterised their policy.

Judging from the reports cited by Mr. Newman, there has been no failure on the part of the responsible advisers of the Government of India in devising schemes,—both engineering and financial,—to meet the wants of that country; neither has there been failure

on the part of the Government as far as recognising the soundness of that policy; but their action seems unquestionably to have fallen short of their professions, certainly as regards the construction of works of irrigation, and still more of lines of cheap communication. When challenged on the subject in Parliament or elsewhere, reference is invariably made, as was done by Mr. Danvers, to the 15,000 miles of railway now open. Of course, as far as they go, the railways have unquestionably afforded a sensible degree of relief from the burden of costly transport; for, on the whole, they have been economically constructed, and still more economically worked; but then it is an incontrovertible fact that even the comparatively low prices at which the railways carry, are still too high for the great mass of bulky goods of small value, which has to be moved, but which cannot and never will be moved until a far cheaper rate of carriage than is possible on railways is provided for the country. Hence the opinions of laymen, especially when they are accompanied by such intelligent discrimination as is exhibited in Mr. Newman's paper, are always welcome, and the more valuable when they are the expressions, not of Government officials or zealous partisans, but of a purely disinterested observer.

The information supplied in the paper has been compiled from various sources; amongst others are several extracts from the valuable Reports of the Indian Famine Commissioners, who state that "the Government of India must be prepared for the occurrence of scarcity in some degree of severity, and in some part of the country as often as two years out of every nine, and that great famines may be anticipated at average intervals of twelve years," and "as Indian famines are necessarily recurring calamities, against which such precautions as are possible must be taken *beforehand*, it is the duty of the Government to do its utmost in devising some means of protecting the country." It is well that these words of warning are brought into prominent notice, now that the cycle has nearly run its course, and a visitation of scarcity may not be far off. After paying a tribute to the railway system of India, which consists of nearly 15,000 miles in operation, Mr. Newman truly observes, that though in many cases railways are the only means by which grain can be quickly poured into a district where dearth prevails, yet that "railways cannot create crops," and that "just as railways have their service and limitation so irrigation works have their limits of service"; meaning thereby that there are localities where their usefulness is unavoidably limited owing to their entire dependence on a local rainfall subject to fall.

One of the principal excuses usually urged against a vigorous prosecution of irrigation works is that in several instances they have failed to afford a direct return to Government on the capital invested. The Famine Commissioners meet that by the following obvious and sensible rejoinder:—"The true value of irrigation works is to be judged very differently. First must be reckoned the direct protection afforded by them in years of drought by the saving of human life, by the avoidance of loss of revenue remitted and of the outlay incurred in costly measures of relief; but it is not only in years of drought that they are of value. In seasons of average rainfall they are of great service and a great source of wealth, giving certainty to all agricultural operations, increasing the outcome per acre of crops and enabling the more valuable description of crops to be grown." The truth of these remarks was admitted by the chairman, Lord Harris, when he observed that it had been found in several instances that works which had been undertaken as protective works only had, in course of time, to be removed from the category of protective into that of productive works. The Government, the chairman also observed, had not failed to recognise the truth and force of the Famine Commissioners' remarks, but were hampered by the difficulty of meeting the interest of the borrowed money with which the non-paying works had to be constructed, owing to the impossibility of raising further revenue by taxation; but he at the same time indicated that that difficulty would probably be met to a certain extent by the decentralisation policy which had been lately inaugurated, and which would, by the help of the Municipal Committees, admit of funds, hitherto provided entirely from the Imperial revenues, being raised locally for local necessities. This may possibly prove one solution of the difficulty, but still it cannot but strike disinterested outsiders that if money can be had and is raised for the prosecution of expensive wars, which are destructive of human life and are worse than unproductive, surely there must be some available method by which money for works necessary for the saving of human life can be procured. It is not only human life, however, that has to be thought of, but there is the preservation of the cattle, which in every famine, as stated by Mr. Danvers, perish in countless numbers. It is but to a limited extent that lands in India are set aside for pasture, and cattle have therefore to be fed with the straw of rice, maize, or other similar crops, and, in some cases, with special fodder crops. In such localities as are accessible to the jungle the cattle are driven to the latter to pick up a subsistence; but elsewhere, if the ordinary food crops perish, the cattle must perish too, and so agricultural operations are seriously crippled for a long time after the scarcity has passed away.

It was asserted by some witnesses examined before the last Indian Public Works Committee, that it was not works for increasing the quantity of food that were required, but merely additional facilities for its diffusion, inasmuch as India grows already more than enough food for its population. This may or may not be the case; but admitting that it is so, and that means for the diffusion of food to human beings can be perfectly secured, it is manifestly impossible for any means yet devised to carry the quantity of food necessary to keep alive the tens of thousands of cattle in the purely agricultural tracts of the extent affected by an Indian famine. English legislators accustomed to the small dimensions of their own country cannot, and do not, fully realise the enormous areas which have to be dealt with in India, and still less the very great distances which have to be traversed, and the consequent serious enhancement in the price of food when it has to be procured from a distant province. Hence it seems clear that increased facility for transport never can by itself meet the difficulty or prevent that impoverishment of the people caused by famine, which lies at the root of the financial embarrassments of India. Moreover, by abnormally stimulating prices, an artificial scarcity is created, which presses severely on

the inhabitants of the province whence the food is drawn; and then, as has been experienced in most famines, while barely sufficient relief is afforded to the famine-stricken tracts, not only at a great cost, but with a disastrous dislocation of the ordinary carrying trade, hardship is inflicted on another large portion of the community without any commensurate advantage.

An additional serious objection to making one province dependent on another was brought out in the discussion on Mr. Newman's paper, viz., the diversion which it occasioned of the surplus produced from those foreign markets to which in the ordinary course of trade it would be exported. By compelling one part of India to feed another in time of dearth, neither the State nor the people are benefited, for besides being a simple transfer of money from one part of the empire to another, its effect is to raise the price of food all over the country to its own people, and is, as far as the Government is concerned, but taking money out of one pocket to put it into the other. All that can be said for it is that it is better than paying other countries for food. But it is obvious that every ton of produce which is exported and paid for by the foreigner is so much gain to India, whereas the same food paid for by its own inhabitants merely means a transfer of coin from South to North, or from East to West, as the case may be, a proceeding which cannot possibly add to the general wealth of the community. On the other hand, it seems clear that if every part of the empire can be relieved from the spasmodic if not chronic uncertainty with which its agricultural operations are at present carried on, and if every province can be furnished with the means both of growing sufficient food for its own consumption, and of conveying its surplus at the cheapest possible rates to the ports for shipment to foreign markets, the value received for that surplus will be a positive increase to the resources of its inhabitants.

It is the poverty of the masses in India, and their utter inability to cope with such calamities as periodically devastate that country, that has not only led to heavy financial demands on the Government, but it is also the great obstacle to their devising means to meet those demands. As long as they remain in that state of poverty, it is in vain for England to send its wares to a population destitute of purchasing power. If a portion of the labouring community could be diverted to channels of industry other than agricultural, then the policy of providing increased facilities of communication rather than works for securing and increasing the production of food might have more in its favour; but, as yet, there is apparently but little hope of seeing such a conversion in India; and, whether it may eventually become a great manufacturing country or not, the Government has to deal with the present, and its choice lies between an impoverishing and demoralising procedure in attempting to keep alive its subjects by eleemosynary grants, and the more wholesome policy of helping the population to help themselves by placing agricultural operations beyond the caprice of the seasons. It is the question of the possibility of doing this over the great tract in the southern presidency, which suffered so severely in the last famine, within any reasonable cost, that has occasioned so much controversy, and proved a stumbling-block to the Government. As regards the physical difficulties, they must be left to the engineers, who, according to Mr. Newman, are prepared to undertake their solution; but, as regards the financial problem, the following questions may fairly be asked, What sum is to be considered as the prohibitory limit? By what standard of comparison is the expenditure for the purpose of securing a sufficient portion of the food crops over a whole province from perishing to be measured? Is it to be gauged by the outlay which the State has found it expedient to make on the means of conveying a small portion of the existing produce of the country? Or, may it be measured by the sums which have been disbursed by the Treasury, without the

slightest hope of any reimbursement, in endeavouring to save the lives of the State's subjects? Does the aggregate sum lost to the revenue by the famines during the present century indicate a more appropriate standard? Or, lastly, does the waste of capital involved in such calamities offer a more accurate measure of the limit within which the State should confine its endeavours to find a guarantee for itself and its people against a recurrence of those disasters which have added not only so largely to its own financial embarrassments, but have intensified the poverty of the people?

Whichever of these standards may be accepted, it is certain that if the great mass of the population is to be lifted out of a state of poverty (on the necessity for which there is no division of opinion), that end will certainly not be gained by a restriction of expenditure on the class of works necessary to remove the primary cause of that poverty. As long as 80 per cent. of the population is agricultural, and is obliged to be engaged in the great struggle of raising a sufficiency of food under a constant apprehension of failure from uncertainty of the seasons, so long must it be hopeless to look for any amelioration in their condition; for they cannot spare time to engage in other industries, and consequently will be unable to meet from their pauper incomes the extra high prices of food caused by scarcity, and further aggravated by the cost of long land transport.

Which, then, is the preferable alternative for the Indian Government? To take the chance of seasons, as has been suggested, and encounter periodically such outlay as has been incurred in late famines, amounting to several millions sterling, content with the outlook of a hopeless future; or to grapple with the difficulty by accepting the necessity of a considerable outlay, which, though entailing, perhaps a serious but yet ascertainable temporary addition to the burdens of the exchequer, will save it from unknown and immeasurable calls in the future?

Mr. Newman states that by comparing the Report of Material Progress, published last September, with the Report of the Famine Commissioners in 1880, it appears that 4,365,516 $\frac{1}{2}$ have been spent on irrigation works since the Commissioners' Report; and that there are now 8,376 miles of main canals in operation with 16,344 miles of distributing channels, irrigating, in aggregate, 29,200,000 acres. The actual expenditure in one year (1882-83) was 2,324,000 of capital outlay from borrowed money, and 1,463,700 $\frac{1}{2}$ from current revenues, making 3,787,700 $\frac{1}{2}$, as the total investment in that year. During the ten years from 1873 to 1883, the expenditure was 11,320,700 $\frac{1}{2}$, and, comparing the cost of those ten years with the first, it appears that the outlay on irrigation has just doubled, while a steady increase is shown in the last five years. The average gross annual receipts to the Government on the irrigated area amount to 5s. per acre, the gross expense to a little over 2s., leaving a profit to the Government of 2s. 11d. per acre on the whole area. The same Report likewise shows that the Orissa and Some delta works afford protection to 2,000,000 acres which previously had been the scene of grievous famines, and that the tract between the Rivers Jumna and Ganges is better protected than any similar tract of the same size in India, while in the north-west provinces nearly 2,000,000 acres are actually under irrigation.

These facts, so far as they go, are matter for congratulation. That the further extension of irrigation works would be likely to add permanently to the taxes of the people of India, Mr. Newman considers disproved by the fact that, according to the above-named Report, the gross amount of capital invested in such works over the whole of India is twenty-four millions and three-quarters sterling nearly, and that the revenue receipts on the same for the year, reckoning productive and non-productive works together, were nearly 1,532,000. The profits on the total outlay on productive works are over $\frac{1}{4}$ per cent., so that there is sufficient encouragement, on financial grounds

alone, to continue a prosecution of irrigation works.

Mr. Newman has certainly done excellent service in rousing attention to the all-important question of how to combat famines in India, and it is to be hoped that his admonitions will not only be laid to heart, but lead to a revival of the vigorous policy which was inaugurated some years ago, but which has since been contracted with doubtful expediency. The saying of Solomon seems to be as applicable to States as to individuals, "There is that scattereth and yet increaseth: there is that withholdeth more than is meet, and it tendeth to poverty."

THE LAW OF RATING.*

HERE is no better example of the way in which the jurisdiction of our law courts is affected in the present day by the increased complexity of modern life than the law of rating. The popular idea of a law court is that it is a place where personal disputes are settled, but a study of Mr. Castle's work will show how numberless are the problems, partly economical and partly legal, which have of late years come before the courts in regard to rating. Not that this is the only subject which the tendencies of modern life have brought into legal prominence, but it is one, and not the least important. Nor can any one study this work without perceiving the quiet, unostentatious, but very effective way in which judge-made law becomes part of the law of the land, and grows almost imperceptibly till, in fact, it overwhelms both in size and in importance the original groundwork of statute law upon which it is based.

We have mentioned Mr. Castle's work on the law of rating, the second edition of which now lies before us. We do not, however, propose to make any minute criticisms upon it. It is already well known, and it has secured a position as a standard work on the subject of which it treats. But for the information of those who are not acquainted with it, it may be useful to state that the law is stated in it with precision, yet with reasonable fullness, and the book is written in an easier and more literary style than are the generality of law books. We can scarcely point to any work, indeed, which seems to us to unite better the qualities which both the lawyer and the layman desire. The only fault which it occurs to us to notice, and which we hope may be prevented in the future editions, is the author's habit of using "that" or which, as at p. 367, line 4, and p. 368, line 8. We have said that the law of rating simplifies with extraordinary vividness the size and the importance of our judge-made law as compared with our statute law. The judge-made law largely fills this substantial volume. The statute law upon which it is based is to be found in an Act passed in the forty-third year of the reign of Elizabeth, the substantial part of which is that the parochial authorities, with the consent of justices, "shall use weekly or otherwise, by taxation of every inhabitant, parson, vicar, and other, and of every occupier of lands, houses, tithes impropriate, appropriations of tithes, coal-mines, or leasehold underwood in the said parish, in such competent sum or sums of money as they shall think fit, a convenient stock of flax, hemp, wool, thread, iron, and other necessary ware and stuff, and to set the poor on work. And so competent sums of money for and towards the necessary relief of the lame, impotent, old, blind, &c., . . . to be gathered out of the same parish according to the ability of the same parish." This Act refers to the taxation of personal as well as real property, but the rarer species of property has by statute been declared not to be rateable. "With this exception," says Mr. Castle, "the Act of Elizabeth remains untouched in principle at the present time." It would be impossible to show how in every branch of this subject judge-made law has grown into the great structure of the present day, for our space would not suffice.

It will be enough to take note of one portion of the subject, which also shows the complexities of the modern law of rating, and the difficulties which the courts have had to face in creating our present law.

We take, for example, the parochial principle in its application to modern undertakings, such as waterworks and railways. It is this kind of enterprises, entirely the creation of modern times, which have added so much to the difficulties of formulating the law of rating. There may be difficulties in regard to the assessment of other property, even of a dwelling-house, but they are trifling compared to those in regard to commercial undertakings.

The so-called parochial principle dates from the year 1633, when it was enunciated by the judges of England in what has since been known as Sir Anthony Eaby's case, "that assessments are to be according to the estate of the occupier within the parish, and not having regard to any estate which he has in any other place or town." This is a plain and common-sense proposition, but its application is by no means in all cases easy. It is, furthermore, of interest to note that this clear enunciation, and, indeed, creation of this point of law emanates not from the Legislature, but from the judges, exemplifying what has been already alluded to, namely, the great importance, in regard to the law of rating, of judicial decisions. One of the earliest and most interesting cases in regard to the application of the principle occurred in the year 1813, in regard to the rating of the spring of water at Anwell which supplied the New River. The way in which this principle was to be applied appears from Lord Ellenborough's judgment:—"Here, then," he says, "is land and water enclosed in the basin in the land, which falls into the legal description of land, and although a considerable portion of the profits of such water is derived from pipes, through which it is distributed to other places, yet it is found that the water has a certain ascertained value at the fountain-head; and in cases of this kind it is enough to ascertain the total value of the property, without inquiring whether it yields a return on the spot. The property is locally valuable in the parish where it is rated, although that value is derived from extrinsic circumstances, and although the profits are actually received elsewhere." Here, as Mr. Castle points out, "the spring was declared locally rateable, not because it produced profits outside the parish, but because these profits, though received outside, constituted part of the local value of the spring."

Again, as to railways, the Court, in the Brighton, South-Eastern, and Midland Railway Companies' case, laid it down that "the value which the land occupied in each parish produces, after the due allowances, is that upon which the occupier is to be rated in each." Here there is an important principle of the modern law of rating stated, not by the Legislature, but by the judges. The question was worked out still more elaborately in what is known as the Great Western case, where the difficulty arose in regard to the expenses which were to be allocated to two miles and a half of a branch line belonging to the Great Western Railway Company. The pith of the judgment lay in the words, "We are to ascertain what expenses are incurred in earning the gross receipts on the two miles and a half, what charges, parochial or otherwise, they are liable to, what is fairly to be deducted, tenants' profits," and so on. In other words, the judgment was to the effect that local and general expenses were all to be taken into account, and that the general expenses are not to be divided equally according to mileage, but according to the manner in which,—so far as can be ascertained,—they affect the particular portion of the line under consideration.

There is but one more point on which we have space to touch, that is, in regard to what is of special interest at the present day, the rating of country-houses. Mr. Castle thus sums up the results of the law on the subject: "The assessing tribunal 'have to ascertain the value of the occupation to the existing occupier, and they must find this value from all the

circumstances of the case; in some cases looking to the cost of construction; in others, to the accommodation or to the amount of use made of the premises." It would seem to result from this statement of the law that many country mansions are rated too low. It may be all very well to say that unless Lord A or B lived in a particular house, it would not suit any one else, and that it possesses its value from Lord A's position and his wealth, and that the hypothetical tenant would only pay a comparatively small sum for it; but the mansion is, for Lord A's purposes, of very considerable value. As Mr. Castle very truly says, "the premises should not be rated upon an inadequate assessment, upon the ground that the property is not ordinarily in the market, and would not readily be occupied by a tenant from year to year." The premises have a large value to the existing occupier, having regard to his station and position, and upon such value the assessment should be based.

NOTES.

THE agitation for a new or an enlarged House of Commons appears to be taking, among members of the House, a very decisive form. A memorial on the subject is, we understand, being got up for signature by members; and though Mr. Gladstone returned a doubtful or rather a procrastinating answer to Mr. Mitchell Henry's question on the subject on Monday last, it seems likely that pressure will be brought to bear upon the Government to give practical consideration to the subject without delay. In the meantime, we may repeat our caution that too much is being made by Mr. Mitchell Henry and others of the value of the Report of 1868. There seems to be a vague idea that if only we had this report reprinted it would be all plain-sailing. Now, the fact is that the said Report is by no means conclusive, a great deal of the evidence being very contradictory and devoted to the promulgation of this or that witness's special views. We concur in it so far as this, that if one of the courts adjoining the present House be selected as the site for a new House, it must be the Commons Court on the east of the present House, and not the Star Court on the west, the selection of which would bring the new House too near to the exterior confines of the building, and would necessitate the spoliation of some of the best architectural portions of the internal design of the court. We believe Mr. Chas. Barry, who is in possession of both his father's and his late brother's ideas on the subject, has a scheme sketched out which, utilising part of the space from both courts, would destroy neither, and would give the required accommodation, while leaving the Speaker's chair, and the semi-private entrance behind it which the *Saturday Review* claims as an inalienable right of Government and leading opposition members, just where they are: and in spite of what has been rather too hastily assumed to the contrary, it may be found quite possible to carry on the greater part of the work outside the walls of the present House without interfering with its sittings, leaving the concluding portion, the connexion with the present House, to be carried out during recess. On sanitary grounds it is desirable not to fill up either of the before-named open areas entirely with building, if it can be helped. Of course members must not expect that any House that will seat all the members will be as easy to speak in as the present House. That is not in the nature of things.

MR. MUNDELLA, in his new capacity as President of the Board of Trade, received on Friday last a deputation from the Railway Rates Committee, which included several members of both Houses of Parliament, and was introduced by Lord Henniker. The new familiar grievances of terminal charges and preferential rates were brought forward, and the necessity for immediate legislation urged. This has, of course, been retarded by ministerial changes, but the late Government had fully

* A Practical Treatise on the Law of Rating. Second Edition. By E. J. Castle, Barrister-at-Law. London: Stevens & Sons, 1886.

intended to deal with the question, and Mr. Mundella promises that it shall receive speedy and careful attention at his hands. The right hon. gentleman displayed a pardonable hesitation to credit some of the statements made as to the extent of the preference given to foreign produce as compared with English, and expressed his regret that Lord Heniker was not prepared with proofs. There can be no doubt that exaggerated statements were current during the elections, and that even Mr. Stanhope, the President of the Board of Trade under the Conservative administration, was misled in this respect. He repeated at Horncastle a very improbable story about an Essex farmer finding it cheaper to send his sheep to Rotterdam, and thence to London by sea, than to forward them by rail to the metropolis direct; and the Great Eastern Railway Company drew public attention to the absurdity of this statement in a letter to the daily press on Saturday last. At the same time, it may be noted as a striking proof of the reality of this class of grievance, that at the half-yearly meeting of the London and North-Western Railway last week, one of the shareholders stated that he thought the earning powers of the company were crippled by prejudicing the home producer in the matter of rates, and that this mistaken policy might partly account for the falling off in receipts.

IN the midst of a world-wide commercial depression it is comforting to find that one country shows some sign of improvement. According to the official returns of French imports and exports we find that during last month the exports of manufacturers were 99 millions of francs against 78½ millions of francs for January of last year. On the other hand, taking similar periods, imports of manufactures have diminished 2 millions of francs. Whether the latter is a reassuring sign or not may be a moot point. Statists tell us that the prosperity of a country should be judged by the amount of its imports rather than its exports, but whatever theory may say, probably the French manufacturers will be thankful for the extra 20 millions odd of sales. Comparing the two Januarys again, we find that the imports of raw material have diminished 7 millions, which is undoubtedly not a sign of strength, but the exports have increased 9½ millions. There has been a diminution in both imports and exports of food materials to the extent of eight and six millions respectively. This probably does not indicate that the civilised world is eating less, but that the good harvest general last year has enabled each country more nearly to supply its own wants and not have to look abroad for its food.

A CORRESPONDENT writes:—"Some interesting archaeological remains have been discovered at Athens during the recent explorations carried on in the Acropolis by M. Kabbadias, the Inspector-General of Greek Antiquities. Excavations had been made some eight years ago in the northern portion of the Acropolis for a depth of 6 ft., which had brought to light the foundations of a large building quite unexpectedly; but, from want of funds, no further effort was made until the Archaeological Society of Athens instructed M. Kabbadias to undertake new inquiries. On the 5th of February last, while the King was watching the proceedings, a beautiful female head was unearthed, which he took in his hands and began to clean. Subsequently four more were found, one with an archaic inscription, and all with the hair and robes showing more or less traces of colour. On the next day the torso of a large statue was dug out, of beautiful proportions and workmanship, and this was followed by the discovery of a perfect shoal of statuary, three fluted columns, and a votive altar with inscription. At present there seems to be no solution of the question as to the origin and uses of this building, or why such a store-house of antiquities existed there; but it is most probable that the date of the statues is about the sixth century before the Christian era, or, in other words, the best period of

archaic art. All the heads had attached to them a little ring, as though some ornament had been fastened on, while, rather singularly, in every case the arm was missing that was most prominent, and probably the one that had held up some portion of the robe.*"

MR. UNWIN'S paper at the Society of Arts on Wednesday night, "On the Employment of Autographic Records in Testing Materials," was a highly interesting and valuable one, but hardly possible to render intelligible apart from diagrams. Mr. Unwin passed in review the principal autographic recording apparatus in existence, noting the merits and defects of each, and described his own apparatus, worked in connexion with the Wicksteed type of testing-machine, in which the stress is weighed by a steelyard with a travelling jockey weight of one ton driven by a large screw. From this screw a vertical paper cylinder is driven by a belt, with a pencil sliding on guides and connected to the specimen by a very fine wire. Mr. Unwin added the following description of a semi-automatic apparatus for registering the smaller strains of metal within the elastic limit:—

"A large paper cylinder is connected with the jockey weight, so as to turn accurately a circumferential distance proportional to the load on the specimen. A pencil moves along a slide parallel to the axis. To give motion to the pencil there is an electro-magnet and ratchet-wheel, so arranged that, on sending a current, the pencil moves one step along the slide. If now a scratch on the test-bar is observed through a micrometer, the moment when each extension of 1-1000th in., or, if necessary, of 1-10000th in., can be observed,—if, then, from each such extension a current is sent by the observer, the pencil will mark a step on the paper cylinder. For the paper cylinder is turning proportionately to the increase of stress. Hence we get on the paper cylinder a stepped figure, the angles of which are points on the stress and strain curve. The use of such an arrangement is that a series of readings are taken and registered rapidly, without needing to stop and read the load, and write down the results."

A bar of cast-iron under tension shows on this record a curve nearly straight for some distance from the origin, but curving away rather rapidly on approaching the elastic limit; brass gives a curve much flatter in the later portion; wrought-iron an almost straight line to the elastic limit; steel nearly similar.

IN another part of this week's paper we report meetings of two excellent Institutions connected with the building trade, viz., the Provident Institution of Builders' Foremen and Clerks of Works, and the Builders' Clerks' Benevolent Institution. The first-named body, established in 1842, has a good record of work done, and it might do much more if all eligible men would join its ranks. It is, we believe, the only Provident Institution of its kind, and we trust that the principle of "self-help" will impel many to join it. The other society we have named, the Builders' Clerks' Benevolent Institution, is well worthy of the active support of the building trade, and of builders' clerks in particular, as subscriptions paid by them in times of prosperity may be in a sense regarded as premiums for insurance against times of want or sickness, distressed subscribers having, of course, a prior claim on the funds of the Institution. From our own knowledge we are able to say that some very urgent applications have lately engaged the attention of the Committee, and it is to be feared that in this period of depression such cases are likely to increase in number. In order to meet all worthy claims, it is desired to make the Relief Fund as large as possible this year. Therefore, to slightly vary an old couplet,—

"Let those now give who never gave before,
And those who always gave now give the more;"

that is, if they possibly can. Another excellent trade charity,—the Builders' Benevolent Institution, must not be forgotten in the midst of the many calls from other quarters.

* Since this was in type, further information on the find has been made public. It appears that one of the heads found had a glass eye in it; nothing surprising, since it has long been believed that this practice was frequently adopted in older Greek work. The Cnidian lion (British Museum) had obviously some inserted eyes of this kind.

THE "Selected Exhibition of high-class Water-colours" at Messrs. Agnew's Gallery in Bond-street does not belie its title. It contains, among other things, a superb work of De Wint's, "Lancaster" (43), a landscape which seems built rather than painted, with De Wint's great broad masses of colour, yet full of aerial effect, distance stretching behind distance in far-reaching perspective. Some of Barrett's large classical landscapes, which seem to be becoming a fashion again, serve, in comparison with De Wint, to emphasise the distinction between power and mere ambition in water-colour art. Barrett meant to do something very fine and poetical, and his works may be admired for their poetic interest, in spite of their unreality; but the style is feeble, or rather it is not style, but manner. Mr. Fulleylove's "Diana Fountain, Dunsby Park" (29), we think we have seen before, but it is welcome again, as are one or two others of his works, which are to be seen here. Certain rustic subjects bearing the name of Luigi Chialviva (81, 82, 85, 87), a name not familiar to us, exhibit a certain individuality, with a little suspicion of trickery. There is a large Turner (large for a water-colour), "Carnarvon Castle" (7), effect fine, architecture questionable and rather shoddy, but the castle fills its place in the sentiment of the scene. There are a good many works by deceased artists, Copley Fielding, Duncan, Stanfield, &c. The collection is well worth seeing.

THE last number of the *Revue Archéologique* has an interesting paper on the tombs recently opened at Bologna. These tombs are thought to date from 400 to 200 B.C. They call for special notice because, in addition to the usual features of Etruscan sepulchral architecture, a number of curious funeral stele have been found. On these stele are carved, in relief, figures of chariots, with winged horses, and horse and foot soldiers; also, a frequent subject is a ship surrounded by waves, and a monster with a fish's tail supporting a rock in her hands. These monsters the *Revue* calls sirens; we prefer to leave them unnamed, as we believe the siren of antiquity was invariably either of human or of mixed bird and woman form.

THE *Berliner Philologische Wochenschrift* reports that a large seated statue of Zeus has been excavated at Trèves. It is made of limestone, and is in excellent preservation. The throne of Zeus is adorned with a relief representing Herakles resting his right arm on his club and holding in his left a bow. The bow, it will be remembered, is the earlier attribute of Herakles, the club never appearing on very archaic monuments. The combination of the earlier and later attributes is uncommon.

THE Dudley Gallery Exhibition of Water-colour Drawings, though of a moderate scale of excellence, contains some very nice works. There is nothing in the exhibition calling for special remark; but we may mention "Battersea Bridge and Chelsea Church," by Miss Kate Macaulay (11); "On the Norfolk Broads" (19), by Mr. W. E. Bowman; "Tarlton" (32), by Mr. G. P. Lillingston; "Birches" (69), by Mr. W. H. Wheeler; "The Sentinels of Beer Head" (76), two perpendicular masses of chalk cliff, by Mr. B. J. M. Donne; "Vauxhall Bridge" (117), by Mr. Hubert Meddyott; "Twilight, Ross-shire" (140), by Mr. A. W. Weedon; "A Reach on the Thames, Below Bridge" (164), by Mr. Meddyott; "Pink Peonies" (180), by Miss Helen Thornycroft; "A Hymn of the Morning" (201), a fine sunrise effect, by Mr. G. S. Walters; an old mill, Essex (203), by Mr. F. Hines; a study near Loch Torridon (246), by Mr. C. B. Phillip; "North Glen, Arran" (247), by Mr. Eyre Walker; "The Quiet of an Autumn Afternoon" (274), by Mr. G. Marks; and "The Late Snow (22nd January), Fancourt, Chertsey" (417), a very delicate and beautiful study of snow effect, by Mr. Walter Severn, now the President of the Dudley Gallery Art Society.

THE Society of Lady Artists has a room this season in the Egyptian Hall, and exhibits upwards of 500 works there. We have before expressed an opinion that there is no possible *raison d'être* for a special Society of Lady Artists, as ladies who can paint in a high style of art can get a good position in general exhibitions along with men, and do get it; and those who cannot had better not exhibit. Among the few works which "gave us pause" in the present case were "A Quiet Backwater on the Thames" (173), and a very clever "Portrait Sketch, taken at One Sitting" (333). On referring to the catalogue, these proved to be respectively by Miss Maud Naftel and Mrs. Jopling, whose works secure them a place in the best exhibitions of the day. We do not require to go to an exhibition of lady artists to make their acquaintance. There is here and there another work a little above the level of the rest, but in general there is a dead sea of mediocrity. We repeat that we cannot possibly see the use of the society, except because so many of its members would have no chance of getting into any other exhibition. Men and women who paint with real power are completely on a level now; there are no "female disabilities" of any kind; they take their places side by side in such exhibitions as those of the Society of Painters in Water-Colours, where, in fact, one lady, Mrs. Allington, is one of the few who stand before all the rest in giving the exhibitions their high interest. But here we are asked to be interested in an exhibition of almost entirely poor and weak paintings, because they are the work of ladies. With all possible respect and gallantry towards the sex, we really cannot see it.

FROM Rome comes news of the discovery of a fine antique mosaic. Some workmen engaged in digging the foundations of the new military hospital on Mount Celio came upon a rectangular piece of pavement five metres long by three broad. When cleaned the mosaic was seen to represent a gladiatorial combat. Both the design and the inscriptions are in excellent preservation. The mosaic is being excavated with great care, and will eventually be placed in the Capitoline Museum.

WE have received the annual report of the Kyrie Society. In the decorative branch they mention a good many clubs, mission-rooms, &c., decorated by the Society's workers, and a "Open Spaces Department" they have secured part of the burial-ground of St. George-the-Martyr, Bloomsbury, a piece of waste ground in Quaker-st., Spitalfields, and Ion-sq., for open recreation-grounds for the people, besides supplying seats and trees in other open spaces. This latter portion of the work is an excellent if not very extensive achievement. Decoration may be good or bad, and we have no doubts whether there is rational ground in presenting people with decoration *gratis*, or more than for presenting them with food or money; but the securing of open spaces in large towns is a public and not a private matter, and the Society cannot go wrong in directing their efforts to that end.

WE perceive that Messrs. Peters, Bartsch, & Co., the agents for *Carbolineum* and *varnishes*, are issuing a circular in which they quote our "Note" of August 29, 1885, in favour of its usefulness as a preservative, but omitting the concluding words, in which we stated that it had a tendency to render wood or easily inflammable. We published a counter statement from the agents, to the effect that *Carbolineum* had this result only when freshly applied, giving it on their authority only; but we will not allow our remarks to be circulated as an unconditional recommendation, by the omission of an important paragraph.

The "Shipperies" Exhibition, Liverpool.—As will be seen by an advertisement which appears in another column, the whole of the allotments of space have now been made, and exhibitors are desired to complete their arrangements by March 1st.

ESSEX-STREET CHAPEL.

"Next whereunto there stands a stately place,
Where oft I gazed gifts and goodly grace
Of that great lord which therein went to dwell,
Whose want too well now feels my friendless case."
Spenser's Prothalamion.

The chapel in Essex-street has long formed the head-quarters of the Unitarian community in London. It is just now being thoroughly rehabilitated for conversion into a hall or place of assembly. The existing basement and middle floor will serve for store-rooms and offices; the floor next above, having been cleared of the pews, &c., is to be used henceforward for purposes of meeting and congress. Standing almost north and south, behind the western side of Essex-street, and lately distinguished by the Raikes memorial, this little-known building occupies a position that in point of historical and personal interest has but few rivals in the whole town. Whilst the names of Devereux-court and Essex-street quicken our memory of the ill-starred career of a Queen's favourite, — the friend of Spenser and of Shakespeare's patron, Lord Southampton, — the earlier record of their situation must not be overlooked.

Removing from Old Temple, their original settlement by Southampton Buildings, the Knights Templar were established at the New Temple, between Whitefriars and the Mill-ford, in or about the year 1184. Here they remained until their downfall, *temp.* Edward II. That sovereign made over this their property to Thomas, Earl of Lancaster (1310), on whose attainder a grant thereof was assigned to the renowned Adomar, or Aymer, de Valence, Earl of Pembroke, which grant carried also the Fiqnet (New-square, Lincoln's Inn-fields), and the Fleet Crofts. From Aymer de Valence, who died in 1323, the house passed to Hugh le Despencer, the younger, and, at his execution, reverted to Edward III., to the Crown. It then passed to the Knights of St. John of Jerusalem,* who, however, soon demised it for a rent of 10*l.* a year to certain students of the common law, who are supposed to have collected hither from Thavie's or Thavie's Inn. Immortalised by Chaucer in his Prologue to the "Canterbury Tales," the students so far recovered from their attack and plunder by Wat Tyler's men as to occasion their division into the Inner and Middle Temple Societies, whilst continuing to hold as tenants to the Hospitalers until the general suppression *temp.* Henry VIII.

So much of New Temple as then lay without Temple Bar would seem to have never been occupied as an Inn of Court. Dugdale opines, indeed, that it served for the reserved use of the prior and canons of the Holy Sepulchre. This portion, — by the style of Outer Temple, — was leased by the knights of St. John to Walter Stapleton, bishop of Exeter, who here suffered investment and death at the citizens' hands in 1326. Built by Stapleton, Exeter House thus formed one of the earliest of the riverside "inns," or town-mansions of our provincial bishops, for which the Strand became so chosen a locality. It continued to appertain to Exeter See up to the era of the Reformation. Its subsequent titles of Paget-place, Norfolk House, Leicester House, and Essex House, are in themselves a chronicle *in petto*. King Henry VIII. bestowed Exeter House upon his trusty councillor and executor, Sir William Paget, who was summoned to Parliament as Baron Paget of Beaudesert, county Stafford, on the 23rd of June, 1552. He was ancestor to the now Pagets, Marquesses of Anglesey. Paget-place, as re-edified by him, next went by purchase to Thomas (Howard), fourth duke of Norfolk, who, in 1550, had married, as his first wife, Mary, heiress of the Fitzalans, earls of Arundel. Duke Thomas, attainted of high treason for his communications with Mary, Queen of Scots, suffered in 1572 the same fate which fifteen years later, and for the same cause, overtook Thomas, third Baron Paget, grandson to William, the first of that title. At this juncture of the house's history Stow makes some confusion, for he speaks of the purchase by Thomas, Duke of Norfolk, as having taken place after the attainder, in 1587, of the third Baron Paget. We learn, however, from him that this Duke passed the property "over to the Earl of Leicester, who bequeathed it to his son, Sir Robert Dudley, and of whom the late Earl of Essex purchased it, and it is now called Essex House." Meanwhile Henry Fitzalan, Earl of Arundel, had

* See *Builder*, November 28, 1885.
† A name revived in the chambers lately erected over the site of Palsgrave-place, Strand.

become possessed of Hampton-place, "inn" of the Bishops of Bath and Wells, which stood next westwards on the other side of Milford-lane, together with certain tenements and messuages thereunto adjoining, for the sum of 4*l.* 6*s.* 8*d.* At his death, in 1579, Arundel-place, which lay over all the ground between Milford-lane and Strand Bridge-lane, devolved upon his only child Mary. As Arundel House it constituted the repository of the celebrated works of art which were brought hither from Rome and elsewhere by Thomas, grandson of the fourth Duke of Norfolk, to whom James I. restored the earldom forfeited through his father Philip's attainder.

In Arundel House was lodged Hollar, whose views thereof are supplemented by his plan before us showing ground-plans of Arundel and Essex Houses. The latter, abutting on the Strand, lies between Essex Court, Temple, and Milford-lane. From the middle point of the garden terrace runs an alley or walk to the river, at the foot whereof is a "bridge" or landing-stage. This stage may be taken, we think, to mark the position now occupied by the archway and steps at the foot of Essex-street. There is an entrance to Essex House from the Strand over against the eastern end of St. Clement Dane's Church, and opposite to the corner of the houses which formerly filled the space where the cab-stand now is. His house besieged, and guns laid against it from the tower of old St. Clement Dunes, Essex betook himself along Fleet-street and Ludgate-hill into the City. But there he found that a falling favourite has no friends, and after hearing himself proclaimed traitor in Gracechurch-street, ultimately surrendered on Queen Hithe, being partly moved, he says, "by the cries of ladies." It is said that the Countess of Nottingham, who withheld from Queen Elizabeth his last hope of clemency, died in the neighbouring Arundel House. In Essex House was born his son, Robert Devereux, the Parliament general; during whose residence it was known to royalist songsters as "Cuckold's Hall." On the successor to the old Grecian Coffee-house, in Devereux-court, is his bust: some would ascribe the bust to Cihher's chisel. The Palsgrave was lodged here when he came to marry the Princess Elizabeth, "Queen of Hearts"; and here Anne Sydney, daughter to the Earl of Leicester, passed her childhood. Lord Essex let one-half of his mansion, from the 11th of March, 1630, for ninety-nine years at a charge of 1,100*l.*, to William (Seymour), advanced Duke of Somerset on the 13th of September, 1660, who as Earl of Hertford had married the unfortunate Lady Arabella Stewart. Cunningham tells us that Lord Treasurer Southampton was living in Essex House at the Restoration, and Sir Orlando Bridgman, Lord Keeper, in 1663, when Pepys describes it as "a large, but ugly house." It was eventually acquired by Dr. Barbon, the builder, who with others laid out the property as we now find it, subject to the later improvements by Alderman Pickett in 1810.

In a part of the old house, clearly marked on the plan mentioned above, the Cottonian MSS. and books were lodged during the interval 1712-1730. Paterson, the auctioneer, next rented it as portion, which was then demolished *circa* 1775. On its site the Rev. Theophilus Lindsey, a convert from the Church of England, and Dr. Disney, forthwith established their Unitarian Chapel; Benjamin Franklin being present at the opening ceremony. After Dr. Disney's death in 1805, Mr. Thomas Belsham came hither from the Gravel-pit at Hackney. The present congregation, we are informed, have opened a fresh place of worship at the West End, where a memorial stone of Essex Chapel was laid on the 25th inst. at the Unitarian Chapel, Notting-hill-gate. The new works in Essex-street are being carried out by Mr. John T. Chappell, of Picnic, Messrs. T. Chatfield Clarke & Son being the architects.

Convict Labour in America.—An important measure will be brought forward by the American Congress, prior to the termination of the present session, prohibiting the Government contracts for buildings or public works being given in future to contractors employing convict labour, or using any of the materials produced by that class of workmen. This measure was resolved on in consequence of Secretary Manning's report, in which he states that under the existing law there is no power to reject or exclude any offer for public works.

ICE MAKING: ARTIFICIAL AND REAL.

ALTHOUGH ice may be produced by artificial means, it is not always, of necessity, artificial ice that is so produced, as we will presently show. By the employment of certain chemicals in combination an intensely cold substance may be formed sufficiently hard, when laid on a perfectly smooth flooring, to enable persons to skate upon it with ordinary steel skates. This is true "artificial" ice, as it is the result of artificial means scientifically applied; but in no way does it pretend to be frozen water, or anything approaching it, and therefore should, strictly speaking, hardly be termed "ice" at all.

Another way of producing what is sometimes, though erroneously, called "artificial" ice is by carrying out certain principles well known in natural philosophy, and, by the help of elaborate and most ingenious machinery, producing blocks of actually frozen water, and, therefore, in the true sense of the word, ice pure and simple,—real ice, in fact, but originated by scientific appliances. In both cases the article is manufactured by man's ingenuity; but, in the first, an actually artificial substance is obtained; in the second, a real substance by artificial means.

The manufacturing of "artificial" ice is not altogether new. The pleasure-seeking world of London were surprised and amused, in the year 1840, by the opening of an exhibition of artificial ice, called by the fancy name of the "Glaciarium." The exhibition was established at the now almost forgotten Colosseum, which stood in Regent's Park, and of which Braham, the great tenor, was then the lessee. Among its attractions was a rockery or grotto, with a cascade supplied by a fifteen horse-power engine. It was at the bottom of this rockery that the exhibition of the "Glaciarium" was arranged. The rocks were cleverly covered with chalk powder to represent snow, and this, with the aid of a few small fir trees stuck about here and there, a very fair,—if rather theatrical,—picture of "winter" was carried out. The level floor of this small confined space was covered with a preparation chiefly composed of muriate of ammonia, nitrate of potash, and sulphate of soda, which was formed into a thin sheet of artificial ice, yet sufficiently hard and thick to allow skating on it in ordinary skates. When the place was lighted up at night with a pale white light the effect of the rocks, the fire, the snow, and the skaters was undoubtedly not only very good, but very natural. The speculation paid so well at first that the patentee (Mr. Kirke) ultimately removed the exhibition to larger and far more convenient premises in Baker-street, a spot afterwards known as the "Carriage Bazaar," below Madame Tussaud's Gallery.* The edges or sides of the ice were surrounded by rockwork a couple of feet high, covered with powdered chalk and young fir trees, and dried grasses were planted about in different spots. Near to one corner was a hole broken in the ice, through which could be seen the water just below, and, on a pole close by was the ominous word "Dangers!" painted in large letters, a joke which took very well. The walls of the place were lined with painted canvas, representing a winter landscape of hill and dale covered with snow, and the effect of the whole was, in its way, very successful. Here a regular skating club was formed, and a small band played an excellent selection of music every evening, and, as any one might skate by paying a shilling, very pleasant and novel re-unions took place, and for a time the "Glaciarium" at Baker-street was all the fashion. In course of time, however, it outlived its popularity, like many other human institutions, and at last it was closed altogether, and has never since been attempted in London on the same plan, that is of actually making artificial ice of chemical compounds.

When "rinking" was all the rage, some years ago, and skates running on wheels were employed, the rink was merely a level surface of timber, slate, marble, or asphalt. This, however, was greatly improved upon by a curious and novel invention, for which Dr. Gamgee took out a patent, and which consisted of a skating-rink of real ice, formed by most ingenious artificial means. The rink was opened in Chelsea, and the surface of a small sheet of very shallow water was frozen by the

action of a powerful freezing mixture forced through a series of thin copper pipes passing up and down from end to end, laid close together just beneath the surface. So effectual was this plan in its action on the water, that, even in summer, solid ice was always produced of sufficient thickness to enable persons to skate upon it with ordinary steel skates. The surface was flooded twice a day with fresh water, which was soon frozen, and skating was carried on with great enthusiasm in the middle of summer, and yet on "real ice." But, like everything else that is governed by "fashion," rinking, whether on wheeled skates running on marble or asphalt, or on steel skates on real ice, gradually seemed to lose favour, and thus the exhibition at Chelsea followed the rest of the rinks into oblivion.

But by far the most useful, as it is the most practical, system of making real ice by artificial means is the invention of Herr Windhausen, a German engineer, of Berlin. The plan adopted, though simple in principle, yet requires a large plant of somewhat elaborate machinery to carry out, and by its means ice can be manufactured by the ton, or more, at a time, not for the pur-

taken up, or absorbed, by the acid, whilst the liberated air is at once exhausted by the pump. The result is that, in consequence of the absorption of heat during the process of the evaporating of part of the water, the rest which remains is so entirely cooled down that it is almost immediately frozen into ice pure and simple, and is, in fact, genuine ice produced by artificial means, thereby differing widely from Mr. Kirke's patent, where both the ice and the producing power were alike artificial.

Herr Windhausen's most useful invention is, therefore, only a very ingenious and clever adaptation of the above well-known and oft-repeated experiment, by the aid of beautiful and rather complicated machinery, which was designed by him in 1879, when many factories were opened in different German cities, and where ice was retailed at the low price of 6d. per cwt. The first manufactory opened in London was established at the premises of the Aylesbury Dairy Company, Bayswater, about September, 1882, but was removed last year to West Brompton, where it is now in full operation.

To describe machinery so as to be intelligible

Outline Sketch of the Patent Vacuum Pump and Ice Machine.

A.—Vacuum Pump.
 a, Large cylinder; b, small cylinder; c, suction pipe from pump to absorber and freezing cylinders.
 B.—The Absorber, containing sulphuric acid, which is kept in motion by revolving arms, a vacuum being maintained. d and e, pipes connecting absorber with ice cylinders, the connection between d and e being controlled by valve at top of d.
 C.—The Cylinders in which the ice is formed, i.e., the Freezing Chambers.
 D.—Vessels into which the water to be frozen first passes from the pipe f, before flowing into the cylinders, through the valve controlled by the lever g; h, the lid or bottom of the ice cylinder which is opened so as to allow the ice to fall out.
 E.—Block of ice.
 F.—The Concentrator, in which the acid is freed from the vapours absorbed during the passage of the water from D to C.

G.—Exchange apparatus through which the dilute acid ascends to be concentrated, and the concentrated acid descends to the store-tank H, from which it can be drawn by the vacuum into the absorber as required. In the exchange apparatus the boiling concentrated acid is cooled during its descent by passing over and outside the pipes through which the cold dilute acid is ascending.

K.—Tank into which the acid is received from the absorber after it has become diluted, and from which it is drawn into the concentrator.

L.—Small vacuum pump for maintaining vacuum in the concentrator. i, pipe conveying concentrated acid to store-tank H.

m.—Steam pipe from boiler.

p.—Connection-pipe between absorber and store-tank H.

poses of mere amusement for skating on, but for the general and general use to which ice is now so largely applied by confectioners, fishermen, private families, and the medical profession. The principles on which this system are based are well known to most students of natural philosophy, and especially to those who have practically examined the air-pump, and its powers and capabilities. The one great principle involved has been the subject, in almost all laboratories, of repeated experiments, and those of our readers who may recollect the old original Polytechnic Institution, when under the direction of Dr. Bachoffner and Professor Pepper, may perhaps remember to have seen,—for it was often exhibited there,—the very experiment on which Herr Windhausen's system is based. The experiment referred to is the freezing of water under the receiver of an air-pump, which was usually accomplished by placing two small shallow saucers, one filled with water and the other with concentrated sulphuric acid, under the glass receiver of an air-pump. When the action of the pump has produced a good vacuum, the water immediately begins to bubble up and evaporate, and the vapour so formed is rapidly

to ordinary readers, without the aid of diagrams is perhaps somewhat difficult. We will, therefore, not attempt minute details, but endeavour to give a simple outline sketch of the machinery and its action generally in the operation of ice-making.

On entering the factory, the first object which strikes the eye is the conical-topped concentrator, a circular cast-iron vessel, enclosed in a timber jacket, 7 ft. 6 in. high by 4 ft. 6 in. diameter, and lined with lead. This vessel contains many steam coils by which the acid to be concentrated is heated before it passes upwards, and is kept in motion by a small air-pump close by. From this concentrator the acid passes through several channels until it reaches the acid tank, or absorber, a long narrow, horizontal cylinder of cast iron, 33 in. in diameter and 23 ft. long, having a dome top for collecting the air from the freezing-chambers. This absorber represents the "small saucer of acid" in the well-known experiment, and the "small saucer of water" is represented by six upright cast-iron freezing chambers, of sugar-loaf shape, which are placed three on each side of the absorber, and the whole,—including, of course, the concentrator,—connected by pipe

* Since removed to the corner of Baker-street.

with a powerful double-action air-pump of very peculiar construction, the design, we believe, of Mr. Windhausen. These six freezing-chambers are about 7 ft. in extreme height, but half of their length, together with the absorber, is beneath the floor, and can only be seen by entering the chamber immediately below, from whence they appear to hang from the roof. The pure water is let into these chambers at the top, by means of a governing valve, and their lower extremities are fitted with hinged bottoms, which swing back, for the discharge of the block of ice within, when made. The ingenious manner in which the absorber is emptied of the diluted acid, and the acid forced, by vacuum pressure produced by the air-pumps, through various stages, back again into the concentrator, to be again returned, when concentrated, into the absorber, for further use, is a matter of minute detail, which we need not go into, as it is the great principle involved, and how it is carried out on so large a scale, that we wish to put before our readers.

We will now suppose that all is in readiness. The air-pumps are set in motion by the steam-engine, the concentrated acid passes from the concentrator into the absorber, and pure water is let into the six freezing-chambers. The air and vapour from these chambers pass, by vacuum-pressure, into the absorber, when the vapour is instantly taken up by the acid, exactly as it was in the small experiment, whilst the air collected in the dome of the absorber is exhausted by the larger air-pump, and the inevitable consequence being that each one of the freezing-chambers speedily contains a block of pure ice. The hinged bottoms of these cylinders (which, as already stated, appear as if suspended from the roof of the lower chamber, at about 6 ft. or 7 ft. from the ground) are then uncrewed, and if the external atmospheric pressure is not enough to drive out the ice within, at a given signal a little steam is introduced, when the huge block descends with a tremendous crash into a receptacle, like a large wash-tub on wheels, provided to receive it, when it is immediately removed to the store-house, to be trimmed for the market.

The blocks are about 5 ft. high, and average 370 lb. in weight, requiring only an hour's time to produce. Thus with six freezing-chambers nearly two tons of ice can be made in one hour, the cost of producing which is stated to be not more than 5s. per ton, which, if sold at 6d. per cwt. (as it is said it can be), or 10s. per ton, would give a fair enough profit.

The ice has a perfectly pure white opaque appearance, very much like frozen milk or snow. A scientific writer* says that this is possibly caused by "the enclosure of infinitely fine bubbles containing air, and we are assured that in consequence of this enclosed air this ice does not melt nearly so rapidly as the transparent block ice."

In shape the blocks have much the appearance of gigantic sugar-loaves, the top being usually somewhat depressed, but surrounded by this thin wall of ice, often assuming exceedingly pretty open-work patterns, not altogether unlike iced lace.

The air-pumps and other revolving work are driven by a small steam-engine of 6-h.p., and with the present plant at Lillie-bridge of six freezing-chambers about twelve tons of ice can be produced per day, the cost of which does of exceed 5s. per ton; and, although the machinery is rather elaborate, yet not more than two or three men are required to perform all the duties and keep the work going.

By the courtesy of the authorities the factory, during the summer, was visited by large numbers of persons, who were always invited to wait to see the "fall," and the managers generally contrived to produce a capital effect by discharging the whole six freezing-chambers either at once with a crash like a small thunder-clap or firing them off one after another in quick succession. It must not be forgotten that if ice is largely used as a table-luxury it is also most extensively employed for the cure of disease and for the alleviation of human suffering, and, as such, it becomes a most important adjunct to the labours of the medical profession. It is to be hoped, therefore, that Herr Windhausen's admirable system of ice-making may be soon extensively adopted throughout the country, more especially in all its larger cities.

ARCHITECTURAL EDUCATION.*

BY GEORGE MITCHISON, A.R.A.

IN all affairs, the best beginning is to find out the point at which to aim; the weapon we have to use; and the training to be gone through to hit the mark. The aim of the architect is to direct building, so that it may be substantial and enduring without waste of material; that the structure built may be more conveniently arranged than common, untrained sense can make it; that it be fit for human habitation, or for the purpose intended; and so fashioned inside and out, that it exhibits rhythm, and pleases the cultivated eye.

The 1st we call the science of construction; the 2nd, the art of planning; the 3rd, fitness; the 4th, the fine art of harmonic proportions, and the disposition of light and shade; to which may be added those phonetic and graphic arts which enable a project to be shown to the employer, and by which the directions are conveyed to the workmen.

Speaking, Writing, and Drawing.

Although these arts are subsidiary to architecture, and hypothetically it might be carried on without them; yet as they are mostly the first studies of the architect, it may be well to begin with them. It may, too, he truly said, that in the present day the greatest architect who did not possess them would have but a poor chance of being employed; though if such a one could get an important building to erect, his success might do much to send them out of fashion,—a consummation most devoutly to be wished." when draughtsmanship is mistaken for architecture; and to be a master of sketching in water-colours is considered to be a more valuable accomplishment than to be a master of harmonic proportions.

As the architect has merely to instruct and order, it is essential that he should possess that clearness of thought and expression that will convey his meaning, and not mislead. Writing is essential for instructions to be conveyed to a distance, is useful for reference in case of mistakes, and supplants memory when operations are extended over a length of time.

Mechanical drawing is the readiest way of showing the shape buildings and their parts are to take; is less liable to be misunderstood than verbal description; and, where geometry is used graphically, is essential.

Stereotomy, the art of depicting the cutting of solids, is too much neglected by architects in this country. And so is descriptive geometry. The lines for staircases and for vaulting that in France would be drawn by an architect, are here left to the joiner or the mason. The elaborate stellar groining and fan-vaulting of the Middle Ages, the honeycomb work and interlacing patterns of the Saracens, not to speak of the exquisite mouldings of the Greeks, could never have been invented by persons ignorant of geometry. Rondelet, in his "Art of Building," devotes a book of 182 pp. and forty plates to this subject.

Stone-cutting has been treated by Philibert de l'Orme; by Mathurin Jousse, who calls it "The Secret of Architecture," who also wrote a treatise on carpentry; and by Professor Willis in the Transactions of the Royal Institute of British Architects. M. Jules Bourgoïn has treated of the geometry used in forming the interlacing patterns of the Saracens in his book of "The Arab Arts." It is unnecessary to speak of Peter Nicholson's well-known books.

Perspective, too, is often of use in enabling the architect to see how his building, or any part of it, will look from a given point. It also enables him to present the form of his building to the employer, before a model is necessary.

The science of scenography, or of shading and shadows, is also useful, as it shows the extent of projections and the forms of things. Architecture proper demands no freehand drawing, but the architect will find it of great value if he can acquire it; it improves his accuracy of eye, and may improve his taste at the same time; it is a ready means of explanation, and if he can rapidly record for himself the look of any original, beautiful, or picturesque composition he may see. It enables him, too, to give some notion of the ornament, sculpture, or painting he wishes the sculptor or painter to use on his buildings. An excellent plan might be adopted here of handing over the finished compositions of the architectural students to

the students of painting and sculpture, so that the latter might draw in the statues, bas-reliefs, and carved ornaments; and the former might colour the figure-friezes, figure-panels, and coloured ornaments, and complete the colouring of the building. By these means the painters and sculptors would gain some knowledge of architecture; an insight into the severe style required of them when their compositions were to give greater value to the lines of the architecture, and receive greater value from them; it would enlighten the architects on the choice of places for painting and sculpture, and relieve them from covering spaces with dull ornament where painting and sculpture should be; it would be of invaluable service to the three arts, which are never so thoroughly effective as when they are properly combined.

Colour.

An architect must have a natural gift for colour, and his eye must be trained to appreciate harmonious colour, and to compose harmoniously, if he is to supersede the painter and successfully use colour, coloured marbles, or other coloured materials. The use of the brush is almost necessary for this study, and is absolutely necessary when he cannot choose on the spot the colours that are to be used. To be a good draughtsman in mechanical and freehand drawing confers great incidental advantages on the architect,—often undue advantages,—enabling him at any rate to present his projects in the most favourable manner. A large proportion of the great architects,—at least, since the Renaissance,—have been excellent draughtsmen. Nevertheless, it is better to have the substance than the shadow, and be a good architect rather than a clever draughtsman.

Construction.

The science of construction is founded on statics, or opposing forces producing equilibrium, and on hydraulics and hydrodynamics when the pressure of fluids has to be dealt with. If a knowledge of these sciences can be acquired, it will save much loading of the memory. The investigation of statics, hydraulics, and hydrodynamics is mainly carried on by algebra and geometry. Statics and hydrodynamics solve the abstract problems, while the architect has to deal with them wrapped up in those actual things we call materials, and the structure of the earth on which they stand.

Statics, Hydraulics, and Hydrodynamics.

The statical problems that are mainly to be dealt with in construction are,—the stability of piers, including columns and walls, *i.e.*, their power of resistance from being overturned by the wind, their capacity to bear the weight put on them, their diminution of strength by flexure, when tall in proportion to their diameter; the resistance of walls to the pressure of earth; their resistance to the thrust of arches, vaults, domes, and of inclined pieces of untrussed timber or iron; the strength of arches to stand alone, to support walls upon them, and to support weights in the shape of columns, piers, girders, or trusses that only occur at intervals; the strength of vaults to support themselves, and also to support weights equally and unequally distributed over them. Domes have also to stand alone, to support regular and irregular loads. Those that are to crown buildings often have to support lanterns; in this case the curve of the section of the dome is one of the elements of its stability. The other problems to be solved are,—the cross strains exerted on lintels, breastsummers, girders, beams, corbels, &c., the stresses and strains in trusses, roofs, and partitions. Hydraulics and hydrodynamics treat of the pressure of water against river walls, embankments and tanks, in aqueducts, pipes, sewers, and drains. The importance of this knowledge is readily shown. Many of you may recollect the bursting of the Sheffield reservoir, flooding an immense tract of country, drowning people, herds, and flocks, and washing down or overturning houses; while the bursting of the tank on St. George's Hospital broke down the whole series of wards under it to the ground-floor, killing some people and injuring others.

The answers we get to these problems are in general terms, either in an algebraic or geometric form, and to be practically useful have to be translated by arithmetic into the form wanted, when the weight and strength of the materials and the weight to be carried or the force exerted have been supplied. If we are unacquainted

* *Engineering*, 1882.

* A Lecture delivered at the Royal Academy on Monday evening last.

with statics and hydrodynamics, the rules of which can be applied to each fresh case, we must remember existing cases in buildings which have stood the test of time.

The ignorance of these laws means that we cannot lead in construction, but only follow; the few geniuses that can invent without having learned these laws systematically are rare exceptions.

It is also essential to know the weight and strength of the materials we daily use, and to have tables at hand for those we occasionally deal with. In addition to this we want to know the resistance of each material to the destructive effects of time and weather, and their excellence for the purposes required; the right proportions, and the right methods of mixing the materials of which mortars and concretes are composed; the proper bonding of bricks, stones, &c.; the jointing and putting together of stone, timber, and ironwork; and the various devices by which the inherent weakness of each material may be guarded against.

Although foundations are a part of statics or hydrodynamics, the solution of difficult cases calls for ingenuity and resource, i.e., where the ground is soft, marshy, or of variable powers of resistance; and still more when bogs or quicksands have to be built on, or the foundations are beneath water.

A large proportion of the young architects are in a state of prehistoric knowledge, everything is carried on by them unscientifically; they do not know the weight or strength of any of the materials they use, and are merely safeguarded by working within known examples; an instance may perhaps exemplify this better than much narration. I was once present when a young architect had to submit the drawings for a church to the inspection of a superior authority. The first question was, "Of what stone are the nave columns?" Answer, "Bath stone." Question, "What will the Bath stone you are going to use bear per foot?" A. "I do not know." Q. "What weight have they got to carry?" A. "I do not know." Q. "How do you know they will bear the weight?" A. "Sir G. Scott built a church higher and wider than this, with Bath stone columns of the same diameter; and it still stands." Q. "What is the thrust of the vaults at the main ribs?" A. "There is no thrust." Q. "Why have you flying buttresses?" A. "On account of their picturesque effect." No wonder the engineers laugh at us when our knowledge is of this sort; though I must admit that with this sort of second-hand knowledge, imitation of Medieval construction has been done, which no engineer would venture to do.

Pascal says architecture is one of the progressive arts, but it certainly will not progress structurally if we know nothing of these laws. In the case of iron, it is much too expensive a material to be used in an unscientific way. We cannot afford to use twice the necessary quantity of material, and, if it is ever to be used architecturally, it is not easy to get an engineer to tell us what a column or a girder will carry if we are to shape, mould, and ornament it afterwards.

Much of the halo that surrounds Roman buildings is due to their daring construction, and to their permanence. The Romans built the largest dome yet erected in the world; perhaps the widest vault, but even if the vaults of St. Peter's at Rome exceed those of the Basilica of Maxentius, it is only by a foot or two; and yet the Romans were hampered by the cost, as we may see by the devices they used to lessen the cost of the shoring and centering of their vaults and domes. This is explained in M. Choisy's work "The Art of Building among the Romans." The Mediæval architects built the highest buildings that we have record of, and though their vaults did not exceed the span of the Roman vaults, the quantity of material used in them was comparatively trifling. Not to speak of the feats the Mediæval architects did, in their vaults with pendants, they were constantly improving their methods of construction, and became at last so skillful that much of their work is like a bird-cage. I do not speak of this as an æsthetic success, but merely as showing their knowledge, skill, and boldness in construction. We have had imitations of Mediæval buildings by the hundred, but I never saw any attempt made to contrive their constructive skill, either by using thinner columns of the same stone or by making the vaults of wider span.

Before you can hope to rival the fame of the Romans or the Mediævals, you must show that your constructive skill is greater than theirs.

Scott Russell's dome at Vienna is 360 ft. in diameter; the Britannia tube is 450 ft. span, and the New Tay Bridge is said to be 1,700 ft., and these are by the engineers so many of us pretend to look down on.

Let us not barter away our fame as great constructors to become fourth-rate painters, modellers, or etchers in black-and-white.

I shall be delighted to see competent architects, with minds as encyclopaedian as those of the old Italian architects, who were often goldsmiths, painters, and sculptors, and sometimes poets besides.

We begin with architecture. When you are

until some mastery is gained; then to attack cathedrals, town-halls, palaces, and the like; and, finally, to practise planning on irregular-shaped pieces of ground,—at first without regard to the elevations, but eventually hearing in mind the effect that the shapes in the plans may or will have on the elevations. When some progress has been made, fine plans of existing buildings should be paraphrased, and the methods by which the various shapes have been turned to æsthetic account should be noted at least, if not paraphrased.

St. Paul's is a model for its vistas; St. Mark's for effects of light; St. Stephen's, Walbrook, for arrangement of columns with a dome; and nearly all Wren's churches are admirable for their ingenuity in planning; Sta. Maria della

Plan of S. Maria della Salute, Venice.—By Longheno.

perfect in that, by all means he a landscape-painter, like Inigo Jones; or a mathematician, astronomer, and anatomist, like Wren; or a playwright, like Vanbrugh; or a barrister, like Alfieri; or reverse the epigram on Perrault,—

"De méchant médecin devient bon architecte," and become a good doctor after having been an excellent architect.

Planning.

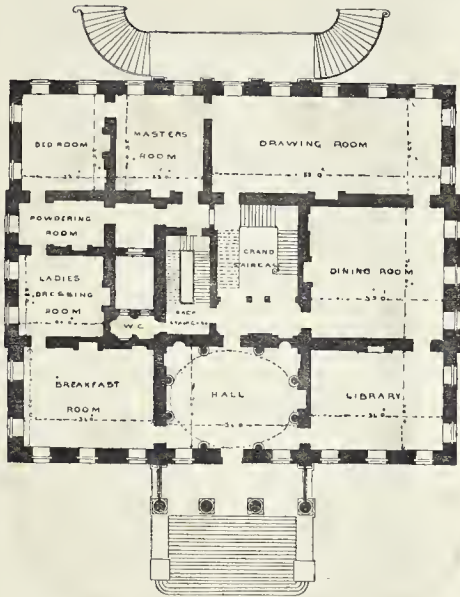

Common planning is but a matter of common sense, but original and brilliant planning evinces a special genius. The method to be adopted is to begin with a cottage, or some other simple building, and plan on paper ruled in squares, and proceed gradually through houses, mansions, chapels, churches, libraries, and hospitals,

Salute, by Longheno, for its shape; the Scala Regia at the Vatican, by Bernini, for its ingenuity and grandeur; the three Massimi palaces at Rome, by B. Peruzzi, for adaptation to an irregular site; the opera-boulevard at Paris, by M. Chas. Garnier, for its simplicity and elegance; Blenheim, by Sir J. Vanbrugh, for its excellent arrangement as a palace, both for convenience and effect; and the Houses of Parliament, by Sir Chas. Barry, for simplicity and grandeur. Capability Brown was said

* We append a few of the plans referred to. We hope, however, that Mr. Aitchison does not mean to recommend to the admiration of students the trick of false perspective by converging the lines of the staircase, whereby Bernini sought to give an impression of greater length to the spectator entering the staircase. The best criticism on such an architectural " dodge " is to look at the perspective from the narrow end.—Ed.

Plan of Scala Regia, Vatican.—By Bernini.

Plan of Claremont.—By Lancelot Brown.

Massimi Palace, Rome.—By Baldassare Peruzzi.

grasp at the same time the utility of the form chosen in the plan for the external effect he wishes to produce.

Fitness.

To begin with human habitations, and with those, too, in towns where the site is already chosen; the requisites to make the buildings fit are that the inside be sheltered from the wind, be dry, with light enough for health and for indoor occupations; that each room contains sufficient air for the occupiers, has a constant supply of fresh air, and the means of escape for the air fouled by human breath and exhalations, and by artificial light. The lantern-maker learned this lesson long ago. He found out that when the door was shut, the light gradually went out; and he eventually had to make a hole at the top for the foul air to get out, and one or several at the bottom for the fresh air to get in. Most rooms have fire-places, doors are often opened, and windows occasionally. Most materials are pervious to air, and most work is ill-fitting, so the health of the occupant of a room is only damaged; he is not suffocated, or the fault of having no permanent ingress and egress for air would have been corrected before the lantern was invented.

The Egyptians found this out, as there is a vent for the air to enter, and another for the air to go out in the chambers of the Pyramids.

Easy means of well warming the house must be provided. It must be furnished with a sufficient supply of good water for drinking, cooking, washing, and cleaning; and this water when used, and all excreta, must be carried away from the site; as well as the water that falls upon the house; the house, too, must be free from bad smells and pernicious gases, and he so made that it is not too easily heated by the sun, nor chilled by the cold.

When a house is built in the open country, care must be taken to remove it from undrained and marshy ground, from the immediate neighbourhood of trees or woods; to place it where it is not overshadowed by mountains, and neither scorched by the sun nor exposed to piercing winds. In this case, too, the rooms should be so arranged that the light enjoyed by them comes from the right quarter; from the north for libraries, picture galleries, beer cellars, larders, and dairies; from the south for drawing-rooms and nurseries; from the east for bed-rooms; and from the west for dining and tea rooms.

Time will not admit of the description of the requisites for all sorts of houses and mansions, much less for all the buildings that are required by man.

Architecture as a Fine Art.

The one main requisite is that every part and the whole should be in harmonic proportion, for without that architecture as a fine art can scarcely exist.

Geometrically speaking, the line A B is said to be harmonically divided when the two points, C on the line, and D on its continuation, are so placed that $A C : C B :: A D : D B$; then CD is an harmonic mean between A D and B D. Whether we see any charm in these proportions or not does not matter, for there can be no doubt that certain proportions are much more agreeable to the eye than others.

Æsthetic architecture and music consist in the proportioning of one part to another in such ratios that in one case the cultivated eye, while in the other the cultivated ear, receives delight.

an excellent planner, but I do not know his works, mostly consisting of alterations. 'Claremont,' the one house he built, cannot be said to have a brilliant plan. In making elaborate plans, where many forms are required, of various shapes and

sizes, the cutting out in cardboard the rooms and passages is often of assistance. Planning should be carried on simultaneously with the other architectural studies, but it can only be finally perfected when the æsthetic part has been mastered too, for the architect must

According to Vitruvius, many Greeks and some Romans wrote treatises on harmonic proportions, but all these treatises are lost, and this science can only be recovered by carefully measuring the remains of Greek buildings, and calculating the ratios. Thanks to Mr. Penrose, much of this has been done for us, and we are able to see and appreciate the subtle methods by which optical defects were not only cured, but turned into beauties; there is a treatise on this subject by John Pennethorne, the brother of Sir James Pennethorne,—the only attempt I know in England to elucidate this subject. M. Aurès has also written on the subject, and on the "Scamilli impares" of Vitruvius.

I know of no better way of training a man in proportion than to make him draw out the Greek orders and buildings, and to make careful analyses of the proportions, until his eye gets so skilful that it serves him, like Michelangelo's, instead of compasses. When the pupil has trained himself in this way, he should continue his studies by calculating the ratios of other fine buildings.

I have told you before that the exquisite proportions of the Reform Club were to some extent due to Sir Charles Barry having had the ratios of all the fine Italian palaces carefully calculated, and taking a mean of them for his guide. Sir Charles was, however, specially gifted, if I may be allowed this here; at least, all his buildings are characterised by admirable proportions, and if you object to attributing superior genius to any one, let us say he studied the subject more, and make our peace with Buffon, who described genius as the gift of taking pains.

In one very important respect architecture is not like music, for music is purely for delight; it has no substructure, and when its sounds have ceased, there is an end of it; but architecture has not only the substructure of building, but the building itself is for some human need, and its actual proportions have been doubly restricted, i.e., by the necessities of the building, and by the cost.

Architecture, therefore, is like pure geometry, a problem to be solved under restrictions. It is only by skill and artifice that harmonic proportions can be given to buildings whose length and height are determined on other principles, or that have their stories not arranged harmonically; and this is mainly done by means of strings, pilasters, panels and mouldings, &c. Invention, too, is to be shown, and the art of composition. Invention is a natural gift; the great architect is a poet in stone, and as Horace truly says:—"the poet is born and not made," though Ben Jonson corrects part of this too sweeping assertion by the remark, that "poets are made as well as born," by which I understand that however great the native poetic genius may be, a great deal of study is needed as well. By many it is believed that no man should be an architect without possessing fertility of aesthetic invention. In composition there are many rules, and some, if not all, of these can be learned, but I shall not enter on these laws now.

It seems to me that if any one can construct soundly, can plan conveniently, make his building fit for its purpose, and can put it into harmonic proportions, we cannot withhold from him the title of an architect. He may not be a great architect, for this requires that he should construct daringly, plan brilliantly, exhibit more than ordinary fitness in his building, and give novelty, exquisiteness, or marked and appropriate character to his building.

It seems to me that if a building is well planned and made fit, it must have the character of its purpose impressed upon it. Supposing M. Zola's remarks on modern churches in France be true, they could only show that the architects had not sufficiently studied the necessities of churches, though I by no means agree with him. The new church of St. Augustin, in the Boulevard Malesherbes, is to me a most characteristic and beautiful church, and I fancy that the habit of seeing most churches of the Gothic type has insensibly warped his judgment. This is what he says:—"Have you remarked what sort of churches they build nowadays? They resemble anything you like,—libraries, observatories, pigeon-houses, barracks, but surely no one is convinced that the Almighty dwells therein."

No architect, I imagine, would leave his buildings without sculpture if he could help it, and by sculpture I mean all carving,—whether

of ornament or figures,—and few would not call in the painter's aid as well, for it is his art to deal with colour.

It seems at first as if light, shade, and shadow were only the necessities by which the shape of buildings, and their parts, are shown, and that it is as unnecessary to mention light and shade as to say that a project can only be exhibited by models or delineation; but on reflection we shall be convinced that they fulfil certain functions of their own. Shadow alone is perpetually forming new shapes; shade is the spirit attached to light, relative projection, and to modulation of surface; but daylight and moonlight shadow is dependent not only on projection, recesses, and modulation of surface, but on centres of light and motion. Too little regard is paid to these conditions. A different which greatly depend on climate. Where the sun treatment is wanted in Egypt,—where the sun is constant and powerful, and where the moonlight is as bright as our sunlight,—from that in Greece or Italy, where, though the sun is generally bright, it is less powerful; while in England and the West, shade rather than shadow is the important consideration, as the air is too often thickened by mist, and the sun is too often invisible, and where to design surfaces for sunlight is to have them spoiled for too great a portion of the year. We had better have buildings look harsh in clear sunshine than have them obliterated for the best part of the year. Small fluted columns high up in a building might as well be plain on dull or misty days; then all fine ornament is obliterated, and delicate mouldings meant for sunlight become at once tame, dull, and ineffective. Nothing can be duller than the Doric of the Greeks in London, but how superb and beautiful in Magna Græcia. Nothing can be finer than the lace work of the Ducal Palace at Venice, shadowed on the wall, or the fretwork of the pierced caves-boards on the walls at Cairo; but here these effects are generally lost, and unless you see the parts themselves hack against the sky they produce no effect. Much too little attention is given to what should be one of the architect's most important observations, the precise effect he is to gain by duty-proportioned projections and recesses, and to the shape of his mouldings; they are too often designed in modern work for sunshine, so that when seen in dull and misty weather,—the bulk of our weather here,—they lack the effect intended. In respect to observation of the effects of climate, the Gothic architects are worthy of all praise. We may like or dislike the proportion or the shape of their mouldings, but they are made to be effective in the duller weather. In a succeeding lecture I hope to explain mouldings more in detail.

There are a few points I wish to advert to. Although I think that buildings with good harmonic proportions would always give satisfaction to the educated eye, we must not forget the adage that "the human mind is greedy of novelty," and, in the present century, the taste in architecture has been nearly as changeable as the taste in dress. Greek, Italian Gothic, and the different forms of European Renaissance, have followed one another with remarkable swiftness; the only one that has not been imitated is Early Italian Renaissance, whose effect is greatly due to sculpture. Interspersed with these, a few cases of almost all known styles have been imitated or paraphrased. Whether anything at once stable and progressive is to come out of the present chaos I cannot prophesy, but it is quite evident that unless it does, any architect, however able or fashionable, who is wedded to one scheme of proportion, may find himself left, like some pre-Adamite animal, without the means of subsistence. So let me hand down this warning, given by Professor Cockerell from this Chair to the students of his day. I will give one instance, that of Decimus Burton, born 1800, died 1881, who practised in the Romano-Greek style, and whose triumphal arch and screen still stand; one on Constitution Hill, and the other forming the entry to Hyde Park, nearly opposite. The *Builder*, in speaking of his death, says:—"Mr. Burton's long life is only just terminated, and yet the method of architecture he practised during a long professional career is already like a vanished dream." Another point is the distinction to be made in the treatment of different classes of buildings, and the different treatments require different studies. In designing small private houses, shops, and small villas, lightness, elegance, even eccentricity, may be allowed; whilst in

the mansions of judges, great soldiers, great sailors, and great statesmen, a greater character of dignity is required, for they are a sort of halfway house between private and State buildings. The halls for great corporations, whether of doctors, musicians, men of science, merchants, bankers, traders, or townsmen, require not only greater size and importance, but a certain gravity; theatres are to be treated differently to parish churches and chapels; and at the head of all are buildings for the State, for the Crown, and for the greater functions of religion, which require grandeur, sublimity, and the last efforts of perfected art. You cannot more appropriately reduce a temple into a park-keeper's lodge than you can enlarge an appropriate lodge into a stately mansion or an office of the State. Buildings should be designed from the inside; the proper plan should make the proper building, but more care should be allowed to individual caprice in small private buildings than in great public ones, in which there should be exhibited greater nobleness and dignity; so that even the uneducated public should discern that the building was for the purposes of the State. Size alone requires a different treatment, and knowledge of the effects produced by distance, and we may even sacrifice some slight convenience for the sake of symmetry, grandeur, and dignity. Most of the great architects of the past caught the grand style by careful measurement, observation, and calculation of the proportions of the ruins of antiquity, but this study seems now to be abandoned. Hence we have but few architects amongst us to whom grand public structures can be safely entrusted.

A very able French architect made the remark in my hearing:—"I have seen a vast number of English buildings in the United Kingdom, and nothing can be more charming and original than the smaller private buildings; every want seems to have been considered, every difficulty carefully worked out, and most frequently a hearty made of it; but I cannot say this of your public buildings."

In the present day curious notions are abroad that each class of building is best carried out in a different style. This is, of course, an abominable heresy, and merely results from the present jumble of styles. At each period were the so-called styles originated there was a thought of such a thing. Civil, military, ecclesiastical, small, middling, and great buildings were built in the same style, and only differed in their shape, size, greater dignity, and amount of elaboration, and when we get a style that will again be the case.

The students of the present day resolutely set their faces against iron. They know nothing about it, and do not want to know anything about it, even in the lowest and most meagre country sense. Every section that is published of any important modern building, whether a house or abroad, bristles with iron girders, iron columns, and iron stanchions. In warehouses and workshops the employer will not have the space at his command wasted nor his building encumbered by huge piles of brick or stone. In large rooms, deep enough will not be given for long girders, one span, and iron columns have to be introduced. In our narrow streets, and with our dull and misty atmosphere, shopkeepers will have all their light obstructed, nor their opportunity of exposing their wares restricted, leaving the greater part of the fronts of the shops dead wall. Why, then, should the student object to study that, which they will almost certainly have to use, and be wholly in the hands of engineers and ironfounders for the construction, and the papier-mâché making for their ornament? But I put it on me higher ground,—you have to your hands a new material in several conditions, each with peculiarities, advantages, and disadvantages inherent in it. I speak mainly of cast-iron, wrought-iron, and steel. What can better your own skill in designing than these new materials, absolutely unhampered by any tradition? If you were fired with any noble ambition, or were even desirous of furthering your art, nothing could be more fascinating than the endeavour to bring these new materials into the domain of architecture. None are more ready to exclaim against the monstrosities or abortions of the engineers than young architects; yet they decline the attempt to bring the constructions within the pale of architecture.

As far as I can judge, the ambition of the

THE BUILDER, FEBRUARY 27, 1886

Well upon a time
 there was one Diabolus
 a wizardly man
 made an assail upon this famous
 town of Mansoul
 to take it and possit his own habitation
 This shant was
 King of the Plagues and a most rancid
 prince he was

Mansoul it hath become
 two worlds there is turred up in the middle
 of the town a most
 high castle called a castle of pride
 a business parade
 for laziness so as within the whole
 of it had freash
 beauty of colour
 and grace

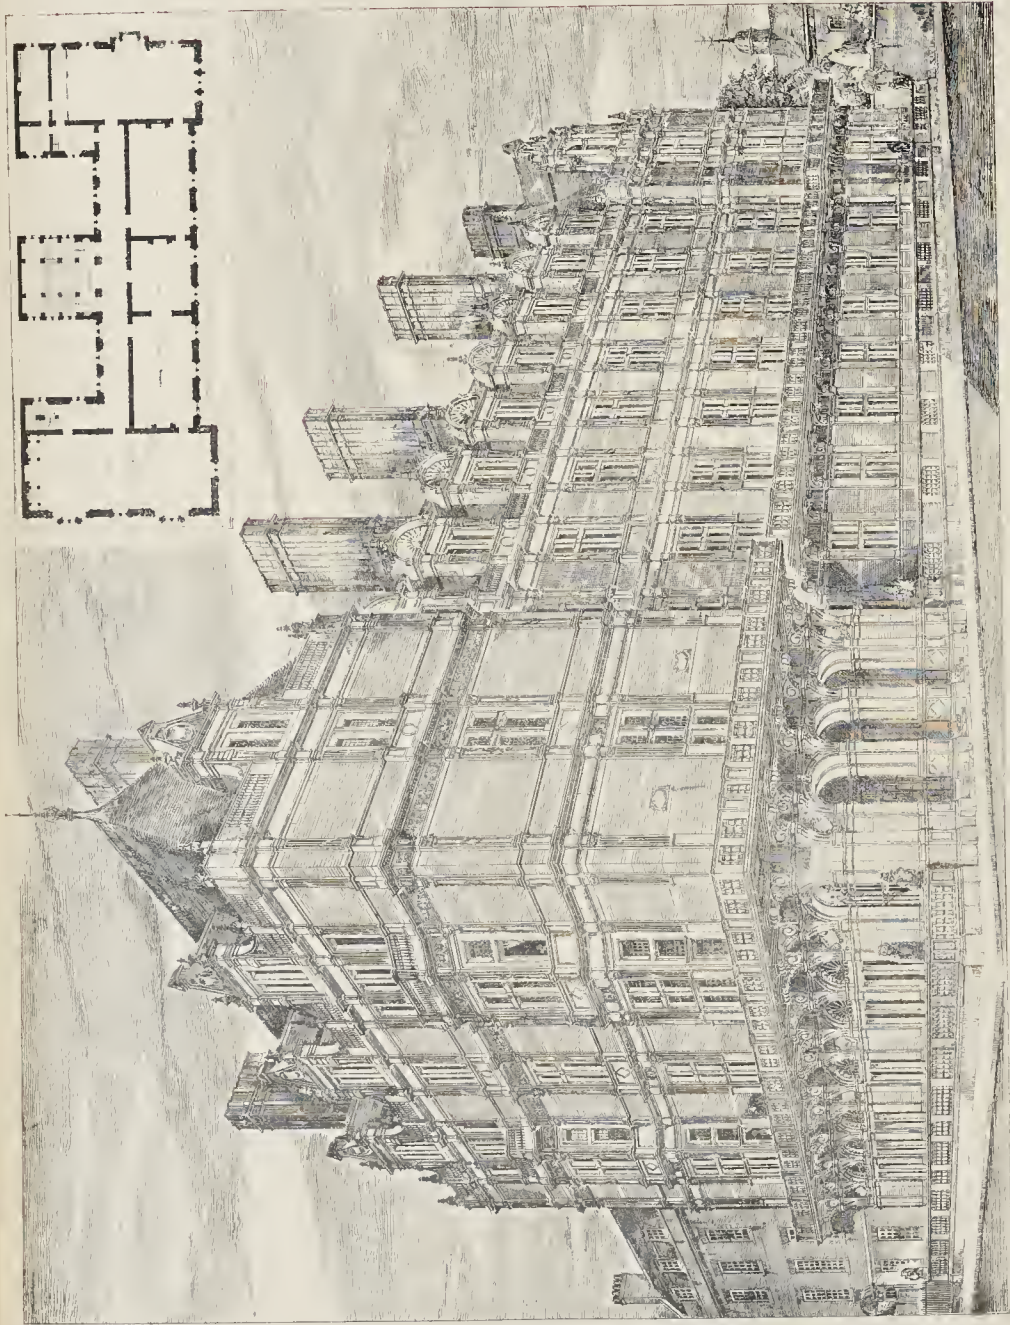

The unarm'd power
 he made war upon the Great Diabolus
 even while he was possess'd of the town of Mansoul
 that he would fight by strength of hand
 true honour of
 his hold and take it to himself to be his Habitation.

rising generation of architects is to be purely designers, to forego the masculine and grand work of constructive architecture, to fit themselves to be "the young men clever with their fingers" who are employed by the builder and the engineer to redeem their work from absolute barbarism. If, with this ideal before them, they will not even take the trouble to emerge from commonplace routine, the sooner the whole generation is swept away, into some more useful channel, the better.

Illustrations.

WINDOW, ELSTOW CHURCH.

HIS window, executed by Messrs. R. W. Winfield & Co., has been recently fixed in Elstow Church. A previously-executed window by the same firm, and in the same church, was occupied with subjects from Bunyan's "Pilgrim's Progress." The present one illustrates Bunyan's allegory of the "Siege of Mansoul," the "Holy War." The following description is reprinted from a portion of an account furnished to the *Birmingham Daily Post* at the time the window was put up:—"The central light of the window represents the town of Mansoul. The text which it illustrates runs as follows:—'It lieth between two worlds. There as reared up in the midst of this town a most famous and stately palace, called a castle, for easiness a paradise, for largeness so as to contain the whole world. It had five gates, Eargate, Eyegate, Monthgate, Nosegate, and Seelgate.' Eargate is placed in the front, and the main street leads, with buildings right and left, to the citadel, which is surrounded by a triple wall, with gates and towers, and rises to a great height in the centre of the town, and occupies the principal part of this light. On the left side (looking at the window) is the city of Diabolus. The chief figure is Diabolus in consultation with Beelzebub. Below, behind, and above are Alecto, Lucifer, Apollyon, and other officers, waiting for the descent upon the town, with their banners. Below are emblems of disease, and death and destruction are further indicated in the withered leaf, thorn, flame, bones, &c. The tone of this light is low in colour, as suited to the character of its subject. In the opposite panel Emmanuel stands in armour of light gold and silver, and crowned, surrounded by Captains Goodhope, Credence, Charity, Innocent, Patience, and their ensigns. Above, angels rejoice at the prospect of the recovery of the city, and below the emblems of Life, Purity, and Duty are indicated in the springing flowers of various kinds and hues in their bright array. The tracery lights are filled with Emmanuel's signs, and the text illustrated runs along the top of the window." This and the "Pilgrim's Progress" window occupy the east end of the church and south aisles of the parish church of Elstow, Bunyan's native village, and are designed by Mr. T. W. Camm.

LIVERPOOL CATHEDRAL COMPETITION. DESIGN BY MESSRS. BODLEY & GARNER.

To give this week the north elevation of Messrs. Bodley & Garner's design, but with the central spire omitted, showing a contrast of the crossing more on the lines of that at Ely, which suggested the plan. On the design as exhibited at Liverpool there was placed so as to cut off the spire at pleasure, to show the effect of either treatment. The central composition with the lantern only, to our thinking, very harmoniously; but were adopted, it would be desirable in that to give rather more height and importance to the western towers and spires, the whole effect of the composition being altered by the omission of the central spire.

DESIGN FOR A TOWN MANSION.

This design was submitted in December last in competition for the Biennial Gold Medal and the Gold Studentship of the Royal Academy. It was, but the judges considered that its merits, Mr. H. O. Cresswell, had failed to comply with the condition as to the limits of cost and declined to consider it. The house was planned and the design dignified and artistic, so that, without questioning the

justice of the decision regarding it, we must regret that the rules of the Royal Academy did not admit of its exhibition with the other designs at Burlington House. The plan given is that of the first or principal floor. The successful design was illustrated in our issue of December 26th, and we hope shortly to give some of the others.

ST. MICHAEL AND ALL ANGELS' CHURCH, WALTHAMSTOW, ESSEX.

This church, which will accommodate 823 persons, was consecrated on the 18th of November last by the Bishop of St. Albans. The walls are built of stock bricks, with red brick band and arches. The tracery and other parts are of stone. The style of the architecture is Early Decorated. The cost was 8000*l.*, exclusive of tower and north porch. The schools, which are built, join the church by a cloister at the south-west corner, and the parsonage-house will be commenced in the spring.

The length of nave and aisle is 104 ft.; width of nave, 28 ft.; total width of church, 56 ft. 4 in.; length of chancel, 27 ft.; aisle, 10 ft. wide; height of chancel to wall plate, 39 ft. 6 in. The roofs are open timber, covered with tiles. The flooring is wood-block with open skeleton seats. The side chapel is formed out of the eastern bay of nave arcade. The baptistery is at the west end. The windows in the morning chapel and baptistery are all filled with stained glass.

Mr. J. M. Bignell was the architect, and Messrs. Adamson & Sons, of Putney, were the builders.

LIVERPOOL CATHEDRAL DESIGNS.

(In the High Court of Justice, Chancery Division.) Before Mr. Justice Kay, Feb. 25, 1886.

COX AND ANOTHER v. BRADLEY AND ANOTHER.

This was an action by the proprietors of the *Builder* Newspaper against the printers and publisher of the *Building News* for an injunction to restrain the defendants, their servants and agents, from publishing, printing, selling, or circulating in the *Building News* any photographic, lithographic, or other copies of designs for the Liverpool Cathedral taken from plates published by the *Builder*, and for damages for infringement of copyright.

Mr. Hadley appeared for the plaintiffs, and Mr. Swinfin Eady for the defendants.

Mr. Hadley said,—This is an action by the proprietors of the *Builder* against the printers and publishers of the *Building News*, in respect of the copying, by a photo-lithographic process, of the *Builder's* plates of the Liverpool Cathedral. Since the notice of motion,—leave to serve which with the writ was given by your Lordship,—the defendants have confessed that they have been doing that which was wrong, and Mr. Swinfin Eady is instructed to consent to a perpetual injunction in the terms of the notice of motion, and to pay all costs, the plaintiffs waiving the question of damages. The action, therefore, stands in this way: the plaintiffs take a perpetual injunction in the terms of their notice of motion, as regards copying the *Builder's* plates of the designs of the Liverpool Cathedral, the defendants paying the costs.

Mr. Justice Kay.—Let it be so.

ARCHITECTURAL SOCIETIES.

Architectural Association.—The next meeting in connexion with the intended excursion to Italy will be held at 9, Conduit-street, on Tuesday next, the 2nd of March, at 6.30, when the subject of Renaissance work at Rome will be considered.

Birmingham Architectural Association.—The fourth ordinary meeting of the current session was held at Queen's College, Paradise-street, on Monday evening last; Mr. John Cotton (Vice-President) in the chair. The following gentlemen were nominated for membership:—Mr. T. N. Parr and Mr. F. W. Baker. A paper was read by Mr. W. Henman on the "Construction and Arrangement of Staircases" which was fully illustrated by diagrams, sketches, &c. A discussion followed. A vote of thanks, proposed by Mr. T. P. Osborne, and supported by Messrs. T. Newton, F. Peacock, J. Cotton, and the secretary, was unanimously accorded to the lecturer. After a lengthy response by Mr. Henman to the many questions propounded, the meeting terminated.

COMPETITIONS.

New Public Offices, West Hartlepool.—Mr. Alfred Waterhouse has acted as assessor in this competition and awarded the premium to Mr. R. Knill Freeman, of Bolton-le-Moors. There were thirty-one competitors. At the meeting of the Commissioners, held on the 16th inst., the award was confirmed, and Mr. Freeman appointed as architect to carry out the works.

Kingston Infectious Hospital Competition.—On Wednesday, the 17th inst., the members of the Kingston Rural Sanitary Authority were engaged in making the selection of designs sent in for this hospital, the result being as follows:—The first premiated design was that under the motto "Efficiency with Economy" (Messrs. W. Jacob Gibbon & W. H. Woodroffe); the second premiated design was "Three Fishes" (Messrs. Carritt & Monier Williams); the third was "Isolation" (Mr. Charles Bell). The design placed first consists of an administration block, three isolation-ward pavilions, and a laundry &c. block, with a suggested alternative special isolation and probationary ward pavilion. A feature specially considered in this design was the ventilation and drainage, of which elaborate details were given. The system of drainage adopted was to treat all slop-water by the process known as "Intermittent Downward Filtration," which consists of evenly and intermittently distributing the slop-water over a well-prepared area of land and collecting it after filtration by under-drains, the effluent water being discharged in a pure condition. Earth-closets are used throughout. The cost of the buildings, &c., will amount to some 6,000*l.*

THE PRESERVATION OF TIMBER.

AMERICAN engineers appear to be awaking to the fact that even the vast stretches of forest land within the Union will not supply timber for ever at the extravagant way in which it is now used. With a view to stopping, as far as possible, one important source of waste, the American Society of Civil Engineers appointed a committee in 1880 to inquire into the best means of preserving timber from decay, and their report has just been published in their Transactions.

The leading methods of preserving timber in use in the United States appear to be the following:—(1) Kyanizing, which is an application of corrosive sublimate; (2) Burnettising, or the use of chloride of zinc; (3) creosoting; and (4) Boucherie's process, which is an application of sulphate of copper.

The result of exhaustive and long-continued observations showed that kyanised timber is well adapted for bridges, trusses, fences, and exposed structures generally, but for railway sleepers, pavements, and other works, subject to damp the system is not so well adapted, as the corrosive sublimate is apt to get washed out. The floor of an engine-house in Charleston was treated in this way because the location was very damp, but the wood decayed apparently as fast as if no special precautions had been taken.

In Burnettising chloride of zinc is used instead of chloride of mercury, and this process appears to be better suited to sleepers and work of the kind than for bridge work. Pine timber Burnettised becomes brittle, and when zinc solutions weak enough not to impair the strength of the timber are employed, they are likely to be washed out by rain. Creosoting is too well known in England to require dwelling on here, as, by the law of the survival of the fittest, it has been proved to be the best means of preserving timber in almost all instances. Creosote, however, is dear in America, and the price of labour also tells against the application of the system in the United States. On the whole, the Committee came to the conclusion that it would be cheaper in most cases to let the timber rot, and replace it, than to incur the expense of creosoting it.

Dr. Boucherie's method of forcing a solution of sulphate of copper into the timber with the grain is well known in France, where it has been in successful operation for many years, but the Committee finds many objections to its use in America. The logs have to be treated on the ground when freshly cut, and, putting aside other inconveniences, the frost would prevent the application of the system, especially in the

Northern States, where the timber is cut in the winter.

Among other systems experimented on was the Earle process, which consists of immersing timber in a hot solution of sulphate of copper and sulphate of iron. The durability of the wood was in this way increased, but the strength was impaired, and it became so badly warped as to be useless: the system was therefore abandoned. Lime and salt were both used for impregnating timber, but with poor success, and charring it gave unsatisfactory results. A dry powder, consisting of salt, arsenic, and corrosive sublimate, was introduced some years ago. It scarcely had a fair trial as a system of timber preservation. Railway sleepers treated with it were eagerly licked by cattle for the sake of the salt. The line was strewed with dead cows for ten miles. The farmers rose in arms, and forced the railway company to take up and burn the sleepers.

In an appendix to the report, comparison is made between the respective merits, from a financial point of view, of the different systems, but it is questionable how far the losses worked upon may be accepted, and in any case the result would have comparatively small value for English readers. The preservation of forests is also treated of in a separate appendix. From this we learn that the supply of first-growth white pine will be practically exhausted in the course of eleven years. The lumber cut during a single year in the States of Michigan, Wisconsin, and Minnesota would load a line of trucks nearly 7,000 miles in length. Vast quantities of hemlock have been destroyed for the bark alone, elms have been burned for the sake of the potash in their ashes, and a great deal of growing timber is hurried in order to clear the ground. But the greatest destroyers of timber are the forest fires. In Ottawa, it is said, ten times as much timber is burned as cut. In spite of all this, the compiler of the appendix concludes that if reasonable care were taken to prevent waste, and the forests were duly re-planted, an abundance of timber may be secured for many generations yet to come.

THE SIXTIETH EXHIBITION OF THE ROYAL SCOTTISH ACADEMY.

A FOREIGNER who this year paid his first visit to Edinburgh, after making the round of the galleries of the Royal Scottish Academy, asked "Is this the best that your Academy can produce after an existence of sixty years? The catalogue gives the number of works exhibited as 1,167; of these only about a dozen are at all remarkable, one or two hundred do not reach beyond mediocrity, and the rest are,—well." In reply he was informed that the Scottish Academy was in the position of a feeder to the Royal Academy; it was pointed out to him that the work he most admired, "The Salon of Madame Récamier," was the work of Mr. Orchardson, a Scottish Academician resident in London, and that the "Church Lottery in Spain" hanging opposite it,—a remarkably vivacious work displaying a variety of well-characterised expression and rich harmonious colouring,—was from the studio of Mr. W. E. Lockhart, who was about to join the Scottish contingent in London.

It is certainly the case that there are fewer important pictures exhibited than usual, the collection owing very little to extraneous sources. There are no canvasses by Leighton, Millais, Alma Tadema, or other distinguished Royal Academicians. There is, indeed, the portrait of Lord Balfour of Burleigh, by Frank Holl, and two charming landscapes by J. W. Oakes. Of non-resident Scotchmen there are examples of the handiwork of James Archer, John Ballantyne, Hugh Cameron, Thomas Graham, K. Halswell, D. A. Murray, Calder Marshall, G. A. Lawson, and John R. Reid. The pathetic subject of the last-named artist, entitled "The Fatherless" tells its own story and excites the sympathy of the spectator. Opposite this picture we have a happier theme, "A Story of the Flood," by R. Macgregor, who introduces us to a homely interior, admirably painted and lighted, where a hearty old grandfather exhibits to his grandchildren the contents of a toy ark and tells the often-told tale to the wondering young folk.

Mr. Martin Hardy, in his delineations of everyday life, has now got quit of a taint of vulgarity

which detracted from their merit, but they have not lost in vigour of characterisation thereby. He gives us a delightful representation of "Our Grandmother's Dancing School." Facing us stand a row of blooming young damsels, one of whom is being specially put through her steps by the alert dancing-master, who, clad in green coat and black velvet "smalls," shows the awkward pupil how to do it. Another damsel watches the teacher with attention, but the rest are more attracted by the groups of male pupils who wait their turn for instruction. In drawing, colour, and expression this work is very satisfactory. Mr. Hardy, we suspect, will succumb to the magnetic attraction, and by and by migrate to the metropolis.

"The Stroller's Tale" is graphically rendered by Mr. G. O. Reid. The stroller, dressed in tights, over which he has thrown a top-coat, has retired to the village inn to enjoy refreshment after labour, his daughter, exhausted by her exertions and still arrayed in tawdry finery, has fallen asleep against the big drum, whilst the mother is engaged in cooking something at the fire, and the stroller himself is discoursing at large to a group of rustics. While admirably conceived, the colour is somewhat crude and lacking in harmony. Robert Alexander's "Wet and Weary," a ploughman returning homeward with his team under a drenching rain, and over the saturated fields, conveys to the mind what the artist intended. The cold, damp, gray atmosphere is admirably rendered, and both horse and man are well put in. John Lavery, a Glasgow artist, whose name is new to us, has a clever picture which he calls "A Pupil of Mine," depicting a young lad engaged in making a study from nature in a garden.

But really the most interesting work in the Exhibition is that of a group of young men (some of them not of age, and still pupils), which if sustained in their future career from the present standpoint will lead to great results. Duddingstone Herdman's portrait of his father will compare favourably with any similar work in the rooms. John Gangee Stanton, son of Clark Stanton, R.S.A., has a small landscape, "Where Branches dip in a quiet Pool," full of sunshine, and showing solid brushwork. David Murray Smith (nephew of the author of a "Life Drama") shows admirable handling and feeling in "Evening, Coldingham," which has been purchased by the Royal Association. Erskine Nichol, jun., has excellent water-colour drawings. Mr. Jennings Brown is perhaps too ambitious in the scale adopted in his "Quartette." Joseph Milne gives admirable seaside views; and Mr. Thomas Wiseman McNece follows the late President (Sir Daniel McNece) in the production of portraits, but as a sculptor and not as a painter, his medallion of Mr. Clark Stanton being refined, yet spirited in execution.

THE UNEXHIBITED SCULPTURES IN THE BRITISH MUSEUM.—II. ROMAN SEPULCHRAL MONUMENTS.

PROFESSOR C. T. NEWTON, C.B., delivered his second lecture* on the unexhibited sculptures in the British Museum on Tuesday afternoon last, in the Theatre of the Royal Institution, Albemarle-street. He commenced by saying that the particular monuments with which he had to deal in the present lecture were for the most part found in Rome or Italy, and were distinctively Roman in character, and nearly all of them were of Imperial time. There were two points which should be borne in mind as distinctive features of Roman sepulchral monuments when compared with Greek monuments, the first was that of a sepulchral character. The first was that when a portrait was seen on a Roman sepulchral monument it was invariably and unmistakably the portrait of the individual who was commemorated by the monument, or of one of his family, for it bore the strongest marks of individual likeness. Secondly, as mentioned in the first lecture, while there was little or no attempt at portraiture on Greek monuments, the Romans from a very early time delighted in the images of their ancestors. Now, with regard to the sepulchral monuments themselves, there were a number of varieties of type which he should not touch upon, as he was not giving a lecture on Roman tombs in general. But there was one kind of sepulchral monument which was very characteristic of the Romans, and which they seemed to have borrowed from the Etruscans, viz., the

sarcophagus, a great stone chest. These sarcophagi were originally made of a particular kind of stone found at Assos, in Asia Minor, which stone was said to possess the property of completely assimilating or consuming human remains, the word "sarcophagus" being derived from a Greek word signifying "flesh-eater." He (the lecturer) had in his time found and opened sarcophagi in which there was absolutely nothing left but a little fine dust and some vases. The word "sarcophagus," however, ultimately came to be used by Roman writers to signify any kind of chest for burial purposes, whether of marble or of other material. The Romans followed the Etruscans in placing on the lids of their sarcophagi a recumbent figure of the deceased, or figures of the deceased and his wife, and upon the sides and ends of the sarcophagi they placed sculptures in relief. A fine example of a sarcophagus in its complete state was the one now at Rome (of which there was a cast in the cellars of the British Museum) in which the celebrated Portland vase was found. The cast was given to the British Museum by a gentleman who wrote many years ago upon the Portland vase, but his liberality had not been of much benefit to the public, because his gift had been hurried in the vanities of the Museum. The sarcophagus in question was long believed to be that of the Emperor Alexander Severus, but that idea had been shown to be erroneous. The lecturer next pointed to a drawing of a Roman sarcophagus, which he had himself dug up at Cuides, one of three which he discovered in a Roman tomb,—a tomb such as was to be seen on the roads leading out of Rome, such as the Via Flaminia, the Via Appia, and others. Referring to the tombs in the immediate neighbourhood of Rome, the lecturer mentioned an interesting tomb of the baker Eurysaces, which bore reliefs representing the whole of the processes connected with his trade, from the grinding of the flour to the baking of the bread. Unfortunately these tombs, owing their conspicuous situation above ground, early attracted the attention of the spoiler, and of the various barbarians who in turn invaded Italy. Subsequently to the overthrow of the Roman empire, a great deal of damage was done in Medieval times by the breaking open and spoliation of the tombs of Rome. What those tombs and sarcophagi were like, however, we knew pretty well by those which had been found in distant parts of the empire, such as the coasts of Asia Minor, in Syria, and in Crete and other islands, though the sarcophagi found in the remote parts of the empire were very much less rich in sculptural decorations than those found in Rome itself. Those found in Italy had enriched many museums and private collections. We had in the British Museum several fine specimens of these sarcophagi. In Paris there was a very fine collection of them, and there were many in the possession of English private collectors in the provinces, as would be seen by reference to the work of Michaëlis. What, then, were the subjects represented by the sculptures on these sarcophagi? They were, with very few exceptions, taken from Greek mythology. That was also the case with the Etruscans. There were stories such as were familiar to us from the Greek and Roman poets, and which were, no doubt, known to the people commemorated by the monuments, and there was a marked preference for scenes which related to untimely death, or for some reference to the other world. For example, the death of Meleager and the death of the family of Niobe were favourite subjects. Other subjects, such as the marriage of Cupid and Psyche, and some very curious representations of the creation of man and of mankind before the soul was put into the body, pointed to the belief in a future state, and there were other sarcophagi in the sculptures of which this doctrine seemed to be taught. For instance, there were some relating to the rape of Proserpine, and to her coming back,—a distinct reference to a future state. Then there were others relating to the mysterious Dionysiac worship. The lecturer next proceeded to point out some of these characteristics by reference to drawings from marbles or casts in the hasement of the British Museum. One of these sarcophagi, found not in Italy, but at Sidon, in Phœnicia, exhibited the characteristics as well as the faults of the sarcophagus of a later time. The composition, consisting of horsemen, and men obviously disposed like the figures in a Greek frieze; the example in ques-

* For report of the first lecture, see *Builder*, Feb. 20, p. 298, *enté*.

tion, indeed, seemed as though the sculptor had aimed at crowding as many figures together as he could. Although the sculptor of this relief had evidently some idea of the anatomy of the human figure, it was evidently merely traditional, and was the anatomy of degradation or decline. The sculptor had, in fact, copied the earlier anatomy without knowing what he was doing. A most singular instance of that practice had been met with in the course of the great excavations at Pergamos, where a Greek frieze, representing a battle of the gods and giants, was found. In the Vatican at Rome was to be seen a later relief representing the same incident; and in the Museum at Berlin there were now to be seen the two in juxtaposition, the relief in Rome being represented at Berlin by a cast for purposes of comparison with the marble from Pergamon. In short, just as the Roman poets adopted and stole all manner of imagery from the earlier Greek poets, so the Roman sculptors, first of all with discrimination, and afterwards indiscriminately, imitated the sculpture of the Greeks. But although we might condemn the art of the greater part of the Roman sarcophagi, it must not be said that they were of no interest, because the sculptures which were upon them undoubtedly represented combinations and groups which once existed in a much more perfect form, and on a larger scale, in the statues in the round or in the great reliefs of the Greeks, such as those found at Pergamon. These Roman reliefs thus throw considerable light on many questions that would otherwise have remained in doubt, and gave us a tolerably faithful idea of the way in which certain subjects had been treated by the Greeks, as had been very clearly shown by Overbeck. Pointing to another example,—the sculptured end of a sarcophagus from the Townley Collection, the lecturer said it was a very beautiful composition in its way. It was the representation of a Roman marriage. The bridegroom, it must be confessed, had a somewhat sorrowful look. He was attended by his "best man." Then there was the bride, attended by her *pronuba*, or bridesmaid. Some persons, taking an idealistic view of the group, thought they saw in this last-named figure Juno, the goddess of marriage. In his left hand the bridegroom held what was once regarded as a very important ornament, but one which there seemed to be some disposition in the present day to improve the face of the earth, viz., the marriage settlement, or *tabula*, as the Romans called it. The arrangement of this composition was exceedingly beautiful, and he (the lecturer) could not place it later than the Antonines. He should be disposed to put it down to the time of the Flavian emperors. A small figure of a boy had once stood in the foreground of the composition, and a piece of his torch remained. Those who wished to regard the relief as an ideal composition considered this figure to have represented Hymenæus, the god of marriage; but he (the lecturer) only regarded it as having been a representation of the youth who carried the nuptial torch. Another very charming composition, the lecturer said, was purchased by him at the Pontifesque, and although it was Roman, and not of a very early period, it was an exceedingly beautiful group. It represented a number of boys playing at some game (the precise nature of which he had been unable to guess) in the *pastra*, or playground. Above the group of boys were two winged Cupids, who held in the air an inscribed label, which told us that the person commemorated was a little boy who died just four years and six days, and that the monument was dedicated by his mother. He (the lecturer) thought he had never seen a monument which possessed a greater charm than this; and, in view of the chief of the ancients that they might properly seek to mitigate the sorrowful aspect of the place where the dead are buried by a certain playfulness, a certain assertion of life, nothing could be more appropriate than the manner in which the lecturer commemorated her loss by reminding the Roman bystander of the games in which no doubt her little son had been in the habit of taking part. Among other interesting specimens of Roman sepulchral monuments referred to by the lecturer was one of a poet, who, as a metrical inscription informed us, was a member of the sacred synod, supposed to be one of those companies of dramatic performers that spread all over Asia Minor in the times of the kings of Pergamon. The metrical in-

scription was written by the poet himself, and if the remainder of his poetry was no better than this, his demise was no great loss to his time. But the inscription was exceedingly curious and interesting as affording some reflex of the time in which he lived, for he exhibited what we should regard as effrontery in the shameless statement which he recorded of himself that "he was also a merchant who traded in beautiful women,"—in other words, he bought beautiful slaves for Rome. This monument was probably not earlier than the time of Septimius Severus. In conclusion, Professor Newton referred to the "pigeon-holes" or *columbaria* in which the ashes of the slaves or dependents of Roman households were placed, and made a few observations on cremation, pointing out that while it was popularly believed that the Greeks buried their dead and that the Romans cremated theirs, the practice of cremation was not by any means so universal amongst the Romans as was imagined. When it prevailed most fully, under the Empire, poisoning attained almost the perfection of a fine art.

THE ART EXHIBITION AT BERLIN.

In place of the regular annual exhibition of the Berlin Academy, it has been arranged to hold during the coming summer an international display, in which architecture and decorative art will be prominently represented. It is intended to make a more distinctive feature of the latter sections than was the case at the Munich Art Exhibition, where they only formed an adjunct to the collections of paintings. Amongst the most notable exhibits will be a reconstruction of the Pergamon altar and the Olympian temple of Zeus in the dimensions of the original. An attempt will be made to illustrate the development of German art since the time of Frederick the Great, who first established these academic exhibitions in 1786. Electric illumination will be provided by Messrs. Siemens & Halske in the main building, while the park and its surroundings will be fitted up by the Berlin Electrical Works. The principal building will contain twenty rooms and two large galleries, while a courtyard, covered with glass (of about 27,000 square feet area), will contain the historical division. The artistic treatment of the interior has been entrusted, after a competition, to two firms,—Kaysers & Von Groszheim and Cremer & Wolfenstein. Professor Otzen has undertaken the arrangement of an internal room. A special building, illustrative of ecclesiastical art, is being arranged by Herr Orth. In addition to the reconstruction of the Olympian temple of Zeus, there will be an Egyptian temple, the interior of which will contain a diorama of the German possessions in Africa, on which five artists are employed.

The masonry and carpentry has been undertaken by a company, and the iron construction has been entrusted to Messrs. Pfeiffer & Druckenmüller. Herr Mächtiger, who devised the effective arrangements of the grounds in the case of the Hygienic Exhibition, will exercise similar functions in the present instance. The entire cost is estimated at 37,500*l.*, towards which the city of Berlin has contributed 5,000*l.*, a like sum having been given by the Landtag or State Council. It is generally considered that the receipts for admission may be expected to make up the difference.

The exhibition being international in its character, the *Deutsche Bauzeitung* and other technical journals have given prominence to the details already arranged, with the view of encouraging architects of all nations to cooperate in the work by sending drawings or other suitable contributions, illustrating the history and condition of architecture in various lands. The arrangements for the reception of such exhibits are being made by the Senate of the Academy of Arts at Berlin.

New Swindon.—St. Paul's Vicarage has just been completed from the designs of Mr. John Bevan, architect, Bristol, who also designed and carried out the chancel of the church. The walls are built of local bricks, relieved with bands of blue brick, and the roof is covered with Broseley tiles. The total cost, including extensive boundary-walls, iron gates, and palisading, with legal and other expenses, will not exceed the sum of 1,730*l.* The builder is Mr. W. Jones, of Gloucester.

FREE LECTURES TO ARTISANS AT CARPENTERS' HALL.

PROFESSOR CORFIELD ON "WATER-TRAPS."

THE second of the present series of free lectures, under the auspices of the Carpenters' Company, was delivered on Wednesday evening last by Professor Corfield, M.A., on "Water Traps." Mr. Joseph Preston, a senior member of the Court of the Company, occupied the chair, and the attendance was again large.

The Professor said that one of the most important matters connected with practical sanitation was that if traps were used at all, they should be of the best possible kind. The conditions requisite for a good trap were that it should be in the first place self-cleansing; secondly, it should not be larger than the amount of water supplied by the particular house or apparatus was capable of supplying to flush it; it should have no angles or obstructions; it should be smooth inside; and lastly, it should be ventilated on the side furthest from the house. A considerable number of the constituents of foul air contained in sewers were capable of being absorbed and given out on the other side of the trap. If a large body of water was thrown at once into the trap, under certain conditions, little or none of it would remain in it to seal the trap. Where a number of traps discharged into the same pipe, under certain circumstances water discharged from the uppermost trap would draw the water out of the traps below, and this was a reason why ventilation was necessary. Dealing with the different kinds of inlet traps to drains, he mentioned that the dipstone trap, simple as it was for preventing the passage of foul air, was yet a comparatively modern invention. The ancient Roman engineers, who were in many respects excellent sanitarians, had no notion whatever of a water-trap, and, indeed, he could find no idea of one before the last century. The well-known hell-trap was one of the worst contrivances ever devised. It was not self-cleansing, and when the grating was taken off, the trap was done away with. He considered the hell-trap should be abolished, and exhibited an improvement on it by Mr. Jennings, in which the hell was not fastened to the cover. The Antill Trap, with two lips, was also a decided improvement on the hell-trap, though likely to be choked up with sediment. Gully traps, or syphon gullies, were a vast improvement on those already referred to, being self-cleansing, with no enclosing angles for the collection of filth, and they were now made enamelled inside. Waste-pipes of sinks should never be directly connected with the drains, but made to discharge into the open air, over a gully. It was necessary, however, to have a trap to the sink, because the waste-pipe of a sink was always, after a little use, a foul pipe. If the pipe passed out into the open air, the air entering the house by its means would carry some amount of foulness with it, so that it was necessary to have traps in the waste-pipe immediately under the sink. The most commonly used trap was what was known as the D-trap, or as Sir William Jenner had termed it, the "Double D" trap,—a trap which dealt disease and death. Its great defect was that it was not self-cleansing, it being, in fact, a small cess-pool. The next improvement was the "Eclipse" trap, but it had the disadvantage of being unsyphonned by momentum. The simplest contrivance of all was not invented until all sorts of complex things had gone forth to the world,—he referred to the syphon-trap in all its different forms. Traps of this kind were self-cleansing, so long as they fulfilled the conditions for such traps, and were not too large for the water which had to pass through them. Under certain circumstances they acted as syphons, and several devices had been contrived for preventing syphonage. Turning to the question of water-closets, the lecturer produced the first patent for these, taken out by Alex. Cunningham in 1775, containing what was called the "re-curved" pipe, and which was really a sort of syphon-pipe. This early trap, however, was displaced by the D-trap, because it was liable to be unsyphonned. The "Eclipse" trap was also used for water-closets, and the latest invention in this direction was termed "the Anti-D-Trap," from which the water could not be drawn. The lecturer concluded by explaining the different kinds of drain-inlet and air-inlet pipes. The lecture was well illustrated by specimens of water-traps lent by Messrs. Doulton and other manufacturers.

PRISON CONSTRUCTION IN GERMANY.

SOME years ago a meeting took place at Vienna, at which prison officials of various European countries discussed the general principles of the above question, with the result that it was arranged to draw up within a year's time a scheme applicable to prison construction in general, which would embrace and illustrate the various principles which had stood the test of practical experience. After the task was ended it was resolved to print the work thus compiled, and, from a statement made by Herr Schuster, one of the editors, before the Hanover Architects' and Engineers' Association, it would seem that the following general principles have been established:—

1. *Site of Prisons.*—Where solitary confinement is contemplated the buildings should be arranged for not less than 200 and not more than 500 inmates. It is desirable for the maximum number to be 400, but motives of economy necessitate the adoption of the higher number.

2. *Situation of Prisons.*—It is recommended to avoid the interior of towns and situations where building is likely to be soon brought close to the site chosen. The neighbourhood of medium-sized towns is a good locality, provided a railway station is near. The building should stand at a height permitting the easy removal of refuse liquids, &c. In the preliminary surveys as to water supply it is advisable to count upon a quantity of 22 gallons daily per inmate being necessary. The highest point reached by underground water should be at least 20 in. below the deepest portions of the building.

3. *Dimensions of the Site.*—Within the circular walls there should be about 100 to 120 acres and outside a surface of sufficient extent to prevent the walls being too closely approached by neighbouring buildings. Convenient sites for the dwellings of officials have likewise to be provided.

4. *Arrangements of the Building.*—The cells are best arranged in three wings, the fourth containing in the lower portion the administrative offices, and in the upper part the church. The cells should be of about 900 cubic feet capacity, with windows 6 ft. 6 in. above the floor.

Various indications are given upon other matters affecting the internal construction of prisons. It is remarked that gas is more advantageous than petroleum for illuminating purposes, when 900 cubic feet do not cost more than 3 cwt. of coal.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE nineteenth annual meeting of this useful and deserving Institution was held at the offices, 21, New Bridge-street, on Tuesday evening last, Mr. George Howard Trollope, President-elect, in the chair.

The Secretary, Mr. H. J. Wheatley, read the annual report, from which we take the following passages:—

"The Committee, in a general meeting of the donors and subscribers are glad to be able to lay before them a more favourable report than at one time seemed probable. Owing, doubtless, to the continued depression in trade, there has been a decrease of income; nevertheless, the sum received, including dividends on Stock, amounted for the year to a total of 682. 0s. 2d. This sum was made up of 237. 1s. 6d. in annual subscriptions, 320. 14s. 6d. in donations; and 75. 4s. 2d. in dividends.

The disbursements during the year consisted of 308. 6s. 8d. on account of the Relief Fund, which included, besides the pensions, several cases of temporary relief, which were promptly assisted. In addition, there were the general expenses for rent, printing, advertising, secretary's salary, collector's commission, &c., amounting to 95. 3s. 7d.

Referring to the Relief Fund, it will be seen from the Statement of Balances that the sum expended on account of this Fund was 367. 11s., while the ordinary income to the same arising from annual subscriptions and dividends amounted only to 246. 8s. 9d., the balance of 121. 2s. 3d. being provided out of the special donations given at the last annual dinner. Your Committee are, therefore, most anxious that the regular income to this useful fund should be materially increased, and fully hope the forthcoming dinner will prove very successful in bringing in some permanent annual help to this particular fund.

In July last, an additional pensioner, Mrs. Hamilton, was elected, making a total of fifteen* now on

* Sixteen with the one elected on Tuesday evening last.

the books, the males receiving 25*l.* per annum, and the females 20*l.* per annum. Ellen Kelly and Edith Friend are the children at present in the Orphan Working School as wards of the Institution. The annual dinner took place on the 24th of March, at the Holborn Restaurant, Jas. Greenwood, esq., the President, in the chair. On that occasion the Society was materially assisted by the announcement of 17*l.* 12*s.* donations and subscriptions to the Relief Fund, and 169*l.* 3*s.* 6*d.* to the Orphan Fund, making a total of 347*l.* 15*s.* 6*d.* Your committee have announced a further purchase of 300*l.* stock on account of the Orphan Fund.

In conclusion, the report expressed the thanks of the Committee to the retiring President, Mr. James Greenwood, for his assistance during the year, especially for his services connected with the annual dinner.

The balance-sheets, signed by the auditors (Messrs. S. J. Thacker, Thos. Stirling, and Thos. Bishop), showed that the Institution has an invested fund of upwards of 3,000*l.*, while there was a balance at the banker's at the end of the year of 177*l.* 16*s.* 2*d.*

The Chairman, in moving the adoption of the report and balance-sheets, said that during the coming year he would do his utmost to maintain the Institution in its present effective and prosperous condition. He had great pleasure in accepting the position of President of the Institution because, in 1875 (eleven years ago), his father occupied that office; but at the same time he (the chairman) felt the responsibilities of the post, for while in 1875 the total income of the Institution was 271*l.*, it had risen last year to nearly 700*l.* It would be his earnest endeavour to make the Institution equal to the demands which might be made upon it, but they could not disguise from themselves the fact that the trade of this country had for the present fallen upon very evil times, and he feared that the number of claims upon the funds of the Institution were likely to increase. With the aid of the committee and secretary, however, he had good hopes of being able to keep the society in its present state of efficiency.

Mr. Edwin Brooks, in seconding the motion, urged that during the coming year a special effort should be made to strengthen the Relief Fund, upon which there were likely, he was afraid, to be many claims for temporary relief.

Mr. Bagg supported the motion, which was unanimously agreed to.

On the motion of Mr. Roe, seconded by Mr. Gilbert, a vote of thanks was accorded to Mr. James Greenwood and the other retiring officers for their services to the Institution during the past year, and Mr. Greenwood said a few words in reply.

It was then resolved that Mr. George Howard Trollope be the President for the coming year; that Mr. James Greenwood be elected vice-president; that Messrs. S. J. Thacker, T. Stirling, and T. Bishop be re-elected auditors for the year; and that Messrs. E. Brooks, F. H. Burchell, W. D. Gilbert, E. Graystone, H. Mason, H. Poston, C. Powell, and C. K. Turpin, retiring members of the committee, be re-elected.

On the motion of Mr. Roe, seconded by Mr. Gilbert, Mrs. Emma Chapman was elected a pensioner on the funds of the Institution.

Mr. Mallett, in moving a vote of thanks to the President for acting as Chairman of the meeting, said that on the completion of Mr. Trollope's term of office the Institution will have attained its majority.

Mr. Poston seconded the motion, and in doing so referred to the late Mr. William Bangs, who was a warm friend of the Institution.

Mr. Wheatley, in support, spoke of the great benefits which the Institution had received from the services of influential members of the building trade in the presidential chair, and the motion having been put and carried,

The President expressed his acknowledgments, and the meeting terminated.

Uddington (Leamarkshire).—It has been decided, owing to the large increase in the congregation, to considerably enlarge and improve the parish church, and Mr. John B. Wilson, Glasgow, has been instructed to prepare plans for that purpose. The enlargement will take the form of an increase in length, and the addition of transepts, as also a chancel, with organ-chamber and choir-gallery. The estimated cost will be about 3,000*l.*, and the proposed increase will give about 450 additional sittings.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS. ANNUAL DINNER.

THE annual dinner of this old-established and useful Institution was held in the Venetian Chamber of the Holborn Restaurant on Saturday evening last, the Governor of this Institution, Mr. George Plucknett, J.P., F.S.A., in the chair. About 250 of the members and friends of the Institution sat down to table. The usual loyal and patriotic toasts having been heartily received (Major Brutton, Secretary of the Builders' Benevolent Institution, responding for "The Army, Navy, and Reserve Forces," and incidentally observing that builders' foremen were to the master-builders what his non-commissioned officers of the Army were to the regimental officers).

The Chairman proposed the toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works," and said he had great pleasure in doing so, especially as he had not to solicit the charitable assistance of the company, for that was not a dinner for obtaining down to table. The usual loyal and patriotic toasts having been heartily received (Major Brutton, Secretary of the Builders' Benevolent Institution, responding for "The Army, Navy, and Reserve Forces," and incidentally observing that builders' foremen were to the master-builders what his non-commissioned officers of the Army were to the regimental officers).

The Chairman proposed the toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works," and said he had great pleasure in doing so, especially as he had not to solicit the charitable assistance of the company, for that was not a dinner for obtaining down to table. The usual loyal and patriotic toasts having been heartily received (Major Brutton, Secretary of the Builders' Benevolent Institution, responding for "The Army, Navy, and Reserve Forces," and incidentally observing that builders' foremen were to the master-builders what his non-commissioned officers of the Army were to the regimental officers).

Mr. Bedford, in responding, said that the Institution, though not so large as he could wish to see it, had been the means of doing a great deal of good by his gratification that clerks of works and foremen whose vocations were sometimes thought to be antagonistic, had yet such a high opinion of each other that they were able to combine in the work of carrying on so useful an Institution.

Mr. Groome, in proposing "The Donors and Honorary Subscribers," said that on the benefits of the Institution, and asked for it increased support both in an augmentation of the number of members and in donations and subscriptions. Mr. Horwood responded.

Mr. Rashleigh proposed "The Directors," of whose behalf Mr. Groome replied; and Mr. Stapleton proposed "The Visitors," coupled with the name of Mr. Ben Turner who, in replying, urged the importance of efforts being made to obtain more annual subscribers to the funds of the Institution from the foremen and clerks of works themselves.

The other toasts were "The Architects and Surveyors" (proposed by Mr. Merrifield and responded to by Mr. J. H. George); "The Builders" (proposed by Mr. Ross and replied to by Mr. Hall, of the firm of Hall, Beddall, & Co.); "The Press" (proposed by Mr. Bedford and coupled with the name of the representative of the *Builder*); and "The Officers of the Institution" (proposed from the Chair and responded to by Mr. Welsh, the Treasurer).

We may add that the offices of the Institution are at No. 9, Conduit-street, Regent-street, where meetings are held on the first and third Wednesday, in every month at 8-30 p.m.

COLONIAL AND INDIAN EXHIBITION.

THE following are the detailed proposals for facilitating the visits of artisans to this exhibition, to which we referred in our last:—

"The mayors and principal authorities of several of the large towns in the United Kingdom have expressed their willingness to co-operate with H.R.H. the Prince of Wales, K.G., President, with the view of organising means whereby artisans and workpeople, with their wives and families, may secure an opportunity, during the present year, of visiting (as much for purposes of instruction as for entertainment) the Colonial and Indian Exhibition. It is desirable that they should offer some of the classes indicated as their accommodation whilst in London. The steps being taken in the various towns referred to are the establishment of clubs, to which, during the early months of the present year, workpeople will periodically subscribe small sums. At any time which may be convenient to them after the 21st of June next, the members of such clubs can withdraw the subscriptions (which, in certain cases, will be aided by grants from the donations of sympathisers), and with members of their families may proceed to London for one or more days; but in no case shall the stay in London under the terms of club membership exceed twelve days. The proprietors of respectable hotels, lodgings-houses, &c., who may be disposed to offer accommodation to the class indicated, are requested to send in, not later than the 30th of April,—a statement to the official agent

of the Royal Commission, at the City offices, 96, London-wall, London, E.C., specifying in detail the sum they will be prepared to charge per head for bed, breakfast, dinner and tea or supper, for adults and for children, for one or more days, not exceeding twelve. After due inquiries have been made as to the respectability of applicants, their names and addresses, and the rates they propose to charge, will be printed in a list which will be supplied to all local clubs. The applicants will be deemed to agree to make only such charges as are indicated in their letter of application. Any complaints made to the Royal Commission by visitors will be inquired into; and, if they be well founded, the names of those persons who have given grounds for such complaints will be removed from the list, with an intimation of the reasons for such a course of procedure. Each member of a club will be supplied with a ticket properly vouchered by the exhibition and the local authorities as a means of identification and as a proof of his right to the special terms indicated on the lists supplied. The Royal Commission limits its responsibility to all parties to the action above described."

COMPETITIONS.—MONEY DEPOSITS.

SIR,—You referred, in a paragraph of your last issue [p. 296], to the increasing habit of promoters of competitions demanding money deposits. Learning out of notice, just now, the real question, and the advantages or disadvantages of such a practice, I would suggest the following modifications:—

1. The advertisement asking for designs should state the title of the proposed work, the amount of the premiums, the time for the delivery of the plans, and the amount of the deposit required from each competitor.
 2. The conditions of the competition should be supplied free to all intending competitors, and should state clearly all information as to the general conduct of such competition.
 3. The deposit would be payable for the detailed information, plan of site, statistics of accommodation required, &c., and such should, of course, be complete and worthy of the deposit.
- By this arrangement I think there would be the chance of "buying a pig in a poke," and the advertisement, conditions, and information were what each ought to be, it is probable that the deposit system,—if kept within reasonable limits,—might tend to raise the level of competitions. H. F. K.

* * * We quite concur in the suggestions of our respondent. What we so strongly object to is the request for a deposit before giving any information whatever. We may note here that, among other points, information ought always to be given as to whether the promoters of the competition intend to employ a professional adviser or assessor, as a large number of architects have pledged themselves not to compete under that condition.

THAMES RIVER NUISANCE.

SIR,—In reference to a previous letter on this subject, in the *Builder* for Feb. 13, 1885, the condition of the waters of the River Thames, I take the opportunity of intimating the following experimental observations on them during autumn.

During about three weeks last October and November, the specific gravities and temperatures of the water were taken every morning at eight o'clock, at the Embankment, near Charing-cross, as also its reaction and sensible condition.

On the third week in October, the mean gr. was 997 and mean temperature 48 deg. F., taste fresh, muddy, air 46 deg. Fabr., winds chiefly easterly.

On the fourth week in October the mean gr. was 1000, mean temperature 47.2 deg. F., taste fresh, muddy, air above 43.7 deg. F., winds north-westerly.

On the first week in November the sp. gr. was 998, temperature 45.5 deg. Fabr., muddy, taste ditto, air over 44.2 deg. Fabr., winds westerly. Litusm paper was neutral in the air, but always acid in the river. It would be, therefore, that the river water was land-gr, quite sweet and fresh, and fit for household use, but for the light mud floating in it.

It was not salt or brackish, so that the sea was brought up by the tides must lie at the bottom of the river, if it comes up to the embankment at Charing-cross at all.

The temperatures of the water were at that time of the day always found higher than those of the air at the same place, but the difference

was gradually diminishing as the winter season was approaching, and the temperatures of the draining soils were being reduced to that of the winter atmospheres.

The litmus paper test showed that the waters were neutral in reaction, while that in the air was always found to be markedly acid in proximity above it. Light mud was always deposited for about 1 in. in depth by every recession of the flow, and was of the usual organic description, denoted by its flocculent gummy character, but it emitted no putrefactive odour.

The air over the river was generally more foggy than further up the streets, and exhibited no character in the spectroscopic, was destitute of ozone, and was saturated with moisture.

The prevailing winds were from all quarters of the compass, but north-east, east, and south-east were more felt than the others, at the Charing-cross bend of the river, and they made the air colder in the mornings than the water temperature below them at that situation.

The very light specific gravity of the water shows that little soluble mineral matter is taken up by the river passing through London, or by drainage from the contiguous streams along its course in the country westerly of the City.

This flocculent mud appears different from the mud of a river in the open country, and is readily identified with muds deposited at months of barhous or large ports, being adherent and miscible, indicating its source from animal decomposition. Its lightness will therefore prevent its being deposited in the centre of the bed of the river, where the current is the strongest, and it will be driven to the sides of the stream, where they are milder.

It will then become emulsified in quiet creeks and shores, and will only there get time to settle, and so will be found most abundant on the sides of the river when left bare by the receding tides.

It would be of interest to ascertain by experimental observation how far down the river this sheet of fresh water usually extends, and it would also be useful to find out the depth of this fresh water layer at Charing Cross and other places above and below it,—say at Kew and Greenwich.

W. G. BLACK, F.R.M.Soc.

January, 1886.

SIGNALS OF DISTRESS IN PROFESSIONAL CIRCLES.

SIR,—I have just beheld with equal surprise and regret a sad proof that the present depression is beginning to tell upon professional men so severely as to drive them to adopt methods of attracting public notice which it has hitherto been left to the tradesmen alone to profit by; much as a keen winter drives the birds to our window-sills for crumbs.

Between Dalston Junction and Broad-street I have noticed near the railway a large block of buildings in progress, adorned with the usual big, bold, black board announcing who the builder is and where he is to be found; but to be equally conspicuous on another big, bold, black board were two by no means unknown names of members of the architectural profession bracketed together as "joint architects."

I am so sorry that these gentlemen should be driven to this. If you think well of starting a subscription for their relief my note is ready, but only on condition that the black board be hauled down.

A FELLOW OF THE INSTITUTE.

DOMESTIC FIREPLACES.

SIR,—With five years' start of Mr. Pridgin Teale in the use of what he calls, in his admirable paper [p. 285, ante], the "Economiser," I am glad to be able to testify to the advantages of it. Ten years ago, when moving into a new house, I adopted the idea which had occurred to me of applying a vertical plate as he now describes to close the aperture below the front bars of the fireplace, and thus convert the space below the grate into a kind of box or chamber as an improvement on placing a flat plate on grate at bottom of fireplace, or on the so-called slow-combustion stoves with solid bottoms, and was well satisfied with the result. The immediate effects were less combustion, less required attention to fire, greater warmth in room, particularly to the feet, less draught along floor; and the chamber forming a convenient place for the ashes to drop into, consequent cleanliness and tidiness.

After trial in dining-room, where there was a cir-

cular-fronted ordinary register stove, it was soon requisitioned into the bedroom. There, in addition to other advantages, that of quiet was appreciated. In certain stages of illness the scraping up of the hearth, the knocking and noises in connexion with the daily cleaning of a stove, are very unpleasant. These, with the use of the vertical plate, were reduced to a minimum, and the stove could be allowed to go several days if required without the ashes being removed. The plate was soon asked for in the nursery and school-room. Eight or nine years ago I applied it at my district office; some six years ago it was fitted to the fireplaces of my offices here; and when I removed to a fresh residence three years ago, I had it fitted all through the house, including both kitchens.

I have never lost an opportunity of recommending these plates to stove-makers, particularly at exhibitions, and am glad to find that some makers now make them of cast iron, to fit their stoves. When made of wrought iron, they should be of fender-plate, sheet-iron not being stout enough. They are adaptable to any form of stove.

In another point Mr. Teale urges a large grate or bottom to the fireplace. I entirely concur. Small grates, and the lessening of large ones with fire-bricks or otherwise, is always to be avoided, on account of the increased draught. A small fire can be easily kept in a large fireplace, while it is difficult to keep any in a small one.

The vertical bars he recommends are doubtless good, and I find can be obtained through an ironmonger, of cast iron, to fit inside bars of circular-fronted fireplaces, but there are not as yet many wholesale houses who supply them in London.

As regards sides and back of fireplace, I remember a very good effect being produced by lining them about 1 in. thick with plumbago, the materials of some old crucibles. A capital heat was obtained.

The leaning forward of the back plate over the fire is another good point tending to assist in keeping the heat of the fire where it should be, viz., in the fireplace, instead of up the chimney. The good old stoves provided for this by regulating the register from the front, without having to use long or soil the hands, as is unfortunately the case with most new stoves.

ROBERT P. NOTLEY.

35, Ducklersbury, E.C., Feb. 17, 1886.

SURVEYORS IN NEW ZEALAND.

SIR,—Could any reader of the *Builder* give me information respecting examinations for land surveyors in New Zealand? Where and how are they conducted, and is it a necessary qualification for candidates to have been previously articled in an engineer's or surveyor's office? Also, what are the subjects for examination? H. H. P.

THE INTERNATIONAL HEALTH EXHIBITION, 1884.

SIR,—Referring to the paragraph from *Invention*, in your issue of the 20th inst., complaining that the special certificates awarded at the Health Exhibition of 1884 have not yet reached the exhibitors, we think it only just to the committee to state that we received our certificates three weeks ago.

BANNER BROTHERS.

Billiter-square, E.C.

PROVINCIAL NEWS.

Accrington.—At a meeting of the Accrington and Church Outfall Sewerage Board, held on the 4th inst., the Clerk reported the result of an interview, held by a deputation from the Board, with Mr. Petre respecting the purchase of Copy Clough site for sewage purification works. The deputation had agreed to purchase the site for 5,000l. This was considered very satisfactory, as it was 300l. less than was first asked, and Mr. Petre also agreed to add nearly another acre of land. A satisfactory arrangement was also come to for the lease of a plot of land between the sewage site and the canal for wharfage purposes. The report was approved and adopted. At the same meeting the engineer submitted complete plans and estimates for the proposed outfall sewers and purification works, his estimate for these purposes being 22,767l. It was resolved to apply to the Local Government Board for powers to borrow 28,000l., the difference being made up by cost of site and legal expenses. The engineer for the works is Mr. E. Knowles, C.E., Accrington.

Haverfordwest.—The new Sunday Schools in connexion with the St. Thomas's Church have just been completed by Mr. W. Reynolds, of Haverfordwest, from the designs and under the superintendence of Mr. E. H. Lingen Barker. The main room is 42 ft. by 32 ft., and the four class-rooms 20 ft. by 14 ft. each. The walls are of local stone, and the roofs open-timbered and

slated. The cost has been about 700*l.*, and the accommodation provided is for 305.

Kentsford.—New premises for the Post-office authorities were opened at Kentsford last Monday. The new buildings have a frontage to King-street of 50 ft., and are designed on Old English type, of which so many examples are to be found in Chester and throughout the county. The front external walls have for their main feature a series of large brick piers carried from base course to cornice, terminating at the front in three overhanging gables, the windows to the first floor being projecting oriels. The size of the Post-office is 32 ft. by 17 ft. The facing bricks and terra-cotta work have been supplied by Mr. J. C. Edwards, of Raobon; and the works have been carried out by Mr. Henry Pemberton, of Kentsford, from the designs and under the superintendence of Mr. W. Owen, of Manchester.

CHURCH-BUILDING NEWS.

Lancashire.—The Church of St. David, Haigh, Lancashire, built by a most useful pioneer of the revival of Gothic architecture, T. M. Rickman, is about as dreary a building inside and out as could well be found. The Earl of Crawford and Balcarres having promised a subscription of 500*l.*, and other gifts coming in, it is now proposed to build a chancel, vestries, and organ-chamber, form a baptistery, and make other improvements to render the church more fitting for divine worship. The father of the present Earl was a large subscriber to the Church of St. Elizabeth, built a few years ago in this parish.—The Church of Holy Trinity, Parkfield, Middleton, Lancashire, a poor specimen of Modern Gothic, but which has hearty services and good congregations, has taken a step forward in the direction of internal improvement. Common deal benches have been removed to make way for oaken choir-stalls and prayer-desks. There is also arched paneling against the north and south walls of the chancel, and additions to the organ front. Further improvements are in contemplation.—St. Anne's, Brindle Heath, which is a little chapel of ease to St. Thomas Pendleton, has lately been adorned by an oaken reredos, with flanking arcading on the east wall, north and south of the altar. From the central part oaken pillars spring, carrying an arch over the east window, which, heretofore, was plain and bare. The panels of the reredos proper contain a cross and other sacred symbols. The six panels of the arcading have been decorated by paintings of plants, executed by Messrs. Heaton, Butler, & Bayne. The cost of the whole has been defrayed by Mr. Charles J. Heywood, who is warden, and resides in the neighbourhood. Mr. Medland Taylor, of Manchester, is architect for all the above-mentioned works.

Bestwood (Notts).—Of late years a colliery village has sprung up at Bestwood, on the estate of the Duke of St. Alban's. The church is a mile and a half away, and the school is the only building in which a service can be held. A mission church has, therefore, been projected by the Rev. A. S. Hawthorne, the vicar, and it is to be built at once. The Duke of St. Alban's gives the site and 600*l.*, and the Colliery Company gives also 600*l.* A simple brick building is proposed, so planned as to be suitable for lectures and parish gatherings of various kinds. Mr. Medland Taylor, of Manchester, is the architect.

London.—St. James's Church (Minor), Garlick-hill, has been entirely rededicated by Messrs. Campbell, Smith, & Campbell, under the superintendence of Mr. Francis Chambers, architect.

Carmarthen.—A new church to seat 300 adults is to be built near Carmarthen from the designs of Mr. J. Buckley Wilson, architect, Swansea.

The New Surrey Chapel Buildings.

The erection of the new Surrey Chapel, in Blackfriars-road, is about to be commenced. The site of the new chapel is only a few yards distant from that which it is to succeed. Three properties on the east side of Blackfriars-road have been purchased to clear the site for the new building, including the premises now occupied as Turkish Baths. The building will have a frontage of 54 ft. to Blackfriars-road, and will extend to a depth eastward of 96 ft. The cost of the new chapel and schools in connexion is estimated at 12,000*l.*

The Student's Column.

FOUNDATIONS.—IX.

PILES should always, if possible, be driven through such soft earth into solid ground below. They have thus been made to penetrate several feet through the hardest clay or gravel. They cannot be driven into pure sand, as the force of the blow is not spent in producing penetration, but is spread downward in a conical form through the body of the sand so as to give complete resistance to the blow. The effect of pure, fine gravel in resisting the penetration of a pile is somewhat similar, in proportion to its fineness. In making the foundations for the high-level bridge at Newcastle, piles were driven through 40 ft. of mixed sand and gravel, so as to rest upon the rock. A pile so driven would bear 150 tons for several days without sign of failure. Holes have been made in rock in order to receive the feet of piles. It is considered that a pile is well driven when it will stand thirty blows of a ram weighing 800 lb., with a fall of 5 ft., without sinking more than one-fifth of an inch. The safe load upon a pile that is driven in firm ground may be taken to be 1,000 lb. per square inch of the head of the pile, but in soft ground this must depend upon the degree of resistance which it affords,—about 200 lb. per inch being generally reckoned upon in practice. With regard to the actual capacity of the pile to carry weight, looking upon it as a square column of timber, and allowing that such a column might, if fixed above ground, be safely loaded to one-tenth of its breaking-weight, the pile (being surrounded by earth) may be loaded to one-fifth of the breaking-weight. But, on the other hand, the breaking-weight of wet timber is only about half that of timber that is dry,—as in the case of a wooden stanchion or story-post. Therefore, the safe load upon a pile is practically the same as that upon a stanchion of similar length and section. No account is taken of any direct support to a building that may be obtained from the earth that is between the piles.

The best material practically available for piles is elm, both on account of its toughness under the blows of the ram and of its durability. Some of the piles under old London Bridge were of this wood. Elm is one of the few kinds of timber in which the sap-wood appears to be of equal durability with the heart. It should be used green. American elm has been largely used, but Memel timber is most generally employed. Whole timbers from 9 in. to 18 in. square are available, or half-timbers which are made by dividing the square balks into two pieces longitudinally. When the ground is hard it is necessary to fit a ring of wrought-iron round the head of each pile to prevent splitting, and also to put a wrought-iron or cast-iron shoe, either pointed or chisel shaped, at the foot to enable it to penetrate the earth.

The application of piling to the various purposes for which foundations require to be made in soft earth or under water is a subject of great extent and variety; but, in general, these foundations are made by the use of bearing piles of whole timbers which carry the whole weight of the structure. *Sheeting* piles made of half-timbers are used either in the making of a cofferdam to keep out the water during construction, or as a permanent enclosure of the area in which the bearing-piles have been driven. The bearing-piles are usually placed in pairs along the course of a wall, or in groups under large piers, or under the foundation of a tower or chimney-shaft, the tops of the piles being cut off level to receive planking to carry the brickwork or masonry. It is not usual to drive the piles much closer together than 3 ft. between their centres, and it is not advisable to disturb the soil around them more than is necessary. In the case of a group of piles that are intended to carry a massive base, the soft earth may be cleared away for some 3 ft. below the level of the heads, and the space so found may be filled with concrete on which the planking can be placed. The concrete best fitted for use in important works under water is that which is made by first mixing sand and a good hydraulic lime into a paste or mortar, and then adding the broken stone or gravel. In France, where material so compounded is largely used, it is called *béton*.

In forming the inclosure round such a foundation the sheet piling is put in by driving, in

the first instance, "guide" piles at the angles and at intervals between them, and tying these piles together by horizontal timbers fixed on both sides of them. The ordinary piles are then driven between them, beginning in each case close to a guide-pile, and making the chisel-shaped shoe of the sheeting pile with the edge inclined, so that it has a tendency to press towards the guide-pile as it descends. In the centre of each space a pile which exactly fits the opening that is left is driven so as to complete the inclosure at that spot. The swelling of the timber through being soaked with the water suffices to make the sheeting sufficiently tight.

Cast-iron piles driven in the ordinary way have been used, a wooden block being placed between the ram and the head of the pile to prevent danger of fracture from the blow. Such a block or "dolly" has often to be used in order to transmit the blow from the ram down to a pile that is lower than the base of the machine. The loss of effective power is very considerable. Cast-iron plates have also been used where the object was to inclose a waterway or space rather than to carry a building.

Books.

Wood-carving: Practically, Theoretically, and Historically considered. By FRED MILLER. London: Wyman & Sons.

THE book so entitled covers a great deal of ground and raises a multitude of questions touching the philosophy of art in its widest sense, into the discussion of which we cannot now afford space to follow the author. Mr. Miller is known to be an experienced and accomplished worker in many of the by-paths of art, possessed of quick sympathies and a facility of exposition which is not given to every practical artist. His subject is one of engrossing interest, and the field it offers is almost unexplored. We cannot but regret, therefore, that he has treated it in a partial, and somewhat discursive fashion; saying many things which might well have been left unsaid, and omitting much which is essential to an adequate treatment of the art and mystery of carving in wood. He is a declared Goth, and expends some energy in attacking certain forms of art with which he has but an imperfect sympathy, and he falls into the common error of attempting to exalt the craft of which he undertakes the elucidation by unfair depreciation of its rivals, going so far as to speak of "flaunting, brazen splendour of stucco and carton pierre." The hand, as he truly says, is the only perfect machine for artistic expression, but the hand can severely express itself as effectually in a plastic material as in the more refractory oak. Nor can we see that moulded is of necessity more "aggressive" than carved ornament. Both may be overdone, and one may, in such circumstances, be as reasonably accused of "bragging boldness" as the other. This is, however, by the way. The main purport of the book is to recommend the art of carving in wood, to mark out the lines upon which its study should proceed, and to explain the mechanical processes incident to its practice and the several tools and appliances required by the carver. All this is done earnestly, intelligently, and according to knowledge, and we confidently commend the result to the student and amateur. The opinions expressed on the relative value of various phases of the art may be read to be "weighed and considered," as Bacon recommends. Mr. Miller has elected for a certain school and cannot bring himself to tolerate any other. Classic art is with him effete, and the methods of the artists of the Italian Renaissance little short of immoral. We would plead for a somewhat broader view of the subject, and will even confess that we are unable to see with his eyes the wickedness of mixing up animal and vegetable forms in purely ornamental designs as the Renaissance artists did, or the essential difference in their use of such ornamental opportunities and those "gorgons, hydras, and chimeras dire" of the Medieval carvers, which are often allied and interwoven with their works. Of the century with which he visits the realistic school of Grinling Gibbons we make no complaint, and we are not quite sure that some of the modern work which the author commends is as approaching Chibbons's type a little too closely.

Recent Patents. Abstracts of Specifications. 7,763. Drain Pipe. T. Watson, Glasgow.

13,036. Street Lamp-post. T. Lumley. Consists in the combination of a street lamp post, a post-office letter-box, and a fire alarm, or any two of these.

13,136. Window-sash Fastener. G. Gny. The latch guard of an ordinary sash-fastener is slotted, and a bent lever pivoted within it so as to fall behind the arm of the fastener and secure it.

14,974. Fireplaces. T. Fraser. An arched recess is formed at the back of an ordinary open fireplace, into which fuel is fed to be coked. The coke is raked forward and burned, while fresh fuel is fed into the recess.

15,506. Bath. S. Owen. The bath is cast with a seat at the head. Pipes from the hot and cold water tanks are led into the supply pipe, and thus the mixing is effected before discharging into the bath.

16,452. Manhole-cover for Sewers. B. Badham. The manhole cover and ventilator are cast in one piece with a chilled surface. A catch-pit is built in the brickwork underneath the ventilator to intercept any dirt which may gain access.

thoroughly practical manner. The author has not aimed at writing a treatise on boiler-making, but has endeavoured to set before practical men a collection of rules and tables to which they can turn for assistance on doubtful points, or which will shorten and simplify the necessary calculations required in designing steam boilers.

The value of the work would be increased by some data as to testing, and the section that treats of the riveting of boilers might well be enlarged, especially in view of the light that has been thrown on the subject lately by the labours of the Commission on riveting of the Institution of Mechanical Engineers.

The Engineer's, Millwright's, and Machinist's Practical Assistant. By WILLIAM TEMPLETON. London: Crosby Lockwood & Co.

This is a collection of tables, rules, and data compiled for the use of engineers, the whole being comprised in just over one hundred pages. There are the usual weights and measures, tables of circumferences and areas of circles, weights of flat and round iron, tables of specific gravities, pitch circles of wheels, &c. The desultory remarks on the properties of steam and construction of steam boilers might well have been left out. They are useless to those acquainted with the subjects, and not sufficient to instruct those ignorant of such matters; there is plenty of useful matter left out of the book that might well fill the space.

RECENT PATENTS. ABSTRACTS OF SPECIFICATIONS. 7,763. Drain Pipe. T. Watson, Glasgow.

The drain-pipe is trough-shaped, and fitted with a movable longitudinal cover. The lengths are connected by spigot and faucet joints.

13,036. Street Lamp-post. T. Lumley. Consists in the combination of a street lamp post, a post-office letter-box, and a fire alarm, or any two of these.

13,136. Window-sash Fastener. G. Gny. The latch guard of an ordinary sash-fastener is slotted, and a bent lever pivoted within it so as to fall behind the arm of the fastener and secure it.

14,974. Fireplaces. T. Fraser. An arched recess is formed at the back of an ordinary open fireplace, into which fuel is fed to be coked. The coke is raked forward and burned, while fresh fuel is fed into the recess.

15,506. Bath. S. Owen. The bath is cast with a seat at the head. Pipes from the hot and cold water tanks are led into the supply pipe, and thus the mixing is effected before discharging into the bath.

16,452. Manhole-cover for Sewers. B. Badham. The manhole cover and ventilator are cast in one piece with a chilled surface. A catch-pit is built in the brickwork underneath the ventilator to intercept any dirt which may gain access.

The manhole cover and ventilator are cast in one piece with a chilled surface. A catch-pit is built in the brickwork underneath the ventilator to intercept any dirt which may gain access. To facilitate the removal of this dirt, the ventilator is hinged and fastened down by a catch. The escaping gas may be disinfected by passing it through charcoal, &c. To flush the sewer, it is only necessary to raise the ventilator, and introduce a hose-pipe by the opening.

13,497. Exhaust Ventilator. S. Chinn. Three series of vertical plates are arranged one within the other on the shaft top, between a plate and a cover. The plates of one series overlap the spaces between those of the series next inside. The outer and inner plates are slightly bent, the middle ones being flat.

MEETINGS.

SATURDAY, FEBRUARY 27. Architectural Association.—Visit to the New Buildings of St. John College and the Offices of the London School Board. Members to meet at the College, Victoria Embankment, at 2.30 p.m. Royal Institution.—Rev. C. Taylor, D.D., on "The History of Geometry." 3 p.m. St. Paul's Ecclesiastical Society.—Visit to St. Paul's Cathedral. 2.15 p.m. Edinburgh Architectural Association.—The Visit to the Museum of Science and Art will not take place, as announced last week, in consequence of the recent illness of Col. Murdoch Smith, who was to have conducted the party.

MONDAY, MARCH 1. Royal Academy of Art.—Lectures in Architecture: Mr. G. Hitchison, A.R.A., on "Style and Composition." 8 p.m. Royal Institute of British Architects.—Special General Meeting. 8 p.m. Society of Engineers.—Mr. E. S. Bellasis on "The Roorkee Hydraulic Experiments." 7.30 p.m. Victoria Institute.—8 p.m.

Clerks of Works' Association.—Monthly meeting at 31, Spring-gardens, 8 p.m.
Philosophical Society of Glasgow (Architectural Section).
 Papers by Mr. David Thomson and Mr. W. P. Buchanan, On Ventilation."

TUESDAY, MARCH 2.

Royal Institution.—Professor C. T. Newton, C.B., on "The Unexhibited Portions of the Greek and Roman Sculptures in the British Museum." III. 3 p.m.
Female School of Art.—Annual Distribution of Prizes, at Freemasons' Hall, 3 p.m.
Institution of Civil Engineers.—Further discussion on Mr. L. F. Vernon-Harcourt's paper on "The River Seine," 8 p.m.
Society of Biblical Archaeology.—8 p.m.
Manchester Architectural Association.—Paper by Mr. Alfred Darbyshire, F.R.I.B.A., 7.30 p.m.

WEDNESDAY, MARCH 3.

Carpenters' Hall, London Wall.—Professor Kerr, F.R.I.B.A., will give a Lecture entitled "A Gossip on the Philosophy of Building Materials," 8 p.m.
British Archaeological Association.—(1) Mr. T. Morgan, F.S.A., will read a paper entitled "Notes on Haslemere." (2) Mr. H. Mann on "The Roman Villa at Box." 8 p.m.
Society of Arts.—Mr. C. V. Boys on "Calculating Machines," 8 p.m.
Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting, 8.30 p.m.

THURSDAY, MARCH 4.

Royal Academy of Arts.—Lectures in Architecture: Mr. W. Watkiss Lloyd on "The Theory of Proportion in the Arts generally, and particularly in Architecture," 8 p.m.
Society for the Encouragement of the Fine Arts.—Mr. W. Cave Thomas on "The Proportions of the Beautiful of the Human Form," 8 p.m.
Society of Antiquaries.—Ballot for the Election of Fellows, 8.30 p.m.
Parkes Museum of Hygiene.—Mr. Shirley Murphy on "Metropolitan Defences against Infectious Diseases," 8 p.m.

Royal Archaeological Institute.—(1) Mr. G. J. Bain on "The Grubans or Gravenes of the Debatable Land." (2) Mr. G. Warden on "The Ancient Buildings of the Chatterhouse." (3) Mr. W. T. Watkin on "Roman Inscriptions found in Britain in 1855," 4 p.m.
Edinburgh Architectural Association.—Mr. John McLachlan on "Old Edinburgh Architects," 8.30 p.m.

FRIDAY, MARCH 5.

University College.—The Rev. C. T. Newton, C.B., on "Greek Myths illustrated by Fictile Vases and other Monuments," II. 4 p.m.
Lincoln Diocesan Architectural Society.—12.15 p.m.

SATURDAY, MARCH 6.

Royal Institution.—The Rev. C. Taylor, D.D., on "The History of Geometry," II. 3 p.m.
Association of Public Sanitary Inspectors.—Mr. W. Warner on "The Disposal of Sewage Sludge," 6.30 p.m.

Miscellaneous.

British Archaeological Association.

At the meeting of this Association on the 17th inst., Mr. George R. Wright, F.S.A., in the chair, the Rev. Scott Surtees exhibited photographs, &c., of the Church at Heysham, a portion of which building is of Saxon date. Mr. Proctor Barronchs, F.S.A., described a curious ring with a cameo head of early work set in gold. Mr. Loftus Brock, F.S.A., exhibited some objects of fictile ware discovered in excavations in the City of London, among which was an altar flower vase of green glazed pottery, probably from one of the parish churches. The Rev. G. F. Browne, of Cambridge, exhibited rubbings of the remarkable Saxon sepulchral stone at Hitchchurch, Hants. This stone is semicircular in form, having an inscription around the semicircular edge, a bust being in the front face and a charming design of interlaced work on the corresponding position behind. The first paper was by Mr. E. Walford, M.A., on the custom of burial in woolfen. After referring to the Act 13th of Charles II., which provides that every person should be buried in woolfen and not wrapped in linen, in order to prevent the importation of the latter fabric into England, the mode of procedure was stated. In the discussion which followed, it was pointed out that the law was probably but an amplification of a much older custom. Mr. Hodgetts showing that a Saxon chief was buried in his cloak. Mr. Birch that Queen Elizabeth believed that the custom would improve the woolfen trade, and Mr. Mould that the custom was not yet quite extinct. A paper was then read by Mr. Romilly Allen, F.S.A. (Scot.), on the remarkable Saxon cross stones at Halton and Heysham, Lancashire. One of these has the emblems of the Evangelists, another has a curious representation of a Saxon building, there being interlaced patterns on all.

Maidstone.—Another Munich stained-glass window has just been erected by Messrs. Mayer & Co., of Munich and London, in St. Philip's Church, Maidstone, representing in two lights Samuel as a child ministering to the Lord and Hannah presenting Samuel with a coat. The window is a memorial to Mr. Collis, mother of the present vicar, the Rev. H. Collis, M.A.

Glasgow.—At the meeting of the Deacon's Court of Stockwell Free Church a few days ago a design prepared by Mr. John B. Wilson, of Glasgow, was selected for erection from seven submitted in limited competition for the new church proposed to be erected in Pollokshields. The selected design is Italian Renaissance in style, and will have a tower at the corner about 120 ft. high. The church will give accommodation to over 970 sitters, and has also a hall seating 400 persons, besides class-rooms, vestry, &c. The proposed cost is £5,500.

Royal School of Mines.—Prof. Warington Smyth, F.R.S., in continuing his lectures on Mining, in the theatre of the Geological Museum, Jermyn-street, considered the various details connected with the laying of the piers for Blackfriars Bridge. The foundations of the piers were put in by means of wrought-iron caissons, the casings of the lower part of which were left permanently in the work. The upper part, which was formed of buckle-plates, was afterwards removed. The iron used in the caissons was, in every case, to be capable of bearing a tensile strain of eighteen tons per square inch. The faces of the L-irons and plates which formed the outer edge of the movable panels were so planed up as, after riveting, to insure perfect accuracy in the dimensions and form of these movable panels, without which a watertight dam never can be obtained. The caissons were rendered perfectly watertight before the last spit of excavation, previously to commencing the foundation, was allowed to be removed. The joints of the movable panels of the caissons were made good with vulcanized indiarubber. A complete covering round the whole of the edges of the panels to be joined was cemented on before the panels were put in place, and a strip of indiarubber was also cemented over the edge of the permanent part before the temporary superstructure was erected, thus giving a double strip of indiarubber, 2½ in. by ¼ in. between every joint. The space allowed for the indiarubber, when screwed up, was ½ in. The central or rectangular caissons were of the same dimensions for all the piers, but the cut-water caissons for the two middle piers were larger than those for the piers next the abutments by 1 ft. 9 in. on the two convex sides. The ground was carefully prepared before the caissons were lowered, all stones, piles, and old timber being removed, and the bed of the river dredged to a level. Guide piles, strongly framed and secured were used to guide the caissons into place, the caissons being lowered by strong tacking attached to six points. Weights were then applied to force down the caissons. The excavation of gravel and clay from the interior was partly done by dredging and partly by divers, and when the bottom was laid dry, by ordinary working. When the separate caissons of each pier were sunk to the full depth, the foundations were then put in up to the level of the top of the permanent plates. The intermediate spaces were then dredged out, the ends closed with double piling and clay. The enclosed space was then also filled up to the top of the permanent plates with cement concrete. When thus secured, the water was pumped out, and the temporary plates removed as the work proceeded, thus clearing the whole pier from end to end, and allowing it to be bonded throughout.

Coventry.—A four-light stained-glass window has just been erected in Holy Trinity Church, Coventry, in memory of Alderman Fynes, by his family and old friends. The subject, which occupies the whole of the window, illustrates the Adoration of the Magi. Messrs. Heaton, Butler, & Bayne, of Garrick-street, London, were the artists who designed and executed the work.

The Late Earl Cairns's Town Residence in the Auction Market.—Last week at the Auction Mart, by direction of the executors, Messrs. J. & N. Kemp, of Albany-street, Regent's Park, submitted to competition the town mansion of the late Earl Cairns, in Cromwell-road, and known as No. 5, Cromwell Houses, within a short distance of Cromwell-place and the South Kensington railway station. The mansion, which is held on lease for an unexpired term of several years, was stated to be very substantially built and to contain a large number of reception and entertaining apartments. The highest offer for the property being 15,300l., it was withdrawn, as being considerably below the reserve.

The New Railway Bridge and Station at Blackfriars.—The London, Chatham, and Dover Railway Company's new bridge and station works at Blackfriars are approaching completion, and it is expected that they will be opened for traffic early in the summer. The bridge across the Thames is all but finished, and the rails are now being laid. The bridge carries six lines of rails, and as the existing bridge carries four lines, there will be ten lines of metals between the Middlesex and Surrey shores when the line, as widened, is opened for traffic. The iron and steel used in the construction of the bridge has been supplied by the Thames Iron Company. The station buildings in Queen Victoria-street have also been externally completed, and are now receiving their interior fittings. The building is faced with red brick and Corshill stone, and has a frontage to Queen Victoria-street of 120 ft. in length, with three entrances. From the booking-office on the ground-floor, the railway level and platforms are reached by spacious staircases. In addition to the trains to be despatched from the new station, there will also be a connexion with the Ludgate-hill Station, effected by an additional line on the east side of the existing girder bridge over Queen Victoria-street. The roof over the station area is likewise in course of construction. The station area, with covered platforms, extends a considerable distance southwards over the Thames. The station buildings have been erected in part over the Metropolitan District line, with the Blackfriars Station of which there will be a communication. The old Blackfriars Station on the Surrey side of the Thames will not again be opened for passenger traffic; the Company intending to appropriate it exclusively as a goods depot, and the new station on the Middlesex side taking its place as the Blackfriars passenger station. The works are being carried out under the direction of Mr. Wolfe Barry, the Company's engineer, Messrs. Lucas & Aird being the contractors.

International Congress on Inland Navigation.—Following up the Congress which assembled in Brussels last summer on the general subject of inland navigation, it has been decided to hold a second international meeting in the city of Vienna on the same subject during the coming summer. A committee of the Danube Verein, or Danube Club, in the Austrian capital, has been appointed to make all necessary preparations. It is intended at the conference that the general question of inland water communication shall be discussed from the scientific as well as practical point of view. The programme will contain four principal sections. The first will discuss the best means of making more generally known the advantages of inland navigation or canal traffic. The second will deal with the question of the best dimensions of canals, locks, &c. The third section refers to organisation of traffic of canals, whilst the fourth section relates to ships, canals for sea-going vessels. The Vienna committee proposes to organise two or three trips which cannot fail to be of the highest interest to all engineers who take part in the proceedings. One of the excursions, for instance, will be down the Danube to the celebrated Iron Gate, in order to enable the visitors to witness what Australian engineers have been able to effect for the regulation of the Danube at this difficult spot. Another trip will be up to the Danube to Linz, through the Rapids at Greben. The conference will assemble in Vienna early in the month of June.

Llanely (South Wales).—The first portion of the Lakefield-road Schools, viz., the Department for Infants, has just been completed by Messrs. Thomas, Watkins, & Jenkins, & Swansen, from the designs and under the superintendence of Mr. E. H. Lingen Barkie. The buildings accommodate 250 children, at a cost, including fittings, being 1,043l. 4s. 11d. and the offices and boundary walls have been carried out at a cost of 302l. 17s. 6d.

Trade Memos.—Messrs. Clark, Hunt, & Co. have removed their stock of stoves, chimneys, pipes, &c., from 49, Old Bailey, to their show-rooms in Shore-ditch (Nos. 159 and 160).—Mr. T. W. Helliwell asks us to mention that his future his London address will be No. 5, Westminster Chambers.—Messrs. Gibbs & Cann, have opened a London office and show-room, Bridge House, 181, Queen Victoria-street, E.C., and have appointed Mr. F. W. Geddes to represent them.

The Engineering Society.—On the evening of Wednesday, February 17th, Professor A. B. W. Kennedy and the Committee of the Engineering Society held a most successful meeting at University College, London, in connection with the College Society. Visitors were received in the Engineering Laboratory, where machinery was in motion, and Mr. A. S. Ashcroft's autographic stress diagram apparatus was shown in action. All the available space was occupied with exhibits, among which were working models of the Westinghouse Brake Company and the Worthington Pumping Company. Mr. P. Brotherhood showed a three-cylinder engine and centrifugal pump. The Manganese Bronze Company gave a large exhibit of fittings, with two specimens, which were tested during the evening; while a piece of the Mersey lift-ran, with drawings of the lift, and a hydraulic ram, with work air-vessel, were sent by Messrs. Easton & Anderson. The Electric Apparatus Company and Messrs. Woodhouse & Rawson both gave electrical exhibits, which proved very popular, and mathematical instruments and indicators were shown by Messrs. Stanley & Elliott brothers. Numerous drawings by the students of the College, and excellent photographs lent by Mr. Tweddell, the Worthington Company, Messrs. Perkins & Son, and others, supplemented the exhibits. The College Society organised a show of photographs and photographic apparatus in the Library, where Messrs. Clarke & Clarke exhibited their method of lighting by gaslight. They also gave a concert in the Botanical Theatre, which was transmitted by telephone to a distant room.

Table with 4 columns: OILS, £. s. d., OILS (continued), £. s. d. Lists various oil types and their prices.

CONTRACTS AND PUBLIC APPOINTMENTS:

Epitome of Advertisements in this Number.

CONTRACTS.

Alcorn & Sons (accepted) 4370 0 0

Alley's Almshouses, Norwood.—The architect of these buildings, for which the tenders appeared in our last, was Mr. C. N. McIntyre North, not "Worrb" as it appeared through a misprint.

House, Conservatory, &c., Colchester.—In reference to the tenders for this work, published in our last, a correspondent writes:—"I see Mr. Dupont's tender is put the wrong amount; it should be 3,950l., not 4,950l., which would place him third up from the bottom instead of at the top."

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS. Registered Telegraphic Address, "THE BUILDER, LONDON."

H. W. (we will consider it, but the design is well known and has been often published)—W. H. R.—G. J. S.—D. D.—C. G. Paris (published)—S. B. Bransford (not received)—X. (not important, as the Court seems to have made no ruling on the general principle involved)—T. R.—C. B.—

Letters or communications (beyond mere news items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES. Registered Telegraphic Address, "THE BUILDER, LONDON."

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Each additional line (about ten words) 0s. 6d. Terms for Series of Trade Advertisements, and for special advertisements on front page, Consultation, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

FOUR Lines (about THIRTY words) or under 2s. 6d. Each additional line (about ten words) 0s. 6d. PUBLISHERMENT IS ABSOLUTELY NECESSARY.

Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post office, Covent garden, W.C. DOUGLAS FROST, Publisher.

Advertisements for the current week's issue must reach the Office by the PUBLISHER'S CLOSING PAGE ON FRIDAY. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS in STANDING ADVERTISEMENTS or ORDERS to DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

PERSONS Advertising in "The Builder," may have Articles addressed to the Office, 46, Catherine-street, Covent Garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.
