## VOLUME IV.

The asterisk \* prefixed to the name indicates that the subject of the memoir is still living.

MAAS, NICOLAS.

MAAS, or MAES, NICOLAS, a celebrated Dutch painter, was born at Dort in 1632. He was a scholar of Rembrandt, whose manner he imitated with so much skill that it was thought difficult to distinguish the works of the pupil from those of the master. But a visit to Antwerp, where he diligently studied the productions of Rubens and Jordaens, led Maas to adopt a new and more independent style; and one in which, while retaining his former neatness and delicacy of touch, and breadth of chiaroscuro, there was more freedom of handling and variety of colour. His early celebrity was acquired by his genre pictures, chiefly domestic interiors, but he eventually devoted himself to portrait painting, especially after his removal to Amsterdam, where he settled in 1678; and where he rose into high reputation as a portrait painter, and acquired a considerable fortune by the practice of that lucrative branch of art. He died at Amsterdam in 1693. Bartsch mentions several plates etched by him. In the National Gallery there are three paintings by him—like most of his genre pictures, of small size, but elaborately finished—'The Cradle,' 'The Dutch Housewife,' and 'The Idle Servant.'

MABILLON, JEAN, born in 1632, studied at the college of Rheims. He took vows in the congregation of St. Maur, belonging to the Benedictines, in 1654. He afterwards assisted Father D'Achery in his collection entitled 'Spicilegium,' and also edited the works of St. Bernard. In 1668 he published the first volume of his 'Acta Sanctorum Ordinis S. Benedicti,' being the Fasti of his order, preceded by a learned introduction, 'Præfationes in Acta Sanctorum.' Mabillon was afterwards sent to Italy by Louis XIV. to make a collection of books and manuscripts for the royal library. On his return he published his 'Museum Italicum,' 1689, a kind of literary and antiquarian itinerary of Italy, in which he briefly describes the towns that he visited, and more at length the churches and convents, especially those of his order, such as Monte-Casino, Vallombrosa, &c., the libraries and colleges, the rare manuscripts, inscriptions, and other curiosities. This work is followed by learned dissertations upon subjects of ecclesiastical history and palæography. The second volume of the 'Museum Italicum' is occupied by a 'Commentarius in Ordinem Romanum,' or Commentary on the ritual of the various services, or liturgy, and ceremonies of the Roman Church, which are there exhibited at full length. He had previously published 'De Liturgia Gallicana libri tres,' 1685, in which he compares the Gallican with the Mozarabic liturgy.

Mabillon wrote also the 'Iter Germanicum,' being a similar tour through part of Germany, namely, Suabia, Helvetia, and Bavaria, which he likewise undertook by order of Louis XIV. In this journey he visited the abbeys and libraries of St. Gall, Augsburg, &c., and among others the secluded Benedictine convent of Tegern See, where he and his companion met with a very scurvy reception from the librarian, a rough Bavarian, who hated them as being Frenchmen, and the more so as they caused him to be called out of the refectory to attend upon them. He also wrote an 'Iter Burgundicum,' which is among his posthumous works: 'Ouvrages Posthumes de Jean Mabillon et de Thierri Ruinart, Bénédictins de la Congregation de St. Maur,' 3 vols. 4to, Paris, 1724. This interesting collection contains, among other valuable matter, Mabillon's correspondence, and his 'Reflexions sur les Prisons des Ordres Religieux,' in which he censures the cruelties practised in several monastic houses against the monks who transgressed the rules of their order, and speaks among others of the famous "Vade in Pace," or subterraneous dungeons in which

BIOG. DIV. VOL. IV.

MABLY, ABBÉ DE.

some were confined till they died. This strange authority exercised by communities over the liberty and life of individuals, uncontrolled by, and unknown to the state, is one of the most repulsive features of the monastic system.

In the above collection of Ouvrages posthumes are: 'Discours sur les Anciennes Sepultures de nos Rois,' 'Remarques sur les Antiquités de l'Abbaye de St. Denis,' 'Histoire de la Contestation sur l'Auteur de l'Imitation de Jesus Christ' [KEMPIA, THOMAS A], 'Lettres et Ecrits sur les Etudes Monastiques.' These last contain a curious controversy between the Abbé de Rancé, the founder of the order of the Trappists, and the Benedictines. De Rancé, in his ascetic enthusiasm, had forbidden his monks all scientific studies, and indeed all reading except the Breviary and a few monastic tracts. The rest of the clergy, both secular and regular, took the alarm, and Mabillon was requested to defend monastic studies and learning as perfectly compatible with piety and religious discipline, as the Benedictine order had fully proved. Mabillon accordingly wrote his 'Traité des Etudes Monastiques,' in 1691, which was received with great applause, and was translated into Latin and other languages. This led to a controversy with Rancé, who had the worst of it: 'Réflexions sur la Réponse de l'Abbé de la Trappe,' 1692. Another controversy which Mabillon had with Rome concerning the worship of relics of unknown persons whose bones were found in the catacombs fills part of the posthumous works: 'Lettres et Ecrits sur le Culte des Saints inconnus.' They contain also a 'Votum D. Io. Mabillonis de quibusdam Isaacii Vossii Opusculis.' While Mabillon was at Rome, he was asked his opinion by the Congregation of the Index concerning some writings of Isaac Vossius, in which that scholar gave the preference to the chronology of the Septuagint over that of the Hebrew text, and in another place maintained that the deluge had not been universal. Mabillon said that although he believed the opinions of Vossius, especially the latter, were not correct, yet he did not think that they constituted heterodoxy, and accordingly the Congregation did not place Vossius in the Index.

Mabillon wrote also 'De Re Diplomatica libri sex, accedit Commentarius de antiquis Regum Francorum Palatiis;' 'Veterum Scripturarum varia Specimina,' &c., a work much esteemed. In 1701 he was chosen member of the Academy of Inscriptions, and in 1703 he published the first volume of his 'Annales Ordinis S. Benedicti,' which he brought down to the year 1157, 6 vols. folio. He died at Paris, in 1707. Mabillon was one of the most learned men of his age, and his liberal and candid disposition is clearly exhibited in his 'Correspondence,' and in his other posthumous writings.

MABLY, ABBÉ DE, was born at Grenoble in 1709. He studied at Lyon in the Jesuit College, and afterwards went to Paris, where he was introduced to the Cardinal de Tencin, who was then minister. In 1740 he wrote his 'Parallèle des Romains et des Français,' which acquired him a kind of popularity. He was employed by the cardinal as his secretary, and while in that office he compiled his 'Droit public de l'Europe, fondé sur les Traités,' a useful work derived from good sources. Mably was employed in several secret negotiations between 1743-46, after which he appears to have quarrelled with the cardinal, in consequence of which he gave up his official prospects for a studious retirement. His historical works are:—1. 'De la manière d'écrire l'Histoire;' 2. 'De l'étude de l'Histoire;' 3. 'Observations sur l'Histoire de la Grèce;' 4. 'Observations sur les Romains;' 5. 'Observations sur l'Histoire de France,' 2 vols. 12mo, 1765, with a posthumous

continuation in two more volumes, published in 1790 (this is the best of his historical works); 6. 'Entretiens de Phocion sur le Rapport de la Morale avec la Politique.' Many of the author's views, especially in the last work, are visionary; such as a community of goods; he would also banish commerce and the fine arts from a republic. Mabuse was a great admirer of the institutions of Sparta. He died at Paris, April 23, 1785.

MABUSE, or MAUBEUGE, JOHN. This eminent painter, whose proper name was John Gossaert, was born at Maubeuge in Hainault, in 1470. Nothing is known of his parents, or of the name of the master under whom he studied. It is evident however that in early life he must have very assiduously devoted himself to the study of nature, and have acquired habits of industry. Considering that he was in after-life of a most restless ardent temperament, indulging in dissolute and licentious habits, and especially addicted to immoderate drinking, we cannot but admire the patience, fidelity, and labour which appear in his works. Most writers have affirmed that he went early to Italy, but even this is not clearly ascertained; whatever advantages he may have derived from the study of the great masters and of the antique, he never attained the elegance of the Roman school.

After his return from Italy he lived for some time at Utrecht, in the service of the bishop, Philip of Burgundy. From Utrecht he went to Middelburg, where he painted the celebrated altarpiece, representing the 'Descent from the Cross,' for the great church. This picture, which was of extraordinary dimensions, was highly admired by Albert Durer. The church, with this picture and all the treasures of art that it contained, was destroyed by lightning. Mabuse seems to have lived in a very extravagant manner at Middelburg, and was at last thrown into prison; but whether for debts or for some excesses is not known. It seems to have been after the recovery of his liberty that he came to London, where he was employed in the service of Henry VIII. He painted the king's children, and many portraits of the nobility, which gained him great reputation. Several of his pictures painted in England are still in existence, and others were destroyed in the fire at Whitehall Place. One of his finest works is at Castle Howard, the seat of the Earl of Carlisle, and is in an excellent state of preservation. It represents the Wise Men's Offering, and is a rich composition, in which there are thirty principal figures. Most of the great galleries on the Continent have specimens of his works. Among these are three in the celebrated Boisseree collection purchased by King Ludwig of Bavaria. These pictures are—a very large and splendid composition representing the Crucifixion, the archangel Michael overcoming Satan, and a small highly-finished picture representing the Virgin Mary as Queen of Heaven. This is conjectured to be the picture which was most highly extolled during his lifetime, and which he painted while in the service of the Marquis of Verens, a wealthy Flemish nobleman, and in which he took the marchioness and her son as models for the Virgin and Child. This nobleman having to entertain the Emperor Charles V., put all the persons in his service into new and splendid liveries, and among the rest ordered suits of rich white brocade for his painter and two others of his household. Mabuse, under some pretence, got possession of the brocade, which he sold, and spent the produce at a tavern. When the great day came, and the retainers and servants were to pass in procession before the emperor, the dress of Mabuse appeared to be of such superior whiteness and beauty, that the emperor desired to examine it, and, to his astonishment, discovered it to be paper: thus the secret came out, and greatly amused the company. Mabuse died at Antwerp, October 1, 1532. The National Gallery possesses a half-length male 'portrait' by him (No. 656).

In the catalogue of his pictures belonging to King Charles I. is 'The children of Henry VII.: Prince Arthur, Prince Henry (afterwards Henry VIII.), and Princess Margaret.' This picture is now at Hampton Court, where it is attributed to Mabuse; but as Henry VIII. was born in 1491, and the picture represents him as a child of seven or eight years old, it is plain that it could not have been painted by Mabuse, or does not represent Henry. It has in fact been ascertained (1806) to be the 'Children of Christian of Denmark.'

MACADAM, JOHN LOUDON, was born in Scotland in 1756. He was educated for a surveyor, and having been appointed to the management of a district of roads in Ayrshire, invented and practised successfully on them for some time the system of road-making, now known by his name. The principles of this system he developed in two works, 'A Practical Essay on the Scientific Repair and Preservation of Public Roads,' London, 1819; and 'Remarks on the Present State of Road-making,' London, 1820. The system recommended, so far as it was new, was in the use of broken granite or other hard stone, instead of the rounded pebbles. The stones are broken into irregular-shaped fragments, never exceeding six ounces each, which, spread over the road in thin layers of from three inches to six inches in depth, are worked together into a solid mass by the traffic passing over them. When once fixed the road forms a hard crust, impervious to sudden wet, and if the water is prevented from settling, and the moist mud scraped off, will remain firm for a long time. In 1827, when the metropolitan roads were placed under the management of commissioners, Mr. MacAdam became their general surveyor, and for his exertions in making the roads thoroughly efficient, was rewarded by a grant of 10,000*l.* from the government, but declined the honour of knighthood, which was bestowed on his son in 1834. Many other roads, particularly one in

the mining districts of Cumberland and Durham, were constructed under his inspection. Mr. MacAdam died on November 26th, 1836.

MACARTNEY, GEORGE MACARTNEY, EARL OF, was the only surviving son of George Macartney, Esq., a gentleman of Scottish descent, but whose family had been for some generations settled on their estate of Lissanoure, near Belfast in Ireland, where the subject of the present notice was born on the 14th of May 1737. At the age of thirteen he was admitted a fellow-commoner of Trinity College, Dublin; and in 1759, after having obtained his degree of M.A., he came to London, where he entered himself of the Inner Temple, but without any intention of prosecuting the profession of the law. He then made the tour of Europe, and on his return home in 1764 it was arranged, through the interest of Lord Holland, that he should be returned to the British parliament for Midhurst; but this destination was changed by his appointment, on the 22nd of August of the same year, as envoy extraordinary to the Empress of Russia, for the purpose of concluding a commercial treaty with that country. He was knighted before proceeding on this business, which, after a long and arduous negotiation, he at last brought to a satisfactory conclusion. He returned to England in June 1767, and soon after received the appointment of ambassador extraordinary and plenipotentiary to Russia, which however circumstances induced him to resign.

In February 1768 he married Lady Jane Stuart, second daughter of the Earl of Bute; and in April he was returned to parliament for Cocker-mouth, but resigned it in the July following, he having been elected for Armagh in the Irish parliament, in contemplation of his appointment to the office of chief secretary for Ireland, which took place on the 1st of January 1769. Macartney, who was now sworn of the Irish privy council, greatly distinguished himself by his exertions in the debates of the House of Commons against Flood, Dr. Lucas, and the other leaders of the opposition. He held his office till June 1772, when he was made a Knight of the Bath, and in 1774 was appointed to the sinecure of governor of Toome Castle, which produced an income of above 1000*l.* a year. In October 1774 he was returned to the British parliament as member for the Ayr burghs; but in December 1775 he was sent abroad as governor of the island of Granada. He was raised to the Irish peerage by the title of Baron Macartney, on the 10th of June 1776. He remained in Granada till July 1779, when after a most gallant defence he was compelled to surrender the island at discretion to the French admiral Count d'Estaing, and was himself sent prisoner to France. He was however very soon exchanged, and after having been employed by Lord North in a confidential mission to Ireland, was in September 1780 again returned to the British parliament for Beeralstone.

On the 14th of December of the same year he was appointed by the East India Company governor of Madras. Having returned to England in January 1786, he found that before his arrival he had been appointed governor-general; but the state of his health and other considerations induced him to decline that post, and it was eventually given to Lord Cornwallis. Very soon after his return home Macartney was severely wounded in a duel with Major-General Stuart, an officer whom he had when in India found it expedient to remove from the service. In 1788 he took his seat for the first time in the Irish House of Peers, and he resided chiefly in his native country till 1792, when he was appointed to his most memorable public employment as ambassador extraordinary to Peking. Having on the 28th of June been made an Irish viscount, he sailed on the 26th of September, taking with him as his secretary his old friend Sir George Staunton, by whom the account of the embassy was afterwards given to the public. The amount of the benefit gained by this first diplomatic communication on the part of England with the court of Peking has been matter of dispute; but it is generally agreed that no other person could have accomplished more than was done by Lord Macartney, whose conduct at least was well calculated to impress the subjects of the celestial empire with a respect for the country which he represented. He left China on the 17th of March 1794, and landed at Portsmouth on the 5th of September of the same year, having on the 1st of March previous been made Earl Macartney in the Irish peerage.

In June 1795 he was sent on a confidential mission to Italy, from which he returned in May 1796; and having on the 8th of June been made a British peer by the title of Baron Macartney, he was in the end of the same year appointed governor of the newly-captured territory of the Cape of Good Hope. Here he remained till November 1798, when his impaired health compelled him to return to England. The same cause induced him to refuse the office of president of the Board of Control, with a seat in the cabinet, which was offered him on the formation of the Addington ministry in 1801; and he lived in retirement, suffering severely from gout, till his death, at Chiswick, on the 31st of March 1806. The manner in which Lord Macartney discharged his duty in the various public services in which he was employed procured him from all parties the reputation of very considerable ability and the highest honour. An account of his public life, with a selection from his unpublished writings, was published by Mr. (afterwards Sir) John Barrow, in 2 vols. 4to, London, 1807. His writings here printed, which occupy the second volume, consist of extracts from an 'Account of the Russian Embassy,' 'A Sketch of the Political History of Ireland,' and 'A Journal of his Embassy to China.' The manuscript of the 'Account of Russia' is in the King's Library at the British Museum,

and also a printed but not published copy of the same tract, in 8vo, dated London, 1768.

MACAULAY, CATHARINE, was the daughter of John Sawbridge, Esq., of Olantigh, near Wye, Kent, where she was born in 1783. She took the name by which she is best known from her first husband, Dr. George Macaulay, a London physician, to whom she was married in 1760. It was soon after this date that she commenced authorship, by the publication of her 'History of England from the accession of James I. to the elevation of the House of Hanover,' the first volume of which, in 4to, appeared in 1763, and the fifth and last, which however only brought the narrative down to the Restoration, in 1771. The work also went through more than one edition in 8vo. On its first publication it attracted considerable attention, principally from the double piquancy of the sex and the avowed republicanism of the writer; but it had not merit enough to preserve it from passing into the oblivion of waste paper. The five volumes of the 'History' were followed in 1773 by another, entitled 'The History of England from the Revolution to the present time, in a series of Letters to the Reverend Dr. Wilson, rector of St. Stephen's, Walbrook, and prebendary of Westminster,' 4to, Bath. The six letters of which this volume consists come down to the termination of the administration of Sir Robert Walpole, in 1742.

In 1778, or, according to another account, in 1785, Mrs. Macaulay, having lost her first husband, married a Mr. Graham. Both during the progress of her great work and after its completion, she also wrote several pamphlets; among them were:—'Remarks on Hobbes's Rudiments of Government and Society,' 1787, enlarged and republished in 1769, with the more striking title of 'Loose Remarks on some of Mr. Hobbes's Positions;' 'Observations on a Pamphlet (Burke's) entitled Thoughts on the Causes of the present Discontents,' 1770; 'An Address to the People of England, Scotland, and Ireland, on the present Important Crisis of Affairs,' 1775; 'A Treatise on the Immutability of Moral Truth,' called in a second much enlarged edition, 'Letters on Education,' 1790; and 'Observations on the Reflections of the Right Hon. E. Burke on the Revolution in France, in a Letter to the Right Hon. the Earl of Stanhope,' 1791. In 1785 she made a voyage to America to visit Washington. On her return she retired with her husband to a small house in Leicestershire, where she died on the 22nd of June 1791. In 1790 was printed a little volume entitled 'A Catalogue of Tracts,' which a manuscript annotation on the copy in the royal library in the British Museum states to be "Mrs. Macaulay's," meaning apparently the tracts in her library. The titles are between 5000 and 6000 in number, besides about 1800 sermons.

MACAULAY, THE RIGHT HON. THOMAS BABINGTON, was born at Rothley Temple, Leicestershire, October 25, 1800. His father, Zachary Macaulay, well known in the early part of the present century for his exertions against the slave-trade and in other works of philanthropy, was the son of the Rev. John Macaulay, a Presbyterian minister in the Scottish Highlands, descended from the Macaulays of the island of Lewis. This John Macaulay, and a brother of his named Kenneth, also a clergyman of a Highland parish, are both mentioned with respect in Johnson's 'Tour to the Hebrides.' A daughter of John, that is, a sister of Zachary Macaulay, married a Mr. Thomas Babington, a rich English merchant, and the name Thomas Babington was bestowed on the nephew. He was educated at Trinity College, Cambridge, where his career was one of distinction. In 1819 he gained the chancellor's medal for a poem entitled 'Pompeii,' then published; in 1821 he gained the same chancellor's medal for another poem entitled 'Evening,' also published; in the same year he was elected to the Craven scholarship; in 1822 he graduated B.A., and was elected a Fellow of Trinity; and in 1825 he graduated M.A. Having adopted the bar as his profession, he was called at Lincoln's Inn in February 1826. During the whole course of his university career he was noted as a various and indefatigable reader, whose memory was almost miraculously retentive both of words and things. The range of his acquirements, and the brilliancy of his style, were indicated at an early period in his contributions to 'Knight's Quarterly Magazine'—his ballads, and some of his essays in that periodical, having gone far beyond a mere promise of excellence. It was in August 1825, or six months before his call to the bar, and when he was just twenty-five years of age, that Mr. Macaulay contributed his article on 'Milton' to the 'Edinburgh Review'—the first of that long series of brilliant essays with which, for a period of twenty years, he enriched the pages of the great northern periodical, and upon which even yet so much of his fame in literature depends. Various articles, including those on 'Machiavelli' and on 'Hallam's Constitutional History,' had succeeded the one on Milton, when, in recognition of the literary articles of the young barrister, and of his relationship to Zachary Macaulay, the Whigs appointed him to a commissionership of bankruptcy. In 1830 he became a member of parliament in the Whig interest, representing the borough of Calne. In this capacity, and holding the ministerial office of secretary to the Board of Control for India, he enacted a very conspicuous part in the debates during the Reform Bill agitation. His greatest parliamentary speech on Reform was published separately in 1831; and at the same time he extended his choice of topics for the 'Edinburgh Review,' writing occasionally on political questions as well as on themes of

purely literary or historical interest. In December 1832 Mr. Macaulay was returned to the first reformed parliament as member for Leeds; and he retained his seat till 1834, increasing his reputation as a parliamentary orator and as a liberal and philosophic politician. In 1834, somewhat to the surprise of the public, he resigned his seat, in order to go out to India as a member of the Supreme Council of Calcutta. The special purpose of Mr. Macaulay's appointment was the preparation of a new Indian code of law. He was therefore exempted from all share in the executive government, and had four assistants assigned to facilitate his labours. He remained in India two years and a half, and after his return in 1838 his proposed Penal Code was published. It contained twenty-six short chapters, embracing 438 clauses. Its great ability was generally acknowledged; but the variety of races and customs to which it was to be applied, and other difficulties, have prevented any attempt to carry it into execution. While in the East he increased or acquired that knowledge which at a later period he exhibited in his splendid essays on 'Clive' and 'Warren Hastings.' Nor while residing in India did he cease to write for the 'Edinburgh Review;' several of his most celebrated articles, including, we believe, that on 'Bacon,' having been sent over from Calcutta. It was one consequence, too, of Mr. Macaulay's absence in India that, when he did return to England, he returned with a fortune which, if not large, rendered him independent.

Re-entering political life as secretary-at-war in 1839, Mr. Macaulay was elected member of parliament for the city of Edinburgh in January 1840. He held the secretaryship-at-war, and was a conspicuous member of the Whig administration, till September 1841, when the accession of Sir Robert Peel deprived him of office. On the return of the Whigs to office in 1846, under the premiership of Lord John Russell, he was appointed paymaster-general of the forces, with a seat in the cabinet; and this office he held till July 1847, when, chiefly on account of a disagreement with the majority of his Edinburgh constituents on the subject of the Maynooth grant, he lost his election. The rejection of such a man in such circumstances caused great surprise, and Mr. Macaulay could easily have found another constituency, but he preferred withdrawing altogether from parliament.

It was the consolation of Mr. Macaulay's admirers on his retirement from active politics that his time would thus be given in larger measure than before to literary labour. During the first four or five years after his return from India, and while first acting in parliament as representative for Edinburgh, he had continued as sedulously as ever his contributions to the 'Edinburgh Review;' where, indeed (his style being known), they were now regularly looked for by an eager circle of readers. He also found time to return to a form of literature of which he had been fond in his youth—the metrical ballad—and to compose those well-known 'Lays of Ancient Rome,' which were published in 1842. After this publication he wrote but four or five articles for the 'Review;' the last from his pen being, it is understood, that on 'The Earl of Chatham,' which appeared in the number for October 1844. As almost all the articles of the splendid twenty years' series of which this was the last, were well known, the Americans had already in 1840 reprinted in five volumes such of them as had appeared up to that time; and copies of the reprint in considerable numbers had been imported into Britain. This led to the publication by Mr. Macaulay himself in 1843, of an authorised English edition in three volumes, revised by himself, and containing, with a few exceptions, all the essays included in the American reprint. Three papers on the Utilitarian Philosophy, not included in the American edition, were also omitted from this, for a reason very honourable to the author. "He has determined," he says, speaking of himself in the third person in the preface, "to omit these papers, not because he is disposed to retract a single doctrine which they contain; but because he is unwilling to offer what might be considered as an affront to the memory of one [Mr. James Mill] from whose opinions he still widely dissents, but to whose talents and virtues he admits that he formerly did not do justice. Serious as are the faults of the 'Essay on Government,' a critic, while noticing these faults, should have abstained from using contemptuous language respecting the historian of British India. It ought to be known that Mr. Mill had the generosity, not only to forgive, but to forget the unbecoming acrimony with which he had been assailed, and was, when his valuable life closed, on terms of cordial friendship with his assailant." The essays thus republished have passed through numerous editions, and have been by far the most popular of such republications in this country. The later editions close with the article on Chatham above alluded to. In that article Mr. Macaulay took farewell of the 'Essay' form of literature, in which he had won such reputation and which he had done so much to dignify. It was known that in doing so he was reserving his strength for a more continuous and laborious, if not a more brilliant species of work; and, believing this work to be already somewhat advanced, the public, in its interest, regretted less in 1847 Mr. Macaulay's retirement from parliament. At length in 1849, the fruits of his leisure in his town residence in the Albany were seen; and the first two volumes of his 'History of England from the Accession of James II.' were given to the world. Since the publication of Gibbon's immortal work, few historical works have had such a reception; edition after edition was called for; and after a little while the public began to be anxious for the appearance of the succeeding volumes.

To the honours of successful authorship, other honours were added. In 1849 Mr. Macaulay was elected Lord Rector of the University of Glasgow; and his inauguration address was published. In the same year he became a bencher of Lincoln's Inn; in 1850 he was appointed to the honorary office of Professor of Ancient History in the Royal Academy; and in 1853 he received the Prussian Order of Merit. Most gratifying perhaps of all, the citizens of Edinburgh spontaneously in July, 1852, re-elected him one of their representatives; and this though he did not attend the election, nor even issue an address. He accepted the mark of their restored confidence with great good-will; and for a year or two was again nominally "member for Edinburgh," though the state of his health did not permit him to return to office nor to undertake the active discharge of parliamentary duties. In 1854 he published a collected and revised edition of his 'Speeches, Parliamentary and Miscellaneous'—these speeches having been already reprinted in America, and an edition by a London publisher compiled from 'Hansard' and the newspapers being also in the market. The 'Speeches' however have not been so popular as the 'Essays.' At length, after a long interval, the third and fourth volumes of the 'History of England' were published in 1855, causing a furor of excitement in the publishing and reading world of Britain, to which the annals of Paternoster Row hardly furnish any parallel. As Mr. Macaulay has recently resigned his seat for Edinburgh, and with it all intention of resuming public or parliamentary life, there will be now (1856) no other delay in the continuation of this, the great work of his life, than may be involved in the nature of the work itself, and the continuance of the author's powers of occupation. [SUPPLEMENT.]

**MACCABEES**, a Jewish family celebrated for their heroic resistance to the oppression of the Greek kings of Syria in the second century before the Christian era. Their genealogy has been given under **ASMONÆANS**. Though the name Maccabees is applied to the whole family of Mattathias, and is often used even with a wider signification, it belonged properly only to Judas, the third son of Mattathias, who was surnamed Maccabeus ('the hammerer') on account of his prowess in war. (1 Macc. ii. 4.)

Antiochus Epiphanes, on his return from his campaign in Egypt, took Jerusalem by storm, polluted the Temple, carried away from it the sacred utensils and treasures, and made Philip the Phrygian governor of Judæa (B.C. 169). Two years later, after his last Egyptian expedition, he commenced a furious persecution of the Jews. Apollonius, his chief collector of tribute, was sent to Jerusalem, which he attacked and plundered, massacring many men, and making the women and children captives. He fortified Mount Sion, and placed in it a Syrian garrison. At the same time Antiochus issued an edict that all his subjects should adopt the same usages; and not content with this blow at the religion of the Jews, he sent orders forbidding them the exercise of their religious rites, and commanding them to sacrifice to idols, to profane the Sabbath, and to discontinue circumcision. Resistance to these commands was made a capital offence, and many of the Jews were put to death; while some saved themselves by fleeing into the wilderness, and others conformed to the idolatrous rites imposed upon them. The books of the law were sought for and destroyed, and whoever kept them was put to death. Jerusalem was deserted, and the Temple was polluted a second time. An old man, named Athenæus, who was sent by Antiochus to instruct the Jews in the Greek religion, placed on the great altar a smaller altar to Jupiter Olympius, which the author of the first book of Maccabees calls "the abomination of desolation" (1 Macc. i. 54), alluding, it is generally supposed, to the prophecy of Daniel (viii. 13; xl. 31; xii. 11). In consequence of this the daily sacrifice ceased on the 15th of the month Chisleu, which answered to parts of December and January, B.C. 168-67. (Clinton's 'Fasti,' vol. iii., p. 321.) The officers of Antiochus were sent through the cities of Judæa to enforce the king's edict. Some of them came to Modin, where Mattathias dwelt and lamented with his five sons over the state of Israel. Upon the attempt being made to compel the people of the city to sacrifice to idols, Mattathias made an open resistance, killed a Jew who came to sacrifice, slew the king's officer, and pulled down the altar. He then fled to the mountains with his sons and their adherents. About the same time some Jews who had taken refuge in the wilderness were attacked on the Sabbath by Philip, the governor of Judæa, and massacred without resistance to the number of a thousand. In consequence of this Mattathias and his party resolved not to abstain from fighting on the Sabbath. Being now joined by the *Assidæans*, a sect of very strict religionists, and others, Mattathias went through the Jewish cities destroying the altars of idols, punishing the apostate Jews, and enforcing the law of Moses.

In the midst of this successful course Mattathias died, having appointed his third son, Judas Maccabeus, his successor in the military command, and his second son, Simon Matthes, to be his brother's counsellor (B.C. 166). Judas pursued his father's career of victory. He defeated and slew Apollonius, the governor of Samaria; and with a small force put to flight a large army under Seron, the lieutenant of Ptolemy Macro, governor of Coele-Syria. Antiochus now gathered an immense army, with part of which he marched against the Armenians and Persians, leaving the remainder under Lysias to act against the Jews. Judæa was presently invaded by 40,000 infantry and 7000 horse under Ptolemy Macro, Nicanor, and Gorgias. Judas had only 6000

men; but by a skilful manoeuvre he surprised the Syrians in their camp, and completely routed them. Next year he defeated an army of 60,000 foot and 5000 horse commanded by Lysias himself, and by this victory became master of Judæa. His first care was to purify the Temple, which he did on the 15th of the month Chisleu, B.C. 165-4, exactly three years after its pollution. An annual feast of eight days was established in commemoration of this event. In the meantime Judas attacked the Syrian garrison on Mount Sion, which however he was unable to reduce, and fortified the Temple and the fortress of Bethsura, near Jerusalem. His attention was now occupied by the attacks of the neighbouring idolatrous nations, whom he and his brothers Simon and Jonathan repeatedly defeated. Enraged at these events, Antiochus marched in great haste to invade Judæa, but died on his way in the greatest agony, confessing that he suffered for his cruelty to the Jews (B.C. 164 or 163). The Jews now enjoyed a short interval of peace with Ptolemy Macro, upon whose death however the war with the neighbouring nations broke out afresh, and Judæa was once more invaded by Lysias, who had possession of the person of Antiochus Eupator, the infant son and successor of Epiphanes. Lysias was defeated, and concluded a peace with Judas. But not long after this, at the instigation of some idolatrous Jews who had escaped from the castle on Mount Sion, Lysias and the king again invaded Judæa with 100,000 foot, 20,000 horse, 32 elephants, and 300 war-chariots. Before this force Judas was compelled to retreat, after fighting one great battle, in which his younger brother Eleazar Savarau died in performing a heroic action. (1 Macc. vi. 43-46.) Bethsura was taken, and the Jews were closely besieged in the Temple, when Lysias was compelled, by the state of affairs in Syria, to grant them peace on favourable terms; but before leaving Jerusalem he demolished the fortifications of the Temple. Under Demetrius Soter the war was renewed at the instigation of Alcimus, who aspired to the high-priesthood. The Syrian armies sent under Bacchides and Nicanor to support his claims were defeated by Judas, and Nicanor himself was killed in battle at Capharsalama. During the short interval of peace which followed, Judas made an alliance with the Romans; but in the next year (B.C. 160) another army entered Judæa under Bacchides and Alcimus, and Judas Maccabeus fell in battle.

The Syrians were now for a time masters of the country, and Alcimus was established in the priesthood. About this time John, the eldest son of Mattathias, fell into an ambush of the enemy, and was put to death. In the following year Alcimus died in agony while engaged in violating the sanctity of the Temple; and Bacchides left Judæa, which remained in peace two years under the government of Jonathan Apphus, the youngest of the Maccabean family. At the end of this period another invasion of the Syrians was repelled, and Bacchides made peace with Jonathan, whose authority became fully established. The subsequent history of the Maccabees has already been given fully enough under **ASMONÆANS**. See also **ANTIOCHUS IV.**; **JUDAS MACCABÆUS**; **JONATHAN APPHUS**; and **SIMON MACCABÆUS**.

Five books have come down to us under the title of **THE BOOKS OF THE MACCABEES**.

1. The First Book of the Maccabees contains the history of the Jews during forty years, from the accession of Antiochus Epiphanes to the death of Simon Matthes, B.C. 136. The author is unknown. Some suppose the book to have been compiled from the memoirs of the Maccabean princes, perhaps by John Hyrcanus, about the close of whose reign internal evidence would lead us to fix its date. (1 Macc. xvi. 23.) The general opinion of critics is that it was written in Hebrew. Origen and Jerome assert that they had seen the Hebrew original, and the Greek copy which we possess bears internal evidence of being translated from Hebrew. It forms part of the Septuagint, and there is an ancient Latin version made from the Greek, and a Syriac version, which Michaelis supposes to have been translated from the Hebrew. This book is considered the best authority for the history of the period to which it relates.

2. The Second Book of the Maccabees begins with two letters which are not connected with each other, nor with the rest of the book. It then mentions some events which preceded the persecution of Antiochus Epiphanes, relates the acts of Judas Maccabeus, and concludes with the defeat of Nicanor, recorded in 1 Macc. vii. This book is abridged from an earlier work in five books, by one Jason of Cyrene. (2 Macc. ii. 23-32.) The author is unknown, but from the style he is supposed to have been a Hellenistic Jew. It exists in the Greek of the Septuagint, which is considered to be the original, and there are ancient versions in Syriac and Latin. Its authority is greatly inferior to that of the first book, from which it often differs.

The first and second books of Maccabees are received as canonical by the Greek and Roman churches, but not by Protestants. Josephus intimates that they were not reckoned by the Jews as inspired ('Cont. Apion,' i., § 8), and Jerome says—"The church does indeed read the books of the Maccabees, but does not receive them among the canonical Scriptures." (Præfat. in 'Prov. Salomonis.')

3. The Third Book of the Maccabees is prior in time to the first and second, and in fact has nothing to do with the history of the Jews at Alexandria during eight or nine years, from the battle of Raphia, in B.C. 217. The author is unknown. The Greek of the Septuagint is supposed to have been the original. There is a Syriac version in the

Paris and London polyglots, but no ancient Latin version exists. Its canonical authority has been maintained by some of the fathers and by the Greek church; but the Western churches have never received it. Its historical value is but small.

4. The Fourth Book of Maccabees contains an account of the martyrdom of Eleazar and the Seven Brethren (2 Macc. vi, vii.), and of the attempt of Heliodorus to plunder the Temple. (2 Macc. iii.) It is found in Greek in the Alexandrian and Vatican manuscripts, and in some editions of the Septuagint. It is generally supposed to be the same as the treatise of Josephus, 'De Maccabæis,' or 'De Imperio Rationis.' It is praised as a composition by Jerome and Augustine, but it has never been received into the canon.

5. The Fifth Book of the Maccabees only exists in Arabic and Syriac. Calmet supposes it to have been written in Hebrew, and thence translated into Greek. It extends from the attempt of Heliodorus to plunder the Temple to within a few years of the birth of Christ. It must have been written after the taking of Jerusalem by Titus, for it refers to that event (chap. ix. and xxi.) The author is unknown. Some suppose it to have been compiled from the acts of the successive high-priests.

(The Five Books of the Maccabees, by Henry Cotton, D.C.L., Oxford, 1832; Calmet's Dictionary and Dissertations; the Introductions of De Wette, Eichhorn, Bertholdt, and Jahn.)

\* MACCLURE, SIR ROBERT JOHN LE MESURIER, Knight, Captain R.N., was born January 28, 1807, in the town of Wexford, Ireland. His father was Captain MacClure of the 89th regiment, who served with General Abercrombie in Egypt, and who died four months after his marriage with the daughter of Archdeacon Elgee, rector of one of the parishes of Wexford. General Le Mesurier, hereditary Governor of the Isle of Alderney, having been an intimate friend of the late Captain MacClure, became godfather to the posthumous child, and having then no children of his own, undertook to educate and provide for him. After remaining four years with his mother at the residence of his maternal grandfather, Robert MacClure was removed to the house of General Le Mesurier, where he remained till he was twelve years of age. The wife of General Le Mesurier, after having been childless upwards of twenty years, gave birth to three sons in succession. The general however did not neglect his godson. He sent him to Eton College, and thence to the Royal Military College, Sandhurst. From Sandhurst however Robert MacClure, with three other youths, deserted, and went to France, and General Le Mesurier, finding that he preferred the naval profession to the military, obtained for him the appointment of a midshipman on board Nelson's old ship the Victory. He afterwards served on board the Hastings, 74, on the Home Station; in the Niagara, on the Lakes of Canada; and in the Pilot, on the coast of North America and the West Indies.

In 1836, Robert MacClure having served six years as a mate, and passed his examination for the rank of lieutenant, volunteered to join the exploring expedition under Captain Back, then about to sail for the Arctic Seas. This expedition left England June 14, 1836, and reached Lough Swilly on the north coast of Ireland, on its return, September 3, 1837. Mr. MacClure was then promoted to a lieutenancy, and appointed to the Hastings, which was to convey Lord Durham to Canada. He had for some time the superintendence of the dock-yard of Quebec. He was afterwards appointed to the Hastings receiving ship at Havana on the coast of Cuba, where he remained till 1846. He was subsequently employed in the Coast-Guard. In 1848 he volunteered to accompany Sir James Ross in his expedition in search of Sir John Franklin and his crew, and was then made first lieutenant. That expedition set sail June 12, 1848, and reached England on its return in November 1849. Lieutenant MacClure was then promoted to the rank of commander.

The Board of Admiralty having resolved to send out another expedition, consisting of two ships, in search of Sir John Franklin, Captain Collinson, the senior officer, was appointed to the command of the Enterprise, and Captain MacClure to that of the Investigator. The two commanders were directed to pass through Behring's Strait, and then endeavour to reach Melville Island by sailing in a direction east and north. The two ships sailed from Plymouth January 20, 1850, provisioned for three years. They were parted by a gale in the Straits of Magalhaens, and never met again. Captain Collinson reached the Sandwich Islands, and left them a few days before Captain MacClure arrived there. The Enterprise was so much impeded by ice and fogs as to be unable to get to Behring's Strait, and Captain Collinson was obliged to go to Hong-Kong to pass the winter. Captain MacClure left the Sandwich Islands July 4, 1850, passed through the Aleutian Islands July 20th, and on the 27th of July had got through Behring's Strait into Kotzebue Sound. Meantime Captain Kellett, in the Herald, had passed through Behring's Strait with instructions for Captain Collinson, and not having met with him was returning southward when he saw the Investigator off Cape Lisburne sailing in the opposite direction. Captain Kellett was the chief officer on that station, and deeming the attempt to proceed farther with a single ship too hazardous, directed the Investigator to return; but Captain MacClure, taking the responsibility upon himself, resolved to proceed forward.

On the 5th of August the Investigator rounded Point Barrow, on

the 10th passed the mouth of the Colville, and on the 11th reached Jones's Island. Struggling on through narrow bands of water between the pack-ice and the coast, the Investigator passed the mouth of the Mackenzie River on the 21st of August, and Cape Bathurst on the 1st of September. Continuing his course eastward in shallow water, Captain MacClure reached the small islands off Cape Parry on the 6th, and then changing his course to about north by east, on the 7th was off the southern end of Baring's Island (as Captain MacClure afterwards named it), a bold headland rising perpendicularly to the height of more than 1000 feet. The pack-ice was resting against the west side, but the eastern side was comparatively clear of ice. Captain MacClure therefore, steering north-eastward, on the 9th discovered the west side of a country which he named Prince Albert's Land, there being a passage between it and the east side of Baring's Island, which he named Prince of Wales's Strait. Sailing up this strait, which has a general direction south-south-west and north-north-east, the Investigator from the 11th to the 30th of September was beset with ice in such quantities as several times to have narrowly escaped destruction. The ship was at last frozen in on September 30th, in 72° 50' N. lat., 118° 42' W. long., not far from the northern extremity of the strait, and there remained during the winter. Captain MacClure went out with an exploring party, and ascertained that Prince of Wales's Strait opened into Barrow's Strait, on the southern shore of which the party pitched their tent in 73° 31' N. lat., 114° 39' W. long. The northern entrance to the strait has been named Investigator Sound. Here then was the first discovery of a North-West Passage. The north-western coast of Baring Island was explored in the spring, and found to be the land seen by Captain Parry, and by him named Banks' Land. On the 14th of July 1851, the ice opened without pressure, and the Investigator was again afloat. Great exertions were made to pass into Barrow's Strait, but after many fruitless attempts, on the 15th of August strong winds from the north-east driving large masses of ice before them, not only arrested the progress of the Investigator, but drove her back. Thus baffled, Captain MacClure resolved to retrace his course southward, and then, rounding the southern end of Baring's Island and keeping near the coast, endeavour to make his passage northward along the western side of the island. After escaping many dangers, and surmounting obstacles which only the most scientific and practical seamanship combined with invincible resolution could have surmounted, the Investigator was navigated into Barrow's Strait, and found at last a haven of refuge, which was named Mercy Bay, where in the night of the 24th of September 1851, she was frozen up, in 74° 6' N. lat., 117° 54' W. long., on the north-western shore of Baring's Island, with Barrow's Strait in front and Melville Island opposite. The discovery of a second North-West Passage was thus accomplished. In April 1852, a party crossed over the ice of Barrow's Strait to Melville Island, and there deposited a document giving an account of Captain MacClure's proceedings and of the position of the Investigator. The ice did not break up in the summer of 1852. Provisions becoming scarce, and the health of the crew giving way, Captain MacClure, on the 30th of March 1853, as the only chance of escaping death, told off the crew into two sledge-parties, one to proceed northward to Melville Island, and thence eastward to Beechy Island, and the other southward towards the mouth of the Mackenzie River. Meantime Captain Kellett, in the Resolute, had reached Melville Island from the Atlantic, had found the document deposited there in April 1852, and as soon as it was practicable, in April 1853, despatched a sledge-party to Mercy Bay with provisions and comforts, under Lieutenant Fin, who was himself the first to meet Captain MacClure on the ice not far from the ship. Part of the crew returned to England with Captain Kellett, but Captain MacClure with a few of them remained with the Investigator, which however continued frozen up, and they returned to England in 1853 with the expedition under Captain Sir Edward Belcher.

Captain MacClure, after his return, received the honour of knighthood, and a reward of 5000*l.* for his discovery of the North-West Passage, which had been sought for in vain during three centuries by other nations as well as by Great Britain.

MACCULLOCH, DR. JOHN, was born in Guernsey on the 6th of October 1773. He was descended from an ancient Scottish family, the MacCullochs of Nether Ardwall, in Kirkcudbrightshire, a younger branch of the MacCullochs of Myretown. He was the third son of James MacCulloch, Esq., and Elizabeth, daughter of Thomas de Lisle, Esq., one of the jurats of the royal court of Guernsey. In his childhood John MacCulloch was thoughtful, and fond of being alone. He taught himself to write, and wrote Latin exercises at an age when many children have barely acquired a knowledge of the alphabet. His family having removed to Cornwall, the first school John MacCulloch was sent to was the grammar-school at Plympton. He was afterwards removed to one at Fenzance; and thence, in 1787, to the grammar-school at Lostwithiel, where he remained three years.

In 1790 he went to prosecute his medical studies at Edinburgh, where he obtained his diploma of physician, at the age of eighteen. He subsequently entered the artillery as assistant-surgeon, and on the 5th of April 1803 accepted the situation of chemist to the Board of Ordnance. In 1807 he resided at Blackheath, where he practised as a physician. His application while pursuing his studies at Edinburgh

was intense, and probably received an additional stimulus from the circumstance that his father, who was settled as a merchant in Bretagne, was arrested at the beginning of the French Revolution, and with his family imprisoned during the whole of the Reign of Terror—a state of things which naturally put a stop to the lucrative business in which he was at that time embarked. During Dr. MacCulloch's occasional visits to Penzance, whither his father, on the fall of Robespierre, retired, he became acquainted with Sir Humphry Davy, who was indebted to him for some of his earliest instruction in chemistry.

About 1811 he was engaged by government to make various surveys in Scotland. He in consequence gave up his practice, which he never regularly resumed, although he was frequently consulted. The first business on which he was employed in Scotland, was in a search for stones adapted to the use of the government powder-mills. The second was an examination of the principal mountains, with a view to the repetition of the experiments which had been made at Soehallian on the density of the earth. The third had for its object the correction of the deviations of the plumb-line on the meridian of the trigonometrical survey. Whilst he was making these surveys, he also employed himself in geological observations, and in collecting materials for a mineralogical map, as well for his own amusement and instruction as with the hope that they would be useful to the country. In 1826 he was desired by government to complete the work which he had begun; and this was the commencement of the last great public work in which he was employed—the mineralogical and geological survey of Scotland, which was continued every summer from 1826 to 1832, when he completed it. The winters of these years were spent in the laborious task of putting in order the observations made in the summer, in drawing sections and preparing the map. This great work, precise and exact as it is, the labour of one individual, begun, carried on, and completed by himself alone, extending over a country richer in its variety of rocks than any country of equal extent in the world, abounding in geological difficulties, has never been surpassed, or even equalled, by any undertaking of a similar nature. In making this survey Dr. MacCulloch had to contend with many hardships, for great part of the time was spent upon a boisterous sea or a miserably poor comfortless land; and it was his lot to do all the different works provided for in all other surveys by half-a-dozen men and as many salaries.

Some of the fruits of these separate surveys were published. The first publication was 'A Description of the Western Islands of Scotland, including the Isles of Man,' &c., 2 vols. 8vo, with 1 vol. 4to of plates, London and Edinburgh, 1819. Next, 'A Geological Classification of Rocks, with Descriptive Synopses, comprising the Elements of Practical Geology,' London, 1821, 1 vol. 8vo. Thirdly, 'The Highlands and Western Isles of Scotland, in a series of Letters to Sir Walter Scott,' London, 1824, 4 vols. 8vo. This work, in addition to a most graphic description of the country, contains many learned dissertations on the history, antiquities, language, music, and economy of the Highlands. Fourthly, 'A System of Geology, with a Theory of the Earth, and an Explanation of its Connection with the Sacred Records,' London, 1831, 2 vols. 8vo. In 1821 he published a 'Treatise on the Art of making Wines,' which reached a fourth edition in 1829; and in 1823 he published anonymously an account of Blair and Dunkeld, forming a guide-book to those localities. He contributed many papers both to the 'Encyclopædia Britannica' and to Brande's Journal, on various subjects connected with Scotland generally, or its rocks and minerals, besides others on different topics. One of these is a description of twenty-two species of Medusa found about Shetland and Orkney. He published many articles in the 'Transactions of the Geological Society,' and wrote frequently in the 'Edinburgh,' 'Westminster,' and 'Quarterly' Reviews, and in the 'London' and 'New Monthly' Magazines.

Although unable to follow up the practice of his profession, Dr. MacCulloch never lost sight of it, the proofs of which we have in two elaborate works which appeared in 1827 and 1828. The first is entitled 'Malaria, an Essay on the Production and Propagation of this Poison, and on the Nature and Localities of the Places by which it is produced,' &c., 1 vol. 8vo, London. The second is 'An Essay on the Remittent and Intermittent Diseases, including generally Marsh Fever and Neuralgia,' &c., in 2 vols. 8vo, London. He appears to be the first who referred a large list of disorders, hitherto deemed anomalous, and which appear to have nothing in common with one another, to their true source—the poison of the malaria.

Dr. MacCulloch's writings contain internal evidence that they must have resulted from deep thought, based on an intimate knowledge of the subjects he treated of. The acquisition of this knowledge was gained by intense study, aided by a wonderfully retentive memory. The variety of his acquirements was not less remarkable than their extent. Allusion has been already made to his knowledge of medicine, geology, mineralogy, chemistry, and mathematics. He was also well acquainted with theology, astronomy, zoology, botany, physics, and the mechanical arts. He was skilled in architecture. He drew well, and has left an immense number of drawings. He was a good musician, and his musical compositions show that he was conversant with the theory as well as the practice of the science. His accomplishments, as they are called, were cultivated at times which many persons pass

without employment. His drawings were done while others were employed in walking or riding. His flowers and herbs were examined, dried, and painted before breakfast in the long summer mornings. When he used to practise music, he did so during the twilight hours. In short, no portion of his time was unoccupied. And the magnitude of his labours appears still more remarkable from the fact, that for many years he was afflicted most severely by the effects of malaria.

He completed, in 1830 a work entitled 'Proofs and Illustrations of the Attributes of God, from the Facts and Laws of the Physical Universe; being the Foundation of Natural and Revealed Religion.' It was intended for publication in the following year, but its appearance was delayed by the announcement of the Bridgewater Treatises. In obedience to his last will, it was published in 1837 in 3 vols. 8vo. Many papers on various subjects however remain unpublished.

He married, in the summer of 1835, Miss White. He was with her in Cornwall, on a visit to an old friend, when the accident occurred which led to his death on the 21st of August 1835. He was thrown out of a pony phaeton, by which, in addition to other injuries, his right leg was so shattered that amputation became necessary. He only survived the operation a few hours. He was buried in the churchyard of Gulval, a village near Penzance, in which his family had at one time resided.

Dr. MacCulloch was Fellow of the Royal, Linnæan, and Geological societies, and at one time vice-president of the last. In 1820 he was appointed physician-in-ordinary to Prince Leopold of Saxe-Coburg. For some years, and till his death, he filled the situation of lecturer on chemistry and geology at the East India Company's Military Establishment at Addiscombe.

MACCULLOCH, JOHN RAMSAY, was born about 1789 in the district of Galloway, Scotland. He became a contributor to 'The Sootaman' Edinburgh newspaper, soon after its commencement, and was afterwards the editor for about two years. He also became a regular contributor to the 'Edinburgh Review.' He is the author of several works on political economy, and various branches of public administration, all of which are distinguished by philosophical views, clearness of statement and argument, liberal principles, and practical good sense. He has also published some very useful compilations, especially a 'Dictionary of Commerce,' and a 'Dictionary of Geography.' The intrinsic and permanent value of all these works is best proved by the number of editions which the public demand has called forth. Mr. MacCulloch occupies the important post of Comptroller of the Stationery Office, and receives a pension of 200*l.* a year for his services to literature.

The following is a list of Mr. MacCulloch's works:—'A Discourse on the Rise, Progress, Peculiar Objects, and Importance of Political Economy, containing an Outline of a Course of Lectures on the Principles and Doctrines of that Science,' 8vo, 1825; 'The Principles of Political Economy; with some Inquiries respecting their Application, and a Sketch of the Rise and Progress of the Sciences,' 8vo, Edinburgh, 1825; 4th edit. 1849. 'Statements illustrative of the Policy and probable Consequences of the proposed Repeal of the existing Corn-Laws, and the Imposition in their stead of a moderate Fixed Duty on Foreign Corn,' 8vo, 1841; 'A Treatise on the Principles and Practical Influence of Taxation and the Funding System,' 8vo, 1845; 'The Literature of Political Economy: a Classified Catalogue of Select Publications in the different Departments of that Science, with Historical, Critical, and Biographical Notices,' 8vo, 1845; 'A Treatise on the Succession to Property vacant by Death, including Inquiries into the Influence of Primogeniture, Entails, Compulsory Partition, Foundations, &c., over the Public Interest,' 8vo, 1848; 'A Treatise on the Circumstances that determine the Rate of Wages and the Condition of the Labouring Classes,' post 8vo, 1851; 'A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation, illustrated with Maps and Plans,' 8vo, 2nd edit. 1834, republished several times, with improvements and additions in one volume. 'A Statistical Account of the British Empire, exhibiting its Extent, Physical Capacities, Population, Industry, and Civil and Religious Institutions,' 2 vols. 8vo, of which several editions have been published. 'A Dictionary, Geographical, Statistical, and Historical, of the various Countries, Places, and principal Natural Objects in the World, illustrated with Maps,' 2 thick and closely-printed vols. 8vo. This work, originally published in numbers, and completed in 1842, was republished with additions, in 1846, with a supplement in 1849, and a new edition in 1856. 'Smith's Wealth of Nations, with a Life of the Author, Notes, and Supplemental Dissertations,' 8vo, 2nd edit. 1838, 4th edit. 1850. 'A Select Collection of Early English Tracts on Commerce,' printed by the Political Economy Club of London for private distribution, from the originals supplied by Mr. MacCulloch, who also wrote the Preface. [SUPP.]

MACDIARMID, JOHN, was born about 1789 in Edinburgh, where he received his early education, partly at the common schools and partly at the university. He began his career as a clerk in a manufacturing establishment, whence he removed to the Commercial Bank, where for a few years he discharged highly responsible duties. While so engaged he ceased not to pay attention to his literary studies, was occasionally amanuensis to Professor Playfair, contributed poetry to the 'Scots' Magazine, and was an active member of a debating society called 'The Forum.' In January 1817 he became editor of the 'Dumfries Courier,' of which he afterwards became the proprietor. It

was in this position that Mr. MacDiarmid chiefly distinguished himself. He raised the character of the provincial press by introducing originality and taste into the conduct of it, his newspaper becoming highly successful, and a model for others. Mr. MacDiarmid had a partiality for natural history, and he was accustomed to observe and record the abnormal specimens which occurred; but though a laugh was sometimes raised at his accounts of enormous gooseberries or marvellous turnips, it is not known that he ever wilfully exaggerated. In addition, he drew attention to the antiquities and natural beauties of Dumfriesshire, and the adjacent counties of Kirkcudbright and Wigton, not only in the newspaper, but by separate publications, 'The History of Dumfries,' 'The Guide to Moffat,' &c. His other works were—'Life of Cowper,' published in 1817; a 'Life of William Nicholson, the Galloway Poet;' 'Sketches of Nature,' 'The Scrap-Book,' &c. After conducting the paper with extraordinary vigour and fertility, he died on November 12, 1852.

MACDONALD, ANDREW, an unfortunate man of letters, furnishes the theme for one of the most affecting passages in Disraeli's 'Calamities of Authors.' He was born about 1755, and was the son of a gardener in Leith. After having been educated in the University of Edinburgh, he took orders in the Scottish Episcopal Church, and in 1777 became pastor of a congregation in Glasgow. In 1782 he published 'Velina, a Poetical Fragment,' in Spenser's stanza. This volume was succeeded by a novel called 'The Independent;' and afterwards a tragedy of his, called 'Vimonda,' was played with success in the theatre of Edinburgh, with a prologue written by Henry Mackenzie. Becoming tired of a charge very ill remunerated, and being encouraged by the reception of his play, he resigned his place, and came to Edinburgh; first however marrying the servant-maid of the house he had lodged in, and then living for a short time very extravagantly. He next removed to London, where in 1787 his tragedy was brought on the stage by Colman with much pomp and very considerable approbation. But on August 22, 1790, he died in his lodgings, Kentish Town, leaving his wife and child in indigence. A volume of his sermons was published in 1790; and a volume of poems, including 'Vimonda' and three other plays, appeared in 1791. His dramatic genius cannot be rated high, but he possessed no inconsiderable power both of poetic fancy and of expression. There is a good deal of vigour in some of his light poems, written in London, in the manner of Peter Pindar.

MACDONALD, ETIENNE-JACQUES-JOSEPH-ALEXANDRE, Duke of Tarentum and Marshal of France, was born on the 17th of September 1765, at Sancerre in the department of Cher, though some authorities make Sedan the place of his birth. He was descended from a Scotch family, which, on account of its participation in the rebellion of 1745, was compelled to take refuge in France. In 1784 he entered the army as a lieutenant in the legion of Maillebois, and afterwards joined the regiment of Dillon, chiefly composed of Scotch and Irish, in the French service. His military talents procured him a place at the commencement of hostilities on the staff of General Dumouriez, and he rose to the rank of captain after the battle of Jemmappes. He served in the campaign of the Low Countries under General Pichegru, and distinguished himself by the passage of the Waal on the ice, under a severe fire from the batteries of Nimeguen, by which exploit the Dutch fleet was captured. Having risen to the rank of General of Division, he commanded in 1796 at Düsseldorf and Cologne. He then joined the army of the Rhine, and afterwards that of Italy; and when in 1798 the French became masters of Rome, Macdonald was appointed governor of that city. On the approach of General Mack he was obliged to abandon Rome, and his army was attacked by the enemy at Otricoli; the Austrians however were defeated, and he was enabled to regain possession of Rome. He was afterwards sent by the French government against Naples, and when compelled to retire before the superior force of Suvarov, he saved his army, and reconducted it to France by a retreat in which he displayed considerable skill. [SUVAROV.]

Macdonald had command at Versailles during the period of the revolution of the 18th Brumaire. In 1800 he was appointed commander-in-chief of the army of reserve in Switzerland. His celebrated passage of the Splügen, the dangers and difficulties which he surmounted, the persevering ability which he displayed, have rendered his name greatly celebrated in the annals of warfare. There are indeed but two events recorded in history to which this memorable exploit can be compared—the passage of Hannibal over the Alps, and that of Napoleon I. over the great St. Bernard. In March 1802 he was appointed French ambassador at the court of Copenhagen; and on his return to Paris he was created Grand Officer of the Legion of Honour. He afterwards remained some years without employment, on account of the free expression of his sentiments with respect to the conduct of the first consul towards General Moreau. [BONAPARTE, NAPOLEON I.; MOREAU.] It was not until 1809 that he was recalled to military service, when the command of a division of the army of Italy under Eugene Beauharnais was given to him by the emperor. Macdonald on this occasion made a noble use of the opportunity of renewing his military reputation: The troops under his orders entered Styria; he compelled the Austrian general Meerfeldt to capitulate at Laybach (May 22, 1809); and he shared the glories of the victory of Raab. He was present on the 6th of July at the famous battle of Wagram; the important duty of forcing the enemy's centre, which

was defended by 200 pieces of cannon, was committed to him, and he executed this critical movement with consummate skill and bravery, but with immense loss. On the morning after this great and sanguinary engagement, Napoleon, as he passed by Macdonald, stopped, and, holding out his hand as a pledge of their reconciliation, paid him a just tribute of praise for his share in the victory, and as an earnest of his admiration presented him with the marshal's staff.

He was afterwards appointed Governor of Gratz, where by the strict discipline he maintained among his troops he so conciliated the esteem of the inhabitants, that on his leaving the town they begged his acceptance of a most valuable gift of jewels, intended as a present to one of his daughters who was about to be married. This gift however he refused, and added that the best proof of their gratitude towards him would be shown by their care of 300 sick soldiers whom he was obliged to leave behind him. In April 1810 Macdonald returned to Paris, and was created Duke of Tarentum, and appointed to the command in Catalonia of the corps of Marshal Augereau, who was recalled. [AUGEREAU.] His conduct in Spain did not add to his military reputation. On one occasion indeed he was engaged in an enterprise which has tarnished the glory of his previous exploits. After the fall of Tortosa (March 29, 1811), he was attacked on his march to Barcelona by the Spanish general Sarafeld, and his troops met with a determined opposition on the bridge of Manresa, when they forced their way through the town, whose inhabitants offered them no resistance, and wreaked their vengeance upon it by setting fire to its buildings: 700 houses and two large hospitals were thus destroyed, and Macdonald, who witnessed the conflagration, made no efforts to put a stop to it, and offered no assistance to the sufferers. This atrocious and wholly unnecessary cruelty was visited by universal indignation, and rekindled in all its vigour that guerilla warfare which proved so harassing in its effects and so important in its ultimate results. In 1812 Macdonald accompanied Napoleon in the expedition to Russia, with the tenth corps of the army under his command. In the Saxon campaign of 1813 he distinguished himself at the battles of Bautzen and Lützen. In that of Katabach (August 29, 1813) he met with a severe reverse. In direct violation of Napoleon's orders, he imprudently advanced against Marshal Blücher, who was at the head of an army very superior in numbers to his own, which was imprudently scattered over a space of thirty miles from Liegnitz to Schoenen; so that when attacked on his centre and his left by the concentrated masses of the Prussians he had no adequate force at hand to arrest the onset of the enemy. The result of this engagement was the loss of one of his divisions, that commanded by Puthod, 100 officers, including Puthod himself and all his staff; 3000 soldiers became prisoners; twelve pieces of artillery also fell into the hands of the enemy. At the great and disastrous battle of Leipzig, more fortunate than the illustrious Poniatowsky, he was enabled in the retreat to swim safely across the Elster.

In 1814 Marshal Macdonald constantly adhered to the declining fortune of Napoleon; he also warmly exerted himself with the allies to obtain favourable terms for the emperor and his family. He was with him at Fontainebleau, where Napoleon expressed to him his regret at not having before appreciated his value, and presented him with a splendid Turkish sabre, the gift of Ibrahim Bey. On the first restoration of the Bourbons, Macdonald was called to the Chamber of Peers, where he proposed without success several measures of justice towards the returned emigrants and the veterans of Napoleon's army. When his former chief returned from Elba, this marshal was solicited to accept a command, but refused; and, proceeding to Lyon to join the Count d'Artois, afterwards Charles X., he endeavoured, though fruitlessly, to induce the troops to remain faithful to the Bourbon cause. On his failure he returned to Paris, and when Napoleon approached that city he accompanied to the frontier the fugitive king (March 20, 1815). It is however stated by some that he came back to Paris, and there performed duty as a simple soldier in the national guard.

On the second restoration of the Bourbons he was named Chancellor of the Legion of Honour, which office he retained till 1831. He likewise received the appointment of Governor of the Twenty-first Military Division, and that of Major-General of the Royal Guard. The rest of Macdonald's life appears to have been chiefly passed in tranquil occupations on his estates. He visited Scotland, where he showed much kindness to some relatives whom he found in the Highlands in humble circumstances. He died at Paris on the 24th of September 1840.

\*MACDONALD, LAURENCE. This distinguished sculptor is a native of Scotland, and received his early artistic education in the schools of the Royal Academy, but settled many years ago in Rome, where he still resides, and where he divided with Gibson the admiration and the commissions of the British patrons of art. Like Gibson, he is a thorough classicist in taste; but though, like him, he takes all his original works from the mythology of Greece and Rome, Mr. Macdonald has obtained a larger share of celebrity and profit from his portrait busts than from his poetic statues. The character of his original works may be gathered from the titles of a few of those which he has executed in marble:—'Andromeda,' executed in 1842 for the Marquis of Abercorn; 'Hyacinthus;' 'Ulysses,' a noble figure of the heroic size, executed for Sir Arthur Brooke, and one of

Macdonald's finest works; 'Eurydice,' 'Arethusa,' 'A Bacchante,' &c. For the most part they consist of single figures, and are characterised by classic beauty and refinement of style, by graceful modelling, serenity of expression, admirably-arranged draperies, and faultlessness of pose and proportion; but there is seldom seen any lofty flight beyond the regions of classic conventionalism. In his busts Mr. Macdonald always gives as much dignity to the countenance as it is capable of receiving without endangering the likeness; and in his female heads he is especially fortunate in combining with the elevation of style a pleasing air of ease and refinement. In the Crystal Palace are casts of several of his busts, and of his 'Ulysses' and 'Andromeda.'

\*MACDOWELL, PATRICK, R.A., was born in Belfast, Ireland, on the 12th of August 1799. His father, a tradesman in that town, died while his son was yet an infant, leaving his wife in very straitened circumstances. When about eight years old the boy was sent to a school in Belfast kept by an engraver named Gordon, who encouraged his early fondness for drawing, and furnished him with prints to copy. Here he remained till he was twelve years old, when his mother removed to England, and placed him with a clergyman in Hampshire. At the end of two years he was apprenticed to a coach-maker in London, who becoming insolvent, young MacDowell's indentures were cancelled after he had been four years and a half at this uncongenial occupation. He now took lodgings in the house of a French sculptor named Chenu, and began to employ his idle hours in sketching from the various plaster casts by which he was surrounded, and soon made strenuous efforts to acquire a knowledge of the sculptor's art. After he left these lodgings he continued to draw with great diligence, and to model portions of the human form. At length he ventured to make a reduced copy of a whole figure—a Venus by Donatelli—which, when he had completed, he carried to Chenu, who was so well pleased with it as to become its purchaser. The young student now set to work with redoubled zeal. Other models were produced, and other purchasers found. At length he was persuaded to become a competitor for the execution of a monument proposed to be raised to the memory of Major Cartwright, and his model was chosen. Eventually, the sum subscribed proving inadequate for his design, another sculptor was employed; but the model was the means of introducing Mr. MacDowell to the widow of Major Cartwright, who, with other members of the family, became active and zealous promoters of the young sculptor's interests.

He now began to receive commissions for busts, and some of those he executed obtained places in the exhibitions of the Royal Academy. When not thus engaged he turned to ideal subjects. "The first group I attempted—and I shall never forget the pleasure I felt while doing it," Mr. MacDowell writes in a graceful autobiographical sketch contributed to the 'Art-Journal' for January 1850,—"was from Moore's 'Loves of the Angels,' the figures about three feet nine inches high. It is now in the possession of George Davison, Esq., of Belfast. My next work was a group from Ovid, of 'Cephalus and Procris.' I was commissioned to execute this in marble for E. S. Cooper, Esq., member for Sligo. After that I modelled a group, life-size, of a 'Bacchus and Satyr'; I then commenced a model of a 'Girl Reading,' which when finished I sent to the exhibition, which was the first exhibition in the new Academy in Trafalgar-square."

This figure led to an interview with Sir James Emerson Tennant, who asked the young artist the name of his master. "I never studied under any one," was the reply, "but was apprenticed to a coach-maker." Finding, on a little further conversation, that they were not merely countrymen, but fellow-townsmen, Sir James became still more interested in his young acquaintance, gave him a commission for busts of himself and Lady Tennant, and introduced him to his friend W. T. Beaumont, Esq., M.P. for Northamptonshire, who, with characteristic impetuosity, at once gave MacDowell commissions for the execution of his model of the 'Girl Reading' in marble, for two large groups in marble from any subject he chose, and at the same time stipulated that he should do nothing for any one else for three years.

The marble of the 'Girl Reading' was exhibited in 1838, and excited general admiration; a duplicate was executed for the Earl of Ellesmere. In 1840 Mr. MacDowell exhibited at the Royal Academy a statue of a 'Girl going to Bathe,' which he executed in marble, and exhibited in the following year, along with a statue entitled 'Prayer;' and he was (November 1841) elected A.R.A. He was now urged to visit Italy by Mr. Beaumont, who undertook to supply ample funds. He remained abroad eight months, and on his return completed for Mr. Beaumont his 'Prayer,' exhibited in 1842; his large marble group 'Love Triumphant,' exhibited in 1844; 'Cupid,' 1845; 'Early Sorrow,' 1847, &c. In 1846 he was elected R.A., and the same year he exhibited his statue of Viscount Exmouth, for Greenwich Hospital. Among the more important of his subsequent works are his 'Virgin and her Daughter' 1847; 'Cupid and Psyche,' and 'Eve,' 1849; a bronze statue of the Earl of Warren, for the New Palace at Westminster, and 'Psyche,' 1850; 'The Slumbering Student,' 1851; 'Love in Idleness,' 1852; 'The Day Dream,' 1853; and 'The First Thorn in Life,' and a bronze statue erected in Belfast of the late Earl of Belfast, 1856. He has also executed a large number of portrait busts.

The works of Mr. MacDowell exhibit little of the appearance of a self-taught hand. While free from all servile imitation of the antique, they yet evince a careful study of classic art, and they are executed

with great mastery over the chisel. What chiefly characterises them is a quiet and graceful poetic spirit. His female forms are always beautiful, and their faces almost always animated with the true sentiment of the character they are intended to impersonate. His ideal male figures are perhaps not equal to his female, but some of them are of a high order of merit.

MACEDO, JOSE AGOSTINHO DE, a Portuguese poet and miscellaneous writer of considerable celebrity, was a native of the city of Evora. The date of his birth was probably not later than 1770, as he speaks of his didactic poem of 'Meditation' as having been written during the progress of the French Revolution, and a poem of that nature is not likely to have been commenced before the age of twenty. He became not only a churchman but an Augustine monk, but he afterwards obtained a release from his monastic vows. In 1810 he was chaplain to the Prince Regent of Portugal, and was one of the most popular preachers in Lisbon. In that year he issued a pamphlet entitled 'Os Sebastianistas,' directed against one of the most singular delusions that has ever prevailed outside of the walls of a lunatic hospital. When King Sebastian of Portugal fell in 1578 in Morocco at the battle of Alcazar, it was natural enough that many of his subjects at home, whom the unexpected news struck like a thunderbolt, should refuse to give credit to the truth of the distant calamity, which placed Portugal in the hands of the Spaniards, and should still hope year after year to see the king come to enjoy his own again; but it might have been confidently supposed that this belief would expire with the last of that generation. Not only however throughout the 17th century but also through the 18th there were still persons in Portugal who lived in hopes of Sebastian's return, and when Napoleon's invasion took place, the belief suddenly obtained a large accession of followers, who looked for their deliverance from the oppressor not at the hands of Lord Wellington, but of King Sebastian returning to Portugal from either Heaven or Morocco, some two hundred and twenty years after his disappearance. Macedo's pamphlet was intended to prove that these 'Sebastianists' must be bad citizens and bad Christians; but the tone he adopted was somewhat intemperate, and he was met by replies to show that several Sebastianists were honest and respectable lunatics. The general character of his political writings was violent, and he was especially bitter against Freemasons, who may possibly be a different body in Portugal from what they are in England. For some years he conducted the official 'Gazette' of Lisbon, and he also at one time issued a periodical entitled 'The Trumpet of the Last Judgment.' He warmly espoused the cause of Don Miguel against Don Pedro, and one of his last productions was a 'Refutation of the monstrous and revolutionary Pamphlet published in London (by Midosi) entitled Who is the legitimate King of Portugal?' Lisbon, 1828, 8vo. He died at Lisbon in September 1831, it has been said of mortification at the suppression of one of his pamphlets by the authorities.

It is as a poet and critic that the name of Macedo is most respectable. He had the moral courage to point out to reprobation some of the faults of Camoens, and for this he has been censured, almost as if guilty of some act of moral obliquity, not only by Portuguese, but by French and German critics. One of the most celebrated passages in the 'Luciad' is that in which Vasco de Gama, when he is labouring round the Cape of Storms, is encountered by the spirit of the cape, who on being questioned as to who and what he is, relates his history. Strange to say, the poet puts it in his mouth that he was unknown "to Strabo, Ptolemy, and the other ancient geographers," and some other parts of his oration are almost equally infelicitous. Many of those that are more poetic are shown by Macedo to have been borrowed from the Italian poets, to whom Camoens was largely indebted, and he also points out that in other passages generally, Camoens had followed much too closely the prose narrative of the historian De Barros. In the same year, 1811, in which Macedo's 'Reflections on the episode of Adamastor in the Luciad' appeared, he had the hardihood to publish an epic poem, entitled 'Gama,' in which he himself attempted to sing the discovery of India. A remodelling of this poem under the title of 'O Oriente' ('The Orient') appeared in 1814, and reached a second edition in 1827. In spite of the assaults to which it was subjected from the offended admirers of Camoens, it has stood its ground as a work of considerable merit, and as the finest Portuguese epic of recent times. A didactic poem entitled 'A Meditacao' ('Meditation'), is however considered Macedo's masterpiece, and is spoken of in terms of enthusiasm by the best Portuguese critics, Almeida Garrett included. Another poem entitled 'Newton,' dedicated to the glory of the great English philosopher, is of a very inferior cast, and is chiefly remarkable for the terms of intense admiration in which the writer speaks of the glories of England. A translation of Horace, a collection of poems entitled 'A Lyra Anacreontica,' and a tragedy entitled 'Branca de Rossia,' are the principal remaining works of Macedo.

MACER, ÆMILIUS, a Roman jurist, who lived under the Emperor Alexander Severus, or shortly after his time. He was either a contemporary of Ulpianus, or wrote after Ulpianus, for he cites him several times. There are 275 excerpts from Macer in the Digest. His works mentioned in the Florentine Index are—two books on Military matters, two on Publica or Publica Judicia, two on the Officium Præsidis, two on the *eiectio* or *Vicesima hereditatum*, and two on Appellationes. According to Priscian he also wrote *Annales*.

MACGILLIVRAY, WILLIAM, a distinguished Scotch naturalist. He was born in the Isle of Harris, and early acquired a taste for natural history, and having gone to reside in Edinburgh, became the assistant of Professor Jameson in the Natural History and Geological Museum of the University. He was afterwards appointed to the position of Conservator of the Museum of the Royal College of Surgeons in Edinburgh. In these positions he had extensive opportunities of studying the specimens and preparations which were committed to his charge, and he seems to have neglected none of the rare opportunities which presented themselves for adding to his store of knowledge. He did not however confine himself to the museum, for he was in the strict sense of the word a lover of nature, and studied natural history extensively in the field. Nor did he confine himself to one department—minerals, plants, and animals, all laid claim to his attention, and he possessed a sufficient knowledge of each to make considerable contributions to the branches of science which contemplate their study. On account of his extensive knowledge of natural history the University of Aberdeen bestowed upon him the degree of LL.D., and subsequently he was appointed Professor of Civil and Natural History in Marischal College, Aberdeen. Here he cultivated natural history with great ardour, and wrote some of his most valuable works. He died at Aberdeen on the 5th of September 1852.

Dr. Macgillivray published various papers on natural history subjects in the 'Memoirs of the Wernerian Society,' the 'Edinburgh New Philosophical Journal,' the 'Reports of the British Association,' and the 'Magazine of Zoology and Botany.' He was also the author of several substantive works of great value.

His labours in botany were not so extensive as in other departments of natural history, he nevertheless edited an edition of Withering's 'Arrangement of British Plants,' and published several lists of plants illustrative of the distribution of the British species.

His geological papers were numerous, and he published in 1839 'A Manual of Geology, with a Glossary and Index.'

Of his various works on zoology, his 'History of British Birds,' in three volumes, two of which were published after his death, is undoubtedly the most important. In this work he has displayed great power of observation, with a skill in the description of the habits of birds quite unrivalled. This work is illustrated with sketches drawn by the author, which display very considerable artistic skill. He is also the author of a 'History of British Quadrupeds,' in Jardine's 'Naturalist's Library.' In 1843 he published 'A History of the Molluscous Animals of the counties of Aberdeen, Kincairdine, and Banff.' He also produced a 'Conchologist's Text-Book,' which has gone through a large number of editions.

At the time of his death he had prepared for the press a volume on the 'Natural History of Dee-Side,' which consisted of an account of a personal tour up the valley and among the mountains of Dee-Side. It also contained sketches of the geology, botany, and zoology of the district, with lists of the minerals, plants, and animals of Dee-Side. As this work could hardly be expected to meet with a remunerative sale the family declined to publish it, and the existence of the manuscript having been made known to the Queen of England she generously purchased it of the family, and the work has since been published by her Majesty's command. It forms a handsome octavo volume, illustrated with several woodcuts of the scenery of the district, and contains a carefully executed map of the district of the river Dee, in which the geology of the valley and mountains is laid down. This work was printed for private circulation, and was very liberally presented to the naturalists, natural history societies, and public libraries of Great Britain by His Royal Highness Prince Albert.

Dr. Macgillivray left behind him a large family. His eldest son, Mr. John Macgillivray, accompanied Captain Stanley in the voyage of the Rattlesnake, and published an account of the voyage on his return. He has also published several papers on various departments of natural history.

The following estimate of his character appeared in a notice of his 'British Birds' in the 'Athenæum' for 1852:—

"Dr. Macgillivray was a naturalist, and one of no mean order. Had he confined his attention to a few of the subjects of the vast field over which he laboured with unwearied industry through a long life, he would perhaps have attained a yet higher position as a man of science than that which he reached. Whilst in the fields, on the mountains, or by the sea-shore, he had an eye to every natural object that surrounded him, and the interest with which he regarded them is expressed in the numerous papers and works which he has written on botany, geology, and zoology. Though a list of Dr. Macgillivray's works would alone occupy a large space, yet he was not a man of the closet. Though one of the most diligent of compilers, he was a laborious original investigator. Whilst he lived by natural history as a profession, he pursued it as a science, and in return for the scanty means which it afforded towards the necessities of existence, he rendered a large amount of observation made with great labour and self-sacrifice. Although naturally an amiable man, he has frequently in his works—as is often the case with self-educated men of an ardent character—expressed himself strongly on the views of others, and in this way he made many enemies during his life. Now that the

BIOG. DIV. VOL. IV.

grave has closed over him, even those with whom he most differed will look back on his career only to admire."

MACHIAVELLI, NICCOLO', was born at Florence in 1469, of an old though not wealthy family of that republic. Having received a liberal education, he was employed in the office of Marcello Adriani, chancellor of the community of Florence, and afterwards, when twenty-nine years of age, he was made secretary of the "Ten," a board entrusted with the management of foreign affairs and diplomatic negotiations. Machiavelli's abilities and penetration being soon perceived by his superiors, he was successively employed on many and some very important missions. The first was in 1498, to Jacopo Appiani, lord of Piombino, for the purpose of engaging him to join the Florentine troops which were besieging Pisa, whilst their general Vitelli was defending the Florentine territory against the Venetians, who, joined to the emigrant partisans of the Medici, were making incursions from the borders of Romagna. In the following year 1499, Machiavelli was sent to Catherine Sforza, countess of Forlì, in order to make arrangements with her son Ottaviano to engage as a condottiero in the service of the republic. The instructions given by the Ten to Machiavelli for each of his missions, and his letters or reports to them written during the course of his negotiations, have been published, at least in great part, and they occupy volumes iv. and v. of the 4to edition of his works (Florence, 1782). They are most curious and valuable documents for the history of the times, and they are also most useful for the understanding of Machiavelli's political and historical works which he wrote later in life. Many letters however, and some of great importance, written to or by Machiavelli, remain still inedited. (Valéry, 'Voyages en Italie'; Avenel, three articles on the French translation of the works of Machiavelli by Périès, which appeared in vols. 41 and 42 of the 'Révue Encyclopédique'.)

In 1500 Machiavelli was sent as a commissioner to the Florentine camp before Pisa. He was present at the arrival of a body of French and Swiss auxiliary troops under De Beaumont, sent by Louis XII., who had just reconquered Lombardy and had formed an alliance with Florence. Dissensions however arose between the allies concerning the pay of the auxiliaries. The Swiss mutinied, and insulted Luca degli Albizzi, one of the Florentine commissioners; and the French abandoned the attack against Pisa, throwing all the blame upon the Florentines, and took possession of Pietrasanta, of Massa and Carrara, and other districts belonging either to Florence or its allies. This was an anxious period for Florence, which saw itself entirely at the mercy of France, while it was threatened on the other side by Cesare Borgia, then the terror of central Italy, who, supported by his father Pope Alexander VI., and also by the French, was making himself master of Romagna by force or treachery, and threatening Florence, where he wished to re-establish the Medici. [BORGIA, CESARE.] In July 1500, Machiavelli was despatched to France in order to explain to Louis XII. the untoward occurrences at Pisa, to endeavour to keep the king, or rather his all-powerful minister Cardinal d'Amboise, archbishop of Rouen, in a friendly disposition towards Florence, and thus screen the republic from the ambition of Borgia. This was a very delicate mission. The French king and minister were prejudiced against the Florentines; they had an interest in favouring the Borgias, and they were also instigated against Florence by Trivulzio, Beaumont, and other persons of influence at the French court. Machiavelli's mission to France lasted till January 1501. He followed the French court to Melun, Blois, Nantes, and other places, and by dint of much skilful management, of fair promises and professions, and of timely suggestions, he left Louis better disposed towards Florence than he had found him, and made him watchful and jealous of the movements of Cesare Borgia. This jealousy of the French king proved the salvation of the republic a few months after, when the ferocious and unprincipled Borgia entered Tuscany with 8000 men, and encamped a few miles from Florence. The citizens showed firmness, and in the meantime letters came from the French king forbidding Borgia from molesting the republic. A convention was concluded in May 1501, between Florence and Borgia, by which the latter, after receiving a sum of money, went his way to Piombino, and left the Florentine territory after committing many depredations. But in the following year Borgia, having returned to Romagna, drove away Guidobaldo, duke of Urbino, and took possession of Camerino, whose lord Giulio Varano, he caused to be strangled with his three young sons, while his subordinate Vitellozzo Vitelli supported the revolt of Arezzo, Cortona, the Val di Chiana, and other districts against Florence, and in favour of the Medici. Here again the French interfered, and Vitelli, who began to be alarmed at the cruelty of Borgia, entered into an agreement with the French and with Florence, by which Arezzo and other towns were restored in August 1502. On this occasion Machiavelli, being requested by the government, wrote his opinion concerning the manner in which the revolted districts ought to be treated: "Sul metodo di trattare i popoli di Val di Chiana." Quoting the opinion of L. Furius Camillus after the subjugation of Latium, and the conduct of the Roman senate towards the Latin cities, he advised moderation in the present instance, except towards Arezzo, which he compared to Veitrus, and advised to be treated accordingly.

In September of the same year, 1502, the Florentines, alarmed at the dangers by which they were encompassed, saw the necessity of

giving greater stability to their executive, by appointing a gonfaloniere perpetuo, a kind of dictator for life. They chose for this office Piero Soderini, a man upright and disinterested, and without children, and therefore less likely to excite suspicions or jealousy. About the same time Machiavelli was sent on a mission to Duke Valentino, the formidable Borgia, who was then at Imola in Romagna. Borgia had just returned from Lombardy, from an interview with Louis XII, in which he endeavoured to clear himself from the charge of having countenanced the insurrection against Florence, and moreover to obtain assistance from the French king for the purpose of subduing Bologna, which he intended to make the capital of his duchy.

During his absence in Lombardy, his own friends and former colleagues, Vitellozzo Vitelli, Baglioni of Perugia, the Orsini, and Oliverotto da Fermo, alarmed at the increasing ambition and cruelty of Borgia, determined to forsake him, and entered into a secret league with Bentivoglio of Bologna and Petrucci of Siena, who were his declared enemies. At the same time they invited the Florentines to join them. But as Borgia was protected by France, whose displeasure the Florentines were afraid of incurring, they sent Machiavelli to make professions of friendship to Borgia, and at the same time to watch his movements, to discover his real intentions (which was not an easy thing, for Borgia was the closest man of the age), and to obtain something in return for their friendship. The account of this mission is extremely curious. There was deep dissimulation on both sides: Borgia hated Florence as much as the Florentines hated him; but they were both kept in check by the fear of France, and both Borgia and Machiavelli made the fairest and apparently most candid professions towards each other. Borgia even assumed a confidential tone, and began to tell Machiavelli of the treachery of his former friends; he added that he knew how to deal with them, and was only waiting for his own time; he also expatiated on his well-disciplined forces, his artillery, and the assistance he expected from France; and all this in order to persuade the Florentines of the great value of his friendship, and that they should give him a condotta, that is to say, the chief command in their army. Borgia however had to do with a negotiator who, though young, was a match for him. "I answered," says Machiavelli, in the 21st letter of that mission, "that his excellency the duke must not be compared to the generality of other Italian lords, but that he must be considered as a new potentate in Italy, with whom it is more fit and becoming to make a treaty of alliance than a mere condotta or mercenary convention. And I added that as alliances are maintained by arms, which are the only binding security for either party, your lordships (the magistrates of Florence) could not see what security there would be for them if three-fourths or three-fifths of your forces were to be in the hands of the duke." Still the negotiations went on about the condotta, whilst Borgia was meditating another stroke of his usual policy. Machiavelli had a foretaste of it at Cesena, where a certain Rimino, a confidential agent of Borgia, and, as such, hateful to the people, was suddenly arrested by order of his master, and the next morning (on the 26th of December) was found in the middle of the square cut into two pieces: "Such," says Machiavelli, "has been the duke's pleasure, for he wishes to show that he can do and undo his own men as he thinks proper." On the last day of December, Borgia, followed by Machiavelli, marched with his troops to Sinigaglia, where the Orsini, Vitellozzo, and Oliverotto were waiting for him, to have a conference and settle matters. As soon as his troops had entered the town he arrested those chiefs, strangled two of them that very night, and kept the Orsini in prison until he heard that his father, the pope, had secured the person of their relative Cardinal Orsini at Rome, after which they also were put to death. On that very night Borgia sent for Machiavelli, and said that he had done a great service to Florence in ridding the world of those men who were the sowers of discord. He then expressed his wish to attack Siena and revenge himself on Petrucci; but the Florentines, being cautioned by Machiavelli, took measures to thwart his plans, and Petrucci was saved. Machiavelli returned to Florence in January 1503, after three eventful months passed in the court and camp of Borgia, which was the most complete school of that policy which he afterwards illustrated in his treatise 'Del Principe.' His letters (fifty-two in number) written during that mission have a certain dramatic character which awakens feelings of surprise, terror, and intense curiosity. Machiavelli wrote also a detached report of the Sinigaglia tragedy: 'Descrizione del modo tenuto dal Duca Valentino per ammazzare Vitellozzo Vitelli, Oliverotto da Fermo, il Sigr. Pagolo e il Duca di Gravina Orsini.' He obtained one thing from Borgia by this mission, a free passage through Romagna to all Florentine travellers and merchants, and their goods and other property.

In August of that same year 1503, Alexander VI. died, and his successor, Pius III., died a few days after. A new conclave being assembled in October, the Florentines sent Machiavelli to Rome, where he was present at the election of Julius II., and soon after witnessed the fall of Cesare Borgia, who was arrested at Ostia by order of the pope, and all his ill-gotten dominions were taken from him. His troops, in passing through Tuscany, were disarmed and disbanded agreeably to Machiavelli's secret advice.

In January, 1504, Machiavelli was sent to France to rouse Louis XII. to the danger threatening both Florence and the state of Milan from

the Spaniards, who were advancing from Naples towards North Italy. The truce between France and Spain put an end to this mission. After several minor missions to Piombino, to Baglioni of Perugia, Petrucci of Siena, and the Duke of Mantua, Machiavelli was sent, in August 1506, to Pope Julius II., whom he met on his march to dispossess Baglioni of Perugia and Bentivoglio of Bologna, whither the Florentine envoy followed him, and returned in October. ('Opere di Machiavelli: Legazione seconda alla Corte di Roma.') He then wrote 'Provisione per istituire Milizie Nazionali nella Republica Fiorentina.' He had always blamed the employment of mercenary troops and condottieri, which was an old custom of the Florentines.

In December 1507, Machiavelli was sent to the Emperor Maximilian in Germany, who had signified his intention of going to Italy to be crowned, and had demanded money of the Florentines. He proceeded by Geneva and Constance, where, finding that the emperor had moved southwards by the Tyrol, he followed him to Bolzano. The Venetians however opposed the passage of Maximilian, and Machiavelli returned to Florence in June 1508. On his return he wrote several reports on the affairs of Germany, besides the letters which he had sent home during his mission. 'Rapporto sulle cose di La Magna;' 'Discorso sopra le cose dell' Alemagna;' 'Ritratti di Lamagna.' In February 1509, he was sent to the camp before Pisa, which was again besieged by the Florentines, and he thence addressed a report on the state of affairs 'Discorso fatto al Magistrato dei Dieci sulle cose di Pisa.' In June of that year Pisa surrendered, through famine.

In July 1510 Machiavelli was sent to France a third time. The Cardinal d'Amboise was lately dead. The object of this mission was to encourage the French court to maintain the alliance with the pope and the emperor against the Venetians (the league of Cambrai), and to induce Louis to prevent the Swiss from enlisting in great numbers in the service of the pope, for fear that Julius, feeling himself independent, should take some new whim into his head. And this in reality happened soon after; for, while Machiavelli was in France, Julius formed a league to drive the French out of Italy. The letters of this mission are very important. The audiences of Louis to Machiavelli, and the conferences of the latter with the cardinal of Paris, the chancellor of France, and others, and his reflections on the pope, on the projects of Louis, on the proposal made by the Emperor Maximilian to Louis, of dividing Italy between them, which Louis refused to accede to, are extremely interesting. Machiavelli returned to Florence in September 1510, having consolidated the alliance of Florence with France.

On his return he wrote his second 'Decennale,' or short chronicle, in terza rima. The first 'Decennale' went as far as 1504, after the fall of the Borgias. The second 'Decennale' comes down only to the year 1510, but Machiavelli intended to complete it till 1514. In September 1511 he was sent again to France, concerning the council which assembled at Pisa, by order of Louis XII., to try and depose Pope Julius, which council however broke up without effecting anything. Machiavelli fell ill, and soon returned home. In 1512 the battle of Ravenna was fought, Gaston de Foix was killed, and the French lost Italy. Julius, who was irritated against Florence for having sided with the French, engaged the Spanish viceroy of Naples to send a body of troops against it, and re-establish the Medici by force. The catastrophe took place soon after.

In September 1512, when Giuliano and Giovanni de' Medici, the sons of Lorenzo, re-entered Florence by means of the Spanish infantry, and overthrew the popular government, the gonfaloniere Soderini made his escape, and the secretary Machiavelli, with others of the popular party, was dismissed from office, and banished for a time from the city. In the following year a conspiracy was discovered against the Medici, in which Machiavelli was accused of having participated; being arrested in February 1513, he was put to the torture, which was the usual means then employed under all the governments of Florence and of Italy, of examining persons accused of state crimes. He however maintained that he had nothing to confess. From his prison of Le Stinche he wrote a sonnet to Giuliano de' Medici, who was then governor of Florence, his brother Giovanni having gone to the conclave at Rome, where he was elected pope by the name of Leo X. The sonnet, which is half sad, half humorous, describing his sufferings, his own torture, the annoyance of hearing the screams of the other prisoners, and the threats he had of being hanged, is given by Artaud in his biography, entitled 'Machiavel, son Génie et ses Erreurs,' 2 vols. 8vo, Paris, 1833. He was soon after released, in consequence of a pardon sent from Rome by Leo X. to all those concerned in the conspiracy. Before however the pardon arrived, two of them, Pietro Boscoli and Agostino Capponi, had been executed.

Machiavelli now withdrew for several years from public life, and retired to his country-house at San Casciano, about eight miles from Florence. During this retirement he wrote his discourses upon Livy, his books on the art of war, and his 'Principi.' The book 'Del Principe,' or 'De Principatibus,' for that was the original title, was not intended for publication; it was written by the author for the private perusal first of Giuliano, and then of Lorenzo de' Medici, afterwards duke of Urbino, son of Piero and grandson of Lorenzo the Magnificent, who was appointed by Leo X. governor of Florence, his uncle Giuliano having removed to Rome. Machiavelli, in a letter discovered only in 1810, and addressed to his friend Vettori, then at

Rome, 10th of December 1513, after humorously describing his mode of life in the country, mentions this treatise on which he was then engaged, and tells him that he wishes to show to the Medici "that he had not spent the 15 years in which he had studied the art of government in sleeping or playing, so that they might think of employing a man who had acquired experience at the expense of others;" and he adds, "I wish that these signori Medici would employ me, were it only in rolling a stone. They ought not to doubt my fidelity. My poverty is a testimony of it." These expressions show clearly enough that Machiavelli's object in writing the 'Principe' was to recommend himself to the Medici. All the ingenious surmises of later critics about his wishing to render absolute princes odious to the people, or to induce the Medici, by following his precepts, to render themselves insupportable and thus bring about their own fall and the restoration of the republic, are completely overthrown. Machiavelli saw clearly enough that the Medici were too firmly seated at Florence to be dislodged, and although he was himself partial to a rational system of civil liberty, if consistent with a strong government, he was still more attached to the national honour and independence of his country; and what he dreaded most was, that, through some rash ebullitions of party spirit, foreigners might be enabled to interfere and enslave Florence, as they had enslaved Lombardy and Naples. At the end of his 'Principe' (ch. xxv.) he displays this feeling with great energy, in a passage which explains sufficiently that Machiavelli wrote his 'Principe' to please the Medici and to encourage them in their views of Italian dominion.

Machiavelli says, at the beginning of his treatise (c. 2), that he does not intend to treat of republics, of which he had spoken in former works, nor of hereditary principalities, because these are by precedent and custom firm and secure; but he intends to treat of what he styles mixed principalities; that is to say, where a new ruler or prince takes possession of a country, in which he must necessarily have many enemies. He illustrates, by examples from ancient and modern history, how a new ruler can secure himself in his recently acquired possessions. In the 7th chapter he gives a sketch of the method pursued by Cesare Borgia, whose political art he extols. The 8th chapter treats of those who usurp the government of their own country, and he instances Oliverotto, the petty tyrant of Fermo, who after one year of usurped power fell by the arts of a greater and more able tyrant, Cesare Borgia. The 9th chapter treats of those new princes who, without any criminal violence, but with the consent of their countrymen, have risen to the supreme power. Chapter 10 treats of the strength of the various principalities. Chapter 11 concerns ecclesiastical states, and especially that of Rome. Chapters 12, 13, 14, treat of the military force, mercenary, auxiliary, and native, showing the danger of relying upon the first two species of troops. Chapter 15 treats of the things which bring to princes praise or blame. Chapter 16 of liberality and parsimony. Chapter 17 of cruelty and clemency, and whether it is better to be loved than feared. He says the sovereign should be feared without being hated, and with this view he ought to abstain from touching the women and the property of his subjects; and he repeats, that even in cases of punishment for treason, he ought not to resort to confiscation, "because men sooner forget the death of their father than the loss of their patrimony." The 18th chapter, which has been considered as the most obnoxious, is in answer to the question, "In what manner ought a prince to keep faith?" Machiavelli begins by observing that everybody knows how laudable it is for a prince to keep his faith, and to live with integrity and not to practise craft: but yet, he adds, we have seen in our own times that those princes who have cared little about faith and have known how to deceive mankind have effected great things. There are two ways of ruling, one by the laws and the other by force: the former is proper for men, the other for beasts; but as the former is not always sufficient, one must resort to the second, and adopt the ways both of the lion and of the fox. If all men were good, this lesson were not good; but as they are bad, and would not keep faith with you, you must not keep faith with them. And then he cites the example of Alexander VI., who did nothing else but deceive men, and never thought of any other means, always confirming his promises with the most solemn oaths, and always succeeding in deceiving others. In chapter 19 Machiavelli, among other things, praises the institutions of the kingdom of France at that time; and he approves of the parliament as a check upon the nobility. Chapter 20 speaks of fortresses, of factions, of the balance to be kept between various parties in the state. He says the best fortification for a prince is to be liked by his people. Chapter 21 is entitled, 'How is a Prince to conduct himself in order to acquire reputation?' and the author adduces the example of Ferdinand the Catholic. Chapter 22 treats of the secretaries of princes. 23, That flatterers ought to be shunned. 24, Why and how have the Italian princes lost their states? 25, That fortune has a great share in human affairs, and how we can resist its influence. 26, Exhortation to deliver Italy from the barbarians. Had Machiavelli written his book in the form of a commentary upon history, instead of adopting a didactic style, all that he says would be no more than matter of fact, for it was openly practised in his age, and had been practised long before him. Moral considerations are of course totally out of the question in such a work. But even in its didactic form, most of its precepts were not new. Gilles Colonne (Frater

Egidius Romanus), an Austin friar, preceptor to Philippe le Bel, wrote for the instruction of his pupil a treatise, 'De Regimine Principum,' afterwards printed at Venice in 1473, and translated into Spanish under the title of 'Regimiento de los Principes,' for the instruction of the Infante Don Pedro of Castile. This book was probably before the eyes of Machiavelli when he composed his 'Principe.' Several of the obnoxious principles of that treatise are also found in the 'Memoirs' of Comines, and in the 'Politie' of Aristotle.

The 'Principe' was first published, after Machiavelli's death, at Rome in 1532, with the permission of Clement VII. The 'Legazioni,' or letters of the political missions of Machiavelli, which are the key to his 'Principe,' were not made public till the middle of the last century.

In 1516 Machiavelli wrote his 'Discorsi sulla prima Deca di Tito Livio,' or commentary on the first ten books of Livy, which are still much admired. After the death of Lorenzo de' Medici, in 1519, Cardinal Giulio having become governor of Florence, both he and Leo X. seem to have remembered Machiavelli, and it was at Leo's request that he wrote a 'Discorso sopra Riformare lo stato di Firenze,' which was a plan of a new constitution for that state.

After 1521 Machiavelli was again employed on various missions. He was sent once to Venice, in 1525, and several times to his friend Guicciardini, who was governor, first of Modena, and then of Parma, for the pope. This was the time when Pope Clement VII. and the French were allied against Charles V., and when the Imperial army under Bourbon was threatening to cross the Apennines, no one knew whether to fall upon Tuscany or upon Rome. Machiavelli was sent to Parma to spy their motions. He returned to Florence in May 1527, after Bourbon's army had gone to Rome. Being unwell in the stomach, he took some medicine of his own, upon which he grew worse, and died, after receiving the sacrament, on the 22nd June, at the age of fifty-eight. A letter of one of his sons describes the particulars of his death. He left five children by his wife Marietta Corsini, but little or no fortune. He was buried in the family vault in the church of Santa Croce: but it was only in 1787 that a monument was raised to his memory, through the exertions and liberality of Earl Cowper.

The other works of Machiavelli, not mentioned above, are—'Storie Fiorentine,' which he presented to Clement VII. in 1525, and which came down to the death of Lorenzo the Magnificent, in 1492. They rank among the best works on Italian history. The style of Machiavelli is remarkably nervous, concise, and comprehensive, and very different from that of his contemporary (and, it may be said, continuator) Guicciardini. Machiavelli has left fragments which bring down the history of Florence to 1499; 2, 'La Mandragora' and 'La Clizia,' two comedies; 3, 'L'Asino d'Oro,' an imitation of the 'Golden Ass' of Apuleius; 4, 'Vita di Castruccio Castracani,' incomplete; 5, 'Sommario delle cose di Lucca,' which is a political and statistical account of that republic; 6, 'Sette libri dell'Arte della Guerra,' which were highly esteemed by Frederick the Great of Prussia and other competent judges; 7, 'Discorso se la Lingua di Dante, Boccaccio, e Petrarca, debba chiamarsi Italiana, Toscana, o Fiorentina;' besides minor productions and a multitude of letters. The best editions of his works collectively are those of Florence, 1783, 6 vols. 4to; 1796, 8 vols. 8vo; and 1818, 10 vols. 8vo.

MACHIN, JOHN, succeeded Dr. Torriano as professor of astronomy to Gresham College on the 16th of May 1713. His death is announced in the 'Gentleman's Magazine,' June 7th, 1751, but the date of his birth is unknown. He is the author of a method for determining the quadrature of the circle, by means of the known development of an arc according to the ascending powers of its tangent, which he so modified as to render rapidly convergent. It was however by means of Dr. Halley's method that he computed the ratio of the circumference of the circle to its diameter as far as one hundred places of decimals. In the 'Philosophical Transactions' he wrote—1, A paper 'On the Curve of quickest Descent,' xxx., 1718; 2, 'A Case of Dis-tempered Skin,' xxxvii., 1732; 3, 'Solution of Kepler's Problem,' xl., 1738. Besides the above, he published a pamphlet on the 'Laws of the Moon's Motion according to Gravity,' which was printed at the end of Motte's translation of Newton's 'Principia,' 8vo, 1729.

\* MACKAY, CHARLES, was born at Perth, 1812, but removed early to London, where he was educated. In 1830 he was in Brussels, and was there a witness of the events of the revolution, which separated Belgium from Holland. In 1834, after having published a small volume of poems, he became an assistant on the 'Morning Chronicle,' where he continued for several years. In 1844 he was appointed editor of the 'Argus,' a Glasgow newspaper, which situation he resigned in 1847, on occasion of a dispute among the Liberal party as to the choice of a candidate to represent that city in parliament; but while resident there, in 1848, the university bestowed on him the degree of LL.D. In the meantime he had produced several works, and on his return to London devoted himself entirely to literature. In 1846 he published in Glasgow a small work, 'Education of the People, in Letters to Viscount Morpeth.' 'Voices from the Crowd,' a collection of poems, which had first appeared in the 'Daily News;' and 'Scenery and Poetry of the English Lakes,' were published in the same year in London. In 1847 he wrote 'Voices from the Mountains,' a small volume of poems. In 1848 appeared 'Town Lyrics, and other Poems.' In 1849 appeared 'The

Bottle,' a poem to illustrate George Cruikshank's celebrated etchings, with 'The Drunkard,' a supplement. In 1849, in conjunction with Mr. Cooke Taylor, he produced 'The World as it is, a System of Modern Geography,' in 2 vols 4to, the third volume being furnished by Mr. C. Stafford; and edited 'The Streets of London,' by J. T. Smith. In 1850 he produced 'Egeria, or the Spirit of Nature, and other poems,' and a romance entitled 'Longbeard, or the Revolt of the Saxons;' in 1851, 'Memoirs of Extraordinary Delusions;' in 1853, 'The Salamandrine,' his longest poem; in 1856, 'The Lump of Gold, and other poems,' 'The Songs of the Brave,' 'Ballads and Lyrical Poems,' and 'Under Green Leaves.' In 1864 appeared his 'Studies from the Antique.' He also wrote 'The Thames and its Tributaries,' a work which is little better than a compilation. Mr. Mackay's highest merit is as a writer of songs, in which he has succeeded in catching and reflecting the public feeling; many of his songs having attained an immense popularity, particularly his 'Good Time Coming, Boys.' They are usually fluent and well adapted to the music, but they often foster prejudices, though we believe the writer is perfectly honest in the adoption of the sentiments he inculcates. For some years he wrote leading articles for 'The Illustrated News;' and his songs, with music—the music frequently furnished by himself—still occasionally appear in that paper.

MACKENZIE, SIR ALEXANDER, born about 1760, was a native of Inverness in Scotland, from which he emigrated to Canada when a young man, and there obtained a situation in the counting-house of Mr. Gregory, one of the partners of the North-West Fur Company. He had resided for about eight years in the service of Mr. Gregory at Fort Chipewyan, at the head of the Athabasca Lake, in the savage country to the west of Hudson's Bay, when the knowledge he had acquired of the country and the people, and his intelligence and enterprising character, determined his employers to send him out on an exploring expedition through the regions lying to the north-west of that station, and conjectured to be bounded by the Arctic Ocean, a part of which Hearne was supposed to have seen, and, as is now well ascertained, actually had seen on his visit to the Coppermine River in 1771. Mackenzie, attended by a German, four Canadians, and three Indians, together with two Canadian and two Indian women, left Fort Chipewyan on the 3rd of June 1789. Embarking in their four canoes on the Slave River, the party reached the Slave Lake, with which it communicates by a course of 170 miles, on the 9th of the same month. Resting there six days, during which the ice somewhat gave way, they launched their canoes again on the 15th, and skirting the margin of the lake, reached the entrance of the river which flows from its western extremity, and is now called the Mackenzie River, on the 29th. Mackenzie pursued the north-westward course of this river, with a perseverance and intrepidity which no dangers or difficulties could subdue, till on the 15th of July it brought him to the object of his hopes, the great Northern Ocean, in lat. 69°. Returning by the same route, the party regained Fort Chipewyan on the 12th of September. On the 10th of October 1792, Mackenzie set out from the same point on another adventurous journey, the object of which was to reach the Pacific; an attempt, the first made in North America, in which he was also successful. Proceeding partly by the Ungah or Peace River, and partly by land, after encountering still greater difficulties than on his former expedition, he reached the sea on the 23rd of July 1793, and returned in safety by nearly the same route. Of both his journeys Mackenzie has himself given a full account in his 'Voyages from Montreal, on the River St. Lawrence, through the Continent of North America, to the Frozen and Pacific Oceans, in the years 1789 and 1793,' 4to, Lond., 1801. The account is preceded by a general history of the fur trade (130 pages), and the volume is embellished with a portrait of the author, who soon after received the honour of knighthood. He died in 1820.

MACKENZIE, SIR GEORGE, of Rosehaugh, son of Simon Mackenzie (brother of the Earl of Seaforth) by a daughter of Dr. Bruce, principal of St. Leonard's College, St. Andrews, was born at Dundee in 1636, and having finished his grammar education, which he did with much applause, he proceeded to Bourges, "the Athens of Scottish lawyers," as he calls it, to study the civil law. On his return he passed advocate, January 1659, being then about twenty-three years old. The next year he published his 'Aretina, or the Serious Romance,' where, says Ruddman, he gives "a very bright specimen of his gay and exuberant genius." The year following we find him in the important situation of justice-depute, an office in the nature of an English justice in eyre, or of assize; and in that character appointed to repair with his colleagues "once a week at least to Musselburgh and Dalkeith, and to try and judge such persons as were there or thereabout accused of witchcraft." Not many years afterwards, though at what time is not quite certain, he had the honour of knighthood. In the meantime he continued his literary labours. In 1663 his 'Religio Laici, or Short Discourse upon several Divine and Moral Subjects,' appeared; two years afterwards, his 'Moral Essay upon Solitude,' in which he exalts that state above public employment with all its advantages; and in 1667, his 'Moral Gallantry,' a treatise in which he attempts to establish the moral duties on the principles of honour. It was shortly after this time he entered parliament, representing the county of Ross, where the influence of his family was powerful and extensive; and in 1674 he was

appointed king's advocate in the room of Sir John Nisbet of Dirleton. He continued in the office till the accession of King James, when it was given to Sir John Dalrymple; but in a short time he was reinstated and continued in office till the Revolution. Previous to this last event he had published several of his legal works, and had been instrumental in founding the Advocates' Library. It was in 1682 that this library was founded; and at its foundation he delivered an inaugural oration setting forth its advantages. In 1678 he published his 'Discourse on the Laws and Customs of Scotland in Matters Criminal.' In 1684 he published his 'Institutions of the Laws of Scotland,' a concise and, generally speaking, excellent compendium of the law; and in 1686 he published his 'Observations on the Scotch Acts.' He seems also to have attempted the establishment of a chair of law in the University of Edinburgh, but was unsuccessful in obtaining that object.

After the Revolution Sir George retired to Oxford, where he was admitted a student on the 2nd of June 1690; but he did not live long afterwards to enjoy the retirement which he had early praised and had now begun to experience. He died on the 2nd of May 1691; and after lying several days in state in the abbey of Holyrood House, Edinburgh, his body was conveyed to Greyfriars churchyard, attended by a procession consisting of the council, the nobility, the college of justice, the college of physicians, the university, the clergy, and many others.

Sir George was the correspondent of Dryden and other writers of England; and he was among the first Scotchmen who wrote the English language in a style approaching to purity. But it was as a lawyer, and still more as an officer of state, that he was principally distinguished; and in this last character he received the appellation, which will live with his name, of 'The blood-thirsty Advocate.'

MACKENZIE, HENRY, was born at Edinburgh in August 1745. He was the son of Dr. Joshua Mackenzie, a physician in extensive practice and of literary habits. His mother belonged to an ancient family in the county of Nairn. He was educated at the high school and university of his native city; and afterwards he became one of the attorneys in the Scottish Court of Exchequer. His professional duties, while he held this place, must have left him abundant leisure for indulging his literary tastes. While in London in 1765, studying the English practice in Exchequer, he had begun to write his earliest and best novel, 'The Man of Feeling,' which was published anonymously in 1771, and for some years was not acknowledged by the author. In 1783 he published his second novel, 'The Man of the World;' and next came 'Julia de Roubigné,' his last considerable work of this class. Meantime he had edited two well-known periodicals in the manner of the 'Spectator': 'The Mirror,' which continued to appear for seventeen months from January 1779; and 'The Lounger,' which, begun in February 1785, came to a close about two years afterwards. To the 'Mirror' Mr. Mackenzie contributed forty-two papers; to the 'Lounger' fifty-seven. Among these are his small novels, such as 'The Story of La Roche,' and a kindly criticism on the poems, then new, of Robert Burns. The 'Transactions of the Royal Society of Edinburgh' received from him several papers; and one of these, a memoir on German tragedy, was followed in 1791 by a volume of dramatic translations, which was one of the earliest causes that drew the attention of Walter Scott to German literature. The Highland Society likewise published in their 'Transactions' papers of Mr. Mackenzie, one of which was his account of the Asiatic Controversy. In 1793 he wrote, for an edition of the works of the blind poet Blacklock, a memoir of the author; and a 'Life of John Home, the author of 'Douglas,' which he read to the Royal Society of Edinburgh in 1812, was afterwards prefixed to an edition of Home's works, and also published separately. Mr. Mackenzie himself wrote several plays, which are more remarkable for refinement of feeling, imagery, and language, than for dramatic force or effectiveness. The collected edition of his works contains three of these: 'The White Hypocrite,' a comedy, which was once performed at Covent Garden; 'The Spanish Father,' a tragedy, which Garrick had declined to bring on account of the harrowing nature of the catastrophe; and 'The Prince of Tunis,' which had been acted at Edinburgh with much applause in 1773, and printed separately the same year.

Mr. Mackenzie was likewise a political writer in the Tory interest. His most elaborate work of this sort was 'An Account of the Proceedings of the Parliament of 1784,' which was revised and corrected by Mr. Pitt's own hand; and he published some anti-jacobin tracts at the time of the French Revolution. The merit of these services to the government, set forth by his friends Lord Melville and Mr. George Rose, procured for him in 1804 the place of comptroller of taxes for Scotland, an office of large emolument, but considerable labour and responsibility, which he held thenceforth till his death.

In 1808 he edited a complete collection of his literary works, in eight octavo volumes; and this was almost his last contribution to literature. Indeed that tendency to sickly refinement, which characterised his exquisite novels, indicated a want of the vigour of mind essential to success in the highest walks of literary invention; and his is not the only case in which genius of this cast has put forth all its strength in youth, and been overborne in mature years by the realities of life. Accordingly, for many years, Mr. Mackenzie's leisure was spent either in the society of literary and other friends, or in

shooting and fishing, sports to which he was particularly attached, and which he pursued as long as his strength permitted. His old age was healthy, cheerful, and happy: a slight deafness alone indicated the decay of nature. He, who had in youth breakfasted with Dr. Johnson, and who had enjoyed the friendship of Blair and Robertson and Adam Smith, lived to see one generation after another, and revolution after revolution in the phenomena of literature. He had married the daughter of Sir Lodovick Grant of Grant: and by this lady he had eleven children, one of whom was long a judge in the Supreme Court of Scotland. Henry Mackenzie died in Edinburgh on the 14th of January 1831, being in the eighty-sixth year of his age.

MACKINTOSH, SIR JAMES, was born at Aldourie, on the banks of Loch Ness, seven miles from Inverness, Scotland, on the 24th of October 1765. His father, Captain John Mackintosh, was the representative of a family which had for above two centuries possessed a small estate called Kellachie, which Sir James inherited from him. His mother, originally a Miss Marjory Macgillivray, was connected with several good Scottish families; and, with her child, resided with her mother and sisters at a small house called Clune, her husband being absent with his regiment at Antigua and Dublin for eight or nine years after the birth of their child. Sir James, in his 'Autobiographical Sketch,' written in India, says of this period of his life,—“The only infant in a family of several women, they rivalled each other in kindness and indulgence towards me, and I think I can at this day discover in my character many of the effects of this early education.” In the house of his grandmother he found the works of the chief writers of Queen Anne's time, and from them acquired a fondness for desultory reading, which became in later years a confirmed habit. From the ordinary day-schools of Fortrose he passed in his fifteenth year to college at Aberdeen, where he remained from 1780 to 1784, the vacations being passed in the house of his grandmother.

At Aberdeen Robert Hall, who was his senior by a year, was his fellow-student, and Mackintosh records “the great influence which Hall's society and conversation had on his mind.” They lived in the same house, were constantly together, and led each other into controversies on the most abstruse points of theology and metaphysics. By their fellow-students they were regarded as the intellectual leaders of the university, and under their auspices a society was formed in King's College, which was commonly designated “The Hall and Mackintosh Club.” Several of the professors at Aberdeen at this time were men of eminence, but Mackintosh does not appear to have owed much to their prelections. He finally quitted Aberdeen in the spring of 1784, having taken his M.A. degree on the 30th of March. His own inclination was for the bar, but the circumstances of his family seemed to present an insurmountable obstacle, and he eventually proceeded to Edinburgh (October 1784) to study medicine. There he mingled freely with the intellectual society of the place; divided his studious hours between medicine, metaphysics, and politics, intermingling with each excursions into its lighter literature and passing or past controversies, and he became a prominent speaker in the medical, physical, and speculative societies. Three years were thus pleasantly spent, and not unprofitably, as regarded the general culture of his mind, but his professional education advanced probably little beyond the theoretical information which enabled him to maintain the thesis necessary to secure his diploma.

Having obtained that, he naturally turned southwards. It was a season of great political excitement when the young physician arrived in London, and he entered heartily into it. Listening to the eloquence of Burke at Warren Hastings' trial, parading the streets with Horne Tooke's colours in his hat during the fervour of a Westminster election, or talking politics in a debating society, was an occupation far more to his taste than walking the wards of a hospital. Moreover he had obtained introduction into literary and political society, and his conversational talents—backed by remarkable kindness of manner—and social habits rapidly widened the circle. But he made, or his friends made for him, some efforts to secure a professional establishment. At first it was arranged that he should avail himself of an opening for a physician at St. Petersburg; then he sought to settle at Salisbury, and afterwards at Weymouth; but all in turn were abandoned. Yet while thus undetermined in his plans, he married (February 1788) a young lady with as little fortune as he himself possessed. A tour made through the Low Countries to Brussels, and a somewhat protracted stay there, led to his undertaking the “foreign department” of the ‘Oracle’ newspaper; and the success of the articles which he contributed to the ‘Oracle’ led him to turn his attention to the study of the law. Burke's ‘Reflections on the Revolution in France’ had thoroughly aroused the public mind, and called forth a multitude of advocates and opponents. Mackintosh, who was an ardent admirer of the revolution, as far as it had then proceeded, was eager to join in the fray, but it was not until 1791 that he completed his ‘Vindiciae Gallicae.’ The work was hailed with enthusiasm by the Whig party, and was generally acknowledged to be the ablest answer to Burke which had appeared. The author at once became famous; and the highest anticipations were formed of his future career. Fox, Sheridan, and the other leading Whigs of the day sought his acquaintance; and on the formation of the well-known ‘Association of the Friends of the People,’ he was unanimously appointed the secretary, and entrusted with the drawing up of the ‘Declaration.’

But he gradually devoted less time to politics, and concentrated his powers upon his legal studies. He was called to the bar by the Society of Lincoln's Inn in Michaelmas Term 1795. Still he continued his wide and excursive reading, and occasionally contributed to the literary periodicals of the day. A critique on Burke's ‘Thoughts on a Regicide Peace,’ which appeared in the ‘Monthly Review’ (November and December 1798), excited much attention, and led to some correspondence, and ultimate friendly intercourse, with Burke—a circumstance to which Mackintosh used in after years to revert with great delight.

To a mind so long conversant with the study of general principles, the rudiments and technicalities of law, as then commonly pursued, could not fail to be distasteful. Without therefore neglecting them, he turned with ardour to the broader field of public or international law—a subject then of intense interest in connection with current events. Here he found a thoroughly congenial pursuit, and he probably during the next few years studied with more concentration of thought and purpose than at any other period of his life. He saw too that it was a study which, from its general omission in the scheme of professional training, afforded him a favourable opportunity of distinguishing himself; and he could not but feel that his previous wide though discursive range of reading—which a memory of extraordinary capacity enabled him to render at all times fully available—and his familiarity with mental philosophy, qualified him to enter upon the study with more than usual advantages. Having conceived the plan of giving a course of lectures on the subject of international law, he, in order to remove any objections which the novelty of his scheme might provoke, at the beginning of 1799 published an ‘Introductory Discourse,’ which was received with marked favour by men of all parties and character—Mr. Pitt, Mr. Perceval, the Lord Chancellor, and Dr. Parr being among the earliest in expressing their admiration. The benchers of Lincoln's Inn granted the use of their hall, and in February Mackintosh began a course of thirty-nine lectures ‘On the Law of Nature and Nations,’ and it was repeated with some variations the following year. Its success was triumphant. The old hall was filled daily “with an auditory such as never before was seen on a similar occasion. All classes were there represented—lawyers, members of parliament, men of letters, and country gentlemen, crowded to hear him.” Canning was a regular attendant, as were other men of mark from the party to which Mackintosh was politically opposed; but he was somewhat piqued to observe that, except Lord Holland, none of the prominent men of his own political party were among his auditors. Indeed the lectures, greatly as they added to his reputation, for a time rather lessened the hold he had secured upon the Whig leaders. The terms in which he spoke of the French revolution were very different from those of the ‘Vindiciae Gallicae,’ while he availed himself of every opportunity to record his admiration of Burke both as a statesman and a philosopher—a change which the friends of Fox were at this time sure to resent. But the breadth of view, the general philosophical calmness and impartiality with which he conducted his argument, the evident love of truth, and the manly eloquence of their style, secured for the lectures general approbation; and judges from the bench, and clergymen from the pulpit, quoted them as authorities. But, having thus as he said “disburdened his mind in his lectures,” he turned somewhat disgusted from revolutionary politics, and spent the next three or four years in the steady prosecution of his professional and literary pursuits, and in domestic and social enjoyment. He joined the Norfolk circuit, in which he soon took a leading position. He was a powerful advocate where the case permitted him to appeal to general principles or high moral feelings, and Mr. Basil Montagu (his colleague in the cause) has mentioned one such case in which Mackintosh's speech produced an effect such as he believes was never equalled in a court of justice. (‘Life,’ i. 163.) This forensic reputation was raised to its highest pitch by the speech which Mackintosh delivered (February 21, 1803) in the action brought against M. Peltier, an emigrant royalist, for a libel on Bonaparte, then First Consul. The speech was published, and being translated into French by Madame de Staël, was quickly circulated throughout Europe, despite the efforts made by the partisans of Bonaparte for its suppression.

His prospects at the bar were quite as favourable as he could have anticipated; at the end of seven years he found himself in the receipt of an income of 1200*l.*, and he was looked up to with general respect by the profession. But his position was far from satisfactory. His social standing and his social habits entailed an expenditure which not merely encumbered his present efforts, but, at a time when he was long for ease and learned leisure, rendered a life of continuous toil the inevitable prospect. He had married a second time, and had now a family of a son and five daughters. Accordingly he began to turn his thoughts to the Indian bench as an honourable retreat, and through the friendly efforts of Canning the recordership of Bombay was obtained for him. On receiving this appointment the honour of knighthood was conferred on him. Sir James reached Bombay in May 1804, and remained there till November 1811. To his duties as recorder were added in 1806 those of judge of the Admiralty Court, and in all respects his judicial conduct secured general respect. Throughout his judicial career he was the sole judge in his courts, and in criminal cases he had to decide without the intervention of a jury; and it was no small relief to his feelings that only in one instance, and that only a short

time before leaving Bombay, did he feel himself compelled to condemn a prisoner to death. But not only was it by his upright and able, yet humane, judicial administration that he secured a more than ordinary share of esteem; he set himself with success to raise the tone of official character, and to arouse a spirit of literary enterprise and emulation. One of his first measures was the founding (November, 1805) of the 'Literary Society of Bombay,' and he opened the proceedings of that society by an elaborate 'Introductory Discourse;' and he afterwards laid before the society (May, 1806) a 'Plan for Forming a Comparative Vocabulary of the Indian Languages,' which was printed and widely circulated at the time by the different governments of India. Both the 'Discourse' and the 'Plan' were printed in the first volume of the society's 'Transactions.'

On his return to England Sir James was offered by Mr. Perceval a seat in parliament—known to be a great object of his ambition—with intimations of future advancement; but Mackintosh, little inclined to abandon his party, respectfully declined the offer; he also declined offers of subordinate places in the succeeding governments made by Canning and Lord Liverpool. He was elected (June 1813) through the interest of Lord Cawdor member for the county of Nairn. In the House of Commons he took from the first a high place. His speeches on foreign affairs in the first session especially attracted much notice, but his eloquence was of too temperate and philosophical a character to raise him to eminence as a parliamentary debater. His eloquence was fitted for great occasions, it was not fitted for the ordinary business of the House, or adapted to the requirements of party. Perhaps it was partly on this account that when the Whigs coalesced with Canning (April 1827), the name of Mackintosh was not one of those submitted by them to the premier for office—very much it is said to Canning's surprise: he was however admitted somewhat later to the privy council. From 1819 to his death Sir James sat as member for Knaresborough, a borough then entirely in the interest of the Duke of Devonshire. Among the great subjects which he took an earnest and prominent part in advocating were, Roman Catholic Emancipation, and the removal of all religious disabilities; the abolition of slavery; municipal and parliamentary reform; and the amelioration of the criminal code, which last subject was after the death of Romilly left in his hands, and under his prudent conduct made considerable progress. From the retirement of Tierney Mackintosh was regarded as one of the leaders of the opposition.

In 1818 Sir James accepted the office of Professor of Law and General Politics in the East India College at Haileybury, and he continued to hold it with honour to himself and great benefit to the students till 1824. When the Grey ministry came into power (November 1830) it was generally expected that Mackintosh would be called upon to fill an important post; but, like Burke and Sheridan before him, he was doomed to experience the aristocratic exclusiveness of Whig governments. He was not admitted into the cabinet: that was reserved for patrician 'connections;' but for this eminent man was found the place of 'Commissioner for the Affairs of India'—the same which eighteen years before he had refused at the hands of his political opponents. In the debate on the second reading of the Reform Bill, Mackintosh made a speech of great power; and on the 9th of February 1832, he spoke on the state of Portugal; but his health was failing, and a slight accident brought on an illness, which terminated fatally May 30, 1832.

We have noticed Mackintosh's earlier literary works. Whilst in India the intention of writing a new 'History of England' assumed a definite shape, and as soon as he arrived in England he set about collecting materials. It was his purpose to commence with the fall of James II. The Prince-Regent gave him access to the Stuart papers; the archives of the French Foreign-office were freely opened to him; and the public and private libraries of the kingdom were made readily available. It may give an idea of the extent to which he carried the task of collecting his materials to mention that they filled fifty manuscript volumes. But he exhausted too much time and strength over these preliminary labours; and he was dismayed alike at the vast accumulation of materials, and the thought of the impossibility of satisfying the expectations which his extended preparations had excited. Moreover parliamentary and professional occupations filled his days, social engagements his evenings, and he could not bring himself to break away from either. The little time he could give to literary composition he frittered away in the easier and more stimulating task of writing essays for the 'Edinburgh Review.' At length when he was applied to, to write a brief general survey of English history for Lardner's 'Cyclopædia,' he complied with a sigh, and laid aside for ever his great work; of which, 'a fragment,' all he had written, of the 'History of the Revolution in England in 1688,' was published after his death. Of the general History two volumes appeared during his life; of the third he only lived to write a part, bringing the work down to the reign of Elizabeth. It is except in particular cases deficient in details, but as a general survey of English history it is a work of great value, being comprehensive in grasp; free from all partiality (except perhaps for the oppressed); clear, just, and liberal in its views; and calm but often eloquent in style. A new edition of the 'History of England,' revised by his son, has been published in 2 vols. 8vo. He also wrote a very pleasing 'Life of Sir Thomas More' for Lardner's 'Cyclopædia.'

Another important work is his 'Dissertation on the Progress of Ethical Philosophy, chiefly during the 17th and 18th centuries,' prefixed to the seventh edition of the 'Encyclopædia Britannica.' As a history of ethical philosophy it is very incomplete, as being confined almost exclusively to British authors, and of them the survey is often far from satisfactory, while the narrative and didactic portions are so intermingled as to produce some confusion. Nor is it either in plan or execution free from serious objections in other respects. Everywhere in fact the work bears evidence of having been written in an irregular and desultory manner. Yet it shows that the mind of the author had dwelt long and fondly on the subject, and it is everywhere imbued with a tolerant spirit, and a love of truth and virtue. It is in fact rather a pleasing than a profound work; one calculated rather to stimulate than to satisfy. A separate edition of it was published in 1836 with a preface by the Rev. W. Whewell. 'The Miscellaneous Works of Sir James Mackintosh,' including his contributions to the 'Edinburgh Review,' have been published in 3 vols. 8vo; and also in a single volume sq. crown 8vo.

*Memoirs of the Life of the Right Hon. Sir James Mackintosh:* edited by his son, Robert James Mackintosh, Esq., 2 vols. 8vo, 1835.)

MACKLIN, CHARLES, an actor and dramatic writer. His family name was MacLaughlin. The exact place and date of his birth are unknown; but according to the account of a female relative, "he was two months old at the battle of the Boyne" (July 1, 1690), a few days previous to which event his mother travelled with him from Drogheda to a little village six miles off, in which they resided for some years. At the age of fourteen he was apprenticed to a saddler, but soon ran away and came over to England, where he contracted a marriage with the widow of a publican in the Borough. The circumstance coming to the ears of some friends, the marriage was dissolved on the grounds of nonage, and he was sent back to Ireland, when he became a badgerman in Trinity College, Dublin. At the age of twenty-one he again visited England, joined a strolling company, and played Harlequin, returned to Trinity College, and again to England in 1716, when he recommenced actor at Bristol. In 1725 he was a member of Mr. Rich's company at the Lincoln's Inn Fields theatre, London. On the 10th of May 1735, he unfortunately killed a brother performer, named Hallam, by accident in a quarrel, for which he was tried and found guilty of manslaughter. On the 14th of February 1741, Macklin established his fame as an actor in the character of Shylock. In 1753 he took leave of the stage, and on the 11th of March 1754, opened a tavern and public ordinary in the Piazza, Covent-Garden, adding to it "a school of oratory and criticism," in which he gave lectures, full dressed, only to be laughed at by Foote and other wags of the day. This scheme failing, Macklin became a bankrupt, and in 1757 went to Dublin, where he assisted in laying the first stone of the Crow-Street theatre. In 1759 he accepted an engagement at Drury-Lane, and from thence went to Covent-Garden. On the 18th of November 1773, he was driven from the stage by a cabal, but brought an action and obtained damages against the ringleaders. On the 28th of November 1788, while representing the character of Sir Pertinax MacSycophant, in his own comedy, 'The Man of the World,' his memory suddenly and entirely failed him. He made a last attempt for his own benefit, May 7, 1789, in the character of Shylock, but was unable to complete the part. Macklin died July 11, 1797, at the great age (it is supposed) of one hundred and seven, and was buried in the chancel of St. Paul's, Covent-Garden.

There are ten dramatic pieces ascribed to him, but two only have kept possession of the stage, 'Love à la Mode,' a farce, and 'The Man of the World,' a comedy. His memoirs, written by J. T. Kirkman, Esq., were published in two vols. 8vo, London, 1799.

MACKNIGHT, JAMES, D.D., an eminent divine of the Church of Scotland, was born in Argyleshire in 1721. He studied in the university of Glasgow, but, like many of the Presbyterian divines both of his own country and of England, went abroad and finished his studies at Leyden. On his return he became a minister in the Scotch Church, and was appointed, in 1753, pastor of Maybole, in Ayrshire. Here he spent sixteen years, during which time he prepared two works; one, 'A Harmony of the Gospels,' with copious illustrations, being in fact a life of our Saviour, embracing everything which the evangelists have related concerning him; the other, 'A new Translation of the Epistles.' Both these works were favourably received, and are by many persons highly esteemed. The 'Harmony' has been repeatedly printed, and to the later editions there are added certain dissertations on curious points in the history or antiquities of the Jews. The theology of them is what is called moderately orthodox. While at Maybole he published also another theological work, which is held in high esteem, in defence of 'The Truth of the Gospel History.' For these his valuable services to sacred literature, Dr. Macknight received such rewards as a Presbyterian church has it in its power to give. The degree of D.D. was conferred upon him by the University of Edinburgh. In 1769 he was removed from Maybole to the more desirable parish of Jedburgh, and in 1772 he became one of the ministers of the city of Edinburgh. Here he continued for the remainder of his life, useful in the ministry, though not accounted one of the most attractive and engaging of the preachers in that city. His attention to his theological studies was unabated, and in 1795, at the age of seventy-four, he produced his 'Literal Translation of all the Apostolic

Epistles,' with a large apparatus of Commentary and Notes, and a Life of the Apostle Paul. He died in 1800. There is an account of the life of Dr. Macknight by his son.

MACLAURIN, COLIN, one of the most eminent of Scottish mathematicians, was descended of an ancient family in Argyleshire, and was born at Kilmoddan, in that county, in February 1698. His father was a minister of the kirk, and died shortly after the birth of his third son Colin: his mother also died when he was very young, and the care of his education devolved upon an uncle, who sent him to the university of Glasgow at the age of eleven. It is said that in the following year, meeting accidentally with a copy of Euclid, he made himself master of the first six books in a few days, a story utterly incredible upon the mere statement. It is said also, and with much more likelihood, that at the age of sixteen he had invented many of the propositions afterwards published in his 'Geometria Organica.' However this may be, he took his degree of Master of Arts with distinction in the fifteenth year of his age (1713), and afterwards lived in studious retirement till the autumn of 1717, when, after a severe competition and ten days' examination, he obtained the professorship of mathematics at the Marischal College, Aberdeen. In 1719 and 1721 he visited London, and formed the acquaintance of many eminent men, particularly of Newton. In 1722 he travelled on the Continent as tutor to a son of Lord Polwarth; but the death of his pupil during their tour occasioned his return to Aberdeen.

In 1726 he was appointed to assist James Gregory, whose strength was declining, in the duties of his chair at Edinburgh. The want of funds to pay an assistant placed difficulties in the way of this arrangement, which were removed, but how is not clearly stated. We mention them here to record, in honour of Maclaurin, that Newton, on hearing of the obstacles, offered to pay 20*l.* a year, till Gregory's death, towards the assistant's salary, if Maclaurin were to be appointed. At Edinburgh he remained almost all the remainder of his life. When the Rebellion broke out in 1745, he exerted himself vigorously for the existing government, and the hasty works which were thrown up for the defence of Edinburgh were planned and superintended by him: fatigue and exposure laid the foundation of a mortal disorder. When the pretender entered Edinburgh, Maclaurin withdrew, to avoid making the submission which was demanded of all who had volunteered to defend the town; but he had previously managed to introduce a good telescope into the castle, and to contrive a method of supplying the garrison with provisions. He accepted the invitation of Dr. Herring, archbishop of York, with whom he remained till it was safe to return to Edinburgh. Shortly after his return he died of dropsy, June 14, 1746, aged forty-eight years and four months.

Maclaurin married in 1738, and his wife, with two sons and three daughters, survived him. Of his character it can only be stated, from the general eulogy, that it was such as secured him the highest regard of his contemporaries.

The writings of Maclaurin are not numerous, but they have exercised considerable influence upon the mathematical studies of this country; more however we think, in what has been taken from them, or on their model, by others, than in the extensiveness of their own circulation. There is both originality and depth in all of them, and we shall proceed to notice them separately.

1. The various papers which he published in the 'Philosophical Transactions' are on subjects intimately connected with his separate works. The numbers of the 'Transactions' in which they occur are 356, 359, 364, 377, 394, 408, 439, 461, 467, 469, 471.

2. 'Geometria Organica, sive descriptio linearum curvarum universalis,' London, 1720. This is an elaborate treatise on the description of curves by the intersections of moving straight lines.

3. In 1724 he gained the prize of the Academy of Sciences for an essay, proposed by that body, on the Leibnitzian method of measuring the force of bodies in motion. In 1740 he divided with Daniel Bernoulli, Euler, and Cavalleri, the prize of the same academy for an essay on the tides. This work is printed in what is called the Jesuits' edition of Newton.

4. 'A Treatise of Fluxions,' Edinburgh, 1742 (3 vols. 4to; a second edition about 1801, 8vo). The immediate cause of this work was the attack of Berkeley upon the first principles of Fluxions, in his 'Analyst': it is of great prolixity, as might be expected in an elementary treatise which is written entirely on the defensive; but it must always be remarkable as having been the first work in which the principles of fluxions were placed in logical connection with each other. The details are very extensive, forming a great body of applications, several of them quite new at the time. Among others is the theorem now known by the name of Maclaurin, but which had been previously noticed by Stirling. Of all the treatises which have been organised upon the fluxional principle, this is undoubtedly the most sound as well as complete.

5. 'A Treatise on Algebra,' 1748 (sixth edition, 1796). This work certainly surpassed all its predecessors in clearness, though far from being as logical a work as the 'Fluxions.' It contains two appendices on the general properties of curves. It was left not quite complete, and was finished by an editor.

6. 'An Account of Sir Isaac Newton's Philosophical Discoveries,' London, 1748. This work also was published from the author's papers; the editor was Patrick Murdoch. After the death of Newton,

his nephew Mr. Conduitt proposed to publish his life, and applied to Maclaurin for assistance. The latter immediately prepared an account of the philosophical systems which preceded that of Newton. But Mr. Conduitt's death frustrated the plan, and Maclaurin, extending his design to the length of explaining all Newton's mechanical and cosmical discoveries, left this work in the state in which it was printed. The optical discoveries were omitted, and the editor states that the author's intention seems to have been the explanation of those parts only of Newton's discoveries which had been and were controverted. In the present day, when popular explanation of scientific points has been well studied, it would be easy to name works which are preferable to that of Maclaurin in matter and form; but in style it would be difficult to do the same. At a time when the theory of gravitation was hardly admitted by many at home, not yet received by any of note abroad, and really understood by very few, such a work was of peculiar value.

Besides the preceding, Maclaurin edited in 1745 an edition of David Gregory's 'Practical Geometry.' He was also actively engaged in many matters closely connected with scientific publications. We need do no more than mention his exertions to found an observatory at Edinburgh, which did not succeed, and a medical society: to the latter he contributed several papers. He was engaged at one time in promoting the survey of part of the north of Scotland; at another in examining and reporting on the manner of gauging vessels; and he organised and computed tables for a provident society for the widows and orphans of the Scottish clergy, in a manner which secured the stability and usefulness of the scheme.

\* MACLISE, DANIEL, R.A., was born on the 25th of January 1811 at Cork, Ireland, where his father, a native of Scotland, having retired from the army, had established himself in business. While a child MacLise showed a great aptitude for drawing, and he was very desirous of becoming a painter; but, his friends being unwilling, or unable, to comply with his wish, he was placed in a banking house at Cork. This he left however at the age of sixteen, and gave himself up to the pursuit of art, managing to maintain himself by the sale of sketches and the drawing of likenesses. He had entered himself a student in the Cork Society of Arts, where he made rapid progress, studied anatomy under an eminent surgeon, and made a sketching tour through the Wicklow mountain district, which supplied a valuable fund of pictorial materials. In 1828 he came to London, and was admitted a student in the Royal Academy. Here his course was unusually brilliant. The year of his entry he won the medal in the antique; the medal for the best drawing from the life followed; and the series of his triumphs was crowned by his carrying off the gold medal for the best historical composition. The summer of 1830 he spent in studying in the galleries and ateliers of Paris. During the three or four years between his entering the schools of the Academy and his winning the gold medal, Mr. MacLise laboured hard in making designs and sketches for book-sellers and others, and in painting portraits: his caricature portraits which appeared about this time in 'Fraser's Magazine' will probably be remembered by some of our readers.

The first oil-paintings which he publicly exhibited, were, we believe, 'Mokanna Unveiling his Features to Zelica,' at the British Institution in 1833, and 'Allhallow Eve,' and 'A Love Adventure of Francis I. with Diana of Poitiers,' at the Royal Academy in the same year. They attracted a good deal of attention, and as works of a young man of two-and-twenty were by all admitted to be of very unusual promise. 'The Installation of Captain Rock'—in a vein he would have done well to have followed farther—exhibited in the following year, increased the general admiration; and the 'Chivalrous Vow of the Ladies and the Peacock,' 1835, amply established the young artist's position as one of the most original of our semi-historical painters. He was the same year elected A.R.A. and enrolled as a lion of the season. With some slight oscillations, partly arising from the fluctuations of public taste, partly from little wilfulnesses on his own side, he has ever since retained his place among the first of our painters in popularity, though from the very extent of his success, and the widely different character of his style from that of other temporary or permanent favourites, he has had to endure at least his fair share of adverse criticism.

Mr. MacLise has been a prolific painter, the character of his works being considered—which are generally of rather large size, yet in every part full of detail and carefully finished, and contain mostly numerous figures painted with an attention to costume and accessories which often evinces considerable research. The titles of the more important of them will sufficiently indicate his range of subjects:—'Robin Hood and Richard Cœur de Lion in the Greenwood,' 'Salvator Rosa painting his friend Masaniello,' 'Olivia and Sophia fitting out Moses for the Fair,' and 'Merry Christmas in the Baron's Hall' (1838)—a picture of even greater power and at least as great popularity as his 'Vow of the Ladies and the Peacock,'—it secured his election (February 1840) as R.A. His great picture in the exhibition of 1840 was 'The Banquet-Scene in Macbeth,' but along with it he sent two of those smaller and less ambitious pictures which used in these his earlier years always to be regarded as among his pleasantest works, as well as foremost among the minor attractions of the Academy exhibitions,—'Gil Blas dresses en Cavalier,' and a 'Scene from Twelfth Night,' now in the Vernon Gallery. In 1841 he had 'The Sleeping Beauty,' and 'Hunt the Slipper at Neighbour

Flamborough's. In 1842 his chief work was his powerful rendering of the 'Play-Scene in Hamlet'—now a leading attraction in the Vernon Collection,—'The Return of the Knight,' and the 'Origin of the Harp.' In 1843, 'The Actor's reception of the Author—Gil Blas;' in 1844, 'Sabrina releases the Lady from the Enchanted Chair—Comus,' which he repeated in fresco in the summer-house at Buckingham Palace; in 1846, 'Ordeal by Touch;' in 1847, 'Noah's Sacrifice;' and in 1848, 'Chivalry of the reign of Henry VIII.,' and his famous design of 'Shakespeare's Seven Ages.' In 1850 he painted the last he has exhibited of his happy versions of Goldsmith—indeed the last, as it was perhaps the best of his small humorous pictures,—'The Gross of Green Spectacles.' This year he painted his very striking fresco in the House of Lords, 'The Spirit of Justice.' 'Caxton's Printing-Office' appeared in 1851; in 1852, 'Alfred in the Tent of Guthrum the Dane;' in 1854, 'The Marriage of Strongbow to the Princess Eva' to be repeated with alterations in the New Palace of Westminster; and in 1855 a 'Scene from As You Like It—Orlando about to engage with the Duke's Wrestler.'

Both in his choice of subjects and his mode of treating them, Mr. Maclise has struck out a path for himself. Without rejecting their teaching, he has leant less than almost any other of our eminent historical painters upon his great predecessors. Neither in composition nor colour can he be charged with imitation. Always he is original and always self-reliant. In his earlier pictures he showed the possession of much humour, in his later he has aimed more and more after intensity of expression—not seldom marring thereby the dignity and repose of his conception: but at all times he has displayed a teeming, often an exuberant, imagination. His drawing is true and firm, and all the details are strongly made out, whence sometimes arises a considerable degree of hardness. So again his colour, whilst generally true and frequently very beautiful, especially in parts, has somewhat of an overwrought metallic lustre: but that it wears well, improving in tone and general effect, may be seen by the 'Play-Scene in Hamlet' in the Vernon Gallery, and even more decidedly in some of his great works in private collections.

Besides his historical and genre pictures, Mr. Maclise has painted a good many portraits, of which those of Lytton, Dickens, Forster, and Macready are among the best known. He has also designed numerous illustrations for books, among others Moore's 'Irish Melodies,' Bulwer's 'Pilgrims of the Rhine,' the 'Keepsake,' and other annuals, &c. [See SUPPLEMENT.]

**MACNAB, SIR ALAN.** The name of Sir Alan MacNab is well known to English readers, through the pages of Sir Francis Head's 'Emigrant' and his 'Narrative of Canadian Affairs,' as one of the ablest and most public-spirited of her Majesty's Canadian subjects. Sprung from the ancient Scottish family of Mac à Nab, his father emigrated to Canada, where Sir Alan himself was born in 1798 and received his early education. Having been called to the Canadian bar, he became a member of the Legislative Assembly of Western Canada, and ultimately Speaker of the House and Prime Minister under the last part of the governorship of the Earl of Elgin, and the first few months of that of Sir Edmund Head, who succeeded him. In 1838 Sir Alan MacNab received the honour of knighthood in recognition of his gallant services against the insurgents in the Canadian rebellion, during which he held the post of commander on the Niagara frontier; and in July 1856 he was further rewarded by promotion to a Baronetcy of the United Kingdom. It was while he held the command at Niagara, that he seized on the Caroline steamer and sent her over the Falls—a daring act which was fully justified by Lord Palmerston at the time, and is stated by Sir Francis Head to have saved this country from a rupture with America. [SUPPLEMENT.]

\* **MACNEILL, REV. HUGH, D.D.**, was born in 1795, at Ballycastle, in the county of Antrim, Ireland. He was educated at Trinity College, Dublin, where he took the degree of M.A. He afterwards received the degree of D.D., and the appointment of canon of Chester. In 1822 he married the daughter of Dr. Magee, late archbishop of Dublin, in whose family he had been tutor. He is a popular preacher, energetic and declamatory, with a powerful voice. He was for some years in London, and attracted large congregations, chiefly at Charlotte-street Chapel, Fitzroy-square. He afterwards became the incumbent of St. Jude's, Liverpool, and is now the incumbent of St. Paul's, Prince's Park, near Liverpool. He has published the following works:—'The Church and the Churches; or the Church of God in Christ militant here on Earth,' 8vo; 'Lectures on the Church of England,' 12mo; 'Lectures on the Prophecies of the Jews,' 12mo; 'Lectures on the Sympathies, &c., of our Saviour,' 12mo; 'Letters on Seceding from the Church,' 12mo; 'Sermons on the Second Advent,' 12mo; 'Seventeen Sermons,' 12mo. He has also published several separate sermons, addresses, and controversial pamphlets.

\* **MACNEILL, SIR JOHN, G.C.B.**, third son of John MacNeill, Esq., of Colonsay, and brother of the Right Honourable Duncan MacNeill, was born in 1795. He entered the military service of the East India Company at an early age; and served for some time in their Bengal army. In 1831 he was appointed assistant envoy at the coast of Persia, and afterwards became secretary to the embassy, and was envoy extraordinary and minister plenipotentiary at that court from 1836 to 1844. While thus employed, he gained an insight into the habits, policy, and resources of the Eastern nations which lie between

Russia and our Indian frontiers, and was thus enabled to predict the aggressive line of policy adopted by the late Emperor Nicholas, long before he had commenced to put it into execution. On returning to England, he was appointed head of the board to superintend the working of the New Poor-Law Act in Scotland; and in 1851 conducted a special inquiry into the condition of the western highlands and the adjoining islands. The credit which he acquired by these various commissions led to his being sent in the winter of 1854-55 to the Crimea in company with Col. Tulloch, to inquire into the state of the commissariat department; and they presented to the home government a report, in which blame was attributed to certain officers, and more especially to the quarter-master general's staff. The statements of this report were however impeached by the officers most directly alluded to, and were subjected to a formal examination before a board of general officers assembled at Chelsea Hospital, who considered that the amount of censure thrown upon the commissariat and quarter-master general's department was not borne out by the facts. The character and conduct of that court however were such as to secure little public respect, and their decision was not received as generally satisfactory.

\* **MACNEILL, SIR JOHN**, was born at Dundalk, in the county of Louth, Ireland. He was educated as a civil engineer, and acquired considerable reputation from the construction of 'Tables for facilitating the Calculation of Earthwork in Railway Cuttings, &c.' He was employed as chief engineer on the Dublin and Drogheda railway, which was completed in 1844, on the opening of which he was knighted by Earl de Grey, then lord-lieutenant of Ireland. In 1842 he was appointed professor of civil engineering in Trinity College, Dublin, an office which he held till 1862.

**MACPHERSON, JAMES**, was born in 1738, at the village of Ruthven in Inverness-shire, and was sent in 1752 to King's College, Aberdeen, with a view to be educated for the Scottish Church. On leaving college he was appointed schoolmaster of his native village; and it was while holding this situation that he gave to the world what appears to have been his first publication, a poem entitled 'The Highlander,' in 1758. Before this date however he had written some other poetical pieces, among which are mentioned one called 'Death,' and another called 'The Hunter,' which last is said to have been only a rude sketch of 'The Highlander.' Soon after he sent to the 'Scots Magazine' several contributions in verse, which have been preserved from oblivion by the great controversy that afterwards arose about his capacity for manufacturing the poems ascribed to Ossian, which he professed to have only translated. Some attention appears to have been first given to the traditional poetry preserved in their native dialect among the Scotch Highlanders by Dr. Adam Ferguson, the well-known historian, himself a mountaineer; by him an interest in the subject was communicated to his friends the Rev. Dr. Carlyle, minister of Inveresk, a gentleman of extensive connections among the literary men of his day, and John Home, the author of 'Douglas.' The two latter met with Macpherson in the autumn of 1759, when he showed them some fragments of Gaelic verse, of which they prevailed upon him to furnish them with translations. These were shown to Dr. Blair, and the poets Shenstone and Gray, by all of whom they were greatly admired; and in 1760 they were published under the title of 'Fragments of Ancient Poetry, collected in the Highlands of Scotland, and translated from the Gaelic or Erse Language,' with an anonymous preface by Blair. The fragments are sixteen in number. The effect was to induce the faculty of advocates in Edinburgh to raise a subscription for enabling Macpherson to make a tour through the Highlands with the object of collecting more poetical treasure of the same kind. What he found, or pretended to have found, he brought to London, and published there in two successive volumes, the first of which appeared in 1762, under the patronage of Lord Bute, with the title of 'Fingal, an Epic Poem in six books, with other lesser Poems;' the second in 1763, with the title of 'Temora, an Epic Poem in eight books, with other Poems.' From the first the genuineness of these Gaelic epics was questioned by many persons, but it was more zealously asserted by more, and to Macpherson himself the notoriety which he acquired was the beginning of a long course of good fortune. We shall examine the question of their authenticity presently: it will be most conveniently discussed after we have run through the leading events of Macpherson's life. In 1764 he obtained the situation of private secretary to Captain Johnstone, on the appointment of the latter as governor of Pensacola; and he was also made surveyor-general of the Floridas, in which capacity he went out to America and the West Indies, and returned to England in 1766, retaining his salary of 200*l.* a year for life. Some of the years that followed he spent chiefly in literary labour, much of it, from the popularity of his name, highly profitable. In 1771 he published, in one vol. 4*to*, a disquisition on the antiquities of the Scottish Celtic race, under the title of 'An Introduction to the History of Great Britain and Ireland;' in 1773 a prose translation of the 'Iliad' of Homer; in 1775 a 'History of Great Britain from the Restoration to the Accession of the House of Hanover,' in 2 vols. 4*to*, together with 2 vols. of 'Original Papers,' which last work he sold to the booksellers for 3000*l.* During this period of his life he also wrote several pamphlets for the ministry, in support of the war against the American colonies, which are now all nearly forgotten. At last his appointment to the lucrative office of agent to the Nabob of Arcot turned his

versatile mind and pen to Indian affairs, upon which he also produced a succession of publications of temporary interest. This post brought him into parliament in 1780 as member for Camelford, for which he sat till 1790; he then retired to a considerable property which he had purchased in his native county of Inverness, where he died, February 17th, 1796. His body was brought back to England for interment in Westminster Abbey.

We now proceed to state as briefly as we can the controversy respecting the epics known as the POEMS OF OSSIAN, the publication of which has already been mentioned. Macpherson affirmed that they were translations made by himself from ancient Erse manuscripts which he had collected in the Highlands of Scotland, and which were the genuine compositions of Ossian, a Highland poet, who lived about the middle of the 3rd century, and whose poetical works had been transmitted orally from bard to bard, and from age to age, till the introduction of the art of writing into the Highlands afforded the means of fixing them in those manuscripts from which the translations were made.

The truth of this statement was denied by Dr. Johnson, who boldly pronounced the whole of the poems ascribed to Ossian to be forgeries, and defied Macpherson to produce a manuscript of any Erse poem of earlier date than the 16th century. Hume, Gibbon, and others, though they did not express so decided an opinion, seemed to more than doubt their authenticity. On the other side, Dr. Blair defended them in an elaborate 'Critical Dissertation;' Dr. Henry, in his 'History of Great Britain,' founded many of his statements relating to the early condition and manners of the inhabitants, of the northern part of the island especially, upon their authority; Lord Kames, in his 'Sketches of Man,' appealed to them as substantiating his theories; Cesarotti annexed to his Italian translation, which improved their beauties and softened their defects, a dissertation in which he speaks of Ossian as equal if not superior to Homer; Arthur Young lent his aid on the same side; and the whole body of the Highlanders seemed ready to do battle in the cause of the Gaelic bard.

In the year 1800, Malcolm Laing added to the second volume of the first edition of his 'History of Scotland' a dissertation in which he endeavoured to establish, from historical and internal evidence, that the 'Poems of Ossian' were, without a single exception, entirely spurious.

The Highland Society of Edinburgh, in 1797, appointed a Committee to inquire into the authenticity of the 'Poems of Ossian.' A list of queries was sent to every person who was likely to afford information on the subject, ancient Erse and Irish manuscripts were assiduously sought after, and all the traditions existing in the Highlands which had any relation to the subjects of the poems were carefully collected. In 1805, when the Committee had completed their labours, they published their Report, with the name of Henry Mackenzie annexed to it as their chairman. The Report states, that "the Committee had not been able to obtain any one poem the same in title and tenor with the 'Poems of Ossian.'" About the same time was published a splendid edition of the 'Poems of Ossian, &c., containing the Poetical Works of James Macpherson, Esq., in Prose and Rhyme; with Notes and Illustrations by Malcolm Laing.' The object of these notes and illustrations was to destroy the authority and depreciate the value of the text.

The research, the acuteness, and the close reasoning of Laing, both in his dissertation and in the notes to his edition of the poems, together with the admissions made in the Report of the Highland Society, appeared to have nearly decided the question against Macpherson. The controversy however, as far at least as relates to the historical authority of the poems, can hardly be said to be terminated. As late as 1837, in 'The Highlanders of Scotland, their Origin, History, and Antiquities,' by F. Skene, a work published at the request of the Highland Society of London, we are informed, that "by a fate altogether singular in the case of the Highlanders, a complete body of these ancient versified histories have been handed down in the 'Poems of Ossian'" (vol. i., p. 206); and that "the value of Ossian, as an historical poet, must stand in the highest rank, while, whether the chief part of these poems are of ancient or of modern composition, there can remain little doubt that in him we possess the oldest record of the history of a very remote age" (vol. i., p. 215); and similar sentiments still occasionally gain publicity. We proceed therefore to offer, first, what appear to us to be the most important facts and arguments which bear upon their authenticity, and, secondly, our own estimate of their poetical value.

Of the languages spoken by the Gaelic nations who inhabited the western parts of Europe in the time of Julius Cæsar, the Irish is probably that which has suffered least by mixture with others. The Erse, spoken in the Highlands of Scotland, approximates so closely to the Irish, that it may be considered rather as a dialect of it than a distinct language. But while the Irish has been a written language from an era probably anterior to the Christian, with an ancient alphabet, and a series, not only of bards, but of historical annalists, of whose works there are manuscripts still extant of as early a date as the 9th century, there is no evidence that the Erse was ever written previous to the 15th or 16th century. If then these poems were composed by Ossian, in Erse, at the end of the 4th century, they must have been preserved by tradition for 1800 or 1400 years. The

BIOG. DIV. VOL. IV.

Irish, with all the advantage of writing to fix it, has suffered so much alteration, that the oldest manuscripts are understood with difficulty even by those who are most learned in the language, and some are quite unintelligible. We have therefore a right to infer that the Erse, unwritten, and spoken by a people at least as rude as the Irish, has undergone a similar change; and that these poems, if preserved in the words in which they were composed by their supposed author, could not be understood by the present race of Highlanders.

Macpherson published the Erse of the seventh book of 'Temora,' but it was printed from a copy in his own handwriting, and the original has never been produced. Macpherson of Strathmashie, a poet who assisted, as he affirms, in transcribing the poems from old manuscripts or from oral tradition, said that one of these old manuscripts was dated in 1410; and Lord Kames, in his 'Sketches of Man,' asserts, that the first four books of 'Fingal' were obtained from a Gaelic manuscript, written on vellum in 1408, and found by the translator in the Isle of Skye. No doubt Macpherson told him so, but he does not say that he saw the manuscript, nor has it ever been produced. Indeed the oldest Scotch manuscript extant, a copy of Winton's Chronicle, in the Royal Library, Edinburgh, is not of an earlier date than 1420. As to the Erse manuscripts, frequent appeals were made by Macpherson's friends to the 'Red Book' of the bard of the Clanronald family, which was in Macpherson's possession, and was said to contain "some of the poems which are now translated and published." It was obtained from him, but not till he was actually threatened with a prosecution by the Clanronald family, and was found to be a small 12mo of 150 leaves, written in the Irish character, and dated September 8, 1726, in the midst of the songs. It was found to contain only one poem which had any relation to Ossian, a short ballad on the longevity of the Fians. Another appeal was made to "a large folio manuscript" called the 'Red Rhymer,' which was stated to have been given "by Mr. Macdonald of Glencaladel in Muideart, to Mr. Macdonald of Kyles in Cnoideart, who gave it to Mr. Macpherson. It contains a variety of subjects, such as some of Ossian's poems, Highland Tales, &c. Laing applied to Mr. Mackenzie, the gentleman to whom Macpherson bequeathed his manuscripts, and the publication of his Erse 'Ossian' (mentioned below), for the production of this manuscript. We give the result of this application in Laing's own words: "In consequence of this requisition, nineteen manuscript volumes, in quarto and octavo, were transmitted to Edinburgh; but the 'Red Rhymer' in folio, the only remaining manuscript ever specified or appealed to for the originals of Ossian, was not produced. The manuscripts consisted of medical and religious treatises, Irish legends and legendary histories, an obituary, a vocabulary, genealogies, &c., with many of the Irish ballads ascribed to Ossian, but not a single original, as far as could be discovered, of Macpherson's pretended translation of Ossian."

A subscription of 1000*l.* was raised by Macpherson's countrymen in the East Indies to defray the expense of publishing the supposed Erse originals. It was placed in Macpherson's hands, and he retained it till his death, when he left it to be applied to the purpose for which it was raised. In 1807 appeared 'The Poems of Ossian, in the original Gaelic, &c.; with Notes and Observations, by John M'Arthur,' London, 8 vols. 8vo. This edition was accompanied by a literal Latin translation, by Robert Macpherson, and preceded by a dissertation on the authenticity of the poems by Sir John Sinclair. Still there were no ancient manuscripts; the 'original Gaelic' was printed entirely from Macpherson's hand-writing, and corresponded literally with the English, which, there is no doubt, was translated into Gaelic by Macpherson himself. He had abundance of time for this task before he died, and is known to have been well-qualified for it, Erse, not English, being his native language.

The truth is, that not a manuscript, nor a fragment of a manuscript, of any ancient poem, Erse or Irish, which Macpherson has translated in his 'Ossian,' has ever been discovered. Ballads indeed there are, some in Erse, but many more in Irish, in which the Ossianic heroes are celebrated; there is a large manuscript collection of them in the Dublin University Library, several of which were published by Miss Brooke in 1789 with an English poetical version; and there are traditions, not only in Ireland, but also in Scotland, especially in Argyleshire and other districts of the West Highlands, relating to Fingal, Ossian, &c. Some of these ballads and traditions have supplied circumstances, or names, or incidental allusions, which have been worked up into the Ossianic collection; so that the Highland reader was continually reminded of something which was familiar to his imagination, and having found parts which he thought he knew, was ready to claim the whole. These materials have been carefully compared, both by Laing and the Highland Society, with the poems, and the use which has been made of them in each instance specifically pointed out.

According to 'Ossian's Poems,' Fingal was king of Morven, which may be supposed to represent Argyleshire and the adjoining parts of the West Highlands; here he had his palace of Selma (a name never heard of before the publication of 'Ossian's Poems'), and here his father Comhal, his grandfather Trathal, and his great-grandfather Trenmor reigned. Ossian was the son of Fingal, and Oscar the son of Ossian. For this kingdom and its kings there is absolutely no foundation in the annals of the Highlands or of the Highland clans: in some

D

Erse ballads however and Highland traditions Fingal and Ossian are occasionally spoken of as Highland heroes, but in others they are mentioned as Irish. On the contrary, the Irish annalists and the Irish bards are uniform and consistent and distinct in their notices of them. According to the Irish annalists, Fingal, son-in-law of Cormac, king of Leinster, was commander of the Fianna Eirinn, or Fianna, a military race who existed at this time in Ireland. Fingal's palace was at Almtuin, or Allen, in Leinster, and he died in the year 273. In the reign of Cairbar, the son and successor of Cormac, this military class, or militia as they have been called, were put down by force in consequence of their dangerous presumption and the dissensions among their own body. "They were attacked," says Moore, ('History of Ireland,' vol. i.), "by the united force of almost all the royal troops of the kingdom (the King of Munster alone taking part with the rebellious Fianna), and a battle, memorable for its extent of carnage, ensued, in which Osgar, the son of Oisín, or Ossian, was slain by the monarch's own hand." This was the battle of Gabhra, which forms the groundwork of the poem of 'Temora.'

At this time, and for some centuries afterwards, the name of Scotia was exclusively applied to Ireland, and the name of Scotti, or Scots, to the inhabitants. They were a warlike race, who had conquered the greater part of Ireland, and gradually imposed their name on the island and its inhabitants. One of this race, Cairbar Riada, in the year 258, led over a colony of the Scotti from Ireland, and established them in Argyshire. Riada had a territory in Ireland named Dalriada, and the district obtained by his colony was called Dalriada also. They had great difficulty however in maintaining their station against the power of their opponents the Picts, and it is uncertain whether they were not driven back to Ireland. But in the year 503 a larger colony was led over by Fergus Mac Erth, who established the kingdom of Dalriada, which afterwards obtained possession of the whole of the northern part of Britain, and imposed the name of Scotti on the inhabitants, and of Scotland on the country, as had previously been done in Ireland. Thus the Highlanders became connected with the Scots of Ireland, and through them derived their traditions of Fingal and Ossian.

It is not worth while to enter into evidences of forgery afforded by single circumstances and minor details in the various poems. Such evidences are in fact diffused through the whole of them, and meet us at every step, either in sentiments inconsistent with the rude state of society at the time, in the omission of every allusion to the dwellings, the dresses, the means of subsistence, and the superstitions of the inhabitants, as well as all mention, even incidentally, of animals which are known to have been in the country at the time. Such omissions could hardly have been made by a poet who was familiar with the manners and objects of that age, and was himself a party in the events which he describes.

To show the modern materials and workmanship of the poems, Laing has pointed out, in numerous passages, imitations of the Bible, and of Homer, Virgil, Milton, and others. Many of these imitations are obvious enough, but others are mere casual resemblances of phrases and words, which a genuine translator might have easily fallen into in rendering a real original.

The substance of Dr. Blair's 'Critical Dissertation on the Poems of Ossian' was originally delivered, soon after the first publication of 'Fingal' in the course of his lectures as professor of rhetoric and belles-lettres in the University of Edinburgh. This 'Critical Dissertation,' an elaborate composition of nearly pure nonsense, which expresses unbounded confidence in the genuineness of the poems, and bestows the most extravagant encomiums upon them as equal and in some respects superior to Homer, added to the natural astonishment that such poems should have been produced by a Gaelic bard in the 3rd century, extended their fame not only throughout Great Britain, but over the whole continent of Europe; and France, Germany, and Italy vied with each other in enthusiastic admiration of them. This fever has in a great measure subsided, but Ossian has still his admirers, and the 'Dissertation' no doubt its readers. To us it appears that almost everything which gives intrinsic value to other poems is wanting in these. We read them with almost uninterrupted incredulity. The characters represent a race of men which it is an absurdity to suppose ever to have existed. The events and incidents, so far as they are intelligible and there is anything approaching to detail, are such as we cannot even imagine to have occurred at any time or under any circumstances. All good poetry is distinguished by the truth and distinctness of its representations; and it has always been remarked of the greatest poets that they must have looked upon external nature and watched the workings of the human mind with the greatest diligence; and this appearance of truth is preserved not only in such poetry as represents the actual appearances of nature and the ordinary events of human life, but even in that more elevated poetry which passes beyond the bounds of reality. In Homer, with whom Ossian has been so absurdly compared, the scenes are perfectly panoramic; we never imagine that we are looking at a picture; the objects themselves are before our eyes; we are present at the events; the persons are known to us, with all their peculiarities, and we can trace their motives of action; when they express themselves in such or such a way we can tell what passion it was that moved them, or what specific object they had in view. There is nothing of this kind in Ossian.

Everything is vague and indistinct; the scenes are all confused; and the images, undefined as they are, seem to recur continually. Hence nothing is impressed upon the mind; nothing fixes itself upon the memory. There is no discrimination of character. We are informed indeed that some are old and some are young, some are generous and some are cruel, but even these broad personal distinctions we should hardly have discovered from any peculiarity in their thoughts or manner of speaking. Every one expresses himself in nearly the same way, and a wearisome repetition of affected sentimentality pervades the whole.

Without something however of the substance of poetry, so high a reputation as these poems once had could hardly have been obtained. Macpherson was a Highlander, and had lived among mountain scenery from his infancy; and though many of his pictures, even of that scenery, are false, still there are sketches interspersed throughout all the poems which are true and beautiful. Sir Walter Scott, in a letter to Anna Seward, says, "Most Highlanders, after they have become complete masters of English, continue to think in their own language; and it is to me demonstrable that Macpherson thought almost every word of Ossian in Gaelic, although he wrote it down in English. This gave a great advantage to him in forming the style of Ossian, which, though exalted and modified according to Macpherson's own ideas of modern taste, is in great part cut upon the model of the tales of the sennachies and bards." But the great charm of Ossian's poems is in the language: a rich stream of harmony flows through all of them, which many are sensible of who are quite incapable of judging of the truth of the representations or the propriety of the thoughts.

\*MACREADY, WILLIAM CHARLES, was born March 3, 1793, in the parish of St. Pancras, London. His father, the lessee and manager of several provincial theatres, was desirous of educating his son for the church or the bar, and young Macready was placed at Rugby School at ten years of age. At the age of seventeen he found his prospects changed by his father's embarrassments. Though feeling a distaste for the profession of an actor, he sacrificed his own predilections to a high sense of duty; and in order to relieve his father's immediate necessities, and retrieve if possible his father's fortunes, he appeared for the first time as an actor on the boards of the Birmingham Theatre in June 1810. He was decidedly successful. Till Christmas 1814 he continued with his father's company, performing with great success at the theatres of Birmingham, Sheffield, Chester, and Newcastle; and subsequently performed at the Bath, Dublin, and Glasgow theatres with like results. On Sept. 16, 1816, he made his first appearance before a London audience at Covent Garden Theatre as 'Orestes' in the 'Distressed Mother.' His success was undoubted, but he had many difficulties to overcome. Kemble, Young, and Kean had taken a sort of exclusive possession of the characters of Shakspeare, in which, at a later period, Macready displayed such excellence. With a resolute industry however, a deep and subtle insight into the shades and peculiarities of character, and a style at once original and simple, he made a certain range his own. As 'Rob Roy' and 'Gambler' he won applause, but in the 'Virginian' of Sheridan Knowles his true position was first fully demonstrated. From this time he continued to establish himself in the public favour. In 1826 he visited America, where he was equally appreciated, and in 1828 he was enthusiastically applauded in Paris. In London he increased his fame by his performances in the higher comedy. In October 1837 he became lessee and manager of Covent Garden Theatre. His first efforts were directed to make the entire representation of a play, as his acting of individual characters had been, the working out of one harmonious idea. His labour was immense. He did not overlay the drama by too gorgeous scenery or too minute attention to the costume, as if they were to be the principal attractions, but by making them appropriate to the situation and feeling of the scene. He also avoided all puffery, and endeavoured so to regulate his theatre as to banish, as far as possible, those exhibitions of profligacy which, in some degree, had justified the denunciations of the scrupulous. From various causes Mr. Macready's undertaking was not profitable. At the end of the second season he resigned the management, when a public entertainment was given to him at Freemasons' Hall, and a subscription for a handsome memorial was entered into. After performing at the Haymarket and other theatres in 1842, he undertook the management of Drury Lane. His second management in spirit resembled the first, but was distinguished from it by his introduction of musical dramas, set forth in the highest style of scenic illustration. 'Acis and Galatea' and 'Comus' were presented with a feeling of high art which has never been exceeded. He was also liberal in introducing new dramas to the public, amongst which were the best pieces of Sheridan Knowles, Talfourd, and Sir E. Bulwer Lytton. At the end of the second season Mr. Macready again resigned; and in his parting address pointed out the injurious operation of the theatrical monopoly. This he followed up by a petition to the legislature against it, and it was almost immediately removed. On a subsequent visit to America in 1849, a quarrel raised by Mr. Forrest, an American actor, gave rise to a riot in the Astor Opera House at New York on May 10, while Mr. Macready was performing, in which his life was endangered, and the riot was not suppressed until the military were called in, shots fired, and several persons killed and wounded. Towards the end of that year Mr. Macready entered on his concluding engagement at the Haymarket Theatre, but ill-health compelled him to desist. In 1850 and 1851 he

completed the representation of all his principal characters, and took a final farewell of the stage. A complimentary dinner was given to him on this occasion at the Hall of Commerce in London, with Sir E. Bulwer Lytton in the chair, which was attended by nearly all the most eminent men connected with literature and art. Since his retirement Mr. Macready has lived first at Sherbourne, Dorset, and later at Cheltenham. His active mind and cultivated taste have been there employed for the promotion of the moral and intellectual advancement of his neighbours, and the Mechanics' Institute and other literary institutions have derived an inestimable benefit from his own lectures, and from other modes in which he has given his support to popular education.

M'CRIE, THOMAS, a writer on ecclesiastical history and polemics, was born at Dunas in Berwickshire, in November 1772. His father was a petty manufacturer and trader, who had by his industry and economy been enabled to purchase a small estate, and spend his old age in quiet independence. "Dr. M'Crue's parents," says his biographer, "being connected with that branch of the secession usually termed Anti-Burghers, he was brought up under the ministry of the Rev. Mr. Whyte, at a period when the primitive strictness of that communion was retained in a measure which is now wholly unknown. In these circumstances he received that thoroughly religious education, of the importance of which he was ever afterwards so strenuous an advocate, and of the success of which he was himself a striking example." Having received the rudiments of education at the parish school of his native place, he afterwards studied at the University of Edinburgh, which he entered in 1788. Contemporaneously with his academical studies, he occupied himself in teaching younger lads, an employment for which he seems to have been well qualified. In 1791 he commenced his peculiarly theological studies. In 1795 he was licensed as an elergyman by the Associate presbytery of Kelso, and he was immediately afterwards chosen pastor of a congregation of the same body in Edinburgh. In the earlier period of his ministry he entered warmly into those discussions naturally prevalent among bodies who have so many points of repulsion from each other as the small Presbyterian sects which had sprung from the Church of Scotland. He soon commenced however the important task of studying, for the purpose of some undefined literary projects, the early history of the Presbyterian Church in its connection with its most remarkable champions. The body to which he belonged followed a rule of Presbyterian discipline, from the strict tenor of which they maintained that the established church had diverged; and, recurring perpetually to the conduct of the fathers of Presbyterianism, it was likely that any member of this body with sufficient talent would be the most zealous biographer of these primitive worthies. In 1812 he published 'The Life of John Knox.' Scholarship or literary ability were qualities which the clergy of his sect, consisting almost entirely of the humbler members of society, were not expected to display; and this first attempt, which showed both qualities in an eminent degree, accompanied by much patient research, was looked on as a literary phenomenon. In 1813 he received the degree of D.D. from the University of Edinburgh, previous to the appearance of the second edition of his work. It has since passed through several editions, and, while it is very popular with the uneducated classes in Scotland, is highly esteemed by historical students. In 1819 he published a work of still more extensive and curious research, 'The Life of Andrew Melville,' a celebrated champion of Presbyterianism in the reign of James VI. of Scotland. The indefatigable minuteness of the researches connected with this volume had the effect of resuscitating from the most obscure materials—records of births, marriages, and deaths, ecclesiastical and proprietary registers, and like sources—the circumstances connected with the lives of some interesting men who in the stir and bustle of their own active age had failed to find commentators. The partisan zeal with which these works were undertaken is not their least remarkable feature, and obtained from Mr. Hallam the apt designation of 'Presbyterian Hildebrandism.' There is no doubt of the accuracy with which Dr. M'Crue stated facts and cited authorities, and that he was thoroughly honest; but from the beginning to the end each work is a piece of industrious and acute special pleading, and the reader whose position enables him to take an impartial view of the characters discussed in them sees plainly that he knows what portions may be favourably dwelt upon, and what should be hastily passed over, if not omitted. His palliations and vindications are singularly ingenious; and amid all the rude morality and savage acts of the turbulent periods of which he gives the history, he vindicates his own heroes from all follies as well as from all vices; even the destruction of the Scottish ecclesiastical buildings has its meed of praise. Written in such a spirit, and being works of genuine learning and research, they are very popular with the ultra-Presbyterian party in Scotland. In a similar spirit he wrote a review of 'Old Mortality' in the 'Edinburgh Christian Instructor,' to controvert Sir W. Scott's representation of the character of the Covenanters, the ability of which was acknowledged by Scott himself. The author led a blameless simple life, on a small salary, which, with the free use of the valuable public libraries in Edinburgh, contented his unmercenary disposition. He died on the 5th of August 1835, deeply lamented by the members of his congregation and a wide circle of private friends. (*Lives of Thomas M'Crue, D.D.*, by his son, the Rev. Thomas M'Crue, 1840.)

MACRINUS, OP'LIUS, a native of Mauritania, was prefect of the

pretorium under Antoninus Caracalla, whom he accompanied in his expedition against the Parthians, and caused to be murdered on the march. [CARACALLA.] Macrinus was immediately proclaimed emperor by the army, A.D. 217, and his son Diadumenianus, who was at Antioch, was proclaimed Cæsar; both elections were confirmed by the senate. Macrinus, after a battle with the Parthians near Nisibis, concluded peace with them. On his return to Antioch, he reformed many abuses introduced by Caracalla. But his excessive severity displeased the soldiers, and an insurrection, excited by Mæsa, the aunt of Caracalla, broke out against Macrinus, who, being defeated near Antioch, fled as far as Calchedon, where he was arrested and put to death in 218, after a reign of about fourteen months. He was succeeded by Elagabalus.

MACROBIUS, AMBROSIUS AURELIUS THEODOSIUS, probably lived about the middle of the 5th century of the Christian era. We possess hardly any particulars of his life; he is generally supposed to be the person who is mentioned in the 'Cod. Theod.' vi. 8, as "chamberlain of the royal bed-chamber" ("sacri cubiculi præfectus"), during the reigns of Honorius and Theodosius the younger, but this does not appear certain. It has also been disputed whether he was a Christian or a pagan; it has been supposed, from his occupying so high a rank at the court of a Christian emperor, that he must have belonged to the Christian religion; but this opinion seems quite at variance with the whole scope and tenor of his writings. The place of his birth is uncertain; but he informs us himself, in his preface to the 'Saturnalia,' that the Latin language was not his mother-tongue.

Three works of Macrobius have come down to us; a commentary on the 'Somnium Scipionis' in the sixth book of Cicero's 'Republic'; 'Dialogues' which were supposed to have taken place during the Saturnalia at the house of Vettius; and a 'Treatise on the Latin and Greek Verb,' which however is imperfect.

The commentary on the 'Somnium Scipionis,' which is divided into two books, is addressed to his son Eustathius. It is principally occupied with the opinions of the later Platonists respecting the laws which govern the earth and the universe. There is a Greek version of this commentary by Maximus Planudes, in the king's library at Paris.

The 'Saturnalia' is however the most important and interesting of the works of Macrobius. Although written in very bad Latin, and full of trifling absurdities, it contains much valuable information on many subjects relating to antiquity. It is divided into seven books; the first contains a discussion on the origin of the Saturnalia and the principal Roman festivals, and on the character and history of several of the Roman deities; the second is of a more discursive nature; it unfolds at great length the whole art and mystery of joking according to the Roman notions, and relates some of the best jests of Cicero, Augustus, and other celebrated Romans, which however would scarcely excite a smile in modern society; it also gives a long account, among other things, of the luxury of the Romans, and contains a particular description of their favourite dishes. The third, fourth, fifth, and sixth books are occupied with an examination of Virgil's poems, in which a list is given of the principal passages which he imitated or copied from the Greek or preceding Latin poets; and the seventh is principally occupied with a discussion respecting the different kinds of food, and their effect on the human system.

\*MADDEN, SIR FREDERICK, an eminent antiquarian writer and one of the principal officers of the British Museum, is the seventh son of Captain Madden of the Royal Marines, and was born at Portsmouth in 1801. About 1825 he was engaged to assist Mr. Roscoe, then past his seventieth year, in the compilation of the catalogue of manuscripts at Holkham, which had descended to the late Earl of Leicester from a more literary predecessor in the title. He not only described the works in the collection which had not been examined by Mr. Roscoe, but added so many notes to the portion of the catalogue already made by that gentleman, that the whole work would, if printed, have occupied five or six quarto volumes, and the intention of printing it was therefore, at Mr. Roscoe's suggestion, relinquished. In 1826 Mr. Madden entered the service of the British Museum, to assist in the compilation of the classed catalogue of the printed books which was then in progress; in 1828 he was made assistant-keeper of the department of manuscripts; and, in 1837, on the appointment of the Rev. Josiah Forhall, then keeper of the department, to the post of secretary, he succeeded to the keepership. In his evidence before the Royal Commission to enquire into the Museum in 1848, Sir Frederick stated that in January 1837 the number of manuscripts in the Museum, exclusive of charters and other similar documents, was 23,900, and that in May 1848, the time at which he spoke, it was 32,000. "The number of manuscripts acquired since 1827 is very great," says Dr. Perts, the head of the Berlin Royal Library (in Perts's 'Archiv,' vol. ix.), "the establishment obtains information of every important sale on the Continent, and it is easy to foresee that if affairs continue in their present course every important manuscript in Europe, that is not already looked up in fixed collections or does not become so, will in the course of another century become the property of the British Museum." The date which Dr. Perts assigns for the commencement of this remarkable activity in the progress of the collection, is, it will be observed, 1827, which is that of the appointment to the keepership of Mr. Forhall, Sir Frederick's predecessor. Sir Frederick was made a knight of the Hanoverian order by King William IV. in 1832. He has been twice

married; the present Lady Madden is the daughter of Dr. William Robinson of Tottenham, the author of histories of Tottenham, Edmonton, and Stoke Newington.

Sir Frederick's works are numerous and important, and have generally a bearing on English history and the earlier progress of the English language and literature. In 1828 he edited for the Roxburghe Club the metrical romance of 'Havelok the Dane,' to which he assigns a conjectural date between 1270 and 1290, and which he considers to be superior in merit "to every specimen we possess prior to the time of Langland and Chaucer." Mr. Singer published some remarks on the Glossary appended to the volume, which were answered by the editor in a separate pamphlet. 'Sir Gawayne, a collection of ancient romance poems by Scottish and English authors, relating to that celebrated knight of the Round Table,' was edited in 1839 for the Bannatyne Club at Edinburgh. Still more important was 'Layamon's Brut, or Chronicle of Britain, a poetical semi-Saxon paraphrase of the Brut of Wace, now first published from the Cottonian Manuscripts in the British Museum, accompanied by a literal translation, notes, and a grammatical Glossary, published by the Society of Antiquaries of London,' 3 vols. 8vo, 1847. Of this poem, which runs to upwards of thirty-two thousand lines, Sir Frederick prints side by side two entire copies from two manuscripts of different dates, which exhibit considerable variations in language and otherwise, and by this lucid arrangement brings before the reader in the most instructive way the most interesting monument of our language in the 13th century, appending a mass of valuable materials for its illustration. The preparation of this work had occupied years, and a very long period was also consumed by the editorship of 'The Holy Bible, in the earliest English version made by J. Wycliffe and his followers, edited by the Rev. J. Forshall, and Sir F. Madden,' which was issued from the Oxford University Press in 1850, in 4 vols. 4to. Here again two varying copies were printed at full length side by side, and a mass of research into the early history of the English versions testified to the diligence and learning of the editors. It is stated in the preface that a considerable portion of their time during twenty-two years had been spent in accomplishing their task, and to establish the text fifty-five manuscripts had been collated.

Sir Frederick's other works comprise an interesting volume on the 'Privy Purse Expenses of the Princess Mary afterwards Queen Mary, with a Memoir of the Princess, and Notes,' London, 1831, 8vo; a work splendidly illustrated by Mr. Shaw on 'Illuminated Ornaments selected from MSS. and early printed books, from the 6th to the 17th centuries' (London, 1833, 4to), containing descriptions of some of the choicest treasures of the British Museum, and an abridged translation with notes of Silvestre's French work on 'Universal Paleography,' 2 vols. 8vo, 1850. He is also the writer of several communications to the 'Archæologia,' one of which, 'Observations on the Autograph of Shakspeare,' is in support of the authenticity of the autograph in a copy of Florio's translation of Montaigne's 'Essays,' which was purchased by the British Museum for a hundred and twenty guineas. Sir Frederick's name is also officially appended to some printed catalogues of portions of the manuscript collections at the museum, some of which are stated in the prefaces to be made by subordinate officers of his department.

MADISON, JAMES, was born on the 16th of March 1751, at the seat of his maternal grandmother, near Port Royal, on the Rappahannock River in Virginia. His parents' home however was then at Montpellier, in Orange County, Virginia, where Mr. Madison always resided. He received his first instruction from Donald Robertson, a Scotch teacher in King and Queen County, Virginia, with whom he was placed at twelve years of age. During the three or four years that he was under Robertson's care he acquired some knowledge of Greek, Latin, and French, with the elements of mathematics. He afterwards studied about two years at home under the Rev. J. Martin. In 1769 he was sent to the college of Princeton in New Jersey, where in 1772 he took the degree of B.A. He returned to Virginia in the spring of 1773, and commenced a course of reading to prepare himself for the bar; but the dispute between the colonies and Great Britain having then commenced, he was soon induced to take an active part in it. He particularly distinguished himself as a friend to religious freedom by his efforts in behalf of the preachers of the Baptist persuasion, who were then prosecuted and occasionally thrown into prison for preaching in defiance of prohibitory laws. In the spring of 1776 his political career commenced by his being chosen a member of the Virginia convention, which formed the first constitution of Virginia. He continued a member of the legislature till 1777, when he lost his election, in consequence, it is said, of his conscientious refusal to treat the freeholders, according to the practice then prevailing. The legislature however named him a member of the council, in which office he continued two years, until he was appointed a member of congress, in which body he took his seat in the month of March 1780, and in its proceedings he took a very active part during the three years that he was a member of it.

Returning to private life after the peace, he resumed his legal studies, but intermingled them with miscellaneous and philosophical reading. Natural history, to which the genius of Buffon had then given unusual attraction, seemed to have been his favourite branch of science, and he has left some notes of his observations on European and American

animals of the same species. In 1784 he was again elected to the legislature of Virginia, and continued a member of that body for the years 1785 and 1786. Here he formed the scheme, and drew up a resolution for that purpose, of inviting the meeting at Annapolis, which led the way to the convention which formed the constitution of the United States. He was one of the three commissioners from Virginia who assembled at Annapolis, where he met Alexander Hamilton, with whom he was afterwards so closely united in forming the new constitution, and from whom he was so widely separated in carrying it into execution.

While he was in the Virginia legislature he drew up the memorial and remonstrance against the project for a compulsory support of religion, which was perhaps made with a view to a permanent establishment; and he succeeded in defeating it. (Tucker's 'Life of Jefferson,' chap. 4.) His talents and acknowledged influence at this time were all exerted in favour of a policy as liberal as it was practical and wise. Finding that Kentucky was determined to separate from Virginia, he furthered her purpose instead of making a fruitless opposition to it. He opposed the attempt to introduce paper-money; he was the efficient supporter of the laws introduced into the code prepared by Jefferson, Wythe, and Pendleton; and he favoured the recovery of the debts due to British creditors. He carried on an extensive correspondence at this time with some four or five friends, which gives the best view of the state of Virginia at that period. In the convention which formed the present constitution of the United States he bore a conspicuous part; and anticipating the interest which future times would take in the proceedings of that body and in the opinions of its members, he was at the pains to keep a record of the debates—the only one extant which is either complete or authentic. He commonly wrote out at night what had been said in the day. After the constitution was formed, he united with Alexander Hamilton and John Jay in recommending it to the American people in newspaper essays, under the signature of 'Publius,' which have been since published under the title of 'The Federalist.' The debates, which he would never consent to publish during his lifetime, were purchased by congress for 30,000 dollars, and were published, with 'Letters,' &c., in three large 8vo volumes in 1840, under the editorial care of Mr. H. D. Gilpin.

After the federal constitution was submitted to the several states for their adoption, Mr. Madison went into the legislature of Virginia, where Patrick Henry headed the opposition to it; and it was to Mr. Madison's cool and powerful reasoning that its adoption in that state was mainly due. If it had failed there it would have failed altogether. Mr. Madison had also more agency than any other individual in inducing Virginia to make a cession of all her claims to the lands north-west of the Ohio (now comprehending the states of Ohio, Indiana, and Illinois), to which she asserted a right, both under her regal charters and by conquest during the revolution.

He was chosen a member of the first congress under the constitution in 1789, and continued a member of that body until 1797. In 1794 he married Mrs. Todd, a widow of Philadelphia, whose parents were Virginians, but, being Quakers, had removed to Philadelphia. From this time he felt the strongest inclination to retire from public life, and to devote himself exclusively to the cultivation of letters and science, and the pursuits of agriculture. But his countrymen appreciated his worth too highly to permit him to retire into private life. In congress no one had more weight personally; but soon finding that his views and those of Mr. Hamilton did not coincide as to the principles and spirit in which the federal government should be administered, he separated himself from the administration, and was thus on most great measures in a minority. When the public debt was funded he made an unavailing attempt to secure to the soldiers and other original creditors the benefits of the rise in value of the public claims, which speculators had purchased at about one-eighth of their nominal amount. This was the first great measure in which he opposed the ministerial policy of which Hamilton was the chief author. He also opposed the unqualified assumption of the state debts by the federal government. After the French revolution broke out European politics mingled in those of the United States, and for a time gave them their chief form and colour. Mr. Madison was a warm friend of the revolution; and it had his hearty wishes for its success.

Though thus leading an organised opposition to General Washington's administration, this circumstance for a long time seemed to have no influence on their friendship, and it never produced positive alienation. Before his first term had expired, General Washington, being bent on retirement, conceived the purpose of a farewell address; and, after making an outline of his views, he requested Mr. Madison to fill it up. Some years afterwards he greatly enlarged Mr. Madison's draft, which he then submitted to Messrs. Hamilton and Jay, and the document as published contains some of Mr. Madison's original forms of expression. The intimacy and correspondence of these two great men continued until 1796.

After it was known that General Washington would retire in March 1797, parties prepared themselves for the struggle of electing his successor—the Federalists uniting in favour of Mr. Adams, and the Republicans in favour of Mr. Jefferson. Mr. Adams succeeded by three votes. When parties were so nearly balanced each redoubled its efforts for the ascendancy. The administration party prepared two

laws for removing dangerous and suspicious aliens, and for punishing libels on the government (called Alien and Sedition Laws), which gave their adversaries a fit occasion to make a powerful appeal to the people. To further this object, Mr. Madison, who was now withdrawn from congress, went into the Virginian legislature, and in the session of 1798 prepared resolutions denouncing these acts of congress as infractions of the constitution, and inviting the concurrence of the other states. As some of the states opposed the doctrines, and the subject produced much discussion in pamphlets, in the following year Mr. Madison prepared new resolutions, with a preamble, in which he examines the whole subject in a close and profound piece of reasoning. It is thought to have contributed more than anything else to the revolution of parties which soon followed. When Mr. Jefferson was elected president, Mr. Madison was made his secretary of state, and from that time until his retirement his life is comprehended in the history of the United States. But the principal parts which he acted will be briefly noticed here.

His pen was put in requisition in maintaining the claim of the United States to the right of deposit at New Orleans, under the treaty with Spain; in discussing the question of the true boundary of Louisiana; in corresponding with Mr. Rose and Mr. Jackson, ministers of Great Britain, on the subject of the attack on the Chesapeake; in drawing up instructions to Mr. Monroe concerning the treaty with England, and the objections to that which was made; and in corresponding with the American ministers on the French Decrees and British Orders in Council. Besides these official papers, he wrote an able 'Examination of the Doctrines of National Law' asserted by Mr. Stephens.

In 1809 he succeeded Mr. Jefferson as president of the United States; he obtained 122 votes out of 176. General Pinckney, of South Carolina, his opponent, obtained 47 votes.

It is known that after many fruitless efforts to induce Great Britain and France to respect neutral rights, war was declared against Great Britain during his administration, and that it continued with various success until 1815. It is said that Mr. Madison, being aware how unprepared the United States were for war, and anxious to preserve peace as long as it could be preserved consistently with the neutral rights of America, wished to postpone the declaration of war, but was urged into it by Mr. Clay and some ardent spirits whose patience was exhausted. If this be so, had his counsels prevailed, the war would have been prevented, for he has often told the writer of this notice that the administration had afterwards indubitable evidence that the British ministry had decided on revoking the offensive Order in Council, in which case the principal cause of war would have been removed.

After serving two terms Mr. Madison retired to private life in March 1817; and it may be questioned whether the eight years which he served as president were not the least happy of his life. In 1829, when the constitution of Virginia was submitted to revision, he consented to serve as a member of the convention, and no doubt contributed largely to soothe the irritation which the conflict of local interests created. He also acted as a visitor of the University of Virginia, and succeeded Mr. Jefferson as its rector. Except in the discharge of these duties, he not only held no office after his retirement, but, we believe, never left his county after he quitted Washington. Although Mr. Madison lived to the age of eighty-five, he had a very delicate constitution, and never enjoyed good health. He died on the 28th of June 1836. His physician said that he had two or three diseases, any one of which was commonly sufficient to shorten life.

In person Mr. Madison was below the middle size; though his face was ordinarily homely, when he smiled it was so pleasing as to be almost handsome. His manner with strangers was reserved, which some regarded as pride, and others as coldness; but on further acquaintance these impressions were completely effaced. His temper seemed to be naturally a very sweet one, and to have been brought under complete control. When excited, he seldom showed any stronger indication of anger than a slight flush on the cheek. As a husband, Mr. Madison was without reproach. He never had a child. He was an excellent master, and though he might have relieved himself from debt, and secured an easy income, he could never be induced to sell his slaves except for their own accommodation (to be with their wives or husbands). The writer has sometimes been struck with the conferences between him and some trusty servant in his sick chamber, the black seeming to identify himself with his master as to plans of management, and giving his opinions as freely, though not offensively, as if conversing with a brother. Mr. Madison has more than once told the writer that he should have been a great gainer in a pecuniary point of view if he had many years before emancipated his slaves. It was his deliberate conviction that the colonisation of the slaves in Africa was practicable. He endeavoured to keep aloof from party feelings, but regularly read the newspapers, and remembered their contents better than most people. Though he was cautious in expressing his sentiments, he could not forbear taking the liveliest interest in public concerns, especially in those of the general government, towards which he seemed always to feel a parental solicitude. He stood well with all parties, and was solicitous so to stand, both from a sense of duty and a love of popularity. He felt great solicitude about

the irritating discussions between the North and South on the subject of slavery, and was anxious for some compromise.

(Communication from Virginia.)

MADDOX, the second son of Owen Gwynedd, prince of Wales, is said by some authors to have discovered America long before Columbus. The Welsh chronicles are said to state that Madoc, having been compelled by civil disturbances to leave his native country, set sail in 1170 with a small fleet, and directing his course westward, landed after some weeks on a continent which produced abundantly the necessaries of life, and the inhabitants of which differed greatly from those of Europe. After remaining in the country a long time he left there 120 persons, and returned to Wales, where he equipped a fleet of 10 vessels, and set sail again, but was never afterwards heard of. Some of those who adopt this narrative suppose Madoc to have landed on the coast of Virginia or Carolina, and support it by an account of the discovery of an Indian population in North America who spoke the Welsh language. If however there is any truth in the story, Madoc probably landed in a higher latitude than Virginia. See Filson's 'Discovery, Settlement, and present State of Kentucky; with an Account of the Indian Nations within the United States,' 8vo, London, 1793; also Bertuch, 'Ephémérid. Géog.,' September, 1819. The above narrative of Madoc's voyage (which has been copied by Hakluyt in the third volume of his 'Voyages') is given in the 'Historie of Cambria, now called Wales, a part of the famous Yland of Brytaine, written in the Brytish language, above 200 years past, by Caradoc; translated into English by H. Lloyd, gent.; corrected, augmented, and continued out of records and best approved authors, by David Powell,' 4to, London, 1584. Owen's 'British Remains' (8vo, London, 1777; 12mo, 1785) contains 'An Account of the Discovery of America by the Welsh 300 years before the Voyage of Columbus,' written by Dr. Plott. Herbert, in his 'Travels,' defends the claims of his countryman Madoc, as the discoverer of the New World, with more warmth perhaps than good sense. But the Northmen are said to have discovered America some time before the date of Madoc's alleged voyage, and this fact appears to be established by evidence of a stronger kind than that of the expedition of the Welsh prince.

MADDOX, THOMAS. Of the personal history of Madox little is known. He resided in the Middle Temple. He always writes from the Middle Temple. Thomas Madox of London was called to the bar by that society in 1704, and the son of a clergyman of Wales of the same name in 1705. His first work appeared in 1702, entitled 'Formulare Anglicanum; or a Collection of Ancient Charters and Instruments of divers kinds, taken from the originals, from the Norman Conquest to Henry VIII.' to which is prefixed a very learned dissertation on ancient charters and instruments. In 1711 he published his great work, entitled 'The History and Antiquities of the Exchequer of the Kings of England, in two periods: from the Norman Conquest to the end of the reign of King John, and from the end of the reign of King John to the end of the reign of Edward II., taken from records: together with a correct copy of the ancient dialogue concerning the Exchequer, generally ascribed to Gervasius Tilburienis; and a dissertation concerning the most ancient great Roll of the Exchequer, commonly styled the Roll of Quinto Regis Stephanus.' This work, which was reprinted in two vols. quarto, with the valuable addition of an index, in 1769, begins with a dedication to the queen, followed by a long prefatory epistle to Lord Somers, in which the author says:—"The records which I here vouch were taken by my own pen from the authentick membranes, unless where it appeareth by my references to be otherwise, and except haply in two or three instances, which it is not material to recollect; and in giving an account of the ancient state of the Exchequer, I have for the most part contrived, as far as the subject-matter would permit, to make use of such memorials as serve either to make known or to illustrate the ancient laws and usages of this kingdom: for which reason the present work may be deemed not only a history of the Exchequer, but likewise an apparatus towards a history of the ancient law of England." This epistle concludes with "a large digression concerning the Romanick dialect."

The 'History of the Exchequer' treats of the court of the kings of England during the two periods comprised in it, its great offices, the jurisdiction of the king's exchequer, its officers and business; of the exchequer of the Jews, showing the peculiar mode in which they were governed and protected as "the king's villeins;" of the different sources of the royal revenue, fully considered in all its branches; the whole illustrated by references to an immense mass of documents. The dialogue concerning the exchequer (which Mr. Madox ascribes to Richard Fitz-Nigel, bishop of London), treats, in the form of questions put to the author and his answers, of the functions of the different officers of the exchequer in the reign of Henry II., and of some other miscellaneous matters, in the first book, and of the mode of collecting the king's revenue in the second. It is preceded by an epistolary dissertation addressed to Lord Halifax. The dissertation, with which the volume concludes, relating to the great roll of the exchequer, commonly called the roll of Quinto Stephanus, is addressed to Lord Somers. It has been ascertained by that eminent antiquarian, the Rev. Joseph Hunter, that this roll ought to be referred to the 31 Henry I., a discovery which has removed some of the obscurity in which this part of the reign of Stephen is involved. Though Madox doubted whether this roll belonged to the reign of Henry I.,

Stephen, or Henry II., yet in his table of the barons of the Exchequer from the Conquest, subjoined to the 'History of the Exchequer,' all who are placed in the list in the time of Stephen are so placed upon the supposition that it relates to the fifth year of that king, at which time many of these barons were and long had been the adherents of the rival claimant of the throne, the empress Maud.

In 1726 Mr. Madox published his 'Firma Burgi, or an Historical Essay concerning the cities, towns, and boroughs of England, taken from records.' A posthumous work from the pen of Mr. Madox, entitled 'Baronia Anglica,' a history of the land-honors and baronies, and tenure in capite, verified by records, in which he corrects the errors into which Lord Coke and others have fallen in the use of these terms, appeared in 1736, and, with merely an alteration of the date in the frontispiece, in 1741. He died in 1735.

Mr. Madox was indefatigable and successful in collecting his materials, and skilful in arranging them, but he has left it for others to apply them to the political and statistical history of the kingdom. A large body of documents, collected as materials for the works which he prepared for publication and for others which he projected, were deposited by his widow in the British Museum. Mr. Madox held the office of historiographer royal.

\* MADOZ, PASCUAL, a distinguished Spanish statesman and author, was born at Pampeluna on the 17th of May 1806. At the age of fourteen he went to the University of Saragoosa to study law, and when the movement for the constitution took place, he supported it, young as he was, not only by his advocacy but by arms. He was one of those who successfully defended the castle of Monzon, on the 15th of May 1823, when it was attacked by a detachment of the French invading army, and being taken prisoner a few days after, when the garrison revolted and surrendered, he was kept in a dungeon for seventeen months before he was released. He then returned to the University of Saragoosa, where he supported himself by rendering assistance to other students who were richer than himself, and took his degree with the eminent honour of the unanimous vote in his favour of the thirty-five examiners, to every one of whom he was obnoxious on the ground of his political opinions. This liberality of treatment did not extend however to his sentiments in religion, as he was shortly afterwards expelled from the university on the charge of teaching Jansenist doctrines in private. This blow was the more severe that the minister Calomarde had introduced a regulation that no advocate should be admitted to the bar before the age of twenty-five, and Madox was in consequence left almost destitute of resources. For a short period he emigrated to France, and on his return succeeded in obtaining the editorship of a 'Universal Geographical Dictionary,' commenced by Bergnes, which was published in 10 vols. 8vo, between 1831 and 1834, at Barcelona, by far the most literary city in Spain after Madrid. A biographical dictionary in thirteen volumes, which appeared at the same city about the same time, was pillaged by wholesale from French sources, was very deficient in the Spanish articles, and was altogether a worthless compilation. To this the 'Geographical Dictionary' presented a complete contrast; it was carefully put together, from numerous sources—the information in the Spanish articles was novel and valuable, and on the whole it did credit, not only to Madox and the contributors, but to the country which produced it. He also engaged in a large work entitled 'Coleccion de Casusas Celebres,' a history of the most interesting lawsuits throughout Europe, on the plan of those in which French and German literature are so rich. The exclusively Spanish portion of the Spanish work occupies six or seven octavo volumes. Thus occupied he did not make his appearance at the bar till 1835, when liberal principles were in the ascendant, and in the same year he was appointed a Judge of the First Instance at Barcelona. This office he resigned almost immediately after to take the command of a battalion of infantry against the Carlists who had invaded Catalonia, the resignation however was not accepted, and he was at the same time a judge of Barcelona and military governor of the valley of Aran. His election as deputy to the Cortes sent him to Madrid, where he soon occupied himself with the preparation of his great work—the largest literary enterprise but one in modern Spain—the 'Diccionario Geografico-estadistico Historico de España,' an alphabetical dictionary of all the names of places in Spain and its beyond-sea possessions, of which he was at once editor, publisher, and printer, having set up a large establishment for the express purpose of passing it through the press. The dedication to the Queen of Spain bears date the 10th of November 1843, but the book was not issued to the public till between 1848 and 1850. This dedication commences in a singular vein of self-glorification, "To one who during the war knew how to defend your Majesty's rights with the sword, to one who has since defended for eight years in Parliament ('en el Parlamento') the noble cause of the crown now happily united with that of the people, it may be permitted to offer to his Queen the fruit of the literary labours of long years and of no scanty vigils." The preface is in a similar strain: "Constancy," says Madox, "is my distinctive character, and my resolution always increases in proportion to the increase of the difficulties it has to encounter." The real merits of the dictionary are very great. It extends to sixteen volumes quarto, of about 600 pages, each closely printed in double columns,—the article Madrid alone occupies a volume, which was also issued separately, and is by

far the best and most copious account of the Spanish capital which has appeared in any shape. In the preceding dictionary of Spain and Portugal by Miñano, the Spanish public was in possession of a national gazetteer quite on a par with the usual works of the class; in that of Madox it has one to which neither England nor France has as yet, for extent and excellence combined, produced an equal. It seemed to require an explanation how such a work could be produced in the Peninsula, and in 1855 Sanchez de Ocaña, in a reply to some attacks of Madox on the Moderado finance ministers, stated that at all events the publisher of the 'Diccionario Geografico' owed them a debt of gratitude, since in 1850 they had contributed two million reals (about 20,000*l.*) to the support of his work. This was done it appears in the same way that support had been afforded to Miñano, the holders of public offices were encouraged to take copies by being allowed to charge the price to the government, who paid Madox, and deducted the sum from the salaries of the subscribers, which in Spain are as a matter of course always much in arrear. Of course a subscriber who did not wish to retain his copy could always obtain an advance from a bookseller on sixteen substantial volumes of attractive matter fresh from the press, and thus all parties received what might be considered a benefit. Between 1843 and 1848 Madox had been from political causes obliged to absent himself for some time in France and Belgium, on his return and on the publication of his gigantic work he was elected to important offices at Barcelona, and came to be looked upon as the head of the party of 'Progresistas' in the Cortes. When in 1854 Espartero was restored to power, Madox was elected President of that assembly, and on the 21st of January 1855 he was appointed Minister of Finance. So soon afterwards as the 10th of February, he brought forward a gigantic scheme of a new loan to be guaranteed by 'dismortization' of the public property, and the immediate sale of all estates belonging to the crown, the clergy, and the establishments of public charity and education. The invasion of the property of the clergy was in opposition to the stipulations of the Concordat with Rome in 1851, and the queen was so averse to the plan that rumours were current that O'Donnell and Espartero then united, had been obliged to exert their influence to the utmost to wring her reluctant assent. Madox was accused of such inaction in the management of the loan as to open a door for gross frauds, and after only four months of office made way for a successor. On the dismissal of Espartero in July 1856, the ex-minister of finance presided at a meeting of the Cortes which voted a want of confidence in the ministry, and headed a body of the national guard, who offered resistance to O'Donnell in the streets of Madrid, but the attempt did not succeed, and Madox was obliged to seek safety in concealment. Later he succeeded in escaping from Spain. Towards the close of 1858 he was permitted to return, and was again elected member of the Cortes. Madox has been long married, and has a family. A few years ago he had the misfortune to see one of his daughters, while bathing on the coast near Barcelona, carried out to sea and drowned before his eyes.

MÆCENAS, CAIUS CILNIUS, belonged to the equestrian order (Horat., 'Carm.' i. 20, 5; Velleius Pater., ii. 88; Tac., 'Ann.' vi. 11), and was descended from an ancient Etruscan family at Arretium. The cognomen Mæcenas is derived, according to Varro, from a town of the same name. ('De Ling. Lat.' vii., end.) We are ignorant of the place and time of his birth; but he appears to have received a superior education, and was well acquainted with the Greek language. (Hor., 'Carm.' iii. 8, 5; 'Epist.' i. 19, 1.) He early became acquainted with Octavianus (Augustus Caesar), and continued through his life an intimate friend and chief adviser of that emperor. While Augustus was engaged in opposing Sextus Pompeius, and also during many of his other wars, Mæcenas was entrusted with the charge of the city; and it appears to have been owing in a great degree to his prudence and sagacity that peace was preserved in Rome during the absence of Augustus. (Tac., 'Ann.' vi. 11; Dio., xlix. 16; Seneca, 'Epist.' 114; Hor., 'Carm.' iii. 29, 25.) Mæcenas is said to have dissuaded Augustus from his purpose of restoring the ancient Roman constitution, which Augustus however could never have seriously intended. (Sueton., 'Octav.' 28; Seneca, 'De Brev. Vit.' 5.) Mæcenas was held in the greatest honour by Augustus, although during the latter part of his life he appears to have been for a short time in disgrace with the emperor, principally owing to the intrigues of his wife Terentia; but he was probably received into favour again before his death, which happened B.C. 8, four years after that of Agrippa. Mæcenas enjoyed with Agrippa the full confidence of Augustus, and his death was considered by Augustus as an irreparable loss. If we may believe a tale related by Dion, he sometimes rebuked the emperor with the utmost freedom (lv. 7). Mæcenas was a great patron to literature; and it was principally owing to his assistance and support that Virgil and Horace were raised from a state of poverty and indigence, and enabled to devote themselves to poetry. They were both admitted to his friendship, and Horace in particular appears to have lived on terms of the greatest intimacy with him. The health of Mæcenas was not good, and was probably injured by his luxurious and voluptuous habits. He lived in a magnificent house on the Equiline Hill, from which Nero is said to have witnessed the burning of Rome. (Suet., 'Nero,' c. 38; Sen., 'Epist.' 114.)

Mæcenas wrote several works, none of which have come down to us. Their loss however is not much to be deplored, since, according to the

testimony of many ancient writers, they were written in a very artificial and affected manner. (Suet., 'Octav.', c. 86; Sen., 'Epist.' 114; Tac., 'Dial. de Orat.', c. 26, who speaks of the 'calamistros Mæcenatia.') They consisted of poems, tragedies (one entitled 'Prometheus,' and another 'Octavia'), a history of the wars of Augustus (Hor., 'Carm.' ii. 12, 9), and a symposium, in which Virgil and Horace were introduced. The few fragments which remain of these works have been collected and published by Lion under the title of 'Mæcenatiana, sive de C. Cilnii Mæcenatis Vita et Moribus,' Göttingen, 1824.

MÆCIA'NUS, LUCIUS VOLUSIUS, a Roman jurist, who lived in the time of Antoninus Pius and Marcus Aurelius. He was one of the legal advisers of Antoninus (Capitolinus, 'Anton. Pius,' 12), and one of the instructors of Aurelius in law (Capitolinus, 'Ant. Philosoph.' 3). He was held in high estimation by Aurelius, as appears from a Rescript of the Divi Fratres, in which he is styled their friend and a most careful student of the Civil Law ('Dig.' 37, tit. 14, s. 17). He was also a friend of the jurist Julianus. It is conjectured that he was made governor of Alexandria by Aurelius, for Vulcatius Gallicanus, in his Life of Avidius Cassius (c. 7), mentions a Mæcianus who was put to death there by the army for joining in the rebellion of Avidius Cassius. The writings of Mæcianus which are mentioned in the Florentine Index are sixteen books on Fideicommissa, and fourteen on *Judicia Publica*. There are forty-four excerpts from Mæcianus in the Digest. His *Libri Quaestionum* are also mentioned in the Digest (29, tit. 2, s. 86); and a commentary, or something of the kind, on the *Lex Rhodia de Jactu* ('Dig.' 14, tit. 2, s. 9). Mæcianus is cited by Papinianus, Ulpianus, and Paulus.

An extant treatise, 'De Asse et Ponderibus,' is supposed by some writers to belong to another author of the same name.

MAES, NICOLAS. [MAAS.]

MÆSTLIN, MICHAEL, a German astronomer, born about the year 1550, probably at Tübingen, in Wirtemberg, at the university of which place he held the appointment of professor of mathematics. While resident in Italy he became acquainted with Galilei, whose conversion from the doctrine of Ptolemaeus to that of Copernicus is partly attributed by some authorities to the arguments adduced by Mæstlin in favour of the latter. Upon his return to Germany he became tutor to Kepler, to whom he behaved with marked liberality; for notwithstanding the great benefit which Kepler must have derived from his instruction, he declined accepting any pecuniary remuneration whatever; indeed Kepler does not appear to have been wanting in gratitude towards him, for both in his 'Mysterium Cosmographicum,' and in a letter prefixed to the 'Narrative of Rheticus,' he acknowledges the great encouragement he had invariably received from his tutor; and at a later period, when struggling with disappointment and poverty, he presented him with a handsome silver cup, bearing an appropriate inscription. Mæstlin died at Tübingen, in 1631. His published works are:—1, 'De Stellâ nova,' 2, 'Ephemerides, according to the Prutenic Tables by Erasmus Reinhold,' 1551. 3, 'Thesis de Eclipsibus,' 4, 'Observatio et Demonstratio Cometæ anni 1577 et 1578,' Tübing., 1578, 4to. 5, 'Consideratio et Observatio Cometæ,' 1580; Heidelb., 1581. 6, 'Alterum Examen Gregoriani Calendarii,' Tübing., 1586, 4to. 7, 'Epitome Astronomiæ,' Tübing., 1597, 1610, &c.

MAFFEI, SCIPIO'NE, Marquis, born at Verona in 1675, of a noble family, was educated in the college of Parma, and showed an early aptitude for poetry and literature in general. When the war of the Spanish succession broke out, he entered as a volunteer the Bavarian service, in which his brother Alessandro Maffei held the rank of general. After passing some time in Germany he left the army for Italy with the view of devoting himself entirely to study. He wrote upon many and various subjects, and he generally wrote well. His principal works are:—1, 'La Merope,' a tragedy, the first written in Italian which deserves the name; it was received with great applause, and went through seventy editions in the author's lifetime. 2, 'Verona Illustrata,' which is the principal work of Maffei, and full of antiquarian and historical learning. The first part contains a history of Verona from its foundation to the time of Charlemagne; the second is a literary history of Verona, with biographical notices of the native writers; the third is a stranger's guide to all the remarkable objects in Verona and its neighbourhood; in the fourth the author illustrates the Roman amphitheatre in that city, which is one of the best preserved remains of the kind. The whole work is written in a spirit of sound criticism, and exhibits the various features of the social, political, and intellectual state of that part of Italy during a long course of ages. 3, 'Della scienza chiamata Cavalleresca libri tre,' dedicated to Pope Clement XI., in which he combats the absurdity of duelling. 4, Three treatises against the belief, then still prevalent, in magic: 'Arte Magica dileguata,' 1749; 'Arte Magica distrutta,' 1750; 'Arte Magica annichilata,' 1754. Maffei was charged by one Tartarotti with being almost an infidel because he did not believe in sorcery. 5, 'Trattato dei Teatri antichi e moderni,' in which he took up the defence of theatrical performers against the denunciations of Father Concina, a Dominican, who attributed to them all the corruption of the age. Pope Benedict XIV., in a brief dated the 5th of October 1750, addressed to Maffei, testified his full approbation of this defence, saying that "theatres ought not to be suppressed, but that the performances ought to be as much as possible honest and decorous."

Maffei had a controversy with the Jansenists on account of something which he wrote concerning the bull *Unigenitus*; and also because he maintained, against two priests of Verona named Ballerini, that it was lawful to receive a moderate interest on a loan of money, 'Impiogo del Danaro.' The Jansenist party, which was powerful in North Italy, prevailed on the Venetian senate to exile Maffei, who was then seventy years of age. But the senate soon perceived their error, and Maffei was honourably re-called after four months, and re-entered Verona in triumph.

Maffei, in union with Vallisneri and Zeno, originated the first literary journal which appeared in Italy, 'Giornale dei Letterati,' begun in 1710, and which was continued till 1730. After the discontinuance of that journal he wrote a sort of continuation of it under the name of 'Osservazioni Letterarie,' of which he published six volumes.

In 1773 Maffei visited France, where he collected the materials for his work, 'Gallia Antiquitates,' which he afterwards published. He was numbered among the members of the Academy of Inscriptions. From France he visited England, and was well received at the court of George III., especially by the Prince of Wales, who was very fond of Italian literature. He was made a member of the Royal Society, and the University of Oxford, which he also visited, conferred on him the degree of LL.D. He travelled through Holland and Germany, and returned to Italy after an absence of four years.

Maffei died at Verona, February 11, 1755, being eighty years of age, with the well-merited reputation of one of the first Italian scholars of the 18th century.

There is another but much older writer of the same name, GIOVANNI MAFFEI, who wrote a 'History of the East Indies,' in Latin, in sixteen books, of which an Italian translation was published at Florence in 1589. He was born in 1526, and died in 1603.

MAGALHAENS, FERNANDO, commonly but incorrectly called MAGELLAN, was one of the most distinguished sea-officers of his time, and as a navigator and discoverer only inferior to Columbus. He was born about 1470, in some place in Alentejo, and entered the Portuguese navy at an early age. He was afterwards sent to the East Indies, where he served for five years under Alfonso Albuquerque, and distinguished himself at the conquest of the town of Malacca in 1511. He afterwards returned to Europe, either from discontent, because the recompense which he thought due to his services, and which he had demanded, had been refused, or through fear of punishment for having embezzled some money intrusted to him. Being desirous to distinguish himself by some great enterprise, and finding that the numerous voyages to America had made it evident that this continent extended to a great distance towards the south, and being at the same time aware that the Moluccas, or Spice Islands, discovered a few years before, were situated much farther to the west, he revived the idea of Columbus of sailing to Asia by a westerly course. According to some authorities he proposed the enterprise to King Emanuel, who rejected it; but others assert that he made the proposal in the first instance to the court of Spain, where it was favourably received by Cardinal Ximenes, the regent, and afterwards approved by the emperor Charles V. A squadron of five vessels, with 236 men on board, was fitted out for that purpose, and Magalhaens left San Luçar de Barameda on the 20th of September 1519. His object being to discover a strait or open sea, which would take him to the Moluccas, he directed his course with great judgment to the southern shores of Brazil, and entered the La Plata River, but he was soon convinced that it was not a strait. He then sailed southward, along the eastern coast of America, and was obliged to pass the winter in the harbour of San Julian (near 50° S. lat.), where a conspiracy was formed against him. In detecting and putting down this conspiracy he showed great sagacity, prudence, and resolution. He discovered and entered the strait, which bears his name, about the end of October 1520, and reached its western extremity on the 27th of November, when he entered the Pacific Ocean. He navigated the Pacific for three months and twenty days without finding an island, but during this course he enjoyed continuous fair weather, with such favourable winds, that he bestowed on this ocean the name of Pacific, which it still bears. The length of the voyage however reduced the crew to the greatest distress for want of food, and they began to suffer also from the scurvy. On the 6th of March 1521, Magalhaens arrived at a group of islands, which he called *Los Ladrones*, from the inclination to theft which the inhabitants displayed. After having refreshed his crew, he continued his course westward, and discovered the extensive group of the Philippines, which he called the archipelago of San Lasaro. He induced a chieftain of the island of Zebu to acknowledge the sovereignty of the King of Spain, promising to assist him in subduing his enemies. With this view he undertook an expedition against the chieftain of the small island of Matan, but he was courageously resisted by the inhabitants, and killed, April 17, 1521. The command of his vessels devolved on Juan Sebastian del Cano, who conducted them to the Moluccas, and thence to Spain.

MAGENDIE, FRANÇOIS, a distinguished French physician and physiologist. Although his father practised as a physician in Paris, he was born at Bordeaux on the 15th of October 1783. He was soon after brought to Paris, where he had the misfortune to lose his mother. His father took an active part in the revolutionary movements of the

period, was mayor of the 10th arrondissement, a member of the Hospital Council, and of the Commune de Paris. He also married a second time, and the result was an almost entire neglect of his child, who is said not to have been able to read at the age of ten. He was however then sent to school, and at the age of fourteen had achieved such success that he was rewarded with a prize at the annual concours. Through his father he was introduced to the celebrated Boyer, and became his pupil, and afterwards his demonstrator of anatomy. At the age of twenty, after an examination by concours, he was appointed aide d'anatomie (prosector) in the Faculty of Medicine, and shortly afterwards a demonstrator. In this position he devoted himself enthusiastically to the study of surgery, but he was induced by Dupuytren to give up this branch of the medical art, and devote himself to the practice of medicine. He was subsequently appointed physician to the Hotel Dieu. In 1819 he was elected a member of the Academy of Sciences; he was also a member of the Academy of Medicine, and in 1831 he succeeded Professor Recamier, who had resigned on the accession of Louis Philippe to the throne of France, in the chair of anatomy in the College of France.

Professor Magendie was a laborious writer as well as one of the most illustrious physiological experimentalists and discoverers. His larger works are as follows:—1, 'Formulaire pour la Préparation et l'Emploi de plusieurs nouveaux Médicaments.' This work was published in 1821, and was speedily translated into all the languages of Europe. It contained an account of the action of those potent active principles found in plants, which had at that time been introduced into the practice of medicine, more particularly by the exertions of French chemists and physicians. It included such remedies as morphine, strychnine, prussic acid, and others, on the operation of which on the animal system Magendie had successfully experimented. 2, 'Précis Élémentaire de Physiologie.' This work was originally published in two volumes at Paris in 1816-17. It went through several editions, and was afterwards entitled 'Elémens de Physiologie.' It was translated into German and English, and for many years it was one of the best manuals of physiology for the use of students. 3, 'Leçons sur les phénomènes physique de la Vie.' These were a series of lectures delivered at different times, and collected together by M. J. James, and published in 1836-42. These were also translated, though occupying four volumes, into German. 4, 'Leçons sur les Fonctions et les Maladies du système nerveux.' These also were lectures delivered in the College of France, and were published in two volumes in 1839. 5, 'Leçons sur le Sang.' These lectures on the blood were also published in Paris in 1839. 6, 'Recherches philosophiques et cliniques sur le liquide cephalo-rachidien, ou cerebro-spinal,' Paris, 1842. In addition to these larger works, Magendie has published a large number of papers, which will be found scattered through the 'Comptes Rendus,' and contained in the 'Journal de Physiologie expérimentale,' a periodical which he started in 1821, and which he continued to edit for ten years. He was also a contributor to several of the dictionnaires which appeared in France during the commencement of the present century. He wrote for the 'Dictionnaire de Médecine et de Chirurgie pratique,' the 'Encyclopédie des Gens du Monde,' and the 'Dictionnaire de Médecine usuelle.'

Although Magendie wanted the generalising power which would have placed him at the head of European physiology, he was most industrious in the performance, and ingenious in devising of physiological experiments. It was as an experimenter that he produced a lasting impression on the progress of physiology. In fact so numerous were his experiments at one time on living animals, that the authorities in France thought it necessary to interfere. Some of the results of his physiological enquiries are too important to be passed over in this notice:—

1. Magendie first successfully demonstrated what had been only suspected by previous physiologists, that the veins were organs of absorption. His experiments on this subject have been regarded by physiologists as setting this question at rest, and proving that the veins are the great agents in the absorption of liquids.
2. His numerous experiments on the absorption of poisons led to a more accurate apprehension of the nature of their action on the human system. He first demonstrated that strychnia acts upon the spinal cord, and destroys by paralysis the nerves of respiration, thus inducing asphyxia.
3. He gave a more accurate account of the act of vomiting, and showed how little it depended on the action of the stomach itself.
4. He investigated with great care the action of hydrocyanic, or prussic acid on the human system, and drew attention to its value as a remedy in certain forms of cough arising from irritation in the lungs.
5. Long before the chemical nature of food was understood, Magendie pointed out that non-nitrogenous foods were innutritious. This conclusion was the result of a long series of experiments on the feeding of the lower animals.
6. He performed a series of experiments on the admission of air into the veins, and showed how likely this was to be a cause of death in operations about the throat.
7. Magendie must share with Sir Charles Bell the honour of having discovered the real functions of the spinal nerves. Walker had demonstrated the existence of two roots to the spinal nerves. Bell showed that the nerves performed two functions, that of sensation and

volition, and that these were sometimes separate, but the final demonstration of the two roots of the spinal nerves being devoted to the two separate functions, seems to have been first clearly established by Magendie.

To these more important discoveries and investigations must be added a large number of experimental researches upon the functions of the brain, its parts, and nerves. If these did not lead to immediate and decisive results, they have been important facts by means of which others have been since guided to more correct conclusions.

Magendie was made a Commander of the Legion of Honour, and few men gained more of the respect and confidence of the government in matters of public health, whilst amongst the medical profession he was held in the greatest respect on account of his great talent and original genius. He died on the 8th of October 1855.

MAGLIABECCHI, ANTONIO, born at Florence in 1633, early showed a great aptitude for philological and historical studies; he was an indefatigable reader, and had a prodigious memory. He employed his scanty savings in buying books, and gradually collected a vast library, which after his death became the property of the city of Florence, and is open to the public, and known by the name of Magliabecchiana.

Magliabecchi, in consequence of his immense erudition, was considered as an oracle, and was consulted by scholars from every part of Europe. Several princes showed by compliments and gifts their regard for him. His own sovereigns, the grand-dukes Medici, appointed him their librarian. Magliabecchi left no work of his own. Some of his letters have been published in various collections: 'Lettere di Uomini Illustri,' Macerata, 1782; 'Lettere di Uomini Dotti,' Venezia, 1807; 'Prose Fiorentine,' &c. Unfortunately Magliabecchi was very vain, irritable, and abusive, and his temper involved him in personal quarrels with several of his contemporaries. He died at Florence in 1714, at the age of eighty-one.

MAGNENTIUS, commander of the Roman army in Gaul, revolted against Constantine, son of Constantine the Great, and emperor of the West, and caused him to be killed near the Pyrenees, A.D. 350. Constantius, the brother of Constantine, and emperor of the East, marched against Magnentius, and a battle was fought between them on the banks of the Drave in 351. Magnentius, being defeated, fled to Italy, from whence he escaped into Gaul, where Constantius followed him and defeated him again in 353. Magnentius, finding himself forsaken by his troops, killed himself; and his brother Decentius, whom he had made Cæsar, followed his example. Constantius thus became sole master of the whole empire.

#### MAGNUS, ALBERTUS. [ALBERTUS MAGNUS.]

MAHMUD I., son of Mustapha II., was raised to the throne of the Ottomans after the deposition of his uncle Ahmed III. in 1730. He continued the war begun under his predecessor against Nadir Shah of Persia, but with no success, and made peace in 1736. A war with Russia followed, in which the Russians took Oczakow and Kiburn in 1737, and, the Austrians having joined them, invaded Wallachia. The Austrian forces being defeated at Krotaka on the Danube, the court of Vienna submitted to a disadvantageous peace in 1739, by which it gave up not only its recent conquests, but also the important town of Belgrade, the conquest of a former war. Peace was soon after made between Turkey and Russia, and the latter power restored Oczakow. A new war broke out with Persia in 1747, and terminated by a treaty unfavourable to the Ottomans. Mahmud took little part in all these transactions, but left all the cares of state to his ministers and favourites. He died in December 1754, being then fifty-eight years of age.

MAHMUD II., Sultan of Turkey, the younger son of Sultan Abdul-Hamid, or Ahmed IV., was born on the 14th of Ramadan, A.H. 1199 (the 20th of July, A.D. 1785), and succeeded his elder brother, Sultan Mustafa IV., on the 28th of July 1808. Sultan Selim, the uncle of Mahmud, was deposed and imprisoned in 1807 on account of his civil and military reforms, and Mustafa had no sooner succeeded him than he abolished the new institutions of Selim, especially the Nizam Jedid, or the body of troops who were disciplined on European principles. Mustafa Bairaktar, pasha of Rusjuk, an old friend of the deposed Selim, strongly objected to the policy of Sultan Mustafa, and no notice being taken of his remonstrances, put himself at the head of his troops, marched upon Constantinople, occupied the town, and proclaimed Selim sultan. But while Selim's name was shouted by the victors in the streets of Constantinople, he had ceased to live; he was assassinated by order of Mustafa, who thought that by removing the object of the revolution, he could also crush it. He was mistaken. Mustafa

Bafraktar occupied the seraglio, after a bloody struggle, and after having confined Sultan Mustafa in the same prison in which Selim was murdered, he proclaimed Mahmud, who was found in a room hid under carpets and books, and more ready to believe that he was going to be murdered than to be placed on the throne of Osman. Hitherto Mahmud had spent his days in the quiet confinement of the seraglio, chiefly occupied with Turkish and Persian literature, and enjoying, during the last twelve months previous to his accession, the instruction of the captive Selim, who, it is said, foretold his nephew's future elevation, and initiated him in those principles of reform through which he had endeavoured, though in vain, to reorganise Turkey. Mahmud was also imbued with that deep hatred of the Janissaries which was one of the leading principles of his future actions.

Mahmud ascended the throne when Turkey was in a violent political and social crisis. In consequence of the enlightened but weak government of Selim the prejudices of the people were roused without meeting with a power sufficient to keep them in check; the sultan's authority was disregarded by the pashas of Europe, Asia, and Africa; and the Janissaries, who were exasperated through Selim's attempts upon their privileges, were ready instruments in the hands of those agitators who, under the pretext of either avenging the murder of Selim, or the deposition of Mustafa, were, at first secretly, then openly, sowing the seeds of discord. In spite of this threatening state of the empire, Sultan Mahmud boldly proclaimed that he would carry out the reforms of Selim, and by choosing Mustafa Bafraktar his grand vizir, he proved that he was not using idle words. Several pashas who were severely punished for disobedience were the first to perceive that Turkey was now governed by a reformer more energetic than Selim. When the turn of the Janissaries came, they broke out in open rebellion, and besieged Mustafa Bafraktar, whom they believed to be the originator of the reforms, in his fortified palace. Unable to hold out longer, and receiving no relief from the sultan, who was himself assailed by the rebels, the gallant vizir blew himself up. Mustafa was proclaimed sultan, and the rebels cried out for the head of Mahmud. In this critical position Mahmud did a deed at which humanity shudders, but which was one of the boldest political strokes ever attempted by a Turkish sultan: he ordered his captive brother to be strangled, together with his infant son; and those of Mustafa's women and concubines who were pregnant, four in number, were sewn up in leathern sacks, and drowned in the Bosphorus. By these murders Mahmud became the only male descendant of Osman.

His life was in the utmost danger. Yet he had no higher thought than the glory of Turkey, and he made its existence depend upon his own, for with the death of the last of the house of Osman, the empire of Osman would have become a prey to anarchy. The very fact however of his being the only descendant of Osman, was a sort of guarantee for his life, for although the people had massacred more than one sultan, and the sultans themselves had shed the blood of more than a hundred royal princes, these crimes were committed against individuals and not against the reigning family, the popular belief being that Turkey would last no longer than the family by whose great ancestor the empire was founded. Mahmud was fully aware of this when he sacrificed his brother and his brother's children, and we may fairly presume that his object was to make himself the only representative of the founder's family.

Mahmud succeeded in crushing this bloody rebellion after a struggle of two days, and having conciliated the Janissaries by abolishing the Nizam Jedid and establishing his authority at home, he turned his attention to his relations with the European powers. The war with Russia had just broken out. The Turks were defeated; Constantinople was in danger: the principal pashas in Asia, Africa, and Europe threatened a revolt or had revolted; and Czerni George raised the standard of independence in Servia. Mahmud, although pressed to make peace, persisted in continuing war, and he was encouraged to do so by French diplomacy, for a war between France and Russia was imminent. That war broke out in 1812, and Constantinople became the centre of European intrigue, Russia and Great Britain being active in making peace acceptable to the Sultan, while Napoleon I. made the greatest efforts to rouse him to further resistance. Although the Russians had conquered Northern Turkey as far as the Danube, Mahmud could fairly hope that the Russian army would soon be compelled to evacuate the Turkish territory, and he would perhaps have continued the struggle, but for the strong remonstrances of England, which were backed by a large fleet in the Mediterranean. Under these circumstances he made peace with Russia at Bukarest, on the 28th of May 1812, on conditions more favourable to him than the unfortunate turn of the war allowed him to expect. He lost only that part of Moldavia which lies east of the Pruth, which now became the frontier of the two empires, and a few districts in the Caucasus; while the Servians, abandoned by Russia, were obliged to submit once more to the Turkish yoke.

Mahmud availed himself of the peace to continue the work of reform, in which he was ably assisted by his personal friends Berber Bashi and Khalet Efendi. He succeeded in keeping down the rebellious spirit of the pashas of Baghdad, Damascus, Widdin, and Silistria; and he received good news from Mehmed 'Ali, the pasha of Egypt, who had retaken Mecca from the Wahábis who had seized it. His attention was chiefly directed to 'Ali Pasha of Janina, whom he watched with

great suspicion, being convinced that sooner or later that great feudatory would kindle a rebellion all over Greece. His conduct towards 'Ali Pasha was signalised by that mixture of craft and frankness which is so striking in the character of eastern nations; and while he deprived the sons and grandsons of 'Ali of their offices, or drew them over to his side by bribes, he still professed to be a friend of 'Ali himself, till the moment came for ensnaring and crushing him. The downfall and death of 'Ali Pasha, in 1822, seemed to promise a harvest of future success to the Sultan. But Turkey's enemies were like the hydra; the more heads fell the more foes rose; and no sooner was 'Ali's head exposed on the gate of the seraglio, than Mahmud had to prepare for a contest with Russia, a deadly struggle with Mehmed 'Ali of Egypt, and an open rebellion of the Greeks.

The Greek rebellion came first. The attempts of Alexander Ypsilanti in Wallachia, and of the Greeks of Constantinople, who had formed a plan to get possession of the Turkish fleet, were easily frustrated; but the insurrection in Greece compelled the Sultan to make the greatest efforts. Unable to quell the revolution with the forces under his immediate command, Mahmud persuaded Mehmed 'Ali to join him, on the promise that he should be invested with Candia as soon as the object of the campaign was attained. An Egyptian fleet, with an army of 12,000 men, commanded by Mehmed 'Ali's son, Ibrahim, the conqueror of the Wahábis, sailed for the Peloponnesus, and the combined Turkish and Egyptian forces committed those atrocities which roused a cry of indignation throughout Europe, and induced Great Britain, France, and Russia to interfere on behalf of the unfortunate Greeks. Mahmud, bent upon crushing all rebellion within his dominions, and making himself equally respected by both his Turkish and Christian subjects, declined any interference, and the three powers entered into an alliance by the convention of the 7th of July 1827. They proposed that Greece should be a vassal state of Turkey, and should acknowledge the Sultan's suzerainty by paying an annual tribute. The Greeks promised to submit on that condition, but the Sultan rejected the proposition with disdain. Upon this the combined British, French, and Russian fleets attacked the Turko-Egyptian fleet in the bay of Navarino (20th of October 1827), and the pride of the Sultan, his splendid ships of war, which had cost him so dear, were destroyed after a gallant resistance. A French army now landed in the Peloponnesus, Ibrahim Pasha evacuated the country, and Greece, without being independent, was freed from her invaders. None of these defeats dispirited the Sultan, and proud of having humbled the most dangerous of Turkey's internal foes, he boldly proclaimed "a holy war" against Russia, well knowing that the insurrection in Greece was in a great measure the work of the czar. Before however we proceed to the Russian war, it is necessary to speak of the destruction of the Janissaries.

Mahmud accomplished this the greatest of his measures at a time when the whole of his attention seemed to be absorbed by the interference of the three powers in the Greek insurrection. At this time he proceeded so openly with his reforms as to leave no doubt of his firm intention to overthrow the ancient institutions of Turkey, and to form an entirely new state of things. He had musical and theatrical entertainments performed in the seraglio; he dressed after the fashion of Europe, and abandoned the sacred turban for the fez; and, to the deep indignation of the Janissaries, gave orders to form another Nizam Jedid, or *Azáiri Mahammediyeh*, as he now chose to call these troops. When he signed that order he had likewise resolved to destroy the Janissaries, who did not allow him to wait for an occasion to begin the contest. On the 15th of June 1826 the Sultan and the grand vizir being then in the country, a strong body of Janissaries, reinforced by a crowd of the worst characters, met at their great barrack, the *Et-Meidán*, and thence marched in battle array to the palace of the grand vizir, which they took and burnt after a feeble resistance on the part of the domestics, who were cut to pieces. The vizir's women escaped by hiding themselves in some subterraneous vaults in the garden. The grand vizir hastened to Constantinople as soon as he had heard of the riots, informed the absent Sultan of the event, assembled the *diván*, and concentrated round the seraglio all the troops than he could dispose of. The shouts of "Down with the Nizam Jedid! we will have the heads of all those who advised the Sultan to introduce new institutions!" soon reached the ears of the ministers, who were then assembled in the '*Aralán Kháneh*,' or the menagerie of the seraglio. Thither crowded the *ulemá*s and the students, the marines, the sappers, and the officers of the artillery with their guns, all ready to shed their blood for the Sultan and his reforms. Encouraged by the presence of so many adherents, the grand vizir sent an answer to the rioters, that he would not satisfy their demands, but would repel force by force. The Janissaries were preparing for an attack upon the seraglio, when Mahmud arrived in a small boat from his country-seat at Beshik Tásh, on the Asiatic side of the Bosphorus. Fully aware of the danger of his position, he harangued his troops, and declared that he would put himself at their head and attack the rebels, but having been dissuaded from this resolution he sent the grand vizir with a body of troops to the mosque of Sultan Ahmed, which was to be the chief meeting-place of the Sultan's party, and contented himself with encouraging his men from a kiosk on one of the outer walls of the seraglio. On his order the mufti unfolded the '*shánjak sberif*,' or the standard of the prophet, and hundreds of

'shāsh,' or cries, dispersed themselves through the capital, summoning all faithful Mohammedans to rally round the holy standard, and to defend the throne and their religion against a mob of impious rebels. An immense crowd soon gathered round the seraglio, and marched off to the mosque of Sultan Ahmed, cutting to pieces the detachments which the Janissaries had placed in all the streets leading to that mosque, for the purpose of isolating the grand vizir. At the sight of the holy standard the Janissaries concentrated their forces in the square, round the Et-Mejdān, and threw up entrenchments. Hussein Pasha, Ibrahim Pasha, and Mohammed Pasha, who summoned them by order of the Sultan, to lay down their arms, were received with a terrible yell and narrowly escaped assassination. "They were strong enough, they said, to defend themselves till the evening, and the coming night would bring destruction over the reformers. Two thousand houses in flames would throw light upon their path!" The mufti now read with a loud voice the first chapter of the Korān, the 'Al-Fātihah,' the shortest chapter of the Korān, a prayer which is held in as much veneration by the Mohammedans as the Lord's Prayer by the Christians, and is considered to contain the quintessence of the whole Korān. While the mufti was reading this prayer every man was prostrate on the ground, and at the close of the prayer the signal of attack was given. The entrenchments were soon levelled by the ordnance, and the Janissaries retired within their fortified barrack, whence they kept up a murderous fire upon the assailants. But their resistance only delayed their fate for a few hours; the massive walls crumbled under the fire of a heavy and well-directed artillery; fuses were thrown upon the roof; and the whole building was soon in a blaze. Thousands of the rebels were burnt under the falling ruins; others who tried to escape were received with grape-shot; and only two hundred succeeded in reaching the streets, where they were massacred and their bodies thrown round that majestic plane-tree which is said to have cast its shadow over the centre of the hippodrome for more than two thousand years. Six thousand Janissaries perished in the course of one day; several hundreds who had not taken part in the action, but were known as rebels, were massacred in the streets or in their houses, and 15,000, who had kept quiet, were exiled to different places in Asia Minor. On the following day, the 16th of June, a hattī shērīf pronounced the abolition of the military corporation of the Janissaries, after it had been the bulwark of Turkey during five centuries from the time of its foundation by 'Alf-ed-din, the vizir of Sultan Urkhan. Thus Mahmud crushed his most dreaded enemy at home, only four years after he had been compelled to sacrifice to the fury of the Janissaries his favourites Berber Bashi, the mufti, and his favourite wife.

Although Mahmud was sufficiently provoked by the Emperor Nicholas to take up arms against him, his declaration of war in 1828 was a rash act. Mahmud thought that his army, being now organised after the European system, would behave as well as European armies; but he was greatly mistaken, and paid dearly for learning that it is easier to create a name than a thing. We shall not dwell upon the particulars of the Russian campaign. After an indifferent struggle in 1828, the Russians, commanded by Diebitch and Paskiewicz, made astonishing progress in 1829, in Europe as well as in Asia; and after the victory obtained by Diebitch over the Grand Vizir Jusuf Pasha at Shumla, in the eastern Balkan, and the capture of Erzurum by Paskiewicz, Constantinople would have been lost, and the Turkish empire would have fallen a prey to the Russians, but for the interference of the great European powers, headed by England, through whose mediation the war was concluded by the peace of Adrianople, on the 14th of September 1829. This was the most disastrous war that was ever undertaken by the Turks, although their loss of territory was comparatively trifling, and far less than the loss of Hungary and Servia after the peace of Karlowicz and Passarowicz with Austria. Mahmud's direct loss was only a small tract on the Caucasian frontier. But Greece was now definitively separated from Turkey; the suzerainty of the Sultan over Moldavia and Wallachia was reduced to a shadow, and the Russian emperor acquired that sovereignty over the two principalities which was formerly possessed by the sultans; Servia was acknowledged as an independent state, though tributary to Turkey; Russia obtained a free navigation from the Black Sea to the Mediterranean, and an effective protectorship over the Greek Church throughout all Turkey; and the Sultan at last was required to pay the expenses of the war, a sum so heavy that a few years afterwards he was compelled to solicit the remittance of about one-third of it. The circumstance most humbling for the pride of the Sultan was that he obtained that peace through the mediation of the European powers.

During the years subsequent to the peace of Adrianople Mahmud, with unabated perseverance, was active in creating a new army and navy, and in improving his ruined finances. He wanted both men and money to check the increasing power of Mehmed 'Ali, whom he watched with hate and suspicion. A conspiracy detected at Constantinople to depose the Sultan was attributed to the intrigues of the Pasha of Egypt, and increased Mahmud's hatred: to reward those who had proved most loyal under such trying circumstances he founded a new order, the Nishān Istikhar. In 1831 hostilities commenced with Mehmed 'Ali, Ibrahim Pasha having made war against the Pasha of Damascus and conquered Syria; but there was not open war till 1832, on Mehmed 'Ali's refusal to withdraw his troops from Syria. The declaration of war took place on the 15th of April 1832; on the 7th

of July Ibrahim defeated the Turks at Hama; and on the 21st of December he obtained the splendid victory of Koniah, in consequence of which the Turkish army was disbanded, and the Egyptians advanced upon Constantinople. The mediation of the European powers effected a truce, but in spite of it Ibrahim pushed on and occupied Brusa. The ruin of the Sultan seemed to be inevitable. He was saved by his greatest enemy: a Russian fleet appeared off the Bosphorus, and opposite Constantinople landed a strong body of Russians, commanded by General Lasaref, whose arrival stopped the progress of Ibrahim. On the 4th of May peace was concluded at Koniah, and Mehmed 'Ali obtained the object of his armament, the investiture of Syria and Adana, but he remained a tributary vassal of the Porte. So much was Turkey weakened through this war, that Mahmud, despairing of further independence, threw himself into the arms of Russia; and on the 8th of July signed the treaty of Unkiar Skelesi, by which Russia bound herself to assist Turkey with an army whenever she should want it, in acknowledgment of which Mahmud promised that no armed ship of foreign nations should be allowed to pass the Dardanelles without the permission of Russia. Mahmud was more fortunate in an expedition against Tripoli, which was brought back under the Sultan's immediate authority, and at Tunis also he succeeded in obtaining obedience to his orders.

Mahmud's hatred of Mehmed 'Ali became now the principal motive of his actions. As early as 1834 things were so bad that Mahmud not only resolved upon a fresh war, but put himself at the head of his troops in order to conduct it in person; but in crossing the Bosphorus he dropped the sacred sword of Soliman II., which fell into the sea and was lost for ever, and this bad omen induced him to give up his plan and to return to Constantinople. War was prevented by the mediation of England, France, and Russia; but the Sultan nevertheless continued preparing for a contest which he wished, and which could be postponed, but not prevented. The care which he bestowed upon his military preparations was surprising, but the result was far from answering his expectations. The second war with Mehmed 'Ali would perhaps not have broken out so soon (1839), but for the pasha's manifest design to subject all Arabia to his authority; and it is said that the Sultan was urged by Russia, and especially by Great Britain, to open the campaign in that year, although he knew that his army was not yet able to take the field with any chance of success. On the 25th of June the Turkish army under Hafis Pasha was entirely defeated by Ibrahim Pasha, near Nisibis; and there being no other army to oppose his victorious career, it was evident that Turkey would be lost if the European powers did not interfere. Mahmud was fortunately not destined to hear of the disgrace of his arms. He died on the 1st of July 1839, a few days before the news of the battle of Nisibis threw the seraglio and the capital into consternation. Mahmud was succeeded by his eldest son, Abdul-Mejid. [ABDUL-MEJID.]

MAHMUD, Soboktegin of Ghisni, the founder of the Ganevide dynasty, succeeded to the sovereignty of Khorasan and Bokhara (A.D. 997), which his father Emir-Nasireddin Soboktegin had occupied under the kalifs El-Thal-Billah and Kader-Billah. After having assumed the title of sultan, which was readily granted to him by the kalif, Mahmud subdued the circumjacent provinces of East Persia, made Ghisni his capital, and totally shook off the yoke of his legitimate sovereign. Bound, as he asserted, by the most solemn vow to adhere to the precept of the Korān, which enjoins the propagation of the Islam and war against the unbelievers as a matter of faith, he directed his arms against the quiet and peaceful Hindoos, and first attacked Jaipal, the neighbouring king of Lahore, in 1001. This expedition having proved successful, Mahmud invaded Hindustan almost every year, and in no less than fourteen subsequent incursions, made in various directions and as far as the carelessness and the feeble resistance of the Hindoo rajahs would permit him to proceed, he devastated the provinces, ravaged and plundered the cities, destroyed the places of religious worship, and murdered the inhabitants, always returning with an immense booty. In the year 1016 the far-famed city of Kanoge was destroyed; and shortly after the ancient and magnificent Mathura, whose palaces and temples of marble and alabaster filled even their savage conqueror with respect and religious awe. The remotest expedition of Sultan Mahmud was directed against the celebrated temple of Somnat (Somanātha) in Guzerat (1025). After having once more attempted a predatory excursion into Mooltan, he died at Ghisni, 1080. All that can be said in praise of Sultan Mahmud is, that men of learning were attracted by the fame of Ghisni, which he adorned with the most splendid buildings, and by the lustre and magnificence of his court; and the new epoch of Persian poetry, of which the Shah-Nameh is the most eminent and imperishable monument, was encouraged by the sovereign. But as the satirical poems of Ferdusi testify, even his liberality and favours were in a great degree dependant on his capricious temper, and were often bestowed in a very niggardly manner. About three miles from the modern city of Ghisni, the tomb of Mahmud is still preserved, and in remembrance of his having been a zealous defender of the faith, Mohammedan priests are maintained, who constantly read the Korān over his grave.

MAHOMET I., son of Bayasid I., was sandjak, or governor of the town and district of Amasia when his father was defeated and taken prisoner by Timur at the battle of Anoyra (July 1401). The invader

having left Asia Minor, Mahomet's elder brothers Mousa and Solyman disputed their father's succession between them. Mahomet took no part in their quarrel, but continued to administer his province, and strengthen himself in it, until Mousa, having prevailed against Solyman, put him to death, upon which Mahomet declared war against Mousa, who was defeated and killed, and Mahomet became sole Sultan of the Ottomans in 1413. Mahomet was the restorer of the Ottoman empire, which he found in a state of anarchy. He extended his conquests into Europe, and obliged the princes of Bosnia, Servia, and Wallachia to pay him tribute. He also equipped a fleet to resist the attacks of the Venetians by sea. He died, after nine years' reign, in 1421. He was succeeded by his son Mourad II.

MAHOMET II., son of Mourad II., was proclaimed emperor of the Ottomans after the voluntary abdication of his father in 1444; Mourad however was obliged by a mutiny of the Janissaries, who objected to his son's youth, to resume the reins of government till his death, which happened at the beginning of 1451, when Mahomet, then twenty-two years of age, commenced his reign. He broke the truce existing with the Byzantine emperor, by building a fort on the European side of the Bosphorus, opposite to the fort of Anatoli-Hissar, which his predecessor Bayazid had built on the Asiatic coast of the straits, by which means Mahomet established a complete command of the Bosphorus. This led to remonstrances from Constantine Palaeologus, the Byzantine emperor, which were received with scorn by Mahomet, who went on subduing the Greek towns on the Propontis and the Euxine, ravaged Thrace, and invaded the Peloponneseus. At last, having assembled an immense host, stated by some at 300,000 men, with a formidable artillery, and a fleet of 120 sail, Mahomet laid siege to Constantinople in April 1453. After fifty-four days' siege, the Ottomans carried the city by storm on the 29th of May 1453. Constantinople fell bravely fighting in the breach, covered by a heap of the slain. After three days of plunder and massacre Mahomet restored order, released most of the prisoners, granted to the conquered the free exercise of their religion, and gave them the use of one half of the existing churches; the remainder, and the best of them, Santa Sophia among the rest, were transformed into mosques. Mahomet remained nearly three years at Constantinople, after which he returned in triumph to Adrianople, which was then the residence of the Ottoman sultans.

In 1456, after invading Servia, he laid siege to Belgrade, but was opposed and defeated by John Hunnyades, a gallant Hungarian noble, who was regent of the kingdom in the absence of King Ladislas. This was the first check which the Mohammedan arms encountered in their advance towards Western Europe. At the same time Mahomet's generals were defeated in the mountains of Albania by Scanderbeg. The Turks however took Corinth and the Morea. In 1461 they took Trebizond, and put an end to the dynasty of the Comnena. In 1462 they took Lesbos and other islands of the Archipelago. They next conquered Bosnia, and Mahomet, after promising safety to the prince of that country, had him put to death. In 1465 Mahomet marched against Scanderbeg, but was defeated under the walls of Croia. But Scanderbeg lost all the open country, and dying soon after, left his infant son John Castriot under the guardianship of the Venetian senate. The Venetians attacked and plundered the coasts of Thrace, Asia Minor, and several of the Greek islands. In 1470 Mahomet laid siege to the town of Negroponte, the stronghold of the Venetians in the Aegean Sea. The Provveditore Erizzo, after a gallant resistance, being obliged to capitulate, Mahomet promised to spare his head, but by a barbarous equivocation he had him sawed in two, saying that he had not promised to spare his sides. The Venetians by means of their commercial agents excited against Mahomet, Husun Hassan, shah of Persia, who invaded Asia Minor, and took Teos in 1472. [CONTAARDI, AMBROGIO.] Mahomet hastened to encounter him, and a battle was fought near Trebizond, in which the Turks had the advantage over the Persians, who withdrew beyond the Euphrates.

In 1475 Mahomet took the Crimea, the khan of which became his tributary. The Turks invaded also Dalmatia and Frioul in 1478, and, advancing as far as the Tagliamento, obliged the Venetians to sue for peace, which was concluded between them and Mahomet in January 1479, by which Venice gave up Scutari and other fortresses in Illyria, Albania, and the Morea. In 1480 a Turkish force landed at Otranto, and spread alarm throughout Italy. In the same year the Turks attacked Rhodes, but were defeated by the Knights of St. John, under their grand-master Peter d'Aubusson. Mahomet was greatly irritated at the news of this defeat; and while he was making preparations for resuming the attack in person, he died at Teggar Zair in Bithynia, in May 1481. His remains were carried to Constantinople and interred with the following epitaph:—"I designed to conquer Rhodes and subdue proud Italy."

Mahomet was a successful conqueror. He was cruel, like most of the Ottoman warriors; but he was not an illiterate or rude barbarian. He knew several languages—Persian, Arabic, and Greek; was fond of poetry, and was a good letter-writer. Several of his letters have been translated into Latin, and published by Landini, Lyon, 1520. Three of his letters, addressed to Scanderbeg, are found in Melchior Junius's Collection, 1596. He founded two medressés, or colleges, at Constantinople. Several stories of his cruelty, such as that against a Greek

female, Irene, and the story about Bellini the painter, rest upon doubtful authority. [BELLINI, GENTILE.] His bad faith however is fully proved, in the instances of the unfortunate Erizzo, of the Prince of Bosnia, and others. In Turkish history he is styled Mahomet the Great and the Conqueror.

MAHOMET III. succeeded Mourad III. in 1595. He began his reign by putting to death all his brothers. Giving himself up to idleness and pleasure, he left the government in the hands of his ministers, who were under the influence of his mother. His troops were beaten in Hungary by the imperial troops, and by Batori, prince of Transylvania, and they lost Gran and other places. Mahomet, being roused from his apathy, collected a large force, with which he entered Hungary and took Agram; but he soon left the army, and hurried back to his capital. The war was carried on in Hungary by his generals, but with no success to the Ottoman arms. In the meantime revolts broke out, and the Asiatic provinces and the janissaries at Constantinople mutinied. In the midst of all these disorders Mahomet died, in 1603, and was succeeded by his son Ahmed I.

MAHOMET IV., son of Ibrahim I., succeeded his father, who was strangled in a meeting of the Janissaries in 1649, when Mahomet was seven years of age. His mother assumed the regency; but a fresh revolt of the Janissaries soon overthrew her power, and she also was put to death. Mahomet Kuperli, or Kupruli, was now raised to the post of grand vizir, or prime minister. Like many other officers who have distinguished themselves in the annals of the Ottoman empire, Kupruli was an Albanian. He and his son Achmet after him were the ruling ministers during the greater part of the reign of Mahomet IV., who troubled himself little with state affairs, being chiefly engrossed with the sports of hunting and other pastimes. The two Kuprulis spread a last ray of departing glory over the decline of the Turkish state. The elder Kupruli, after repressing by severe measures the spirit of insurrection within, formed a new fleet to oppose the Venetians, who, under the two gallant brothers Mocenigo, threatened to force the passage of the Dardanelles in 1657. He also sent fresh troops to carry on the war in the island of Candia. Meantime the war was raging in Hungary between the Turks and the Emperor Leopold I. The Turks advanced as far as Neuhausel, which they took, spreading alarm to the gates of Vienna; but they were defeated by Montecuccoli, general of the imperial forces, at the battle of St. Gothard (1663), after which peace was concluded. The same year Mahomet Kupruli died, and his son Achmet Kupruli became grand vizir. In 1667 Achmet went in person to Candia, and the siege of the capital town of the same name began in real earnest. The Venetian general Morosini directed the defence. In September 1669, Morosini, after a most gallant resistance, having exhausted all his resources, made an honourable capitulation, and at the same time concluded a treaty of peace between Venice and the Porte upon terms more favourable than might have been expected.

In 1671 war broke out between the Turks and Poland, and Mahomet IV. led his army in person; but he was surprised in his camp at Budchas by John Sobieski, grand-marshal of Poland, and the sultan was obliged to seek safety in flight. In the following year Sobieski took the fortress of Kotsim, and drove the Turks to the south of the Danube. In 1675 a formidable Turkish host, commanded by the pasha of Damascus, who for his bravery had earned the name of "Shaitan" (the devil), entered Poland. Sobieski, who was then king, resisted all their efforts with a handful of men, and at last obliged them to ask for peace, which was concluded in 1676.

In 1683 the Turks, after seven years' preparation, put into motion the most formidable army which Europe had seen for a long time. They swept over Hungary like a storm, and marched direct upon Vienna. It is generally admitted that Louis XIV. was privy to their plans. The Emperor Leopold and his family left their capital, and Germany and Italy were thrown into consternation. On the 15th of July Vienna was invested by the grand vizir Kara Mustafa (Kupruli was dead), at the head of 300,000 men, Turks and Tartars. On the morning of the 11th of September Sobieski and Charles duke of Lorraine, at the head of their combined forces, 40,000 strong, reached the summit of the Calenberg, from which they beheld the Austrian capital, and the wide-spread glittering tents of the Ottomans. On the following day Sobieski attacked and drove the Turks to their formidable entrenchments, against which, at five o'clock in the afternoon, he led a general assault, carried everything before him, and obliged the vizir to fly, leaving his camp, his baggage, and his artillery in the hands of the Christians. The Turks subsequently lost Hungary. In consequence of these disasters the Janissaries at Constantinople revolted in 1687, Mahomet IV. was deposed, and Solyman III. was raised to the throne. Mahomet died in confinement in 1691.

MAHON, LORD. [STANHOPE, EARL OF.]

MAI, ANGELO, CARDINAL, and Prefect of the Vatican Library, was born at Schilpario, a mountain village of the province of Bergamo, on the 7th of March, 1732. He received his early education in the village school, and his first master in the higher studies was the ex-Jesuit Father, Lewis Moasi de' Caspiani. In 1799, Moasi, struck by the taste and capacity for classical learning which Mai displayed, selected him, along with four other youths of the village, to enter the novitiate of the Jesuit society, which, although elsewhere suppressed, the Duke of Parma, with the sanction of Pius VI., was

about to re-establish at Colorno, a small city of his duchy. In this community Mai resided till the provisional restoration of the society in Naples (1804), whither he was sent as Professor of Greek and Latin literature. About the end of 1805, he was transferred to Rome for the completion of his theological studies, and soon afterwards was removed to Orvieto, on the invitation of the bishop, Giambattista Lambruschini. He was here admitted to priest's orders; and to the opportunities which he thus enjoyed of intercourse with two learned Spanish fathers of the Society, Montero and Menchaca, he himself used to ascribe not only his familiarity with the Hebrew language, but what much more sensibly influenced his after-career, his accurate knowledge of palaeography, and his skill in deciphering ancient manuscripts.

Mai returned to Rome in 1808, just about the time when the contest of Pius VII with Napoleon was reaching the crisis; and an order issued by the viceroy, commanding all subjects of the kingdom of Italy to return to their respective provinces, compelled him to change his residence once again. Happily for the interests of literature he settled at Milan.

The Ambrosian Library of that city had long been known as rich in manuscripts of the highest interest—the remnant of the treasures of the old monastic libraries, especially those of Bobbio and Lucca, and of some of the suppressed Benedictine convents of the Protestant cantons of Switzerland. Many of its best treasures had been made public by Muratori, Mabillon, and the Benedictine editors; but there yet remained a department entirely unexplored, which Mai soon appropriated to himself, and which has since come to be regarded as exclusively his own—that of palimpsest or re-written manuscripts, in which the original writing has been effaced in order to make room for a later work written over it. Through the influence of Padre Mozzi and the recommendation of his friends, and especially of Count Mellerio of Milan, Mai was admitted an associate and eventually a doctor of this celebrated library; and, from the date of his arrival in Milan till his ultimate translation to the Vatican, he laboured in his novel editorial career with a zeal and success not unworthy of the traditional glories of his country. His first essay as an author was a Latin translation (with a commentary) of *Isocrates' De Permutationibus* (1813), the original of which had been published by a Greek named Andrew Mustoxidi in the previous year; but this was only the prelude of his far more remarkable successes in the decipherment and publication of palimpsest manuscripts. Up to this period, with the exception of Kuster and Wetstein's readings of the Old and New Testament from the 'Codex Ephremi,' Knittel's portions of the Gothic Bible of Ulphilas, Peter Bruns's fragment of the ninety-first book of Livy, and Barrett's palimpsest of the Gospels, palimpsest literature was entirely untried. Within a few years Mai deciphered and published from palimpsest sources two volumes of inedited fragments of Cicero's 'Orations;' a volume of letters and other writings of Fronto, the preceptor of Marcus Aurelius; some fragments of the lost 'Vidularia' of Plautus; a lost work of Porphyrius, the Platonist; some portions of Dionysius of Halicarnassus; two works of Philo Judæus; eight orations of Lysimachus; an oration of Iseus; two books of the Sybilline Verses; and several other works of the same character.

During this time Mai, although a member of the Jesuit Society, had not taken the solemn vows of the order, which indeed was not formally restored by papal authority till 1814. It was then thought, both by his superiors and by the authorities at Rome, that he could render more effective services to literature and to religion by remaining attached to the Ambrosian Library. Accordingly, with the full approval of all the authorities, he withdrew from the Society, and remained, as a simple priest, at Milan till 1819, when he was called to Rome as chief keeper of the Vatican Library, canon of the Church of St. Peter's, and domestic prelate of the Pope Pius VII. Soon after his establishment in the Vatican, he completed what was wanting in those fragments of Fronto which he had already printed at Milan; having happily discovered in the Vatican the missing portion of the manuscript from which the Milanese fragments had been printed, and which had (as well as the Milanese manuscript) originally belonged to the library at Bobbio. In the following year he published the work by which he is best known out of Italy—a large and interesting portion of the long-lost 'De Republica' of Cicero, the fragments of which he arranged with consummate skill in their respective order, and interwove with all the known extracts of the work which had been preserved by ancient authors. The whole text he illustrated by a critical commentary of exceeding interest, which at once established his reputation as one of the first scholars of the age.

From these comparatively desultory labours he turned to a project not unworthy of the palmiest days of Italian editorship. Selecting from the vast and till then imperfectly explored manuscript treasures of the Vatican, he prepared his 'Scriptorum veterum Nova Collectio e Vaticanis Codicibus edita;'—a vast series of ten 4to volumes (Rome, 1825, and following years), on the plan of the various *Anecdota*, published under different titles by Mabillon, Pex, Montfaucon, Muratori, and others. It is a work of immense labour and research, and of a most miscellaneous character—Greek and Latin, sacred and profane, theological, historical, patristical, and philosophical. One of the volumes, the second, is perhaps the most curious of the entire, con-

taining considerable fragments, recovered from a very early palimpsest manuscript, of almost all the ancient Greek and Roman historians, Polybius, Diodorus Siculus, Dionysius of Halicarnassus, Dion Cassius, Appian, Dexippus, Eunapius, and others.

The 'Vaticana Collectio' was quickly followed by a similar collection in ten volumes, 8vo, 'Classici Scriptorum ex Codicibus Vaticanis editi,' completed in 1838; which included some of the editor's earlier publications (especially the 'De Republica'); although, with the exception of about two volumes, its contents are entirely new. While he was engaged in the publication of this series he held the laborious and responsible post of secretary of the Propaganda, to which he had been appointed in 1833; and it was observed with wonder that his extensive literary engagements never were suffered to interfere with the duties of the secretariate. His active and business-like habits, the promptness of his decisions, and the prudence and discretion of his whole administration, are still gratefully remembered by the members of the various missions under the surveillance of the Propaganda.

After five years of service in this laborious office, he was named (1838) cardinal, at the same time with his friend and successor in the Vatican Library, Mezzofanti; and soon afterwards was appointed to several important and confidential offices in the Roman court, chiefly of a literary character. He was named successively Prefect of the Congregation for the Supervision of the Oriental Press; Prefect of the Congregation of the Index; and Prefect of the Congregation of the Council of Trent. In 1853 he was appointed to the still more congenial post of Librarian of the Roman Church.

This elevation did not interrupt in the slightest degree the literary labours in which he had been engaged. Scarcely was the collection of 'Classici Auctores' completed, when he commenced a similar one, also in ten volumes 8vo, 'Spicilegium Romanum' (1839-44), equally interesting and various in its contents, and a fourth collection entitled, 'Nova Patrum Bibliotheca,' published in 1853 in six volumes 4to;—thus completing a series unparalleled since the days of Muratori, and indeed far more extraordinary than the older collections, from the circumstance that it was compiled from the mere gleanings which had escaped the research of the earlier generations of editors and collectors. Several years before, he had undertaken to edit the well-known 'Codex Vaticanus' of the Old and New Testament with various readings and prolegomena. The text of this edition was printed many years before his death, but its publication was delayed in order that it might be accompanied by the intended prolegomena. He died however at Albano, September 8, 1854, in his seventy-third year, leaving this great work still unpublished; and it is much to be regretted that since his death no trace has been found among his papers of the long-expected dissertations which he had intended to prefix to the 'Codex Vaticanus.' It is conjectured either that, engrossed by his other manifold editorial occupations, he deferred year after year this anxious and difficult task, or that, dissatisfied with the execution, he in the end destroyed what he had prepared.

Cardinal Mai's abilities as an editor were of the very highest order. While his collections comprise an infinite variety of authors of every age, of every country, of every variety of style, and in every department of literature, in all he appears equally the master. Whether the subject be theology or history, or law, or languages, or general literature, his learning is never at fault, and his critical sagacity never fails. In the many delicate and difficult questions which so often arise;—in assigning an anonymous manuscript to its true author, in collecting fragments of the same work and dovetailing them together into intelligible order, in selecting from a heap of unknown materials all that is unpublished, and deciding upon the question of its genuineness or its intrinsic value; in a word, in all the thousand investigations which fall to the lot of a critical editor treading upon untried ground, he possessed a skill and acuteness which can hardly be described as other than instinctive, and which, taking into account the vast variety of subjects which engaged him, must be regarded as little short of marvellous.

The private character of Cardinal Mai has been well described as the very ideal of a Christian scholar. Earnestly devoted to the duties of his sacred calling, he yet loved literature for its own sake also, and he was ever foremost in every project for its advancement. He was a member of all the leading literary societies of Italy, and not unfrequently read papers in those of Rome and Milan. His charities were at all times liberal and indeed munificent; and at his death (reserving to the Vatican Library the right to purchase it at a moderate price) he bequeathed the proceeds of the sale of his noble library to be applied to the benefit of the poor of his native village of Schilpario. A monument has been erected to his memory in the church of St. Anastasia, from which he derived his title as cardinal.

MAIANO, BENEDETTO DA, a celebrated Italian sculptor and architect, was born at Florence, in 1442. He first distinguished himself as a carver and inlayer of wood, and in both of these arts he was the first artist of his time. He executed some very extraordinary inlaid-work for cabinets for the kings of Naples and Hungary, and an accident which happened to two which he made for the latter king caused Maiano to give up the art of inlaying in disgust. These two chests or cabinets suffered so much in the transport from Florence to Hungary by undue care or the change of climate, that when they

were uncovered by Benedetto before the king, a great part of the inlaid-work, owing to the effect of the moisture on the glue, fell to pieces, to the great dismay of the king and the horror of the artist, and had to be remade. Benedetto felt that an art in which the works were subject to destruction by so slight a cause, was unworthy the attention of superior abilities, and he thenceforth applied himself exclusively to sculpture in marble and to architecture.

Benedetto's marble works however were also of an ornamental or decorative class, consisting of fonts, pulpits, and tombs. His fonts and pulpits were of a most elaborate character, being loaded with beautifully executed small figures, besides other decorations. One of his master-pieces is the marble pulpit of Santa Croce, which is still in good preservation: the sculptures represent the life of San Francesco and the establishment of his order, in five compartments; with the figures also of Faith, Hope, Charity, Fortitude, and Justice. The whole has been beautifully engraved by Gio. Paolo Lasinio, and was published with letter-press description in 1823—'Il Pergamo scoltivo in marmo da Bened. da Majano nella Chiesa di Santa Croce in Firenze.' Benedetto made also the crucifix over the altar of the cathedral of Florence; and he finished the Magdalen in Santa Trinità, which was left imperfect by Desiderio da Satignano. In architecture he did very little: he built the portico of the church of the Madonna delle Grazie near Arezzo; a chapel for himself on his own estate near Prato; and he is said to have designed the Palazzo Strozzi. He died rich in 1498, aged only fifty-six, and was buried in San Lorenzo at Florence. He left the reversion of his property to the brotherhood of the Bigallo.

GIULIANO DI NAZZO DA MAIANO, the brother of Benedetto, and likewise a distinguished artist, was born at Maiano, in 1432. He was intrusted with several important charges in Florence, in Pisa, in Loreto, in Naples, and in Rome, yet he is said to have been a joiner and a sculptor before he became an architect. At Naples he built the palace of Poggio Reale, and executed the sculptures of the Porta Capuana, also the triumphal arch, and the reliefs of the Castello Nuovo (now the Arsenal). At Rome he built of Travertine stone the loggie of one of the courts of the Vatican; and the church and palace of San Marco for Pope Paul II. in the same material; and a report was long in circulation that part of the Colosseum was pulled down for the stones, but more charitable persons have presumed that the pope used only such stones as had already fallen. Giuliano commenced also, in 1464, a new nave to the church of the Madonna in Loreto, which was completed by his brother Benedetto. Giuliano died at Naples, December, 1490, a fact clearly ascertained by Gaye; Vasari's account therefore that he died at Naples, in the reign of Alfonso I. (1435-58) is erroneous; this statement is also evidently incorrect from the fact of Giuliano being employed by Paul II., who was pope from 1464 to 1471.

(Vasari, Florence, ed., and the Notes to the German translation by Schorn; Cicognara, *Storia della Scultura*; Rumohr, *Italienische Forschungen*; Gaye, *Carteggio*.)

MAIKOV, BASIL IVANOVITCH, a Russian author who gained some distinction by his talent for comic poetry, was born at Jaroslav, in 1725. Although he had received but a very moderate education, a natural aptitude for writing verses and a turn for humorous satire enabled him to distinguish himself by his 'Yelisei, or Bacchus Enraged,' a burlesque poem in five cantos, the hero of which is a yamshtshik, or carter, named Yelisei, whom Bacchus takes under his protection. It is chiefly by this production that Maikov is now remembered; but the fiction itself is so extravagant, and the narrative in many parts so confused, as to detract considerably from the pleasure afforded by the humour displayed in many passages. He also wrote two poems in a similar vein; one entitled 'Igrok Lombera, or the L'Homme Player;' the other, 'The Most Shocking Fall of the Poets;' each of which is in three cantos. His other works consist of two tragedies and several tales and fables. To these last-mentioned productions the epithet 'Moral,' prefixed to them by the author himself, can hardly be said to belong, for one of them at least is most scandalously indecent. There is also considerable grossness in many parts of 'Yelisei.' Maikov died at Moscow in 1778, but the first entire collection of his poems did not appear till 1809, when they were published in one volume, at St. Petersburg.

MAILATH, JANOS NEPOMUK, an ingenious Hungarian poet and historian, was born at Pesth on the 14th of October 1786, and was the fourteenth child of a family of eighteen. He received an excellent education at Erlau and Raab, and his father, Count Joseph, an Austrian minister of state, introduced him into the same service, which he was compelled to relinquish after ten years, from increasing weakness of eye-sight. For two years he was forbidden to read and write, and it was during this time that he resolved to devote himself to literature. His works on poetry and history are numerous. Many of his poems and one of his histories, that 'Of the Religious Dissensions in Hungary,' are in the Hungarian language; most of the others are in German. He translated with success into German the 'Himfy of Kisfaludy.' [KISFALUDY, SANDOR.] His 'History of the Magyars' (5 vols., 1828-31), and his 'History of the Austrian Empire' (5 vols., 1834-50), are the most important of his historical works: the latter contains the result of his investigations during a period of eighteen years. Count Mailath, who returned to the public service and held the office of a counsellor

of the Hungarian Chancery and some others at Pesth, was a member of the Hungarian Conservative party, and in his history mentions his own name, along with that of Count Stephen Szechenyi, as those of the only two magnates who opposed what he characterises as the violent and oppressive proceedings of the Magyars in forcing their language on the six-million inhabitants of the country, whose languages were entirely different. The whole of his narrative of the conduct of the Kossuth party in Hungary before the outbreak is deserving of attention, as a statement of one side of the question which is little known in England. The results to unfortunate Mailath were most disastrous. Deprived of the posts he held in Hungary by the revolution of 1848, he appears to have been unable to obtain a compensation from the Austrian government. His literary labours did not prove remunerative, and his fortitude gave way under the combined afflictions of poverty, exile, old age, and blindness. The old man, whose productions have earned him a permanent and honourable place in the literature of both Hungary and Germany, was driven by the pressure of extreme destitution to drown himself in the Lake of Starnberg in Upper Bavaria, and with him his daughter, who had for some time acted as his amanuensis. This most painful catastrophe took place in the early part of January, 1855.

MAIMBOURG, LOUIS, born in France in 1610, entered the order of Jesuits, and studied theology at Rome. On his return to France he was employed as a preacher. Having published in 1682 a work in which he defended the principles of the Gallican Church, 'Traité Historique de l'Eglise de Rome,' the pope caused him to be expelled from the order of Jesuits. Louis XIV. on this occasion gave him a pension, and he retired to the abbey of St. Victor at Paris, where he died in 1686. The four propositions which Maimbourg, with the greater part of the French clergy, maintained are:—1. That the pope has no authority in temporal matters. 2. That the general councils of the church are superior to the pope. 3. That the pope may err in his decisions, which are subject to the approbation of the church. 4. That the rights, usages, and canons established in the Gallican Church cannot be altered by the pope without the consent of the clergy and the state.

Maimbourg wrote several works on church history, the principal of which are—1, 'Histoire du Pontificat de St. Grégoire;' 2, 'Histoire du Pontificat de St. Léon;' 3, 'Histoire du Calvinisme,' which has been criticised by Bayle and others; 4, 'Histoire de l'Arianisme;' 5, 'Histoire des Iconoclastes;' 6, 'Histoire du Luthéranisme,' in which he defends indulgences in their fullest extent, as remitting not only the temporal penalty, but the penalty hereafter, both to the living and the dead; 7, 'Histoire de la Ligue.' Maimbourg is often prejudiced and inexact, but his style is attractive; and several of his works are not destitute of merit. Voltaire, no favourable judge, said of him that "he had been too much praised at first, and too much neglected afterwards."

MAIMONIDES, or more properly MOSES BEN MAIMON, one of the most celebrated of the Jewish Rabbis, was born at Cordova in Spain, about A.D. 1131 or 1138. He studied philosophy and medicine under the celebrated Averroes, an Arabian physician and philosopher; and also paid great attention to mathematics and natural science, as far as they were known at that time. In addition to a knowledge of Hebrew and Arabic, he is also said to have been acquainted with Greek, and to have studied the writings of the most celebrated Grecian philosophers. In consequence of a violent persecution having arisen against his master Averroes, Maimonides withdrew to Egypt, where he is said to have gained his livelihood at first by working at the trade of a jeweller. His great merits afterwards introduced him to the Sultan Alphonse, who appointed him physician to his own household, and treated him with distinguished honour. He died in Egypt, December 13, 1204.

The learning and abilities of Maimonides have been universally acknowledged both by Jews and Christians, although the independent mode of thinking which characterised most of his writings, as well as his rejection of some of the favourite absurdities of the rabbis, rendered him an object of suspicion and dislike among many of his contemporaries. The rabbis of Montpellier in particular attacked his opinions with the greatest vehemence, and burned his writings; but their proceedings were censured by most of the Spanish rabbis. The controversy continued till about the year 1232, when the celebrated David Kimchi was chosen by both parties as an arbiter of the dispute. [KIMCHI.]

The most celebrated of the writings of Maimonides are—1. 'Moreh Nevochim,' or 'Teacher of the Perplexed,' originally written in Arabic, and translated into Hebrew by his disciple Samuel Aben Tybbon. This is perhaps the most valuable work of Maimonides; it contains an explanation of difficult passages in the Old Testament, as well as of types, allegories, &c. The original Arabic has only been printed quite recently, with a French translation, under the title of 'Le Guide des Egarés traité de Théologie publié en Arabe avec traduction et notes par S. Munk,' tom. i., royal 8vo, Paris, 1856. The Hebrew translation has been published at various times; the best edition is by Salomon Maimon, Berlin, 1791. The 'Moreh Nevochim' has been also translated into Latin by Justinian, bishop of Nebio, Paris, 1520, and by the younger Buxtorf, Basel, 1629, with a preface, which contains an account of the life of Maimonides. Dr. Townshend has

published an English translation of this treatise, under the title of 'The Reasons of the Laws of Moses, from the "Moreh Nevochim" of Maimonides,' London, 1827. 2. 'P'erush ha-Mishna,' or 'Commentary on the Mishna,' which was also originally written in Arabic, but has been translated into Hebrew by many rabbis, and has usually been published with editions of the 'Mishna.' Surenhusius, in his edition of the 'Mishna,' Amst., 1698-1708, has given a Latin translation of this work. Part of it was published in the original Arabic by Pooscke, Oxford, 1645, under the title of 'Porta Mozia.' 3. 'Yad Hazakah,' or the 'Strong Hand,' which contains a complete digest of the Hebrew laws. It is written in remarkably good Hebrew. The best edition is that printed at Amsterdam, 1702, 4 vols. folio. 4. 'Shalosh Asarah Ikkarim,' or 'The Thirteen Articles of Faith,' printed at Worms, 1529, and Jena, 1540. Maimonides also wrote several other treatises on different points of the Jewish law, and many works on medical subjects. He also translated, at the command of the Sultan of Egypt, the writings of the Arabian physician Avicenna, or Ibn Sina.

Maimonides founded a college at Alexandria for the instruction of his countrymen, in which he delivered lectures on philosophy and the Jewish laws.

MAINTENON, FRANÇOISE D'AUBIGNÉ, MARQUISE DE, was born at Niort in 1635. Her father, Constant d'Aubigné, son of the friend of Henri IV. [AUBIGNÉ, THEODORE AGRIPPA D'], was a man of profligate character. He was in prison at Niort at the time of the birth of his daughter; he afterwards went with his wife and child to the West Indies, where he died in 1645. His wife and daughter returned to France in a state of destitution, and Mademoiselle d'Aubigné was brought up by an aunt, and educated in the Calvinist communion, which was that of her paternal relatives. After her mother's death, her godmother, Madame de Neuillant, took her into her house, and obliged her to join the Romish Church. Her situation however at Madame de Neuillant's became so unpleasant and humiliating that she was glad to leave it by marrying Scarron, the comic poet, a man witty but old, infirm, and deformed, who felt for her the interest of compassion. Scarron's house was frequented by fashionable company, among whom Madame Scarron, by her pleasing conversation and address, made several friends.

When Scarron died in 1660, his widow was left poor; but some of her friends recommended her to Madame de Montespan, the mistress of Louis XIV., as governess to her children by the king. She thus became known to Louis, who gradually conceived great esteem for her, especially for the care which she bestowed on the Duke of Maine, one of his sons. The king made her a present of 100,000 livres, with which she purchased the estate of Maintenon. Madame de Montespan's temper was not one of the mildest, and the governess had much to endure from the imperious favourite. Louis himself was often obliged to interfere to restore peace. By degrees the king, who had grown tired of Madame de Montespan, became more strongly attached to Madame Scarron, whose conversation interested and instructed him. She had learnt, in the school of adversity, great forbearance and much tact. The king at length conferred on her the title of Marchioness of Maintenon. The queen-consort of Louis was now dead; Louis was no longer young; and he felt the want of an intellectual companion and friend, to whom he could confide his thoughts. Having consulted his confessor, Father La Chaise, the latter advised a private marriage; and in 1685 Louis, who was then forty-seven years of age, was secretly married to Madame de Maintenon, who was fifty years old, by the Archbishop of Paris, in presence of the Père La Chaise and two more witnesses. The marriage was always kept secret, and Madame de Maintenon herself never avowed it. Louis however lived openly with her, visited her several times a day, received his ministers in her apartments, and sometimes in their presence asked her advice upon state affairs. Without appearing to seek any political power, but rather professing to shun it, she undoubtedly exercised great influence over the king in his latter years; the choice of ministers and generals was ascribed to her by common report, and she was accused of many faults committed by the cabinet. But it would be very difficult to discriminate between those acts in which she really had a share, and those in which her influence was only supposed.

Madame de Maintenon has been hardly dealt with by many writers, and by St. Simon among the rest. She was ambitious, but not interested, arrogant, or vain; she was fond of religious discussions, and she exerted considerable power over the conscience of Louis, but she complained that "she could never make him understand that humility was a Christian virtue." Madame de Maintenon is still favourably remembered as the founder of the institution or school of Saint Cyr, for the education of poor girls of good families. In the latter years of Louis's life she was made unhappy by his fretful and querulous temper, and the fits of passion to which he was subject. In one of her letters she complains that "she was obliged to please and amuse a man who would not be pleased or amused." After the death of the king she retired to Saint Cyr, where she died April 15, 1719.

(*Lettres de Madame de Maintenon*, 6 vols. 12mo, Paris, 1812; *Lettres Inédites de Madame de Maintenon*, Paris, 1826; Lemontey, *Essai sur l'Établissement Monarchique de Louis XIV.*, *Pièces Justificatives*, No. V., *Observations sur le Mariage de Louis XIV. et de Madame de Maintenon*.)

MAIR, JOHN. [MAJOR, JOHN.]

MAIRE, JAMES LE, was the son of a merchant established at Egmont, near Alkmaar, and was born about 1590. As the Dutch East India Company, which had been formed about that time, had obtained a declaration from the states-general by which every Dutch vessel not belonging to the company was prohibited from doubling the Cape of Good Hope, some private merchants in the towns of Alkmaar and Hoorn formed a joint-stock company for the purpose of trying to effect a passage to the East Indies without doubling the Cape. Among these was Isaac Le Maire, the father of James. Two vessels were equipped for sea; the command of them was given to Cornelius Schooten, an experienced navigator, and James Le Maire was sent with him as the commissioner of the company. They set sail in June 1615, and having passed the entrance of the Strait of Magalhaens in the following January, they continued their course southward, in the hope of finding a less difficult route to the Pacific than that through the Strait of Magalhaens. They discovered the strait between Staaten Land and Terra del Fuego on the 24th of January, and gave it the name of Le Maire. In a few days they doubled Cape Horn, being the first navigators who accomplished this undertaking. In traversing the Pacific from the east to the west, they sailed through a part of it, where only a few scattered islands occur. At last they arrived on the northern shores of New Guinea, or Papua, where an island near a cape called Good Hope was named after Schooten. After visiting Gilolo, one of the Moluccas, they proceeded to Batavia, then called Jaccatra. From Batavia they sailed for Europe in a vessel belonging to the East India Company, during which voyage James Le Maire died, the 31st of December, 1616.

MAITLAND, SIR RICHARD, of Lethington, son of William Maitland, of Lethington and Thirstane, by his wife Martha, daughter of George, second Lord Seaton, was born in the year 1496. Having completed his grammar education, he proceeded to France, at that time the common resort of his youthful countrymen, particularly for the study of the law. On his return to Scotland he was successively employed by King James V., the regent Arran, and Mary of Lorraine. Of the early part of his life however few particulars are known. In the end of the year 1550 his book of 'Reports of the Decisions of the Court of Session' commences, and about the same time he appears in the sederunts of the court as an extraordinary lord of session. Not many years afterwards his eldest son William, having returned from the Continent, whither he had been sent, like his father, in early life, was appointed by the queen-dowager secretary of state; but afraid, as it seems, of his safety at that troublesome period, he left her and joined the Protestants in October 1559; and in August 1560 acted as speaker of the Convention, in which the Roman Catholic supremacy in Scotland was destroyed. In the meantime his father, Sir Richard, had become blind. At what time this calamity overtook him is uncertain; it was probably about the year 1559, in the end of which he concludes his 'History and Chronicle of the House and Surname of Seaton.' He continued however to report the decisions of the court of session; and what is remarkable, from about the period of his becoming blind he began to write and collect Scottish poetry. In 1562 he was made lord privy-seal; but this office he in a few years afterwards resigned in favour of his second son John, who was also the next year appointed an ordinary lord of session. His eldest son William had been some time before in the like situation, being in 1561 appointed an extraordinary lord of session, and in 1566 advanced to the place of an ordinary lord of the same court. Old Sir Richard's blindness and peaceful disposition concurred to save him from mixing in the political broils of that period; but nevertheless, in 1570, when his sons were denounced as rebels by the king's party, his lands were ravaged by the English. He lived however to know that his second son was reinstated on the bench as a lord of session, and he died only a month or so before he was advanced to the high office of Chancellor of Scotland. He died on the 20th of March 1586, with the character of "a maist unspotted and blameless judge, a valiant, grave, and worthy knight;" but it is in his character of a writer and collector of Scottish poetry that he is now chiefly remembered.

His collections consist of two volumes: a folio, comprehending 176 articles; and a quarto, of 96 pieces, in the handwriting of Mary Maitland, his daughter. They are now preserved in the Pepysian Library, Magdalen College, Cambridge. His poetical writings were for the first time printed in an entire and distinct form in 1830, in one quarto volume, by the Maitland Club, a society of literary antiquaries, so designated from this distinguished collector of Scottish poetry.

MAITLAND, REV. SAMUEL ROFFY, D.D., F.R.S., F.S.A., was born in King's-road, Bedford-row, London, in the year 1792. Without having first passed through any public school, Mr. Maitland proceeded to Trinity College, Cambridge, but was incapable of graduating as not being a member of the Church of England; his family being Presbyterian, and he having himself been baptised in the Kirk of Scotland. After keeping two terms at Cambridge, and the required number at the Inner Temple, he was called to the bar in Easter Term, 1816. But his views having been turned to the Church, he was ordained deacon at Norwich by the bishop of that diocese on Trinity Sunday, 1821, and priest at Wells by the Bishop of Gloucester on the 19th of August in the same year. From 1823 to 1829 he held the perpetual curacy of Christchurch, Gloucester. In 1837 Dr. Maitland was appointed librarian to the Archbishop of Canterbury (Dr. Howley),

and keeper of the manuscripts at Lambeth—an office for which he was eminently qualified by his very unusual acquaintance with early and mediæval literature, and with general bibliography. This office he held till the Archbishop's death in 1848, and besides his service in rendering the collection of books more complete and available, he rendered a special service to literary men and students of early English literature by preparing and publishing a valuable 'Index of such English Books printed before the year 1600 as are now in the Archbishopial Library at Lambeth;' and a 'List of some of the Early Printed Books in the Archbishopial Library at Lambeth—which was printed (8vo, 1848) but not published.

But it is as an essay writer and controversialist that Dr. Maitland has chiefly distinguished himself. His writings all turn more or less directly on theology and theological history and literature; and upon every subject he has treated he has brought to bear extensive erudition—much of it of a kind little cultivated—a shrewd appreciation of the exact point for investigation, great power of reasoning, and precision and perspicuity of statement, and a style which, though thoroughly original, in its directness of purpose, masculine strength and simplicity, wit and polish, and occasionally trenchant treatment of an opponent, not seldom reminds the reader of Robert South. Dr. Maitland's works may be perhaps arranged conveniently for the purpose of this notice under three or four classes. First, there are those of which the type is his best known work—'The Dark Ages: being a series of Essays intended to illustrate the state of Religion and Literature in the 9th, 10th, 11th, and 12th centuries,' 1 vol. 8vo, 1844, of which a third edition has recently appeared. Of this work the purpose is "to furnish some materials towards forming a right judgment of the real state of learning, knowledge, and literature during the dark ages"—in other words, to show that the darkness has been very much exaggerated; and in the course of the argument Robertson, Henry, Warton, and some other popular historians are subjected to a somewhat severe trial. 'Facts and Documents illustrative of the History, Doctrines, and Rites of the Ancient Albigenses and Waldenses,' 1 vol. 8vo, and 'Essays on Subjects connected with the Reformation in England,' 1 vol. 8vo, do for those particular people and periods of ecclesiastical history pretty much what the 'Dark Ages' were intended to accomplish for the more general theme: to point out, that is, the way in which the ordinary historians have, without fresh inquiry, followed each other in the recital of circumstances and assumptions which will not bear the test of comparison with the original contemporary evidence, and the conclusions of legitimate reasoning. These last two works gave rise to much angry controversy, but Dr. Maitland supported his own views, and assailed those of his adversaries in several pungent 'Letters,' 'Notes,' and 'Reviews,' some of which eventually grew into volumes. Of these it will be enough to name his 'Twelve Essays on Fox's Acts and Monuments,' 'Review of Fox's History of the Waldenses,' 'Some Strictures on Mr. Faber's recent work, entitled "The Ancient Vallenses and Albigenses,"' 'Notes on the Contributions of the Rev. George Townsend, M.A., to the New Edition of Fox's Martyrology,' 'Strictures on Milner's "Church History,"' &c. These various publications contain a vast amount of mediæval lore, and exhibit a singularly intimate acquaintance with the period of the Reformation, and that immediately preceding and following it, and they are everywhere full of matter and animated with humour and sarcasm. In many instances Dr. Maitland will probably fail in convincing his readers that he is right, and the ordinary historian wrong in opinion; but many new readings of events which are now quietly accepted and repeated by popular writers—often without a hint of whence they were obtained—were first started in the Essays or Letters of Dr. Maitland.

Another class of Dr. Maitland's works refers to the explanations published of the Apocalyptic and prophetic millenium: such are—'An Enquiry into the Grounds on which the Prophetic Period of Daniel and St. John has been supposed to consist of 1260 Years;' 'A Second Enquiry,' &c. While another larger and more miscellaneous class is devoted to the investigation of various current opinions in theology and morals; and some of these volumes and essays are among the most learned and elaborate which have fallen from his pen—the learning being quite out of the common course, and handled by a writer who is free from any appearance of pedantry:—'Eruvin, or Miscellaneous Essays on Subjects connected with the Nature, History, and Destiny of Man,' sm. 8vo, 1850 (some of the subjects being 'The Nature and Objects of Revelation,' 'Man before the Fall,' 'Satan,' 'Modern Miracles,' &c.); 'Eight Essays on Various Subjects,' 8vo, 1852 (including the 'Mystical Interpretation of Scripture,' 'Sacred Art,' 'Realism in Modern Art,' &c.); 'Illustrations and Enquiries relating to Mesmerism;' 'Superstition and Science: an Essay,' sm. 8vo; 'The Voluntary System,' sm. 8vo, a work which has gone through several editions; 'False Worship: an Essay,' sm. 8vo; and several pamphlets on 'The Translation of Bishops,' 'Convocation,' 'Tract No. 89.' [SUPP.]

MAITTAIRE, MICHAEL, was born in France, 1668, of Protestant parents, who settled in England at the revocation of the Edict of Nantes. Maittaire was educated at Westminster School under Dr. Busby, and obtained at Oxford, whither he afterwards went, a warm friend and patron in Dr. South. He took his degree of M.A. in 1698, and from 1695 to 1699 discharged the duties of second master in Westminster School. In 1699 he resigned that appointment, and

devoted the remainder of his life to literary pursuits. He died on the 4th of August 1747.

Maittaire was a learned and laborious scholar. He edited many of the classical authors, with useful indexes, and also wrote several works, of which the most important are—'De Græcorum Lingua Dialecticis,' London, 1708, 1742 (the best edition is by Sturz, Leip., 1807); 'Stephanorum Historia vitæ ipsorum ac librorum complectens,' Lond., 1709; 'Historia Typographorum aliquot Parisiensium vitæ et librorum complectens,' Lond., 1717; 'Annales Typographici ab artis inventæ origine ad annum 1657 (cum Appendice ad annum 1664),' Amst. and Lond., 1719-1741; 'Marmora Oxoniensia,' Lond., 1732.

MAJOR, or MAIR, JOHN, was born at the village of Cleghorn, near North Berwick, in East Lothian, about the year 1470. He appears to have studied for a short time both at Oxford and Cambridge, but he always regarded the University of Paris as his true *alma mater*, whither he proceeded in 1493, and where he attached himself successively to the colleges of St. Barbe, of Montaigu, and of Navarre. Having been made a doctor of the Sorbonne in 1505, he betook himself to the teaching of the scholastic philosophy, or divinity, in the college of Montaigu, and in this department soon came to be reputed one of the most distinguished ornaments of the university. Major's scholastic writings indeed have been rated by Dupin and others in later times as the ablest that have come down to us from that age. In 1519 he returned to his native country, and officiated for some time as one of the regents or masters in St. Salvator's College, St. Andrews; but a dispute with some of his colleagues soon induced him to go back to Paris, and there he remained till 1580, when he was induced once more to transfer himself to St. Andrews, which he never afterwards left. He became eventually provost or principal of St. Salvator's College, and appears to have died in that office about 1550.

Major's works are all in Latin, and the principal are Commentaries on the Four Books of Sentences, some theological expositions and commentaries on parts of the Scripture, and his History of Scotland, entitled 'De Historia Gentis Scotorum, seu Historia Majoris Britannia,' first printed in 4to, at Paris, in 1521. The style of all his writings is careless and inelegant to barbarism; but his 'History' appears to have the merit of being a faithful chronicle of events, so far as he knew them. It is however as little marked by any spirit of critical or profound research as by classical purity of diction. Both this and some of his philosophical writings are remarkable for a freedom of sentiment upon points both of civil and ecclesiastical government, which he is believed to have derived from his teachers Jean Gerson and Pierre d'Ailly, and to have communicated to his famous pupils Buchanan and Knox. Dr. M'Crie, in his 'Life of Knox,' Edinb., 1818 (vol. i., p. 345), has given some extracts from Major's works, which evince the liberal complexion of his opinions. The well-known epigram of Buchanan however, in which he designates him "Solo cognomine Major," testifies that the great scholar and wit had no very high opinion of the intellectual endowments of his old master.

MAKRIZI (or, with his full name, TAKKI-EDDIN ABU-MOHAMMED ABUL-ABBAS AHMED ALMAKRIZI), a celebrated Arabic writer, was born at Cairo between 1358 and 1368. His family originally lived in one of the suburbs of Baalbec, called Makriz, whence he derived the surname by which he is usually known. We have very few particulars of his life; but it appears that he resided at Cairo during the greater part if not the whole of his life, that he discharged at different times the duties of several public offices, and that he died at an advanced age in 1442.

Makrizi wrote several historical works, of which copious extracts are given in De Sacy's Arabic Chrestomathy. The most important of these works is his 'Description of Egypt,' which gives an account of the history of the country from its conquest by the Mohammedans, as well as a description of its natural history and antiquities, and of the manners and customs of the inhabitants. De Sacy, in his notes added to his translation of Abd-Allatif, published under the title of 'Relation de l'Égypte,' Paris, 1810, has made many interesting quotations from the work of Makrizi.

The only works of Makrizi which have been printed are, as far as we are aware—'Historia Monetæ Arabicæ,' in Arabic and Latin, by Tychsen, Rostock, 1797, of which a French translation, much superior to the Latin one by Tychsen, was published by De Sacy, under the title of 'Traité des Monnoies Musulmanes,' Paris, 1797; 'An Account of the Mohammedan Princes in Abyssinia,' by Rink, Leyd., 1797; 'Narratio de Expeditionibus à Græcis Franciscis adversus Dimyatham ab a.c. 708 ad 1221 susceptis,' in Arabic and Latin, by Hamaker, Amst., 1824; 'Historia Coptorum Christianorum in Ægypto,' Arabic and Latin, by Wetzer, 1828, and with notes by F. Wüstenfeld, Gött., 1845; 'Histoire des Sultans Mamlouks de l'Égypte: Traduite en Français par M. Quatremère,' tom. i. and ii., 4to, 1837; 'Ueber die in Ägypten eingewanderten arabischen Stämme,' Arabic and German, by F. Wüstenfeld, 8vo, Gött. 1848.

MA'LACHI, the last of the twelve minor Hebrew prophets. So completely are we ignorant of the personal history of this prophet, that it has been doubted whether Malachi is the name of a person, or only a title ('my messenger') descriptive of the prophetic office. In the absence of any positive proof of the latter supposition, the former must be adopted as the more natural. Many of those who

believe that Malachi is an official title identify the prophet with Ezra. This was the opinion of Jerome.

Malachi evidently prophesied after the Babylonian captivity. He was later than Haggai and Zechariah; for he does not, like them, exhort the people to seal in rebuilding the Temple, but he refers to it as already built (i. 7, 10; iii. 1, 10). In chap. i., ver. 8, he speaks of a political ruler of the people; now, no one appears to have held such an office later than Nehemiah, after whose time political power was in the hands of the priests. Moreover the state of things described and reproved in this prophecy agrees with the account which Nehemiah gives of the manners of the people after his second return from Persia into Judæa. (Compare Mal. ii. 8-11, with Nehem. xiii. 23-29; Mal. iii. 8, 10, and Nehem. xiii. 5, 12, x. 38, 39, with Nehem. xiii. 6-13; Mal. i. 8, 11, 13, ii. 8, with Nehem. xiii. 15, &c.) Hence Vitringa and others have concluded that Malachi prophesied during the latter part of Nehemiah's administration (about B.C. 432 or 420).

The object of this prophecy is to reprove the people and the priests for their irreligion. To the complaint of the people, that God dealt unkindly with them, the prophet replies by comparing their prosperity with the calamities that had befallen the Edomites (i. 2-5). He reproves the priests for their dislike to the service of God, their unholy sacrifices, and their perversions of the law, and the people for their intermarriages with the neighbouring heathen nations (i. 6, to ii. 16). Before the Captivity idolatry had been the great sin of the Jews; but now they seem to have been prone to infidelity, complaining that the wicked were favoured by God, and that the Messiah did not appear. The prophet therefore announces the approach first of the Messiah's precursor, and then of the Messiah himself, whom he styles "the messenger of the covenant," to purify the people of God, and to punish the ungodly (ii. 17, to iii. 6). He points to the withholding of tithes and offerings as the cause of the barrenness of the land, and promises a return of plenty upon the payment of these dues (iii. 7-12). He again answers the infidel complaints of the people by referring to a future recompense, and predicts the coming of Elijah to bring the people to repentance, denouncing a curse upon the land if they despised his ministry (iii. 13, to the end). This part of the prophecy is applied in the New Testament to John the Baptist. (Compare Mal. iii. 1, with Matt. xi. 10, Mark i. 2, Luke i. 76, vii. 27; and Mal. iv. 5, 6, with Matt. xi. 14, xvii. 10-13, Mark ix. 11-13, Luke i. 17.)

The prophecy of Malachi is almost entirely in prose. His style has the vigour which belongs to an indignant censor of abuses, but he is deficient in the poetical beauties of the earlier prophets. Bishop Lowth remarks that "the book is written in a kind of middle style, which seems to indicate that the Hebrew poetry from the time of the Babylonian captivity was in a declining state, and, being past its prime and vigour, was then fast verging towards the debility of age." ('Prælec. xxi.) The canonical authority of this book is not disputed.

MALALA, JOHN (called also MALELA, or MALALAS, or MALELAS), was the author of a chronicle in the Greek language, in eighteen books, which extends from the creation of the world to the reign of Justinian. The time in which he lived is uncertain. He must have been alive after the reign of Justinian, since he mentions the number of years which that emperor reigned. Hody, in his 'Prolegomena' to the Oxford edition of this writer, endeavours to show that he lived in the 9th century; but this opinion has been controverted by Jortin, Gibbon, Reiske, and L. Dindorf, who maintain that he lived shortly after the reign of Justinian.

Malala is a Syriac word, signifying 'orator,' or 'rhetorician.' He is also called John of Antioch; but he must not be confounded with the John of Antioch who also wrote a chronicle, extracts from which have been preserved in a work of Constantine Porphyrogenetus, 'On Virtues and Vices.'

The chronicle of Malala was printed for the first time at Oxford, 1691, under the superintendence of Chilmead, who died however before the work was published. Hody prefixed a dissertation to that edition on the life and writings of Malala; and Bentley an appendix, in the form of a letter to Mill, in which he corrected numerous passages. Bentley's letter to Mill was reprinted at the end of Bentley's 'Emendationes in Menandri et Philemonis Reliquias,' Camb., 1718. The chronicle was also published at Venice in 1733; but the best edition is by L. Dindorf (Bonn, 1831), which contains the notes of Chilmead and Hody, as well as Bentley's letter to Mill.

MALATESTA, MALATESTI, Lords of Rimini, an historical family of Italy during the middle ages. Like many other great feudatories of Italy, the Malatesti are said to have originally come from Germany. One of the name is mentioned in some chronicles as 'Vicarius,' or Imperial Lieutenant of Rimini, under Otho III., A.D. 1002. It is not however, until the second half of the 13th century, that we find authentic records of this family as being at the head of the Guelph party in Rimini. Giovanni Malatesti, called 'il Zoppo,' or 'the lame,' married Francesca, daughter of Guido di Polenta, lord of Ravenna. Paolo, brother of Giovanni, seduced his wife, and being caught in adultery with her, they were both killed by the outraged husband. This tragical event forms the subject of one of the most beautiful episodes of Dante's 'Inferno.' After many vicissitudes, owing to the factions of those times, we find Galeotto Malatesta, in the early part of the 14th century, acknowledged by the pope as Lord of Rimini, Pesaro, Fano, and other places in fief of the Papal Sea. His descend-

ants continued in possession of Rimini, with various interruptions till the time of Clement VIII., in 1528, when Sigismondo Malatesta, was deprived of his dominion by the pope, and retired to Venice, after which several of the same family figured in the service of that republic. One Carlo Malatesta had already distinguished himself in the wars of the 15th century, between the Duke of Milan and the Venetians. (Sansovino, *Famiglie Illustri d'Italia*.)

MALCOLM I., King of Scots, was the son of Donald IV., who died in the year 904. He succeeded to the throne when Constantine III. abdicated, for the retirement of a monastery, in the year 944; and he appears to have reigned about ten years. The principal event of his reign was the cession of Cumbria by the English king to the King of Scots. In this it is said the English king resigned to Scotland what he found he could not easily retain, the border districts being from the mixed character of the population, in a state of very frequent disturbance; and by the cession of these districts the English king hoped to secure the fealty and friendship of the King of Scots. Malcolm was slain by the men of Moray, in the north of Scotland, where he had marched to repress an insurrection in that quarter; but the precise time, place, or circumstance in which this event occurred, is not certain.

MALCOLM II., King of Scots, was the son of King Kenneth III., and grandson of Malcolm I. Inheriting the ambitious spirit of his father, he set up a claim to the throne, in opposition to his cousin Kenneth IV., and on the fall of Kenneth in a pitched battle between the partisans of the two princes, Malcolm succeeded in the year 1003. He reigned about thirty years, the greater part of which period was spent in warlike encounters with the Danes, who sought a settlement in the kingdom. It was in gratitude for a victory obtained over these pirates, that Malcolm founded and endowed a religious house at Mortlach, which afterwards became a bishopric, and at a still later period went to form, with other churches, the bishopric of Aberdeen; and on the same occasion he made many and various grants and oblations to the church and clergy. His piety was accordingly acknowledged and approved by the papal see. Malcolm is also said to have been a legislator, and there is a collection of laws which go by his name, but the authenticity of the 'Leges Malcolmi' is disputed. Malcolm died in the year 1033; and there is still shown in the church-yard of Glamis, "King Malcolm's grave-stone," which is a rude mass, without any inscription, 16 feet high and 5 feet broad. He appears to have had no son, but only two daughters, both of whom were married. One of these was mother of King Duncan, who was killed near Elgin in 1039, by a stroke of 'treasonous malice.'

MALCOLM III., King of Scots, was the son of 'the gracious Duncan,' whose story has been immortalised in the pages of Shakspeare. On his father's death Malcolm fled into England; but after the fall of Macbeth, and that of his successor, he recovered his father's sceptre, and was declared king in the year 1057; and, as Chalmers reckons in the thirty-third year of his own age. He is commonly known in history as 'Malcolm Canmore,' or 'Malcolm Great-head,' probably from the wisdom and prudence of his character. A contemporary bard gives him two epithets, the one implying that he had a handsome person, the other that he had a cheerful mind; and it appears that for a series of years his reign was undisturbed either by foreign or domestic enemies. The accession of William Rufus however proved the signal for hostilities between the two countries; and in an encounter with the English forces Malcolm was surprised by Earl Mowbray, and slain on the 30th of November 1093, in about the seventieth year of his age.

MALCOLM IV., King of Scots, was the grandson of King David I., and on the death of that king, on the 24th of May 1153, he succeeded to the throne, being then in the twelfth year of his age. The same year he was called on to repress the insurrection of Somerled, lord of the Isles, a Hebridean chief of such great influence, that when a peace with him was secured, the event was deemed of sufficient importance to form an epoch in the dating of Scottish charters. The standard of rebellion was afterwards raised in Galloway, and Malcolm was obliged to lead a great force against Fergus, the lord of that country, whom he at length subdued. Malcolm had also a struggle with the men of Moray, and in 1161 he compelled them to submit to his authority. The powerful Somerled also again rose, but was defeated by the Scottish king. The period of his reign however was not of long duration; as he died of a lingering disease at Jedburgh, on the 9th of December 1165, at the early age of twenty-four.

MALCOLM, SIR JOHN, G.C.B. and K.L.S., was born in Eakdale, Dumfriesshire, Scotland, in 1769. He was sent to India, when he was only thirteen, under the care of his maternal uncle Dr. Paisley, and was appointed a cadet on the Madras establishment. He returned to England in 1794, for the benefit of his health, but sailed again to India in the following year, and took an active part, as an inferior officer, in the war with the celebrated Tipoo. After the fall of Seringapatam he was appointed, jointly with Captain (afterwards Sir T.) Munro, secretary to the commissioners who were intrusted with the division of Mysore; and his prudence and abilities were already so highly estimated by the British government in India, that he was sent in the same year (1799) to Persia on affairs of the most important nature.

On his return from Persia, in 1801, he was appointed private secre-

tary to the governor-general; but he was again sent to Persia in the following year, in consequence of the death of Hajed Kullek Khan, the Persian ambassador, who was accidentally shot at Bombay. In February 1803, he was nominated to the presidency of Mysore, and joined the army of General Wellesley in his campaign against the Mahrattas; but in 1805 he was recalled to Bengal, where he was occupied in the performance of active and responsible political duties, and particularly in concluding treaties of alliance with several of the Indian princes.

In consequence of the extensive projects of Bonaparte, who was said to be meditating an invasion of India, and who had entered into an alliance with Persia, Malcolm was again sent to Persia in 1807, but was unable to obtain any advantages in favour of the British government. On his return to India, in 1808, he proceeded to his government in Mysore; but owing to a change in the policy of the Persian court, he was again appointed minister plenipotentiary to Persia, where he arrived in 1809, and was received in the most flattering manner. On his departure in 1810, in consequence of the nomination of Sir Gore Ouseley as his majesty's ambassador at the Persian court, the shah conferred upon him the order of the Sun and Lion, and appointed him a khan and sepahdar of the empire. Malcolm returned to England in 1812, and was knighted shortly after his arrival. In 1815 he published his 'History of Persia,' in 2 vols. 4to, which contained an account of the country from the earliest period to the time when the work was published. This work is extracted from native sources, and is the only account which we possess of many portions of Persian history. D'Herbelot's narrative terminated with the reign of Shahrokh, in A.D. 1446. Malcolm's History is also valuable for the information it affords us respecting the religion, government, manners, and customs of the inhabitants of Persia in all periods of their history; and more particularly for his accurate account of the state of Persia in his own time, which he had obtained by personal observation and diligent inquiries in the country.

Malcolm returned to India in 1817, and was, immediately on his arrival, attached, as the governor-general's political agent, with the rank of brigadier-general, to the army under Sir T. Hislop, in the Deccan. He served under this general, as second in command, in his campaigns against the Mahrattas and Pindarries, and greatly distinguished himself in the decisive battle of Mehidpoor, in which Holkar was completely routed. Mr. Canning, then president of the Board of Control, after moving the thanks of parliament to Sir T. Hislop, added, "and to Sir J. Malcolm, who was second in command on that occasion, but who is second to no one in valour and renown. The name of that gallant officer will be remembered in India as long as the British flag is hoisted in that country."

After the conclusion of this war Sir J. Malcolm received the military and political command of Malwa and the adjoining provinces, where he remained four years. The central provinces of India were at that time almost in a state of anarchy; the plundering expeditions of the Mahrattas and Pindarries had reduced many fertile districts to complete deserts, and had thereby forced multitudes to adopt the same marauding mode of life; and the war, which had just been brought to a close, had thrown upon society thousands of soldiers who had been trained to every species of bloodshed and rapine. Too much praise cannot be attributed to the prudent and firm manner in which Sir J. Malcolm administered the government of these provinces: he was particularly successful in conciliating the affections of the natives, and reclaiming by mild and conciliatory means the remains of the Mahratta and Pindarry armies from their savage mode of life. When Bishop Heber visited this part of India, a few years afterwards, the inhabitants spoke of Sir J. Malcolm in the highest terms of admiration, and eagerly asked when they might expect his return. An interesting account of this part of India was published by Sir J. Malcolm in 1823, under the title of 'A Memoir of Central India, including Malwa and the adjoining Provinces; with the History and copious Illustrations of the past and present Condition of that Country.' Sir J. Malcolm returned to England in 1821; and on his quitting Madras a general order was issued by the government, in which his services were acknowledged in terms of the highest praise. Sir J. Malcolm continued to remain in England till 1827, when he was appointed governor of Bombay; but he resigned that office at the end of three years, and again returned to England. He was elected, shortly afterwards, member of parliament for Launceston, and took an active part in the opposition to the Reform Bill. He died on the 31st of May 1833, of an attack of paralysis. A monument has been erected to his memory in Westminster Abbey, and also an obelisk, 100 feet high, near his native town of Langholm, in the district of Eskdale.

In addition to the works of Sir J. Malcolm, which have been mentioned above, he also wrote an account of the 'Political History of India,' from 1784 to 1823, in 2 vols. 8vo, 1826, and a 'Life of Lord Clive,' which was published after his death, in 1836.

MALCZEWSKI or MALCZESKI, ANTONI, a Polish poet of the first degree of eminence, was born about 1792, in Volhynia, and received his education first under a French tutor at Dubno, where his family resided, and afterwards at the school of Krzemieniec, founded by Czacki [CZACKI], with whom he was a favourite, and where he showed a strong capacity for mathematics. His father, who was a general first in the Polish and afterwards in the Russian service, had so impaired

BIOG. DIV. VOL. IV.

the family property that Malczewski, who fell violently in love with his cousin Anna, could not aspire to her hand till he had bettered his position, and he entered the Polish army in 1811 with that view. The campaign of 1812 ruined his hopes; his cousin married a richer suitor, from whom she afterwards separated, and his character received a tinge of melancholy from which it never recovered. When Poland was transferred to the Emperor Alexander I., Malczewski, who had acquired some reputation as an engineer officer, and published a work on the fortification of Modlin, was appointed one of his suite. A sudden quarrel with an intimate friend led in 1816 to an immediate duel, in which Malczewski was severely wounded in the foot, and he quitted or was made to quit the army. For the next five years he travelled in Switzerland, Italy, and France. He was the first Pole who achieved the ascent of Mont Blanc, an account of which, written by him at the request of Professor Pictet, was inserted in the 'Bibliothèque Universelle' of Geneva for August 1818. It does not bear his name, and the only notice of it taken in Albert Smith's 'Story of Mont Blanc' is in a brief mention, after an allusion to failures, that "in 1818 a Russian, Count Mateyski, succeeded." Malczewski also ascended the 'Aiguille du Midi,' and prepared to attempt the passage from the summit of the 'Aiguille' to that of Mont Blanc, but none of the guides could be prevailed on to accompany him, and he was consequently obliged to relinquish the project. His account of the ascent of Mont Blanc has none of the fire and animation that might have been expected from a future poet. His poetical faculty was not developed till he returned homeward with his resources utterly exhausted by his travels and a residence in Paris, to make an attempt to retrieve his fortunes as a farmer on a solitary farm in the Ukraine. In his early education the study of Polish had been almost utterly neglected, and French was the language with which he was by far the most familiar. He now returned with ardour to his native language, which had become endeared to him by absence; but there was always a certain stiffness in his Polish style which gave his productions a foreign air, something we may suppose like that which hangs about the English of the last productions of Byron, written during his long residence in Italy. Malczewski's poem of 'Maria' was composed during this period, which lasted some years, and was brought at last to a melancholy conclusion. On a visit to the farm of a neighbouring proprietor, who was his friend, the friend's wife, who was in a magnetic sleep at the time he entered, exclaimed "My angel, my angel comes." Owing to the remarks of the neighbours Malczewski soon afterwards left the Ukraine for Warsaw, where this unhappy woman followed him, it is said against his will. His poverty became so extreme that falling into illness, he at last depended for support on the bounty of the landlord of his lodgings, and on the 2nd of May 1826 he died after long disease at Warsaw, not without suspicion of having accelerated his death by poison.

A few months before his decease, 'Maria, Powieść Ukrainka' ('Maria, a tale of the Ukraine'), a poem in two cantos, appeared at Warsaw. It is founded on the too true history of Gertruda Komorowska, a young and amiable Polish lady, who had the misfortune to be loved and married by one of the Counts Potocki, without the consent of his savage father, who, bursting into fury when he heard of the misalliance, sent some of his myrmidons in disguise to surround the house of the unfortunate bride, who, torn from under the eyes of her parents, was accidentally or intentionally smothered in the flight of the ruffians with their prey. This event, which took place in Galicia in the year 1778, and is still in fresh remembrance in Poland, was transferred by Malczewski to the Ukraine, and to the more appropriate period of the middle ages. His whole manner of narration is strongly Byronic, and often reminds the reader of 'The Corsair,' from which he takes the motto for his second canto. A vein of misanthropy runs through the whole. The poem at its appearance dropped still-born from the press; it then began to be assailed for faults of language and verification; then one critic after another pronounced in its favour, and now, with the exception of some of the poems of Mickiewicz, it is and has been for a quarter of a century the most popular poem in the Polish language. So early as 1830 a subscription was raised at Warsaw to erect a monument "to the poet of Maria," but it was found impossible to discover the exact place of his interment, only four years after his death. 'Maria' is, as far as we are aware, the only Polish poem that has been reprinted in its native language in England. A very neat edition, dedicated singularly enough to a Countess Potocka, appeared in London in 1836, but it was rendered almost useless by the strange whim of adopting in its several alterations in the system of Polish orthography. The best of the numerous Polish editions is that in 'Antoni Malczewski, jego Żywoty Pisma' ('Antony Malczewski, his Life and Writings'), edited by Bielowski at Lemberg in 1843, to which a portrait is prefixed, which Goszczynski declares cannot be that of Malczewski, because he knows it to be that of another person. A life by Goszczynski is prefixed to a good German translation of 'Maria,' by C. R. Vogel, published at Leipzig in 1845. The other writings of 'the poet of Maria' are insignificant in point both of extent and merit.

MALEBRANCHE, NICOLAS, one of the most illustrious disciples of Des Cartes, who both gave to his master's views a wider development and imparted to them clearness and vivacity, was born at Paris, 1638. Of a sickly and deformed habit of body, Malebranche passed

his early youth in retirement and the close study of languages and biblical literature. His attention was first directed to the pursuit of philosophy by accidentally meeting with the work of Des Cartes 'De Homine.' The perusal of this work is said to have excited his susceptible disposition to such a degree that he was several times forced to lay it aside on account of the violent palpitation of his heart. Abandoning his previous literary pursuits, he devoted ten years to the examination of the Cartesian philosophy, and he acquired the reputation of surpassing all his contemporaries in a knowledge of its true spirit and tendency. As the result of his philosophical meditations, Malebranche published, in 1673, the first book of the 'Recherche de la Vérité,' which was quickly followed by the other five. This work thus complete was greatly altered in the several subsequent editions: the most correct and complete edition is that which appeared three years before the author's death, which took place at Paris, in 1715.

The philosophical writings of Malebranche are a model of a style at once elegant and perspicuous, in which neither the clearness of the thought is sacrificed to the graces of composition, nor the ornaments of language to simplicity. If the profound originality of his ideas gained Malebranche any admirers, the novelty and boldness of his assumptions exposed him to much opposition. Among the most famous of his opponents were Foucher, the Jesuit Du Fertre, and Arnaud, who, like Malebranche, was also a member of the Oratory, and at one time his friend and associate.

The object of the 'Recherche de la Vérité' is partly logical and partly metaphysical. On the one hand it investigates the sources of human error, which are reduced to three general heads—sensation, imagination, and the pure intellect (esprit pur). On the other, it attempts to establish some universal method for the investigation and discovery of truth. The source of error however lies not in any imperfection of the cognitive faculties, nor in any incomplete or wrong employment of them, but in the will, which forms its own opinion of the objects presented to it. When, for instance, we see a light or feel warmth, that which is in either case seen or felt is certainly light and warmth, and they are actually perceived, and so far error is impossible; but when, as the will is free to do, it is maintained that the light and warmth of which the subject is percipient exist in the subject without, then error arises. Now as all sensuous perceptions are accompanied by pleasure or pain, which chiefly move the will, sensation is the principal source of error, and especially of those false systems of morality which make the highest good to consist in pleasure: for the senses present to the mind nothing but a delusive good, whereas the only true and real good—the Deity—is cognisable by the pure intellect alone.

But the most distinctive point in the system of Malebranche is the assumption by which he explained the possibility of knowledge. For as he followed Des Cartes in making extension to be the essence of matter and thought of mind, it was necessary for him to account for the possibility of the interaction of two such distinct natures as thought and extension. The existence of ideas in the mind is, according to Malebranche, a fact not requiring to be proved; from this fact however he denies that it follows of necessity that objects corresponding to those ideas do actually exist; for, he observes, the imagination often presents ideas and combinations of ideas which do not exist. Indeed there is no greater hindrance to truth and knowledge than the erroneous belief that ideas refer to actually existing objects. Now all ideas may be classed under two heads: they are either internal; that is, thoughts properly so called, which are therefore mere modifications of the thinking soul; or they are relative to certain external objects of which the soul cannot be cognisant without the mediation of ideas. Now the latter refer to material or spiritual things. External spiritual things may however be perceived both immediately and also mediately by ideas, but the material only mediately, both because they are extended and there is no community between them and the simple spiritual nature of the mind, and because the mind cannot pass out to distant objects. Here Malebranche refutes the hypothesis of material effluxes which pass from bodies and enter through the sensuous organs. Because, he says, these effluvial images must partake of the nature of body, and therefore being extended, they would impede each other in the passage to the senses, since from the same point and at the same time an incalculable number of objects may be perceived. Moreover this hypothesis does not account for the perception of the different distances of objects. Malebranche proceeds, in the next place, to refute the supposition that the mind arbitrarily produces the ideas which it has of outward objects. This is as absurd as to suppose that a painter can delineate an animal which he has never seen or heard described. Equally untenable is the explanation of cognition by innate ideas. For the number of ideas which the mind may entertain is potentially infinite, and it is absurd to suppose that an infinity of ideas have been originally implanted in the mind, of which however most individual minds are actively conscious of a very few at the utmost. Besides, with such a supposition, the choice and selection of ideas would be inexplicable. Again, the supposition that at each operation of thought the ideas are created and presented by God, is contradicted by the fact that the mind can at all times think of whatever object it pleases, and that consequently an infinite number of ideas must, however obscurely, be always present to the mind. Lastly, Malebranche examines the opinion that the soul,

in order to the perception of outward objects, requires nothing but itself, by the contemplation and perfect development of its own powers. But this would be to make man equal to Deity, who alone is capable of being cognisant of all things in this manner and by the spontaneous exercise of his own energies. After repeating these theories as the only ones worthy of examination of all that have been advanced to account for the matter, Malebranche concludes, that we see all things in and by God (nous voyons tout en Dieu). God, as the creator of all, necessarily possesses within himself ideas of all things, since otherwise the creation of them would have been impossible: by his omnipresence and as the source of spirituality he is intimately connected with all spirits, for God may be called the place of all spirits, as space is that of whatever is corporeal. The soul therefore sees in God the works of God, as far as it pleases him to reveal them to humanity.

The mind consequently, as well as matter, possesses no more than a passive activity, and the Deity is the original cause of all their operations. As then truth consists only in certain combinations of these ideas, which are furnished to the mind from without and by a foreign cause, the only method of truth is demonstration and the analytical investigation of the implicit consequences of explicit ideas.

The other works of Malebranche were partly controversial and partly religious. Of the latter we may mention the 'Entretiens d'un Philosophe Chrétien et d'un Philosophe Chinois sur la Nature de Dieu,' Paris, 1708; 'De la Nature et de la Grâce,' Amsterdam, 1680. The following are of a mystical character, blending religion with metaphysics:—'Traité de la Morale,' Rott., 1684; and 'Entretiens sur la Métaphysique et sur la Religion,' Rott., 1688. A complete edition of his works was published at Paris, 1712, in 11 vols. 12mo.

MALESHERBES, CHRETIEN GUILLAUME DE LAMOIGNON, was born at Paris on the 16th December 1721. His father was chancellor of Paris, and Malesherbes, after finishing the course of legal study, was first appointed deputy to the procureur-général. Shortly afterwards he was elected a counsellor of the parliament of Paris, and in 1750 president of the Cour des Aides. In this office, he on the one hand courageously resisted the extravagant expenditure of the court, and on the other put a stop to the frauds and speculations of the farmers-general of the revenue. When, in consequence of their opposition to the court, the parliaments were abolished by Louis XV., the Cour des Aides was also abrogated, and Malesherbes retired to his country-seat, and employed himself in benevolent plans for the education and improvement of his vassals. Upon the restoration of the constitutional courts of the parliaments by Louis XVI., Malesherbes resumed his duties as president of the Cour des Aides; and in the following year (1775) he was appointed minister of the king's household. Upon the retirement of Turgot, Malesherbes also tendered his resignation to the king, which was accepted. The interval between this date and the troubles which preceded the outbreak of the Revolution, Malesherbes devoted to a tour of inspection through his native country, Switzerland, and Holland, acquainting himself with the state of industry and the arts, and carefully investigating the nature and efficiency of their public institutions. He was again invited by the king to aid him with his counsel in 1787; but finding that he had no power, and that his advice was not listened to, he again retired just before the meeting of the states-general. When Louis XVI. was brought to trial, Malesherbes claimed the honourable but dangerous post of his defender, and was associated with Tronchet and Desèze. The fearless intrepidity of Malesherbes entailed upon him the hatred and suspicions of the party in power, and, with several members of his family, he was cast into prison, condemned to death, and guillotined on the 22nd of April 1794, meeting his fate with cheerfulness and resignation.

The works of Malesherbes, who was a member of the French Academy and of the Academy of Belles Lettres and Inscriptions, are mostly on subjects of natural history and rural economy. His 'Discours et Remonstrances,' printed in 1779, are still quoted as authorities on financial questions. His 'Mémoire sur la Liberté de la Presse' particularly deserves mention for the enlightened view which it takes upon this difficult question, the more especially as the tolerance and liberality which it advocates had been practised by himself when the surveillance of the press was entrusted to him. On this ground he incurred the censures of the ultra party, and La Harpe expressly ascribes the excesses of the Revolution to the facility of publication under Malesherbes' ministry of the press. After the Restoration a monument to the memory of Malesherbes was erected by Louis XVIII. in the hall of the Chamber of Justice, with the inscription, "Strenue semper fidelis regi suo, in solio veritatem, praesidium in carcere attulit."

MALHERBE, FRANÇOIS DE, born in 1655, at Caen in Normandy, of a noble family, studied first in his native town, and afterwards at Heidelberg and Basel. On his return to France, he accompanied Henri de Angoulême, son of Henri II., who went to Provence as governor in 1679, and remained attached to his household till that prince's death in 1685. During that period he married at Aix in Provence and settled there. He afterwards served in the army during the wars of the League. In the year 1600 he wrote an ode on the arrival in France of Marie de' Medici, the wife of Henri IV. With this ode his poetical reputation began. In 1605, having come to Paris on private business, Henri IV. sent for him, praised his poetry, and provided him with the means of remaining at court. After the death

of the king, his widow Marie de' Medicis gave Malherbe a pension in consequence of an ode which he addressed to her. In 1627 he had the misfortune to lose his only surviving son in a duel, a loss which he felt severely. He took steps to bring the offenders to justice, and even wrote a letter to Louis XIII., in which he demanded satisfaction: this letter is published among his works. Malherbe having repaired to the camp before La Rochelle, where the court was then pressing the siege of that place, he fell ill and died in a few days, in 1628, being seventy-three years of age.

Malherbe has been styled by competent judges the restorer of the French language and poetry. He had a delicate ear and a refined taste, and he was very careful in the choice of his expressions. Malherbe's poetry is more remarkable for gracefulness of expression than for power of thought. He was an elegant versifier rather than a real poet.

(*Poésies de Malherbe, rangées par Ordre Chronologique, avec la Vie de l'Auteur*, Paris, 1776.)

MALLET, DAVID, was born about 1700, at Crieff, in Perthshire, where his father, whose name was James Malloch, and who is said to have been one of the proscribed clan Macgregor, kept a small public-house. He is supposed to have been sent first to college at Aberdeen, but he afterwards studied at the university of Edinburgh; and he was attending the classes there and supporting himself by private teaching, after the custom of the Scotch students, when, on the recommendation of the professors, he was appointed tutor to the sons of the Duke of Montrose, with whom he made the tour of Europe. He first became known as a writer by the publication of his ballad of 'Margaret's Ghost,' or, as it was originally entitled, 'William and Margaret,' which appeared anonymously in the 36th No. of Aaron Hill's 'Plain Dealer,' 14th of July 1734. There has been some controversy however as to Mallet's claim to more than the recasting of this famous ballad. (See Percy's 'Reliquis of antient English Poetry,' 1794, vol. iv. 382-36, where the ballad is given in the shape in which it was finally published by Mallet, in his collected works, 1759; 'The Hive,' a collection of songs, vol. i., 1724, where at p. 169 it is given as it had appeared the same year in the 'Plain Dealer;' 'The Hive,' vol. iii., published in 1725, where, at p. 157, is given the other poem which has occasioned the controversy as to the originality of Mallet's; and 'The Friends,' 1773, vol. i., where the attempt was first made to convict Mallet of plagiarism.) He now laid aside his paternal name, and took that of Mallet, which he probably imagined had more of an English sound, and was better suited to his ambition to be taken for a native of South Britain: the earliest known mention of him under his new name in print is said to occur in 1726. In 1728 he published his poem of the 'Excursion,' in two cantos; and in 1731 his tragedy of 'Eurydice' was performed at Drury Lane, but very indifferently received. A poem entitled 'Verbal Criticism,' which he soon after produced, was of some importance to his fortunes by introducing him to the acquaintance of Pope, and through him to that of his friend Bolingbroke. Through these connections he obtained the situation of private secretary to Frederic, prince of Wales, with a salary of 200*l*. In 1739 his tragedy of 'Mustapha' was acted at Drury Lane, with much applause, for the greater part of which however it was probably indebted to some satirical hits at the king and the minister Walpole. The next year, by command of the prince, he wrote, in conjunction with Thomson, the masque of 'Alfred,' which was performed in the gardens of Cliefden, in honour of the birthday of his royal highness's eldest daughter. It was afterwards entirely re-written by Mallet, and acted at Drury Lane, in 1751, with no great success. Of Mallet's remaining writings, the principal are, a 'Life of Bacon,' of extremely little merit, prefixed to an edition of Bacon's Works, in 1740; his poem of the 'Hermit, or Amyntor and Theodora,' 1747; and his tragedy of 'Elvira,' acted at Drury Lane in 1763. To this last a political meaning was at least ascribed by the public, and one that was not to the advantage of the play, for Mallet had now become a supporter of the unpopular administration of Lord Bute, who, soon after this, and as was understood, by way of especial reward for this particular service, gave him a place in the Custom-house. Mallet was besides already in the receipt of a pension, which he had earned some years before from the Duke of Newcastle's administration, by the assistance which he gave in directing the tide of the public rage against the unfortunate Admiral Byng. Two other transactions complete the history of his venal literary career: the first, his acceptance of a legacy of 1000*l*. left to him by Sarah, duchess of Marlborough, as the price of a Life of the great Duke, of which he never wrote a line; the second, his basely ungrateful attack upon his newly deceased patron Pope, at the instigation of his living patron Bolingbroke, in the affair of the latter's 'Idea of a Patriot King.' [BOLINGBROKE, VISCOUNT.] It is believed however that he was in the end rather a loser than a gainer by Bolingbroke's bequest to him of the property of his works, which was his pay for this exposure of himself; he refused the bookseller's offer of 3000*l*. for the works, and then published them on his own account.

Mallet was an avowed freethinker or infidel, and indeed he does not seem to have had much principle of any kind. He was vain not only of his literary talents, but of his person, which, although short, is described as having been rather handsome before he became somewhat corpulent, and which he was accustomed to set off with all the advantages of dress. He appears to have made a rather considerable figure in society. He was twice married; first, to a lady by whom he

had, besides other children, a daughter, who married an Italian gentleman named Cilezia, and wrote a play called 'Almida,' acted at Drury Lane in 1771; secondly, to a Miss Elstob, by whom he got a fortune of 10,000*l*. He died possessed of considerable property, 21st of April, 1765. A collected edition of his poetical works was published by himself, in 3 vols. 8vo, in 1759.

MALLET, PIERRE-HENRI, born at Geneva in 1730, became professor of belles-lettres at Copenhagen, where he wrote several works on the history and antiquities of Scandinavia. He was made member of the academy of Upsala, and became also correspondent of the Académie des Inscriptions et Belles-Lettres de Paris. He afterwards returned to Geneva, and was appointed professor of history in the academy of that city. He died February 8th, 1807. His principal works are:—1, 'Introduction à l'Histoire du Danemarck,' Copenhagen, 1755; 2, 'Edda, ou Monumens de la Mythologie et de la Poésie des Celtes,' translated into English by Bishop Percy under the title of 'Northern Antiquities and the Edda,' 2 vols. 8vo, London, 1770; 3, 'De la Forme du Gouvernement de la Suède,' 1756; 4, 'Histoire du Danemarck,' 3 vols. 4to, 1777; 5, 'Histoire de la Maison de Hesse;' 6, 'Histoire de la Maison de Brunswick.'

Mallet must not be confounded with MALLET DU PAN, also a Genevese writer (born in 1750), who was well known for the various journals which he edited in Paris and London, and especially for his 'Mercure Britannique,' 1793-99, which, owing to the ability of the conductor and the energy of its language, was one of the most powerful organs of the Anti-Gallican press of that time.

MALMESBURY, WILLIAM OF, one of the most valuable of our old historians, is said to have been born in Somersetshire, about 1095 or 1096: his father was a Norman, his mother an Englishwoman. When a boy he was placed in the monastery whence he derived his name, where, in due time; he became librarian, and, according to Leland, precentor, and ultimately refused the dignity of abbot. He is generally supposed to have died about 1143, though Sharpe, in his translation of Malmesbury's 'History of the Kings of England,' says it is probable that he survived this period some time, for his 'Medera History' terminates at the end of the year 1142: and it appears that he lived long enough after its publication to make many corrections, alterations, and insertions in that work, as well as in the other portions of his history, or those alterations and additions must have been made by some other person without intimating the fact of their being by another hand. Some notion of Malmesbury's diligence may be afforded by the following list of his works:—1, 'De Gestis Regum' (the history of the kings of England). The first three books were probably written after 1120. After some delay he wrote the fourth and fifth books, which he dedicated to Robert, earl of Gloucester, at whose request he afterwards composed, 2, 'Historia Novella' (the modern history). This appears to have been begun after the death of Henry I. 3, 'De Gestis Pontificum' (the history of the popes of England), containing, in four books, an account of the bishops and of the principal monasteries, from the conversion of the English by St. Austin to 1123, to which he added a fifth, that is, 4, 'De Vita Aldhelmi,' completed in 1125; 5, 'De Vita Dunstani,' in two books, extant in the Bodleian Library, MS. Rawlinson, 263, written at the request of the monks of Glastonbury; 6, 'Vita S. Patricii,' in two books, quoted by Leland in his 'Collectanea,' tom. iii., p. 273, but of which no manuscript is at present known, any more than of, 7, 'Vita S. Benigni;' 8, 'Passio S. Indracti,' MS., Bodley, Digby, 112; 9, 'De Antiquitate Glastoniensis Ecclesie,' addressed to Henry, bishop of Winchester, and of course written after 1129; 10, 'Vita S. Wulstani, Episcopi Wigorniensis,' a translation from the Anglo-Saxon, the greater part of which is published by Wharton in his 'Anglia Sacra;' 11, 'Chronica,' in three books, supposed to be lost; 12, 'Miracula S. Eligie,' in metre; 13, 'Itinerarium Joannis Abbatis Meldunensis versus Romam,' drawn up after 1140, a manuscript of which was formerly in the possession of Bale; 14, 'Expositio Threnorum Hieremie,' MS., Bodley, 868; 15, 'De Miraculis Divæ Mariæ libri quatuor,' noticed by Leland in his 'Collectanea,' tom. iv., p. 155; 16, 'De Serie Evangelistarum,' in verse. This also is mentioned by Leland (*ibid.*, p. 157), but neither this nor the preceding work is at present in our manuscript libraries. 17, 'De Miraculis B. Andrea,' MS., Cotton, Nero E. i.; 18, 'Abbreviatio Amalarii de Ecclesiasticis Officiis,' MS., Lambeth, 380; 19, 'Epitome Historie Aimonis Floriacensis,' MS., Bodley, Selden, Arch., B. 32. This work contains an extract from the 'Breviarium Alaricianum,' or Visigoth Code, made by the author with the object of giving a view of the Roman law. (Selden, 'Ad Fictam,' c. 7, § 2.) 20, 'De Diotis et Factis memorabilibus Philocephorum,' Harl. MS. 3969. Tanner ascribes one or two other pieces to him.

William of Malmesbury's greater historical works, 'De Gestis Regum,' 'Novella,' and 'De Gestis Pontificum,' were published by Sir Henry Savile among the 'Scriptores post Bedam,' fol. 1596, reprinted, fol., Francof., 1601; but a far superior edition of the 'De Gestis Regum,' and the 'Historia Novella,' is that printed by the English Historical Society under the editorial care of Mr. T. Duffus Hardy, 2 vols. 8vo, 1840. A translation of the 'De Gestis Regum,' into English, by the Rev. John Sharpe, was published in 4to, London, 1815; and reprinted, with some alterations, as a volume of 'Bohn's Antiquarian Library,' under the care of Dr. Giles, 1847. Gale printed Malmesbury's

'Antiquities of Glastonbury,' and Wharton, as already noticed, published his 'Life of St. Wulstan.'

An excellent feature of Malmesbury's literary character is his love of truth. He repeatedly declares that for the remoter periods of his historical works he had observed the greatest caution in throwing all responsibility for the facts on the authors from whom he derived them; and as to his own times, he declares that he has recorded nothing that he had not either personally witnessed or learned from the most credible authority.

(Leland, *De Script. Brit.*; Tanner, *Bibl. Brit. Hib.*, pp. 359-360; Nicolson, *English Histor. Lib.*, edit. 1776, pp. 47 84-88; J. A. Fabricii, *Bibl. Lat. med. et inf. etatis*, 4to, Patav., 1754, tom. iii., p. 152; Sharpe, *Pref.* to his translation of William of Malmesbury, *De Gestis Regum*; Hardy, *Pref.* to *De Gestis Regum*; Wright, *Biog. Brit. Lit., Ang. Norman Period.*; Hardy, *Desc. Cat. of Materials of Hist. of Great Britain.*

MALMESBURY, JAMES HARRIS, FIRST EARL OF, was the only son of James Harris, the author of 'Hermes' [HARRIS, JAMES], and he was born at Salisbury on the 21st of April 1748, the day of the battle of Culloden. After having been put in the first instance to the grammar-school of his native town, the subject of this notice was sent to Winchester, where he remained till September 1762. His father, who was by this time in office, now kept him with him in London for above six months, and then sent him to Merton College, Oxford. In a letter written in his advanced years he expresses himself as unable to decide whether his father did right or wrong in introducing him to society before he was sent to the university; and he professes to look back upon the years he passed at Merton as the most unprofitably spent of his life, yet he appears to have by no means altogether neglected study amid the then prevailing idleness and dissipation of the place.

On leaving Oxford in 1765 he was sent for a year to study at Leyden, and there at least he seems to have made excellent use of his time, spending many hours daily among his books, while he also mixed much in society. He then, after being eight months at home, set out in 1767 on a short continental tour, in the course of which he visited Holland, Prussia, Poland, and Paris; and in the autumn of the same year he was, through the patronage of Lord Shelburne, his father's colleague and friend, appointed secretary of embassy at Madrid, and thus entered public life at the age of one-and-twenty.

Three years after, the affair of the Falkland Islands occurred, when he chanced to have been left at Madrid as chargé d'affaires, and, acting upon his own responsibility, he had the good fortune very quickly to bring the Spanish government to concede the object in dispute. The Falkland Islands, the acknowledgment of our right to which was thus obtained from Spain, were given up by England four years after; but the temper and firmness, as well as talent, with which Harris had managed his successful negotiation, gave so much satisfaction to his government that he was the following year appointed to the post of minister at the court of Berlin. He retained this mission for four years, and then returning to England in 1776, married Harriet Mary, second daughter of Sir George Amyand Cornwall. In 1777 he was sent as ambassador to St. Petersburg, and, having in the meantime received the Order of the Bath in 1780, he remained in Russia till his health compelled him to return home in 1784. He had ever since 1770, notwithstanding his being abroad, held a seat in the House of Commons as member for Christchurch, and had, like most of Lord Shelburne's friends and connections, attached himself to the party of Mr. Fox. When Fox however was now superseded in the direction of affairs by Pitt, the latter at once offered Sir James Harris the post of minister at the Hague, to which it had been intended that he should have been appointed if the Fox and North administration had remained in power; and he accepted it with the full approbation of Mr. Fox. While at the Hague he succeeded in negotiating, in April 1788, the treaties of alliance with Holland and with Prussia, by which the power of the stadtholder was at that time preserved from being overthrown by the democratic party, and Holland in all probability rescued from the grasp of France. For this great service, as it was considered, Sir James was, in September of the same year, raised to the peerage as Baron Malmesbury.

He now, after a short visit to Switzerland, returned to England. He continued to act with the Whig party in parliament till 1793, when he formed one of the large body of the friends of Mr. Fox who went over to ministers with Burke and the Duke of Portland. Lord Malmesbury was now sent over by Mr. Pitt on a mission to Berlin, where he prevailed upon the new King of Prussia to enter into a second alliance with England and Holland, which however did not last for quite two years. In 1794 he was employed to negotiate the marriage between the Prince of Wales and Caroline, the daughter of the Duke of Brunswick; and, after having gone through the ceremony of marrying her Royal Highness by proxy, he accompanied her to England. His published 'Diary' relates many curious particulars respecting this affair, the issue of which was hardly more unhappy than he had anticipated that in all probability it would be; but his directions left him no discretionary power whatever. It is stated however that he was never forgiven for the part he acted by the prince, "with whom until then he had been on terms of great intimacy and confidence."

His last missions were those on which he was sent in 1796 and

1797 to Paris and Lisle, to negotiate a peace with the French republic, and which were attended with no result. He was then attacked by a deafness which, in his own opinion, unfitted him for being again employed on any foreign service of importance. In 1800 he was created Earl of Malmesbury and Viscount Fitzharris. He died at his house in Hill-street, London, on the 20th of November 1820, leaving a son, who succeeded him in the title, and three daughters.

Lord Malmesbury was without doubt one of the very ablest diplomatists of his time, and a man of great general talent. Talleyrand said of him, in a phrase the point of which cannot be preserved in a translation, "Si on lui laissait le dernier mot, il avait toujours raison." And he was equally noted for readiness and spirit in his ordinary conversation as when acting in his diplomatic capacity.

A very favourable impression also of his good sense and general right-mindedness is made by his 'Diaries and Correspondence,' which have been edited by his grandson, the present earl, in 4 vols. 8vo, Lond., 1844, and which besides throw much valuable illustration upon many of the events and transactions of the important period in which it was his fortune to live and act. The materials of the present article have been mostly abstracted from the Memoir prefixed to that publication.

\* MALMESBURY, JAMES HOWARD HARRIS, THIRD EARL OF, grandson of the preceding, was born in 1807, and received his education at Eton, and at Oriel College, Oxford. He entered public life in 1841 as member for Wilton, but the death of his father almost immediately translated him to the House of Lords. He had not been either a frequent speaker or active politician when the Earl of Derby, on his accession to office in February 1852, appointed him Secretary of State for Foreign Affairs. In this capacity he showed considerable ability, and his conciliatory conduct tended much to confirm the alliance with the Emperor of the French, which has had such important results on European policy, and more especially in uniting the Western powers against Russian aggression. At the close of the late war with Russia, Lord Malmesbury in his place as a Peer of Parliament severely criticised the peace which was concluded at Paris in March 1856 under the auspices of the Earl of Clarendon. Lord Malmesbury is favourably known in the literary world as the editor of the 'Diaries and Official Correspondence' of his grandfather, the first Earl.

MALONE, EDMOND, was born at Dublin in 1741. His father was one of the judges of the Court of Common Pleas in Ireland; and the subject of this notice, having taken a degree in the University of Dublin, was called to the Irish bar in 1767. Mr. Malone was however devoted to literary pursuits; and an independent fortune having devolved upon him, he took up his residence in London, and became an intimate of the more eminent literary men of that day, including Burke and Johnson. He subsequently became distinguished, principally as an editor of Shakspeare. His first publication, connected with this his favourite subject, was that of a 'Supplement' to Steevens's edition of 1778, in 2 vols. This contains Shakspeare's sonnets and other poems, with notes, and the various plays which by general consent have been rejected from his works—we mean 'Sir John Oldcastle,' 'Loocrine,' &c. It also includes 'Pericles,' which has subsequently found a place in the variorum editions. Malone displayed in this work many qualities which in some degree fitted him to be an editor of Shakspeare's undoubted works, and in 1790 he brought out an edition of his own. He had previously contributed some notes to Steevens's edition of 1785. There were essential differences of opinion between Steevens and Malone, which would have rendered their co-operation perhaps impossible. Steevens carried his disregard of the authority of the texts of the old editions to an extravagant length; Malone, on the contrary, had a proper deference for that authority. Steevens, especially, despised the text of the first folio; Malone, in a much greater degree, respected it: Steevens was coarse and even purring in his editorial remarks; Malone was cautious and inoffensive: Steevens had the more acuteness; Malone the greater common sense. As it was, Malone published a rival edition, and Steevens quarrelled with him for ever. In Malone's edition, his 'History of the Stage' was, for the time at which it was written, a remarkable performance; and his 'Essay on the Genuineness of the Three Plays of Henry VI.' displays great critical sagacity and discrimination. The same qualifications which he exercised as an editor of Shakspeare were equally exhibited in the part which he took in the controversies as to the genuineness of the Rowley poems, and the Shaksperian papers published by the Irelanders. He was amongst the first to proclaim his belief that the poems attributed to Rowley were the production of Chatterton; and the imposition of William Henry Ireland was very clearly pointed out by him in a letter addressed to Lord Charlemont. This tract contains many interesting researches into our earlier literature, and is worth referring to, amidst the mass of nonsense which this controversy called forth. Malone also published in 1797 the posthumous edition of the works of Sir Joshua Reynolds, with a memoir, he being one of that eminent man's executors. The remainder of his life was spent in adding to his notes on Shakspeare, and preparing for a new edition, which he did not live to complete. He died May the 25th, 1812, when he was in his seventy-first year. His posthumous edition of Shakspeare, very carefully edited, was published by his friend Mr. James Boswell, in 1821, in 21 vols.

Of Malone it is not perhaps very high praise to say, that he was

without doubt the best of the commentators on Shakspeare. He is, compared with his predecessors, more trustworthy in his assertions, more cautious in his opinions, and more careful to interpret what he found in the text than to substitute his own conjectures. But he belonged to an age when the merits of Shakspeare were not properly appreciated; and he is, like the rest of his brethren, cold and captious. He was of a critical school which, to a great extent, is fortunately extinct.

MALPIGHI, MARCELLUS, was born near Bologna in 1628. He studied medicine in that university, and in 1653 received his doctor's degree. His chief instructor in anatomy was Massari, at whose house he tells us that he and a few other select students were accustomed to meet in private to dissect and discuss the important discoveries of the day. In 1656 he was appointed professor of medicine at Bologna, but soon after resigned on being invited to a similar office in the University of Pisa. Here he formed an intimate acquaintance with Borelli, the professor of mathematics in the same institution, to whom he often expresses his gratitude for the kindness and instruction which he received from him, though he doubtless repaid no small part of his obligations in the assistance which he gave to the valuable treatise 'De Motu Animalium.' Declining health obliged Malpighi to return to Bologna, but in 1668 he went to Messina, where he held the professorship of medicine for four years. He then again resided near Bologna till 1691, when he was summoned to Rome, and appointed chief physician and chamberlain to Innocent XII. In 1694 he died of apoplexy.

Malpighi is now chiefly remembered in connection with his discoveries in the anatomy of the skin and of the secreting glands. He first described clearly the structure of the tongue, showing that it is at once a muscular and a sensitive organ; and he pointed out the fine papillæ on its surface as the seat of sensation. Imagining that he could perceive a structure in the skin analogous to that of the surface of the tongue, he examined the former tissue in several animals, and at length succeeded in demonstrating that it is everywhere beset with delicate conical papillæ, the chief organs of the touch. In the coloured portion of the tongue of the ox he had first discovered the rete mucosum, or, as it is often called in his honour, rete Malpighii; and he afterwards showed a similar membrane on the skin of the negro. He proved, as Riolan had before done, that the colour of the skin depends on this substance, the cutis of white and of coloured races being always of the same rosy hue. [SKIN, in NATURAL HISTORY DIVISION, vol. iii. col. 832.]

On the subject of the structure of secreting glands, Malpighi was long engaged in a discussion with Ruysch, maintaining that all glands consisted of ducts terminating in minute sacculi, on which blood-vessels ramified without having any open communication with them; while Ruysch held that the blood-vessels were continued directly and with open orifices into the ducts of the glands. The point was still debated when Müller's work, 'De Glandularum Structura,' proved that Malpighi, though incorrect in some details, was perfectly correct in the general view which he had taken of this structure.

Malpighi was the first who examined the circulation with the microscope. He published also some excellent observations on the chemical and other characters of the blood; and his works on the process of incubation, and on the structure and physiology of plants, though now almost forgotten, must have been very important additions to the knowledge of his day.

Several editions were published both of his separate treatises and of his complete works. The titles of the most important are:—'Anatomies Plantarum Idea,' 'De Bombyce,' 'De Formatione Pulli in Ovo,' 'De Cerebro,' 'De Lingua,' 'De externo Tacitæ Organo,' 'De Omento,' 'De Structurâ Viscerum,' 'De Pulmonibus,' 'De Structurâ Glandularum Conglobatarum.' The 'Opera Posthuma' were edited by Petrus Regis of Montpellier; they consist chiefly of a history of his discoveries and controversies, with which he has interwoven his own biography. Several of Malpighi's best works were addressed to the Royal Society of London, of which he was elected an honorary member in 1688, and was afterwards a constant correspondent.

MALTHUS, REV. THOMAS ROBERT, was born in 1766, at the Rookery, a small but beautiful estate in the county of Surrey, in the neighbourhood of Guildford and Dorking. His father, Daniel Malthus, was a gentleman of good family and independent fortune, attached to a country life, of retired habits, and devoted to literary and philosophic pursuits. He was the author of several works, published anonymously, which met with considerable success. Thomas Robert Malthus, who was his second son, was never sent to any public school except to the academy at Warrington, and that for a very short time. Besides the instruction which he received from his father, he was for some time under the private tuition of Robert Graves, author of the 'Spiritual Quixote,' whose house however he left when young, and was afterwards instructed by Gilbert Wakefield, with whom he remained till 1784, when he was admitted of Jesus College, Cambridge. He took the degree of B.A. in 1788, and that of M.A. in 1797, when he was made a Fellow of his college. Having taken orders about the same time, he undertook the care of a small parish in Surrey, near his father's house, but he occasionally resided at Cambridge, in order to pursue his favourite course of study with more advantage.

Mr. Malthus, about the year 1797, wrote a pamphlet called 'The Crisis,' which however at the request of his father he did not publish. It was directed against the government of Mr. Pitt in general as well as against certain specific measures connected with the poor laws. In 1798 he published 'An Essay on the Principle of Population, as it affects the future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and other Writers.' The book excited considerable attention; but finding that his facts and illustrations were imperfect, in 1799 he went abroad in search of materials to establish his theory more completely. He sailed for Hamburg in company with three other members of his college, Dr. Edward Clarke, Mr. Cripps, and Mr. Otter. In Sweden the party separated, when Dr. Clarke and Mr. Cripps proceeded to the north, and Mr. Malthus and Mr. Otter journeyed leisurely through Sweden, Norway, Finland, and part of Russia, and then returned to England. During the short peace of 1802 Mr. Malthus travelled through France and Switzerland with some of his relations, observing whatever was curious in nature or art, but especially examining into the state of the people, and collecting materials for the improvement of his work. In 1803 he published a new edition of his 'Essay on the Principle of Population,' with the omission of the controversial parts, but much enlarged in what related to the general subject. A third and fourth edition appeared a few years afterwards. The fifth edition, containing several additional chapters, was published in 1817. The sixth, which contained few alterations, was published in 1826.

The title of the work as it at present stands is as follows:—'An Essay on the Principle of Population, or a View of its past and present Effects on Human Happiness, with an Inquiry into our prospects respecting the future removal or mitigation of the evils which it occasions.' The following is a brief summary of its leading principles:—Mr. Malthus's propositions are—that population, when unchecked, goes on doubling itself every twenty-five years, or increases in a geometrical ratio; while the means of subsistence, under the most favourable circumstances, could not be made to increase faster than in an arithmetical ratio. That is, the human species may increase as the numbers 1, 2, 4, 8, 16, 32; while the increase of food would only proceed in the following ratio, 1, 2, 3, 4, 5, 6. Thus if all the fertile land of a country is occupied, the yearly increase of produce must depend upon improved means of cultivation; and neither science nor capital applied to land could create an increased amount of produce beyond a certain limit. But the increase of population would ever go on with unabated vigour, if food could be obtained, and a population of twenty millions would possess as much the inherent power of doubling itself as a population of twenty thousand. Population however cannot increase beyond the lowest nourishment capable of supporting life; and therefore the difficulty of obtaining food forms the primary check on the increase of population, although it does not usually present itself as the immediate check, but operates upon mankind in the various forms of misery or the fear of misery. The immediate check may be either *preventive* or *positive*; the former being such as reason and reflection impose, and the latter consisting of every form by which vice and misery shorten human life. Thus a man may restrain the dictates of nature which direct him to an early attachment for one woman, from the fear of being unable to preserve his children from poverty, or of not having it in his power to bestow upon them the same advantages of education which he had himself enjoyed. Such a restraint may be practised for a temporary period or through life, and though it is a deduction from the sum of human happiness, the evil is not to be compared in extent with that which results from the positive checks to population, namely, unwholesome occupations, severe labour, and exposure to the seasons, extreme poverty, bad nursing of children, excesses of all kinds, the whole train of common diseases and epidemics, wars, plagues, and famines.

The preventive and the positive checks which form the obstacles to the increase of population are resolved into, 1, moral restraint; 2, vice; and 3, misery. *Moral restraint* (considered as one of the checks to population for the first time in the second edition, 1803) is the prudential restraint from marriage, with a conduct strictly moral during the period of this restraint. Promiscuous intercourse, unnatural passions, violation of the marriage bed, and improper arts to conceal the consequences of irregular connections, are included under the head of *Vice*. Those positive checks which appear to arise unavoidably from the laws of nature may be called exclusively *Misery*. Such are the checks which repress the superior power of population, and keep it on a level with the means of subsistence.

Perhaps no author has been more exposed to vulgar abuse and misconception than was Mr. Malthus on account of this work. He was accused of hardness of heart, and represented as the enemy of the poorer classes, whereas no man was more benevolent in his views; and the earnestness with which he engaged in his work 'On Population' arose from his desire to diminish the evils of poverty to their lowest possible amount. His mind was philosophic, practical, and sagacious; his habits, manners, and tastes, simple and unassuming; his whole character gentle and placid.

—In 1805 Mr. Malthus married Harriet, eldest daughter of Mr. Ekersall, and was soon afterwards appointed Professor of Modern History and Political Economy at the East India College at Haileybury, in Hertfordshire, which situation he held till his death. He attended to his

professional duties, preached regularly in his turn in the college chapel, and enjoyed the society of his family and friends. He was taken ill suddenly, when apparently in strong health, while on a visit to his father-in-law Mr. Eckersall, at Bath, where he died December 29, 1834. He left a widow and a son and daughter.

When a boy, and while at Cambridge, Malthus displayed a great love of fighting for fighting's sake, a keen perception of the ludicrous, much relish for wit and humour, and considerable comic power of imitation; but his character gradually changed: he retained indeed his cheerfulness and playfulness, but he became placid, temperate, patient, and forbearing under the obloquy which was heaped upon him. His manners were kind and gentle, his conversation mild but earnest and impressive, his deportment gentlemanly. In politics he was a Whig and a decided advocate of all salutary reforms, but strongly attached to the institutions of his country, and fearful of all imperfectly considered changes and innovations.

The following is a list of his works in the order in which they were published:—

1, 'An Essay on the Principle of Population, as it affects the future Improvement of Society; with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and other Writers.' Anonymous, London, 8vo, 1798. 2, 'An Investigation on the cause of the present high Price of Provisions, containing an Illustration of the Nature and Limits of Fair Price in Time of Scarcity, and its Application to the particular State of this Country,' 8vo, 1800. 3, 'An Essay on the Principle of Population; or a View of its past and present Effects on human Happiness; with an Inquiry into our Prospects respecting the future Removal or Mitigation of the Evils which it occasions.' New edition, 4to, 1803. 4, 'A Letter to Samuel Whitbread, on his proposed Bill for the Amendment of the Poor Laws,' 8vo, 1807. 5, 'A Letter to Lord Grenville, occasioned by some Observations of his Lordship on the East India Company's Establishment for the Education of their Civil Servants,' 8vo, 1813. 6, 'Observations on the Effects of the Corn Laws, and of a Rise or Fall in the Price of Corn on the Agriculture and general Wealth of the Country,' 8vo, 1814. 7, 'The Grounds of an Opinion on the Policy of restricting the Importation of Foreign Corn;' intended as an appendix to the 'Observations on the Corn Laws,' 8vo, 1815. 8, 'An Inquiry into the Nature and Progress of Rent, and the Principles by which it is regulated,' 8vo, 1815. This, next to the 'Essay on Population,' is Malthus's most important work, and that which has had most influence on opinion. 9, 'Statements respecting the East India College, with an Appeal to Facts in Refutation of the Charges lately brought against it by the Court of Proprietors,' 8vo, 1817. 10, 'Principles of Political Economy, considered with a View to their Practical Application,' 8vo, 1820. 11, 'The Measure of Value stated and illustrated; with an Application of it to the Alteration of the Value of the English Currency since 1790,' 8vo, 1823. 12, 'Definitions in Political Economy, preceded by an Inquiry into the Rules which ought to guide Political Economists in the Definition and Use of their Terms,' 8vo, 1827. 13, 'A Summary View of the Principle of Population,' 1830. (From the 'Supplement to the Encyclopædia Britannica'.)

(*Memoir of Malthus* by Dr. Otter, late Bishop of Chichester, prefixed to the 'Principles of Political Economy'.)

MALUS, ÉTIENNE LOUIS, a distinguished philosopher and military engineer, was born at Paris, June 23rd 1775. He received his first lessons under the eyes of his father, Anne Louis Malus of Mitry; and, in early youth, his time appears to have been nearly equally divided between classical and mathematical studies. This judicious combination of the two great branches of education had the happiest effect in expanding the mind of the pupil. His memory was very retentive, and it is said that, even near the close of his life, he could repeat several passages of the 'Iliad' of considerable length. His early taste for classical literature is shown by the fact that, when seventeen years of age, he had written a tragedy entitled 'The Death of Cato;' but subsequently his studies were almost exclusively of a scientific character.

At the time that the tragedy is said to have been written, young Malus was, after a strict examination, in which he acquitted himself to the satisfaction of the persons in authority, admitted as a pupil in the École du Génie Militaire, it being the intention of his father that he should enter into that branch of the public service; and he is said to have immediately distinguished himself by his diligence and his scientific talents. From some cause however which is not explained, but probably because his father, who held the post of Treasurer of France, had become suspected by the government (the great revolution having commenced), he was dismissed from the Institution; and either from choice or compulsion, he entered the army as a private soldier. He was for a short time employed in that capacity, with the battalion to which he was attached, in repairing the fortifications of Dunkirk. But on the termination of the reign of terror, the government having decided upon the formation of the École Polytechnique, inquiry was made for a certain number of young men, who, having completed the usual course of education, might be the first to receive instruction in the higher branches of science; and it is recorded to the honour of M. Le Père, the commandant of the engineers at Dunkirk, that, knowing the great talents of the young soldier, he withdrew him immediately from the ranks and sent him to Paris with a

recommendation to the celebrated Monge. Malus was immediately admitted, and was joined in a class, with about twenty other persons to attend a course of instruction in mathematics, physics, and engineering. During three years he prosecuted his studies with extraordinary ardour, and distinguished himself by his applications of analysis to the solutions of some intricate propositions; he is said also to have occasionally delivered lectures on mathematical subjects. It is added that he then commenced those researches concerning the properties of light, which prepared the way for his subsequent discoveries in optics; and his first step in this brilliant career consisted in investigating the path of a ray of light after being reflected from or refracted into a medium having a surface of any form.

On quitting the École Polytechnique, Malus was for a time employed as a professor of mathematics in the military school at Metz; but the smallness of his fortune, his family having suffered great losses during the revolution, and perhaps an inclination in favour of a more active life, induced him to abandon the project which he at one time entertained of devoting himself entirely to the sciences. He therefore entered the corps of engineers with the rank of captain; and, in 1797, he was sent to join the Army of the Sambre and Meuse. He accompanied that army across the Rhine, and was present at the actions of Ukratz and Altenkirk.

At the termination of the campaign Malus went to Paris, and, in the following year, he embarked with the expedition to Egypt under Bonaparte. He was engaged in the battle of the Pyramids and in the affair of Chebrees: he was also employed as an engineer at the sieges of El Arish and Jaffa; and, after the taking of the latter place, he was appointed to superintend the repair of its fortifications. While performing this duty he fell ill of the plague, and lay for some time in the military hospital which he had assisted to form: he recovered however with little aid from medicine, and he was almost immediately sent to fortify Damietta. He was afterwards engaged in the action with the Turkish forces which landed at Aboukir; he was also at the battle of Heliopolis, at the affair of Coraim, and at the surrender of Cairo.

When the Institute was founded in that city, he was appointed one of its members; and in the first volume of the 'Décade Egyptienne' there is an account of an excursion which he made far into the country, with his discovery of a branch of the Nile which had not before been noticed. Malus continued in Egypt till the remains of the French army capitulated, when, in 1801, he returned to his native country in an English vessel. Exhausted by the arduous services in which he had been engaged, and with his health nearly ruined, he yet performed the duties of an officer of engineers, having, in 1804, been appointed by the government to superintend the construction of the works which were being added to the fortifications of Antwerp. He had then the title of sub-director of fortifications, and he was made a member of the Legion of Honour. Five years afterwards he was appointed superintendent of barracks in the department of the Seine; and in the following year, 1810, he was made a member of the Committee of Fortifications and Lieutenant-Colonel of Engineers.

Almost immediately on his return to France, Malus married a daughter of Kœch, the Chancellor of the University of Giessen, to whom he became attached before his departure for Egypt; and, during the rest of his life, all the time he could spare from his professional avocations was spent in the cultivation of the sciences, particularly in the continuation of those optical investigations which he had commenced at the École Polytechnique. His first published work was entitled 'Traité d'Optique,' in which he treated the phenomena of the reflection and refraction of light as they were then known; and he particularly distinguished himself by his experiments and researches concerning the reflection of light in transparent media. It was known that when a pencil of light has entered into glass at a considerable angle of incidence, the internal reflection takes place either before it arrives at the posterior surface, or at a certain distance from that surface on the exterior; but it had been found impossible to determine, though an inequality in the angles of reflection in the two cases was manifest, to which of the cases either of the observed reflections should be referred. Malus overcame this difficulty by applying successively to the surface an opaque medium, which, by preventing the reflection of the emergent rays, proved that the observed reflection had taken place within the glass, and a transparent medium, which, by permitting the rays to pass quite through the glass, afforded a reflection from the exterior of the latter.

The subject of double refraction in crystals was very imperfectly known, when, in 1808, the Institute of France offered a premium for the best Mémoire on the subject; and Malus immediately entered with ardour into this field of research. It was while prosecuting his experiments that there occurred to him one of those fortunate accidents which only men of genius have the power of rendering available as steps to great discoveries. He then resided at Paris, and, happening one day to direct a prism of crystal which he held in his hand to one of the windows of the Luxembourg palace, on which there was a brilliant light produced by the reflected rays of the setting sun, he was surprised to find that, while turning the crystal round, one of the images produced by the double refraction in it varied in intensity, and alternately appeared and disappeared. As such phenomena had not been observed when the prism was directed to any other bright object,

as the flame of a candle, Malus was for a time at a loss to divine the cause; but after making several observations on the light from the same windows, he ascertained that the effect was produced only when it fell on them at a particular angle of incidence, which he determined from the known position of the sun with respect to the surface of the building.

In the prosecution of the researches to which this interesting discovery gave rise, Malus found that when a pencil of light is reflected from unquicksilvered glass at an angle of incidence equal to  $54^{\circ} 35'$ , or from the surface of water at an angle equal to  $52^{\circ} 44'$ , the reflected light possessed the same properties as were exhibited by one of the pencils produced by double refraction in a crystal. He observed also that when the pencil reflected from a transparent medium, at a certain angle of incidence, is made to fall on another such medium at a certain angle of incidence; if the plane of the second reflection is coincident with the plane of the first, the light is reflected as usual; but if the planes are at right angles to one another, no reflection takes place at the second surface, the pencils of light being wholly refracted.

To the effect produced on light so reflected, Malus gave the name of polarisation; conceiving that the particles of light have poles or axes, and that, on entering the doubly refracting crystal, those which form one of the pencils may arrange themselves so as to be capable of being transmitted through it, while those which should have formed the other ray may have such dispositions as prevent the passage, in certain directions, from being effected.

These phenomena may be said to have laid the foundation of a new branch of physical optics; and an account of them is given in the 'Mémoires de la Société d'Arcueil,' as well as in the 'Mémoires' of the French Institute. Of this learned body Malus was immediately elected a member; and, in 1811, though, on account of the war, there was scarcely any intercourse between Great Britain and France, the Royal Society of London awarded him the Rumford medal; thus performing a noble act of homage to scientific merit in the person of a foreigner, and one who carried arms among the enemies of the country.

In 1810 Malus published at Paris his 'Théorie de la Double Refraction de la Lumière dans les Substances cristallisées;' and in the following year he presented two papers to the Institute on some remarkable phenomena of polarised light. In the first of these it is shown that when a pencil, after being polarised by reflection, falls on glass, part of it is reflected and part transmitted; the reflected part is wholly polarised in one direction, while the transmitted part consists of two portions, in one of which the particles preserve the character of direct light, and in the other the light is polarised in a direction contrary to that of the reflected pencil: it is added that the portion which has the character of direct light diminishes gradually by transmission through several plates of glass successively; and at length the whole of the transmitted ray becomes polarised in a direction contrary to that of the reflected pencil. In the second paper it is shown that all polished bodies, opaque and transparent, polarise light by reflection; and that, in different bodies, the polarisation takes place with different angles of incidence. Polished metals however resisted for a time the efforts of Malus to produce the phenomena of polarised light; but, at length, by a particular disposition of the reflecting surface, he succeeded in exhibiting them: he discovered that the pencils reflected from polished metals are polarised in opposite directions, while those which are reflected from transparent bodies are polarised in one direction only. He observed the modifications which parts of organised bodies, whether animal or vegetable, produce on light when they are thin enough to transmit the polarised pencil through them; and he noticed the coloured and multiplied images which are sometimes seen in Iceland spar. He ascribed these images to the effects of fissures parallel to the longer diagonal of the crystal rhomboid; but Sir David Brewster has since ascertained that they arise from veins which act upon the transmitted light at both of their surfaces.

During the short remainder of his life, Malus continued his scientific researches amidst all the duties which his post as a member of the Committee of Fortifications required. He was chosen Examiner in Physics and Descriptive Geometry at the École Polytechnique; and though his health was fast declining, he neglected no occasion of performing the functions of that office. He was on the point of being made Director of the Studies in that Institution when he was removed by death from the scene of his useful labours.

He died in Paris, February 23rd, 1812, in the thirty-seventh year of his age; and his wife who, ever since their union, had alleviated his labours by her attentions, and watched him in his last days with affectionate solicitude, survived him but two years.

Malus enjoyed the esteem of the public for the qualities of his mind, and was beloved by all who knew him for the benevolence of his character.

(*Eloge de Malus*, by Delambre; *Biographie Universelle*.)

MALVOISINE, WILLIAM DE. [MALVOISINE.]

MAMUN, ABUL ABBAS ABDALLAH, the seventh Abbaaside caliph, was born at Baghdad in 786. He was entrusted, during the life of his father, the celebrated Harun al Raschid, with the government of Khorassan; but on the death of Al Raschid in 808, and the succession of his brother Amin, Mamun was deprived of this government,

and commanded to repair to Baghdad. But as such a step would doubtless have been followed by his death, Mamun disobeyed the orders of the caliph, and proclaimed war against him. The contest was carried on till 818, when Baghdad was taken by Thaher and Harthemah, the generals of Mamun, and Amin put to death.

The early part of Mamun's reign was greatly disturbed by the pretensions of the descendants of Ali, the cousin of Mohammed. [ALI.] Mamun, in order to restore peace to his empire, named one of the princes of the house of Ali as his successor, and commanded that the black colour, which distinguished the Abbasides, should be discontinued at the court, and replaced by the green, which was worn by the descendants of the prophet. This step however occasioned a revolution in the government; the Abbasides rose against their caliph and proclaimed in his stead Ibrahim, the son of Mahadi. After the end of two years, Mamun obtained the caliphate again, and, taught by experience, restored the black colour of the Abbasides, and named his brother as his successor. The partisans of the Alides again rebelled against Mamun, but were unable to obtain any advantages over him. In addition to these wars Mamun was also engaged, during part of his reign, by the revolt of the son of Harthemah in Armenia, and by that of Thaher in Persia.

In 830 Mamun engaged in a war with Theophilus, the emperor of Constantinople, which is said to have arisen from the refusal of the emperor to allow Leon, a celebrated teacher at Constantinople, to repair to Baghdad, whither he had been invited by the caliph. The war was carried on, principally in Cilicia, during three successive campaigns; at the close of which Mamun died in the vicinity of Tarsus in 833, and was succeeded by his brother Motasem.

Although the reign of Mamun was disturbed by so many wars and intestine commotions, yet science and literature were more extensively cultivated than under any preceding caliph. Mamun was a munificent patron of literature; he founded colleges and libraries in the principal towns of his dominions, and invited to his court not only Greek and Syrian, but also Hindu philosophers and mathematicians. Many of the most celebrated Greek and Hindu works were translated into Arabic by his command; and among other works written during this time, we may mention an 'Elementary Treatise on Algebra,' by Mohammed ben Musa, which was published with a translation by the late Dr. Rosen. [ABBASIDES.]

MANASSEH, King of Judah, was the son of Hezekiah, whom he succeeded in B.C. 690, when only twelve years of age. He abandoned the faith of his father, and became a zealous idolater, setting up an idol in the Temple, and causing his children to pass through fire as a mark of their consecration to Baal. He is said to have practised witchcraft, and gathered wizards around him. Prophets in vain endeavoured to recall king and people from their vile practices, and "innocent blood filled Jerusalem from one end to the other." After a long continuance in this course, Esar-haddon, the king of Assyria, invaded Judah, captured Jerusalem, and carried Manasseh in chains to Babylon, where he endured a long captivity. In his seclusion he repented of his sins, humbled himself, and prayed to God for deliverance. His prayer is said, in 2 Chronicles xxxiii. 19, to be "written among the sayings of the seers;" and a prayer exists, translated from the Greek, which is given at the end of Chronicles, in the edition of the Bible by Christopher Barker in 1589, and is now printed in the Apocrypha. Esar-haddon at length released his captive, and restored him to his kingdom, but rendered him tributary. Manasseh had become wiser from affliction; as Father Southwell, the Jesuit, has expressed it in his poems—

"King Manasses, sunk in depth of sin,  
With plaints and tears recover'd grace and crown."

On his return to his kingdom he restored the worship of the true God, repaired the altars, rebuilt the walls of Jerusalem, and garrisoned all his 'fenced cities.' He was unable however to reclaim his people, many of whom had been carried away with himself by Esar-haddon, and their places filled by Assyrians. He died in A.C. 641, and was succeeded by his son Amon. It may be noticed that Manasseh is the only one of the kings of Judah or Israel that bore the name of the founder of a tribe, and none bore that of any of the old patriarchs.

MANBY, CAPTAIN GEORGE WILLIAM, the author of several inventions applied to the saving of life in shipwreck, was born at Hilgay in Norfolk, on November 28th, 1765, and died at his residence Pedestal House, Southtown, near Great Yarmouth, on November 18, 1854, thus having nearly completed his eighty-ninth year. He adopted the military profession, but appears to have retired from any active duty after he had attained the rank of captain in 1803, when however he was appointed barrack-master at Great Yarmouth. Here in February 1807 occurred the loss of the Snipe gun-brig, when he saw sixty-seven persons drowned within a few yards of the beach; and, in the same gale, so many other disasters occurred that one hundred and forty-seven dead bodies were cast upon a line of coast of about thirty miles in extent. Such calamities induced him to devise means of assistance by throwing a line over the vessel. This was at first proposed to be done by a ballista; but a successful experiment with a small mortar, when he threw a line over a church led him to prefer the use of gunpowder. The great difficulty to be overcome was as to the connection of the shot with the rope. Chains

broke on the discharge. At length, after repeated trials, stout strips of raw hide closely plaited, were found to answer, and on the 12th of February 1808, when the crew of the brig Elizabeth were in imminent danger, about one hundred and fifty yards from the beach, having lashed themselves to the rigging with the sea breaking over them, and in what would have been a hopeless position, Captain Manby threw a line over the vessel, a boat was hauled off by it, and the crew of seven men were brought to land. In the same severe winter Captain Manby rescued the crews of several vessels by similar means. In 1810 his services were brought before the House of Commons. A committee was then appointed on the subject of saving of life in shipwreck. The merits of previous inventions for the same object were brought before that committee, especially by the friends of Lieutenant Bell of the Royal Artillery, who in 1792 had communicated to the Society of Arts a plan for throwing a rope from a mortar from the vessel itself, and to whom 50 guineas had been awarded after some experiments at Woolwich. That plan however would have been obviously very difficult of application in the case of a vessel in a raging sea. Captain Manby having been reported of with high approval by the Committee, received a pecuniary recompense from the Exchequer, and was employed to report upon the dangerous parts of the coast from Yarmouth to the Frith of Forth. He advised that mortars, constructed on his principle, should be stationed at various points; in 1814 the House of Commons addressed the Prince Regent on the subject; and within two years afterwards fifty-nine stations were provided with the requisite apparatus. The attention which was thus given to the subject of the preservation of life in cases of shipwreck, was further expressed through associations which were formed throughout the country chiefly by Captain Manby's exertions. He also contrived means of obtaining a sight of a vessel on a dark night, by the use of a description of firework throwing stars to burn at a certain height; and he suggested the use of shells, filled with a burning composition, to allow the crew to discover the flight of the rope. He also devised an improvement in the manufacture of ropes to prevent mildew and rot, disusing vegetable mucilage, and using a solution with sugar of lead and alum in equal parts; and he suggested various improvements in life-boats. Late in life he visited the Northern seas, chiefly in order to test the efficacy of a new form of harpoon which he had invented. For his various inventions, which were the means of saving upwards of a thousand lives, he received at various times 7000*l.* from the British nation, and the thanks of the chief sovereigns of Europe.

MANDEVILLE, BERNARD DE, was born at Dort, in Holland, somewhere about the year 1670. He was brought up to the profession of medicine, and completed his studies and took the degree of Doctor of Medicine in Holland. He afterwards came over to England to practise his profession in London. He does not appear to have had much success as a physician; but his writings assisted him in procuring the means of subsistence, while they also gained for him considerable notoriety. His first work was 'The Virgin Unmasked, or Female Dialogues betwixt an elderly maiden Lady and her Niece on several diverting Discourses on Love, Marriage, Memoirs, and Morals,' &c., and was published in 1709. This is a work on a coarse subject, written in a coarse style. In 1714 Mandeville published a short poem, called 'The Grumbling Hive, or Knaves turned Honest,' to which he afterwards added long explanatory notes, and then published the whole under the new title of 'The Fable of the Bees.' This work, which is of an altogether superior character to the 'Virgin Unmasked,' and which, however erroneous may be its views of morals and of society, is written in a proper style, and bears all the marks of an honest and sincere inquiry on an important subject, exposed its author to much obloquy, and, besides meeting with many answers and attacks, was denounced as injurious to morality in a presentment of the Middlesex grand-jury, in July 1723. It would appear that some of the hostility against this work, and against Mandeville generally, is to be traced to another publication, recommending the public licensing of stews, the matter and manner of which are certainly exceptionable, though it must at the same time be stated that Mandeville earnestly and with seeming sincerity recommends his plan as a means of diminishing immorality, and that he endeavoured, so far as lay in his power, by affixing a high price and in other ways, to prevent the work from having a general circulation. Mandeville wrote also at this time in a paper called the 'London Journal,' which shared with the 'Fable of the Bees' the censure of the Middlesex grand-jury. He subsequently published a second part of the 'Fable of the Bees,' and several other works, among which are two, entitled 'Free Thoughts on Religion, the Church, and National Happiness,' and 'An Enquiry into the Origin of Honour and the Usefulness of Christianity in War.' We are told by Sir John Hawkins, in his 'Life of Dr. Johnson,' that Mandeville was partly supported by a pension from some Dutch merchants, and that he was much patronised by the first Earl of Macclesfield, at whose table he was a frequent guest. He died on the 21st of January 1738, in his sixty-third year.

The 'Fable of the Bees, or Private Vices Public Benefits,' may be viewed in two ways, as a satire on men and as a theory of society and national prosperity. So far as it is a satire, it is sufficiently just and pleasant; but viewed in its more ambitious character of a theory of society, it is altogether worthless. It is Mandeville's object to show that national greatness depends on the prevalence of fraud and luxury;

and for this purpose he supposes a "vast hive of bees," possessing in all respects institutions similar to those of men; he details the various frauds, similar to those among men, practised by bees one upon another in various professions; he shows how the wealth accumulated by means of these frauds is turned, through luxurious habits, to the good of others, who again practise their frauds upon the wealthy; and, having already assumed that wealth cannot be gotten without fraud and cannot exist without luxury, he assumes further that wealth is the only cause and criterion of national greatness. His hive of bees having thus become wealthy and great, he afterwards supposes a mutual jealousy of frauds to arise, and fraud to be by common consent dismissed; and he again assumes that wealth and luxury immediately disappear, and that the greatness of the society is gone. It is needless to point out inconsistencies and errors, such for instance as the absence of all distinction between luxury and vice, when the whole theory rests upon obviously false assumption; and the long dissertations appended to the fable, however amusing and full of valuable remarks, contain no attempts to establish by proof the fundamental points of the theory.

In an 'Enquiry into the Origin of Moral Distinctions,' contained in the 'Fable of the Bees,' Mandeville contends that virtue and vice, and the feelings of moral approbation and disapprobation, have been created in men by their several governments, for the purpose of maintaining society and preserving their own power. Incredible as it seems that such a proposition as this should be seriously put forth, it is yet more so that it should come from one whose professed object was, however strange the way in which he set about it, to promote good morals; for there is nothing in Mandeville's writings to warrant the belief that he sought to encourage vice.

MANDEVILLE, SIR JOHN DE, was born at St. Albans, about the year 1800. He was descended from a family of distinction, and appears to have received a better education than was usual in those times. He studied mathematics, theology, and medicine, and for some years pursued the last as a profession. In 1827 he left England, passed through France, and proceeded to Palestine, where he joined the army of the infidels. He afterwards served in Egypt under the Sultan, and in Southern China under the khan of Cathay. He resided for three years at the city of Peking, then called Cambalu, and appears to have travelled over a large part of Asia. After an absence of about thirty-three years, he returned to England, and wrote a narrative of his travels, which he dedicated to Edward III. He died on the 17th of November 1872, at Liège, where he was buried.

His work contained details more ample and minute than any which had previously appeared concerning Palestine, Egypt, and parts of India and China, and must for some centuries have been an extremely interesting work. To render it more amusing, he seems to have borrowed unscrupulously from previous writers; he inserted parts of such chronicles as were then in existence, and introduced romantic tales of knight-errantry, miraculous legends, monsters, giants, and devils. Probably some of the most absurd parts of the work have been added or improved upon by the contemporary copyists.

His reputation as a traveller was very high in his own age. Besides a Latin version of his work, translations of it appeared in all the principal languages of Europe—in Italian, French, Spanish, and German. A manuscript of Sir John Mandeville's travels, which belongs to the age of the author, is in the Cottonian Collection in the British Museum (Titus, C. xvi.). The first English edition was printed by Winkyn de Worde, at Westminster, 8vo., 1499: 'A lytell Treatise or Booke, named John Maudevill, knyght, born in Englande, in the towne of Saynt Abone, and speaketh of the wayes of the Holy Lande towards Jherusalem, and of Marvyles of Ynde and other dyverse Countreies.' The best English edition is perhaps that of London, 1725, 8vo., but there are two or three more recent editions: 'The Voiage and Trauaile of Sir John Mandeville,' &c. Perhaps the first printed edition was that of Pietro de Cornero, 4to, Milan, 1480: 'Tractato delle piu maravigliose Cosse e piu notabili che si trovano in le parte del monde vedute . . . del Cavaler Johanne da Mandavilla.'

MANETHO, a celebrated Egyptian writer, a native of Diospolis, who is said to have lived in the time of Ptolemy Philadelphus at Mendis, or Heliopolis, and to have been a man of great learning and wisdom. (Ælian, 'De Animal,' x. 16.) He belonged to the priest caste, and was himself a priest, and interpreter or recorder of religious usages, and of the religious and probably also historical writings. It appears probable however that there were more than one individual of this name, and it is therefore doubtful whether all the works which were attributed by ancient writers to Manetho were in reality written by the Manetho who lived in the reign of Ptolemy Philadelphus.

The only work of Manetho which has come down to us complete is a poem in six books, in hexameter verse, on the influence of the stars (*ἄστρολογικὰ*), which was first published by Gronovius, Leyden, 1698, and has also been edited by Axtius and Rigler, Cologne, 1832. It is probable however, for many reasons, as Heyne has shown in his 'Opuscula Academica' (vol. i., p. 95), that parts at least of this poem could not have been written till a much later date. We also possess considerable fragments of a work of Manetho on the history of the ancient kings of Egypt, which there is every reason for supposing was written by the Manetho who lived under Ptolemy Philadelphus. It was in three books, or parts, and comprised the period from the earliest times to the death of the last Persian Darius. Considerable fragments

are preserved in the treatise of Josephus against Apion; and still greater portions in the 'Chronicles' of George Syncellus, a monk of the 9th century. The 'Chronicles' of Syncellus were principally compiled from the 'Chronicles' of Julius Africanus and Eusebius, bishop of Cæsarea, both of whom made great use of Manetho's 'History.' The work of Africanus is lost, and we only possess a Latin version of that of Eusebius, which was translated out of the Armenian version of the Greek text preserved at Constantinople. Manetho derived his history of the kings of Egypt, whom he divides into thirty classes, called dynasties, from the sacred records in the temple at Heliopolis.

In addition to these works, Manetho is also said to have written—1, *Ἱστορία Βιβλίου*, on the Egyptian religion; 2, *Περὶ ἀρχαῖσιν καὶ εἰσεβείας*, on the ancient rites and ceremonies of the Egyptians; 3, *φυσικῶν ἐπιτομὴ* (Laert., *Proöm.*, a. 10), probably the same work as that called by Suidas *φυσικολογικά*; 4, *Βιβλίου τῆς Σόφειας*, both the subject and genuineness of which are very doubtful.

It is no easy matter to ascertain the real value of Manetho's 'History' in the form in which it has come down to us. The reader may judge of the use that has been made of it for Egyptian chronology by referring to Rask's 'Alte Aegyptische Zeitrechnung' (Altona, 1830), to the works of Champollion, Wilkinson, and the other authorities which will be indicated by a reference to these works.

(Fabricii, *Bibliotheca Græca*, ed. Harles, vol. iv., pp. 128-139; the *Preface* of Axtius and Rigler; Bunsen, *Aegyptens Stelle in der Weltgeschichte*, v. i.; and *Egyptian Antiquities*, in the 'Library of Entertaining Knowledge,' vol. i., pp. 26, 27.)

MANFRE'DI, natural son of the Emperor Frederic II. and of a Lombard lady, was appointed by his father, at his death in 1250, regent of the kingdom of the Two Sicilies, until the arrival of his brother Conrad, the legitimate son and heir of Frederic. Pope Innocent IV. excommunicated Manfred, and declared that the dynasty of Suabia had forfeited the crown of Sicily in consequence of Frederic having revolted against the see of Rome, whose feudatory he was. Upon this, most of the towns of Apulia revolted against the authority of Manfred. Conrad however came with an army from Germany, and soon reduced the rebels; but he died in the midst of his successes, in 1254, leaving an only son in Germany, Conradino, then a child two years old. Manfred became again regent of the kingdom in the name of his nephew, and as such had to carry on the war against the pope and his own revolted subjects, among whom the powerful baronial house of San Severino stood foremost. The city of Naples opened its gates to the pope and swore allegiance to him, but Manfred found refuge among his father's faithful Saracens at Lucera. Upon the death of Innocent, which took place soon after, Manfred recovered possession of Naples, and cleared the kingdom of the invaders.

A report being spread that Conradino had died in Germany, the barons, prelates, and towns of the kingdom invited Manfred to ascend the throne, and he was crowned at Palermo in 1258. On his return to Apulia he found messengers from Margaret, Conradino's mother, who informed him that his nephew was still alive, and they claimed his inheritance in his name. Manfred refused to resign the crown, but declared in the presence of the envoys that, as he had no male issue, the crown should at his death devolve on his nephew or his nephew's heirs. No one presumed to gainsay Manfred's words: he was brave, high spirited, and handsome, and the idol of the people. He had just delivered the country from the invaders, and his illegitimate birth was no longer remembered. Margaret herself tacitly assented to his retaining the crown upon such conditions: her son was but a boy, and had a fair prospect of succeeding his uncle in due time. To crown Manfred's good fortune, Pope Alexander IV. made peace with him. Manfred was now looked upon as the hereditary protector of the Ghibelines of North Italy, and he sent troops to the assistance of those of Tuscany, who defeated the Guelphs at Montepertoso, and occupied Florence. In 1261 Alexander IV. died, and was succeeded by Urban IV., an inveterate enemy of the Ghibelines and of the House of Suabia. The new pope began by excommunicating Manfred, treating him as a usurper, and offering the crown of Sicily for sale among the princes of Europe. He offered it to Richard, earl of Cornwall, brother to Henry III. of England, who laughed at the proposal, and said "it was like making him a present of the moon." Urban then offered the crown of Sicily to Henry himself for his second son Edmund, but the English king had neither troops nor money to enforce such a claim. At last the pope addressed himself to Charles, count of Anjou, brother of Louis IX. of France, who accepted the offer in 1264: the conditions were, that he should receive the crown of Sicily as a fief of the see of Rome, pay a yearly fee of a thousand ounces of gold and a white horse, surrender to the pope the right of nominating to all the sees of the kingdom, and grant an appeal to Rome on all ecclesiastical affairs. After concluding this bargain Urban died, but his successor Clement IV. followed up his policy. Charles, having collected an army of his Provençal vassals and of French adventurers, came to Rome, where he was solemnly crowned by Clement in 1265. In January 1266 he marched from Rome, and entered the dominions of Manfred, who met him under the walls of Benevento. A desperate battle took place in the month of February. Manfred's faithful Saracens fought bravely, but being unsupported by the Apulian troops, who refused to advance, they were thrown into disorder; and Manfred, seeing himself betrayed, spurred his horse into the thickest of the enemy's ranks, and fell under

BIOG. DIV. VOL. IV.

a heap of the slain. His body was buried by Charles's soldiers, without any honours, under a heap of stones on the banks of the river Calore; but the papal legate ordered it to be disinterred, because, being excommunicated, it could not remain within ground belonging to the holy see. The body was dragged as far as the frontiers of Abruzzo, where it was allowed to rest on the banks of the river Verde, an affluent of the Tronto, near Ascoli. Dante, in pathetic and at the same time indignant strains, alludes to this disgraceful act of fanaticism ('Purgatorio,' canto iii.).

Manfred was fond of letters, was himself a poet, and is praised by the Neapolitan chroniclers for his great and noble qualities. The Guelph writers, on the contrary, have accused him of horrid crimes; among others, of poisoning and incest. This tradition has preserved the remembrance of him as a dark and mysterious character. Manfred was the founder of the town of Manfredonia.

\* MANGLES, CAPTAIN JAMES, R.N., entered the navy as a first class volunteer in March 1800, on board the Maidstone frigate, in which he served off the coasts of France and Portugal, and made a voyage to Quebec. In November 1801 he passed to the Narcissus, 32 guns, as midshipman, and after cruising in the North Sea and also the Mediterranean, accompanied the expedition to the Cape of Good Hope. After the reduction of the Cape in 1806 and the capture of the French frigate Volontaire, 46 guns, he was invested with the rank of acting lieutenant. In September 1806 he passed to the Penelope, 36 guns, and in 1811-13 to the Boyd, 98 guns, and the Ville de Paris, 110 guns, flag-ships in the Channel Fleet of Sir Harry Burrard Neale, under whom he latterly discharged the duties of signal-lieutenant. In September 1814 he was appointed to the Duncan, 74 guns, as first-lieutenant, and in January 1815 to the acting command of the Racoon sloop-of-war. He was confirmed in his present rank of commander in January 1815. He has not since been in active service, and retired on half-pay in 1832.

In August 1816 Captain Mangles, in company with Captain the Hon. C. L. Irby, left England with the intention of making a tour on the Continent. They were led to extend their travels through several parts of the Levant, which had then been little visited by modern travellers. In May 1817 they joined company at Phisæ with Mr. Beechey and Mr. Belzoni, and proceeded with them up the Nile. They joined with Belzoni in clearing away the sand from the entrance to the great temple of Abousambul, a laborious task, which occupied twenty days. Having returned to Cairo, they started in October 1817 for Syria, and in May 1818 commenced their journey to Petra and the Dead Sea. They returned to England at the end of 1820. Soon afterwards they were induced, as a convenient mode of satisfying the inquiries of numerous friends, to make a selection from the letters which they had addressed during their absence to their relatives in England. They printed a limited edition for private circulation only. The book became well-known as the 'Travels of Irby and Mangles,' and copies of it being much in request, they made a gift of the copyright to Mr. Murray, the publisher, who printed it in the popular series of the 'Colonial and Home Library,' with the title of 'Travels in Egypt and Nubia, Syria, and the Holy Land, including a Journey round the Dead Sea and through the Country east of the Jordan, by the Hon. Charles Leonard Irby and James Mangles, Commanders in the Royal Navy,' 16mo, London, 1844. The book is written in the form of a journal, simply and unostentatiously, but is very interesting and trustworthy, though it has been in some degree superseded by the investigations of more recent travellers.

MANI, as he is called by the Persians and Arabians, or MANES, or MANICHEUS, according to the Greek and Roman writers, from whom the heretical Christian sect of the MANICHEANS derived their name. The particulars of the life and death of this individual are variously reported by the Greek and oriental writers, but it appears from all accounts that he was a native of Persia, or at least brought up in that country; that he was well acquainted with the doctrines of the Magi; that he attempted to amalgamate the Persian religion with Christianity; and that, after meeting with considerable success, he was eventually put to death by Varanes I., king of Persia (A.D. 271-274). It is difficult to determine the exact time at which the doctrines of Mani were first promulgated in the Roman empire, but they do not appear to have been known before the end of the 3rd century or the beginning of the 4th.

The Manichæans believed, like the Magi, in two eternal principles, from which all things proceed, namely, light and darkness, which are respectively subject to the dominion of two beings, one the god of good and the other the god of evil. They also believed that the first parents of the human race were created by the god of darkness with corrupt and mortal bodies, but that their souls formed part of that eternal light which was subject to the god of light. They maintained that it was the great object of the government of the god of light to deliver the captive souls of men from their corporeal prisons; and that with this view he created two sublime beings, Christ and the Holy Ghost; and sent Christ into the world, clothed with the shadowy form of a human body, and not with the real substance, to teach mortals how to deliver the rational soul from the corrupt body, and to overcome the power of malignant matter. Referring to the promise of Christ shortly before his crucifixion, which is recorded by John (xvi. 7-18), that he would send to his disciples the Comforter,

"who would lead them into all truth," the Manichæans maintained that this promise was fulfilled in the person of Mani, who was sent by the god of light to declare to all men the doctrine of salvation, without concealing any of its truths under the veil of metaphor, or under any other covering. Mani also taught that those souls which obeyed the laws delivered by Christ, as explained by himself the Comforter, and struggled against the lusts and appetites of a corrupt nature, would, on their death, be delivered from their sinful bodies, and, after being purified by the sun and moon, would ascend to the regions of light; but that those souls which neglected to struggle against their corrupt natures would pass after death into the bodies of animals or other beings, until they had expiated their guilt. Their belief in the evil of matter led them to deny the doctrine of the resurrection. Mani rejected the authority of the Old Testament, which he said was the word of the god of darkness, whom the Jews had worshipped in the place of the god of light. He asserted that the books of the New Testament had been grossly interpolated, and that they were not all written by the persons whose names they bear. The doctrines of the sect were contained in four works, said to have been written by Mani himself, which were entitled respectively 'Mysteries,' 'Chapters,' 'Gospel,' and 'Treasury;' but we know little or nothing of their contents.

Bower, in the second volume of his 'History of the Popes,' has attempted to prove that the Manichæans were addicted to inamoral practices; but this opinion has been ably controverted by Beauobre and Lardner, who have shown that they were, on the contrary, exceedingly rigorous and austere in their mode of life.

The disciples of Mani were divided into two classes, one of which was called the 'Elect' and the other 'Hearers.' The former were bound to abstain from animal food, wine, and all sensual enjoyments; the latter were considered as imperfect and feeble Christians, and were not obliged to submit to such a severe mode of life. The ecclesiastical constitution of the Manichæans consisted of twelve apostles and a president, who represented Christ; of seventy-two bishops, who also represented the seventy-two disciples of Christ; and of presbyters and deacons, as in the Catholic Church.

The Manichæans never appear to have been very numerous, but they were spread over almost all parts of the Christian world. Numerous treatises were written against them, the most important of which were by Eusebius of Cæsarea, Eusebius of Emesa, Serapion of Thumia, Athanasius of Alexandria, George and Apollinaris of Laodicea, and Titus of Bostra. Much valuable information concerning this sect may be found in the writings of Augustine, who was for nine years a zealous supporter of the Manichæan doctrines.

The *Paulicians* are generally considered to be a branch of the Manichæan sect, and are supposed to have appeared first in the 7th century in Armenia, and to have derived their name from Paul, a zealous preacher of the doctrines of Mani.

In the 6th century the Manichæan doctrines are said to have spread very widely in Persia. They continued to have supporters, under their new name of Paulicianism, till a very late period in ecclesiastical history. About the middle of the 8th century the Emperor Constantine, surnamed Copronymus, transplanted from Armenia a great number of Paulicians to Thrace, where they continued to exist even after the capture of Constantinople by the Turks. In the 11th and 12th centuries the doctrines of the Paulicians were introduced into Italy and France, and met with considerable success.

MANILIUS, MARCUS or CAIUS (whose name is sometimes written Mallius or Manlius), a Latin poet, who wrote a work on astronomy, called 'Astronomicum,' in five books. We possess no particulars respecting his life, but the opinion of Bentley seems the most probable, that he was born in Asia, and lived in the time of Augustus Cæsar. Some writers suppose Manilius to be the same person as the Manilius or Manlius of Antioch, the astrologer, mentioned by Pliny (H. N., xxxv. 17), and others the same as Manlius the mathematician, also mentioned by Pliny (xxxvi. 15, a. 6); but the only reason for these opinions consists in the similarity of the names. The 'Astronomicum' does not appear to be complete. The five books which are extant treat principally of the fixed stars; but the poet promises in many parts of his work to give an account of the planets. The 'Astronomicum' contains several passages which are not unworthy to be compared with some of the best writings of the Augustan age; but the subject gave the author little opportunity for the exercise of his poetical powers. It appears from many parts of the work that Manilius was a staunch adherent of the Stoic philosophy. A manuscript of the 'Astronomicum' was first discovered by Poggio in 1416, and it was first printed at Nürnberg, 1472 or 1473. The best edition is that by Bentley, Lond., 1739. It has been translated into English verse by Creech, Lond., 1700.

MANIN, DANIELE, a distinguished Italian politician and patriot, was born at Venice in 1804, the son of Pietro Manin, a respectable advocate. His grandfather, Lodovico Manin, bore the same name as the last doge of Venice, whose weak behaviour at the time of the extinction of the ancient republic by Bonaparte (1797) had attached a certain discredit to the name. Young Manin, who from the first showed great abilities, was bred up to his father's profession of the law, and graduated as Doctor of Laws at the University of Padua at a very early age. He married in 1825, and shortly afterwards com-

menced practice as a lawyer at Mestre, a small town near Venice. Here he led a quiet domestic life, employing his leisure in historical and legal studies, and occasionally in writings of a kindred character. From the first however he shared fervently in the general discontent of his countrymen with Austrian rule, and the general aspiration after restored liberty and independence for Venice. Though not affiliated to any of the revolutionary societies then existing in Italy, he often discussed with several intimate friends—especially Alexandre Zanetti, Leopold Cicognara, Giovanni Minotto, and Francesco degli Antoni—the wrongs of his native country, and the possibility of remedying them by insurrection or other means. Once or twice—as during the time of the excitement caused by the affair of the brothers Bandiera in 1844—these secret counsels were on the point of bursting out into open action; but, on the whole, it was felt by the friends that no movement was practicable, and Manin continued in the ordinary exercise of his profession, varying it by occasional contributions on economical topics to journals. As a speaker, he was distinguished for a logical, direct, positive and incisive manner, different from the ordinary eloquence of his countrymen. As on several important public trials he acted a vigorous part on the liberal side, he came into collision with the Austrian government; and in the early part of 1848 he was imprisoned. But this year was to witness a change in his fortunes, and in those of Italy. On the 18th of March the spirit of insurrection with which the whole peninsula was charged broke forth in Milan; the news of the expulsion of the Austrians from Milan acted immediately on Venice, and on the 28th of March the Austrian commander of the city, Count Zichy, was obliged to surrender, and the republic was declared. It was at this time that Manin stepped forth as a man born to lead. The progress of events was for a time complex—the fate of the Venetians being involved in that of the other Italians. "What we preferred," Manin has since said, "was to be an independent republic, in confederation with the other Italian states; but what we would have accepted was, to become a portion of one great kingdom comprising all Italy."

The war of Charles-Albert, the king of Piedmont, against the Austrians in the name of Italy, as a whole seemed for awhile to give likelihood to the latter expectation. The Venetians, willing to show their trust in Charles-Albert, agreed to the fusion of their little republic with Lombardy and Piedmont, so as to form a united independent kingdom of Northern Italy. But the battle of Custozza having ended that dream and restored Lombardy to the Austrian dominion, the Venetians again fell back upon their own resources and prepared for a separate defence. The republican standard of St. Mark was again hoisted; a triumvirate was appointed to carry on the executive government, Manin being the chief of the three; and the military command was intrusted to the Neapolitan general Papé, who had thrown himself into Venice two months before, rather than obey the order that he should return to Naples. Though the Austrians kept up a blockade against Venice, it was not till March 1849, when the second attempt of Charles-Albert was brought to an end by the defeat of Novara, and when the Austrians were thus free to reconquer all that still remained to be reconquered of their lost territories in Italy, that the Venetians endured the full agony of the struggle. By that time the patriotic movement had been completely crushed in every part of Italy besides, with the exception of Rome. The two republics of Rome and Venice were the sole remains of the insurrectionary work of the previous year; and against the one of these the French were mustering their power in conjunction with the Austrians and Neapolitans, while the other was assailed by the Austrians alone. Both republics behaved bravely. What Mazzini was to Rome, Manin was to Venice. From March 1849 he was invested with all the powers of the dictatorship. The defence of Venice conducted by him is one of the most gallant and obstinate in recent history. It was on the 3rd of July that the French entered Rome; but Venice did not surrender till the 24th of August, after it had suffered a dreadful bombardment. With the fall of Venice the re-subjugation of Italy was complete. The terms of the surrender were such that Manin was able to go safely into exile. He has since resided chiefly in Paris, supporting himself honourably, respected by all Europe, and waiting for a new opportunity for the revival of liberty in his native land. With Mazzini, he still adheres to the idea of the unification of Italy (accompanied by the expulsion of the Austrians and the secularisation of the Papacy), as essential to the cause of freedom and Italian development; but he differs considerably from Mazzini in his ideas as to the practical means of such a unification. [See SUPPLEMENT.]

MANLIUS, the name of one of the most illustrious patrician *gentes* of ancient Rome. Those most worthy of notice are—

1. MARCUS MANLIUS CAPITOLINUS, who was consul B.C. 390 (Liv., v. 31), and was the means of preserving the capitol when it was nearly taken by the Gauls (Liv., v. 47), from which he obtained the surname of Capitolinus. He afterwards became a warm supporter of the popular party against his own order, and particularly distinguished himself by the liberality with which he assisted those who were in debt. He publicly sold one of his most valuable estates, and declared that as long as he had a single pound he would not allow any Roman to be carried into bondage for debt. In consequence of his opposition to the patrician order he was accused of aiming at the kingly power.

The circumstances attending his trial and death are involved in much obscurity. It would appear that he was accused before the centuries and was acquitted; and that afterwards, seeing that the patrician party were determined on his destruction, he seized upon the capitol, and prepared to defend it by arms. In consequence of this Camillus, his personal enemy, was appointed dictator, and the curies (that is, the patrician assembly) condemned him to death. According to Livy, who implies that Manlius did not take up arms, he was thrown down from the Tarpeian rock by the tribunes; but Niebuhr supposes, from a fragment of Dion (xxxi.) compared with the narrative of Zonaras (vii. 24), that he was treacherously pushed down from the rock by a slave, who had been hired for that purpose by the patrician party. ('Roman History,' vol. ii., pp. 610, 611, Engl. transl.; Livy, vi. 11, 14, 20.) The house which had belonged to Manlius was raised; and the Manlian gens resolved that none of its patrician members should again bear the name of Marcus. Manlius was put to death B.C. 381.

2. TITUS MANLIUS CAPITOLINUS TORQUATUS, son of L. Manlius, surnamed Imperiosus, who was dictator B.C. 361. When his father Lucius was accused by the tribune Pomponius on account of his cruelty towards the soldiers under his command, and also for keeping his son Titus among his slaves in the country, Titus is said to have obtained admittance to the house of Pomponius shortly before the trial, and to have compelled him, under fear of death, to swear that he would drop the prosecution against his father. This instance of filial affection is said to have operated so strongly in his favour, that he was appointed in the same year (B.C. 359) one of the military tribunes. (Liv., vii. 4, 5; Cicero, 'De Off.', iii. 31.) In the following year Manlius distinguished himself by slaying in single combat a Gaul of gigantic size on the banks of the Anio. In consequence of his taking a chain (torques) from the dead body of his enemy, he received his surname of Torquatus. (Liv., vii. 10.) Manlius filled the office of dictator twice, and in both instances before he had been appointed consul: once, in order to conduct the war against the Carites, B.C. 351; and the second time in order to preside at the Comitia for the election of consuls, B.C. 346. (Liv., vii. 19-26.) Manlius was consul at least three times. (Cic., 'De Off.', iii. 31.) In his third consulship he defeated the Latins, who had formed a powerful confederacy against the Romans. In the same campaign he put his own son to death for having engaged in single combat with one of the enemy, contrary to his orders. (Liv., viii. 5-12.)

3. TITUS MANLIUS TORQUATUS was consul B.C. 235, and obtained a triumph on account of his conquests in Sardinia. (Vell., ii. 38; Eutrop., iii. 3.) In his second consulship, B.C. 224, he conquered the Gauls. (Polyb., ii. 31.) He opposed the ransom of the prisoners, who had been taken at the battle of Cannæ. (Liv., xxii. 60.) In B.C. 215 he defeated the Carthaginians in Sardinia (Liv., xxiii. 84, 40, 41); and in 212 was an unsuccessful candidate for the office of Pontifex Maximus. (Liv., xxv. 5.) In 211 he was again elected consul, but declined the honour on account of the weakness of his eyes. (Liv., xxvi. 22.) In 208 he was appointed dictator in order to hold the Comitia. (Liv., xxvii. 33.) The temple of Janus was closed during the first consulship of Manlius. (Liv., l. 19; Vell., ii. 88.)

4. CNEIUS MANLIUS VULSO was consul B.C. 189, and appointed to the command of the war against the Gauls in Galatia, whom he entirely subdued. An account of this war is given by Livy (xxviii. 12-17) and Polybius (xxii. 16-22). After remaining in Asia the following year as pro-consul, he led his army home through Thrace, where he was attacked by the inhabitants in a narrow defile and plundered of part of his booty. He obtained a triumph, B.C. 186, though not without some difficulty. (Liv., xxxix. 6.)

MANNYNG, ROBERT, is more usually called Robert de Brunne. He owes this name to his having been a Gilbertine canon in the monastery of Brunne or Bourne in Lincolnshire. He lived in the reigns of Edward I. and his successor, and was the writer of one of the earliest of the Metrical Chronicles whose language can be called English. His work however is merely a translation from the French. It is in two parts: the first, translated from the 'Brut d'Angleterre' and 'Roman le Rou' of Wace and Gaimar, begins with Æneas and ends with Cadwallader; the second, from Cadwallader to Edward I., is translated from the Chronicle of Peter Langtoft. [LANGTOFT, PETER.] Robert's version was published by Hearne in 1725. The measure of it is octosyllabic in the first part, and Alexandrine in the second. Its poetical merit is very small; but it is interesting as an early monument of the language, and valuable for its information, both historical and literary. Robert made in English rhymes a translation, which has never been printed, of Saint Bonaventura's treatise 'De Coena et Passione Domini.' He translated also, freely, into octosyllabic verse, the 'Manuel Peche', or 'Manual of Sins,' which used to be attributed to Bishop Grossthead on insufficient grounds. Of this unprinted translation specimens are given in Warton's work and elsewhere. Hearne has supposed, with little reason, that Robert de Brunne was the author of the old English metrical romance called 'Rycharde Cœur-de-Lyon.'

MANSARD, the name of two French architects of great celebrity in the 17th century.

FRANÇOIS MANSARD the elder, whose father, Absalon, is said to have been architect or builder to the king, was born at Paris in 1598. At the age of twenty-two he began to distinguish himself by his restora-

tion of the Hôtel Toulouse; and a short time afterwards he was commissioned to execute the portal of the church of the Feuillans, in the Rue St. Honoré. The reputation he acquired by these works soon procured him abundant employment, and obtained for him ample opportunities for displaying his talents. Among the numerous châteaux erected after his designs may be mentioned Berni near Paris, Balera, Bierancourt, Choisy, and that of Maisons, which last was built for the president De Longueuil, and is generally considered his best work of that class. Among his churches the most noted is that of the Val de Grace at Paris, the dome of which was once generally extolled as a fine piece of architecture, although now considered a grotesque composition, remarkable for nothing so much as its impure and meagre taste. The façade of the church of the Minimes in the Place Royale is also by him, and has been admired as exhibiting the solution of a knotty problem, the metopes being perfect squares throughout! Such was the puerile and pedantic trifling that formerly engaged the attention of architects and connoisseurs, and for the sake of which they overlooked matters of infinitely greater importance in architectural taste and design. François died in 1666. This architect is said to have been the inventor of the curb roof, called, after him, a Mansard, which consists of two planes on each side, a steeper one below and a flatter one above. It has however little beauty of form to recommend it, having very much the look of being broken or doubled.

JULES HARDOUIN MANSARD was the nephew of the preceding, being the son of a painter who had married the sister of François. Jules, who assumed his maternal family name on becoming heir to his uncle, was born in 1645. He was brought up by François to his own profession, in which he became much the more celebrated of the two. Most assuredly he had ample field allowed him for the display of his talents, since, had he been employed on no other work, he was called to execute one which for lavish prodigality has hardly its parallel in any age or country. It becomes therefore quite as much a satire as a eulogium on his 'genius' to say, that on that occasion, and with unlimited resources, he produced nothing better than Versailles—a huge pile of building, which Sir Christopher Wren happily described as composed of "heaps of littleness." It would not be difficult to select from his other works numerous instances of exceedingly bad taste, of puerile caprices, and downright solecisms; their magnitude and the costliness of their decorations however give to his works an imposing air, though the effect thus produced is hardly to be ascribed to the architect himself. After Versailles, the work which has chiefly contributed to his reputation is the dome of the Invalides at Paris, which, although as splendid as gilding can make it, is externally greatly inferior to that of our St. Paul's in harmony and majesty of design and proportions. The plan of the interior of the edifice presents far more that deserves commendation, the whole being skilfully arranged for perspective effect. Both the Place Louis XIV. and that called Des Victoires at Paris were built after his designs, but have little at all remarkable, except it be that the one is an octagon and the other an oval in plan. He was enabled to amass a vast fortune. He died suddenly at Marly in 1703, and was buried in the church of St. Paul, at Paris, where a monument by Coysevox was erected to him.

MANSFIELD, WILLIAM MURRAY, EARL OF, lord-chief-justice of the king's bench, was born at Perth on the 2nd of March 1704, O.S. He was the fourth son of Andrew Viscount Stormont. When three years old he was removed to London, and in 1719 he was admitted a king's scholar at Westminster school. On the 18th of June 1723 he was entered at Christ Church, Oxford, where, as before at Westminster, he distinguished himself by his classical attainments. After taking his degree of M.A. he left the university in 1730, and after travelling some time abroad he was called to the bar in Michaelmas term 1731. In early life he appears to have associated a good deal with the "men of wit about town."

It has been said of him, as of other eminent lawyers, that he had been heard to say that he never knew the difference between a total want of employment and an income of 3000*l.* a-year. But in 1732, the year after his being called to the bar, it appears that he was engaged in an important appeal case; and in the two following years he was frequently retained in similar cases before the House of Lords. (Holliday's 'Life,' p. 25.) The first cause in the common-law courts in which Mr. Murray distinguished himself was an action for criminal conversation brought by Theophilus Cibber against Mr. Sloper. A sudden attack of illness having prevented his leader from appearing in court, the duty of conducting the defence devolved upon him. The result brought him an influx of business which at once raised his income from a few hundreds to thousands. In 1743 he was appointed solicitor-general, and obtained a seat in the House of Commons, where his eloquence and legal knowledge soon rendered him very powerful. In the House, Murray and Pitt (Lord Chatham) were opposed to each other as the best speakers of their respective parties. Pitt's attacks on Murray seem to have occasionally exceeded the limits prescribed by modern parliamentary regulations, and Murray had not the nerve to return or to parry his fierce invectives. In 1754 Mr. Murray was made attorney-general, and in 1756 he received the appointment of chief-justice of the king's bench, and was immediately created a peer, by the title of Baron Mansfield, of Mansfield

in the county of Nottingham. On his elevation to the seat of chief-justice, Lord Mansfield, contrary to the general usage, became a member of the cabinet.

Few lawyers have been more tempted than Lord Mansfield to quit their profession for politics. On several occasions (such as his power as a speaker and such was the opinion entertained of his abilities by his party) high political office, with the prospect of higher, of indeed the highest, was pressed upon his acceptance. But he was firm in refusing all offers of the kind and in adhering to his profession. Thus when the duchy of Lancaster and a pension of 2000*l.*, with the reversion of a valuable post for his nephew, Lord Stormont, were offered to him, and subsequently the amount of the proposed pension was raised to 6000*l.*, he was firm in his refusal. "He knew," says Walpole, "that it was safer to expound laws than to be exposed to them; and he said peremptorily at last, that if he was not to be chief-justice, neither would he any longer be attorney-general." Shortly after Lord Mansfield's promotion to the bench, on the dismissal of Pitt, and the resignation of Legge, the chancellor of the exchequer, the seals of the latter office were *pro tempore* placed in the hands of Lord Mansfield, and he was intrusted by the king with full power to negotiate on the subject of a new administration with Mr. Pitt and the Duke of Newcastle. The same reasons which made him refuse political office seem to have induced him to decline the custody of the great seal when it was, upon more than one occasion, offered to him. He preferred the purely judicial office of chief-justice of the king's bench, where he was safe from political storms and the vicissitudes which they produce. Yet in that office, though safe from political, he was not safe from popular storms. His political leanings were not towards the popular side; and even his conduct as a judge, though now, when at a distance from him and his time we can survey it with calmness, it may appear deserving of a very small portion of the reprehension heaped on it by such writers as Junius, was at the time not free from the appearance of some bias against popular rights.

In the cases of the trials of the publishers of Junius's letter to the king, Lord Mansfield incurred much popular odium by laying down the doctrine that the fact, not the law, was what the jury had to consider. In the trial of Woodfall, Lord Mansfield, in his summing up, directed the jury, "that the printing and sense of the paper were alone what the jury had to consider of." (*State Trials*, vol. xx., p. 900). In the case of Wilkes, which occurred in the same year, Lord Mansfield remained firm to his former opinion, and in allusion to the odium which he had incurred in consequence, thus expressed himself: "I honour the king and respect the people; but many things, acquired by the favour of either, are, in my account, not worth ambition. I wish popularity, but it is that popularity which follows, not that which is run after. It is that popularity which, sooner or later, never fails to do justice to the pursuit of noble ends by noble means."

In the famous riots of 1780, Lord Mansfield's house in Bloomsbury-square was attacked and set fire to by the populace. The walls were all that were left of it. His library of books and manuscripts, his private papers, pictures, furniture, and other valuables were all consumed. Though the treasury, in pursuance of a vote of the House of Commons, applied for the particulars and amount of his loss, with a view to compensation, his lordship declined returning any account of his loss, lest, he said in his letter to the Treasury, "it might seem a claim or expectation of being indemnified." After having presided for upwards of thirty-two years in the court of king's bench, he retired from his office in 1788. He died on the 20th of March 1793, in his eighty-ninth year. He left no issue. The earldom of Mansfield, which was granted to him in 1776, descended to his nephew, Viscount Stormont.

Lord Mansfield's judicial character stands high. His acute and powerful intellect enabled him to take a clear and comprehensive view of every case. The depth of his legal learning has been questioned; probably not without reason. And this want of depth, assuming it to have existed, may account for his sometimes making law instead of expounding it—a thing sometimes unavoidable in a judge; and though extremely difficult to do well, easier to do ill or indifferently than to unravel and set forth in luminous order a large and confused mass of law already existing on a given subject: which suggests the reflection, that though that judge who is the profoundest lawyer will be the most competent to make law, at least to know when it is necessary to make it, yet those judges who are the least profound lawyers, and consequently the least able to say when law needs to be made, will be the most likely to evade the difficulty of elucidating the old law by making new. This is matter of every-day experience to lawyers. Lord Mansfield's judicial legislation has been most successful in some branches of commercial law. In the law of real property he was less successful. For example, his decision in the case of *Perrin v. Blake*, which involved an alteration in the old established rules of law, particularly as regarded what is called the rule in Shelley's case, was reversed in the Exchequer Chamber. (Fearn's *'Contingent Remainders'*, p. 158; and Dougl., *'Rep.'* 329 or 343 of third edition, in note.)

In reviewing the character of Lord Mansfield, his principles of toleration in matters of religion, which he maintained both in parliament and on the bench, ought not to be forgotten.

(*Life of Lord Mansfield*, by Henry Roscoe, Esq., in Dr. Lardner's *Cabinet Cyclopædia*.)

MANTEGNA, ANDREA, was born at Padua, in 1431. His parents were persons in humble life. It does not appear under what circumstances or at what age he became a pupil of Francesco Squaricone, who was so struck with his talents that he adopted him as his son. On Andrea marrying a daughter of Jacopo Bellini, Squaricone's competitor, the latter was offended, and censured his pupil as much as he had before praised him; but these censures, being in many instances well founded, only tended to his improvement, which was further promoted by the friendly advice of the brothers Gentile and Giòvanni Bellini.

His chief residence and his school were at Mantua, where he settled under the patronage of the Marquis Lodovico Gonzaga, but worked occasionally at other places, especially Rome. There are several of his oil-paintings in Mantua. His master-piece was the picture 'Della Vittoria,' which was in the Oratorio de' Padri di San Filippo. Few of this painter's works now remain, and most of them have been much injured. One of his greatest and most celebrated works, 'The Triumph of Julius Cæsar,' was part of the rich gallery of paintings that belonged to the Gonzaga family, which was purchased by King Charles I. for 80,000*l.* This, the greatest and most esteemed work of Mantegna, consisting of nine pictures, each 9 feet high and 9 feet wide, is now at Hampton Court. Unhappily it was coarsely painted over by Laguerre, in the time of William III. 'The Triumph of Scipio,' painted in black and white, and in admirable preservation, is in the possession of Sir George Vivyan. The Earl of Pembroke has a picture by Mantegna, representing 'Judith with the head of Holofernes.' In the National Gallery is a painting by Mantegna of 'The Virgin and Child enthroned; St. John the Baptist and the Magdalen;' and in the British Museum there is an admirable drawing in bistre touched with white, representing the dominion of the vices over the virtues, a counterpart to Mantegna's picture in the gallery of the Louvre (No. 1107), representing the vices expelled by the virtues. It is not probable that he painted many cabinet pictures, his time being so much occupied by large works and engraving; though not the inventor of this art, he was the first engraver of his time; the series of plates executed by his own hand exceeds fifty. Mantegna died at Mantua, September 13, 1506, at the age of seventy-four. He left two sons, Francesco Mantegna, who completed several of the works left unfinished by Andrea, and who was considered his father's best scholar, another also a painter, but who attained no celebrity.

MANTELL, GIDEON ALGERNON, a palæontologist and geologist of extensive and varied acquirements, was born at Lewes, in Sussex, about 1790. For several years he practised as a medical man at Lewes, in a district which he rendered classical by his researches into its geological structure. He was a memorable instance of a man of genius, constantly and diligently occupied in discharging the duties of a laborious profession—in which he acquired great provincial reputation, especially for the delicacy of his manipulation in surgical cases, and for the tenderness of his demeanour to his patients—nevertheless reaching great eminence as a man of science, and finding time to pursue his favourite studies with distinguished success. During his residence at Lewes he collected a vast number of interesting fossils, and formed a private museum, such as has rarely if ever been equalled. Here also he published his principal separate works, 'The Fossils of the South Downs,' and 'The Illustrations of the Geology of Sussex.' The former appeared in 1822, simultaneously with that of Cuvier and Bronniart upon 'The Geology of the Environs of Paris;' and many of the organic remains of the chalk were described in both works simultaneously, though independently. Whilst at Lewes also he called attention to the interest and beauty of the remains of fishes found in the chalk, and it was there he commenced the series of observations which placed him in a prominent position among British geologists. His attention was early directed to the phenomena exhibited by the assemblage of clays, sands, and subordinate limestones which immediately underlie the cretaceous system in the Weald district, happily designated by his friend Mr. P. J. Martin as the 'Wealden formation.' His location being exceedingly favourable for researches in that group of rocks, he became the original demonstrator of the fresh-water origin of the mass of Wealden beds, thus making a great step in British geology; and it is remarkable and instructive that this resulted from the direct application of the knowledge of existing causes and phenomena to the investigation of the past. Dr. Mantell's observation of the conditions under which existing fresh-water shells were imbedded in the alluvium of the valley of the Sussex Ouse, and even alternated with marine exuvies, suggested the probability of the occurrence of similar, but immensely more ancient, phenomena in the clays and sands of the Weald; and careful research fully confirmed his conjecture. His chief and very memorable palæontological discoveries are connected with the Wealden. But the particular circumstances under which researches in fossil osteology have been pursued in England for many years past render it difficult, with a due regard to brevity, to define accurately the character, and to delineate the extent, of Dr. Mantell's labours in that department of science. The following view of the subject is from the impartial pen of Mr. William Hopkins, F.R.S., and forms a part of an obituary notice contained in his 'Anniversary Address' from the chair of the Geological

Society, on the 18th of February 1853, on which the present article is founded.

Out of the Wealden, Mr. Hopkins states, Dr. Mantell "procured the most interesting of the relics of prodigious extinct reptiles, which owe to him their scientific appellations, and whose remains will long constitute some of the chief attractions of the great collection originally amassed by him, and now displayed in the galleries of the British Museum. Whether we regard his discovery and demonstration of the *Iguanodon* and its colossal allies in a geological point of view, as characterising distinctly an epoch in time, or, with respect to their zoological value, as filling up great gaps in the series of *Vertebrata*, and elucidating the organisation of a lost order of reptiles, at once highest in its class and most wonderful, we must, as geologists and naturalists, feel that a large debt of gratitude is due to the indefatigable and enthusiastic man out of whose labours this knowledge arose. In the group of Dinosaurian reptiles were some of the largest of terrestrial animals. In their organisation, whilst truly Reptilian, they approached [by a direct relation of analogy] the Mammalian type. Their characters were so peculiar, that of the value and distinctness of their order there can be no question. Their osteology has been elaborated with skill and care, and has worthily occupied the attention of the most eminent anatomists. They give a feature to the herpetology of the middle portion of the secondary epoch. Now, of the five marked genera constituting this group, as at present known, we owe the discovery and demonstration of four—viz., *Iguanodon*, *Hylaeosaurus*, *Pelorosaurus*, and *Regnosaurus*—to Dr. Mantell. Worthily then were the Wollaston Medal and Fund adjudged to our lamented colleague in 1835, for his long-continued labours in the comparative anatomy of fossils, especially for the discovery of two genera of fossil reptiles, *Iguanodon* and *Hylaeosaurus*." That he did not rest from his labours, after having received this honourable reward, the discovery of two additional genera mentioned above can testify. Nor did he cease from continually seeking to perfect his knowledge of the wonderful animals brought to light during his earlier career. Thus, whilst the announcement of the *Iguanodon* dates as far back as 1825, his account of the jaw of this reptile was given to the world fifteen years afterwards. His paper on *Pelorosaurus*, in the 'Philosophical Transactions,' was published in 1850."

Dr. Mantell was equally interested in all other branches of palaeontology. One of his earliest papers, communicated to the Linnean Society, and published in its 'Transactions,' vol. xi, related to the bodies called by him and now well-known as *Ventriculites*, found in the chalk, and referred by him to *Aleyonia*. On fossil *Mollusca* and *Radiata* he wrote many valuable papers, especially those that concern the *Belemnites* and their allies. Mr. Henry Deane of Clapham, afterwards president of the Pharmaceutical Society, having detected the soft bodies of *Foraminifera* (*Rotalia*) in an extraordinary state of preservation in the chalk of Folkestone, and prepared illustrative specimens of them for the microscope, called Dr. Mantell's attention to them, who devoted much time to their investigation, and, uniting the observations made by Mr. Deane and himself with the results of some of his own previous researches, communicated a paper to the Royal Society on the general subject of the 'Fossil Remains of the soft parts of Foraminifera, discovered in the chalk and flint of the South-east of England,' which was inserted in the 'Philosophical Transactions' for 1846. Among his most recent labours was the account of the remarkable reptile from the Old Red-sandstone, named by him *Telerpeton Elginense*, an animal of singular interest, regarded, until very recently, as the most ancient unquestionable relic of its class. At the time he died he was occupied with a description of a very singular fish from the chalk, to which he intended to give the name of *Rynchonichthys*.

Dr. Mantell was elected a Fellow of the Royal Society in 1825, shortly after his discovery of the *Iguanodon*, and in 1849 he received from the Council the royal medal, as an acknowledgment of his palaeontological researches. He was also enrolled as a Fellow of the Royal Society of Physicians, London, in recognition of his scientific eminence, he not having been originally connected with the College. In 1835 he removed from Lewes to Brighton, and four years later, after the purchase of his collection of fossils by the trustees of the British Museum for 5000*l.* to Clapham, near London. Some years having elapsed, he disposed of his medical practice at that place, and removed to Chester-square, London, where he continued to reside and practise for the remainder of his life. For many years he endured severe illness and excruciating pain, owing to a spinal disease, the result of an accident. But no torture could destroy his love for science, or his energetic pursuit of geological research. He died at his residence in Chester-square on the 10th of November 1852, aged sixty-two.

Dr. Mantell's scientific character has two distinct features, those of an original discoverer, and of a public teacher. His influence in science depended less perhaps upon the former, brilliant as it was, than upon the latter. As a popular expounder of geological facts he was unequalled; as a lecturer, within his own particular field, he had no rival; fluent, clear, eloquent, and elegantly discursive, he riveted the attention of his audience, and invariably left them imbued with a love for the science he had taught them. His popular writings, of which the 'Wonders of Geology' and the 'Medals of Creation' are among the more useful, had a wide circulation, and are held in high esteem by general readers. They have a considerable reputation also on the

Continent, and have been translated into German. The 'Medals of Creation' is almost the only book in the English language, in which a comprehensive survey of the fossil world, and a perspicuous and satisfactory outline of British palaeontology, both adapted to the educated and general reader, can be met with. He was likewise the author of several interesting views of the geological structure and physical geography of Sussex and Surrey, or of portions of those counties, as well as of the adjacent county of Kent (into which his favourite Wealden also extends), which were inserted in topographical works, as introductory to the general history of the districts described. One of these forms a portion of the prefatory matter in the 'County History of Surrey,' by the late Edward Wedlake Brayley, F.S.A. In the 'Bibliographia Zoologica et Geologica' of Agassiz and Strickland, no fewer than sixty-seven works and memoirs of various degrees of importance and length, are enumerated as having proceeded from Dr. Mantell's pen; to these must be added some antiquarian papers, and several professional disquisitions.

MANUTUA'NO, the common name of a family of artists of Mantua, of the 16th century. The proper name appears to have been Ghisi, but few particulars regarding the lives of its members are known.

GIOVANNI BATTISTA, called Giovanni Mantuano, and also Bertano, was painter, sculptor, engraver, and architect, and author of a commentary on Vitruvius—'Gli oscuri e difficili Passi dell' Opera di Vitruvio,' fol., Mantua, 1558. He was the pupil of Giulio Romano, executed many designs, some engravings, and a few paintings; but his chief business was architecture, and he built the church of Santa Barbara at Mantua. It is not known what relationship he bore to the following artists. He was born about 1500, and was alive in 1568.

GIORGIO GHISI, called Giorgio Mantuano, was born at Mantua about 1524. He was painter and engraver, and died at Rome, about 1590. Bartsch describes seventy-one of his engravings, many of which are after the most celebrated works of the 16th century; they are well drawn and executed with great mastery, much in the style of Marcantonio. Among the most valuable are the Last Judgment, and the Prophets and Sibyls, by Michel Angelo, in the Sistine Chapel; and the Dispute on the Sacrament and the School of Athens, after the frescoes by Raffaele in the Vatican.

Bartsch describes 129 prints by ADAMO GHISI, called also Mantuano; and 46 by DIANA GHISI, called Mantuana. Those of the former are dated from 1566 to 1576, and those of Diana from 1575 to 1588. Diana was the daughter of Giovanni Battista Mantuano, and was married to Francesco da Volterra, architect. She was born about 1536, and was living in 1588.

(Gandellini, *Notizie Storiche degli Intagliatori*; Bartsch, *Peintre-Graveur*; Brulliot, *Dictionnaire des Monogrammes*, &c.)

MANUEL, FRANCISCO, one of the most eminent of the modern poets of Portugal, was born at Lisbon in 1734. His first study was music, but he afterwards devoted himself entirely to literature, and more especially to poetry, his talent for which obtained him many admirers, and also some enemies and persecutors. His enemies accused him not only of entertaining exceedingly heretical opinions, but of openly professing his contempt for the church, alleging against him his arguments in favour of toleration, his free remarks on the monks, and, not least of all, his translation of Molière's 'Tartuffe.' Being summoned to appear before the Inquisition, instead of obeying the mandate of the Holy Office, he attacked and disarmed the agent sent to apprehend him, and saved himself by immediate flight to Paris in 1788; in which city he resided till February 25, 1819, when he died at the age of eighty-four.

Though a zealous cultivator of the purest models of Portuguese literature and poetry, Manuel was a no less ardent admirer of the classics, whom he regarded rather as models to be invariably followed, than as studies upon which a sound poetical taste is to be formed; and to this predilection for the poets of antiquity is to be ascribed his dislike to rhyme. Nevertheless his merits and excellences are undeniable; and it has been said of him that no Portuguese poet or writer since the time of Camoens did so much for the language, in which respect his services were more valuable than those of a whole academy. He excelled in lyric and satiric poetry, and among his productions of the former class his odes to D'Albuquerque and Washington are deservedly admired for their sublimity and grandeur. Many of his epistles, tales, and fables are also stamped by merit, though of a different kind. The services which he further performed for Portuguese literature were very considerable, for he produced admirable versions of Wieland's 'Oberon,' Silius Italicus, Châteaubriand's 'Martyrs,' and La Fontaine's 'Fables.' Like his original compositions, these translations are distinguished by purity of style, carried occasionally perhaps rather too far, as his horror of Gallicisms and new-coined expressions frequently led him to adopt obsolete words, thus producing an appearance of pedantry and affectation.

MANUEL, NICLAUS, or NICOLAS, sometimes called DEUTSCH, who claims notice not only as an artist, but as a poet and author, and one who took an active part in the Reformation in Switzerland, was born at Bern in 1484. His real name is conjectured by his biographer, Dr. Grütneisen, to have been Alleman, but as he was illegitimate, it was, for family reasons, changed anagrammatically into that of Manuel. It is further conjectured that he was brought up by his maternal grandfather, Thüring Frickart. Having made choice of painting as a

profession, he studied the art at Colmar, under the successors of the celebrated Martin Schön, until the fame of Titian attracted him to Venice, where about 1511 he became one of his pupils: he is the Emanuello Tedesco of Ridolfi and other Italian writers. He is said to have assisted Holbein, in 1515, in his 'Dance of Death;' but this is very improbable, as he was himself employed at that time in painting the same subject in the cloister of the Dominican convent at Bern. It was executed in fresco or distemper. The picture consisted of forty-six subjects, forty-one of which were the actual 'Todtentanz;' it has been long since destroyed, but the compositions are preserved in prints and copies: the wall on which it was painted was pulled down in 1660. Manuel was an active reformer, and many of these designs are reflections upon the abuses of the Roman church. He also ornamented his own house with a large fresco, representing Solomon worshipping idols. But of these and several other of his works nothing now remains, except some small water-colour copies preserved in the library at Basel. However, either from his pencil not bringing him sufficient for the maintenance of his family, or his political ardour, he was induced to engage himself in military and public affairs. He served, as quartermaster or commissary, among the Swiss allies who assisted Francis I. in his expedition against Milan, 1522, and was present both at the storming of Novara and the battle of Bicocca. In the following year he was chosen landvoigt of Erlach; and from the year 1526 distinguished himself by his zeal in the cause of the Reformation. From this period he was entirely devoted to that cause, and to his various public employments. He died in 1531, when only forty-six years of age.

As a writer he began to distinguish himself in 1509, by various popular poems and songs in the Swiss dialect, full of humour and sharp satire. His 'Fastnachtspiele,' or 'Dramatic Moralities and Mysteries,' which he began to compose about 1522, are marked by the same qualities, in which his polemical pieces in support of the Reformation appear not to have been at all deficient.

(Dr. Grüneisen, *Nicolas Manuel, Leben und Werke eines Malers, Dichters, Kriegers, Staatsmannes, und Reformators*, Stuttgart and Tübingen, 1837; Nagler, *Neues Allgemeines Künstler-Lexicon*.)

MANUZIO, ALDO, born in 1447, at Bassano in the Papal State, studied at Rome and at Ferrara. He became intimate with Pico, count of Mirandola, and with Alberto Pio, lord of Carpi, with whose assistance he established a printing-press at Venice. The art of printing was first introduced into Italy from Germany by two Benedictine monks, called Sweinheim and Pannartz, who printed the works of Lactantius in the monastery of Subiaco in 1465. This was the first book printed in Italy. In 1469 two other Germans from Speyer established printing-presses at Venice, and soon after the art spread rapidly through Italy. The first Greek book was printed at Milan, and the first Hebrew types were used at Soncino near Cremona. Nicholas Johnson, a Frenchman, established a printing-press at Venice in 1471, which was distinguished for the elegance of its types. But Aldo Manuzio surpassed all other printers of his time in the correctness of his books. Being a man of learning as well as a printer, and having an extraordinary zeal for his profession, he procured the most correct manuscripts from distant countries, and he established an academy in his house, with the view of obtaining assistance in the superintendence of his publications. Bembo and Navagero were among the members of that society. The first publications of Aldo appeared about 1490: the first with a date in 1494. In this year he published the poem of 'Hero and Leander' in Greek and Latin, and shortly after the Grammar of Lascaris, and that of Gaza, with Theophrastus, and the works of Aristotle. He invented a new sort of type, which was light and resembled writing, called by the Italians 'corsivi,' and known to other nations by the name of 'Italic.' In this type he printed the Latin classics. A list of the Aldine editions was published at Padua in 1790: 'Serie delle edizioni Aldine per ordine alfabetico e cronologico;' and a still more complete catalogue has been since published at Paris by Renouard: 'Annales de l'Imprimerie des Aldes, ou Histoire des trois Manuces et de leurs éditions,' 2 vols. 12mo, 1803; a second edition of which, in 3 vols., was published in 1825, and a third, much improved, in 1 vol. 8vo, Paris, 1834. It is said that the Greek books of Aldus are less correct than his Latin and Italian prints: but it must be recollected that his Greek books are often printed from a single manuscript, and that an imperfect one; a circumstance however that renders some of his Greek books very valuable at present, as being tolerably faithful transcripts of manuscripts either now lost or not always accessible. These editions, especially when upon large paper, have often sold in modern times for considerable sums.

Aldo complains in several of his prefaces of the difficulties which he experienced, and the intense labour which he had to undergo in his profession, to which he devoted his whole life. He died at Venice in 1515, with the well-merited reputation of being not only an accurate printer, but a good scholar. He was the author of a Latin and Greek Grammar, a Greek and Latin Dictionary (the first of its kind), and several other works. His son Paolo Manuzio succeeded him in the direction of his printing establishment. Paolo was a man of learning, an author, and a critic. His principal works are: 1, 'Antiquitatum Romanarum liber de Legibus,' fol., 1569; 2, 'De Comitibus Romanorum;' 3, 'De Senatu Romano;' 4, 'De Civitate

Romana;' besides notes and commentaries on Cicero's Epistles and Orations.

\* MANZONI, ALESSANDRO, was born March the 8th, 1784, at Milan. His father, who was a count, and possessed a moderate property, died while Manzoni was young. His mother was a daughter of Beccaria, the author of the well-known treatise 'On Crimes and Punishments.' Manzoni received a college-education first at Milan and afterwards at Pavia. In 1803 he went to Paris with his mother, and during his residence there became acquainted with several of the leading literary men, and especially formed an intimate friendship with M. Fauriel, to whom he afterwards dedicated his tragedy of 'Il Conte di Carmagnola.' He first attracted attention by a poem in blank verse on the death of Carlo Imbonati ('In Morte di Carlo Imbonati,' Paris, 1806), a relative, who died in Paris, and left the whole of his property to Manzoni's mother. Manzoni returned to Italy in 1807, and in 1808 married Enrichetta Luigia Blondel, the daughter of a banker of Geneva. In 1809 he published 'Urania, Poemetta.' During his residence in Paris Manzoni had imbibed to some extent the delictical opinions which were then prevalent in the French metropolis. These notions however he renounced after his marriage, and became a devout Roman Catholic, as did also his wife, who had previously belonged to the Calvinistic protestant church. He made known the change which had taken place in his religious opinions by the publication in 1810 of his 'Inni Sacri,' a series of lyrical poems on the Nativity, the Passion, the Resurrection, the Pentecost, and the Virgin Mary. In 1820 he published his tragedy of 'Il Conte di Carmagnola.' In the construction of this tragedy he rejected the rule of French tragedy which limited the action to one day and one place; and defended the opposite system which he had adopted in a long 'Lettre de M. Manzoni à M. C—, sur l'Unité de Temps et de Lieu.' In this letter, written in French, the arguments are presented with great skill and force. In 1823 he published his tragedy of 'Adelchi.' The 'Carmagnola' has a chorus at the end of the second act; the 'Adelchi' has two of these lyrical compositions, one at the end of the third act, and another in the middle of the fourth. Both of the tragedies are accompanied by a series of interesting historical notices ('Notizie Storiche'), relating to the events and characters of the respective periods. After the death of Napoleon, May 5, 1821, Manzoni published an ode on the subject entitled 'Il Cinque Maggio.'

The work by which Manzoni has obtained a reputation throughout Europe is his historical novel, 'I Promessi Sposi,' 3 vols., Milan, 1827, which has been translated into English under the titles of 'The Betrothed' and 'The Betrothed Lover.' He has not since produced any other work of fiction. In 1834 he published 'Osservazioni sulla Morale Cattolica,' in reply to the remarks of Sismondi in the 127th chapter of his 'Histoire des Républiques Italiennes du Moyen Age.' This work has been translated into English under the title of 'A Vindication of Catholic Morality, or a Refutation of the Charges brought against it by Sismondi in his History of the Italian Republics of the Middle Ages,' 12mo, London, 1836. In 1842 Manzoni published the 'Storia della Colonna Infame,' which is a historical treatise having reference to that portion of the 'Promessi Sposi,' which described the plague that occurred in Milan in 1630. Among the circumstances of that event was a popular belief in the propagation of the disease by persons who were supposed to have anointed the walls of the houses with a poison fatal to those who touched it. Many persons accused of being 'untori' (anointers), were subjected to torture in order to procure confessions and accusations; and being tried, were found guilty, and executed with circumstances of appalling cruelty. The house of a barber of the name of Mora, the supposed preparer of the poison, was pulled down, and a column erected on the site, which remained standing near the Via Ticinese till 1778, and was called the Colonna Infame, or Column of Infamy, whence the name given by Manzoni to his treatise. Manzoni's first wife died in 1833; he afterwards married again, and has continued to live in retirement with his family at his villa of Brusano, near Milan.

Manzoni's poetical works, including his two tragedies, though they contain many passages of great beauty, are not of the very highest order; but 'I Promessi Sposi,' for skilful construction and interest of narrative, vividness of description, and discrimination and exhibition of character, is entitled to take rank beside the best of the historical novels of Sir Walter Scott.

MAPES, WALTER, or MAP, as he appears to have himself spelt his name, one of the most eminent writers of the reign of Henry II., was a native of the Welsh marches, where he was born, probably in Herefordshire, towards the middle of the 12th century. He studied at the University of Paris, where he appears to have been soon after 1160. On his return to England he was introduced to the court, and became a great favourite of the king, Henry II., who, according to Mapes's friend, Giraldus Cambrensis, esteemed him alike for his learning and his courtly manners. Henry sent him on a mission to the court of Louis VII. of France, and afterwards to attend a council called by Pope Alexander III., at which Mapes was directed to reply to the deputies sent by the Waldenses. Henry also made him a canon of the cathedral churches of St. Paul's and Salisbury, precentor of Lincoln, and eventually archdeacon of Oxford, besides giving him the living of Westbury in Gloucestershire and other ecclesiastical prefer-

ments. He appears to have accompanied the king in most of his progresses; and he acted in the western parts of England as a judge itinerant. He was made archdeacon of Oxford in 1196, after which there is no further mention of him. The date of his death is unknown, but it probably occurred very early in the 13th century.

Mapes is commonly known as the writer of certain satirical rhyming or Leonine Latin poems, and especially that which Warton calls "the celebrated drinking ode of this genial archdeacon," which begins, "Meum est propositum in taberna mori." Hence, says Warton, "he has been very happily styled the Anacreon of the 11th [12th] century." This drinking song however forms only part of a longer poem, where the stanzas are differently arranged; and Mr. Wright, who has collected for publication by the Camden Society all the poems attributed to Mapes, expresses very strong doubts whether he wrote that or any other of them. But this seems to be carrying sceptical criticism to an extreme, though it is remarkable that such of them as are known to have been in circulation during Mapes's life appear to have gone under the name of Goliath or Goliadus (a generic term for a loose and reckless liver); and so far was Mapes's name from being then associated with them, that, as Mr. Wright observes, "Giraldus speaks against them and their supposed author, Goliath, with great harshness in a chapter of the same book [*Speculum Ecclesie*], in which he dwells with so much warmth on his friend Mapes's praise." However, it is certain that these verses were at a very early period associated with the name of Mapes, and that only recently has any doubt been thrown upon his being the author of several of them. They have, as already stated, been collected and printed—both those which are usually regarded as his, and those which there really seem no grounds for ascribing to him—for the Camden Society, under the title of 'The Latin Poems commonly attributed to Walter Mapes, edited by Thomas Wright, F.S.A., &c., 4to, Lond., 1841.

Mapes was likewise a diligent writer of prose, both in the learned Latin and the courtly Anglo-Norman languages. His great prose work is entitled 'De Nugis Curialium,' and consists of a series of dissertations against the corruptions of courts and monasteries, and the general depravity of manners, conveyed in historic sketches and traditions of the English court from William II. to Henry II.—monastic stories, legends, &c.—accounts of heretics and heresies—and tirades against monks, especially of the Cistercian order; together with curious and interesting notices of Welsh manners, fairy legends, &c.: the whole of this strange combination being divided into five sections termed 'distinctiones,' a form of division adopted by Giraldus and some other writers of that period. Mapes's Latin style is impure, but his writings show much knowledge of the world, and contain much curious matter. The 'Nugis Curialium' has also been printed by the Camden Society—'G. Mapes de Nugis Curialium, Distinctiones Quinque. Edited from the unique manuscript in the Bodleian Library at Oxford, by T. Wright,' 4to, 1850.

To his Anglo-Norman writings we owe a large portion of the existing body of the romances of the Round Table. The 'Roman de Lancelot du Lac,' the 'Roman des Diverses Quêtes du St. Graal,' and 'La Mort d'Artus,' are expressly claimed as the work of Mapes in the last paragraph of the 'Mort d'Artus;' but the 'Quêtes du St. Graal,' Mapes asserts, he merely translated from a Latin original, which he says was drawn up by order of King Arthur himself, and deposited in the library of Salisbury Cathedral. (See further, Warton, 'Hist. of Eng. Poetry,' vol. i., ed. with notes, 1840; Craik, 'Sketches of the Hist. of Eng. Lit.,' vol. i.; Wright, 'Biog. Brit. Lit., Anglo-Norman Period,' and Introductions to the Camden Society's volumes noticed above.)

MARAT, JEAN PAUL, was born near Neuchâtel in 1744. He studied medicine at Paris; but, although not deficient in intelligence and quickness, he wanted the application and perseverance requisite for the regular study of his profession, and he became an empiric. At the first symptoms of the revolution in 1789, he showed himself a furious demagogue, addressing himself to the passions of the Paris populace, and preaching open insurrection and massacre. He was one of the members of the club of the Cordeliers, founded by Danton in 1790. He then became editor of a journal entitled 'L'Ami du Peuple,' which was hawked about the streets, and became a favourite with the lower orders. In this periodical he urged the poor to rise against the rich, the private soldiers against their officers, and the nation at large against the king. In 1792 he became a member of the first committee of public safety, and as such sent circulars all over France to recommend the massacre of the so-called aristocrats. He said in his paper that France would never be happy unless 270,000 heads were struck off by the guillotine; and he actually published long lists of individuals whom he denounced as proper objects of public vengeance: yet this man was returned by the department of Paris to the National Convention.

In the convention, Marat was the declared enemy of the Girondins: he attacked them in April 1793, but Robespierre, who was more cautious, checked him then: things were not yet ripe for their proscription. Marat was even impeached, and underwent a mock trial before his friends of the revolutionary tribunal, but was acquitted, and re-entered the Convention in triumph. He saw the downfall of the Girondins, but did not long survive them. On the 13th of July 1793, while taking a bath, a young woman from Normandy, named

Charlotte Corday, was introduced to him, under the pretext of having some pressing information to communicate. She showed him a list of pretended aristocrats in her own district, and while Marat was reading it she stabbed him to the heart, boasting that she had delivered France of a sanguinary monster. She was guillotined, and died with the greatest composure. [CORDAY D'ARMANS.]

Marat was proclaimed by the Jacobins, as a martyr of liberty, and his body was interred with great honour in the Pantheon, the former church of St. Gervaise, from which it was removed after the end of the reign of terror. Marat has been called a madman, but there was method in his madness; he was one of those depraved men whom revolutionary convulsions throw up to the surface of society.

MARATTI, CARLO, the last eminent painter of the Roman school, was born at Camurano, in the March of Ancona, May 15, 1625. From his childhood he manifested a great fondness for drawing and painting. In his eleventh year he went to Rome, and became the favourite pupil of Andrea Sacchi, with whom he remained till he was nineteen years of age. By studying the works of Raffaello, the Caracci, and Guido Reni, he formed a style peculiar to himself, and acquired during his lifetime the reputation of being one of the first painters in Europe, though his talents were certainly not of the highest order. He was particularly celebrated for the lovely, modest, and yet dignified air of his Madonnas, which procured him the name of Carlo del Madonne. He painted for Louis XIV. his celebrated picture of 'Daphne.' Pope Clement IX., whose portrait he painted, gave him a pension, and conferred on him an order of knighthood. He was patronised by six successive popes; and the churches and palaces of Rome, which are filled with his works, are proofs of the esteem in which he was held. He was employed also in restoring the frescoes of Raffaello in the Vatican, and of Annibale Caracci in the Farnese Palace. He also etched several beautiful plates. Of his pupils, the best known are F. Jorani and Chiari. He likewise promoted the art of engraving, and the famous engraver Jacob Frey was his scholar. In private life he was highly esteemed for his modesty and obliging disposition. He died at Rome, December 15, 1713.

MARBECK, JOHN, who, as composer of the solemn and now venerable notes set to the 'Proces' and Responses, which are still in use, with some alterations, in all our cathedrals, is entitled to our notice, was organist of Windsor during the reigns of Henry VIII. and his successor. A zeal for religious reformation led him to join a society in furtherance of that object, among the members whereof were a priest, a singing-man of St. George's Chapel, and a tradesman of the town. Their papers were seized, and in the handwriting of Marbeck were found notes on the Bible, together with a Concordance, in English. He and his three colleagues were found guilty of heresy, and condemned to the stake. The others were executed according to their sentence; but Marbeck, on account of his great musical talents, and being rather favoured by Gardiner, bishop of Winchester, was pardoned, and lived to witness the triumph of his principles, and to publish his work, which appeared under the title of 'The Boke of Common Praier, noted.' The colophon is "Imprinted by Richard Grafton, printer to the kinges majestie, 1550, cum privilegio ad imprimendum solum." In the same year appeared also his Concordance; and in 1574, 'The Lives of Holy Sauncts, Prophets, Patriarchs, and others;' and subsequently his other books connected with religious history and controversy. He died about 1585.

MARCELLINUS AMMIANUS. [AMMIANUS MARCELLINUS.]

MARCELLINUS was bishop of Rome in the reign of the emperor Diocletian. He has been represented by some as having, through fear during the persecution raised under that emperor, offered incense to the heathen deities, but this is contested by others. He died A.D. 304.

MARCELLO, BENEDETTO, a patrician of Venice, son of Agostino Marcello, a senator, was born in 1686. His elder brother, Alessandro, who was famed for his knowledge in natural philosophy and mathematics, as well as for his musical acquirements, had weekly music-parties at his house, to which probably the early predilection of Benedetto may be attributed. Among the masters to whom the care of his education was assigned are mentioned Gasparini and Lotti, under whom he studied composition, but we do not find that he produced anything particularly worthy of notice till 1716, in which year a serenata from his pen was performed at Vienna, when the birth of the first son of the emperor Charles VI. was there celebrated with much ceremony and splendour.

His great work, and that to which is to be ascribed the celebrity of his name throughout Europe, was published in 8 vols. folio, in the years 1724 and 1726, under the title of 'Estro Poetico-armonico, Parafraasi sopra i 50 primi Salmi, Poesia di G. A. Giustiniani, musica di B. Marcello, patrizi Veneti.' The learned M. Suard, whose reputation as a musical critic once stood high, seems to approve the rather strong term with which this title commences; for, says he, nothing equals the enthusiasm that reigns in all these compositions; it transfers to music the energy of Oriental thought, and converts the composer at once into a Pindar and a Michael Angelo. Whichever may have been the degree of enthusiasm possessed by Marcello—and doubtless it was great—there is certainly too much of it in this opinion. Graceful and appropriate melody, supported by harmony of the purest kind, is his true characteristic. He occasionally, though not often, is grand, but this grandeur springs out of simple sources

and does not count learned combinations and complicated parts among its elements. In his style is to be traced sound musical knowledge, guided by good sense and polished by good taste.

Mr. Avison, in his well known 'Essay on Musical Expression,' carries his admiration of Marcello's Psalms to great lengths, and leaves us to infer that he considers them at least on a level with the works of the Italian's great contemporary, Handel. Time has shown the extravagance of this opinion, and assigned to the Venetian composer his true rank, which undoubtedly is high, though far from being of the loftiest kind. Avison however evinced the sincerity of his admiration by issuing proposals for publishing an edition of the 'Salmi' set to English words; but the execution of this design devolved on Mr. Garth, organist of Durham, who very skilfully adapted to the music our own prose translation of the Psalms, and published the work (which is now to be found in most musical libraries) in eight handsome folio volumes. Marcello composed many other works besides his Psalms, but few, if any of them, have survived. He did not confine his attention to music, but was an active magistrate, and during many years one of the Council of Forty. He died July 24, 1739.

MARCELLUS, EMPIRICUS, was born at Bordeaux, and was *magister officiorum* in the reign of Theodosius the Great. The only work of his which has come down to us is entitled 'De Medicamentis empiricis, physicis et rationalibus,' published at Basel, 1537, Venice, 1547; and with the 'Medici Principes,' Paris, 1567. Though Marcellus does not appear to have belonged to the medical profession, he gives us much curious information respecting the manner in which medicine was studied at that time in Gaul.

MARCELLUS, MARCUS CLAUDIUS, born of a Roman consular family, after passing through the offices of *ædile* and *quæstor*, was made consul B.C. 224. The Transpadane Gauls having declared war against Rome, Marcellus marched against them, defeated them near Acerræ on the Addua, killed their king Viridomarus, and carried off his arms, the "spolia opima," which were exhibited in his triumph. At the beginning of the second Punic war, Marcellus was sent to Sicily as prætor to administer the Roman part of the island, and had also the task of keeping the Syracusans firm to their alliance with Rome. After the battle of Cannæ he was recalled to Italy, to oppose Hannibal. He took the command of the relics of the Roman forces in Apulia, kept Hannibal in check, and defended Nola. In the year 214 B.C., being again consul, he took Casilinum by surprise. He was next sent to Sicily, where Syracuse had declared against Rome. [HIRONUMUS.] After a siege of nearly three years, the town was taken in the year B.C. 212, and Marcellus returned to Rome with the rich spoils. Archimedes lost his life on the occasion of this taking of Syracuse. [ARCHIMEDES.] Marcellus did not obtain the triumph, but only the ovation, as the war in Sicily was not entirely terminated.

In the year B.C. 210 he was again chosen consul, and had the direction of the war against Hannibal in Apulia, when he took the town of Salapia, and fought several partial engagements with the Carthaginians without any definite result. In the following year he continued in command of the army, and fought a battle against Hannibal near Cannusium, in which the Romans were defeated and ran away. On the following day Marcellus renewed the fight and defeated the Carthaginians, upon which Hannibal withdrew to the mountains of the Bruttii. In the next year, B.C. 208, Marcellus was elected consul, for the fifth time, with T. Quintus Crispinus. He continued to carry on the war against Hannibal, when, being encamped near Venusia, he rashly ventured out, fell into an ambuscade of advanced posts, and was killed. Hannibal caused his body to be buried with honour. (Livy, xxvii. 2, 14, 29.) He was one of the most distinguished Roman commanders during the second Punic war, and had the honourable reputation of a disinterested man.

MARCELLUS, ULPPIUS, a Roman jurist, who lived under Antoninus Pius and his successors. He was employed by Pius as one of his legal advisers (Capitolinus, 'Anton. Pius,' 12), and also apparently by Aurelius, the successor of Pius ('Dig.' 28, tit. 4, s. 3), for Marcellus speaks of the proceedings in a case before Aurelius, A.D. 166, in which the emperor delivered judgment. Marcellus ('Dig.' 26, tit. 2, s. 19), as quoted by Ulpianus, cites an oratio of the Divi Fratres, which proves that he survived Aurelius, if the word Divi was used by him, and is not introduced by Ulpianus. It is conjectured that this is the Ulpian Marcellus who commanded in Britain during the reign of Commodus, the successor of Aurelius, and by his military success excited the jealousy of the emperor. (Dion Cassius, lxxii. 8.) But it is doubtful if this Ulpian Marcellus is the jurist. (See the note of Reimarus on Dion Cassius.)

The writings of Marcellus mentioned in the Florentine Index are thirty-one books of Digesta, six books on the *Leges Julia et Papis*, and two books of *Responsa*. There are 159 excerpts from Marcellus in the Digest; and other works of his are cited besides those just enumerated. Marcellus is quoted by Marcianus, Ulpianus, and Paulus frequently, and by Modestinus.

MARCELLUS I. succeeded Marcellinus as bishop of Rome, but we know little of him, except that he is said to have been strict in enforcing the discipline of the church. He died A.D. 310.

MARCELLUS II. was elected after the death of Pope Julius III. in 1555, but died in less than a month after his election. He was succeeded by Paul IV.

MARCIA'NUS, born in Thrace of obscure parents towards the end of the 4th century, entered the army, rose gradually by his merit to high rank, and was made a senator by Theodosius II. When Theodosius died (A.D. 450), his sister Pulcheria, then fifty-two years old, offered her hand to Marcianus, who was near sixty, because she thought him capable of bearing the crown with dignity and advantage to the state. Marcianus married her, and was proclaimed emperor. His reign, which lasted little more than six years, was peaceful, and his administration was equitable and firm. He refused to pay to Attila the tribute to which Theodosius had submitted. In the year 455 Marcianus acknowledged Avitus as Emperor of the West. Marcianus died in 457; his wife Pulcheria had died before him. He was succeeded by Leo I.

MARCIA'NUS ÆLIUS, a Roman jurist, who was writing after the time of Septimius Severus, for he calls him Divus ('Dig.' 50, tit. 4, s. 7). He also survived Caracalla, the successor of Severus, for he names him Divus ('Cod.' 9, tit. 8, s. 8). He probably wrote chiefly under the reigns of Septimius and his son Caracalla. The works of Marcianus which are mentioned in the Florentine Index are sixteen books of *Institutiones*, four books entitled *Regularia*, two books on *Appellationes*, two books on *Publica Judicia*, a single book on *Delatores*, a single book on the *Hypothecaria (formula)*, and a single book *Ad Senatusconsultum Turpilianum*. Marcianus is cited by Ulpianus and Paulus ('Cod.' 7, tit. 7.) There are 275 excerpts from Marcianus in the Digest.

MARCUS GRÆCUS. Of this writer, and his 'Liber Ignium,' nothing is known but one old mention and a quotation. A certain Græcus is mentioned (about A.D. 800) by the Arabic physician whose name is Latinised into Mesua. John Mesua's medical works were printed at Venice, 1581, folio. There is a surmise by Fabricius and Dutens, that this same Græcus is mentioned by Galen. His name first appears, as far as we can find, in Dr. Jebb's edition of Roger Bacon. In speaking (preface, sheet C, leaf 1) of Bacon's distinct reference to some sort of detonating powder, Jebb thinks he may have drawn his account from the 'Liber Ignium' of a certain Marcus Græcus, of which work he (Jebb) had seen a manuscript in the possession of Dr. Richard Mead. Dutens, author of the 'Origine des Découvertes attribuées aux Modernes,' procured the account from Dr. Jebb, and ascertained that there was a manuscript in the Royal Library at Paris: but the work has never been printed. [BAOON, ROGGE.] As the passage in question is not easily met with entire, and certainly describes gunpowder and its consequences, in the form of a rocket, we shall transcribe it, seeing that the early existence of some such thing as gunpowder is clearly indicated, not merely by the passage itself, but by Bacon's reference to it or a similar account:—

"Secundus modus ignis volatilis hoc modo conficitur: lib. i sulphuris vivi; lib. ii carbonis salicis; salis petrosi vi libras, que tris subtilissimè terantur in lapide marmoreo. Postea pulvis ad libitum in tunica reponatur volatili, vel tonitrum faciente. Nota quod tunica ad volandum debet esse gracilis et longa, et prædicto pulvere optimè conculcato repleta. Tunica vel tonitrum faciens debet esse brevis, grossa, et prædicto pulvere semiplena, et ab utraque parte filo fortissimo bene ligata. Nota quod in qualibet tunica primum foramen faciendum est, ut tenta imposita accendatur, que tenta in extremis tibus fit gracilis; in medio vero lata, et prædicto pulvere repleta. Nota quod ad volandum tunica plicaturas ad libitum habere potest, tonitrum vero faciens quam plurimas plicaturas. Nota quod duplex poterit facere tonitrum ac duplex volatile instrumentum, vel tunicam subtiliter in tunica includendo."

MARENZIO, LUCA, the most voluminous, and, in the opinion of many, the best of all the composers of madrigals, was born at Coucaglia in Breecia, about the middle of the 16th century. His parents were poor, but his fine voice recommended him to the protection of the principal ecclesiastic of the place, who had him instructed in music by Giovanni Contini, the author, we are told, of many sacred compositions. His first appointment was as 'maestro di Capella' to the cardinal Luigi d'Este, and at Rome, says Adami, he was beloved and caressed by many great personages, and among the number by the king of Poland, on whose invitation he paid a visit to the dominions of that monarch. Peacham, in his 'Complete Gentleman,' tells us that he was "in displeasure with the pope, for overmuch familiarity with a kinswoman of his holiness," which was the cause of his quitting Italy for a time. He states other particulars relative to this, which are extraordinary at least, but now not worth investigating. Marenzio returned however to the papal city, and was admitted into the pope's chapel, but in what capacity does not appear; Peacham says as organist; Dr. Burney denies this, assigning as the reason of his disbelief, that in the papal chapel there is no organ. The former, who certainly was acquainted with Marenzio, describes him as a "little black man," and mentions the first, second, and third parts of his 'Thyrsis,' as "songs the Muses themselves might not have been ashamed to compose." He died at Rome in 1599.

In relation to his style of composition the Italians described him as 'impro dolce cigno' (the sweetest swan), and the praise thus poetically expressed was perfectly just. Indeed as respects tenderness of air and gracefulness of harmony he has had few rivals. In vigour of imagination he has superiors, among whom our own best English madrigalists may be named without incurring the charge of national partiality. As

he was one of the earliest composers of eminence, his works have been open to all, and he has been more or less imitated by many writers of vocal music in parts. Handel and Purcell, as Dr. Burney remarks, did not disdain to become his debtor.

MARGARET, daughter of Waldemar III., king of Denmark, married in 1363 Haquin, king of Norway, on the death of Waldemar. In 1375 Margaret's son Olaus, then a minor, succeeded to the crown of Denmark under the guardianship of his mother. His father Haquin dying, Margaret was acknowledged queen of Norway. Olaus died in 1387, and the Danes also acknowledged Margaret as their queen. She turned her arms against Albert, king of Sweden, who was not popular with his subjects, defeated him, and made him prisoner, and was then acknowledged queen of Sweden. After seven years' confinement, she released Albert, on condition of his formally renouncing the crown of Sweden. In 1396 the estates of the three kingdoms assembled at Calmar, where it was agreed that in future they should all be ruled by one and the same sovereign. This act was called the 'Calmar Union.' On this occasion Margaret designated her nephew Erick as her successor. She died October 28, 1412, being fifty-nine years of age.

Margaret had many great qualities; but her political conduct, especially in her transactions with Sweden, was marked by duplicity and violence. To the Danes however she proved a good queen. She loved pomp and splendour, was brave and resolute, and had rather the qualities of the stronger sex than those of her own. [ERICK XIII. of Sweden.]

MARGARET OF ANJOU. [HENRY VI.]

MARGARET OF RICHMOND. [HENRY VII.]

MARGARITONE D'AREZZO, a celebrated old Italian painter, sculptor, and architect, was born at Arezzo, in 1236, and being an older painter than Cimabue he was little influenced by the innovations of that famous artist. Margaritone was a painter of the Greek or Byzantine school, and of great reputation in his day. He executed many works in Arezzo, both in tempera and in fresco; in the latter style he painted the whole interior of the old church of San Clemente, which, with other buildings, was destroyed by the Duke Cosmo de' Medici in 1547, to make room for improvement in the fortifications of Arezzo. Most of Margaritone's works have now perished; but one, which, according to Vasari, Margaritone considered one of his masterpieces, namely, 'San Francesco,' painted for a convent in Sargiano, still exists, and is engraved in Lastris' 'Etruria Pittrice,' l. 7. Vasari speaks highly of a picture on canvases, illustrating the lives of the Virgin and John the Baptist, in small figures, and in which, says Vasari, Margaritone much surpassed his larger works; but this picture has also perished. There is still an old painted wooden crucifix by Margaritone in the church of Santa Croce at Florence, where it is placed by the side of a similar work by Cimabue. Margaritone's fame was very great in his time, but it was almost wholly eclipsed by the reputation of Cimabue and Giotto. He had a peculiar way of stretching and priming his canvases; they were primed with plaster mixed with size or glue made of strips of parchment, and were stretched and fastened with the same glue upon a pannel.

In sculpture, says Vasari, Margaritone was more successful than in painting. There is still by him, in the cathedral of Arezzo, a reclining marble statue of Gregory X. over the tomb of that pope, which was also constructed by Margaritone; in the upper part of the tomb was also Gregory's painted portrait, but this has been defaced by time: this monument, according to Vasari, is Margaritone's masterpiece. As an architect, Margaritone conducted the building of the cathedral of Arezzo, some time after the death of Jacopo Lapo, but according to the design of that architect, from about 1277 until 1289, when a war broke out between Arezzo and Florence. He died at Arezzo in 1313.

The National Gallery has one painting by him (No. 564), 'The Virgin and Child with Scenes from the Lives of the Saints.'

MARIA THERESA, archduchess of Austria, queen of Hungary and Bohemia, and empress of Germany, born in 1717, was the eldest daughter of Charles VI. of Austria, emperor of Germany. [CHARLES VI.] In 1724 Charles by his will, known by the name of the Pragmatic Sanction, regulated the order of succession in the family of Austria, declaring that, in default of male issue, his eldest daughter should be heiress of all the Austrian dominions, and her children after her. The Pragmatic Sanction was guaranteed by the diet of the empire, and by all the German princes individually, and also by several other powers of Europe, but not by the Bourbons.

In 1736 Maria Theresa married Francis of Lorraine, who, by the peace of Vienna of the preceding year, had been recognised as the future grand-duke of Tuscany, after the death of Gian Gastone, the last offspring of the house of Medici. Gian Gastone died in July 1737, and Tuscany became subject to Francis, who in January 1739 repaired to Florence with his consort. Upon the death of Charles VI., in 1740, the king of Prussia, the elector of Bavaria, the elector of Saxony, France, Spain, and the king of Sardinia, agreed to dismember the Austrian monarchy, to parts of which each of those powers laid claim. Maria Theresa however, with a spirit and decision remarkable for her age, lost no time in repairing to Vienna and taking possession of Austria, Bohemia, and her other German states; she then proceeded to Presburg, took the oaths to the constitution of Hungary, and was solemnly proclaimed queen of that kingdom in 1741. Frederic of Prussia offered the young queen his friendship on the condition of her

BIOG. DIV. VOL. IV.

surrendering Silesia to him, but she resolutely refused, and Frederic invaded that province. The elector of Bavaria on his part, assisted by French auxiliaries, invaded Austria and Bohemia, and pushed his troops to the gates of Vienna. Maria Theresa, being obliged to quit her capital, repaired to Presburg. Convoking the Hungarian diet, she appeared in the midst of that assembly with her infant son Joseph in her arms. She told the magnates, prelates, and deputies, that "being assailed by enemies on every side, forsaken by her friends, and finding even her own relatives hostile to her, she had no hopes except in their loyalty, and that she had come to place under their protection the daughter and the son of their kings." This heart-stirring appeal was answered by a burst of chivalric enthusiasm. The Hungarian nobles, drawing their swords, unanimously cried out, "Moriatur pro Rege nostro Maria Theresa," and the whole military force of Hungary was soon in arms to defend their queen. Her troops under General Kevenhuller and Prince Charles of Lorraine, her brother-in-law, fought gallantly, and drove the French and Bavarians out of the hereditary states. In the meantime Charles Albert, elector of Bavaria, was elected emperor of Germany, by the diet assembled at Frankfurt, by the name of Charles VII.

Frederic of Prussia soon made peace with Maria Theresa, who was obliged to surrender Silesia to him. She also made not only a peace but a treaty of alliance with the King of Sardinia against the French and Spaniards, who were kept in check on the side of Italy. In 1748 the French were entirely driven out of Bohemia. In 1744 Frederic again declared war against Maria Theresa, and invaded Bohemia; but the elector of Saxony, who had made his peace with her, sent the queen reinforcements, which obliged the Prussians to evacuate the country. In 1745 Charles VII. died, and Francis, Maria Theresa's husband, was elected emperor. In 1746 the Austrian and Piedmontese troops obtained great advantages in Italy; they gained the battle of Piaccenza against the French and Spaniards, and occupied Genoa, which however they afterwards lost through a popular insurrection. In 1747 the war continued to rage in Italy and Flanders, with various success. In 1748 the peace of Aix-la-Chapelle terminated the war called "the war of the Austrian succession," and Maria Theresa was left in peaceful possession of all her hereditary dominions, except Silesia, which the King of Prussia kept.

In 1756 began the Seven Years' War, between France, Austria, and Russia on one side, and Frederic of Prussia on the other. [FREDERIC II.] It ended in 1763, leaving both Austria and Prussia with the same boundaries as before. In 1765 Maria Theresa lost her husband, for whom she continued to wear mourning till her death, and her son Joseph was elected emperor. [JOSEPH II.] She however retained in her hands the administration of her dominions, and devoted all her cares to promote their prosperity and to the improvement of the people under her sway.

The only important act of Maria Theresa's political life with which she can be reproached is her participation in the first partition of Poland. The plan however did not originate with her, and she for some time refused to accede to the treaty of partition drawn up by Prussia and Russia in 1772, until she was plainly told that Russia and Prussia would effect the dismemberment of Poland without her consent, and that by refusing to accede to it she would only endanger her own dominions. Prince Kaunitz and her own son Joseph II. urged her to join the two other powers; she was told that Galicia and other parts of Poland were ancient dependencies of the crown of Hungary, and at last she gave her assent.

The improvements which Maria Theresa made in her dominions are many and important. In 1776 she abolished the torture in her hereditary states, and in the kingdoms of Hungary and Bohemia. In 1777 she abolished the rural and personal services which the peasants of Bohemia owed to their feudal superiors, and commuted them for a sum of money. Literary piracy was forbidden under severe penalties. Between the years 1774-78 she occupied herself with the establishment of a general system of popular education in her dominions. She divided the schools into three classes: 1, 'normal schools,' one in each province, to serve as a model for all the other schools in the province; 2, 'principal schools,' in the large towns; 3, 'communal schools,' in the small towns and villages. A central commission of studies was also appointed to superintend the whole, which received annual reports, and examined candidates for the masterships.

Maria Theresa was a sincere Roman Catholic, but not a blind devotee of the court of Rome, and she knew how to discriminate between the temporal and spiritual jurisdictions. In her instructions to the Junta, or Board of Public Economy, dated June 1768, she states the principle that "everything which is not of divine institution is subject to the supreme legislative authority of the state." Agreeably to this principle she made several important reforms in the temporalities of the clergy: she suppressed the pensions charged at Rome upon benefices; she forbade the alienation of landed property in favour of ecclesiastical bodies; she ordered all the property of the clergy to be registered; she placed the convents under the jurisdiction of the respective bishops, and in temporal matters under that of the civil magistrate. She put a check to the arbitrary power of the Inquisition, which still existed in her Italian dominions: she took out of its hands the censorship of books and gave it to a commission of

civil magistrates appointed for the purpose. In Tuscany, which was administered by a council of regency in the name of her second son Leopold, she ordered that lay assessors should be joined to the inquisitors in all suits for heresy. She also took away the *sbirri*, or armed force, which was before under the orders of the inquisitors. The Inquisition of Lombardy and Tuscany was finally abolished under the reign of her sons Joseph and Leopold.

Maria Theresa possessed the strong affection of her Belgian subjects, and it required all the subsequent rashness of Joseph II. to detach them from their loyalty to Austria. The Belgian capitalists eagerly supplied the loans which the court of Vienna was obliged to contract during the Seven Years' War.

In Lombardy the administration of Maria Theresa and of her minister Count Firmian was a period of returning happiness for that fine country, after the vicissitudes of the preceding wars and the previous long misrule of the Spanish governors. The empress ordered a new censimento, or valuation of estates, for the purpose of an equitable assessment of the land-tax; she caused the *bilancio camerale*, or a regular budget of the public revenue and expenditure, to be made; she abolished the custom of farming the various branches of the indirect duties to the highest bidder, made regulations to protect the peasants against the oppression of their feudal superiors, and established representative communal councils to superintend the local expenditure; she began, in short, and effected to a considerable extent, that great legislative and administrative reform which was completed under her successor Joseph II. Firmian encouraged men of learning, and protected them against the cabals of their enemies. Pietro Verri was made counsellor and president of the financial board; Beccaria was appointed professor of political philosophy; Carli was made president of the council of commerce; and the advice and suggestions of these men were listened to, appreciated, and followed. The naviglio, or navigable canal of Paderno, which joins the Adda to the Martesana, was executed under Maria Theresa. In 1749, soon after she obtained peaceful possession of Lombardy, the duchy of Milan contained 900,000 inhabitants; in 1770 the population had risen to 1,130,000. Maria Theresa will ever rank high among illustrious women, and among those sovereigns who have been the benefactors of mankind. She died at Vienna on the 29th of November 1780. With her ended the house of Austria Habsburg, and at the same time began the present dynasty of Austria Lorraine.

MARIANA, JUAN, was born at Talavera in 1586. He early showed great talents, which were developed under the eminent teachers of the University of Alcalá, such as Father Cyprian of Huerça and others. At the age of seventeen Mariana joined the Jesuits, who had already acquired a reputation which attracted to them the ablest students. He had to pass two probationary years at Simancas, under Saint Francis of Borja, the hereditary duke of Gandía, and favourite of Charles V., who had renounced the world to join the new order. After this probation Mariana returned to Alcalá to resume his studies. In 1588 he was appointed to a professorship by Laynez, the second general of his order, who framed the rules of the Jesuits, raised their aspirations, prepared them for the influence which they afterwards exercised, and opened their splendid college 'Il Gesu' at Rome.

In this college Mariana, at the age of twenty-four, taught scholastic philosophy and divinity. Among his pupils was the young Jesuit (afterwards cardinal) Bellarmín. Mariana was sent in 1585 to open a course of divinity in Sicily, and thence to Paris two years after on the same mission, in which he was still more successful. Seven years of unremitting application in an ungenial climate so greatly impaired Mariana's health, that he was permitted to retire to Toledo, near his birthplace. But his talents and moral worth were still put in requisition. He restored and edited the works of Saint Isidore, to which he added some valuable notes. When Leon de Castro questioned the orthodoxy of Arias Montano, for introducing Rabbinical readings and commentaries into the 'Plantina Regia,' or 'Philippina Polyglott,' a new edition of the 'Complutensis,' which Montano had undertaken at the command of Philip II., Mariana silenced the noisy polemic by his historical, ecclesiastical, and biblical lore, as well as by the fair and candid tone of his discussion.

In the meantime he proceeded during his leisure hours with the great work which he had long contemplated. He had observed that the sudden rise and ascendancy of Spain excited a general interest and curiosity abroad, while its origin and causes were either unknown or misunderstood. The Spanish historians, though numerous, were at that time little read, and some of them were hardly known. His 'History of Spain' first appeared in twenty books, under the title 'Historiæ de rebus Hispaniæ,' fol., Toleti, 1592, libri xx. It was subsequently extended to thirty books, in which form it appeared in the complete edition of 1605, published at Mainz. This compact and lucid exhibition of an unbroken chronological narrative, from the origin of the Spanish nation to the death of Ferdinand the Catholic (a period of twenty-five centuries at least), embraces the history of all the Spanish kingdoms, which had hitherto been treated separately. A subject so extensive, expressed in classical Latin, met with universal favour and acceptance. A Spanish translation soon became necessary, and fortunately Mariana accomplished the task himself, and carried the work through four successive Spanish editions in his lifetime.

Mariana has been charged with credulity; but traditions held sacred

in times past, although rejected in the present age—prodigies which formed part of history, and which Mariana could not dismiss with the disdainful smile of modern criticism, are spots which will never obscure the brilliancy of his digressions on some of the most important events of the world, events which appear as great causes when so admirably interwoven with those peculiarly belonging to the history of Spain.

The manly feelings of the historian, his noble indignation against crimes, his bold exposure of the misdeeds of princes and their abettors, deserve still higher commendation. Yet he, as well as Ferreras and Masdeu more recently, has spared a gross instance of Queen Urraca's licentious conduct; but on the other hand, the defence of Queen Blanca's honour is highly creditable to Mariana. It is true also that Mariana did not always examine all the original authorities, as Ranko observes in the 'Kritik neuerer Geschichtschreiber;' but to institute an inquiry into every minor detail, to comprehend a wide field of inquiry, and yet to open new and to disdain all trodden paths, would have required the perusal of whole libraries, and a single life would not have been sufficient to complete the undertaking. And if others had been invited to join in the labour of the investigation, a motley compilation might have been the only result of so much research, which it is almost impossible ever to combine into one harmonious whole. Mariana's portraits of lords and favourites were found too original and faithful by the living; as in the case of the Condestable of Castile, Fernandez Velasco, and his worthy secretary Pedro Mantano. The secretary, after having been a panegyrist of the new historian, tried to serve his master by his attack on Mariana, entitled 'Advertencias á la Historia de Mariana.' He was discovered however, and roughly treated by Tamayo Vargas in 'La Defensa de Mariana.' Probably to this criticism may be traced many improvements in Mariana's second Spanish edition of his history, which appeared at Madrid, 1608. It is on this edition and the various readings selected from the editions of 1617 and 1623, that the edition of Valencia is based, which contains ample notes and illustrations, 9 vols. 8vo, 1783-96. This edition also closes, like the original, with the reign of Ferdinand the Catholic (1515-16). There has subsequently been published at Madrid—1, The continuation of Mariana, by Miñana, translated from the Latin, by Romero, fol., 1804; 2, A complete Mariana, continued down to the death of Charles III., 1788, by Sabau y Blanco, 20 vols. 4to, 1817-22; 3, Another by the same, brought down to the year 1808, 9 vols. 8vo, with portraits.

Mariana's little respect for potentates and great personages was denounced with greater asperity when his 'De Rege et Regis Institutione' appeared in 1599. By his attempt on the life of Henri IV., in 1594, Jean Chatelet, who had studied among the Jesuits, not only involved the whole body in the odium of his crime, but provoked a decree for their expulsion from France. Finally the assassination of Henri, in 1610, which was supposed to have been instigated by the Jesuits, excited such horror, that the parliament of Paris condemned the new tract of Mariana to the flames; and his treasonable doctrines, as they were called, continued during the whole of that age of loyalty and part of the following to furnish a common subject of animadversion and a chief ground of accusation against the Jesuits. The Jesuits have indeed occasionally supported the claims of the people against their rulers, but always with a view to the interests of their own body only. Mariana, on the contrary, discussed this subject on better and higher grounds. Mankind occupied his thoughts, and had a much stronger hold on his affections than the interests and plans of his order. By his defence of Arias Montano, already mentioned, he lost all chance of preferment, which however he was glad to exchange for learned leisure and the gratification of his love of historical research. Mariana published also, in 1599, his imperfect work, 'De Ponderibus et Mensuris,' a subject which his countrymen Lebrija or Nebrija, Diego Covarrubias, Pedro Ambrosio Morales, and Arias Montano, had treated before, and which Eisen Schmidt, Freret, Fauchon, &c., have pursued much further since.

The profound erudition of Mariana is also displayed in his 'Tractatus Septem,' Cologne, 1609. The second of these treatises, 'De Editione Vulgata,' is an epitome of his report on the fierce controversy between Arias Montano and Leon de Castro. The fourth, 'De Mutatione Monetæ,' provoked the indignation of the Duke of Lerma and his partners in the system of general speculation and frauds which Mariana exposed. He foretold the calamities which threatened the Spanish nation; and his words, which had been disregarded, were remembered when the opportunity was gone. As a reward for proclaiming such unwelcome truths, at the age of seventy-three he suffered a whole year of judicial trickery, humiliations, and confinement in the convent of St. Francis at Madrid. In searching his papers another exposure was found, entitled 'Del Gobierno de la Compañia,' or on the defects of his order, in which he also pointed out the means of correcting them. Copies of this manuscript had multiplied so alarmingly, that the year after the author's death, the general of the Jesuits, Vitaleschi, issued a circular, dated Rome, July 29, 1624, enjoining the collection of such papers in order to be burnt. Still that measure did not prevent its being printed at Bordeaux in 1625, and reprinted elsewhere in several languages. This curious circular was found in the archives of the Jesuits of Valencia at the time of their sudden expulsion from the Spanish dominions in 1767.

After his persecution he made an epitome of the 'Bibliotheca' of Photius, translated some homilies, revised his 'History of Spain,' and published a supplement, or rather a summary, or concise annals of Spain from 1515 to 1612. At the age of eighty-three he published his 'Scholia' on the Old and New Testament, availing himself of the best Hebrew commentaries, and some valuable and very early manuscripts, which dated from the age of the ancient Gothic dominion in Spain. This work secured for him a place among the best commentators in the 'Histoire Critique du Vieux Testament' of the hypercritical Father Simon, who is usually unfavourable to Spaniards. Bayle, in his 'Dictionary,' supposes Mariana to be also author of a work 'De Republica Christiana,' but neither Alegambe nor Nicolas Antonio, both of them Spaniards, mentions it. Stevens, the English translator of Mariana's history, mistakes some particulars of the author's life, and very unaptly compares him with Raleigh. Mariana left manuscripts of at least twice the extent of all his publications. He died on the 6th of February 1623, in the eighty-seventh year of his age and the forty-ninth of his retirement to Toledo.

Besides the authorities quoted there may be added:—Mondejar, *Advertencias á Mariana*; *Juicio y Noticia de los Historiadores de España*; Andrade, *Vida de Mariana*; Acosta, *Vida de Mariana*; Andr. Schot., *Hispan. Illustrat.*; Baronius, *Annal. Ecclesiast.*; Bernard. Girald., *Pro Senatu Veneto*, quoted in Colomesius, *Hispania Orientalis*; René Rapin, *Réflexions sur l'Histoire*.

MARIE ANTOINETTE, born at Vienna November 2nd, 1755, was the daughter of Francis of Lorraine, emperor of Germany, and of Maria Theresa of Austria. In May 1770 she married Louis, the dauphin, grandson of Louis XV., who in 1774 became king of France, under the name of Louis XVI. She was handsome, lively, and thoughtless, but kind-hearted and with good intentions. She disliked the etiquette and reserve of the court, but she affected, rather too ostentatiously, a taste for privacy and domestic familiarity. Although her thoughtlessness afforded a pretence for slander, her private conduct has been generally allowed to have been guiltless. When the difficulties and dissensions which produced the revolution began, Marie Antoinette was on the side that was for making resistance; but unable to impart energy to her husband, she only led him into inconsistencies. She did not disguise her aversion to those leaders who had begun the revolution, and would never stoop to conciliate their favour. After the national assembly had assumed the supreme power, she refused the offers of Mirabeau to support the interests of the crown, and thus drove that able but unprincipled orator back into the ranks of the revolutionists. But her influence in the councils of Louis has been much exaggerated by her enemies. Louis, naturally disposed to concession, was by temper irresolute, and he allowed himself to be led away by the course of events, instead of striving to direct them. Marie Antoinette was one of the advisers of the attempted flight of the king, which proved unsuccessful, and only served to excite the public animosity against her and her husband. After that epoch there

Medal of Marie Antoinette.

was no longer much opportunity for her to exercise any political influence; her husband had lost all power; besides which, a strong faction supported by the armed masses had determined to do away with the kingly office altogether. Marie Antoinette showed great courage during the various attacks made against the royal family; she appeared much more anxious about her husband and her children than about herself. She shared their captivity with resignation; her demeanour, under the most trying circumstances, never lost its dignity. Adversity imparted firmness to her mind, and she exhibited a moral strength which astonished while it irritated her bitterest enemies. After the death of her husband, she seemed forgotten for a time; but the terrorist faction having overthrown the Girondins, its leaders resolved to make away with the ex-queen, an act of cruelty the more odious as it was entirely useless. They brought her to trial before the convention. She was of course found guilty, and condemned to death. In the presence of her judges her fortitude never forsook her, and the burst of indignant maternal feeling with which she appealed to the mothers who might be there present,

when an infamous and absurd charge was brought against her, overawed even her accusers.

On the 16th of October 1793, Marie Antoinette was removed in a common cart from the prison of the Conciergerie to the place of execution. On her way she was reviled and abused by the ferocious mob in the most unfeeling manner; but she appeared heedless of their vociferations, and suffered death with firmness and composure. She was thirty-eight years of age, but her sufferings had given her a much older appearance. She left one son, who died in prison (Louis XVII.), and a daughter, afterwards Duchess of Angoulême.

MARIE DE' MEDICI, the daughter of Francis I., grand-duke of Tuscany, and of the Archduchess Joan of Austria, was born at Florence in 1573, and was married in 1600 to Henri IV. of France. She was handsome, and Henri was for a time really attached to her; but she was violent, jealous, and obstinate, and seldom passed a week without quarrelling with her husband. The memoirs of Sully and others contain details of these domestic bickerings. But the best historical critics acquit her of any more serious misconduct, and especially of the odious insinuation, thrown out by some writers, that she was privy to the murder of her husband. Henri at that time was just going to set off for the army, and he had signified his intention to leave her regent of the kingdom. Héroult only observes that she did not show sufficient grief for the death of her husband. Mary was weak rather than wicked; she had the aspirations of ambition without corresponding mental powers; and when she became regent, during her son's minority, she found herself incapable of bearing the weight of the administration. [LOUIS XIII.] She next quarrelled with her son, and made peace with him by means of Richelieu, whom she had introduced into the council; but she afterwards grew jealous of Richelieu's great influence, and plotted against him. She was exiled in 1630; went to Belgium, England and Germany; and at last died at Cologne, in 1642, in a state bordering upon destitution.

MARIOTTE, EDMÉ. Little is known of his life. He was a Burgundian born, a priest by profession, and resided in the earlier part of his philosophical career at Dijon. He was afterwards prior of St. Martin, near Beaune, and died May 12, 1684, having been one of the first members of the Academy of Sciences. See the *éloge* by Condorcet, vol. i., p. 74, of his collection.

Several of the writings of Mariotte were published by himself, and one or two more after his death. Those of the former class were several times reprinted, and the whole were finally collected under the title 'Œuvres de Mariotte,' in two volumes quarto, Leyden, 1717. Another edition (perhaps the same with a new title,) was published at the Hague, in 1740. This collection contains treatises on percussion, on vegetation, on the nature of the air, on heat and cold, on the nature of colours, on hydraulics, on some phenomena connected with sight, on levelling, on the motion of the pendulum, on the congelation of water, and on the logic of the sciences.

Condorcet says of Mariotte, that "he was the first Frenchman who carried with him into experimental philosophy a spirit of observation and doubt, and inspired others with that caution and timidity which are so necessary to those who interrogate nature and undertake to interpret her responses." His writings, though more connected with mathematical deduction than those of Robert Boyle, somewhat resemble them in the miscellaneous character of the experiments with which they are crowded.

The principal results by which the name of Mariotte is known to a reader of modern works are the following:—1. He was the discoverer of that law of elastic fluids which now goes by his name; that is, of the elastic force being exactly in the inverse proportion of the space which a given mass of fluid occupies. Subject to such alterations as difference of temperature may require, the formula derived from this law is now one of the fundamental parts of aerostatics. 2. He discovered that air, and air in a state of condensation, exists in liquids. 3. He found that the part of the retina in which it meets the optic nerve is not capable of conveying the impression of sight. Among minor matters, we may mention the now common guinea and feather experiment, which he first made with the air-pump.

MARIUS, CAIUS, was born of humble parents, at or in the neighbourhood of Arpinum, about B.C. 157. He served at the siege of Numantia, B.C. 134, under Scipio Africanus, together with Jugurtha, where he highly distinguished himself. He received great marks of honour from Scipio, who used frequently to invite him to his table; and when, one evening at supper, Scipio was asked, where they should find so great a general when he was gone, he is said to have replied, placing his hand upon the shoulder of Marius, "Here, perhaps."

In B.C. 119 he was elected tribune of the plebs, through the influence of Cæcilius Metellus, according to Plutarch, but more probably in consequence of the fame he had acquired in the Numantian war. In this office he showed himself, as he did throughout the whole of his life, a most determined enemy to the patrician order, and one who was not easily to be put down by the threats and opposition of his enemies. Having proposed a law to prevent illegal voting at elections, the senate passed a decree that the law should not be put to the vote in the popular assembly, and summoned Marius before them to answer for his conduct. Marius not only appeared, but threatened to commit the consuls to prison, if they did not repeal the decree; and

when Metellus continued to support it, he commanded him to be led away to prison.

Marius obtained the prætorship with great difficulty, in consequence of the violent opposition of the patrician order, who accused him of having obtained the office by means of bribery. At the expiration of his prætorship the province of Spain was assigned to him, which he cleared of robbers. On his return to Rome, he was anxious to obtain the consulship; but he did not venture to become a candidate for many years after. He continued however to rise in public opinion, and appears about this time to have married Julia, one of the Julian family, who was aunt to the famous Julius Cæsar.

In B.C. 109 he accompanied Metellus into Africa in the capacity of 'legatus' (second in command); and by his prudence and courage in the war with Jugurtha he added greatly to his military reputation. His friends took advantage of his increasing popularity at Rome to persuade the people that the war with Jugurtha would never be concluded until the command was given to Marius. This led to an open rupture between him and Metellus; and it was with the greatest difficulty that Metellus allowed his lieutenant leave of absence to go to Rome in order to stand for the consulship. Marius was however successful; he obtained the consulship (B.C. 107) and the command of the Jugurthine war. On his arrival in Africa, Marius prosecuted the war with the greatest vigour; and in the following year (B.C. 106) obtained possession of the person of Jugurtha, who was treacherously given up by Bocchus to his quaestor Sulla. [JUGURTHA.] Marius remained in Africa during the next year (B.C. 105); in which the consul Manlius and the proconsul Cæpio were defeated by the Teutones and Cimbri in Gaul, with the prodigious loss, according to Livy ('Ep.' 87) of 80,000 soldiers, besides 40,000 camp-followers. The news of their defeat caused the greatest consternation at Rome, especially as the Teutones and Cimbri threatened the immediate invasion of Italy; and Marius was accordingly elected consul in his absence, without any opposition even from the patrician party, as the only man in the state who was able to save it from impending ruin.

Marius entered upon his second consulship B.C. 104, and triumphed on account of his victories over Jugurtha; but in consequence of the threatened invasion of Italy having been deferred by an irruption of the Cimbri into Spain, Marius was again chosen consul in the two following years (B.C. 103, 102). In the fourth consulship of Marius (B.C. 102) the Cimbri, having been defeated by the Celtiberi in Spain, returned to Gaul, and resolved to invade Italy in two divisions; the one, consisting of the Teutones and Ambrones (a Gallic people), through Gallia Narbonensis; and the other, comprising the Cimbri, by way of Noricum. Marius defeated the Teutones and Ambrones near Agus Sextis (Aix) in Gaul; but Catulus, who was stationed at the foot of the Alps to oppose the passage of the Cimbri, retreated first to the other side of the Athesis (Adige), and afterwards quitted this position also without waiting for the enemy's attack. In the following year, B.C. 101, Marius, who was again elected consul, for the fifth time, joined his forces with those of Catulus, and entirely defeated the Cimbri in the plain of Vercellæ (Vercelli), situated to the north of the Po, near the Sessaites (Sesia). In these two battles the Teutones and Ambrones are said to have lost the incredible number of 290,000 men (200,000 slain, and 90,000 taken prisoners); and the Cimbri 200,000 men (140,000 slain, and 60,000 taken prisoners). (Livy, 'Ep.' 88.)

Marius again became candidate for the consulship for the following year; but now that the fear of the Gallic invasion was removed, he was opposed by the whole strength of the patrician party. He nevertheless obtained the consulship, in great part owing to the exertions of Saturninus, the tribune, who is described as a man who scrupled at the commission of no crime in order to obtain his object. The events of the sixth consulship of Marius, which are some of the most important in this period of Roman history, are imperfectly narrated by the historians. It appears that an Agrarian law, proposed by Saturninus and supported by Marius and one of the prætors named Glaucia, was carried notwithstanding the most violent opposition of the patrician party; and that Metellus Numidicus was driven into exile in consequence of refusing to take the oath of conforming to the law. When the election of consuls for the ensuing year came on, Memmius, who opposed Glaucia as a candidate for the office, was murdered by order of Saturninus; and the senate, perceiving the city to be in a state of anarchy, passed the usual decree, "that the consuls should take care that the republic should receive no injury," by which almost absolute power was vested in the consuls. Marius, unable or unwilling to protect his old friends, besieged Saturninus and Glaucia, who had seized upon the capitol. They surrendered themselves to Marius on the promise that their lives should be spared, but they were all immediately put to death. It appears probable that Marius, after the blow which had been given to the popular party by the surrender of Saturninus and Glaucia, would not have been able to save their lives, even if he had made the attempt.

At the expiration of his consulship, Marius left Rome to avoid witnessing the triumph of the patrician party in the return of his old enemy Metellus, whose sentence of banishment was repealed after the death of Saturninus. According to Plutarch, Marius went to Cappadocia and Galatia, under the pretence of offering a sacrifice

which he had vowed to Cybele; but with the real object of exciting Mithridates to war, in order that he might be again employed in military affairs, since he did not obtain much distinction in peace.

In B.C. 90 the Marsian or Social war broke out; in which both Marius and Sulla were engaged as legati to the two consuls. Marius gained several victories over the enemy, but he no longer possessed that activity and energy which had distinguished him in his earlier years; and disgusted, it is said, with the increasing reputation of Sulla, he resigned his command before the conclusion of the war.

The Marsian war had scarcely been brought to an end, before the civil war commenced between Marius and Sulla. The command of the Mithridatic war had been assigned to Sulla, who was now consul (B.C. 88); but Marius used every effort to wrest it from him, and is said by Plutarch to have gone every day to the Campus Martius, and to have performed his exercises with the young men, although he was now in his seventieth year and very corpulent, in order to show that he was not incapacitated by age. He was warmly supported by P. Sulpitius the tribune, who possessed great property and influence; and a law was eventually passed that the command should be taken from Sulla and given to Marius. Sulla was with the army at the time besieging Nola; but as soon as he heard of the law which had been passed, he marched to Rome; and Marius and his adherents were obliged to quit the city. After wandering through many parts of Italy, Marius escaped with the greatest difficulty to Africa; but he had no sooner landed at Carthage, than Sertilius, the governor of the province, sent word to him, that unless he quitted Africa, he should treat him as a public enemy. "Go and tell him," replied Marius, "that you have seen the exile Marius sitting on the ruins of Carthage." But in the following year (B.C. 87), in the absence of Sulla, who had gone to Greece to oppose Archelaus, Marius returned to Italy in order to join the consul Cinna, who, in his attempts to abrogate the laws of Sulla, had been driven from Rome by his colleague Octavius, supported by the patrician party. Shortly afterwards Marius and Cinna entered the city at the head of a large army; and a general massacre of the opposite party ensued. Marius always appears to have been of a fierce and unrelenting temper; and the sufferings he had lately undergone, which at his time of life must have greatly impaired his health, tended to exasperate him more than ever against the party which had opposed and thwarted him during the whole of his life. All the leaders of the patrician party who were unable to escape from Rome were put to death; Lutatius Catulus, who had been the colleague of Marius in the war with the Cimbri, put himself to death in order to avoid assassination; and among the numerous illustrious patricians who fell were C. and L. Julius Cæsar, and the celebrated orator M. Antonius, who is so frequently praised by Cicero, and is one of the principal speakers in the treatise 'On the Orator.' Marius and Cinna declared themselves consuls for the ensuing year (B.C. 86), without even holding the comitia; but Marius died of a fever in the beginning of the year, on the seventeenth day of his consulship, according to Plutarch (c. 46), or the thirteenth, according to Livy ('Ep.' 80.)

The character of Marius is chiefly known to us from his life by Plutarch, who appears to have taken his account from the 'Memoirs of Sulla,' the inveterate enemy of Marius. It cannot be denied that after his return from exile Marius was guilty of the greatest cruelties, but even these were surpassed by the atrocities of Sulla; and we should not be doing justice to Marius, if we ascribed to him, during the whole of his life, the character which he displayed in his seventh consulship.

(Plutarch, *Life of Marius*; Sallust, *Jugurthine War*; *Epitomes of Livy*; Velleius Paterculus; Cicero, *De Oratore*, iii. 2, 3; Clinton, *Fasts Hellenici*.)

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE, born at Paris in 1688, was one of the most popular romance-writers of the 18th century, and one to whom that branch of literature is mainly indebted for the character and authority which it has acquired as a representation of actual life and manners, illustrated by the analysis of conduct and motives, sentiments and feelings. He began his career as a dramatic writer, and his pieces were for a long time the support of the Théâtre-Italien. Yet although they display much ingenuity and talent, and procured for their author a seat in the French Academy, they now possess little interest, except as being productions of the same pen which gave the world 'La Vie de Marianne' and the 'Paysan Parvenu.' Marivaux also wrote another romance, entitled 'Pharsamon,' every way inferior to the two on which his reputation rests; also 'Le Spectateur François,' and 'Le Philosophe Indigent.' The inequality of his taste was also manifested by his 'Homère Travesti,' which was published in 1716, was neglected from the very first, and has long been deservedly forgotten; while his two novels still charm by the master-touches with which they abound, by their accurate and highly-finished delineations of character, and by the intimate knowledge which they display of the human heart. Marivaux was no less estimable as a man than as an author, illustrating in his life the lessons which he endeavoured to impress upon others. Benevolence to all, active sympathy for the unfortunate, and a philosophic indifference towards wealth and distinctions, were prominent traits in his character. He died at Paris, February 11, 1763.

MARK, ST., the Evangelist, is supposed by the greater number of ancient and modern writers to be the same person as John Mark, who

is mentioned in the 'Acts of the Apostles' (xii. 12, 25; xiii. 5, 13; xv. 37). It is most probable that John was his Jewish name, and that he took the surname of Marcus when he went to preach among the Gentiles. He was the son of Mary, a pious woman at Jerusalem, in whose house the disciples were wont to meet (Acts xii. 12), and the nephew of Barnabas (Col. iv. 10). He left Jerusalem with Paul and Barnabas about A.D. 44 (Acts xii. 25), and accompanied them in their return to Antioch; and thence in their mission (Acts xiii. 5) as far as Perga in Pamphylia, where he parted from them, and returned to Jerusalem (Acts xiii. 13). About A.D. 53 we find him again at Antioch, when Paul proposed to Barnabas to visit the Asiatic churches. Barnabas wished to take Mark with them, but Paul refusing on account of his having deserted them in their former journey, they separated from each other, and Mark accompanied Barnabas to Cyprus (Acts xv. 37-39). Paul appears to have been reconciled to him afterwards, for we find him at Rome with the apostle during his imprisonment, and he is honourably mentioned in some of Paul's Epistles (Col. iv. 10; Philemon, ver. 24; 2 Tim. iv. 11). We also find him with Peter in Asia (1 Pet. v. 13; see Steiger's 'Commentary on the First Epistle of Peter,' *in loco*); and it is supposed that he accompanied that apostle to Rome. According to Eusebius, Epiphanius, and Jerome, he afterwards went to Egypt, and founded a church at Alexandria, where he died and was buried, according to Jerome, in the eighth year of Nero's reign, A.D. 62. But this date appears to fix his death earlier than other circumstances in his history will warrant.

All the early writers affirm that Mark was intimately acquainted with St. Peter: Papias, Irenæus, and Tertullian call him 'Peter's interpreter.' It has been supposed that he was converted to Christianity by St. Peter, as that apostle calls him 'my son' (see Kuinoel's note on Matt. xii. 27). Some of the later fathers mention him as one of the seventy evangelists; but there is no good authority for this tradition, and it is contradicted by Papias, who expressly says that he had heard from the presbyter John, who was contemporary with the apostles, that Mark was not a hearer nor a follower of Christ, but of Peter. (Eusebius, 'Ecc. Hist.,' iii. 39.)

MARKLAND, JEREMIAH, was born on the 29th of October 1693 at Childwall, in Lancashire, of which parish his father was vicar. He was educated at Christ's Hospital, London, whence he was sent to St. Peter's College, Cambridge, in 1710. He took his degree of M.A. in 1717, and was soon afterwards elected a fellow and tutor of his college. After residing at Cambridge for some time, he removed to Punsborn in Hertfordshire, to undertake the education of Mr. Shode's son, and afterwards travelled with his pupil on the Continent. During the latter part of his life he resided at a small village near Dorking, in Surrey, where he died on the 7th of July 1776.

Markland lived in the greatest retirement, and devoted a long life to the diligent study of the Greek and Roman writers. He was one of the best English scholars and critics of the last century, but wrote very little. He edited the 'Sylva' of Statius (Lond., 1728), the 'Supplices' (1763), and the two Iphigenias of Euripides (1771), which have been republished by Gaisford. Subjoined to his edition of the 'Supplices' are his 'Explicationes veterum aliquot Auctorum.' He also contributed some observations to Taylor's edition of Lysias, to Bowyer's reprint of Küster on the 'Middle Verb in Greek,' and to Musgrave's edition of the 'Hippolytus.' In 1745 he published 'Remarks on the Epistles of Cicero to Brutus, and of Brutus to Cicero, in a Letter to a Friend,' in which he attempts to prove that they could not have been written by Brutus or Cicero; and in an Appendix to this work he also maintains that the four orations which occupy a place in Cicero's works, under the titles of 'Pro Domo sua apud Pontifices,' 'De Haruspicio Responsis,' 'Post Reditum in Senatu,' and 'Ad Quirites post Reditum,' are also spurious. This opinion has been supported by F. A. Wolff and many other able critics.

MARLBOROUGH, JOHN CHURCHILL, DUKE OF, the ablest general and most consummate statesman of his times, was born at Ashe, in Devonshire, on the 24th of June, 1650. He was the second son of Sir Winston Churchill, a gentleman of ancient family, whose fortunes had suffered severely in the civil war, through his devotion to the royal cause; and whose loyalty, after the restoration, was rewarded with sundry small offices under the crown for himself, and with the more questionable benefit of appointments for his children in the profligate court of Charles II. Arabella Churchill, his daughter, became first maid of honour to the Duchess of York, and next mistress to her husband, the duke, afterwards James II.; and John Churchill, who was appointed page to the same prince, doubtless owed his early advancement to this disgraceful connection. It is remarkable that one of its fruits, James Fitzjames, duke of Berwick, proved a commander of renown only less illustrious than his maternal uncle.

The natural talents and merits of Churchill however were of too high an order to be solely dependent on the patronage which had sullied the honour of his house. Notwithstanding the disadvantages of a neglected education, which seems to have been confined to a short residence at St. Paul's School, he gave early indications of spirit and intelligence; and his desire for a military life having been gratified by his patron with a commission, he invariably distinguished himself in each of his early campaigns: in the defence of Tangiers against the Moors, and in the successive operations in which the English troops shared as auxiliaries to the French armies under Louis XIV. during

the unprincipled alliance of Charles II. with that monarch against the Dutch. On the great theatre of continental warfare, in which Churchill continued to serve from 1672 to 1677, his brilliant courage and ability, no less than the singular graces of his person, attracted the notice of the illustrious Turenne, who pronounced, with prophetic sagacity, that "his handsome Englishman" would one day prove himself a master of the art of war.

On the conclusion of the peace of Nimeguen, Churchill, now a colonel, returned to England, and was happily rescued from too licentious a career of dissipation by an ardent attachment for the celebrated woman who became his wife, and who, for good and evil, influenced the whole tenor of his subsequent life. This was Sarah Jennings, a young lady of birth, genius, and beauty, whose irreproachable purity in a vicious age might have rendered her worthy of the uxorious love of the hero, if her imperious temper had not disgraced his submission to its tyranny, alienated his political friends, and embittered his domestic peace. She had been placed, like himself, at an early age in the household of the Duke and Duchess of York, where she had become the favourite associate of their daughter the Princess Anne, and had acquired over the spirit of the future queen that commanding influence which it belongs to the stronger to exercise over the weaker mind. Her marriage separated neither her husband nor herself from their service in the dual household: Churchill was confidentially employed by the Duke of York on many political occasions, and when the Princess Anne was married, his wife was, by her express desire, made a lady of her bed-chamber. Churchill had previously been raised, through the interest of James, to a Scotch barony; and when that prince succeeded his brother on the throne, he was further promoted to an English peerage by the style of Baron Churchill of Sandridge. Under this title he contributed by very effectual military service to the suppression of Monmouth's rebellion, and was rewarded with his master's unbounded reliance on his fidelity.

This confidence he basely betrayed, before and after the landing of William of Orange, with a deliberate treachery, which sophistry has vainly laboured to justify, and the infamy of which no excuse, even in the difficult circumstances of the times, can be found to palliate. After offering his services to the Prince of Orange, he accepted the command of a large body of James's troops to oppose him; after accepting that command, he deserted to the prince; and when William became king, he received at his hands the title of Earl of Marlborough, and the offices of privy-councillor and lord of the bed-chamber, as the reward of his ingratitude. His subsequent conduct throughout the reign of William was consonant to this outset, for he corresponded and intrigued with the exiled king. By this double treason and perjury he took from the former desertion of his deluded sovereign the extension of a conscientious principle; he broke his allegiance to the new king whose favours he had accepted; and he branded his own inconsistency with the motives of self-interest and self-preservation.

William III., who knew equally well how to estimate the capacity and the sincerity of Marlborough, alternately imprisoned and employed, cashiered and re-commissioned, the man whom he is said on his death-bed to have recommended to his successor as the fittest person to "lead her armies and direct her councils." The favour of Marlborough's wife with Queen Anne was probably a more powerful, though less rational, motive for the appointment which he now received to the command of the allied forces in the war of the Spanish succession; and he immediately entered on a course of glorious achievement which since the days of Henry V. had never been equalled, and which until our own eventful times was never surpassed by any British commander or army.

When Marlborough landed at the Hague, in June 1702, to take the command of the allied army, the French under the skilful Boufflers, by the superior force and vigour of their preparations, had already been able everywhere to assume the offensive; the very frontiers of the Seven Provinces were threatened; and it was feared that the efforts of the English general must be restricted to the defence of the republican territory. Moreover, he had to encounter the petty jealousies and disobedience of the other allied commanders, and the opposition of the Dutch deputies, whom the states-general sent into the field to control the movements of their troops, and whose ignorance of war and dread of responsibility were grievous impediments to every bold enterprise. Yet, notwithstanding these obstacles, which shackled all his operations and heavily taxed his forbearance, he succeeded, by a series of masterly movements, in compelling the French armies to retreat in all quarters, delivered the Dutch frontiers from their presence, and closed the campaign by the sieges and capture of Venloo, Ruremond, Stevenswaert, and Liège. These services, short as they fell of the results which might have been attained if the genius of the commander had been allowed its full play, were so far beyond the anticipation of the allies, that the states-general loaded him with eulogy, and Queen Anne elevated him to the dual title.

The following campaign of 1703 presented a repetition of the same obstacles to the enterprising spirit of Marlborough. Arrested by the timidity of the field-deputies, and harassed by the misconduct of the Dutch generals, he was allowed to effect nothing in the Netherlands except the reduction of Bonn, Huy, Limburg, and Guelders: while the elector of Bavaria with his own troops, and the French under Villars, broke into the Imperial dominions on the Danube, signally defeated

the forces of the emperor, alarmed that prince for the safety of his capital, and threatened dissolution to the grand alliance itself. These dangers roused Marlborough to attempt the masterstroke of his military career. Early in the campaign of 1704, after providing for the safety of the Netherlands, he secretly conceived and executed upon his own responsibility the bold design of marching into Germany at the head of the English troops. He formed a junction on the Danube with the Imperialists; stormed the strong Gallo-Bavarian lines at Donauebering; and finally, in concert with the Imperial commander Prince Eugene of Savoy, a kindred spirit, attacked the enemy on the 18th of August 1704, at and near the village of Blenheim on the Danube, with such skill and impetuosity as to inflict on them a total defeat. In this memorable battle, the French and Bavarians, who were commanded by the elector in person and Marshals Tallard and Marsin, lost above 30,000 men in killed, wounded, and prisoners, Marshal Tallard himself being among the latter. But the moral and political effects of the victory were yet greater: it dimmed the lustre which the successes of Louis XIV. had shed upon the French arms, and destroyed the charm of their invincibility; it delivered the empire; and it laid Bavaria prostrate before the allies. For this great exploit Marlborough was rewarded with the conveyance to himself and his heirs of the crown lands at Woodstock, on which it was also resolved to erect for him a palace at the royal cost. This noble design to perpetuate the memory of his services was ultimately realised, under the direction of the architect Vanbrugh, in the majestic though cumbrous pile which still bears the title of the castle of Blenheim: but the public enthusiasm which had dictated so splendid a monument was stifled in faction, and the completion of the work is indebted more to the care of his high-spirited widow, than to the good faith of the crown or the munificence of the nation. The gratitude of the Imperial house for the preservation of its capital and dominions was neither less loud nor more durable. The territory of Mindelheim, with the title of prince of the Holy Roman empire, was conferred upon the victor of Blenheim; but though the premature death of his only son left him without heirs male, the dignity was not allowed to descend in the female line; and when the lands of Mindelheim were included in the districts restored to Bavaria at the peace, the Imperial court had the meanness to withhold any compensation from its deliverer.

The march into Germany had liberated Marlborough from the paralyzing control of the Dutch field-deputies and the wretched intrigues of their officers. But his return to the Netherlands subjected him again to the same impediments and annoyances; and in the campaign of 1705, though he skillfully forced the French lines between Namur and Antwerp, he was once more restrained from striking any decisive blow upon the enemy. But in the following year (1706), happily for his wishes, the great efforts of the French in the Low Countries under Villeroi enabled him to tempt them to an encounter; and in the great battle of Ramillies he gained a second victory, so complete that the enemy, with a loss of 13,000 men, eighty standards, and all their cannon, were compelled to evacuate the whole of Spanish Flanders. Brussels, Ghent, Antwerp, and Oudenarde opened their gates to the conqueror, and the strong fortresses of Ostend, Menin, Dendermonde, and Ath were reduced by regular sieges.

Through the apathy of the Dutch these successes were followed, in 1707, by a year of inaction; but in the summer of 1708 an attempt of the enemy to recover possession of Spanish Flanders brought on a general engagement at Oudenarde, which terminated in the utter rout of the French under the Dukes of Burgundy and Vendôme, with a loss of 14,000 men. The forcing of the passage of the Schelde and reduction of the great fortress of Liège, a place of first-rate strength, and defended by a garrison of 15,000 men under Boufflers, were the chief fruits of this victory. The following year (1709) was distinguished by the sanguinary combat of Malplaquet, the most dubious of Marlborough's exploits; since, though he was undoubtedly victorious, the assault of an immense army under Villars in a position of tremendous strength, has exposed him and his colleague Eugene to the charge of reckless temerity; and the result produced no advantages equivalent to the frightful carnage by which it was purchased. The next campaign (of 1710) opened with another successful passage of the enemy's lines by Marlborough, which was followed by the reduction of Douay, Bethune, and other posts. Villars employed the autumn and winter in constructing a series of strong lines on the Flemish frontiers, to cover the interior of France against the further advance of the victorious allies; and so confident was he in the impregnable character of these works, that he openly boasted of having "at last brought Marlborough to his *ne plus ultra*." The futility of this vaunt was disgracefully exposed, and never did the military genius of Marlborough break forth with more splendour than in this, which was destined to be his final campaign; even while his mind was distracted, and his energies were crippled by the malignant intrigues of his political enemies in England. On the 5th of August 1711, by a sudden and unexpected manœuvre, he burst through the lines of his able though gasconading antagonist near Bouchain, formed the siege of that strong fortress, and effected its capture—his last achievement—under the eyes of the superior French army.

The political intrigues which disgraced the court of Queen Anne, and closed the triumphs of Marlborough, belong rather to general history than to the biography of the illustrious leader who was their

victim. But they were fomented in his domestic circle; and his imperious wife, if she had assisted his rise, was also the real instrument of his fall. So romantic was the friendship which the queen had cherished for her, that utterly impatient of the etiquette and restraints of a court, and under the assumed name of Mrs. Morley, laying aside every distinction of her rank, she corresponded in all the freedom and affectionate intimacy of an equal, with the duchess as "her dear Mrs. Freeman." If the duchess had been contented to use her influence with moderation, the easy nature of the queen might never have felt the yoke. But Anne was sincerely attached to Tory principles, the duchess was a violent politician, and notwithstanding her husband's Tory connections and prepossessions, she had become warmly devoted to the Whig as the queen to the opposite party. As long as William III. lived, an aversion which they shared to that prince and his government, united the two ladies in a band of political sympathy more powerful than their own differences of opinion. But when his death relieved them from an object of common dislike and apprehension, Anne gave way to her Tory predilections; the duchess ardently advocated the rival cause; and so arrogantly and intemperately were her tyrannical injunctions enforced, that they ceased not until the weak queen had been compelled to surround herself with the leaders of a party whom she detested. But the queen had much of the cunning of weak minds, and she secretly contrived measures with a new female favourite, Mrs. (afterwards Lady) Masham, who had for some time been intriguing with Harley earl of Oxford; and at length she openly avowed her complete alienation from her former friend; the intriguer Harley, the most perfidious of political adventurers, found it easy to increase the feud; and the machinations of the bedchamber-woman, whom he made his instrument, were sufficient to change the political aspect of Europe.

The hatred of the queen for the duchess was soon unjustly and ungratefully extended to the man who had achieved the principal glories of her reign, and whose great merits were innocent of personal offence. The abject entreaties to which Marlborough descended, in vain imploring the queen to spare his duchess the mortification of a dismissal from her place in the royal household, present perhaps the most humiliating scene of his life. The next blow struck by his enemies was his own removal from command; and this measure was envenomed by their malignity with a charge of peculation, which really appears to have been unfounded. Before the storm thus raised against him Marlborough withdrew to the Continent, where he remained until just previous to the death of Queen Anne. George I., immediately on his accession, restored him to his military offices of captain-general and master of the ordnance; and in the undisturbed enjoyment of these dignities he passed the eight remaining years of his life. In this interval two paralytic strokes shook his strength, but without at all seriously impairing his faculties; and the line which Johnson inserted in the 'Vanity of Human Wishes,'

"From Marlborough's eyes the streams of dotage flow,"

was at least a poetical exaggeration; for he continued to attend his parliamentary and official duties until a few months before his death, which occurred when he was in the full possession of his senses, and in the seventy-second year of his age, on the 16th of June 1722. On the death of his son, which happened during the duke's lifetime, the reversion to the ducal title and estate of Blenheim had been settled on his daughters and their heirs male; and the eldest, who thus succeeded her father, having died leaving no son, the family honours descended through her next sister, the lady of Charles Spencer, earl of Sunderland, to the house which still inherits them, and which in our own age has assumed the name of Churchill.

In estimating the character of Marlborough, under its twofold aspect of political and military greatness, it will readily be concluded that he was the most distinguished personage of his country and times. As a statesman, he was unrivalled in personal address and diplomatic skill, in the arts of persuasion, and in the powers of combination and arrangement. He was the life and soul of the grand alliance which arrested the ambitious career of Louis XIV. and preserved the liberties of Europe; his influence pervaded every continental court; and by his energetic hand was set in motion every spring of that vast confederacy which centred its only real point of confidence in his spirit. One of his bitterest enemies and ablest contemporaries, Bolingbroke, was not ashamed to acknowledge, after the grave had closed over him, that he was the greatest minister that this country had ever possessed.

As a general, it has not been the fate of Marlborough to be numbered with the few, such as Maurice of Nassau, Gustavus Adolphus, or Frederick of Prussia, whose genius has stamped its impress upon the warfare of their times, and made a distinct epoch in military science. He left the art, which he practised with unrivalled ability, in the same state in which he had found it; nor is there a single change or improvement in strategy attributed to his master-mind. But if this absence of inventive power may seem to detract from his claim to the very highest order of military merit, it must not the less be remembered that he was beyond comparison the most accomplished commander of his warlike age. It was an age of formal tactics and deliberate sieges; which had produced Vauban and Coehorn, raised the art of fortifying for the time to an apparent perfection, and exaggerated the importance

of regular fortresses and long-drawn lines of intrenchment. In the system of operations which naturally grow out of such circumstances, Marlborough greatly excelled; and of six conspicuous occasions on which he is recorded to have penetrated the intrenched position of his opponents, five were nearly bloodless triumphs of his tactical skill. In all these, his success equally proclaims his own superiority over his antagonists, and the vicious practice of the age, which, in attempting to cover an assailable country with extended chains of intrenchment, aboriginally invited as many points of attack as it multiplied works. But Marlborough himself, in his own practice, adhered to the same rules of defence, of which his success might have shown him the futility. Once indeed, after the victory of Oudenarde, he broke through the pedantry of rules, and proposed to Eugene, by masking Lisle and Fournay with a corps of observation, to penetrate into the heart of France: a plan which, instead of consuming the remainder of a victorious campaign in the siege of two fortresses, might have triumphantly ended the war. But the bold proposal seemed too hazardous even to Eugene.

Each however of Marlborough's great battles, and of the operations which preceded them, will testify that his skill comprehended much more than the conduct of a war of sieges and intrenchments. The consummate adroitness with which the objects of his memorable march into Germany in 1704 were concealed from the enemy, and their fears successively misdirected to the Moselle, to Alsace, and to Landau, until it was too late to prevent his real designs on the Danube, must ever be numbered among the most perfect efforts of military science. So also may be cited, with equal admiration, the singular and beautiful manœuvres by which the battle of Ramilies was won, and of which the curious military reader may find an ample and lucid account in the memoirs of General Kane, himself an eyewitness and an excellent tactician. And when it is considered that the successes of Marlborough were gained with an army in which the native British contingent never amounted to 20,000 men, and of which three-fourths were composed of a motley roll of Dutchmen, Hanoverians, and Hessians, Danes, Würtembergers, and Prussians, and moreover that his plans were in almost every enterprise marred by the timidity or obstinacy of the Dutch deputies, the moral triumphs of victory with such heterogeneous materials, and under such heavy disadvantages and discouragements, must very much raise our estimate of the genius by which they were won.

As a man, it is less easy to form a true judgment of the character of Marlborough than as a statesman or a general. If we were to estimate his moral worth by his double treachery to James II. and to William III., by his tame submission to the ingratitude of Queen Anne, and by the avarice which degraded his private habits, he might justly be numbered among the greatest and meanest of mankind. Nor is there any weight in the extenuation which has been attempted for his political falsehood, that he was no worse than his contemporaries; since it is the test of true greatness to rise above, not to sink to, the level of a common corruption. Yet with all his faults, it would be easy to prove that there were not wanting in Marlborough many of the qualities of a good patriot and a good man. His friend the lord-treasurer Godolphin and himself appear, of all their contemporaries, to have been most free from the virulent spirit of faction and most sincerely devoted to the true honour and interests of their country. The attachment of Marlborough to the tenets and principles of the Church of England was sincere and pure; he was unaffectedly a person of strong religious feeling and practice; and in these respects the example which, as a commander, he held out to his troops, and enforced in his camp, of a piety without fanaticism, was as salutary as it has been infrequent. His courage too, which the inconceivable baseness of faction affected to doubt, and which in his youth had been fiery and impetuous, displayed in his later years the calm and collected spirit of the Christian hero. In public action he was ever as humane and merciful, as towards personal enemies he was placable and magnanimous. In private life, if we except the stain of parsimony, his conduct, at least after his marriage, was a pattern of moral virtue; his temper was imperturbably sweet, gentle, and affectionate; and he was but too fond a husband, too confiding a friend, and too indulgent a master.

Macaulay, in his 'History of England,' and especially in the third and fourth volumes, has pursued the memory of Marlborough with studied and persevering enmity. It is needless to say that we are very far from agreeing with his conclusions, and regret the evident absence of the calm judicial spirit which should never be laid aside by the historian: but his strictures, coming from so high an authority, render it most desirable that the life of Marlborough should be again investigated—and more thoroughly than it yet has been—in all its bearings.

The principal biographies of Marlborough and memoirs relating to his campaigns are:—1, Lediard's Life of him (3 vols., 8vo, London, 1736); 2, An anonymous Life, published in 8vo in 1713, and accompanied by a Life of Prince Eugene, evidently written by one who had served under the duke and shared his confidence; 3, Dumont and Rousset, 'The Military History of Prince Eugene of Savoy, the Duke of Marlborough,' &c. (translated from the French by P. Chamberlain, folio, London, 1736); 4, 'Histoire de Jean Churchill, duc de Marlborough' (3 vols., 8vo, Paris, 1803): a signal foreign tribute to his

greatness, since it was composed by order of Bonaparte, and written, with a few exceptions, in a fair and candid spirit; 5, Coxe 'Memoirs of John, duke of Marlborough' (3 vols., 4to, London, 1818-19):—a work of which the chief value consists in a great mass of original correspondence, published from the family papers at Blenheim and other sources; 6, 'Life of Marlborough,' by Sir Archibald Alison (3rd edition, 2 vols., 8vo.); 7, Brodrick, 'Complete History of the late War in the Netherlands' (8vo, London, 1713); 8, Kaue, 'Campaigns of King William and Queen Anne, from 1689 to 1712,' &c. (8vo, London, 1745); 9, Millner, 'Journal of all the Marches, Battles, Sieges, &c. of the Confederate High Allies, from 1701 to 1712, under the conduct and command of the Duke of Marlborough' (8vo, London, 1733); 10, 'Marlborough Despatches,' edited by Sir George Murray.

MARLOWE, CHRISTOPHER, a dramatic writer of some eminence, was born, according to Malone, in 1565, but the exact date is unknown. All that is known of his life may be given in a very few lines. He was entered of Corpus Christi College, Cambridge, took his Bachelor of Arts degree in 1583, and that of Master of Arts in 1587. On leaving the university he became a playwright, and perhaps an actor. His moral character appears to have been bad. He was killed in a quarrel of a disgraceful nature, on the 1st of June 1593, as appears from the register of the old church at Deptford, from Anthony à Wood, and others.

The following plays are attributed to him:—'Dr. Faustus,' 'Edward the Second,' 'The Jew of Malta,' 'Tamburlaine the Great,' 'Lust's Dominion,' 'The Massacre at Paris,' and 'Dido, Queen of Carthage.' The prevailing opinion however is, that the three first only are his sole productions. Both the matter and the style of 'Tamburlaine' are asserted to differ materially from Marlowe's other compositions, and there is reason to believe that 'Lust's Dominion' is later than his time.

There remain then, 'The Massacre at Paris,' 'The Jew of Malta,' 'Edward the Second,' and 'Faustus.' Of the first little need be said; for the text, as it now stands, is an imperfect copy of a hasty work, as Collier has very well shown by a comparison of the received version with one leaf of a contemporary manuscript. 'The Jew of Malta' is one of those extraordinary impersonations which imply in the chief character a villainy more than human; such in fact as was ascribed only to the nation to whom Barabas belongs. There is a general resemblance between Barabas, the 'Jew's daughter,' in the old ballad, and Shylock; but they are like, not as imitations of each other, but as representations of one class, supposed to contain in itself malignity and avarice, and cruelty beyond all comparison.

Faustus, which succeeded the 'Jew of Malta,' is a play to which greater interest is attached at present than fifty years ago, owing to the celebrity of Göthe's 'Faust.' Those who consider that the 'Faust' of Germany is the greatest conception of human invention—who believe that a deep meaning lies hid behind all the apparent absurdities, and that the moral influence of the work is of a high and impressive kind—will of course laugh at any attempt at comparing the German with his English predecessor. At the same time they must allow that Marlowe's play is one of the first, if not the very first, of the attempts at portraying the struggles of a man whose faith is wavering—the first exhibition in a dramatic shape of that doubting spirit which has been on the ascendant for the last four centuries. Moreover, the solitary horror of Faust's death far surpasses the stage-effects which tell so strongly in the last scene of the first part of the German poem; and it would not be hard to show that Göthe has borrowed not a little from his English rival. Perhaps, on the whole, we must assign the first place among Marlowe's works to 'Edward the Second.' It is the prelude to the Shakespearian 'History,' and contains many passages which almost come up to Shakespere's manner.

Owing to the carelessness of the printers, many lines have been confused in Marlowe's plays, to the grievous injury of various passages, which now appear to be prose, though they are in reality verse. Marlowe has been compared to Æschylus: there is something specious in the comparison, but it can only be very general. To him we are indebted for the first regular form of the English drama cleared of rhymes; and he may be considered as the link between Shakespere and the Moralities. 'Faustus' is nearly a 'morality'; 'Edward the Second' is a regularly formed 'history.' Besides his plays, Marlowe translated Ovid's 'Art of Love,' and some other classical works.

(Collier, *History of Dramatic Poetry*; Preface to Marlowe's Works, ed. 1826.)

MARMION, SHAKERLEY, the son of a Northamptonshire squire, was born about 1602, became a gentleman commoner of Oxford in 1617, and proceeded master of arts in 1624. He squandered a good fortune; took military service in the Low Countries; and in 1639 became one of the officers in the troop raised by Sir John Suckling for the king in his expedition against the Scots. But, becoming sick at York, he returned to London, and died there before the end of the year. Besides small scattered poems, he wrote three plays:—1, 'Holland's Leaguer, an excellent comedy,' 1632, 4to; 2, 'A Fine Companion,' a comedy, 1633, 4to; 3, 'The Antiquary,' a comedy, 1641, 4to, a drama of considerable merit, which is reprinted in the tenth volume of Doddeley's 'Collection.'

MARMONT, AUGUSTE FRÉDÉRIQUE LOUIS VIESSE DE, MARÉCHAL DUC DE RAGUSE, the son of the Chevalier de Marmont, an old officer of distinction, was born at Châtillon-sur-Seine, on the 20th of July 1774. He entered the army as sub-lieutenant of infantry in 1789; but his father wishing him to receive a sound military education, sent him, in 1792, to the Artillery School of Châlons. Towards the end of that year he served in the campaign of the Alps, under General Montesquieu. He was present at the siege of Toulon, December 1793; and having been noticed by Bonaparte for his skill in directing his guns, was chosen as his aide-de-camp, and made a captain in 1794. In this capacity he accompanied his general to the army of Italy, during the campaign of that year. After the great insurrection of the Sections, on the 13th Vendémiaire (October 6, 1795), Marmont, having been appointed chef-d'escadron, went a second time to Italy, in March 1796, as principal aide-de-camp to General Bonaparte. In this famous campaign he was present in almost every field: at Lodi, at Castiglione, and at the battle of Saint-Georges, his intrepidity, his skill, his aptitude and invention were alike conspicuous; he was created colonel, and sent to Paris with 22 colours taken from the enemy. Next, he took part in the expedition to Egypt, and was made a general of brigade for his services during the investment of Malta. During the campaign of Syria, in 1799, he was appointed commander in Alexandria, and defended that city against the English and Turks, in a season of famine and pestilence. When General Bonaparte set sail for France, on his return from Egypt, August 22, 1799, General Marmont was one of the seven officers selected to bear him company in his perilous enterprise.

During the crossing of Mount Saint-Bernard in the spring of 1800, Marmont's plans for the conveyance of the guns having been adopted, he superintended the entire transport, and by his persevering efforts the passage of this important arm was effected. He fought with much distinction at the battle of Marengo, June 14, 1800, and was immediately after raised to a division. After the peace gained by this victory, he was made inspector-general of artillery; he then applied himself zealously to various reforms in the service, especially for the accelerating the transit of the artillery train. All these improvements were sanctioned by the First Consul, though the young military reformer was only in his twenty-seventh year.

In the campaign of 1805, General Marmont was present at the capture of Ulm, October 20, 1805; and he was next successfully employed in the reduction of the province of Styria. Henceforth he commanded armies. In 1806 he was sent to command the army in Dalmatia, where he acted as general-in-chief for several years. On the 2nd of October, with an army of 6000 men, he defeated an allied corps of 9000 Montenegrins, Greeks, and other troops, sustained by a second corps of 7000 Russians. During his occupation of the duchy, Marmont carried out a beneficial system of public works, including a great line of roadway, 210 miles in length, for which useful improvements he received his title of Duc de Raguse in 1808. When the campaign of Wagram opened in 1809, Napoleon called this general to support his main army. Marmont took the field with a corps of 9500 infantry, only 300 cavalry, and 12 pieces of cannon. With this force he defeated an Austrian army of 20,000 men in several severely-contested engagements; and then encountering General Giulay, at the head of 35,000 troops, posted on the Drave, compelled that general to retreat into Hungary. After these successes he joined Napoleon the day before the great battle of Wagram, July 5, 1809, took part in the action, and received his marshal's baton for his conduct in that arduous engagement. This decisive victory being followed by the treaty of Vienna, the Austrian government made over to France the provinces of Dalmatia, Istria, Ragusa, and Croatia, with other adjacent lands, which Napoleon formed into a single state, under the title of the Illyrian Provinces, and placed them under the direction of Marshal Marmont as governor-general. In this high office he continued nearly sixteen months, giving proofs of superior capacity as an administrator, whilst he was honourably distinguished from other marshals by his integrity and disinterestedness. Towards the close of 1810 he stood so high in the esteem of his master, that he was sent into the peninsula to supersede Marshal Massena in the command of the army of Portugal. Though independent in his command, he hastened to unite his army to that of Soult, placed himself under the orders of that eminent leader, and assisted him in relieving Badajoz. Less fortunate at the battle of Salamanca, July 22, 1812, he displayed however many proofs of skill as a general before he retreated, nor did he leave the field until he and the two generals who succeeded him, had been disabled by severe wounds. In the campaign of 1813 the marshal, though scarcely recovered, took the command of the second corps, and was present at Bautzen, May 20, 1813; at Dresden, August 26, and at Leipzig on the 16th, 17th, and 18th of October. In this last battle he defended the village of Schönfeld, which was taken and retaken seven times. Eight of his generals were either killed or wounded in the action; four horses sank under him, and he was twice wounded.

His name appears again in almost every battle fought on the French soil, in 1814, for the defence of his country. He terminated this campaign, perhaps the most brilliant in his career, by the battle before the walls of Paris, on the 30th of March 1814. The enemy, consisting of Russians, Prussians, and Austrians, were more than four

to one, yet Marmont maintained his post for several hours, not surrendering even when the heights of Montmartre had been taken, and the first Russian guns had begun to sweep the boulevards within the city; and it was not till some hours after receiving a letter from Joseph Bonaparte authorising them to capitulate, that Marmont and Mortier called a council of general officers at an inn within the suburb of La Villette, when they agreed to the evacuation of Paris.

The army of the allies entered the French capital on the 31st of March, and Marshal Marmont, on the 4th of April, after a short correspondence with Prince Schwartzberg, stipulating for the retirement of the French troops into Normandy, with their arms, baggage, and artillery, entered the allied lines, and thence marched to Versailles. It was this step, taken without the sanction of Napoleon, which afterwards drew down upon him so much odium.

The Duc de Raguse was now wedded to the cause of the restored dynasty. He accompanied Louis XVIII. to Ghent in 1815, returned to Paris with that sovereign after the battle of Waterloo, and was employed repeatedly both by that monarch and Charles X. in offices of great trust. At the outbreak of the July revolution in 1830, he was charged with the invidious duty of quelling the revolt, and having failed, became a second time the mark of almost universal obloquy. To satisfy the popular indignation, he was struck off the list of the French army, and exiled from France. He spent his years of banishment in visiting different countries, and in writing works of considerable merit on the military systems of Russia, Austria, and other states. Nearly twenty-two years after his disgrace, he died at Venice, on the 2nd of March 1852, in his seventy-eighth year. Since his death the 'Mémoires du Duc de Raguse,' from his original manuscript, have been published in 9 vols. 8vo.

MARMONTEL, JEAN-FRANÇOIS, was born at Bort in Limousin, in 1723. His parents were of very humble condition, and he owed his instruction in the Latin tongue to the gratuitous tuition which he received in a college under the direction of the Jesuits. His father placed him with a tradesman at Clermont, and a love for literature interfered with all commercial pursuits. At an early age he became professor of philosophy at a seminary of the Bernardines at Toulouse, and supported his mother and family after the death of his father. An acquaintance with Voltaire, to whom he had sent some poems, and who encouraged his attempts, brought him to Paris in 1745. Voltaire introduced him to several persons of distinction, and the success of his first tragedy, 'Denys le Tyran,' stamped him as a dramatic poet. Owing to the patronage of Madame Pompadour he was made historiographer of the royal buildings ('Historiographe des Bâtimens du Roi'), with a pension of 1500 livres, and he also obtained the right of publishing the 'Mercure,' by which he gained 40,000 livres. He was falsely suspected of satirising a person of distinction, and in consequence lost the 'Mercure,' and was confined in the Bastille. His celebrated 'Contes Moraux'—which, however dubious as to their moral character, are exquisite specimens of the lighter kind of French writing—followed his release, and gained him great reputation. On the death of Duclos he became Historiographe of France; and in 1783 he was made secretary to the Académie in the place of D'Alembert. He lost his appointments and his property on the breaking out of the Revolution, and he removed some distance from Paris in a state of destitution. In 1796 he became member of the National Institute, and in 1797 was elected into the council of the ancients, but this election having been reversed after the 18th Fructidor (September 4) in the same year, he retired to Abbeville, where he died December the 31st, 1799, and was buried in his own garden by some Roman Catholic priests.

The works by which MarmonTEL is chiefly known are his 'Contes Moraux,' his romances 'Belisaire' and 'Les Incas,' and his 'Mémoires.' The 'Contes Moraux' and 'Belisaire' are so familiar in an English shape, that they are almost British classics.

\* MARMORA, ALFONSO, CONTE DELLA, Lieutenant-General in the Sardinian army, was born November 18, 1804, in the city of Turin, and is descended from a distinguished Piedmontese family. He was educated in the military academy of Turin, and left it in 1823 to enter into the artillery as a lieutenant. In 1847 he was a major with the command of a company. In June 1848 he attained the rank of colonel, and in October 1848 that of major-general. During the revolutionary period of 1848 he held the post of minister of war and marine, from August 27 to December 16. The Sardinian army was defeated by the Austrians under General Radetzky, March 23, 1849, when Carlo Alberto abdicated the throne of Sardinia, and was succeeded by his son, Victor-Emmanuel. Alfonso della Marmora was then raised to the rank of lieutenant-general, and was deputed by the king to re-organise the staff of the dispirited and disorganised army—a task which he accomplished in such a manner as to excite the admiration of the military officers of other nations as well as his own. He was appointed minister of war and marine, November 3, 1849, and retained it till he was re-appointed under the new ministry of November 4, 1852. He also held the post of commander of the military division of Genoa. On the 26th of January 1855 a treaty of alliance was ratified between Sardinia and the Western Powers, and at the same time a military convention was entered into for sending a corps of 15,000 Sardinian troops to the Crimea, under the command of General della

Marmora. He then resigned his office of minister of war, and on the 15th of May 1855 landed at Balaklava with a portion of the troops. The management of the Sardinian army in the Crimea, in the hutting and other accommodations, as well as in matters of discipline, received general approbation; and when the Russians were preparing to cross the Tchernaya, General della Marmora was one of the first to observe their advance, and prepare for their reception. During the battle which ensued, he and his army contributed essentially to the victory of the allies, and proved themselves to be not at all inferior to the French and British troops. [See SUPPLEMENT.]

CARLO, MARCHESE DELLA MARMORA, eldest brother of General della Marmora, was born in 1788, served in the cavalry of the French army in 1812-13, became first aide-de-camp to the present king, Victor-Emmanuel, and died in 1854.

ALBERTO, CONTE DELLA MARMORA, next eldest brother, born in 1789, served also in the French army, became a major-general in the Sardinian army in 1840, and a lieutenant-general in 1848. He has constructed a valuable Atlas of Sardinia, and written in French an account of the island, under the title of 'Voyage en Sardaigne, ou Description Statistique, Physique, et Politique de cette Ile,' 8vo, second edition enlarged, 1839-40, with Atlas in 4to, Paris. [See SUP.]

ALESSANDRO, CAVALIERE DELLA MARMORA, another brother, born in 1799, became a major-general in 1848, and in 1849 a lieutenant-general and chief of the general staff of the Sardinian army. He died in 1855, in the Crimea, whither he had gone with the Sardinian troops.

\*MAROCHETTI, CARLO, BARON, Sardinian sculptor, was born at Turin in 1809, but after having fairly started on his career as a sculptor, he removed to Paris, where he was residing at the outbreak of the revolution in 1848, and he then repaired to London, where he has since for the most part remained. Baron Marochetti has been singularly fortunate in commissions for public works. His earliest—the equestrian statue of Immanuel Philibert, was erected in Turin; in Paris he executed for erection in that city an equestrian statue of the Duc d'Orléans, and a large bas-relief on the Arc de l'Étoile, as well as an 'Assumption' for the high altar of the Madeleine; while as early as 1844 he was employed to execute the equestrian statue of the Duke of Wellington erected by public subscription in Glasgow. His first introduction to the general public of London may however be said to have been made by his colossal model of 'Richard Cœur de Lion,' which was erected in the open air west of the Great Exhibition building, Hyde Park, in 1851. Its striking attitude and vigorous execution attracted very general attention and admiration, and on the close of the exhibition a subscription, headed by her Majesty and Prince Albert, was set on foot for the purpose of having the statue cast in bronze, and erected in some suitable spot in the metropolis as a memorial of the Great Exhibition. In 1854 the model was placed on a pedestal in Palace Yard, in front of Westminster Hall, but it was generally regarded as ill adapted to the site, and it has since been cast in bronze and erected near the Victoria Tower. Since he came to England Baron Marochetti has found ample patronage. He is the favourite sculptor of the court and aristocracy of England, as he was of that of France. At the exhibitions of the Royal Academy his chief contributions have been a 'Sappho,' 1850; 'Bust of Prince Albert,' 1851; a 'Cupid and Greyhound,' 1854; and a 'Bust of the Queen,' in stained marble, 1856; besides several busts of ladies of title. In 1854 an equestrian statue of the Queen from his chisel was erected in Glasgow. The execution of the monument to the English soldiers who were buried at Scutari was entrusted to Baron Marochetti, and the model, erected in the Crystal Palace at Sydenham, was inaugurated in the presence of the Queen and a large and brilliant assemblage, in May 1856. It consists of a lofty granite obelisk with a winged angel at each of the four corners of the pedestal, and a gilt cross and circle on the top; but the most remarkable things about the monument are its size and its cost (17,500*l.*). At the same time was exhibited an equally large 'Peace Trophy,' as it was called, by Baron Marochetti, the chief feature of which was a gilded and muslin-clad goddess, erected on a huge pedestal, in the attitude of distributing wreaths and crowns. The tawdry and meretricious character of the trophy, and the baldness and poverty of thought exhibited in the monument, were so much beyond all ordinary limits, and so entirely at variance with the preliminary announcements, and the efforts made to give éclat to the works by the splendour of their inauguration, as to excite general disappointment, and to call forth very loud expressions of disapprobation. Nor has the disappointment been in any way lessened by the Baron's 'Monument to the Officers of the Coldstream Guards who fell at Inkermann,' erected in St. Paul's cathedral (September 1856), which is in no respect worthy of the subject or of the sculptor's reputation. Another work is a monument to the Princess Elizabeth, daughter of Charles I., erected (December 1856) in Newport Church, Isle of Wight, by command of the queen. The style of Baron Marochetti belongs to what is termed the romantic, and verges very closely on the theatrical. He is happiest in his representations of horses, which are always true and admirable in form, and full of animation; and the riders sit their horses with ease and firmness. In the portrait busts of ladies he is also regarded as very successful,—imparting to them always an air of conventional dignity, to assist which he generally idealises and 'elevates' the countenance. His

1809. DIV. VOL. IV.

execution is sometimes of a very superior character. Baron Marochetti was elected A.R.A. in 1861, and R.A. in 1866.

MAROT, CLEMENT, was born at Cahors in 1495. He entered the service of the Duchess of Alençon as page, but afterwards followed Francis I. to Italy, and was wounded and taken prisoner at the battle of Pavia. On his return to France he wrote poetry for Diana of Poitiers, the king's mistress, who showed him favour; but having presumed too much upon his familiarity with her, she discarded him, and he was soon after put in prison, through her agency as some have believed, in 1525. During his imprisonment he wrote his 'Enfer,' a satire against the lawyers, and he revised his 'Roman de la Rose.' When Francis I. returned from his Spanish captivity, Marot was released, and re-appeared at court. Margaret, queen of Navarre, was much pleased with him; but as usual his vanity made him too presumptuous, and he fell into disgrace. He then turned Calvinist, and went to Geneva; but soon finding himself in an atmosphere little suited to him, he returned to Lyon, abjured Calvinism, and served again under Francis I. in the Italian campaign of 1535. Some years afterwards he published a French version of part of the Psalms, which was read with pleasure; but the Sorbonne condemned it, and Marot took refuge at Turin, where he died in poverty in 1544. He wrote epistles in verse, elegies, satires, ballads, rondeaux, and epigrams. His style has the simplicity of his age, united with grace and poetical fancy. He left a natural son, Michel Marot, who was also a poet. The works of both father and son were published together at Lyon in 4 vols. 4to, 1731.

MARPURG, FRIEDRICH WILHELM, a very eminent writer on the theory of music, was born in 1718 at Sechhausen in Prussia. According to M. Fayolle he was a counsellor of war to Frederick II. of Prussia, but his friend Gerber says that he was secretary to one of that king's ministers; both however agree that he latterly held the office of director of the lotteries at Berlin. Little more is known of his personal history than that early in life he passed a considerable time in Paris—which probably led to his adoption of the theory of Rameau, though he was by no means a slave to it—that his learning was considerable, his industry indefatigable, his morals exemplary, and his manners engaging. In 1793 M. Gerber spent some weeks with him at Berlin; he then possessed all the vivacity of youth, and his conversation was witty and agreeable. Shortly after this he began to show symptoms of mental as well as bodily decay, and died May 22, 1795. Marpurg is one of the most estimable didactic writers on music that Germany has produced. "He was perhaps," Dr. Burney remarks, "the first German theorist who could patiently be read by persons of taste, so addicted were former writers to prolixity and pedantry." Among his works are two which claim particular notice—his 'Manual of Harmony and Composition' ('Handbuch für den general-bass,' &c.), and his 'Traité de la Fugue et du Contrepoint.' The first is exceedingly methodical and clear, and may be considered as a musical Euclid. The second would be the best treatise on fugue and canon that has appeared, were it not lamentably deficient in method and arrangement, and also too much devoted to instrumental music, to the exclusion of that of the vocal kind; but in a new edition of this, M. Choron has remedied much of the evil of which there was such ample reason to complain. Marpurg was author also of many other works, all of them possessing more or less merit, a full and descriptive list of which is given in Gerber's 'Lexicon.'

MARRAST, ARMAND, who succeeded Carrel as chief editor of 'Le National,' was born in 1802, in the south of France. After a careful education at the College of Pont-Levoy, he went to Paris in 1827, and immediately commenced his career of politics by writing pamphlets against the government. The pungency and playful humour of these light productions drew notice upon the author, and he at once made for himself a distinct position among the young politicians of the day. When he arrived in the French capital, a vivid contest was being waged between the practical school of philosophy, conducted by Laromiguière, and the eclectic school, presided over by Cousin. Marrast entered the ranks of the former, and month after month amused and excited the public by the light artillery of his pleasant brochures against Cousinisme.

In 1830 Marrast established the newspaper 'La Tribune.' It became the organ of the ultra-liberal party, and as such organ it was constantly quoted by foreign as well as French journals. It contained very bitter articles against the government of Louis Philippe, and the fines to which it was condemned, together with the law expenses attending its defence, put an end to its publication after a few years. Armand Marrast, on one occasion, was called to the bar of the Chamber of Deputies on account of two articles in 'La Tribune.' On another occasion he was arrested and sent to prison as one of the conspirators concerned in the 'complot d'Avril.' He was soon released, when he published his celebrated pamphlet, 'Vingt Jours de Secret,' which produced a great sensation, and much increased his popularity. Proceedings were taken against him by the ministry. He sought refuge in England; remained several months in London, remitting every week one or more letters of great ability to 'Le National,' and married an English lady during his sojourn in this country. These letters were the origin of that long connection with Armand Carrel and 'Le National,' which afterwards gave to Marrast the influence he possessed over his countrymen. He became sub-editor of 'Le

National' in 1834; and on the death of Carrel, July 24th 1836, he succeeded him as chief editor. From this time until the revolution of February 1848, a period of nearly twelve years, Marrast conducted that journal, and maintained it in the high position it had acquired under Thiers, its first editor, and then under Carrel.

During 1847, a series of exciting incidents rapidly followed one another, highly favourable to Marrast's satirical ability. At one time, it was a course of ministerial prosecutions; at another, rumours of bribery and corruption among men high in office; next, these rumours were succeeded by flagrant exposures or confessions; and, lastly, came the scandal of an assassination in the mansion of a great noble. The republican journals made the most of these incidents, and 'Le National' took the lead in denouncing the government and the court. The revolution of February, and the abdication of Louis Philippe, followed. Pending the crisis of this event, the office of 'Le National' became for a few days the seat of government; and deputations visited Marrast, and received their instructions from him. His name was now on every tongue; and when Lamartine was placed by the rapid progress of events at the head of the provisional government, Marrast became secretary, afterwards maire de Paris, and finally president of the National Assembly. This last office was limited by a new regulation to one month; but the urbanity of the new president, and his extraordinary influence over the 900 members in consequence of his tact in calling them to order by humorous appeals, caused him to be re-elected several times. To him likewise was committed the task of drawing up the new constitution. But the red republican party soon found that Marrast was not advanced enough for them; they began to stigmatise him as a moderate, and his popularity fast declined. On the 15th of May 1848 the insurgents, headed by Barbès and Blanqui, forced their way into the Hôtel-de-Ville, their first cry being "Where is Marrast! We must make an end of that soft-handed republican!" But he had withdrawn for concealment to a private chamber which was not searched. After the insurrection of June, and the consequent dissolution of the Lamartine cabinet, Marrast retired into private life. We believe that he still contributed to 'Le National' without any longer being its editor, until the paper was suppressed by the government of Louis Napoleon. He died on the 10th of March 1852.

MARRYAT, FREDERICK, was born in London on the 10th of July 1792. His father, Joseph Marryat, Esq., of Wimbledon, Surrey, was a wealthy West India merchant, and M.P. for Sandwich, and traced his descent from a French Protestant refugee, who had come over to England in the 16th century. His mother was the daughter of an American loyalist. After being educated at various schools in and near London, young Marryat entered the naval service in September 1806, as a midshipman on board the *Impérieuse*, 44 guns, commanded by the celebrated Lord Cochrane. Under this daring commander he was engaged in upwards of fifty actions, of more or less importance, off the French and Mediterranean coasts during the next three years. In one he was left for dead on the deck of a ship which he had boarded, and only recovered when a fellow midshipman, who had a grudge against him, touched his supposed dead body with his foot, and began to moralise in rather uncomplimentary terms on his premature exit from life. The reputation for gallantry and ability which he acquired under Lord Cochrane, was amply sustained by his conduct under other commanders during three additional years of service as a midshipman. On four or five occasions he saved men from drowning by leaping overboard, at the risk of his own life. On one such occasion he saved the life of a son of William Cobbett, then his fellow midshipman. At another time, on jumping overboard in an attempt to save a sailor's life, he found to his horror the man bleeding from the maw of one of three sharks that were following the ship; and he had given himself over for lost before he was picked up. In 1812 he was appointed to his lieutenancy on board the *Espiegle* sloop, whence he removed to the *Newcastle*, sent under Lord George Stuart, to cruise off the American coast. He attained a commander's rank in 1815. In 1820 he commanded the *Beacon* sloop off St. Helena, whence he exchanged into the *Rosario*, in which he brought home duplicate despatches announcing the death of Napoleon. After being employed for some time in the preventive service, he was appointed in March 1823 to the *Larne*, 18 guns, and proceeded to the East Indies. He was senior naval officer in the attack on Rangoon, and in Dec. 1824 he accompanied Sir Robert Sale in the expedition up the Bassein River. His good services in the East Indies procured him the thanks of the governor-general and much distinction at home. In June 1825 he received the decoration of C.B., and at the same time the Royal Humane Society awarded him its medal for having saved so many lives from drowning. From November 1828 to November 1830 he commanded the *Ariadne* in the Channel service; and it was at this time, when he was approaching his fortieth year, that he began his career as a novelist by the publication of his 'Frank Mildmay.' This was followed at brief intervals during the next sixteen years by his other well-known writings, most of them novels of sea-life—'Peter Simple,' 'Jacob Faithful,' 'Japhet in Search of a Father,' 'The King's Own,' 'Mr. Midshipman Easy,' 'Newton Forster,' 'The Pacha of Many Tales,' 'Rattlin the Reefer,' 'Snarly-yow, or the Dog-Fiend,' 'The Children of the New Forest,' 'Olla Podrida,' 'The Pirate and the Three Cutters,' 'The Phantom Ship,' 'Poor Jack,' 'The Poacher,'

'Masterman Ready,' 'Perceval Keene,' 'The Narrative of Monsieur Violet in California, &c.,' 'The Settlers in Canada,' 'The Mission, or Scenes in Africa,' 'The Privateer's Man,' and 'Valérie.' The merits of these works as amusing works of adventure and description are universally known. Besides these, he published in 1837 a work of a different class, 'A Code of Signals for the use of vessels employed in the Merchant Service,'—which was adopted by government, and is now in general use by our own and all foreign navies, and which procured him the cross of the Legion of Honour from Louis Philippe. He also published in 1839 in two series of three volumes each, 'A Diary in America, with remarks on its Institutions,' a work which gave great offence to the Americans by its satirical spirit. It is said that the free expression of opinions by Captain Marryat against the practice of impressment was the cause of his not having been raised to higher professional rank. For a year or more before his death he was laid aside from duty and literary labour by an illness arising from the bursting of several blood-vessels. He died at his residence at Langham, in Norfolk, on the 2nd of August 1848, aged fifty-six years. By his marriage with Catherine, daughter of Sir Stephen Shairp, once chargé-d'affaires at the court of Russia, he had six children. Of two of his sons who had entered the navy, one perished, before his father's death, in the *Avenger* steamer; one of his daughters has recently appeared in her father's character as a writer of novels. Captain Marryat was a Fellow of the Royal Society.

MARS, ANNE-FRANÇOISE-HYPPOLITE BOUTET, known as MADEMOISELLE MARS, was born in Paris on the 9th of February 1779; her father being the actor Monval of the Théâtre Montansier; her mother a country actress named Mars-Boutet. She appeared before she was ten years old in juvenile parts, and in 1793 she already filled at the Théâtre Feydeau, what on the French stage are called "les rôles d'ingénues." She met with a generous patroness in Mademoiselle Contat, then the leading actress in comedy, and received from her the best training for the cast of characters which her early talents pointed out as her own. After she had made herself familiar with these parts of the young girl, she was induced, still directed by Mademoiselle Contat, to attempt 'les jeunes amoureuses;' in which characters she succeeded to the first place, after the retirement of Mademoiselles Méséray and Lange in 1798. She was then twenty. Her fine talent was very gradual in its development, nor did the public at all foresee what she would become. It was not until 1803 that her first marked success had been obtained. In that year the part of a deaf and dumb pupil of the Abbé de l'Épée, in the piece of that name, having been assigned to her, she displayed so much feeling, ingenuousness, and grace in its performance, that from that night she took rank as one of the great comic actresses. Her talents rapidly increased under the influence of cordial encouragement. Her kind instructress, Mademoiselle Contat, took leave off the stage in 1809, leaving the inheritance of her 'répertoire' to be divided between Mademoiselle Mars and Mademoiselle Levard, which gave rise to a long contest between the rival stars. The former however soon distanced all competitors, and for a space of thirty years stood at the head of all French actresses in genteel comedy, gaining a new success in every new part, down to that of Mademoiselle de Belle-Ile, in Dumas's drama, which she played for the first time on the 2nd of April 1839, when she had passed the age of three-score.

Yet, although she never refused to take the leading characters in plays of the new school, and in each achieved a new triumph, she was to the last opposed to the modern romancists, and generally required extensive changes to be made in her own parts. Victor Hugo and the elder Dumas were sometimes embarrassed by her criticisms and strictures, and the latter, in his 'Mémoires,' has described some piquant disputes of this nature between the actress and the dramatists. But her grandest delineations were in the ancient drama, especially in the comedies of Molière. In the lady of fashion, in the coquette of the beau monde, every spectator felt the collected self-possession, the fulness of attention with which she performed these characters. It was her resolute will and extraordinary ability which alone kept alive a respect for the ancient dramatic literature in the house to which she belonged, when a dozen theatres and fifty modern dramatists were endeavouring to subvert it.

Those who never saw Mademoiselle Mars on the stage, can form no idea of the simplicity, the seeming artlessness, the graceful elegance of her acting; nor of the music of her voice, so distinct that the very letters seemed printed in it, nor of the exquisite expression of her smile. Her form was very fine, her gait easy yet majestic, her costume remarkably elegant and distinguished. She was one of the shareholders of the Théâtre Français, and her yearly rent from this source amounted to 40,000 francs; and, in 1816, Louis XVIII. settled on her as well as on Talma a pension of 30,000 francs. The hotel in which she lived was open to the most celebrated foreign as well as native artists and literati, some of whom were daily to be seen paying their court to her. She was sedulously attentive to the critics and feuilletonists, all of whom vied with each other in describing her performances. On the night of the 7th of March 1841 she appeared for the last time on the boards of the Théâtre Français, in the 'Misanthrope' and the 'Fausse Confidences.' It was of course a benefit night, and for the last time she performed the parts of Célimène and Araminte. She died on the 20th of March 1847, her

death having been accelerated, if not caused, by the habit of having her hair dyed every ten days. She left behind her a fortune of 800,000 francs.

MARSDEN, WILLIAM, a distinguished Oriental scholar, was born in Dublin, on the 16th of November 1754. He was of a Derbyshire family which had settled in Ireland at the end of the reign of Queen Anne. John Marsden, his father, was the son of one of the original settlers, and was established in Dublin as a merchant on a large scale. The subject of this article was his tenth child. After going through the usual course of classical education in the schools of Dublin, he was about to be entered at Trinity College with a view to the church, when his destinies led him to take a very different course. His eldest brother had before proceeded to Benocoolen as a civil servant of the East India Company; and sending home a very favourable account of his prospects, the father was induced to apply for another appointment in the same quarter for William, which proved successful. He was accordingly removed from school, and in the beginning of the year 1771, when he was but sixteen years of age, he embarked for India, and arrived at Benocoolen in May of the same year. Here his assiduity, intelligence, and integrity quickly secured to him such distinction as a small establishment and community afforded. He became first sub-secretary, and soon after principal secretary to the government. The duties of these stations were not very laborious, and afforded ample leisure for study and inquiry. Mr. Marsden mastered the vernacular language of the country, the Malay, and at the same time laid in that stock of local knowledge which, being embodied afterwards in his publications, was the foundation of his fame as a writer.

Mr. Marsden's whole stay in Sumatra did not exceed eight years, but how well and diligently he employed this brief period can only be sufficiently appreciated by those who, like the writer of this article, have been engaged in the same pursuits. But he felt that his powers were wasted in the narrow field in which they were exercised, and he determined upon an experiment, usual in such a case as his, that of returning to England to push his fortune. He felt that, at all events, literary leisure, independence, and a congenial climate would be assured to him by this step.

Having this object in view, he quitted Sumatra in the summer of 1779, and in the last days of the same year arrived in England, with good health, but with an income of a few hundred pounds a year. His first attempt was to procure a small post under the government; but, failing in this, he resolved on a literary retirement, and on supplying the want of wealth by a prudent economy; and if he afterwards abandoned this course, his departure from it cannot be said to have been of his own seeking. Shortly after his return to England he made the acquaintance of the late Sir Joseph Banks, and at his philosophical breakfasts met and acquired the friendship of some of the most eminent men of the day, Solander, Maskelyne, Dalrymple, Rennell, and Herschel. He soon became a Fellow of the Royal Society, and eventually of almost every learned or scientific society of eminence in the kingdom. His literary reputation was insured by the publication in 1782 of the well-known 'History of Sumatra.' This work, which has been translated into French and German, has maintained its reputation to the present time. It has the peculiar impress of Mr. Marsden's mind, strong sense, truthfulness, and caution. In so far as our language at least is concerned, it may be considered as the first book of Oriental travels which, with a thorough and intimate personal knowledge of local details, combines philosophy, science, and a liberal acquaintance with letters.

For fourteen years after his return to England Mr. Marsden's time was devoted wholly to literature and science; and in this manner it was his fixed intention to have passed the rest of his life. In 1782 he had resisted the temptation of going to India with Admiral Sir Hyde Parker, with the lucrative office of secretary; and in 1787 the certainty, under the auspices of the leading parties at the India House, of becoming an East India Director. In 1795 however, invited by Earl Spencer, on the recommendation of his friend, the celebrated geographer, Major Rennell, he accepted the situation of second secretary; and in due course of time he became chief secretary to the British Board of Admiralty, with the war salary of 4000*l.* per annum. No man at the same time could be better fitted, by diligence, official training, integrity, and general intelligence, to discharge the various functions which he was called upon to perform, and he did so discharge them for a period of twelve years, greatly to his own honour and the public advantage. This period too comprehended the most eventful and glorious in the history of the British navy, for it embraced the victories of Cape St. Vincent, Camperdown, the Nile, and Trafalgar. In 1807 Mr. Marsden, whose health began to suffer severely by the laborious discharge of the very onerous duties of his office, tendered his resignation of the secretaryship to the Admiralty, and retired on a pension of 1500*l.* per annum.

The first solid fruits of Mr. Marsden's leisure were the publication, in 1812, of his Grammar and Dictionary of the Malay language, the most difficult, elaborate, and perhaps the most likely to endure of his literary labours. A portion of the materials he had of course brought with him from Sumatra, and we find him engaged in the compilation of the Dictionary as far back as 1786. The eventual publication of these works however did not take place until thirty-three years after he had

quitted Sumatra, and, consequently, after he had ceased to receive any assistance from native instructors. When we consider therefore the accuracy and erudition by which they are so eminently characterised, we must look upon them as affording the highest proofs of happy industry and acuteness. Translations of them have been made, under the auspices of the Netherland government, both into the French and Dutch languages. In 1817 he published his 'Translation of the celebrated Travels of Marco Polo.' The translation has been made with Mr. Marsden's accustomed accuracy, and is accompanied by a commentary far more valuable than the translation itself. In 1823 he published the first part, and in 1825 the second, of his 'Numismata Orientalia, or Description of Eastern Coins,' a valuable collection of which had fallen into his hands by purchase. This is a work of great care and learning, in which, as well as in some respects in the compilation of the Malayan Dictionary, he had the invaluable assistance of his learned relative Sir Charles Wilkins. In 1832, in his seventy-eighth year, Mr. Marsden published his last work, comprising three Essays, the longest, most elaborate, and important of which is on the Polynesian or East Insular Languages, a subject which had long engaged his attention and was a great favourite with him. He was indeed the first that pointed out the existence of a considerable body of Sanscrit words in all the cultivated Polynesian languages, and also the singular connection which exists among these languages themselves, extending from Madagascar to Easter Island.

In 1831 Mr. Marsden voluntarily relinquished his pension to the public, an act of liberality which, at the time, had no example, and has had very few since. It met, as it well deserved, the warmest applause of the House of Commons. In 1834, feeling, as he himself says, the increasing infirmities of age, he determined in his life-time to bestow his rich collection of coins and medals and his extensive library of books and Oriental manuscripts in such a manner as would make them most serviceable to the public. The coins and medals he gave to the British Museum, and his library to the newly-founded King's College. In 1833 he had a slight apoplectic attack, and in 1834 and 1835 a second and third. These greatly enfeebled his body, leaving him however in the entire possession of his memory. The final and fatal attack did not take place until the 6th of October 1836, when, at seven o'clock in the morning, after passing a tranquil night, he gently expired, hardly uttering a groan, in the eighty-second year of a happy, prosperous, and well-spent life. Agreeably to his own directions, he was interred in the cemetery at Kensal Green. In 1807, shortly after quitting the Admiralty, Mr. Marsden married the eldest daughter of his old and intimate friend the late Sir Charles Wilkins: she survived him, and was the judicious and accomplished editor of the 'Autobiographical Memoir' from which we have extracted this brief account.

MARSHALL, JOHN, Chief Justice of the United States of North America, was born in Fauquier County, Virginia, September 24, 1755. He was the son of Colonel Thomas Marshall, and the eldest of fifteen children. He received a little instruction in Latin and Greek, but went through no regular course of education, and was never at any college. On the breaking out of the American war, he engaged with enthusiasm in the cause of his country. In 1776 he was appointed a first lieutenant, and in 1777 was promoted to the rank of captain. He was present at the battles of Brandywine, Germantown, and Monmouth. There was however a redundancy of officers in the Virginian army, and Marshall having applied himself to the study of the law, was admitted to the bar in 1780, and in 1781 resigned his commission in the army. Thenceforward he devoted himself to the law, and rose rapidly to great distinction in the profession.

Marshall was a member of the Virginia Convention for the ratification of the constitution of the United States, and both then as well as subsequently in the Virginia legislature distinguished himself by his judgment and eloquence. He was twice offered the situation of attorney-general, and on both occasions declined on private grounds to accept the offer. In June 1797 John Marshall, Charles Cotesworth Pinckney, and Elbridge Gerry, jointly and severally, were sent to France as envoys extraordinary and ministers plenipotentiary. Marshall returned to America in 1798. In 1799 he became a member of Congress, and on the 18th of May 1800 he was appointed secretary of state. On the 31st of January 1801 he succeeded John Jay as chief justice of the United States, and from that time till his death continued to fill the office with increasing reputation for ability and integrity. He died July 6, 1835, at Philadelphia, to which city he had gone from his residence at Richmond in Virginia, in hope that by medical advice and change of scene his declining health might be improved. Three of his children were with him, but his eldest son died suddenly at Baltimore, on his journey to attend his father's death-bed.

Judge Marshall was the author of the 'Life of Washington,' originally published in London, in 5 vols. 4to, the first volume in 1804, the fifth in 1807. The work was criticised by the 'Edinburgh Review' (October 1808) severely, but perhaps not unfairly, as having been swelled out to an unreasonable bulk by historical matter unconnected with the life of Washington; as containing no details of his private character and habits, which Judge Marshall had ample opportunities of knowing; as diffuse and undiscriminating in narrative, and heavy and unanimated in style. This criticism seems not to have been thrown away. Marshall published a second edition of the work in 1832, compressed into two volumes, and greatly improved. The 'History of the American

Colonies,' which in fact occupied the first volume of the original work, he had published in a separate form in 1824. A selection from his judicial decisions, &c., was published under the care of Judge Story in 1839, under the title of 'The Writings of John Marshall, late Chief Justice of the United States, upon the Federal Constitution.'

As a judge, it is admitted that he was one of the most distinguished that America has produced. Judge Story, who was twenty-four years his associate on the bench of the Supreme Court, wrote in 1828 an article in the 'North American Review' (vol. xvii.), 'On the Public Services of Judge Marshall,' in which he says:—"Splendid as has been the judicial career of this eminent man, it is scarcely possible that the extent of his labours, the vigour of his intellect, or the untiring accuracy of his learning, should be duly estimated except by the profession of which he was so great an ornament. . . . Many of those exquisite judgments which have oost days and nights of the most elaborate study, and for power of thought, beauty of illustration, variety of learning, and elegant demonstration, are justly numbered among the highest reaches of the human mind, find no admiration beyond the rank of lawyers, and live only in the dusty repositories of their oracles. . . . We emphatically say of Chief Justice Marshall that his master-mind has presided in our deliberations, and given to the results a cogency of reasoning, a depth of remark, a persuasiveness of argument, a clearness and elaboration of illustration, and an elevation and comprehensiveness of conclusion, to which none others offer a parallel."

"MARSHALL, WILLIAM CALDER, R.A., was born at Edinburgh in 1813, and after receiving an initiatory training as a sculptor, he removed to London, entered himself as a student in the Royal Academy, and became successively the pupil of Chantrey and of Baily. Having won the gold medal and travelling scholarship of the Royal Academy, he proceeded to Rome, where he remained from 1836 to 1838. On his return to London he devoted himself to poetic sculpture, in which line his works gradually obtained for him a high place in public favour by their simplicity, grace, and refinement. Mr. Marshall has been a diligent practitioner of his art, not a single exhibition having occurred since 1839 to which he has not contributed some poetic conception. Among these may be mentioned—'The Creation of Adam,' 'Una and the Lion,' 'Ophelia,' and 'Cupid and Psyche,' 1840; 'Atalanta and Hippomanes,' and 'Puck,' 1841; 'The Broken Pitcher,' and 'Eve and the first-born,' 1842; 'David with the head of Goliath,' and 'May Morning,' 1843; 'Little Red-Riding-Hood,' 'Caractacus before Claudius,' and 'Christ blessing little Children,' in 1844, works which secured his election as A.R.A. in the November of that year. 'The First Whisper of Love,' and 'Paul and Virginia,' appeared in 1845. In 1846 his 'Hero guiding Leander,' and 'Sabrina,' illustrating the well-known lines of Milton, and worthy of them. This statue has caught the general taste more perhaps than any other of Mr. Marshall's works, and the admirable reduction of it in Parian forms one of the most popular of the statuettes which have been produced in that beautiful material; several other of Mr. Marshall's works have also been copied as Parian statuettes, with more or less success, such as the 'Little Red-Riding-Hood,' and 'A Dancing Girl Reposing' (one of the most graceful of his classic works which gained the Art-Union prize of 500*l.*, and was exhibited at the Royal Academy in 1848). In 1847 Mr. Marshall exhibited 'Eurydice,' and the 'First Step,' in 1848 'Cupid Captive,' and a 'Young Satyr drinking,' in 1849 'The Grecian Maid,' 'Zephyr and Aurora,' and statues of Campbell and Cowper—the first of his monumental statues. That of Campbell has since been executed in marble, and placed in Westminster Abbey. In 1850 appeared a 'Nymph,' and a 'Mermaid on a Dolphin,' in 1851 'Hebe rejected,' in 1852 'The Hindoo Girl,' he having in February of that year been elected R.A.; in 1853 'Pandora,' in 1854 'Godiva,' in 1855 'The Mother's Prayer,' 'Ariel,' and 'Ajax,' and in 1856 'Imogene asleep,' 'She sat like Patience on a Monument,' and 'Hermia and Helena.' Mr. Marshall has also been one of the sculptors employed in the New Palace of Westminster, for which he has executed statues of the Chancellors Clarendon and Somers, and the poet Chaucer. He also executed the statue of Peel for Manchester; a colossal figure in bronze of the great statesman, with a statue representing the city of Manchester, as illustrative of manufactures and commerce, and another, typical of the Arts and Sciences, at the base of the pedestal—on the whole one of the most ambitious and perhaps the most successful of the memorials yet erected in honour of Sir Robert Peel. Another of Mr. Marshall's works is a statue of Captain Coram, the founder of the Foundling Hospital, erected at the entrance gates of that institution in November 1856.

MARSHAM, SIR JOHN, was one of six sons and four daughters of an alderman of London, and was born in the parish of St. Bartholomew in 1602. He had his education in Westminster school, and St. John's College, Oxford. He afterwards travelled much abroad in France, Italy, and Germany, both as a private gentleman and in the suite of Sir Thomas Edmunds the ambassador. When he returned home he betook himself to the study of the law, but it does not appear that he attained to more than to be appointed one of the six clerks in Chancery, and even this office he lost when the contentions arose between the king and the parliament. Nor was this all; for following the king to Oxford, and remaining attached to the royal cause, he

suffered greatly in his estate. On the change of the times he was returned to parliament for the city of Rochester, was restored to his six clerks' office, was knighted, and soon after was created a baronet. He died at Busby Hall near Watford in 1685.

Such is the outline of his life. The predominance of a political power to whom he was obnoxious, in the period of his life when his mind was at maturity, gave him leisure to pursue those studies for which he had acquired a taste in the earlier period of his life. The subject on which his mind was particularly directed is one of peculiar intricacy and difficulty, the disentangling the perplexed statements to be found in early writers concerning ancient dynasties and events in the earliest periods of history. The results of these studies he gave to the world in a folio volume, printed at London in 1672, which he entitled 'Canon Chronicus, Ægyptiacus, Ebraicus, Græcus,' being an enlargement of a work on the same subject published in 1649, entitled by him 'Diatrise Chronologica.' Sir John Marsham has treated the subject in a manner befitting a scholar intent on nothing but the discovery of truth, if truth be attainable. His work was published at Leipzig in 1676, and at Franeker in 1696, with a preface by the editor Menckenius, in which some of his conclusions are questioned. Of course the modern discoveries in Egypt have affected in some points the argument of this learned scholar.

In the same spirit he attacked the difficulties which rest on the 'Chronology of the Early History of Persia;' but this work has not we believe, been given to the public; nor the 'Dissertations on the Money of the Ancients,' and on the 'Roman Provinces and Legions,' which it is understood he left in manuscript. There is another work of his, less celebrated, the Preface, or Προσῳλαος, as he called it, to the great work on English monasteries, entitled 'Monasticum Anglicanum,' which was begun by Roger Dodsworth, and finished by Sir William Dugdale. This appeared in 1655.

Sir John Marsham was not only himself learned, but his two sons, Sir John Marsham of Cuxton, and Sir Robert Marsham of Busby, were also studious and learned men. The son of Sir Robert was created Lord Romney by George I.

MARSHMAN, JOSHUA, D.D., one of the "Serampore Brethren," as the band of missionaries among whom he and Dr. Carey were the most prominent often styled themselves, was born in 1767 at Westbury Leigh in Wiltshire. He was sent out to India in 1799 by the Baptist Missionary Society. He acquired, by severe and diligent labour, a complete knowledge of the Bengalee, Sanskrit, and Chinese languages. Into the Chinese he translated the Four Gospels, the Epistles of Paul to the Romans and the Corinthians, and the Book of Genesis. He also wrote 'A Dissertation on the Characters and Sounds of the Chinese Language,' published in 1809 in 4*to*; 'The Works of Confucius, containing the original text, with a Translation,' also in 4*to*, published in 1811; and 'Clavis Sinica; Elements of Chinese Grammar, with a Preliminary Dissertation on the Characters and Colloquial Medium of the Chinese,' printed at Serampore in 1814. In Sanskrit and Bengalee he assisted Dr. Carey in the preparation of a Sanskrit grammar in 1815, and a Bengali and English dictionary in 1825. In 1827 he published an abridgment of the dictionary. In 1826 he visited England on the subject of the disagreement between the Serampore Brethren and the Baptist Missionary Society, which led to their separation in the following year; his son John having previously visited England in 1822 on the same business. In this disagreement, which arose about 1817, the uncompromising and somewhat impracticable spirit of this otherwise excellent man, appears to have had considerable share. He again reached Serampore in June 1829, and remained there till his death on the 5th of December 1837, a few days previous to which event arrangements were concluded in London for the re-union of the Serampore Mission with the parent society, and for retaining him in the superintendance. In a sketch of his character at the end of the first volume of Dr. Cox's 'History of the Baptist Missionary Society' he is said to have been possessed of great mental power and diligence, of firmness bordering upon obstinacy, and of much wariness. Dr. Marshman's name is especially known by his controversy with Rammohun Roy [RAMMOHUN ROY], who distinguished himself greatly among his countrymen in India by his spirited attacks upon idolatry, and by the publication of a work entitled 'The Precepts of Jesus, the Guide to Peace,' in which, while exalting the precepts, he asperses the miracles of Christ. Dr. Marshman answered this work by a series of articles in the 'Friend of India,' a periodical issued by the Serampore missionaries, which were subsequently republished in London, in 1822, in a separate volume, entitled 'A Defence of the Deity and Atonement of Jesus Christ, in reply to Rammohun Roy, of Calcutta.' In 1824 appeared a second London edition of Rammohun Roy's work, illustrated with a portrait of the author, and containing replies to Dr. Marshman.

MARSIGLI, LUIGI FERDINANDO, COUNT, born at Bologna, of a noble family, in 1658, studied mathematics under Borelli, and natural history under Malpighi and other able professors. At the age of twenty he went to Constantinople. On his return he published 'Osservazioni sul Bosforo Tracio' (Rome, 1681), which he dedicated to Christina of Sweden; and he also wrote a memoir on the rise and decline of the Ottoman empire, which was not published until after

his death. He afterwards served in Hungary as a volunteer in the imperial army against the Turks, was raised to the rank of captain, and was wounded and taken prisoner at the battle of Raab, in 1633. He was sold as a slave, and, after suffering considerable hardships, was ransomed by his family. He was then employed by the Emperor Leopold I. as an engineer, to settle the boundary-line of the Austrian dominions on the side of Turkey, agreeably to the treaty of peace between the two empires. When the war of the Spanish succession broke out, Maragli, who was already a general, was actively employed, and he found himself in command of the garrison of Brisach, of which town the Count d'Arco was political governor. Brisach surrendered to the French thirteen days after they had opened the trenches. The aulic council of Vienna highly disapproved of the surrender, and Maragli was publicly sentenced to be cashiered. He tried every means to have the sentence revoked, but in vain. He wrote and published a memoir in his defence, which is said to have appeared perfectly satisfactory to competent judges, and among others to Marshal Vauban. From that time he devoted himself to study; he travelled in France, was numbered among the members of the Academy of Sciences at Paris, and at last returned to his native town, Bologna, to which in 1712 he made a donation of his scientific collections, which were placed by the senate of Bologna in a building allotted for the purpose, and called the Institute of Sciences and Arts. In 1726 Maragli published his great work on the Danube, 'Danubius Pannonico-Mysicus, Observationibus Geographicis, Astronomicis, Hydrographicis, Historicis, Physiis, perlustratus ab Aloysio Ferdinando Comite Marali, socio R. Societatum Parisiensis, Londinensis,' etc. (Amsterdam, 7 vols. folio, with handsome plates). The first volume treats of the geography of Hungary, Servia, and other countries bordering on the central Danube; the second, of the ancient monuments in the same; the third, of the geology; the fourth, fifth, and sixth, of the ichthyology, zoology, and ornithology; and the last contains a catalogue of the plants, and treats of the nature and properties of the waters of the Danube. He died November 1, 1730.

MARSTON, JOHN, a dramatist in the reigns of Elizabeth and James I., the particulars of whose life, and even the exact times of whose birth and death, are, like those of many of his contemporary poets, very uncertain. On the testimony of Wood, he seems to have been a student at Corpus Christi College, Oxford. At one time he appears to have been intimate with Ben Jonson, if we may judge from his dedication to that poet of the 'Malecontent;' but from the epistle to the reader, prefixed to his 'Sophonisba,' it seems that his friendship subsequently ceased, as that epistle contains severe strictures on Jonson for his use of passages from classical authors in his tragedies of 'Sejanus' and 'Catiline.'

Marston left several plays, of which the following have been printed separately:—'Antonio and Mellido,' 'Antonio's Revenge,' 'Dutch Courtesan,' 'Insatiate Countess,' 'Malecontent,' 'Parasitaster,' 'Sophonisba,' 'Tamerlane the Great,' and 'What you Will.' Of these the 'Malecontent,' an excellent play, abounding in causticity, and embellished with the most forcible poetic expressions, is printed in Dodaley's Collection. It appears however from the title-page of the first edition (1604) that this piece was written by Webster, and only altered by Marston. He also left some miscellaneous poetical works, collected and edited by Mr. Bowle in 1764; and he assisted Ben Jonson and Chapman in the composition of 'Eastward Hoe,' a play which is in Dodaley's Collection.

MARTEL, CHARLES. [CHARLES MARTEL.]

MARTIALIS, MARCUS VALETERIUS, was a native of Bilbilis in Spain, where he was born on the Calends of March, about the year 43. Very few particulars of his life are ascertained, and even these are principally collected from his own writings. He went to Rome at an early age, and passed about thirty-five years of his life in that city. He left Rome probably about the commencement of Trajan's reign, and retired to his native town. The emperor Titus appears to have been his first imperial patron. Domitian, the successor of Titus, gave him the 'jus trium liberorum,' and conferred on him the dignity of tribune ('Epiq., ii. 91; iii. 95), for which and other favours the grateful poet made a most abundant return of flattery. Some critics have supposed that the author was married, and had a wife Marcella (xii. 21, 31); but the conclusion to be drawn from his writings is on the whole the other way. Martial was acquainted with most of his literary contemporaries, Juvenal, Quintilian, Pliny the younger, and others. He died about 104.

There are extant of Martial fourteen books, entitled, 'Epigrammata,' of which the thirteenth also bears the particular name of *Xenia*, and the fourteenth that of *Apophoreta*. A book called 'Spectaculorum Liber,' which is prefixed to the 'Epigrams,' contains a number of small poems on the shows of Titus and Domitian, and, as some critics suppose, may not be altogether the work of Martial. The whole collection contains above 1500 epigrams.

Many of the epigrams of Martial belong to that class of compositions which are now known by the name of epigrams, and may be considered as the prototype of that species of composition: they are short pieces, varying in length from two lines to four, six, or more, the point of which is generally contained in the last line. Like modern compositions of the kind, the thought is often forced and laboured, and the whole meaning sometimes obscure. Other of his

compositions belong to that class more properly called epigrams, according to the original signification of the word, and are often characterised by great felicity of expression: they are on a great variety of subjects, and contain much matter that needs and requires comment. There is perhaps no Roman writer extant whose works, if well studied, would be so useful as Martial in illustrating the period in which he lived. Martial's description of his native Bilbilis and the river Salo (Xalon) which flows by it, and several other pieces, show a taste for a country life, and a poetic vein hardly inferior to that of Horace (i. 50, &c.). The twelfth book of his 'Epigrams' was published after his return to Bilbilis (xii. 3). Many of the epigrams of Martial are as gross and obscene as thought and expression can make them; as to which it may be sufficient to remark that the manners of his age did not forbid the publication of obscene poetry, and that in this respect Martial was no worse than many of his contemporaries. In the Delphin edition the most obscene epigrams have been carefully selected and placed together at the end of the work, for reasons which, as there given, do not appear very satisfactory.

The editions and translations of Martial are very numerous: the best recent edition is perhaps that of Schneidewinn, Grem., 1842. There are several English translations of selections from Martial; the latest complete version, so far as we know, is that by James Elphinstone, London, 1782.

MARTIN I., a Tuscan by birth, succeeded Theodore I. in the see of Rome in 649. He held a council of Italian bishops in the Lateran church, in which the Monothelites were condemned. The Emperor Constant II., who favoured the Monothelites, gave orders to the exarch of Ravenna to seize the person of the pope. Martin was taken to Constantinople, where a judicial inquiry was instituted against him for disobedience to the emperor, and he was banished to the Thracian Chersonesus, where he died in 655. He was succeeded by Eugenius I.

MARTIN II., called by some Marinus I., succeeded John VIII. in 882, and died in 884. He was succeeded by Adrian III.

MARTIN III., called by some Marinus II., a Roman by birth, succeeded Stephen VIII. in 942. He died in 946, and was succeeded by Agapitus II.

MARTIN IV., CARDINAL SIMON DE BRIE, a native of France, succeeded Nicholas III. in the papal chair in 1281, through the influence of Charles of Anjou, king of Sicily and Naples. The Sicilian Vespers in 1282 having deprived Charles of Sicily, Martin excommunicated Peter of Aragon, whom the Sicilians had elected king; but his excommunication was of no more avail than the arms of the Angevins, for the Sicilians stood firm against both. Martin excommunicated the Byzantine emperor Michael, by which he widened the breach between the Greek and Latin churches. He died in 1285, and was succeeded by Honorius IV.

MARTIN V., CARDINAL OTTO COLOMNA, of an illustrious Roman family, was chosen by the Council of Constance, after the deposition of John XXIII. and of the two anti-popes Gregory and Benedict. Martin closed the Council of Constance in April 1417 without its having effected the reforms in the Church which were expected from it by Europe in general. Martin however promised to call together a new council for the purpose, which after much delay met first at Siena and afterwards at Basel in Switzerland, whither the pope sent his legate, Cardinal Julian Cesarini, in 1431. But Martin died soon after, and was succeeded by Eugenius IV.

MARTIN, JOHN, was born at a house called the Eastland Ends, Haydon Bridge, near Hexham, Northumberland, on the 19th of July 1789. His early ambition being to become a painter, his father, as the best way of turning his desire to profitable account, apprenticed him to a coach-maker at Newcastle (where the family had removed) to learn herald-painting. Here however he only remained a few months; and, his indentures having been cancelled, he was then placed with an Italian painter named Bonifacio Musso, the father of Charles Musso, who acquired some distinction as an enamel painter. With him young Martin removed to London in September 1806, and soon after, not getting on very pleasantly in his master's family, took lodgings for himself; and, as he relates in some autobiographical notes contributed to the 'Athensum' (see 'Ath.' for 1854, p. 246, to which we are indebted for the leading facts contained in this notice), "at this time, by close application till two or three o'clock in the morning, in the depth of winter, I obtained that knowledge of perspective and architecture which has since been so valuable to me. I was, at this time, during the day employed by Mr. C. Musso's firm painting on china and glass, by which, and making water-colour drawings and teaching, I supported myself: in fact, mine was a struggling artist's life when I married, which I did at nineteen."

His marriage stimulated him to a bolder course. He determined to paint a large picture, and by a month's application produced in 1812 his first work, 'Sadak in search of the Waters of Oblivion.' Before it left his hands his hopes received a severe blow: he "overheard the men who were to place it in the frame disputing as to which was the top of the picture." It was a mistake easy enough to make; but once in the frame the top of the picture would not be again in danger of being taken for the bottom. It found a place in the Royal Academy Exhibition, and, what was better, a purchaser for 50 guineas, in Mr. Manning, a bank director. He followed up his success by sending to the British Institution an 'Expulsion from

Paradise,' and to the Academy in 1815 'Clytie,' a work which was hung in the ante-room, as was, in the following year, his more ambitious picture, 'Joshua commanding the Sun to stand still.' At the British Institution, where the 'Joshua' was again exhibited the following spring, it was placed in a post of honour, and awarded the prize. Martin was excessively angry with the Academy for this treatment of his "grand work," and the breach was never healed: he removed his name from the Academy's books as a candidate for membership, and as a necessary consequence, according to the laws of the Academy, he never received any academic distinction. With the picture itself, and the success it met with, he was however abundantly satisfied. "The confidence I had in my powers," Martin writes, "was justified, for the success of my 'Joshua' opened a new era to me. In 1818 I removed to a superior house, and had to devote my time mainly to executing some immediately profitable works; but in 1819 I produced the 'Fall of Babylon,' which was second only to the 'Belshazzar,' in the attention it excited. The following year came 'Macbeth,' one of my most successful landscapes; then, in 1821, 'Belshazzar's Feast,' an elaborate picture, which occupied a year in executing, and which received the premium of 200*l.* from the British Institution."

These works, and especially the 'Belshazzar's Feast,' were of a kind then quite new, and took the London public by storm. A sturdy opposition was raised; but for the time it was borne down by the swelling tide of popularity. It was loudly declared—and pretty widely believed—that a new era was opened to art, as well as to the painter's self; and the engravings quickly made the artists' "sublime style" familiar from one end of the island to the other. Nor was he slow to follow up his success: 'The Destruction of Herculaneum' appeared in 1822; the 'Seventh Plague,' and the 'Paphian Bower,' in 1824, the 'Creation,' in 1826, the 'Deluge,' and in 1828 the 'Fall of Nineveh,' perhaps the most popular of all his pictures after the 'Belshazzar.' He was now however so much engrossed with engraving, and with various schemes for the improvement of London, and other engineering projects, that for awhile his pencil was somewhat less diligently employed, and when he resumed its exercise he discovered that the spell was broken. His later pictures indeed found admirers, but they were few as compared to those which greeted his earlier works, and infinitely less enthusiastic. Yet he went on to the last painting subjects no less awful than those which had originally captivated the public eye. Thus during the last twelve or fourteen years of his life he painted—'The Death of Moses,' and 'The death of Jacob,' 1838; 'The Eve of the Deluge,' 'The Assuaging of the Waters,' 1840; 'The Celestial City and River of Bliss,' and 'Pandemonium,' 1841; 'Flight into Egypt,' 1842; 'Christ stilling the Tempest,' and 'Caute the Great rebuking his Courtiers,' 1843; 'Morning,' and 'Evening,' 1844; 'The Judgment of Adam and Eve,' and 'The Fall of Adam,' 1845; 'Evening—coming storm,' 1846; 'Arthur and Ægle in the Happy Valley,' 1849; 'The Last Man,' 1850; 'Valley of the Thames viewed from Richmond Hill,' 1851.

The last picture he exhibited during his life was a 'Scene in a Forest—Twilight' (1852). He was now engaged on a series of three grand paintings, illustrative of the 'Last Judgment,' which he fondly hoped would be his master-work, and he laboured steadily at these till a few weeks before his death. Then suffering under a paralytic attack he set out in the hope of improving his health to Douglas, Isle of Man, where, at the house of Thomas Wilson, Esq., he died February 17th, 1854. His remains were interred in the lonely cemetery of Kirk Braddan, on the Strang Road, a few miles from Douglas. His three pictures, 'The Last Judgment,' 'The Great Day of Wrath,' and 'The Plains of Heaven,' have since his death been exhibited in London and the provinces. As might be expected from the nature of the subjects, and the circumstances under which they were painted, suffering under the infirmities of age, with mind and body both enfeebled, they are comparative failures, having all the worst faults and mannerisms of the painter's earlier pictures, and only few of their redeeming excellences.

Martin was undoubtedly an original painter, and possessed a very considerable share of imagination; and in the expression of material grandeur and terror,—the vastness and might of nature, in contrast with the weakness and littleness of man,—he was eminently successful. At least until by repetition the conception had been rendered commonplace and unimpressive, this was unquestionably the case; and the unparalleled popularity of his early pictures, while the manner was new, can be readily understood. But Martin did not perceive that his was a trick of style which would not bear often repeating; and he kept on covering acres of canvas with interminable vistas of buildings, pile upon pile, as buildings never could have existed in reality, and crowding the roads and fields with myriads of little insignificant figures, and clothing the whole in floods of stormy gloom and twilight, with flashes of jagged lightning or streams of dazzling sunshine; never advancing beyond a harsh and niggling touch, or attaining to anything better than a crude and conventional system of colour. Seeing only two, or at most three, of his pictures, he might be pronounced a man of genius; seeing all, while acknowledging his talent, it is difficult not to feel surprise at his deficiencies of taste, observation, and judgment.

It has been said that during many years the subject of the improvement of London occupied much of his time and thought. As early as

1828 his ideas had taken a definite shape, and he gave them to the public in a 'Plan for supplying with pure water the Cities of London and Westminster, and improving the western end of the metropolis;' and he continued to publish new and revised editions almost down to his death. The following is his own account of his labours in this line, contained in his contribution to the 'Athenæum' already referred to: "My attention was first occupied in endeavouring to procure an improved supply of pure water to London, diverting the sewage from the river, and rendering it available as manure; and in 1827 and 1828 I published plans for the purpose. In 1829 I published further plans for accomplishing the same objects by different means, namely, a weir across the Thames, and for draining the marshy lands, &c., &c. In 1832, 1834, 1836, 1838, 1842, 1843, 1845, and 1847, I published and republished additional particulars, being so bent upon my object that I was determined never to abandon it, and though I have reaped no other advantage, I have at least the satisfaction of knowing that the agitation thus kept up constantly, solely by myself, has resulted in a vast alteration in the quantity and quality of the water supplied by the companies, and in the establishment of a Board of Health, which will, in all probability, eventually carry out most of the objects I have been so long urging. Amongst the other proposals which I have advanced is my railway connecting the river and docks, with all the railways that diverge from London, and apparently approved by the Railway Termini Commissioners, as the line they intimate coincides with that submitted by me, and published in their report;—the principle of rail adopted by the Great Western line; the lighthouse for the sands, appropriated by Mr. Walker in his Maplin Sand Lighthouse; the flat anchor and wire cable; mode of ventilating coal mines; floating harbour and pier; iron ship, and various other inventions of comparatively minor importance, but all conducing to the great ends of improving the health of the country, increasing the produce of the land, and furnishing employment for the people in remunerative works." He also took out patents for water and sewer-pipes, &c.

Besides his great pictures Mr. Martin painted a great number of water-colour landscapes very elaborately wrought out; he also made some drawings for books, including 'Paradise Lost and Regained,' 'Pilgrim's Progress,' &c., for which he received large sums, but which, though popular in their day, now seem for the most part strangely infelicitous as illustrations. For the Milton illustrations he is said to have received 2000*l.* guineas.

\* MARTINEAU, HARRIET, is descended from a family of French extraction, who were compelled to leave their country in consequence of the revocation of the Edict of Nantes, and settled at Norwich, where for several generations they carried on the business of silk-manufacturers. Harriet, the youngest of eight children, was born at Norwich in June 1802. The substantial brick-house in which her father resided for many years is now pointed out to strangers as her birthplace. Her education had been chiefly received at home, and was solid rather than showy. Her self-culture was unremitting; for a partial deafness, contracted in her youth, threw her very much upon her own internal resources for pleasure and improvement. She evinced a very early talent for composition; and the habit of writing, which was originally her amusement, became the real business of her life. Her father became embarrassed in his commercial affairs; and the numerous members of the family of the supposed-wealthy manufacturer were thrown upon their own unaided resources. In the hour of necessity the wonderful energy of Harriet Martineau was signally manifested. With a noble pride she resolved to be independent; and she did not seem to add to her little resources by the humble industry of needlework. But in literature she saw the means of support. In 1823 she published a volume of 'Devotions for Young People.' This she followed up by her 'Christmas Day,' in 1824; to which, in the following year, she added a sequel, called 'The Friend.' In 1826 appeared her 'Rioters,' and 'Principle and Practice,' succeeded next year by 'The Turn out' and 'Mary Campbell.' In 1828 she published a tale, called 'My Servant Rachel;' a series of small 'Tracts' on questions relating to the working classes; and a sequel to 'Principle and Practice.' In 1830 she selected a loftier subject for her pen in the 'Traditions of Palestine,' a work containing most interesting and graphic sketches of that country in the time of Christ.

In the early part of 1830 the committee of the British and Foreign Unitarian Association offered prizes for the production of three tracts on the 'Introduction and Promotion of Christian Unitarianism among the Roman Catholics, the Jews, and Mahometans.' Three distinct sets of judges were appointed to decide on the comparative merits of the essays sent in for competition, and each set of judges awarded the prize to the composition of Harriet Martineau: the titles of her essays were, 'The Faith as unfolded by many Prophets,' 'Providence as manifested through Israel,' and 'The Essential Faith of the Universal Church.' Still the reputation of Miss Martineau was in a great degree limited to a small circle, when she conceived the bold idea of publishing a monthly series of tales, that should illustrate the leading doctrines of political economy. To the publishers of that day, the notion of what was deemed the most dry and difficult of studies being rendered amusing appeared little more than an absurdity. The Society for the Diffusion of Useful Knowledge also unwisely rejected the proposition, for the sober and unimaginative majority of their committee shrank from "truth severe in fairy fiction dressed." The Illustrations of

'Political Economy' came out from the shop of a publisher in Paternoster-row, little known beyond his Unitarian connections. Their immediate success showed how justly the authoress had estimated her powers. Independent of their value as expositions of great principles, some of these tales will always be read for their truthful pictures of life, and the ingenious construction of a story limited by its especial purpose. These were followed by six tales entitled 'Illustrations of Taxation,' and four others on the 'Poor Law and Paupers.' In 1835 Miss Martineau made a voyage to America, and the results of her visit to the United States were given to the world in her work on 'Society in America,' published in 1837. In 1839 Miss Martineau appeared more distinctly than in her 'Illustrations' in the character of a novel writer; 'Deerbrook,' and 'The Hour and the Man,' which succeeded it, scarcely commanded the popularity due to their merits. The series of 'The Playfellow,' placed her in the highest rank as a writer for the young.

From 1839 to 1844 her health was greatly impaired. During the most trying period of her illness, she resided at Tynemouth; and the indefatigable exercise of her mental powers in this crisis was exhibited by her publication of 'Life in the Sick-Room.' Her recovery, according to her own statement in the 'Athenaeum,' was the effect of mesmeric agency. She resumed her pen with renewed vigour; her next production being 'Forest and Game-Law Tales,' in 3 volumes. In 1846, shortly after she had published a pretty tale in one volume called 'The Billow and the Rock,' she went on an expedition to Syria and the Holy Land, and on her return published her impressions of those countries in a work entitled 'Eastern Life, Past and Present.' She afterwards formed an engagement with Mr. Knight to carry on the 'History of England during the Thirty Years' Peace,' which he had commenced to write, but which he was obliged to relinquish, as Miss Martineau states in her Preface, "in consequence of extensive changes in his commercial arrangements." The value of this history of a most interesting period was fully acknowledged, even by those who differed from its political conclusions on the great changes which England had experienced since 1815. After this publication Miss Martineau astonished the world by avowing, in a volume published in conjunction with Mr. Atkinson, certain opinions upon the great principles of religious belief which were signally opposed to those of her previous career. Her last important work is a free and condensed edition of Comte's 'Positive Philosophy'; but she is understood to have been, during several years a large contributor to the Westminster and other Reviews, and also to the daily and weekly press, more particularly to the 'Daily News.' A little volume, 'Sketches of Life,' appeared at the end of 1856. She now resides at the pretty house which she built at Ambleside, occupying herself, so far as ill-health will allow, in occasional writing.

MARTINEZ DE LA ROSA, FRANCISCO, a Spanish lyric and dramatic poet, historian, orator, and statesman, who is at the head of the moderate party in politics in that country, and of a party somewhat analogous in literature. He was born at Granada on the 10th of March 1789, the year of the outbreak of the first French revolution. He went through a course of study for the law at the university of his native city, and, by the account of all his biographers, held the appointment of lecturer on ethics and professor at the college of San Miguel at the time of the French invasion, when he had not completed his twentieth year. He threw himself with ardour into the patriotic cause, and was sent by the junta of Granada on a mission to the English authorities at Gibraltar to procure arms and supplies, which were liberally granted, and contributed towards the signal victory of Baylen. He afterwards went on a similar mission to England itself, and it was in London in 1811 that his first productions saw the light. The Spanish government had offered a prize for the best poem on the heroic defence of Saragossa, but the prize was never awarded. Martinez de la Rosa's poem, 'Saragossa' (8vo, London, 1811), which was highly approved by Jovellanos and Quintana, is however universally considered to have deserved it. He also wrote a short historical sketch of the war of independence for Bianco White's Spanish periodical, 'El Español,' which was published in London between 1810 and 1814. A short poem, 'The Remembrance of Home,' which heads the collection of his lyrics, and bears date 'London, 1811,' is so full of yearnings for the sun of Spain, as sufficiently to explain why his residence in England was not of long duration. He appears however to have taken back with him an admiration of constitutional government which has survived a host of vicissitudes. Shut up at Cadix with the patriotic government, he became intimate with Quintana and Arguelles; but was prevented by the deficiency in age, which had been considered no obstacle to his professorship, from being chosen a member of the Cortes. The theatre at Cadix was within range of the French bombs; a temporary one was constructed in a safer position; and one of the first plays produced in it was his 'Viuda de Padilla,' or 'Widow of Padilla,' a tragedy in the style of Alfieri, founded on the story of the widow of the Spanish patriot who perished in defending, in the 16th century, the rights of the commons of Castile. This tragedy, which had much success, and was afterwards reproduced with approbation at Madrid, is probably the only Spanish play which has ever been represented on the stage in London, having been acted by an amateur company of Spanish emigrants at the Coburg (now the Victoria) Theatre in 1829. A comedy by Martinez de la Rosa, 'Lo que puede

un Empleo' ('The Effects of holding Office'), was still more successful; and is said to be the first in which political life was made a subject of the comic drama, a vein which has since been much worked in France. Several pamphlets on the events of the day from the same fruitful pen are described by Galiano, long the author's rival, as abounding in Andalusian wit. In 1813 he was elected by the city of Granada deputy to the Cortes, and at once took his place as an orator of the first rank, his fine person and delivery enhancing the effect of his easy command of elegant and classical language. He was at that time a zealous defender of the constitution of 1812, of which it was then the fashion to maintain that it would work excellently but for the unfortunate absence of the king in the hands of the enemy; and it was not till King Ferdinand's return in 1814 that it was discovered that, of all obstacles to its working, and all enemies to Spain, he was the head and front. When by the decree of the 4th of May 1814 he at once subverted the constitution and proscribed its supporters, Martinez de la Rosa, for the crime of having been a member of the constitutional Cortes, was sentenced to ten years' imprisonment in the fortress of Velez de Gomers, on a rock on the coast of Marocco. Here he was treated with so much mildness that he had even the opportunity of getting up private dramatic performances; but it is said by Galiano that, when he returned to Spain, the old spontaneous gaiety for which he had been remarkable had disappeared for ever. His imprisonment was cut short at the end of six years by the insurrection of the Isle of Leon in 1820, which commenced the second constitutional era of Spain.

Soon after his return Martinez de la Rosa was secretary of state, but he did not hold the office long. His opinions had undergone a change with respect to the extent to which constitutional reforms were to be carried, and he was no longer disposed to insist on the democratic constitution of 1812. An outcry was soon raised against him as lukewarm in the cause of freedom; he became so unpopular as to be threatened with violence by the mob, and resigned his post before the measure was enforced of carrying the king to Seville. When however, after the subversion of the constitutional government by the French under the Duc d'Angoulême, he was required to give in his adhesion to the new order of things, he refused; and he was considered fortunate in only receiving his passport for France, instead of being sent afresh to the coast of Marocco. The next eleven years of his life were chiefly passed in the public libraries and the best society of Paris, with occasional excursions to Germany and Italy, in the course of one of which, as we learn from one of his best poems (an Ode to Granada), he shouted the beloved name of his native city in the interior of the crater of Vesuvius. His pen was far from inactive, and in 1827 he commenced the publication at Paris of a collection of his 'Obras Literarias,' which amounted at its completion in 1837 to five volumes. The first two are occupied with his 'Poetica,' a didactic poem on the art of poetry, accompanied by notes and illustrations, which comprise historical essays on the Spanish drama, and other forms of literature—the poem occupying less than 80, and the notes more than 900 pages. It has been justly observed, that in this large body of criticism, the author not only takes no notice of the modern or 'romantic' school of aesthetics, but even appears unaware of its existence, writing as if Boileau and Batteux were the absolute monarchs of the realm of taste, whose decrees it might be considered revolutionary to contest. The work however contains matter of considerable value, though, as a whole, half a century behind its date. The other volumes of the 'Obras' comprise the 'Viuda de Padilla,' already mentioned, and four others, which deserve mention—'La Niña en Casa y la Madre en la Mascara' ('The Girl at Home and the Mother at the Masquerade'), a comedy first performed at Madrid in 1821, and still a favourite on the Spanish boards, both in Europe and America, which has also been translated into French, and acted with success at Paris; 'Aben Humeya,' a romantic drama on the insurrection of the Moors under Philip II., written by Martinez de la Rosa in French, and produced successfully at the Porte St. Martin, and afterwards translated by the author into Spanish, not, as he tells us without some difficulty; 'Edipo,' a classical tragedy on the time-honoured subject of 'Oedipus,' in the preface to which is given a new analysis of the drama of Dryden and Lee; and 'La Conjuracion de Venecia' ('The Venice Conspiracy'), founded on an historical event of the year 1810, and written in direct imitation of the modern French romantic school. The July revolution of 1830 produced a general impression that things could not remain as they were in Spain, and the first indication of an impending change was King Ferdinand's permission to Martinez de la Rosa, who had always kept aloof from the main body of Spanish emigrants, to return to Granada. He there occupied himself in the completion of an historical novel on the fall of Granada, to emulate, as he says in the preface, those of Walter Scott and Cooper, of which the fame had spread throughout Europe. This novel, 'Doña Isabel de Solis,' the first volume of which did not appear till 1837 and the third and last till 1846, was interrupted in its progress by the recall of its author to power on the occasion of the death of Ferdinand, and the necessity which was felt of opposing a principle of some sort to the claims of Don Carlos.

Though the queen regent, Christina, was not well disposed to Martinez de la Rosa, he was the only man who had at the same time a high reputation among the Liberal party and had not been personally

obnoxious to her deceased husband. He became the head of the Spanish ministry, and it was from his hand that the 'Estatuto Real,' or Royal Statute, emanated, which, granted in the name of the queen in 1834, established a new constitutional system, with double chambers, as in England, and abolished the exclusive privileges of the ancient provinces. Almost contemporaneously with the 'Estatuto,' the 'Conjuracion de Venecia' was produced at Madrid, and had an extraordinary run of success. Martinez de la Rosa was at the same time the most popular dramatist of the day and the prime minister of the kingdom. In 1835 he commenced the publication of 'El Espiritu del Siglo' ('The Spirit of the Age'), which he stated in the preface that he had begun to compose in 1823, and which he intended to comprise a course of political science, illustrated by examples taken from the history of his own times. Unfortunately it was soon shown by events that his appreciation of the signs of the times was by no means unerring. The abolition of the privileges of the Basque provinces by the 'Estatuto Real' led to the adhesion of those provinces to the cause of Don Carlos; a civil war commenced, and began to grow in proportions till the results were looked to with apprehension at the capital. When, at the suggestion of the Duke of Wellington, the treaty with the Carlists called the 'Eliot Treaty' was signed, and an end was put to the sanguinary reprisals between the contending armies, the discontent of the populace of Madrid broke out with such violence that assassins surrounded the prime minister's carriage as he left the Cortes and attempted his life. It probably did not win him favour that he signed in 1835 with the English ambassador, Mr. Villiers (the present earl of Clarendon), a convention to more effectually repress the slave trade, which the English had been ineffectually pressing on the Spanish government ever since 1817. His influence went on declining till in 1836 he surrendered the reins of government to the Count de Toreno. His career as a member of opposition was the most brilliant parliamentary period of his whole life; nor was it long before he again had a place in the ministries which succeeded Toreno's; but the course of events was against the moderate party. The 'Estatuto Real' gave way to the Constitution of 1812. When, in 1840, the fall of Queen Christina took place, and Espartero assumed the regency, Martinez de la Rosa thought it expedient to leave Spain in disguise. He applied himself to continuing the 'Espiritu del Siglo' at Paris, and paid a short visit to London, during which he might be seen quietly engaged over a rare 'Lope de Vega' in the reading-room of the British Museum. The fall of Espartero and rise of Narvaez brought him back to Madrid as a member of the Narvaez cabinet, and he accepted the post of ambassador to Paris, which he afterwards exchanged, on the election of Pius IX. to the papedom, for that of ambassador to Rome. It is probable that in taking this post he had anticipated years of quiet; he was, as it turned out, involved in the most stirring series of events that the eternal city had witnessed for many centuries. On his return to Spain he was elected President of the Chamber of Peers. He is also Perpetual Secretary of the Spanish Academy, a post which he continued to hold at the time that he was prime minister. In 1851 he published the tenth volume of his 'Espiritu del Siglo,' completing the work, which had thus been in progress of composition for eight-and-twenty years, and of publication for sixteen. The greater part of it is a comment on the rise and progress of the French revolution, in which no striking novelty or brilliancy of view can be observed. The eloquent biographer of Martinez de Rosa, Pacheco, has expressed his regret that so much of his time has been devoted to this voluminous publication; and in that regret there are few who will not share, as well as in the accompanying remark that an autobiography from the pen of this literary minister could hardly fail to be a most valuable contribution to the history of the earlier half of the 19th century. [See SUPPLEMENT.]

The best collection yet made of Martinez de la Rosa's miscellaneous works is to be found in three volumes of Baudry's 'Coleccion de los autores Espanoles' (1844-45). Two other volumes of the same collection are occupied with a reprint of part of the 'Espiritu del Siglo.' The variety is great, and, except in the case of the 'Espiritu,' there is no signal failure; but it is only in some of the poems, especially one on the death of the Duchess de Frias, and some of the plays, especially the comedies, that there is signal excellence. The speeches on which much of his reputation is founded have never been collected from the reports of the debates of the Cortes. With regard to the author's political life, it is related that he himself wrote beneath a series of pictures representing very different events in his strangely-varied career—one, his return to Granada in 1820 beneath a triumphal arch, and another, one of the popular tumults of which he was nearly the victim—"He deserved neither the one nor the other." The leading feature in his political character is his honesty, which has never been called in doubt even by his opponents. He has been frequently accused by his own partisans of serious errors in judgment, and of weakness, and combined with weakness a singular toughness and tenacity; but all agree in regarding the leader of the moderate party in Spain as a man of honest purposes and a true lover of his country.

MARTINI, GIAMBATTISTA, well known throughout Europe under the title of the Padre Martini, was born at Bologna in 1706. Early in youth he entered the order of St. Francis, and, prompted by a spirit of inquiry and love of antiquity, soon set out on travels which he extended to Asia, on his return from which he seriously

recommended the study of music, under the celebrated Ant. Peri. In 1725 he became Maestro di Capella of the convent of his order which office he retained till his death. "He was," says Dr. Burney, who knew him well, "regarded during the last fifty years of his life as the most profound harmonist, and the best acquainted with the art and science of music, in Italy. All the great masters of his time were ambitious of becoming his disciples, and proud of his approbation." He was also a composer, and produced much music for the Church, which was formerly held in esteem. His sixty Canons in unison, for two, three, and four voices, are still known, and admired for their smoothness and grace. But the reputation of Padre Martini depends on his Essay on Counterpoint, published in 2 vols. folio, at Bologna, in 1774; and on his 'History of Music,' in 3 vols. 4to, the last of which appeared in 1781.

Martini's Essay ('Saggio fondamentale pratico di Contrappunto sopra il Canto-Fermo') is divided into two parts. In the first is a compendium of the rules of counterpoint, explaining clearly and well illustrating the laws of harmony. This is followed by the application of the foregoing to 'Canto-Fermo,' and succeeded by upwards of sixty compositions by the great masters of the ancient Italian school. The second part is wholly devoted to fugue and canon, and is extremely recondite, containing however too many musical enigmas and other matters which happily have no value in the present day; but compensation is made, for what now can only be considered as laborious trifling, by nearly fifty specimens of composition, in from two to eight parts, by several of the most distinguished of the old Italian masters.

The History ('Storia della Musica') by Martini was intended to be most voluminous, it is to be presumed, for the third volume only reaches the time of Alexander the Great. What is completed exhibits vast erudition and research, but is grievously defective in plan; and though valuable as a work of reference, will now be read chiefly by the studious professor and the patient antiquary, who may derive from it much curious and useful information. The materials collected by the author for his purpose were of surprising extent; the number of volumes in his library amounted, we are told, to 17,000, of which 300 were manuscripts of great rarity; and a large part of all this he was enabled to purchase and obtain through the generosity and interest of Farinelli, the famous singer. Martini died in 1784.

MARTINI, GIUSEPPE SAN, a composer of distinguished merit and a most celebrated performer on the oboe, an instrument which he may be said to have civilised, was a native of Milan, and arrived in England in 1723. He was soon engaged at all the public and private concerts, and in 1740 was taken into the service of the Princess of Wales, and received the appointment of music-master to the Princess. His Twelve Sonatas for two violins and violoncello were long in the highest favour with the public; but his best work is his Concertos for a full band, which display great invention, very elegant taste, and a thorough knowledge of his art. He died in 1750.

MARTINI, VINCENZO, commonly known as Martini of Madrid, was born at Valencia in Spain in 1754. He was Maestro di Capella to the Prince of Asturias in 1785, and has always been thought one of the most agreeable composers of Italian operas. Among his works are 'L'Arbore di Diana,' brought out at Vienna in 1787, and 'La Cosa Rara,' produced about the same time, both of which have been everywhere popular, particularly the latter, which is well known on our English as well as on the Italian stages, Stephen Storace having introduced most of it in Cobb's opera, the 'Siege of Belgrade.' He died at St. Petersburg in 1810.

MARTINO, SIMONE DI. [MEMMI, SIMONE.]

\*MARTIUS, CARL FRIEDRICH PHILIP VON, a distinguished German botanist, was born in 1794 at Erlangen, where his father was Hofapotheker. He received his early education at the Gymnasium of his native town, and studied medicine in the university, where he took his degree of M.D. He early evinced a taste for botany, and in 1807 published the 'Flora Cryptogamia Erlangensis.' This book contained an account of all the flowerless plants of the neighbourhood of Erlangen, and was illustrated with six plates, four of which were devoted to drawings of all the known species of *Jungwermannia* in Germany.

In 1817 Von Martius accompanied Spix in an expedition sent out by the Austrian and Bavarian governments to the Brasilia. In three years the travellers visited the breadth and length of this vast territory, and Martius returned with an herbarium of 7500 species of plants, and a mind deeply impressed with the grandeur and beauty of the scenes amid which he had travelled. His personal adventures were published in a work entitled 'Reise nach Brasilien,' which was published at Munich in 1824 in three volumes. This work is not only gracefully written, but is rich in observations on the geographical distribution of plants, the ethnology, statistics, and geography of the Brasilia, and has placed Von Martius as a traveller second to no one but the great Alexander von Humboldt.

Amongst the plants that most arrested the attention of Von Martius was the noble family of Palms, and to this family he has given the largest share of his attention, and published on them one of the most magnificent monographs that has ever been devoted to a group of plants. This work which he was several years in publishing was entitled 'Genera et species Palmarum,' and contains nearly 200

illustrations in folio of the tribe of palms. It also includes a separate art on the structure of the palm tribe by Hugo von Mohl. This work is not a mere dry description of the genera and species of palms, but is accompanied by descriptions of the districts in which they grow, and the plants and scenery with which they are associated.

Von Martius has not however neglected the mass of other plants he found in the Brazils. The palms were the central group around which he has described the vegetation which accompanies them in nature. Assisted by other botanists he has published in three volumes folio, with 300 engravings, the new genera and species of plants collected in his Brazilian travels. These appeared from 1823 to 1829 under the title of 'Nova Genera et Species Plantarum,' &c. Another work of smaller size entitled 'Flora Brasiliensis,' and containing descriptions of all the plants collected in his travels in Brazil, was commenced in 1829. These works have established for Von Martius the highest reputation as a descriptive and systematic botanist. In the course of his observations on plants he was led to regard the fruit as the organ of most importance in the plant, and proposed to classify the vegetable kingdom according to its variations in structure. He published his views in 1835 in a work entitled 'Conspectus Regni Vegetabilis secundum characteres morphologicos præsertim carpulorum,' &c. Although it contains a great amount of valuable observation on the structure of plants, the system has never been adopted. It is in fact too artificial.

On his return from the Brazils he was appointed Professor of Botany at Munich, and Director of the Botanic Garden. His lectures are clear expositions of the state of botanical science, and delivered in a very attractive manner. He has published many papers on the physiology of plants, but some of these are very speculative. In one of his works he advocates the doctrine that plants are possessed of a consciousness independent of their structure, and that with animals they have probably, although a lower, a similar existence, independent of their corporeal structure. Von Martius is a Fellow of the Royal and Linnean Societies of London, and of many other learned bodies on the continent of Europe.

MARTOS, IVAN PETROVICH, director of the Academy of Fine Arts, St. Petersburg, born about 1755, was not only the most eminent sculptor that Russia has yet produced, but one who would have ranked high in almost any age or country. The number of his works is very considerable, and among the more important are the following public monuments:—the bronze colossal group of the patriot Minin and Pozharsky, at Moscow; the monument to the Emperor Alexander, at Taganrog; the statue of the Duke of Richelieu, at Odessa; Potemkin's monument, at Cherson; and that erected in honour of Lomonosov, at Arkhangel. Martos has been styled the Canova of Russia; and while some have admitted that his works are inferior to those of the great Italian artist in point of refined elegance and high finish, they assert them to be free from that mannerism and over-studied gracefulness which were Canova's defects. Their characteristics are nobleness of conception, truth of expression, and freedom without negligence of execution. His skill in the draping of his figures has been much praised; he had a particular talent for bas-relief subjects. One of the most admired of these is that which adorns the monument of the grand-duchess Helena Paulowna, and which represents Hymen extinguishing a torch. Martos died April 17th, 1835.

MARTYN, HENRY, known as the 'Missionary,' was born in 1781. The short life of this amiable and zealous man may thus in brief be delineated. His birth was obscure. He was the son of a person who had been a labourer in the mines at Gwennap in Cornwall, but who was probably a person of talent and virtue, as he raised himself to the situation of clerk to a merchant at Truro, in which town Henry Martyn was born. He had his education in the grammar-school of Truro, and having acquired a considerable share of grammar learning, he tried for a scholarship in Corpus Christi College, Oxford; but failing in this, he in 1797 entered St. John's College, Cambridge. Here he pursued his studies with such energy, that in 1801 he came out senior wrangler. During this period also his mind became directed with more than common earnestness to the truths of revelation. The death of his father is thought to have affected him at this period of his life so deeply as to have had no small share in turning his thoughts into the channel in which from this time they continued to flow; and not less the intimacy which he had formed with the Rev. Charles Simeon, the celebrated evangelical preacher in the University of Cambridge. He was chosen Fellow of St. John's in March 1802; but out of zeal in the cause of religion, he finally determined to devote himself to the work in which many of his countrymen had by that time begun to engage themselves, of propagating Christianity in nations which had not received it. There had been, it is true, a Society in England associated for the purpose of propagating the Gospel in foreign parts; but a new impulse and a new energy were given to such operations by the establishment of missionary societies, supported by the Methodists, the Independent Dissenters, and by the Evangelical party in the Church. Mr. Martyn offered himself to the African and Eastern Missionary Society as a person willing to undertake the duties of a missionary in the East, and finally embarked for India in 1805.

It now became necessary that he should make himself master of the languages of the countries which he was about to visit; and with what

success he studied them is evidenced by the fact that he had the superintendence of the translations of the New Testament made under the instructions of the Missionary Society, both into Persian and Hindustanee. He made also some progress in an Arabic translation. In his capacity of missionary he traversed large tracts both of India and Persia. After above five years' labour in these countries his health began to decline, and it soon became manifest that he would see his native shores no more. He did however make the attempt to return; but his strength wholly failing him, he was obliged to halt at Tokat, in Asia Minor, about 250 miles from Constantinople, where in a few days he died, October 16, 1812. The regrets in England which this event occasioned were great. Much was expected from him, and much would probably have been done by him in the cause to which he had devoted himself. As it was, he brought not a few both Hindoos and Mohammedans to make profession of the Christian faith, and he caused the Scriptures to be extensively dispersed among a people who had not previously known them.

An interesting account of his life, compiled from various journals left by him, was published by the Rev. John Sargent, 1819.

MARVELL, ANDREW, was born on the 15th of November 1620 at Kingston-upon-Hull, where his father was master of the grammar-school and lecturer of Trinity church. At the age of fifteen he was sent to Trinity College, Cambridge. All that is known of Marvell's career through the university is what may be gathered, and that is not much certainly, from the following entry in the Conclusion Book of his college, under date September 24th, 1641:—"It is agreed by the master and eight seniors that Mr. Carter, Dominus Wakefield, Dominus Marvell, Dominus Waterhouse, and Dominus Maye, in regard that some of them are reported to be married, and the others looked not after their dayes nor acts, shall receive no more benefit of the college, and shall be out of their places, unless they show just cause to the college for the contrary in three months."

For the ten following years there is little information respecting Marvell, though some notion of his occupations during that time may be gathered from the following passage of a letter from Milton to Bradshawe, dated February 21, 1652:—"He (Marvell) hath spent four years abroad in Holland, France, Italy, and Spain, to very good purpose, as I believe, and the gaining of those four languages; besides he is a scholar, and well read in the Latin and Greek authors, and no doubt of an approved conversation, for he comes now lately out of the house of the Lord Fairfax, who was general, where he was intrusted to give some instructions in the languages to the lady his daughter."

In 1660 Andrew Marvell commenced his parliamentary career. We may judge of the manner in which he acted in that course from an anecdote which has been often related, varying somewhat as to details, though the same in the main circumstances. The following version of it is extracted from a pamphlet printed in Ireland about 1754:—"The borough of Hull, in the reign of Charles II., chose Andrew Marvell, a young gentleman of little or no fortune, and maintained him in London for the service of the public. His understanding, integrity, and spirit were dreadful to the then infamous administration. Persuaded that he would be theirs for properly asking, they sent his old schoolfellow, the Lord-Treasurer Danby, to renew acquaintance with him in his garret. At parting the lord-treasurer, out of pure affection, slipped into his hand an order upon the treasury for 1000*l.*, and then went to his chariot. Marvell, looking at the paper, calls after the treasurer, 'My lord, I request another moment.' They went up again to the garret, and Jack, the servant boy, was called. 'Jack, child, what had I for dinner yesterday?' 'Don't you remember, sir? You had the little shoulder of mutton that you ordered me to bring from a woman in the market.' 'Very right, child. What have I for dinner to-day?' 'Don't you know, sir, that you bid me lay by the bladebone to broil?' 'Tis so; very right, child; go away.' 'My lord, do you hear that? Andrew Marvell's dinner is provided; there's your piece of paper. I want it not. I know the sort of kindness you intended. I live here to serve my constituents: the ministry may seek men for their purpose; I am not one.' This story may serve to show the current notion of his incorruptibility, and it may have had some foundation in fact, but it has plainly too melodramatic an air to be strictly accurate: it seems however, from the numerous pictures which have been painted of it, to have caught the fancy of many of our younger painters.

Marvell was twice elected member for Hull in 1660. In April 1661 he thus writes to his constituents:—"I perceive you have again (as if it were grown a thing of course) made choice of me, now the third time, to serve you in parliament; which as I cannot attribute to anything but your constancy, so God willing, as in gratitude obliged, with no less constancy and vigour I shall continue to execute your commands and study your service." Marvell really had cause to be grateful for their constancy. They were undeviating in their support of a man who had neither wealth, nor power, nor rank, nor even brilliant reputation to strike the vulgar eye and dazzle the vulgar imagination; and who had in fact nothing to recommend him but his unostentatious adherence to what he considered to be the line of his duty. Throughout the whole of Marvell's parliamentary career the electors are no less deserving of praise than the elected. In the first parliament in which Marvell served, he and his colleague, Mr. Ramsden, used to write jointly; but afterwards Colonel Gilley was elected in the room

of Mr. Ramsden, and then, in consequence of some misunderstanding between him and Marvell, the latter wrote singly to his constituents. A gap occurs in Marvell's correspondence after June 1661. He appears to have been in Holland for a considerable time. Lord Bellasis, then high-steward of Hull, having requested the corporation to proceed to the election of a new member, they wrote to Marvell, who immediately returned to England and resumed his seat in the house.

About three months after his return, Marvell again left England as secretary to Lord Carlisle, who was appointed ambassador-extraordinary to Russia, Sweden, and Denmark. Marvell's acceptance of this appointment seems a little at variance with his alleged invariable refusal to accept any mark of royal favour. He was absent on this embassy nearly two years.

Marvell's various publications were mostly of a temporary interest. Mr. Dove gives the following account of the close of his career:—"Marvell had now rendered himself so obnoxious to the usual friends of a corrupt court, and to the heir presumptive, James, duke of York, that he was beset on all sides by powerful enemies, who even proceeded so far as to menace his life. Hence he was obliged to use great caution, to appear seldom in public, and frequently to conceal the place of his abode; but all his care proved ineffectual to preserve him from their vengeance, for he died on the 16th of August 1678, aged fifty-eight years, not without strong suspicions (as his constitution was entire and vigorous) of having suffered under the effect of poison." (*Life of Andrew Marvell*, p. 65, London, 1832.) It is however only fair to say that there does not appear to be any just grounds for this suspicion.

Marvell's powers as a poet were not sufficient to ensure him lasting fame. Few or none of his poetical compositions, any more than his prose, obtained a lasting popularity. Many of his verses, particularly the satirical, are defaced by the coarseness of his time, from which his contemporary, Milton, is so remarkably free. Others display a degree of feeling and a perception of the beauties of nature, expressed with a harmony of versification and felicity of language which not unfrequently recall the 'L'Allegro' and 'Il Penseroso' of Milton. Upon the whole Andrew Marvell's claim to be honourably remembered is founded rather on his moral than his intellectual qualities. His intellectual merits are those of a wit and satirist; and though in these departments considerably above mediocrity, and even famous in his day, he could scarcely have hoped for a different fate from that of other wits and satirists who are now forgotten. But the degree in which Andrew Marvell possessed that very rare quality, political integrity, gives him a claim to the remembrance of after-ages, still greater than is due to him as the friend and associate of Milton.

(*Marvell's Works*, by Captain Edward Thompson, with his *Life*, London, 1776.)

MARY I., Queen of England, was the daughter of Henry VIII., by his first wife Catherine of Aragon, and was born at Greenwich, on the 18th (Burnet says 19th) of February 1516. She was the only one of several children borne by her mother that lived; and on this account, according to Burnet, and because her father was then "out of hopes of more children," he in 1518 "declared his daughter Princess of Wales, and sent her to Ludlow to hold her court there, and projected divers matches for her." It was first settled that she should be married to the dauphin by a treaty with the King of France, dated 9th of November 1518, which however was soon after broken. Then it was arranged, 22nd of June 1522, that her hand should be given to the emperor Charles V. On Charles declining to fulfil this bargain, some overtures of a Scottish marriage followed in September 1524. Finally, in April 1527, it was agreed that the princess should be given in marriage either to the French king Francis, or to his second son, the Duke of Orleans; but before it was determined whether she should be married to the father or the son, the affair of her mother's divorce, implying her own illegitimacy, came to be agitated, and stopped all match-making for some years.

Mary was brought up from her infancy in a strong attachment to the ancient religion, under the care of her mother, and Margaret, countess of Salisbury, the effect of whose instructions was not impaired by the subsequent lessons of the learned Ludovicus Vives, who, though somewhat inclined to the reformed opinions, was appointed by Henry to be her Latin tutor. After her mother's divorce, Mary was deprived of her title of Princess of Wales, which was transferred to the Princess Elizabeth soon after she came into the world; and during all the time that Anne Boleyn lived, Mary, who clung to her mother's cause and her own, remained in a state of estrangement from her father. In the meantime, according to Lord Herbert, negotiations for disposing of her in marriage were twice entered into by her near relation the emperor, without her father's consent having been asked; in 1533 he offered her to James V. of Scotland, and in 1535 to her old suitor the dauphin. But immediately after the execution of Queen Anne in 1536, a reconciliation took place between Henry and his eldest daughter, who was now prevailed upon to make a formal acknowledgment both of Henry's ecclesiastical supremacy—utterly refusing "the Bishop of Rome's pretended authority, power, and jurisdiction within this realm heretofore usurped"—and of the nullity of the marriage of her father and mother, which she declared was "by God's law and man's law incestuous and unlawful." (See the 'Confession of me, the Lady Mary,' as printed by Burnet, 'Hist.

Ref.' from the original, "all written with her own hand.") B new act of succession however, passed this year, she was again well as her sister Elizabeth, declared illegitimate, and for excluded from claiming the inheritance of the crown as the lawful heir by lineal descent. While she was thus circumstanced "excluded," as Lord Herbert expresses it, "by act of parliament all claim to the succession except such as the king shall give by the powers reserved to him of nominating his own successor failure of the issue of Queen Jane, or of any other queen who might afterwards marry, she was in 1538 offered to Don Louis, of Portugal, and the next year to William, son of the Duke of Cleves. Meanwhile continuing to yield an outward conformity to a father's capricious movements in the matter of religion, she succeeded in regaining his favour, that in the new act of succession passed in 1544, the inheritance of the crown was expressly secured her next after her brother Edward and his heirs, and any issue king might have by his then wife Catherine Parr.

Mary's compliance with the innovations in religion in her father's time had been dictated merely by fear or self-interest; and when, the accession of her brother, his ministers proceeded to place whole doctrine, as well as discipline, of the national church upon a new foundation, she openly refused to go along with them; nor all their persuasions and threats, aided by those of her brother self, move her from her ground. Full details of the various attempts that were made to prevail upon her may be found in Burnet's 'History,' and in King Edward's 'Journal.' Mention is made latter, under date of April 1549, of a demand for the hand of Lady Mary by the Duke of Brunswick, who was informed by council that "there was talk for her marriage with the Duke of Portugal, which being determined, he should have answer." At the same time it is noted that "whereas the emperor's ambassador desired leave, by letters patent, that my Lady Mary might have mass, it was denied him." On the 18th of March of the following year, the king writes: "The Lady Mary, my sister, came to me at Westminster, where, after salutations, she was called, with my council, into a chamber; where was declared how long I had suffered her mass, in hope of her reconciliation, and how now being no hope, which I perceived by her letters, except I saw some short amendment, I could not bear it. She answered, that her soul was God's, and her faith she would not change, nor dissemble her opinion with contrary doings. It was said, I constrained not her faith, but wished her not as a king to rule, but as a subject to obey; and that her example might breed too much inconvenience." In fact throughout this reign the Princess Mary was the centre of the intrigues of the Roman Catholic party, and the hope of her succession their main strength and support. In the summer of this same year a project was entered into by her friends at home and abroad for removing her from England, where her faith at least, if not her person, was probably supposed to be in some danger. On the 29th of August, her brother writes: "Certain pinnaces were prepared to see that there should be no conveyance over sea of the Lady Mary secretly done. Also appointed that the lord chancellor, lord chamberlain, the vice-chamberlain, and the secretary Petre should see by all means they could whether she used the mass; and if she did, that the laws should be executed on her chaplains."

Mary's firm adherence to the Roman faith finally induced Edward, under the interested advice of his minister Northumberland, to attempt at the close of his life to exclude her from the succession, and to make over the crown by will to the Lady Jane Grey, an act which was certainly without any shadow of legal force. [EDWARD VI.] Although Lady Jane however was actually proclaimed, scarcely any resistance was made to the accession of Mary, the commencement of whose reign accordingly is dated from the 6th of July 1553, the day of her brother's death. [GREY, LADY JANE.]

Mary was scarcely seated on the throne when she proceeded to re-establish the ancient religion. In the course of the month of August, Bonner, Gardiner, and three other bishops, who had been deposed for nonconformity in the late reign, were restored to their sees, and the mass began again to be celebrated in many churches. In the following month Archbishop Cranmer and Bishop Latimer were committed to the Tower; and in November the parliament passed an act repealing all the acts, nine in number, relating to religion, that had been passed in the late reign, and replacing the church in the same position in which it had stood at the death of Henry VIII. These measures, and the other indications given by the court of a determination to be completely reconciled with Rome, were followed by the insurrection, commonly known as that of Sir Thomas Wyatt, its principal leader, which broke out in the end of January 1554, but was in a few days effectually put down; its suppression being signalised by the executions of the unfortunate Lady Jane Grey and her husband the Lord Guildford Dudley, of her father the Duke of Suffolk, and finally, of Wyatt himself.

On the 25th of July, Mary was married in the cathedral church of Winchester to the Prince of Spain, afterwards Philip II., the son of the emperor Charles V.; and the reunion with Rome was speedily completed by a parliament which assembled in the beginning of November, and which passed acts repealing the attainder of Cardinal Pole, who immediately after arrived in England with the dignity of

papal legate, restoring the authority of the pope, repealing all laws made against the see of Rome since the 20th of Henry VIII., reviving the ancient statutes against heresy, and in short re-establishing the whole national system of religious policy as it had existed previous to the first innovations made by Henry VIII. By one of the acts of this session of parliament also Philip was authorised to take the title of king of England during the queen's life. All these acts appear to have been passed with scarcely any debate or opposition in either use, except occasionally upon mere points of detail and form.

The remainder of the history of the reign of Mary is occupied chiefly with the sanguinary persecutions of the adherents to the reformed doctrine. The Protestant writers reckon that about two hundred and eighty victims perished at the stake, from the 4th of January 1555, on which day John Rogers was burnt at Smithfield, to the 10th of November 1558, when the last 'auto-da-fé' of the reign place by the execution in the same manner of three men and two women at Colchester. Dr. Lingard admits that after expunging from Protestant lists "the names of all who were condemned as felons, traitors, or who died peaceably in their beds, or who survived the station of their martyrdom, or who would for their heterodoxy been sent to the stake by the reformed prelates themselves, had been in possession of the power," and making every other possible allowance, it will still be found "that in the space of four years almost a hundred persons perished in the flames for religious opinion."

Among the most distinguished sufferers were Hooper, bishop of Gloucester; Ferrar of St. David's, Latimer of Worcester, Ridley of London, Crammer, archbishop of Canterbury, Gardiner, bishop of Winchester, and lord chancellor, who was Mary's chief minister till his death in November 1555, after which the direction of affairs fell mostly into the hands of Cardinal Pole, who after Crammer's deposition was made archbishop of Canterbury; but the notorious Bonner, Ridley's successor in the see of London, has the credit of having been the principal instigator of these atrocities, which, it may be remarked, so far from contributing to put down the reformed doctrines, appear to have had a greater effect in disgusting the nation with the restored church than all other causes together. At the same time that the new opinions in religion were thus attempted to be extinguished by committing the bodies of those who believed in them to the flames, the queen gave a further proof of the ardour of her own faith by restoring to the church the tithes and first-fruits, with all the rectories, glebe-lands, and tithes that had been annexed to the crown in the times of her father and brother. She also re-established several of the old religious houses, and endowed them as liberally as her means enabled her.

Tired both of the country and of his wife, Philip left England, in the beginning of September 1555, and continued absent for about a year and a half. The bond however by which this marriage attached the English court to Spain and the Empire remained the same as ever; and when, after a short cessation of hostilities, war recommenced in the spring of 1557 between Spain and France, Mary was prevailed upon to join the former against the latter power. The principal consequence of this step, in so far as this country was concerned, was the loss of the only remaining English continental possession, the town and territory of Calais, which surrendered to the Duke of Guise, in January 1558, after a siege of a few days. This event, which was regarded as a national disgrace worse than any mere loss, excited the bitterest feelings of dissatisfaction with the policy of the court; and Mary herself is said never to have recovered from the blow. Some ineffectual efforts were made to retaliate upon France by force of arms; but at last negotiations for a peace between the three belligerent powers were opened at Cambray, in the midst of which Queen Mary died, worn out with bodily and mental suffering, on the 17th of November 1558, in the forty-third year of her age and the sixth of her reign. She is affirmed to have said on her deathbed, that if her breast should be opened after her decease, Calais would be found to be written on her heart. Mary left no issue, and was succeeded on the throne by her half-sister Elizabeth. [ELIZABETH.]

MARY, WIFE OF WILLIAM III. [WILLIAM III.]

MARY STUART, Queen of Scotland, was born on the 7th of December 1542. She was the third child of king James V. of Scotland, by his wife Mary of Lorraine, daughter of the duke of Guise, who had previously borne her husband two sons, both of whom died in infancy. A report prevailed that Mary too was not likely to live; but being unwedded by her nurse at the desire of her anxious mother, in presence of the English ambassador, the latter wrote to his court that she was as goodly a child as he had seen of her age. At the time of her birth her father lay sick in the palace of Falkland; and in the course of a few days after he expired, at the early age of thirty, his death being hastened by distress of mind occasioned by the defeats which his nobles had sustained at Fala and Solway Moss. James was naturally a person of considerable energy and vigour both of mind and body, but previous to his death he fell into a state of listlessness and despondency, and after his decease it was found that he had made no provision for the care of the infant princess, or for the administration of the government. The ambitious Beatoun seized this opportunity, and producing a testament which he pretended was that of the late king, immediately assumed the office and title of regent. The fraud was soon discovered; but by the haste and imprudence of the regent Arran and Henry VIII. of England, who wished a marriage agreed to

between his son and the young queen, Beatoun regained his influence in the country; and on the 9th of September 1543, Mary was crowned by the archbishop, who was also immediately afterwards appointed lord high chancellor of the kingdom. He had even the address to win over the regent Arran to his views, both political and religious; and thus the French or Roman Catholic party obtained the ascendancy. The first two years of Mary's life were spent at Linlithgow, in the royal palace of which she was born; she was then removed to Stirling Castle; and when the disputes of parties in the country rendered this a somewhat dangerous residence, she was carried to Inchmahome, a sequestered island in the Lake of Monteith, where she remained about two years. In the meantime a treaty of marriage had been concluded between her and the Dauphin Francis; and in terms of the treaty it was resolved she should be sent into France to be educated at the French court, until the nuptials could be solemnised. Accordingly in the fifth year of her age she was taken to Dumbarton, where she was put on board the French fleet; and setting sail towards the end of July 1548, she was, after a tempestuous voyage, landed on the 14th of August at Brest, whence she proceeded by easy stages to the palace at St. Germaine-en-Laye.

Soon after her arrival at her destination Mary was placed with the French king's own daughters in one of the first convents of the kingdom, where she made rapid progress in the acquisition of the literature and accomplishments of the age. She did not however remain long in this situation, being soon carried to the court, which, as Robertson observes, was one of the politest but most corrupt in Europe. Here Mary became the envy of her sex, surpassing the most accomplished in the elegance and fluency of her language, the grace and liveliness of her movements, and the charm of her whole manner and behaviour. The youthful Francis, to whom she was betrothed, and was soon to be united in wedlock, was about her own age, and they had been playmates from early years: there appears also to have grown up a mutual affection between them; but the dauphin had little of her vivacity, and was altogether considerably her inferior both in mental endowments and personal appearance. The marriage, which took place on the 24th of April 1558, was celebrated with great pomp, the vaulted roof of the cathedral ringing with the shouts and congratulations of the assembled multitude.

The solemnities being over, the married pair retired to one of their princely retreats for the summer; but that season was hardly gone when, a vacancy having occurred on the throne of England by the death of Queen Mary, claims were put forth on behalf of the queen of Scots through her grandmother, who was eldest daughter of King Henry VII. of England; and notwithstanding that Elizabeth had ascended the throne, and was, like her sister Mary (both daughters of King Henry VIII.), queen both 'de facto' and by the declaration of the parliament of England, yet this claim for the Scottish princess was made and continued to be urged with great pertinacity by her ambitious uncles the princes of Lorraine. On every occasion on which the dauphin and dauphiness appeared in public, they were ostentatiously greeted as the king and queen of England; the English arms were engraved upon their plate, embroidered on their banners, and painted on their furniture; and Mary's own favourite device at the time was, the two crowns of France and Scotland, with the motto 'Aliamque moratur,' meaning that of England. Henri II. died in July 1559, and in September of the same year Francis was solemnly crowned at Rheims. Mary was now at the height of her splendour; it was doomed however to be only of short continuance. In June 1560 her mother died; and in December of the same year, her husband, who had been wasting away for some months, expired. By this latter event, Catherine de' Medici rose again into power in the French court, and Mary, who did not relish being second where she had been the first, immediately determined on quitting France and returning to her native country. The queen of England however interposed; and as Mary would not abandon all claim to the English throne, refused to grant her a free passage. Mary notwithstanding resolved to go, and at length, after repeated delays, still lingering on the soil where fortune had smiled upon her, she reached Calais. Here she bade adieu to her attendants, and sailed for Scotland; but as long as the French coast remained in view, she continued involuntarily to exclaim, "Farewell, France! Farewell, beloved country!" She landed at Leith on the 19th of August 1561, in the nineteenth year of her age, and after an absence from Scotland of nearly thirteen years. She was now, in the language of Robertson, "a stranger to her subjects, without experience, without allies, and almost without a friend."

A great change had taken place in Scotland since Mary was last in the country. The Roman Catholic religion was then supreme; and under the direction of Cardinal Beatoun the Romish clergy displayed a fierceness of intolerance which seemed to aim at nothing short of the utter extirpation of every seed of dissent and reform. The same causes however which gave strength to the ecclesiastics gave strength also, though more slowly, to the great body of the people; and at length, after the repeated losses of Flodden and Fala, and Solway Moss and Pinkie,—which, by the fall of nearly the whole lay nobility and leading men of the kingdom, brought all classes within the influence of public events,—the energies, physical and mental, of the entire nation were drawn out, and under the guidance of the reformer Knox expended themselves with the fury of awakened indignation upon the

whole fabric of the ancient religion. The work of destruction was just completed, and the Presbyterian government established on the ruins of the Roman Catholic, when Mary returned to her native land. She knew little of all this, and had been taught in France to abhor Protestant opinions: her habits and sentiments were therefore utterly at variance with those of her subjects; and, nurtured in the lap of ease, she was wholly unprepared for the shock which was inevitably to result from her being thrown among them.

Accordingly the very first Sunday after her arrival she commanded a solemn mass to be celebrated in the chapel of the palace; and, as might have been expected, an uproar ensued, the servants of the chapel were insulted and abused, and had not some of the lay nobility of the Protestant party interposed, the riot might have become general. The next Sunday Knox preached a violent sermon against idolatry, and in his discourse he took occasion to say that a single mass was, in his estimation, more to be feared than ten thousand armed men. Upon this, Mary sent for the reformer, desiring to have an interview with him. The interview took place, as well as one or two subsequent ones from a like cause; but the only result was to exhibit the parties more plainly at variance with each other. In one of these fruitless conferences the young queen was bathed in tears before his stern rebukes. Her youth however, her beauty and accomplishments, and her affability, interested many in her favour; and as she had from the first continued the government in the hands of the Protestants, the general peace of the country remained unbroken.

A remarkable proof of the popular favour with which the young queen was regarded, appeared in the circumstances attending her marriage with Darnley. Various proposals had been made to her from different quarters; but at length she gave up all thoughts of a foreign alliance, and her affections became fixed on her cousin Henry Stuart, lord Darnley, the youthful heir of the noble house of Lennox, to whom she was united on Sunday, the 29th of July 1565, the ceremony of marriage being performed in the chapel of Holyrood-house, according to the rites of the Romish church. Whether the queen had any right to choose a husband without consent of parliament, was in that age, as Robertson observes, a matter of some dispute; but that she had no right to confer upon him, by her private authority, the title and dignity of king, or by a simple proclamation invest him with the character of a sovereign, was beyond all doubt: yet so entirely did she possess the favourable regard of the nation, that notwithstanding the clamours of the malcontents, her conduct in this respect produced no symptom of general dissatisfaction. The queen's marriage was however particularly obnoxious to Queen Elizabeth, whose jealous eye had never been withdrawn from her rival. Knox also did not look favourably on it. Nevertheless the current of popular opinion ran decidedly in Mary's favour, and it was even remarked that the prosperous situation of her affairs began to work some change in favour of her religion.

This popularity however was the result of adventitious circumstances only. There existed no real sympathy of opinion between Mary and the great body of her people; and whatever led to the manifestation of her religious sentiments dissolved in the same degree the fascination which her youth and accomplishments had created. It is in this way we may account for the assistance given to Darnley in the assassination of Rizzio—an attendant on Mary, who seems to have come in place of Chatelard. The latter was a French poet who sailed in Mary's retinue when she came over from the Continent; and having gained the queen's attention by his poetical effusions, he proceeded, in the indulgence of a foolish attachment for her, to a boldness and audacity of behaviour which demanded at last the interposition of the law, and he was condemned and executed. Rizzio, a Piedmontese by birth, came to Edinburgh in the train of the ambassador from Savoy, a year or so before Chatelard's execution. He was skilled in music, had a polished and ready wit, and like Chatelard, wrote with ease in French and Italian. His first employment at court was in his character of a musician; but Mary soon advanced him to be her French secretary; and in this situation he was conceived to possess an influence over the queen which was equally hateful to Darnley and the Reformers, though on very different grounds. Both therefore concurred in the destruction of the obnoxious favourite, and he was assassinated accordingly. Darnley afterwards disclaimed all concern in the conspiracy; but it was plain the queen did not believe and would not forgive him; and having but few qualities to secure her regard, her growing contempt of him terminated in disgust. In the mean time the well-known Earl of Bothwell was rapidly advancing in the queen's favour, and at length in open defiance of all decency, no business was concluded, no grace bestowed, without his assent and participation. Meanwhile also Mary bore a son to Darnley; and after great preparations for the event, the baptism of the young prince was performed according to the rites of the Romish Church. Darnley himself was soon after seized with the small-pox, or some dangerous distemper, the nature and cause of which are not very clear. He was at Glasgow when he was taken ill, having retired thither to his father somewhat hastily and unexpectedly. Mary was not with him, nor did she visit him for a fortnight. After a short stay they returned to Edinburgh together, when Darnley was lodged, not in the palace of Holyrood, as heretofore, but in the house of the Kirk of Field, a mansion standing by itself in an open and solitary part of the town. Ten days after, the house was

blown up by gunpowder, and Darnley and his servants buried in the ruins. That Mary knew of the intended murder is not certain, and different views of the circumstances have been taken by different historians. The author of the horrid deed was Bothwell, and the public voice was unanimous in his reprobation. Bothwell was brought before the privy-council for the crime; but the shortness of the notice prevented Lennox, his accuser, from appearing. The trial nevertheless proceeded, or rather the verdict and sentence; for, without a single witness being examined, Bothwell was acquitted. After this mockery of a trial he was not only continued in all his influence and employments, but he actually attained the great end which he had in view by the perpetration of the foul act. This was no other than to marry the queen herself, which he did in three months after his murder of her husband; having in the interval met the queen, and carried her off a prisoner to his castle of Dunbar, and also raised a process of divorce against the Lady Bothwell, his wife, on the ground of consanguinity, and got a decree in the cause just nine days before the marriage. Before the marriage, also, Mary created Bothwell duke of Orkney; and the marriage itself was solemnised at Holyrood-house by Adam Bothwell, bishop of Orkney, according to the forms both of the Romish and Protestant religions. [BOTHWELL].

Public indignation could no longer be restrained. The nobles rose against Bothwell and Mary, who fled before an armed and indignant people from fortress to fortress. At length, after they had collected some followers, a pitched battle near Carberry Hill was about to ensue, when Mary abandoned Bothwell, and threw herself on the mercy of her subjects. They conducted her first to Edinburgh, and thence to the castle of Lochleven, where, as she still persisted to regard Bothwell as her husband, it was determined she should at once abdicate in favour of the prince her son James. Instruments of abdication to that effect were accordingly prepared, and she was at last constrained to affix her signature to them; upon which the prince was solemnly crowned at Stirling, 29th of July 1567, when little more than a year old. Mary continued a prisoner at Lochleven; but by the aid of friends, in less than twelvemonths she effected her escape, and collected a considerable army. The battle of Langside ensued, where she was completely routed; upon which she fled towards Galloway, and thence passed into England. Elizabeth refused her an audience, but declared her readiness to act as umpire between her and her subjects. Mary would not yield to this, or consent to be regarded in any other light than as queen of Scotland. The consequence was, that Elizabeth continued to detain Mary as a captive till the end of the year 1586—a period of about nineteen years—when she was accused of being accessory to Babington's conspiracy against the queen of England. To try this accusation a commission was appointed by Elizabeth, but Mary at first refused in a very decided manner to acknowledge its jurisdiction. Deluded however by the pretext that she would thus vindicate her character, Mary consented to be tried. The commission accordingly proceeded: Mary was condemned, and, on Wednesday the 8th of February 1587, beheaded at Fotheringay castle, in the forty-fifth year of her age. She died professing the religion in which she had been brought up, and to her adherence to which almost as much as to her own misconduct many of her miseries may be traced.

In the interval between her trial and execution James made considerable efforts to save the life of his mother, though it is said that his ambassador to the English court was among the most urgent instigators of her execution; and after her death James gave utterance to some loud denunciations of what he termed the insult that had been offered to him, but he was easily pacified, and the amity previously existing between the English and Scottish courts remained unbroken. [ELIZABETH; JAMES I.]

MARY, DUCHESS OF WÜRTEMBERG, or the Princess Marie d'Orléans, was born in April 1813, during the exile of her father Louis-Philippe, then Duc d'Orléans, and residing at Palermo with his wife Amelia, second daughter of King Ferdinand of Naples. The Princess Marie spent much of her childhood at Twickenham, near London; her youth was passed under the care of her mother at Neuilly, until her father was raised in 1830 to the dignity of King of the French. From her childhood a devoted love for art had been a distinctive feature of her character, and as soon as she was at an age to benefit by the instruction of masters, Louis-Philippe commanded some of the most skilful artists in their several styles to attend upon her. Ary Scheffer was her master in design and painting, Pierre Jean David instructed her in modelling and in sculpture, and Mr. Newton Fielding taught her drawing in water-colours. She was married to the Duke of Würtemberg in 1837, and she died at Pisa in January 1839, in consequence of injuries suffered from the conflagration of her palace at Stuttgart.

She is said to have left numerous designs, and to have executed many beautiful drawings. Some of her works in sculpture acquired for her a European reputation; among these her marble statue of Joan of Arc is the most popular. Joan is standing with her eyes fixed upon the ground in deep meditation, her arms are crossed upon her breast, and in her right hand she grasps her sword; her costume is that of a female and a knight combined. The original statue is of the size of life, but it has been copied in many materials and in many

sizes. She executed also an equestrian statue of Joan of Arc. There is also a small model by her of the 'Death of the Chevalier Bayard,' and in a chapel at Fontainebleau there are some windows painted after her designs.

MASACCIO, called MASO DA SAN GIOVANNI, one of the earliest painters of the Florentine school, was born at San Giovanni in Val d'Arno, about 1401. He was a disciple of Masolino da Panicale, to whom he proved as much superior as his master was to all his contemporaries. He had great readiness of invention, with unusual truth and elegance of design. He made nature his constant study; and he gave in his works examples of that beauty which arises from a judicious and pleasing choice of attitudes, accompanied with spirit, boldness, and relief. He was the first who studied to give more dignity to his draperies, by designing them with greater breadth and fulness, and omitting the multitude of small folds. He was also the first who endeavoured to adapt the colour of his draperies to the tints of his carnations, so that they might harmonise with each other.

He was remarkably well skilled in perspective, which he was taught by P. Brunelleschi. His works procured him great reputation, but excited the envy of his competitors. He died in 1428, not without strong suspicions of having been poisoned. Fuseli says of him—"Masaccio was a genius, and the head of an epoch in the art. He may be considered as the precursor of Raffaele, who imitated his principles, and sometimes transcribed his figures. He had seen what could be seen of the antique in his time at Rome, but his most perfect works are the frescoes of S. Pietro del Carmine at Florence, where vigour of conception, truth and vivacity of expression, correctness of design, and breadth of manner are supported by truth and surprising harmony of colour." His portrait, by himself, is in the National Gallery.

MASANIELLO. [ANIELLO, TOMMASO.]

MASCAGNI, PAUL, was born in 1752. He studied medicine in the University of Siena, and in 1774 succeeded his master, Tabarani, in the professorship of anatomy in that institution. He is chiefly celebrated for his admirable work on the absorbent system, and the beauty of his anatomical preparations, of which the greater part are preserved in the Anatomical Museum of Florence. An outline of his great work was published in 1784 in French, under the title 'Prodrome d'un Ouvrage sur le Système des Vaisseaux Lymphatiques,' and was sent to the Académie des Sciences in competition for a prize offered for the best essay on the subject. In 1787 the more complete work, 'Vasorum Lymphaticorum Corporis Humani Historia et Iconographia,' was published in folio at Siena. It contains 27 large plates, finished and in outline, of the lymphatics in different parts of the body, engraved with extreme delicacy by Cyro Sancti. It was dedicated to the reigning Duke of Tuscany, under whose patronage Mascagni afterwards rapidly advanced in reputation. In 1800 he left the University of Siena for that of Pisa, and the year after went to that of Florence. He died in 1815.

After his death two large works were published from his papers—'Anatomia per uso degli Studiosi di Scultura e Pittura,' Florence, 1816; and 'Prodromo della Grande Anatomia,' Florence, 1819, by Antommarchi. Mascagni also published works of some celebrity on the lagunes and hot-springs of Tuscany, and on the cultivation of the potato and other branches of agriculture, to which he devoted all his leisure time.

MASCHERONI, LORENZO, an Italian mathematician, was born at Bergamo in 1750. His studies were at first directed to the languages and literature of Greece and Rome, and to these subjects he applied himself with unwearied diligence. At eighteen years of age he was appointed professor of humanity in the university of his native city, and he attracted some notice at that time by a poetical dissertation on what he called the false eloquence of the pulpit. He afterwards became professor of Greek in the University of Pavia; and, having taken orders in the church, he acquired the title of Abbé.

It was not till he was twenty-seven years of age that he began the study of mathematics; but he rapidly acquired a taste for the sciences, which induced him to abandon his classical pursuits, and so great was his progress in this branch of learning that he was appointed professor of geometry in the college Mariano at Bergamo. When the Revolution took place in the north of Italy, on the invasion of the country by the French, Mascheroni was chosen a member of the legislative body in the Cisalpine Republic; and soon afterwards he was sent to Paris to assist in the formation of the new system of weights and measures. He was at one time also engaged at Bologna, with other mathematicians, in the performance of experiments with a view of proving the rotation of the earth on its axis by the place at which a body struck the ground when let fall from the upper part of a lofty building.

Mascheroni published in quarto a work entitled 'Sulle Curve che servono a delineare le Ore Ineguali degli Antichi nelle superficie Piane,' Bergamo, 1784; and in the following year, at the same place, a tract, also in Italian, on the Equilibrium of Vaults, &c. In this tract the higher branches of analysis are employed, and the investigations are extended to subjects beyond those which are treated in the works of the earlier writers on the applications of science to practical engineering. In 1795 he published at Milan, in 8vo, a work entitled 'Geometria del Compasso,' in which are ingenious solutions of several geometrical propositions by means of a pair of compasses only; that

is, by the intersection of circular arcs, without the assistance of a ruler. Among these propositions is one in which it is required to find between or beyond two given points, and in the direction of a straight line joining them, other points whose distances from the former are in any assigned proportions. There are given in the work methods of finding points in lines perpendicular or parallel to, or making given angles with, a line joining two points whose positions are assigned; of determining a mean proportional between, and third, fourth, &c., proportionals to two given lines; and of inscribing polygons in circles. There are also approximative solutions of problems, such as the duplication or multiplication of a cube, and the trisection of an angle, which require, in the usual method of operating, applications of the conic sections or other curves.

Besides the mathematical works just mentioned, and a tract containing notes on Euler's 'Institutiones Calculi Differentialis,' Mascheroni published some verses which were addressed to the Countess Grismondi, an elegy on the death of Borda, and a poem entitled 'Invito di Dafni a L'abia,' in which he introduced a precise description of the objects contained in the museums of natural history and philosophy at Pavia.

He died in July 1800, in consequence, it is said, of too close application to his scientific studies, leaving several manuscripts, and among them one on 'Pyramidometry,' a subject which La Grange had previously investigated, but which Mascheroni had the merit of placing in a new light.

MASCLEF, FRANCIS, was born at Amiens in the year 1662. He very early devoted himself to the study of Oriental languages, in which he attained an extraordinary degree of proficiency. Having been brought up to the Church, he became first a curate in the diocese of Amiens, and afterwards obtained the confidence of De Brou, bishop of Amiens, who placed him at the head of the theological seminary of the district, and made him a canon. De Brou died in 1706, and Masclaf, whose opinions on the Jansenist controversy were not in accordance with those of the new prelate Sabbatier, was compelled to resign his place in the theological seminary and to retire from public life. From this time he devoted himself to study with such close application as to bring on a disease, of which he died, on the 24th of November 1728, at the age of sixty-six. Though austere in his habits, he was amiable and pious.

Masclaf's chief work is the 'Grammatica Hebraica, à punctis aliisque inventis Massorethicis libera,' in which he embodied an elaborate argument against the use of the vowel points. The first edition was published in 1716, and speedily called forth a defence of the points from the Abbé Guarin, a learned Benedictine monk. In the year 1731 a second edition of Masclaf's work was published at Paris, containing an answer to Guarin's objections, with the addition of grammars of the Syriac, Chaldee, and Samaritan languages. This work still ranks as the best Hebrew grammar without points. The other works of Masclaf were, 'Ecclesiastical Conferences of the Diocese of Amiens;' 'Catechism of Amiens;' and in manuscript, 'Courses of Philosophy and Divinity.' The last-mentioned work was not printed, on account of its being thought to contain Jansenist opinions.

MASÈRES, FRANCIS, was born in London, December 15, 1781. His father was a physician, descended from a family which was driven out of France by the revocation of the Edict of Nantes. He was educated at Clare Hall, Cambridge, and took the degree of B.A. in 1792, obtaining the highest place both in classics and mathematics. He then (having first obtained a fellowship in his college) removed to the Temple, was in due time called to the bar, and went the western circuit for some years with little success. He was then appointed attorney-general for Canada, in which province he remained till 1773, distinguished "by his loyalty during the American contest, and his zeal for the interests of the province." On his return in 1773 he was appointed curator baron of the Exchequer, which office he held till his death. He was also at different times deputy recorder of London and senior judge of the sheriffs' court. He died May 19, 1824, at Reigate, in the ninety-third year of his age.

Baron Masères (as he was commonly called) has left behind him a celebrity arising partly from his own writings and partly from the munificence with which he devoted a part of his income to reprinting such works as he thought useful, either in illustration of mathematical history or of that of his own country. These were the objects of his private studies; and a peculiarity of his mathematical views which tintured the whole of his writings, as well as his selection of works to be reprinted, requires some explanation.

It is well known that the art of algebra grew faster than the science, and that, at the time when Masères began his studies, a branch of knowledge which is essentially distinct from arithmetic, or rather of which arithmetic is one particular case, had been pushed beyond the simple science of numbers in its methods, reasonings, and results, while its fundamental definitions were allowed to be expressed in arithmetical language, and restricted by arithmetical conceptions. The consequence was, that the algebraical books were anything but logical; and while those who could make for themselves the requisite generalisation at the proper time were more likely to employ themselves in extending the boundary of the science than in writing elementary works, all other students had to take a large part of algebra on trust, their faith being built partly on authority, partly on continually seeing verifiable

truths produced by its operations. Masères, when a young man, rejected all of algebra which is not arithmetic, as being what he could not comprehend himself, though he admitted that others might do so. In his earliest publication but one ('Dissertation on the Use of the Negative Sign in Algebra,' London, 1758), which is in fact a treatise on the elements of algebra, after rejecting an equation in which negative quantities occur, he adds:—"I speak according to the foregoing definition, by which the affirmativeness or negativeness of any quantity implies a relation to another quantity of the same kind, to which it is added, or from which it is subtracted; for it may perhaps be very clear and intelligible to those who have formed to themselves some other idea of affirmative and negative quantities different from that above defined."

The other works of Masères are—'Elements of Plane Trigonometry,' London, 1750; 'Principles of the Doctrine of Life Annuities,' London, 1783; Appendix to Friend's 'Principles of Algebra,' 1799; tracts on the 'Resolution of Equations,' 1800; various remarks on the tracts published in the 'Scriptores Logarithmici,' presently to be noticed; papers in the 'Philosophical Transactions;' and political writings, a list of which will be found in the 'Gentleman's Magazine' for June 1824. The characteristic of all these writings is an extreme prolixity, occasioned by his rejection of algebra, and the consequent multiplication of particular cases. In his 'Dissertation,' &c., above noticed, the four rules, and the solution of equations of the second and third degree, occupy 300 quarto pages.

Of the reprints which Baron Masères made at his own expense, the most important is the 'Scriptores Logarithmici,' a collection, in six volumes quarto, published in various years from 1791 to 1807, of writings on the subject of logarithms. Here we find the works of Kepler, Napier, Snell, &c., interspersed with original tracts on kindred subjects. The republication of these old writings has put them in the way of many students to whom they would otherwise have been inaccessible, and has thus tended to promote historical knowledge and to excite inquiry. The 'Scriptores Optici,' 1823, a reprint of the optical writings of James Gregory, Descartes, Shooten, Huyghens, Halley, and Barrow, has a merit of the same kind: it was begun at an earlier period, but having been delayed by circumstances, was completed under the superintendence of Mr. Babbage. Besides these, he also reprinted the tract of James Bernoulli on 'Permutations and Combinations,' and discovered and printed Colson's translation of Agnesi's 'Analytical Institutions.' He also reprinted a large number of tracts on English history. The expense of Hales's Latin treatise on 'Fluxions,' 1800, was defrayed by him; and we understand that more than one other author was indebted to him for assistance of the same kind.

(*Gentleman's Magazine*, June, 1824.)

MASHAM, ABIGAIL, the favourite of Queen Anne, noted in the history of the time for her political intrigues, was the daughter of Francis Hill, a Levant merchant of London, who married the sister of Mr. Jennings, the father of the Duchess of Marlborough. Upon the bankruptcy of her father she became the attendant of a baronet's lady, whence she removed into the service of her relative, then Lady Churchill, who procured her the place of waiting-maid to the Princess Anne. She retained her situation after the princess ascended the throne, and by her assiduity, complaisance, and cunning, acquired a great degree of influence over her. The high-church principles in which she had been educated contributed to increase her credit with the queen, who was secretly attached to the Tory party, though obliged, in the beginning of her reign, to favour the Whigs. The marriage of Miss Hill with Mr. Masham (son of Sir Francis Masham of Otes in Essex), in 1707, occasioned an open quarrel with the Duchess of Marlborough, who was in consequence of it deprived of her majesty's confidence. Harley, afterwards earl of Oxford, connected himself with the new favourite; a change of ministry was the result of their intrigues, and in 1711 Mr. Masham was raised to the peerage. He and his wife appear to have been actively engaged in the secret proceedings of the Tories in favour of the exiled house of Stuart, as well as in every low scheme for advancing their own pecuniary interests. Lady Masham lived a long time in retirement after the death of the queen, and died herself at an advanced age, December 6, 1734.

MASKELYNE, NEVIL, was born in London, October 6, 1782; was educated at Westminster, and afterwards at Catherine Hall and Trinity College, Cambridge, in which university he took the degree of B.A. with distinction in 1754. In 1755 he took orders, but he had previously been led to turn his attention to astronomy by the solar eclipse of 1748, and by becoming acquainted with Bradley, whom he assisted in the formation of his tables of refraction. In 1761 he went to St. Helena to observe the transit of Venus, and to detect, if possible, the parallax of the fixed stars. In this voyage, and in one undertaken to Barbadoes in 1764 to try the merits of Harrison's new chronometers, he acquired that knowledge of the wants of nautical astronomy which afterwards led to the formation of the 'Nautical Almanac.' In 1765 he was appointed to succeed Mr. Bliss as astronomer-royal, and from this time, with the exception of his voyage to Scotland in 1772 to determine the mean density of the earth by observing the effect of the mountain Schehallien upon the plumb-line, his life was one unvaried application to the practical improvement of astronomical observation. He died February 9, 1811.

Delambre dates the commencement of modern astronomical observa-

tion, in its most perfect form, from Maskelyne, who was the first who gave what is now called a standard catalogue (1790) of stars; that is, a number of stars observed with such frequency and accuracy that their places serve as standard points of the heavens. The 'Nautical Almanac' was first suggested by him, and it was published under his superintendence from its first publication in 1767 to the end of his life, during which time it received the highest encomiums from all foreign authorities. His Schehallien experiment on the effect of a mountain mass on the plumb-line was of considerable importance, and its accuracy was fully verified by the subsequent experiments of Baron Zach. His observations in Greenwich Observatory were confined in a great degree to thirty-six principal stars, and to the regular observation of the sun and moon. The latter, and the exclusive adoption of the principal stars, give a greater value (other things being equally favourable) to the determinations deduced from his observations than to those obtained from Bradley's.

Dr. Maskelyne, as arbitrator on the part of the government of the merits of the chronometers which were submitted by their makers as competitors for the prize, had more than one public accusation of partiality to bear. The now celebrated Harrison was one of his opponents, and Mr. Mudge, jun., on the part of his father, another. The only publication (as far as we know) which he ever made out of his official capacity, with the exception of papers in the 'Philosophical Transactions,' was a reply to a pamphlet by the latter, London, 1792. He edited Mayer's lunar tables, and was the means of 3000*l.* being awarded to the widow of the author. [See MAYER, SIMON.]

MASON, WILLIAM, was born in 1725. He was the son of a clergyman at Hull. He took his B.A. degree at Cambridge in 1745, after which he removed from St. John's College to Pembroke, of which college he was elected Fellow in 1747. Having taken orders, he was presented to the rectory of Aston in Yorkshire, and became chaplain to the king. His political principles placed him in strong opposition to the American war, and he was a member of the Yorkshire association for obtaining reform of parliament. The horrors of the French revolution however are said to have caused a change in his opinions, but as he was growing an old man when it broke out, the timidity of age probably worked as strongly as the reign of terror. He died in 1797, aged seventy-two, having been for years precentor and canon-residentary of York. There is a tablet to his memory in Poets' Corner, Westminster Abbey.

Mason's poems are now little read. Two tragedies, 'Elfrida' and 'Caractacus,' a descriptive poem called 'The English Garden,' and some odes, are his principal productions; but he is now perhaps best remembered as Gray's biographer and friend. His style is to a great extent that of an imitator of Gray, and not being so perfect an artist in language as his master, he has been proportionally less successful. In addition to his poetical reputation he possessed considerable skill in painting and music, and in the latter subject entertained opinions not at all consonant to those of musicians in general. He wished to reduce church music to the most dry and mechanical style possible, excluding all such expression as should depend on the powers and taste of the organist. (Mason's 'Compendium of the History of Church Music.')

MASSÉNA, ANDRÉ, Prince of Essling, Duke of Rivoli, and Marshal of France, was born at Nice, May 6, 1758. "Several of the French marshals," says Disraeli, "and the most famous—Masséna, for example—was a Hebrew; his real name was Manasseh." ('Coningsby,' ii. 203.) Left an orphan at an early age, his education was greatly neglected. He appears to have spent some years of his youth at sea with a relation who was captain of a trading vessel, but having taken a dislike to a seafaring life, he abandoned it, and in 1775 entered the army as a private soldier in the regiment Royal Italian, in which one of his uncles was a captain. After a diligent discharge of his duties in that regiment for fourteen years he only attained the rank of sergeant, which, when he afterwards became marshal, he declared was the step in his military career which had cost him the most to gain. Discouraged by this slow promotion, he retired to his native city, where he made an advantageous marriage. Events connected with the French revolution recalled him to his former profession, and he was appointed by the suffrages of his fellow-soldiers to the rank of adjutant-major of the battalion raised in the department of the Var, of which regiment he subsequently became colonel. He was made general of brigade in August 1793, and general of division a few months later. In the Italian campaigns of 1794 and 1795 he served under the generals Kellerman and Scherer, and it was chiefly owing to his skill as a tactician that the victory was gained in the defile of Saorgio (August 1794), and on the Col de San Giacomo in 1795. Indeed the great success of these campaigns has generally been attributed to the ability of the plans which the influence of his talents caused to be adopted. When Bonaparte assumed the command of the army in Italy he employed Masséna actively on all occasions of importance, the brilliancy of whose military conceptions he so justly appreciated that he surnamed him the 'favoured child of victory.' The scenes of his principal exploits were—Montenotte (9-11th of April, 1796), Millesimo (14th of April), Castiglione (29th of June—5th of July), Arcola (15-17th of November), and Rivoli (9th of January, 1797). At the peace of Campo Formio, October 17, 1797, Masséna was sent to France to present to the Directory the ratification of the treaty of peace by the Emperor of Austria. In February 1798 he was appointed to the

command of the army which, under General Berthier, was occupying Rome and the Papal States. His appointment to this office was equally disliked both by the French soldiers and the inhabitants of the subjected country, for they both became the victims of that insatiable avarice which on every occasion characterised him. The multiplied complaints which his disposition gave rise to at last obliged him to resign his command and to return to Paris. He there published a 'Mémoire' in justification of his conduct, notwithstanding which he was left without employment till 1799, when the important command of the armies of the Danube and of Switzerland was confided to him. In the direction of this campaign he evinced a military talent of the highest order. The memorable battle of Zürich (5th and 6th of June, 1799), in which he obtained considerable advantages over the Russian army under Korsakow, saved France from the invasion of the allied powers, and led to the dissolution of the coalition which had been formed between the Russians and Austrians.

On the return of Bonaparte from Egypt, Masséna was employed by him to defend Genoa, which was at that time invested by a large Austrian army, and closely blockaded by the English fleet under Lord Keith. He arrived there on the 18th of February 1800, and defended it against immensely superior forces, and amidst the horrors of famine, till the 3rd of June, when, unable to prevent the rising of the inhabitants, he was compelled to agree to an honourable capitulation. Only eleven days after this capitulation, Bonaparte, conqueror at Marengo, stipulated the evacuation of this city, which was again re-entered by the French under General Sacch, on the 24th of June, 1800.

Masséna's name does not appear connected with any event of importance till May 1804, when, on the same day that Napoleon became emperor, Masséna was created a marshal of France. In 1805 he was again appointed to the command of the army in Italy, where he was opposed to the Austrian army under the Archduke Charles: he conducted this campaign with varying success, but he was at last enabled to drive back the Austrians into Germany, and to effect a junction with the grand army of Napoleon. After the peace of Presburg (20th of December 1805), Masséna had the command of the army which was to conduct Joseph Bonaparte [BONAPARTE, JOSEPH] to Naples. By his success over the insurgent Calabrians, and the reduction of the fortress of Gaëta (18th of July 1806), he enabled Joseph to take possession of his new kingdom. In 1807 he was appointed to the command of the right wing of the army opposed to the Russians in Poland, and his services during this important campaign were rewarded by the title of Duke of Rivoli, in commemoration of the skill and bravery which he had displayed in that celebrated battle (1797): a large sum of money was at the same time given him to support his new dignity. A singular and untoward circumstance occurred on his return to Paris. He, who had exposed his person in so many battles without receiving a wound, had the misfortune to lose the sight of his left eye while on a hunting party, a portion of shot having accidentally struck it.

The Austrian campaign of 1809 shed considerable lustre on the already high military character of Masséna. He greatly distinguished himself at Landshut and Eckmühl. The rapid capture by storm of the strong castle of Ebersdorf, which, from its position on the river Traun, was deemed almost impregnable, especially attracted the admiration of Napoleon. At the battle of Emling [LANNES] the defence of the village of Aspern was confided to Masséna, and it is generally believed that to his obstinate resistance in that village the French army was indebted for its preservation. His eminent services on that most critical occasion were rewarded by the rank and title of Prince of Emling.

The same success attended the operations of Masséna at Engersdorf and at Wagram. At the battle of Wagram he was obliged to direct the movements of the left wing of the army while seated in a carriage, on account of an injury produced by a fall from horseback. An incident there occurred which showed that in more than one respect he was 'the favoured child of fortune': at one time success appeared doubtful, and to animate his soldiers he insisted on being placed on horseback; he had scarcely been so when a cannon-ball struck the vacant carriage, and shattered the seat which he had occupied. In 1810 Marshal Masséna was appointed to the chief command of the army in Portugal, which was about 72,000 strong: his commission was to drive the British, under Wellington, from Portugal. His exploits in this campaign, though in many instances marked by great military talent, have not added to his reputation as a general; while the frequent examples of his cruelty, avarice, and breach of faith, recorded in the histories of that period, have left a deep stain upon his memory. One achievement however—his masterly retreat into Spain, after the failure of his attempts on the lines of Torres Vedras—has been the subject of the highest praise and admiration, as far as military skill was concerned, by both English and French historians.

Masséna was recalled from Spain in 1812, and the command of the army which he left was bestowed upon Marshal Marmont. [MARMONT.] His health having severely suffered, he was unable to join the expedition to Russia. In the latter end of 1813 he was sent to Toulon to take the command of the Eighth Military Division, from which place he formally declared his adhesion to the Bourbons, on the 6th of April 1814, and was by them confirmed in his command. On the return of Napoleon from Elba, after some hesitation, he recognised his government, but kept aloof from all active participation in the events

which took place during the Hundred Days. After Napoleon's second abdication he was appointed commander-in-chief of the National Guard of Paris. Being chosen a member of the council of war which was assembled for the trial of Marshal Ney, he at first declined sitting as a judge on a fellow-soldier with whom he had been for some time at variance; and when this objection was overruled, he joined the majority of members in pronouncing for the incompetency of the court. [NEX.] Some months after these events he was denounced in the Chamber of Deputies on the charge of having been at the head of a conspiracy for the return of Napoleon. He was however satisfactorily acquitted, and he afterwards publicly repelled the accusations which had been brought against him in a 'Mémoire Justificatif,' to which a reply was published in a pamphlet entitled 'A Letter of a Citizen of Marseille to Marshal Masséna,' which was written in a spirit of such bitter invective that it produced a sensible effect on his mind and health, already enfeebled by bodily infirmities, and is said to have hastened his death, which took place on the 4th of April 1817. His funeral eulogium, which was pronounced by General Thiébault, was inserted in the 'Mercur,' and afterwards published separately.

Masséna was gifted by nature with a powerful frame of body and with indomitable resolution. His bravery was rather characterised by perseverance than by impetuosity. He was considered the most skilful tactician among Napoleon's generals, and on the field of battle he was remarkable for the coolness and precision of his orders, and for his penetrating insight into the intended movements of the enemy. He had moreover the invaluable quality in a commander of not being dispirited by defeat. His faults and vices we have already alluded to; they were principally rapacity and avarice, and they frequently brought down upon him the displeasure and punishment of his chief.

\* MASSEY, GERALD, one of a number of young poets who within the last five or six years have made their appearance in different parts of Great Britain, was born in May 1828, near Tring in Hertfordshire. The circumstances amid which he was born were those of the very extreme of poverty and hardship. His father was a canal-boatman, earning ten shillings a week, and that precariously; he could not write his own name; and the hovel in which he lived was so low that he could not stand upright in it. Gerald Massey's mother, though also uneducated, was a woman of superior character and of courageous spirit. The children of this poor couple received no other education than what could be got from occasional attendance at a penny-school: as soon almost as they were able to go about, they were sent to work at a neighbouring silk-mill, that their small earnings might eke out the subsistence of the family. At the age of eight years the future poet was sent to this mill, rising at five in the morning summer and winter, working till half-past six in the evening, and receiving on Saturday night the sums of ninepence, one shilling, and finally one shilling and threepence for his whole week's toil. "But the mill was burned down, and the children held a jubilee over it. The boy stood for twelve hours in the wind, and sleet, and mud, rejoicing in the conflagration which thus liberated him. Then he went to straw-plaiting—as toilsome, and perhaps more unwholesome, than factory-work. Without exercise, in a marshy district, the plaiters were constantly having racking attacks of ague. The boy had the disease for three years, ending with tertian ague. Sometimes four of the family, and the mother, lay ill at one time, all crying with thirst, with no one to give them drink, and each too weak to help the others." Looking back on these days of want and misery, Massey has said, "Having had to earn my own dear bread by the eternal cheapening of flesh and blood thus early, I never knew what childhood meant: I had no childhood." His mother's thoughtfulness in having sent him to the poor penny-school, had however put him in possession of the beginning of a means by which he was to rise out of the depths of his early penury. He had learnt to read; and though books were all but inaccessible to him, the few that came in his way were read diligently. The Bible and the 'Pilgrim's Progress' were the first he read; and 'Robinson Crusoe,' and a few Wesleyan tracts completed the stock. These constituted his sole reading till he came to London in his fifteenth year as an errand-boy. Employed in this capacity at very low wages in various establishments in succession, he spent all his spare time in reading and writing—advancing from 'Lloyd's Penny Times' and other cheap periodicals to Cobbett's works, 'French without a Master,' and some of our higher novelists and historians. "Till then," he says, "I had often wondered why I lived at all. Now I began to think that the crown of all desires and the sum of all existence was to read and get knowledge. Read! read! read! I used to read at all possible times and in all possible places; up in bed till two or three in the morning—nothing daunted by once setting the bed on fire. Greatly indebted was I also to the bookstalls, where I have read a great deal, often folding a leaf in a book and returning the next day to continue the subject; but sometimes the book was gone, and then great was my grief. When out of a situation, I have often gone without a meal to purchase a book. Until I was in love, and began to rhyme as a matter of consequence, I never had the least predilection for poetry. In fact, I always eschewed it: if I ever met with any, I constantly skipped it: over and passed on." It was about his seventeenth year apparently that, moved by the influence above-mentioned, he first began to rhyme himself. "The first verses I ever made," he says, "were upon 'Hope,' when I was utterly hopeless; and after I

had begun I never ceased for about four years, at the end of which time I rushed into print." His first appearances in print were in a provincial paper, and the burthen of most of his verses was the sufferings and the hopes of the poor, and the "power of knowledge, virtue, and temperance" to elevate them. A collection of these occasional pieces was published in his native town of Tring, in a shilling volume, entitled 'Poems and Chansons,' of which 250 copies were sold.

But a new and most powerful influence in Massey's life was the political excitement of 1848. "As an errand-boy," he says, "I had of course many hardships to undergo, and to bear with much tyranny; and that led me into reasoning upon men and things, the causes of misery, the anomalies of our society, state, politics, &c. I studied political books—such as Paine, Volney, Howitt, Louis Blanc, &c., which gave me another element to mould into my verse, though I am convinced that a poet must sacrifice much if he writes party-political poetry. . . . The French Revolution of 1848 had the greatest effect on me of any circumstance connected with my own life." Partaking in this excitement, Massey, together with some other working-men, started in April 1849, a cheap paper called 'The Spirit of Freedom,' which he edited, and to which he supplied both poems and articles conceived in a spirit of fiery political earnestness. This political manifestation cost him five situations in eleven months. Latterly he was connected with some of the working-men's associations that sprang up in London, with a view to the substitution of some of the practical plans of co-operative labour for the mere theoretical notions of Chartism; and it was thus that he became acquainted with the Rev. F. D. Maurice, the Rev. Charles Kingsley, and others, who at that time were promoting this new movement among the working-men of London. About this time he married. Still continuing to write lyrics, some of them in a political strain, but others domestic, impassioned and more purely imaginative, his name had begun to be known, in consequence of the publication of some of these in the columns of weekly London newspapers, when the appearance in 1853 of his volume entitled 'The Ballad of Babe Christabel, with other Lyrical Poems,' took the public by storm, and at once secured him general fame. Welcomed with encomiums by Landor and by all the press, it was eagerly read everywhere, and by the year 1855, five editions of it were sold. This success was not without its effect on the worldly circumstances of the author. After changing his employment in London, he was induced in 1855 to remove to Edinburgh; where he was closely occupied in literary labour, and whence he next year issued a new volume of poems entitled 'Craigcrook Castle' (1856). This work, though subjected to a severer criticism than its predecessor, has also met with a very enthusiastic reception, and has fully maintained the author's reputation. He himself speaks modestly of it. It is "my best," he says, "for the time being, but, in other years, if God so wills, I may win a touch more certain and a larger reach upon a harp of tenser strings." Mr. Massey has since been connected with a London daily newspaper. In 1866 he published a large volume entitled 'Shakspeare's Sonnets never before Interpreted.'

MASSILLON, JEAN-BAPTISTE, was born the 24th of June 1663, at Hières, in Provence, and at a very early age entered the Collège de l'Oratoire of that town; but his father, intending him for the profession of a notary, withdrew him before he had completed his studies. Massillon however eagerly seized every opportunity of returning, and his father was ultimately prevailed upon to allow him to re-enter the college, which he did in 1681, and commenced the study of theology under P. de Beaujeu, afterwards bishop of Castres. Here he read the sermons of Lejeune, and, being pleased with them, made some attempts in that species of composition himself, which, although acknowledged to be successful, did not satisfy his own taste. In 1696 he was called to Paris to direct the seminary of St. Magloire, where he composed his first ecclesiastical conferences, which, although differing in tone from his sermons, were not wanting in vivacity. Although a great admirer of Bourdaloue, Massillon did not take him for his model: he was desirous of opening a new way, and of searching the human heart, its secret passions and interests, in order to arrive at the motives and combat the illusions of self-love by reason and powerful appeals to the feelings. In the pulpit he appeared without gesture or any extravagant display of action; nevertheless when he grew animated, his look and deportment became so expressive, that at this time, when the orators of the pulpit were held in high estimation as patterns of declamation, the celebrated actor Baron, struck with the beauty of Massillon's style, exclaimed, "There is indeed an orator, but we are merely comedians." At Versailles he was as successful as he had been at Paris. The court of Louis XIV. was composed of men who might be touched though not convinced. Massillon felt this, and painted the passions with so much truth and such irresistible force, that even those whose vicious tendencies he exposed were constrained to love and admire him.

In 1704 he preached his second Lent sermon at the court, and with so much success that Louis XIV. promised he would hear him every two years; but for some reason unknown, Massillon was never again at Versailles. In 1709 he delivered the funeral oration of the Prince de Conti, which, though much applauded as delivered from the pulpit, was greatly criticised when it appeared in print. After the death of Fléchier in 1710, Massillon remained the last of the

orators of the grand siècle. In 1717 Massillon was made Bishop of Clermont, and preached before the king his last Lent sermon, which is considered to be his 'chef-d'œuvre'; and in 1719 he was canonized in the king's presence by Cardinal de Fleury. Massillon abolished in his diocese those indecorous processions that the ages of ignorance had perpetuated, and also certain superstitious customs spoken of in the 'Origines de Clermont.' He died on the 16th of September 1742, of apoplexy.

The fame of this celebrated man stands perhaps higher than that of any preacher who has preceded or followed him, by the number, variety, and excellence of his productions, and their eloquent and harmonious style. Grace, dignity, and force, and an inexhaustible fecundity of resources, particularly characterize his works. His 'Avec et Carême,' consisting of six volumes, may be justly considered as many 'chef-d'œuvres.' Massillon, in his sermons, endeavoured to convince the young king Louis XV. that he derived his authority from the people, and should never exercise it but for their advantage, nor deceive himself by thinking that he could do no wrong. The most interesting of his works, next to his sermons, are his 'Conferences,' which are discourses addressed to the young ecclesiastics under his direction in the seminary of St. Magloire. Massillon's works were collected and published by his nephew, in 12 vols. 8v. in 1745 and 1746.

MASSINGER, PHILIP, born at Salisbury, in 1584, was the son of Arthur Massinger, one of the Earl of Pembroke's retainers, who appears to have been employed as a special messenger to Queen Elizabeth. In 1602 he was entered at St. Alban's Hall, Oxford, where he was supported by the Earl of Pembroke. Here, as Anthony à Wood informs us, he spent his time in reading "poetry and romances" rather than "logic and philosophy, which he ought to have done as he was patronised to that end." Perhaps it is unnecessary to find upon Anthony so harshly as Gifford does for this assertion. The biographer merely means to say that it was a kind of dishonesty to spend the time for which he was indebted to another person on studies alien to those which his benefactor wished him to pursue. Be this as it may, his works are a sufficient contradiction to the accusation of wasted time; and if the Earl of Pembroke lost a chaplain, the world has gained what is worth many homilies.

Massinger took no degree, and also seems to have lost his patron's favour. The reason is uncertain, but Gifford supposes that he had changed his religion at Oxford, and consequently alienated his Protestant friends. Whether he ever did change his religion at all rests on Gifford's inference from certain expressions in his work; but be this as it may, he was driven to betake himself to dramatic composition about the time of his arrival in London. It is probable that he did not for some years attempt anything beyond assisting others in the composition of plays, for we hear little or nothing of him as an author until the appearance of his 'Virgin Martyr' in 1622, sixteen years after his arrival in London. There is evidence moreover to prove that after Beaumont's death in 1615, he assisted Fletcher in the composition of some of the numerous plays (between thirty and forty) which appeared under that author's name during the succeeding ten years. During the rest of his life, Massinger was employed in writing plays, the last of which appeared only six weeks before his death, which took place the 17th of March 1640, at the Bankside. His name is noticed in the Burial Register of St. Saviour's, with the addition "a stranger," which however by no means refers to his poverty and obscurity as has been too readily taken for granted; but merely that he was not a parishioner of St. Saviour's.

Massinger's situation as last in order of time of the great dramatic poets of the 16th and 17th centuries, is probably the reason why he was so utterly lost sight of for seventy years after his death. The first thing we hear of his works is Rowe's intention of editing them, which he afterwards changed into an actual piracy, by which he adapted the 'Fatal Dowry' to suit the taste of the 18th century and published it as his own, under the name of the 'Fair Penitent.' Gifford gives a complete list of Massinger's plays, with the dates of their appearance, which range from 1621 to 1640. They are thirty-seven in number, including those of which he wrote only a part, but which went under his name. Of these eighteen remain, and ten or not twelve more, might have been added to their number had it not been for the folly of Warburton, through whose carelessness the manuscripts were destroyed by a servant.

There is a peculiar interest in Massinger's plays derived from the state of the times in which they were written, and the bearing of influence which they must have exercised on those national feelings from which, as is probable, they took their own actual shape. No one who reads the play called 'The City Madam' can help seeing in it the exposition of a state of society likely to give birth to troubles as well as the direct exhibition of many of those opinions and feelings which took such active part in the Revolution then impending. We see there portrayed a city opulent to extravagance, courtiers needy and unprincipled, and a landed proprietor of no family not scrupling to compare himself with one of the barons of the realm, and appearing to advantage as a blunt honest man contrasted with a noble, overbearing and insolent, though not intended by the poet to exhibit any vices except those incident to all members of his order. Still more striking are the political doctrines contained in 'The Maid of Honour

Massinger is, we believe, the only dramatist of his time who did not either openly or in secret espouse the court doctrine of the divine right of kings. Massinger's plays are distinguished by an almost entire abstinence from common oaths, and although we cannot add to this that they contain no coarse or even disgusting passages, we might perhaps venture, in respect to some of them, those for instance in the 'Virgin Martyr,' to shift the blame from Massinger himself to his coadjutor in the composition. Whether this abstinence from profanity arose from the restraining influence of the growing prejudice against stage-plays, or from Massinger's own taste, we cannot now tell, but the delicacy, approaching to feminine, so evident in his writings, would induce us to ascribe it to the poet's own choice.

Massinger's extant plays are, 'The Old Law,' 'The Virgin Martyr,' 'The Unnatural Combat,' 'The Duke of Milan,' 'The Bondman,' 'The Renegado,' 'The Parliament of Love,' 'The Roman Actor,' 'The Great Duke of Florence,' 'The Maid of Honour,' 'The Emperor of the East,' 'The Fatal Dowry,' 'A New Way to Pay Old Debts,' 'The City Madam,' 'The Guardian,' 'A Very Woman,' and 'The Bashful Lover.'

(Gifford, *Preface to Massinger*; and the *Edinburgh Review* for 1808.)

MASSON, ANTOINE, a celebrated French engraver and painter was born at Loury, near Orléans, in 1636, and was originally an armourer and 'damasquineur,' or ornamental engraver and inlayer of metals, an artist in much request in the days of armour and chivalry. Masson, who in engraving appears to have been self-taught, had extreme facility and certainty of execution, and he was one of the first artists who made a marked distinction in the textures of the objects which he engraved; he was also extremely successful in his mode of representing colour. The fantastic and eccentric mode however in which he sometimes engraved his portraits, has been condemned by some critics as mere bravura to display his own remarkable facility in handling the graver; in some heads the features are engraved in continuous and peculiar lines. He was very fond of displaying his skill also in executing hair, whether of man or beast, though he frequently sacrificed truth to his propensity for making these fine lines, and in draperies and animals he has gone so far beyond the truth, that this peculiarity is the most striking feature of some of his works. A print, after Titian, of the Disciples at Emmaus, is from the nature of the cloth on the table generally known as La Nappe, and there is a dog in the picture which is such a mass of hair, that upon a close inspection it appears, says Watelet, to be made entirely of straw; yet notwithstanding these peculiarities, says the same intelligent critic, this print is the best engraving after Titian. Watelet says that Masson's faults are faults which he would have, and that they are always compensated by his beauties. The print of the Disciples at Emmaus has an additional value beyond its merits as an engraving, for, with the exception of that of Christ, all the heads are portraits—the praying disciple is the Pope Adrian IV., the other is the Emperor Charles V., the host is the emperor's confessor, and the attendant is Philip II. of Spain. Masson died at Paris, in 1700, as engraver in ordinary to the king, and a member of the French Academy of Painting. He has executed many portraits, several after his own paintings, and some of them are nearly of the size of life. Masson's portraits have a peculiar interest also as representing a great portion of the most distinguished men during the reign of Louis XIV. His historical pieces are not numerous, but they are all excellent. (Watelet and Levesque, *Dictionnaire des Beaux Arts*; Robert Dumesnil, *Peintre-Graveur Français*; Nagler, *Neues Allgemeines Künstler-Lexikon*.)

MAS'ÚDÍ, ABU'-L-HASAN 'ALI' BEN-HUSEIN BEN-'ALI', one of the most celebrated Arabian writers, was born, according to his own statement, at Bagdad, in the 3rd century of the hejra, or the 9th of the Christian era. He belonged to the illustrious family of 'Abdallah-ben-Mas'úd, of the tribe Hodzáll, and one of his ancestors was among the few early followers of Mohammed who accompanied the prophet on his flight from Mecca to Medina. Mas'údí was gifted with great talents, which he applied at an early age to learned pursuits. He gathered an immense stock of knowledge in all branches of science, and his learning was not mere book learning, but he improved it in his long travels through all parts of the East, Turkey, Eastern Russia, and Spain. In A.H. 303 he visited India, Ceylon, and the coast of China, where the Arabs had founded numerous small colonies; thence he went to Madagascar and Southern Arabia; thence through Persia to the Caspian, and he visited the Khazars in Southern Russia. In A.H. 314 he was in Palestine; from 332 to 334 in Syria and Egypt, and he says that in 345, when he wrote his last work, the second edition of his 'Golden Meadows,' he was in Egypt, and had been a long time absent from his native country, Irak. He says that he travelled so far to the West (Morocco and Spain), that he forgot the East, and so far East, that he forgot the West. Mas'údí died probably at Kahirah (Cairo), in A.H. 345 (A.D. 956), and since he visited India as early as A.H. 303, it is evident that those who say he died young are mistaken.

No Arabian writer is quoted so often, and spoken of with so much admiration by his countrymen, as Mas'údí, and although only a small portion of his numerous and voluminous works is known to Europeans, it is sufficient to show that he deserves his reputation. The variety of subjects on which he wrote astonishes even the learned, and the philosopher is surprised to see this Arab of the middle age resolving questions which remained problems to Europeans for many centuries

after him. Mas'údí knew not only the history of the Eastern nations, but also ancient history and that of the Europeans of his time; he had thoroughly studied the different religions of mankind, Mohammedanism, Christianity, those of Zoroaster and Confucius, and the idolatry of barbarous nations. His geographical knowledge was no less extensive and correct than his acquaintance with history, and no Arabian writer can boast like him of learning at once profound and almost universal. A characteristic feature of Mas'údí is his want of method in arranging the prodigious number of facts which a rare memory never failed to supply him with while he was writing. He illustrates the history or geography of the West with analogies or contrasts taken from China or Arabia; he avails himself of his knowledge of Christianity to elucidate the creeds of the different Mohammedan sects; and while he informs the reader of the mysteries of the extreme North, he will all at once forget his subject and transfer him into the desert of the Sahara.

The principal works of Mas'údí are:—1, 'Akhbár-es-zemán,' or 'History of the Times.' This work, the wonder and delight of the learned in the East, was too voluminous to meet with popularity. According to Burekhardt there is a manuscript of it in the library of the mosque of St. Sophia, which, incomplete as it is, consists of twenty large volumes in 4to, and ten at least are said to be wanted to make it complete. The 'Akhbár-es-zemán' was a general history of all nations; it has never been printed; manuscripts are very rare in the East, and there are none in Europe. In the royal library in Paris however there is a manuscript fragment of it on Egypt, of which there is a manuscript translation by Pétis de la Croix, which has been perused by later orientalisists. The Arabic work 'Kitáb tarikh-al-júmán fi mokhtasár akhbár-es-zemán,' or 'The Book of Pearls gathered from the History of the Times,' of which there is a manuscript copy in the Royal Library at Copenhagen, and another in that of Paris, is an extract from the 'Akhbár-es-zemán,' according to the Danish orientalist Rasmussen. Saint Martin however doubts this. This extract was made in the 9th century of our era, by Shehábéd-din Ahmed-am-Mokri, a native of Fez in Morocco. 2, 'Kitáb-al-úsat,' 'The Book of the Middle,' the word 'úsat' the plural of 'wesat,' being probably taken in the sense of 'proportionate,' 'not exceeding a certain size.' This is the complement to No. 1, and treats of the most curious and important questions in history and geography. There is no manuscript of it in Europe, and we know some of its details only through the quotations of other Arabic writers. Aware that his works were too voluminous, Mas'údí wrote, 3, 'Morúj-ad-dhehel we m'áddin-al-jewáhir,' his celebrated 'Meadows of Gold and Mines of Gems.' This is an extract with additions from Nos. 1 and 2. In the Leyden manuscript perused by Dr. Sprenger, the work is divided into 132 chapters, of which the doctor gives the titles in the introduction to the first volume of his translation of the work; in a Paris manuscript it is divided into 129 chapters, 65 of which treat on foreign countries, and the remainder on the Empire of the Arabs. Mas'údí wrote this work in A.H. 332, in the space of one year, according to the author, for each chapter bears the date when the author finished it. This seems however scarcely credible. In A.H. 345 the author issued a second edition containing 350 chapters, but this work was again too voluminous, and met with less favour from the public than the first edition, of which there are many manuscripts in the East as well as in Europe; but there is no manuscript extant of the second edition. A Spanish Arab, El-Shatibi, a native of Xativa, made an extract from the 'Golden Meadows,' and so did Reiske during his residence at Leyden. The 'Historia Jootanidarum,' in Schultens' *Monumenta Antiquissima Historiæ Arabum*, is a translation of a chapter of the 'Golden Meadows,' and it appears that the Arabic treatise of which Renaudot published a translation under the title 'Anciennes Relations des Indes et de la Chine de deux Voyageurs Mohammedans' is likewise a fragment of that work, though probably of the second edition. Dr. Gildemeister published a translation of a chapter of it on India, entitled 'De India,' Bonn, 1836, 8vo. The Oriental Translation Fund proposed to publish a translation of the whole work, but only the first volume, containing the first seven chapters, translated by Dr. Aloys Sprenger, with the co-operation of the late Earl of Munster, has appeared under the title 'El-Mas'údí's Historical Encyclopaedia entitled Meadows of Gold and Mines of Gems,' 1st vol., London, 1841, 8vo. A French translation 'Les prairies d'Or par Derembourg' is announced as "in the press." The 'Golden Meadows' treat on the history, geography, religion, manners, and politics of most of the Eastern and European nations, and are full of matter both important and curious.

The following are works of Mas'údí, some of which are extant in manuscript, but most of them are only known by being quoted by other writers:—

4, 'Kitáb fonúu-al-m'árif,' &c., 'Different Branches of Science, and of what has happened in bygone times'; 5, 'Kitáb dekháir-al-'olum,' &c., 'Treasury of Science,' &c.; 6, 'Kitáb-al-istib sár,' 'The Book of Consideration,' treats on a matter of the highest importance to all Moslems, namely on those who were entitled to succeed Mohammed as Khalif; 7, 'Kitáb-al-mesáil,' &c., 'The Book of Questions on the Causes of Religion'; 8, 'Kitáb-al-ábánah,' 'On the Principles of Religion'; 9, 'Kitáb-as-safwah,' 'On Sincerity,' treats on the different Mohammedan sects. Mas'údí was a schismatic, and it is believed that he left his native town, and settled abroad, on account of some religious differences; 10, 'Kitáb sirr-al-háyáh,' 'On the Secret of Life,'

especially on the soul, and its transmiration; 11, 'Kitáb-al-d'áwí-ash-sheni'ah,' 'On Extravagant Opinions.' It is much to be regretted that there is no translation of this work; 12, 'Kitáb tabl-an-nofús,' 'The Physician of the Soul,' with a metaphysical digression on dreams; 13, 'Hadúk-al-aházár,' 'Beds of Flowers,' contains historical information on the descendants of Mohammed and their virtues; 14, 'Al-mabáddi we al-tarákib,' 'On Principles and Compositions,' treats among other subjects on the influence of the sun and the moon; 15, 'Kitáb-ar-rús asseb'f'yah min as-sásah am-molúkiah,' 'The Book on the Seventy Chapters,' treats on the policy of kings, and is a very remarkable work. We close this list with, 16, 'An Account of the Establishment of the Fatemite Dynasty in Africa, from a manuscript ascribed to Mas'údi,' with notes, by John Nicholson, Ph.D., Tübingen and Bristol, 1840, 8vo. According to Kosegarten and Silvestre de Sacy, this work is a fragment either of No. 1 or No. 2 in our list. The manuscript used by Dr. Nicholson is one of those which the unfortunate Dr. Seetzen purchased at Damascus; it is now No. 261 in the library of the reigning Duke of Saxe-Coburg-Gotha, at Gotha; it was written in A.H. 627, and is consequently of more modern date. An orientalist well acquainted with the works of Mas'údi would confer a great benefit on geographers by writing a commentary on the geographical system of the author. Mas'údi had thoroughly studied the systems of Ptolemaeus and Marinus of Tyre, and he distinguishes between the maps of Ptolemaeus and those of the Syrian geographer. There is consequently no doubt that the geography of Marinus was extant in the 10th century of our era. Mas'údi speaks of the Arabic origin of the kings of Tibet, a fact which is likewise mentioned in the Chinese annals; of a Syrian empire anterior to that of Nineveh; of Wán in Armenia as the city of Semiramis; of cuneiform inscriptions, and other matters.

(Haji Khalfah, *Biographical Dictionary*; Herbelot, *Bibliothèque Orientale*; Quatremère de Quincy, *Mémoire sur Masoudi*, in 'Journal Asiatique,' 3ième Série, vol. 7, January 1839, a very valuable reference; the *Introductions to the Translations* by Dr. Sprenger and Dr. Nicholson mentioned above.)

MATHAM, JACOB, a celebrated Dutch engraver and painter, was born at Haarlem in 1671. He was the pupil of Golsius, who married Matham's mother, by whom he acquired considerable fortune. Matham's prints are very numerous; Bartsch describes nearly 300. He died in 1631.

MATHER, COTTON. The name of Mather is associated with a remarkable period in the early history of New England, where three of that name occupied in succession conspicuous situations; while two of them were among the earliest and most voluminous of American writers. In his life of Cotton Mather, the Rev. W. B. O. Peabody has quoted an old doggerel tombstone inscription, as describing pretty accurately the relative qualities of father, son, and grandson:—

"Under this stone lies Richard Mather,  
Who had a son greater than his father,  
And eke a grandson greater than either."

RICHARD MATHER, the grandfather, a non-conformist divine, had emigrated to New England, then the Puritan land of promise, in 1635, and was called to be minister of a church in Dorchester, Massachusetts, where he remained to the end of his life generally respected as a man of learning, ability, and piety.

INCREASE MATHER, his son, was however a man of higher mark. Born at Dorchester on the 21st of January 1639, he was a native colonist, and among the little community his early promise was watched with interest and pride. Already talked of as a scholar, he at the age of twelve entered Harvard College, and having graduated there with honours in 1656, he proceeded to Trinity College, Dublin. There he studied diligently for four years, and then returned to Boston, at that time the largest and most important city in America. He was soon after chosen pastor of North-Church, Boston, an office he held for sixty-two years; and, after once before declining the honour, he in 1684 became principal of Harvard College, and continued its president till 1701, when he resigned the presidency rather than the pastorate, the duties of the two having become incompatible. From the college he received the degree of D.D., his being the first diploma of that class granted in America.

But Increase Mather was something more than merely the pious and faithful minister of a flourishing city church, or even the learned head of the first American university. He was also the leading political counsellor and statesman of the community. As Mr. Bancroft observes ('Hist. of America,' ii. c. xv.), "The same causes which had given energy to the religious principle, had given weight to the ministers. In the settlement of New England the temple, or as it was called, the meeting-house, was the centre round which the people gathered. As the church had successively assumed the exclusive possession of civil franchises, the ambition of the ministers had been both excited and gratified. They were not only the counsellors by an unwritten law; they also were the authors of state papers, often employed on embassies, and at home, speakers at elections and in town-meetings." In Increase Mather's time this ministerial influence was at its height, and he as one of the first "native-bred ministers," and by general repute the most learned, enjoyed an unusual share of it; but he lived to see its decline, and his son participated in its

downfall. Increase and Cotton Mather were foremost in counselling opposition to the arbitrary measures of Charles II., and when that monarch annulled the charter of Massachusetts in 1685, Increase Mather was despatched to England on the dangerous mission of agent for the colonies. He was still in England in this capacity when James II. fled from his throne, and he procured from William III. a new charter of somewhat less democratic character than that which Charles II. had taken away. On his return to Boston he received the thanks of the House of Representatives, but the new constitution was less satisfactory than the old, and Mather's popularity suffered for the part he had taken in procuring it. He gradually took a less prominent share in public affairs, yielding the lead to his more ambitious but less prudent son; but to the close of his life he continued in the active exercise of his ministerial and benevolent labours. He died on the 28th of August 1723, aged eighty-four: the 'Patriarch of New England,' as he was affectionately called by his fellow-citizens.

Increase Mather was a diligent writer, the list of his works numbering ninety-two distinct publications. But few of them are remembered now. One has however been recently republished in this country as a volume of Mr. Russell Smith's 'Library of Old Authors':—'Remarkable Providences, illustrative of the earlier days of American Colonisation; with Introductory Preface, by George Ofor,' 8vo, 1856, and is curiously illustrative of the mental character and peculiarities of the people whose virtues it celebrates.

COTTON MATHER, son of Increase Mather, was born at Boston, February 12, 1662-63. Educated under the eye of his father, he was at the age of twelve, when he entered Harvard College, not only able to read Virgil and the Latin classics, but to enjoy Homer and Isocrates, in the original. At college his progress was answerable, and when at the age of sixteen he took his first degree, the president, Oke, addressed him in a Latin speech, lauding in glowing phrase his past conduct and attainments, and predicting a glorious future. But it was not in worldly knowledge only that he was so advanced a student. The descendant of a line of ministers, he seemed to be himself, by his aptness in learning and early seriousness, specially marked out for the ministry. But among the New England churches, before there could be a call to that office, it was requisite that there should be manifest evidence of great personal piety and a strong internal desire for the work. As early as his fourteenth year, Cotton Mather's mind began to be greatly exercised with religious thoughts. He at this time laid down a system of rigid fasts, which he continued to practise monthly or weekly, and sometimes oftener through the rest of his life, of strict and regular self-examination, and of prolonged times of prayer, to which he afterwards added frequent nightly vigils. It is necessary to mention these things in order to understand some points in his character and conduct in future years. For awhile he was diverted from his purpose of becoming a minister by a growing impediment in his speech, and began to study medicine. But being shown how by a "dilated deliberation" of speech he might avoid stammering, he returned to his theological studies; at eighteen commenced preaching, and received in February 1680 a unanimous invitation to become assistant minister to his father in the North Church; and in January 1682 he was elected co-pastor.

As a minister he was in every way zealous, yet he found time not only to continue and extend his studies, but to send to the press a prodigious number of sermons, works of devotion and stimulants to religious usefulness, and to accumulate materials for greater works he was already contemplating. Nor did he any more than his father shrink from the political duties which the ministerial office had been supposed to cast upon those who held it. "New England," he wrote, "being a country whose interests are remarkably inwrapped in ecclesiastical circumstances, ministers ought to concern themselves in politics." When therefore his father was sent to England to seek relief from the arbitrary measures of Charles II. and James II., Cotton Mather regarded himself as the natural leader of the citizens, and on their seizing and imprisoning the obnoxious governor, he drew up their declaration justifying that extreme measure. But the people were beginning to tire of the dominance of their ministers, and Mather regarded the growing freedom of thought and manners as evidence of a falling away from the purity of the old faith; and he fancied he saw signs that the evil one was busy in turning away the hearts of the people. A case of supposed possession occurred at an opportune time for his theory. The daughter of one Goodwin, a respectable mechanic of Boston, accused a laundress of having stolen some of the family linen. The mother of the suspected person, an Irish emigrant, expostulated in no very gentle terms against such a charge, and as was averred, not content with abuse, cast a spell over the accuser. The younger children soon began to suffer similarly; and the poor Irishwoman was denounced as a witch. To test, as he said, the truth of the story, Cotton Mather took the eldest girl, then about sixteen years old, into his house, and her vagaries soon left on his mind no doubt that she was really under the influence of an evil spirit. The poor Irishwoman was tried, condemned, and executed; and Mather published a relation of the circumstances, and an account of such influences in other places. The book, which was published with the recommendation of all the ministers of Boston and Charlestown, was entitled 'Memorable Providences relating to Witchcraft and Possessions: with Discoveries and Appendix,' 8vo,

Boston, 1689. Everywhere in the colony it was greedily read, and in England it was republished with a preface by Richard Baxter, as sufficient to convince all but the most obdurate Sadducees. In the pulpit, and in his intercourse with both magistrates and people, Mather urged the necessity of eradicating the sin. That he fully believed in the reality of witchcraft—which indeed comparatively few then doubted—there can be little question, but the narrative he gives of his own 'experiments,' as he calls them, is sufficient proof of his almost infantile credulity. By these 'experiments' he arrived at some rather curious 'conclusions.' One was that though the devils understood Hebrew, Greek, and Latin, as well as English, there was one 'inferior' Indian language which they could not comprehend. A blunder made on one occasion led him to conclude that "perhaps all devils are not alike sagacious." "Whether devils know our thoughts or no?" was a question he was anxious to solve, and though he does not undertake positively to decide the point, he shows that his opinion is in the affirmative. He found too that while the spirits had a vehement antipathy to the regular meeting-houses, they rather enjoyed a visit to a Quakers' meeting. So again they found pleasure in the Roman Catholic service, and whilst a "minister's prayer" was torture to them, they took a marvellous delight in that abomination of the puritans, the Book of Common Prayer; nay, what was more wonderful still, although they could not endure to hear a passage read from the Bible, they had no objection at all to listen quietly to either gospel, epistle, or psalms, when read from the "episcopal service-book."

Mather's book was not slow in producing its fruit. In the beginning of 1692, the children of Mr. Samuel Parris, a minister of Salem village, about three miles from Boston, became strangely afflicted. They accused an Indian servant, who appears to have actually used some Indian incantations with a view to their relief, of having bewitched them. She was cast into prison, and brought to confess that she was guilty. But this, instead of putting an end to the mischief, was but its commencement. The girls now began to accuse others of being witches; and becoming as it were clairvoyant—only one of the points of resemblance between the Salem witchcraft and more modern 'manifestations'—found that they were possessed of the faculty not only of discovering witches, but also of seeing their familiar spirits. The magistrates applied to Mather for advice, and he urged them to adopt the most rigorous measures. No doubts occurred to his mind. That there were evil spirits abroad was one of the most cherished articles of his creed, and that they should especially prevail in New England was what he thought was quite to be expected. "The New Englanders," he had written in his 'Memorable Providences,' "are a people of God settled in those which were once the devil's territories; and it may easily be supposed that the devil was exceedingly disturbed when he perceived such a people here accomplishing the promise of old made unto our blessed Jesus 'that he should have the utmost parts of the earth for his possession.'" And he thought himself in a more particular manner bound to be zealous in the matter, for in the course of his 'experiments' with the girl Goodwin, one of the spirits had been driven to acknowledge that Mather himself, by his "little books," with which as he says he had "filled the country," had brought this visitation upon the people—"that this assault of the evil angels upon the country was intended by Hell as a particular defiance upon my poor endeavours to bring the souls of men unto Heaven."

What is known as the 'Salem Tragedy' followed. What with constant preaching against witchcraft, prayer-meetings, fasts, and public examinations, the people of Salem soon came to be in a state of the most fervid excitement. Nothing hardly but witchcraft and demoniacal possession was spoken of. Every unusual form of disease in people or cattle was attributed to this cause; and Mather, as the chief minister, was constantly among them, stirring up their already too ardent zeal. By May, in that small town, above 100 persons were in jail, and the infection soon spread to the surrounding villages. The deputy-governor and five magistrates went over from Boston to conduct the preliminary examinations; and when the new charter arrived, a special court was at once appointed to try the accused. The first trial was of a poor old woman named Bridget Bishop. Her guilt was declared 'notorious,' and the evidence adduced, though of the most ridiculous kind, was received as though any evidence was scarcely necessary. She was declared guilty, and, protesting her innocence, was hanged. The same measure was dealt out to others similarly suspected. Such as confessed their guilt, and professed penitence, had their lives spared; those who persisted in denying their guilt, were, upon conviction, hanged. One poor man named Cory, eighty years old, whose wife had been executed as a witch, refused to plead, and was by the barbarous punishment of the 'peine forte et dure' (which was permitted long after to disgrace the English criminal code) pressed to death—the last instance of the kind in North America. By September twenty persons had been put to death; eight more were under sentence of death; fifty-five had confessed their guilt, and so escaped hanging; above a hundred more were lying in jail, and twice that number were at large under suspicion. The last execution had produced a deep impression on the country. It was that of a Mr. Burroughs, formerly a minister at Wells, who had occasionally preached at Salem, and seems to have been regarded

by Parris—the chief prosecutor in all the trials—with professional as well as personal hatred. On evidence the futility of which he made perfectly clear in his defence, the unfortunate man was convicted, and his execution took place in spite of the general expression of public sympathy. His speech at the gallows deepened the feeling, notwithstanding, or perhaps the more, that Cotton Mather had the extreme bad taste to address the crowd in answer to the poor man's appeal, and after repeating the evidences of his guilt, to warn the people against being misled by his seeming piety, since "even Satan could, if occasion were, transform himself into an angel of light." But now beyond the influence of the excitement a cry of horror was raised. The grand jury of Andover ventured to throw out a bill though the evidence was direct. A reaction was evidently in progress, which Cotton Mather in vain attempted to arrest. With the concurrence of the governor, the deputy governor, the president of Harvard University, and the ministers, he drew up and published an elaborate justification of what had been done, and an expression "of pious thankfulness to God for justice being so far executed among us," under the title of 'The Wonders of the Invisible World; Observations upon the Nature, the Number, and the Operations of the Devils' (8vo, Boston, 1693). But it was too late. In the adjourned court of sessions more than half the bills were thrown out; and in the twenty-six trials which followed all the accused were acquitted, though the evidence was stronger than in the previous convictions. A sturdy opponent, one Robert Calef, met Mather on his own ground by the publication of 'More Wonders of the Invisible World,' in which he tried to show that the whole was a delusion; and though Mather caused the pamphlet to be publicly burned, the author was not silenced. The trials were now at an end; the accused were all set at liberty; the convicted were pardoned. Some of the judges even went so far as to stand up publicly in the religious assemblies whilst their prayers for pardon if they had shed innocent blood were read aloud. But Mather evinced no signs of penitence or even regret. In his 'Magnalia Christi,' published nine years later, he does indeed admit that there had perhaps been "a going too far in that affair," but this was evidently a concession to public opinion rather than to conviction. Mr. Bancroft seems to decide against Mather's good faith in these proceedings; but we think that they will arrive at a more correct as well as charitable conclusion who look at his whole character—who remember that his education had been of the sternest order of Puritanism—that he regarded New England as in some measure under theocratic government, and that he drew all his notions of public sin and punishment from the Old Testament—who remember also that in his own person he was accustomed to look for immediate spiritual guidance by some sign or token in all his conduct,—that his prayers and fasts and vigils were all with a view to direct providential interposition, and that as a consequence he looked on the direct interposition of evil spirits as constant and certain.

From this time his public influence declined. Twice even when a president of Harvard College had to be chosen he was to his great mortification passed over, though not only universally regarded as the most learned of its alumni, but as a man of almost unequalled genius. But he lived and laboured on with all his wonted zeal. In 1713 he was elected, on account of his 'Curiosa Americana,' a Fellow of the Royal Society of London (being the first American who received that distinction), and some letters appearing in its 'Transactions' in 1721, giving an account of the practice of inoculation, then recently introduced from Constantinople by Lady Mary Wortley Montague, determined him to endeavour to render inoculation available for the benefit of his countrymen. Small-pox was then raging in Boston, and Mather convoked a meeting of the physicians of the city, but they with one exception declared against the innovation. Mather and his convert Dr. Boylston persisted, and though they were assailed by every kind of professional and popular invective, they succeeded in persuading 247 persons out of 5589 who suffered from the epidemic in Boston in 1721, to submit to the operation, some of the younger members of Mather's family being the first upon whom it was tried. The result was found to be that of the inoculated only one in forty-two died, while of those not inoculated one in seven died; and inoculation became a part of the established medical treatment in America. Cotton Mather survived till the 18th of February 1728; and it is a noteworthy circumstance that in his later years the chief actor in the terrible witch tragedy was the friend and adviser of Benjamin Franklin, the great American representative of so entirely opposite a school of philosophy.

We spoke of Cotton Mather as the author of a prodigious number of works. He himself mentions having published above 300; their actual number is said to be 382. How with his busy public and ministerial engagements he could have written so much it is difficult to imagine, for he was also an indefatigable reader. Dr. Chauncey, a learned contemporary, declared of him that there were "hardly any books in existence with which Cotton Mather was not acquainted," but he also says of him that he was "the greatest redeemer of time he ever knew." Many of his publications were sermons and "little books," but some are of considerable bulk: his greatest work, the 'Scripture Illustrations,' on which he laboured from his thirty-first year to his death, still remains in manuscript in the archives of the Massachusetts Historical Society. For a long period his "practical works" were great authorities with certain religious sects. Benjamin

Franklin in his 'Autobiography' says of Cotton Mather's 'Essays to do Good,' that "they perhaps gave him a tone of thinking that had an influence on some of the principal future events of his life;" and in reading Franklin's writings and plans of self-discipline we have often fancied that we saw the influence also of Cotton Mather's 'Student and Preacher,'—a student's guide which in the theological academies and among the studious young men of the dissenting bodies of England, as well as in America, was a cherished manual, till superseded by the 'Mental Discipline' and the 'Student's Manual' of the Burders and the Todds of our own day. Mather's writings on witches and spirits will be preserved by the circumstances to which they refer; his greatest published work 'Magnalia Christi Americana: or the Ecclesiastical History of New England, from its first planting in the year 1620, unto the year of our Lord 1696; in seven books,' London, 1702; first American edition 2 vols. 8vo, Hartford, 1820, though a mere mass of undigested materials, is valuable as an important contribution to the early ecclesiastical and general history of New England.

MATHEW, THE REV. THEOBALD, the Apostle of Temperance in Ireland, was born at Thomastown, county of Tipperary, October 10, 1790. His father, an illegitimate member of the family of the earls of Llandaff, died while his children were young, and Theobald was enabled by the kindness of the Countess of Llandaff and Lady Elizabeth Mathew, to proceed to the academy of Kilkenny, and afterwards to St. Patrick's College, Maynooth, where he remained until he was ordained a priest of the Roman Catholic Church in 1814. He was appointed to a missionary charge at Cork, where his influence was great among the rich and the poor alike: on his appointment to this mission he received from the pope, Gregory XVI., the degree of D.D., with a dispensation enabling him to hold property. Among other benefits which Father Mathew conferred upon the inhabitants of Cork was the establishment of a religious society for the purpose of visiting the sick and needy, on the model of the societies of St. Vincent de Paul: this institution obtained the warm approbation of the Irish Poor-Law Commissioners in 1834. About four years later he was requested to lend his aid to a temperance association formed in Cork. He joined the association and became its president; and devoting himself heart and soul to the peaceful agitation, he had the satisfaction to see within a few months no less than 150,000 converts in Cork alone. Extending his sphere of action he commenced a 'progress' through the west of Ireland, where proportionate results were seen; wherever he went the crowds that flocked to 'Father Mathew' to take the pledge of temperance were so numerous, that they could only be kept in control by the military and police. The same results followed in all the towns which he visited in the north of Ireland, and at Dublin, and to a considerable extent in Liverpool, Manchester, and London, where regardless of creed and country he went about doing good, and raising the squalid objects of pity and compassion to self-respect, independence, and industry. It ought to be added, that in the execution of his mission Father Mathew did not scruple to sacrifice his temporal prospects; a distillery in the south of Ireland which belonged to his brother, and formerly provided him with almost all his income, being shut up in consequence of his preaching against the use of ardent spirits. His services in the cause of morality and religion having been recognised by statesmen of all shades of opinion, her Majesty granted to Father Mathew out of the civil list an annuity of 300*l.* a year—a sum, which though ample in itself, is understood to have been little more than sufficient to keep up the payments on policies of assurance upon his life obtained for the sake of securing his creditors; and a private subscription was entered upon for his assistance. He died on the 8th of December 1856; having from the state of his health been for some years incapacitated for active labours.

MATHEWS, CHARLES, an eminent comedian, was born on the 28th of June 1776, and educated at Merchant Tailors' School. His father, Mr. James Mathews, was a bookseller in the Strand, and intended Charles, who was his seventh son, to follow the business. A strong and early inclination for the stage however induced the son, after two or three attempts in private, to make his debut as an amateur in the parts of Richmond in 'Richard III.,' and Bowkit in 'The Son-in-Law,' at the Richmond Theatre, on Saturday, September 7, 1793; and on the 19th of June 1794 he made his first appearance as a regular comedian at the Theatre-Royal, Dublin, for the benefit of Mrs. Wells, and in the characters of Jacob in 'The Chapter of Accidents,' and Lingo in 'The Agreeable Surprise.' In 1797 Mr. Mathews married his first wife, Miss Eliza Kirkham Strong, the daughter of a physician at Exeter. She died at York in 1802, and in 1803 Mr. Mathews was united to his second and surviving wife, Miss Anne Jackson, at that time a member with himself of the York company. On the 15th of May in the same year Mr. Mathews made his first bow to a London audience at the Haymarket Theatre, and on the 17th of September 1804 his first appearance at Drury Lane, in the character of Don Manuel, in 'She would and she would not.' On Wednesday, April 12, 1808, at the Theatre-Royal, Hull, he made his first trial of those popular performances, his 'Entertainments' and 'At Homes,' by the recital of his 'Mail-Coach Adventures, or Rambles in Yorkshire.' On the 22nd of July 1814 Mr. Mathews was severely injured by being thrown out of a tilbury in which he was driving his friend Mr. Terry. The effects of this unfortunate accident he felt to the last day of his life. On the 2nd of April 1818 he commenced his extraordinary

engagement with Mr. Arnold of the English Opera House, and gave his first 'At Home' in London, an entertainment which he repeated thirty-nine nights to overflowing houses. In 1822 he paid his first visit to New York, returned to England in the following year, and in 1824 produced his entertainment entitled 'A Trip to America.' In January 1828 he accepted a short engagement at Drury Lane, and in the autumn of the same year became joint-proprietor with Mr. Yates of the Adelphi Theatre, by the purchase of his deceased friend Mr. Terry's share. In 1834 he again visited America, but was compelled by ill health to return prematurely, having played only thirty nights. On Tuesday, 28th of June, 1835 (his birth-day), he expired at Plymouth, after considerable suffering, aged fifty-nine, and was buried in the vestibule of St. Andrew's church in that town. As a comedian, Mr. Mathew ranked deservedly high; but his greatest popularity was certainly achieved by his wonderful talent for personation and imitation, in the exercise of which his kind heart as well as good taste kept him guiltless of offence even to the most sensitive of those whose peculiarities of voice, manner, or person he so happily assumed. In private life Mr. Mathews was universally respected, and with him the stage lost a perfect gentleman as well as a distinguished professor. His memoirs, partly autobiographical, and edited by his widow, have been recently published in 8vo. His son, the present Mr. CHARLES MATHEWS, was educated as an architect, and commenced the practice of that profession with a fair prospect of success, but eventually gave scope to his strong bent for the stage. As manager, in connection with his wife, so long a public favourite as Madame Vestris, first of the Olympic and afterwards of the Lyceum Theatre, Mr. Mathews's career is well known. As a light comedian, he has secured for himself a special line of characters in which he is without a rival.

MATILDA or MAUD, EMPRESS. [HENRY I.; HENRY II.]

MATSYS, QUINTIN, an eminent painter, born at Antwerp in 1466, is said to have followed the trade of a blacksmith, or farrier, till he was at least twenty years of age. His quitting his trade to take up painting has been ascribed to different causes. The story that he gained most credit (perhaps because it is the most romantic) is, that he fell in love with a young woman whose father was resolved she should marry none but an artist; and that he in consequence applied himself to painting with such success, that he was in a very short time qualified to claim the lady's hand. He was admitted a Master of the Guild of Painters in 1491. His manner is singular, and different from that of any other master; his design is correct and true to nature, and his colouring forcible. His pictures are carefully finished, though rather dry and hard. It is thought by competent judges that, if he had been in Italy, and studied the antique and the great masters of the Roman school, he would have been one of the most eminent painters of the Low Countries. Though he generally took his subjects from ordinary life, he sometimes ventured with success into the higher departments of the art. One instance of this is a 'Descent from the Cross,' painted for the cathedral of Antwerp, and now in the museum of that city. His most remarkable and best known picture is that of the 'Two Misers,' of which there are numerous copies. The picture in the Royal Gallery at Windsor is supposed to be the original. Dr. Waagen speaks in the highest terms of a 'Mary Magdalen,' half-length, three-quarters the size of life, in the gallery at Corsbam House, the seat of Lord Methuen. The drawings of Matsys are extremely rare. He died at Antwerp in 1530. The National Gallery has a 'Salvator Mundi' (No. 295), by him.

MATTHEW, ST., the Apostle and Evangelist, was a native of Galilee, and a publican or collector of customs and tribute under the Romans. While employed in his office at the city of Capernaum, he was called by Christ to follow him (Matt. ix. 9), and was afterwards chosen to be one of the apostles (Matt. x. 3). An account which corresponds in all respects to that of the conversion of Matthew, is related by himself, is given by Mark (ii. 14), and Luke (v. 27), respecting a publican named Levi, the son of Alphaeus. Grotius and others have supposed that Matthew and Levi were different persons, whose conversion took place at the same time; but if so, why should Matthew relate his own conversion and omit all mention of that of Levi? As the three narratives plainly refer to the same time and place, and as Levi is not mentioned among the apostles, nor in any other passage of the New Testament, we may safely conclude that Matthew and Levi are names of the same person. Perhaps Levi was his proper name, and Matthew a surname given him after his conversion, as that of Peter was to Simon. The Hebrew word Matthew signifies 'a gift of Jehovah.'

In the Acts of the Apostles (i. 13), Matthew is mentioned with the other apostles as remaining in Jerusalem after the ascension of Christ. His subsequent history is quite uncertain. According to Sozrates, an ecclesiastical historian of the 5th century, he went to Ethiopia (Soz. 'Hist. Eccl.' lib. i. c. 19); but according to another tradition, to Parthia. It has been a commonly-received opinion that he was put to death at Naddabar, a city in Ethiopia (Cave's 'Lives of the Apostles,' p. 178); but Heraclon, a Valentinian of the 2nd century, mentions him among those of the apostles who escaped martyrdom. The passage is cited by Clement of Alexandria ('Stromata,' lib. iv., p. 502 B).

MATTHEW OF WESTMINSTER, one of those valuable old writers, the Latin chroniclers of England, who have handed down to us in a simple statement of facts the deeds of the sovereigns and the persons who guided public affairs at a remote period. Matthew spent

his life near the ancient palace of the kings of England, where the parliaments were usually held and the most important affairs transacted, for he was a monk of the abbey of Westminster, the church of the abbey being the usual place of interment of the kings and their families, and still remains to show of what a splendid establishment it formed a part. Matthew's date is the reign of Edward II. His history closes with the death of Edward I.; little or nothing is known of his personal history.

He entitles his work 'Flores Historiarum.' He begins with the creation of the world, and the first and least valuable half is taken up with affairs of other countries and our own before the Conquest. Two hundred and thirty-six pages in the Frankfurt edition contain the history from the Conquest to the death of Edward I. This portion is very highly esteemed. Matthew of Westminster was published in London in 1567, and again at Frankfurt in 1601, in the same volume with Florence of Worcester, another writer of the same class, and a continuation of Matthew to the year 1377, the year of the death of Edward III. A translation of the 'Flowers of History,' by C. D. Yonge, forms two volumes of Bohn's 'Antiquarian Library,' 1858.

MATTHIAS, EMPEROR. [HABSBURG, HOUSE OF.]

MATTHISSON, FREDERICK, born at Hohendodeleben, near Magdeburg, in 1761, was a posthumous child, and brought up by his grandfather, a village pastor, until the age of fourteen, when he was sent to the school at Klosterbergen, and afterwards to the University of Halle, to study theology. His natural taste however led him to apply himself more to philology and general literature. Instead therefore of entering the church, he supported himself for some time as a private tutor at Altona, Heidelberg, and Mannheim, after which he resided for two years with his friend Bonstetten near the Lake of Geneva. In 1794 he obtained the appointment of reader and travelling companion to the reigning princess of Anhalt-Dessau, and during the next seven or eight years visited Italy, the Tyrol, and part of Switzerland, relative to which countries his 'Briefe' and his 'Erinnerungen' furnish many interesting details, besides numerous sketches and anecdotes of distinguished literary persons and others with whom he became acquainted in the course of his tours. Although somewhat deficient in regard to simplicity of style, these works exhibit him to considerable advantage as a prose-writer; but it was as a lyric poet that he was the favourite of the German public, and will long continue to be admired for the happy delineation of external nature, and the touching melancholy and charm of sentiment which characterise his poems, besides their charms of style and versification. His 'Elegy in the Ruins of an old Castle' is hardly less popular than that of Gray is with us, being one of those productions which are of themselves sufficient to give the writer a lasting reputation. Matthiesson also performed a good office for the poetical literature of his country by his 'Lyrische Anthologie,' a collection in twenty volumes, published at Zürich, 1805-7, and containing select pieces and specimens from 202 lyric poets, commencing with Weckherlin, Zingref, Opitz, and other earlier poets, and terminating with Tiedge. These volumes may be considered as a gallery where the specimens of the different masters are arranged chronologically, and exhibit the characteristic qualities of each. Matthiesson died at Wörlitz, near Dessau, March 12, 1831.

MATY, MATTHEW, M.D., the son of Paul Henry Maty, a Protestant clergyman, was born in 1718, at Montfort, near Utrecht, and was originally intended for the Church; but in consequence of some mortifications which his father received from the synod on account of particular theological sentiments, his thoughts, when he grew up, were turned to physic. He took a degree at Leyden, and in 1740 came to settle in England, his father being determined to quit Holland for ever. His earliest patron in England appears to have been Lord Chesterfield. In 1750 he began to publish, in French, an account of the productions of the English press, which he printed at the Hague, under the name of 'Journal Britannique;' a publication which Gibbon praised as exhibiting a candid and pleasing view of the state of literature in England for the space of six years, from January 1750 to December 1755. It answered its intention, and introduced Dr. Maty to the most eminent literary persons of the country. In 1756, as soon as the establishment of the British Museum was completed, he was appointed one of the first under-librarians of that institution. In 1758 he became a fellow, and in 1765, upon the resignation of Dr. Birch, was chosen secretary of the Royal Society. In 1772, upon the death of Dr. Gouin Knight, Dr. Maty, by his majesty's appointment, became principal librarian of the British Museum. He died of a lingering disorder, August 2, 1776. His body being opened, the appearances which presented themselves were considered so singular that they were described before the Royal Society by Dr. Hunter, whose account of them was inserted in vol. lxxvii. of the 'Philosophical Transactions.' Dr. Maty was an early and active advocate for inoculation; and when a doubt was entertained that a person might have the smallpox, after inoculation, a second time, he tried it upon himself, unknown to his family. Besides various smaller pieces, he published:—1, 'Mémoire sur la Vie et sur les Ecrits de M. Ab. de Moivre,' 12mo, Haye; 2, 'Authentic Memoirs of the Life of Richard Mead, M.D.,' 8vo, London, 1755. At the time of his death he had nearly finished the 'Memoirs of the Earl of Chesterfield,' which were completed by his son-in-law Mr. Justamond, and prefixed to that nobleman's 'Miscel-

aneous Works,' 2 vols. 4to, 1777. Dr. Maty was Lord Chesterfield's executor.

MAUPERTUIS, PIERRE-LOUIS-MAREAU DE, was born at St. Malo, 17th of July 1698. Upon quitting the army, in which he held the rank of captain of dragoons, he applied himself assiduously to the study of mathematics and astronomy, partly under the instruction of M. Nicole. In 1723 he was admitted a member of the Royal Academy of Paris, and in 1727 a member of the Royal Society of London. At this time the error in the measurement of the arc of the meridian conducted by Dominic and James Cassini had not been detected. It is well known that the result of this survey was directly at variance with the conclusion to which Newton had arrived relative to the figure of the earth: and although several of the geometers of the day were of opinion that the comparison of degrees in latitudes so nearly contiguous (for the measured arc consisted of two conterminous portions, the difference of the mean latitudes of which was little more than 4') could not be considered decisive, inasmuch as the errors incidental to the survey could not be supposed to be confined within such narrow limits as the small difference of length which the survey was employed to detect; still it afforded to others, who were interested in refuting the Newtonian theory, plausible grounds for disputing the oblate figure of the earth, to which that theory had led. To set the question at rest, Bouguer and La Condamine were sent to Peru; and during their absence Maupertuis, in company with Clairaut, Camus, Lemonnier, and Outhier, were deputed by the Academy to measure an arc of the meridian in Lapland. They were afterwards joined by the Swedish astronomer Celsius, who brought with him from London instruments made by Graham, of a very superior construction to any then in use. The party reached the gulf of Bothnia in July, 1736, intending to fix their trigonometrical stations upon the islands of the gulf; but upon examination, they found the valley of the river Tornea more eligible for the purpose, and, in December following, commenced measuring a base of 7407 toises upon the frozen surface of that river. An account of this survey was published by Maupertuis in 1738: 'La Figure de la Terre,' 8vo, Paris, 1738. The result was that the difference of latitude of the extreme stations, namely, the town of Tornea and the mountain Kittis, was 57' 29.6", and that the length of the corresponding arc was 55,023 toises, from which it followed that a degree of the meridian in 66° N. lat. exceeded a degree in the latitude of Paris by 512 toises, and consequently tended to prove that the earth's figure was that of an oblate spheroid. The survey was repeated in the years 1801-2-3, by Svanberg, whose result differed from that of Maupertuis by 226 toises.

Maupertuis was one of the first among his countrymen who defended the Newtonian theory against the attacks of Descartes, and when his opinion was confirmed by the result of his survey, he became an open and strenuous opposer of the Cartesian philosophy. When Frederic II. was about to reorganise the academy of Berlin, he offered the presidency to Maupertuis, who, tired of his stay in Paris, where, says M. Delambre, the reputation of many had a tendency to eclipse his own, eagerly assented to so honourable a proposition. But his residence at the court of Prussia, which dates from 1745, seems to have been chiefly occupied in cultivating the good graces of Frederic, and he showed little interest as to scientific research except such as had reference to his survey in Sweden. His vanity on this point was conspicuous. In the portrait which he had painted of himself he is represented in the act of compressing the poles of the earth. He died at Basel, 27th July, 1759, at the house of two of the sons of John Bernoulli, with whom he had always been on terms of friendship. His latter years were embittered by a dispute with Koenig, professor of mathematics at the Hague and foreign associate of the academy of Berlin, respecting a mechanical principle of considerable importance, which Maupertuis appears to have been the first to promulgate, and from which he deduced the laws of the reflection and refraction of light, and those to which the collision of bodies are subjected, but of which he was unable to give any general demonstration. This principle, which he designated "the principle of least action," he enunciated in terms identical with those employed at the present time (see his 'Essai de Cosmologie,' Leyden, 1751, p. 70), although he probably attached to them a somewhat different signification. Koenig endeavoured to show, first, that the same principle had been previously advanced by Leibnitz; secondly, that it was not true. The academy of Berlin, to whose arbitration the dispute was referred, decided in favour of Maupertuis, and ordered the name of Koenig to be erased from their list of associates; but even this decision, added to the support of the celebrated Euler, seemed inadequate to compensate Maupertuis for the railing of Voltaire, who, although totally incompetent to judge on the scientific merits of the case, had taken the part of Koenig, and published his satirical piece, entitled 'Diatribe du docteur Akakia, Médecin du Pape,' wherein he was too successful in turning into ridicule both Maupertuis and his "principle." Frederic, who disliked Maupertuis, laughed at the satire, but ordered it to be burnt by the common executioner, which led to Voltaire's asking and obtaining permission to leave Berlin. ('Vie de Voltaire,' par Condorcet.) The following list of the published works of Maupertuis is given in Quérard's 'Dictionnaire Bibliographique':—

'Anecdotes of moral and moral, 12mo, no date. 'Nautical Astro-

onomy, or Elements of Astronomy, alike applicable to a fixed and moveable Observatory,' 8vo, Paris, 1743 or 1751: Lyon, 1756. 'Memoirs read before the royal academies of France and Prussia,' 16mo, Dresden, 1753. 'Memoir on the Moon's Parallax,' 1755. 'Discourse on the different Forms of the Stars, with an Exposition of the Systems of Descartes and Newton,' 8vo, Paris, 1732 and 1742. 'A Latin inaugural metaphysical Dissertation on the System of Nature,' 12mo, 1751. The same in French, Berlin, 1754. 'Dissertation on the White Negro,' 8vo, 1744. 'Elements of Geography,' 8vo, Paris, 1740. 'Eloge of Montesquieu,' 8vo, 1755. 'Essay on Cosmology,' 8vo, Berlin, 1750. 'Essay on Moral Philosophy,' Berlin, 1749; and London, 1750. 'Disinterested Examination of the different Undertakings for determining the Figure of the Earth,' Oldenburg, 1738; and Amsterdam, 1741. 'Examination of the three Dissertations published by M. Desaguliers on the Figure of the Earth,' Oldenburg, 1738 (this book, by some attributed to Maupertuis, is supposed to have been written by the Count de Bièvre). 'The Figure of the Earth, as determined by the Observations of MM. Maupertuis, Clairaut, Camus, Le Monnier, Outhier, Celsius, &c., near the Polar Circle,' Paris, 8vo, 1738. 'Letter to Madame de Vertillac,' Paris, ——. 'Letter to Euler,' ——. 'Letter of an English Clockmaker to an Astronomer of Pekin,' 12mo, 1740 (a humorous satire against MM. de Cassini on the subject of the measurement of the meridian). 'Letter upon the Comet,' Paris, 1742. 'Letter on the Progress of the Sciences,' Berlin, 1752. 'The Measurement of a Degree of the Meridian between Paris and Amiens, determined by Picart, with the Observations of MM. Maupertuis, Clairaut, Camus, and Le Monnier,' 8vo, 1740. 'Miscellaneous Works,' 12mo, Amsterdam, 1744. 'Philosophical Reflections on the Origin of Language and the Signification of Words,' 12mo. 'A Method of superseding the action of the Wind,' 1753. 'Venus physique,' 1745 and 1777. The works of Maupertuis were collected and published at Dresden, in 1752, 4to; and at Lyon, in 1754 and 1768, in 4 vols. 8vo. Among his memoirs in the Transactions of the French Institute, his 'Ballistic Arithmetic,' 1731, and an elegant Commentary upon the 12th section of the first book of the *Principia*, 1732, deserve particular mention.

(*Life of Maupertuis*, by Delambre, in the *Biographie Universelle*; Montucla, *Histoire des Mathématiques*, &c.)

MAUR, ST. There appear to have been two persons of this name: one a disciple of St. Benedict, who is mentioned in St. Gregory's 'Dialogues,' and who is said to have died in 584; the other, abbot of Glanfeuil, who lived till 640, and was a monk of the order of St. Columban, and not of St. Benedict. Of the former of these a Life is extant in the great work of the Bollandists. His day was the 15th of January.

MAURICE OF NASSAU. [NASSAU, HOUSE OF.]

MAURICE, REV. FREDERICK DENISON, M.A., a chief of one of the parties in the Church of England, and whose influence as an intellectual leader is widely felt, not only in the church but in society at large, was born in 1805, the son of a Unitarian minister of high reputation for intelligence and philanthropic zeal. Mr. Maurice was sent at an early age to Trinity College, Cambridge, where he formed an intimate friendship with the late John Sterling, a friendship which lasted through the whole of Sterling's life, and which was made closer in the end by the marriage of the friends to two sisters. From Trinity College both Maurice and Sterling removed to the smaller corporation of Trinity Hall; and here already the former began to exert that singular influence, partly intellectual and partly moral, upon all who came near him, which has accompanied him throughout his whole career. Being a Dissenter he was unable to take a degree, though he passed the usual examinations with the highest distinction. Such was his reputation in the college that not only was a Fellowship offered him, but, on his declining it on the ground that he could not declare himself a *bonâ fide* member of the Church of England by signing the articles and so qualifying himself for the appointment, it was proposed to him to keep his name on the college-books for a year or two as a non-resident member, in order that, if during that time his scruples vanished, he might still take his degree and enjoy a fellowship. This also he declined, on the ground that, by holding out to himself such a prospect, he would be subjecting his intellectual independence to the risk of a temptation, and bribing his conscience. Accordingly, quitting Cambridge without a degree, he removed to London, where for some time he devoted himself to literature. With his friend Sterling he became connected with the 'Athenæum,' then just started by Mr. Silk Buckingham. Notwithstanding the intellectual and literary power which Maurice, Sterling, and their friends threw into this journal at its commencement, it did not succeed commercially; and it was reserved for Mr. Dilke, who afterwards purchased it, to raise it to its present position among British literary journals. About the same time Mr. Maurice wrote a novel of very thoughtful and striking character called 'Eustace Conyers.' Meanwhile his own views and beliefs had shaped themselves into a form which enabled him conscientiously to become not only a member but a clergyman of the Church of England. With a peculiar delicacy however he did not return to Cambridge to complete his qualification, but did so at Oxford, by a residence of one or two terms, so as to take his degree. Since that time the Church of England has been the scene and object of his chief activity, and Christian theology

in connection with that church, and with the wants of modern British society has been his all-absorbing study.

The following is a list of his principal writings, omitting numerous separate sermons and occasional tracts:—'The Doctrine of Sacraments Deduced from the Scriptures'; 'Lectures on the Ecclesiastical History of the First and Second Centuries'; 'Theological Essays'; 'Priests and Lawgivers of the Old Testament'; 'Prophets and Kings of the Old Testament'; 'The Unity of the New Testament'; 'Christmas Day and Other Sermons'; 'On the Religions of the World'; 'On the Prayer Book'; 'The Church, a Family'; 'On the Lord's Prayer'; 'On the Sabbath'; and 'Law on the Fable of the Bees.' Mr. Maurice was also a contributor to the 'Encyclopædia Britannica,' from whose pages two works of his on the 'History of Moral and Metaphysical Philosophy,' in ancient and in mediæval times have been republished. In all these writings, the theological and ecclesiastical views expounded are those of what has been named the 'Broad-Church' party, as distinguished from the other denominational sections of the Church of England. Since the death of Dr. Arnold, indeed, Mr. Maurice has been a prominent leader and adviser of this section of the Church of England, looked up to with extraordinary veneration by all who have belonged to it, including such men as the late Archdeacon Hare and Mr. Kingsley. The influence exerted by Mr. Maurice on such men has been partly through his writings, partly personal and private; and it is said that no man has come near him personally without contracting a very unusual degree of respect for his moral and intellectual character. It is Mr. Maurice's great idea that the Church of England ought to grapple intellectually, in its theological aims and expositions with the most advanced forms of sceptical thought, in such a manner as to evince a liberal sympathy with much that is new in theological in its apparent aspect, in order the more surely to exhibit the supremacy of religion over all; it is also his idea that the Church of England, as an institution, ought to grapple with contemporary forms of social evil, so as to exhibit Christianity as the true source of every effective social amelioration. In carrying out these ideas he has necessarily come into conflict with the views of others, both in and out of the church. His orthodoxy on various doctrinal points has been questioned, and at no time more loudly than immediately after the publication of his 'Theological Essays,' in which his language respecting both the Atonement and the question of Eternal Punishment was made the text of many attacks. As the originator, or one of the originators, of the Christian socialist movement, the design of which was to break down the system of competitive labour, and elevate the working classes by teaching them to associate together in little companies, undertaking work in common, and sharing the proceeds, Mr. Maurice necessarily came in conflict with another set of antagonists. In the midst of much controversy however, no one has ever questioned his ability, his zeal, or his single-mindedness. The only ecclesiastical office he holds is that of chaplain to Lincoln's Inn, in which capacity he preaches sermons which draw audiences as select as any in London. Till recently he held a professorship of divinity in King's College, London, but that office he vacated, in consequence of the objections raised by the college authorities to the opinions advanced in his 'Theological Essays.' Mr. Maurice is the founder and principal of the Working Men's College, Red Lion Square, and during the last few years has devoted a great deal of time and energy to its management. He also takes great interest in the cause of female education. But indeed there are few social questions of importance to which his sympathies do not extend.

MAURICE, THE REV. THOMAS, was born about 1755, at Harford, where his father was then head-master of the Christ's Hospital school. After his father's death the family was impoverished by an unfortunate marriage of the widow: and his education proceeded irregularly till Dr. Parr, on opening his school at Stanmore, was prevailed on to receive him as a pupil, and treated him with great generosity and kindness. At the age of nineteen he was entered of St. John's College, Oxford, whence he removed next year to University College. After taking his degree of B.A., he was ordained by Bishop Lowth; and he held for some time the curacy of the large parish of Woodford in Essex, which in 1785 he resigned for a chapel at Epping, in order to obtain greater leisure for study. Next year he married, but his wife lived for no more than four years. He had already published a translation of the 'Edipus Tyrannus,' and several other volumes of poems; and he long continued to publish volumes of verse. But his turn for historical studies had been fostered at University College by his distinguished tutor Lord Stowell; and before removing to Epping he had begun to concentrate his attention on the history of India, for dealing with which he made proposals in 1790 in a published letter addressed to the East India Directors. The irreligious spirit of the French Revolution, alarming Mr. Maurice's mind, induced him to remodel his first work after it was nearly completed, and to devote a considerable proportion of it to dissertations on the Hindoo mythology. His 'Indian Antiquities' began to be published in 1791, when two volumes appeared, in octavo; the rest were brought out at intervals, the completion of the work being mainly owing to the liberality of the Earl of Harborough; and the seventh and last volume appeared in 1797. Meantime he had undertaken his 'History of Hindostan,' the three volumes of which, in quarto, were published

n 1795, 1798, 1799; and a second edition appeared in 1821. In 1798 Earl Spencer presented him to the vicarage of Wormleighton in Warwickshire: next year he was appointed assistant librarian in the British Museum: in 1800 Bishop Tomline obtained for him the pension hat had been held by the poet Cowper: and in 1804 he received from the Lord Chancellor the vicarage of Cudham in Kent. His 'Modern History of Hindostan,' in two volumes, appeared in 1802 and 1804. Several other volumes on Eastern history and theology, and attempts in verse, succeeded this work: and one of his last undertakings was his 'Memoirs, comprehending the History of the Progress of Indian Literature, and Anecdotes of Literary Characters in Britain, during a period of thirty years.' Of this work the three volumes appeared in 1819, 1820, and 1822. Mr. Maurice died at his apartments in the British Museum, on the 30th of March 1824.

MAURICIANUS, JUNIUS, a Roman jurist, who appears to have been writing in the time of the emperor Antoninus Pius, from an expression which he uses ('Dig.' 38, tit. 2, a. 23); he was therefore a contemporary of Gaius. The only work of his that is mentioned in the Florentine Index is six books *Ad Leges*. There are four excerpts from Mauricianus in the Digest.

MAUROLICO, or MARULLO, FRANCIS, abbot of Messina, was born at that place, September 16, 1494, and died there, July 21, 1575. Several accounts, which do not conceal the age which he attained, state that he was prematurely sacrificed to excess of study. His life was written by his nephew of the same name, and was published at Messina in 1613; we have not seen this work, but it is much used, and freely quoted, in the Abbé Scina's 'Elogio,' Palermo, 1803, which contains a full but flattered account of the life and writings in question. Maurolico taught mathematics publicly at Messina, and lived in habits of close friendship with Cardinal Bembo. These, and his being obliged, much against his will, to suppress a part of his dissertation on comets, on account of the offence which some passages gave to certain Venetian noblemen, are the only circumstances of his personal life which are worth recording.

The printed works of Maurolico are numerous, and those which he wrote still more so; a list of all (but without titles or dates for the printed works) is given by the Abbé Scina. Among the former must be mentioned an edition of Autolyus with commentaries, Messina 1558, folio; of Archimedes, 1670, and 1681 (or 1685?); the Phenomena of Euclid, 1588, and an edition of Theodosius and Menelaus in the same year, which contains a table of secants, being the first introduction of these lines; 'Opuscula,' printed at Venice, 1575, containing treatises on the sphere, the calendar, astronomical instruments, gnomonics, music, and arithmetic; treatise on Cosmography, 1543. Other works have been stated as printed, but we have only inserted those which have good authority.

Maurolico will be remembered by his geometrical writings, particularly his manner of treating the conic sections, by his optical theorems, and by his arithmetical works; but the interest which attaches to his writings connects them rather with the general history of the science than with his own biography, as there are no very prominent discoveries to record. In his arithmetic he proceeds upon geometrical principles, as his eulogist states (and with confirmatory descriptions and citations), but at the same time with an attempt to generalise operations into rules, and to present them in a form closely approaching to the modern algebra, to the spirit of which they approach, without the language. It is to be remembered that before the time of Vieta the method of expressing general formulae, which now constitutes the foundation of algebraical language, did not exist; and it seems to us, from such parts of Maurolico's writings as we have seen cited (the works themselves are very scarce), that the transition from the arithmetic of Euclid to that of Maurolico is an approach to algebra of a character which deserves more attention than it has met with from historians. These writers, so far as algebra is concerned, do not even mention the name of Maurolico, a circumstance which must be explained probably by the latter not being in the line of investigation of Cardan, Tartaglia, and those who lie in the direct track between the Hindoo algebra and that of Vieta. Nevertheless the propositions of Maurolico on the summation of series, and the methods by which they were deduced, form a very curious step in the progress of arithmetical enquiry.

MAURUS TARENTIANUS, a Latin grammarian, who is said to have been born at Carthage. The time in which he lived is uncertain. Cassius supposes him to have been the same Tarentianus who is addressed by Martial as the prefect of Syene in Egypt ('Epigram,' i. 7); and he at all events lived during or before the time of St. Augustine, since he is mentioned by the latter in terms of the highest respect. 'De Civitate Dei,' vi. 2; 'De Utilitate Credendi,' c. 17.)

The only work of Maurus which has come down to us is entitled 'De Litteris, Syllabis, Pedibus, et Metris Carmen.' It is included in the 'Grammatici Veteres,' edited by Putschius, Hanover, 1605; and has been also edited by D. J. V. Lennep, Leyden, 1825, and by Lachmann, Leipzig, 1836.

MAURY, JEAN SIFFREIN, Cardinal, was born on the 26th of June, 1746, at Vauréal, in the Venaissin, of poor but respectable parents. He showed at a very early age a great disposition for learning, and, being destined by his parents for the ecclesiastical profession, he was placed at the seminary of St. Garde, at Avignon, to

pursue his theological studies. At the age of eighteen he proceeded to Paris, in the expectation of earning a subsistence by the cultivation of his talents. Though he was without friends in that city, his first publication attracted considerable notice. Encouraged by this early success he took orders, and devoted himself to the study of pulpit eloquence. In 1772 an 'Eloge' on Fénelon, which he published, was favourably received by the French Academy, and caused him to be appointed vicar-general of the Bishop of Lombes. He however soon returned to Paris, where he became very popular as a preacher. A panegyric of St. Louis, which he delivered before the French Academy, and one of St. Augustine before an assembly of the clergy, met with so much success that the abbey of Frenade in the diocese of Saintes was bestowed upon him by the King, Louis XVI, who likewise appointed him preacher to the court. In 1785 he became a member of the Academy in the place of the lyric poet Lefranc de Pompignan; and the following year the valuable benefice of the priory of Lioris was conferred upon him. At the assembly of the States-General in 1789 he was named deputy of the clergy for the bailiwick of Péronne, and soon took a prominent part in the debates. From the first he enlisted himself on the aristocratic side, where his energetic eloquence and peculiar talent at reply rendered him a formidable antagonist to Mirabeau. [MIRABEAU.] His impressive and impassioned oratory, though it expressed opinions hostile to the great majority of the assembly, was often listened to with admiration and greeted with applause. His great moral courage and firm adherence to the principles which he had adopted, and which in spite of the most violent opposition and in the face of the greatest danger he earnestly advocated, secured for him the respect and esteem of the more enlightened portion of his enemies. On the 27th of November 1790, a decree was passed in the National Assembly, by which every ecclesiastic in the kingdom was required to take an oath to maintain with all his power the new constitution; and, in case of any priest's refusal it was declared that he should be held to have renounced his benefices. To this constitution the pope had refused his sanction, on account of its hostility to the interests of the church, and the oath was indignantly refused by the great majority of the clergy. When the day arrived for the taking of it by the bishops and clergy of the Assembly, an infuriated mob surrounded the hall, threatening death to all who should refuse. On this occasion also Maury displayed his usual intrepidity, and boldly advocated the independence of his order. "Strike, but hear me," was his exclamation, when the last efforts of his impassioned eloquence in that Assembly were interrupted by the incessant cries of his political antagonists. At the close of the stormy session of the National Assembly, Maury, who could lend no further aid to the prostrate cause of royalty and religion, quitted his native country, and, at the invitation of Pius VI., took up his residence at Rome. He was there received with the highest distinction, and the loss of his benefices in France was more than compensated by his speedy elevation to the highest situations in the Roman church. In 1792 he was named Archbishop of Nicæa "in partibus infidelium," and afterwards appointed apostolical nuncio to the diet held at Frankfurt for the election of the Emperor Francis II. This mission accomplished, in 1794 he was elevated to the dignity of a cardinal, and was instituted to the united sees of Monte-Fiascone and Corneto.

On the invasion of Italy by the French in 1798, though every effort was made to seize Cardinal Maury, he escaped under disguise to Venice, where he assisted at the conclave assembled for the election of Pius VII. In 1799 he returned to Rome upon the conquest of Italy by Suwarrow, and was accredited as ambassador to his exiled king, Louis XVIII., who was at that time residing at Mittau. This office he resigned on the reconciliation of the Church of Rome with the government of France under Napoleon, on which occasion he addressed to the First Consul a letter, couched in the most submissive language, praying for permission to return to France. This letter, which was deemed not to be in unison with the tenor of his former conduct, subjected him in after-times to the reproaches and persecutions of the party whom he had served with so much personal hazard. Napoleon gladly received the proposal of a reconciliation with so distinguished a member of the Church whose establishment he was restoring in France: an interview took place between them at Genoa, and in May 1806 Maury re-appeared at Paris. The flattering reception he there met with was calculated to attach him to the interests of this chief, who admitted him to his intimacy, and availed himself of his counsels in ecclesiastical matters. He received the pension assigned to the dignity of a French cardinal, and was appointed First Almoner of Jérôme Bonaparte. In 1807 he was elected a member of the Institute in the place of Target, one of the advocates of the unfortunate Louis XVI. His acceptance in 1810 of the archbishopric of Paris subjected him to the displeasure of Pius VII., between whom and Napoleon there had arisen much disagreement. Cardinal Maury was a warm and sincere admirer of the emperor, and he not only espoused his cause in the disputes with the head of the Church, but took every occasion, which the frequent victories of this chief afforded him, of testifying his gratitude by the expressions of admiration which were contained in his mandates to the clergy of his diocese. These mandates, written in a style of the most florid eloquence, do not remind us of the impressive and energetic orator of the National Assembly: they were severely criticised by the adherents of the ancient régime, and by the witty frequenters of the

Parisian saloons, who styled them 'archiepiscopal despatches,' in allusion to their military tone, and their imitation of the style and manner of Napoleon's bulletins.

After the capitulation of Paris on the 30th of March 1814, Maury was deprived by the Bourbons of the administration of his diocese; and in their resentment for his adherence to Napoleon's fortune they forgot his former daring and powerful support of their tottering throne. He then returned to Rome, where he was imprisoned during one year by the orders of the pope; he was afterwards allowed to live in retirement on a pension which was given to him in compensation for his resignation of the see of Monte-Fiascone. In this retirement, deeply affected by the ingratitude of his former party and that of the pontiff, to whose elevation he had been instrumental, he died on the 11th of May 1817.

"Notwithstanding his extraordinary eloquence," says the Duchess of Abrantes, who knew him intimately, "the Abbé Maury had been before the Revolution, what he was in proscription, what he continued under the empire, a man of talent rather than a man of sense, and a curate of the time of the League rather than an abbé of the reign of Louis XIV." She adds that his figure was in the highest degree disagreeable, but the description she gives of it appears rather a caricature than a portrait.

His principal work, 'Essais sur l'Eloquence de la Chaire,' 3 vols. 8vo, published after his death by his nephew Louis Siffrein Maury, still maintains its well-merited popularity. His mind was formed to appreciate the eloquence of Massillon, Bossuet, and Bourdaloue, and his criticisms on the other French divines are in general as correct as they are temperate. In his review however of English pulpit oratory, he manifests a want of acquaintance with the writings of our most celebrated preachers, such as Jeremy Taylor, Sherlock, and Barrow, and he selects Blair as the best model of English eloquence; the comparison which he draws between him and Massillon is necessarily most unfavourable to Blair. His own Panegyric of St. Augustine is esteemed one of the finest pieces of French pulpit eloquence. He is also supposed, conjointly with l'Abbé de Boismonet, to be the author of a work entitled 'Lettres sur l'Etat actuel de la Religion et du Clergé de France.'

MAWMOISINE, or MALVOISINE, WILLIAM DE, was bred in France, and has been thought by some to have been a native Frenchman. He afterwards came to Scotland, where he was made one of the *clerici regis*, and archdeacon of St. Andrews, in which latter capacity he was present at the baptism of Prince Alexander, afterwards King Alexander II. He was made chancellor of Scotland in August 1199, about which time also he was elected bishop of Glasgow, and consecrated the following year by special precept from the pope. (Fordun, viii. 61.) In the year 1202 he was translated to the see of St. Andrews, when he seems to have resigned the office of chancellor. In September 1208, he dedicated a new cemetery at Dryburgh Abbey. (Chalm., 'Caled.,' ii. 339.) He afterwards made a visit to the Continent; and having returned, we find him and the bishop of Glasgow, in 1211, possessed of legatine powers from Rome, and assembling at Perth a great council of the clergy and people, to press upon the nation the pope's will and command that an expedition be undertaken to the Holy Land. In 1214 he attended the coronation of King Alexander II., and is said to have set the crown upon the king's head. The next year he went with the bishops of Glasgow and Moray and the mitred abbot of Kelso to the Fourth Lateran Council, where the doctrines of Wycliffe were condemned; and he seems to have remained abroad till 1218. From the Continent he brought with him into this country various orders of monks and mendicants, till then unknown here, and had convents of Black Friars erected at Aberdeen, Ayr, Berwick, Edinburgh, Elgin, Inverness, Montrose, Perth, and Stirling, and monasteries for the monks of Valliscaulium at Pluscardine, Beaulieu, and Ardochattan. He wrote lives of the popish saints Ninian and Kentigern. It was to him and in his time that Pope Innocent III. sent the decretal letters which we find in the 'Corpus Juris Canonici,' to the king of Scots, and to the bishop, archdeacon, and abbot of St. Andrews, respectively. But zeal for the church was by no means this prelate's only passion; for we find that on one occasion, noticed by Fordun (viii. 62), he deprived Dunfermline Abbey of the presentation to two churches, because the monks had failed to provide him wine for supper. Fordun adds that the monks had indeed supplied wine, but the bishop's own attendants had drunk it all up. He continued bishop of St. Andrews till his death (Keith, 'Bishops'), which happened on the 9th of July 1238 (Chalm., 'Caled.,' iii. 616); and he is remembered in a composition respecting tithes, 1297 (Connell, 'On Tithes,' ii. 413).

MAXENTIUS, MARCUS AURELIUS VALERIUS, son of Maximianus, the colleague of Diocletian in the empire, was living in obscurity when, after his father's abdication, and the elevation of Constantine to the rank of Cæsar, he became envious of the latter, and dissatisfied with the neglect of Galerius towards him. Accordingly he stirred up a revolt among the prætorian soldiers at Rome, and was proclaimed emperor, A.D. 306. Galerius, who was then in the East, sent orders to Severus Cæsar, who had the command of Italy, to march from Milan to Rome with all his forces, and put down the insurrection. In the mean time Maximianus, who lived in retirement in Campania, proceeded to Rome, and was proclaimed emperor as colleague with his son, in 307. Severus, on arriving with his troops near Rome, was deserted by most of his officers and soldiers, who had formerly served

under Maximianus, and were still attached to their old general. Upon this he retired to Ravenna, which he soon after surrendered to Maximianus, on being promised his life and liberty; but Maximianus put him to death. Maximianus proceeded to Gaul to form an alliance with Constantinus, leaving Maxentius at Rome. Galerius soon after arrived in Italy with an army; but not finding himself strong enough to attack Maxentius in Rome, and fearing the same fate as that of Severus, he made a precipitate retreat. Maximianus, returning to Rome, reigned for some months together with his son, but afterwards quarrelled with him, and took refuge with Galerius, who acknowledged him as emperor. There were then no less than six emperors, Galerius, Maximianus, Constantinus, Maxentius, Licinius, and Maximinus Daz. In the following year, 309, Maxentius was proclaimed consul at Rome, together with his son, M. Aurelius Romulus, who in the next year was accidentally drowned in the Tiber. Maxentius possessed Italy and Africa; but Africa revolted, and the soldiers proclaimed as emperor an adventurer of the name of Alexander, who reigned at Carthage for three years. In the year 311 Maxentius sent an expedition to Africa, defeated and killed Alexander, and burnt Carthage. Proud of this success, for which he had the honour of a triumph, Maxentius made great preparations to attack Constantine, with whom he had till then preserved the appearance of friendship. Constantine moved from Gaul into Italy, advanced to Rome, and defeated Maxentius, who was drowned in attempting to swim his horse across the Tiber, in 312. [CONSTANTINUS; FLAVIUS VALERIUS.]

Coin of Maxentius.  
British Museum. Actual size. Gold.

MAXIMIANUS, GALERIUS VALERIUS, was surnamed Armenianus, on account of having been a herdsman in his youth. The events of his life are narrated under DIOCLETIAN, CONSTANTINUS I., and CONSTANTINUS. According to the historians, he died (A.D. 311) of a loathsome disease, which was considered by his contemporaries and himself as a punishment from heaven for his persecution of the Christians.

Coin of Galerius Valerius Maximianus.  
British Museum. Actual size.

MAXIMIANUS, MARCUS VALERIUS, a native of Pannonia born of obscure parents, served in the Roman armies with distinction, and was named by Diocletian his colleague in the empire, A.D. 286. The remainder of his life is given under DIOCLETIAN, CONSTANTINUS, and MAXENTIUS. He was put to death at Marseilles, by order of Constantine, for having conspired against his life, in 310.

Coins of Marcus Valerius Maximianus.  
British Museum. Actual size.

MAXIMILIAN. [HABSBURG, HOUSE OF.]  
MAXIMINUS, CAIUS JULIUS VERUS, was originally a Thracian shepherd. He was of gigantic size and great bodily strength. He entered the Roman army under Septimius Severus, and was rapidly advanced for his bravery. Alexander Severus gave him the command of a new legion raised in Pannonia, at the head of which he followed Alexander in his campaign against the Germans, when the army being

encamped on the banks of the Rhine, he conspired against his sovereign, and induced some of his companions to murder him in his tent, as well as his mother *Mammaea*, A.D. 235.

Maximinus, being proclaimed emperor, named his son, also called Maximinus, Cæsar and his colleague in the empire. He continued the war against the Germans, and devastated a large tract of country beyond the Rhine, after which he repaired to Illyricum to fight the Dacians and Sarmatians. But his cruelty and rapacity roused enemies against him in various parts of the empire. The province of Africa revolted, and proclaimed Gordianus, who was soon after acknowledged by the senate and the people of Rome, A.D. 237.

But Capellianus, governor of Mauritania for Maximinus, defeated Gordianus and his son, who fell in the struggle, after a nominal reign of little more than a month. [GORDIANUS, MARCUS ANTONIUS AFRICANUS.] Rome was in consternation at the news, expecting the vengeance of Maximinus. The senate proclaimed emperors Clodius Pupienus Maximus and Decimus Cælius Balbinus, but the people insisted upon a nephew of the younger Gordianus, a boy twelve years of age, being associated with them. Maximus marched out of Rome with troops to oppose Maximinus, who had crossed the Isonzo and laid siege to Aquileia. Maximinus experienced a brave resistance from the garrison and people of that city, which excited still more his natural cruelty, and the soldiers, being weary of him, mutinied, and killed both him and his son, in 238. Maximinus the father, then sixty-five years old, was a ferocious soldier and nothing else, and wonderful tales are related of his voracity, and the quantity of food and drink that he swallowed daily. His son is said to have been a handsome but arrogant youth. (Capitolinus, in 'Historia Augusta.')

Coin of Maximinus.

British Museum. Actual size. Copper.

MAXIMINUS, DAIA, or DAZA, an Illyrian peasant, served in the Roman armies, and was raised by Galerius, who was his relative, to the rank of military tribune, and lastly to the dignity of Cæsar, A.D. 305, at the time of the abdication of Diocletian and Maximianus, when he had for his share the government of Syria and Egypt. After the death of Galerius, in 311, Maximinus and Licinius divided his dominions between them, and Maximinus obtained the whole of the Asiatic provinces. Both he and Licinius behaved ungratefully towards the family of Galerius, their common benefactor. Valeria, the daughter of Diocletian and widow of Galerius, having escaped from Licinius into the dominions of Maximinus, the latter offered to marry her, and on her refusal banished her with her mother into the deserts of Syria. He persecuted the Christians and made war against the Armenians. A new war having broken out between Licinius and Maximinus, the latter advanced as far as Adrianople, but was defeated, fled into Asia, and died of poison at Tarsus in 313.

Coin of Maximinus.

British Museum. Actual size.

MAXIMUS, C. P. [BALBINUS, D. C.]

MAXIMUS MAGNUS was a native of Spain, or, as some think, though much probably, of Britain. He accompanied Theodosius several of his expeditions, and was with him, in the capacity of general, in Britain in 368, and remained there several years. Whilst there he is said to have married Helena, daughter of a wealthy British noble of Caersegont (Caernarvon), in Wales, but this is very doubtful. The measures of Gratian having excited discontent among the soldiery, the army in Britain revolted, and proclaimed Maximus emperor, A.D. 383. He immediately proceeded to Gaul, whither Gratian advanced to meet him, but being deserted by most of his troops, he was easily defeated by the usurper near Paris, and forced to fly. He was, however, overtaken at Lyon, and put to death; and Maximus was acknowledged as emperor throughout Gaul, Spain, and Britain, and recognised as sole emperor of those provinces by Theodosius and Valentinian. But Maximus having determined on crossing Italy also, crossed the Alps, and compelled Valentinian to

100. DIV. VOL. IV.

take flight, in 387. Theodosius however now came with all the force he could muster to the aid of his colleague. The troops of Maximus were unable to oppose any successful resistance, and the emperor was driven to take refuge in Aquileia. Thither Theodosius followed him and stormed the city. Maximus was taken, loaded with chains, and carried before Theodosius, who, after reproaching him for his ambition, ordered him to be beheaded, August 388. [GRATIANUS; THEODOSIUS.]

Coin of Maximus Magnus.

British Museum. Actual size. Gold.

MAXIMUS, PLANUDES. [PLANUDES MAXIMUS.]

MAXIMUS, RUTILIUS, a Roman jurist, whose period is uncertain, but he probably wrote under Severus and Caracalla. The only work of his mentioned in the Florentine Index is 'Ad Legem Falcidiam,' or a commentary on the Lex Falcidia. ('Dig.' 30, s. 125). There is one excerpt from Maximus in the Digest.

Q. CORNELIUS MAXIMUS, a contemporary of Cicero, was the master of C. Trebatius Testa, the friend of Cicero and Horace (Cicero, 'Ad Diversos,' vii. 8, 17; 'Dig.' 1, tit. 2, s. 2, s. 45). There is no excerpt from his writings in the Digest, but he is once cited by Alfenus Varus ('Dig.' 33, tit. 7, s. 16), who prefers his opinion to that of Servius on the question that if a vinea (vineyard) was bequeathed with the "instrumentum," the word "instrumentum" comprised the rakes, spades, poles, and stakes.

MAXIMUS TYRIUS, a rhetorician and Platonic philosopher, lived in the latter half of the 2nd century, during the reigns of the Antonines and of Commodus. He resided principally at Athens, but sometimes visited Rome: he does not seem to be the same person as the stoic Claudius Maximus, who was one of the philosophical friends of the Emperor M. Aurelius, though some critics have been of this opinion. ('Life of Aurelius,' by J. Capitolinus, c. 3.)

There are extant forty-one dissertations (*διαλέξεις* or *λόγοι*) of Maximus Tyrius on various points connected with the Platonic philosophy, which are written in an easy and pleasing style, and more commendable for the expression than the matter. The following examples will give some idea of the subject of these dissertations:—'On Plato's opinion respecting the Deity;' 'Whether we ought to return Injuries done to us;' 'Whether an Active or a Contemplative Life is to be preferred;' 'Whether Soldiers or Husbandmen are more useful in a State;' 'On the Dæmonium of Socrates;' 'Whether Prayers should be addressed to the Deity,' &c.

The best editions of Maximus Tyrius are by Stephanus, Paris, 1557; by Heinsius, Leyden, 1607, 1614, reprinted at Oxford, 1677; by Davis, Cambridge, 1703, reprinted at London with notes by Markland, 1740. The dissertations have been translated into French by Morel, Paris, 1607, by Forney, 1764, and by Dounais, 1802; into Italian by Petro de Bardì, Venice, 1642; and into German by C. T. Damm, Berlin, 1764. There is, we believe, no English translation of this author.

There were several other ancient writers of the name of Maximus, of whom the most celebrated was Maximus of Ephesus, who initiated Julian into the Eleusinian mysteries, and had subsequently great influence in the councils of that emperor.

MAXIMUS, THE GREEK, a celebrated personage in Russian church history, was a native of Arta in Albania, where he was born towards the end of the 15th century. After studying at Paris, Florence, and other cities then distinguished as seats of learning, he entered the cloister of Mount Athos, where he took the monastic vows; but the Grand Duke Vassili Ivanovich, having desired the Patriarch of Constantinople to send two persons to arrange and describe a vast number of Greek manuscripts and books that had recently been discovered in some part of the palace, the choice fell upon Maximus for one of them. He accordingly set out for Moscow, and was astonished to meet with such a prodigious store of Greek literature. He was directed by Vassili to examine the books, and to select such as were most deserving of translation; but as he was then wholly ignorant of the Slavonic tongue, he had first to prepare a Latin version, which was afterwards rendered by others into Slavonian. It was thus that the translations of a Psalter with a commentary, and Chrysostom's 'Homilies on St. John,' were produced. Desirous of returning to his convent, it was only at the instances of the Tzar, who wished him to revise the earlier translated books of the Greek Church, that he remained and undertook that task, for which he was then qualified by having obtained in the interim a competent knowledge of Slavonian. The diligence with which he executed it tended however only to raise up numerous enemies against him, among the rest Daniel, the metropolitan; for the corrections he deemed it requisite to make were so numerous as to give great offence to the more zealous. What more immediately tended to his disgrace

M

was the firmness with which he opposed Vassili's divorce from his first wife Salome (on account of barrenness), and his marriage with the Princess Helena Gliniski. He was condemned by a synod, excommunicated as a heretic, and imprisoned in the Otrotch monastery at Tver, in 1525. In this confinement he was treated with great rigour till the death of the metropolitan Daniel; after which the Bishop of Tver interceded for him, and obtained some mitigation of the severity used towards him. At length the next Tzar, Ivan Vassilivich, consented to his being removed to the monastery of St. Sergius, where he continued until his death in 1556. A great number of works are extant by him (chiefly in manuscript) on a variety of subjects, dogmatical, polemical, philosophical, &c.; from which considerable information has been derived with regard to the opinions and prejudices of the clergy and people in that age; nor was he at all timid in reproving the abuses and vices of the times. This alone would account for the persecution which he drew down upon himself; but after his death even those who had been among the more violent against him admitted his innocence, nor was it long before his memory came to be regarded as that of a holy man and a martyr.

MAXWELL, ROBERT, LORD, son of John, third Lord Maxwell, who was killed at Flodden, in September 1514. He had been knighted, and appointed Stewart of Annandale, on the resignation of his father, on the 10th of June preceding; and in 1517 he was appointed warden of the West Marches. In 1524 he was provost of Edinburgh, and in that capacity chosen one of the lords of articles for the commissioners of boroughs: a solitary instance, it is supposed, of a peer being so elected. He was afterwards chosen one of the privy-council; and on the 17th of November 1533, appears in the sederunts of the Court of Session as an extraordinary lord of session. In 1536 he was appointed one of the lords of the regency to whom the government of the kingdom was intrusted during the absence of King James V. on his matrimonial expedition to France; and the next year he was himself despatched to negotiate the marriage of Mary of Lorraine. He is said to have advised the expedition which terminated at Solway Moss, but was so incensed at the command of the army being given to Oliver Sinclair, that in common with most of the Scots nobility he mutinied and yielded himself up a prisoner to the English, who had a force much inferior to their opponents. On the death of King James V. he was ransomed and allowed to return to Scotland, in the hope that he would further the projects of King Henry VIII., in reference to the marriage of the young Queen of Scots. In the first parliament of Mary, which met in March 1543, he presented to the lords of articles one of the most important acts of the time, which had undoubtedly considerable effect in accelerating the progress of the Reformation. This was a writing, or as we should now term it, a 'Bill,' for an act of parliament to allow the reading of the Scriptures in the vulgar tongue. The lords of articles found the proposal reasonable; and it was accordingly brought into parliament, and passed into a law notwithstanding the protest and opposition of the lord chancellor and the whole hierarchy of the kingdom. Towards the end of the same year, Beaton became chancellor, and Lord Maxwell was apprehended, but he contrived to make his escape almost immediately after. He died on the 9th of July 1546.

MAY, THOMAS, an early English dramatist and historian, was born in 1595. He was the son of Sir Thomas May, who was descended from an ancient family in the county of Sussex. Having finished his education at Sidney-Sussex College, Cambridge, he came to London, adopted the law as his profession, and made the acquaintance of several persons of distinction. In 1637 May was opposed to Sir William Davenant as candidate for the office of laureate, which the death of Ben Jonson had left vacant. Sir William was successful, and his success so exasperated May, that although hitherto a courtier, he became hostile to the king's party, and by the interest of Cromwell was made secretary of the parliament, of which he wrote a 'History.' On the 13th of November 1650 he was found dead in his bed. It is supposed that he was strangled by the tightness of his nightcap strings; but Marvel intimates that it was from the effects of drinking. He was buried in Westminster Abbey; but his body was taken up after the Restoration, and removed to a large pit in the churchyard of St. Margaret's, Westminster, and his monument in the abbey pulled down.

Besides a history of parliament, he wrote a 'Description in Verse of Henry II.,' and a prose 'Short Survey of the Changes of the Reign of Henry II., with the Character of Henry and Richard, his sons;' a poem entitled 'The Victorious Reign of Edward III.:' and a translation of Lucan's 'Pharsalia,' with a continuation both in Latin and English translations of Virgil's 'Georgics,' and 'Selected Epigrams of Martial.' His plays are supposed by some to be five in number, and these five are named 'Agrippina,' 'Antigone,' 'Cleopatra,' 'The Heir,' and 'The Old Couple.' The last two are comedies, and are printed in Dodsley's Collection. 'The History of the Parliament' was reprinted with a Preface by Baron Masères.

MAYER, SIMONE, was born in Bavaria (at Sandersdorf, in 1760, according to Gerber; at Mendorf, in 1763, as stated by Lichtenthal). He was sent at an early age to study music in Italy, in which country he passed the greater portion of his life. In 1799 appeared his first distinguished opera, now known under the title of 'Il Fanatico per la Musica.' In 1802 he was chosen as Maestro di Capella to the church

of Maria Maggiore in Bergamo. In the same year he produced his 'Misteri Eleusini,' which on the Continent has always been considered a work of the first class, though we believe it never reached this country. It is supposed to have prepared the way for the reception of Mozart's compositions in Italy, by the introduction of richer harmony and fuller and bolder accompaniments. In 1803 he brought out at Vienna 'L'Equivooco,' an opera buffa; and in the same year 'La Ginevra di Scozia,' founded on the episode of Ariodante in the 'Orlando Furioso,' which yet is occasionally placed on the Italian lyric stage. So indeed are his 'Lodojiska,' 'Aleramo ed Adelasia,' and 'La Rosa Bianca, e la Rosa Rossa,' the subject of the latter from the history of our wars of the Red and White Roses. But the greatness of his conceptions, and the most striking proof of the energy of his mind, are evidenced in his serious opera, 'Medea,' first made known in London by Madame Pasta, whose personation of the Sorceress of Colohis was by all acknowledged to be one of the finest histrionic efforts that any stage in any country had exhibited, and who did it less justice to the vigorous music of the composer than to the classical taste of the poet, Signor Rosetti, who built his drama on the foundations laid by Euripides and Corneille. The bold determination of Mayer (and also of Paer) to draw more effects from the orchestra—give to his compositions a higher colouring, as well as deeper contrast of light and shade, than had been allowed by the Italian school—was at first with much opposition from the sturdy non-progressives, and, through their influence, from the public generally; but its enlarged powers of the art thus obtained soon became apparent, and overcame all resistance. Mayer died in Italy, December 2, 1845.

MAYER, TOBIAS, was born at Marbach, a town of Württemberg, on the 17th of February 1723. His father was a civil engineer, and held the appointment of inspector of the water-works (inspecteur des eaux) at Esslingen. From him young Mayer received some elementary instruction in the mathematics, but it could not have been much, since we read that he was left an orphan and unprovided for at a very early age. To gain a livelihood he began teaching the mathematics, and at the age of twenty he studied the principles of gunnery, probably with a view of entering the army. In the year 1746 he took an active part in the establishment of the Cosmographical Society at Nürnberg, to whose 'Transactions' he afterwards contributed several interesting memoirs. Among these is one, published in 1750, 'On the Libration of the Moon,' in which, besides treating the subject in a very able manner, he then for the first time employed "equations of condition," which are now of such extensive and important application. In 1751 he became director of the observatory at Göttingen, and at the same time or subsequently was appointed professor of astronomy in that university, which appointment was probably a sinecure, since it does not appear that he ever taught any subject but the mathematics and their application. At Göttingen, during the remainder of a very short life, he laboured with the most praiseworthy zeal to promote the sciences of geography, navigation, and astronomy. His 'Zodiacal Catalogue' was "deserving of all confidence" (Delambre) and comprised 998 stars, including those whose correct positions are of most importance to the astronomer. In 1755 he published his 'Lunar Tables' in the 'Acts of the Academy of Göttingen,' and a copy of them was forwarded to the London Board of Longitude. In order of the board the accuracy of the tables was rigorously tested by Dr. Bradley, who was able in no instance to detect an error greater than 1' 30" (the error of the other tables then existing sometimes amounted to 10'), and even part of this he was of opinion might fairly be attributed to his own observations. (See Dr. Bradley's 'Letter to the Secretary of the Admiralty,' dated 10th of February 1757.) These tables were printed by the Board of Longitude in the year 1757, and likewise the 'Solar Tables' by the same author in the year 1758. After the death of Mayer the British parliament, at the recommendation of the Board, paid his widow the sum of 3000*l.* The original resolution of the Board, dated 9th of February 1765, recomended that a sum "not exceeding 5000*l.*" should be awarded; and Delambre states that a further sum of 2000*l.* was subsequently paid; but this is a mistake. The act of parliament awarding the 3000*l.* is that of 5 Geo. III., c. 20; and the later acts relating to the Board of Longitude make no further mention of Mayer's widow. To Mayer is also due the discovery of the principle of the repeating circle, which was afterwards so fully developed by Borda, and employed by him in the measurement of the arc of the meridian. [BORDA, vol. i., col. 55.] Mayer died at Göttingen on the 20th of February 1762. His grave was spoken by Kaestner (Gött., 4to, 1762). In 1801 a simple monument was erected to his memory at Göttingen, the place of his interment.

The following list of his published works is given by M. Delambre from the 'Eloge' of Mayer by Kaestner:—'Description of a new Globe of the Moon' (Nürnberg, 1750); 'Terrestrial Refractions;' 'Geographical Maps;' 'Description of a new Micrometer;' 'Observations of the Solar Eclipse of 1748;' 'Conjunctions of the Moon and Stars observed in 1747-48;' 'Proofs that the Moon has no Atmosphere;' 'Motion of the Earth explained by a Change in the Direction of Gravity;' 'Determination of the Latitude of Nürnberg, with other Astronomical Observations;' 'Memoir on the Parallax of the Moon, and upon the Distance of that Satellite from the Earth, as deduced from the Length of the Second Pendulum;' 'On the Transformation of Rectilinear Figures into Triangles;' 'Inclination and

Declination of the Magnetic Needle as deduced from Theory; 'On the Inequalities of Jupiter.' In addition to the above there appeared at Göttingen, in 1775, in folio, edited by George Lichtenberg, his successor at the observatory of Göttingen, the first volume of what was intended to be a complete edition of Mayer's works. This, which is the only volume that has been published, consists of six memoirs entitled, 1, 'A Method of determining more correctly the Variations of the Thermometer: a Formula for determining the mean Temperature of Different Latitudes, and the Period of the Year corresponding to the greatest Intensity of Heat and Cold;' 2, 'Observations made with his mural Quadrant of six feet radius;' 3, 'An easy Method of calculating the Eclipses of the Sun;' 4, 'A Memoir on the Affinity of Colours,' wherein he recognises but three primitive colours, 5, his 'New Catalogue of Stars;' 6, 'A List of Eighty Stars,' in which he believed he had detected a motion, in addition to that resulting from the precession of the equinoxes.

('Notice of the Life of Mayer,' by M. Delambre, in the *Biog. Univ.*; Hutton, *Mathematical Dictionary*; and Montucla, *Hist. des. Math.*)

\*MAYHEW, HENRY, was born November 25, 1812, in London, where his father was a solicitor in good practice. He was sent for education to Westminster School, where he continued some time, but did not take kindly to the discipline, twice ran away, and before he had completed his course of study was placed on board a ship-of-war, in which he made a voyage to Calcutta. On his return to England he was articled to his father, in whose office he remained three years. He afterwards rusticated for a time in Wales, but, returning to London, commenced the course of literary occupation in which he has since been uninterruptedly employed. He assisted in starting the periodical called 'Figaro in London,' and in partnership with the late Mr. Gilbert A'Beckett, who had been his school-fellow at Westminster, took the Queen's Theatre, near Tottenham Court Road, where he brought out his farce of 'The Wandering Minstrel.' This speculation was entered into without capital, and terminated without profit. In 1841 he was the principal agent in the establishment of the well-known periodical, 'Punch,' of which he was for some years the editor, but retired from it in consequence of a difference with the proprietors. He was also the editor of the 'Comic Almanac,' and has since been employed not only in contributing largely to magazines and other periodicals, but has published several works in his own name.

In 1842 Mr. Mayhew published 'What to teach, and how to teach it,' a small treatise on education, in which he argues vigorously against the system of teaching usually adopted in schools, and against all task-work, flogging, and prizes, contending that the pupil ought to be induced to pursue his studies by the delight which the mind naturally experiences from the acquisition of knowledge; and that the teacher should communicate the information himself, rather than oblige the scholar to acquire it from books. Under the influence of this train of reasoning he perhaps recommends a system not generally practicable, but the work contains truths and suggestions worthy the attention of parents as well as professional teachers. During the period from 1846 to 1850 there were published several works 'By the Brothers Mayhew,' illustrated by George Cruikshank, in the composition of which perhaps Henry Mayhew had some share, but which were probably for the most part the productions of two of his brothers, Augustus and Horace. They are of a humorous character, but are coarse, broadly farcical, generally overcharged with modern slang, and containing little of the true imitation of either life or nature. The principal of these joint productions are the following:—'The Good Genius that turned Everything into Gold, or the Queen Bee and the Magic Dress, a Christmas Fairy Tale,' 1846; 'The Greatest Plague of Life, or the Adventures of a Lady in Search of a Servant,' 1847; 'Whom to Marry and how to get Married, or the Adventures of a Lady in Search of a Good Husband,' 1848; 'The Image of his Father, or One Boy is more Trouble than a Dozen Girls, being a Tale of a Young Monkey,' 1848; 'The Magic of Kindness, or the Wondrous Story of the Good Huan,' 1849. Another brother, Edward Mayhew, besides contributing perhaps to the above works and to magazines and newspapers, has published some works on the management and medical treatment of cattle, horses, and dogs. About the time of the opening of the Great Exhibition of Industry, Mr. Henry Mayhew published in his own name, '1851, or the Adventures of Mr. and Mrs. Sandboys and Family, who came up to London to enjoy themselves, and to see the Great Exhibition,' illustrated by George Cruikshank.

Mr. Henry Mayhew's most important work is 'London Labour and the London Poor, a Cyclopedia of the Condition and Earnings of those that will work, those that cannot work, and those that will not work,' 2 vols. 8vo, 1851, &c. This work is incomplete, and has been suspended, in consequence, as Mr. Mayhew states, of its having been thrown into the Court of Chancery, owing to the claims of contending parties arising from matters over which the author had no control. This work originated in a series of inquiries into the condition of the poor of London, the results of which were published in the 'Morning Chronicle' in the form of letters. The sketches of the condition and characters of the poorest classes of London were highly effective, and excited much attention; but a suspicion gradually arose that the accounts were exaggerated, and had been overcharged for the sake of effect. In one of the series an attack was made on the Ragged Schools, which could not afterwards be substantiated, and thus some

degree of discredit was thrown over the whole. Still the work contains a vast amount of information obtained from the people themselves, at the same time that it exhibits the condition of their homes and families from personal observation. Mr. Mayhew had several assistants in his labours of investigation. He mentions particularly Mr. Henry Wood and Mr. Richard Knight (late of the City Mission). While he was engaged in this work he published anonymously 'The Mormons, or Latter-Day Saints, a Contemporary History,' cr. 8vo, 1852. During the interruption of the 'London Labour and London Poor,' Mr. Mayhew published two educational works, written in a narrative form, for boys in humble life, and intended partly for their instruction, but chiefly perhaps as a stimulus to self-education. The first of these is 'The Story of the Peasant-Boy Philosopher' (founded on the life of James Ferguson), 18mo, 1854, and treats of the mechanical powers, the construction of a clock and watch, and so much of astronomy as relates to the measurement of time by the motions of the earth and moon, the observation of the stars, &c. The other work is 'The Wonders of Science' (founded on the life of Humphry Davy), 18mo, 1855, and treats of the diffusion of heat, the effects of heat, the safety-lamp, the refraction of light, the reflection of light, and photography. Both the works are copiously illustrated by woodcuts and diagrams. The work on which Mr. Mayhew is at present engaged (December 1856) is 'The Great World of London,' 8vo. The nine numbers already published consist of a brief topographical sketch, and of a full description of the prisons of London and its suburbs, illustrated by wood-engravings. The materials have obviously been derived from actual inspection and careful personal investigation. The work, if completed upon its present scale, must occupy several volumes. In the spring of this year Mr. Mayhew issued a prospectus of an association for the reformation of criminals, and held two or three meetings, which were attended by that class of persons, some of whom detailed their experiences. The machinery of the proposed association was to consist of a home for prisoners after their discharge from jail, a bank for deposits or loans, a school for instruction, &c. We have not seen any notice of the actual establishment of this benevolent institution.

MAYNE, JASPER, was born in 1604, in Devonshire. After having continued at Westminster School till nineteen years old, he was entered as a servitor of Christchurch, Oxford; and in 1631 he commenced M.A. Taking holy orders, he became a popular preacher; and, being presented by his college to two livings in the neighbourhood, continued to reside in the university. He was created D.D. in 1646. Firmly devoted to the royal cause, he was deprived of his student's place in 1648, and soon lost both of his vicarages. But his spirit was unbroken; and in 1652 he held a public disputation with a noted Anabaptist preacher. Afterwards he resided, till the Restoration, as chaplain in the family of the Earl of Devonshire. In 1660 he was restored to his livings; he then became chaplain in ordinary to the king, a canon of Christchurch, and archdeacon of Chichester. He died at Oxford in 1672, and was buried in the aisle adjoining to the choir of Christchurch. Dr. Mayne published, in 1662, a translation of a part of Lucian's 'Dialogues;' and also several sermons and scattered poems. But he is now remembered only through the humour which marked his conversation, and which gave birth to two plays of his: 1, 'The City Match, a Comedy,' folio, 1639; 4to, 1658; 8vo, 1659; and in the ninth volume of Dodaley's 'Old Plays;' a work considerably more amusing than decorous, and especially lively in its satire on the Puritans; 2, 'The Amorous Warre, a tragic-comedy,' 4to, 1648.

MAYO, HERBERT, M.D., a distinguished medical writer, whose works on physiology, although now to some extent superseded, were in considerable advance of his time. The first, by which he made himself known was, 'Anatomical and Physical Commentaries,' published in 8vo in 1822; followed by a smaller work in 12mo in 1825, 'A Course of Dissections for the Use of Students.' In 1827 he published in 8vo, 'Outlines of Human Physiology,' of which several editions have been published; and in the same year, in folio, 'A Series of Engravings intended to illustrate the Structure of the Brain and Spinal Cord in Man.' On the establishment of King's College he was appointed Professor of Anatomy and Physiology, which office he held till 1836, when he left in consequence of having become a candidate for a similar office at University College. In 1837 he issued 'The Philosophy of Living,' in 8vo and 12mo; and the 'Management of the Organs of Digestion,' in 12mo; in 1840, in 8vo, 'A Treatise on Syphilis;' and in 1842, 'The Nervous System and its Functions.' About this time he became a convert to the theory of mesmerism, and wrote many papers in the 'Medical Gazette,' strongly advocating his newly-adopted opinions. Subsequently he also adopted hydropathy. His practice as a medical man fell off, and he at length removed to Germany in order to follow his profession as a hydropathist. He settled at Bad-Weilbach, near Mainz, on the Rhine, and there died on August 15, 1852. The product of his later opinions was the 'Cold-Water Cure, its use and misuse examined,' published in 1842; and 'Letters on the Truths contained in Popular Superstitions,' issued at Frankfort in 1849, and re-issued in London in 1851, with 'An Account of Mesmerism.'

MAZARIN, JULES (properly MAZZARINO, GIULIO), the cardinal and celebrated minister of Louis XIV. of France, was descended from

a noble Sicilian family, and born on the 14th of July 1602, most probably at Pescina, near the Lake of Celano, in Abruzzo Citra, though in the letters of naturalisation granted him in France in 1639 it is stated that he was born at Rome. He was undoubtedly educated at Rome by the Jesuits, and at the age of seventeen went to Spain to study law in the universities of Alcalá and Salamanca. In 1622 he returned to Rome, and shortly afterwards entered the military service. In 1625 he had attained the rank of captain, and was serving in the army of Pope Urban VIII, in the Valtellina, where a religious war had been raging for some years. Mazarin's talents as a statesman were here first displayed: he was employed to negotiate with the French and Spanish generals; by his address he gained the confidence of both, and his labours led to the peace of Monçon in 1626. The war being ended, Mazarin resumed in Rome the study of jurisprudence. Shortly afterwards the contested succession to the duchy of Mantua, in which France supported the pretensions of the Count de Nevers; the Emperor of Germany, the King of Spain, and the Duke of Savoy, those of the Duke of Guastalla; led Pope Urban to fear another war in Italy. To prevent this, Cardinal Sacchetti was sent to Turin as a mediator, and Mazarin (who now received a Doctor's degree) was given him as an assistant. Sacchetti at once perceived his talent, gave him his entire confidence, and in fact devolved upon him the entire management of the negotiation. It was not immediately successful; for in 1629 Louis XIII. in person invaded Savoy, took Suza, and forced the Duke of Savoy to abandon his alliance with Spain. Sacchetti returned to Rome, leaving Mazarin, with the title of 'internuncio,' to continue the negotiations. Urban then sent his nephew, the Cardinal Barberini, to replace Sacchetti; and Barberini found Mazarin as indispensable as his predecessor had done. Mazarin laboured hard, though for some time ineffectually, to restore peace. He visited the contending powers; and in 1630 he first saw Louis XIII. and Cardinal Richelieu, who both formed a high opinion of him, and this visit proved the first step to his future eminence. In the following year (1631) he succeeded in effecting the treaty of Cherasco, by which peace was restored, but in which Mazarin displayed considerable trickery in favour of France. By this unfair partiality he acquired the hatred of the courts of Spain and Germany, and the thanks of Louis and Richelieu, who recommended "the able negotiator" to 'the favour of the pope. To enable him to receive the reward for his services, he a second time relinquished the sword for the gown, and had an office in the chancery of Rome conferred on him.

In 1634 he was named vice-legate to Avignon, but was sent to Paris as nuncio to intercede with Louis XIII. in favour of the Duke of Lorraine, of whose duchy Louis had taken possession. Mazarin, in this part of his mission, did not succeed; probably he was not very earnest in his supplications, for it is said he neglected no means of making himself agreeable to Louis and his powerful minister Richelieu. His efforts in this direction were far more fortunate. He returned to Rome in 1636 as the avowed supporter of French interests, and on the death of Richelieu's celebrated confidant Father Joseph, Pope Urban was solicited by Louis and his minister to bestow the cardinal's hat upon Mazarin which had been promised for father Joseph. Urban refused, and in 1639 Mazarin quitted Italy for France. In 1640 he was nominated ambassador to Savoy, where, after a short war, he was enabled to restore peace, and in 1641 he was at length raised to the rank of cardinal. Mazarin, in France, was a faithful and useful assistant to Richelieu, especially during the famous conspiracy headed by Henri de Cinq-Mars, which ended by his execution in Sept. 1642. This was Richelieu's last triumph. In the following December he died, recommending on his death-bed that Louis should receive Mazarin as his own successor. Louis was sufficiently predisposed in Mazarin's favour to accede to this wish. Mazarin as prime minister adopted a milder and more conciliatory line of conduct than Richelieu had done; and he released from their imprisonment Bassompierre and many other political victims. He also succeeded in inducing Louis XIII. to name a council of regency, to govern for his infant son in case of his decease, consisting of himself, the Duke of Orleans, the Prince of Condé, the Chancellor Séguier, and the secretaries of state, Bouthillier and Chavigny. Louis died on May 14, 1643.

From this period the history of Mazarin's life is that of the history of France; and will be found noticed under LOUIS XIV. One incident only need be further mentioned; the attachment formed by Louis XIV. for one of his nieces, Marie Mancini, the daughter of a Roman nobleman by Mazarin's sister. Louis, it is stated, was desirous of marrying her, but Mazarin prevented it, by sending her to Italy, and ultimately marrying her to Prince Colonna, a union which was not happy. The lady involved herself in some curious and romantic adventures in escaping from her husband, and made more than one attempt to revive the passions of Louis in her favour; but he had grown cold, refused even to see her, and she at last retired to a convent and took the veil. After governing France with great ability, and just as Louis XIV. was arriving at an age when he felt the capacity and desire for governing for himself, Mazarin died on March 9, 1661. In 1690 some letters, written by Mazarin during the negotiation of the peace of the Pyrenees, were published, additional letters were published in 1693, and in 1745 others were added, and the whole arranged under the title of 'Lettres du Cardinal Mazarin, où l'on voit le secret de négociation de la Paix des Pyrénées.' They

were written for the information and instruction of the young king, and form useful examples of clearness and precision in diplomatic writings.

MAZEPPA, Hetman (that is, commander-in-chief) of the Cossaks of the Ukraine, has become celebrated by a poem of Lord Byron, which has for its subject his extraordinary adventure. He was the son of a Polish gentleman in Podolia, and served for some time as a page at the court of King John Casimir (who reigned 1648-1655), where he acquired some education. On his return to his native province he carried on an intrigue with the wife of one of his neighbours. Being surprised by the offended husband, he was bound by his order, according to the current story, to one of those wild horses which roam in a half-savage state about the Ukraine, and the animal was turned loose. The frightened horse ran with his unwilling burden, till it reached the country of the Cossaks, where Mazeppa, who was in a senseless state, was released from his dangerous position. Being restored to health by the kind treatment of the Cossaks, he entered into their service, and rose by degrees to the rank of their supreme commander. The story however as related in the contemporary memoirs of Passak, which were some thirty years ago published in Polish, is to the effect that, Mazeppa was bound by the offended husband to the same horse on which he had come to pay his addresses to the wife. The horse, being let loose, carried its master back to his own house, and the shame which Mazeppa felt at having been exposed in such a manner induced him to leave his native land and retire among the Cossaks. Whatever may have been the reasons which induced Mazeppa to take that step, he soon distinguished himself by his bodily strength, great courage, natural abilities, and some acquirements, so that he became general-adjutant and secretary of Hetman Samoilowich, and after his death in 1637 was chosen to his place.

The Cossaks of the Ukraine, who were organised by King Stephen Batory (who died in 1586), rebelled against Poland in 1648, and being unable to maintain themselves as an independent nation, they submitted to the yoke of Muscovy in 1654, on condition that all their liberties and privileges should be preserved. But the Muscovites soon began to encroach on their liberties, and attempted to convert the Ukraine into a province and govern it like the other parts of their empire. Mazeppa, who was much in favour with Peter the Great, to whom he had rendered many eminent services, was strongly attached to the liberties of his adopted country, and is said to have made strong but useless representations against their violation. The victories of Charles XII. of Sweden induced Mazeppa, notwithstanding his great age, for he was then about seventy, to enter into a negotiation with him for the independence of the Ukraine, which Charles promised to establish if Mazeppa would join him with his forces. The negotiation was discovered by two colonels of the Cossak army, named Iskra and Kocubey, who reported it to Peter the Great. Peter was however so confident in Mazeppa's fidelity, that he gave up both the colonels as calumniators to Mazeppa, who ordered them to be beheaded.

According to his agreement with Mazeppa, Charles turned from the high road to Moscow, which he was pursuing, to the south, in order to join Mazeppa and spend the winter in the rich Ukraine, but the disasters which befell his army on a march during the severe winter of 1708-9, reduced it to a wretched condition; whilst the designs of Mazeppa being discovered, his capital, Baturin, was taken, after a desperate resistance, by the troops of Peter, and Mazeppa, being deserted by his army, joined Charles with an inconsiderable force. After the battle of Pultava he retired with Charles to the Turkish territory, where he died in September 1709.

\* MAZZINI, GUISEPPE, was born at Genoa in the year 1809. His father was an eminent medical practitioner in that city. Mazzini was the only son of his parents, and was educated with great care, both at home and at the public school and university of his native place. He chose the profession of the law; but, before he had well begun the practice of his profession, he had devoted himself, heart and soul, to a career very different from that which would have awaited him as a Genoese lawyer. About the year 1829-30, when Mazzini was twenty years of age, Italy was in its lowest state of political degradation—such portions of it as were not under the Austrians being under native despotism of the most absolute kind. In Tuscany alone was the government comparatively mild: the Piedmontese or Sardinian states, to which the territory of Genoa had been attached since 1615, were then (though now the case is altered) under a system of tyranny as abject as prevailed in Naples or in any other part of the peninsula. The reigning king was Charles-Felix (1821-31), and the condition of Piedmont under him was such that the Piedmontese were as well qualified as any other portion of the Italians to know the pains which all alike suffered. Nowhere, either, throughout the Sardinian states, was the discontent stronger than in Genoa, the people of which, having been so recently incorporated with the Sardinian kingdom, still cherished their ancient republican memories, and were in some other respects distinct in character from the Piedmontese. Accordingly, about the time in question, there was an unusually fervent aspiration after political liberty among the young men of Genoa. Above all, this aspiration incarnated itself in Mazzini. Of a character unusually enthusiastic, he became the centre of a circle of young

men of all professions, to whom he communicated his spirit and his zeal. At first, the ardent longing with which he was inspired and with which he inspired his friends, found vent in conversations about art and literature, and the past glories of Italy in both. The controversy between Classicism and Romanticism was then agitating intellectual Europe; and the friends were drawn to the side of Romanticism, and that with which all their aspirations corresponded. To give effect to their ideas, Mazzini established a literary journal in Genoa, and when that was suppressed by the police, another in Leghorn in the Tuscan states, where the censorship was more liberal. He wrote many papers on literature and art for these journals, all breathing his peculiar spirit, and though not formally political, yet clearly inculcating doctrines tending to revolution. But this was not enough. Though once or twice since 1815, insurrection had been attempted in Italy and had failed, the example of the successful revolt of the Greeks against the Turks was quoted again and again by Mazzini among his friends as a proof that, if duly organised beforehand, insurrection might succeed in Italy too.

What was necessary, he said, was a 'Heteria' or universal association in secret of patriotic souls, to prepare measures and watch for the right time of action. For awhile, it appeared to him and his friends that the requisite elements of such an association might be furnished by a revived form of the so-called Carbonarism—that is, that system of secret association which had sprung up among the Neapolitans when struggling twelve or fifteen years before with the restored Bourbons. Soon however they became disgusted with Carbonarism, as an effete and mean system, and resolved to originate an association on what they conceived to be purer and higher principles. The French Revolution of July 1830, striking an electric shock through Europe, gave new alacrity to their desire. In the midst of their hopes and consultations however, some hint of what they were scheming reached the Piedmontese government; and Mazzini was arrested. Nothing definite could be ascertained against him, and after a short imprisonment, he was released on the condition of leaving Italy (1831). Marseille became the place of his exile. Here however he was not idle. Clinging with unabated tenacity to his purpose of revolutionising Italy, and entering into relations with the numerous Italian refugees whom he found already in Marseille and in other parts of France, sheltered for the time by the new government of Louis-Philippe, he determined to act upon Italy even from his position as an exile. The rudiments of a new organisation were formed by him among the refugees, under the striking name of 'La Giovine Italia,' or 'Young Italy,'—a name also borne by a journal which he established in Marseille, copies of which were conveyed in great numbers, both overland, and by sea, into Italy. The main idea of this celebrated association—and it is the idea to which Mazzini has uncompromisingly adhered ever since, and which he has never ceased to propagate—was that "the freedom of Italy, both from domestic and from foreign tyranny, could only be attained by a union of all the separate states into one nation—Romans, Piedmontese, Tuscans, Neapolitans, Lombards, Venetians, &c.—all merging their separate interests in the one common name of Italians, and under this name forming a single powerful European nation." What should be the form of government of this united Italian nation, was to be determined by events; but Mazzini's own preference was for a Republic. Meanwhile, he urged, the only way in which the union could be effected, was by a general popular insurrection.

These views he communicated by correspondence to the friends he had left behind him at Genoa, urging them to prepare means for putting them in practice. Charles-Felix was no longer on the Sardinian throne; he had been succeeded by his distant relative, Charles-Albert (1831-49), who, though he had been connected with the Carbonari before his accession, gave no sign, when the government came into his own hands, of any intention to alter the policy which he had condemned. Accordingly, Mazzini's communications from Marseille were eagerly received, and led to extraordinary results. "After months of secret plotting, a conspiracy was organised which, from Genoa as a centre, spread through all Italy, from the Alps to the extremity of Sicily; and even the officers and soldiers of the Piedmontese and Neapolitan armies were concerned in it." According to every account the organisation was truly formidable. Before the moment fixed for the outburst however the conspiracy was discovered; the Piedmontese government took steps with the other governments for breaking it up; many of the chief agents were arrested and put to death or imprisoned; and others escaped and took refuge in France, Switzerland and Italy (1833).

From 1833 to 1848, was a period during which, with one or two exceptions, Mazzini's exertions in the cause to which he had devoted his life were confined to a propagandism of his ideas through the European press, and to a correspondence with Italy in order to repair and maintain the insurrectionary organisation which had been broken. Expelled from France, at the instance of the Piedmontese ambassador, by the government of Louis-Philippe, he and other Italian exiles moved into Switzerland, where they established journals in the cause of "Young Italy," and whence they made at least one attempt to throw insurrection into northern Italy. At length the Swiss government too was obliged, by threats from the menaced powers, to refuse them shelter; and, after persisting in remaining as long as he

could, Mazzini came over to London. Here he resided for a good many years, contributing articles, both political and scientific, to some of the leading English and French journals, and, though living in seclusion, known to many of the first men of the day. His correspondence however with Italy still continued; and the Mazzinian or "Young Italy" party still continued to exist in Italy and to look to him in his exile as their chief. In 1844 his name came prominently before the British public, in consequence of the discovery that his letters had been opened in the Post-office by the authority of the British Home Secretary, and that, in consequence of information thus derived and communicated to the Austrian government, the brothers Bandiera, who were then planning an insurrection in the Venetian states, lost their lives. The matter formed the subject of a vehement discussion in parliament.

After the French revolution of February 1848, Mazzini went over to Paris; and when the shock of that great event was responded to in Italy by the insurrection of Milan (March 1848), the evacuation of Lombardy by the Austrians, and the concession of constitutions by the native Italian princes, he was able once more to present himself in his native land. He appeared in Milan, and there, by his personal exertions, strove to give a direction to the Italian movement corresponding to the ideas which he had always preached. As all know however, the conduct of the great war into which all Italy then rushed for the utter expulsion of the Austrians, was undertaken by the Piedmontese King Charles-Albert, who sought this opportunity of at once blotting out the remembrance of former facts in his career by a heroic patriotism, and increasing his own dominions by the annexation of Lombardy. Mazzini has been accused of impeding the efforts of Charles-Albert in this enterprise by preventing the republican party from co-operating with him; and he has defended himself, as Manin has also done, by asserting that the jealousy was on Charles-Albert's side and not on that of the republican leaders, whose co-operation was rejected, but who were willing to give it, and to postpone all questions as to future political arrangements if Charles-Albert would have done the same. Suffice it to say that, from whatever cause, or complication of causes, Charles-Albert failed, and by the battle of Custoza (July 24, 1848) Radetzky once more restored Austrian domination in Lombardy.

By this time also the reaction had begun in other parts of Italy, more particularly in the Neapolitan kingdom; and in other parts of Europe the revolution was ebbing. Still the struggle was not over in Italy, and Mazzini remained there to do what he could to bring it to the issue he desired. After the return of the Austrians to Milan, and the other Lombard cities, he wandered about as a volunteer with Garibaldi, who, with his band, tried to protract the war. He made his way to Tuscany, where, at Florence and other places, he laboured to bring about a union between the Tuscans and the Romans. At length in February 1849 he, for the first time in his life, set his foot in Rome. The moment at which he arrived was one of the utmost importance. In November 1848 the pope had fled into the Neapolitan States, leaving Rome and the provinces without a regular government; he had refused to return; and the Roman Constitutional Parliament then sitting had resigned its functions and convened an assembly to be elected by universal suffrage, and to take the responsibility of the extraordinary crisis. This assembly, consisting of 150 members, had met on the 6th of February 1849; and on the 9th of February it passed two momentous decrees—one, carried with only five dissenting votes, abolishing for ever the temporal sovereignty of the pope in the Roman States; the other, carried with only eleven dissenting votes, constituting these states into a republic. These measures were passed before Mazzini's arrival in Rome; but as such a revolution accorded with the tenor of his ideas and breathed his spirit, it was natural that he should be received by the Romans with acclamations. He was elected to the assembly, and immediately became the acknowledged leader of the new republic. On the 30th of March Mazzini, Saffi, and Armellini were appointed a triumvirate, and charged with full powers for the defence of the republic against the coalition which the pope at Gaëta was forming against it. The main attack however came not from Austria, Spain, or Naples, but from France. The French expedition, under Oudinot, (fitted out by the government of Louis-Napoleon, then president, landed at Civita Vecchia on the 24th of April 1849. It was expected that the Romans would admit them into the city, and so surrender to the French government the right of restoring the pope under new arrangements; but the Romans and the triumvirs had prepared themselves to resist to the last. The French accordingly marched against Rome, and began the siege. For two months the Romans, who had only 14,000 regular troops in the city, maintained the defence with an obstinacy which raised the astonishment of Europe; besides at the same time repelling a Neapolitan invasion. Mazzini was the soul of this defence. At last, on the 3rd of July, after great part of the city was laid in ruins, the French entered it. They remained masters of it until April 1850, when the pope returned and re-established his rule under the protection of a French garrison left on purpose.

On the fall of Rome Mazzini returned to England, where he has chiefly resided since, publishing writings explanatory of the events of 1848-49, corresponding as before with Italy, and waiting for that new explosion which he has never ceased to expect, and which it is his aim, so far as means offer, to bring to pass as expeditiously as

possible. His ideas are to be read in detail in his numerous writings and proclamations. A collection of his chief writings, political and literary, has been published in Italian, and selections from them have been translated.

MAZZOLINI, LODOVICO, a celebrated painter of Ferrara, sometimes called Ludovico Ferrarese, was born about 1481. Mazzolini, like several other distinguished painters not Florentines, owing to the silence of Vasari regarding them, has only recently received his due meed of praise. His name is sometimes confounded with Massolino, a name given by Lomazzo to Parmigiano, as the diminutive of Mas-suoli, and Vasari has noticed him slightly under the name of Malini, whence, says Lanzi, he has been divided into two—Malini and Mazzolini, and treated as two distinct scholars of Lorenzo Costa, instead of one and the same; an error which is not corrected by Baruffaldi, the historian of the Ferrarese painters, who appears to have had very imperfect knowledge of him. Mazzolini was nevertheless, in pictures of small dimensions and small figures, one of the most successful of all the early Italian painters. His works are miniature altar-pieces, and are excellent in colour, light and shade, and expression; and even in composition they are equal to the best works of their style, the symmetrical. They are on the whole little inferior to the small works by Garofalo. Mazzolini generally painted architectural backgrounds, and these are remarkable for the beautiful detail of the ornaments and figures in basso-rilievo which are introduced into them. He died at Ferrara in 1580.

The works of Mazzolini are not numerous. There are several in the Capitol and in the Doria Gallery at Rome; four in the Gallery of Berlin, among which is a valuable large picture on wood, of 'Christ disputing with the Doctors.' There are two very characteristic works—both Holy Families—by this master in the National Gallery, and a small piece, 'The Woman taken in Adultery.' Besides these, there are very few authenticated works by this painter, many being, no doubt ascribed to other masters, especially to Gaudenzio Ferrari, as in the case with a beautiful Nativity, in the Florentine Gallery.

MAZZUOLI, FRANCESCO. [PARMIGIANO.]

MEAD, RICHARD, M.D., was born near London in 1678, and after studying in some of the most celebrated of the continental schools, took the degree of Doctor of Medicine at Padua in 1695. On his return to England, obtaining considerable reputation in his practice, he was appointed in 1708 physician to St. Thomas's Hospital, and in 1711 anatomical lecturer to Surgeons' Hall. He was also elected a Fellow of the Royal College of Physicians, and was physician to George II. On the death of his chief patron, the celebrated Dr. Radcliffe, Mead became the most renowned physician of the day, and was obliged to relinquish all his public offices. He employed the greater part of the wealth which he obtained from his practice, in the patronage of science and literature, and in collecting pictures, and a very valuable library, of which he bequeathed the greater part to the College of Physicians. He died February 16, 1754.

Mead's principal works are, 'A Mechanical account of Poisons,' London, 1702; 'De imperio solis et lunæ in corpora humana, et morbis inde oriundis,' 1704; 'A short Discourse concerning Pestilential Contagion,' 1720, which was written at the request of the secretary of state, in reference to the contagious nature of the plague then raging at Marseille, for the prevention of which Mead recommended the most rigorous measures of quarantine and disinfection; some papers on Grecian coins struck in honour of physicians, from which he inferred many interesting facts in the history of medicine, and on which he had a long discussion with Dr. Conyers Middleton; 'On the Scurvy,' 1749; this was published as an appendix to the account of the method of ventilating the holds of ships then lately invented by Sutton; 'On Small-pox and Measles,' 1748; containing a full account of inoculation, of which he had witnessed the first experiments in this country on some condemned prisoners; 'Medicina Sacra, seu de Morbis insignioribus qui in Bibliis memorantur,' 1748; 'Monita et Præcepta Medica,' 1751, containing a general summary of his medical experience. All these works, both individually and collectively, passed through several editions in this country, as well as in Germany, France, and Italy.

(*Authentic Memoirs of the Life of Richard Mead*, by Matthew Maty, M.D., 8vo, London, 1755.)

ME'CHAIN, PIERRE-FRANÇOIS-ANDRÉ, was born on the 16th of August 1774 at Laon, a town of France, in the present department of Aisne. After quitting the school 'Des Ponts et Chaussées,' where the limited means of his parent had enabled him to pursue his studies only for a short time, he engaged himself as mathematical tutor, and devoted his leisure to the cultivation of astronomy. Shortly after this an accident brought him under the notice and patronage of Lalande. The necessity of affording some pecuniary assistance to his father obliged Mechain to dispose of an astronomical instrument which by rigid economy he had recently been able to purchase. Lalande became the purchaser, and, after acquainting himself with the past history of Mechain, procured for him a government appointment as hydrographer, in which he was engaged in the construction of marine charts, and, jointly with M. Bretonnière, in the survey of the French coast between Nieuport and St. Malo. His attention however appears to have been chiefly directed to the theory of eclipses, and of comets, of which he discovered eleven, and computed the orbits of twenty-

four. To his memoir on the comet of 1582, which it was expected would re-appear in 1789 or 1790, the prize of the Academy of Sciences was awarded, and the same year (1782) he was admitted a member of that society. In 1791, the National Convention having determined upon employing the length of the arc of the meridian computed between Dunkirk and Barcelona as the basis of their new measure, the measurement of the southern portion of this arc, between Laon and Barcelona, was, at the recommendation of the Academy, confided to Mechain. The northern portion was allotted to M. Delambre, whose account of the entire survey ('Système Métrique,' 3 vols. Paris, 1806, 1807, 1810), containing many interesting particulars relative to Mechain, we refer the reader. It will be sufficient here to state that Mechain experienced his share of the difficulties and annoyances which have usually attended such operations, and that the break-out of the French revolution, which prevented his return from Spain, and the consequent anxiety for his family whom he had left behind, brought upon him a melancholy state of mind from which he never wholly recovered. His skill as an observer is particularly mentioned by Delambre, and also the accuracy of all his calculations connected with the survey. Of this Mechain himself was unconscious. He employed the repeating circle, an instrument which he regarded as absolutely infallible; and finding a difference of three seconds between his observations at Barcelona and Montjouy, he attributed it wholly to his own incapacity. Upon his return to Paris, which he reached with much personal risk, fearing to divulge this discrepancy, he refused to deliver his papers to the Academy. The subject continuing to press upon his mind, he applied, after several years, to the French board of longitude, and urged them to prolong the measurement of the arc from Barcelona to the Balearic Islands. To this the board consented, but being unwilling to dispense with his services at the Paris Observatory, they suggested that Mechain should not be the conductor of the survey. This however would have been to relinquish the chief object of his application. He obtained permission to depart, but after his arrival in Spain he was attacked by an epidemic disorder, of which he died on the 20th of September 1805 at Castellon, a town of Catalonia.

Before Mechain's departure, he entrusted all the manuscripts relating to his previous expedition to M. Delambre. They have since been arranged and deposited in the Paris Observatory, together with a much of his correspondence as related in any way to the survey.

Mechain's published works are few. They consist of papers printed in the 'Connaissance des Temps,' subsequently to 1785, in which year he succeeded Jaurat as editor of that ephemeris, and several memoirs in the 'Transactions' of the French Institute, commencing with the year 1782. These memoirs refer chiefly to the cometary theory of eclipses.

(Delambre, *Notice of the Life of Mechain*, in the *Biog. Univers. Hutton, Mathematical Dictionary*, &c.)

MECHITAR, or MEKHITAR, the founder of the order of Mechitarists, and by that means the reviver of Armenian literature, was born at Sebaste, a town of Armenia Minor, in 1676. His original name was Manug, which he changed to that of Mechitar, or 'Conscience' on entering into ecclesiastical orders. At the age of fifteen he became an inmate of the convent of the Holy Cross, near Sebaste; and a few years after, being made the secretary of the Archbishop Michael, who took him to Erzerum, he became acquainted with a fellow-country man who had travelled in Europe, who lent him an Armenian work by Galanus, an Italian missionary.—'On the Reconciliation of the Armenian Church with that of Rome,' published at Rome in 1691. Though Mechitar still continued professedly a member of the Armenian priesthood, he appears from this time to have become in secret proselyte to the Church of Rome; but the exact date of his passage over seems to have been unknown to all his biographers. He was anxious to make himself acquainted with the civilization of the west, and, though dissuaded by his friend Beauvilliers, a French Jesuit sent out for Italy, but, attacked by severe illness in the island of Cyprus, was compelled to return, begging his way as he went. In 1700, when a preacher at Constantinople, some dissensions between the patriarchs of two rival patriarchs divided the Armenian community into two hostile parties. Mechitar at first advised reconciliation, and afterwards to their surprise, preached submission to the Church of Rome, which roused such a storm against himself that he was obliged to claim the protection of the French ambassador, which was readily afforded.

From this time he appeared openly as a Roman Catholic. To escape from the animosity of his countrymen he still found it necessary to remove in disguise to Smyrna, and finally he settled at Modon in the Morea, under the protection of the Venetian government, to whom it then belonged. Already on the 8th of September 1701 he had founded at Constantinople a new religious community, in which ten other persons joined with him; at Modon on the 8th of September 1703 he took possession of an estate given him by the Venetians, to build a convent of the new order, which was called after his own name. The rules of the Mechitarists are modelled after those of the Benedictines, but every member must be of the Armenian nation, and be actively devoted to the cultivation of the Armenian language and literature. The result, it has been said, has been the formation not only of a convent but of an academy, and in fact the best schools for the study of Armenian are in the houses of the order. The conquest

of the Morea by the Turks drove Mechtitar to Venice, where he exerted his remarkable persuasive powers, and on the 8th of September 1717 the senate presented him with the little island of San Lazzaro, near the Lido, on which the convent was built from his designs which still attracts the attention of every visitor to Venice. From that time till his death on the 27th of April 1749 he was left in quiet to develop his plans, which have had up to our own times a widely beneficial influence on the literary state of the Armenian nation. In early life Mechtitar was noted for never parting with any book that came to his hands till he had perused it. When attacked by a disorder of the eyes that prevented him from reading, he caused some poetry to be read aloud to him, and committed it to memory. He was himself a somewhat voluminous author; he composed several hymns which are still sung in the Armenian churches, some poems, a few of which relate to his own adventures, a translation of Thomas à Kempis's 'Imitation of Christ,' and of St. Thomas Aquinas's 'Theology,' and above all, a Grammar and Dictionary of the Armenian language. The first volume of the dictionary appeared in 1749 the year of his death, the second in 1769, and the two contain more than three thousand quarto pages. The grammar, which is entirely in Armenian, was published in 1770. By these latter works he greatly contributed to improve the study of the literal Armenian, the ancient language of the country, which differs as much from the modern, or as it is called the vulgar Armenian usually spoken, as the ancient from the ordinary modern Greek.

Mechtitar is acknowledged even by his opponents of the Armenian Church to have revived the literature of his country from a state of lethargy. He not only contributed to this by his writings, but in a still more important degree by the establishment of a printing-press in his convent, for which he imported three different founts of Armenian types from Amsterdam, previously the most distinguished seat of Armenian typography in Europe. From the presses of San Lazzaro have issued a whole Armenian library, extending to some hundreds of volumes—the theological portion of which has a Roman Catholic circulation only, but the other portions have found a welcome from all classes in Armenia. A periodical, in imitation of the 'Penny Magazine' of the Society for the Diffusion of Useful Knowledge, is one of their publications which has had a marked success, and numerous translations from the European languages appear in the long catalogue of their stock. Among those from the English are to be found the 'Paradise Lost,' Young's 'Night Thoughts,' 'Robinson Crusoe,' and the ubiquitous 'Uncle Tom's Cabin.' Recently another society of Mechtitarists, also distinguished for literary activity, has been founded at Vienna, and a third at Paris—the brethren of the convent at Venice having, it is said, felt themselves cramped in their movements by a discordance of opinion with the congregation of the Propaganda. A branch is also in course of formation at Constantinople. The Armenian missionaries, who compose books in the so-called vulgar Armenian, appear however to have made an impression on the Armenian population, even more favourable than that produced by the Mechtitarists. The fullest account of Mechtitar and his institution, in English, is to be found in 'A brief Account of the Mechtaristic Society, founded on the island of St. Lazzaro, by Alexander Goode, Venice, printed at the press of the same Armenian Academy, 1835.' It is dedicated to Pascal Aucher, the instructor of Lord Byron in Armenian.

MECKENEN, MEKENEN, or MECHELN, ISRAEL VAN, a celebrated old goldsmith, engraver, and painter of the 15th century, born probably at Meckenen near Bocholt, in the bishopric of Münster, though this is a matter of speculation. His name is written in a great variety of ways, but the above form has met with most supporters, as it is found written in full on his tombstone and upon two of his prints: some however have supposed that the engraver and painter were two distinct artists, or that Israel van Meckenen is not Meister Israel the painter mentioned by several old writers. There are eighteen beautiful old oil-paintings in the Pinakothek at Munich, and some in other collections, which are attributed to Meister Israel; they are of the Van Eyck school, but most of them have been found in the neighbourhood of Cologne and Coblenz, which is one of the reasons for concluding that Meckenen in Westphalia was the artist's birthplace, notwithstanding Meckenheim near Bonn is in the district in which these works have been collected. There is good evidence in favour of Meckenen, as Israel was buried at Bocholt, and he appears to have resided there. In Ottley's 'Early History of Engraving' there is a print from a drawing in the British Museum, which was made from Israel's tombstone (since lost), which contains an inscription in the old Gothic character to the following purport:—"In the year of our Lord 1503, died Master Israel van Mecknen; his soul rest in peace."

Israel van Meckenen was evidently an engraver, from the signatures on his numerous prints, and we know him to have been a goldsmith, from accounts in the old Bocholt records in which his name occurs, from 1482 to 1498 inclusive; but he is on no occasion mentioned as a painter. Yet a painter of the name of Israel is mentioned by several writers, and among them by Jacob Wypfeling, in his 'Herum Germanicarum Epitome,' c. 67, "de pictura et plasticis;" but from this circumstance it is argued that the goldsmith and engraver Israel Van Meckenen cannot have been the painter Israel

Alemannus mentioned by this writer, as engraving was not known until the latter part of the 15th century, and subsequent to the time that Wypfeling appears to indicate. Wypfeling however does not say 'picturæ' or 'tabulæ depictæ,' but 'icones' Israelis Alemanni, which may mean prints as well as pictures, and he certainly speaks of Israel as of his own time and contemporary with Albert Dürer, while he notices Martin Schoen, or Schongauer, an excellent engraver, as already dead, of whom he says, "qui fuit tam eximius." He therefore clearly writes at a time when engravings were not only known, but very generally spread over Europe: his book appeared first in 1505, at Strasbourg, only two years after the death of Israel van Meckenen: it is evident therefore that as far as Wypfeling is concerned, there are no grounds for disputing the identity of Israel Van Meckenen the engraver, and Israel Alemannus the painter.

Lomazzo, in his 'Trattato della Pittura,' which was published in 1584, also notices a German engraver of the name of Israel. He calls him Israel Metro (Meken?), and says he was the master of Martin Schön; but if we substitute pupil for master we shall probably have the truth, for Israel studied the engravings of Martin, and there are still extant forty copies by him of Martin's prints. It is remarkable that out of three hundred prints and upwards, attributed with and without certainty to Israel, one only has the date fixed to it, and that is the Virgin Mary crowned by two angels and standing upon the half-moon, with the infant Christ on her left arm, and in her right hand a crucifix; the whole surrounded by a glory of angels. On the margin of this print is 'Dñs maculavit Adam propter me et matrem meam,' &c., with the following signature and date—"Israel V. M. A. 1502," the 5 being reversed. It is No. 44 in Heineken's list. His prints are generally signed Israel V. M.; I. V. M.; I. M.; and sometimes Israel alone. He has engraved his own portrait twice: in one his name is signed in full 'Israel Van Meckenen, goldsmit;' the other, in which his wife is also engraved, is marked 'Figuracio Facierum Israelis et Ide ejus uxoris—I. V. M.' The pictures attributed to Israel van Meckenen, perhaps upon insufficient authority, are all upon gold grounds and upon panel. They are some of them on a large scale, many of the figures being about half the size of life, and in execution are equal to any works of their style extant; their expression is often excellent, and the colouring very clear, forcible, and effective. The Ascension and Coronation of the Virgin, Joachim and Anne at the golden gate, and several pictures of Apostles, in the Pinakothek at Munich, are very beautiful works, and if by Van Meckenen, he is evidently entitled to rank with the Van Eycks, Wilhelm von Köln, Hans Burgkmair, Hans Memling, Lucas van Leyden, and other distinguished masters of that time and school. Some of these pictures were drawn in lithography, in 1822, by N. Strixner. The supposed signature of Van Meckenen, with date on a picture in the gallery of Vienna, mentioned in the catalogue of Von Mechel, is according to Bartsch an error.

MEDE, JOSEPH, was born at Berden in Essex, in the year 1586. When only ten years old he lost his father, but his education was well provided for by his relations. While a boy at school he met accidentally with a copy of Bellarmine's Hebrew grammar, and soon gained a considerable acquaintance with that language. In 1602 he entered Christ's College, Cambridge, and took his degree of master of arts in 1610. At this time his learning is spoken of as extraordinary. During the earlier part of his residence at college he is said to have been troubled with sceptical opinions, which however he soon shook off. His first work was a treatise, 'De Sanctitate Relativa,' addressed to Dr. Andrews, bishop of Ely, which procured for him the patronage of that prelate, who requested him to become his domestic chaplain. This offer Mr. Mede declined, and was soon after made a fellow of his college and reader of the Greek lecture of Sir Walter Mildmay's foundation. He appears to have been remarkably skilful and successful as a tutor. In 1618 he took his degree of B.D. He refused the provostship of Trinity College, Dublin, which was twice offered him, in 1627 and 1630, through the influence of archbishop Usher. The extent of his ambition seems to have been to pursue his studies without interruption in the retirement of his college. There he spent the remainder of his life, and died on the 1st of October 1638, aged 52.

Mr. Mede was distinguished for his meekness, modesty, and prudence, and his liberality was such that he devoted the tenth of his scanty income to charitable uses. His learning was diversified and profound. In his younger years he studied astrology, but afterwards abandoned the pursuit. He was well acquainted with mathematics, medicine, and the various branches of philosophy, and was deeply versed in history and antiquities, and in the literature and sciences of the East, into the abstrusest parts of which he searched for illustrations of the prophecies of Scripture.

His chief work is the 'Clavis Apocalyptica,' containing a system for explaining the Apocalypse, which has been followed more or less by nearly all subsequent writers on the prophecies, and is recommended by Bishop Hurd in his tenth sermon on the study of the prophecies, as being the first rational attempt to explain the Apocalypse. This work was translated by Mr. T. Bransby Cooper, 8vo, Lond., 1833. Mede's whole works were collected after his death by Dr. Worthington, in one vol. fol., Lond., 1672, with a life of the author prefixed.

**MEDICI, FAMILY OF.** The early history of the family of the Medici is obscure, although some authors have traced their genealogy from the age of Charlemagne. But it must be remembered that these genealogies were made after the elevation of this family to supreme power in Florence. It appears, however, from authentic monuments, that many individuals of this family had signalled themselves on various important occasions. Giovanni de' Medici, in the year 1251, with a body of only one hundred Florentines, forced his way through the Milanese army, then besieging the fortress of Scarparia, and entered the place with the loss of twenty lives. Francesco de' Medici was at the head of the magistracy of Florence in 1348, at the time when the black plague, which had desolated so large a portion of the world, extended its ravages to that city. Salvestro de' Medici acquired great reputation by his temperate but firm resistance to the nobles, who, in order to secure their power, accused those who opposed them of being attached to the party of the Ghibelines, then in great odium at Florence. The persons so accused were said to be *ammontiti* (admonished), and by that act were excluded from all offices of government. In the year 1379, Salvestro, being chosen chief magistrate, exerted his power to reform this abuse, which was not however effected without a violent commotion, in which several of the nobility lost their lives. After the death of Salvestro, his son, Veri de' Medici, continued to hold a high rank in the republic, and was in great favour with the populace.

The founder however of that greatness which his posterity enjoyed for several ages was GIOVANNI DE' MEDICI, the great-grandfather of Lorenzo the Magnificent. By a strict attention to commerce, he acquired great wealth; by his affability, moderation, and liberality, he ensured the confidence and esteem of his fellow-citizens. Without seeking after the honours of the republic, he was honoured with them all. The policy by which the house of Medici attained its political power is indicated in the charge given by this venerable old man on his death-bed to his two sons, Cosmo and Lorenzo; "I feel," said he, "that I have lived the time prescribed me. I die content; leaving you, my sons, in affluence and in health, and in such a station, that whilst you follow my example, you may live in your native place honoured and respected. Nothing affords me more pleasure than the reflection that my conduct has not given offence to any one; but that, on the contrary, I have endeavoured to serve all persons to the best of my abilities. I advise you to do the same. With respect to the honours of the state, if you would live with security, accept only such as are bestowed on you by the laws and the favour of your fellow-citizens; for it is the exercise of that power which is obtained by violence, and not of that which is voluntarily given, that occasions hatred and contention." He died in the year 1428, leaving two sons, Cosmo, born in the year 1389, and LORENZO in 1394, from the latter of whom is derived the collateral branch of the family, which in the beginning of the 16th century obtained the absolute sovereignty of Tuscany.

Even in the lifetime of his father, Cosmo had engaged not only in the extensive business by which the family had acquired its wealth, but also in the affairs of state. Such was his authority and reputation, that in the year 1414, when Balthasar Cossa, who had been elected pope, and had assumed the name of John XXIII., was summoned to attend the council of Constance, he chose to be accompanied by Cosmo de' Medici, among other men of eminence, whose characters might countenance his cause. By this council, which continued nearly four years, Balthasar was deprived of his pontifical dignity, and Otto Colonna, who took the name of Martin V., was elected pope. Cosmo did not desert in adversity the man to whom he had attached himself in prosperity. At the expense of a large sum of money, he redeemed him from the hands of the Duke of Bavaria, who had seized upon his person; and afterwards gave him an hospitable shelter at Florence during the remainder of his life. The successful pontiff, instead of resenting the kindness shown to his rival, soon afterwards paid a public visit to Florence, where, on the formal submission of Balthasar, and at the request of the Medici, he created him a cardinal, with the privilege of taking the first place in the sacred college. The new-made cardinal died in 1419, and it was rumoured that the Medici at his death possessed themselves of immense wealth which he had acquired during his pontificate. This rumour was afterwards encouraged by those who well knew its falsehood. The true source of the wealth of the Medici was their superior talents and application to business, and the property of the cardinal was scarcely sufficient to discharge his debts and legacies.

The authority which Cosmo and his descendants exercised in Florence, during the 15th century, consisted rather in influence than in any definite power. Cosmo exerted this influence with great prudence, yet owing to the discontent of the Florentines with the result of the war against Lucca, a party arose, headed by Rinaldo de' Albizi, which, in 1433, after filling the magistracies with their own adherents, seized Cosmo, and committed him to prison. He was afterwards banished to Padua for ten years, and several other members and friends of the Medici family were treated in the same way. From Florence Cosmo proceeded immediately towards Venice, where he was received with marked respect by the government; and after a short stay there he went to Padua. Upon an application to the Florentine state by Andrea Donato, the Venetian ambassador, it was consented

to that he might reside on any part of the Venetian territories, but not to approach within 170 miles from Florence. The affectionate reception which he had met with at Venice induced him to fix his abode there. Within a year of Cosmo's retreat, Rinaldo was obliged to quit Florence; and Cosmo was recalled, and returned amidst the acclamations of the people. The gonfaloniere, or standard-bearer, the executive officer who had pronounced his sentence, with a few others of his party, were put to death on the occasion. Measures were now taken to restrict the choice of magistrates to the parties of the Medici, and alliances were formed with the neighbouring powers for the purpose of supporting and perpetuating the new system of administration in Florence. The subsequent life of Cosmo de' Medici was an almost uninterrupted course of prosperity. The tranquillity enjoyed by the republic, and the satisfaction which he experienced in the esteem and confidence of his fellow-citizens, enabled him to indulge his taste for the promotion of science and the encouragement of learned men. Though a private citizen, he surpassed almost all the princes of Europe in his munificent patronage of literature and the fine arts. He assembled round him some of the most learned men of the age, who had begun to cultivate the Greek language and philosophy. He established at Florence an academy expressly for the explanation of the Platonic philosophy, at the head of which he placed the celebrated Marsilius Ficinus. By means of foreign correspondence, he collected the Greek, Latin, and Oriental manuscripts, which formed the basis of the Laurentian library; nor was he less liberal in his encouragement of the fine arts. During the retirement of his latter days, his happiest hours were devoted to the study of letters and philosophy, and the conversation of learned men. He also endowed numerous religious houses, and built an hospital at Jerusalem for the relief of distressed pilgrims. The spirit of his administration was moderate, he avoided all appearance of state which might excite the jealousy of the Florentines; and, by way of increasing his interest among them, he confined the marriages of his children to Florentine families. By this prudent conduct and his benevolence, he acquired the title of 'father of his country,' which was inscribed upon his tomb; an appellation which, as it was founded on real merit, has ever since been attached to the name of Cosmo de' Medici. He died August 1st, 1464. Cosmo de' Medici married Contesina Bardi, of a noble and illustrious family, which had been long distinguished at Florence. By her he had two sons, Giovanni and Piero; and he had a natural son by a mistress.

GIOVANNI DE' MEDICI was one of the Florentine ambassadors who were sent, in 1455, to take the necessary oaths to Calixtus III., who had succeeded Nicholas V. He was Cosmo's favourite son, on whom all his future hopes and expectations rested; but he died prematurely in 1463. Giovanni married Cornelia de' Alessandri, by whom he had only one son, who died an infant. PIERO DE' MEDICI succeeded to Cosmo's fortune and authority at Florence: Cosmo, in the decline of life, had recommended to his surviving son to employ one Diotisaloro Neroni as his minister, whom he believed to be attached to the Medici interests; but the ambition of Neroni, and the disaffection of some former friends of the Medici, had nearly proved fatal to Piero's administration. It was the intention of the conspirators to surprise Piero at one of his country residences; but one of the conspirators went and communicated the plot to him. Piero, by an expeditious return to the city, at the head of a chosen troop of his friends, baffled the designs of his enemies. Most of the conspirators saved themselves by flight; and though, with the assistance of the Venetians, they afterwards made a stand, they were finally compelled to evacuate Tuscany. Piero died December 3, 1469, leaving by his wife, Lucrezia Tornabuoni, two sons and two daughters, Lorenzo, Giuliano, Bianca, and Giovanna.

At the death of Piero de' Medici, his two sons inherited his property; but Lorenzo succeeded him as head of the republic, and upon him the title of Magnificent was afterwards conferred. LORENZO the MAGNIFICENT was born January 1, 1448. From the time of Cosmo's death, in 1464, on account of the infirmities of his father, Lorenzo had been introduced to a knowledge of public affairs, although then only sixteen. With this view he was sent to visit the principal courts in Italy. Upon the accession of Sixtus IV. to the papal throne, he went, with other citizens of Florence, to congratulate the new pope, and was invested with the office of treasurer of the holy see; and while at Rome took every opportunity to add to the remains of ancient art which his family had collected. One of the first events after he undertook the administration of affairs was a revolt of the inhabitants of Volterra, on account of a dispute with the Florentine republic. By the recommendation of Lorenzo, force was used, and the result was the sack of Volterra. In 1472 he re-established the academy of Pisa, to which city he removed in order to complete the undertaking; he selected the most eminent professors, and contributed a large sum from his private fortune, in addition to that granted by the state of Florence.

Lorenzo, who was, or affected to be, an admirer of Plato, took an active part in the establishment of an academy for the cultivation of the Platonic philosophy, and instituted an annual festival in honour of Plato. Whilst Lorenzo was thus dividing his time between the administration of the state and the promotion of literature, the Pazzi, a numerous and distinguished family in Florence, formed a conspiracy

to assassinate Lorenzo and his brother. Giuliano was killed, but Lorenzo escaped. The people, who were attached to the Medici, collecting in great numbers, put to death or apprehended the assassins. Salviati, archbishop of Pisa, was hung through the windows of the palace, and was not allowed to divest himself even of his robes; and Jacopo de' Pazzi, with one of his nephews, shared the same fate. The name and arms of the Pazzi family were suppressed, its members were banished, and Lorenzo rose still higher in the regard of his fellow-citizens.

Sixtus IV., who was a party to this conspiracy, excommunicated Lorenzo and the magistrates of Florence, laid an interdict upon the whole territory, and, forming a league with the king of Naples, prepared to invade the Florentine dominions. Lorenzo appealed to all the surrounding potentates, and he was zealously supported by his fellow-citizens. Hostilities were commenced, and carried on for two campaigns. At the close of 1479, Lorenzo took the bold resolution of paying a visit to the king of Naples, and, without obtaining any previous promise of security, trusted himself to the mercy of his enemy. The result of this confidence was a treaty of mutual defence and friendship between the king of Naples and Florence, and Sixtus afterwards consented to a peace. The death of Sixtus IV. freed Lorenzo from a dangerous enemy, and he found a friend in his successor Innocent VIII. Lorenzo now secured to the republic of Florence a degree of tranquillity and prosperity which it had scarcely ever known before; and by procuring the institution of a deliberative body, of the nature of a senate, he corrected the democratical part of its constitution.

Lorenzo distinguished himself above all his predecessors by the encouragement of literature and the arts. His own productions are sonnets, canzoni, and other lyric pieces; some longer works in stanzas, some comic satires, carnival songs, and various sacred poems. Many of the lighter kind were popular in their day. Although the ancestors of Lorenzo laid the foundation of the immense collection of manuscripts contained in the Laurentian library, Lorenzo has the credit of adding most largely to the stock. For the purpose of enriching his collection of books and antiquities, he employed learned men in different parts of Italy, and especially his intimate friend Politian, who made several journeys in order to discover and purchase the valuable remains of antiquity. Two journeys were undertaken at the request of Lorenzo into the East by John Lascaris, and the result was the acquisition of a great number of manuscripts. On his return from his second expedition, Lascaris brought two hundred manuscripts, many of which he had procured from a monastery at Mount Athos; but this treasure did not arrive till after the death of Lorenzo, who in his last moments expressed to Politian and Pico of Mirandola his regret that he could not live to complete the collection which he was forming. On the discovery of the art of printing, Lorenzo quickly saw and appreciated its importance. At his suggestion, several Italian scholars devoted their attention to collating the manuscripts of the ancient authors, for the purpose of having them accurately printed. On the capture of Constantinople by the Turks, many learned Greeks took refuge in Italy; and an academy was established at Florence for the purpose of cultivating the Greek language, partly under the direction of native Greeks, and partly under native Italians. The services of these learned men were procured by Lorenzo, and were amply rewarded by his bounty. "Hence," as Roscoe observes, "succeeding scholars have been profuse of their acknowledgments to their great patron, who first formed that establishment, from which (to use their own scholastic figure), as from the Trojan horse, so many illustrious champions have sprung, and by means of which the knowledge of the Greek tongue was extended, not only through Italy, but through France, Spain, Germany, and England, from all which countries numerous pupils attended at Florence, who diffused the learning they had there acquired throughout the rest of Europe."

Lorenzo also augmented his father's collection of the remains of ancient art. He appropriated his gardens in Florence to the purpose of an academy for the study of the antique, which he furnished with statues, busts, and other works of art, the best in their kind that he could procure. The higher class of his fellow-citizens were incited to these pursuits by the example of Lorenzo; and the lower class by his liberality. To the latter he not only allowed competent stipends while they attended to their studies, but gave considerable premiums as rewards of their proficiency. To this institution, more than to any other circumstance, Roscoe ascribes the sudden and astonishing advance which, toward the close of the 15th century, was evidently made in the arts, and which, commencing at Florence, extended itself to the rest of Europe. In 1488 Lorenzo lost his wife; and on the 8th of April 1492 he sunk under a slow fever, and expired in the forty-fourth year of his age. Leoni of Spoleto, his physician, a person of great eminence in his profession, is said to have hastened his death by mistaking his case.

By his wife, Clarice Orsini, Lorenzo had a numerous family: three sons (Piero, Giovanni, and Giuliano) and four daughters arrived at the age of maturity. Piero was born February 15th, 1471, Giovanni in 1475, and Giuliano in 1478. Giovanni was afterward known under the name of Leo X.; and Giuliano, having allied himself by marriage to the royal house of France, became Duke of Nemours.

Of Giuliano, the brother of Lorenzo, Roscoe preserves an interesting anecdote. Shortly after the attempt at assassination, he says, "Lorenzo

received a visit from Antonio da San Gallo, who informed him that the untimely death of Giuliano had prevented his disclosing to Lorenzo a circumstance with which it was now become necessary that he should be acquainted: this was the birth of a son, whom a lady of the family of Gorini had borne to Giuliano about twelve months before his death, and whom Antonio had held over the baptismal font, where he received the name of Giulio. Lorenzo immediately repaired to the place of the infant's residence, and, taking him under his protection, delivered him to Antonio, with whom he remained until he had arrived at the seventh year of his age. This concealed offspring of illicit love, to whom the kindness of Lorenzo supplied the untimely loss of a father, was destined to act an important part in the affairs of Europe. The final extinction of the liberties of Florence, the alliance of the family of Medici with the royal house of France, the expulsion of Henry VIII. of England from the bosom of the Roman church, and the consequent establishment of the doctrines of the reformers in this island, are principally to be referred to this illegitimate son of Giuliano de' Medici, who through various vicissitudes of fortune at length obtained the supreme direction of the Roman see, and under the name of Clement VII. guided the bark of St. Peter through a succession of the severest storms which it has ever experienced."

PIERO, the eldest son of Lorenzo, succeeded him in the administration of Florence. Politian said that his father had a favourable opinion of his capacity, but it soon appeared that he was unequal to the task of government. With the view of obtaining the sovereign power at Florence, he formed a more intimate connection with the pope and the king of Naples. On the entrance of the French into Italy under Charles VIII. he deserted his allies. As soon as the French king reached the confines of the Florentine state, Piero had a secret interview with him, in which he was lavish in his offers to promote the interest of the king, and as a pledge of his fidelity surrendered to him the important fortress of Sarzana, with the town of Pietra Santa, and the cities of Pisa and Leghorn. Charles undertook to restore these places as soon as he had accomplished the conquest of the kingdom of Naples. On his return to Florence after this disgraceful compromise, Piero was refused admittance into the palace of the magistrates, and, finding the people were so highly exasperated against him as to endanger his personal safety, he hastily withdrew himself from his native place to Venice. The miseries which the inhabitants of Italy experienced in consequence of the French invasion belong to the general history of Italy. The plundering of the palace of the Medici, and the dispersion of that invaluable library which had been collected by the care of the Medici, were among the misfortunes that befel Florence. The French troops, which had entered the city without opposition, led the way to this act of barbarism, in which they were joined by the Florentines themselves, who openly carried off or purloined whatever they could discover that was rare or valuable. Besides the numerous manuscripts, the plunderers carried off the inestimable specimens of the arts which the palace of the Medici contained, and which had long made it the admiration of strangers and the chief ornament of the city. Exquisite pieces of ancient sculpture, vases, cameos, and gems of various kinds, were lost amidst the indiscriminate plunder, and the rich accumulations of half a century were destroyed or dispersed in a single day.

The subsequent history of Piero was a continual succession of mortifications and disappointments. In 1504, when Italy was invaded by Louis XII., Piero entered into the service of the French, and was present at the engagement in which they were defeated by the Spaniards with great loss, upon the banks of the Garigliano. In effecting his escape he attempted to pass the river; but the boat in which he, with several other men of rank, had embarked, being laden with heavy cannon, sunk in the stream.

Of the subsequent restoration of the Medici to Florence, an account is given in the life of LEO X., as well as, under Cosmo I., of the assassination of Alessandro, and the final extinction of the republic, when Cosmo was elevated to the rank of duke of Florence, and afterwards to that of grand-duke of Tuscany. For more minute details of the house of Medici, the several works may be consulted from which this notice has been chiefly derived.

The genealogy of the Medici to the present time is given in a splendid work but little known, entitled 'Famiglie celebri Italiane,' di P. Litta. The Medici and their descendants are comprised in 'Fascicolo XVII,' in seven parts, folio, Milan, 1827-30.

(*Modern Universal History*, 8vo, vol. xxxvi.; Noble, *Memoirs of the House of Medici*, illustrated with genealogical tables; Tenhove, *Memoirs of the House of Medici*, translated from the French by Sir R. Clayton, 2 vols. 4to, Bath, 1797; Roscoe, *Life of Lorenzo de Medici*, 2 vols. 4to, Lond., 1796; and his *Life and Pontificate of Leo X.*, 4 vols. 4to, Liverpool, 1805.)

ME'DICI, GIAN GIACOMO, Marquis of Marignano, born at Milan in 1495, was the son of a steward of the Duke of Milan. He entered early the military profession, in which he showed great courage, accompanied with a want of all principle. In the war between the Italian powers and the French, for the disputed possession of Lombardy, Medici took the part of his countrymen, and served under Pescara in the campaign of 1522, in which the French were driven out of Lombardy. He acquired the confidence of the Duke Francis Sforza

and of his chancellor Morone, who employed him to murder Astorre Visconti, a descendant of the former dynasty of the dukes of Milan, who gave umbrage to the actual occupant of the ducal throne. Medici, having committed the deed, was sent to assist in recovering the castle of Musso, situated in the mountains above the lake of Como, which was still held by the French. He succeeded in taking possession of it, and he kept it for himself for years after, defying from his stronghold the duke's authority, and making predatory incursions among his neighbours. When Francis I. again invaded Lombardy, in 1525, Medici made an incursion into the Valtellina which belonged to the Grisons, and took possession of Chiavenna. The Grisons, alarmed for their own country, recalled their troops which were serving as auxiliaries in the French camp, and this defection is said to have contributed to the defeat of King Francis at Pavia. In consequence of this service, Medici was acknowledged by the duke as feudatory of Musso and other places, with the title of Chatelain.

In the subsequent quarrel between Duke Sforza and his overbearing allies the Spaniards, Medici put himself at the head of the disaffected Milanese emigrants, and annoyed the Spaniards; but after a time the Spanish governor of Milan succeeded in conciliating Medici, on whom he conferred the title of Marquis of Musso. The object of Medici was to carve out a principality for himself at the expense of his neighbours. He again invaded the Valtellina, and took Morbegno. At last, in the year 1532, Duke Sforza, partly by force and partly by offering him a sum of money with an amnesty for the past, made him give up Musso and his other strongholds. Medici then retired to Piedmont, and entered the service of the Duke of Savoy. Here his career as an adventurer terminated. Medici afterwards served in the campaign of 1536 against the French in Piedmont. Having returned to Milan after the death of Duke Sforza, he was made Marquis of Marignano by Charles V. He then went to Spain, whence he accompanied Charles in his expedition against the revolted Flemings. Thence he went to Hungary to fight for the emperor against the Turks, and afterwards he served in Germany under Charles himself against the Duke of Saxony. Returning to Italy, Medici was appointed to the command of the expedition against Siena, which city he took after a long siege in the year 1555. On his return he was received by Duke Cosmo I. of Tuscany at Florence with great honour, and on this occasion his relationship to the Medici of Tuscany was acknowledged by Cosmo, notwithstanding which it is still greatly doubted, or rather disbelieved. On his return to Milan, Medici fell ill and died in November 1555. The Duke of Alba, Spanish governor of Milan, attended him in his last moments. His body was buried at Marignano with great pomp, but afterwards his brother, Cardinal Giovanni Angelo Medici, having become pope in 1559 by the name of Pius IV., built him a splendid monument in the cathedral of Milan, whither his remains were transferred. Gian Giacomo Medici was one of the most able and successful commanders of the age of Charles V., but was likewise one of the most unprincipled, rapacious, and cruel.

(*Missaglia, Vita di Jo. Jacopo Medici, Marchese di Marignano; Verri, Storia di Milano.*)

MEERMAN, GERARD, was born at Leyden in 1722, and in 1748 became pensionary of Rotterdam. He spent the greater part of his life in learned research, chiefly relating to law. He died at Aix-la-Chapelle, December 15, 1771. His two great works were—his 'Novus Thesaurus Juris Civilis,' &c., 7 vols. fol., 1751-53 (to which his son added an eighth volume in 1780), and his 'Origines Typographicæ,' 2 vols. 4to, Hague, 1765. An analysis of this last work was published in 'The Origin of Printing, in two Essays,' 8vo, London, 1774, by Messrs. Bowyer and Nichols, the main object of which was to establish the claim of the town of Haarlem to the invention of printing—a claim now quite abandoned.

MEERMAN, JOHN, son of the preceding, was born in 1753. His earliest literary effort was made at the age of ten years, in a translation into Dutch of the 'Mariage Forcé' of Molière. He commenced his regular studies at Leyden, and afterwards prosecuted them at Leipzig under Ernesti, and at Göttingen under Heyne. At different times in his life he visited nearly every country of Europe. His supplement (in an eighth volume) to his father's 'Thesaurus Juris Civilis' has been already mentioned. The more important of his other works were—'Specimen Juris Publici de Solutione Vinculorum quod olim fuit inter sacrum Romanum Imperium et Fœderati Belgii res publicas,' 4to, Leyden, 1774; 'A History of William, Count of Holland, King of the Romans,' in Dutch, 5 vols. 8vo, 1783-97; 'Remarks during a Tour in Great Britain and Ireland,' 8vo, Hague, 1787; 'An Historical Account of the Prussian, Austrian, and Sicilian Monarchies,' 4 vols. 8vo, Hague, 1793-94; 'Historical Account of the North and North-East of Europe,' 6 vols. 8vo, Hague, 1804-6; 'A Narrative of the Siege and Conquest of Leyden by John, Duke of Bavaria, in 1420,' 8vo, Leyden, 1806; all in Dutch. He also published 'Hugonis Grotii Parallelon rerum publicarum, liber tertius de moribus ingenioque populorum, Atheniensium, Romanorum, Batavorum,' with a translation into Dutch, 3 vols. 8vo, 1801-2; and 'Grotii Epistolæ ineditæ,' 8vo, 1806. In 1812 he published, in Dutch and French, a poem entitled 'Montmartre;' and in the same year a 'Discourse on the First Travels of Peter the Great, principally in Holland,' 8vo. His last publication was a translation into Dutch of Klopstock's 'Messiah.'

Under Louis Bonaparte, as king of Holland, he was made Director

of the Fine Arts and Minister of Public Instruction, and was entitled to the gratitude of his country for the zeal and success with which he prosecuted his functions. Afterwards, when Holland became united to France, he was made a count of the empire and senator by Napoleon. He died August 15, 1815. The Meerman Library was sold by auction in 1824, and produced no less a sum than 131,000 florins.

MEGASTHENES lived in the time of Seleucus Nicator, king of Syria, who sent him on an embassy to Palibothra, the capital of Sandracottus, king of the Prasii. The territories of Sandracottus were on the Ganges and the Jumna. Megasthenes stayed in India several years, and on his return recorded his observations in a work entitled 'India.' Of this work, which is unfortunately lost, there are extracts in Strabo, Arrian, and Ælian. Though Strabo has on several occasions expressed an unfavourable opinion of the trustworthiness of the author, it is quite certain that the work contained much valuable information which was then entirely new to the Greeks. Megasthenes gave the first account of Taprobane, or Ceylon.

MEHEMET ALI, Pasha of Egypt, was born in the town of Cavalla, in Roum-ili, about the year 1769. He began life as the keeper of a small shop in his native town; but having volunteered into the army, he gained the good opinion of the governor of Candia by his zeal in suppressing a rebellion of the pirates of that island. In 1799 he headed a contingent of 300 Candian soldiers in an expedition to Egypt, where he co-operated with the British forces for the expulsion of the French. Here he laid the foundation of his military renown and of his political ascendancy. On the evacuation of Egypt by the troops of the Emperor Napoleon I., the Sultan nominated, as viceroy of Egypt, Mohammed Khosrew; but the Mamelukes, having risen to assert their ancient rank and influence, of which they had been deprived during the occupation of their country by the French, chose Mehemet Ali as their viceroy. In 1806 he was made Pasha of Cairo, to which in the following year was added the Pashalic of Alexandria, as a reward for his services rendered to the Ottoman Empire. No sooner however had he gained this pitch of power than he turned against his old confederates the Mamelukes—470 of whom he murdered in the citadel of Cairo, while the rest, to the number of 1200, were massacred through the country: an end was thus put to a turbulent and formidable race which had kept Egypt in a state of anarchy and warfare for upwards of 400 years. After the destruction of the Mamelukes, Mehemet Ali made himself master of Upper Egypt. He obtained from the Sultan the government of that part of the country, the revenue of which he considerably increased by raising the land-tax and the custom duties on its internal trade. In 1811 he was sent against the Wahabis, a fanatical sect of the Moalems, who had pillaged the holy cities of Mecca and Medina, and whom he subdued after six years of constant warfare, and at a vast sacrifice of men and money. When the Greek insurrection against the Porte broke out, he offered to take part in the reduction of that country: his fleet accordingly sailed for the Morea in the summer of 1824, under Ibrahim Pasha, who however was obliged to retire after the battle of Navarino in 1827. In 1830 the administration of the island of Candia was confined to Mehemet Ali; but he had greater schemes in his view. He aimed at obtaining possession of Syria; and pleading as an excuse his desire to recover possession of some Egyptians who had settled in that country, he invaded Syria, with a large army under Ibrahim Pasha, and soon reduced it to submission. Syria as well as Egypt was an integral part of the Ottoman Empire; but the Viceroy of Egypt could not remain content with his own vice-regal territory; and peace was only made between the viceroy and the sultan [MAHMUD II.] by the interference of the European powers in 1833. Syria was ceded to Mehemet Ali on his acknowledging himself a vassal of the Porte. He remained in quiet possession of Syria as well as Egypt until 1839, when his nominal master, the Sultan, jealous and weary of the sway of so formidable a rival, sent an army and fleet to expel him from Syria; and when he found that this was impossible, he sought and obtained the co-operation of England and the other European powers. In the summer of 1840 the combined fleets appeared before the coast of Syria; in the autumn of the same year the Egyptian army was defeated near Beyrut, and both that city and Acre were captured, and Alexandria itself blockaded. Mehemet Ali was obliged to come to terms, and abandoned his claim to Syria, on condition of the Pashalic of Egypt being made hereditary in his family. He continued to administer the affairs of the country until September 1848, when he resigned the reins of government into the hands of his son Ibrahim Pasha, on whose death they passed to Abbas Pasha his grandson. Mehemet Ali himself lived only a few months after these changes, as he died August 2, 1849, at the age of about eighty years. By his wives and concubines he had sixteen children; two of his sons he sent to Paris for the sake of education. He was buried at Cairo with great pomp and splendour.

Mehemet Ali was tolerant in matters of religion to an extent rarely known among Mohammedans. His constitution was strong, his stature short; his features, though dark and stern, were animated and expressive. He was very ambitious, yet particularly sensitive to the opinions formed by others as to his public policy. His government has been extravagantly praised by some writers; but it certainly was more rational, orderly, and enlightened than that of most of the dominions of the Porte. He administered justice without partiality, established police

and law-courts, abolished torture, and encouraged education. He did his best to remove the prejudices felt by his countrymen against the introduction of the arts and sciences of Europe; he even went so far as to establish European manufactures and machinery in his dominions, including a printing office for the publication of a periodical journal. He also formed schools and colleges for teaching the arts and sciences and naval and military tactics. But with all these liberal measures, his government was essentially despotic and absolute; and in order to support the expenditure necessary to maintain the institutions already mentioned as having been introduced by him, he was obliged to have resort to a heavy forced taxation, and for his army to an enormous conscription.

Upon the whole however, it must be admitted that the Albanian peasant was in his day a great benefactor not only to his country but to society at large. Gifted with an admirable talent for organisation, he introduced into one of the most neglected and disorganised of countries the first conditions of a civilised state, order and security, to such an extent that it is said that a traveller, laden with gold, "could traverse without fear the immense territories under his sway, from the Taurus to the frontiers of Abyssinia, between sea and Nile and desert." In the administration of justice and the general management of his empire he introduced more of equity and settled principle than exists at the present time in any Oriental state. He did his best to curb the fanaticism of his subjects and to protect the Christian population. He not only encouraged commercial intercourse with Europe, but in a great measure created it; and by various enterprises of a grand and striking character, awakened that beneficial spirit of industry which for many a long century had lain dormant in Egypt. He first called into life the cultivation of cotton, indigo, and sugar, which has since been pursued with increasing success—a large portion of the produce being manufactured in his own dominions, in factories erected for that purpose at his expense. At the same time he gave a great impetus to the cultivation of silk in Syria by the plantation of mulberry-trees on an extensive scale. He founded a system of national education, of which no one for centuries past had conceived the idea in the East, and he devoted immense sums to that purpose. In fact he projected and founded more useful institutions than any Egyptian ruler since the days of Saladin. In addition to this, though at his accession to power he found Egypt without a ship or a drilled and disciplined soldier, he found means to build a fleet and to form an army trained after the European fashion. Such are the means by which the Albanian peasant, who only learned to read in his thirty-fifth year, and who often, during his eventful life, did not know where to lay down his head in safety, became a powerful prince, who twice made the Ottoman Sultan tremble on his throne at Constantinople, and whose personal energy and public importance gave him a place among the potentates of the earth.

MEIBOM, MARC, a member of a numerous German family, who were distinguished in the 17th century for their classical knowledge and scientific attainments. He was born at Tonningen, in the duchy of Schleswig, about the year 1680, and died at Utrecht about the year 1711. Dr. Hutton gives 1690 as the year of his birth, and 1668 as that of his death, which are no doubt incorrect. Marc Meibom was patronised by Christina, queen of Sweden, to whom he dedicated a collection of seven Greek authors upon music, *Amster.*, 1652, 4to. He was subsequently appointed to a professorship in the university of Upsal, by Frederick III., to whom he acted in the capacity of librarian. He quitted Upsal for the professorship of belles-lettres in the academy of Amsterdam, where he remained but a short time. In 1674 he came to England, where he proposed the publication of a new edition of the Hebrew Bible, asserting that the edition then in use was full of errors; his pretensions appear however to have been ridiculed by the learned. Among his published works, a list of which will be found in the 'Biographie Universelle,' there is a curious 'Dialogue on Proportion,' wherein he introduces the whole of the ancient geometers, Euclid, Theon, Apollonius, &c. Many of the views advanced by Meibom in this work respecting the doctrine of proportion were shown to be erroneous by Langius, and by Dr. Wallis in a tract printed in the first volume of his works. (*Hutton, Dict.; and Biograph. Univ.*)

MEISSNER, AUGUSTUS GOTTLIEB, a popular and voluminous German writer of the last century, was born at Bauzen in Upper Silesia, November 4, 1753. In 1785 he was appointed professor of æsthetics and classical literature at the University of Prague, and in 1805 director of the High school at Fulda, where he died, February 20, 1807. He wrote several dramatic pieces, including some translations from Molière and Destouches; also an abridgment in German of Hume's 'England;' but it is his 'Skizzen' that rendered him a favourite with the public. These sketches, extending to fourteen 'sammlungen,' or series (the first of which appeared in 1778, the last in 1793), consist of essays, tales, narratives, anecdotes, dialogues, &c.; and recommend themselves by their agreeable liveliness, shrewdness, and pleasantry. Although not entirely free from blemishes of style, they have the merit of being the most successful attempts in the lighter walks of literature which Germany could then produce. Many of these pieces were translated or imitated in French, Danish, and Dutch, and one or two were translated by Thompson in his 'German Miscellany.'

His 'Tales and Dialogues' (1781-89) may be considered as a continuation of his sketches, being similar in plan. His 'Alcibiades,' 'Massaniello,' 'Bianca Capello,' and 'Spartacus,' are productions of greater length (the first-mentioned being in four volumes), and are specimens of the historical and biographical romance. With the exception of the last, they have all been translated into French. Besides the above, and a variety of other works, Meissner contributed a great number of literary and historical articles to different periodicals.

\*MEISSONIER, JEAN-LOUIS-ERNEST, one of the most popular French genre painters, was born at Lyon in 1813, and received his professional education in the atelier of Léon Cogniet. By the first pictures which he sent to the Salon in 1836, 'Les Joueurs d'Échecs,' and 'Le Petit Messager,' he caught the public attention. The favourable opinion was strengthened by his 'Religieux consolant un Malade,' 1838, which was purchased by the Duc d'Orléans; and still more by 'Le Liseur,' 1840, which won for him the third-class medal (genre). In 1841 he exhibited 'La Partie d'Échecs,' and was honoured with the second-class medal. In 1843 'La Peintre dans son Atelier' was exhibited, and he was accorded the first class medal; thus, while under thirty obtaining this, one of the highest objects of the French artist's ambition. Since then distinctions have continued to be showered upon him. He was created a Chevalier of the Legion of Honour in 1846; in 1848 the first-class medal was again bestowed upon him; a medal of honour in 1851; and at the Exposition Universelle of 1855 he was awarded one of the large gold medals. Among the more celebrated of his works painted since those mentioned above are:—'Le Corps-de-Garde;' 'Jeune Homme regardant des Dessins;' 'La Partie de Piquet;' 'La Partie de Boules;' 'La Fumeur;' 'Les Soldats;' 'La Rixe,' &c. A picture a good deal out of his usual style representing a 'Barricade—Juin 1848,' excited a "sensation" at the Exposition of 1851. As will have been seen by the enumeration of his pictures his subjects are usually of a homely character. They are in fact much of the class which the old Dutch and Flemish painters delighted to paint. His pictures are generally of small size, and finished with Flemish care and neatness, but with sufficient Gallicism of style to remove them from the class of imitative pictures. M. Meissonier has an extremely light clean touch, but free and spirited; and his colour, though not comparable with that of the great masters of his line of art, is far better than that of the majority of French genre painters; while both in composition and chiaroscuro he displays the knowledge and the skill of a master. His works are in great request, and though small in size, command high prices and find many imitators. M. Meissonier has painted a good many small portraits, and he has also made several vignette designs for illustrated books, among others, 'Paul et Virginie,' Balzac's 'La Comédie humaine,' 'Les Français peints par eux-mêmes,' &c.

MELA, POMPO'NIUS, a Roman writer on geography. He is thought by some critics to have been the same person as the Annæus Mella, or Mela, who was implicated in a conspiracy against Nero, and who put an end to his own life (*Tac., Ann., xvi. 17; Plin., H. N., xix. 6*); but this opinion is only founded on the similarity of the names. It is probable, from a passage in which Mela speaks of the recent conquest of Britain (*iii. 6*), that he was contemporary with the Emperor Claudius; and it is evident from many passages in his work that he could not have lived before the time of Augustus (*iii. 1, "turris Augusti titulo memorabilis;" compare iii. 2, &c.*). It appears from a passage in his own work (*ii. 6*) that he was born at Tingitana in Spain; but the manuscripts differ so widely in this passage, that it is difficult to determine the right reading: many critics think that we ought to read Mellaria.

Mela's work is entitled in most manuscripts, 'De Situ Orbis.' It is divided into three books, and contains a very brief description of the various parts of the world. In the first book, after giving a short account of the great divisions of the earth, Mela commences with Mauritania (part of Morocco), and following generally the coast, he describes successively Numidia, the province of Africa, Cyrenaica, Egypt, Arabia, Syria, Phœnicia, Cilicia, Pamphylia, Lycia, Caria, Ionia, Æolia, Paphlagonia, and the countries on the Euxine and the Mæotis as far as the Rhiphæan mountains. In the second book he commences at the river Tanais (Don), and gives an account of the countries in Europe on the western side of the Mæotis and the Euxine as far as Thrace. He then proceeds to describe Greece, Italy, Gallia Narbonensis, and the coast of Spain as far as the straits of Gibraltar, from which he commenced his description in the first book. The remainder of the second book is occupied with an account of the islands in the Mediterranean, Adriatic, Ægean Sea, &c. In the third book he commences again at the straits of Gibraltar, and follows the western coast of Spain till he reaches Gaul; he then gives an account of the western coast of Gaul, and afterwards describes Germany and the central parts of Europe and Asia as far as the Caspian. After mentioning some of the islands in the ocean, he next describes India and the maritime coast of Carmania, Persia, and Arabia, and concludes with a description of the central parts of Africa.

Mela appears to have been a mere compiler, and to have had no scientific knowledge of his subject. If we consider him later than Strabo, it does not appear from Mela's work that geography had made any progress in the meantime. Like Strabo, he considers the earth

as penetrated by four great inlets of the ocean, of which the Mediterranean, the Red Sea, and the Persian Gulf were three: the fourth was the Caspian Sea. The singular error as to the Caspian is the more remarkable when contrasted with the fact that Herodotus knew the Caspian to be a lake. (Herod. i. 203; Strabo, p. 121; Mela, i. 1; iii. 6.)

The best editions of Mela are by Gronovius, Leyden, 1685, frequently reprinted; by Tschucke, 7 vols. 8vo, Leip., 1807; and the Bipont, 1809. Mela has been translated into English, by Arthur Golding, Lond., 1685 and 1590; into Italian, by Porcacchi, Ven., 1557; into German, by Dietz, 1774; and into French, by Fradin, 3 vols., 8vo, Paris, 1804.

MELANCHTHON, PHILIP (or MELANTHON, as he himself was most accustomed to write the name, according to Christ. Saxius, 'Onomast.' iii. 589), was born February 16, 1497, at Bretten or Bretheim, in the Palatinate of the Rhine, or Lower Palatinate, as it used to be called, the dominion of the elector palatine. His father was George Schwarzerde, or Schwarzerdt, and is called by Melchior Adam, the earliest authority, Magister Armorum, a description which has given rise to some controversy. It appears that whatever was the original condition of Melanchthon's father, he was a man of remarkable ingenuity in his profession, and had worked his way up to a situation of some distinction, that of principal engineer to the elector, before the birth of his son. According to Joachim Camerarius (in 'Vit. Ph. Melan.'), he was a native of Heidelberg, and came to take up his residence at Bretten upon marrying the daughter of John Reuterus, a person who had been mayor of that town. Reuterus, who lived till his grandson was eleven years old, has the credit of having been the chief superintendent of his earliest training. On the death of his grandfather, which was followed within a fortnight by that of his father, he was sent to the college of Pfortsheim, where the remarkable progress he had already made in his studies was continued at an answerable or an accelerated rate. At Pfortsheim he lodged in the house of a sister of the celebrated Greek scholar John Reuchlin, who was his relation, and it was from Reuchlin, who had translated his own Teutonic surname into the Greek formation Capnio, on the supposition of its connection with Rauch (smoke), that the young Schwarzerde, a compound, meaning, in English, 'black earth,' received the more melodious Grecised appellation of Melanchthon (quasi μέλαινα χθών), intended to signify the same thing; by which alone he is now known.

After spending about two years at Pfortsheim, Melanchthon was removed in 1509 to the University of Heidelberg, which however he quitted in 1512 for that of Tübingen, where he remained till, on the recommendation of his friend Reuchlin, he was in 1518 appointed, by the elector Frederick of Saxony, professor of Greek in the newly-established University of Wittenberg. This situation he held as long as he lived. It was at Wittenberg that Melanchthon became acquainted with Luther, then occupying the chair of theology in that university. In his young colleague the great reformer found, along with a ready disposition to imbibe his opinions in religion, a piety as sincere as his own, and an erudition greatly superior; while, if Melanchthon wanted the fiery energy and boldness, and the large heart of Luther, he was free also from some of the defects apt to attend upon such endowments of strength and passion, and, by the calmness, moderation, and gentleness of his whole nature, was formed both to temper the impetuosity of his friend, and to win admittance for their common views into minds of a certain class, and that by no means the lowest, which all the powers of the other might have assailed in vain.

Thus attached by the characteristics in which they were contrasted, as well as by those in which they resembled each other, they soon became the most intimate of associates and fellow-workers. After that of Luther, Melanchthon's is the most distinguished name in the history of the Reformation in Germany; and the remainder of his biography is chiefly the detail of his various labours in the promotion of that great cause. In 1519 he accompanied Luther to Leipzig, to hold a disputation on the divine original of the papal authority with Ecceus or Eckius, one of the ablest of the Roman Catholic champions of that age. For some years after this he was actively employed, not only in writing books in defence of the reformed doctrines, but in founding schools and colleges, in visiting churches, and in other services of the same kind, undertaken at the command of the elector.

In 1530 he was appointed by the general body of the reformers to draw up what was intended to be the conciliatory Confession, or exposition of their opinions, which was presented to the emperor at the diet held at Augsburg in March that year. Both Francis I. of France, and Henry VIII. of England, were desirous of obtaining the assistance of Melanchthon in their religious reforms, but circumstances interfered to prevent him from visiting either country. In 1540 and 1541 he maintained another great disputation with Ecceus, which was begun at Worms, and afterwards transferred to Ratisbon, where it was carried on before the diet, the emperor presiding in person. After the death of Luther, Melanchthon became involved in a bitter controversy with the more ardent spirits of his party, in consequence of his aversion to extreme courses, and especially the timidity he was accused of showing in his approval of the system of compromise between the two religions issued by the emperor in 1548, and after-

wards known by the name of the Interim, an approval in which, whether the circumstance is to be held honourable to him or the reverse, it must be admitted that he stood nearly alone among the distinguished men of both sides. He died at Wittenberg on the 12th of April 1560, leaving two sons and two daughters by his wife, the daughter of a burgomaster of that town, whom he had married in 1520, and who died in 1557. His numerous works, consisting of theological treatises, commentaries on several of the Greek and Latin classics, Latin poems, and some historical and philosophical writings, were published in a collected form in 5 vols. fol., at Basel, in 1544, and in 4 vols. fol., at Wittenberg, in 1664, again in 1680, and again in 1801.

Melanchthon principally contributed to the diffusion of the Aristotelian philosophy in Germany, both by his teaching and his writings, among which were his 'Elements of Logic and Ethica.' [ARISTOTELIS vol. i. col. 329-330.]

MELENDEZ VALDES, JUAN, a Spanish poet of the highest reputation, and of great influence on the literature of his country, was born at the town of La Ribera del Fraico, in Estremadura, on the 11th of March 1754, of parents in easy circumstances. After studying philosophy at Madrid, "or what was then taught as such," says his friend and biographer Quintana, he pursued the study of the law at the university of Salamanca, where he formed an intimate friendship with Cadalso the poet, then residing there, who was probably the first to call his attention to English literature, in which he became proficient. Cadalso, who was an officer in the army, was so well acquainted with the English language, that he is said to have turned it to account at the siege of Almeida, by entering into conversation with an English officer, who mistook him for a countryman, thus becoming possessed of the enemy's secrets. His life was finally cut short by an English grenade at the siege of Gibraltar in 1782. Melendez was, in later life, accustomed to say of himself that it was from 'Locke's Essay on the Understanding' he had first learned the reason, and he was so warm an admirer of Pope's 'Essay on Man' that he declared any four lines of that poem exceeded in value all that he ever wrote. Young and Thomson were also his especial favourites, and he imitated in passages the manner of both. Before he left the university he had composed a number of Anacreontics, many of them while he was on a diet ordered by his physicians, and some descriptive poetry, in which the influence of both Thomson and Geesner was discernible. In 1780 the Spanish Academy awarded a prize to his idyl of 'Batilo'; soon afterwards the academy of San Fernando awarded him another for a Pindaric ode on the Fine Arts; and in 1784, on the occasion of the conclusion of peace with England, when there were fifty-seven competitors for two prizes for a drama on the occasion, Melendez and another were the two successful dramatists. This play of 'Las Bodas de Camacho,' 'The Wedding of Camacho,' founded on an episode of Don Quixote, has however long sunk into neglect, while the poems which have been mentioned are still at the head of Spanish literature as models in their peculiar line. For grace and harmony of language, and for exquisite felicity of idiom, they are pronounced by the best native critics to be unrivalled by any other Spanish poems of the eighteenth century; but it has been justly remarked that their beauties are precisely of the kind which are certain to be brushed away by the hand of any translator however tender, and that to appreciate Melendez it is absolutely necessary to read him in the original. A volume of his collected poems appeared at Madrid in 1785, and had an unexampled success. "Four editions, one genuine and the others pirated, were exhausted," says Quintana, "at once." Melendez was generally acknowledged as the leading poet of his time, and a knot of young poets who clustered around him, Moratin the younger, Cienfuegos, Quintana, and others, were regarded as forming "the school of Melendez." He had been appointed a year or two before to the professorship of polite literature at Salamanca, he was happily married, and in possession of a fine library in which he took great pleasure, being always curious in books, and he passed his time in the cultivation of literature, partly at Salamanca and partly at Madrid, where like our own Anacreon of some twenty years later at London, he was, says Quintana, the "spoilt child of society and the Muses." His friends were therefore surprised to find that in 1788, seized with the ambition of being something more than a poet, he relinquished all these advantages to follow the profession of the law, in which however he was remarkably successful, and became one of the most distinguished ornaments of the Spanish bar. He held several high legal offices at Valladolid and elsewhere, and was noted for his readiness and diligence in dictating official papers as fast as they could be written.

In 1797 appeared at Valladolid a fresh collection of his poems, now augmented to three volumes, but the additional pieces, which were chiefly of a graver and more philosophical character than his earlier ones, were far from equalling them in merit. The whole collection was dedicated to Godoy, the then all-powerful favourite, and included a poetical epistle to Godoy and another to Jovellanos, who had been the intimate friend of Melendez from early days in Salamanca. At that time, when Melendez was in favour with the favourite, and Jovellanos was minister of justice, it was generally considered that he was certain of attaining, as soon as opportunity offered, to the highest judicial posts. In fact, in March 1798, he was appointed "Fiscal of the House

f Alcaides" at Madrid; and his first appearance was as the accuser in the case of the murder of Castillo, one of the most celebrated causes in the history of Spanish jurisprudence, and which was then attracting the attention of all Spain. On the 27th of August, in the same year, Melendez received an order to leave Madrid in four-and-twenty hours. The fall of Jovellanos, whom Godoy had just overpowered in the ministry, drew with it that of his friend. Banished from the capital without a word of explanation or accusation, and afterwards, just as he thought himself on the point of reinstatement, again plunged in disgrace, it was not till 1802 that Melendez obtained permission to settle in Salamanca, nor till 1808 that, on the fall of Godoy by the revolution of Aranjuez, he was recalled to the capital. The outrages offered to his country in that year by the French called forth two poems under the title of 'Alarmas Españolas,' but these were quite unworthy of the fame of Melendez, and only made remarkable by his subsequent career. The idea took possession of him, probably fostered by the wrongs he had himself suffered, that the old order of things in Spain had come to an end, and he had the weakness to pass over to the French party, and to allow himself to be sent by Murat on a mission to Asturias, in company with the Count del Pinar, to appease the excitement of the people.

Never, says Quintana, was a weakness more terribly expiated. As they entered Ovidio the delegates were met by an exasperated mob, who tore them from their carriage, and to protect their lives they were lodged by the authorities in the prison. The mob soon repented of its clemency in allowing them to escape its hands, burst open the prison doors, and dragged out the captives for instant execution. Melendez endeavoured to assuage their fury by reciting one of his recent patriotic odes, but this had no effect, and it was only as a great favour that the intended victims were allowed a confessor. Melendez had the presence of mind to make his confession as long as they would allow, but at last even that was ended, and he was tied to a tree, while a body of the men planted themselves in front with their loaded guns ready to fire. Fortunately for him it struck them that to be shot in the breast was too honourable a death for a traitor, and they untied him and tied him again in a position to be shot in the back. This delay saved him. The 'Cabildo,' or town-council, made its appearance at the moment with some ecclesiastics, bearing the Host, and succeeded in carrying off the prisoners in a procession to the cathedral. A few days after, Melendez and his companion were dismissed, and they made their way in safety back to Madrid. The warning he had received would, it might have been imagined, have been found sufficient, but it proved otherwise. A name so distinguished was of value to the French party, and the persuasions of Joseph Bonaparte, and it has been said, a few blandishments from Napoleon in person, were sufficient to induce Melendez to accept the offices of counsellor of state and minister of public instruction under the government, of which his best friends Jovellanos, Quintana, and Cienfuegos, were either the antagonists or the victims.

In the general ruin of the French cause he was of course involved, and he shared the retreat of the French army from the capital to the frontier. As he arrived on the banks of the Bidassoa he went on his knees to kiss the soil of Spain, which he was then, in his sixtieth year, about to leave for the first time, and he exclaimed with a sad presentiment, "I shall never tread thee more." The prophecy proved true. After four years of poverty and obscurity, alleviated by a slight pension from the French restored government and the tender attentions of some of his countrymen, Melendez, who had been previously struck with paralysis, died at Montpellier on the 21st of May 1817, in the arms of his wife and nephew. He had no children.

The early poems of Melendez, especially the 'Anacreontics,' still retain their fame. In his later years he made alterations in them which he considered improvements, but as in the case of several other poets, the first reading has had the abiding favour of the public. The standard edition of his works is one in four volumes, published in Madrid in 1820 at the expense of the Spanish government, with the life by Quintana, to which reference has previously been made. A small volume was published at Madrid in 1821 of his 'Discursos forenses' or 'Legal Discourses,' including among others one in which he contends in favour of a legislative measure to forbid the street ballads in which the deeds of smugglers and robbers are held up for approbation, and to substitute for them compositions on the great historical deeds of Spaniards and the discovery of America, &c., for which he was of opinion that prizes should be offered by the government.

MELI, GIOVANNI, was born at Palermo, in Sicily, about 1740. He studied medicine, in which science he took the degree of doctor, and afterwards became professor of chemistry in the university of his native city. But he is best known for his poetical compositions in the vernacular dialect of Sicily, which have earned him the name of the modern Theocritus. His pastoral poems are equal to any compositions of the same kind which Italy has ever produced. The luxuriant beauty and variety of Sicilian scenery inspired the author, who has faithfully portrayed in his eclogues the various appearances of the seasons in that fine climate, as well as the rich tints of the sky, the wild features of the mountains and coasts, the occupations of the shepherd and the husbandman; and he has enlivened his description with love-songs, which have become popular in Sicily, and have been set to music for the favourite native instrument, the guitar. Meli

has excelled particularly in his 'Eloghe Pescatorie,' or fishermen's dialogues, in which he has borrowed the peculiar language and humour of that class of people. Unlike Guarini, Tasso, and other courtly writers of pastoral poetry, Meli makes his shepherds, husbandmen, and fishermen speak their own homely and unpretending language, which is nevertheless susceptible of poetical imagery. The seventh idyll describing the lamentation and the miserable end of Polemuni, a man persecuted by fate, and forsaken by his fellow-creatures, is in a loftier key.

Meli's odes, which fill the second volume of his works, are mostly amorous, though not indecent. Some of them are exquisitely finished, such as 'Lu Labbru' (the lip), and 'Lu Pettu' (the breast). An Italian version of them has been published by Professor Rosini of Pisa, which however is inferior in gracefulness to the original.

Meli has written a mock heroic poem, under the title of 'Don Chisciotti' (Don Quixote), in twelve cantos, which is a sort of imitation of Cervante's celebrated novel. It abounds with beauties of detail, but the ludicrous prevails throughout, and often becomes mere farce. He also wrote a volume of fables, besides satires, some of which reflect on peculiar features of Sicilian life and manners, and other minor poems. His works were collected and published at Palermo, under his own revision, in 1814, in seven volumes. King Ferdinand granted the author a copyright for ten years, and gave him also a small pension, for which the author expresses his gratitude in one of his compositions. Meli died, not long after, at an advanced age, December 20, 1815.

The Sicilian dialect has assumed, under his pen, a delicacy of refinement which places it foremost among the written languages of Italy. Some remarks on the Sicilian and other Italian dialects, with specimens of their poetical capabilities, are given in an article 'On the Study of the Italian Language and Literature,' in No. X. of the 'Quarterly Journal of Education;' see also an article 'On the Dialects and Literature of Southern Italy,' in No. IX. of the 'Foreign Quarterly Review,' November 1828.

ME'LITO, SAINT, was bishop of the church at Sardinia, in Lydia, in the 2nd century. He is supposed by some to have been the angel of the church at Sardinia, to whom St. John addressed the epistle in Rev. iii. 1-6; but this conjecture is not supported by any ancient writer, and it is also improbable on account of the length it assigns to the episcopate of Melito.

By Polycrates, bishop of Ephesus, in the 2nd century, he is called "Melito the Eunuch," probably because he lived in celibacy, in order the better to discharge the duties of his office: the same writer adds, that he was guided in all his conduct by the influence of the Holy Spirit (Euseb., 'Hist. Ecc.,' v. 24.) Tertullian, as quoted by Jerome, praises his eloquent and oratorical genius, and says that he was thought by many to be a prophet. Yet he has been charged with heterodoxy; but upon no better ground than the titles, or perhaps a misunderstanding of the titles, of one or two of his works. During the persecution of the Christians in the reign of Marcus Antoninus, Melito wrote an apology for them. It is addressed to the emperor, but we are not told whether it ever reached his hands. Eusebius, who has preserved an extract from this apology, places it in A.D. 170; Tillemont assigns to it the date of 175; Basnage and Lardner, that of 177. Melito died and was buried at Sardinia before the end of the 2nd century.

Eusebius and Jerome have given lists of Melito's works, of which the most important is a 'Catalogue of all the Books of the Old Testament which are universally acknowledged.' This is the earliest catalogue of the Old Testament Scriptures found in any Christian writer. It was obtained, as Melito himself informs us, in Palestine, whither he had travelled on purpose to procure it. It contains all the books at present received as canonical, except Nehemiah and Esther, of which the former is probably included under 'Kedras' (Ezra). The 'Proverbs of Solomon' are also called 'Wisdom.' Melito wrote a book on Easter, a fragment of which is preserved by Eusebius, on the occasion of a controversy which arose in Laodicea concerning the time of keeping that feast. All his other works are lost; but from the title of one of them, 'Concerning the Devil and the Revelation of John,' Lardner thinks it probable that he received the Apocalypse as canonical, and ascribed it to the apostle John. All the remaining fragments of Melito's writings have been collected by Routh, 'Reliquiæ Sacræ,' vol. i.

(Eusebius, *Hist. Ecc.*, iv. 26; Hieronymus, *De Vir. Illust.*; Du Pin, *Ecc. Hist.*, cent. 2; Cave, *Lives of the Fathers*, vol. i., p. 179; Lardner, *Credibility*, part ii., c. 15.)

MELLAN, CLAUDE, a distinguished French engraver, was born at Abbeville in 1598. He studied painting in Rome under the then celebrated Vouet; but he soon gave up painting for engraving, which from that time became his chief business. He remained some years in Rome, and engraved many plates there, executed in the ordinary method of line-engravers. He did not altogether adopt his own peculiar method of engraving by a single line until his return to France. He latterly executed all his plates by single lines; that is, instead of crossing one set of lines by a second or even a third set, where great depth was required, he accomplished a similar effect by merely thickening the single set of lines; the varieties of light and shade he produced wholly by varying the thickness of the line. Mellan

carried this peculiarity to a great extreme on one occasion: he engraved a 'Sancta Veronica,' or the Face of Christ, as large as life, by a single spiral line, commencing at the end of the nose; the execution is beautiful, and it is an extraordinary monument of patience and perseverance, but what it has gained in singularity it has lost in effect as a work of art. He made two preparatory drawings for this print: one is in the Imperial Library at Paris. Mellan's prints are very numerous; they amount, according to some accounts, to upwards of 500: many of them are after his own designs. His masterpieces are—'Rebecca at the Well,' after Tintoretto; 'St. Peter Nolasco borne by two Angels,' after a design by himself; and 'Pope Urban VIII,' after Bernini. He enjoyed a great reputation during his lifetime: Charles II. invited him to England, and Louis XVI. granted him an annual pension, and gave him apartments in the Louvre. He died at Paris, on the 9th of October, 1688. (Florent Le Comte, *Cabinet des Singularités, &c.*; Huber, *Manuel des Amateurs, &c.*)

MELMOTH, WILLIAM, bencher of Lincoln's Inn, born in 1666, died in 1748. The work by which his name is known is 'The great Importance of a Religious Life,' a book of which the author was not known till after his death, and which was ascribed by Walpole to the first Earl of Egmont. Nichols mentions, in his 'Literary Anecdotes,' that since the death of Melmoth to his time above 100,000 copies of this work had been sold. It has now passed into entire oblivion.

MELMOTH, WILLIAM, son of the above, was born in 1710. He was appointed commissioner of bankrupts by Sir Eardley Wilmot. He was an accomplished scholar, though not educated at either university, and his translations of the Epistles of Pliny, those of Cicero to his friends, and the treatises on Old Age and Friendship, are generally allowed to be the best in the English language. These translations are made in an easy and pleasing but rather diffuse style. He was the writer of 'FitzOsborne's Letters,' containing dissertations both moral and literary. He wrote a treatise on the Christian Religion; Memoirs of his father; and a poem on Active and Retired Life, in Doddsley's 'Collection,' which is characterised by smooth versification and sound morality. He was twice married, first to the daughter of the well-known Dr. King, secondly to Mrs. Ogle; and died in 1799.

MELVILL, or MALEVILL, GEOFFREY DE, of Melville Castle, in the shire of Edinburgh, first appears in the records about the middle of the 12th century, when he is designated by King Malcolm IV., "Vicecomes meus de castello puellarum," that is to say, sheriff of Edinburgh. There was then no sheriff of the shire of Edinburgh; none had yet been constituted, nor for some time afterwards; and the public business was in all likelihood principally transacted in the castle, of which he was said to be sheriff. In the same reign and forwards to the year 1171, Melvill was lord-justiciar of "Scotland," then strictly so called, or the territory of the king of Scots north of the Frith of Forth; the district south of the Forth (once a part of Northumberland) long continuing a distinct territory under the name of "Lothian," and having its own separate justiciar. Melvill is the earliest justiciar of Scotland yet discovered in our records. The time of his death is uncertain. He had a younger son Philip, who by his marriage obtained the barony of Monethyn in the Mearns. Philip de Malevill, the son of the said Philip, was sheriff of the Mearns about the year 1200. In 1222 he was made sheriff of Aberdeen; and in 1240 a joint-justiciar of Scotland with Richard de Montalt.

MELVILL, REV. HENRY, B.D., was educated at the university of Cambridge, where he took the degrees of B.A. and M.A., and became a tutor and fellow of St. Peter's College. Having taken holy orders, he received the appointment of minister of Camden Chapel, Camberwell, London, and in 1828 published a volume of 'Sermons by Henry Melvill, M.A.,' and a second volume in 1838. In 1836 he published at Cambridge, by request of the university, 'Sermons preached before the University of Cambridge, during the Month of February 1836; also Two Sermons preached in Great St. Mary's Church, at the Evening Lecture,' 8vo, and a similar course in the years 1837 and 1839. He had become greatly distinguished for his eloquence as a preacher. He received the degree of B.D., was appointed chaplain to the Tower of London, and published 'Sermons on certain of the less prominent Facts and References in Sacred History,' 8vo, vol. i. in 1843, and vol. ii. in 1845, after he had been appointed Principal to the East India College at Haileybury, Hertfordshire. In 1846 he published a volume of 'Sermons on Public Occasions,' 8vo. He was next elected to what is commonly known as the Golden Lectureship, and having completed his first annual course, there was published 'The Golden Lectures: Forty-Eight Sermons delivered at St. Margaret's Church, Lothbury, on Tuesday Mornings, from Jan. 1. to Dec. 31, 1850,' 8vo, London, and similar courses for the subsequent years. These Sermons first appeared in 'The Pulpit,' and were published without Mr. Melvill's sanction. Mr. Melvill has also published 'Thoughts suggested by the Season and the Days,' 12mo. He was selected to preach before the House of Commons on the day of the general fast in March 1855, and has been appointed Chaplain in Ordinary to the Queen. Having been appointed a canon of St. Paul's Cathedral in 1856, he resigned the Golden Lectureship. A selection of sermons has been published under the title of 'Voices of the Year; a course of Expository Readings, appropriated to the

Sundays and Holidays throughout the Year, chiefly selected from the Golden Lectures delivered by the Rev. Henry Melvill, B.D. (Chaplain in Ordinary to her Majesty) in the Church of St. Margaret, Lothbury.' 2 vols, crown 8vo, London, no date.

MELVILLE, ANDREW, was born on the 1st of August 1541. He was the youngest of the nine sons of Richard Melville of Baldor, a small estate on the banks of the South Esk, near Montrose; and he had the misfortune to lose both his parents when only about two years old, his father falling at the battle of Pinkie in 1547, and his mother dying in the course of the same year. The care of young Melville devolved upon his eldest brother, who was minister of the neighbouring parish of Maritoun after the establishment of the Reformation in 1560. The year preceding this, Melville, then at the age of fourteen, was removed from the grammar-school of Montrose, where he had been for some time, to St. Mary's College, in the university of St. Andrews. This place he left in 1564, with considerable reputation for proficiency in philosophy and the languages; and repairing to the Continent, entered himself a student in the university of Paris, where he remained two years, when, in order to acquire a more perfect knowledge of the civil law, he proceeded to Poitiers. He had scarcely arrived there when, such was the opinion entertained of him, that though a stranger and only twenty-one years of age, he was made a regent in the College of St. Marceon. He continued in this situation for three years, prosecuting at the same time the study of the law when, on account of the political disturbances of the place, he retired to Geneva, and was there, by the influence of Beza, appointed to the chair of humanity in the Academy, which happened to be then vacant. When he received this appointment he was, as to pecuniary means, in a state of almost total destitution. Leaving his books and other effects behind him, he had set out on his journey to Geneva on horseback along with a young Frenchman, who wished to accompany him, and on reaching their destination the joint fund of the two travellers did not exceed a crown. The quarter's salary, which was advanced to Melville at his admission to the chair, proved accordingly a most reasonable relief. Geneva was a scene to which the mind of Melville often recurred in after-life. It was there he made that progress in Oriental learning for which he became so distinguished. There also he enjoyed the society of some of the best and most learned men of the age; but above all it was there the hallowed flame of civil and religious liberty began to glow in his breast, with a fervour which continued unabated ever after. He left Geneva in the spring of 1571 at the urgent request of his friends at home, and returned to his native country after an absence altogether of about ten years. On this occasion Beza addressed a letter to the General Assembly, in which, among other expressions of a like kind, he declared that Melville was "equally distinguished for his piety and his erudition, and that the Church of Geneva could not give a stronger proof of affection to her sister church of Scotland than by suffering herself to be bereaved of him that his native country might be enriched with his gifts." It was about this time Melville seems to have made his first appearance as an author. His earliest publication consisted of a poetical paraphrase of the 'Song of Moses,' and a chapter of the Book of Job, with several smaller poems, all in Latin, and worthy of the disciple of Buchanan, as he terms himself.

On Melville's arrival in Edinburgh, in July 1574, he was invited by the regent Morton to enter his family as a domestic tutor; but the invitation was declined by Melville, who was averse to a residence at court, and preferred an academic life. He was early gratified in his wish; for shortly afterwards he was appointed by the General Assembly Principal of Glasgow College. Here his learning, energy, and talents were eminently serviceable, not only to the university, in which he presided, but to the whole kingdom and to literature in general. He introduced improvements in teaching and discipline, of great importance, and infused an uncommon ardour into his pupils. His very table-talk and conversation were so interesting and instructive that the master of the grammar-school, who was afterwards principal of the college, used to say "he learned more of Mr. Andrew Melville cracking and playing, for understanding of the authors which he taught in the school, than by all his commentators." It was not however as a mere scholar or academician that Melville was distinguished. He took a prominent part in the ecclesiastical disputes of the time, and was active in the church courts and in the conferences held with the parliament and privy-council on the then much agitated subject of church government. To him is generally ascribed the overthrow of Episcopacy at that time and the establishment of Presbytery, and he commonly went afterwards by the name of Episcopomastix, or the ' scourge of bishops.' His intrepidity was often very remarkable. On one occasion, when threatened by the regent Morton in a menacing way, which few who were acquainted with his temper could bear without apprehension, Melville replied, "Tush, man! threaten your courtiers so. It is the same to me whether I rot in the air or in the ground; and I have lived out of your country as well as in it. Let God be praised; you can neither hang nor exile his truth!"

Another matter to which the attention of the General Assembly was at this time directed was the reformation and improvement of the universities. Here Melville also took a leading part. At the end of the year 1580 he was translated from Glasgow to be principal of St. Mary's College in the University of St. Andrews, where he distin-

ished himself by his usual zeal and ability. Besides giving lectures on theology, he taught the Hebrew, Chaldee, Syriac, and Rabbinical languages, and his prelections were attended not only by young students in unusual numbers, but also by several masters of the other colleges. In these scholastic labours however he did not lose sight of the condition of the Church, and being called on to open an extraordinary meeting of the General Assembly in 1582, he inveighed in his sermon in strong terms against the arbitrary and oppressive measures of the court. His boldness gave offence to the regent; and shortly afterwards he was cited before the privy council on a charge of high treason founded on some expressions which it was alleged he had made use of in the pulpit. The charge was not proved; but being determined to silence him, the privy council found him guilty of behaving irreverently before them, and sentenced him to imprisonment, and to be further punished in his person and goods as his Majesty should see fit. Fearing his death was ultimately intended, he was urged by his friends to make his escape; and accordingly, leaving Edinburgh, he went first to Berwick and then to London, where he remained till about the end of 1585, when, Arran being driven from the court, Melville returned to Scotland after an absence of about twenty months, and resumed his former station in the university. His sincerity and zeal however were by no means agreeable to the king, who wished to assume an absolute control over the affairs of the Church; and, in order to accomplish his wish to get rid of him, the king had recourse to one of those stratagems which James thought the essence of 'king-craft.'

In May 1606, after the king had ascended the English throne, Melville received a letter from his Majesty desiring him to repair to London that his Majesty might consult him and others of his learned brethren on ecclesiastical matters. Melville and others went accordingly, and had various interviews with the king, who at times condescended even to be jocular with them; but they soon learned that they were interdicted from leaving the place without special permission from his Majesty. Melville having written a short Latin epigram, in which he expressed his feelings of contempt and indignation at some rites of the English church on the festival of St. Michael, was immediately summoned before the privy-council, found guilty of 'scandalum magnatum,' and, after a confinement of nearly twelve months, first in the house of the Dean of St. Paul's, and afterwards in that of the Bishop of Winchester, was committed to the Tower. Here he was kept a prisoner till February 1611, a period of about our years, when, at the solicitation of the Duke of Bouillon, who wished his services as a professor in the University of Sedan, he was permitted to depart the kingdom.

In 1620 his health, which had previously been slightly impaired, grew worse, and in the course of the year 1622 he died at Sedan, in the seventy-seventh year of his age, but under what circumstances is not accurately known.

Melville appears to have been low in stature and slender in his person, but possessed of great physical energy. His voice was strong, his gesture vehement, and he had much force and fluency of language, with great ardour of mind and constancy of purpose. His natural talents were of a superior order; and perhaps his biographer was not far wrong in saying, "next to the Reformer I know no individual from whom Scotland has received such important services, or to whom she continues to owe so deep a debt of national respect and gratitude, as Andrew Melville."

(M'Crie, *Life of Melville*.)

MELVILLE, or MELVIL, SIR JAMES, is supposed to have been born in 1535. He was the third son of Sir John Melville of Raith, one who early joined the party of the Reformation in Scotland, and after suffering from the animosity of Cardinal Beaton, at length fell a victim to his successor, Archbishop Hamilton, in 1549. Young Melville, then about fourteen years old, was upon this, it seems, sent by the queen dowager's influence and direction, and under the protection of the French ambassador returning to France, to be a page of honour to the youthful Mary, queen of Scotland. He appears however to have continued in the ambassador's employ till 1553, when he got into the service of the constable of France. He afterwards made a visit to the court of the Elector Palatine, and being well received, remained there for some time, but ultimately came to Scotland. It would be a fruitless task to follow the knight in all his missions and movements. He was a courtier in the strict sense of that term; one to whom a court was the whole world, and its principles of action the great code of duty. He appears to have had a high idea of his own importance, and sometimes blames himself for the unfortunate tamper, which he says he possessed, of finding fault with the proceedings of the great. All this and much more we learn from the elaborate memoirs of his own life and times, which he was careful to write for the benefit of posterity. Two mutilated editions of this curious work were published in English, besides a French translation, but an accurate edition was published some years since from the original manuscript. Sir James died on the 1st of November 1607.

MEMLING, HANS, or JAN, until recently more commonly called HEMLING, and sometimes HEMMELINCK, and MEMMELINCK: Memling appears to be the correct form. Like his name, the place of the birth of this admirable painter of the old Flemish or German school of the

15th century, has been the subject of much discussion. Dr. Boisseree writes his name Hemling, and upon the strength of a manuscript found by Herr von Laasberg at Eppishausen, near Constance, has assumed Constance to be the place and 1439 to be the date of his birth. This date is later, though approximate to the common account, and accords with the dates on most of his pictures. Van Mander calls him Memmelinck, and a native of Bruges: according to some accounts he was born at Damme, near Bruges, about 1425. As regards the spelling of his name, it is shown by M. de Bast, of Ghent, that the initial letter of the name on his pictures is the same letter as the initial of Maria on a coin of Mary of Burgundy, and in many other names commencing with M in documents of the period. It is the capital M of that time, though more like the modern H: it very much resembles an H with an additional short stroke in the middle, reaching from the under side of the cross line to the bottom of the letter; or somewhat like a small Roman m, the two outside strokes being twice the height of the middle one. This peculiar letter however occurs in two instances as an H also; the question can therefore scarcely be said to be absolutely decided. Because a Hans Hemling, or Memling, is mentioned in a German manuscript, it does not follow of necessity that he is identical with the celebrated painter of this name; nor, on the other hand, does Memling's residence in Bruges prove that he was a Fleming, as he may have been attracted there by the fame of John van Eyck. Marcus van Vaernewyck, in his 'Historie van Belgien,' 1565, notices a German painter of the name of Hans who lived at Bruges, and he alluded very probably to Memling. Vasari also apparently alludes to Memling when he speaks of Ausse (Anese) of Bruges. The dates of Memling's pictures range, according to the printed accounts, between 1450 and 1491. The date 1450 is found on the portrait, at Venice, of Isabella of Aragon, wife of Philip of Burgundy; this picture is mentioned in the anonymous 'Journal' published by Morelli in 1800—"Notizia d'Opere di Disegno nella prima Metà del Secolo XVI, esistenti in Padova, Cremona, Milano, Pavia, Bergamo, Crema, e Venezia, scritta da un Anonimo di quel Tempo," in which the painter is called Mamelino, or Memelingo. If this date be correct, Memling must have been born before 1439, and cannot have been the Hans Hemling of Constance. The date 1491 is found on a large altarpiece in the cathedral, Lubeck. Still later he is reported to have finished some paintings for the Carthusian convent of Miraflores near Burgos in Spain, in which he is said to have died not long afterwards: the account is given by Ponz, in his 'Viage de España.' This convent was destroyed by the French in 1812. The ascription of these works to Memling rests on his identification with the Juan Flamenco of Flanders who was at Miraflores between 1496 and 1499, and perhaps later. He probably also visited Italy and Germany, and certainly Cologne; and he is said to have served Charles the Bold, duke of Burgundy, both as painter and as warrior. The story is, that he was at the battles of Granson and Morat in 1476, and in the beginning of 1477 was admitted, ill from wounds and destitute, into the Hospital of St. John at Bruges, a religious institution, into which, by provision of its foundation, none but inhabitants of Bruges or Maldegheem could be admitted. It was during his residence in this hospital that he painted the beautiful pictures which still adorn that establishment and Bruges, and have placed his name among the first of the painters of the 15th century.

The principal work by Memling in this hospital is the history, in minute figures, of St. Ursula and her companions, exquisitely painted in oil, in many compartments, upon a relic case of a gothic design, known as La Châsse de Sta. Ursula. This châsse, or shrine, has been made the subject of a special work by Baron von Keverberg, entitled 'Ursule, Princesse Britannique, d'après le Légende, et les Peintures d'Hemling,' Ghent, 1818. The paintings have been drawn in lithography by Messrs. Manche and Ghemard. Memling painted also during his stay in this hospital the small picture of the 'Adoration of the Magi,' and the splendid large altarpiece of the 'Marriage of St. Catherine,' both of which are still there.

The 'Marriage of St. Catherine,' in which the figures are much larger than is usually the case in Memling's works, was painted in 1479, and is one of the most brilliant pictures of the 15th century. It is in three compartments, a centre and two revolving wings. In the centre is the marriage of St. Catherine, attended by angels and various saints; and in the background are painted episodes illustrating the lives and martyrdoms of the attendant saints and of St. Catherine herself. The left wing is the beheading of John the Baptist; the right wing is the vision of John the Evangelist in the island of Patmos: the last is a remarkably comprehensive composition. On the exterior of the left wing are two Hospital Brothers, the Apostle James and St. Antony of Padua; on the right exterior are two of the Hospital Sisters, with saints Agnes and Clara. There is an inscription on this work, but, as it has been renewed, it cannot be taken as an authority in a difference respecting the signification of letters. There are three other pictures by Memling in this hospital: a 'Descent from the Cross,' on wood, with two wings; the 'Madonna and Child,' with a portrait of Martin van Nieuwenhoven, burgomaster of Bruges in 1497, on two panels closing one upon the other, painted in 1487; and a female, inscribed 'Sibylla Sambetha quæ et Perica an: ante Christ nat. 2040.' There are other works by this painter in the Academy of Arts, and in other buildings of Bruges.

There are also pictures attributed to Memling at the Hague, at Antwerp, at Louvain, at Berlin, and at Munich. Our National Gallery has two pictures by him: 'The Virgin Enthroned,' and a 'Virgin and Child.' The nine works attributed to him at Munich are worthy of all the praise that has been bestowed upon Memling: they were nearly all formerly in the Boisseree collection. Of these nine the following are remarkable pictures:—'Israelites collecting the Manna;' 'St. Christopher carrying the infant Christ;' 'Abraham and Melchisedek;' the 'Seizure of Christ in the Garden;' a 'Sancta Veronica,' or Face of Christ; and, above all, the 'Joys and Sorrows of the Virgin,' and the 'Journey of the three Kings from the East,' with their numerous retinues, six feet wide by two feet and a half high. Few pictures can have cost so great an amount of labour as this last mentioned. Besides an extensive and elaborate landscape covering almost the whole panel, for the point of sight is very high, it contains about fifteen hundred small figures and other objects of various kinds, all executed with the minutest attention to detail, with extreme care, and with a clearness and brilliancy of colouring which could not easily be surpassed, and has certainly seldom been equalled. Memling, not satisfied with the mere representation of the epiphany or the adoration of the kings, has represented them in every stage of their expedition from the setting out to the accomplishment of their mission; he has represented all the countries they journeyed through, and, in the extreme distance, even their own kingdoms and homes, with their cities and their palaces. In the foreground are represented also, besides the nativity and adoration of the kings, the flight into Egypt, the murder of the Innocents, and the other principal events of the life of Christ, to his ascension, and to the descent of the Holy Ghost. The figures range in size from about six inches to one, and the whole is well modelled and arranged, and harmonious in light and shade and colour.

Rathgeber enumerates upwards of one hundred pictures which are attributed to Memling, but few of them can be authenticated. Some of them have been lithographed by Strizner. Memling also decorated missals and other books of church service: there is one in the library of St. Mark at Venice. There are other similar works attributed to him in different parts of Europe.

The date and place of Memling's death are as uncertain as those of his birth, but it occurred prior to December, 1495.

MEMMI, SIMONE, or SIMONE DI MARTINO, was a very celebrated Italian painter of the 14th century. Though he is called Memmi by Vasari and Lanzi, Martini appears to be the more correct name, as Martino was the name of his father, and he has inscribed his name as Simon Martini upon some of his works. Memmo, or Guglielmo (William), was the name of his father-in-law, and he is said to have also inscribed himself Memmi upon some of his pictures. He was born at Siena about 1284, or 1285: he is supposed by some, upon the authority of Vasari, to have been the pupil of Giotto, which Rumohr and others consider scarcely possible. He was the rival of Giotto: Petrarch speaks of the two together in one of his letters in the following terms: "I have known two excellent painters, Giotto, a citizen of Florence, whose fame among the moderns is immense, and Simone of Siena." Simone now owes his fame chiefly to Petrarch: they were both living at the same time at Avignon during the residence of the popes there, and Simone painted the portrait of the celebrated Madonna Laura for the poet, who, through admiration and gratitude, wrote two sonnets on the painter (Son. 56 and 57), by which he has given him an undying name. Few of Memmi's works now remain, and these are dry and meagre performances. The principal are the frescoes of the chapter of the chapel Degli Spagnuoli at Florence, painted in 1332: they consist of stories from the lives of Christ, San Domenico, Saint Peter Martyr, and part of the history of the order of the Dominicans or Predicants. In one of the last works are the reputed heads of Petrarch and Laura, but this story, as Lanzi says, is a mere fable, for Memmi did not paint Laura until four years after the completion of these works, in 1336, after he was invited to Avignon. [GADDI, TADDEO.] There are also some stories by Memmi, from the life of San Ranieri, in the Campo Santo at Pisa; they are engraved in Lasinio's 'Pittura del Campo Santo.'

Simone painted also in miniature. There is a manuscript of Virgil, with the commentary of Servius, now in the Ambrosian Library at Milan, but formerly in the possession of Petrarch, which is preceded by a miniature (supposed to have been made at the instance of Petrarch) of Virgil seated with his pen in his hand, invoking the poetic muse; before him is Æneas in armour, with his sword, representing the Æneid; there are likewise a shepherd and a tiller of the soil, representing the Bucolics and Georgics; and Servius is also there, drawing a fine veil to himself, as symbolical of the elucidation of his commentary. Memmi died at Avignon in 1344.

Notwithstanding Vasari's encomium upon the style of Memmi, which he said was worthy of one of the moderns, his remaining works are not at all beyond his age, and he was surpassed by the two Gaddi: his design is meagre and ugly. Of his portrait of Laura nothing whatever is known. The reputed head of Laura above mentioned is engraved in D'Agincourt's 'Histoire de l'Art par les Monuments,' *Paint. pl. cxxii. 2*, and in Cicognara's 'Storia della Scultura,' i. pl. 48. Cicognara has disputed the authenticity of this and some other reputed portraits of Petrarch and Laura, at consider-

able length in the third volume of his History. The only authentic portrait of Laura extant, of that age, appears to be a miniature in a manuscript in the Bibliotheca Laurentiana at Florence, which however may have been copied from the original work by Memmi: there is an outline of this also in Cicognara's work, i. pl. 42.

LIPPO MEMMI, the brother-in-law of Simone, assisted Simone in some of his works, and completed others which were left unfinished at his death. He was not equal to Simone, though a better colourist than he: there are a few of his works still extant. He was living in 1361.

MEMNON, a personage frequently mentioned by Greek writers. He is first spoken of in the 'Odyssey,' as the son of Eos, or the morning, as a hero remarkable for his beauty, and as the vanquisher of Antilochus (iv. 188; xi. 521.) Hesiod calls him the king of the Ethiopians, and represents him as the son of Tithonus. ('Th.,' 985.) He is supposed to have fought against the Greeks in the Trojan war, and to have been killed by Achilles. In the *Vvxoσpaia*, a lost drama of Æschylus, the dead body of Memnon is carried away by his mother Eos. ('Fragm.,' No. 261, Dindorf.) He is represented by most Greek writers as king of the Ethiopians, but he is also said to have been connected with Persia. According to Diodorus (ii. 22), Tithonus, the father of Memnon, governed Persia at the time of the Trojan war, as the viceroy of Teutamus, the Assyrian king; and Memnon erected, at Susa, the palace which was afterwards known by the name of Memnonium. Diodorus also adds that the Ethiopians claimed Memnon as a native of their country. Pausanias combines the two accounts: he represents Memnon as a king of the Ethiopians, but also says that he came to Troy from Susa, and not from Ethiopia, subduing all the nations in his way. (Paus., x. 31, § 6; i. 42, § 2.) Æschylus also, according to Strabo, spoke of the Cissian, that is, Susian, parentage of Memnon (xv., p. 720): and Herodotus mentions the palace at Susa, called Memnonia, and also says that the city itself was sometimes described under the same name. (Herod. v. 53, 54; vii. 151.)

The great majority of Greek writers agree in tracing the origin of Memnon to Egypt or Ethiopia in Africa; and it is not improbable that the name of Memnon was not known in Susa till after the Persian conquest of Egypt, and that the buildings there called Memnonian by the Greeks were, in name at least, the representative of those in Egypt. (British Museum 'Egyptian Antiquities,' i., p. 267.) The partial deciphering of the Egyptian proper names affords us sufficient reason for believing, with Pausanias (l. 42, § 2), that the Memnon of the Greeks may be identified with the Egyptian Phamenoph, Phamenoth, Amenophis, or Amenothph; of which name the Greek is probably only a corruption. Phamenoph is said to mean 'the guardian of the city of Ammon,' or 'devoted to Ammon,' 'belonging to Ammon.'

Memnon then must be regarded as one of the early heroes or kings of Egypt, whose fame reached Greece in very early times. In the 18th dynasty of Manethon the name of Amenophis occurs, with this remark:—"This is he who is supposed to be the Memnon and the vocal stone." He is Amenophis II., and the son of Thutmosis, who is said to have driven the shepherds out of Egypt.

There are many colossal statues in Egypt, which have been called Memnonian, of which the most celebrated is the vocal statue described by Strabo and Pausanias. At sunrise a sound was said to proceed from this statue, which Pausanias compares to the snapping of a harp or lute string (i. 42, § 3). Strabo states that he heard the sound himself, in company with Ælius Gallus (p. 816); and Tacitus relates that Germanicus also heard the sound. ('Ann.,' ii. 61.) This statue is identified, by the descriptions of Strabo and Pausanias, with the northernmost of the two colossal statues in the Theban plain, on the west bank of the Nile. Its height, according to modern travellers, is about 50 feet; and its legs contain numerous inscriptions in Latin and Greek, commemorating the names of those who had heard the sound. Most of these inscriptions belong to the period of the early Roman emperors. There is some difficulty however, notwithstanding these inscriptions, in identifying this statue with the one described by Strabo and Pausanias. These writers say that the upper part had in their time fallen down; but at present the upper part exists in its proper position, though not in a single piece. Heeren conjectures that the broken statue might have been repaired after the time of Strabo. With respect to the sounds supposed to come from this statue, it is conjectured that they were caused by some trickery of the priests. "Alexander Humboldt speaks of certain sounds that are heard to proceed from the rocks on the banks of the Oronoko at sunrise, which he attributed to confined air making its escape from crevices or caverns, where the difference of the internal and external temperature is considerable. The French 'savans' attest to having heard such sounds at Carnak, on the east bank of the Nile; and hence it is conjectured that the priests, who had observed this phenomenon, took advantage of their knowledge, and contrived, by what means we know not, to make people believe that a similar sound proceeded from the colossal statues." (British Museum, 'Egypt. Antiq.,' vol. i., p. 266.)

The head of the colossal Memnon in the British Museum has no claim to be considered as the vocal Memnon described by Strabo, Tacitus, and Pausanias. The height of the figure to which the head

belongs was about 24 feet, when entire. There is also an entire colossal Memnon in the British Museum, 9 feet 6½ inches high, which is a copy of the great Memnon at Thebes.

MEMNON of Rhodes was the brother of the wife of Artabazus, the satrap of Lower Phrygia, and was advanced, together with his brother Mentor, to offices of great trust and power by Darius Ochus, king of Persia. We are ignorant of the time of Memnon's birth, but he is mentioned by Demosthenes as a young man in B.C. 352. ('Aristocrat,' p. 672.)

Memnon possessed great military talents, and was intrusted by Darius, the last king of Persia, on the invasion of Asia by Alexander of Macedon, with an extensive command in Western Asia; but his plans were thwarted and opposed by the satraps, and it was contrary to his advice that the Persians offered battle to the Macedonians at the Granicus. After the defeat of the Persians at the Granicus, Memnon was appointed to the chief command in Western Asia, as the only general who was able to oppose the Macedonians. He first retired to Miletus, and afterwards withdrew to Halicarnassus in Caria, which he defended against Alexander, and only abandoned at last when it was no longer possible to hold out.

After the fall of Halicarnassus, Memnon entered into negotiations with the Lacedæmonians, with the view of attacking Macedonia. He was now completely master of the sea, and proceeded to subdue the islands in the Ægean. He took Chios, and obtained possession of the whole of Lesbos, with the exception of Mitylene, before which place he died, B.C. 333. The loss of Memnon was fatal to the Persian cause: if he had lived he would probably have invaded Macedonia, and thus have compelled Alexander to give up his prospects of Asiatic conquest, in order to defend his own dominions.

(Arrian; Diodorus Siculus; Quintus Curtius.)

MEMNON, a Greek historian of Heraclea in Bithynia, lived in the first or second century of the Christian era. He wrote a history of the tyrants of his native town, of which considerable extracts have been preserved by Photius; these extracts have also been published separately. The best edition is by Orrellius, Leip., 1816. They have also been translated into French by the Abbé Gédéon, in the 'Mém. de l'Acad. des Inscriptions,' vol. xiv., p. 279-333. Photius was not acquainted with the first eight books of Memnon's History, nor with those which follow the sixteenth book. (Phot., c. 224.) The 'Excerpts' of Photius embrace a period from the assassination of Xerchus to the death of Brithagoras, which was at least later than B.C. 46.

MENA, JUAN, the best Castilian poet of the 15th century, was born about 1412 at Cordova, the 'alma ingeniorum parens,' as Nicolas Antonio calls it, on account of its numerous authors, especially Latin, Arabic, Hebrew, and Castilian poets. Although Mena did not show an ardent love of letters till he attained his twenty-third year, yet he so quickly and fully stored his mind, both in his native city and at Salamanca and Rome, that he was much courted by the elegant poet the Marquis of Santillana, Don Enrique de Villena, the constable Alvaro de Luna, and the rhymesters who attended Juan II. This king appointed Mena his Latin secretary, and also his historiographer, most honourable office, which was instituted by Alphonso X., 'el abio,' that is, 'the Learned.' A fatal pleurisy stopped Mena's career in 1456 at Torrelazuna, where his friend the Marquis of Santillana erected a sumptuous monument to his memory.

Mena's chief performance, 'El Laberinto,' or 'Las Trescientas coplas,' is a didactic moral poem of the allegorical kind, but the genre is different from that of Dante, and it is unlike the work of the Italian poet also both in metrical form and style. It was published for the first time in 1496. Quintana, a high authority ('Poesi. elec. Introduc.'), dwells on it with little of his wonted severity. Outhey, on the contrary, appears to forget the age in which the poem was written. The scenery, says he, and machinery, are despicable. He has however overlooked its most glowing passages, such as the patriotic end of the naval hero Conde de Niebla: he observes, 'There is no glimpse of imagination, and scarcely a trace of feeling' in it. Even the erudition of the commentator Fernan Nufiez, which must have been prodigious in his time, is mere schoolboys' learning, according to this critic. If Mena, coming 200 years after Berceo, is to be denied the title of the Spanish Ennius, it is much to be regretted that his more fortunate and immediate successors did not estimate his merit, and themselves imitate him in making new words and poetical forms or inflections, which are so congenial to inspiration and originality of thought, and so productive of deep impressions.

Mena also wrote some fugitive pieces; 'La Coronacion,' in honour of his patron and friend Santillana, and part of another moral legory, 'Tratado de Vicios y Virtudes.' This latter was unsuccessfully continued by Gomez Maurice, Pero Guilen (styled 'el gran obador,' probably of Segovia), and Jeronimo de Olivares, knight of Calatrava. He also wrote 'La Cronica de Juan II.,' from 1420 to 1435. Some imitated memoirs on noble families of Castile ('Libro de inges'), and a portion of the Iliad in Spanish, still in manuscript, is properly attributed to him. This is not the case however either with the first act or the whole of 'La Celestina, o Tragi-Comedia de Plauto y Melibea,' which was begun by Rodrigo Cota, and continued in a different style by Fernan de Rojas; nor with the anonymous 'Coplas de Mingo Rebulgo' (a satirical eclogue against Enrique IV., BIOC. DIV. VOL. IV.

not Juan II., as Bouterwek has hastily fancied); nor the commentary, which, as well as the text, belongs to Fernando del Pulgar, according to Mariana (year 1472 of his history) and the learned Sarmiento ('Obras Postumas'). The primary sources for Mena's biography are, Bachiller Fernan Gomez de Cibda Real ('Canton Epistolario'), Valero Francisco Romero ('Epicedio à Hernan Nufez'), and Sanctius Brocensius, the editor of the corrected edition of all his works, which Lucas Junta published at Salamanca in small 12mo in 1582, and which was the foundation of a 25th, published in 1804 at Madrid, in small Spanish 8vo, by Repulles. This has not however the glosa, or comment, of Fernan Nufez above mentioned, who is not to be confounded with the chronista Fernan Perez de Guzman.

MÉNAGE, GILLES, was born at Angers (where his father, a man of considerable learning and eloquence, held the office of 'Avocat du Roi'), on the 23rd of August 1613, as he has himself informed us in his 'Anti-Baillet,' chap. 71, where he inveighs with no small bitterness against the malignity of Baillet, who, in his 'Jugemens des Savans,' had made him more than three years older than he was, forgetting, observes Ménage, that the older I am, the more respect he owes me, and that Callistratus, the juriscounsel, on the fifth law of the Digest, 'De Jure Humanitatis,' has said, "In our state, old age hath been at all times venerable; for our ancestors were wont to give to old men almost the same honour as to magistrates." Ménage began life by practising as an advocate at Paris; but finding this profession not to suit his taste or his temper, he got himself made an abbé, which enabled him to hold some livings in the church without cure of souls. He then resided for a time in the family of Cardinal de Retz; but he finally established himself in a house of his own in the cloister of Nôtre Dame, which soon became celebrated for the assemblies of men of letters, whom he continued to gather around him on the Wednesday evening of every week to the end of his long life,—his 'Mercuriales,' as he called them, from the Latin name for that day. A very considerable range of learning, an admirable memory, and some wit enabled Ménage, notwithstanding a pedantry which was often ridiculous, to maintain his position with sufficient éclat as the central figure of these réunions; and he also made some small profession of gallantry, both Madame La Fayette and Madame Sevigné having the honour of ranking him among their avowed admirers. These social enjoyments however did not prevent him from writing a great many books, which brought him a wide reputation, and were highly applauded in his own day by the general voice of the literary world, although the satiric and contemptuous style in which he was apt to indulge had not failed to make him a good many enemies; and one unfortunate performance in particular, his 'Bequôte des Dictionnaires,' published in ridicule of the Dictionary of the Academy, for ever shut against him the doors of that institution, or at least excluded him from a seat till he thought himself too old and infirm to accept one when he might have had it. (See the account he himself has given of this affair in his 'Anti-Baillet,' chap. 82.) Of his numerous works, the following are the most important:—'Origines de la Langue Française,' 4to, Paris, 1650, afterwards enlarged and republished under the title of 'Dictionnaire Etymologique de la Langue Française,' folio, 1694, and 2 vols. folio, 1750; 'Poemata Latina, Gallica, Græca, et Italica,' 8vo, Par., 1658, and 12mo, Amstel., 1687; 'Observations sur la Langue Française,' 12mo, Par., 1672; 'Origini della Lingua Italiana,' folio, Genev., 1685; 'Anti-Baillet,' 8vo, Par., 1685, and, along with Baillet's 'Jugemens,' 4to, Amst., 1725; a valuable edition of Diogenes Laertius, with annotations; and some other editions of classical and other works. After his death, on July the 23rd, 1692, his friends published, under the title of 'Ménagiana,' a collection of his bon-mots and other remarks made in conversation, upon the value of which Bayle, in his Dictionary, has pronounced a high eulogium, and which is still generally considered to be one of the best, if not the best, of this class of works. It was originally published in two volumes, the first of which appeared in 1693, the second in 1694; but the best edition is the third, published in 1715, and enlarged by the additions of the learned editor, M. de la Monnoye, to four volumes.

MENAHÉM, King of Israel, the son of Gadi, was one of those military leaders, who after the murder of Zechariah, assumed the crown. Shallum, who had conspired against and slain Zechariah, had declared himself king in B.C. 771; but Menahem advanced against him with an army, defeated, and slew him, after a reign of thirty days. Shallum seems to have been supported by the people, and they did not submit to Menahem until after a strenuous resistance. Menahem "smote Tiphshah and all that were therein, and the coasts thereof from Tizrah, because they opened not to him," securing his sovereignty only by the most savage barbarity. He was hardly seated on his throne when the Assyrians, under Pul, their king, made their first irruption into Judæa. Menahem was unable to resist them, but he bought their departure by the payment of a thousand talents of silver (upwards of 350,000*l.*), which he raised by a levy of fifty shekels of silver from "all the mighty men of wealth." He remained undisturbed in his kingdom for the remainder of his days, maintaining the idolatry of the golden calves, and died in B.C. 760, when he was succeeded by his son Pekahiah.

MENANDER (*Mένανδρος*), a Greek comic poet, one of that class who are called the writers of the new comedy, was born B.C. 341, and died, as some suppose, by drowning, B.C. 289 or 290. According to Suidas

he was the son of Diopithes and Hegistratés, was cross-eyed, and yet clear-headed enough. The same authority says that he was inordinately addicted to women. He wrote more than one hundred comedies, of which only fragments remain, but in spite of this fertility, and although the most admired writer of his time, he was only eight times victor. His master was Theophrastus, according to the testimony of Pamphila.

All antiquity agrees in praise of Menander. We learn from Ovid ('Trist.,' ii. 370) that his plots all turned on love, and that in his time the plays of Menander were common children's books. Julius Cæsar called Terence a "dimidiatus Menander," having reference to his professed imitation of the Athenian dramatist. Plutarch preferred him to Aristophanes, and Dion Chrysostomus to all the writers of the old comedy. Quintilian ('Inst. Orat.,' x. 1. 69), gives him unqualified praise as a delineator of manners. From these notices, from the plays of Terence, and from an awkward compliment passed upon him by Aristophanes the grammarian, we may infer Menander to have been an admirable painter of real life. His effeminate and immoral habits, and that carelessness in his verses, which subjected him to the charge of plagiarism, or at least of copying, all point to the man of fashion rather than the imaginative poet. And indeed the writer of what is termed the new comedy (that, namely, which satirised characters, not persons) had more occasion for knowledge of the world than for higher qualities. It has been observed that there is very little of the humorous in the fragments of Menander which remain; but we cannot judge of a play by fragments. Sheridan's plays, if reduced to the same state, would be open to a similar charge, although he was the most witty writer of his age. The essential aim of the comedy of manners is to excite interest and smiles, not laughter. The plays of Menander were probably very simple in the dramatic action. Terence did not keep to this simplicity, but, as he tells us himself, he added to the main plot some subordinate one taken from a different piece of Menander; thus, as he says, making one piece out of two.

Between the time of Aristophanes and that of Menander a great change must have taken place in the Athenian character, which was probably mainly brought about by the change in the political condition of the Athenian state. The spirit of the people had declined from the noble patriotism which characterised the plays of Aristophanes at a time when Athens was struggling for supremacy in Greece; and in the time of Menander, Macedonian influence had nearly extinguished the spirit that once animated the conquerors of Marathon and Plataea. Manners probably had not changed for the better in Athens, though the obscenity and ribaldry of Aristophanes would no longer have been tolerated. The transition from coarseness of expression to a decent propriety of language marks the history of literature in every country. Thus the personal satire and the coarseness which characterised the old comedy were no longer adapted to the age and circumstances in which Menander lived, and there remained nothing for him to attempt as a dramatist, but the new species of comedy in which, by the unanimous judgment of all antiquity, he attained the highest excellence.

The fragments of Menander are principally preserved in Athenæus, Stobæus, and the Greek lexicographers and grammarians. A good critical edition of the fragments of Menander and Philemon, by Meineke, was published at Berlin, 1823, 8vo. It seems possible that some of the plays of Menander may yet exist; at least there is evidence to the fact of some of the plays having been in existence in the 17th century. ('Journal of Education,' i. 188.) Many of the fragments of Menander have been well translated by Cumberland in the 'Observer.'

MENANDER, ARIIUS, a Roman jurist, of the time of Severus and Caracalla. The only work of his mentioned in the Florentine Index is four books on Militaria. There are six excerpts from Menander in the Digest.

MENANDER, PROTECTOR, a Greek writer, who lived at Constantinople during the latter half of the 6th century. He was one of the emperor's body-guards, whence he derived the surname of Protector. ('Cod. Theodas.,' vi. 24.) He wrote a history of the Eastern empire from A.D. 559 to A.D. 582, in eight books, of which considerable extracts have been preserved in the 'Eclogæ Legationum,' attributed to Constantine Porphyrogenetus. The best edition of Menander is by Bekker and Niebuhr, Bonn, 1830, together with the fragments of Dexippus, Eunapius, Patricius, &c.

MENASSEH BEN ISRAEL, a celebrated Jewish Rabbi, was born in Spain about A.D. 1604. He was educated in Holland, whither his father, Joseph Ben Israel, had fled to escape the persecution of the Inquisition. At the age of eighteen he succeeded his tutor, Rabbi Isaac Uziel, as preacher and expounder of the Talmud in the synagogue at Amsterdam; and he soon after commenced his work entitled 'Conciliator,' on which his reputation as one of the most learned and accurate of Jewish theologians chiefly rests. At the age of thirty-five he lost his fortune through the confiscation of his father's property by the Spanish Inquisition; and in consequence of this loss he betook himself to commerce, a necessity of which he grievously complains on account of the interruptions which it caused to his studies. He came over to England during the Protectorate, and was graciously received by Cromwell, from whom he obtained some favours for his nation. He died at Amsterdam about 1659.

Menasseh lived on terms of intimacy with several of the most

learned men of his age, by whom he was highly esteemed for his erudition and moral worth. Grotius testified his respect for the Rabbi's learning by consulting him on the most difficult points of theology, and by recommending his works, especially the 'Conciliator,' to the attention of biblical students. Menasseh was strongly attached to Judaism, and some of his works are disfigured by the introduction of invectives against Jesus Christ.

The following are his chief works:—1, 'Conciliator nel Pentateuco,' published in Spanish at Amsterdam in 1632. A Latin translation of this work, by Dionysius Voss, was published at Frankfurt in 1633, with the title, 'Conciliator, sive de Convenientia Locorum in Scripturis quæ pugnare inter se videntur.' 2, 'De Resurrectione Mortuorum,' Amst., 1636. 3, 'De Creatione Problemata xxx,' Amst., 1635. 4, 'De Termino Vitæ Libri iii,' Amst., 1639. 5, 'Spes Israel,' and in Spanish, 'Esperanza de Israel,' Lond., 1650. 6, 'A Defence of the Jews in England,' Lond., 1656. 7, An edition of the Hebrew Bible in 2 vols. 4to, Amst., 1635.

MENDELSSOHN, MOSES, was born at Dessau, in 1729, where his father Mendel was a schoolmaster. Being a Jew, he instructed his son in the Hebrew language and the elements of Jewish learning, though he caused him to be instructed in the Talmud by others. The celebrated work of Maimonides, 'Moreh Nevochim,' (the guide to the wanderers) he studied with such zeal that an impaired constitution and a distorted spine were lasting marks of his application. This work however seems to have strengthened his mental powers. In 1742 he went to Berlin, where he subsisted on the small bounties of the members of his own persuasion; but his mind was greatly improved by his intercourse with men of superior intellect. Isaac Moses, a Jewish mathematician, urged him to read Euclid's 'Elementa,' a physician named Kitach instructed him in Latin; and by the aid of Dr. Aaron Salomon Gumpertz, he became acquainted with modern literature. He lived for some time in a very humble condition, until a rich silk-manufacturer, named Bernard, took him into his house as instructor to his children. He subsequently became a superintendent in the factory, and was ultimately taken into partnership. His intimacy with Lessing began in 1754, and is said to have been of the greatest advantage to him. Philosophy now became his favourite study, and his first work was his 'Briefe über die Empfindungen' (letters on the sensations). He published other philosophical works from time to time, and gained a high reputation for acuteness rather than for originality of thought: his excellent moral character also greatly contributed to the respect in which his religious authority was held. His 'Jerusalem, oder über Religiöse Macht und Judenthum' (Jerusalem, or an essay on the interference of the state in matters of religion and Judaism) appeared in 1783. He had begun a philosophical work entitled 'Morgenstunden' (morning hours), of which the first volume was published, when he received Jacobi's 'Essay on the Doctrine of Spinoza.' He thought that this essay charged his friend Lessing (the deceased) with Spinozism; a charge then more heavy than at present, when many German philosophers are avowed admirers of Spinoza. The zeal with which he defended his friend by a written answer excited him to such a degree, that a cold, which he subsequently took, was sufficient to terminate his existence. January 4, 1786.

As an instance of the successful pursuit of knowledge under difficulties, Mendelssohn is immortalised; and to do him full justice, the circumstances of his life must be remembered by the reader of his works, one of which has been translated into almost every European language; this is his 'Phædon,' a dialogue on the immortality of the soul, held between Socrates and his disciples. The characters are taken from Plato's dialogue of the same name, and the descriptive parts are mere translations of the original. The Jewish philosopher however has made Socrates produce new arguments in place of those attributed to him by his disciple Plato; thinking these new arguments better adapted to the conviction of modern readers. The following is his principal and indeed his only peculiar argument, the rest of the dialogue being employed in its defence, and in expressions of reliance on the goodness of the Deity. For every change three things are required: first, a state of the changeable thing prior to its change; secondly, the state that follows the change; and thirdly, a middle state, as change does not take place at once, but by degrees. Between being and not-being there is no middle state. Now the soul being simple, and not, as a compound body, capable of resolution into parts, must, if it perish, be absolutely annihilated; and in its change from death to life, it must pass at once from being to not-being, without its course going through any middle state; a change which, according to the three requisitions of change, is impossible. Thus by 'reductio ad absurdum' the immortality of the soul was proved. Kant, in his 'Critik der reinen Vernunft' (second edition, it is not in the first edition: see the complete edition of Kant's works, by M. Rosenkranz, Leipzig), has shown the futility of Mendelssohn's argument, while he admits his acuteness in perceiving that mere incapability of resolution into parts was of itself not sufficient to preserve the immortality of the soul, as had been supposed by many philosophers of the time. Mendelssohn, by assuming that change must be gradual and not sudden, thought that he had established his point, as the soul, being simple, could not admit of gradual resolution. Kant however shows that we may conceive a gradual annihilation even without resolution

into parts; or, to use his own expression, a diminution of the 'intensive magnitude.' Thus a deep red colour may grow fainter and fainter till at last all the redness is gone, and this without any diminution of the surface coloured. Another fallacy in Mendelssohn's argument is that his definition of change applies only to a transition from one state of being to another, and therefore does not include a transition from being to not-being. For if not-being be considered a state of being, there is no occasion for an argument at all, as the continuance of being is assumed in the definition of change, nor would anything be gained by supposing the soul in such a paradoxical state as non-entity with still a sort of being attached to it.

A magnificent edition of Mendelssohn's works was published some years back at Berlin: an English version of the 'Phædon' appeared in 1789 and also in 1838.

**MENDELSSOHN.** FELIX MENDELSSOHN-BARTHOLDY, one of the greatest musicians of the present century, was born at Hamburg on the 3rd of February 1809. He was the grandson of the celebrated MOSES MENDELSSOHN, noticed above. His father, who was the head of a great banking-house, on his marriage adopted the name of his wife's family in addition to his own. He had embraced the Lutheran faith, in which his children were brought up. When Felix was in his infancy, his father removed from Hamburg to Berlin, where he resided till his death, enjoying a distinguished place in the society of the Prussian capital. He bestowed the utmost care upon the education of his son, who showed, at a very early age, singular attainments, not only in the art to which his genius especially directed him, but in various branches of literature and science. While yet a child, he gained the affections of Göthe, who was a friend of the family; and the published letters of that illustrious man contain many touching expressions of his love for the youthful Felix and prognostications of his future greatness. He was even then remarkable for his amiable disposition and simplicity of mind; qualities which he retained unimpaired to the end of his too short life.

As in the case of almost every great musician—of almost every great artist indeed of any description—Mendelssohn's genius showed itself even in infancy. He tried to play almost before he tried to speak. His talents received the best and earliest culture. Zelter, the friend and correspondent of Göthe, was his chief instructor in music, and his progress was almost as marvellous as that of Mozart. Indeed his first works, which were afterwards published, were in advance of anything produced by Mozart at an age equally tender. His three quartets for the pianoforte, violin, and violoncello, written before he was twelve years old, are not merely surprising juvenile compositions, but masterly works, which continue to be constantly performed, and hold their place among the classical music of the age. He was in his sixteenth year when his opera, 'The Wedding of Camacho,' was produced on the Berlin stage, more, it has been said, from the wish of his proud and happy parents than his own, for the most unaffected modesty always formed a part of his character. It was favourably received; but, as it betrayed some inexperience in composition for the stage, it was withdrawn by his friends. It was however published; and, though it is not generally known to the public, many copies of it are in the hands of amateurs. The music is not only charming, but full of the dramatic element. Every personage speaks in his own characteristic language, from the solemn pomp of Don Quixote and the grotesque humour of Sancho, to the passionate tenderness of the young lovers whose wedding and its crosses form the subject of Cervantes's delightful story. This most interesting piece shows what great things Mendelssohn might have done for the music of the stage, had he not left this branch of his art to tread the highest of all—that in which he followed, and at no great distance, the footsteps of Handel. Another proof of the dramatic character of his genius at that early age was the composition of the overture to 'The Midsummer Night's Dream,' which breathes in every bar Shakespeare's own inspiration. Its popularity has now become unbounded; and no listener can fail to trace in its passages, in which the fanciful, the delicate, and the grotesque are so exquisitely blended, the various conceptions of the poet. The rest of the music for 'The Midsummer Night's Dream' was not written till many years afterwards, for the purpose of accompanying the performance of the play at Berlin. Its effect, thus introduced, was found to be so delightful, that in Germany the play is never represented without it, and the same thing is beginning to be the case in this country.

Mendelssohn had just reached his twentieth year when he made his first visit to England; a visit which deeply influenced the whole course of his life. He arrived in London in April 1829. His reputation was not unknown to our most eminent musicians, by whom he was cordially received. At the first concert after his arrival of the Philharmonic Society, his overture to 'The Midsummer Night's Dream' was performed, and received with enthusiasm by an audience, most of whom could never have heard of his name. It was immediately published. In a little memoir of his life, published a few years ago by Mr. Benedict the eminent German musician so long resident among us, there are some valuable remarks on his London début. "The effect," says Mr. Benedict, "of the first performance of the overture to 'The Midsummer Night's Dream' in London was electrical. All at once, and perhaps even when least expected, the great gap left by the death of Beethoven seemed likely to be filled up; and I am happy to

adduce this success as another proof of the much underrated taste of the English public, and its discernment in appreciating and even discovering new-born musical talent. Not to speak of the Elizabethan era—of Orlando Lasso, Luca Marenzio, the great madrigal writers—did not Handel compose his immortal works almost exclusively in England and for an English audience? Were not Haydn's finest symphonies written to gratify the London amateurs before a note of them was heard or known in Germany or France? Was not Beethoven known and revered by English artists, by English musical societies, when almost forsaken and neglected in Germany? And so it was with Mendelssohn. His renown, after the enthusiastic but just reports of his reception in London, both as a composer and pianist, spread like wildfire all over Europe, and gave the young and ardent maestro a new stimulus to proceed on his glorious path."

In the same year Mendelssohn visited Scotland. In Edinburgh he was warmly welcomed by a literary and musical society well able to appreciate his genius and attainments, and his stay in that city was always regarded by him as one of the most agreeable incidents of his life. He afterwards made an extensive tour through the Highlands and the Western Isles; and many reminiscences of the days spent in Scotland are to be found in his compositions. He was deeply impressed with the wild and romantic beauty of the old Caledonian music, even in its rudest and most primitive form, and especially admired the Highland bagpipe and those antique strains, which though harsh and discordant to "ears polite," and scarcely allowed by dainty connoisseurs to deserve the name of music, yet reach the heart of every true Scotsman. Such music Mendelssohn could understand and value. A Scottish friend carried him to witness the "Competition of Pipers," as it is called, a gathering of masters of the national instrument, who are chiefly retainers of great families, and assemble annually in the Edinburgh theatre to contend for the palm of minstrelsy in the presence of the most brilliant company of the metropolis—a relic of Scottish feudalism still preserved. To the surprise of his cicerone, who merely wished to give him half an hour's amusement, Mendelssohn remained to the last, immersed in what he heard, and earnestly comparing the merits of the various pibrochs and the powers of the performers. Many years afterwards, the same friend heard the celebrated symphony in A minor (now called the Scottish symphony) performed for the first time, under the author's own direction, at a concert of the Philharmonic Society. Struck with the strains of Highland melody which characterize that piece—the festive dance, the gathering, the warlike march, the lament—he was about to make some remark to Mendelssohn, when he said with a smile, "You remember the pipers!" His fine orchestral piece too, 'The Isles of Fingal,' is full of the impressions made upon his mind by the wild and stormy shores of the Hebrides.

In the following year he was for some time in Italy; and two years afterwards he visited Paris. From thence he came a second time to London; and from that time, we believe, to the end of his life, there was scarcely a season in which he did not visit England. He began even then to feel that he was more justly appreciated in our country than even in his own; and thenceforth England became, as it were, his adopted country, and was associated with the most important circumstances of his artistic life. His treatment at that time by his own countrymen appears to have inspired him with different feelings, and we have the authority of Mr. Benedict for saying, that "the mean cabals which were always at work against him at Berlin increased his dislike to that city so much as to induce him to leave it, as he then thought, for ever." He left Berlin for Leipzig, where he accepted the directorship of the famous Gewandhaus Concerts, and where he remained till the year 1844, when he was induced, by the pressing request of the King of Prussia, to return to Berlin.

His entrance upon his glorious career as a composer of sacred music may be fairly ascribed to the committee of the Birmingham Festival; for he set about the composition of his first oratorio, 'St. Paul,' under the arrangement that it should be performed under his own direction at the festival of 1837. And it was so performed accordingly, having been previously produced at Düsseldorf and Leipzig.

The performance of this oratorio in the Town-hall of Birmingham on the 20th of September 1837, was an event memorable in the annals of music in England. It was got up with the unrivalled magnificence for which the musical festivals of that town are distinguished. The impression which it made upon an immense assemblage will long be remembered by those who were present. Mendelssohn was again at the Birmingham Festival of 1840, when the 'Lobgesang,' or 'Hymn of Praise,' composed expressly for that festival, was performed under his own direction. This remarkable work, called a 'Sinfonia-Cantata,' in which the powers of vocal and instrumental music are equally employed in developing a grand design, had a great success, and like 'St. Paul,' was speedily reproduced in the metropolis, and at all the great music-meetings in the kingdom.

His third and last oratorio, the greatest of them all—'Elijah,' was also written expressly for Birmingham. Though he undertook it immediately after the production of 'St. Paul' in 1837, it was not performed till 1846; and during these nine years, it occupied a large share of his thoughts and his labours. When the time for its production drew near, he resigned his post at Berlin and gave up every other occupation, in order to devote his whole powers to this

work. The poem, in which the principal events in the life of the Hebrew Prophet are related in the language of the Bible, was constructed by Mendelssohn himself; and the English version was executed and adapted to the music with admirable skill by Mr. Bartholomew. The first performance took place on the 26th of August 1846, the performance being conducted by the author. The enthusiasm it excited cannot be described. It was pronounced by the general voice to be not only the masterpiece of the composer, but the greatest oratorio given to the world since 'The Messiah:' and this judgment, pronounced ten years ago, has ever since been strengthened and confirmed, not merely by the opinions of connoisseurs and critics, but by the united voice of the British nation.

The production of this immortal work was the crowning glory of Mendelssohn's career. He was again in London, in 1847, to superintend its performance at Exeter Hall by the Sacred Harmonic Society. It was four times performed there, and afterwards, under his own direction, at Birmingham and Manchester. Soon afterwards he left England, never to return. His health had for some time been declining. Shortly after his arrival at home, he received a shock in the sudden death of his sister, who strongly resembled him in character and talents, and to whom he was fondly attached. From this blow he never recovered. He was persuaded to visit Switzerland, where, living quietly in the bosom of his family, he regained his strength and returned home to Leipzig, seemingly convalescent. But he soon relapsed, and at length sank under his malady, an affection of the brain, and expired November 4th, 1847, before he had completed his thirty-ninth year. He left many manuscript compositions, which, it is understood, were placed in the hands of several eminent musicians, friends of his family, with a view to selection and publication; but none of them have been given to the world except a fragment of an Oratorio, entitled 'Christus,' and some scenes of 'Lorely,' a romantic opera. The suppression of all the others, some of which were known to be works of magnitude and importance, has excited much surprise and dissatisfaction.

In a sketch like this, it is impossible to speak in detail of Mendelssohn's works. They are very numerous and embrace every branch of his art; but it was in sacred music that his highest powers were displayed; and 'St. Paul' and 'Elijah' will descend to posterity along with 'The Messiah' and 'Israel in Egypt.'

Mendelssohn was exposed to none of the cares, struggles, and vicissitudes which genius is too often heir to. Happy in all his domestic relations, in the enjoyments and triumphs of his art, and above all, happy in a pure mind and blameless life, few men have had a more enviable lot than Felix Mendelssohn.

MENDOZA, INIGO LOPEZ, better known as the MARQUIS DE SANTILLANA (Sancta Juliana), was born in 1398, at Carrion de los Condes, and died in 1458. He was grandson of the poet Pero Gonzalez Mendoza, and a descendant of that Mendoza who, in the battle of Aljubarrota, saved the life of Juan I. at the expense of his own. (Romane de Hurtado de Velarte, 'El Caballo vos han muerto.') He was also the father of the first duke of Infantado, who secured the preservation of his valuable library, and directed it to be kept at his palace of Guadalajara.

Santillana was the most elegant scholar at the court of Juan II., then the most brilliant in Europe. Much of his poetry is still in manuscript, and is partly lost or lying in dust. Several of his pieces however, chiefly devotional and amatory, are contained in the older Cancioneros. Like the compositions of D. Juan Manuel, the Marquis Enrique de Villena, and many others, they exhibit a singular contrast with the fierceness of that period. They throw a false shade, perhaps a decent veil, over realities too disgraceful and disgusting, from which the gifted few sought mental relief in subtlety and imaginary affection; but such poetry can never touch the heart nor even be forcibly expressed when it is not genuine, that is to say, when it is not deeply felt. By introducing the sonnet Santillana (Quintana, 'Poes. Escog.') became a forerunner of the bold innovator Boecan. But he did more, by endeavouring to impart a moral tendency to the national poetry, by extending it by allegorical invention, and embellishing it with learning. His efforts in that respect are apparent in his 'Elegy to his tutor and friend Villena,' and his 'Doctrinal de Provados,' which show that he was no adherent of Alvaro de Luna. All parties were eager to obtain the powerful assistance of Santillana's military, political, and moral character. His 'Refranes' (Traditional Proverbs) were reprinted by the learned Mayans ('Origenes de la Lengua Castellana,' vol. i. p. 179.)

Fernando del Pulgar, Sarmiento ('Obras Postumas'), Nico. Antonio, and Sanchez ('Colec. de Poes.),' give much curious information on this Mendoza.

MENDOZA, DIEGO HURTADO, a scholar, statesman, and general under Charles V., was grandson of Lopez Mendoza (noticed above), and younger son of the first marquis of Mondejar, who was also second count of Tendilla. Diego Mendoza was born in 1503, at Granada, and not at Toledo, as was supposed by Tamayo Vargas. He received his early education at home from Peter Martyr d'Angleria, who had been brought to Spain by the first count of Tendilla to teach the youth of the nobility. After learning Arabic at Granada, he studied Latin, Greek, Hebrew, divinity, and civil and canon law at Salamanca, where by way of relaxation he produced the first specimen

of the comic romance in his 'Lazarillo de Tormes,' a work which has been improperly ascribed by Siguenza to the Jeronymite Juan Ortega. It is written in that *gusto picaresco*, which was much in fashion in the 17th century.

Being sent from the university to the imperial army in Italy to show his talents in a new capacity, he still found time occasionally to visit the universities of that country, and to hear the eminent lecturers, such as Niphus of Naples and Montesdoca of Seville. In his capacity of ambassador at Venice and at Trent, when political interests were at stake—at Rome, the centre of intrigues—and as general in Tuscany, which was threatened by the Turks: their ally Francis I., he always defeated the treachery of the French king, and baffled the designs of all parties. He faced every danger, and commanded the respect and admiration even of those whom he could not please. (Paul Mann, 'Cic. de Philoso.,' Lazaro Bonamico. Nor could he conceal that spirit of freedom which Charles had destroyed in Spain. He strongly reprobated his sale of the Tuscan fortresses to Cosmo de' Medici, and by his opposition prevented the transfer of Milan and Siena to Paul III., who wanted to buy them of Octavio Farnesio. In a letter to Zuñiga, alluding to ambassadors, he boldly says, "When kings wish to cheat, they begin by us." The republicans or burghesses indeed looked on Mendoza as the greatest enemy of Italy. That country however was indebted to him for having introduced into it the writings of Basil the Great, Gregory Nazianzus, Cyril of Alexandria, Archimedes, Apian, and others. Not satisfied with employing Arnoldus Ardenius in transcribing the Greek manuscripts of different libraries, especially those which Cardinal Bessarion had bequeathed to Venice, Mendoza sent Nic. Sophianus of Corcyra to Thessaly and Mount Athos in search of manuscripts. He also paid a heavy ransom for a Turkish priest who was a favourite of Solyman the Magnificent. As a return for this service he only asked for ancient works from the sultan, to which they were useless, and begged him to permit the Venetians, then in great want of corn, to import it from Turkey. His request was granted, with a present of several chests of literary treasures. In 1555 Mendoza was superseded at Rome, in order to promote Julius III.

Subsequently Mendoza fell under the displeasure of Philip II., who banished from his court this old servant, then sixty-four years of age. This act of royal severity proved however beneficial both to the illustrious veteran and to posterity. In his retirement at Granada Mendoza prosecuted those studies which were congenial to his taste: he investigated antiquities, collected above 400 Arabic manuscripts, and crowned his literary fame by his 'Guerra contra los Moriscos,' the publication of which, even with omissions, the government did not permit till the year 1610. The true text was restored in 1776, at Valencia, by Portalegre, who prefixed to it the author's life, which although ill written, is highly interesting. In this work, the latest specimen of the historical style in the Spanish language, Mendoza has left the best example of an imitation of the Latin historians that modern European literature possesses. The rich and florid diction of this history forms a contrast with the conciseness and rigidity of Sallust, with whom however Mendoza has generally been compared. The modern historian is a model of impartiality: he does not even spare his own brother. Having been an eye-witness of most of the events which he has so admirably recorded, he has happily combined in the same work the strictest accuracy with integrity and the ability of a great writer.

In 1575 Mendoza obtained permission to return to Madrid on business, but he died shortly after his arrival there. He bequeathed his valuable library to the king. Ambrosio Morales, Nico. Antonio, Bouterwek, and many others, are profuse in their eulogiums of Mendoza. Juan Diaz published his poems in 1610 at Madrid, but without the numerous comic and satiric pieces. Other more important works of his have never yet been published: among them are his political commentaries.

MENELAUS (called also MILLEUS by Apian and Mersenne, but on what authority is not known; in a copy of Weidler which belonged to Montucla we find the latter, in a manuscript note, describing Milleus as "Menelaus défiguré par les Arabes") was an Alexandrian, who observed the stars for a long while at Rome, and was living there in the time of Trajan. He is mentioned by Proclus and Pappus, and probably is the person intended by Plutarch, who mentions a mathematician of that name. Pappus gives the titles, or other mention, of at least two works of Menelaus which have not come down to us. Ptolemæus, in the Syntaxis, compares some of his own observations with those of Menelaus.

The only writing of Menelaus which has come down to us is the Latin treatise on spherical geometry, translated from the Arabic; the Greek is probably lost. This work, in three books, was published (Lalande) in a collection of Greek geometers made at Paris, in 1626; and afterwards (Lalande, Heilbronner) by Mersenne, in his 'Universæ Geometris Synopsis,' Paris, 1644; also (Heilbronner and Weidler) by Regiomontanus. Another work on chords is said by Heilbronner to be contained in Mersenne's Synopsis: this is a mistake, since the work is entirely lost.

The books of Menelaus on spherical geometry have been much used by Ptolemæus in the Syntaxis, and the latter had for a long time

the credit of two very remarkable propositions which appear in Menelaus, and which have been much used by Carnot and others in the modern extensions of geometry. These are the well-known propositions relating to a transversal which cuts the three sides of a triangle, plane, or spherical. There are other propositions of great ingenuity; so that Menelaus, who must be looked on as the successor of Hipparchus and Theodosius in the school of Greek geometers who treated of the doctrine of the sphere, must also be considered as having gone considerably beyond his predecessors.

MENGS, ANTON RAFAEL, one of the most distinguished artists of the eighteenth century, was born at Aussig in Bohemia, in 1728. He was scarcely six years old when his father, who was himself a painter, though one of very moderate ability, being determined to bring him up to the same profession, whether he had talent or not, adopted a course of education for him more calculated to inspire him with a disgust than with a true relish for it. Being of a most harsh and tyrannical disposition, he compelled the boy to employ himself in drawing the whole day long, allowing him neither recreation nor relaxation from his tasks. In course of time Rafael was instructed by his father in oil-painting, and miniature and enamel-painting, but was still tasked in the same rigorous manner, and frequently received severe chastisement, if he had not completed within the time allotted him—which was generally short enough—what he had been set to do. In 1741 his father quitted Dresden, whither he had been called by Augustus III. (for he was a native of Denmark), and went to Rome, taking young Mengs with him. On his arrival in that city, his father used to take him every morning to the Vatican, in order that he might there study the productions of Raffaele, and would make him remain there the whole day, without other refreshment than a bottle of water and piece of bread, until he came to fetch him back in the evening; nor was he even then allowed to recruit himself from his fatigue, but compelled to revise and finish up the studies he had brought home. This excessive drudgery did not however disgust him with the profession to which he was thus in a manner yoked: still the mode of life it occasioned was prejudicial, inasmuch as it prevented his acquiring other knowledge, and tended to render him shy of all society. In 1744 he returned with his father to Dresden, where his talents obtained for him the notice of Augustus, who appointed him court-painter; but according to a stipulation he had previously made, he was permitted to return to Rome, and his father accompanied him. After continuing his studies some time longer, he began to distinguish himself by his original compositions, among the rest by a 'Holy Family,' in which the Virgin was painted from a beautiful peasant girl, of whom he became so enamoured, that he turned Roman Catholic for her sake and married her. After that event he again returned to Dresden, where his pension was raised to a thousand dollars, and he was commissioned by the king to paint a large altar for a new chapel; which he wished to execute at Rome. But on his arrival there, other commissions (among which was a copy of Raffaele's 'School of Athens,' for Lord Percy, afterwards Duke of Northumberland), and the Seven Years' War, which caused the stoppage of his pension, interfered with the prosecution of the work. In 1767 he made his first attempt in fresco, a ceiling-piece in St. Eusebio, which was in too simple a style to satisfy the taste of that day. His 'Apollo and the Muses,' another work of the same class, in the Villa Albani, obtained for him much greater renown, and was by his contemporaries regarded as one that would bear comparison with those by the greatest Italian masters. About this time he became acquainted with Webb, to whom he communicated his ideas on art, which the other has been charged with having passed off as his own in his 'Remarks on Poetry and Painting.' Mengs's reputation was greatly increased by the numerous works he executed for Charles III. of Spain, by whom he was invited to Madrid in 1761, and remained in that country till 1775, with the exception of an interim of three years, in the course of which he painted the ceiling of the Camera de' Papiri at Rome. His pencil was employed in decorating the royal palaces of Spain; and the Apotheosis of Trajan, in that of Madrid, is considered his chef d'œuvre.

After a marriage of the utmost domestic harmony, Mengs lost his wife in 1778. From that time his health began to decline, nor was it long before he followed her to the tomb: he died on the 29th of June in the following year, and was buried by her side in the church of San Michele Grande at Rome. Notwithstanding the great sums he had received during his life, about 250,000 livres, instead of amassing money he left scarcely sufficient to defray the expenses of his funeral; but the king of Spain bestowed pensions on his two sons, and provided also for his five daughters. Although Mengs's reputation as an artist does not now stand so high as in the last century, he undoubtedly possessed many excellences, and, compared with his immediate contemporaries, deserved the applause showered upon him. Refined taste, much nobleness of idea, correctness of drawing, finished execution, and studied grace are merits of a high rank, which he possessed in an eminent degree; but though most carefully studied, and in conformity with the principles he laid down for the art, his works display few of those loftier qualities of mind which the higher branch of historical painting demands. He is in fact a favourable example of a carefully trained painter, whose works are produced in studious imitation of those of certain great masters of an earlier age, and he is no more. His writings, which were published after his death

by the Cavalier d'Azara, contain many excellent precepts, and both practical and critical observations, and have accordingly been translated into the principal modern languages.

MENNO, SIMON, the founder of the MENNONITES, a religious sect which sprung up in Holland and Germany about the time of the Reformation, and which is identified by many writers with the sect of the Anabaptists, with whom the Mennonites held several leading doctrines in common.

Simon Menno was born at Witmarsum, a village in Friesland, in the year 1506. In 1536 he left the Roman Catholic Church, in which he was a priest, and joined the Anabaptists, among whom he became a teacher in the next year. During the remainder of his life, Menno travelled with his family and preached his doctrines throughout a great part of Germany and Holland, where he gained many proselytes, chiefly from among the Anabaptists. He died in 1561, in the duchy of Holstein. His works were published in one volume folio, at Amsterdam, in 1651. Though he is said to have been a notorious profligate when young, his character after he came forward as a religious teacher was unimpeachable; and he was possessed of considerable genius, some learning, and a persuasive eloquence. His doctrines were free from the anti-social and licentious tenets and the pretensions to inspiration which are ascribed to the Anabaptists; but he agreed with them in condemning the baptism of infants, in expecting a personal reign of Christ on earth for a thousand years at the Millennium, in excluding magistrates from the Christian Church, and in maintaining that all war was unlawful, that the taking of oaths was prohibited by Christ, and that human science is useless and pernicious to a Christian. But these tenets were so explained and modified by Menno, as to differ very little from the doctrines generally held by the reformed churches. He insisted upon the strictest attention to moral duties, and exercised a most severe discipline upon offenders.

The followers of Menno very soon split into two sects, the *Flemings* and the *Waterlandians*, so called from the countries in which they arose. The latter somewhat relaxed the severe discipline of Menno towards offending members, which the former maintained in all its rigour. The Flemings divided again, on the subject of the treatment of excommunicated persons, into Flandrians and Frieslanders; and there also arose a third division called Germans. In process of time the greater part of these sects joined the Waterlandians.

The Mennonites put forth several confessions in the 17th century, the earliest of which is one drawn up by the Waterlandians. By these confessions it appears that their doctrines were nearly the same with those mentioned above as held by Menno. According to Mosheim, their fundamental principle was that "the kingdom which Christ established upon earth is a visible church, or community, into which the holy and the just are alone to be admitted, and which is consequently exempt from all those institutions and rules of discipline that have been invented by human wisdom for the correction and reformation of the wicked."

In the 17th century the Mennonites obtained toleration in Holland, Germany, and England. In the year 1630 a considerable part of them arranged their differences in a conference at Amsterdam, and formed a union, which was renewed in 1649.

Further information respecting this sect may be found in Herman Schryn's 'Historiæ Mennonitarum plenior Deductio,' which is a defence of the Mennonites, and in which the author protests against their being confounded with the Anabaptists; and also in Mosheim's 'Eccles. Hist., cent. xvi., sect. iii., part ii., c. 3; and cent. xvii., sect. ii., part ii., c. 5. It is to be wished that Mosheim had written the history of this sect in a spirit of greater candour.

MERCATOR, GERARD (whose real name was KAUFFMAN, of which Mercator is the Latin equivalent), was born at Rupelmonde, in East Flanders, in the year 1512. He applied himself with great industry to the sciences of geography and mathematics, and was patronised by the Emperor Charles V., and appointed in 1559 cosmographer to the Duke of Juliers. He gave his name to the method of geographical projection now usually employed in the construction of nautical maps, in consequence of his having first represented the meridians by equidistant parallel lines, and the parallels of latitude by straight lines at right angles to the meridian, but he did not know the distance which ought to separate these parallels. Nicholas Mercator is said to have discovered the law which regulates these distances; but the English mathematicians having refused to pay for the promulgation of his discovery by accepting a pecuniary challenge which he is said to have proposed to them, he died without communicating it even to his friends. The credit of first investigating the principles of that projection, and applying them to the purposes of navigation, appears to be due to Edward Wright. Gerard Mercator died at Doesburg, December 2, 1594. His published works are entitled 'De Usu Annuli Astronomici,' Louvain, 1562; 'Chronologia,' fol., Cologne, 1568; 'Tabulæ Geographicae,' fol., Cologne, 1578; 'Harmonia Evangelistarum,' 4to, Doesburg, 1592. His maps were collected in 1 vol. 4to in 1594; and another edition was published in 1623, containing 156 maps. (Hutton, *Mathematical Dictionary*; Montucla, *Histoire des Mathématiques*; Robertson, *Dissertation on the Rise and Progress of Navigation*.)

MERCATOR, NICHOLAS (whose real name was NICHOLAS KAUFFMAN), was born at Holstein, in Denmark, in 1640. At an early age

he was engaged in a correspondence with some of the principal geometers of Denmark, Italy, and England. In 1680 he came to England, and shortly after the formation of the Royal Society he was elected a member of that body. The date of his death is uncertain. According to Dr. Hutton, it took place in England in the year 1690 ('Mathematical Tracts'), or in 1694 ('Mathematical Dictionary'); but, according to Weiss ('Biog. Univers.'), he died at Paris, February, 1687. The reputation of Mercator rests principally upon a method, of which he was the author, whereby the area of the spaces comprised between the hyperbola and its asymptote may be determined arithmetically to any degree of approximation required; and upon the application of this method to the construction of logarithmic tables. These investigations were published by Mercator in 1668, in a work entitled 'Logarithmotechnia, sive methodus construendi logarithmos nova, accurata et facilia,' 4to, London. Wallis, who soon improved upon this method, says, when speaking of the work in a letter addressed to Lord Viscount Brouncker, "With this book, which has just appeared, I was so much pleased, that I could not quit it until I had completed its perusal. The doctrine by which the logarithms may be expeditiously constructed is perspicuously and ingeniously treated." ('Phil. Trans.,' 1668.)

Mercator has been charged with dishonourably appropriating the discoveries of others, and with meanly withholding the publication of some which really belonged to him. [MERCATOR, GERARD.] In the 'Philosophical Transactions' for 1670 there is a paper by him entitled 'Considerations concerning the Geometric and Direct Method of Signior Cassini for finding the Apogees, Excentricities, and Anomalies of the Planets,' besides which he has left the following works:—'Cosmographie,' 12mo, Danzig, 1651; 'Rationes Mathematicæ subductæ,' 4to, Copenhagen, 1653; 'De Emendatione Annuæ diatribæ duæ, quibus exponuntur et demonstrantur Cycli Solis et Lunæ,' 4to; 'Hypothesis Astronomica nova et consensus ejus cum observationibus,' fol., Lond., 1664; 'Institutionum Astronomicarum libri duo,' 8vo, London, 1676; 'Euclidia Elementa Geometrica,' 12mo, Lond., 1673.

(Hutton, *Mathematical Tracts*; Montucla, *Hist. des Mathém.*; *Biog. Univ.*)

MERCIER, LOUIS SEBASTIEN, a prolific writer on men and manners, politics, science, the drama, literary criticism, and many other subjects, was born at Paris on the 6th of June 1740. He was for some years professor of rhetoric in the college of Bordeaux. The greater part of his works are sunk in oblivion, but several of them still deserve and obtain attention. Such are those in which he attacks the manners and morality of his age. The first of these appeared in 1771, with the title 'L'An 2440; Rêve, s'il en fut jamais.' In 1781 he commenced the publication of the 'Tableau de Paris.' Having courted the attention of the authorities to his authorship of this book which, by its bitter remarks on all the social institutions of France, was sure to provoke their wrath, he found it prudent to retire to Switzerland, where he completed this remarkable work. Without holding with its author that the 'Tableau de Paris' produced the French Revolution, there is no doubt that it did much to open the eyes of mankind to the immoral and corrupt state of the social system of the French capital, and the inapplicability of the great national institutions of the country to supply their proper end of doing good to the nation at large. Mercier wrote with an animated, descriptive, and biting pen. He occasionally appealed to a high sense of morality, but his chief power lay in showing his readers the bad taste and the folly of the prevalent habits of the day. Wherever he had to depict honest industry struggling against false social laws, or the remains of pristine simplicity holding out against the inroads of corrupting manners, his tone has dignity and feeling. When he speaks of the prodigal administration of the laws, of the artificial and vicious tastes of the leaders of fashion, of the tyranny over the free expression of opinion, he overwhelms with sarcastic ridicule. The work is a curious anatomy of Parisian society, and exposes many evils incident to large cities, of which the lapse of seventy years has not entirely enabled us to find the remedy. The sanitary regulations which have lately so much occupied the attention of society, and other means of social organisation, are intended to supply deficiencies which Mercier points out in his own peculiar fashion: whether he could have devised remedies for the defects he discovers may be questioned. He was an avowed hunter after paradoxes. In 1801 he published 'Néologie, ou Vocabulaire de Mots nouveaux, à renouveler, ou pris dans des Acceptions nouvelles,' a work in which he announced such propositions as 'Les prosateurs sont nos vrais poètes.' He made war on the chief ornaments of French literature; seeming, wherever public opinion had unequivocally declared itself, to find that he had to perform the function of reversing the judgment. In philosophy he was equally paradoxical, raising his voice against the best-established truths in physical science. From these peculiarities his attacks on the social morality of his age have been received as chance blows struck in a right quarter by a man who struck at everything. But Mercier deserves a better appreciation, and no one can attentively read his censures without seeing that they proceed not only from a condemnation of what is wrong, but a sense of what is right. A list of his works would be much longer than the present article. He passed a life of cheerful vivacity, surrounded by friends who seem not to have been the less attached to him that he perpetually displayed with singular simplicity his sublime self-conceit. He died on the 25th of April 1814.

MERIAN, MATTHEW, an eminent engraver, was born at Basel in 1593. After having for some time pursued his profession with success in his native place, he removed to Frankfurt-on-the-Main, where he established a book and print business; and where he died about 1651. Though he acquired a considerable standing as an engraver in his own day, he is now perhaps chiefly remembered as the father of his more distinguished son and daughter, whom we proceed to notice.

MATTHEW MERIAN was born at Basel in 1621. He was the pupil of Sandrart, who was much attached to him; he studied also after Vandyck in London; became acquainted with Le Sueur and Vouet in Paris, and studied under Sacchi and Carlo Maratti at Rome. As a portrait painter he attained a very high reputation. From about 1655, when the elder Merian died, Matthew conducted his father's book and print business, at Frankfurt-on-the-Main, but he did not give up his own profession. He painted the Emperor Leopold I. on horseback, and many other German princes and nobles. He also painted some historical pieces, and engraved a few plates, which are marked M. Merian, junior. He died at Frankfurt in 1687.

MARIA SIBYLLA MERIAN, the daughter of Matthew Merian the elder, was born at Frankfurt-on-the-Main, April 12, 1647. Her instructor in drawing was Abraham Mignon. In 1665 she married John Andries Graff, a painter of Nürnberg, but the celebrity which attached to her own name as an artist prevented that of her husband from being adopted. They had two children, both daughters, who were also skilled in drawing. In consequence of liberal offers Madame Merian and her husband settled in Holland, but Maria Sibylla, whose great object was the study of nature, travelled for the sake of delineating insects, flowers, and other natural objects. In 1699 she went to Surinam for the express purpose of making the drawings which have since added so considerably to her fame, and remained there till the month of June 1701. Madame Merian died at Amsterdam, January 13, 1717.

She published—1, 'The Origin of Caterpillars, their Nourishment and Changes,' in Dutch, 2 vols. 4to, the first published at Nürnberg in 1679, the second in 1683, published in Amsterdam in Latin, 4to, 1717. This work, much enlarged by herself and her daughters, was published in French by John Marret, fol., Amst., 1730, under the title of 'Histoire Générale des Insectes de l'Europe.' 2, 'Dissertatio de Generatione et Metamorphosis Insectorum Surinamensium,' fol., Amst., 1705, separately in Dutch and in Latin. These editions contain only sixty plates. To some of the later ones twelve plates were annexed by her daughters Jane Helen and Dorothea Maria Henrietta. There is an edition of this work in folio, French and Dutch, printed at Amsterdam in 1719; another in French and Latin, Hage, 1726; and another in Dutch in 1730. There have been also editions of the two works united, under the title of 'Histoire des Insectes de l'Europe et de l'Amerique,' fol., Par., 1768 and 1771.

Many of the original drawings of this artist are preserved in the department of drawings and prints in the British Museum, in two volumes, purchased by Sir Hans Sloane at a large price. One contains the insects of Surinam, the other those of Europe. A few of the Surinam insects, though elegantly finished, appear, upon examination, not to be entirely drawings, but to have been coloured upon outline proofs of the engravings. Those of Europe are entirely original delineations. All are upon vellum. Other drawings of Madame Merian are preserved at Petersburg, in several collections in Holland, and at Frankfurt. A portrait of Madame Merian, formerly Sir Hans Sloane's, is still preserved in the British Museum. An engraved portrait of her, by Houbraken, is prefixed to the Latin edition of the 'Origin of Caterpillars,' 1717.

MERIVALE, JOHN HERMAN, was born at Exeter in 1779, in which neighbourhood his father, John Merivale, Esq., resided, and was possessed of some landed property: his grandfather, the Rev. Samuel Merivale, was a Presbyterian minister at Exeter, and tutor at the dissenting theological academy there. Mr. Merivale entered St. John's College, Cambridge, in 1797, but took no degree, in consequence of the impediment of his dissenting persuasion, although at a later period he joined the Church of England. He married Louisa, daughter of the Rev. Dr. Drury, head master of Harrow School: was called to the bar in 1805, and practised in the Court of Chancery. He published three volumes of Chancery Reports from 1815 to 1817, of cases decided by Lord Eldon and Sir William Grant. In 1825 he was a member of the commission for inquiring into the state of the Court of Chancery, which was appointed in consequence of the attacks made at that period on Lord Eldon; and wrote a 'Letter on the Chancery Commission' in 1827, as well as some other pamphlets on law reform. He became a commissioner of bankruptcy on the then newly organised system in 1831; and continued to hold that office till his death in April 1844. From his early youth Mr. Merivale was addicted to literary and antiquarian pursuits, especially to the study of Italian and, in his later years, of German literature. He contributed a large proportion of the translations contained in the 'Collections from the Greek Anthology,' published in 1813 under the editorship of the Rev. Robert Bland; of which Mr. Merivale brought out a second edition, enlarged, in 1833. In 1814 appeared his poem of 'Orlando in Roncesvalles,' a tale in the ottava rima, being chiefly a free abridgment of part of the 'Morgante Maggiore.' In 1841 Mr. Merivale published two volumes of 'Poems, original and translated,' comprising most of

his earlier pieces; and in 1844, shortly before his death, a volume of translations of the 'Minor Poems of Schiller, of the second and third periods, with a few of those of earlier date.' This was perhaps the most successful of his productions. It is an essay towards the rendering of the pieces of the German poet in the same, or nearly the same, metres with the originals, and with an approach to close but not literal version. The more metaphysical or subjective poems of Schiller's later period—those which it is the most difficult to bend to his species of treatment—the Gods of Greece, the Feast of Eleusis, the Progress of Art (die Künstler), and others of the same character—are among the best executed parts of the work. Mr. Merivale was an extensive contributor to literary reviews, but none of his prose essays on these subjects are published in a separate form.

MERLIN, or, more properly, MERDWIN. Some of the Welsh antiquaries speak of three Merlins: Merdwin Emrys, or Merlinus Ambrosius; Merdwin Wyllt, or Merlinus Caledonius, or Merlinus Sylvestris; and Merdwin ap Morvryn, otherwise called Merlinus Avalonius from a poem ascribed to him, entitled 'Avalonau, or the Orchard,' and also known by the Latin names of Melochinus, Melkinus, and Merwynus. (Nicholson's 'Eng. Hist. Library.') It is generally agreed however that the second and third are the same person; and it is far from improbable that all the three Merlins are but one individual. Of Merlin Ambrosius the principal account we have is in Geoffrey of Monmouth's 'Historia Brittonum,' where he is represented as a great prophet and enchanter, who flourished in the time of King Vortigern, about the middle of the 5th century. This is the Merlin who is celebrated by many of our old poets, especially by Spenser, in the 'Faery Queen,' book iii., and elsewhere; and he is also the subject of the English metrical romance of Merlin, of the first part of which here is a copy in the library of Lincoln's Inn, and a more ancient one, containing also a second part, in the Auchinleck manuscript in the Advocates' Library, and of which Mr. Ellis has given an analysis, with extracts, in the first volume of his 'Specimens of Early English Metrical Romances.' Of the Caledonian Merlin there is a life in Latin hexameters, extending to 1528 lines, by Geoffrey of Monmouth, who professes to have compiled it from an Armorican original; it is extant in one of the Cotton manuscripts (Vesp. E. iv.), and has never been printed, but here is an account of it in the same volume of Mr. Ellis's work. (See also Pinkerton's 'Inquiry into the Early History of Scotland,' ii. 275.) Merdwin, in the third book of his 'Scotichronicon,' has a long account of Merlin the Wild, and especially of an interview between him and St. Kentigern, bishop of Glasgow, who lived in the latter part of the 6th century. This account agrees with other testimonies as to the age of the Caledonian Merlin, and also as to his having been a native and inhabitant, not of the country now called Wales, but of the Welsh kingdom of Reged, or Strathclyd, which extended over the south-west of Scotland. That district, it may be added, still retains several traditionary recollections of the fame of Merlin; his grave, in particular, is yet shown near the village of Drumelzier, on the Tweed. (See Sir W. Scott's 'Introductio to Romance of Sir Tristram,' p. 38; and Note to 'Vision of Don Roderick,' p. 387, edita. of 1834.) Collections of the Prophecies of Merlin have appeared in French, at Paris, 1498; in English, at London, 1629 and 1688; in Latin, at Venice, 1654; and there are also manuscripts of them, in French and English, in the Cotton and other libraries. (See Warton, 'Hist. of Eng. Poet.,' iii. 430, edit. of 1824.) We find some of them applied by the poet Lawrence Minot, who wrote about 1360, to the victories of Edward III. (Ibid., and Minot's 'Poems,' by Ritson, 'note,' pp. 100-104.) It appears to have been generally assumed by the French and English collectors that the author of these prophecies was Merlinus Ambrosius; but in the Scottish edition, printed at Edinburgh, 1615, they are attributed to Merlin the Wild, or the Caledonian. They appear to have been very famous in Scotland in the early part of the 16th century. (See Sir W. Scott's 'Minstrelsy of the Border,' iv. pp. 134-147.) The 'Avalonau,' and some other Welsh poems, attributed to Merdwin Wyllt, are published in the 'Welsh Archaeology,' 3 vols. 8vo, 1801, &c. See Mr. Sharon Turner's vindication of the authenticity of these productions, printed at the end of his 'History of the Anglo-Saxons,' vol. iii., 1823.)

MERRICK, JAMES, an English divine and poet, was born in 1720. At the age of fourteen, while still at Reading school, he published the 'Messiah, a Divine Essay,' and in 1739, at Trinity College, Oxford, he made a translation of the poem of Tryphiodorus on the Capture of Troy. He also published, in 1741, the Greek text of Tryphiodorus. He was chosen Fellow of Trinity College, Oxford, in 1744, and took holy orders, though, owing to infirm health, he never undertook parochial duties. His chief works were, 'A Dissertation on Proverbs,' h. ix.; 'Prayers for a Time of Earthquakes and Violent Floods,' written in 1756, soon after the earthquake at Lisbon; 'An Encouragement to a Good Life, particularly addressed to some soldiers quartered at Reading.' He appears to have paid great attention to this class of men, who at that time especially required it. He also wrote 'Poems on Sacred Subjects,' and made an excellent translation of the Psalms into English verse. This, beyond all doubt the best poetical translation we have, was unfortunately not adapted for parochial choirs, inasmuch as it was divided into stanzas for music. On this account it has not been used as generally as its merits would justify. He published several other religious treatises, and some remarks on profane as

well as sacred writers. Dr. Lowth calls him "one of the best of men and most eminent of scholars." He died January 5, 1769.

MERSENNE, MARIN, a very learned philosopher and mathematician, one of the religious order of 'Minimes,' was born in 1588 at Oyse, in the present department of Maine, and received his education at the college of La Flèche, where he was a fellow-student of Descartes, with whom he formed an intimacy which a similarity of pursuits ripened into a friendship that death only dissolved. He afterwards studied at the University of Paris, and subsequently at the Sorbonne. In 1612 he took the vows at the convent of the Minimes, in the neighbourhood of Paris, and the year following received ordination as priest, when he deemed it incumbent on him to study the Hebrew language, a thorough knowledge of which he acquired. In 1615 he filled the chair of philosophy at Nevers, and there taught till the year 1619, when he was chosen superior of the convent, and on completing the term of his office he travelled into Germany, Italy, and the Netherlands. He finally settled in Paris, where his gentle temper and his polite and engaging manners procured him a number of distinguished friends. Of these the chief was the founder of the Cartesian philosophy, who entertained the highest opinion of his abilities, and consulted him upon all occasions.

It has been stated—though the story seems highly improbable—that Descartes, by the advice of Mersenne, at once changed his intention of founding his system on the principle of a vacuum, and adopted that of a plenum. The discovery of the cycloid has been ascribed to him and also to Descartes, but it now seems pretty clear that neither are we indebted for the first notice of this curve. Mersenne died at Paris in 1648, in consequence of drinking cold water when over-heated. The result of this indiscretion was an internal abscess in the side, which he desired should be opened. The surgeon made the incision two inches below the right place, and the patient expired under the operation.

The Père Mersenne was undoubtedly a man of great learning and unwearied research, and deserved the esteem in which he was held by the philosophers and literati of his age; but, except his 'Harmonie Universelle,' his works are now unread and almost unknown. If by some he was over-rated, by others he has been undervalued; and when Voltaire mentioned him as "Le minime et très minime Père Mersenne," he indulged his wit at the expense of one with whose writings, it is to be suspected, he was very little acquainted. His eulogist however, in the 'Dictionnaire Historique,' admits that he very ingeniously converted the thoughts of others to his own use; and the Abbé Le Vayer calls him "Le bon Larron"—a skilful pilferer. Nevertheless, the work above named, 'L'Harmonie Universelle, contenant la Théorie et la Pratique de la Musique,' in 2 vols. folio, 1637, has proved of the utmost value to all later writers on the subject, and among the number to the author of the present notice. The work was in 1648 translated into Latin and enlarged, by the author; but both the original and translation are now become as rare as they are curious to the antiquary and interesting to the musical inquirer.

MERZLIAKOV, ALEXIUS PHEODOROVICH, a Russian writer, more distinguished as a critic than as a poet, though not without talent in the latter character, was born at Dalmatova, in the government of Perm (where his father was a wealthy merchant), in 1778. In his fourteenth year he recommended himself to Catherine II. by an ode on the peace with Sweden, and the empress ordered him to be sent to the University of Moscow, where he was placed under the charge of Kheraskov [KHERASKOV], and in 1798 was made professor of eloquence and poetry. In 1805 he quitted Moscow for the northern capital, where he held a similar professorship in the university. It was at St. Petersburg that, at the suggestion of Prince Galitzin, he commenced a popular course of lectures on literature, which were numerous attended, and obtained for him a high reputation with the public. These lectures, which were held twice a week during the winter at Galitzin's house, were then a novelty, and were the more interesting to his auditors, because the critic discussed at length the merits of the principal Russian poets and prose-writers.

His own productions consist chiefly of translations, among which are Aristotle's 'Poetic,' Virgil's 'Eclogues,' select scenes from the Greek tragedians, Eschenburg's 'Theory of Literature,' and Tasso's 'Giurnallemma.' Among his original poems, his shorter lyric pieces and songs are the best, the latter more especially, for they breathe strong national feeling, and have accordingly acquired more than a transitory popularity. Merzliakov died July 29, 1830.

MESMER, FRIEDRICH ANTON, was born in 1734 at Marburg in Baden, on the borders of the Lake of Constance. He was educated at the schools of Dillingen and Ingoldstadt, whence he proceeded to Vienna to study physic, and took his degree of Doctor of Medicine in the university of that place, in the year 1766. On that occasion he published an inaugural thesis on the 'Influence of the Planets on the Human Body,' which asserted the existence of a subtle fluid exercising an influence on the human body. This he supposed to be planetary and to resemble the power of gravitation. In 1772 he began some investigations as to the power of the magnet, in conjunction with the professor of astronomy at Vienna, a Jesuit, named Father Hell, who had great faith in the influence of the loadstone on human diseases, and had invented steel plates of a peculiar form which he impregnated with the virtues of the magnet, and applied to the cure

of diseases "with extraordinary success." Mesmer, who had his own notion of the virtues of the magnet, availed himself of his friend's steel plates to employ the magnet to his own peculiar views. Wonderful were the results; on the communication of which to Father Hell, his friend published an account of them; but in this account he attributed all the cures to the form of the plates, and spoke of Mesmer as a physician whom he had employed to make his experiments. Mesmer, expressing great indignation at this representation, accused Hell of treachery, and of endeavouring to turn to his own advantage a discovery with which he had been entrusted in the confidence of friendship. Hereupon arose a violent controversy which ended in the total defeat of Mesmer, who, as if deriving fresh energy from discomfiture, went on working greater cures than before, and making incomparably greater noise about them, having now discovered that the same effects could be produced without the use of the magnet, and this new power he designated animal magnetism. Nevertheless, being deserted by all men of science, who universally regarded him as an impostor, he was obliged to quit Vienna. After travelling some time in different parts of Germany and Switzerland, continuing everywhere to work wonderful cures, at last in a lucky hour he set out for Paris, where he arrived in the year 1778. His first care, on reaching this new and favourable theatre for his exploits, was to procure public apartments for the treatment of patients. And thither speedily flocked peer and peasant in such numbers that his apartments were crowded, and hundreds were ready to attest the wonderful cures wrought upon their own persons by the great magnetiser. In the general excitement it would have been wonderful if no regular member of the medical faculty had become a convert. Mesmer found a highly useful one in a certain M. d'Eslon, who openly professed his conversion to the system, and who practised it with so much success that he is said to have received in fees from his patients no less a sum than 100,000*l.* The disciple in this proceeded further than was altogether satisfactory to the master. Mesmer complained bitterly that he was betrayed and ruined; and that the fruit of long study and incessant watchings, which it had been the labour of his life to bring to perfection, was snatched from him by another. He now applied to the government, and succeeded in obtaining the patronage of the queen. "A château and its lands, where he might be enabled to continue his treatments at leisure and independently of persecution," was what he asked. A life-rent of twenty thousand francs per annum, and in lieu of the château and its lands another sum of ten thousand francs a year to enable him to select a proper situation for the treatment of his patients, were actually offered him. The offer however was coupled with one condition, namely, that persons nominated by the government should witness and report upon his proceedings. Nevertheless it was stipulated that, even if the report of these persons should prove unfavourable, the sums promised him should not be forfeited, while, if favourable, he might look for the most splendid rewards. The commission, consisting of nine persons of scientific eminence, was nominated in 1784. But Mesmer was sharp-sighted enough to foresee that the report would not be favourable, and that the reward would not be continued if undeserved. He therefore suddenly quitted France and repaired to Spa. Thither he was followed by several patients of rank and fortune, who, on condition that he would communicate to them his doctrine and practice, bound themselves to find one hundred persons who would pay him each 2400 francs for his instructions. The sum actually raised by this subscription amounted to 340,000 francs, nearly equal to 14,000*l.* sterling. On receiving this sum, Mesmer returned to Paris and recommenced his public treatments. Meantime his disciples, who had paid thus liberally for his instructions, formed themselves into what they termed *Sociétés de l'Harmonie*, for the purpose of gratuitously propagating the doctrines of animal magnetism. But the master disputed their right to do this: the disciples, on the other hand, maintained that they had purchased the privilege; at all events they resolved to exercise it, and set about doing so; and now Mesmer seeing no prospect of making any further personal advantage by his discovery, quietly put the money in his purse, quitted France, and after living a short time in England under an assumed name, he retired to Germany, published in 1799 a new exposition of his theory, and died at Marburg on March 5, 1815.

In addition to the work 'On the Influence of the Planets,' &c., mentioned above, Mesmer wrote, in support of his professed system, 'Mémoire sur la Découverte du Magnétisme Animal,' 1779, and 'Précis Historiques des Faits relatif aux Magnétisme Animal, jusques en Avril, 1781.' Mesmer's charlatanerie is now universally admitted, but he seems to have been aware of a power not then generally known, and which men of far more honesty and ability than himself have since been zealously investigating. This branch of the subject belongs to the Division of the ARTS AND SCIENCES, where it will be found treated under ANIMAL MAGNETISM.

MESSALINA. [CLAUDIUS NERO.]

MESSALLA, or, with his full name, MARCUS VALERIUS MESSALLA CORVINUS, was born B.C. 59, in the same year as Livy. It would appear from a passage in Cicero's letters that he went to Athens in his fifteenth year to study. ('Ep. Att.' xii. 32.) He was opposed in early life to the party of Antony and Octavianus (Augustus), and was in consequence included in the proscription of the second

triumvirate, B.C. 43 (Dion, xvii. 11; App., 'Civ.' iv. 38); but after the battle of Philippi he contrived to make his peace with the conquerors, and was subsequently advanced by Augustus to offices of great trust and power. He accompanied Augustus in his campaign against Sextus Pompeius, B.C. 36, and on his return to Rome was made augur for the services he had rendered in that war. The military talents of Messalla appear to have been highly valued by Augustus: in B.C. 34 he subdued the Salassi and other warlike tribes which inhabited the Alps, and four years afterwards he conquered the Aquitani, to which victory Tibullus frequently alludes (i. 7; ii. 1, 3, 5, 117). In the two following years he was sent by Augustus to Egypt and various parts of Asia on important public business, and on his return, B.C. 27, he obtained the honours of a triumph on account of his conquest of Aquitania. He was consul B.C. 31, and was appointed prefect of Rome B.C. 26. He died about A.D. 11.

Messalla was one of the most celebrated orators of his time; he is frequently mentioned by Quintilian in terms of the highest praise ('Inst. Orat.' x. 1; compare Hor., 'Sat.' i., 10, 29; 'Ars Poet.' 174) and the author of the dialogue 'De Oratoribus' considers him as superior to Cicero in grace and elegance of expression (c. 18). Messalla also appears to have paid attention to the study of language, and Quintilian informs us that he had not only written treatises on separate words, but even on separate letters. ('Inst. Orat.' i. 7; compare ix. 4) He was a great patron of literature in general, and appears to have conferred no small benefits on Tibullus, who frequently celebrates in praises of his patron with as much subserviency as the other poets of the Augustan age.

METASTASIO, PIETRO, was born at Rome on the 6th of January 1698. His father, once an opulent citizen of Assisi, afterwards a soldier, then an amanuensis, and finally a small pastrycook at Rome, was enabled by the profits of his trade to place his son at a grammar-school, where he soon displayed that talent for poetry which so highly distinguished him in after-life. Before he was ten years of age he could, it is said, make verses on any subject; and it was no unusual sight to see his father's porch surrounded in the evening, after school hours, by groups listening to the poetry of a child. During one of these tuneful fits the celebrated lawyer and critic Gravina happened to pass by, and was forcibly struck by the extraordinary talent displayed by the youthful improvisator. He offered the young poet money, which was refused in a manner so firm, yet so polite, that Gravina's admiration of him was increased, and he instantly formed the resolution of adopting him. The father, Felice Trapassi, willingly consented; and the next morning Pietro was assigned to the care of his patron, who changed his name to Metastasio (*Merdovasis*, 'mutata a changing'), a term expressing his situation by adoption.

Gravina immediately determined to educate his charge for the profession of the law, wishing rather that he should become an orator than a poet, well knowing that the former profession leads to fortune and the latter, most commonly, to empty fame. He nevertheless caused him to study the ancient poets, in which pursuit his ardour and success were so great, that at the early age of fourteen he produced his tragedy 'Giustino,' written after the Greek models. His patron now not only allowed but encouraged his devotion to the muses; and when Metastasio had reached his eighteenth year, Gravina accompanied him to Naples, that he might meet and sing with the most eminent improvisatori of the day. He became a universal favourite. The harmony of his verse, the grace and dignity of his elocution, and the expressiveness of his countenance, were the topics of all conversation. Still he continued to study the law; and, to secure an opening in the only other road to preferment, entered into a minor order of priesthood.

Within two years after his arrival at Naples his patron died, and Metastasio mourned his loss like an affectionate son. By Gravina's will he became sole possessor of all his property, consisting of 15,000 crowns, a fine library, and a little estate in the kingdom of Naples; but such was the generosity, not to call it by a harsher name, of the poet's disposition, that in the short space of two years all that remained to him of this property was the small landed estate. He now applied to the law, and during a whole year was most assiduous in his studies under Paglietti, a mortal enemy to the muses; but at the end of that time he was again attracted to his poetic pursuits, and produced a 'Epithalamium' at the request of the Countess of Althaus, who likewise prevailed on him to write the drama 'Endimione.' Under the patronage of the viceroy of Naples he next produced 'Gli Orti Esperidi' ('The Gardens of the Hesperides'), and then 'Angelica,' the plot from Ariosto. The former of the two was most successful, and especially admired by Signora Bulgarini, better known as 'The Romanina.' She was the first singer of her day, and performed the part of Venus in the favoured opera. Such were her admiration and esteem for the author, that she persuaded him to renounce the law, to take up his abode under her husband's roof, and to dedicate the whole of his energies and time to the muses and to friendship. His 'Didone Abbandonata' was written at the request of his female friend, to whom, it has been surmised, the poet is indebted for some of the finest dramatic incidents. Such was the celebrity of this drama, that it was set by all the great Italian composers of that period, and not only established the author's fame, but brought him a large pecuniary recompense. In 1727 he accompanied the Romanina to Rome, where he produced his 'Semi-

ramide, 'Ezio,' 'Alessandro nell' Indie,' 'Catone in Utica,' and the opera so well known by our English version of it, 'Artaserse.' But praise was nearly the whole of the reward he reaped from his labours in the pope's dominions.

In the year 1729 Metastasio received an invitation from the court of Vienna, whither he repaired, and became the successor of Apostolo Zeno, the Imperial laureate. This appointment was rendered more gratifying to him, as it was made on the recommendation of Zeno himself, who had long enjoyed the office, and had written a vast number of lyrical dramas, among which are some of the best that the Italian language can boast. The stipend assigned to Metastasio—8000 florins—was then a large salary; and other advantages were added. This came rather opportunely, for at Rome he had suffered much from the slenderness of his income, and was often indebted to his friend for assistance. To her, when he left Italy, he entrusted his affairs, and deposited with her a small sum for the temporary support of his father, till he could make an arrangement of a permanent kind. His reception by Charles VI. was most gratifying, and promised everything for the future, a promise not disappointed. During the succeeding three years, his correspondence with his "inestimable counsellor and friend" amounts almost to an autobiography; but in 1734 he sustained an irreparable loss by her death, who to the last proved the sincerity of her attachment by bequeathing to him, after the decease of her husband, the whole of her property, amounting to 25,000 crowns. Metastasio however, guided in this instance, as he was in every other, by the strictest rules of honour, declined to derive any advantage from the will so generously made in his favour, and immediately transferred to the husband all right to the reversionary property. What may have been the nature of the connection between the poet and Signora Bulgarini (or the Romanina), it is now impossible to say. From Metastasio's letter to the husband on the death of his wife, the sorrow expressed is in a tone of candour which looks as if there had been nothing to conceal or disguise. At what age the lady died is unknown, but as she was first singer at Genoa in 1712, it is likely that she was much the senior of her friend.

Metastasio's mode of life, from his first settling in Vienna till the moment of his death, was that of a poet and man of letters, who devoted his time and thoughts to the muses, to general literature, and to the conversation of persons more or less connected with his pursuits. In 1733 he produced, among other pieces, 'L'Olimpiade,' which the Italians distinguish as 'il divino,' and his very popular canzonetta, 'La Libertà.' For the emperor's birth-day in 1734 he wrote the noble opera, so well known in every part of Europe, 'La Clemenza di Tito,' which was set by the Imperial composer, Caldara, but not a vestige of the music remains. The same drama however was in 1790 chosen by Mozart, whose magic notes have assisted in bestowing on it immortality. It is not unworthy of remark, that though all the poet's operas were set as soon as written, yet not even a single piece of the original music is now known, or, we believe, to be found, except perhaps in the Imperial library of Vienna.

He continued supplying the court with lyric dramas and oratorios, and also employed himself in the production of various detached pieces of poetry, till the year 1740, when the death of the emperor brought on the long and devastating war in Germany, and this led to the closing of the theatre, for which he had so successfully laboured. He now employed his pen in translating into blank-verse the 'Ars Poetica' of Horace, together with one of his Satires and Epistles, and Juvenal's third Satire. He likewise wrote notes on the Greek tragedians, and translated a portion of Aristotle's 'Poetic,' adding a very earned, luminous, and ingenious commentary, which appeared in print after his decease. But though his dramatic labours for the Imperial city were suspended, he produced in 1744 'Antigono' for the court of Dresden, and 'Ipermestra' in the same year. On the return of peace he wrote in 1751 'Il Re Pastore' for the ladies of the Imperial court, by whom it was performed. His last drama was 'Il Ruggiero,' performed in 1771 at Milan, on the marriage of the archduke Ferdinand.

Of Metastasio's seven sacred dramas, or oratorios, 'La Passione,' 'La Morte d'Abel,' and 'Isacco' are best known; but all of them, Calabigi justly observes, are as perfect as this kind of composition will allow. Of his cantatas, 'La Primavera,' 'La Libertà,' and 'La Partenza' are admired by all who have any acquaintance with Italian poetry. His occasional short dramatic pieces, sonnets, and other miscellanies are too numerous to be mentioned here; a catalogue raisonné of them is given in the work whence we have drawn most of our materials for the foregoing portion of this article. (Dr. Burney's 'Memoirs of Metastasio'.)

One of the occupations of the poet when far advanced in years was he preparing corrected copies for the magnificent edition of his works printed at Paris in 1780. This may be considered his last labour. On the 1st of April 1782, he was attacked by symptoms of fever, alarming at his age, and on the 12th he expired. His remains were deposited in the church of St. Michael at Vienna. His property, consisting of a well-furnished house, carriage, &c., many princely presents, an ample library, and 180,000 florins, he bequeathed to the son of his old friend Signor Martinetz, whose house was his first bode in Germany; but from this sum were to be deducted 20,000 orins for each of the executor's sisters, and 3000 for each of his younger brothers.

BIOG. DIV. VOL. IV.

The genius of Metastasio, says Arteaga, "may be compared to the goddess Chloris of the Greeks, who, in flying through the air, scattered roses wherever she went." He did indeed ornament and cast a fragrance on whatever he touched. His reputation soon obscured that of Apostolo Zeno, W. Schlegel observes, because, having the same object in view, he showed more flexible talent, and knew better how to adapt himself to the views and means of the composer. A perfect purity of diction, adds the same acute critic, a grace and unalloyed delicacy, have rendered Metastasio, in the eyes of his countrymen, a classic author, the Racine of Italy. He has above all a delightful softness in his verses designed for music. Perhaps no other poet of the musical drama ever possessed in the same degree the gift of compressing in a short space situations so pathetic, so touching, but it is done frequently by the entire abandonment of all probability of sentiment and incident. It is said of him, by Schlegel, that in order not to endanger his originality, he carefully abstained from reading the chefs-d'œuvre of the French stage. However this may be, we will add, that in all his works it is clear that he was no imitator: his style, his chasteness, his tenderness, were his own. In deep tragedy he could not excel; he had not the power to wring the heart; his life was too serene, he was too happy in himself to imagine scenes of bitter anguish, of complicated misery; but in depicting gentle grief, that grief which does not pass the confines of reason, he has no superior. He has been described as, 'par excellence,' the poet of love, but his most passionate expressions never are sullied by the slightest breathing of indelicacy. His morality is unimpeachable, is exemplary. In all his works he stands high; in his operas he is unrivalled.

METELLI, a distinguished family of the Cæcilian 'gens' in ancient Rome. Those most worthy of notice are—

1. Q. CÆCILIUS METELLUS MACEDONICUS, who was sent when prætor (B.C. 148) into Macedonia against Andriscus, who pretended to be a son of Perseus, the last king of Macedonia, and who had excited a revolt against the Romans. In this war Andriscus was defeated and taken prisoner by Metellus. (Liv., 'Epit.' 50; Paus., vii. 13, 1; Eutrop., iv. 13.) In B.C. 146, Metellus defeated the Achæans near Thermopylæ, and on his return to Rome obtained a triumph on account of his conquest of Macedonia. (Liv., 'Epit.' 52.) Metellus, in his consulship, B.C. 143, was sent into Spain to oppose Viriathus, who had obtained possession of the whole of Lusitania, and had defeated successively the prætors Vetilius and Plautius. Metellus remained in Spain two years, and obtained several victories, but was succeeded in the command, before the conclusion of the war, by Q. Pompeius. (Liv., 'Epit.' 52, 53; Val. Max., iii. 2, 21; vii. 4, 5; ix. 3, 7; Appian, 'Iber.' 76; Eutrop., iv. 16.) During the censorship of Metellus and Q. Pompeius, B.C. 131, it was decreed that all citizens should be obliged to marry. The oration which Metellus delivered on this subject was extant in the time of Livy, and is referred to by Suetonius (Liv., 'Epit.' 59; Suet., 'Octav.' 89.) We are told by Livy and Pliny that when Metellus was returning one day from the Campus Martius, he was seized by command of C. Attinius Labeo, a tribune of the plebs, whom he had in his censorship expelled from the senate, and dragged to the Tarpeian rock; and that it was with the greatest difficulty that his friends were enabled to preserve his life by obtaining another tribune to put his veto upon the order of Attinius. (Liv., 'Epit.' 59; Plin., 'Nat. Hist.' vii. 45.) Metellus died in B.C. 115, during the consulship of his son Marcus. Pliny refers to Metellus as an extraordinary example of human happiness. "For besides the possession of the highest dignities," says Pliny, "and having obtained a surname from the conquest of Macedonia, he was carried to the funeral pile by four sons, of whom one had been prætor, three had been consuls, two had enjoyed a triumph, and one had been censor." ('Nat. Hist.' vii. 45.)

2. QUINTUS CÆCILIUS METELLUS NUMIDICUS derived his latter cognomen or surname from his victories in Numidia, whither he was sent in his consulship, B.C. 109, in order to oppose Jugurtha. He remained in Numidia, B.C. 108, as prætor; but in the beginning of the following year he was superseded in the command by Marius, who had formerly been his legatus, or lieutenant-general. On his return to Rome, Metellus obtained the honour of a triumph. (Sallust, 'Bell. Jugurth.'; Vell., ii. 11; Eutrop., iv. 27; Liv., 'Ep.' 65.) [JUGURTHA.] Metellus was censor B.C. 102. He took an active part in the civil commotions of his time, and was one of the most powerful supporters of the aristocratical party. In B.C. 100 he was obliged to go into exile in consequence of opposing the measures of the tribune Saturninus; but on the execution of the latter, Metellus was recalled from exile in the following year. [MARIUS.]

3. Q. CÆCILIUS METELLUS PRUS, son of Numidicus, belonged to the same political party as his father, and supported Sulla in his contest with Marius. Metellus received especial marks of favour from Sulla, and was consul with him, B.C. 80. In B.C. 78 Metellus was sent against Sertorius in Spain, where he appears to have remained till the conclusion of the war, in B.C. 72. From the year 76 Pompey was his colleague in the command; and they triumphed together at the end of the war. [SERTORIUS.] (Vell., ii. 30; Eutrop., vi. 5; Plut., 'Pomp.') Metellus was Pontifex Maximus; and on his death, B.C. 63, in the consulship of Cicero, he was succeeded in that dignity by Julius Cæsar.

METHODIUS AND CYRILLUS, two brothers, the apostles of Christianity among the Slavonians in the 8th century, and the inventors of the Slavonian alphabet, were natives of Salonica or Thessalonica in Greece. Methodius held a high command in the Greek army under the Emperor Michael III. Constantine, or according to the monastic name he afterwards assumed, Cyrillus, who had been educated at the court of Constantinople, was in holy orders, and was keeper of the library of Santa Sophia. He was first sent by the emperor as a missionary to convert the Saracens inhabiting the banks of the Euphrates; and about the year 863 he and his brother Methodius proceeded on a religious mission to the Slavonians, at the request of the princes Rotislav, Swiatopolk, and Kozel, who had made application to the court of Constantinople for instructors in the Christian faith. The choice both of the emperor and the clergy fell upon Methodius and Cyrillus, the first being selected on account of his knowledge of the Slavonian, and the other because he was well skilled in many Oriental languages. Whether both brothers had a share in the formation of the Slavonian alphabet is doubtful, some writers attributing it to both of them, others to only one, and of these latter some to Methodius, others again to Cyrillus. They translated the Psalter, the Gospels, and many other parts of the Scriptures into Slavonic. Cyrillus however did not continue there above four years and a half, after which he visited Bulgaria, and next proceeded to Rome, where he died, according to Schlozer in 871; according to others, in 878. Methodius, on the contrary, remained, and continued his labours for about thirty years, in the course of which time he is said to have translated all the Scriptures. None of the original manuscripts are extant, but it is supposed that the Slavonic version adopted by the Greek Church is derived immediately from that of Methodius and Cyrillus.

METTIUS, ADRIAN, was born at Alkmaar, a town of North Holland, 9th of December 1571. His father, whose name, according to Lalande, was likewise Adrian, although Montucla calls him Peter, was a military engineer of considerable reputation. His skill contributed greatly to the successful defence of Alkmaar, when besieged by the Spaniards in 1573. It was he also, and not his son, who first gave  $355 : 113$  as the ratio of the circumference of the circle to its diameter.

From his father young Adrian soon acquired a practical knowledge of the mathematics, which his natural inclination towards such pursuits enabled him greatly to improve. After studying law and medicine at the University of Franeker, he passed into Germany and Denmark, where he became a pupil of Tycho Brahe. Upon his return to Holland he assisted his father in his professional avocations, until the year 1598, when he was appointed professor of mathematics in the University of Franeker. He retained this appointment until his death, which took place at Franeker, 26th of September 1635. A considerable part of his fortune was expended in the study of alchemy, but he either ridiculed or disregarded the speculations of astrologers. The following list of his works is given by his friend P. Winsem, in his 'Elogium Adriani Metii,' printed in the 'Memoirs of the Academy of Franeker':—'Doctrina Sphærica,' Franq., 1598, 8vo; 'Institutionum Astronomicarum Libri III.' Ibid., 1606, 1608, 8vo; 'Arithmetica et Geometria Practica,' Ibid., 1611, 4to; 'De Gemino Usu utriusque Globi,' Amst., 1611, 4to; 'Praxis nova Geometrica per usum circini et regulæ proportionalis,' Franq., 1623, 4to; 'Calendarium perpetuum articulis Digitorum computandum,' Roterod., 1627, 8vo; 'Astrolabium,' Franq., 1627, 4to; 'Opera omnia Astronomica,' Amst., 1633, 4to.

(*Biographie Universelle*; Montucla, *Histoire des Mathém.*; Hutton, *Dictionary*.)

METTIUS, JAMES, was a younger brother of the preceding, and the reputed inventor of the refracting telescope. On this point Montucla quotes the following passage from the 'Dioptrics' of Descartes, wherein the latter says, "It is now about thirty years since this admirable invention was first ascribed to James Metius, a man who had never studied the mathematics, notwithstanding that both his father and brother had made their profession. This individual, while one day amusing himself with a few burning-glasses, after looking through them singly, began to look through them by pairs, placing one at each extremity of a short tube. In this way a convex and concave lens happening to be employed together, the first refracting telescope is said to have been constructed." (Montucla, tom. ii., p. 230.) The reputed date of this discovery is the beginning of the 17th century.

A somewhat similar story is related of the children of a spectacle-maker of Middelburg, in Zealand. There is however as much or more reason to suppose that the discovery took place in England, more particularly when it is remembered that the satellites of Jupiter were observed in England by Harriot in 1610. (See the 'History of Optics,' by Mr. Barlow, in the 'Encyclopædia Metropolitana.') Weiss adds ('Biog. Univers.') that Metius guarded his secret with such extreme caution, that, even when about to die, the priest who attended him could not induce him to divulge it; another story is that he confided the secret reluctantly to Prince Maurice, on an occasion when that prince honoured him with a visit for that especial purpose. We have not been able to find the year in which James Metius was born, or that in which he died.

METON. The astronomer Meton was living at Athens at the beginning of the 87th Olympiad, B.C. 432. He was, according to some, a Lacedæmonian (*Λάκων*), but the best authorities call him a Leuconian

(*Λευκωνεύς*). All we know which is worth recording here is, that the solstices which he observed with Euctemon are preserved by Ptolemy, and that he was the founder of the celebrated lunar cycle which is preserved by the Western churches in their computation of Easter.

The METONIC CYCLE takes its rise as follows: 235 revolutions of the moon are very nearly 19 revolutions of the sun, and one complete revolution of the moon's node. If these approximations were exact all the relative phenomena of the sun and moon, particularly those of eclipses, would recommence in the same order, at the end of nineteen years. There is however an error of some hours in the cycle.

The first year of the first Metonic period commenced with the summer solstice of the year B.C. 432; and if the reckoning had been continuous, what is now called the 'golden number' of any year would have denoted the year of the Metonic cycle, if the summer solstice continued to be the commencement of the year. On reckoning however it will be found that A.D. 1, which is made the first year of the period of 19 years, would have been part of the fourteenth and part of the fifteenth of a Metonic cycle.

METRODORUS, a distinguished ancient painter and philosopher of Athens, born about two centuries before the Christian era. At the defeat of Perseus by Paulus Æmilius, in Greece, B.C. 168, the Roman general ordered the Athenians to send their most able person to perpetuate his triumph, and their most distinguished philosopher to educate his sons. The Athenians paid Metrodorus the extraordinary honour of declaring to Paulus Æmilius that he was their greatest painter and their most distinguished philosopher; the Roman general is said to have been perfectly satisfied with the choice.

As Metrodorus was chosen to paint the triumph of Paulus Æmilius and to educate his sons, and gave him satisfaction in both respects we must infer that he did paint his triumph, though there is no mention of the picture. It must have been an undertaking of great magnitude, and indeed, if adequately represented, a very extraordinary performance; for in the procession of this triumph, which is described by Plutarch, there were 250 waggons containing Greek works of art. The spectacle lasted the entire day.

(Pliny, *Hist. Nat.*, xxxv. 40; Plutarch, *Paulus Æmilius*, 32.)

METTERNICH, CLEMENT WENCESLAS, PRINCE, was born at Coblenz on the 15th of May 1773. His ancestors had gained distinction in the wars of the empire against the Turks. His father, Count Metternich, was the associate of the well-known minister Kaunitz, whose name is so much associated with the transactions of the Low Countries [KAUNITZ], after whom the son was named, and who stood as his godfather. At the age of fifteen the young Metternich entered the University of Strasbourg, and having stayed there about two years, he went to complete his studies at Mainz. In 1790 he made a tour through Holland and England, and in the same year he was attached to the Austrian embassy at the Hague. In 1795 he married Mary Eleanor, daughter of Kaunitz.

Metternich's first appearance as a diplomatist was as deputy from Westphalia at the congress of Rastadt; he afterwards accompanied the Count de Stadion to Berlin and St. Petersburg. In 1801 he was appointed minister at Dresden. In 1803-4, as ambassador to Berlin, he took a leading part in negotiating the treaty between his own country and Prussia and Russia. In 1806 he was sent to Paris, and in the following year signed the treaty of Fontainebleau. War had scarcely broken out between Austria and France in 1809, when Metternich was recalled home to undertake the post of foreign secretary, and it was during his tenure of office that the emperor Napoleon divorced the unhappy Josephine and married the Austrian archduchess Marie Louise, whom Metternich conducted to Paris. At the conferences of Dresden and Prague he warmly espoused the cause of his country, and the commencement of the downfall of Napoleon was dated from this time. In August 1813 war was formally declared by Austria against France, and in the following month the Grand Alliance was signed at Töplitz, when Count Metternich was rewarded by being raised to the dignity of a prince of the empire. In the proceedings consequent upon the invasion of France by the allied armies and the occupation of Paris, Prince Metternich took a leading part, and signed the Treaty of Paris on behalf of Austria. Soon after this he visited England, but returned to his country on the renewal of war, and was at once the representative of Austria at the congress of Vienna and president of its councils. From this period, down to the death of the Marquis of Londonderry and the accession of Mr. Canning to office in 1822, Prince Metternich was not only the arbiter of Austrian interests, but had vast influence over the courts and cabinets of the Continent. In the subsequent drama of European politics Prince Metternich played no undistinguished part; but he has been much censured for permitting the Russian emperor during the war of 1828 with Turkey to establish his power in Moldavia and Wallachia, and the other provinces which lie near the mouth of the Danube, to the detriment of Austria. In 1830 the revolution of July broke out in Paris, and alarmed the court of Vienna, whose influence was thrown into the opposite scale; but, through the instrumentality of Metternich, friendly relations were established with Louis-Philippe. Austrian troops were sent to occupy Italy and other places, in which it was feared that republican principles would assert themselves. In

Poland, Spain, Holland, Prussia, and in the Germanic states, the Austrian minister used all the influence which he could command for the purpose of crushing the movement in favour of popular government. By these means Prince Metternich was enabled to preserve the position of Austria down to the period of the outbreak of the revolution at Paris in 1848. A strange sympathy unites the continental thrones and people: no sooner had the monarchy of France fallen than Austria was shaken to its base. The revolutionists rallied in the streets of Vienna, overthrew the government, and compelled Prince Metternich to resign his office. He retired, together with his sovereign and the court, and after seeking an asylum in vain in Moravia and at Leipzig he came to England, where he remained until a reaction took place. In 1851 he returned to Vienna, but has taken little or no share in public affairs since that time. (*Les Diplomates Européens*, par M. Capefigue.) [See SUPPLEMENT.]

\* METZ, DE, or as he writes it himself, DEMETZ, FRÉDÉRIC AUGUSTE, was born about 1796. He was educated for the law, and became Conseiller Honoraire à la Cour Royale and Membre du Conseil Général de Seine-et-Oise. As a judge of the Court of Appeal in Paris, his attention had been strongly drawn to the subject of criminal jurisprudence and the best means of effecting the reformation of criminals, particularly of the juvenile class. Demetz joined and became an active member of the Société de Patronage, instituted at Paris for the purpose of effecting the reformation of young criminals, the growing leprocity of which class threatened the most serious consequences. This society soon arrived at the conclusion that the establishment of agricultural schools or colonies would be the most effectual means of attaining their object, and Demetz and the late Léon Faucher were reputed to proceed to Belgium and Holland, there to examine the industrial establishments for paupers. They formed the opinion that it was a mistake to make such establishments on sterile soil; they did not pay, though the discipline was severe, and the food of the coarsest and scantiest description. M. Faucher returned to Paris, while M. Demetz proceeded to Hamburg and other places. M. Demetz at Hamburg carefully examined the Rauhe Haus, in which considerable progress had been made in the reformation of criminals.

With his acquired experience M. Demetz returned to France, and in 1839 the establishment at Mettray, near Tours, in the department of Indre-et-Loire was commenced. The Viscount de Courteilles, a most energetic assistant in this good work, had the establishment formed on his property, and in July twenty-three youths of respectable connexions were settled there to be trained as teachers by the two principals. In six months they were fitted for their duties, and early in 1840 twelve young criminals were admitted, a number which was gradually increased. The first principles of the institution are the inculcation of religion, the formation of the culprits into a family union, compelling them to habits of continued and useful industry, and a strict military discipline. In consequence of the well-directed efforts of the founders, the system has produced much good. The exertions of M. Demetz are incessant. He begins work at four in the morning, and continues his work all the day. He appeals to all the better feelings of the lads under his care, encouraging the good by rewards and praise, and mildly remonstrating with the unruly and idle. The institution still flourishes, but in 1852 a great loss was sustained in the death of M. de Courteilles, who died at the age of fifty-five: he was buried at Mettray, and his funeral was attended by the whole of the persons at Mettray, who mourned for him as for a father. The establishment had attracted the attention of many benevolent individuals interested in the reformation of youth, some of whom visited it, among them may be named M. D. Hill, the recorder of Birmingham. They endeavoured to introduce similar establishments into England, and the prison at Parkhill in the Isle of Wight, and the Reformatory School and Farm of the Philanthropic Society, London, at Redhill, near Reigate, were the result of their exertions. In 1855 M. Demetz came to England, visited those establishments, and was entertained at a public dinner at Birmingham in October. The success of the system at Mettray has had great influence in the legislative establishment of reformatory schools in Great Britain, as well as on the exertions of private individuals who have devoted themselves to the rescue of youthful offenders from the dangers to which they were further exposed from association in prisons with older criminals more deeply steeped in vice, and from want of employment and want of skill in applying themselves to labour. The only works M. Demetz has published on the subject are a 'Résumé sur le Système Pénitentiaire,' in 1844; and the annual reports of the progress of the establishment at Mettray, under the titles of 'Rapport de M. Demetz à la Société Paternelle,' 'Rapport sur les Colonies Agricoles,' &c.

METZ, CONRAD MARTIN, a celebrated German engraver of Bonn, where he was born in 1755. He studied under Bartolozzi, in London, and remained altogether about twenty years in England. He published in 1790 a set of thirty-three engravings, including the title, after George the Third's collection of drawings by Parmegiano; and in 1791 a set of sixty-three plates in a similar style, after the designs by Polidoro da Caravaggio, in the possession of Sir A. Hume, Bart. He engraved many other imitations of drawings by the old masters. In 1801 Metz went to Rome, and commenced a series of engravings after the 'Last Judgment' in the Sistine Chapel, by Michel Angelo. It is engraved in chalk manner in fifteen separate sheets,

with an outline of the whole. Metz died at Rome in 1827, aged seventy-two. Dr. Nagler enumerates upwards of two hundred of his engravings in his 'Künstler-Lexicon.'

METZU, GABRIEL, one of the most celebrated of the Dutch painters, was born at Leyden in 1615. It is not known under what master he studied, but he obtained a great reputation at Amsterdam while still young. Like Mieris and Terburg, Metz belongs to the higher class of genre painters. He painted what are called conversation pieces; and often a lady at her toilet, or in her boudoir, with all the usual accessories; his scenes are occasionally taken from humble life, but generally from the middle classes of society. He excelled in light and shade, drawing, and colour, and his execution is always extremely careful; his pictures, though very small, are always finished with the minutest attention to detail. Metz perhaps attained perfection in his style, and carried painting as a mere imitative art to its highest degree of excellence: the tone of his pictures is complete nature, every tint is perfectly true, and every object is accordingly in its proper place, for his drawing and linear perspective were equal to his light and shade, and colour. Beyond this he did not go; his works exhibit nothing choice or extraordinary either in subject or arrangement; and the faithful representation of familiar life appears to have been the end of his art, not for the sake of the scenes, but for the imitation's sake. He was essentially a materialist in art, and this is the distinguishing characteristic of the Dutch painters generally. He painted a few portraits; there is one of Admiral van Tromp in the Louvre. Some of his works realise very high prices; many of them have been engraved. Metz died, according to D'Argenville, in 1658, in consequence of undergoing an operation for the stone; but as there is a picture by him in the Van Loon collection, Amsterdam, dated 1667, his death could not have occurred before the latter date.

MEULEN, ANTHONY FRANCIS VAN DER, born at Brussels in 1634, was a disciple of Peter Sneyers, an eminent battle-painter, under whom he improved with extraordinary rapidity. While he was pursuing his profession at Brussels, it happened that some of his works were taken to Paris, and shown to the minister Colbert, who was so pleased with them that he invited him to Paris on very honourable and advantageous conditions. His talents as a battle-painter recommended him to Louis XIV., whom he always accompanied in his campaigns. He designed on the spot the most remarkable events, and the views of the cities and fortresses which had been the scene of the most memorable victories, and from these sketches he composed the paintings which were to perpetuate the remembrance of the king's successes. Such opportunities enabled him to attain that unusual skill in his line of art, of which his numerous works give such evidence. They are distinguished by truth to nature, excellent colouring, freedom of touch, and the happiest distribution of light and shade. No painter excelled him in designing the motions and attitudes of horses; and this induced his friend Le Brun, whose niece he married, to give to him the execution of the horses in his celebrated paintings of the battles of Alexander the Great. Van der Meulen painted also landscapes, and other subjects, with almost equal excellence. His principal works are at Paris; but many of his easel pictures are preserved in England, France, and Flanders. In the 16th and 18th vols. of the 'Cabinet du Roi,' there are 152 engravings after his works. He was chosen member of the French Academy of Painting in 1673. He died at Paris, October the 15th, 1690. His most celebrated scholar was I. van Hutchenburgh, battle-painter to Prince Eugene.

MEURSIUS, JOHN (the Latinised form of his real name, which was De Meurs), was born near the Hague, in 1579. He was educated at the University of Leyden; and after he had completed his studies, was entrusted with the education of the children of Barneveldt. [BARNEVELDT.] In 1610, Meursius was appointed professor of history at Leyden, and in the year following professor of Greek. After the execution of Barneveldt, on the 14th of May 1619, Meursius was exposed to great annoyance and persecution from the enemies of his illustrious patron; and it was therefore with great pleasure that he accepted an invitation from the king of Denmark, in 1625, to settle in his dominions. Meursius died on the 20th of September 1639.

Meursius was a diligent and laborious scholar. He edited several Latin and Greek writers, and wrote many works on historical and archæological subjects, which were collected and published by Lami, Florence, 12 vols. folio, 1741-63. The following are a few of his principal works:—1. 'Glossarium Græco-barbarum,' Leyd., 1614. 2. Various treatises on different branches of Greek and Roman antiquities, most of which are reprinted in the 'Thesaurus' of Grævius. 3. 'Rerum Belgicarum Liber Primus,' Leyden, 1612. 4. 'Historia Danica,' Copenhagen, 1630.

MEYER, FELIX, was born at Winterthur in the canton of Zürich, in the year 1653. He studied first under an artist at Nürnberg, and afterwards under Ermels, a good landscape painter, whose manner he adopted. He went to Italy for improvement, but the climate not suiting his constitution, he returned to Switzerland. The beautiful and sublime scenery of that country supplied him with ample materials for numerous designs which deservedly gained him a high reputation and also fortune. To a lively and fertile imagination he added great facility of execution, of which he gave a remarkable proof at the abbey of St. Florian, in Upper Austria, where he happened to stop on

his travels. The abbot desiring to have two grand apartments painted in fresco, and having consulted another artist, who was very dilatory, asked Meyer for his advice as to the manner in which it should be executed. Meyer, after some minutes' consideration, took a long stick, to which he fastened a piece of charcoal, and immediately began to design, saying, "Here I would have a tree;" which he sketched as quickly as possible; "in the distance I would have a forest, thus; here a fall of water tumbling from great rocks, and so on;" designing as fast as he spoke, to the astonishment of the abbot, who immediately engaged him to undertake the work, which he entirely completed in the course of the summer. This adventure spread his reputation through all Germany, and from this time he was constantly employed by the princes and nobility.

In the latter part of his life he endeavoured to adopt a manner which should be at once more expeditious and more pleasing; but these latter performances are not equal to his earlier works, which give him a high place among the most eminent landscape painters. He was not skilful in drawing figures. His most esteemed works have figures by Roos or Bugendas. He died May 28, 1713.

MEYER, HEINRICH, a German designer and painter, and a distinguished writer on art, known in Germany in his life-time as 'Göthe-Meyer,' from his close intimacy with the great writer. Meyer was born in 1759 at Zürich, where he was for some years the pupil of J. C. Fussly, the brother of Henry Fuseli, R.A. [FUSSELL.] About 1786 he went to Rome, where he made the acquaintance of Göthe. In 1787 he was at Naples, lived there in the same house with Tischbein, and became acquainted also with Herder, then travelling in the suite of Amalia, duchess of Weimar. In 1792 he visited for some time, Weimar, and in 1797 established himself for the remainder of his life there. He became a great favourite with the court at Weimar, was intimate with all the distinguished literary men of the place, and held, from 1807, the office of director of the academy there, and enjoyed the titular rank of Hofrath. There he enjoyed constant intercourse with Göthe, and for forty years Meyer was Göthe's consulting and confirming oracle in all opinions on art, and was even the author of many portions, especially of the critical parts, of Göthe's publications on art, as 'Kunst und Alterthum,' 'Winckelmann und sein Jahrhundert,' 'Propyläen,' 'Farbenlehre,' &c.

From 1794 until his death in 1832 Meyer was mainly engaged on literary compositions relating to the history and theory of art, but chiefly the history of Greek and Roman art. He was the principal editor of the complete edition of the works of Winckelmann, which were published in 8 vols. at Dresden between 1808 and 1820 inclusive, and was the author of the greater part of the numerous notes by which they are illustrated. These notes he afterwards arranged and connected into a consecutive history of Greek art, under the title 'Geschichte der Bildenden Künste bei den Griechen,' 2 vols. 8vo, Dresden, 1824. A third volume, being the continuation of the history of Greek art in Rome, was edited by Dr. F. W. Riemer, after the death of Meyer, under the title 'Geschichte der Bildenden Künste bei den Griechen und Römern,' 1 vol. 8vo, Dresden, 1836. This work, though agreeably written, and containing a good general account of the progress and the remaining works of ancient art, has failed to satisfy those interested in the subject, and has obtained little popular or general notice. In the first place its form is against it: the text and the author's remarks are separated, the latter being at the end of the volumes. The text is little more than a chronological catalogue of names and works; and the notes at the end of the volumes, besides being troublesome to refer to, are disconnected with their subject, and do not clear up the obscurities, or reconcile the apparent contradictions of ancient authors. Reflections are rare, and when they occur they are neither profound nor illustrative, nor does he in any case indulge in æsthetical remarks, or attempt to deduce or investigate theories. The work is also surpassed by other German works on the same subjects, though it is the only special work in the language that examines the progress of the two arts of painting and sculpture, throughout their whole course, from the earliest times until the decline of the Roman empire.

As a painter Meyer produced little. His works consist chiefly of water-colour and other drawings from antique remains, or from the works of the great Italian painters. His principal work is an allegory of human life, represented by children, as a painted frieze, in the palace at Weimar.

MEYER, JAMES, was born on the 7th of January 1491 at Vloter, a village near Bailleul in Flanders, from which place, agreeably to the custom of his time, he took the name of Baliolanus. After acquiring the knowledge of ancient languages, he came to Paris, and went through a course of philosophy and theology. Subsequently returning to Flanders, he embraced the clerical profession; and establishing himself at Ypres, opened a school, which in a short time acquired great celebrity. On being appointed incumbent to the living of the church of St. Donatien, he removed his school to Bruges, and finally renounced it to accept the curacy of Blankenburg, where he died on the 6th of February 1552. His remains were carried to Bruges, and interred at St. Donatien. His principal works are:—'Flandricarum Rerum Decus,' containing the origin, antiquity, nobility, and genealogy of the counts of Flanders, 4to, Bruges, 1531; and 'Chronicon Flandriæ, ab anno Christi 445 usque ad annum 1278,' 4to, Nürnberg, 1538;

'Chronicles of Flanders, from the year 445 to the year 1278,' which was continued by his nephew to the year 1476, and published under the title of 'Annales Rerum Flandricarum,' fol., Antwerp, 1561.

MEYERBEER, GIACOMO, shares with Spohr and Rossini the highest rank among living musicians in the art of dramatic composition. But Spohr and Rossini have finished their career, while Meyerbeer continues to pursue his with unabated energy. He was born at Berlin in 1794, and is of Hebrew descent. His family is wealthy, and well known in the commercial world; and several of its members have been distinguished in science and literature. One of his brothers was an eminent astronomer; and another, who died young, manifested considerable genius as a tragic poet. Meyerbeer was a precocious child, and his musical dispositions were encouraged and cultivated by his family. When he was nine years old he was regarded as a masterly pianist, in a city full of excellent musicians. At ten the instinct of his genius led him to composition, and, guided by no rules but such as he practically deduced from the music he was accustomed to hear and execute, he produced many songs and pieces for the pianoforte which surprised his friends by their originality and spirit. He was placed under the tuition of a person named Weber, a teacher of repute, who had been a pupil of the celebrated Abbé Vogler, the great musical instructor of that day. But Weber seems to have possessed limited knowledge and little judgment. He encouraged his aspiring young scholar to proceed too rapidly, and to produce elaborate exercises in the profoundest branches of counterpoint, without being able to discern and correct their faults. Vain of his pupil's progress, he sent to his own master, Vogler, one of Meyerbeer's attempts at fugue-writing as a wonderful proof of his attainments. But the abbé sent it back, drily pointing out that it was a string of blunders. The young student saw at once that this would not do, and resolved of his own accord to put himself under the care of Vogler himself. His family accordingly allowed him to go to Darmstadt, and take up his abode with Vogler, who had established a renowned school of composition in that city. He was then fifteen. At that school the author of the 'Freischütz' was his fellow-student, and the warm friendship then begun continued during Weber's life. Under the Abbé Vogler's able instructions Meyerbeer was initiated in the mysteries of harmony and counterpoint, and composed a great quantity of learned and elaborate sacred music in the severe scholastic style of his master. All those things are lost, as the composer, when his mind became more matured, did not care to preserve them. One of these however did him service: it was an oratorio bearing the grandiloquent title of 'God and Nature,' which was performed in the presence of the grand duke, and obtained for the author the distinction of being appointed composer to the court.

When Meyerbeer was eighteen, his first dramatic piece, entitled 'Jephtha's Daughter,' was performed at Munich. Though written for the stage, it was more of an oratorio than an opera, not only from its sacred subject, but from its style, acquired under the lessons of his learned preceptor, full of contrapuntal skill, with little attention to the attractions of melody. It is not surprising therefore that it did not please the Bavarian public. Dissatisfied with his own progress, Meyerbeer repaired to Vienna, where he applied himself earnestly to the study and practice of the pianoforte, that being the branch of the art in which he had hitherto been most successful. In this pursuit his success continued; and Moscheles, himself at that time a young and rising pianist in Vienna, has said that had Meyerbeer persevered he would have been one of the greatest performers of the age. Happily for music, the bent of his genius drew him back to the path of dramatic composition, which ever since he has steadily pursued. He was employed to compose an opera for the court theatre, and produced 'Alcimelek, or the Two Caliphs;' but the lessons of the Abbé Vogler stuck by him, and the Austrian public, familiar with the music of the Italian school, did not relish the learned stiffness of his style. 'Alcimelek' failed, and was speedily forgotten. Meyerbeer now saw that he was not in the right road, and, wisely profiting by his experience, determined to seek for melody at its fountain-head by travelling into Italy, for centuries pre-eminently the land of song, and, even in her present decay, not wholly deprived of her pre-eminence. At this time Rossini had just appeared, and all Italy was beginning to ring with his first great opera, 'Tancredi.' At Venice, Meyerbeer heard it for the first time. He was charmed with music so graceful, so flowing, and so free from the cumbrous fetters of the schools. From that time his own style was changed. He learned the great truth that melody is the soul of music—of vocal and dramatic music especially. But he did not on that account throw away the fruits of his German studies. His acute judgment perceived that, though the Italian school excelled all others in the *drawing* of the art—though in grace and beauty of form it was incomparable—yet that its *colouring* was pale and feeble, and lacked the richness and variety derived from the resources of harmony. He did what Mozart had done before him—resolved to make Italian melody the prominent feature of his music, strengthening and embellishing it by all the means of harmonious combination. With this object in view he produced his earliest successful work—'Romilda e Costanza,' performed at Padua in 1818; 'Semiramide' at Turin in 1819; and 'Emma di Resburgo' at Venice in 1820. The last opera, though it is now forgotten, as well as those which preceded it, laid the foundation of the composer's reputation. It was not only

performed at all the principal theatres in Italy, but was received with favour in Germany.

But while Meyerbeer was thus beginning to gather laurels in the north, he was looked upon among his own northern compatriots as little better than a renegade German. It is curious to observe what is fellow-student and attached friend, the candid and generous Weber, did upon this subject. Weber disliked Italian music, and—for this charming artist dabbled a little in literature—was in his critical writings addicted to ridicule it; though, it may be observed, had it not been for Italian music, Weber would never have charmed the world by his 'Freischütz' and his 'Oberon.' Weber was of too gentle a nature to quarrel with his friend for his apostasy, and the warmth of their mutual attachment was not for a moment interrupted; but there is in Weber's published correspondence a letter to his namesake Gottfried Weber, the celebrated didactic writer on music, which shows how strongly he felt. The author of the 'Freischütz' is describing a visit which he had just received from Meyerbeer, who had then written his famous 'Crociato in Egitto':—"Last Friday," says Weber, "I had the great joy of having Meyerbeer to spend a whole day with me. Your ears would have tingled! It was truly a happy day—a reminiscence of the good old times at Mannheim. We did not part till midnight. Meyerbeer is going to Trieste to produce his 'Crociato.' Next year he returns to Berlin, where he will perhaps write a German opera. Heaven grant it! I have made many appeals to his conscience."

The production of the 'Crociato in Egitto' was preceded by that of another Italian opera, 'Margherita d'Anjou' (founded on the story of the queen of our Henry VI.), which was performed for the first time at Milan in 1822. This piece was received with great favour both in Italy and France, and its success would doubtless have been more lasting had not the author himself thrown it into the shade by the superior brilliancy of the work by which it was immediately followed. 'Margherita d'Anjou' did not long retain possession of the stage, but many beautiful pieces from it are still performed at concerts.

The 'Crociato in Egitto' rivalled the most successful works of Rossini, at a time when that composer's popularity was at its height. Produced at Venice in 1825, it rapidly made the round of all the musical theatres in Europe. In the same year it was brought out at our Italian Opera, then under the active and able management of Mr. Ayrton. It was first performed on the 23rd of July—a day memorable in our opera annals, not only on that account, but also for the début of Signor Velluti, the last singer of a class now entirely extinct. No singer of that class had been heard in England for thirty years, and there was a strong prepossession against him. But his real qualities, as a tragedian and a singer, overcame the opposition which he at first encountered. Velluti became the fashionable favourite of the day. He drew crowded houses, and no opera but the 'Crociato' was performed to the end of the season. The following season the management of the theatre was put into his hands; Mr. Ayrton, in consequence of opera-house intrigues, having been set aside to make way for this Italian, and the performances of the 'Crociato' were resumed; but he was no longer an object of attraction, while he made himself unpopular by a mean and grasping management. The theatre was abruptly closed, and Velluti left England before the end of the season. From that time he was no more heard of, and Meyerbeer's opera, in which the music of the principal character was written expressly for him, necessarily disappeared along with him from the stage: had it not been for this, the 'Crociato' ought to have kept possession of the stage as well as the contemporary pieces of Rossini, or it is a great as well as a beautiful work.

After the production of the 'Crociato,' Meyerbeer remained seemingly inactive for several years. His marriage in 1827, and the state of melancholy caused by the deaths of two infant children, suspended his musical labours; and it was not till the year 1831 that his next great work, 'Robert le Diable,' made its appearance. He had by this time fixed his residence at Paris, and this piece, of which the libretto is from the pen of M. Scribe, was produced at the Grand Opéra. It was received with a degree of enthusiasm almost unprecedented—in enthusiasm which spread over Europe, and which the lapse of a quarter of a century has scarcely been able to diminish. In the following year Meyerbeer visited London for the first time, in order to superintend the production of this opera at the King's Theatre, then under the management of Mr. Monk Mason, who had purchased from the composer a copy of the score, and the exclusive right of performing it in London. Nevertheless, though this transaction was publicly known, the performance was forestalled by both of the great English theatres, the managers of which, though not possessed of the genuine core, contrived, each of them, to bring out a spurious piece, bearing Meyerbeer's name, but vamped up by English musicians employed for that purpose, from the piano-forte arrangement of the music, which had been published at Paris. Both Drury Lane and Covent Garden profited largely by the wrong; for 'Robert the Devil,' thus clumsily patched up, drew crowds to both houses during the whole season. At a subsequent period the opera was brought on the English stage in a more respectable manner and more complete form. Its production at the King's Theatre was not only in its original form and language, but with the company of performers, the costumes, decorations, and properties of the Paris stage. The Grand Opera was transported for the

time, as it were, to the Haymarket. But the business was mismanaged, and so many impediments and delays occurred, that Meyerbeer took his departure before his opera was ready for performance. It was not produced till the season was almost over. The present immense popularity of this opera in England is due to its production in an Italian dress at her Majesty's Theatre and at the Royal Italian Opera: at the former house Jenny Lind made her first appearance in this country in the character of 'Alice,' the most beautiful and successful of all her efforts.

The admiration and delight with which 'Robert le Diable' was received on its first production, were mingled with astonishment, created by the composer's total change of style. There was scarcely a trace of the author of the 'Crociato;' and it was evident that Meyerbeer, during the apparently inactive years which preceded its production, had been thinking deeply on the principles of his art. His melody, still beautiful, was no longer Italian: it had lost much of the Italian smoothness and prolixity, and had gained terseness and vigour. Dramatic truth was more strictly observed, and Meyerbeer's peculiar power of throwing groups and masses of people into busy and animated action was now for the first time displayed. It was found, in short, that 'Robert le Diable,' as it was one of the greatest, was one of the most original works ever produced.

All the subsequent great dramatic works of Meyerbeer—the 'Huguenots,' the 'Prophète,' and the 'Étoile du Nord'—have been produced for the Parisian stage; the first two for the Grand Opéra, the last for the Opéra Comique. The 'Huguenots' was first performed at Paris in 1836, and at our Royal Italian Opera, in an Italian version, in 1848. The 'Prophète,' originally produced in 1848, was performed at London, in Italian, in 1849; and the 'Étoile du Nord,' brought out at the Opéra Comique in 1854, was performed at the Royal Italian Opera in 1855, having been adapted to the Italian stage by the composer himself, who transformed the original French spoken dialogue into Italian recitative. The poems of all Meyerbeer's French operas have been written by Scribe, a man whose productions—tragedies, comedies, operas, vaudevilles, and farces—are to be numbered by hundreds, but who has nevertheless given to the world some works which will descend to posterity among the chefs-d'œuvre of the French drama. Meyerbeer has been heard to say that the advantage of having Scribe for a 'collaborateur' was his principal reason for devoting himself, so exclusively as he has done, to the service of the Parisian stage. And in so doing he has manifested his judgment; for it cannot be doubted that Scribe's beautiful lyrical poems have stimulated the genius of the composer, and greatly contributed to his success.

Meyerbeer visited London a second time on the occasion of the production of the 'Étoile du Nord,' which he superintended in person. He mingled a good deal in our literary and artistic society, and gained much esteem and regard by his intelligent conversation and the unaffected simplicity and kindness of his manners. Several years ago, another opera, 'Le Camp de Silesie,' originally written for the French stage, was produced by him at Berlin, but not with the success which has attended his other works; a comparative failure owing, we believe, to the defects of the drama. The best portions of the music have been incorporated in the 'Étoile du Nord.' He now resides principally at Berlin, where he holds the office of Musical Director to the King of Prussia. [See SUPPLEMENT.]

MEYRICK, SIR SAMUEL RUSH, K.H., LL.D., celebrated for his antiquarian knowledge, particularly in matters relating to ancient armour, was born on the 26th of August 1783, and was the son of John Meyrick, Esq., of Great George Street, Westminster, and Peterborough House, Fulham, who was descended from the Meyricks of Biddorgan in Angelsea. Samuel Rush Meyrick took the degree of B.A. at Queen's College, Oxford, but we have little other information of his early life, beyond the statement that he married when about twenty years of age; and thus offended his father, who in consequence so arranged the inheritance of the family property, that it should chiefly pass to the next generation. It thus happened that the large collections of armour which were commenced by the subject of this notice at his residences No. 3, Sloane Terrace, and No. 20, Upper Cadogan Place, were purchased with the money of his son, and were known as those of Llewelyn Meyrick, Esq. The original intention as to property was however frustrated ultimately by the death of that son in 1837.

Samuel Rush Meyrick adopted the branch of the legal profession connected with the Ecclesiastical and Admiralty Courts, in which, as Dr. Meyrick, he practised for many years. Prior to this, in 1810, he had published 'The History and Antiquities of the County of Cardigan.' In 1812, he was engaged upon a history on the plan of that of Dr. Henry, relating to the period of the monarchs of the British blood, before their abdication in 703. The materials, which were collected for a work of great extent, were however not published in the form intended. But in 1814, with Captain Charles Hamilton Smith, he produced a work on the 'Costume of the Original Inhabitants of the British Islands,' which was published in 4to with plates. His great work on Arms and Armour was published in 1824 in three 4to volumes, under the title, 'A Critical Inquiry into Ancient Armour as it existed in Europe, but more particularly in England from the Norman Conquest to the reign of King Charles II., with a Glossary of Military Terms of the Middle Ages.' A new edition of

this work appeared in 1848, under the care of Mr. Albert Way, with corrections, much required, in the documents and quotations. Dr. Meyrick assisted the Rev. T. D. Fosbroke in the compilation of his 'Encyclopedia of Antiquities,' of which the first edition appeared in 1825. In 1826, the assistance of Dr. Meyrick was sought in the arrangement of the collection of arms and armour at the Tower of London ('Gentleman's Magazine,' 1826-27); and in 1828 he was called on by George IV. to arrange the collection at Windsor. For these services, the Hanoverian order was conferred upon him by William IV. in January 1832, and he was made a knight-bachelor on the 22nd of February following. Meanwhile, about the year 1827, Dr. Meyrick had endeavoured to purchase the ruins of Goodrich Castle, on the Wye; but being then unable to succeed, he commenced in 1828, on the opposite hill, a mansion of which Mr. Blore was the architect, and which is now well known as Goodrich Court. The main part of the plan was arranged specially for the display of the collection of armour,—the whole suite concluding with a chamber, where was represented a grand tournament. The chief scenes in the display are shown in a work published by Mr. Joseph Skelton, F.S.A., in 2 vols. 4to, in 1830, and entitled 'Engraved Illustrations of Ancient Armour,' &c., to which Dr. Meyrick supplied drawings and descriptions. In 1834, when High Sheriff of Herefordshire, he revived a procession of the javelin-men in armour, and with mediæval pageantry. In 1836 he contributed the descriptive matter to Mr. Henry Shaw's 'Specimens of Ancient Furniture.' Sir Samuel Meyrick's last important work was 'Lewis Dwnn's Heraldic Visitation of Wales,' which he completed in 1846. He had continued a frequent contributor to the Proceedings of the Society of Antiquaries (of which body he was elected a Fellow in 1810). Some of his contributions are printed in the 'Archæologia,' and others are referred to in the 'Gentleman's Magazine,' in which work also he wrote many papers from 1822 to 1839 ('Gent. Mag.,' New Series, vol. xxx., p. 94). Latterly, he also contributed to 'The Analyst,' the 'Cambrian Quarterly Magazine,' and the 'Cambrian Archæological Journal.' Sir Samuel Meyrick died on the 2nd of April 1848, in his sixty-fifth year. His collection, and his domain in Herefordshire, which last he had largely extended by purchase a few months before his death, devolved upon his second cousin Colonel Meyrick.

MEZERAÏ, FRANÇOIS-EUDES DE, was the son of a surgeon named Eudes, and was born in 1610, near Argentan, in the village of Rye. He studied in the University of Caen, and afterwards obtained the post of *Commis de Guerres*, which situation he subsequently gave up, and at Paris took the name of De Mezeraï. Owing to great application he became dangerously ill, on which occasion the Cardinal Richelieu sent him 200 crowns, and the promise of his patronage. At Paris he produced his 'History of France,' which he afterwards enlarged by the introduction of verses, made by his friend Jean Baudouin, upon the principal persons of each reign; this latter edition had great success in 1646 and 1651; and a second and third volume appeared, both of which were equally fortunate. He also published several pamphlets directed against Cardinal Mazarin, under the name of Sandricour. An abridged edition of his 'History of France' appeared in 1668, and in 1662 his 'History of the Turks,' which is a translation from Chalcondylas. He succeeded Voiture in the Academy, and died July 10, 1683.

Among other singularities, it is said of Mezeraï, that he would shut himself up from the light of the sun at noon-day, and in the middle of summer, pursuing his avocations by candle-light; and, as if fearful that this eccentricity would not be generally known, he lighted his visitors to the door. Mezeraï, besides the harvest reaped from his works, which much exceeded his expectations, had several foreign pensions. His merits as an author are exceedingly doubtful; for, according to the writer in the 'Biographie Universelle,' the extraordinary success of his 'History of France' was, in a great degree, due to the number of engravings it contained, consisting of portraits of kings and queens, which however were inserted without much regard to historic truth. His style is sometimes coarse, but generally clear, distinct, and forcible. Voltaire observes, that he lost his pensions for having told what he thought to be the truth. The same author observes, that he is more bold than accurate, and that his style is unequal.

MEZZOFANTI, JOSEPH CASPAR, celebrated for his extraordinary powers as a linguist, was born at Bologna, on the 17th of September 1774. His father, Francis Mezzofanti, was a carpenter; and he himself, being destined for the same humble career, was placed at one of the free schools of the Oratory in his native city. Father Respighi, a priest of that congregation, observed the remarkable talents of the boy, and saved him for literature. He was removed to a higher school—one of the so-called 'Scuole Pie' of Bologna—and eventually to the archiepiscopal seminary, where, after completing the usual course of letters, philosophy, divinity, and canon law in the university, he was admitted to priest's orders in September 1797. Of the details of his progress in the study of languages during these early years no accurate record is preserved; but it is known that, like most eminent linguists, he was gifted, even in childhood, with a very wonderful memory; and that, partly under the various professors in the university, partly by the aid of foreign residents in the city, partly by his own unassisted studies, he had acquired, before the

completion of his university career, the Latin, Greek, Hebrew, Arabic, Spanish, French, German, and Swedish languages. In September 1797, at the early age of twenty-two, he was appointed Professor of Arabic in the university, and commenced his labours in the December of that year; but he did not long enjoy what would have been a most congenial office. On the annexation of Bologna, as one of the papal legations, to the newly-established Cisalpine Republic, he refused to take the oaths of the new constitution, and was set aside from the professorship. After the conclusion of the concordat between Pius VII. and the first consul, the ancient constitution of the university was restored. In 1803 Mezzofanti was named to the higher professorship of Oriental Languages, and in the same year he became assistant librarian of the public library of the city. The professorship of Oriental Languages, however, being suppressed in 1808, Mezzofanti was for some years reduced to great distress, and became dependent for his own maintenance, and that of the orphan family of his sister, mainly upon the casual income derived from private tuition. The elder brother of the late Archdeacon Hare is said to have been one of his pupils, and a living English countess received lessons in English from him at a later period. Meanwhile he steadily followed in private what had become his engrossing pursuit—the study of languages. A letter of his, dated in 1804, to the celebrated Orientalist John Bernard de Rossi, whose personal acquaintance he subsequently formed during a short visit to Modena in 1805, inclosed a composition in twelve languages, which he submitted for the judgment of his correspondent; and before 1812 his reputation as a linguist had become thoroughly established. The well-known Pietro Giordani, in several of his letters to his friends, calls him "the divine Mezzofanti," and declares that his skill in living and dead languages entitles him to be regarded as "a man of all ages and all nations." The war of which Northern Italy was so long the theatre had afforded Mezzofanti many opportunities of extending his stock of languages. In the hospital of Bologna, to which he was attached as volunteer chaplain, were to be met—among the invalids of the Austrian, Russian, and French armies—Germans, Hungarians, Bohemians, Wallachians, Servians, Russians, Poles, and Croats. Partly in the desire to offer these sufferers the consolations of religion, partly from his love of the study itself, Mezzofanti laboured assiduously to turn these and all similar opportunities to account; and several instances are recorded in which, without the assistance of a grammar or dictionary, he contrived to establish a mode of communication with a stranger who was utterly ignorant of every language except his own, and eventually to master that language sufficiently for all the purposes of conversation. He has left an account of his mode of study during these years, which is not a little curious and interesting. "The hotel-keepers," he says, "were in the habit of notifying to me the arrival of all strangers at Bologna; and I never hesitated, when anything was to be learnt thereby, to call upon them, to interrogate them, to make notes of their communications, and to take lessons in the pronunciation of their several languages. There were a few learned Jesuits too, and several Spaniards, Portuguese, and Mexicans residing in Bologna, from whom I received valuable assistance, both in their own and in the learned languages. I made it a rule to learn every strange grammar, and to apply myself to every new dictionary that came within my reach. I was constantly filling my head with new words. Whenever a stranger, whether of high or low degree, passed through Bologna, I tried to turn the visit to account, either for the purpose of perfecting my pronunciation, or of learning the familiar words and turns of expression. Nor did all this cost me so much trouble; for, in addition to an excellent memory, God had gifted me with remarkable flexibility of the organs of speech."

In the year 1812 Mezzofanti was appointed assistant-librarian of the university; in 1814 he was reinstated in his professorship; and in 1815 he became chief librarian. From this period, especially after the peace, his reputation rapidly extended. Every visitor of Bologna related fresh marvels regarding his prodigious attainments. Tourists from every nation, whether of Europe or of the east, united in representing him as perfect, each in his own language. Mr. Stewart Rose, in 1817, reported him as reading twenty languages, and speaking eighteen. Baron Zach, in 1820, sets down the number at thirty-two. Lord Byron, about the same time, pronounced him "a walking polyglot, a monster of languages, and a Briansus of parts of speech." When Lady Morgan saw him, in 1822, common report described him as speaking no less than forty languages; but when she inquired from himself the truth of the report, he replied that he had only gone over the outline of that number. M. Molboch, a Danish traveller of the year 1820, reports the number of his languages at "more than thirty," and testifies to his speaking Danish "with almost entire correctness." French, German, Spanish, Polish, Russian, Greek, and Turkish travellers concur in the same report, not only with regard to their own, but also to many other languages.

During all these years—except a short visit to Pisa, Leghorn, Florence, and Rome—he had resided altogether at Bologna, though invited, with many flattering offers, to transfer his residence to Paris, to Vienna, to Florence, and to Rome. At length, having come to Rome, as a member of the deputation sent by the Bolognese to offer their submission to the pope, Gregory XVI., after the revolution in

31, he was induced by the pope to settle permanently in Rome, and to accept a prebend in the church of St. Mary Major, which he soon after exchanged for a canonry in St. Peter's; and, on the promotion of the celebrated Angelo Mai, then keeper of the Vatican Library, to the secretaryship of the Propaganda, Mezzofanti was appointed to succeed him in the important charge of the Vatican. He held this office till 1838, in which year, conjointly with Mai, he was elevated to the cardinalate. His residence in a great centre of languages, such as Rome, and especially the facilities of intercourse with the various races represented in the college of the Propaganda, gave a new impulse to Mezzofanti's linguistic studies. The reports of his visitors at Rome are still more marvellous than those of the Bolognese period. An eminent German scholar, Herr Guido Görres, who had much intercourse with him in the year 1841, writes thus: "He is familiar with all the European languages; and I think I understand not only the ancient classical tongues, and the modern ones of the first class, such as the Greek and Latin, or the Italian, French, German, Spanish, Portuguese, and English—his knowledge extends also to the languages of the second class, viz., the Dutch, Danish, and Swedish—to the whole Slavonic family, Russian, Polish, Bohemian, or Czechish—to the Servian, the Hungarian, the Turkish; and even to those of the third and fourth classes, the Irish, the Welsh, the Wallachian, the Albanian, the Bulgarian, and the Illyrian. Even the Romani of the Alps and the Lettish are not unknown to him; nay, he has made himself acquainted with the Finnish. He is master of the languages which fall within the Indo-European family, the Sanscrit and Persian, the Koordish, the Georgian, the Armenian; he is familiar with all the members of the Semitic family—the Hebrew, the Arabic, the Syriac, the Samaritan, the Chaldee, the Sabaic—nay, even with the Chinese, which he not only reads, but speaks. Among the Hamitic languages, he knows Coptic, Ethiopic, Abyssinian, Amharic, and Angolese."

What is especially notable in this marvellous gift possessed by Mezzofanti is, that his knowledge of each among this vast variety of languages was almost as perfect as though his attention had been devoted to that language exclusively. The reports of the representatives of all the great families of language concur in describing him as speaking in each always with the precision, and in most cases with the fluency, of a native. His pronunciation, his idiom, his vocabulary, were alike unexceptionable. Even the familiar words of every-day life, and the delicate turns of conversational language, were at his command; and in each language he was master of all the ading dialects, and even of the provincial peculiarities of idiom, of pronunciation, or of expression. In French, he was equally at home as the pure Parisian of the Faubourg-St.-Germain or in the Provençal of Toulouse. He could accommodate himself in German to the rudeargon of the Black Forest, or to the classic vocabulary of Dresden; and he often amused his English visitors by specimens of the provincialisms of Yorkshire, Lancashire, or Somersetshire. With the literature of these various countries too he was well acquainted. He loved to talk with his visitors of the great authors in their respective languages; and his remarks are described as invariably sound and judicious, and exhibiting careful and various reading, often extending to departments with which it would never be supposed that a foreigner could be familiar. A Dutch traveller, for instance, Dr. Wap, was surprised to find him well acquainted with his own national poets, Oudel and Cats; a Dane, with the philological works of Raek; a Swede, with the poetry of Ochsensjerna; to a Sicilian he would repeat whole pages of the poetry of Meli; and an English gentleman was astounded to hear him discuss and criticise Hudibras, and all English writers the least attractive as well as the least intelligible to a foreigner. He was in the habit too of amusing himself by metrical compositions in the various languages which he cultivated, and often wrote for his visitors a couplet or two in their native language as a little memento of their interview. Dr. Wap, the Dutch traveller just referred to, speaks in high praise of some extempore verses in Dutch by which Mezzofanti replied to a sonnet which Dr. Wap had addressed to him; and the well-known Orientalist, Dr. Tholuck, having asked Mezzofanti for some memorial of his visit, received from him a Persian couplet after the manner of Hafis, which he composed although not without some delay) during Dr. Tholuck's visit.

After his removal to Rome, although he had already passed his fortieth year, he added largely to his stock of languages. His most notable acquisition during this period was Chinese, which he acquired partly at the Chinese College in Naples, partly among the Chinese students of the Propaganda) in such perfection as to be able not only to write and converse freely in it, but even to preach to the young Chinese ecclesiastics. During the same period he acquired the Abyssinian, the Californian, some of the North American Indian languages, and even the 'impossible' Basque. And it was in Rome, and especially in the Propaganda, that he displayed in its greatest perfection his singular power of instantaneously passing in conversation from one language to another, without the slightest mixture or confusion, whether of words or of pronunciation.

Mezzofanti, as cardinal, was a member of many ecclesiastical congregations in Rome, but he never held any office of state. He died on the 15th of March 1849, and was buried in the church of St. Onofrio, beside the grave of Torquato Tasso.

It is difficult to determine with accuracy the number of languages known by Mezzofanti, and still more so to ascertain how many of these he spoke, and with what degree of fluency in each. During his lifetime, as we have seen, report varied considerably at different times; nor was he himself believed to have made any very precise statement on the subject. To a Russian traveller, who visited him before the year 1846, and who begged of him a list of all the languages and dialects in which he was able to express himself, he sent a paper in his own hand containing the name of God in fifty-six languages. The author of a memoir which appeared soon after the cardinal's death in a Roman journal, the 'Civiltà Catolica' (who is now known to be Father Bresciani, a Roman Jesuit), states that, in the year 1846, Mezzofanti himself informed him that he was able to express himself in seventy-eight languages. Marvellous as these statements may appear, they seem fully borne out by inquiries (with a view to the preparation of a biography) which have been made since the death of the cardinal. Reports have been received from a vast number of individuals, natives of different countries, whose collective testimony, founded on their own personal knowledge of Mezzofanti, places beyond all question the fact of his having spoken fluently considerably more than fifty different languages. There are others among the languages ascribed to him, regarding which it is difficult to institute any direct inquiry; but, judging from analogy, and relying on the well-known modesty and truthfulness of Mezzofanti, we need not hesitate to accept his own statement as reported by F. Bresciani; the more so, as among his papers now in the possession of his family is a list, drawn up from memoranda contained therein, of no less than a hundred and twenty languages with which he possessed some acquaintance, unaccompanied however by any note specifying those among the number which he spoke, or the degree of his knowledge of each.

In general learning Mezzofanti's attainments were highly respectable. He was a well-informed theologian and canonist, and an impressive though not eloquent preacher. M. Libri, the historian of mathematical science in Italy, found him well acquainted with algebra, and reports an interesting conversation which he had with him on the Bija Gannita (the algebra of the Hindoos), as well as on the general subject of Indian history and antiquities. Other travellers describe him as entering freely into the history as well as the literature of their several countries. But as an author he is almost unknown. He occasionally read papers at various literary and scientific societies in Bologna and Rome; but his only known publication is a short memoir of his friend and brother professor, Father Emmanuel Aponte, which was printed at Bologna in 1820; and he leaves no monument for posterity beyond the tradition that he was incomparably the greatest linguist the world has ever seen.

MIAZZI, GIOVANNI, an Italian architect of the 18th century, was born at Bergamo, in 1699, and was originally brought up to his father's trade of carpenter. He was almost entirely self-educated in the profession which he afterwards followed; for it was not till he was forty that he availed himself of the instructions of Preti, who was his junior by two years. He had however previously built a small theatre in his native town, and the church of La Trinità in the Borgo of Angarano. One of his later and best works is the church of San Giambattista at Bassano, in which he successfully overcame the numerous obstacles arising out of the site and the conditions he was obliged to comply with. He also built the collegiate church at Schio, that at Valdarno, another at San Vito, and a fourth at Simonzo, besides that at the convent of Monte Gargano, in Puglia. The Spineda Palace, at Venegazza, in the Trevegiano, excited much admiration for the elegance of its design, which has since been greatly impaired by the demolition of the chapel and corresponding wing, and the arcades uniting them to the central edifice. The beautiful theatre at Treviso is another of his works; for although the original design proceeded from Bibbiena, he greatly improved it; and the façade, the vestibule, and many of the internal arrangements are entirely his own. Miassi died about 1780, and, notwithstanding his age, continued vigorous and active almost to the last.

MICAH, one of the twelve minor Hebrew prophets, is called in the title to his prophecy the Morasthite, and thus he is distinguished from Micaiah, the son of Imlah, who prophesied the death of Ahab, about B.C. 897. (1 Kings xxii. 8-28.) This appellation was probably derived from his birth-place, Moresheth-Gath (Micah i. 14), or Maresbah, a city of the tribe of Judah. (Micah i. 15; Josh. xi. 44; 2 Chron. xi. 8; xiv. 9-10.)

From the title to the book of Micah we learn that he prophesied in the days of Jotham, Ahas, and Hezekiah, kings of Judah, or from B.C. 759 to 699. The kings of Israel during this period were Pekah and Hoahes. Thus Micah was contemporary with the latter part of Hosea's prophetic ministry, and with Isaiah. This date is confirmed by a reference made to the prophet by Jeremiah (xxvi. 18, 19), who quotes his prophecy respecting the destruction of Jerusalem (Micah, iii. 12), and says that it was uttered by Micah in the days of Hezekiah. He must have delivered his prophecy before the sixth year of Hezekiah (B.C. 723), in which the kingdom of Israel was destroyed, for he speaks of that calamity as a future event. (Micah i. 6, &c.)

Hartmann contends that Micah prophesied after the fourteenth year of Hezekiah, and that the book which bears his name is a collection of different prophecies made during the Babylonian captivity, some of

which are Micah's, and others not. ('Micah, neu übersezt und erläutert,' Lemgo, 1800.) This hypothesis, which is totally at variance with all the testimony we have on the subject, and is not sustained by internal evidence, on which it professes to be founded, has been amply refuted by Jahn ('Einleitung,' vol. ii, p. 430) and Rosenmüller ('Scholia in Vet. Test., Proem. in Mic.').

Micah prophesied both to Israel and Judah (i. 1). He begins by predicting the overthrow of both nations, upbraids them with their cruelty, injustice, and impiety, and concludes this part of the book with the striking prophecy of the destruction of Jerusalem, which Jeremiah quotes, and which some suppose to refer to the taking of the city and the razing of the temple by the Romans. (chaps. i, ii, iii.) He next prophesies the restoration of the people to Jerusalem (iv. 1-8), after they shall have been carried captive to Babylon (iv. 9, 10), and the destruction of their enemies (iv. 11, 13). He foretells the birth of the Messiah at Bethlehem, after great calamities (v. 1-3), his ministry, and final triumph (v. 4-15). In chap. vi. he again reproves the people for their ingratitude, irreligion, and injustice. In chap. vii. Jerusalem is represented as complaining of the corruption and faithlessness of her sons, but patiently waiting for deliverance from God (ver. 1-10). The prophet consoles her with the promise of her restoration (ver. 11-13), and concludes his book with a sublime prayer to God for the fulfilment of that promise (ver. 14-20).

"The style of Micah," says Bishop Lowth, "is for the most part close, forcible, pointed, and concise, sometimes approaching the obscurity of Hosea, in many parts animated and sublime, and in general truly poetical." ('Prælect.,' xxi.)

The canonical authority of this book is undisputed. One of the most remarkable predictions in it (v. 2) is quoted in the New Testament as being understood by the Jewish priests and scribes to refer to the birth of the Messiah. (Matt. ii. 6.)

(Rosenmüller, *Scholia in Vet. Test.*; the Introductions of Eichhorn, Bertholdt, Jahn, De Wette, and Horne; *The Minor Prophets*, by Newcome and Horsley; *Micah, übersezt und erläutert*, von K. W. Justi, Leip. 1820.)

MICHAËLIS, JOHN BENJAMIN, one of the minor classic poets of Germany, was born at Zittau on the last day of the year 1746. Though he had no other instruction than what the gymnasium of his native place afforded (for his father, who was a cloth-maker, had suffered so much in his circumstances by the war, as to be unable to send him elsewhere), his natural abilities, seconded by a happy memory, stood him greatly in lieu of a regular classical education. Having made himself a complete master of Latin, he went to Leipzig with the intention of applying himself to the study of physic, but soon desisted from it as one for which he had no relias, and applied himself to poetry. At the recommendation of some of his friends, but far more out of necessity, he published a volume of poems in 1766. These first proofs of his poetical talent obtained for him the encouraging notice of Gellert, Weisse, and Oeser; the last-mentioned of whom interested himself warmly in his success, and earnestly recommended him to Gleim, who was afterwards his truest patron. In 1770 he was invited to undertake the editorship of the 'Hamburg Correspondent;' but he soon relinquished the office, which, alluring as it appeared at first, soon proved too irksome for him. While at Hamburg however he became acquainted with Lessing, who exerted himself to serve him, and obtained for him the situation of stage-poet in Seyler's company; but his nervousness and ill state of health soon compelled him to give it up. He now determined to avail himself of the generous proposal which Gleim had previously made him, to take up his residence with him, and make his house a permanent home. By Gleim he was welcomed as if rather conferring an obligation than receiving one; and thus suddenly placed in ease and comfort, and in the society of such men as Jacobi and Lichtwer, nothing further was left him to wish for, except that he might continue to enjoy his happiness. Unfortunately he became subject to a spitting of blood, which carried him off on the 30th of September 1772, in the twenty-fifth year of his age.

In the favourable circumstances in which he was latterly placed, there is no doubt but that had longer life been granted him he would have distinguished himself among the writers at the close of the 18th century. The productions he left are to be considered merely as the blossoms of poetical talent. The principal ones among them are his satires, fables, and tales, and poetical epistles; and they afford proof not only of literary talent, but of the excellence of his moral character.

MICHAËLIS, JOHN DAVID, was born at Halle on the 27th of February 1717. His father, Christian Benedict Michaëlis, was professor of theology in the University of Halle, and a distinguished Hebrew scholar. After receiving instruction for some time from private tutors, Michaëlis spent four years in the Orphan School at Halle, where his attention was particularly directed to languages and philosophy. In 1738 he began to attend the lectures at the university, and it was here that he obtained from the chancellor Ludwig's lectures on German history the foundation of that knowledge of general law and of the constitution of society which was afterwards displayed in his 'Mosaisches Recht.' After taking his degree in 1740, he visited England, where he made the acquaintance of several eminent scholars both in London and in Oxford. During part of his

residence in England he preached at the German chapel in St. James's Palace. On his return to Germany he devoted himself to the study of history, Oriental languages, and biblical criticism. At the death of the chancellor Ludwig, Michaëlis was commissioned to arrange and catalogue his immense library. The catalogue was published in 1741 and is considered a model for such works.

In 1745 he went to the University of Göttingen at the invitation of Münchhausen; and there he spent the rest of his life, although he was invited by Frederick the Great in 1763 to return to Prussia. At the University of Göttingen Michaëlis rendered the most important services, as professor of theology and oriental literature from 1745 to 1791; as secretary and director of the Royal Society of Sciences, from 1751 to 1770, when he left it on account of some differences with its members; as editor of the journal entitled 'Gelehrte Anzeigen,' from 1753 to 1770; and as librarian and director of the philological seminar, which would have been abandoned after the death of Gesner in 1770, if Michaëlis had not consented to direct it gratuitously.

In order to throw new light upon biblical science, Michaëlis planned the expedition to Arabia and India which was conducted by Carz Niebuhr. The first project of this enterprise was submitted in the year 1756 to the Baron von Bernstorff, then minister of Frederick V. king of Denmark. The choice of the travellers was entrusted chiefly to Michaëlis, who drew up a series of questions for their guidance.

In 1775 Michaëlis was made a knight of the Polar Star by the king of Sweden; in 1786 he was appointed an Aulic counsellor of Honor, and in 1789 he was elected a Fellow of the Royal Society of London. He died on the 22nd of August 1791. He was twice married; by his first wife he had only one son, Christian Frederic; by his second he had nine children, of whom one son and three daughters survive him.

The mind of Michaëlis was strongly characterised by independence. He always acted in the spirit of his motto 'libera veritas.' But his love of independence often led him to undervalue the labours of other learned men, and to do injustice to some of his most distinguished contemporaries. He often appeared to delight in discovering deficiencies solely that he might have the pleasure of removing them. In the examination of the Old Testament he treated the Masoretic traditions with a contempt hardly less extravagant than the reverence entertained for them by the school of Buxtorff; and in every department of criticism he was apt to hazard ingenious conjectures in opposition to all real evidence. Though a good Hebrew scholar, he never possessed an accurate knowledge of the classical languages, and his acquaintance with Arabic was superficial. Notwithstanding these defects, his contributions to biblical and Oriental learning are invaluable, especially when he treats of subjects capable of illustration from history and philosophy. His religious opinions were never firmly fixed, but he invariably expressed the greatest reverence in the Scriptures.

The works of Michaëlis are very numerous; the following are some of the most important. In Oriental literature, grammars of Hebrew, Chaldee, Syriac, and Arabic, and treatises on various subjects connected with these languages; 'Oriental and Exegetical Library,' 2 vols., New do. 8 vols.; 'Supplements in Lexica Hebraica,' 6 vols. In philosophy, an essay 'On the Influence of Opinions on Language and of Language on Opinions,' which obtained a prize from the Prussian Academy of Sciences in 1759; a treatise on moral philosophy; and other works. In history, geography, and chronology, 'Spicilegium Geographiae Hebraeorum extera post Bochartum;' other treatises on geography and chronology; several separate dissertations on the law and antiquities of the Jews, the substance of most of which is embodied in his 'Mosaisches Recht,' in 6 vols., 1770-75; a second edition of the first 5 vols. of this work was published in the years 1775-80. This work, which is considered the masterpiece of Michaëlis, was translated into English by Dr. Alexander Smith, in 4 vols., 8vo, 1811 under the title of 'Commentaries on the Laws of Moses.' "The great object of Michaëlis in this work is to investigate and illustrate the philosophy of the Mosaic laws, to show their wonderful adaptation in every respect to the very peculiar circumstances in which the people to whom they were given had been placed by providence; and, while he takes every opportunity of establishing the claims of Moses to the character of an ambassador from heaven, to inculcate upon human legislators the important lesson of studying those particulars respecting the nature and political situation, the ideas and prejudices, the manners and customs of their countrymen, by attention to which alone they can ever hope to make them virtuous, prosperous, and happy." (Dr. Smith's 'Preface,' p. xvii.) In biblical criticism Michaëlis's 'Introduction to the New Testament' is well known in England by the translation of the late Bishop Marsh; he also published part of an 'Introduction to the Old Testament;' a 'Translation of the Bible, with Notes, for the Unlearned;' and several other critical works.

(Professor Hassencamp, *Collection of Memoirs relating to the Life and Writings of Michaëlis*; and *Biog. Univ.*, vol. xxviii.)

MICHAUX, ANDRÉ, was born in 1746. He visited Syria, Persia, and North America, at the latter part of the last century, in all which countries he made considerable collections of dried plants. He is chiefly known as the author of a valuable account of the oaks of North America, published in folio, at Paris, in 1801, and of the

Flora Boreali-Americana,' which appeared in 1803, in 2 vols. 8vo. of the latter work he is said to have been less the author than the Professor Louis Claude Richard. He died November 13, 1802.

MICHAUX, FRANÇOIS-ANDRÉ, son of André, was employed by the French government to explore the forests of North America, with a view to the introduction into Europe of the valuable timber-trees of that country. For this purpose he made three voyages to the United States, during which he succeeded in sending to France large quantities of seeds. His principal work is the 'Histoire des Arbres forestiers de l'Amérique Septentrionale,' in 3 vols. large 8vo, Paris, 810-13; this is an excellent account of the principal North American forest-trees, abounding in valuable information as to their geographical distribution and botanical distinctions, and the uses and qualities of their timber. Besides these, he published a treatise 'On the Naturalisation of Forest-Trees in France,' 8vo, Paris, 1805; 'Journey to the West of the Alleghany Mountains,' 8vo, Paris, 1804; and 'A Notice of the Bermudas,' 4to, 1806. He was born 1770, and died Oct. 23, 1855.

MICHEL ANGELO. [BUONAROTTI, MICHEL ANGELO.]

\* MICHELET, JULES, one of the most eminent of modern French historians, was born at Paris on the 21st of August 1798. After completing his own studies, he began active life in 1821 in the profession of a teacher in public seminaries. From the first his favourite studies had been in history and in departments relating to it; and in 1826 he became teacher of history and languages in the Collège Rollin. His first efforts as an author were in the production of works to assist pupils in the study of history. Of this kind were his *Tableau Chronologique de l'Histoire moderne depuis 1453 jusqu'à 1789*, originally published in 1825, and his *Tableaux synchroniques de l'Histoire moderne*, originally published in 1826. These have passed through many editions, as also have some later works of a similar educational order—his *Précis de l'Histoire moderne*, 1831; his *Introduction à l'Histoire universelle*, 1834, and his *Précis de l'Histoire de France jusqu'à la Révolution Française*, 3rd edit. 1838. In 1830, shortly after the revolution of July, M. Michelet, whose reputation for historical research had been established by some of the above works, was appointed chief of the historical department of the archives of France; and at the same time he was chosen by Guizot, who was then diverted from literature into politics, to continue his course of lectures in history to the Faculty of Literature in Paris. In 1838 he succeeded Daunou in the chair of history and moral science in the College of France, and in the same year he was elected to the Institute as a member of the class of moral and political sciences. Meanwhile he had published various works, characterised not only, as his former had been, by research, but by that tendency to philosophic generalization and that warmth and colour of style, which have since distinguished almost all that he has written. Among these, besides an abridged translation of Vico's *Scienza Nuova*, or *Philosophy of History*, were his *'Histoire Romaine'* (the Republican Period), 2nd edit. 1839; the early volumes of his *'Histoire de France'* begun in 1838, and the seventh volume of which, leaving the work still far from complete, was published in 1856; and his *'Origines du Droit Français cherchées dans les Symboles et Formules du Droit Universel'*, 1837. During the latter part of Louis-Philippe's reign Michelet distinguished himself by his vehement interest in contemporary social and religious questions, and, above all, by his antagonism to the Jesuits and their influence. His little treatises, *'Du Prêtre, de la Femme, et de la Famille'*, and *'Le Peuple'*, both well known in English translations, were published, the first in 1845, the other in 1846; and his *'Life of Luther'*, which has also been translated, was published in 1846. In consequence of these writings and his antireligious spirit generally, his lectures were interdicted by the government of Guizot; and his public influence, and his popularity with the liberal party correspondingly increased. In 1848 he published his *'Cours professé au Collège de France, 1847-48.'* In the previous year he began his *'Histoire de la Révolution Française'*; on which great work, together with his *'Histoire de France'*, he has continued to labour since, issuing a volume of the one or the other at intervals. Both have been translated as far as published. At the revolution of 1848 Michelet's high popularity would have secured him an important place in the new system, had he not preferred to act still only through his lectures and books. Since the accession of Louis-Napoleon he has again been in opposition to the ruling powers, and has been subject to various impediments in consequence. His last writings, besides the recent volumes of his two histories, have been, one on *'The Martyrs of Russia'*, published in 1851, others entitled *'L'Oiseau'*, published in 1856; *'L'Insecte'*, 1857; *'L'Amour'*, 1858; *'La Femme'*, 1859; *'La Mer'*, 1861; *'La Sorcière'*, 1862; *'La Pologne Martyre'*, 1863; and *'La Bible de l'Humanité'*, 1864.

MICHELOZZI, MICHELOZZO, an eminent Florentine sculptor and architect of the 15th century, was a pupil of Donatello, and was patronised by Cosmo de' Medici, to whom he was so attached, that on the latter being banished, in 1438, he chose to follow him. It was for Cosmo that he erected the edifice since denominated the Palazzo Riccardi at Florence, a noble monument of the older Florentine style, simple even to severity, yet possessing an air not only of grandeur, but of magnificence. The façade consists of a lofty rusticated basement, with comparatively small apertures, above which are two ranges of large arched windows, seventeen on a floor, and each

divided into two lesser arches resting on a central column. The whole is crowned by a very rich cornice. The interior court has upper and lower porticos or galleries, with arches resting upon columns, and with an enriched frieze between the first and second arcades. He also greatly improved the court of the Palazzo Vecchio, originally built by Arnolfo, and which is in a rich though somewhat fanciful style inclining to Gothic. Among his other works at Florence is the Palazzo Tornabuoni, now Corsi; and in the neighbourhood of that city the villas Cafaggiuolo and Careggi; also a palace at Fiesole, for Giovanni de' Medici, son of Cosmo I. During his residence at Venice he made designs for many public and private buildings in that city, and erected there the celebrated library in the convent of San Giorgio. He was likewise employed by his patron Cosmo in enlarging and embellishing a palace at Milan, bestowed on him by Ludovico Sforza. His last work was designing and superintending the execution of the monumental chapel of the Annunciation, erected by Piero de' Medici in honour of Cosmo, in the Chiesa dei Servi, at Florence. Michelozzo died at the age of sixty-eight, but the precise time of his decease is not known—probably it was about 1470.

MICIPSA. [JUGURTHA.]

MICKIEWICZ, ADAM, the greatest poet that Poland has ever produced, was born in the year 1798 at Nowogrodek, a small town in Lithuania, one of the few in the environs of which the ancient Lithuanian language is still spoken. It is certainly remarkable that a man, the chief effort of whose life was to prevent the language, the nationality, and the religion of Poland from being overpowered by those of Russia, should be the native of a country which had lost its language, its nationality, and its religion by its union with Poland. His father, by birth a noble, was by profession an advocate, and an unsuccessful one, and his brother afterwards became a legal writer of some reputation. Mickiewicz himself had so little respect for the nobility of his family, that in his poem of *'Pan Tadeusz'*, in which the scene is laid in Lithuania in the year 1812, he introduces his family name as that of a dissipated and illiterate brawler in a pothouse. It is singular that Pushkin, who acquired the name of the Russian Byron as Mickiewicz did that of the Polish Byron, takes occasion in his play of *'Boris Godunov'*, to introduce one of his own ancestors in an odious and contemptible light. The feeling of the two poets in this respect was very different from that of their English prototype.

Mickiewicz after receiving his preliminary education at Nowogrodek and the grammar-school of Minak, was sent when a youth of seventeen to the University of Wilna, where his uncle, an ex-Jesuit, was one of the professors. The university under the auspices of Sniadecki the mathematician, and the patronage of Prince Czartoryski, then minister of public instruction, was at that time in the full tide of prosperity, the chief seat of learning for eleven millions of the population of Russian Poland, and celebrated for the success with which the exact and natural sciences were taught. Almost the first person whom Mickiewicz saw at Wilna was Thomas Zan, a celebrated Polish patriot, who was occupied with getting up secret societies among the students, of which Mickiewicz at once became a member. The professor of history, Lelwel [LELEWEL], was another determined opponent of the Russian government, and to him Mickiewicz addressed the first poem he published. While at Wilna he fell deeply in love with the sister of a fellow student, Maria Wereszszakowna, by whom his addresses were finally rejected for those of a richer suitor. When he left the university where he had first been noted for his devotion to chemistry and afterwards to poetry, he was appointed professor of classical literature in a college at Kowno, and it was while residing there in 1822 that two small volumes of poems from his pen were published at Wilna. Like those of Burns and Byron, they at one blow made their author famous.

These poems not only at once placed their author at the head of the Polish literature of his own time, but above every other serious poet who had ever appeared in the language. The *'Ballads'* they contain, several of which are imitated from the Lithuanian, are of very various degrees of merit, some of them spirited, others pleasing, and others again poor and commonplace. But two poems of the set, *'Grażyna'* and *'Dziady'*, are of a very high class. In *'Grażyna'*, in which the poet takes for his scene the old castle of Nowogrodek, the ruins of which are still remaining near his native town, he tells in a tersely classical, and sculpturesque style, which reminds the reader of the happiest effusions of Tennyson, the story of a Lithuanian heroine, who to save the honour of her husband assumes his armour, and meets death on the field of battle. It became the favourite poem of a real Lithuanian heroine, Emilia Plater, who eight years afterwards fought in the Polish ranks in the insurrection of 1830, and to whose memory Mickiewicz devoted a poem. The *'Dziady'*, or *'Ancestors'*, is a poem of a new kind, an autobiographical drama, in which the poet appears as one of his own characters. In it the poet relates, with this slight veil, the story of his love for *'Maria'*, the *'Mary Chaworth'* of his life, and except in Byron's *'Dream'*, which Mickiewicz afterwards rendered into Polish, it would be difficult to find a love-tale more tenderly and delicately told.

The name of Mickiewicz became at once popular among his countrymen. A valley near Kowno, which he was fond of visiting, and where he wrote some of his verses, received the name, which it still retains, of *'Mickiewicz's Valley.'* The enthusiasm of the Poles was

heightened by the next intelligence that spread far and wide concerning him, that he was a prisoner in the hands of the Russian government, on suspicion of being concerned in the secret societies which had been found to exist in the University of Wilna. The dedication of the 'Poems,' containing 'Dziady,' had been to Thomas Zan and a few friends, and probably the poet little anticipated the dedication which he was to prefix to another part of the 'Dziady,' published after long years of interval—"To the sacred memory of John Sobolewski, of Cyprian Daszkiewicz, of Felix Kolakowski, my fellow-students, my fellow-prisoners, my fellow-exiles, persecuted for love to their country, who, with a longing for that country in their hearts, died at Archangel, at Moscow, at St. Petersburg, the martyrs of their country's cause." Imprisoned for upwards of a year in the Basilian convent at Wilna, while the examination into the conspiracy went on, under circumstances and incidents which were afterwards delineated with all the force of his genius, Mickiewicz, found guilty of being a member of two secret societies, was condemned, in 1824, to perpetual banishment in the interior of Russia. At the age of twenty-six Mickiewicz left Poland for exile, and he never saw it again.

At St. Petersburg, where he was at first permitted to reside, Mickiewicz found himself, in the latter years of the Emperor Alexander, in the midst of native conspirators against the Russian government. Ruliyev and Bestushev, afterwards so active in the abortive insurrection at the accession of the Emperor Nicholas, were ardent for the Polish cause. In a poem "to his Russian friends," written in after years, Mickiewicz mentions them both by name, as victims of the vengeance of the czar, and alludes apparently to Pushkin, to whom they introduced him, as having deserted the cause of liberty. The 'Russian Byron' and the 'Polish Byron' met at St. Petersburg in the year of the death of the English Byron. Probably the conjunction was not looked upon with favourable eyes by the Russian government, which ordered Mickiewicz to Odessa; there however he soon obtained permission for a tour in the Crimea, which gave rise to a series of 'Crimean Sonnets,' the first sonnets in the Polish language. Their subject now gives them an additional interest. One of them is 'On the View of the Mountains from Koslov,' or Eupatoria; another, 'On the ruined Castle of Balaklava.' These poems have been very popular; and one of them, 'On the Chatuir-Dagh,' has enjoyed the singular distinction of being translated into Persian; but we believe that from no other poems of Mickiewicz could so many instances of false brilliancy and other common-place be selected. They obtained for him an invitation to Moscow from the governor, Prince Golitsuin, and afterwards permission to return to St. Petersburg, where, in 1828, his next great poem, 'Wallenrod,' appeared.

This poem was at once prohibited by the censorship of Warsaw, and to those who have read it, it is an inexplicable problem how it should ever have passed the censorship of St. Petersburg. Under the thin disguise of a story of a Lithuanian of the 14th century, who works his way to the mastery of the order of the Teutonic Knights, the enemies of his country, for the purpose of destroying them in detail, it inculcates the most burning hatred on the part of a crushed nation to its foreign oppressors. Its meaning, which was at once apprehended by every Pole, seems to have escaped every Russian. Two Russian translations were published, and it is even said that the Emperor Nicholas sent a message of compliment to the author. A diplomatic appointment in the Russian service was also, it is said, proffered to him; but the only favour he asked was to be allowed to visit Italy for the benefit of his health, and he obtained it by the intercession of the Russian poet Zhukovsky. He left Russia, as he left Poland, never to return.

After passing through Germany, where he spent some days with Goethe, he resided at Rome, where he became intimate with Fenimore Cooper, in whose Memoirs, now preparing by his daughter, it is probable that some interesting particulars of him will be found. It was at Rome that the news of the Polish insurrection of 1830 reached him, an insurrection which was commenced by a party of the insurgents singing in the streets of Warsaw some lines from his 'Ode to Youth.' The rising was crushed by the time Mickiewicz had reached Posen on his way to join it. He retired to Dresden, and there composed another part of the 'Dziady,' which was first published in 1832 at Paris.

As in the former part of this poem Mickiewicz had told in a dramatic form the tale of his early love, in this he related in a succession of scenes the story of his imprisonment in Wilna before the sentence of banishment. As a lover, he represented himself as having been driven by disappointment to insanity; as a man, he actually delineated himself as possessed by the devil, and the devil as exorcised out of his body by a priest, after the utterance of a proud and presumptuous challenge to Heaven, the impious vanity of which is represented as having called down the chastisement. This strange and repulsive scene is accompanied by others of a less eccentric character, in which the poet's friends and foes are put in action without reserve, and in which the horrors of the Russian sway in Poland are depicted with surprising power and pathos. On the whole, this wild production is one of the most remarkable for poetical power that the literature of the quarter of a century since 1830 has produced.

The last great poem of Mickiewicz, 'Pan Tadeusz,' or 'Sir Thaddeus,' was published at Paris in 1834. It differs as entirely in style and

sentiment from the 'Dziady' as 'Waverley' from 'Manfred.' It is a minute delineation of Lithuanian domestic life in the year 1812, the time of the poet's boyhood, in which the somewhat insignificant story of a common-place hero is relieved against the dark background of the approach of Napoleon's invading army on its march to Russia, and the intense excitement it produces among the Lithuanians, from the peasant and the publican to the priest and the noble. By some it is regarded as totally unworthy of the powers of Mickiewicz—by many as the finest production of his genius; and there can be no doubt that it is by far the most pleasing and the least objectionable.

Up to this period the career of Mickiewicz had been one to which his Polish admirers had looked with constantly increasing admiration, and he occupied a position in the literature of his country without a rival either in the present or the past. "He is our Byron, our Shakspeare," was the verdict of Klementyna Hoffmanowa herself, a staid and decorous writer. None indeed could then have foreseen in what darkness the star of Mickiewicz was to set. In 1832, two years before the appearance of 'Pan Tadeusz,' he had published 'A Book of the Polish Nation and the Polish Pilgrimage,' which presented an unbroken series of dull absurdity and extravagance. It was probably the influence of his name which procured its translation into French by Count Mostaembert, and into English by Lach Szymra, combined with the fact that in it Mickiewicz presented himself to the world in the character of a fervent Roman Catholic, convinced that it was to its toleration of Protestantism that the ruin of Poland was to be ascribed.

Before this period Mickiewicz had fixed his residence at Paris, and it was in that city, in 1834, that he became united to Celina Szymarowska, a Polish lady, to whom he had, in 1828, addressed some verses at St. Petersburg. To Paris and to the French he was strongly attached, but his pecuniary circumstances compelled him to accept, in 1839, an appointment as professor of classical literature at Lausanne. In the next year, when M. Cousin, then minister of public instruction, determined to establish a chair of Slavonic literature and the Slavonic languages at the College of France, it was considered a good fortune for the minister to be able to appoint, for the first professor, the greatest poet of Poland.

The first lectures which he gave were eagerly attended, and were reproduced in the French and German journals; but ere long strange alterations began to develop themselves. Already in 1841, when Madame Mickiewicz, who was in bad health, had received some benefit from being mesmerised by a Polish fanatic named Towianaki, Mickiewicz had allowed himself to become associated with this man as the interpreter of certain dreams, in which Towianaki alleged that he was favoured with revelations by the Virgin Mary. In his lectures on Slavonic literature the professor gradually lost sight of Slavonic literature altogether, and preached a series of discourses, in which this Towianaki was represented as the new Messiah of a new religion, of which the principal feature was the worship of Napoleon Bonaparte. This Mickiewicz represented as a new and necessary development of improved Christianity. At last, in 1844, the French government interposed, ordered Towianaki to quit Paris, and put a stop to the course of lectures which had long excited general scandal and disgust. Mickiewicz's name appeared in the list of professors for some years afterwards, but he lived in obscurity, an object rather of compassion than other feelings. In 1848 the revolution of February again excited his hopes for Poland, and he made a journey to Italy for the purpose of gaining over the pope, and was received with enthusiasm by the insurgents at Florence. In 1851 his name appeared in the French calendars as "Sub-Librarian of the Library of the Arsenal at Paris," to which he was appointed by the prince president, who might possibly view as a venial error the inculcation of the worship of Napoleon I.

About 1854 Mickiewicz became a widower, and he afterwards returned in some degree to public life. Soon after the commencement of the war with Russia he headed a deputation to the French emperor, to remind him of the opportunity that presented itself for redressing the wrongs of Poland, and in 1855 he was sent by him on a secret mission to the east, which was destined to prove the last incident in his career. He died at Constantinople on the 27th of November 1855. His remains were removed to France, where they were interred in the cemetery of Montmartre, and a subscription was opened directly after at Paris and London for the benefit of his children.

One of the most remarkable editions of Mickiewicz's works was published at Paris in 1828 and 1829, in three volumes, at the expense of the Countess Ostrowska, a Lithuanian lady, who presented the money received from its sale to the author, then a captive in Russia. It is generally stated to be the first book printed in France in the Polish language, but it had two predecessors, as its editor, Leonard Chodzko, points out in the preface—one in 1668 and another in 1814. Its successors may be counted by hundreds, many of the best works in Polish being now originally printed at Paris. The best edition of Mickiewicz's works is that in four volumes, issued at that city in 1844, revised by the poet himself and edited by Alexander Chodzko. A translation of all his works into French by Christian Ostrowski was published at Paris in 1841, and again in 1845, with two very different prefaces, the first all enthusiasm for Mickiewicz and his genius, the second full of the disappointment and estrangement his devotion to

Towianaki had inspired. The English language possesses one only of his larger poems in two translations—the 'Wallenrod,' in prose by Leon Jablonski, Edinburgh, 1841, and in verse by Cattley, London, 1842. An article of some length on Mickiewicz appeared in the London 'Metropolitan,' at the outset of his career, and another in the 'Athensum' for 1856, on the occasion of his death.

The name of 'the Polish Byron,' which has been generally assigned to Mickiewicz, conveys as correct a notion of the nature and the extent of his genius as any single epithet could possibly do. The most striking point of dissimilarity between the two is the vehement patriotism of the Pole, and the indifference to his country which was professed by the Englishman, but a great deal of this was probably owing to the different position of the two countries, one at the foot of a foreign sovereign, and the other in the most prosperous period of its history. It may be remarked that in 'Pan Tadeusz,' where Mickiewicz has occasion to delineate the character of his countrymen, he depicts them, not conspicuously perhaps on his own part, as arrogant, ignorant, prejudiced, spiteful, and headstrong, with scarcely any good qualities to balance. There is an obtuseness in Mickiewicz's own moral perceptions which it is often painful to observe. His poem of 'Wallenrod' is devoted from the first line to the last to the inculcation of a spirit of systematic treachery, and in one remarkable passage he delineates his young hero in the palace of his foe as descending to the meanest spite—

"I remember how oft in the castle  
I secretly sharpened my knife, and with what a rapture of vengeance  
I cut the carpets of Winrych, and rained his glittering mirrors."

It is said that at the time of the appearance of this passage in 'Wallenrod,' the Poles in the palace of the Grand Duke Constantine at Warsaw carried out the idea. The gross anachronism of the carpets and the mirrors in a story of the 14th century is only one of many which abound in the works of Mickiewicz, and it is unsafe to rely on his authority for facts in literary or other history, where his views and theories were concerned. He tells us, for instance, in one of his Napoleonic lectures that the genius of Byron was undoubtedly kindled by a ray from that of Napoleon, and inquires how such a poet could otherwise have arisen in a literature so decrepit and almost dead as that of England, which had as it were come to a close with Thomson and his followers. This general inaccuracy and untrustworthiness must, in fairness to the Russians, be remembered by the readers of the thrilling delineations of their cruelty which abound in the 'Dziady.' Whatever may be the judgment pronounced on Mickiewicz as a writer, a politician, and an historian, nothing can ever erase from Polish literature the name of the poet of 'Grażyna.'

MICKLE, WILLIAM (or, as he sometimes called himself, WILLIAM JULIUS MICKLE), was born in 1784 at Langholm, in Dumfriesshire, where his father was a Presbyterian minister. At the age of sixteen he was sent to the counting-house of a relation who was a brewer, and remained there five years. He afterwards set up in business on his own account, but failed, it is said, because he devoted those hours to his poetical studies which should have been dedicated to business. He subsequently became corrector of the Clarendon Press in Oxford, and though several of his juvenile poems had been printed, his name remained unknown to the public till the publication of an elegiac ode, called 'Pollio,' in 1765. This was followed in 1767 by a poem in imitation of Spenser called 'The Concubine,' published with many corrections and additions ten years afterwards under the title of 'Sir Martyn.' He also wrote, besides several other poems, a 'Letter to Dr. Harwood,' against the Arian views; an attack on deism, called 'Voltaire in the Shades;' and a tragedy entitled the 'Siege of Marseilles,' which was refused by Garrick, Harris, and Sheridan in succession, and never produced. In 1775 came out his translation of Camoens's 'Lusiad,' which had occupied him five years. Governor Johnstone, his patron, having been appointed commander of the Romney man-of-war, took him out to Lisbon, where he was appointed joint-agent for the prizes that might be taken in an expected cruise. His translation procured him much respect among the Portuguese, and he was admitted a member of the Royal Academy, of which Prince Don John of Braganza was president. A poem called 'Almada Hill' was the result of his residence at Lisbon. After Mickle's return to London with Governor Johnstone he wrote several pieces both in prose and verse, the last of which was 'Eakdale Braes,' a ballad. He died at Wheatly, in Oxfordshire, October 25, 1788.

Mickle's translation of the 'Lusiad' has been severely censured on account of the liberties taken with the original, and the unwarranted diffuseness of the translation. His poems as a whole are worth little, indeed so little, that we may wonder how they acquired the small celebrity which they have attained. A ballad by Mickle entitled 'Cumnor Hall' is not without merit; it furnished the idea of Sir W. Scott's 'Kenilworth,' and is printed in the introduction to that work in the complete editions of Scott's Novels.

MICON (*Μίκων* or *Μίκων*), a distinguished Greek painter and sculptor, was the son of Phanochus of Athens, and was one of the most celebrated of the Greek painters for painting horses. He lived about the middle of the 5th century B.C., and was the contemporary of Phidias and Polygnotus.

The history of Micon is less known than that of many others of

the eminent artists of ancient Greece. He was however one of the painters chosen by the Athenians to perpetuate their great victories in the Colonnades of the Ceramicus, which was enlarged or rebuilt by Cimon after his victories over the Persians; and he was also appointed to paint the walls of the temple of Theseus at Athens; an honourable distinction, indicating the highest eminence in his art.

Micon painted the battle of the Amazons and the Athenians under Theseus, in the gallery of the Ceramicus, which was called subsequently, in consequence of this and other pictures, the variegated gallery, or the Poecile (*ἡ ποικίλη Στόα*). He appears also to have assisted Pausanias in the picture of the battle of Marathon, in the same gallery, for it is said that he was fined thirty minas, or half a talent, for painting the Barbarians larger than the Greeks, in that picture. In the temple of Theseus he painted another battle of the Amazons and Athenians; and opposite to it the battle of the Centaurs and the Lapithæ. A third wall also was painted by Micon in this temple, but the picture was so much defaced through age, that Pausanias could not discover the subject of it. Micon also painted, together with Polygnotus, the temple of the Dioscuri; he painted there the return of the Argonauts to Thessaly with Medea and Æsteropea and Antiope, the daughters of Pelias; they were so called according to this picture, on which their names were inscribed. This circumstance is noticed by Pausanias, who remarks also that the best part of these paintings was Acastus and his horses. It is observable that all Micon's pictures were of such subjects as admit of the introduction of horses, and some of them were the best subjects that could be chosen for the display of the painter's skill in painting these animals, as the battles of the Amazons and the Centaurs. Micon, as already mentioned, was one of the most celebrated of the Greek painters in this respect, yet he was not altogether perfect in his horses, for he gave some of them lashes to their under eyelids, which horses have not. His horses were objected to on this account by Simon, an Athenian well skilled in such matters, and who, according to Pliny, was the first writer on Equitation: a statue by a sculptor of the name of Demetrius was erected to Simon's memory at Athens. This nicety of criticism tends rather to establish Micon's reputation than otherwise, as this was the only error detected by so able a critic. According to another account, it was a fault that was found with some of the horses of Apelles. Great excellence however, in the drawing of the horse, is not at all inconsistent with the state of the art at the time that Micon lived, for we have actual remains of that very period in the beautiful horses of the frieze of the Parthenon, now in the British Museum, executed under the superintendance of Phidias, who was the uncle of Pausanias, with whom Micon worked in the Poecile.

A figure in one of Micon's battles of a certain Butes was the origin of an Athenian proverb: Butes was painted concealed or crushed by a stone, and all that appeared of him was his head and eyes, which seemed to the Athenians so very expeditious a method of painting a warrior, especially one it was necessary to give a name to, that "Micon painted Butes," and "quicker than Butes," became sayings for expressing anything that was quickly done. Varro speaks of the style of Micon as crude and unfinished when compared with the works of Apelles and later artists. This is very probable, and the same might be said of many of the works of Michel Angelo and Raffaele compared with those of almost any of the scholars of the Caracci; yet the difference is a mere matter of execution, and is not at all essential, nor does it in the least interfere with the higher qualities of art, as form, expression, or composition.

Micon was also a sculptor: he executed, according to Pausanias, the statue of Callias, the Athenian pancratiast, at Olympia.

Micon appears to have been not an uncommon name among Greek artists. The father of Onatas of Ægina was Micon; and Pliny mentions Timarete, herself a painter, as the daughter of a painter of the name of Micon.

There was also a Syracusan sculptor of the name of Micon; he was the son of Niceratus, and made the two statues of Hiero II., which were placed by the sons of Hiero at Olympia.

(Pliny, *Nat. Hist.*, xxxiv. 19; xxxv. 35; Varro, *Lingua Latina*, viii.; Pausanias, i. 15-18; vi. 6; viii. 11; Ælian, *Hist. Animal.*, iv. 50; Sopotar, *Ret. Græc.*, p. 340, ed. Ald.; Böttiger, *Ideen zur Archæologie der Malerei*; Sillig, *Catalogus Artificum*.)

MIDDLETON, CONYERS, was the son of William Middleton, rector of Hinderwell, near Whitby in Yorkshire, where he was born in 1688. At the age of seventeen he was sent to Trinity College, Cambridge, of which college he was two years afterwards chosen a scholar. He took his degree of B.A. in 1702, and was shortly after ordained deacon. In 1706 he was elected a fellow of Trinity College; and in 1708, joined with other fellows of his college in a petition to the Bishop of Ely, as the visitor of the college, against Bentley the master. Middleton, who was then a young man, did not take a prominent part in this proceeding; but the feelings of hostility to the master originated by these disputes sank deep into his mind, and made him subsequently the most determined and dangerous of his enemies. Middleton married soon afterwards, and resided for a short time in the Isle of Ely on a small living in the gift of his wife, but the unhealthiness of the situation induced him to return to Cambridge at the end of a year.

When George I. visited the University of Cambridge in 1717, Middleton, with several others, was created Doctor of Divinity; but Bentley, who was Regius Professor of Divinity, refused to confer the degree unless a fee of four guineas was given to him in addition to the broad piece which was the ancient and customary compliment on this occasion. This demand was resisted by Middleton, who however at last consented to pay it, on condition that the money should be restored if it should be determined that it was an illegal demand. Middleton sued Bentley for it in the vice-chancellor's court; and Bentley, refusing to pay the money or to acknowledge the jurisdiction of the court, was deprived of all his degrees by a grace of the senate, October 17, 1718. [BENTLEY.] As Bentley was a firm supporter of the Whig ministry then in power, it was feared that a commission might be issued by the crown to inquire into the state of the university; and Middleton, to justify himself and his friends, accordingly published 'A full and impartial Account of all the late Proceedings in the University of Cambridge against Dr. Bentley,' which, says Dr. Monk, "was the first published specimen of a style, which, for elegance, purity, and ease, yields to none in the whole compass of the English language. The acrimonious and resentful feeling which prompted every line is in some measure disguised by the pleasing language, the harmony of the periods, and the vein of scholarship which enliven the whole tract." ('Life of Bentley,' p. 388.)

A few months afterwards, Middleton published 'A Second Part of the full and impartial Account of all the late Proceedings, &c., and also 'A true Account of the present State of Trinity College, in Cambridge, under the oppressive Government of their Master, R. Bentley, late D.D.' In the latter pamphlet Middleton had declared "that the fellows of Trinity College had not been able to find any proper court in England which would receive their complaints;" and Bentley perceiving that his adversary had been guilty of an expression which might be considered as a libel upon the whole administration of justice in the kingdom, brought an action against him in the Court of King's Bench, in which the jury returned a verdict of guilty. The court however was unwilling to pronounce sentence, and the matter eventually dropped by Middleton's begging pardon of Bentley and consenting to pay all the expenses of the action, which must have been considerable, since the share of the expenses of the prosecution not allowed by the master of the court, and paid by Trinity College, amounted to 150*l*.

While this matter was pending, Bentley published Proposals for a new edition of the Greek Testament, with a specimen of the intended work. The proposals and specimen were drawn up by candle-light one evening, according to Bentley's own confession; and the whole sheet bore marks of precipitation and haste. Middleton eagerly availed himself of the opportunity which the carelessness of his great enemy had afforded him, and accordingly published a severe critique upon it, in a pamphlet entitled 'Remarks, paragraph by paragraph, upon the Proposals lately published by R. Bentley for a new edition of the Greek Testament,' and followed up his attack by 'Some further Remarks' a few weeks afterwards. Although Middleton professed, in the commencement of the pamphlet, that "his remarks were not drawn from him by personal spleen or envy to the author of the Proposals, but by a serious conviction that he had neither talents nor materials proper for the work he had undertaken, and that religion was much more likely to receive detriment than service from it," the whole tenor and style of the pamphlet showed that it was the result of the most virulent personal animosity, and he in fact descended to the lowest abuse against his antagonist; but it must be allowed that in this respect he was not much more than a match for the master of Trinity.

As Middleton had been put to great expense and trouble by his recent prosecution, his friends in the university, regarding him as a sufferer in a public cause, resolved to bestow some public mark of distinction upon him, and accordingly established a new office of principal librarian, to which Middleton was elected notwithstanding the violent opposition of the other party. Shortly after his election he published a plan for arranging the university library, which was entitled 'Bibliothecæ Cantabrigiæ Ordinandæ Methodus quædam,' 1723; in the dedication of which to the vice-chancellor he expressed himself in a manner which appeared to call in question the jurisdiction of the Court of King's Bench, for which he was again prosecuted by Bentley, and condemned to pay a fine of 50*l*.

Having lost his wife shortly after this, he travelled on the Continent, and spent some months in Rome in 1724. On his return to England he renewed his suit against Bentley for the recovery of the four guineas, who at length paid the money to Middleton in 1725. In 1726 he published a short treatise, 'De Medicorum apud veteres Romanos degentium Conditione Dissertatio; qua &c. servilem atque ignobilem eam fuisse ostenditur;' which was considered an insult upon the whole medical profession. Several pamphlets were published in answer to it, to which Middleton replied in the following year.

In 1729 Middleton published his celebrated 'Letter from Rome,' in which he attempted to show that "the religion of the present Romans was derived from that of their heathen ancestors;" and that in particular the rites, ceremonies, dresses of the priests, &c., in the Roman Catholic Church, were taken from the pagan religion. This work was received with great favour by the learned, and went through four

editions in the author's lifetime; but the free manner in which he attacked the miracles of the Roman Catholic Church gave offence to many divines of his own communion, who suspected and maintained that the author had as little respect for the miracles of the apostles as for those of the Roman Catholic saints. This suspicion was confirmed by his next publication in 1731, which was a letter to Dr. Waterland, containing some remarks on Waterland's reply to Tindal's attack upon revealed religion, in a work written by the latter, which was entitled 'Christianity as Old as the Creation.' This letter, which was first published anonymously, but was soon known to be written by Middleton, gave the greatest offence to the clergy. Pearce, bishop of Rochester, replied to it; and so strong was the feeling against Middleton, that he was nearly deprived of his degrees, and nearly degraded from his office of public librarian. Finding it necessary to make an explicit avowal of his sentiments with regard to religion, Middleton published in 1732 'Some Remarks on a Reply to the Defence of the Letter to Dr. Waterland, wherein the Author's sentiments as to all the principal points in dispute are fully and clearly explained,' in which he expressly asserted his belief in Christianity, and disclaimed all intention of attacking the evidences of revealed religion. It must however be admitted that Middleton had spoken of the Scriptures in a manner that was calculated to give just cause of offence, and there is abundance of evidence in his writings to prove that he regarded Christianity in scarcely any other light than a republication of the law of nature, and that he endeavoured, like a certain class of modern divines in Germany, to reduce as far as possible everything supernatural in the Bible to mere natural phenomena. He expressly maintained that there were contradictions in the four evangelists which could not be reconciled ('Reflections on the Variations found in the four Evangelists'); he accused Matthew "of wilfully suppressing or negligently omitting three successive descents from father to son in the first chapter of his Gospel" ('Works,' vol. ii, p. 24, 4to ed.); he asserted that the apostles were sometimes mistaken in their applications of prophecies relating to Christ ('Works,' vol. ii, p. 59); he considered the "story of the fall of man as a fable or allegory" ('Works,' vol. ii, p. 131); and with respect to the prophecy given at the fall, that the seed of the woman should bruise the serpent's head, he did not hesitate to declare, in another part of his 'Works' (vol. iii, p. 183), "that men who inquire into things will meet with many absurdities which reason must wink at, and many incredibilities which faith must digest, before they can admit the authority of this prophecy upon the evidence of this historical narration." Such being the opinions of Middleton (and passages of a similar nature might be multiplied to almost any extent from his works), it cannot excite surprise that he should have been regarded by his brethren with suspicion, and have been looked upon, notwithstanding his assertions to the contrary, as a disbeliever in the fundamental doctrines of Christianity.

While these discussions were going on, Middleton was appointed to the professorship of natural history, which had been recently founded by Dr. Woodward, which appointment he resigned in 1734, and soon after married again. In the following year he published 'A Dissertation concerning the Origin of Printing in England,' showing that it was first introduced and practised by our countryman William Caxton at Westminster, and not, as commonly supposed, by a foreign printer at Oxford. In 1741 he published by subscription his most celebrated work, 'The History of the Life of M. Tullius Cicero,' Lond., 2 vols. 4to. There were 3000 subscribers to this work, and the profits arising from its sale were so considerable as to enable Middleton to purchase a small estate at Hildersham, six miles from Cambridge, where he chiefly resided during the remainder of his life. Middleton's 'Life of Cicero' is written, like all his other works, in a pleasing and perspicuous style; but the strong bias of the author in favour of his hero has frequently led him to become the panegyrist of very questionable actions, and even to misrepresent, perhaps not intentionally, those events which did not reflect credit on the character of his favourite. [CICERO, vol. ii, col. 247.] Dr. Parr, in a preface to a republication of Bellendenus, entitled 'De Statu,' asserts that Middleton, in his 'Life of Cicero,' borrowed very largely from a work of Bellendenus on the character, literary merits, and philosophical opinions of Cicero, which is entitled 'De Tribus Luminibus Romanorum.'

Two years afterwards, Middleton published a translation of Cicero's letters to Brutus, and of Brutus's to Cicero, with the Latin text, and a prefatory dissertation, in which he defended the authenticity of the Epistles against the objections of Tunstall, who maintained that they were the composition of some sophist. The arguments of Middleton were combated by Markland in his 'Remarks on the Epistles of Cicero to Brutus, and of Brutus to Cicero, in a letter to a friend.' [MARKLAND.]

In 1746 he published 'Germana quædam Antiquitatis eruditæ Monumenta,' &c., in which he gave an account of the various specimens of ancient art which he had collected during his residence at Rome. Two years afterwards he published his 'Treatise on the Roman Senate,' in which he maintained that all vacancies in the senate were filled up by the people; and in the same year he published 'An Introductory Discourse to a larger work, designed hereafter to be published, concerning the Miraculous Powers which are supposed to have subsisted in the Christian Church from the earliest ages,'

which was followed in 1749 by 'A Free Inquiry into the Miraculous Powers, &c. This work gave even more offence than his letter to Dr. Waterland; it was attacked by Dodwell, Church, and Chapman, and was generally condemned by the clergy as tending to destroy the authority of miracles in general. Middleton however disclaimed all such intention; and it must be allowed, that whatever may have been his private opinions, he does not in this work advance anything which could fairly be construed into an attack upon revealed religion; perhaps the former controversy had made him more cautious. The object of the 'Free Inquiry' was to place the divines of his own church in the awkward predicament of either denying the authority of the fathers altogether, or else of admitting the truth of the leading doctrines of the Roman Catholic Church, which he maintains to be satisfactorily established by the testimony and miracles of the early fathers. Edward Gibbon, who was then a young man at Oxford, chose the latter alternative, and went over to the Roman Catholic Church, sooner than abandon the authority of the fathers. [GIBBON.]

In 1750 Middleton published 'An Examination of the Bishop of London's (Dr. Sherlock) Discourses concerning the Use and Intent of Prophecy,' in which he maintained that the use of prophecy, as it was taught and practised by Christ and his Apostles, was drawn entirely from single and separate predictions, gathered by them from the books of the law and the prophets, and applied, independently of each other to establish the Messianism of Jesus, and that there was no foundation for Dr. Sherlock's argument that the prophecies of each age were intimately connected with each other and with those of the preceding age, and that the whole formed one connected series from the time of the antediluvians to the prophecies of Malachi.

Middleton died at Hilderham on the 28th of July 1750. He accepted, shortly before his death, a small living from Sir John Frederick. His subscription to the thirty-nine articles and the canons of the church on that occasion was represented by his enemies, but whether justly or not it is difficult to say, as hypocritical and insincere.

The works of Middleton, with the exception of his 'Life of Cicero,' were collected and published after his death in four volumes, 4to, 1752, and subsequently in five volumes, 8vo. Several treatises appeared in this collection which had not been published before, of which the most important are:—'A Preface to an Intended Answer to all the Objections made against the Free Inquiry'; 'Some cursory Reflections on the Dispute or Dissension which happened at Antioch between Peter and Paul'; 'Reflections on the Variations or Inconsistencies which are found among the Four Evangelists'; 'An Essay on the Gift of Tongues'; 'Some Short Remarks on a Story told by the Ancients concerning St. John the Evangelist and Cerinthus the Heretic'; and 'An Essay on the Allegorical and Litteral Interpretation of the Fall of Man.'

MIDDLETON, SIR HUGH, was the sixth son of Richard Middleton, Esq., who was governor of Denbigh Castle, in Denbighshire, during the reigns of Edward VI., Mary, and Elizabeth. The name was variously spelt in those times, Myddelton, Myddleton, or Middleton. The date of Hugh Middleton's birth is unknown, and nothing has been recorded of the course of his life previous to his great undertaking of forming the New River and bringing it to London, except that he was a goldsmith in London, and had realised a very large property by the working of some copper-mines in Wales; and the decisive boldness with which he engaged in so vast and difficult an enterprise was probably the result of his having, in the conducting of his own mining speculations, acquired that practical knowledge of levelling, draining, embanking, and all the diversity of skill and fertility of resources necessary for the management of such a work.

Towards the latter end of the reign of Elizabeth, the metropolis of England being very inadequately supplied with water, the citizens of London obtained an Act of parliament which gave them the legal authority to bring water from any part of Middlesex or Hertfordshire. For a considerable time however nothing was done, till, on the 28th of March 1606 Hugh Middleton, "citizen and goldsmith," offered to bring to London a sufficient supply of pure water at his own cost. His offer was accepted; the citizens made over to him all the powers and privileges conferred by the Act; and four years were allowed to complete the work. Having made the necessary surveys and preparations, and fixed on the Chadwell and Amwell springs, near Ware, in Hertfordshire, as the sources out of which his New River was to be formed, on the 20th of April 1608 he commenced a work which, considering the imperfect mechanical resources of that age, may justly be regarded as stupendous.

The distance from London by the road is about twenty miles, but the whole course of the river is thirty-seven miles. The ground through which it was to be brought presented much difficulty from its diversity of bottom as well as of level. In some places it was necessary to cut a channel thirty or forty feet deep; in others, to conduct the stream over valleys in troughs on wooden supports upwards of twenty feet high; and a vast number of bridges were to be constructed for the accommodation of those through whose grounds the stream was carried. These difficulties, together with others arising from the opposition of interested and influential persons, rendered it impossible to complete the work in the stipulated four years, and Middleton applied for an extension of the time, which was granted. Soon afterwards however he found that his large property

was entirely exhausted. He applied to his fellow-citizens for assistance, but he applied in vain. He then solicited the king, James I., who, on the 2nd of May 1612, entered into a covenant with Middleton, by which he engaged to pay half the expense, past and future, on condition of being entitled to half the property. The work was now pushed forward with increased vigour, and on the 29th of September 1613, five years and five months from the commencement of the undertaking, and the day on which Sir Thomas Middleton, Hugh's brother, was elected lord-mayor for the ensuing year, the stream was admitted into the reservoir prepared for it at Sadler's Wells, near Pentonville. In the 'Biographia Britannica' an interesting account is given of the ceremony on this occasion, which was attended by the lord-mayor then in office, the aldermen, the recorder, and many of the principal citizens. The whole expense of the work was about 500,000*l.* Middleton was knighted soon afterwards, but for eighteen years after the completion of his undertaking no dividend was returned, and in the nineteenth year the first dividend only amounted to 11*l.* 19*s.* 1*d.* on each share.

Sir Hugh Middleton was compelled to sell his shares, and to support himself by the profession of what is now called a civil engineer. On the 19th of October 1622, he was created a baronet for the following reasons (the king by special warrant kindly excusing him from the payment of the usual fine of 1095*l.*):—"1. For bringing to the city of London with excessive charge and greater difficulty a new cut or river of fresh water, to the great benefit and inestimable preservation thereof. 2. For gaining a very great and spacious quantity of land in Brading Haven in the Isle of Wight, out of the bowelles of the sea; and with banks and pyles and most strange defensible and chargeable mountains, fortifying the same against the violence and fury of the waves. 3. For finding out, with a fortunate and prosperous skill, exceeding industry, and no small charge, in the county of Cardigan, a royal and rich mine, from whence he hath extracted many silver plates, which have been coined in the Tower of London for current money of England. W. Camden, Clarenceux, November 1, 1622." ('*Harleian Misc.*') On the 18th of November 1636, Charles I. regranted to Sir Hugh the whole of King James's shares for an annual rent of 500*l.* Middleton is supposed to have died soon afterwards, leaving a numerous family in very indifferent circumstances.

The springs near Ware are beautifully clear and very copious; but, a great many years ago, the supply having been found inadequate to the demands of the increased population, the New River Company entered into an agreement with the Commissioners of the Lea River to take a portion of the Lea at Ware. The fall of the New River is three feet per mile, which gives a velocity of about two miles an hour. The average width is about twenty-one feet, and the average depth about four feet in the centre; so that, taking it at half the depth, there is a section of forty-two square feet flowing to London at the rate of two miles an hour. The New River, especially in winter, is occasionally rendered dirty by drainage from the land and villages along its course, and the company have been at great expense to purify the water before it is delivered to the inhabitants of London, by the erection of settling reservoirs and other works. Bathing in the New River is entirely prohibited; and men called walkmen mow the bed of the river every week to keep down the growth of weeds, which are stopped by gratings seven miles from each other, where the weeds are taken out. During the last few years an enormous expenditure has been incurred by the New River Company in improving their supply of water by the construction of extensive works consequent on enlarged arrangements with the Commissioners of the River Lea, by improvements on the New River, covering their London reservoirs, &c. The whole of the city of London is supplied with water by the New River Company, and a considerable proportion of other parts of the metropolis also; the total quantity of water furnished by this company being more than one-third of the entire London supply.

MIDDLETON, THOMAS, a celebrated dramatist in the reigns of Elizabeth, James I., and Charles I., the events of whose life are even less known than those of most of his contemporaries: indeed not a single circumstance is recorded respecting him by a writer of his own time; and excepting the fact that he was appointed chronologer to the city of London in 1620, mentioned by Oldys in his manuscript notes to Langbaine, we are absolutely ignorant of his biography. He is supposed by Malone to have died in 1626.

The plays written by Middleton are very numerous: three of them, 'A Mad World, my Masters,' 'The Mayor of Queenborough,' and the 'Roaring Girl,' are in Dodsley's Collection, and the rest can only be procured separately. The 'Roaring Girl' is extremely valuable, as giving a picture of London manners in the author's time; it is interspersed with much of the slang which we find in Beaumont and Fletcher's 'Beggars Bush,' and the heroine is a real character, the notorious Moll Outpurse, who was introduced by Nat. Field, a contemporary dramatist, in his piece, 'Amends for Ladies.' A play of Middleton's, called 'The Witoh,' has gained celebrity from the circumstance that Shakspeare is supposed by some to have borrowed from it his incantations in 'Macbeth.' Besides the numerous pieces by himself alone, Middleton assisted Rowley in 'The Changeling,' 'The Spanish Gipsy,' and 'The Fair Quarrel,' and both him and

Massinger in 'The Old Law'; he also joined with Fletcher and Jonson in the composition of 'The Widow,' which is printed in Dodsley.

Middleton does not hold the first rank among the dramatists of his day. His two best known plays, 'A Mad World, my Masters,' and the 'Roaring Girl,' are chiefly marked by a bustling variety of plot, a succession of incidents somewhat extravagant, and a familiarity with low life. He was however valued by his contemporaries, as is proved by his being chosen to assist such men as Jonson and Massinger.

MIDDLETON, THOMAS FANSHAW, D.D., the first English bishop of Calcutta, was the only son of the Rev. Thomas Middleton, rector of Redleston, in Derbyshire, and was born at that village on the 26th of January, 1769. In 1779 he was admitted into Christ's Hospital, London, and from thence he proceeded to Pembroke Hall, Cambridge, where he took his degree of B.A., with honours, in January 1792. In the following March he received ordination, and entered upon the curacy of Gainsborough, in Lincolnshire. Here he edited a periodical work, entitled the 'Country Spectator,' which continued to appear for about seven months, and most of the papers in which were written by Mr. Middleton himself. In 1794 he became tutor to the two sons of Dr. John Pretyman, archdeacon of Lincoln, and brother of the bishop. In consequence of this appointment he removed, first to Lincoln, and afterwards to Norwich, where he became curate of St. Peter's Maneroft in 1799, having already, in 1795, been presented by Dr. Pretyman to the rectory of Tansor, in Northamptonshire. In 1797 he married Elizabeth, the eldest daughter of John Maddison, Esq., of Gainsborough. This lady not only brought him a great increase of domestic happiness, but also assisted him in his literary labours, by transcribing all his manuscripts for the press. In 1802 Dr. Pretyman presented him to the rectory of Bytham, in Lincolnshire. About this time he wrote his chief work, 'The Doctrine of the Greek Article, applied to the criticism and illustration of the New Testament,' which he published in 1808, with a dedication to Dr. Pretyman. In the same year he took his degree of D.D. at Cambridge, and removed to his living at Tansor, where he discharged his duties in such a manner as to gain the affection and esteem of his people. In 1809 he was appointed by Bishop Pretyman to a stall in the cathedral of Lincoln, and in 1812 to the archdeaconry of Huntingdon. In 1811 he resigned his two livings for the vicarage of St. Pancras, Middlesex, and the rectory of Rottenham in Hertfordshire. He fixed his residence at St. Pancras, and made the acquaintance of several dignitaries of the church and other distinguished individuals.

About this time a provision was inserted in the Act for the renewal of the East India Company's Charter, enabling the crown to constitute a bishopric in India. Calcutta was forthwith made a bishop's see, and Dr. Middleton was appointed the first bishop, and consecrated by the Archbishop of Canterbury on the 8th of May 1814. After receiving an address from the Society for the Promotion of Christian Knowledge, of which he was a warm supporter, requesting his aid in promoting the objects of the society in India, and after being elected a Fellow of the Royal Society, Bishop Middleton sailed on the 8th of June, and arrived in Calcutta on the 28th of November—having during the voyage diligently employed himself in increasing his qualifications for his office, especially by the study of Hebrew and Persian. As Bishop of Calcutta he made every effort to promote the interests of Christianity according to the tenets of the Church of England, and to aid the cause of education. He made three visitations of his immense diocese, in two of which he directed his particular attention to the state of the Syrian Christians in the neighbourhood of Cochin, on the coast of Malabar. By his efforts the Bishop's College at Calcutta was established for the education of clergymen and missionaries for the British possessions in Asia; and he laid the first stone of its buildings on the 15th of December 1820. He instituted a consistory court at Calcutta, and would have done the same at Madras, but for the opinion of the advocate-general at Madras that such a measure would be illegal.

Bishop Middleton died of a fever on the 8th of July 1822, in the fifty-fourth year of his age. He was buried at Calcutta, and the greatest respect was shown to his memory both in India and at home. He was of a tall and commanding person; animated in his manner; sanguine, generous, and amiable in his disposition; and, in his religious principles, firmly attached to the Church of England. As all his papers were destroyed by a direction in his will, none of his works have appeared besides the 'Doctrine of the Greek Article,' the periodical publication mentioned above, and some sermons, charges, and tracts, which have been collected into a volume, to which a memoir of Bishop Middleton is prefixed, by H. K. Bonney, D.D., archdeacon of Bedford (Lond., 1824).

The object of Bishop Middleton's work on the Greek article is, first, to establish the rules which govern the use of the article, and then to apply these rules to the interpretation of various passages in the New Testament, many of which are of such a nature that they furnish arguments for or against the divinity of Christ, according to the different views which are taken of the force of the article. Owing to this circumstance the doctrine of the Greek article has become the subject of warm discussion among theologians; and some Unitarian divines have strongly opposed the views of Middleton. His chief rules have however been received as sound by the great majority of biblical critics. A second and improved edition of Middleton's work

was edited by Professor Scholefield in 1828, and a third edition by the Rev. Hugh James Rose, 1833. An abstract of the work is prefixed to Valpy's edition of the Greek Testament.

MIEL, JAN (called GIOVANNI DELLO VITE), one of the most eminent of the Flemish artists, was born in 1599. He studied under Gerard Segers, in whose school having highly distinguished himself, he went to Rome, where he especially studied and copied the works of the Caracci and Correggio. On being received into the academy of Andrea Sacchi, he gave such proofs of genius, that Sacchi invited him to assist him in a grand design which he had already begun. But in consequence of some disgust, the cause of which does not appear, Miel abandoned the elevated subjects which had hitherto engaged his attention, declined the friendly proposal of Sacchi, and resolved to adopt the style of Bamboccio, to whom he is nowise inferior in force or brilliancy. His favourite subjects were holiday parties, carnivals, gipsies, beggars, and pastoral scenes and persons. We speak of his easel pictures, which are his finest performances; but he likewise painted historical pictures on a large scale, both in fresco and oil, which, though wanting in elevation of design and grace in the heads, are superior to what might be expected from an artist whose subjects were in general of so much lower a class. His pictures of hunting-parties are particularly admired; the figures and animals of all kinds are designed with great spirit and truth to nature; the colouring is transparent, and the tints of his skies are extremely clear and delicate. His great merit procured him the favour of Charles Emanuel, duke of Savoy, who appointed him his principal painter, conferred on him the order of St. Mauritius, and presented him with a cross set with diamonds of great value. He died in 1664. There are many capital pictures by this artist in the imperial gallery at Vienna; and in a grand saloon in the hunting seat at Turin is a series of his noblest productions, representing the chase of various kinds of animals.

MIEREVELT, MICHEL JANZEN, a celebrated Dutch portrait painter, was born at Delft in 1567. His father was a goldsmith. Mierevelt was a very precocious boy; at eight years of age he could write better than any schoolmaster at Delft; at twelve he could engrave, and at fourteen he was a good painter, having studied for about two years under Anthony Bloklandt at Utrecht.

Mierevelt painted almost exclusively portraits, and chiefly heads, but he attained great celebrity, even beyond the limits of his own country, and he could not be persuaded to leave it. The Duke Albert of Nassau, in consideration of his abilities, granted him the privilege of carrying on his Mennonite worship without molestation; and Charles I. of England invited him in 1625 to visit England, an invitation which Mierevelt declined because the plague was at that time in London. He died at Delft in 1641.

Mierevelt's portraits, though extremely numerous—Houbraken computes them at 5000—are generally well drawn and very elaborately finished. Many of them are engraved by various masters, and there are a few etchings by his own hand. He had two sons, who were likewise excellent portrait painters, Pieter Michielsz and Jan Michielsz; the elder was born in 1595, and died aged only twenty-eight in 1623: the younger also died young.

(Van Mander, *Het Leven der Schilders, &c.*, ed. 1764; Houbraken, *Groote Schouburg der Nederlantsche Konstchilders, &c.*)

MIERIS, FRANCIS (called the Elder), was born at Leyden in 1635. This admirable artist was at first placed under the care of Abraham Toorne Vliet, one of the best designers in the Low Countries; and after having made considerable progress under him, he became a pupil of Gerard Douw. He soon so far surpassed all his fellow-students, that Gerard Douw called him the prince of his disciples. He excelled Douw in elegance, in correctness and brilliancy of colouring, and in the art of painting silk, velvet, satin, and other rich stuffs, and was nearly equal to him in finish. His works are rarely to be seen, and more rarely to be sold, and their prices are very high. Besides portraits, he painted conversations, persons performing on musical instruments, patients attended by their physician, &c. His own price for his pictures was calculated according to the time he spent upon them, at the rate of a ducat an hour. His finest portrait is that of the wife of M. Cornelius Plaats, in whose family it was carefully preserved, according to Pilkington, though very large sums had been offered for it. Some of his pictures are in the Florence Gallery. He died March 12, 1681.

MIERIS, FRANCIS (called the Young Francis), was the son of William, but much inferior to him. He made numerous copies of the works of his father and grandfather, and it is probable that such copies are put off at public sales as their performances. He is more distinguished as an historian, by his 'Historie der Nederlandsche Vorsten,' 8 vols. fol., the Hague, 1732-5; and 'Groot Charterboek der Graven van Holland, Zeeland, en Vriesland,' 4 vols., Leipzig, 1753-56. The history of his native town Leyden was left unfinished, one volume only having been published. He was born in 1689, and died in 1763.

MIERIS, WILLIAM (called the Younger), the son and disciple of Francis Mieris the elder, was born at Leyden in 1662. He had made considerable progress during the life of his father; but having lost him when only nineteen years of age, he devoted himself to the study of nature. His first subjects were taken from private life, like those of his father, in which every part was copied minutely after nature. He afterwards attempted historical compositions, and his earliest

performance of this kind was Rinaldo asleep on the lap of Armida, surrounded by the Loves and Graces, which was so highly admired, that he was prevailed upon to paint three repetitions of the same subject. He likewise painted landscapes and animals; and was so admirable a modeller in clay, that it has been said he might be ranked among eminent sculptors. He was inferior to his father in design, grouping, and effect: nor has he the same exquisite touch. His finishing is delicate, and almost over-careful. He died in 1747, at the age of eighty-five, equally esteemed as a man and an artist.

MIGLIARA, GIOVANNI, a very distinguished modern Italian artist, who invested architectural painting with a species of interest which it had not before possessed even in the ablest hands. He was born at Alessandria in Piedmont, October 15th, 1785, of poor parents, who placed him with Luigi Zuccoli of Milan, to learn wood-engraving, but on discovering his strong and peculiar talent, Zuccoli sent him to study architecture and perspective, under Albertoli and Levati, at the academy of the Brera. So prepared, he next studied scene-painting under Galiari, and practised that branch of art—for which Milan was then celebrated beyond any other place in Europe—about eight years, 1802-10, sharing in the fame reaped by Galiari, Perego, Landriani, and Sanquirico. This eminently successful career, one moreover which he pursued with such devotedness, was all at once arrested by a long and dangerous illness, occasioned partly by over-exertion, and partly by a pulmonary attack in consequence of cold caught while working in a damp place. This perhaps eventually proved a great advantage both to himself and to art, inasmuch as it compelled him to relinquish painting for the stage, and led him to produce works that are now treasured up for admiration in galleries. At the time however his illness was a serious calamity, for his family was reduced to very great distress. Owing to the care of a most affectionate wife, he recovered; and no sooner did he begin to recover, and was able to sit up in bed, than he employed himself in making pictures on a small scale of the various scenes—amounting to about a hundred—which he had painted for the theatres. Produced through necessity, as the only means of earning subsistence for himself and family, these subjects not only found purchasers, but there became even a demand for them. Thus encouraged he determined thenceforth to paint architectural scenery "in small," and also to combine the dramatist with the scene-painter, peopling his canvases not with mere figures as accessories, but with episodical groups of actors, either illustrating popular and local manners, or recording some historic incident; and among his numerous pieces of the latter class may be mentioned his 'Ildogonda,' 'Adelaide dying in a souterrain of the Trappists,' the 'Condemnation of a Templar,' the 'Duchesse de la Vallière,' and 'Charles V. at a Convent.' In depicting the personages and manners of familiar and every-day life, he displayed a vein of strong humour; and his convent-kitchens and refectories, and incidents taken from Porta's dialect poems, rendered him an especial favourite with the public. Independently of the figures and stories—the great attraction for the many with which he baited his productions—he converted architectural painting itself, from mere actual portraiture of buildings into real picture, by the united mastery of perspective, chiaroscuro, and colouring. His pictures give the impression and sentiment of the edifices themselves, and are stamped by illusive yet anything but prosaic reality. Such was the reputation he acquired, that not only the King of Sardinia bestowed upon him the Order of Merit, but his native city of Alessandria struck a medal in honour of him, in 1829. Honoured and prosperous in his profession while only in the meridian of life, he might, not unreasonably, look forward for years of uninterrupted happiness, when he was carried off very suddenly—in about half an hour after being seized by it—by an attack of his former pulmonary complaint, April 18th, 1837. He was followed to the tomb by the academicians, artists, and others to the number of upwards of three hundred; and his last work, his unfinished 'Interior of the Basilica of San Marco,' was borne in the procession. His daughter Teolinda painted subjects of the same kind as her father.

(Giuseppe Sacchi, in *Tipaldo's Biografia*; *Westminster Rev.*, vol. xxxv.)

MIGNARD, PETER (called the Roman), was born at Troyes in 1610. His name was properly More; but his father, who was of English origin, took the name of Mignard. He was at first intended for the medical profession; but as he manifested a decided talent for painting, his father placed him in the school of Jean Boucher, at Bourges, and afterwards in that of the celebrated Vouet. Having seen some capital paintings of the Italian masters, he left Vouet and went to Rome, in 1636, to study after Raffaello, Michel Angelo, and A. Caracci. He spent twenty-two years at Rome, during which time he painted many historical pictures and portraits, among which those of popes Urban VIII. and Alexander VII. were the finest. In 1658 he was invited to Paris at the suggestion of Colbert, and, on his way through Italy, had the honour of painting the portraits of several of the Italian princes and their families. In France he acquired the favour of Louis XIV., who sat to him for his portrait ten times, and gave him a patent of nobility; and after the death of Le Brun, appointed him principal painter, director of the Royal collections of the Academy of Painting, and of the Gobelins manufactory. Mignard executed one of the greatest works in fresco in France, the cupola of Val de Grace. He also adorned the great hall at St. Cloud with mythological subjects, undertook several works at Versailles, and

painted numerous portraits. Though Mignard was far inferior to the great models that he studied at Rome, in invention, elevation, depth of feeling, and originality, his pictures, especially his Madonnas, have much delicacy and grace; his compositions are rich; his colouring, in general, is brilliant and harmonious; and he unquestionably is in the first rank of the painters of the French school. He died in 1695, at the age of eighty-five.

NICHOLAS MIGNARD, Peter's brother, two years older, was a very respectable artist: he studied two years at Rome with Peter. He died at Paris in 1668, where he was director of the Royal Academy of Painting.

\* MIGNET, FRANÇOIS-AUGUSTE-ALEXIS, a celebrated French historian, was born at Aix on the 8th of May 1796, and after receiving his preliminary education at Avignon, devoted himself to the study of law at Aix. Here he had M. Thiers for his fellow-student. He had been called to the bar, and had obtained the prize for an Essay on Charles VII. offered by the Academy of Aix, when he removed to Paris and lived in the same lodging with M. Thiers. In 1822 he published a dissertation on feudalism and the legislation of St. Louis, that subject having been prescribed as a prize-subject by the Académie des Inscriptions. In 1824, at the age of twenty-eight, he published his well-known 'Histoire de la Révolution Française depuis 1789 jusqu'au 1814,' a work very carefully written, and which, notwithstanding the many histories of the revolution that have since appeared to compete with it, still retains a high reputation for judgment and trustworthiness. Till 1830, M. Mignet, like his friend Thiers, was conspicuous for his attachment to the principles of the extreme opposition; he gave expression to these principles as a journalist in the 'Courrier Français,' and in 1830 he associated himself with Armand Carrel and Thiers in the conduct of the 'National.' He was one of the journalists who signed the protest against the decrees of Charles X. affecting the French press. After the revolution of July, he was appointed director of the archives in the department of the foreign ministry; in 1832 he was nominated an extraordinary councillor of state; and in the same year he was elected to the Institute, as a member of the section of moral and political science. Of this section he became afterwards secretary, which situation he still holds. In 1837 he became a member of the Academy. His occupation as director of the archives of the foreign office seems to have determined the nature of most of his works since his History of the Revolution. He has published 'Négotiations relatives à la Succession d'Espagne sous Louis XIV.,' forming four volumes of the 'Collection de Documents inédits,' published by the French government (1835-42); 'A. Perez et Philippe II.' (2nd edition, 1846); 'Vie de Franklin' (1848), included in a series of small treatises published by the Academy of Moral and Political Science; 'Histoire de Marie Stuart' (1851); and lastly, 'Charles-Quint: son abdication, son séjour, et sa mort au Monastère de Yuste' (1854), and 'Rivalité de Charles-Quint et de François Ier,' in the 'Revue des Deux Mondes' (1866-67). As secretary of the section of moral and political science and member of the Academy, he has read many biographical papers, some of which have been published under the title of 'Notices et Mémoires Historiques' (1843). Mignet's political principles under Louis Philippe having been very much those of his friend M. Thiers, the revolution of 1848 rather impaired than promoted his fortunes; and on the accession of M. de Lamartine to the foreign ministry of the Republic, he was removed from his directorship of the archives. Under the government of Napoleon III. Mignet's reputation is that of a moderate liberal of the old school.

MILIZIA, FRANCESCO. According to the autobiographical sketch which he has left us, Milizia was born at Oria, a small town of the province of Otranto, in the kingdom of Naples, in 1725, and was of a noble and wealthy family. When nine years old, he was placed under the charge of his maternal uncle, who practised medicine at Padua. With him he remained about seven years, when he ran away from him and joined his father, who was then at Rome, and who sent him to Naples, where he studied logic and metaphysics under the celebrated Genovesi, and physics and geometry under the Padre Orlandi. He was more anxious however to study the world, and set out from Naples with the intention of going to France, but his finances would carry him no farther than Leghorn. After this he was obliged to content himself with leading a half studious, half indolent life at Oria. At the age of twenty-five he married a young lady of family at Gallipoli, and having obtained a handsome allowance from his father, went to Rome, where he ultimately settled with his wife in 1761. It was here that he began to apply himself diligently to the study of architecture, and published his 'Vite degli Architetti piu celebri,' or 'Lives of the Architects,' in 1768, which was followed by his treatise 'Del Teatro,' in 1772, a production that excited so much scandal on account of certain observations in it, that it was suppressed by withdrawing all the copies; yet was soon afterwards republished at Venice. His 'Principles of Civil Architecture,' first published in 3 vols. 8vo, in 1781, and considerably improved in the third edition at Bassano, 1786, greatly extended his literary reputation, being, at the time of its appearance, almost the first attempt to base the art on rational principles, and to expose the pedantry with which it had been taught. It is moreover written in an attractive style, and is seasoned with not a little mordacity and causticity in some of the remarks. On this latter

account, while it was admired by young students, it was censured by many more advanced professors, who charged the author with speaking too freely of many eminent names, with attacking authorities, and propounding his own views without regard to the example of others. His 'Arte di vedere nelle Belle Arti,' in which he showed himself a strong partisan of Mengs, is another work written with great eloquence, and with equal freedom of opinion, impugning Michel Angelo, among others, with unsparring severity. He also published a work entitled 'Roma delle Belle Arti di Disegno,' and his 'Dizionario delle Belle Arti,' which latter, first printed at Bassano, in 1797, 2 vols. 8vo, is chiefly a translation from the 'Encyclopédie Méthodique.' After this, disgusted at the attacks levelled against his 'Roma,' he not only desisted from publishing the second and third parts which he had proposed of that work, but abandoned the fine arts, and took up the study of natural history. He died at Rome in March 1798.

Milizia had for a short time held the appointment of superintendent of the buildings in the Ecclesiastical States belonging to the king of the Two Sicilies, but he resigned it in 1786, not caring to have any such responsibility or tie upon him. His 'Lettere inedite,' addressed to the Count Sangiovanni, and first published in Paris, in 1827, serve to portray his disposition, and, without the testimony of his other writings, to convince us that he abhorred pedantry and dogmatism, false enthusiasm, and quackery. They abound with very free remarks on persons, and are seasoned with much caustic humour. An English translation of his 'Lives of the Architects' appeared in 2 vols. 8vo, in 1826, but it is badly executed and full of gross errors of the press.

MILL, JAMES, was born at Montrose, on the 6th of April 1773. After having as is said received the early part of his education at the grammar-school of Montrose, he was, subsequently, educated in the house of Sir John Stuart (originally Belcher), who was for a long time M.P. for Kincardineshire. Mr. Mill was then sent to the University of Edinburgh, where he was educated for the church, and where he distinguished himself as a Greek scholar. Metaphysical and ethical philosophy also occupied a great part of his time at the university. He was a favourite of Dalzel, the then Greek professor in Edinburgh, who recommended him as a tutor to the Marquis of Tweeddale. He was licensed to preach about 1798. By the advice of a friend he changed his views, and in 1800 accompanied Sir John Stuart to London, where he settled. He became editor of 'The Literary Journal,' a review, which supported him for some time, but was discontinued in consequence of the smallness of the sale. Mr. Macdiarmid, and Dr. T. Thomson, professor of chemistry in the University of Glasgow, were the chief contributors. He afterwards employed much of his time in writing for periodical publications; and for several years he was an occasional contributor to the 'Edinburgh Review.' He married soon after he had settled in London. His acquaintance with Mr. Bentham commenced at an early period of his residence in the metropolis.

His 'History of British India' was commenced about 1806, but being a work of great labour, and the author being obliged to devote a considerable portion of his time to other avocations, it was not published till the winter of 1817-18. It is perhaps no very high praise of this work to say that it is not only the best history of British India, but the only single work calculated to convey to the general reader any clear and connected view of India and Anglo-Indian affairs. But it possesses higher claims than these. It is admitted by some of the most eminent of those who have administered Indian affairs during the last few years, that Mr. Mill's work was the beginning of sound thinking on the subject of India; and the measures of government in that country are stated by those who have the best means of knowing, to be now bearing every year more and more the impress of his views. The style of Mr. Mill's history has been represented by some as dry and unattractive. Mr. Mill certainly does not deal much in rhetorical ornament, at least in what is usually considered such by modern writers, for his style reminds us more of the nervous simplicity and terseness of some of the ancient masters of the difficult art of writing, than that of any modern except Hobbes. The reader who is really in search of a meaning will find it in the writings of Mr. Mill with far less labour than where it is to be sought for in a crowd of unapt and unnecessary words. These remarks may be said to be applicable rather to Mr. Mill's philosophical than to his narrative style. But although not possessing narrative powers of the same kind as Sir Walter Scott or even David Hume, there are passages of Mr. Mill's history which will interest many readers as much as the most spirit-stirring romance; for instance, his account of some of the actions of Clive, and of Cornwallis's night attack upon the outworks of Seringapatam. His narrative of military operations is good; clearness, in which Mr. Mill excels, being the principal quality required. And some of his characters, that of Clive in particular, are drawn in a few bold and forcible lines, which engrave them on the mind of the reader. A new edition of Mr. Mill's 'History of India' has been published with a Continuation by Professor H. H. Wilson.

In consequence of the ability and knowledge of the subject displayed in his history, and although he had in some parts of it freely censured the conduct of the East India Company, the Court of Directors, in the spring of 1819, introduced him into their home-

establishment, and intrusted to him the chief conduct of their correspondence with India in the revenue branch of administration. He afterwards rose, in the course of promotion, to be head of the department in the India House of correspondence with India.

About three years before his appointment to his office in the India House, Mr. Mill became a contributor to the 'Supplement to the Encyclopædia Britannica,' his principal contributions to which were the articles on Government, Education, Jurisprudence, Law of Nations, Liberty of the Press, Colonies, and Prison Discipline. These essays were reprinted in a separate form, and are probably the best known of Mr. Mill's productions. They exhibit great powers both of analysis and ratiocination, and produced, we believe, more marked effects than any other, not only of the works of Mr. Mill, but of perhaps any other writer of this age on such subjects, on the minds of his contemporaries.

His 'Elements of Political Economy,' whatever may be its merits or demerits, and it made no pretensions to originality, published in 1821-22, has at least the very great merit of being written with his usual clearness and precision of language.

In 1829 he published his 'Analysis of the Phenomena of the Human Mind,' a work on which he bestowed more of the labour of thought than on any other of his productions. In this work Mr. Mill has attempted to resolve all the powers of the human mind into a very small number of simple elements. From an examination of a number of the more complicated cases of consciousness, he arrives at the conclusion that they all resolve themselves into three simple elements—sensations, ideas, and the train of ideas. He thus explains what he means by the terms *sensations* and *ideas*:—"We have two classes of feeling: one, that which exists when the object of sense is present; another, that which exists after the object of sense has ceased to be present. The one class of feelings I call sensations; the other class of feelings I call ideas." ('Analysis of the Phenomena of the Human Mind,' vol. i, p. 41.) Mr. Mill begins with the simpler, and thence proceeds to the exposition of the more complex phenomena. "The feelings," he says, "which we have through the external senses are the most simple, at least the most familiar, of the mental phenomena. Hence the propriety of commencing with this class of our feelings." ('Analysis,' vol. i, p. 1.) Accordingly, he begins with sensation; under which head he ranges the feelings which we have by the five senses—small, taste, hearing, touch, and sight; 6, sensations of disorganisation, of the approach to disorganisation, in any part of the body; 7, muscular sensations, or those feelings which accompany the action of the muscles; 8, sensations in the alimentary canal. He next proceeds to ideas, or the copies or images of sensations. He then treats of ideas put together or associated in trains, and of the order of their association and the causes of that order. Before proceeding to the exposition of the more complex ideas or clusters of ideas, he finds it necessary to explain the process of naming, or language; that process by which the sensations and ideas of one man are communicated to another, and by which likewise a record is preserved of sensations and ideas after they are passed. He then treats of consciousness and conception, which philosophers, he says, have erroneously created into what they called powers of the mind; whereas, he says, consciousness is merely a name applied to sensations, and to ideas whether simple or complex; to all the feelings of our sentient nature: and conception a name applied only to ideas, and to ideas only in a state of combination. But consciousness may surely be said to be the power of having sensations and ideas; and conception the power of having ideas in a state of combination.—In this sense, which is not at variance with Mr. Mill's explanation of them, both consciousness and conception may be called powers of the mind.

Again, imagination, he says, is the name of a train of ideas. "I am said to have an imagination, when I have a train of ideas; and when I am said to imagine, I have the same thing; nor is there any train of ideas to which the term imagination may not be applied."

"There is a great diversity of trains. Not only has the same individual an endless variety of trains, but a different character belongs to the whole series of trains which pass through the minds of different individuals or classes of individuals. The different pursuits in which the several classes of men are engaged render particular trains of ideas more common to them than other trains. One man is a merchant, and trains respecting the goods in which he buys and those in which he sells are habitual in his mind. Another man is a lawyer, and ideas of clients and fees, and judges and witnesses, and legal instruments and points of contestation, and the practice of his court, are habitually passing in his mind. Ideas of another kind occupy the mind of the physician; of another kind still the mind of the warrior. The statesman is occupied with a train different from that of any of the classes that have been mentioned, and one statesman with a very different train from another, according as his mind is running upon expedients which may serve the purpose of the day, or arrangement which may secure the happiness of the population from generation to generation. A peculiar character belongs to the train which habitually occupies the mind of the mathematician. The mind of the metaphysician is also occupied by a train distinguished from that of other classes. And there is one man yet to be mentioned, the poet, the peculiarity of whose trains has been a subject of particular observation. To such a degree indeed have the trains of the poet been singled out for distino-

tion, that the word imagination, in a more restricted sense, is appropriated to them. We do not call the trains of the lawyer, or the trains of the merchant, imagination. We do not speak of them as imagining when they are revolving each the ideas which belong to his peculiar occupation; it is only to the poet that the epithet of imagining is applied. His train or trains analogous to his are those which receive the name of imagination." (Vol. i, p. 179.)

In some parts of his book Mr. Mill has, we think, been led into error, in part probably by carrying his notion of association as an explanation of these phenomena too far. Thus in the chapter on classification, after very ably showing how long men had been led away by mere jargon from the real nature and object of classification, he says, "Man first becomes acquainted with individuals. He first names individuals. But individuals are innumerable; and he cannot have innumerable names. He must make one name serve for many individuals." After then alluding to the case of "synchronous sensations so concentered by constant conjunction as to appear, though numerous, only one; of which the ideas of sensible objects, a rose, a plough, a house, a ship, are examples"—he thus proceeds: "It is easy to see wherein the present case agrees with and wherein it differs from those familiar cases. The word man, we shall say, is first applied to an individual; it is first associated with the idea of that individual, and acquires the power of calling up the idea of him; it is next applied to another individual, and acquires the power of calling up the idea of him; so of another, and another, till it has become associated with an indefinite number, and has acquired the power of calling up an indefinite number of those ideas indifferently. What happens? It does call up an indefinite number of the ideas of individuals as often as it occurs; and calling them up in close connection, it forms them into a species of complex idea." (Vol. i. p. 204.) Mr. Mill then says there can be no difficulty in admitting this "because it is an acknowledged fact." Mr. Mill himself furnishes what he considers the reason, for he says, "It is also a fact that when an idea becomes to a certain degree complex from the multiplicity of the ideas it comprehends, it is of necessity indistinct. Thus, when the word man calls up the ideas of an indefinite number of individuals, not only of all those to whom I have individually given the name, but of all those to whom I have in imagination given it, or imagine it will ever be given, and forms all those ideas into one, it is evidently a very complex idea, and therefore indistinct." (Ibid.)

Mr. Mill having gone through an exposition of abstraction, memory, belief, ratiocination, evidence, and some of the more complicated cases of naming, devotes the latter half of the second volume of his *Analysis* to the phenomena in which the sensations and ideas are to be considered as not merely existing, but also as exciting to action. He treats of pleasurable and painful sensations, and of the causes of the pleasurable and painful sensations; then of ideas of the pleasurable and painful sensations, and of the causes of them. He treats of wealth, power, and dignity, and their contraries, of our fellow-creatures, and of the objects called sublime and beautiful, and their contraries, contemplated as causes of our pleasures and pains. Chapter 22 is devoted to the subject of motives; and Chapter 24 to that of the will. Chapter 25 (the last) to intention. Mr. Mill's exposition of all these phenomena is mainly grounded on the law of association, by which he means simply the fact that the order of occurrence amongst our ideas is the order of occurrence amongst our former sensations, of which those ideas are the copies.

Mr. Mill's last work was the 'Fragment on Mackintosh,' published anonymously in 1835. This is a very severe criticism upon the 'Dissertation on the History of Ethical Philosophy,' contributed by Sir James Mackintosh to the 'Encyclopedia Britannica.' Mr. Mill wrote several of the principal articles in the early numbers of the 'Westminster Review.' Among the contributions which are considered his best, are the article on the 'Formation of Opinions,' in No. XI., and the article on the 'Ballot' in No. XXV. Mr. Mill died at Kensington, June 23, 1836.

\* MILL, JOHN STUART, son of the preceding, was born in 1806, and received his education at home from his father. He entered the employ of the Hon. East India Company in 1823, when he was appointed to a clerkship in the India House. Here he rose through the intermediate grades of promotion until in 1856 he was appointed Examiner of Indian Correspondence, the same post which his father had held before him. Mr. Mill was for many years a frequent contributor of articles on various subjects to the 'Westminster' and 'Edinburgh' Reviews, as well as to other leading periodicals. His name however was first made extensively known in England as an original writer by the publication of his 'System of Logic, Ratiocinative and Inductive,' which he gave to the world in 2 vols. 8vo in 1843. This work, besides introducing some new views respecting the principles and grounds of Syllogistic or Deductive Reasoning, attempts to systematise and reduce to strict rules the Inductive method of investigation, the possibility of which is denied by Whately and other writers. The concluding portion of the treatise is of a more strictly practical character, as being (in the author's own words) "an attempt to contribute something towards the solution of a question which the decay of old opinions and the agitation that disturbs European society to its inmost depths, render as important in the present day to the practical interests of human life as it must at all times be to the com-

BIOG. DIV. VOL. IV.

pletteness of our speculative knowledge: viz., 'whether moral and social phenomena are really exceptions to the general certainty and uniformity of the course of nature; and how far the methods by which so many of the laws of the physical world have been numbered among truths irrevocably acquired and universally assented to can be made instrumental to the formation of a similar body of received doctrine in moral and political science.' In the following year appeared his 'Essays on some Unsettled Questions of Political Economy,' dealing with many of the recondite questions of the science, and discussing the definition of political economy and the method of investigation proper to it.

Mr. Mill published in 1848 a treatise entitled 'Principles of Political Economy, with some of their Applications to Social Philosophy.' This work professes, like the well-known treatise of Adam Smith upon the same subject, to combine together a scientific exposition of the principles of political economy, and popular illustrations of their application, embodying many new ideas and new applications of ideas, which have been elicited by modern controversies with regard to foreign trade, the currency, and colonisation. The author incorporates the results of these speculations, carries them down to the days in which we live, and brings them into harmony with the principles already laid down by the best thinkers and writers on the subject. (See the prefaces to the author's works.)

Mr. Mill was selected by Mr. Bentham to edit and prepare for the press the manuscripts of his 'Rationale of Judicial Evidence,' which, with notes and several supplementary chapters by Mr. Mill, was published in 1827. From the time of the French revolution of the Three Days, through the period of the Reform Bill, and for some years after, he was a frequent writer in newspapers on the side of advanced liberalism; and from 1835 to 1840 he carried on the 'London and Westminster Review,' first as the friend and associate of the late Sir William Molesworth, and subsequently on his own account. In 1851 Mr. Mill married Harriet Taylor, the widow of one of his oldest friends. He has no children. [See SUPPLEMENT.]

MILL, JOHN, was born at Shap, in Westmoreland, about 1645. In 1661 he entered as servitor at Queen's College, Oxford, took his degree of B.A. in 1666, of M.A. 1669, and was shortly afterwards chosen a fellow and tutor of his college. In 1676 he was made chaplain to Dr. Lamplugh, bishop of Exeter, and in 1681 obtained the rectory of Blechington, in Oxfordshire, and was appointed chaplain to Charles II. In 1685 he was appointed principal of St. Edmund's Hall, which office he held till his death, which happened June 23, 1707.

Mill is known by his valuable edition of the Greek Testament, which was published only fourteen days before his death, with the following title: 'Novum Testamentum Græcum, cum Lectionibus variantibus, MSS. Exemplarium, Versionum, Editionum, SS. Patrum et Scriptorum Ecclesiasticorum, et in eadem Notis.' This edition, which was the labour of thirty years, was originally begun by the advice of Dr. Fell, bishop of Oxford, and reflects the greatest credit on the diligence and critical acumen of its learned editor. He inserted the various readings that had been previously collected, procured extracts from several then uncollected manuscripts, and added many readings from the ancient versions and the writings of the fathers. Mill however made no change in the text, which was merely a reprint of Robert Stephens's edition of 1550. These various readings, which amounted to more than 80,000, were attacked by Dr. Whitby, in 1710, in a work entitled 'Examen Variantium Lectionum Johannis Millii;' in which he maintained that a collection of so many various readings tended to unsettle the text of the New Testament, and to introduce doubt and uncertainty into the whole system of biblical interpretation. Dr. Whitby's arguments were applied by Antouy Collins, in his 'Discourse on Free-Thinking,' against the authority of the New Testament; whose work was answered by Bentley, a personal friend of Mill's, under the signature of Phileleutherus Lipsiensis.

The edition of the 'Chronicle of Malala,' published at Oxford, in 1691, which is frequently said to have been edited by Mill [BENTLEY], was merely published under his superintendence, since the printing of the work was finished under the revision of Chilmead. [MALALA.]

\* MILLAIS, JOHN EVERETT, R.A., was born at Southampton June 8, 1829. Dedicated from childhood to painting, he was sent at the age of nine to Sass's art-school, Charlotte Street, Bloomsbury, to prepare for the Royal Academy. Entered in 1840 as a student in that institution, his progress through the several schools was a distinguished one, winning a high place, and the usual medals in each, and crowning the whole by carrying off the gold medal in December 1847, for his historical composition—"The Tribe of Benjamin seizing the Daughters of Shiloh." While still a student he united in founding the association now well-known as the 'Pre-Raphaelite Brotherhood,' and of which we have elsewhere noticed the object and the origin. [HUNT, WILLIAM HOLMAN.] Prior to this however, Mr. Millais had appeared before the public as an exhibitor. His first work, 'Pizarro seizing the Inca of Peru,' obtained a place in the Royal Academy Exhibition of 1846; in 1847 he contributed 'Elgiva' to the Royal Academy, and 'The Widow's Mite,' a picture some fourteen feet by ten, to the competitive exhibition in Westminster Hall; and in 1848 his gold-medal picture, 'The Tribe of Benjamin,' to the British Institution.

It was in 1849 that the associated 'Brethren' made their first public essay in their newly-adopted manner; when Mr. Millais sent to the Royal Academy his 'Isabella,' and Mr. Hunt his 'Rienzi'; but the name and the thing were alike regarded as a juvenile freak and rather wondered at than seriously examined. In the exhibition of the following year however they reappeared in larger number and greater strength, and it became evident that there was deliberate purpose and unquestionable ability in the movement. Mr. Millais on this occasion contributed to the Academy exhibition 'Ferdinand lured by Ariel,' and a nameless work,—but which was really a representation of the child Jesus in the shop of his reputed father Joseph the Carpenter; and its character may almost be gathered from the explanatory text or motto in the catalogue—"And one shall say unto him, 'What are these wounds in thy hands?' Then he shall answer, 'Those with which I was wounded in the house of my Friends:'" it was in fact designed in the most extravagant phase of that 'religious symbolism' which the 'Brethren' in their early career regarded themselves as specially called to set forth. As might have been anticipated from its very mediæval manner of looking at a scriptural incident, or rather an incident in which scriptural personages were concerned, the picture was eagerly panegyriced alike by mediæval ecclesiologists and ardent lovers of novelty, but found little favour with art-critics, whose opinions had been formed upon the study of the works of what are usually regarded as the great masters of art, or even with the general public. It served however the great purpose of bringing the name of the painter prominently before the public eye, and of causing his next works to be looked forward to with much curiosity. In 1851 Mr. Millais's pictures in the Royal Academy Exhibition were, 'Tennyson's Mariana,' 'The Woodman's Daughter,' and the 'Return of the Dove to the Ark.' To resuscitate the religious depth and sincerity of the early Italian masters before it had been corrupted by the worldly spirit of Raffaele and his famous contemporaries and successors, had been announced as one of the grand objects of the young band of painters; and Millais in his 'Christ in the shop of the Carpenter,' and the 'Return of the Dove,' seemed to be resolutely entering upon the enterprise. But whether his heart failed, or he took another measure of his own powers, or gave freer scope to his natural inclinations—whatever in short be the reason—certain it is that he has not (at least in any pictures publicly exhibited) recurred to these lofty themes, but contented himself with a lowlier aim and a more subdued method of treatment. His subsequent pictures in the Academy exhibition (to which we believe he has confined himself) have been—'The Huguenot,' and 'Ophelia,' 1852; 'The Order of Release,' and 'The Proscribed Royalist,' 1853; 'The Rescue,' 1855; and 'Peace Concluded,' 'Autumn Leaves,' 'L'Enfant du Regiment,' and the 'Blind Girl,' 1856.

The style of Mr. Millais, like that of the Pre-Raphaelites generally, is marked by an extremely emphatic rendering of the details, and especially of the foreground details; by absence of atmospheric influence and consequent unsubdued richness of colour; and by studied uncoutness of form. But it has many distinguishing and some redeeming qualities. He displays great manipulative skill, and he is fond of displaying it: thus in his flesh-tints, where Titian and the great colourists laboured to blend their colours in one soft mellow hue, unsuggestive of thought of brush or colour, but smooth, glowing, and melting as flesh itself, he effects his purpose by laboured stippling of harsh yellows and purples with a fine pencil, every stroke of which is made palpable. Doubtless it is done with great ingenuity, but like most tricks of execution it is curious rather than felicitous; though sure to catch the applause of the uninitiated. But throughout Mr. Millais seems, in his anxiety to show his scorn of old rules, eager to call attention to his tools. His reading of a well-known axiom appears to be—"The perfection of art is to display art." His great excellence—since his abandonment of 'religious art,'—is his invention. Some of his pictures are in their conception genuine pictorial poems; not translations into the sister art of some selected passage from a poet—or even from a historian or romancer,—but a happy poetic incident conceived in the painter's own mind and at once written in form and colour on the canvass. Such especially, and allowing for peculiarities of manner, told in the happiest and most perspicuous way, are 'The Order of Release,' so well-known by the engraving, and 'L'Enfant du Regiment'—a little child that has been wounded by a stray shot and has had its wound bandaged, and been laid asleep on the monument of some grim warrior of the olden time, by a kind-hearted musketeer, who is now once more busy defending the church into which he and his comrades have made good their retreat. Such too, though disfigured by exaggeration and affectation, are 'The Release,' 'The Huguenot,' and 'The Blind Girl.' But in some of these semi-poetic subjects, as for instance in the 'Peace Concluded,' the affectation and the mannerism predominate to such a degree as to render the failure almost painful. From various indications it would seem that Mr. Millais is entering on a new career as a painter. If Pre-Raphaelitism as originally enunciated meant anything, it is plain that Mr. Millais is no longer a Pre-Raphaelite. Yet his latest exhibited pictures show, as might indeed be expected, that he retains a good deal of the old manner though none of the old turn of mind or tone of thought. He must reconsider his position. If he is to paint

—as he appears now to have set himself the task—the men he sees about him, and those who have but recently passed away, and to embody in form and colour the poetry and the instruction to be found in ordinary life, it is plain that to produce the fullest result, the naturalism which he so ostentatiously affects in the mere details must be carried into the personages of the scene; and he will do well to remember that truth and beauty of form, and grace, elevation, and purity of expression, are essential to works which shall have a lasting instead of an ephemeral popularity. Mr. Millais was elected an associate of the Royal Academy in 1853, and R.A. in 1863.

MILLAR, JOHN (Professor), son of the Rev. James Millar, minister of the parish of Shotts, was born in that parish on the 22nd of June 1785. Two years later, his father was translated to the parish of Hamilton in the same presbytery, and young Millar was about the same time placed under the charge of his uncle, Mr. John Millar of Milhaugh, in the neighbouring parish of Blantyre. At the age of seven he was put by his uncle to the school of Hamilton, and thence sent to Glasgow college, where he distinguished himself by his diligence and attention. He was at first designed for the church; but while at college he adopted the resolution of studying for the bar. On leaving college he became preceptor to the eldest son of Lord Kames, in whose family he spent two years, during which he formed an intimacy with David Hume and other eminent individuals. On the 9th of February 1760 Millar passed advocate; but the cares of a family soon compelled him to abandon his prospects at the bar; and an opportune vacancy having occurred in the chair of civil law in Glasgow college, he applied for and obtained that situation the following year (1761). He now devoted himself entirely to the duties of his new sphere, and by his conduct in it raised the class from a very low and languid condition to be the most popular of the law chairs in the kingdom. "His manner was familiar and animated, approaching more nearly to gaiety than enthusiasm; and the facts which he had to state, or the elementary positions he had to lay down, were given in the simple, clear, and unembarrassed diction in which a well-bred man would tell a story or deliver an opinion in society. All objections that occurred were stated in a forcible, clear, and lively manner; and the answers, which were often thrown into a kind of dramatic form, were delivered with all the simplicity, vivacity, and easy phraseology of good conversation. His illustrations were always familiar, and often amusing; and while nothing could be more forcible or conclusive than the reasonings which he employed, the tone and style in which they were delivered gave them an easy and attractive air, and imparted to a profound and learned discussion the charms of an animated and interesting conversation." ('Edinburgh Review,' vol. iii.) But this was not all. It was also in no small degree owing to his practice of examining his pupils, and prescribing essays on subjects previously discussed in his lectures, that Millar acquired the high reputation as a professor of law which still attaches to his name. Every day before he began his address from the chair he endeavoured to ascertain by examination of his pupils whether they had followed his reasoning on the preceding day; and when the lecture was over he remained some time in the class-room to converse with such as were desirous of farther information. By engaging with them in an easy dialogue he removed obscurities and corrected misapprehensions; and the students were accustomed to acknowledge that it was at these meetings they derived the full benefit of the lectures. (Jardine's 'Outlines of a Philosophical Education,' p. 463.) Mr. Millar had also the good fortune, as we may call it, of long having scarce any rival chair to contend with; for from the time of Mr. Erskine's resignation in 1765 onwards to the end of the year 1786, when Dr. David Hume was appointed, the chair of Scots law at Edinburgh was filled by Professor Wallace, who had too many employments to allow of his attention being devoted to any. Such accordingly was the success which attended Mr. Millar's prelections, that his pupils rapidly increased in number, and the professor of civil law in the Edinburgh college, after seeing his students proportionally diminished, was obliged to abandon the practice, which had till then prevailed in his class, of lecturing in Latin, with the hope of retaining the remainder.

Although most of his lectures were attended with interest, yet remarking a more than ordinary degree of attention manifested to such of them as referred to the progress of society and government, Mr. Millar was induced from this circumstance to publish a short treatise on the subject. This he did in 1771, and the work was favourably received. Some years afterwards he began to turn his attention in a particular manner to the nature and origin of the English government; and in 1787 he published his 'Historical View of the English Government, from the settlement of the Saxons in Britain to the accession of the House of Stuart,' a work which has not however secured for itself the character of an authority. Mr. Millar continued in good health till about the end of the year 1799, when he was seized with an inflammatory complaint, from which however he in a certain degree recovered; but having about a year and a half after exposed himself to cold, he was seized with a pleurisy, of which he died 30th of May 1801.

MILLER, HUGH, an eminent geologist. He was born at Cromarty, in the north of Scotland, on the 12th of October 1802. He was descended from a humble family, who had been long known in the parish of Cromarty as sailors. His father became eventually possessed

of a small vessel of his own, in which he was lost, whilst Hugh Miller was yet a child. In a work entitled 'My Schools and Schoolmasters, or the Story of my Education,' he has given not only an interesting account of his own life, but that of his father, and many of the members of his family. He received his first education at the parish school, where he was early distinguished for his fondness for poetry and poetical composition. At this time he was a large reader, and placed under contribution the libraries of the parish. In this way he laid the foundation of an extended knowledge of literature, which availed him in after life. But the most important part of his education consisted in the natural history instruction he received from an uncle who had acquired a taste for the observation of natural phenomena. Whatever might have been his aspirations, he was obliged to content himself with learning the trade of a mason. This occupation however unexpectedly fostered the taste he had acquired for the study of natural history; and whilst hewing blocks of stone in the quarry, he was diligently studying the traces they exhibited of their past history. It was in this way that he prepared himself to become the historian of the Old Red-Sandstone, amongst the rocks of which he principally worked. His first literary efforts were not however directed to geology. He was early devoted to the muses, and was induced, by the refusal of a newspaper to print one of his poetical effusions, to publish a book of poetry. This work, though it failed to give him a position as a poet, drew towards him the attention of friends, which resulted in his giving up his mason's employment and becoming accountant in a bank in his native town. This appointment gave him more leisure for literature. He became a frequent contributor to newspapers, more especially the 'Inverness Courier;' but his first distinct prose publication was entitled 'Scenes and Legends of the North of Scotland.' Although the subject of this work was only of local interest, the purity of its style and the thought and feeling thrown into the subject discussed, made it a popular work, and several editions have been printed.

With naturally strong feelings, and a power of writing rapidly and impressively, it might be expected that a man in Mr. Miller's position would enter into the great discussion which terminated in a rupture of the Scotch church. His first publication on the subject was entitled 'Letter from one of the Scotch people to the Right Hon. Lord Brougham and Vaux, on the opinions expressed by his lordship in the Ancherarder case.' This letter, which was referred to by Mr. Gladstone in his 'Church Principles,' as the "elegant and masculine production of Hugh Miller," drew at once upon the author the attention of the Free Church party. They had long felt the need of an organ, and the man had at length appeared who was capable of undertaking its conduct. The 'Witness' newspaper was started, and Mr. Miller was invited to accept its editorship. This paper was published twice a week, and conducted with great ability by Mr. Miller to the day of his death. Although never failing in the polemical and political departments, he found time to arrange his geological experience, which he first published in a series of papers in the 'Witness.' These papers excited the surprise and admiration of the geologists who assembled at the first meeting of the British Association in Glasgow in 1840. Sir Charles Lyell, Sir Roderick Murchison, and Dr. Buckland, were amongst the first to express their astonishment at the amount of new matter which was thus for the first time brought before them. Professor Agassiz, who was also present at this meeting, named one of the fishes which had been described by Mr. Miller *Perrinites Milleri*, after its discoverer. These papers were afterwards published in a volume, 'The Old Red Sandstone, or New Walks in an Old Field.' This work is written in a style remarkably pleasing, and treats of the great facts of geology in a peculiarly attractive manner. It has had a very large sale, and still remains one of the most popular works on geology in the English language. Its scientific merit consists in the description of a number of new fossil forms of animals belonging to a formation which had, up to the time of its publication, been regarded as almost destitute of the remains of animal life.

Hitherto Mr. Miller had never visited England. He now made a journey to London, and with pen in hand made notes of what he saw and felt. These notes he published on his return under the title of 'First Impressions of England and its People.' This work has also had a very considerable circulation. An anonymous work entitled, 'Vestiges of the Natural History of Creation,' was published in 1844, which excited much attention, and not least in the religious world. The discovery of a fish and a plant in the old red sandstone furnished Mr. Miller with arguments against the views of the author of the 'Vestiges.' These he embodied in a work entitled 'Footprints of the Creator, or the Asterolepis of Stromness.' It embraced a general view of the natural history of creation, and is regarded as an able exposition of the views of geologists on the interesting points to which it is devoted. Like the author's other works it has had a large circulation.

Mr. Miller has also published other works and papers on geology. In 1848 he published 'The Geology of the Bass.' At the meeting of the British Association at Edinburgh in 1850 he read a paper on 'certain peculiarities of structure in some ancient Ganoids (Fishes).' At the meeting of the Association at Glasgow in 1855 he gave an elaborate account of the Fossil Flora of Scotland. He has also

lectured in Edinburgh and London on geological subjects. Mr. Miller's death was sudden and very startling. On the morning of the 24th of December 1856 he was found dead in his room, shot through the body, and under circumstances which left no doubt that he died by his own hand. He had been latterly engaged, in addition to his editorial labours, at a work, to be called 'The Testimony of the Rocks,' and his brain, already diseased, had become strongly excited. An old habit, that of sleep-walking, had returned upon him. He had, through fear of robbers, kept a loaded pistol in his room; and with this pistol, in a paroxysm of his disease, he put an end to his life.

His death caused a most painful excitement. Few men have occupied a higher position in the estimation of his countrymen. He was a noble example of what self-education can do for a man, and whether regarded as the fearless and independent writer, or the man of literature and science, his character must claim the respect and admiration of posterity.

MILLER, JOHN MARTIN, a novelist, whose productions made a great sensation in Germany in the last century, was born December 2, 1750, at Ulm, where his father was preacher in the cathedral and professor of Oriental languages. At Göttingen, where he went to study theology in 1770, John Martin Miller became acquainted with Voss, Holty, Bürger, the two Stolbergs, and other eminent literary characters of the time, and afterwards with Klopstock, whom he accompanied on his return to Hamburg. After taking orders, he was appointed preacher at the cathedral of his native town in 1783, and in 1797 professor of theology at the Gymnasium. In 1810 the king of Wirtemberg bestowed the deanery of Ulm on him; but he did not live to enjoy it many years, for he died on the 21st of June 1814.

Although now almost forgotten, his romance of 'Siegwart' (first published in 2 vols., 1776, shortly afterwards greatly enlarged, and in many parts rewritten) had astonishing success. It called forth a host of imitators, and had also the distinction of being parodied. It was translated into French, Polish, Dutch, Danish, and Italian. Like his 'Siegwart,' his 'Karl von Burgheim' and other novels have little action or interest of story, but are distinguished by pure morality and an amiable though exaggerated sensibility. This excess of sensibility and sentiment, which however was merely caricatured by his professed imitators, qualified him well for an elegiac and lyric poet; and his productions of that class are distinguished by the tenderness and religious feeling which they breathe. His sermons are likewise compositions of no ordinary merit, attractive in style, eloquent, and impressive.

In his personal character he is said to have been rather cold and reserved, and therefore disappointed many who expected to find in the author of 'Siegwart' an impassioned enthusiast. His romances may be forgotten, but his poems will preserve his name.

MILLER, SIR THOMAS, BARONET, second son of Mr. William Miller, writer to the signet, was born in 1718, and was admitted advocate at the Scottish bar in February 1742. In 1748 he was constituted steward (or sheriff) of Kirkcudbright, and the same year elected joint-principal clerk of the city of Glasgow. These offices he resigned in 1755, being then appointed solicitor to the excise in Scotland. In March 1759 he was made king's solicitor-general: in April of next year he was advanced to be lord-advocate, soon after which he was returned to parliament. In November 1762 he was chosen rector of Glasgow College. He continued in the post of lord-advocate till April 1766, when he was raised to the bench of the court of session, and succeeded Sir Gilbert Elliot, lord-justice-clerk, deceased; on which occasion he took his seat, by desire of the court, on the right hand of the lord-president; and thence, on Dundas's death, he was, in January 1788, elevated to the presidency of the court of session, being the first lord-justice-clerk so promoted. The following month he was created a baronet. He died the 27th of September 1789, leaving behind a high character for legal attainments, judicial worth, and general probity.

\* MILLER, WILLIAM ALLEN, born at Ipswich in Suffolk, on the 17th of December 1817, was carefully instructed during his early years by his mother (from whom he gained the rudiments of the Latin tongue, and an early facility in reading and understanding the French language), and was afterwards sent to Merchant Taylors' School, whence he was transferred at the expiration of a twelvemonth to the school of the Society of Friends at Ackworth in Yorkshire, where he remained two years. It was at this institution that he first acquired a taste for scientific pursuits, chiefly owing to occasional glimpses through a telescope afforded him by one of the masters, and by a course of elementary lectures on Chemistry given by the same gentleman to some of the elder boys. On leaving Ackworth, young Miller pursued his classical and mathematical studies for some time under private tuition. At the age of fifteen he was apprenticed to his uncle, who was at that time surgeon to the General Hospital, Birmingham. Here he studied for the medical profession during nearly five years, at the expiration of which period he was entered in the medical department of King's College, London. Bringing with him some previous knowledge of the manipulations of chemistry, he was enabled to assist the late Dr. Daniell, professor of chemistry at King's College, in preparing his experiments during the temporary indisposition of his

assistant. The introduction thus afforded was the turning-point in the scientific career of the young student. Dr. Daniell admitted him to his laboratory, and soon became his kindest and most valued friend. Under these favourable auspices, Mr. Miller successfully pursued his chemical and scientific education; proving also that he did not neglect the higher studies by carrying off the Warnford prize for 1839, an endowment for the encouragement of theological studies among medical students.

During the summer of 1840 Mr. Miller visited Germany, and passed a few weeks in the laboratory of Liebig at Giessen. In the same year a new office was instituted at King's College, that of Demonstrator of Chemistry, and Mr. Miller was invited to accept it. In this capacity he rendered essential assistance to Professor Daniell by giving a part of his course of lectures during his severe indisposition in 1841. About this time Mr. Miller took his degree as Doctor of Medicine in the University of London. From that period until the death of the professor in 1845, Dr. Miller continued to take part of the lectures, and otherwise to assist his friend. He aided in chemical researches upon the building-stones used for the Houses of Parliament, and conducted the various experiments required in their joint investigations upon the Electrolysis of Saline Compounds. A paper embodying these investigations was published by them conjointly in the 'Philosophical Transactions' for 1844. On the death of Professor Daniell, in 1845, Dr. Miller was appointed to the vacant chair of Chemistry in King's College. In the same year he read a paper before the British Association on the fixed lines of the Prismatic Spectrum, which was published in the 'Philosophical Magazine' for that year. In 1851 he was appointed one of the government commissioners to report on the water supply of the metropolis, and one of the assayers to her Majesty's Mint. From time to time Dr. Miller has furnished papers to the British Association; but his principal work—which is in three parts, and which reached a third edition in 1863—is entitled 'Elements of Chemistry, Theoretical and Practical.'

Dr. Miller holds the offices of President of the Chemical Society, Vice-President of the Royal Society, Honorary Fellow of King's College and of the Pharmaceutical Society, and Assayer to the Mint and to the Bank of England.

\*MILLER, WILLIAM HALLOWS, M.A., F.R.S., an eminent physicist, crystallographer, and mineralogist, Professor of Mineralogy in the University of Cambridge, was educated at St. John's College, and took his B.A. degree in 1826, afterwards becoming a fellow and tutor of his college. In 1832 he succeeded Mr. Whewell in the chair of mineralogy, and in 1838 was elected a Fellow of the Royal Society. He is also one of the leading Fellows of the Cambridge Philosophical Society, of which, after filling the office of one of the secretaries for some years, he has since become a vice-president. One of Professor Miller's most important contributions to physics is the subject of a paper 'On Spurious Rainbows,' in the seventh volume of the 'Transactions' of the society last named, being one of the recent investigations by which the theory of the rainbow has been brought to its actual state of apparent perfection. Mr. Airy having previously determined the relative distances of the brightest parts of the first spurious bow, and of the first and second dark rings, from the geometrical place of the bow, by calculations founded on the undulatory theory of light, Professor Miller in this paper compares these results with observation, employing M. Babinet's method of artificially exhibiting rainbows, and the accompanying spurious bows. He finds that the differences between theory and observation are not greater than might reasonably be expected.

The same work contains also the following papers by Professor Miller on subjects of crystallography and mineralogy: 'On the Crystals of Boracic Acid,' &c., vol. iii.; 'On Crystals found in Slags,' *ibid*; 'On the position of the Axes of Optical Elasticity in Crystals belonging to the Oblique-prismatic System,' two papers, vols. v. and vii. In the first of these two papers he described and adopted, we believe for the first time in this country, the method of representing crystalline forms by their spheres of projection, first employed by Professor Neumann of Königsberg, and afterwards by Grassmann and Uhde. Each diagram of a crystal is the representation of a sphere, to the surface of which the faces of the crystal are referred by means of perpendiculars drawn from the centre of the sphere. It has the advantage of exhibiting all the faces of a crystal without confusion in one figure, and also of allowing all the requisite calculations to be performed by spherical trigonometry. Professor Miller has continued to employ the same method in his subsequent works. Although the reflective goniometer is an English invention, and was produced by Dr. Wollaston more than forty years ago, the number of physical inquirers,—even of professed mineralogists,—who are accustomed to its use in the measurement of the angles of crystals is still very small. On this account Professor Miller, who is skilled in this branch of practical crystallography, is frequently applied to by geologists, chemists, and others, to identify minerals which have occurred to them, or measure and describe crystals of salts and other chemical bodies that have been formed in their laboratories. The results will be found in papers published by him in the Third Series of the 'Philosophical Magazine,' and in memoirs by various authors, contained in the journals of societies and other collections.

Professor Miller has produced, in conjunction with Mr. Henry J.

Brooke, perhaps the most philosophically valuable treatise on Mineralogy in the English language, being a new edition, published in 1852, of the 'Elementary Introduction' to that science, by the late William Phillips, F.R.S. [PHILLIPS, WILLIAM.] In the preface Mr. Brooke states, with characteristic candour, that with the exception of information relative to many minerals derived from his long acquaintance with them, and the supply of specimens and crystals for re-examination, this treatise has been composed and arranged entirely by Professor Miller, Mr. Phillips's work having been entirely reconstructed by him. It is superfluous to remark, that the latest observations and discoveries have been introduced; but it is proper to notice, that while, in other mineralogical treatises it has been the practice to omit nearly all the optical characters of minerals, except those of colour and lustre, this work is advantageously distinguished by an account of the characters and phenomena which depend upon refraction and polarisation, and by many notices of the curious properties they confer upon individual minerals. To make this addition to descriptive mineralogy, the physical pursuits of Professor Miller had eminently qualified him.

An important part has been taken by Professor Miller in the restoration of the standards of weight and measure, which became requisite on the destruction of the national standards by the fire which destroyed the houses of parliament in 1834; and the subsequent construction and verification of the new parliamentary standard of weight has been entirely effected by him. In 1838 a Commission was appointed to consider the steps to be taken for the restoration of the standards. The members received propositions and suggestions from various other men of science and persons engaged in business, including the subject of this article, whose views were stated in an elaborate letter addressed to the Astronomer Royal. A series of connected extracts from this letter, comprising apparently nearly the whole, was printed for official use in a quarto volume in 1840, and laid before parliament in the succeeding year. The observations and recommendations relative to the intended standards which are offered in these extracts are of a very refined and philosophical character, indicating also in the remarks on the metals and other substances proposed to be used in their construction, the knowledge arising from the habits of minute attention to the physical properties of bodies acquired by the study of minerals.

On the subject of the substitution of arbitrary, that is of artificially selected and defined standards of weight, measure, and other physical properties, for the natural standards originally suggested by the genius of Wren and Mouton, and some of their associates, and which, in modern times, it had been supposed might be defined with indefeasible exactitude,—but the use of which again, the refined investigations of a more recent period have shown to be fallacious—Professor Miller is distinguished from other men of science of the present day by a view, which, we believe, is peculiarly his own, uniting a reference to natural elements with their definition by actual observation, using for that purpose experimental facts, not ideal relations which cannot be realised. He urges that the standard of length, for example, might be compared with some distance existing in nature, of which the length of the seconds' pendulum he thinks is probably much the best, but that the length should be expressed in terms of the length of an actual pendulum, swinging seconds in air at a given temperature, pressure, &c., on a given spot, "not in terms of an imaginary pendulum, in absolute vacuo, at the level of the sea &c., circumstances in which the observations cannot be made, and to which the observations cannot be reduced, on account of our imperfect knowledge of the 'constants of nature,' on which the reductions depend." But in some respects Professor Miller goes further than others in rejecting imaginary standards, for he would also put aside 'standard temperature and pressure' as being, not the virtual constants they are assumed to be, but pernicious fictions.

On the 20th of June 1843, a Commission, consisting, with certain changes and additions, of the same scientific men as the previous Commission for the restoration of the standards, was appointed, by the Lords of the Treasury, to superintend the construction of new parliamentary standards of length and weight. Of this Professor Miller was a member, and undertook, at the request of the First Lord, the construction of the standard of weight; the late Mr. F. Baily [BAILY, FRANCIS] having at the same time undertaken the construction of the standard of length. The Commissioners, in the minute of their first meeting, July 11, 1843, state that they "had the highest satisfaction in recognising the fitness of these gentlemen, by their talents, their knowledge of the subjects, and their habitual accuracy, to undertake the tasks assigned to them." In their report of March 1854 they state that the actual work of forming the standard of weight has accordingly been brought to its termination by Professor Miller. For this standard platinum was adopted, and of the form, a cylinder having a groove near the top for convenience of lifting, recommended by Professor Miller. "For the comparison of weights, Professor Miller procured from Mr. Barrow a balance of the utmost delicacy. This instrument was mounted in a cellar beneath the Mineralogical Museum at Cambridge, and there all the operations of weighing the representatives of the lost Standard, the New Primary Standard, and the copy of the French Standard, were performed." Of the materials for restoration of the values of the old or lost standards, being weights which had been compared with the lost Imperial Troy pound standard, the brass pounds had gained in weight, no

doubt from oxidation, while the platinum pounds were found to be unaltered. Professor Miller therefore decided, with the approval of the Commissioners, to base his restoration of the standard pound on the platinum pounds only.

The practical results of the operations thus conducted will be found in the Commissioners' Report of March 28, 1854, already cited; and on the 24th of April last (1856) the first part of a paper by Professor Miller, 'On the Construction of the Imperial Standard Pound, and its Copies of Platinum; and on the Comparison of the Imperial Standard Pound with the Kilogramme des Archives,' was read before the Royal Society. An abstract of it has appeared in the 'Proceedings,' vol. viii., and the paper itself will doubtless be published in the 'Philosophical Transactions.' This paper contains the whole of the particulars of the weighings required to effect the object; and the series of operations described, especially those of weighing itself, for patient attention, care and delicacy of manipulation, and the exquisite adaptation to the object, of the resources of science, the knowledge of the philosopher and the skill of workmen, are perhaps unrivalled in the history of science.

Professor Miller accordingly prepared a Troy pound, by the use of the old platinum pounds, representing, with all the accuracy commanded by the process of weighing adopted, but with a very small assigned error, the weight in air (which may be considered as the commercial weight) of the lost standard. By means of this, five platinum avoirdupois pounds, or pounds of 7000 grains, were prepared. One of these, marked PS 1844 1lb., being compared with the representative of the Troy pound, it was found that in air of the temperature 65.66 Fabr., under the pressure of 29.750 inches of mercury,  $PS = 0.6341$  grain +  $\frac{1}{1000}$  × lost standard; and this may be considered as the commercial weight of PS. Or, assuming that PS and the lost standard are compared in vacuo,  $PS = 7000.000238$  grains, of which the lost standard contained 5760; which may be considered as the philosophical weight of PS. The commissioners finally recommended that PS should be adopted as the parliamentary standard of one pound, which it was shortly afterwards declared by the legislature to be, in the statute 18 & 19 Vict., cap. lxxii. The other four pounds, of which that which varies least from PS exceeds it in weight only 52 ten-thousandths of a grain, while that which varies most from it is deficient in weight only 314 ten-thousandths of a grain, have been adopted by the same authority as parliamentary copies. PS is deposited in the office of the Exchequer at Westminster. Professor Miller has since been engaged in the preparation of thirty secondary copies of the pound, and in preparing the 10 lbs. weight, the various Troy weights, and the kilogramme.

MILLES, JEREMIAH, dean of Exeter, was the son of Jeremiah Miles, and nephew to Dr. Thomas Miles, bishop of Waterford and Lismore. Bishop Miles left his fortune to his nephew Jeremiah, who was born in 1714, and educated at Eton. He afterwards went to Corpus Christi College, Oxford, where he took the degree of M.A. in 1735, and that of D.D. in 1747. His uncle collated him to a prebend in the cathedral of Waterford, and presented him to a living near that city, which he held but a short time, choosing to reside in England. Upon his return he married Edith, the daughter of Archbishop Potter, through whose means he obtained the united rectories of St Edmund the King and St Nicholas Acon, in Lombard-street, with that of Merstham in Surrey, and the sinecure rectory of West Tarring in Sussex. In 1762 Dr. Miles was nominated to the deanery of Exeter, on the advancement of Dr. Charles Lytton to the see of Carlisle, whom he also succeeded as President of the Society of Antiquaries in 1769. In the 'Archæologia' are several communications by him—particularly one entitled 'Observations on the Wardrobe Account of the Year 1483, wherein are contained the Deliveries made for the Coronation of King Richard the Third, and some other particulars relating to that Monarch;' and another ('Archæol.' vol. iv. pp. 331-346), in which he joined the Abbé Barthélemy in denying the genuineness of the Apamean medal. Mr. Gough informs us that, while dean of Exeter, he formed a large collection of materials for the 'History of Devonshire.' His most unsuccessful literary attempt was to vindicate the authenticity of Rowley's Poems, in an edition which he printed, in 4to, in 1782. The dean died February 18, 1784.

MILLIN, AUBIN-LOUIS, an eminent French antiquary, who succeeded Barthélemy as keeper of the antiquities and medals in the Royal Library at Paris, was born in 1759. His 'Dictionnaire des Beaux Arts,' 'Dictionnaire de la Fable,' 'Monumens Antiques,' and 'Galérie Mythologique,' are all useful contributions towards archaeology and the fine arts. Besides these works, his 'Magasin Encyclopédique,' which he carried on for twenty years without seeking any profit from it, was a highly valuable literary journal, and may now be regarded as a repository containing much important information. To the above may be added his 'Voyage dans les Départemens du Midi de la France,' 'Voyage dans la Savoie,' and 'Voyage dans le Milanais.' These works possess a permanent interest on account of the historical and antiquarian matter which they contain. He died August 14th, 1818.

MILLINGEN, JAMES, an eminent English archæologist, was born in London, on the 18th of January 1774. His father, who was a Dutch merchant, placed him at an early age at Westminster School; the boy showed a great partiality to everything connected with ancient

coins, having frequent opportunities of seeing a good collection in the house of one of his father's friends. His principal study in his leisure hours was the science of war, and he was anxious to enter the army in the engineer department; but as he was suffering from asthma, his father determined to send him from Westminster to one of the universities. However, the French revolution, which broke out at the time, changed his plans; for Millingen's father, an enthusiastic admirer of liberty, which seemed to dawn upon Europe, and to have chosen France as its favoured abode, went to reside at Paris, where his son James was received as a clerk in a banking-house. But as his new pursuits were not to his taste, he devoted all his leisure hours in the study of such works as Vaillant, Beauvois, Pinkerton, and Polybius; and his savings were spent in the purchase of ancient coins, of models of cannon, pontoons, and other matériel of war, until after some time he obtained an employment better suited to his pursuits, and was appointed to the mint. In this capacity he became acquainted with several men of distinction and archæologists, among whom we may notice the Abbé Barthélemy, brother of the well-known author of the 'Voyage du Jeune Anacharsis en Grèce,' the geographer Barbé du Bocage, Walckenaer, D'Aumont, and others. The happy days which he spent in such company however were not of long duration, for when the National Convention ordered the confinement of every British subject until the peace, the young archæologist was arrested in the dead of night and conveyed to prison. His father, being a Dutchman, escaped incarceration, but he was ordered to quit Paris under the surveillance of the police. In the Prison des Ecoles, James Millingen became acquainted with Charles Este and Sir Robert Smith, who, after their liberation, established a banking-house at Paris, in which James Millingen became a partner. Shortly afterwards an event occurred which opened to Millingen a wide field of speculation. Some labourers, who were working in a field near Abbeville, discovered a Roman entrenchment, and dug up several earthen vessels filled with gold coins of Roman emperors down to Septimius Severus, Caracalla, and Geta; most of them were in a most excellent state of preservation, and some were extremely scarce. Millingen purchased them at the value of their weight, and soon after disposed of them in France and England to great advantage. From various circumstances the house in which Millingen was a partner failed, and he was thus thrown upon his own resources. His perfect knowledge of coins and the relics of ancient art had in the meantime made his name known throughout Europe, and he would now have returned to England, but his asthmatic constitution rendered it necessary for him to reside in a southern climate, where he enjoyed comparative good health. During the last twenty-four years of his life he resided in Italy, at first in Rome and Naples, but latterly his permanent abode was Florence. He made occasional visits to Paris and London, where his arrival was always hailed by archæologists, as he was always the bearer of some precious relic of ancient art. In 1846 he resolved to return to England, with a view of settling in London, when he was attacked by a severe catarrhal affection. At first he thought little of his illness, and wrote several letters even the day before his death, but on the 1st of October he died without a struggle, at the age of seventy-two, more from the effect of exhaustion than of disease.

What Millingen has done for practical archæology is of the highest importance, for there scarcely ever was a man of such experience, tact, and critical sagacity in antiquarian matters. The amount of knowledge which he possessed was a treasure which will not soon be found in one person. The following is a list of Millingen's works:—1, 'Recueil de Quelques Médailles Grecques inédites,' 4to, Rome, 1812; 2, 'Peintures Antiques inédites de Vases Grecs,' large folio, Rome, 1813, with 63 plates; 3, 'Medallic History of Napoleon,' 4to, London, 1819, to which a supplement was published in 1822, with 74 plates: the same work was also published by the author in French; 4, 'Ancient Coins of Greek Cities and Kings,' 4to, London, 1821, with figures; 5, 'Ancient unedited Monuments of Grecian Art,' 2 vols. 4to, London, 1822 and 1826; 6, 'Remarks on the State of Learning and the Fine Arts in Great Britain,' 8vo, London, 1831; 7, 'Sylogæ of Ancient Unedited Coins,' 4to, London, 1837, with figures; 8, 'Considérations sur la Numismatique de l'Ancienne Italie,' and a supplement, Florence, 1841 and 1844, with two plates. Besides these greater works, there are a considerable number of essays on antiquarian subjects by Millingen, in the 'Annali' and the 'Bulletino' of the Archæological Institute of Rome, and in the 'Transactions' of the Royal Society of Literature of London.

(Classical Museum, part xi. p. 91, &c.)

MILMAN, REV. HENRY HART, D.D., Dean of St. Paul's Cathedral, was born February 10, 1791, in London. He is the youngest son of Sir Francis Milman, 1st baronet, who was physician to George III., and is brother to Sir William George Milman. He was educated at Dr. Burney's academy at Greenwich, at Eton College, and at Brasenose College, Oxford, where he took his degrees of B.A. and M.A., and of which he was elected a fellow. In 1812 he received the Newdegate prize for his English poem on the Apollo Belvedere. In 1815 he published 'Fazio, a Tragedy,' which was performed with success at Covent Garden Theatre, at a period when theatrical managers seized upon a published play, and produced it without an author's consent. Mr. Milman could not even enforce the proper pronunciation of the name of 'Fazio.' He took holy orders in 1817, and was appointed vicar of St. Mary's,

Reading. In the early part of 1818 he published 'Samor, Lord of the Bright City, an Heroic Poem,' of which a second edition was called for in the course of the same year. The hero of this poem is a personage of the legendary history of Britain in the early part of the Saxon invasions of England. The fullest account of his exploits is given in Dugdale's 'Baronage,' under his title of Earl of Gloucester. Harrison, in the 'Description of Britain' prefixed to Holinshed's 'Chronicle,' calls him Eldulph de Samor. The Bright City is Gloucester (Caer Gloew in British). In 1820 Mr. Milman published 'The Fall of Jerusalem,' a dramatic poem, founded on Josephus's narrative of the siege of the sacred city. This, in some respects his most beautiful poem, established his reputation. In 1821 he was elected Professor of Poetry to the University of Oxford, and published three other dramatic poems, 'The Martyr of Antioch,' 'Belshazzar,' and 'Anne Boleyn.' In 1827 he published 'Sermons at the Bampton Lecture,' 8vo, and in 1829, without his name, 'The History of the Jews,' 8 vols. 18mo. A collected edition of his 'Poetical Works' was published in 1840, which besides the works above mentioned and his smaller poems, contains the 'Nala and Damayanti,' translated from the Sanskrit. In the same year he published his 'History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire,' 3 vols. 8vo, in which he professes to view Christianity as a historian, in its moral, social, and political influences, referring to its doctrines no further than is necessary for explaining the general effect of the system. It is the work of an accomplished and liberal-minded scholar. At the commencement of 1849 appeared 'The Works of Quintus Horatius Flaccus, illustrated chiefly from the Remains of Ancient Art, with a Life by the Rev. H. H. Milman,' 8vo, a beautiful and luxurious edition. Mr. Milman's 'Life of Horace' and critical remarks on the merits of the Roman poet are written with much elegance of style, and are very interesting.

In November 1849 Mr. Milman, who had for some years been rector of St. Margaret's, Westminster, and a canon of Westminster, was made dean of St. Paul's. Dean Milman's latest publication is the 'History of Latin Christianity, including that of the Popes to the Pontificate of Nicholas V.,' 8 vols. 8vo, 1854. This work is a continuation of the author's 'History of Christianity,' and yet is in itself a complete work. To give it that completeness he has gone over the history of Christianity in Rome during the first four centuries. The author states that he is occupied with the continuation of the history down to the close of the pontificate of Nicholas V., that is, to 1455. Besides the works before-mentioned, Dean Milman is understood to have contributed numerous articles to the 'Quarterly Review,' and his edition of Gibbon's 'Decline and Fall of the Roman Empire' presented the great historian with more ample illustrations than he had before received. This edition has been republished, with additional notes and verifications by Dr. W. Smith.

MILNE, JOSHUA, an eminent actuary, was born in 1776. He received a good education, became particularly skillful in mathematics, and acquired an extensive knowledge of languages. When about forty years of age he was appointed actuary of the Sun Life Assurance office, a situation which he held for upwards of thirty years. His 'Treatise on Annuities,' published in 1815 in 2 vols. 8vo, is one of the universally-acknowledged authorities on the subject of life insurance, for the calculations of which he invented and described a new system of notation. Mr. Milne had also paid some attention to botany, and was said to have possessed one of the best botanical libraries in London. His uniform courtesy gained him general esteem, and his information and assistance were readily given wherever they might serve a useful purpose. He died on January 4, 1851, having unfortunately become mentally incapacitated a few years earlier.

MILNE-EDWARDS, HENRI. [See EDWARDS, HENRI-MILNE, vol. vi., col. 993.]

MILNER, ISAAC, Dean of Carlisle, and younger brother of Joseph Milner, was born in 1751. At the age of six he began to accompany his brother to the grammar-school at Leeds; but at his father's death his studies were interrupted, and he was employed in learning the woollen manufactory at Leeds. When Joseph Milner was appointed head-master of the Grammar school at Hull, he released his brother from his engagements at Leeds, and took him under his own tuition, employing him as his assistant in teaching the younger boys. In his life of his brother the dean expresses his sense of this act of kindness with an affectionate warmth which shows the attachment that existed between the brothers, and is equally creditable to the feelings of both. In 1770 Isaac Milner entered Queen's College, Cambridge, where he took his degree of B.A. in 1774, and was senior wrangler. In 1775 he was elected Fellow of Queen's College, and in 1788 Jacksonian Professor of Experimental Philosophy; in 1788 he took his degree of D.D., and was elected Master of Queen's College; and in 1798 he was appointed Lucasian Professor of Mathematics. In 1791 he was appointed Dean of Carlisle. He was twice Vice-Chancellor, in 1792 and 1809. At Cambridge he formed a close friendship with the late Mr. Wilberforce, by whom he was introduced to Mr. Pitt; and in company with those eminent men he made a tour on the continent about the year 1787. He died at the house of Mr. Wilberforce, on the 1st of April 1820.

Dean Milner was possessed of very extensive and accurate learning, which he always had at his command. He had great talents for conversation, and a dignified simplicity of manner. His religious and political principles agreed pretty closely with his brother's. He wrote

the following works, besides several scientific papers in the 'Philosophical Transactions,' and the continuation of his brother's 'Church History':—'Animadversions on Dr. Haweis's History of the Church of Christ'; 'Strictures on some of the Publications of the Rev. Herbert Marsh, intended as a Reply to some of his Objections against the Bible Society.' The following were published after his death:—'Sermons,' 2 vols.; 'Essay on Human Liberty.'

MILNER, JOSEPH, the elder brother of the preceding, was born in the neighbourhood of Leeds, on the 2nd of January 1744. He was sent to the Grammar school at Leeds, where, by his industry and talents, among which a memory of most extraordinary power was conspicuous, he gained the warm regard of his instructor, the Rev. Mr. Moore, who resolved to have him sent to college. This plan was nearly frustrated by the death of Milner's father in very narrow circumstances; but by the assistance of some gentlemen in Leeds, whose children Milner had lately engaged in teaching, and by the offer of the office of chapel-clerk at Catherine Hall, Cambridge, he was enabled to enter that hall at the age of eighteen. In the year 1766 he took his degree of B.A., and gained the chancellor's second gold medal for classical knowledge. He now became assistant in the school, and afterwards the curate of the Rev. Mr. Atkinson, of Thorp Arch, near Tadcaster. Here he proceeded in the composition of an epic poem, entitled 'Davideis,' which he had commenced at Cambridge, and which he afterwards finished at Hull. It was submitted to Dr. (afterwards bishop) Hurd, who highly complimented the author on the talent it displayed, but advised him to defer its publication. Not long after he had obtained deacon's orders, Milner was elected head-master of the Grammar school, and afternoon lecturer of the principal church of Hull. The school increased under his care. He not only introduced his younger brother to those literary pursuits in which he was afterwards distinguished [MILNER, ISAAC], but he also took his mother and two orphan children of his elder brother to live with him. About the year 1770 he embraced the sentiments of the evangelical party in the Church of England. This change in his religious views brought upon him neglect, and in some cases open opposition from many among the upper classes who had once been his admirers and friends; but his church was soon crowded with others, chiefly from the lower orders of the people, in whose sentiments and manners his preaching produced a striking change; and at length he not only recovered the esteem of his fellow-townsmen, but lived to see his own religious sentiments become so popular in the town that many of the pulpits of the churches were filled by his friends and pupils, and he himself was chosen vicar of Hull by the mayor and corporation. His election took place only a few weeks before his death, which happened on the 15th of November 1797, in the fifty-fourth year of his age. For seventeen years before his death he had been vicar of North Ferriby, near Hull. A monument, executed by Bacon, was erected to his memory in the high church of Hull by several gentlemen who had been his pupils.

The excellences of Mr. Milner's personal character were of the highest order. He was deeply pious, upright in all his conduct, singularly open and sincere, and kind, cheerful, and amusing in social life. In his political principles he was strongly attached to the established order of things in church and state.

The work by which he is best known is the 'History of the Church of Christ,' which was commenced by himself and completed by his brother, the dean of Carlisle, and which extends from the rise of Christianity to the Reformation. The first edition of this work appeared in 5 vols. 8vo, 1794 to 1812, and a second edition in 1810. It has been more than once reprinted. The plan of the history is thus stated in the author's Introduction: after stating that in all ages of the church there have existed "men who have been real, not merely nominal Christians," he proceeds:—"It is the history of these men which I propose to write. It is of no consequence with respect to my plan, nor of much importance, I believe, in its own nature, to what external church they belonged. I intend not to enter with any nicety into an account of their rites and ceremonies, or forms of church-government, much less into their secular history. Even religious controversies shall be omitted, except those which seem to bear a relation to the essence of Christ's religion, and of which the history of his real church requires some account. Let not the reader expect that the actions of great men (great in a secular view, I mean) will be exhibited to his notice. Nothing but what appears to me to belong to Christ's kingdom shall be admitted: genuine piety is the only thing which I intend to celebrate." It is manifest that on this plan no complete church history can be written. Such a work ought assuredly to record the religious opinions and practices which have at any time prevailed among any of those who profess the Christian faith; leaving the reader to conclude, from these materials, which parties have been right and which wrong. But on Milner's plan we have avowedly the history of only one class of opinions, and the choice of this class is determined solely by their agreement with the sentiments of the author. Now, to say nothing of the temptation to do violence to facts, or to lean with too implicit and uncritical dependence on one particular class of authorities, to which an author is exposed who is determined to trace the existence of certain principles in all ages of the church, it is clear that, writing on this plan, two ecclesiastical historians of opposite creeds would produce works containing very

different sets of facts, but each professing to be a 'History of the Church of Christ.' Though, for these reasons, Milner's work cannot be called a complete church history, its value as a contribution to church history is very considerable; but that even as a contribution it must be read with much caution may be seen by a reference to Dr. Maitland's 'Strictures on Milner's Church History,' and his 'Notes on Milner's History,' &c. The Church History is written in that spirit of piety, and of deep interest in what the author believes to be true religion, which is not always found in our celebrated church historians; and for the very reasons which prevent its being complete, it contains many facts which had previously been little attended to. It surpasses most other church histories in the use made of the writings of the Fathers, though the reverence which the author professes for those venerable men has led him to trust them too much.

The other works of Milner are,—1, 'Gibbon's account of Christianity considered; together with some Strictures on Hume's Dialogues concerning Natural Religion.' 2, 'Some Passages in the Life of William Howard.' 3, 'Essays on the Influence of the Holy Spirit.' 4, 'Tracts and Essays, Theological and Historical.' 5, 'Practical Sermons; with an Account of his Life, by the Dean of Carlisle,' 2 vols. A complete collection of his works was edited by the Dean of Carlisle, 8 vols., 1810.

\* MILNES, RICHARD MONCKTON, M.P., was born in 1809, and is the eldest son of Robert Pemberton Milnes, Esq., of Frystone Hall and Bawtry, Yorkshire, by the Hon. Henrietta Maria, daughter of the fourth Viscount Galway, from whom Mr. Milnes derives the name of Monckton. Mr. Milnes was educated at Cambridge, where he graduated M.A. in 1831. He has secured an honourable position alike in the world of politics and of literature. From his first election in 1837, as member for Pontefract—which place he still represents—Mr. Milnes has pursued an independent course as a member of the lower house. Ranking among the party commonly known as liberal Conservatives, he has never hesitated about quitting them on particular questions when he thought a different line of policy preferable to that which they supported; while, "outside the house," his exertions in various matters of public policy and benevolence have led him to co-operate actively with many prominent men in politics and literature belonging to widely different parties to that of which he calls himself a member. Mr. Milnes has always been a steady and earnest supporter of popular education, and of perfect religious equality; and he has taken a great interest in all sanitary and other measures which seemed likely to improve the health and comfort of the masses. Recently he has strongly advocated measures for the reformation of the criminal population. Mr. Milnes has also taken an active interest in questions relating to continental politics, and particularly in those which have reference to the Italian states and people; and he has both spoken and written with much effect on most of these subjects.

As an author he first made himself known by his 'Memorials of a Tour in Greece,' but he is now chiefly recognised as a poet, and the biographer of a poet. His 'Poems' have been published in four volumes—'Poems of Many Years,' 'Memorials of Many Scenes,' 'Poems Legendary and Historical,' and 'Palm Leaves.' They are contemplative in character; marked by grace and fluency of diction; considerable imagination; and a high moral tone. His 'Life, Letters, and Literary Remains of John Keats,' published in 1848, is a worthy commemoration of the brief career of a man of genius; written with no stint'd appreciation of the genius of the poet and the worth of the man, but at the same time in a spirit of frank though kindly discrimination. Besides these Mr. Milnes has published several speeches and pamphlets (among others 'Thoughts on Party Politics,' 'Real Union of England and Ireland' and 'Events of 1848, especially in their Relation to Great Britain'); and he has contributed some articles to the 'Westminster Review,' and other periodicals. [See SUPPLEMENT, HOUGHTON, Rt. Hon. R. M. MILNES, BARON.]

MILONOV, MICHAEL, a Russian poet of considerable talent, and who, but for his premature death, would probably have risen to greater literary eminence, was born in 1792, and received his education at the University of Moscow, where he distinguished himself by his application and abilities. His poems, which were first published in a collective form in 1819, consist chiefly of satires, epistles, and various lyrical pieces, and display elevation of mind, acute thinking, and tender feeling. Among them are some translations and imitations from Horace, Schiller, and others. He died October 29, 1821.

MILTIADES (*Miltiades*) was the younger son of Cimon (who was sprung from a noble Athenian family), and nephew of the elder Miltiades, who, during the life of Pisistratus, had founded a tyranny, or arbitrary government, in the Chersonese. The elder Miltiades had been succeeded by Stesagoras, the elder son of Cimon, on whose death the young Miltiades succeeded to his place. The first important affair in which Miltiades appears is at that juncture, during the Scythian expedition of Darius, B.C. 513, when the Greek commanders who guarded the raft over the Danube debated whether they should not cut off the Persian king's retreat by breaking up the passage. Miltiades advised the destruction of the bridge, and although his opinion was over-ruled, it is not too much to suppose that his reason for advocating it was exactly that on which it was afterwards rejected. So shrewd a politician could hardly have failed to observe, that to annihilate the Persian power was, as Histæus suggested, tantamount to giving all the tyrants of individual cities their dismissal.

Twenty years afterwards, Miltiades was called upon to act a more important part. Hipparchus, one of the sons of Pisistratus, had fallen by the hands of Harmodius and Aristogiton; and Hippias, the other son, who had been driven from Athens chiefly by the aid of the Spartans, had retired, as Greeks both then and subsequently often did under similar circumstances, to the Persian court. In Ionia, the burning of Sardis was followed by a war which lasted for six years, in which each party seemed to have learned a lesson: the Persians, that their enemy was not altogether despicable; and the Greeks, that without unity of plan there was no hope of success.

In B.C. 492, Mardonius led the first Persian armament, which was dispersed by a storm in doubling the peninsula of Athos. In B.C. 490 a second armament, under Datis and Artaphernes, was sent against Greece. This force crossed to Naxos, and thence to Delos and Euboea. A few days sufficed to sweep through the island of Euboea, and the whole armament made for the coast of Attica. Guided by Hippias, who knew the capabilities of every spot of ground in his country, the army landed at Marathon. The plain of Marathon extends inwards from the sea to the mountains, where it is contracted into a narrow glen by the spurs of two hills, but spreads out beyond the base of these spurs and between them and the sea. It is roughly in the form of a T, the top stroke representing that part which borders on the sea, and the leg of the letter corresponding to the glen, which is divided lengthwise by a mountain stream. Through this glen lay the road to Athens, and on the eastern side of the hill the Athenian army posted itself.

According to custom, the army was under the direction of ten generals, each of whom took the command for one day in turn. One of the ten was Miltiades, who had just been acquitted on a charge of tyranny, more perhaps owing to the politic way in which he had used his power in the Chersonesus than to the real merits of his conduct. He had a powerful ally in the polemarch Callimachus, who by virtue of his office commanded the right wing, and had an equal vote with the ten generals. The votes of the generals being divided on the question of an engagement, Callimachus by his vote decided for fighting; and when the day of command came round to Miltiades, the battle took place.

The Persian army was much more numerous than that of the Greeks, who are generally reckoned at 10,000. In the centre of the Persian host were stationed their best soldiers, a precaution necessary in order to give some stability to an army composed of forty or fifty different tribes, but injurious inasmuch as it exposed them to the very manoeuvre which Miltiades practised, and with a view to which he apparently arranged his forces, so that the centre might be weak and the wings strong. The Persian centre broke that of the Greeks, and pursued them towards the hills; but in each wing the Athenians, who had charged at double-quick time, dispersed those who were opposed to them, wheeled round and routed the victorious Persians. This decided the battle. The vanquished perished in thousands, by the sword, in the marshes, and in attempting to embark on board their ships; and the Athenians and their allies, the Plataeans, were left completely masters of the field. Herodotus states 6400 as the number of the Persian dead, and 192 the number of the Athenians who fell. The tactics practised at this battle are worthy of remark, as being so completely opposed to the Dorian plan of preserving a close and impenetrable phalanx, and much more nearly allied to those of modern warfare. Perhaps no battle ever reflected more lustre on the successful commander than that of Marathon on Miltiades; though it should be observed that he, whom all ages have regarded as the defender of liberty, began his career as an arbitrary ruler, and on only one occasion in his whole life was engaged on the side of freedom; but for the same man to be the liberator of his own country and a despot in another is no inconsistency, as the course of human events has often shown.

The battle of Marathon put an end to the expedition headed by Datis and Artaphernes, and the career of Miltiades closed soon after. He appears next at Paros, to which he laid siege with seventy Athenian ships. The Parians defended themselves bravely, and, if we may believe Herodotus, Miltiades had recourse to magic, in the practice of which he received a wound, which, with general ill success, compelled a retreat. On his return, while yet suffering from a gangrene in the wound, he was accused, tried, and condemned for deceiving the people. The punishment was commuted for a fine; but being unable to pay it, he died in prison.

The character of Miltiades is one on which, with the few materials which history has left, we should not judge too exactly. The outline which remains is one that, if filled up, would seem fittest to contain the very model of a successful statesman in an age when the prime minister of Athens was likewise the leader of her armies. Heeren has briefly noticed the transition which took place in the character of Athenian statesmen from the warrior like Themistocles and Miltiades to the warlike rhetorician like Pericles, and thence to the orator, who to his rhetorical skill united no military prowess. Miltiades with great generalship showed great power as a statesman, and some, but not much, as an orator. This is agreeable to his age. Whether he was a true patriot, governed by high principle, it is now perhaps impossible to determine. He achieved one great action, which for his country produced a most decisive result. The unfortunate close of his career may be considered by some as showing the ingratitude of

democracies; but perhaps a judicious historian will draw no conclusion of the kind, especially with such imperfect materials before him as we possess for the life of this illustrious Athenian.

(See Herodotus, lib. v. vi.; Cornelius Nepos, whose biography of Miltiades is of no value; Plutarch; Thirlwall, *History of Greece*; and Clinton, *Fasts*; for the office of Strategus, Schömann and Meier, *Attische Process*; and for the topography of Marathon, Pausanias, Dodwell, and E. D. Clarke, *Travels*.)

MILTON, JOHN, son of John and Sarah Milton (the name is spelt Mylton in the baptismal register), was born December 9, 1608, at his father's house in Bread-street, London. He was of a good family, his father having been educated at Christchurch, Oxford, but was disinherited for turning Protestant. He was a man of great musical acquirements, and specimens of his composition are preserved in Burney's 'History of Music.'

Milton's education appears to have been sedulously conducted; first under a person of Puritan opinions named Young, who was master of Jesus College, Cambridge, during the Protectorate, and afterwards at St. Paul's School, under Alexander Gill. From St. Paul's he proceeded to Christ's College, Cambridge, where, as the College Register informs us, he was admitted, February 12, 1624. At the University he was distinguished for the peculiar excellence of his Latin verses, and, according to his own expression, met with "more than ordinary favour and respect" during the seven years of his stay there. It will be unnecessary here to go into the momentous question whether Milton was whipped at Cambridge, as asserted by Bishop Bramhall, Aubrey, and others. Dr. Johnson and Warton, as is well known, believe that he suffered that indignity; more recent writers think that there is small reason to admit the fact, and his latest biographer, Keightley, says that he "was quite beyond the whipping-age" when at Cambridge. What was then the whipping-age is however by no means clear, and there is no doubt that students far beyond the age of boyhood were in Milton's time whipped in the universities.

After having declined both the church and the bar, he retired to his father's house at Horton in Buckinghamshire, where, during a residence of five years, he read through the Greek and Latin writers ("evolvens Græcis Latinisque scriptoribus"), and, as it is supposed, wrote his 'Arcades,' 'Comus,' 'L'Allegro,' 'Il Penseroso,' and 'Lycidas.' Attempts have been made to fix the precise place where some of Milton's minor poems were written, by a reference to the descriptions of scenery contained in them. It appears to us that these attempts depend on a mistaken principle; that, namely, of assuming the poet's mind to be influenced in such matters by the scenery with which he is at the time familiar. Now that localities must affect a person who is writing descriptive poetry, no one will deny; but in purely imaginative poetry, like 'L'Allegro' or 'Il Penseroso,' we cannot attach any great weight to such considerations, particularly when the descriptions are so general, and when the describer is Milton.

In 1637, on the death of his mother, Milton travelled into Italy, visiting in succession Florence, Rome, Naples, and Venice, during which journey he was introduced to Grotius, to Galileo, and to Tasso's patron, Manso. While in Italy news reached him of the progress of the troubles in England. Relinquishing his original intention of prolonging his journey to Sicily and Greece, he returned, in 1639, and devoted himself to the education of his nephews, John and Edward Phillips, and to the politics of the day. Much has been said on his system: Dr. Johnson has sneered at it; and more modern authorities have caught at it in order to support a convenient theory, each perhaps without reflecting much on the subject. The tendency of his scheme was not to supply the then existing deficiency of instruction in the knowledge of nature, or to substitute some other treatise on such matters for the works of Aristotle, but to exchange, as quietly as possible, and at the same time as decidedly, the merely formal routine of classical teaching for one in which the books that were read might arouse thought as well as exercise memory. His list comprises almost all the technical treatises extant in Latin and Greek, but excludes history and almost all the better known books of poetry, probably because he only intended it for children, and postponed such subjects for the instruction or amusement of riper years. His aims were not those of a mathematician or the philosopher of nature; the state, not science, was in his view, and his object was to make, not good members of a university, but well-informed citizens. To this tend his eulogy of manly exercises and his plans for a common table, which could have had little importance in the eyes of a student.

In 1641 Milton began his political career by writing a treatise 'Of Reformation,' which was followed in the same year by those on 'Prætical Episcopacy,' 'The Reason of Church Government urged against Prelacy,' and some animadversions on a tract of Bishop Hall's, and in the next by 'An Apology for Smectymnuus.'

In 1643 he married his first wife, who was the daughter of a country gentleman of Oxfordshire. Not long afterwards his conjugal troubles began, by the refusal of his wife to return to him from a visit to her father. He accordingly repudiated her, and in 1644 and 1645 published four treatises in justification of his conduct. The former year is also remarkable as that in which he produced his 'Tractate on Education,' and that most able of all appeals, the 'Areopagitica,' or a

Speech for the liberty of Unlicensed Printing,' a work which contains in the same space more passages of surpassing eloquence than any other which proceeded from his own or from any other pen.

About this time Milton was reconciled to his wife, whose family had been reduced to distress by their devotion to the royal cause. His pen was silent until after the execution of Charles, when he produced a tract on 'The Tenure of Kings and Magistrates'; proving that it is lawful to call to account a tyrant or wicked king, &c. This was followed by 'Observations on the Articles of Peace, and Animadversions on the Scotch Presbytery at Belfast,' in the same year (1649). His next work, 'The History of England,' was interrupted by his appointment to the post of Latin secretary to the Council of State, which had determined that the Latin language should be used in all foreign negotiations. The Council could not have chosen any man in England better qualified for the office by his sound scholarship and his ready command of the Latin language; but it is to be regretted that in his controversies with Salmasius he should have stooped to criticise style instead of weighing arguments. In his new capacity Milton was deputed to answer 'Eikon Basilike,' which he did in his 'Eikonoklastes;' and soon after to rebut Salmasius's vindication of monarchy, by his 'Defensio Populi Anglicani,' of which two books Hobbes declared himself unable to determine whose language was best or whose arguments worst.

After his appointment as Latin secretary Milton changed his abode to Westminster. Upon the death of his first wife he married a daughter of Captain Woodcock of Hackney, who died in childbed within a year of their marriage. In 1654, or perhaps before that time, he became totally blind, a misfortune which his enemies considered as a judgment from Heaven. He has himself given a curious and interesting account of his blindness in his 'Latin Epistles,' No. xv.

The duties of his office, occasional pamphlets on politics, and his 'History of England,' which appeared in 1670, employed him till he began 'Paradise Lost.' At the Restoration he retired into obscurity; but he seems to have incurred no particular danger, although he was once in custody of the serjeant-at-arms. Some ascribe his safety to Sir W. Davenant.

Having obtained indemnity under an Act passed in 1660, he married his third wife, Elizabeth Minshull; and in 1665, according to Elwood the Quaker (who acted in some measure as his secretary), he had completed 'Paradise Lost,' which was shown to Elwood in a finished state in that year, during a visit paid by Milton to some friends of Elwood's in Buckinghamshire. The poem was licensed and published in 1667. Five pounds were paid by Samuel Simmons, the bookseller, for the copy, with a promise of five pounds more when 1300 copies should have been sold of the first, second, and third editions respectively. The 'Paradise Lost' first consisted of only ten books. The division into twelve was made in the second edition, published in 1674, three years before which time he had produced 'Paradise Regained' and 'Samson Agonistes.'

In 1673 he published a 'Summary of Logic;' in 1673 a treatise 'Of True Religion,' &c.; and in 1674 his Latin letters and exercises. His last work was a translation of the Polish declaration in favour of John III. He died on Sunday, November 8, 1674, and was buried in the chancel of St. Giles, Cripplegate.

For full information on Milton's life, his habits, appearance, &c., the reader is referred to the very copious Life by Todd, prefixed to his edition of Milton's Poetical Works; and to the more recent one by Keightley. See also Masson's Life of Milton, vol. i. 1859.

Milton belonged to the Independents, a name in his time expressive both of religious and of political tenets. He seems to have been as bold in speech as in writing, and this boldness, so early as the date of his Italian journey, gave his friends some uneasiness for his safety. But Milton did not consider, as some have supposed, that in entering on controversy he was following the bent of his nature; he calls it expressly a "manner of writing, wherein knowing myself inferior to myself, led by the genial power of nature to another task, I have the use, as I may account it, but of my left hand." Yet he carefully trained himself for the controversial field, and assuredly it was, as he wrote, "not as an unweaponed creature" that he commenced his task. After the death of Charles he took a decided part against the Presbyterians, as is shown by his tract on the 'Tenure of Kings,' and became the champion of republicanism against Salmasius. This was the period of his greatest celebrity. As Latin secretary he held an official residence for eight years, and divided the curiosity of foreigners with Cromwell himself. Yet, at the Restoration, he had no hardships to complain of, except the exorbitant fees charged by the serjeant-at-arms, and it is even said that he had the refusal of his original office.

It would be out of place here to do more than notice in a cursory manner Dr. Johnson's critique of Milton's poetry. To attempt by writing to impress the beauties of an imaginative work upon those acquainted with that work is a task more easy than useful; for those who do not appreciate poetic beauty without the guidance of another man's judgment will seldom form any opinions of their own worth possessing; and in like manner those who are not by their own taste directed to see the faultiness of a critique like that to which we have referred, will probably derive little benefit from being told that it has

faults. But there is another class of readers to whom it may be well to direct a few observations—those, we mean, whose taste is accurate enough to enable them to trace faultiness as pervading the system, though they cannot discern its particular mistakes. In any criticism, on whatever subject, it is most important that the spirit in which the work subjected to criticism was written should be kept in view by the critic. With this restriction and condition an imaginative work like 'Lycidas,' written in the style of a school of Greek poets, of which Theocritus is the model, would never be called "easy, vulgar, and therefore disgusting;" and its rhymes and numbers would not have been stigmatised as uncertain and unpleasing by any one who reflected that Milton had Italian models in view when he wrote 'Lycidas' in verses of unequal length.

Let no one try to render a poem, even epic or dramatic, into an historical form. Charles Lamb has attempted it; a man perhaps more likely to succeed than any of his age, and his prose Shakspeare would rather deter than provoke imitation. The absurdity of reducing a chapter of Hume's 'History of England' into a metrical shape, and then criticising it as a poem, is sufficiently manifest; but when we come to an imaginative work like 'Il Penseroso,' dissect it into elements, and make these elements purely narrative, persons are and have been deceived into supposing this dissection to be legitimate criticism.

'Paradise Lost,' perhaps the greatest continuous effort of human imagination, had originally the form of a drama, of which several plans remain. The epical form however at last asserted its superiority, although enough of the drama remains in the present poem to enable us to trace with some distinctness the shape which it probably assumed. In spite of all that has been said and written on 'Paradise Lost,' the truth of Dr. Johnson's observation must be however to a considerable extent allowed, that it is "one of the books which the reader admires and lays down, and forgets to take up again." Much of this inattention is no doubt owing to the character of this age. Learned poetry suits us not. For allusions to classical authors, however beautiful, for an exhibition and exposition of the leading doctrines of Christianity, couched in language however sublime, and for a history of events so gigantic, we have no taste when conveyed in the form of a poem. In other words, 'Paradise Lost' is not and cannot be extensively popular; and even among its admirers we shall detect many who judge of it not as a poetical but as a theological production. Taken as a whole, a proper estimate cannot be formed of it by any one who has not learning enough to enable him at least to perceive the learning of the author; and the same may be said of the dramatic works of Milton, for the allusions to passages in the Greek tragedies which are contained in the first few pages of 'Samson Agonistes' are almost equal in number to the lines themselves.

Milton's poetry cannot be dismissed without a word or two on his versification. His matchless ear led him to choose blank verse—a measure till then almost unknown except in dramatic works—as the best metre for an epic poem. To the same quality is owing the harmony of his lyrical verses, in which, as in everything else, he seems to have been a century in advance of his own time. If we compare his liquid verses with the lilted jingle which characterises almost all the versifiers of the last century who attempted the octave stanza, the difference will be immediately discerned. It was not until Milton began to supersede the French school that English poets produced verses approaching his own in sweetness.

Of all authors, ancient and modern, respecting whom conflicting judgments have been pronounced, no one has had more to contend with, both from the unwise conduct of his friends and the malice of his enemies, than Milton. Living at a time when party spirit ran high, and identifying himself with one of the extremes, his character has been assailed by many enemies, and of his defenders not a few have made up by violence what they wanted in discretion. It is part of our national habits to regard every man who can be so regarded, not according to his eminence in art or science, so much as according to his station as a political partisan. Thus Milton is often viewed, not as a poet, not as a writer of all writers most eloquent, but as a partisan. And yet, until we divest ourselves of this deep-engrafted habit, we shall never read Milton's prose works as they ought to be read; we shall never see in them the commentaries on his own poetry which they supply; never trace those models of eloquence which they contain; never reflect that in Milton's polemics we find the perfection of a reviewer's style, with all the acumen and not half the heaviness of Bentley, and with qualities more adapted to controversy than any which have been exhibited from his time until the beginning of the present century; that in his historical fragment exists a mythological narrative written not less poetically than Niebuhr's 'Lays' and 'Legends' of Roman History, although Niebuhr was the first who followed, however unconsciously, this great example; and that in his 'Speech for the Liberty of Unlicensed Printing' the sentiments are noble, and are more nobly expressed than in any English composition before the days of Burke. It is as rhetorical models that we must view Milton's prose works; his logic may fail, his facts and arguments may be insufficient, but his eloquence remains unrivalled.

The editions of Milton's poetical works are very numerous. His prose works have been much neglected: we believe that the only uniform edition of them, which includes the tract on 'Christian

Doctrine,' is that which forms five volumes of Bohn's 'Standard Library,' and that does not include the Latin works.

In the year 1823 a Latin manuscript, with the title 'De Doctrina Christiana, libri duo posthumi,' was discovered in the State-Paper Office, and, from internal and other evidence, was ascertained to be the work which Milton was known to have written on this subject, and which was supposed to be lost. It was edited by the present Bishop of Winchester (Sumner), and a translation was also published. This work is characterised by the usual boldness and freedom of opinion which pervade all Milton's writings. As a theological work, it is perhaps almost unnecessary to remark that it would be considered of little value by any denomination of Christians.

MIMNERMUS OF COLOPHON, a Greek elegiac poet, contemporary with Solon. He appears to have flourished from about B.C. 630 to B.C. 600. Müller, quoting a fragment of Mimnermus's elegy 'Nanno,' says that he was one of the colonists of Smyrna who came from Colophon, and whose ancestors at a still earlier period came from the Nelean Pylos. To the reduction of Smyrna to Halyattes, he ascribes the melancholy character of his poems. ('History of the Literature of Ancient Greece,' p. 115.) From Horace and Propertius we gather that his poems had reference for the most part to those appetites which are, in poetical language, expressed by the name of love. His mind however was of a melancholy turn, which gave to his writings a pensive cast not traceable in the writings of others who belonged to the same school. In the few fragments which we have remaining of Mimnermus, he complains of the briefness of human enjoyment, the shortness of the season of youth, and of the many miseries to which man is subject. Mimnermus was the first who adapted the elegiac verse to those subjects which, from this adaptation, are now usually considered as proper to it, Callinus, its inventor, having used it as a vehicle for warlike strains. The fragments of Mimnermus have been several times edited, in the collections of Stephens, Brunck, Gaisford, and Boissonade, to which may be added Bach's separate edition, published at Leipzig in 1826. They have been translated by Ch. von Stolberg, Herder, A. W. Schlegel, and others. (Ulrich, *Geschichte der Hellenischen Dichtkunst*.)

MINE'LLIUS, JOHN, was born about 1625 at Rotterdam, and died in 1683. He was rector of the public school in his native town, and edited many of the Latin classics, with short notes for the use of schools. He also published a translation of Terence in Dutch, Rotterdam, 1663.

\*MINIÉ, M., inventor of the Minié rifle, was born about 1805, in the city of Paris. He entered the French army as a common soldier at an early age, and has attained the rank of chef d'escadron. He is superintendent of a department of the ordnance at Vincennes, where he resides, and has a workshop, in which he occupies himself with carrying out his improvements in the construction of rifles and other fire-arms. He is practically acquainted with the gun-maker's trade in all its details, having had himself instructed in it for the express purpose of more perfectly accomplishing the invention which had engaged his thoughts for some years previously. The Emperor of the French has given him the decoration of the cross of the Legion d'Honneur. The Minié rifle, in accuracy of direction and extent of range, is generally considered to surpass all other rifles previously invented, and is now adopted not only in the French army, but to a greater or less extent in the armies of other European nations.

The musket was invented and brought into use in the first half of the 16th century (1520-30). By degrees it was made lighter, and a flint-and-steel lock substituted for the original match-lock. Little other improvement took place till modern times, when the percussion-lock superseded the flint-lock. The musket-ball being spherical, and of necessity smaller than the bore of the gun, underwent certain irregular movements in its passage outwards, which almost always made it take a direction of flight different from the line of the barrel. So great indeed was the uncertainty of the bullet striking the object aimed at, that even in modern warfare and with the best muskets, only one bullet in 500 was considered to take effect. Marshal Saxe calculated that with the instrument in use in his time, only one bullet in 1000 took effect.

The rifle however, with its grooved bore, and greater accuracy in the flight of the ball, has been long in use by sportsmen, and during the American war was applied by them to the purpose of warfare with destructive effect. It had indeed previously been used for that purpose by the French, and by the Germans under Frederick the Great, but only to a very limited extent; and though riflemen both on foot and mounted have for many years formed a part of the French, British, and other armies, the slowness of loading and the expense of the piece have till very recent times greatly restricted its use. The invention however of an elongated rifle-ball, especially the latest invention of the expanding ball, has operated in producing such an improvement in easiness of loading, in accuracy of flight, and extent of range, that the general adoption of the rifle may be considered as now certain, and the musket as falling rapidly into disuse.

As far back as July 1747, Mr. Robins demonstrated before the Royal Society the directness of flight which would result from the use of elongated projectiles, but no application was made of the principle till the beginning of the French Revolution, when such missiles were used

with success, but were afterwards abandoned on account of the difficulty of loading the gun. In 1824, Captain Norton, who served last before he retired in the 84th regiment, completed his elongated rifle-percussion-shall and expanding elongated shot, both of which were tested with success in 1826 at Woolwich and elsewhere; but no attempt was made to introduce them into the service, the Ordnance Committee adhering to the old opinion that the spherical form was best. At length, in 1833, M. Caron, a French officer of artillery, introduced a rifle loaded with a conical ball, and modifications and improvements of a similar ball were made by Captain Blois, M. Tamisier, and finally by M. Minié, who introduced effectively the principle of expansion. The ball of the Minié rifle is of an elongated form, and enters the rifle freely; it has a conical point in front, and a hollow behind, which throws the centre of gravity forward, the expansion being secured by a metal cup or thimble, so as completely to fill the grooves, and give it a flight of the utmost precision and a range of very great extent.

Mr. Greener, of Aston New Town, Birmingham, in 1836 exhibited some experiments at Newcastle with bullets constructed on the principle of expansion; and in a letter published in the 'Times' newspaper, December 25, 1841, he explained the principle, as he did also before a committee of the Board of Ordnance in 1842. In June 1856 Mr. Greener addressed a memorial to the War department claiming remuneration as having been the first to explain and recommend the principle of expansion in the bullets of rifles, as now in use in the British army. Mr. Greener's claim was referred to an Ordnance Committee, and, in accordance with their report, Lord Panmure, the minister for the War department, on the 17th of December sent a communication to Mr. Greener, informing him that he had, with the concurrence of the Lords Commissioners of her Majesty's Treasury, sanctioned the submission to parliament of an award to Mr. Greener of 1000*l.*, in the army-estimates for 1857-58, as a public recognition of his "priority in bringing this invention before the War department."

MINOS, in history, appears as the lawgiver of Crete. Those critics who consider all the personages of mythological history as little more than names to which is attached the history of social development, would view Minos simply as the concentration of that spirit of order which about his time began to exhibit in the island of Crete the forms of a regular polity. But we are not to consider, because there is much undoubtedly mythological about the history of Minos, that therefore he never existed. The concurrent testimony of Thucydides and Aristotle shows it to have been the general belief in their times, that Minos was the first among the Greeks who possessed any amount of naval power. According to the latter author, he conquered and colonized several islands, and at last perished in an expedition against Sicily.

In the second book of the 'Politics,' Aristotle draws a parallel between the Cretan and Spartan institutions, and he there ascribes the establishment of the Cretan laws to Minos. This comparison, aided probably by the connection which existed between Crete and Sparta, owing to colonies, as early as the time of Homer, has no doubt suggested the theory invented and supported by Müller, that Minos was a Doric prince—a theory, as Mr. Thirlwall asserts, utterly unknown to the ancients. The subject is ably discussed in Thirlwall's 'History of Greece,' i. 135.

Some post-Homeric authorities make Minos a judge in Hades in company with Rhadamanthus being chief judge. In this character he appears in a short Platonic dialogue called 'Minos,' or 'On Law,' which however some critics consider spurious.

Minos is a son of Jupiter; this being the usual method taken by the mythographers to express a person so ancient that they could put him on a level with no mere mortal; and from Jupiter, as his father, he learns those laws which he afterwards delivers to men.

Minos is chiefly remarkable as belonging to a period when history and mythology interlace, and as uniting in his own person the chief characteristics of both. He is a son of Jupiter and yet the first possessor of a navy; a judge in Hades, but not the less for that a king of Crete. It is very curious, that Crete, so famous at this age, both for its naval power and for being the birthplace of the Olympian gods, should never afterwards have attained anything like that celebrity which its position seemed to promise. Its office seems to have been that of leading the way in naval supremacy. Too insulated for power of a durable nature, it was lost in the confederate or opposing glories of Athens and Sparta; but while they were yet in their infancy, its insular form (together perhaps with some Asiatic refinement) gave it that concentrated energy which in an early age is irresistible.

(Homer, *Il.*, ii. 65; xiii. 450; xiv. 321; *Odyssey*, xix. 175; Thucydides, i. a. 3; Plato, *Laws*, b. i. and ii., and 'Minos'; Aristotle, *Politics*, b. ii. and vii.; *Philological Museum*, 'On the Names of some of the Ante-Hellenic Inhabitants of Greece.')

MINTO, GILBERT ELLIOT, SECOND EARL OF, the eldest son of the first earl (who was successively British envoy at Vienna, president of the Board of Control, and governor-general of Bengal), was born in 1782, and was brought up for the diplomatic service. In 1806 he was elected member of parliament for Agherton, and represented the county of Roxburgh in 1813, but in the following year his father's death removed him to the Upper House. Lord Minto took little part in political affairs until 1832, when he was sent as ambassador to Berlin. Returning thence in 1835, he was appointed first lord of the Admiralty under the administration of Lord Melbourne, but retired

with his party in 1841. He held the office of Lord Privy Seal in the administration of Lord John Russell from 1846 to 1852. During this time he was sent on a special mission to Switzerland and Rome, where it is affirmed by Roman Catholic authorities he was sounded as to the views of her Majesty's government respecting the intention of the pope to create Roman Catholic bishoprics in England. Lord Minto has not undertaken any public employment since that time. [See SUP.]

MINUCIUS, FELIX, a Latin Christian writer of the 3rd century, was a native of Africa, but went to live at Rome, where he exercised the profession of advocate, and was much admired, according to the report of Lactantius and Jerome, for his eloquence. We have a work by him, entitled 'Octavius,' which is a dialogue between a Christian called Octavius and a heathen called Cæcilius, concerning the merits of the two religions which were then striving for supremacy. In this dialogue, Octavius repels the absurd imputations of the heathens against the early Christians, whom they accused of all sorts of impurities and crimes in their religious meetings. Through fear of persecution these meetings took place mostly at night and in concealed places, which circumstances exposed them to the obloquy of vulgar ignorance. At the same time Octavius retorts upon his co-disputant by exposing the notoriously licentious practices of the heathens. The style of this work is argumentative and sufficiently pure; the language is animated, and the mode of treating the subject attractive, being mixed up with mythological learning and much information concerning the customs and opinions of that interesting period. As an apology of Christianity, the work of Minucius Felix is a companion to those of Clement Alexandrianus, Athenagoras, Theophilus of Antioch, Justinus, Tertullianus, and other early advocates of the Christian faith in its times of trial and depression, and forms a link between them and those of Arnobius, Lactantius, Eusebius, Ambrose, and the other fathers of the 4th century. The dialogue of 'Octavius' has gone through many editions, among which those by James Gronovius, Leyden, 1709; by Davis, Cambridge, 1712, and by Orelli, Turin, 1836, deserve notice. The latter is accompanied by numerous notes by Dr. Davis and others, and a dissertation or commentary by Balduinus. The 'Octavius' has been translated into French by the Abbé de Gourey, and into German by Runswurm (Turin, 1186), and Lübhart (Leipsa, 1836).

Another work, entitled 'De Fato,' against astrologers, is mentioned by Jerome as being ascribed to Minucius, although Jerome expresses doubts concerning its authorship. This work is lost.

The 'Octavius' was at one time attributed to Arnobius, and was inserted as the eighth book of his Disputations 'Adversus Gentes.' Bouehard has published a 'Dissertation on Minucius,' Kiel, 1805.

MINZONI, ONOFRIO, more distinguished for the quality than the quantity of his poetry, in which last respect he is only one of the minor bards of Italy, was born at Ferrara in 1734. He was educated by the Jesuits, and applied himself with great diligence to the study of theology and mathematics; but it is as a poet that his name is handed down to posterity. Imbued with the study of Dante and Ariosto, he had caught much of their vigour of thought and energy of expression; and was comparatively careless of those mechanical beauties of versification which, in his time, were generally accepted as equivalent to genuine poetry. Freshness of thought, distinctness of imagery, and nobleness of language are the characteristics of his poems, which consist chiefly of sonnets. He likewise distinguished himself by his eloquence in the pulpit so highly, that the citizens of Ferrara struck a medal in honour of him in 1783. In 1780 he was made canon penitentiary of that city, which office he discharged with the most exemplary zeal. He died May 30, 1817.

MIRABEAU, JEAN BAPTISTE DE, was born at Paris in 1675; first embraced the military profession, but left it soon after to devote himself to literature. He made himself known by a French translation of Tasso's 'Jerusalem,' which he published in 1724. He was afterwards made a member of the French Academy, of which he became secretary in 1742. He died at Paris in 1760. Besides the above-mentioned translation, and a very inferior one of Ariosto's poem, he wrote—1, 'Le Monde, son Origine et son Antiquité'; 2, 'Opinions des Anciens sur les Juifs'; 3, 'Sentimens des Païens sur la Nature de l'Âme'; and other minor works. The atheistical work called 'Système de la Nature,' which made much noise at the time of its publication, was attributed to Mirabeau, but is known to have been written by the Baron d'Holbach, with the assistance of some of his friends. [HOLBACH.]

MIRABEAU, HONORÉ GABRIEL DE BIQUETI, COMTE DE, was born at Bignon, near Nérouse, in 1749, of a family which had emigrated from Florence in the 13th century, the name of which, Arrighetti, had become Frenchified into that of Biqueti. He was the son of the Marquis de Mirabeau, a man of some literary note, the author of 'L'Ami des Hommes' and other works, and one of the leaders of the school of the 'Economistes.' The marquis, though a great advocate of liberty and philanthropy in his writings, was a harsh despot in his own family; and his harshness probably contributed to sour the temper of his son, and to drive him into the excesses which stained his earlier career. Young Mirabeau had violent passions, an ardent imagination, and great abilities. He was fond of pleasure, of love intrigues, and of spending money; and his father knew no better means of checking his irregularities than by obtaining 'lettres-de-

cachet' against his son, and confining him in several state prisons in succession. His first imprisonment was in consequence of a love affair, after which Mirabeau served for some time in the army, on leaving which he married a young lady who had been promised to another. His dissipation however rendered the match an unhappy one; he became encumbered with debts, his father obtained an interdiction against him which declared him incapable of administering his property, and moreover a *lettre-de-cachet*, by which he was confined in the castle of Joux, in the Jura mountains. He was then twenty-five years of age. His captivating address won over the commandant of the fort, who allowed him to walk about the neighbouring town of Pontarlier, where he made the acquaintance of a young lady, the wife of an old man who was a magistrate in that province. Mirabeau seduced her, and carried her off to Holland. This is the person to whom he afterwards addressed several licentious works under the name of *Sophie*. For this offence the parliament of Dijon condemned him to death 'par contumace.'

In Holland, Mirabeau began to work for the booksellers as a means of subsistence. While he was thus employed he was seized by the agents of the French police, with the consent of the Dutch authorities, and was finally shut up in the dungeon of Vincennes, near Paris, where he remained more than three years. During his confinement he went through a course of general reading, made translations from Latin and modern foreign authors, formed a collection of extracts, and wrote several works, most of which were of the amorous kind, and some of them obscene. He also carried on a correspondence with his mistress *Sophie*, which was published after his death.

On his release in 1780 he wrote his work 'On the Lettres de Cachet and on State Prisons,' which made a deep impression on the public. Repairing to Pontarlier; he pleaded his own cause and that of his mistress, and compelled the husband to enter into a compromise by which the prosecution was quashed.

About 1784 he visited London, where he became acquainted with *Bouilly*. From England he wrote his 'Letters to Chamfort,' in which he praised the institutions of the country. "Mirabeau," says his friend and biographer *Dumont*, "was then engaged in a work on the American order of *Cincinnatus*, and he had in his portfolio plans and sketches of several other works, upon which he took good care to consult every person capable of affording him information. He was then poor, and obliged to live by his writings. He wrote his 'Doutes sur la Liberté de l'Écoute' (or 'Considerations on the Navigation of the Scheldt') from a letter by *Mr. Chauvet*, which gave him the first idea of the work. Having become acquainted with a geographer, he began to think of writing a universal geography. Had any one shown him the elements of Chinese grammar, he would, I have no doubt, have attempted a treatise on the Chinese language. He studied a subject while he was writing upon it, and he only required an assistant who should furnish matter to him. He could contrive to get notes and additions from twenty different hands; and had he been offered a good price, I am confident that he would have undertaken to write even an encyclopædia. His activity was prodigious. If he worked little himself, he made others work very hard. He had the skill of finding out men of talent, and of successfully flattering those who could be of use to him; he worked upon them by means of insinuations of friendship and of ideas of public benefit. His interesting and animated conversation was like a hone which he used to sharpen his tools. Nothing was lost to him; he collected with care anecdotes, conversations, and thoughts; appropriated to his own benefit the fruits of the reading and study of his friends; knew how to use the information thus acquired so as to appear to have always possessed it; and when he had begun a work in earnest, it was seen to make a rapid and daily progress." (*Dumont's Recollections of Mirabeau.*)

The above sketch, by a clever and impartial friend of Mirabeau, gives an insight into the versatile character of this remarkable man, who might be styled the *Alcibiades* of the French revolution.

In 1786, Mirabeau's abilities having become known, he was employed by the French minister *Calonne* on a secret mission to Berlin, where he spent about eight months, and witnessed the last days of the great *Frederic*, and the beginning of the reign of his weak successor. On his return to France he wrote his work, 'De la Monarchie Prussienne,' which was compiled from very good materials that he had obtained at Berlin. He also published an 'Histoire Secrète de la Cour de Berlin,' which contains many scandalous anecdotes, and which the French government caused to be burnt by the hand of the public executioner. He was paid twice for this work: once by the French minister *Montmorin* for suppressing it, and a second time by the bookseller for publishing it.

It was about this time, in the latter part of 1788, that *Dumont* became acquainted with Mirabeau, whose character then stood very low even in Paris, in consequence of his law-suits with his family, his slopements, his imprisonments, and his licentious character, so that his acquaintances were almost ashamed of seeing him. He was at one time connected with *Calonne* and the other enemies of *Necker*, against whom he wrote several pamphlets. He published also a 'Letter to the new King of Prussia, an Address to the Batavians' on the disturbances then existing in Holland, and a 'Letter to *Joseph II.*,' all of which are remarkable for their turbulent tone. He wrote likewise an 'Essai sur la Secte des Illuminés,' and a 'Lettre sur

*Cagliostro*, in which he exposed that impostor. His reputation as a writer stood very high, although he was indebted to his friends for most of his materials.

The convocation of the States-General in 1789 opened to Mirabeau a new and brilliant career. Two years before he had attended the assembly of Notables, to which he acted as secretary. He now presented himself before the states of Provence as a candidate for representing that province in the States-General, but he was rejected by the nobles on the ground of not being possessed of any *fief*. The true reason was that he was disliked, not so much for his irregular conduct as for the bold attacks which he made upon exclusive privileges.

Mirabeau then offered himself as a candidate to the *Tiers-État*, or Commons, and was returned to the States-General for both the towns of Aix and Marseille. He chose to sit for the former, but he paid a visit to Marseille to testify his gratitude to the citizens who had given him their votes, and was received in triumph. In the midst of his success however he showed himself a friend to social order, and by his personal influence repressed the disorders of the populace, which had broken out in alarming riots both at Marseille and at Aix. It is Mirabeau's peculiar boast, that throughout his political career his passions and party feelings never got the better of his judgment; he always remained master of himself; he knew where to stop, and where others ought to have stopped. Whilst *Brisot*, *Barnave*, *Sièyes*, *Pétion*, and others had chiefly in view the temporary triumph of their respective parties or systems, Mirabeau saw farther; he weighed the ultimate consequences of the measures that were agitated, and he looked to the permanent welfare and security of France, and to the establishment of an orderly rational government.

At the beginning of the great dispute between the two privileged orders and the third estate concerning their mode of sitting and of voting, Mirabeau opposed the motion of the Breton members, that the third estate should assume the title of the National Assembly, regardless of the other two orders. Instead of this he proposed a deputation to the clergy to invite them, "in the name of the God of peace," to join the Commons. This step however proving fruitless, *Sièyes* proposed to send a last message to the privileged orders, to request them to repair to the common-hall of the States, in order to verify their respective powers, and to judge as in default those who should not appear. That very day Mirabeau, foreseeing the consequences of the motion, requested an interview with *Malouet*, the personal friend of the ministers *Necker* and *Montmorin*, and told him that he was the friend of rational liberty; that he saw the storm which was impending, and that the question now was, whether the monarch and monarchy should outlive its fury. "There are," said he, "among ourselves (in the third estate) several hot-headed dangerous men. In the ranks of the aristocracy the clever men have no common sense, and among the fools I know of several who are capable of setting fire to the gunpowder and blowing us all up in the air. You, sir, are the friend of *M. Necker* and of *M. de Montmorin*; I do not like either of them, and I do not suppose that they like me, but that is of no consequence, provided we can understand each other. I should wish to know their intentions, and I request a private conference with them. They would be very guilty, or very short-sighted, if they expected to deal with the present States-General as former ministers have dealt with those assemblies in the old times of the monarchy. That cannot now be. They ought to have a plan of conduct based upon certain principles for the interest of the monarchy; if that plan is reasonable, I shall engage to support it, to prevent the invasion of democracy which threatens to overwhelm us." *Malouet* was delighted with the proposal, for he was aware of Mirabeau's power among the Commons, but the two ministers received the offer coolly, and *Necker*, having at last consented to see Mirabeau, asked him, in a distant supercilious manner, what proposals he had to make? Mirabeau offended at the word "proposals," answered in a few sharp words and went away to the assembly. In passing by *Malouet* he whispered to him, "Your friend is a fool; he will hear of me again by and by." To the honour of Mirabeau it must be said this feeling of irritation was transient, and that in the momentous discussions that followed, his pique against the minister did not carry him beyond the bounds which he had already prescribed to himself. (*Droz, Histoire du Règne de Louis XVI., Paris, 1889.*)

On the 15th of June, when the Commons were deliberating on the name which they were to assume, Mirabeau, after observing that the obstinacy of the privileged orders was inexorable, that the third estate was evidently in the right, and that for this very reason they ought to avoid taking extreme measures, which are the last resource of despair, and theirs certainly was not a desperate situation, continued thus: "You cannot constitute yourselves as the States-General, because that denomination implies three orders, and the three orders certainly are not here. Will you assume another synonymous denomination, implying that you are the representatives of the whole nation? You will still require the king's sanction; you cannot do without it, if you mean to impart legality to your resolutions." He then proposed to assume the title of "Representatives of the People." But in France the word "people" had by long abuse become a word of contempt. *Mounier* proposed the title of "Assembly of the majority of the Deputies deliberating in the absence of the minority duly invited and not appearing." But this title was too long. The discussion

occupied four sittings. Sièyes, Barnave, and Camus denied the necessity of the royal sanction. Mirabeau however persisted that the king's sanction was indispensable; and he continued to support his proposed title of representatives of the people. Mirabeau's opinion however was violently opposed, and the denomination of "National Assembly," which had been sometimes used to designate the States-General, was adopted on the 17th of June, on the motion of Sièyes, the minority who voted against it consisting of ninety deputies. Mirabeau absented himself to avoid voting on the question. He wrote to his friend Major Mauvillon of the Prussian service as follows: "Supposing even that the king should give his sanction to the new title which we have assumed, it is still true that the deputies of the third estate have staked a kingdom at a game of chance, whilst I wished to play at a game of chess in which I was the strongest. It is certain that the nation is not ripe. The excessive ignorance, the frightful disorders of the government have forced a hot-house revolution, and we are carried beyond our capabilities and our instructions." (*Lettres de Mirabeau à un de ses Amis en Allemagne.*)

But the great step once taken by the Commons, Mirabeau was faithful to them, and boldly supported the rights which they had assumed. After the memorable royal sitting of the 23rd of June, in which Louis ordered the three estates to deliberate in separate chambers, the deputies of the Commons still retained their seats in the common hall; and when the Marquis de Brézé, grand master of the ceremonies, reminded them of the king's orders, Mirabeau rose and said: "We have listened, sir, to the intentions which have been suggested to the king; but you, who cannot act as his interpreter to the National Assembly—you, who hold here neither seat, nor vote, nor right of speaking—you are not a fit person to remind us of his speech. Go, and tell those who have sent you, that we are sitting here by the power of the people, and that bayonets alone can drive us hence." All the deputies cried out, "That is the vote of the Assembly, and our firm resolution;" and the grand master withdrew. When he reported to Louis the answer of the Commons, the king, after a few moments' silence, said peevishly, "Well, if they will not quit the hall, let them stay in it." Mirabeau was now acknowledged as the chief leader in the National Assembly, and he continued to hold this supremacy for nearly two years, till the time of his death. Without belonging exactly to any party, he was courted or feared by all. He wished to form a party truly national; and on the 27th of June he made a speech, in which, after telling his colleagues that agitation and tumult could only be favourable to the enemies of liberty, he exhorted them to calm the people, and save them from the excesses into which a furious zeal might lead them. And he drew an eloquent sketch of the advantages which a rational constitution would ensure to France; the equality of taxation, the freedom of industry, economy in the finances, the written law substituted for ministerial caprice.

Louis XVI., after having sanctioned and even commanded the union of the three estates into one National Assembly, allowed his courtiers to collect a great number of troops near Paris and Versailles, as if to overawe that assembly. It was then that Mirabeau, on the 8th of July, in an eloquent speech, denounced the measures of the court as a plot against the independence of the representatives of the nation, and moved a firm though respectful address to the king, whom he excused, as if unconscious of what was being done in his name, requesting him to remove the troops from the neighbourhood of the capital. The address was voted in the midst of acclamations. It has been said that this address, as well as many of Mirabeau's speeches, was written for him by others. But his oratorical powers are proved by his extempore speeches and replies, which, as well as his prepared speeches, have the same form and pressure, the same logic, the same inspiration, and his own peculiar bold and somewhat careless manner. He doubtless made use of notes with which his friends supplied him, but he had the art of making them his own, and stamping them with his original character. This is fully and honourably acknowledged in many places by Dumont himself, who claims (and we see no reason for questioning his statement) the greatest share in having written for Mirabeau.

Louis XVI. made an evasive answer to the address; the people of Paris took the alarm, which was increased by the sudden dismissal of Necker, and an insurrection, led by Danton, Camille Desmoulins, Santerre, and others belonging to the club of the Palais Royal, broke out in the capital, which led to the destruction of the Bastille on the 18th of July, and the organisation of the militia of Paris. During this stormy period Mirabeau was constantly with the Assembly, day and night, at Versailles, supporting the firmness of the members, insisting on the necessity of the king withdrawing the troops from the capital, and sending repeated deputations to the palace for that purpose. The king at last consented to remove the troops, and went himself to Paris on the 17th, where he sanctioned the formation of the new municipality, the arming of the militia, and other popular measures. The Revolution was now complete, and the old monarchy was dead. It has been said that Mirabeau had conspired with the Paris insurgents, in order to make the Duke of Orleans lieutenant-general of the kingdom; but this accusation, as referring to that epoch, was at least premature. Mirabeau may have known or suspected the intentions of the party of the Duke of Orleans, but he also knew the weakness of the duke's

personal character, his bad reputation, and his want of popularity; whilst Louis was still very popular with the people at large. At a later period, on the 5th and 6th of October, when the populace of Paris went to Versailles, insulted the royal family, and threatened their lives, a plot was attributed to the Duke of Orleans, and Mirabeau was implicated in the supposed conspiracy; but the National Assembly declared that there was no ground of accusation against either. Dumont, who lived at that time in Mirabeau's intimacy, examines the matter pretty closely, and, in the end, leaves it in doubt. That some communications from the duke's party were made to Mirabeau through Laclot, the unprincipled author of the *'Liaisons Dangereuses,'* and a familiar of the duke, seems certain; but the intentions of the conspirators, and how far Mirabeau participated in them, are still involved in mystery. Dumont seems to think that the object of the movement was to frighten the king away, and then to appoint the duke lieutenant-general of the kingdom, in which case Mirabeau might have supported him in the Assembly, and have been appointed in return prime-minister, which post was the object of his ambition.

Mirabeau was one of the committee of five appointed to present the model of a declaration of the rights of man, on the motion of the metaphysician Sièyes. But he was, from the first, opposed to this declaration, which he considered as a puerile fiction. He however set about the task with his friends Dumont, Claviere, and Duroveray and "there were we, writing, disputing, adding, striking out, and exhausting both time and patience upon this ridiculous subject. At length we produced our piece of patchwork, our mosaic of pretended natural rights, which never existed. The principles intended to be established by this declaration are dangerous in themselves; for legislators should not be tied down to general propositions, which they are afterwards obliged to alter and modify; above all, they must not be cramped by false maxims. Men are born free and equal! That is not true; on the contrary, they are born in a state of weakness and necessary dependence. Equal! how are they so, or how can they be so! If by equality is understood equality of talents, of virtue, of industry, of fortune, then the falsehood is manifest." Mirabeau, on presenting the project to the Assembly, ventured to make some objections to it, and proposed to defer the declaration of rights until the constitution should be completed. "I can safely predict," said he, "that any declaration of rights anterior to the constitution will prove but the almanac of a single year!" He however withdrew his motion out of weariness and disgust, and the declaration was decreed. (Dumont's *'Recollections.'*)

During this discussion the violent members of the Breton club (afterwards the Jacobin club) charged Mirabeau with abusing his talents, as if he wished to involve the Assembly in contradictory resolutions; and one of them, stooping to personalities, reproached him with the irregularities of his private life. Mirabeau answered, with dignified calmness, "No doubt that in the course of a stormy youth, partly by the fault of others, but chiefly by my own, I have committed many wrongs, and that there are few men who have afforded more matter for bad report and more pretences for slander; but I dare attest to you all, that as a public man, as a political writer or speaker, no one can boast of greater courage, independence, disinterestedness, or of greater uniformity and consistency of principles. Thirty volumes of writings are there to prove my assertion."

Then came the famous night sitting of the 4th of August, in which the Assembly, on the motions of several members of the nobility and clergy, abolished feudal rights, game-laws, tithes, privileges, and indemnities, pensions not for actual services, the corporations of trades, and all the provincial franchises, states, and assemblies, as well as the charters of peculiar towns; questions involving an entire political system were decided in a few hours, put to the vote, and passed by general acclamation. From this sitting Mirabeau, Sièyes, and other leading members happened to be absent. The following day the first two strongly reprobated this hurried work; Sièyes made a speech against the sudden abolition of tithes, which he ended by the words, "They want to be free, and know not how to be just." Mirabeau exclaimed to Dumont, "This is just the character of our Frenchmen; they are three months disputing about syllables, and in a single night they overturn the whole venerable edifice of the monarchy."

The next important discussion was that on the king's veto. Mirabeau had determined to support the absolute veto, which, in the absence of a second or upper house, he considered of vital importance to the monarchy. His speech on the occasion excited much surprise and dissatisfaction among the deputies. Sièyes opposed the absolute veto, and Barnave and Pétion proposed a suspensive or temporary one. Their motion was carried. Mirabeau did not vote on that occasion; and such was the importance which even his antagonists attached to his name, that Camille Desmoulins and other democrats boldly asserted that he had voted in their favour.

Mirabeau's speech on the national bankruptcy was to him a complete triumph. In this speech he supported the minister Necker, to whom he was personally hostile, in his plan of a forced loan to make up the deficit in the revenue. Several members had proposed modifications, which Mirabeau thought would destroy the effect of the measure. He proceeded to remark upon the dangerous state of the public credit, the failure of the revenue, and represented a national bankruptcy, with all its horrors, as the probable consequence of the rejection of

the plan. The force with which he presented so commonplace a subject was miraculous: he elevated it to sublimity. They who heard that speech never forgot it. No attempt was made to reply: the assembly was subjugated by the power of a superior mind, and the project was adopted unanimously. "From that day Mirabeau was considered as having no rival in the assembly: there were indeed other orators, but he alone was eloquent; and this impression was stronger, because in his speech on this question he was obliged to depend entirely upon his own resources; for it was an unexpected reply, and could not therefore have been prepared." (Dumont's 'Recollections.') Molé, the celebrated actor at the Théâtre Français, was so struck with the force of Mirabeau's eloquence and the brilliancy of his delivery, that, approaching the orator with visible emotion, "Ah! monsieur le comte," said he, in a pathetic tone of voice, "what a speech! and with what an accent did you deliver it! You have surely missed your vocation." Mirabeau was by no means displeased at this singular compliment.

After the removal of the Assembly to Paris, some negotiations were entered into for bringing Mirabeau into office. Necker had nearly agreed to it, and the king was about to consent; but Mirabeau's condition was, that he should remain member of the Assembly, without which he felt that his taking office would be of no use. Suspicious of the scheme having been bruited about, some of his antagonists, of Lameth's party, moved that no minister should be a member of the Assembly. Mirabeau in vain opposed the motion, which was carried by a feeble majority. He appealed to the usage of the English parliament, but this appeal told against himself; for the least idea of imitation offended the pride of the innovators, who pretended to establish a monarchical form of government, without preserving a single element of monarchy. "We are not English, and we want nothing English," was the reply on such occasions.

Mirabeau was one of the first to propose a martial law to put down the insurrections which had then become extremely frequent all over France. The law was passed on the 19th of October, notwithstanding violent opposition; and, strange to say, Mirabeau's popularity was not affected by it.

About November of the same year Mirabeau unexpectedly communicated to Dumont a plan to draw the king away from Paris. After placing him in Metz or some other strong fortress, amidst faithful troops, he was to appeal to the people by proclamation, to dissolve the Assembly, and order an immediate election of fresh deputies. Mirabeau was to remain at Paris, and watch the motions of the Assembly; and, as soon as the royal proclamation should appear, he expected to induce all the moderate members to separate from the rest and follow the king. Mirabeau represented this plan as the only thing by which France could be saved from complete disorganisation. Dumont strongly remonstrated against the plan, and Mirabeau acknowledged to him that it had originated with the court party, and that he had intended to co-operate in the movement, in order to direct it in favour of liberty; "otherwise," said he, "it will only lead to new errors and the total ruin of the country. If the plan does not succeed, the monarchy is lost." Dumont represented to him that he would most probably be made use of only as a tool, and then discarded as a victim. A few days afterwards Mirabeau told him that the plan was given up, and the affair remained a secret.

During the year 1790, Mirabeau continued to hold the first rank as a leader of the National Assembly. He supported the law for the sale of church property in order to pay off the national debt, but with some restrictions in favour of the actual possessors, which restrictions were however disregarded. He also supported the issue of assignats or bonds on the security of that property, but limited their issue to a fixed amount. He also proposed, at Dumont's suggestion, a plan of gradual elections, by which a citizen should have to exercise certain civil functions for a stated period in order to qualify him to become a deputy to the legislature. This motion was at first received with favour by most members both of the right and the left section of the Assembly, but Lameth, Barnave, and some others looked upon it as an aristocratic snare; they moved and carried an adjournment, and the motion was ultimately lost. In the important discussion on the right of peace and war, he declared, to the great dismay of the democrats, that the king ought to be invested with this prerogative, and supported his opinion by a logical and brilliant speech. Barnave opposed him, attacked Mirabeau violently, accused him of inconsistency, ridiculed his system, was cheered by the left side, and by the people in the galleries, and received with acclamations by the people out of doors, whilst cries of 'à la lanterne' resounded against Mirabeau. The debate was adjourned. The next day a libel was hawked about the streets with this title in large capitals:—"The great treason of the Comte de Mirabeau," in which he was accused of bribery. The paper was shown to him as he entered the Assembly: he glanced at it, and said, "I know it all; I shall leave the house either triumphant or in pieces." He ascended the tribune amidst the most profound silence: "For several days past," said he, "the section of this Assembly which wishes for the king's assent in questions of peace and war has been represented as hostile to public liberty; rumours of treason and corruption are artfully spread about; popular vengeance is invoked to support the tyranny of party opinions. I also, whom a few days ago they wanted to carry in triumph, I hear myself

now proclaimed in the streets as a great conspirator. I did not require this lesson to remind me that there are only a few steps between the capitol and the Tarpeian rock; but a man who wishes to be useful to his country, who cares little for the vain celebrity of a day, is not easily overcome; he expects his reward from his conscience and from time, the incorruptible judges of us all. I shall therefore resume the question in debate, and explain the true point of contention with all the clearness I am capable of." He then repeated the objections of Barnave, maintained his former opinion, and urged it with redoubled force. He saw in the eyes of the audience the certainty of his triumph, and stopping rather abruptly, he concluded, in an ordinary and careless tone, with these words:—"I think, gentlemen, that the real point in debate is now well known, and that M. Barnave has not at all touched the question at issue. It would now be for me a task too easy and irrelevant to follow my opponent throughout his accessory details, in which, if he has shown a certain talent, he has not exhibited the least knowledge of state or worldly affairs. He has declaimed at length about the mischief which absolute kings can do and have done, but he has not observed that in our constitution the monarch is no longer absolute, and cannot act arbitrarily, and he has, above all, completely abstained from speaking of the evils resulting from popular movements." Mirabeau left the tribune amidst a thunder of applause, which lasted for many minutes. His triumph was again complete, and his opinion prevailed.

He opposed the violent measures proposed against emigration, saying that it was tyrannical to interfere with the locomotive faculties of individuals—that such restrictions could not be carried into effect—that he, for one, would not obey them—and as the extreme left became louder and louder in their marks of disapprobation, he fixed his eyes upon them imperiously, and cried 'but with a voice of thunder, "Silence aux trente voix" (silence, you thirty votes); and the extreme left quailed before him, and was silent accordingly. On the question of the regency he told the Assembly to judge for themselves, and not to heed the shouts out of doors; he told them that the very people who were applauding them to-day would shout still louder were they to see them some other day on their way to the scaffold; and at that moment a loud cheer from the galleries seemed to confirm Mirabeau's prediction.

Thus did this extraordinary man, while crushing the old aristocracy with one hand, repress the fury of the democratic faction on the other. Hardly disguising his contempt for the intellectual capacity of most of his colleagues, he still kept them all in awe; and while openly asserting his independence of clubs, and factions, and mobs, he retained his popularity to the last even with the lowest populace. "Our little mother Mirabeau" was the endearing nickname which the fishwomen of Paris, who sometimes graced the galleries of the legislature with their presence, applied to him.

Mirabeau, assisted by Dumont and others, edited a journal entitled at first, 'Journal des États-Généraux,' and afterwards 'Courir de Provence,' which gave a clever and tolerably impartial report of the proceedings of the National Assembly, until about the middle of 1790, when it was forsaken by its original founders, and retained nothing of its former character except the name.

In January 1791, Mirabeau was named president of the National Assembly. "Never had this office been so well filled; he displayed in it a new kind of talent. He introduced a degree of order and clearness in the proceedings, of the possibility of which no member had previously the least conception. He simplified forms; he could render the question clear by a single word, and also by a single word put down tumult. His regard for all parties, the respect he always paid to the Assembly, the precision of his observations, and his answers to the several deputations at the bar—answers which, whether prepared or extempore, were always remarkable for dignity and elegance, and satisfactory even while conveying a refusal; in short, his activity, his impartiality, and his presence of mind, increased his reputation and added splendour to his talents, in an office which had proved a quicksand to several of his predecessors. He had the art of fixing the general attention even when, being no longer able to speak from the tribune, he seemed to have forgone his most valuable prerogative. His enemies, who were jealous of his eloquence, and had voted him president in order thereby to cast him into the shade and reduce him to silence, were bitterly disappointed when they saw him add another wreath to the chaplet of his glory.

"He was far from enjoying good health at this time. 'If I believed in slow poisons,' he said to me, 'I should think myself poisoned; for I feel that I am dying by inches—that I am being consumed in a slow fire.' I observed to him, that his mode of life would long ago have destroyed any man less robust than himself. Not a moment of rest, from seven in the morning till ten or eleven at night; continual conversations and altercations; agitations of mind and excitement of every kind; too high living, at least as regards food—for he was very moderate in drink. 'You must,' I said, 'be a salamander, to live in the fire which is consuming you.' Like all public and ambitious men, in their moments of ennui and fatigue, he entertained at times thoughts of retiring from public life. The irritation of his system at this time produced violent attacks of ophthalmia; and I have seen him, whilst he was president of the National Assembly, sometimes apply leeches for his eyes in the interval during the adjournment of

the sitting from the morning to the evening, and attend the Assembly with his neck covered with linnen to staunch the blood.

"When we parted for the last time (Dumont was going to Geneva for six months), he embraced me with an emotion which I had never before seen him evince. 'I shall die at the stake, my dear friend,' said he, 'and we shall never perhaps meet again. When I am gone, my value will be appreciated. Misfortunes to which I have put a stop for the present were overwhelming France in every direction; but that base faction, which I now overawe (the Jacobins), will again be let loose upon the country. I have none but direful anticipations. Ah! my friend, how right were we when, at the beginning, we tried to prevent the Commons from being declared a National Assembly. That was the origin of the evil. Since they have carried that point they have not ceased to show that they are unworthy of confidence. They wanted to govern the king, instead of being governed by him; but soon neither they nor he will govern; a vile faction will rule the country, and debase it by the most atrocious crimes.' Three months after this conversation Mirabeau was no more." (Dumont's 'Recollections of Mirabeau'.)

Mirabeau died on the 2nd of April 1791, of a short but violent disease, the result of his mode of living and of continual excitement. During his illness he suffered much, but endured his pain with sufficient calmness and resignation. He repeated to Talleyrand, who attended him, the same gloomy prognostications on the result of the actual struggle in France which he had before expressed to Dumont, and his deterioration, had life been spared to him, of supporting the king's constitutional authority against the attacks of the anarchists. "I carry with me to the grave," said he once, "the last shreds of the monarchy." He had been for some months in correspondence with the court, and had proposed a plan for dissolving the Assembly by the force and will of the nation itself, by getting up addresses from the departments, without having recourse to foreign armies or destroying the people's hope of freedom; for a new assembly was to be convoked forthwith, which would have revised the constitution. Mirabeau never intended to restore absolute power: he knew too well that he would have destroyed himself by such a measure; but all his ambition during the latter period of his life was centred in the idea of becoming prime minister of the constitutional monarchy of France, and he thought that, once in that office, he should eclipse every minister who had preceded him, and that he would attract within the sphere of his patronage all men of distinguished abilities, and thus form a halo of talents whose brightness should dazzle Europe. (Dumont; Bouillé, 'Memoirs.') Cabanis, then a young physician, published an account of Mirabeau's illness and a copy of his will. He died encumbered with debts. "Much has been said of the venality of Mirabeau," says Dumont, "as if his talents were actually put up to the highest bidder; but this is an exaggeration. It may be admitted that he was not over-scrupulous in money matters, but he was too proud to be dishonest; and he would have thrown through the window any one who dared to make him a humiliating proposal. At one time he received a pension from Monsieur (afterwards Louis XVIII.), and subsequently, during the last six months of his life, one from the king; but he considered himself as an agent entrusted with their affairs, and he accepted those pensions, not to be governed by, but to govern and direct those who granted them."

Mirabeau was a brilliant orator, and a fluent though not original writer. The great characteristic of his genius consisted in his political sagacity, his anticipation of events, and his knowledge of mankind. No man at the time, at least in France, saw so far as he did into futurity, and his forebodings of impending calamities were attributed to disappointed ambition. But while he prognosticated the downfall of the monarchy, he had the most lively anticipation of the future destinies of his country. In a letter to Major Mauvillon, of the Prussian service, he said that he considered France as able to resist all Europe; and his correspondence contains many singular passages which show the wide range of his political views. At home he detected by his instinctive penetration the feelings of the principal members of the National Assembly, and often embarrassed his opponents by revealing their secret motives, and laying open that which they were most anxious to conceal. His death gave courage to all the factions. Robespierre, Pétion, and others, who dwindled into insignificance before him, immediately became great men when no longer overawed by his presence. His death was felt as a public calamity by the nation in general; a public examination was made on his body to convince the people that there was no ground for the suspicion of poison. His funeral was conducted with great pomp: all the theatres were closed; the deputies, the ministers, all the public authorities, and a number of other persons, forming a procession of more than two miles in length, followed his remains to the Pantheon, where they were deposited among the illustrious dead.

Little more than two years after, in November 1793, the body of Mirabeau was disinterred by a decree of the Convention as that of an aristocrat; and the ferocious and insane Marat succeeded to his honours. So short is the period of popularity in revolutions.

Mirabeau left a natural son, whom he adopted before his death, and who has published memoirs of his father, in 4 vols. 8vo, London, 1835. Besides the numerous works and pamphlets of Mirabeau which were printed in his lifetime, several collections have been published

since his death:—'Collection complète des Travaux de Mirabeau à l'Assemblée Nationale,' Paris, 1791; 'Œuvres Oraïtoires et Choïsies de Mirabeau,' 6 vols. 8vo, Paris, 1820.

Mirabeau was tall, thick-set, and naturally robust, but very plain in his features; and yet, when he chose, his manner was extremely fascinating. His large head was shaded by a vast mass of dark hair, which he took great pains to cultivate; and he used to say, when his antagonists were troublesome, that he would shake his locks at them, at the same time assuming a threatening look, which, added to his deep powerful voice, had the effect of completely silencing them.

The National Assembly continued its labours for several months after the death of Mirabeau. Having completed the new constitution which it undertook to make for France, it presented it to the king for his sanction in September 1791. The king accepted the constitution, and the Assembly dissolved itself on the 30th of the same month. The French generally designate the first National Assembly as 'l'Assemblée Constituante,' from its having framed the constitution for the kingdom. That constitution lasted about twelve months, after which the republic was proclaimed.

MIRANDA, FRANCISCO, the founder of the independence of Spanish America, was born about the middle of the last century at the city of Caracas, of which province his grandfather had been governor. He travelled on foot at the age of twenty through various parts of the New Continent. He afterwards became a colonel in the Spanish army, and was intrusted occasionally with important matters by the governor of Guatemala. In 1788 he visited the United States, and afterwards travelled on foot through England, France, Italy, and Spain, a country which he detested. Even at that time he ventured to speak of the emancipation of his own country to Pitt and to Catherine II., who treated him with great regard, especially the empress, who entreated him to enter into her service; but the high expectations of the French revolution being far more congenial to his own, drew Miranda from St. Petersburg to Paris in 1789. He was warmly welcomed there by Pétion, to whom he was recommended by the leaders of the opposition in the English parliament; and in consideration of this recommendation, as well as of his military talents and enthusiasm for the popular cause, he was appointed major-general to Dumouriez, who was sent against the Prussians, then intent on putting down the French cause lest it should become a European question. But unfortunately Miranda did not answer the expectations of his new friends, either in raising the siege of Maastricht, on account of General Valence not coming to his assistance, nor at the battle of Neerwind, where the left wing of the army was defeated, a reverse which Dumouriez imputed to Miranda. This charge however he most ably and triumphantly refuted, with the assistance of Tronçon Ducoudrai, before the revolutionary tribunal, which sat eleven days on this case, and, greatly to their credit, acquitted an innocent foreigner whose life was demanded by humiliated national pride, and who was then benefactor of all patronage, since the Girondists were no more. Being again seized and condemned by the Directory on the 18th Fructidor, Miranda escaped, and came as a refugee to England. He returned to Paris in 1803, whence he was banished, a second time, by Bonaparte. Finally, he devoted himself exclusively to his country's independence.

Miranda sailed from New York in 1806 with a ship and some volunteers, and touched at St. Domingo, where he chartered two schooners, which were captured by Spanish cruisers ('guarda costas'). He himself escaped with his ship, and landed at Venezuela in the month of August. He sustained however a complete defeat, which prostrated the American cause till 1810. The supreme junta of Caracas for a moment roused the Spanish Americans again in favour of Ferdinand, who was then a captive of Napoleon I., and subsequently against Napoleon's sway, April 9, 1811. But the cause of independence went on prosperously till the same day of the following year (1812), when a tremendous earthquake destroyed 20,000 persons in Caracas, La Guayra, and Merida. The clergy took advantage of the calamity, and stigmatised the patriots as enemies to God, whose anger they had provoked by their rebellion. This fanatical outcry worked on the terror of the people, which was already great, and gave the Spanish army a complete triumph. General Miranda was forced to surrender, but he surrendered last of all, and not without honour. But a hard fate still awaited him; for when he was about to leave the country he was arrested by some of the officers of the independent party, and with a strange disregard of truth and probability, as well as of right feeling, was accused by Bolivar of being a traitor, and a secret ally of the British cabinet. Bolivar delivered Miranda to the Spanish general Monteverde, from whom he obtained for himself a safe conduct to retire to Curaçao. Monteverde, instead of protecting a man who was the victim of jealousy and envy, violated his agreement with Miranda, and sent him in chains to Spain. He was lodged in the prison of the restored Inquisition at Cadix till 1816, when death released him from his sufferings this most unfortunate veteran and martyr of South American independence.

MIRANDA, SA DE, one of the earliest poets of Portugal, and one of the chief founders of Portuguese literature, was born at Coimbra about the year 1495. He was of a noble family, and being intended by his father for the legal profession, was educated accordingly, and became professor of law in the university of his native town. Having however no inclination for such studies, upon the death of his father

he resigned his appointment, and visited Spain and Italy, chiefly for the purpose of studying the languages and literature of those countries. On his return to Lisbon he obtained an appointment at court, where he was regarded with much esteem; but was afterwards obliged to retire to his country seat of Tapada, near Ponte de Lima, in the province of Entre Douro y Minho, in consequence of some unpleasant affair in which he involved himself. In this seclusion, so well suited to his melancholy turn of mind, he devoted the remainder of his days to rural enjoyment, to his literary studies and occupations, and to music, of which he is said to have been passionately fond. It was also his good fortune to have for the companion of his retirement a wife to whom he was tenderly attached, although she was neither very young nor very beautiful when he married her. In 1558 he had the misfortune to lose his son, who was killed in Africa, and whose death he has bewailed in an elegiac composition of a strong devotional cast. His own death happened in 1568, and was an event that excited general regret.

Sa de Miranda has been styled the poet of reason and virtue, and it has been said of him that he was a philosopher in poetry and a poet in philosophy. Yet greatly as the literature of his country is indebted to him (and he was the first to adopt the metres of Dante and Petrarch), few of his productions are of a class to interest the modern reader. Except as specimens of language and versification, frigid eulogues and detached thoughts in the form of sonnets—not many of which are of striking merit—possess scanty attraction at present, for they have not even historic value as portraying the manners and sentiments of their own age. A considerable number of his compositions, and among them some of his best, are written in Spanish, a fashion in which he had afterwards many imitators, greatly to the prejudice of the native literature. As a dramatist, again, he not only imitated those of Italy, Macchiavelli and Ariosto, but laid his scenes in that country, and described Italian manners and characters. This however is of less consequence, as neither of his two pieces, 'Os Estrangeiros' and 'Os Vilhalpandos' (and he produced no others), shows much dramatic skill in contrivance, or comic power in execution. What is chiefly remarkable in them is the freedom with which the dissolute morals of the Italian clergy are delineated by one who was himself a rigorous Roman Catholic. His 'Cartas,' or poetical epistles, are of far greater intrinsic value than any of his other productions, and are interesting as records of the state of morals and manners in Portugal in the first half of the 15th century. They also throw some light on the poet's personal character, and show him to have been of a good disposition, and a sincere well-wisher to his countrymen.

MIRBEL, BRISSEAU, C.F., a French naturalist more especially distinguished for his knowledge of botany. He was born on the 27th of March 1776. He was appointed professor of botany in Paris in 1801, and one of his earliest published works was the lecture introductory to his course. The subject was the influence of the study of natural history on the civilisation of man. He was associated with others in the production of the volumes on the general and special history of plants, in the series of works in continuation of the natural history of Buffon. In this work, which extended to eighteen volumes, the first, second, fourth, fifth, and sixth, were written by Mirbel. In 1802 he published his treatise 'On Vegetable Physiology.' He was also associated with Lamarck in the publication of a great work on the 'Natural History of Plants,' which was published in 1808. He subsequently, in answer to views put forth by Link, wrote an 'Exposition of the Theory of Vegetable Organisation,' and also a defence of this work in 1808. In 1815 he published his 'Elements of Vegetable Physiology and Botany.' This work was published in three volumes, and was an admirable exposition of the state of vegetable physiology at the time it was published, and contained the result of numerous observations on the structure, functions, and development of plants. In 1835 he published a paper on the nature and origin of the bark on dicotyledonous trees, in which he gave an admirable account of the structure of the bark in exogenous plants. After this he published his celebrated paper on the 'Anatomy and Physiology of Marchantia Polymorpha,' in which he not only described the general structure of the plant, but the history of the development of its embryo. In his general theoretical views and numerous exact observations, Mirbel exercised a great influence on the progress of the science of botany during the first half of the 19th century. He died September 12, 1854.

MIRBELT, M. J. (MIRREVELT.)

MITCHELL, THOMAS, was born on the 30th of May 1783, in London, and was the son of a riding-master. At the age of seven he was admitted into Christ's Hospital, where he remained until 1802, when he went to Pembroke College, Cambridge, on one of the exhibitions of the Hospital. In 1806 he took his degree of B.A., and the distinguished manner in which he acquitted himself at college induced the governors of Christ's Hospital to present him with a handsome silver cup. He did not however obtain a fellowship as he had hoped, for no more than two persons educated at the same school are allowed to hold fellowships in Pembroke College at the same time. This regulation, which was then made and carried into effect for the first time, deranged all Mitchell's schemes, who had determined to devote himself to philological pursuits. A few years afterwards however his acquirements as a scholar procured him a fellowship at Sidney Sussex College, Cambridge. Mitchell never married, and if he

had taken holy orders he might have remained in the enjoyment of that fellowship for life, and would have been spared the cares and anxieties for a livelihood to which he was afterwards exposed. But he never took orders from a fear of the great responsibilities of the pastoral office, and consequently, after a limited number of years, he was obliged by the statutes of the college to vacate his fellowship. He afterwards earned his livelihood by private tuition and by writing for the press: he was engaged for ten years as tutor in private families. In 1813 he commenced a series of essays for the 'Quarterly Review' on Aristophanes and Athenian manners, and this led him to translate some of the plays of Aristophanes into English verse: his translation appeared in 2 vols. 8vo, 1820-22. His articles in the 'Quarterly Review' impressed the patrons of a vacant Greek chair in one of the Scotch universities with so much respect for his classical attainments, that they invited him to accept the situation; but as he would have had to sign the Confession of the Scotch Kirk, which was to him an insurmountable obstacle, he declined the lucrative office, notwithstanding his poverty. During the last twenty years of his life Mitchell lived with some of his relations in the county of Oxford, and occasionally superintended the publication of the Greek works which were from time to time printed at the Clarendon press. During the years 1834-38 he edited, in separate volumes, five of the plays of Aristophanes, with English notes; and in 1839 he began an edition of Sophocles, likewise with English notes; but after the first three tragedies had appeared, the publication was suspended in 1842, because English notes were thought objectionable; and Mitchell now had no other employment but what the Clarendon press might casually offer. The almost entire cessation of literary income not only caused him great pecuniary difficulties, but broke down his health and spirits. His friends became alarmed about him, and made his condition known to Sir Robert Peel, who immediately placed at his disposal the sum of 150*l.* from the royal bounty fund. In 1843 the publication of Sophocles was resumed, and the remaining four plays were likewise edited by Mitchell, though with briefer notes than the preceding three. In 1844 he undertook the publication of a minor edition of a 'Pentologia Aristophanica,' with short Latin notes, and had nearly completed his task when he died suddenly, on the 4th of May 1845, at his house at Steeple Aston near Woodstock. His health had long been in a weak state, but his death was unexpected.

The works Mitchell edited and commented upon contain evidence that he was a Greek scholar of considerable eminence; but his notes are often irrelevant, and the text of his author is seized upon to furnish opportunities of showing his strong political opinions: he had a passionate antipathy to the Athenian democracy and democratical forms of government in general. ('Classical Museum,' vol. iii. p. 213, &c.)

MITCHELL, SIR THOMAS LIVINGSTONE, KNIGHT, was born in 1792, at the residence of his father, John Mitchell, Esq., of Craigend, in Stirlingshire, Scotland. The name of Livingstone was assumed by the family on a marriage with the heiress of J. Livingstone, Esq., of Hadding, brother to Lord Viscount Kilguth, who was attainted in 1716. Thomas Livingstone Mitchell entered the British army in Portugal in 1808, and served on the staff till the termination of the Peninsular War, when he had attained the rank of major. In the course of this service he had distinguished himself so much as to attract the attention of the late Sir George Murray, upon whose recommendation he was sent back to the Peninsula to make surveys of the great battle-fields. The series of military maps which he constructed from these surveys are preserved in the Ordnance-office, and are unsurpassed for accuracy and skilful execution. A model which he formed of the Lower Pyrenees is in the Museum of the United Service, Whitehall. He married in 1818 the daughter of Lieutenant-General Blunt.

In 1827 Major Mitchell published 'Outlines of a System of Surveying for Geographical and Military Purposes,' 8vo, London. In the same year he received the appointment of deputy surveyor-general of New South Wales under Mr. Oxley, whom he succeeded as surveyor-general—an office which he retained till his death. Besides performing the ordinary duties of this important situation, he conducted four expeditions into the interior, and was one of the most successful of the explorers of the Australian continent. Three of these expeditions were performed in the years 1831-32, 1835, and 1836. The first was in search of an imaginary river called the Kindur, which a runaway convict, who had resided among the aborigines, described as having a north-west course, and entering the sea; and the result of the journey was the discovery of the Peel River and the Nammooy. The second expedition was for the purpose of exploring the course of the river Darling, and was continued in the third expedition, when the Darling was traced to its junction with the river Murray. Australia Felix was also discovered, and the Glenelg was explored to its entrance into the sea. These journeys were attended with great danger from the occasional hostility of the native tribes, and required continual vigilance, combined with the steadiness and resolution of an experienced leader. Major Mitchell published in 1838 his account of these journeys, under the title of 'Three Expeditions into the Interior of Eastern Australia, with Descriptions of the recently-explored Region of Australia Felix, and of the present Colony of New South Wales,' 2 vols. 8vo, London, illustrated with lithographic drawings and wood-

outs. He had a short time previously published his 'Map of the Colony of New South Wales, compiled from actual Measurements with the Chain and Circumferenter, and according to a Trigonometrical Survey, in Three Sheets.' Major Mitchell came to England for the purpose of superintending these publications, and, before his return, received, in 1839, the honour of knighthood from the queen, and the title of D.C.L. from the University of Oxford. He was also elected a Fellow of the Royal Society and of the Geographical Society.

Sir Thomas Mitchell's fourth and last expedition was commenced in December 1845, and terminated in December 1846. His account of it was published in 1848, under the title of a 'Journal of an Expedition into the Interior of Tropical Australia, in Search of a Route from Sydney to the Gulf of Carpentaria, by Lieut.-Colonel Sir T. L. Mitchell,' 8vo, London, illustrated with lithographic engravings and maps. This expedition did not reach the Gulf of Carpentaria, having been compelled to return in consequence of the loss of the cattle and horses from drought and want of pasturage; but advanced as far as 21° 30' S. lat. Sir Thomas Mitchell himself was the first to discover the important river which he named the Victoria, and saw it taking a north-western course, in a direction towards the Gulf of Carpentaria. Mr. Kennedy however, Sir T. Mitchell's assistant-surveyor, in a subsequent journey in 1847, found that the river makes a great bend to the south-west, and he traced its course in that direction as far as 26° 14' S. lat. The channels were in many places quite dry, and he was compelled to return from want of water and pasturage for his horses. In 1850 Sir Thomas Mitchell published an admirable manual of geography for the schools of New South Wales, entitled 'Australian Geography, with the Shores of the Pacific and those of the Indian Ocean, designed for the Use of Schools in New South Wales,' 12mo, Sydney. In 1853 he again visited England. Having invented a new propeller for steam-vessels on the principle of the curious instrument used by the natives of Australia, he delivered a lecture on the subject which excited much interest. It was published under the title of 'Origin, History, and Description of the Boomerang Propeller, a Lecture delivered at the United Service Institution,' 8vo, London.

Sir Thomas Mitchell was advanced to the rank of colonel in 1854. He died October 5, 1855, at his residence near Sydney, and his remains received the honour of a public funeral.

MITFORD, MARY RUSSELL, one of the most delightful of our female authors, was born on the 16th of December 1786, at Alresford, Hampshire. Her father was a physician, and a man of very considerable attainments and ability, but of unthrifty and somewhat eccentric habits, and consequently unsuccessful alike in his professional pursuits and in his pecuniary affairs. By his general want of management and injudicious speculations he wasted his wife's property as well as his own, and when a characteristic present made—when his own fortunes were at the lowest ebb—to his daughter on her tenth birthday, of a ticket in the Dublin lottery, turned up a prize of 20,000*l.*, that too was as thoroughly, though somewhat more slowly, dissipated as his previous wealth had been. Yet he was a man of the kindest and most cheerful, as well as sanguine temper, and Mary Mitford, his only child, without a murmur dedicated her life to the promotion of his comfort and happiness, and almost before arriving at womanhood devoted herself to literature as a means of eking out his diminished income.

At ten years of age she was sent to a boarding-school at Chelsea; and in addition placed under the special guidance of a governess, who, as Miss Mitford mentions in the introduction to her dramatic works, was not only herself addicted to verse-writing, but seemed to have the faculty of making her pupils write verses also; and among her pupils she at different times numbered, besides Miss Mitford, Miss Landon (L. E. L.), Fanny Kemble, and Lady Caroline Lamb. Miss Mitford took the poetic fit strongly; and before she was twenty she had published three volumes of poetry, one of which was a romance in verse after the manner of Sir Walter Scott. They were not of much worth, but they met with rougher treatment at the hands of the 'Quarterly,' than their juvenile demerits justified. But though pained she was not disheartened, and she profited by the somewhat rough lesson. Another volume of verse—'Watlington Hill; a Poem,' was published in 1812. She had by this time deliberately adopted literature as a profession, and was busy in writing short tales and sketches for the magazines. She had acquired facility and confidence by these exercises, when the early celebrity probably of the 'Sketch-Book of Geoffrey Crayon,' turned her thoughts to the writing of some descriptive sketches of English rural scenery and rustic life. A pleasant little village on the borders of Berkshire and Hampshire—Three Mile Cross, near Reading—had long been her residence; every lane and field, and almost every nook and corner of it, every house and cottage, and almost every person in them was familiar to her; and it occurred to her that faithful delineations of the country scenery and country manners as they existed in that small southern village would not be unwelcome to the world of readers.

But she met in the first instance with serious discouragement. Thomas Campbell was then editor of the 'New Monthly Magazine,' and the earlier essays of what ultimately formed 'Our Village' were offered to him, but peremptorily rejected. They were beneath the dignity of his magazine. After other rebuffs they were fain to take shelter in the 'Lady's Magazine.' There their freshness, geniality, and

faithfulness were recognised, and Miss Mitford, nothing loth, was called upon to publish them in a collected form. By the general public 'Our Village' was warmly welcomed, and each series has been several times reprinted. They have found many imitators too, but hitherto no rivals. She wrote in the Preface when they were first collected:—"Her descriptions have always been written on the spot and at the moment, and in nearly every instance with the closest and most resolute fidelity to the place and the people. If she be accused of having given a brighter aspect to her villagers than is usually met with in books, she cannot help it, and would not if she could. She has painted, as they appeared to her, their little frailties and their many virtues, under an intense and thankful conviction, that in every condition of life goodness and happiness may be found by those who seek them, and never more surely than in the fresh air, the shade and the sunshine of nature." This is a fair account of them, and fairly represents, moreover, the genial and hearty spirit of their authoress. 'Our Village' is in all respects a work that more than almost any other represents in literature that phase of English taste and feeling, which is so characteristically exhibited in our best water-colour landscapes and scenes of country life—so redolent of the open air and sunshine. 'Our Village' altogether extended in its original collected form to five volumes, or series, the last of which was published in 1832. Of some of the sketches in the last volume or volumes it must however be admitted that there is a little want of the primal freshness, and in them, and in some of her later essays, there is too much yielding to the besetting sin of those who depict character—the tendency to exaggeration or caricature. 'Belford Regis; or Sketches of a Country Town,' in which the neighbouring town of Reading, instead of the pretty country hamlet, supplied the materials, was her most important subsequent work in a similar style. Her later sketches and essays furnished to various periodicals have not we believe been collected. Among her other works may be mentioned her 'Stories of Country Life.' She also for some years edited Finden's 'Tableaux'; and three volumes of 'Stories of American Life by American Authors.'

Whilst at the Chelsea school Miss Mitford's dramatic tastes had been as carefully nurtured as her poetic tastes. The consequence was that in early life her most ardent aspirations as an authoress were directed towards the stage. She wrote altogether a large number of dramatic pieces of various kinds. Four of these were works of considerable importance. The first, 'Julian,' was performed in 1823, with Macready for the hero, and met with decided success. The 'Foscari' appeared with equal good fortune in 1826; and 'Rienzi,' which had a run, in 1828. 'Charles the First' was not so fortunate as its predecessors; Colman then licensor of plays, having refused to sanction its performance on the ground of the impropriety and danger of permitting the trial of an English king to be represented on the stage. Driven from the legitimate houses, Charles I. was at length brought out at a minor theatre, the Coburg, and it has not apparently been repeated elsewhere. Besides these an opera, 'Sadak and Kalasrad,' written by her, was produced at the Lyceum, but was unsuccessful. One of Miss Mitford's last literary appearances was in an edition of her 'Dramatic Works' (2 vols. 8vo, 1854), which, besides the pieces above named, included a tragedy—printed for the first time—'Otto of Wittelsbach'; 'Inez di Castro,' another five-act piece, twice rehearsed for performance, and twice withdrawn; a melodrama, 'Gaston de Blondeville'; and several 'Dramatic Scenes.'

In looking at Miss Mitford's works, it should be borne in mind that, though they seem almost invariably the reflex of a mind full of happy images, and surrounded by pleasant circumstances, they were often really written under the pressure of pecuniary discomfort and during much ill-health. As long as her father lived her attention to him was unremitting, and her own health suffered from her filial devotion: shortly after his death it gave way entirely. Yet she lived and laboured on in her pretty Berkshire cottage, beloved by every friend, and cheered often by finding that her books had made her friends innumerable. About three years before her death she was hurt by the accidental overturning of her pony-chaise, and thenceforth she was pretty much confined to her house; but through her prolonged and hopeless suffering, she retained her wonted cheerfulness, and even her old industry was continued. Besides revising the work on which her fame is chiefly founded—'Our Village'—for a new edition, which appeared in 1852, she compiled a sort of literary patch-work, 'Recollections of My Literary Life; or Books, Places, and People,' which is in fact a sort of gossiping commentary on the "books, places, and people" that had, she fancied, most influenced her mental career, with a somewhat large addition of extracts from her favourite authors. She also prepared the collected edition of her 'Dramatic Works,' already noticed—to which works she prefixed various autobiographic introductions; and in 1854 she published 'Atherton; a novel,' in 3 vols. She died at her residence, Swallowfield Cottage, near Reading, on the 10th of January 1855.

MITFORD, WILLIAM, the eldest son of John Mitford, Esq., of Ebury in Hampshire, was born in London on the 10th of February 1744. In his boyhood he spent some time at the school kept at Chesham in Surrey by the well-known Mr. Ghipin, who afterwards owed to him the living of Boldra. [GILPIN, REV. WILLIAM.] Ill-health caused his removal from school about the age of fifteen; and it seems to have been with very insufficient preparation that he became a

student of Queen's College, Oxford. His time at the university was idly spent; and he left it without taking a degree. Perhaps the most important influence exercised on his mind by his academical residence was derived from the Vinerian lectures of Blackstone, which he attended regularly. He studied law for a time in the Middle Temple, but found the study distasteful; and, having succeeded to the family estate in 1761, on his father's death, he abandoned the profession to his younger brother, who afterwards became Lord Redesdale. In 1766 Mr. Mitford married; and for seven years afterwards his time was chiefly spent in the retirement of his country-seat, where his early predilection for the Greek language and literature grew into a settled passion. In 1769 he became a captain in the South Hampshire militia, of which the historian Gibbon was then major; and the conversation and advice of Gibbon confirmed, if they did not prompt, his resolution to undertake a history of Greece.

Mr. Mitford's first work, 'An Inquiry into the Principles of Harmony in Languages, and of the Mechanism of Verse, Modern and Ancient,' appeared in 1774, and was reprinted in 1804. In this early part of his life, too, he published 'A Treatise on the Military Force, and particularly the Militia, of this Kingdom.' In 1776 he lost his wife, and was himself seized with a dangerous illness, on his recovery from which he left England to spend the winter at Nice. Before leaving home he had become acquainted with the French scholars Villoison and De Meunier: the former introduced him to the Baron de Sainte Croix; and his intercourse with these young and ardent students matured his own literary ambition. On his return home however, he allowed public duties to claim frequent precedence. He acted as a county magistrate, and in 1778 was appointed Verdurier of the New Forest. He retained his commission in the militia, succeeded to Gibbon's lieutenant-colonelcy in 1779, and in 1805 was appointed to the colonelcy, which he resigned in the course of the next year. From 1785 till 1790 he sat in the House of Commons as member for Newport in Cornwall; from 1796 till 1806 he represented Beerlinton, a nomination borough of his maternal kinsman the Duke of Northumberland; and from 1812 till 1818 he was member for New Romney. His parliamentary appearances were chiefly confined to two or three speeches on the militia laws. In 1802 he succeeded, through his mother, to the Revelly estates in Yorkshire. But his paternal estate on the borders of the New Forest continued to be his country residence. He died there on the 8th of February 1827.

His 'History of Greece' was written and published in successive portions, the dates of the first edition, in quarto, being the following: vol. i., 1784 (second edition, 1789); vol. ii., 1790; vol. iii., 1797; vol. iv., 1808; and vol. v., 1818. It closes with the death of Alexander the Great; and the author, enfeebled by age and partly blind, was unable to execute his intention of continuing it to the subjugation of Greece by the Romans. In 1815 appeared an octavo edition of the volumes which had previously been published; and in 1829 there appeared a new edition of the whole work, in eight octavo volumes (since reprinted), with an introduction by his brother, Lord Redesdale, furnishing some particulars of the author's life, but chiefly taken up in vindicating the political opinions expressed in the work. These opinions have exposed Mr. Mitford's 'History' to much animadversion. He is determinedly anti-democratic; and this turn of thinking affects seriously the fairness of the estimate which he forms both of characters and of events. His partisanship is especially palpable in his account of the war between the Greeks and Philip of Macedon. Philip is with him a perfect king, hero, and statesman. Demosthenes is a dishonest and malignant demagogue, and the Athenians are a horde of treacherous miscreants. Yet the author's research and perspicacity have thrown light upon this as well as upon other parts of Grecian history. He has elucidated with remarkable success the state of political parties in some of the severest struggles of Greek politics; and he has suggested new and more accurate views of many particular events. He has been led to these results mainly by his critical way of estimating the ancient authorities, and by his systematic endeavour to gain his knowledge from contemporary sources. Accordingly his history will probably retain a certain value with the classical student, notwithstanding the bias above noticed, and in spite also of its deficiency both in philosophical reflection and in animation of narrative. For the general reader and historic student it has been superseded by the very superior works of Grote and Thirlwall. In style Mitford's work is exceedingly faulty; and the few corrections made in the last edition have removed only the least of the technical faults, the perverse affectation of the orthography. A treatise on the religions of Ancient Greece and Rome, which he published late in life, in a small octavo volume, was regarded by him as a supplement to his 'History,' and would probably have formed a part of it had he been able to complete his original design.

MITHRADATES, or MITHRIDATES, a common name among the Medes and Persians, which appears to have been formed from 'Mitra,' or 'Mithra,' the Persian name for the sun, and the root *da*, signifying 'to give,' which occurs in most of the Indo-Germanic languages. The name however was written in several ways. In Herodotus (l. 110) we find *Μιθραδάτης*; in Xenophon ('Anab.,' vii. 8, § 25), *Μιθραδάτης*; in the Septuagint (Ezra i. 8, iv. 7), *Μιθραδάτης*; and in Tacitus ('Ann.,' xii. c. 10), 'Meherdates.' On the Greek coins it is written *Mithradates*.

Mitra, or Mithra, is said by some writers to have been one of the

most powerful good spirits created by Ormuz. The mysteries of Mithra were celebrated with much pomp and splendour on the revival of the Persian religion under the Sassanides; but we do not read of the worship of the sun under this name in the earlier Greek writers. (Hyde, 'Hist. rel. vet. Pers.,' c. 4, p. 109.) The word is evidently the same as 'mitra,' one of the names for the sun in Sanskrit; and it also appears in many other ancient Persian names. (Pott's 'Etymologische Forschungen,' i, p. xlvii, &c.; Rosen, in 'Journal of Education,' ix, pp. 334, 335.)

The most celebrated race of princes of the name of Mithridates were the kings of Pontus, who were descended from Artabazus, one of the seven Persian chiefs who overthrew the Magi, B.C. 521. (Florus, iii. 5; Diod., xix. 40; Polyb., v. 43.) The following is a list of these kings:—

MITHRIDATES I. was the son of Ariobarzanes, but little is known of him. He was dead before Ariobarzanes II. made himself master of the countries over which he had held rule, B.C. 363. (Aristot., 'De Rep.,' v. 10.)

MITHRIDATES II. succeeded Ariobarzanes II., B.C. 337. He took an active part in the various wars which were carried on by the successors of Alexander the Great; and being an active and enterprising prince, he greatly extended his paternal dominions, whence he is frequently surnamed the founder (*κτίστης*) of the kingdom of Pontus. He also ruled over Cappadocia and Phrygia. He was put to death by Antigonus, B.C. 302, at Cius, in Mysia, at the age of eighty-four, according to Lucian ('Macrob.,' c. 13), because he was suspected of favouring the interests of Cassander.

MITHRIDATES III., son of the preceding, ruled from B.C. 302 to B.C. 286, and considerably extended the possessions he had inherited. He was succeeded by his son Ariobarzanes III.

MITHRIDATES IV., the son and successor of Ariobarzanes III., was left a minor by his father. His accession to the throne is placed by Clinton in B.C. 240, but it probably took place several years earlier. He attacked Sinope, which was taken by his successor Pharnaces, and carried on war against Eumenes II. He was in close alliance with the Rhodians, and joined with some other princes of Asia Minor in making valuable presents to that people, to repair their losses after an earthquake. (Polyb., v. 89, 90.) He married the sister of Seleucus Callinicus, by which alliance he obtained Phrygia. His own daughter was married to Antiochus the Great. His death is placed by Clinton in B.C. 190.

MITHRIDATES V., surnamed Evergetes, was the son of Pharnaces I. and grandson of Mithridates IV. He reigned from about B.C. 156 to 120. He was an ally of the Romans, and assisted them in the third Punic war with a considerable fleet. He was assassinated at Sinope by some of his attendants who had entered into a conspiracy against him.

MITHRIDATES VI., B.C. 120, surnamed Eupator, and called the Great, was one of the most formidable enemies that the Romans ever encountered. He was only eleven years old at the death of his father Mithridates V. whom he succeeded; and during his minority his life was frequently in danger from the numerous conspiracies against him. He is said to have been in the habit of taking an antidote discovered by himself, which was sufficient to counteract the effect of the most violent poisons. (Plin. 'Hist. Nat.' xxiii. 77; xxv. 3; xxix. 8.) Mithridates possessed a strong mind and a vigorous body; he excelled in all athletic sports, and was distinguished in his early years by his bodily strength and his daring spirit. He had also paid great attention to the study of philosophy and polite literature; and, according to Pliny, was able to converse in twenty-two different languages ('Hist. Nat.' xx. 3).

As soon as Mithridates was old enough to take the government into his own hands, he attacked the Colchi and the other barbarous nations who dwelt on the eastern shores of the Black Sea, whom he reduced to subjection. The next acquisition which he made was Paphlagonia, which was said to have been left to the kings of Pontus by Pylæmenes II., king of Paphlagonia, who died about B.C. 121. Part of Paphlagonia he gave to Nicomedes II., king of Bithynia, who was, next to Mithridates, the most powerful monarch in Asia Minor. Nicomedes however was jealous of the increasing power of Mithridates; and on the death of Ariarathes VII., king of Paphlagonia, who had married a sister of Mithridates, Nicomedes married his widow, and seized the kingdom of Cappadocia, to the exclusion of the son of Ariarathes. Mithridates immediately took up arms in favour of his nephew, defeated Nicomedes, and placed his nephew on the throne under the title of Ariarathes VIII. In a few months afterwards he was murdered, at a private conference, by his uncle, who placed a son of his own on the vacant throne, and defeated successively the brother of the late king, and a pretender to the throne, whom Nicomedes represented as a son of Ariarathes.

Unable to cope with his formidable enemy, Nicomedes applied to Rome; and the Romans, who had long been anxious to weaken the power of Mithridates, declared both Cappadocia and Paphlagonia to be free states, but allowed the Cappadocians, at their own request, to elect Ariobarzanes as their king. Mithridates however did not tamely submit to the loss of his dominions. He entered into alliance with Tigranes, king of Armenia, to whom he gave his daughter in marriage; and with his assistance he expelled Ariobarzanes from his kingdom, and also deprived Nicomedes III., who had lately succeeded his father

of Bithynia. The two expelled kings applied to the Romans for assistance, who reinstated them in their kingdoms, and sent an army, under the command of Aquilius, to support them. A war with the Romans was now inevitable, and Mithridates conducted it with the greatest vigour. The Roman armies were defeated one after another; Aquilius was taken prisoner, and put to death by having melted gold poured down his throat; and in B.C. 88 the whole of Asia Minor was in the hands of Mithridates. In the same year he commanded all Romans to leave the country; but before they could do so, they were massacred by the inhabitants of the different provinces of Asia Minor, to the number, it is said, of 80,000. Whether this massacre took place by the command of Mithridates, or was occasioned by the hatred which the Asiatics bore towards the Romans, is doubtful. The islands in the Grecian Archipelago followed the example of the countries on the mainland. Athens also submitted to his power, together with several other places in Greece. The Rhodians, the only people who offered him any vigorous resistance, were attacked, but without success.

In B.C. 87, Sulla arrived in Greece, and immediately commenced the siege of Athens, which was taken on the 1st of March in the following year. Sulla followed up this success by the defeat of Archelaus, the general of Mithridates, near Chæronea, and shortly afterwards by another victory near Orchomenus. During the successes of Sulla in Greece, the party of Marius had obtained the ascendancy in Rome; and Flaccus, who had been consul with Cinna, was sent to succeed Sulla in the command. Flaccus however was put to death by Fimbria, his lieutenant general, an unprincipled man, but who possessed considerable military talents, and prosecuted the war against Mithridates in Asia with great success. The victories of Fimbria, and the state of parties at Rome, made Sulla anxious for peace, which was at length agreed upon (B.C. 84) on condition that Mithridates should abandon all his conquests in Asia, and restore Bithynia to Nicomedes, and Cappadocia to Ariobarzanes.

But this war was scarcely finished before Mithridates was again involved in hostilities with the Romans. Mithridates had collected a large army to carry on war against the Colchi. Murena, who commanded in Asia, perceiving or pretending to perceive a disposition in Mithridates to renew the war, seized the opportunity of enriching himself, and, without any authority from the senate or Sulla, invaded the dominions of Mithridates, and collected much plunder. Mithridates, having in vain complained to the senate, collected an army to defend his dominions, and completely defeated Murena on the banks of the Halya. But as Sulla was displeased with Murena for having attacked Mithridates, the peace was renewed, and thus an open rupture was avoided for the present.

During the next eight years Mithridates employed himself in making preparations for a renewal of the war; and in B.C. 75 he broke the treaty which existed between him and the Romans by the invasion of Bithynia. Lucullus was appointed to the command, B.C. 74, and commenced the campaign by besieging Cyzicus, a city on the Propontis, which had been supplied by Mithridates with every description of military stores. In the following year Mithridates made an effort to relieve the town, but was defeated by Lucullus, and obliged to retire to Pontus. He was soon after followed by Lucullus, and having lost another battle at Cabiri, on the borders of Pontus and Bithynia, he fled into Armenia to his son-in-law Tigranes. His own son Mithridates, who had been appointed king of the wild tribes on the eastern shores of the Euxine, refused to assist his father, and provided for his own safety by making peace with Lucullus.

Coin of Mithridates.  
British Museum. Actual size. Silver.

In B.C. 69, Tigranes was completely defeated by Lucullus, during the absence of Mithridates, near his capital Tigranocerta, which was soon after taken by the conqueror. In the following year Tigranes was again defeated, together with Mithridates, near Artaxata; but Lucullus was not able to derive all the advantages he might have done from his victories, in consequence of the mutinous disposition of his troops. [LUCULLUS.] Mithridates was thus enabled to collect another army without opposition; and having returned to Pontus, he defeated the Roman general Triarius, with the loss of 7000 men, before Lucullus could march to his assistance. This victory was followed by others; various parts of Asia Minor again submitted to his authority; and the Romans appeared to be on the point of losing all the acquisitions they had made during the war. But the power of Mithridates had been shaken to its foundation; and on the appointment of

Pompey to the command, B.C. 66, the war was soon brought to an end. Mithridates was defeated on the banks of the Euphrates; and in consequence of Tigranes having submitted to Pompey, he fled to the barbarous tribes dwelling to the north of Caucasus, who received him with hospitality and promised him support. The spirit of Mithridates had not yet been broken by adversity; and he purposed, with the assistance of the Colchi and Scythians, to carry into execution a plan which he is said to have formed in his earlier years, namely, of marching through Thracia and Macedonia, and invading Italy from the north. But these plans were frustrated by the plots of his eldest son Pharnaces, who gained over the army to his side, and deprived his father of the throne. Unwilling to fall into the hands of the Romans, Mithridates put an end to his own life, B.C. 63, at the age of 68 or 69, after a reign of fifty-seven years.

MITSCHERLICH, EILARD, professor of Chemistry in the University of Berlin. He was born on the 7th of January 1794, at Neurede, near Jever, where his father was a clergyman. He received his early education at the Gymnasium at Jever. In 1811 he commenced his studies at the University of Heidelberg, where he devoted himself to history, philology, and the Oriental languages. In 1813 he studied in Paris, and in 1814 went to Göttingen. He now turned his attention to geology and chemistry. He was the first to draw attention to the fact that two bodies having the same composition could assume different forms. This attracted the notice of Berzelius, who gave the name of 'Isomerism' to the new law discovered by Mitscherlich. After this Mitscherlich proceeded to Stockholm, where he studied with Berzelius till 1821, when he was appointed Professor of Chemistry in the University of Berlin. His great work is his 'Manual of Chemistry,' in 4 vols. This work was commenced in 1829 and finished in 1833. It has gone through many editions, and is regarded as one of the most valuable of the numerous recently-produced introductions to the science of chemistry. The especial character of this work is the way in which it treats of the principles of chemical science from a physical and mathematical point of view. The highest praise that perhaps can be given to Professor Mitscherlich is that he is the most distinguished of the disciples of the great Berzelius. [See SUP.]

MOAB, the son of Lot by his elder daughter (Genesis xix. 37), and founder of the MOABITES. The Moabites were consequently related to the Ammonites, with whom we find them closely connected in their subsequent history. The earliest accounts represent them as dwelling in the country on the east of the Dead Sea and the river Jordan, on both banks of the river Arnon (Wady Modjeb), from which they had driven out the Emim, who were said to be a tribe of giants. (Deut. ii. 11; Gen. xiv. 5.) The plains on the east of the Jordan near its mouth were called from them the Plains of Moab. (Numb. xxii. 1; Josh. xiii. 32; Deut. xxxiv. 1, 8.) Before the invasion of Canaan by the Israelites they had been dispossessed by the Amorites of the country north of the Arnon, which was thenceforth their northern boundary. (Numb. xxi. 13, 26; xxii. 36; Judges xi. 18.) At the division of Canaan among the tribes of Israel this tract of country was given to Reuben and Gad.

By the command of God, the Israelites left Moab in undisturbed possession of their country. (Deut. ii. 9; Judges xi. 15, 18; 2 Chron. xx. 10.) But while the Israelites, after conquering the Amorites, were encamped in the Plains of Moab, Balak, the king of Moab, sent for the prophet Balaam to curse them. (Numb. xxii.-xxiv.) Balaam found himself compelled by a divine impulse to bless the people whom he meant to curse, but was more successful in seducing them to the licentious worship of Baal-peor by means of the daughters of Moab. (Numb. xxv. 1; xxxi. 16; Rev. ii. 14.) For this offence, and for neglecting to assist the Israelites on their march, the Moabites were excluded from the congregation of God to the tenth generation. (Deut. xxiii. 3, 4; Nehem. xiii. 1, 2.)

In the time of the Judges, Moab, in league with the children of Ammon and Amalek, invaded the land of the Israelites, and ruled over them for eighteen years. They were at last delivered by Ehud, who assassinated Eglon, the king of Moab. (Judges iii. 12-30.) After this time it appears from the book of Ruth that there was a period of friendly intercourse between the two nations. Saul warred against Moab (1 Sam. xiv. 47), and David made them tributary to Israel. (2 Sam. ii. 8.) The tribute which they paid consisted of sheep and lambs. (2 Kings iii. 4.) After the partition of the kingdom we find Moab subject to the king of Israel, against whom they rebelled after the death of Ahab, in B.C. 897. (2 Kings i. 1; iii. 5; and Is. xvi. 1.) Jehoram, the son of Ahab, assisted by Jehoshaphat, king of Judah, defeated them in a great battle, but failed to subdue them. (2 Kings iii. 6-27.) Soon after this Moab, with the Ammonites and other nations, invaded Judah, but the invaders quarrelled among themselves and destroyed each other. (2 Chron. xx.) In the reign of Joash, about B.C. 838, the Moabites again made incursions upon Israel. (2 Kings xiii. 20.) It is probable that after the tribes of Reuben and Gad had been carried captive by Tiglathpileser (about B.C. 740), the Moabites recovered the country they had formerly possessed north of the Arnon, for Isaiah (xv., xvi.) speaks of towns of the Moabites in that district; but from the same prophecy it would appear that they

were again driven back over the Arnon by the Assyrians. In common with the other nations on the borders of Palestine, the Moabites were subdued by Nebuchadnezzar, under whom they made war upon Judah. (2 Kings xxiv. 2.) From Jeremiah xxvii. it would appear that near the beginning of the reign of Zedekiah, the Moabites and other neighbouring nations endeavoured to persuade him to revolt from Nebuchadnezzar, but without immediate success, as the rebellion of Zedekiah did not take place till about the ninth year of his reign. (2 Kings xxiv. 20; xxv. 1.) According to Josephus, the Moabites and Ammonites were reduced to subjection by Nebuchadnezzar in the fifth year after the destruction of Jerusalem. ('Antiq.' x. 9.7.) This may have been the event referred to in the prophecies of Ezekiel (xxv. 8-11) and Zephaniah (ii. 8-11). The Moabites are incidentally mentioned in several other passages of the Old Testament, and by Josephus. The prophecies contain many threatenings against them. Their name ultimately disappeared in that of the Arabians.

The Moabites were a pastoral people. (2 Kings iii. 4.) Their country was well adapted for rearing cattle, and also produced corn and wine. (Ruth i. 1; Is. xvi. 8-10.) It contained many mountains and fertile valleys, and was well watered by the Arnon, the Zered, and other rivers which fall into the Dead Sea. It is called by Josephus *Moabitis* ('Bell. Jud.' iii. 3. 3; iv. 8. 2), and corresponds to part of the present district of Kerek. Several cities of Moab are mentioned in the Old Testament. (Is. xv. xvi. &c.) The capital was Ar, or Rabbath-Moab (Deut. ii. 9), afterwards called Areopolis. Its ruins, which still retain the name of Rabba, lie about 25 miles south of the Arnon, near a stream which is now called Beni-Hamed. Jerome states that the city was destroyed by an earthquake in his youth. The country of Moab was well peopled, as is proved by the numerous ruins found there. The Moabites were governed by kings, (Numb. xxii. 4; Judges iii. 12; 1 Sam. xxii. 3; Jer. xxvii. 3) and inferior princes (Numb. xxii. 8, 14; xxiii. 6). Their religion was the licentious idolatry of Baal-peor and Chemosh (Numb. xxv. 1-4; 2 Kings xxiii. 13). In cases of extreme danger they offered human sacrifices. (2 Kings iii. 27.)

(Relandi, *Palestina*; Calmet, *Dictionary*; Winer, *Biblisches Realwörterbuch*; Burckhardt, *Travels in Syria*.)

MOCHNACKI, MAURYCY, an eminent Polish critic and historian, and also remarkable for the part he took in the insurrection of 1830, was born on the estate of Bojaniec in Galicia, in 1804. In 1823 he commenced the study of the law at the university of Warsaw, and in 1825 commenced with Podcasszynski the publication of the 'Dziennik Warszawski,' or 'Warsaw Journal,' a literary periodical to which Brodzinski, Lelewel, Mickiewicz, and other writers of the first reputation in Poland, were contributors. As he was on the point of passing his examination to practise as an advocate, he was arrested on a charge of belonging to secret societies, and afterwards struck off the list of students, declared incapable of holding any office under the government, and not only imprisoned in the Carmelite convent at Warsaw, but it is said condemned to labour in chains as a criminal in the gardens of the Belvedere, the palace of the Grand-duke Constantine. He was released before 1830, and in that year his reputation was suddenly raised by the appearance of a volume 'O Literaturze Polskiej w wieku dziewietnastym' ('On Polish Literature in the 19th century'), in which he advocated the principles of what is called "the romantic school" in poetry, with a spirit of which no other Polish critic had shown an example. The public was at once gained over to his views, and the author of a history of Polish literature published at Posen in 1845, speaks of Mochnacki as taking decidedly the first place as a writer in prose as Mickiewicz in poetry.

Of the insurrection against the Russians which broke out on the 29th of November 1830, Mochnacki was one of the leading promoters. The measures of the provisional government which was at first established, and which entered into negotiations with the Archduke Constantine, excited his strong disapprobation, and it has been since generally acknowledged that they were founded on a mistaken policy; but the measures he adopted against them turned out even more disastrous to the cause of Poland. Already, on the night of the 2nd of December, at the first meeting of the "Patriotic Club," with his friend and former fellow-prisoner Xawery Bronikowski in the chair, he proposed that the provisional government should be called upon to retain the Archduke Constantine as a prisoner and hostage, and that in case of their refusal they should be compelled to admit into their body additional members nominated by the Club. A deputation of the club proceeded, escorted by a mob, to the Bank, in which the government was assembled, and entered the room of council with arms in hand. The result of a strong discussion, in which Mochnacki made his demands, and Niemcewicz, the poet, an aged member of the provisional government, bared his breast to endure death rather than yield to the demands of a mob, was that the government gave way, and the two delegates Bronikowski and Mochnacki were admitted members. Chlopicki, who was soon afterwards named dictator, was an object of suspicion to Mochnacki, who, in a meeting of the club a few days after, declared that the dictator was betraying the revolution. Amid a tremendous uproar, Bronikowski was required to say on his word of honour if he shared the suspicions of his colleague, and he replied in the negative. Mochnacki, assailed with cries of "Down with the slanderer, down with the Polish Robespierre," owed it to

good fortune that he escaped from the hall alive. He attributed the defeat of his proposal to the machinations of the Prince Lubecki, one of the principal members of the provisional government, and on the next day by a fiery speech on horseback to the school of ensigns, a body of young officers who had commenced the insurrection, he induced them to follow him to an attack on the Bank, with the intention of destroying the prince. On their way they were met by one of their officers, Wysocki, an intimate friend of Mochnacki, to whom he whispered his purpose; on which Wysocki, planting himself in their way, declared that they should only pass over his body. The ensigns wavered and dispersed. Mochnacki, detested as an incendiary, was sought in the course of the day by an infuriated mob, eager to consign him to the gibbet, and to save his life was allowed to conceal himself in the house of Prince Lubecki, who reasoned calmly with him on the injury his rashness was doing to the cause. All this is related by Mochnacki himself.

The growing unpopularity of the dictator soon permitted Mochnacki to make his reappearance in public and to receive congratulations on the sagacity which had enabled him to desery the danger of relying on Chlopicki's fidelity to the cause. He joined the army, first as a common soldier, then as an officer, and gained so remarkable an influence, that, according to the testimony of Mieroslawski, though nominally a lieutenant, he in reality directed the sentiments of a large portion of the soldiery. He fought with distinction at Grochow and Ostrolenka, receiving at the latter battle a wound, to recover from which he was removed to Warsaw, where he wrote articles in the newspapers, which produced a strong sensation. The influence he exerted towards the conclusion of the war appears to have been in favour of that sanguinary violence which alienated from the cause of the revolution many, in England and elsewhere, whose wishes had been at first the most ardent for its success. Mochnacki, after the capture of Warsaw by the Russians, found his way to France, where he occupied himself with writing the history of the insurrection; the first two volumes of which, from his pen, are accompanied by a preface, bearing date "Marly-le-Roy, 21st November 1833." They appeared in 1834; and on the 20th of December 1834 the author died at Auxerre, where his remains are honoured with a fine monument.

The most important work of Mochnacki is the 'Powstanie Narodu Polskiego' ('Insurrection of the Polish Nation'), which it is a loss to the history of the 19th century that he did not live to complete. It is a vivid, lucid, and apparently candid narrative, in which the writer certainly relates things of himself which he could hardly expect to gain for him the sympathies of the reader. The account we have given of his violent course of conduct at the outset of the revolution is taken from this book. The book does not appear to have ever been translated throughout in any language, but in a volume on the 'Insurrection in Poland,' by S. B. Gnorowski, published at London in 1839, and dedicated to Campbell, some of the most spirited passages are appropriated from Mochnacki without acknowledgment. In 1854 a pamphlet, on the designs of Russia, entitled 'Faut-il une Pologne,' was issued at Paris, consisting of several chapters, avowedly taken from the introduction to this history. A new edition of it in five volumes was published at Breslau in 1850. A volume of Mochnacki's shorter pieces and contributions to periodicals appeared at Paris in 1836, under the title of 'Pisma Rozmaita' ('Miscellaneous Writings').

MO'DENA or MU'TINA, TOMMASO DA, a painter of Modena, of the 14th century, who has been claimed by some German writers, without any better foundation than the possession of some of his works, for Bohemia. He appears to have been at Prague in the time of the Emperor Charles IV., who was a patron of the arts; but it is also quite possible that the emperor bespoke the works in his possession of the painter at Modena. The name of Tommaso da Modena is of more importance than it otherwise would have been on account of various pretensions which his works have given rise to. The altarpiece, in three compartments, of the 'Virgin and Child,' with Saints Wenceslas and Palmatus, patrons of Bohemia, formerly at Carlestein, but now in the gallery of the Belvedere at Vienna, was said to be an oil-painting, and, in Von Mechel's catalogue, to have been painted in 1297; it was therefore eagerly caught at by writers of Germany and Italy, to confute Vasari, to vindicate the title of their respective countries in opposition to the Flemish claim. This picture however bears no date, and more recent chemical analysis has shown that it is a 'tempera,' and not an oil-painting. The figures are half-length, about half the size of life, and are painted upon a gold ground; and the picture bears the following inscription:—

Quis opus hoc finxit? Thomas de Mutina pinxit,  
Quale vides lector Barisini filius auctor.

Von Mechel read Barisini, but some documents mentioned by Federici, Tiraboschi, and Lamsi show that Barisini should be the reading; Barisino being the name of Tommaso's father, and his own full name accordingly Tommaso di Barisino da Modena.

There is an extensive work, a series of many portraits, in the chapter-house of the Dominicans at Treviso, which Fra Federici, a Dominican, has had engraved for his account of the antiquities of Treviso:—'Memorie Trevigiane su le Opere di Disegno.' They were painted in 1352, and are accompanied by the following inscription:—

Anno Domini MCCCIII. Prior Travinus ordinis predicatorum depingi fecit istud Capitulum, et Thomas Pictor de Mutina pinxit istud. These works are completely in the style of their time, but rather above the standard than otherwise.

MODESTINUS, HERENNIUS, a Roman classical jurist, was apparently a pupil of Ulpianus. He lived under the Emperor Alexander Severus, and was one of his legal advisers (*consiliarii*); he also taught law to the younger Maximinus (*Jul. Capitol.*, 'Maximin. Jun.' 1). Modestinus often cites Ulpianus and Paulus. The Florentine Index enumerates the following works of Modestinus:—Nineteen books of *Responsa*, twelve books of *Pandects*, ten books of *Regulae*, nine books of *Differentiae*, six books of *Excusationes*, four books on *Poenae*. The work on *Excusationes* was written in Greek ('*Dig.*' 27, tit. 1, '*De Excusationibus*'). Nine other works by Modestinus, in single books, are enumerated in the Florentine Index.

The period of Modestinus is also determined by an inscription, which contains the judgment in a suit which was prosecuted some time between A.D. 227 and 245. The inscription was first printed by Fabretti, in his work on *Inscriptions* (p. 278). Modestinus is mentioned in a rescript, of the year 239, of the Emperor Gordianus. There are 345 excerpts from Modestinus in the *Digest*.

The compilers of the *Digest* have made a few excerpts from two writers posterior to Modestinus. These writers are Hermogenianus and Aurelius Arcadius Charisius. Modestinus is cited by Charisius ('*Digest.*' 50, tit. 4, s. 18).

\* MOFFAT, ROBERT, an enterprising agent of the London Missionary Society in South Africa, is a native of Inverkeithing, Scotland, where he was brought up in connection with the Secession Church, to which his parents belonged. In the year 1816 he was designated for missionary work at a service held in Surrey Chapel, London. One of those who were set apart at the same time for service in the mission-field was John Williams, whose labours in the South Sea Islands have since become so famous, and whose violent death at the hands of the natives of a barbarous island has conferred on him the title of the 'Martyr of Erromanga.' [WILLIAMS, JOHN.] The scene of Mr. Moffat's labours was first in Namaqua-land, on the Gariep or Orange river, where the celebrated Africaner exercised his chieftainship, and afterwards in the Bechuana country. Mr. Moffat visited his native country in 1840, and addressed numerous public meetings in England and Scotland, giving details of his missionary labours, as well as of his remarkable personal adventures and hair-breadth escapes in his exploratory journeys through the African wilds and deserts, and among barbarous and often warlike tribes. The work of instruction, although to a great extent successful among various tribes, had been much interfered with, and the mission-settlements were frequently broken up by the wars of the natives with each other, or with their Dutch neighbours on the frontier, the pioneers of a not over-refined civilisation. While in England Mr. Moffat published a volume containing an account of the scenes through which he had passed, under the title of '*Missionary Labours and Scenes in Southern Africa*;' and also carried through the press, at the expense of the British and Foreign Bible Society, a translation of the New Testament and the Psalms in the Bechuana language. Mr. Moffat then returned to South Africa, where he is still engaged.

\* DAVID LIVINGSTON, LL.D., another African missionary and explorer, is married to a daughter of Mr. Moffat. During the sixteen years in which he has laboured as one of the agents of the London Missionary Society, Dr. Livingston has penetrated far into the interior and has made several journeys across the continent of South Africa. At a meeting of the Royal Geographical Society, at which Dr. Livingston was present, on the 15th of December 1856, the president, Sir Roderick Murchison, said:—"They were met to welcome Dr. Livingston on his return from South Africa to his native country, after an absence of sixteen years, during which, while endeavouring to spread the blessings of Christianity through lands never before trodden by the foot of a British subject, he had made geographical discoveries of incalculable importance, which had justly won for him the Victoria or Patron's Gold Medal of the Royal Geographical Society. When that honour was conferred in May 1855, for traversing South Africa from the Cape of Good Hope by the Lake Ngami to Linyanti, and thence to the west coast in 10° S. lat., Lord Ellesmere, their then president, spoke of the scientific precision with which the unarmed and unassisted English missionary had left his mark on so many important stations of regions hitherto blank." Dr. Livingston retraversed these regions, and, after reaching Linyanti, followed the Zambezi, or continuation of the Leambye river, to its mouths on the shores of the Indian Ocean, passing through the eastern Portuguese settlement of Tête, and thus completing the entire journey across South Africa. Sir Roderick added:—"It had been calculated that, putting together all his various journeys, Dr. Livingston had not travelled over less than 11,000 miles of African territory; and he had come back as the pioneer of sound knowledge, who by his astronomical observations had determined the site of numerous places, hills, rivers, and lakes, nearly all hitherto unknown; while he had seized upon every opportunity of describing the physical features, climatology, and even the geological structure of the countries he had explored, and pointed out many new sources of commerce, as yet unknown to the scope and enterprise of the British merchant." In

describing the features of the territory explored by him, Dr. Livingston said that south of the twentieth degree of south latitude the country was arid, and contained very few rivers; but to the north of that line the country was well watered, and very unlike what the centre of Africa was popularly represented to be. The country which he had traversed indeed was covered with a network of waters, many of the streams being large and deep, and never dried up. The natives belonged to the true negro family, having very woolly hair, and being darker than the Bechuanae. They held their women in high estimation, many of whom became chiefs. In a letter published in the '*Times*' newspaper on December 29, 1856, Dr. Livingston states his views on the question of African civilisation, and recommends the encouragement of the growth of cotton in the interior, and the opening up of commercial intercourse between this country and the African tribes. Such measures would, he thinks, tend to the abolition of the slave-trade, and the advancement of civilisation. Dr. Livingston is a native of Blantyre, in Scotland, where he was in his youth employed in the cotton-mills. Having a desire to devote himself to missionary work, he pursued his studies at Glasgow during the winter months, resuming his occupation at the mills during the summer vacation of the classes. He is now about forty years of age. He proposes soon to return to prosecute his career as a missionary among the natives of South Africa. On Monday, January 5, 1857, a public meeting of the merchants, bankers, and others of the city of London, was held at the Mansion House, the Lord Mayor presiding, when it was resolved to congratulate Dr. Livingston, and to take measures to form a '*Livingston Testimonial Fund*.' The meeting was addressed by the Bishop of London, Sir Roderick Murchison, Mr. Gordon Cumming, Mr. Montgomery Martin, Mr. Raikes Currie, and other gentlemen, and a considerable amount was raised for the commencement of the proposed fund. Dr. Livingstone has since published very full accounts of his travels. [See LIVINGSTONE, DAVID, vol. vi. col. 1010, and SUP.]

MOHAMMED, ABUL-KASEM-IBN-ABDOLLAH, was born at Mecca on the 10th of November 570, or, according to other authorities, on the 21st of April 571. His father Abdollah, whose only son he was, belonged to the family of Hashem, the most distinguished branch of the noble tribe of Koreish, which claimed a direct descent from Ismael, the reputed progenitor of the Arabian race, and had acquired a decided superiority over the surrounding tribes. Owing to an active and uninterrupted commerce, the Koreishites were not only renowned for their opulence and refinement, but, being concentrated about the ancient place of the common Arabian worship, they were the hereditary guardians of the celebrated Caaba, the custody of which, together with the sacerdotal office, had for a long time been the privilege of the Hashemites, the ancestors of Mohammed. Mohammedan authors have laboured to adorn the birth of their prophet with many miraculous events, such as the Persian sacred fire being suddenly extinguished, and a splendid light having spread over all Arabia; but these and similar embellishments of his life, with a great number of prodigies attributed to him, we may leave to the credulity of his followers. In his early childhood Mohammed lost both his parents; his mother Amina died in his second year, and the child was committed to the care of his aged grandfather, Abdol Motaleb, who was then the chief priest of the Caaba. Abdol Motaleb was succeeded by Abu Taleb, the uncle of Mohammed, who now became his guardian, and with whom he made several journeys and mercantile adventures, principally towards Syria, and to the fairs of Damascus, Baghdad, and Basra. In his twentieth year, Mohammed took part in an expedition against the predatory tribes which then molested the caravans and pilgrims on their way to Mecca. This wandering kind of life and the practice of warfare animated the youth with an eager desire of adventure and military achievements, and with that spirit of chivalry which may be considered as the germ of his future exertions. To this must be added a strongly-marked propensity to solitary retirement and to religious abstraction, originating probably in his early contemplation of the absurd ceremonies and cruel idolatry of his contemporaries which he witnessed at Mecca, and in which he had been compelled to take part by replacing the famous black stone in the wall of the Caaba when the temple happened to be repaired.

A Nestorian monk, the abbot of a monastery at Basra, named Boheira, was the first who observed and appreciated the character of young Mohammed. After having conversed with him on religious subjects, he foretold to his uncle Abu Taleb that great expectations might be conceived of the boy provided he should escape the snares of persecuting Jews—a caution which will be explained in the course of this narrative.

In the twenty-fifth year of his age, Mohammed became acquainted with a rich widow, Khadija, whom he subsequently married; and during the fifteen following years little more is known of him than that preparatory to his intended mission he frequently retired to the cave of Heva in the neighbouring mountains, and also made a second journey into Syria and occasional visits to the southern parts of Arabia. During these journeys he gained information at such times and in such degree as circumstances permitted, and he is said to have conversed most familiarly with some learned Jews and Christians, among whom are particularly mentioned a celebrated rabbi, Abdollah-Ibn Salaam, and Waraka, the nephew of his wife, who, first deserting his native polytheism and afterwards the Jewish faith, had embraced the

Christian religion, and was well acquainted with the Old and New Testament. (Abulfeda, 'Annales,' i. 283; Marraccius, 'Prodromus,' l. 44.)

In the fortieth year of his age Mohammed assumed the prophetic office, and displayed his views and principles to his own domestic circle. His first efforts were successful, for his wife Khadija, Waraka, Abubeker, his cousin-german Ali-ben-Abi Taleb, and several other members of the family, readily acknowledged his divine mission, and himself as the apostle of Allah. After being three years silently employed in the conversion of his nearest friends, he invited the most illustrious men of the family of Hashem to his house; and after having conjured them to leave idolatry for the worship of one God, he publicly proclaimed his calling, and declared that by the command of that one God, revealed to him by the angel Gabriel, he felt compelled to impart to his countrymen the most precious gift, and the only means of their future salvation. Far from being persuaded, the assembly was struck silent with surprise mingled with contempt. The young and enthusiastic Ali alone, throwing himself at the feet of Mohammed, with a solemn vow offered to be his companion; but his father, the mild and sober Abu Taleb, seriously advised the prophet to abstain from his strange and fanatical design. Mohammed replied that, even if the sun should be placed on his right hand and the moon on his left, they should never divert him from his career. Stimulated rather than intimidated by the resistance of his relations, the reformer soon began to frequent the public places of Mecca, and openly to preach the unity of God, calling upon the citizens to repent of their idolatry, exhorting them to devote themselves to the service of a supreme and most merciful Being, and reciting fragments of the Koran or affixing them at the doors of the Caaba. It is reported that he had the honour of thus converting the celebrated poet Lebid, who, struck with the sublime beauty of a passage thus promulgated, declared it far superior to any production of human genius, and willingly joined in the profession of Islam. The people listened to the precepts of the moralist, and though they were enraptured by the force of his eloquence, very few were yet inclined to desert their hereditary and long-cherished ceremonies, and to adopt a spiritual faith the internal evidence of which they were unable to comprehend. Mohammed was repeatedly urged by them to confirm his divine mission by miracles, but he prudently appealed to the internal truth of his doctrine, and expressly declared that wonders and signs would depreciate the merit of faith and aggravate the guilt of infidelity. The only miraculous act which Mohammed professed to have accomplished, and which has been greatly exaggerated by his credulous adherents, is a nocturnal journey from the temple of Mecca to Jerusalem, and thence through the heavens, which he pretended to have performed on an imaginary animal like an ass, called Borak (lightning); but we need scarcely remark that the simple words of the Koran ('Sur.' xvii.) may as well be taken in the allegorical sense of a vision.

In the meantime several of the noblest citizens, such as Abu Obeida, Hamza, an uncle of Mohammed, Othman, and the stern and inflexible Omar, were successively gained by the moderation and influence of Abubeker, with whom, by marrying his only daughter Ayesha, the prophet had become more nearly allied after the death of his wife Khadija. Nevertheless for more than ten years the new faith made little progress within the walls of Mecca, and might have been extinguished in its birth if the jealous leaders of the Koreishites had not directed their animosity and violence against the whole line of Hashem. Although menaces and persecution, too often repeated to be minutely related here, had compelled the few votaries of Mohammed to retire into Abyssinia, the spirit of party continually kindled the flame of dissension. At last a revolt, which threatened the life of Mohammed, broke out at Mecca, and the prophet took his flight to Yatreb, afterwards known by the name of Medina (Medinat-al-nabi), or the City of the Prophet. This retreat happened on the 16th of July 622, and has been adopted as the Mohammedan era, called Hejra. The citizens of Medina, among whom the seeds of Islam had been sown by some converted pilgrims returning from Mecca, were readily inclined to embrace the cause of the reformer, whom they had often invited by several previous deputations, and to whom they had promised their alliance and protection against his enemies. Accordingly they advanced in procession to meet the banished prophet, invested him with the regal and sacerdotal office, and offered their assistance in propagating by force the tenets of his new religion. From this moment a vast theatre opened to the enthusiasm and ambition of Mohammed. His revelations assumed a much higher claim; he inculcated as a matter of religion and of faith the waging of war against the infidels; and the sword once drawn at the command of Heaven, from that time remained unsheathed until the tribes of all Arabia and the adjacent countries had joined in the profession that there is no God but Allah, and that Mohammed is his apostle.

After various enterprises and petty excursions, three great battles were fought with the Koreishites under Abu Sophian, the most implacable foe of Mohammed and of the Hashemite line, who, after the death of Abu Taleb, had succeeded to the principality of Mecca. A military force of nearly a thousand men had been collected by Abu Sophian, in order to protect a wealthy caravan on its way to Syria, and to attack the daring band of the prophet, who, with only three hundred warriors, awaited them in the valley of Beder, twenty miles

from Medina. The Moslems, inflamed with enthusiasm and expectation of booty, furiously assailed the enemy, who, after a short battle, were totally defeated and dispersed, leaving a rich spoil to the conquerors. To avenge this disgraceful defeat Abu Sophian advanced in the following year (Hejr. 3) with an army of three thousand men towards Medina, and a bloody action, in which Mohammed was severely wounded, took place near Mount Ohud. The Koreishites were now victorious, but the Moslems soon rallied in the field, and a third war, during which the city of Medina was besieged for twenty days, was terminated by a single combat of the valorous Ali. Surrounded by a number of roving clans secretly favouring the new cause, or at least of a doubtful disposition, the idolaters either wanted strength or courage to protract hostilities, and accordingly an armistice of ten years was agreed upon by both parties. This interval Mohammed employed in converting or subduing the principal Jewish tribes, namely, those of Kainokao, Koraidha, Nadhir, and Chaibar. (Abulfeda, 'Vita Moham,' p. 67; Pococke, 'Specimen Hist. Arabum,' p. 11.)

The castles and towns of the unwarlike Jews were rapidly taken and plundered, and the unhappy people, being unwilling to embrace the religion of the conqueror, were driven out, or persecuted and slaughtered with the utmost cruelty. But the prophet paid dearly for this, as he never entirely recovered from the effects of poison prepared for him by a Jewish female of Chaibar. Thus advancing among the tribes of his native country, the power of the fierce and ambitious apostle increased like an avalanche, and as the Koreishites had been guilty of violating the truce, he proceeded at the head of ten thousand warriors towards Mecca (Hejr. 8). The town surrendered without resistance, and yielding to the victorious banners of Islam, the people unanimously hailed, as the sovereign of Mecca, the prophet whom they had driven from his paternal hearth. Mohammed readily forgave his converted brethren the insults which he had formerly received from them, and after having broken the three hundred and sixty idols round the Caaba, and destroyed every vestige of idolatry, he adorned and consecrated the temple to the worship of God. In doing this he himself set an example of the most earnest prayer and devotion, and strictly fulfilled the religious duties and ceremonies which the pilgrims to the holy shrine had theretofore invariably observed. The conquest of Mecca, and a subsequent prosperous expedition against the hostile fortress of Tayef, were speedily followed by the submission of the idolatrous tribes over all Arabia, and even the petty chiefs of the neighbouring provinces presented gifts or offered their friendship and alliance to the victorious prophet. Intoxicated with ambitious pride, Mohammed now despatched his ambassadors to Khoaru Parviz, king of Persia, to Heraclius of Byzantium, and to the king of Abyssinia, solemnly inviting them to the profession of Islam, or threatening them with war. Accordingly an army of three thousand Moslems invaded the eastern territories of Palestine, and although this and a subsequent expedition to the west were only momentary excursions, a number of foreign tribes and cities willingly submitted. This arose principally from the clemency and moderation of the prophet towards the Christians, from whom he claimed only a moderate tribute, and to whom he granted his protection, security and freedom of trade, and toleration of their worship, and whose conversion to his religion he rather expected than enforced. On this occasion a patent in favour of his Christian subjects, known under the name of 'Testamentum Mohammedis,' was formally published, which, whatever may be thought of its authenticity, is at least in accordance with many passages of the Koran, declaring that "no force shall be employed in religion: that the prophet is nothing but a teacher and admonisher of the people, who shall not be governed by violence, and that the believers shall leave those who do not believe to the punishment of God, for He is the only arbiter, and will reward every one as he deserves." ('Sur.' ii, 257; xlv, 14; lxxxviii, 21, &c.) Returning from these military expeditions, and having once more accomplished a solemn pilgrimage to the temple of Mecca, Mohammed retired to Medina, where, to the great consternation of his followers, he died. This event happened, after a severe fever of fourteen days, on the 8th of June, 632, in the sixty-third year of his age. Omar, with many enthusiastic disciples, firmly believed that a prophet could never die; and it required all the authority of the sober and prudent Abubeker to refute so absurd an opinion. "Is it Mohammed," he exclaimed to the frantic multitude, "or the God of Mahommed, whom you worship? The God of Mohammed liveth for ever, but the apostle was a mortal like ourselves, and has experienced the common fate of all mortality."

Having thus rapidly sketched the political life of the Arabian prophet, by whose lofty aspirations and intrepid courage the hostile tribes of an immense country were for the first time united in faith and obedience; and before discussing the principles of a religion, which, during the space of a century, displayed its victorious banners over all Arabia, Syria, Asia Minor, Persia, Egypt, and the coasts of Africa, and whose precepts even now are zealously followed from the Ganges to the Atlantic by more than a hundred and twenty millions of people—we feel it necessary to take a short retrospective view of the state of Arabia previous to the introduction of Islam. The aboriginal inhabitants of the peninsula had, from time immemorial, been divided into a great number of free and wandering clans, limited

communities, and petty states, whose peculiarities of character, mode of life, and political institutions, as they were mostly dependent upon local circumstances, were for centuries stamped with the same unaltered features, and had been preserved almost unchanged even from the time of the Patriarchs in the book of Genesis. The mountainous table-land of central Arabia, abounding in rich pasturage and fertile valleys, but at the same time intersected and skirted with dreary wastes and sandy plains, was occupied by those roving tribes who, in opposition to the settled inhabitants, are proud of the name of Beduins, or people of the plain. Most of them were addicted to a wandering pastoral life, but from being strongly disposed to war and chivalrous adventures, their peaceable occupations were interrupted, either by conducting a caravan of merchants, or still oftener by assailing and robbing their fellow-tribes. Every tribe was governed by the most aged or worthy Sheikh of that family which had been exalted above its brethren by fortune and heroic deeds, or even by eloquence and poetry. For as the heroic bards were at once the historians and moralists, by whom the vices and virtues of their countrymen were impartially censured or praised, a noble enthusiasm for poetry animated the Arabs, and at an annual fair at Okhad, thirty days were consecrated to poetical emulation, after which the successful poem was written in letters of gold and suspended in the temple of Mecca. Those meetings however formed only a very feeble bond of union among the independent and hostile tribes, who only occasionally, and in times of danger and warfare, submitted to a supreme chief, or Emir of Emirs, and had never yet been united into one body. And the tie was still less binding on those inhabitants who, being collected in flourishing towns and cities on the coasts of the peninsula, and mostly employed in trade and agriculture, were regarded with supreme contempt by the free Beduins, as a weak and degenerate race of slaves. The religious worship of the Arabs chiefly consisted in the adoration of the heavenly luminaries, which were considered as so many tutelary deities of the different tribes; and among which, after the sun and moon, the planet Venus had acquired such peculiar pre-eminence, that even to the pious Moslems Friday ever after remained the sacred day of the week. These deities, with many other images of the personified powers of nature, rudely represented by idols of every variety of shape, were principally gathered round the ancient Caaba, or square temple, the Pantheon of Arabian idolatry at Mecca; and their worship was accompanied, not only with the most horrid rites and shocking ceremonies of a degraded paganism, but even with human sacrifices and cruelties of every description. Even children were immolated by some of the ruder clans to the idols; while others, as the Kendites, buried their daughters alive ('Sur. vi., 137; xvi., 58; lxxxi., 8), and we need scarcely remark, that, except a vague belief of the soul becoming transformed into an owl, and hovering round the grave, there is no indication that the Arabian idolaters believed in a future life and final retribution. (Pococke, 'Specimen Historiæ Arabum,' ed. White, 1806.) Among the foreign settlers in Arabia, we pass over in silence the few adherents of Zoroaster, scattered along the Persian Gulf, and the Sabæans, on the southern coast of the peninsula, who, even from the time of David and Solomon, stored their rich emporiums of Ophir, Saba, and afterwards Aden, with Indian merchandise, and who, as is clear from many good arguments, were undoubtedly of Hindoo origin. The Christian religion had long been established in several parts of Arabia, but the Christianity of the Oriental church, at that time, almost resembled paganism, being associated with monachism and with the worship of martyrs, relics, and images. Among the heretical sectaries, who, absorbed in their monophysitical and other abstruse dogmatical controversies, looked upon each other with the utmost hatred, we find particularly mentioned the Nestorians, Jacobites, Marcionites, and Manichæans, besides some other obscure sects, such as the Collyridians, who, deifying the mother of Christ, and adoring her as the third person in the Trinity, probably gave rise to the Christian tritheism so often dwelt on by the author of the Korân. After the destruction of Jerusalem, the Jews had retired in great numbers to Arabia, where, owing to the loose connection and the jealousy of the aboriginal tribes, they had gained considerable power. Many of them, adopting the fierce manners of the desert, chose a wandering life, connected with all its dangers and adventurous strife, and a poem composed by a Jewish Beduin has been preserved in the Hammâa, which breathes the true spirit of Arabian chivalry. ('Hammâa,' p. 49, Freyt.) But in general the Jews were peacefully settled in towns and fortified castles, principally along the coast, or dispersed among the inhabitants of large cities. It was to the Jews of his country that the Arabian reformer first and most eagerly looked for proselytes, and his early predilection in favour of the "possessors of Scripture," as they are honourably called, might be attested by innumerable passages of the Korân. He not only appeals frequently to their testimony in order to verify the revelations of former times, and consequently the truth of his own divine mission ('Sur. ii., 134; x., 93; xxvii., 77; xxxii., 25; xlv., 16), but to gratify the Jewish superstition, he even instructed his first disciples to direct their prayers towards the holy shrine of Jerusalem, which was afterwards altered in favour of the Caaba. ('Sur. ii., 143-146.) But the followers of the Mosaic institution, though already entangled in their fanciful Talmudic lore, were by no means inclined to accept the tenets of Islam, and when the most persuasive summonses of the prophet were repeatedly

answered by ironical sneers and undisguised contempt, his former friendship was converted into implacable hatred, and the Jews were accordingly stigmatised as the enemy of the Moslems, the murderers of their prophets, as interpolators of sacred Scripture, and, in pretending to be the chosen people of God, as the haughty foes of mankind. ('Sur. ii., 58, 73; v., 21, 74, 85.)

Nevertheless it is to his Jewish instructors, and particularly to the above-mentioned rabbi, Abdollah Ibn Salaam, that Mohammed was indebted for that ample knowledge of biblical history, and for those dogmatical legends, fanciful ornaments, and absurd interpretations of Scripture, with which almost every page of his Korân is stamped. (A. Geiger, 'Was hat Mohammed aus dem Judenthume aufgenommen?' Bonn, 1833.) This leads us to that singular work, which has been acknowledged as the fundamental code of civil and criminal law for many millions of mankind; a work which, from the force and sublimity of its style, has been for centuries admired, and has become the model and standard of all Arabic writers, and whose language is even now the vehicle of communication for nations between the Polynesian Isles and the Columns of Hercules; a work which is considered by all these nations as the inexhaustible source of their happiness on earth, and as the only means of their eternal bliss and salvation hereafter; a work which, according to pious Moslems, was written before the throne of God with a pen of light on the table of his everlasting decrees, and of which a mere copy was brought down and revealed to Mohammed by the angel Gabriel.

The Korân (lecture), or with the Arabic article, Alkorân, commonly called the book, or book of Allah, both in imitation of the rabbinical denominations of the Scripture, namely Mikra and Khitab, is a collection of all those various fragments which the prophet, during the time of his apostolic office, successively promulgated as so many revelations from heaven. It would be almost impossible to characterise the leading features of the Korân, or even to give a full and clear account of its contents; for the chronological order of the incoherent rhapsodies has been neglected, and we are at a loss either to trace any logical connection between them, or to reconcile the many glaring contradictions in a work which otherwise might have served as an official journal of the progress of Islam. According to the momentary feelings of the prophet, his frame of mind, or the mere suggestions of his fancy, pious meditations and fervent prayers are suddenly interrupted by hortatory speeches and admonitory discourses. Apostrophes of Allah to the listening apostle, and of course to the refractory unbelievers, are interrupted by legendary tales and fabulous traditions of ancient Arabic heroes and tribes; and religious customs and ceremonies, enforced with moral sentences and the most energetic recommendations of gratitude, charity, patience, and piety, are occasionally illustrated or strengthened by the examples of the biblical patriarchs and prophets derived from rabbinical authority. Add to this the purity of the language, which is the most refined dialect of Hejaz, and the harmony and copiousness of the style, which in splendid imagery, bold metaphors, and occasional rhyme, rather resembles poetry than prose, and, though sometimes obscure or verging upon tumidity, is generally vigorous and sublime,—and we may readily acquiesce in the judgment of Göthe, that the Korân is a work with whose dulness the reader is at first disgusted, but is afterwards attracted by its charms, and finally ravished by its many beauties.

The revelations of the Korân had been originally preserved by oral tradition, or handed about in fragments, written on palm-leaves and pieces of parchment by the slave of Mohammed, Said ben Thabet. The scattered leaves were collected into a volume by Abubeker, two years after the death of the prophet; but many apocryphal additions having crept into the collection, an authentic copy was afterwards revised and sanctioned by the Caliph Omar (652). The code is divided into 114 chapters, or suras, which are inscribed with the name of Mecca or Medina, where they had been promulgated, and with the number of verses which they contain; but they are mostly arranged according to their length, and without any regard to chronology, the seventy-fourth and ninety-sixth chapters being supposed to have been the first revealed. Among the numerous illustrations of the Korân we may notice the celebrated commentaries of Abul Kasem Mohammed Al-Samaohhari, and Nazireddin Al-Beidhavi (in the 12th and 13th centuries), both of whom have endeavoured to reconcile the many discrepancies and contradictions of the work, and to explain its occasional obscurity, mostly by means of that recognised oral tradition which, recording in more than 7000 anecdotes, the private life, opinions, discourses, and sentences of the prophet, had been collected by Abu Abdollah Mohammed Al-Bochâri in the 9th century. This collection, combined with a previous controversy respecting the exclusive right of Ali or of Abubeker and the two following caliphs to the supreme pontificate and secular sovereignty over the Moslems, gave rise to the great division of the whole Mohammedan community into Shites, or sectarians, by whom the authority of tradition is rejected, and Sunnites, or orthodox believers. [ABBASIDES.] The first printed edition of the Korân, by Pagninus Brixiensis (Rome, 1530), was burnt by order of the pope; and that of Lud. Marraccius was not allowed to appear unless attended with a 'Prodrômus ad Refutationem Alcorani,' Padua, 1698, folio. A quarto edition of the text by Abr. Hinkelmann (Hamb., 1694) was critically revised and

reprinted by G. Fluegel (Leipzig, 1834). A French version by Savary (1783), carefully corrected by Garcin de Tassy, appeared in 1825. The English translation by G. Sale, accompanied with a learned Preliminary Discourse and Notes, was first published in 1734, and has been often reprinted.

The religious system of Mohammed, designated by the name of Islam, or Salvation, is displayed throughout the Korán in single and often-repeated precepts. It consists of two parts; of a dogmatical (or Imán) faith, and a practical (or Dín) religion. The principal articles of belief are the following:—There is but one God, eternal, omnipotent, most wise, and most merciful, to whom alone obedience and adoration are due, and whose majesty is daily proclaimed by a host of angels above, as well as by his own works around us; he is the author, preserver, and governor of the universe, and the supreme ruler of fate, by whose divine providence and absolute predestination the destinies of mankind have from eternity been decreed. The will of God and his divine law were often and fully declared by the former prophets, Adam, Noah, Abraham, Moses, and Christ, whose authority and station rise in gradation above each other; but among whom Abraham is the chief prototype of a true believer. "The patriarch was neither a Jew nor a Christian, for he believed in the unity of God: he was a religious Moslem, and the friend of God, as the Islam is nothing more than the faith of Abraham." ('Sur,' ii. 134; xvi. 120.) Nor is Isaac to be considered as the beloved son of the patriarch; for it was Ismael, the pious father of the Arabian race, whom God asked for a sacrifice (xix. 55; xxi. 85; xxxvii. 101); and it may be worth remarking that the author of the Korán is often so totally absorbed by his thoughts, and the truth of his assertions so deeply worked on his mind, as to identify his own feelings with those of the biblical characters. Equal veneration and deferential respect are paid to our Saviour: "Verily, Christ Jesus, the son of Mary, is the apostle of God, and his word, which he conveyed unto Mary, and a spirit proceeding from him, honourable in this world and in the world to come; and one of those who approach near to the presence of God. Yet Jesus was a mere mortal, and not the son of God; his enemies conspired against his life, but a phantom was substituted for him on the cross, while he was translated to heaven" (iii. 54; iv. 156, 159). But after all, it is reiterated in the Korán, Mohammed is the last and by far the most illustrious apostle; with him, who is the seal of the prophets (xxiii. 40), the divine missions have ceased; and as the Scriptures and Gospels have been altered by superstitious Jews and idolatrous Christians, the Korán must be revered as the only genuine revelation by which former religions are corroborated and verified (ii. 89; xvi. 11). The soul of man is immortal, and at the day of resurrection and the final judgment of mankind every one shall receive the just reward of his virtues, or the punishment due to his evil deeds. Sinners, and particularly unbelievers and idolaters, shall be hurled about in a dark or burning hell; whereas the virtuous and pious Moslems shall be rewarded with everlasting happiness in a paradise, enlivened by heavenly virgins, and abounding with shady groves, clear streams of water, and delicious fruits—the most desirable enjoyments in the sandy deserts of Arabia. But the hope of salvation is not confined to the Moslem, for every man who believes in God and does good works shall be saved.

Besides the most weighty obligation to promote the propagation of Islam, which we have already noticed as incumbent on every Moslem, the first practical duties are—prayers directed towards the temple of Mecca at five appointed hours of the day, fasting during the month of Ramadhan, and alms, to which the fortieth part of a person's property must be appropriated, and which must be bestowed even on ices and on the brute creation. Prayer will carry the Moslem half-way to God; fasting will bring him to the door of his palace; but charity and benevolence towards his fellow-creatures, by which the Supreme Being is best worshipped, will gain him admittance. Cleanliness of body and frequent religious ablutions are strongly recommended, and likewise attendance at divine service in the mosques on every Friday; and once in the course of a man's life, if possible, the performance of a holy pilgrimage to the temple of Mecca, the sacred birth-place of Islam. The ancient Arabian custom of circumcision, generally practised in the eighth year, the legislator retained; and in many usages and ceremonies he indulged the prejudices of his countrymen, either by connecting a prevalent superstition with the morals of a purer faith, or by restricting an abusive practice within its just limits. For example, instead of the former polygamy, four wives, at most were legally allowed, and the matrimonial rules were more strictly regulated. The Korán enumerates as deadly sins—wilful murder, adultery, calumny, perjury, and false testimony. Usury, gaming, and the use of wine and pork, are strongly forbidden; and it is but doing justice to Mohammed to observe, that every precept enjoined upon his followers had been fully confirmed by his own example, if we except his incontinence with the sex. The prophet married no less than seventeen wives, strangely enough all widows, except Ayesha, the daughter of Abubeker. This sensuality, the chief stain on his character, can neither be palliated by the natural temperament of the Arabs nor by his hope of posterity and lineal succession, which nevertheless failed, as the four sons of Mohammed died in their infancy. But Mohammed was a great man, and one who in every respect is described as a perfect model of Arabian virtue, brave and liberal, eloquent and

vigorous, noble and simple in all his dealings, and of irreproachable morals. That fraud, cruelty, and injustice were often subservient to the first propagation of Islam, cannot be denied; but a religious enthusiast is compelled to act according to the overpowering suggestions of his imagination, which he persuades himself to be the inspirations of Heaven, and according to his own conviction of the importance and justice of his mission. As to this, the prophet repeatedly and in the strongest terms expresses his purpose of uniting and reconciling the hostile tribes of his country by destroying their gross idolatry, and by bestowing on them the most salutary and precious gift of a purer creed, in whose truth and divine origin he himself firmly believed. And indeed it will readily be admitted that the religion of the Korán, by which prayers and alms were substituted for the blood of human victims, and which, instead of hostility and perpetual feuds, breathed a spirit of benevolence and social virtues, has been a blessing to the Eastern world, and has had a most important influence on its civilisation. It is not merely to the conquering sword and to the intrepid courage of the reformer and his successors, but also to the intrinsic merits and attractive features of a system, rich with all the luxuriance of Eastern poetry, and most congenial to an ignorant and sensual generation, that the rapid progress of the Arabian conquests must be attributed, although favoured and promoted by the discord, internal revolutions, and weakness of the neighbouring governments.

MOIR, DAVID MACBETH, was born at Musselburgh, in the county of Edinburgh, on the 5th of January 1798. He was educated at the grammar-school there, and when only thirteen was apprenticed to Dr. Stewart, a medical practitioner in that town. He was a diligent and attentive student in his profession, but became very early inclined to literary pursuits. In 1812 he produced some poems, which, though neat, had little originality; shortly afterwards he appeared in print with two brief essays in prose, in a small local magazine. During the last year of his apprenticeship, which was for four years, he attended the University of Edinburgh, which he continued to do after his apprenticeship terminated, and obtained his diploma as surgeon in the spring of 1816. It had been his intention to enter the army, but the peace offering few hopes of advancement in that direction, he abandoned his purpose, returned home, and for awhile devoted himself to literature, writing occasionally for the 'Scots Magazine,' and published an anonymous volume, entitled 'The Bombardment of Algiers and other Poems,' which brought him little profit or fame. He was also a member of 'The Musselburgh Forum,' a debating society, in which he favourably distinguished himself. In 1817 he entered into business as a partner, in his native town, with Dr. Brown, who had an extensive but laborious practice. Moir worked hard at his professional duties, but, when the toils of the day were ended, he employed a great part of the night in his literary pursuits. He was at this time a frequent contributor in prose and verse to Constable's 'Edinburgh Magazine.' When 'Blackwood's Magazine' was started, he became a still more constant contributor to its pages. He wrote for it both prose and poetry, both comic and serious. Among his comic effusions were 'The Eve of St. Jerry,' and 'The Auncient Waggoners,' and at the time some of them were supposed to be from the pen of Dr. Maginn. His serious poems were marked as by Δ, a signature which he retained in that magazine until his death. In 1823 he formed a strong friendship with John Galt, who, when he departed for America, left his novel, 'The Last of the Lairds,' unfinished, and Moir wrote the concluding chapters for him. In 1824 he published 'The Legend of Genevieve,' with other Tales and Poems, consisting of selections from his magazine contributions, with some original additions. In the same year he commenced, in 'Blackwood's Magazine,' his novel of 'The Autobiography of Manse Wauch,' which was continued for nearly three years, and afterwards published separately. It had great success, and the character of its hero is a clever embodiment of some of the peculiarities of Scottish character. During all these literary labours he continued to attend to his professional duties with indefatigable assiduity and extreme kindness. Between 1817 and 1828 he is stated never to have slept a night out of Musselburgh. He was now recommended to remove to Edinburgh, where he might have readily attained a more lucrative practice, but his attachment to his old haunts and his old patients and neighbours caused him to refuse. In 1829 he married. In 1831 he published his 'Outlines of the Ancient History of Medicine, being a View of the Healing Art among the Egyptians, Greeks, Romans, and Arabians.' In 1832, after having exerted himself in a most energetic manner when the cholera was raging in his district, he published as a pamphlet 'Practical Observations on Malignant Cholera,' which had a very extensive circulation; and this was followed by 'Proofs of the Contagion of Malignant Cholera,' both works being allowed to possess great merit, even by those who differed from the author's conclusions. In 1832 Mr. Moir attended the meeting of the British Association for the Advancement of Science at Oxford, and afterwards visited London, where he extended his acquaintance among the literary celebrities. In 1843 he published 'Domestic Verses,' in which, among other things, he records, with much tenderness, the loss of two of his sons, who died young. In 1845 he contributed the account of the civil history and antiquities of the parish of Inveresk, of which Musselburgh is the chief town, to the 'New Statistical Account of Scotland.' In 1846 he met with an accident, being thrown from a carriage, by which he was rendered lame for life. In the

spring of 1851 he delivered a series of lectures 'On the Poetical Literature of the Past Century,' at the Edinburgh Philosophical Institution. In the same year, 'Selim,' his last contribution to 'Blackwood's Magazine,' appeared, and on the 6th of July he died. His activity had continued unabated during his whole life. He had, besides paying a sedulous and benevolent attention to his patients, filled various municipal offices, and had been a member of the General Assembly. His contributions to 'Blackwood' alone number 370. His serious poetry, by which he will be chiefly remembered, is sweetly pensive and tender, without any remarkable original poetic power, but it possesses a charm in its natural imagery and its appeals to our feelings that can never fail to please. In 1852 his 'Poetical Works,' which, however, are only a selection, were published, with a memoir of his life, by T. Aird.

**MOITTE, JEAN GUILLAUME**, Chevalier, the son of the engraver P. E. Moitte, was a distinguished French sculptor, and was born at Paris, in 1747. He was first the pupil of Pigal, after whose death he studied under Lemoigne. In 1768 he obtained the grand prize in sculpture for a statue of David carrying the head of Goliath, and he went, as entitled in consequence, to complete his studies at the French Academy at Rome; the Roman climate however proved quite unfit for his constitution, and he was forced to return to Paris, where he died May 2, 1810.

Moitte has executed many excellent bas-reliefs and figures, and some equestrian statues; but he left many models, and among them his principal works, unfinished at his death, as the great bassi-rilievi in the column of Boulogne, and the equestrian statue of General d'Hautpoul, a model in plaster, made for the French government. Moitte was a member of the old French Academy of Painting and Sculpture, and afterwards of the Institute of France, and a Chevalier of the Legion d'Honneur.

The following are some of his principal works:—A marble statue of Cassini; another of General Custines; a baso-rilievo for the tomb of General Leclerc in the Pantheon; a Vestal sprinkling the holy water; Ariadne; a sacrificer; the large baso-rilievo of the front of the Pantheon, representing the Father-land, or La Patrie, crowning civic and military virtues, which was removed after the Restoration; a tasso-rilievo in the court of the Louvre, representing History inscribing l'An VI. and the name of Napoleon with his French title of Le Grand; other bassi-rilievi for the barriers of Paris, and the Château de l'Île Adam, and the colossal figures of Bretagne and Normandie at the barrier des Bons Hommes; an equestrian statue of Napoleon I.; and the baso-rilievo of the warrior devoting himself to his country, or France surrounded by virtues and calling her sons to her defence, now in the gallery of the Luxembourg: it was ordered in 1798 for the vestibule of the Luxembourg facing the garden.

(Gabet, *Dictionnaire des Artistes de l'École Française*, &c.)

**MOIVRE, A. DE.** [DEMOIVRE, A.]

**MOLA.** There are two artists of this name, who were contemporaries, and both studied for a time under Albano. Of these, the more celebrated one, **PIERFRANCESCO MOLA**, was born at Coldre, in the Milanese territory, in 1621, according to Pascoli, or at Lugano, in 1612, according to Passeri; and after receiving his first instructions in art from his father, who was both a painter and architect, he studied successively under Giuseppino, Albano, and Guercino. He attained to great excellence both in design and colouring; and though his chief merit lay in landscape, to which he principally applied himself, he also painted history occasionally, and with much ability. His talents obtained for him the patronage of princes and nobles, and among others of Christina of Sweden. His reputation at length caused him to be invited to France, and he was making preparations for proceeding thither at the time of his death, which happened at Rome in 1666 (Pascoli), or 1668 (Passeri).

**GIANBATTISTA MOLA**, who was not at all related to the preceding, but is said to have been of French extraction, was born in 1620. He studied first at Paris under Vouet, and afterwards under Albano at Bologna. Like his namesake Pierfrancesco, Gianbattista was an excellent landscape-painter, and well skilled also in perspective, though in other respects his inferior. One of his most celebrated works is a 'Repose in Egypt,' in the Rinuccini collection at Florence. He died in 1661.

\* **MOLBECH, CHRISTIAN**, an eminent Danish writer on bibliography, literary biography and history, philology, criticism, and other subjects, was born at Soroe on the 8th of October 1788. His father, Johan Christian Molbech, also an author, was by birth a Norwegian, and held the post of professor of philosophy and mathematics at the celebrated academy of Soroe from 1787 to 1822. The son was intended for the sea, and would have gone on a voyage to India in 1796, but for an illness which kept him at home, and gave occasion to an entire change in his pursuits. He entered the university of Copenhagen and studied for the law, in which he passed a creditable examination, but he was destined to be neither a seaman nor a lawyer. In 1804 he was admitted as a "volunteer" to assist in the royal library at Copenhagen and he is now (in 1857), by gradual advance, the second officer in that establishment.

His activity during a literary career of now more than half a century has been so unintermitted, that the list of his works and of the review of them in Erslew's 'Forfatter Lexicon,' which however

includes articles in periodicals, occupies nearly twelve closely printed pages. These productions, as has been mentioned, are of very various character. Among the most prominent are 'Breve fra Sverrige' ('Letters from Sweden'), 3 vols. 1814-17, giving an interesting, but somewhat diffuse account of a visit to Sweden in 1812, and 'Reise giennem en Deel af Tydakland,' &c. ('Travels through a portion of Germany, France, England, and Italy'), 3 vols. 1821-22, in which he narrates a journey of some months in 1819 and 1820, which he was enabled to undertake by the liberality of the Danish government, with the view among other things, of studying the condition and arrangements of public libraries. With England in general he was much pleased, and with Italy he was delighted, and these were the two countries he most wished to revisit. Some of his other works bear on the subject of libraries, in particular a treatise 'On Public Libraries,' issued in 1829, and a life of Moldenhawer, once librarian of the royal library at Copenhagen, in which there is an interesting delineation of enlightened activity in a field of literary exertion to which little attention has been given in England.

Molbech was early engaged as one of the compilers of the great Dictionary of the Danish language issued under the superintendence of the Copenhagen Academy of Sciences, the first volume of which was issued in 1793, while the last portion that has appeared of it, part of the seventh volume, published in 1853, brings it no farther than the letter T. His name appears as one of the editors to the sixth volume, which comprises the letter S only, and took nineteen years in preparing. It is a singular illustration of the difference between the progress made by individuals and by committees that in 1833 he published in two volumes a complete Dictionary of the Danish language, compiled by himself, which is recognised as the best now existing, and of which a second edition is at present (1857) issuing from the press. A Danish 'Dialect Lexicon' (Copenhagen, 1841), is perhaps a still more valuable contribution to philology, as bringing together for the first time a mass of materials of great interest to the inquirer not only into the Scandinavian, but our own and the other languages of the Germanic stock. A collection of Danish proverbs, proverbial phrases, and mottoes ('Danake Ordsprog, Tankeprog, og Riimsprog,' Copenhagen, 1839), forms a sort of supplement to these works. Molbech has also superintended the publication of various monuments of the ancient Danish language—the oldest translation of the Bible, several rhymed chronicles, and an old medical work of the 13th century by Henrik Harpestreng; and he has taken up a somewhat novel position among philologists by pointing out the superiority of the modern Danish to the old Icelandic, from which it springs, in the greater variety of style of which it admits—a point of comparison which many writers on the advantages of the earlier phases of modern languages seem to have utterly overlooked. A new edition of Holberg's comedies by Molbech, and biographies of Ewald and Schack-Staffeldt, as well as a series of lives of Danish poets prefixed to his selections in a 'Danak Poetik Anthologie,' evince his interest in the more modern classical literature of his country. Perhaps the short biographies, which are remarkably well done, are of all the productions of Molbech's pen the most felicitous. In Danish history, his 'Fortællinger og Skildringer' ('Tales and Sketches'), in the manner of Scott's 'Tales of a Grandfather,' have enjoyed an extensive popularity; and he has edited the 'Diary of Bishop Bircherod,' and, in conjunction with Petersen, a selection of ancient Danish documents and letters. A collection of his miscellaneous smaller writings, 'Blandede Smaaskrifter,' was published in two volumes, between 1834 and 1836. He edited a monthly periodical entitled 'Athene,' in nine volumes, between 1816 and 1817; and also the 'Maanedskrift for Litteratur,' a monthly literary review, in twenty volumes, from 1830 to 1838, which are two of the most valuable works of the kind in Danish literature. The 'Nordisk Tidkrift for Historie' (4 vols., 1827-36), was also edited by him; and the 'Historisk Tidkrift,' or Historical Magazine, issued by the Danish Historical Association, which was commenced in 1840, and still continues, is under his superintendence. He has been urging the same society to undertake a great biographical dictionary of Danes, a work of which there is much need, and which would be a valuable contribution to the literature of Europe. Molbech is a member of the Danish Academy of Sciences, of the first hundred years of which he has published a history, a knight of the order of Dannebrog, and a member of numerous foreign learned societies, among others, of the Antiquarian and Philological of London. His son, Christian Knud Fredrik Molbech, born in 1821, also attached to the Royal Library at Copenhagen, is the author of some poems, and of a volume of travels entitled 'En Maaned i Spanien' ('A Month in Spain'). [See SUP.]

**MOLÉ, COMTE DE**, was born in 1781, and was descended from an illustrious family in France. He was the son of the President Molé, who fell a victim to the violence of the first French Revolution. Enough property however appears to have been saved from the wreck of his family fortunes to enable the father to send his son to the Central school of Public Works, afterwards called the Polytechnique, where he pursued his studies with industry and vigour. In 1806 he published 'Essais de Morale et de Politique' which attracted the attention of the Emperor Napoleon I., and secured for him the post of auditor of the Council of State. These Essays, as may be supposed, were of a highly absolutist cast; and though their author

continued to the last a staunch adherent of the Bonaparte dynasty, he remained in office under the Bourbons after their restoration, who created him a peer of France. To the policy and measures of Prince Polignac he offered the most determined opposition. After the revolution of July 1830 he was appointed by Louis Philippe to the portfolio of Foreign Affairs, and shortly afterwards was advanced to the post of Prime Minister of France, which he eventually was obliged to resign by the opposition of M. Guizot, and M. Thiers. Upon this he retired into private life, and though he was elected a member of the Legislative Assembly, he took little or no part in its proceedings. The family of Count Molé was of that rank which is known as the 'nobility of the robe,' and his ancestors were of gentle blood as long ago as the days of Henri IV. Talents and administrative capacity seem to have been hereditary in the family, as well as the love of legal order, monarchy, and constitutional government. Count Molé was almost the last remaining link between his countrymen of the old and of the new régime, as combining the high-bred tone and monarchical principles of the former with a proportion of the liberal principles which are the distinctive mark of the latter class. But while Count Molé accepted each successive change in the governing system of France as the result of political necessity, it cannot be said that he ever swerved in principle from the opinions which he had originally professed. At the close of his long career, under various successive changes of government, he renewed his relations with the ancient dynasty, and departed life as he entered upon it, a supporter of the old monarchy. In his theological opinions he inclined to the Ultramontane party, and from his high character, great abilities, and illustrious position, he was one of the strongest supporters of the Roman Catholic Church in France. His memoirs, which naturally include reminiscences of all the great men and notables of France during the first half of the 19th century, are shortly to be published. He died suddenly at his family seat at Champalatrux, November 23rd, 1855.

MOLESWORTH, THE RIGHT HON. SIR WILLIAM, eighth Baronet of that name, was born in 1810. He was the lineal representative of an old Cornish family of large landed possessions, originally of Irish extraction. The first baronet, was governor of Jamaica in the reign of Charles II. Sir William's father died in 1823. It is uncertain at what school Sir William Molesworth was first educated, but it is certain that having spent some time at Cambridge, he was sent to Edinburgh, where he was taught classics, mathematics, and metaphysical science, by an Italian refugee, and afterwards passed to a German university. In this latter soil his mind took deep root; he acquired the German language, and followed at will the bent of his own vigorous talents. Having left England with an average acquirement of general and classical knowledge, he concentrated his powers in Germany upon the study of philology and history. His mind however revolted against the mysticism of the German school, and as soon as he was released from collegiate study he made the usual tour of Europe. On his return to England in 1831 he was still in his minority. His first public appearance in this country was at a meeting convened in his native county in that year for the purpose of supporting parliamentary reform, and his maiden speech on that occasion gave considerable promise of future eminence. He was little more than of age when he was returned to parliament unopposed in December 1832, for East Cornwall, by which constituency he was re-elected in December 1834, but withdrew from the contest in July 1837, when he was returned for Leeds. At the dissolution of 1841, being convinced that his chance of success at Leeds was hopeless, he declined a contest and remained out of parliament for four years. During this interval he read and thought much on politics and social economy, gave himself a sounder political education, and accumulated capital for his future senatorial life. In 1850, however, on the death of Mr. Wood, he offered himself as a candidate for the representation of Southwark, and though strenuously assailed for his support of the grant to Maynooth College, he was successful, and he continued to represent the same constituency to his death. In January 1853 he accepted the office of First Commissioner of Public Works on the formation of Lord Aberdeen's administration, and was re-elected without opposition; and again on his subsequent translation to the Colonial Office.

As a 'Commons' debater' Sir William Molesworth was not of first-rate eminence. His speeches in parliament were few, but always valuable, though of too philosophical a cast to be generally popular. Those on the colonies delivered in 1838; in 1840 on the state of the nation and the condition of the people; on transportation in 1837-38; and on many important social and economic questions about the same period, were of great merit and immense practical utility. They were carefully prepared beforehand, and were the results of reading, labour, and reflection. In July 1855 Sir William Molesworth found a sphere far more congenial to his tastes, and a larger scope for his administrative ability, on being appointed to the secretaryship of the colonies, but he held that office only for the brief space of four months, when his career of public usefulness was cut short by death, which occurred on the 22nd of October 1855. The colonial and domestic press were all but unanimous in expressing their satisfaction at his appointment; it was not forgotten that he had taken the deepest interest in the affairs of Canada and Australia, and had

BIOG. DIV. VOL. IV.

studied the problem and mastered the theory of colonisation to a greater extent than perhaps any contemporary. Neither was it forgotten that he was the first person who, in this country, succeeded in calling public attention to the manifold abuses connected with the transportation of criminals, though eighteen years had elapsed since the parliamentary committee, of which he was chairman, brought to light all the horrors of our penal system. In the words of a writer in the 'Times,' "Sir William Molesworth found our colonial empire disorganised and distracted by the mal-administration of the Colonial Office, wedded as it then was to a system of ignorant and impertinent interference. He first aroused the attention of parliament to the importance of our remote dependencies, and explained with incomparable clearness and force the principles of colonial self-government. With untiring diligence and great constructive power he prepared draught constitutions, and investigated the relations between the imperial government and its dependencies. Starting from a small minority, he brought the public and parliament over to his side, till principles once considered as paradoxes came to be regarded as axioms. By such means he fairly won the position of Secretary of State for the Colonies; but he did not live to enjoy the prize which he had grasped. Before we had time to hear of the satisfaction with which his appointment was sure to be hailed by our remote dependencies, the sceptre was snatched from his hand by death, and the post became again vacant. In the full vigour of life and intellect, in the possession of what must have been to him the highest and noblest prize of ambition, in the enjoyment of the confidence of his sovereign and the esteem of his fellow-subjects, he was taken away suddenly and prematurely, yet not so soon as to deprive his friends of the consolation of thinking that he has left behind him durable memorials which will link his name with the destinies of every British community planted on the face of the earth. The best monument that could be raised to him would be a complete collection of his parliamentary speeches; the noblest epitaph that could be inscribed on his tomb would be the title of the 'Liberator and Regenerator of the Colonial Empire of Great Britain.'"

Though he had not avowedly appeared before the public as an author, Sir William Molesworth was favourably known in the world of letters and science. Having purchased the 'Westminster Review,' he for some years conducted it either alone or in conjunction with his friend, Mr. John Stuart Mill, the eminent political economist [MILL, J. S.], and during that time he was a not unfrequent contributor to its pages; he likewise wrote at different times many articles in other periodicals and newspapers. He also edited and published at his own expense a complete edition of the English works of the philosopher Hobbes, in 16 volumes. [HOBBS, THOMAS.] In science Sir William Molesworth had obtained some reputation as a botanist; but his acquirements extended over a large range of subjects. In private life few men have been more highly esteemed.

MOLIÈRE was the name assumed by JEAN-BAPTISTE POQUELIN, who was born at Paris on the 15th of January 1622. His father was a 'tapisier,' and also held the office of 'valet-de-chambre-tapisier' to Louis XIII. Young Poquelin was intended for the same trade, and remained in his father's shop till he was fourteen years of age, having been merely taught to read and write. He had a grandfather who was very fond of him, and often took him to the theatre at the Hôtel de Bourgogne: he even expressed a wish that his grandson might become a celebrated actor, and his words made such an impression on the youth that he gradually became disgusted with his trade. As he returned home from the play one day in a state of melancholy, his father asked the cause, and learned that he desired a superior education. His grandfather joined in his entreaties, and he was sent to the Collège de Clermont, which was under the care of the Jesuits, where he remained till the end of the year 1641. When his studies both in literature and philosophy were ended, he was obliged to fill his father's office about the king's person, and he attended Louis XIII. in the expedition from which resulted the taking of Perpignan from the Spaniards. After this there is a gap in his biography, and we find him in 1645 performing in the Faubourg St. Germain with a company of citizens, who at first acted for pleasure, but afterwards attempted to combine profit with amusement. At this period he took the name of Molière. The company was unsuccessful.

Here comes another gap of eight years, and we find him in 1653 playing at Languedoc, whither he had been invited, at the head of a company, by the Prince de Conti, who appreciated his histrionic talents. In this company was Madeleine Béjart, whose daughter subsequently became the wife of Molière. He afterwards went with his company to Lyon, where in 1653 he produced his first play, 'L'Étourdi,' with such success, that two other companies joined him. This piece is amusing from the variety of situations, which however have the disadvantage of resembling each other too closely. The portrait of the Étourdi shows the beginning of Molière's tendency to sketch character, though character is here subservient to incident. In 1654, having returned to Languedoc, he produced his second piece of 'Le Dépit Amoureux,' which was likewise successful. The Prince de Conti was so pleased with his productions as to make him director of the entertainments which he gave in the province, and even to offer to him the place of secretary. Molière however refused this offer.

After remaining four or five years in Languedoc, the company

v

quitted that province for Grenoble, where they played during the carnival. They then went to Rouen, and finally to Paris, where Molière was introduced to the king, Louis XIV., before whom his company played the tragedy of 'Nicomède,' in 1658, at a theatre erected in the guard-hall of the old Louvre. Molière felt that in tragedy his company was inferior to that of the Hôtel de Bourgogne, and therefore, when the play was ended, he came forward and observed, that they were but faint copies of excellent originals, and hoped that the king would allow them to play one of the little comic pieces which had been successful in the provinces. The king granted the request, and the piece, which was one of those early works of Molière which have not been collected, was played with success. The king wished the company to remain at Paris, gave them the title of 'Troupe de Monsieur,' and allowed them to play, alternately with the Italian comedians, at the theatre called Le Petit Bourbon. In 1660 they removed to the Palais Royal.

In 1658 Molière's early pieces of 'L'Étourdi' and 'Le Dépit Amoureux,' which had been acted with such success in the provinces, were played with great applause at Paris; and in 1659 was produced his celebrated 'Précieuses Ridicules,' which was so successful that the prices of admission were trebled on the second day of performance, and the piece notwithstanding had a four months' run. With this comedy the fame of Molière may be said to begin: the modern reader may find in it only an ordinary farce, but the Parisian public perceived that the author was a bold and strong portrayeur of prevailing characters and manners. It is written in prose, and the design is to ridicule those ladies, called 'Précieuses,' who indulged in an affected way of talking peculiar to the time. In 1660 Molière produced 'Le Cocu Imaginaire' with great success, though it was not so popular as its predecessors. It is ingeniously constructed, but it is not so much an exhibition of character as the 'Précieuses.' 'Don Garcie de Navarre,' brought out by Molière in 1661, was unsuccessful, and injured his reputation. It is called an heroic comedy, and is a weak, heavy production, scarcely readable. His fame was again raised by the 'École des Maris,' which was produced in the same year with great success. The characters of the two principal personages in this piece resemble those of the brothers in the 'Adelphi' of Terence. An excellent piece followed in the same year, called 'Les Fâcheux,' which perhaps exhibits Molière's peculiar talent more than any of his plays. That talent consisted in the portraying of character; and in proportion as there is more or less of character to draw, does Molière become strong or weak. The object of 'Les Fâcheux' was to exhibit every species of disagreeable person in one short drama, and, though the plot is nothing, the different characters of the 'bores' of the period, such as a man who talks of nothing but hunting, a composer, a card-player, a duellist, &c., pass in quick succession, and present a most happy phantasmagoric picture of the times. In 1662 appeared the 'École des Femmes,' which had no very great success in Paris, although the principal character, Agnes, is the original from which Wycherly has taken his Mrs. Pinchwife, in the 'Country Wife,' subsequently altered by Garrick into the 'Country Girl.' Molière was so indignant at the slight success of this piece, that he wrote another, called 'La Critique de l'École des Femmes,' in which he held up its opponents to public derision. One of the characters, a ridiculous marquis, is supposed to represent the Duc de Feuillade. This 'Critique,' which was played in 1663, was very successful. A little piece entitled 'L'Impromptu de Versailles,' was produced the same year, which consists merely of a satirical conversation among the comedians. It is preceded by a 'Remerciement,' or poem of thanks to the king, who had, in the year of its production, granted Molière a pension of 1000 livres. He was greatly esteemed at court, where he held the office which had been filled by his father; and the king is said on one occasion to have sat with him at the same table to shame some of his officers who treated him with haughty coolness. Molière's happiness would have been greater had he not about this time married Armande Béjart, then about seventeen, whose lively and coquetish disposition kept him in all the agonies of jealousy. To relieve himself from domestic disquietude he pursued his labours with additional ardour, and wrote 'Le Mariage Forcé' and 'La Princesse d'Élide,' which were produced in 1664, and 'Le Festin de Pierre,' produced in 1665. Of these the first is a mere farce, which exhibits however Molière's aptitude to sketch character in the two little parts of the peripatetic and sceptical philosophers; the second is one of those heavy mixtures of serious comedy and ballet which, however effective they might have been with splendid decorations, do not now repay a reader the trouble of perusing them; and the third is an ill-constructed piece, with a spark of humour here and there, chiefly remarkable for being one of the numerous versions of the story of 'Don Juan,' which is the subject of Mozart's opera, and for certain censures bestowed upon it by the Sieur de Rochemont, who considered it impious. In 1665 the king engaged Molière's company for his own service, granting them a pension of 7000 livres, and they took the title of the 'Troupe du Roi.' A little piece, called 'L'Amour Médecin,' followed up the attack on the medical profession which Molière had incidentally commenced in the 'Festin de Pierre.'

His excellent comedy 'Le Misanthrope' was produced in 1666, and is reckoned among his chef-d'œuvres. It abounds in character and correct views of society. In the same year appeared 'Le Médecin malgré lui,' a humorous attack on the physicians, well known to the

English by Fielding's version, entitled 'The Mook Doctor.' With respect to the date of the celebrated comedy 'Le Tartuffe,' there is a little difficulty. In collections of Molière's works it is placed at some distance after the 'Misanthrope,' and is dated 1667; but some lines in the 'Misanthrope' appear to allude to a book which the bigots of the day, offended by the 'Tartuffe,' published as Molière's, in order to injure his reputation. The discrepancy has been accounted for by stating that the first three acts of 'Le Tartuffe' were played in 1664, but that the entire piece was not acted till 1667. However this may be, on its very first production the more bigoted part of the community were enraged; and such earnest applications were made to the king, that he ordered the piece to be withdrawn. The representations of Molière induced the king to revoke this order, but Molière did not consider it prudent to perform it at once. About the same period he produced three insignificant little pieces, 'Mélécerte' (a mere fragment), 'Pastorale Comique,' and 'Le Sicilien;' and in 1668 appeared his 'Amphitryon,' a clever version of the 'Amphitryon' of Plautus, altered by the addition of a wife to Sosia, and the substitution of a prophecy of the birth of Hercules for his actual birth. The admirable comedy of 'L'Avare' was brought out in the same year, but played at first with little success, owing, it is said, to its having been written in prose, which the audience did not think calculated for pieces of five acts. It is one of Molière's very best pieces; nothing can be better than the character of the miser (who is supposed to be imitated from the Euclio of Plautus's 'Aulularia'), and we cannot refrain from admiration at the boundless ingenuity displayed by the author in placing him in every possible situation adapted to draw him forth. If 'Les Fâcheux' is the prototype of those pieces where the greatest variety of characters is introduced in succession, 'L'Avare' is, on the other hand, the prototype of those which are chiefly occupied in the exhibition of one character in all its phases. The piece was rendered by Fielding as 'The Miser.' Having produced in the same year a successful piece, 'George Dandin,' which is a droll little farce, Molière ventured on a second representation of 'Le Tartuffe.' The theatre was crowded to excess, and the piece was just about to begin, when a prohibitory order arrived from parties who held authority during the absence of the king, who was in Flanders. The actors, not having the king's permission in writing, returned the spectators their money, and extinguished the lights. Molière instantly despatched two of his actors to the king, to solicit his protection; and on their return with an order in their favour, the piece was played without interruption. Of the merit of this celebrated comedy, so well-known to the English public by the imitation called 'The Hypocrite,' there is no doubt; but whether religious imposture is or is not a fit subject for ridicule on the stage, is a question we leave open to the opinion and feelings of our readers. 'Monsieur de Forceaugnac,' a farce representing the awkwardness of a pompous country-gentleman in a large metropolis, and containing an incidental satire against the physicians, was represented in 1669 with great success, and the famous 'Bourgeois Gentilhomme,' brought out in the following year, was equally fortunate. This, although in five acts, is a farce of the most extravagant kind, and being, as it is called, a comédie-ballet, the author has allowed it at the close to run almost into a pantomime. In construction it is exceedingly loose, and this is the case with all Molière's pieces that go by the name of 'comédie-ballet;' so easy is it to avoid difficult unravelings by the introduction of dances. Several of the pieces named above belong to this class, although they have not been so specified. In spite of its extravagance the 'Bourgeois Gentilhomme' is a favourite piece, and allusions are perhaps more frequently made to it than to any other play of Molière's. The pompous ignorance of the principal character and the pretensions of his several fashionable masters are extremely laughable; but as far as construction goes, it is a mere succession of farcical incidents.

In 1672 Molière produced his 'Femmes Savantes,' one of his best comedies, in which the learned ladies and wittlings of the time are admirably satirized. Its success however was at first not very great, the subject being rather too dry and recondite for the public at large. Before the production of this piece he had assisted in composing a 'tragédie-ballet' on the subject of Cupid and Psyche, and had brought out two inferior pieces, 'La Comtesse d'Escarbagnas,' and 'Les Fourberies de Scapin.'

In the year 1672 Molière became reconciled to his wife, with whom he had long been at variance, and at the same time quitted a milk diet, to which he had restricted himself on account of a complaint in the chest, for animal food. This increased his complaint, but he worked hard at the composition of 'Le Malade Imaginaire,' which was produced in 1673, and is one of his most entertaining pieces, and his severest attack on the physicians. On the third day of the representation of his comedy Molière felt the pain in his chest much increased, and his wife, and Baron the actor, endeavoured to dissuade him from playing. Their efforts were vain, and while acting the part of 'Argan,' a convulsion seized him, which he endeavoured to conceal by a laugh. As soon as the piece was over he entered Baron's box, who remarked that he appeared worse than ordinary. His hands were cold, and Baron accompanied him home. Soon after his arrival he began to spit blood, which at length flowed from his mouth in such abundance as to suffocate him. The date of his death is the 17th of February 1678. The rites of sepulture were at first refused to

Molière, but the king prevailed on the Archbishop of Paris to allow them, on condition that the ceremony should be celebrated without any pomp. He was accordingly buried by two priests, who accompanied the body without chanting, in the cemetery behind the chapel of St. Joseph, Rue Montmartre. All his friends attended, each bearing a flambeau. In this country and in the present age it is scarcely possible to read the treatment of Molière's remains without indignation, especially when we find the writers of his life speaking in the highest terms of his goodness of heart and integrity.

Our opinion of Molière has been given in the remarks on particular pieces, and we need only briefly repeat that his strength lies in the delineation of character. His plots are often excessively artificial and improbable, but in character he is almost unrivalled. He also enters deeply into the humour of a comic situation, though here it is rather difficult to measure his merits by a right standard, as many of his most striking situations are notoriously borrowed from the Italian comedie. On character therefore alone rest his unequivocal pretensions to fame, for even if the idea be borrowed from other writers, still the minute portraying of an individual character, with all its propensities and bearings, requires a master spirit, and if the design be borrowed, the execution must still be original. He has naturally often run into the failing, too common with those who make distinctive character their principal object, of degenerating into caricature; but still, where a personage is made the symbol of a single passion or whim, the omission of the qualifying tints of real life necessarily throws out the single characteristic so prominently, that caricature almost necessarily arises. The personages of Theophrastus and La Bruyère become caricatures, from their representing certain qualities taken abstractedly, instead of a mixture such as is observable in real life.

Besides his dramatic works, Molière translated nearly the whole of Lucretius, but all his translation has been lost, except a few lines, which are introduced in the 'Misanthropes.' His works have been so frequently published, and can be so easily procured in every shape and size, that it is almost useless to point out any particular edition. A very good one was however published at Paris in 1838, in which the actors' names are printed after the dramatic persons, and which thus shows that Molière always played himself the principal comic parts, and also forms a very agreeable illustration to the dramatic history of the times. In this respect it is superior to the more splendid edition, published with wood-cuts by Tony Johannot.

MOLINA, LOUIS, born at Cuenca, in 1535, entered the order of Jesuits in 1558. He studied at Coimbra, became a learned divine, and taught theology for twenty years in the college of Evora. He died at Madrid in October, 1601. He wrote commentaries upon Thomas Aquinas, and a treatise 'De Justitia et Jure;' but the work which has rendered his name famous as the head of a school of theology is his book 'De Concordia Gratia et Liberi Arbitrii,' printed at Lisbon in 1568, with an appendix to it, published after. In this work Molina undertook the task of reconciling the freewill of man with the foreknowledge of God and predestination. He observed that the early fathers who had preceded the heresy of Pelagius had defined predestination as being the foreknowledge of God from all eternity of the use which each individual would make of his freewill; but St. Augustine, who had to oppose the Pelagians, who granted too much to freewill, spoke of predestination in a more absolute and restricted sense. Molina says, that man requires grace in order to do good, but that God never fails to grant this grace to those who ask it with fervour. He also asserts that man has it in his power to answer, or not, to the calling of grace.

The opinions of Molina, which were adopted, enlarged, and commented upon by the Jesuits, and strongly opposed by the Dominicans, gave rise to the long disputes concerning grace and freewill. The partisans of Molina were called Molinists, and their antagonists Thomists, from Thomas Aquinas, the favourite divine of the Dominican order. Already in Molina's lifetime his opinions were stigmatised as savouring of Pelagianism. After numerous disputations, Pope Paul V., in 1609, forbade both Jesuits and Dominicans from reviving controversy. But soon after Jansenius, bishop of Ypres, wrote a book in which he discussed the question concerning grace after the manner of St. Augustine. His book was denounced by the Jesuits, and thus the dispute began afresh between the Molinists and the Jansenists. Pascal, in his second 'Lettre Provinciale,' gives an account of the state of the controversy in his time. He says that the Jesuits pretend that there is a sufficient grace imparted unto all men, and subordinate to their free will, which can render it active or inactive, while the Jansenists maintain that the only sufficient grace is that which is efficacious, that is to say, which determines the will to act effectively. The Jesuits support the "sufficient grace," the Jansenists the "efficacious grace."

Molina must not be confounded with Molines (Michael), a Spanish clergyman of the 17th century, who was the founder of the theory of piety and devotion called Quietism, of which Fénelon and Madame Guyon were distinguished supporters.

MOLLER, GEORG, an eminent architect of Germany, was born at Diepholz in Hanover, in 1736. From 1807 to 1810 he studied architecture, partly at Carlsruhe, under Weinbrenner, and partly in Italy. Much attention was then being paid by the German school to the architecture of the middle ages; and Moller, who studied it zealously and with intelligence, promoted the study effectually. In 1815 he

commenced a work, 'Denkmäler Deutschen Kunst' ('Monuments of German art'), which was not completed till 1845, in three volumes, and in this he first published a fac-simile of the original plan of Cologne cathedral, which he had discovered in a garret-roof. The publication of this work created much interest, as it was the first architectural collection of its kind. He also acquired considerable reputation as a practical architect by the erection of the casino, the opera-house, the Roman Catholic church, and the chancery court in Darmstadt, between 1817 and 1826; and he was appointed court architect. The church is a handsome circular structure, 173 feet in diameter, with a splendid dome 123 feet high, supported by 28 large columns 50 feet high; the effect is grand and imposing, though extremely simple, but it has been found considerable fault with, because the round form has occasioned it to have inconvenient echoes: this fault, however, is scarcely to be attributed to Moller, who recommended the usual cross form, which was rejected, as it was desired to accommodate the largest number of persons at the smallest cost. In 1827 he erected the Roman Catholic church at Bensheim. In 1828 and 1833 he completed the eastern cupola of the cathedral, and the theatre in Mainz, the last a handsome building on the classical model of the ancients, of which, unlike most modern theatres, the outer form bears some relation to the interior. Between 1837 and 1840 the splendid new palace for the Duke of Nassau, at Wiesbaden, was also erected by him, though unfortunately not altogether from his original design. The above are some of his principal works, and belong to the best specimens of modern architecture in Germany, especially as examples of constructive skill. In them he has shown himself far removed from a servile imitation of his ancient models, but carefully adheres to the true principle, that the requirements of the present age, in many respects, demand a distinction of style, particularly in the character and construction of single buildings. What he has chiefly derived from the middle ages is the principle of construction of the ancient architects, which he believes he has first rediscovered, which he styles the net or knot system, and which he has employed in several of his buildings. On this system he has rendered himself eminent as a roof constructor, one example of which is the cupola to the cathedral at Mainz, formed of iron and zinc; and another is the roof of the theatre in that city, which has been imitated with increased effect in the theatre at Dresden, by Semper. Moller's constructive principles have been developed in his 'Beiträgen zur Lehre von den Constructionen' ('Contributions to the Theory of Construction'). He is at the head of a numerous school, which has already produced several excellent architects. [See SUPPLEMENT.]

MOLYN PRTER, [TEMPESTA, CAVALIERE.]  
MOLYNEUX, WILLIAM, was born at Dublin, on the 17th of April, 1656. He entered the university of that city in 1671, whence, after taking the degree of B.A., he removed to London, and entered the Middle Temple, where he studied law during three years. On his return to Ireland he married (1678) the daughter of Sir William Donville, the king's attorney-general. The same year his wife was attacked by an affection of the eyes, which increased so rapidly, that in a few months her sight was wholly destroyed. To divert the melancholy thoughts to which his wife's affliction incessantly gave rise, he took to the study of the mathematics. "This," he says, "was the grand pacificum I used; these were the opiates which lulled my troubled thoughts to sleep." In the mathematics he had probably received some instruction from his father, Captain Samuel Molyneux, who was author of a treatise on gunnery on the principles expounded by Galilei concerning the motion of projectiles. In 1688 he took an active part in the formation of the Dublin Philosophical Society, of which he was first secretary and afterwards president. In 1686 he was appointed by the English government to inspect the fortresses of the Netherlands, and the same year was elected a Fellow of the Royal Society of London. In 1688, upon the political disturbances of Ireland, brought about by the severities of Tyrconnel's government, he, with many other Protestants, was obliged to take refuge in England; but he returned to Ireland after the battle of Boyne in 1690. In 1692 he sat in the Irish parliament as one of the representatives of the university of Dublin, and at the close of the session was nominated by the government commissioner of forfeitures, with an annual salary of 400*l.*, which appointment however he thought fit to decline, chiefly on account of the bad reputation of the other commissioners named.

His principal work is a treatise on optics, entitled 'Dioptrica Nova,' 4to., London, 1692, and 1709. It was the first work on the subject which had appeared in English, and contained a great many propositions practically useful and clearly demonstrated, for which reasons it continued in request for many years. The revision of the proof sheets was undertaken by Dr. Halley, who added in an Appendix his celebrated theorem for finding the foci of optic glasses. Flamsteed had also assisted in the preparation of the work, and in particular had furnished solutions of three propositions, which Molyneux placed after the solutions given by himself. At this circumstance the astronomer-royal, with whom Molyneux had previously been on terms of intimacy, took such offence, says Molyneux, "that he broke his friendship with me, and that with such inveteracy, that I could never after bring him to a reconciliation; so that at last I slighted the friendship of a man of so much ill-nature and irreligion, however ingenious and learned soever."

Among the many persons of literary eminence with whom he maintained a correspondence, Locke was held by him in particular esteem, and in the last year of his life he came to England for the purpose of visiting that philosopher. He died in Dublin, on the 11th of October, 1698.

Besides his 'Dioptrica' and twenty-seven papers on miscellaneous subjects inserted in the 'Philosophical Transactions' between the years 1684 and 1716, he published 'Translation of the Six Metaphysical Dissertations of Descartes, together with the objections against them by Thomas Hobbes,' London, 1671; 'Sciothericum Telescopium, or a New Contrivance for adapting a Telescope to an Horizontal Dial,' 4to, Dublin, 1686; 'Journal of the Three Months' Campaign of His Majesty in Ireland, with a Diary of the Siege of Limerick,' 4to, 1690; 'The Case of Ireland being bound by Acts of Parliament stated,' 8vo, Dublin, 1698-1706-70-76.

(*Account of the Family and Descendants of Sir Thomas Molyneux, Knt., Evesham, 1820, 4to; Hutton, Mathematical Dictionary; Biographia Britannica.*)

MONBODDO, JAMES BURNETT, styled LORD (in his quality of one of the judges of the Court of Session), was born in 1714, at the family seat of Monboddo, in Kincardineshire, and after studying at Aberdeen, was sent to the University of Groningen, according to a custom then common in Scotland, where an education either at a Dutch or French university was considered indispensable for young men intended either for the profession of law or for that of physic. Lord Monboddo has himself mentioned that his father, whose eldest son he was, sold part of his estate in order to afford him this advantage. He returned home in 1738, and from that time practised as an advocate at the Scottish bar, till his elevation to the bench in 1767. He is known in the literary world by two learned but paradoxical works: the first entitled 'A Dissertation on the Origin and Progress of Language,' in 6 vols. 8vo, 1774-92; the second entitled 'Ancient Metaphysics,' in 6 vols. 4to, 1778, &c. An exclusive and somewhat intolerant admiration of the language, literature, and philosophy of the ancient Greeks, some singular notions about men being only a civilised species of monkeys, a preference for the virtues and happiness of the savage state, and a general credulity in favour of the marvellous, are, in addition to considerable erudition, among the most remarkable peculiarities of these performances—now perhaps chiefly remembered on account of these peculiarities. Lord Monboddo however was also esteemed a good lawyer and judge, and his character in all other relations was of the highest respectability. A description of his person and conversation has been given by Boswell in his 'Tour to the Hebrides,' in an account of a visit paid to him by Dr. Johnson at Monboddo (pp. 73-85). In a note Boswell says, "There were several points of similarity between them; learning, clearness of head, precision of speech, and a love of research on many subjects which people in general do not investigate. Foote paid Lord Monboddo the compliment of saying that he was an Elzevir edition of Johnson." Some further account of him may be found in Kerr's 'Memoirs of Smellie,' the Edinburgh printer (vol. I, pp. 409-15). Smellie, we are told, used to be a frequent visitor at what his lordship called his learned suppers. "In imitation of the ancients," says Smellie's biographer, "for whom he professed an enthusiastic admiration, Lord Monboddo always made supper his principal meal, and his regular time of entertaining his friends. These learned suppers used to take place once a fortnight during the sitting of the courts; and among the usual guests were the late Dr. Black, Dr. Hutton, Dr. Hope, Dr. Walker, Mr. Smellie, and other men of science and learning, of whom Edinburgh at that time furnished an ample store." Lord Monboddo died at Edinburgh, in consequence of a paralytic stroke, on the 26th of May 1799.

MONCALVO. [CACCIA GUGLIELMO.]

MONCREIFF, SIR HENRY, a divine, and ecclesiastical leader in the Church of Scotland, was born at Blackford, in Perthshire, on the 6th of February 1760. His father, Sir William Moncreiff, though a cadet of the family, succeeded to the baronetcy by the failure of the elder line, when he was minister of Blackford, in 1744. Sir Henry was the sixth of his family that had belonged to the clerical profession. In the latter part of his life he assumed the name of Wellwood. He studied at Glasgow and Edinburgh, and was ordained a minister on the 16th of August 1771. Though he was probably the only man of rank who ministered in the Church of Scotland, he was as strongly imbued with the spirit of the Presbyterian policy as those, by far the most numerous class in that church, whom the profession was the means of raising from the more humble grades of society. He had a commanding appearance, was gifted with a powerful argumentative oratory, and was zealous and learned. With such advantages, personal and social, he naturally occupied the first rank in the church. He was for some time his father's successor as minister of Blackford, and in 1775 he was appointed to the charge of St. Cuthbert's in Edinburgh, where he remained till his death, on the 14th of June 1827. He was frequently moderator of the General Assembly, and his name was conspicuous in nearly all the ecclesiastical discussions connected with the Church of Scotland during his ministry in Edinburgh. He was the author of many pamphlets connected with these questions. In 1815 he published 'Discourses on the Evidence of the Jewish and Christian Revelations, with Notes and Illustrations;' and in 1818 an

'Account of the Life and Writings of Dr. John Erskine.' [ERSKINE, JOHN.] His sermons, of which there had been some separate publications during his life, were collectively published after his death (1829-1831) in 3 vols. 8vo, with a short memoir of the author, by his son Lord Moncreiff.

MONGAULT, NICOLAS-HUBERT DE, born at Paris in 1674, studied under the fathers of the congregation of the Oratory, and afterwards became preceptor to the Duke of Chartres, son of the Duke of Orleans the regent, by whose interest he obtained several offices under government. He became a member of the French Academy in 1718. Mongault died at Paris in 1746. He made a French translation of Herodias (Paris, 1745), and also a very good translation of Cicero's letters to Atticus (Paris, 1738), with numerous and useful notes. Both these works, and the last especially, are among the best translations from the classics which the French language possesses.

MONGE, GASPARD, was born at Beaune, in 1748. The father of Monge was, we suppose, a thriving inn or hotel-keeper, "possesseur d'une opulente hôtellerie," and Madame Roland styles him "maçon parvenu." Of his education little is said, nor is much to be expected, when we find him "employed at the age of sixteen, in the college of Lyon, to teach the natural philosophy which he had come there to learn the year before." The clergy who superintended the establishment used all means of persuasion to induce their young pupil to enter the church, but the construction of a plan of his native town brought him at this time under the notice of a colonel of engineers, who procured for him and persuaded him to accept an appointment in the college of engineers at Mézières, where he remained till 1780, when he was appointed professor-adjoint with Bossut, in teaching hydrodynamics at the Louvre. During his stay at Mézières, observing that all the operations connected with the construction of plans of fortification (such as the French call 'défilemens' were conducted by long arithmetical processes, he substituted a geometrical method, which the commandant at first refused even to look at, so short was the time in which it could be practised: it was however received with avidity when further inspected, and Monge, continuing his investigations, soon generalised the methods employed into that great alphabet of the application of geometry to the arts which is now called descriptive geometry. Such however was the system of the French schools before the revolution, that the officers who had been trained in this application were strictly forbidden to communicate its methods even to those who were engaged in other branches of the public service. Monge himself, in 1780, conversing with his pupils Lacroix and Gayvernon, was obliged to say, "All that I have here done by calculation, I could have done with the ruler and compass, but I am not allowed to reveal these secrets to you." But M. Lacroix, whose name is now too well known to require further mention, set himself to examine how this could be, detected the processes employed, and published them in 1795, under the title of 'Complémens de Géométrie.' The method was published by Monge himself, first in the form in which the shorthand writers took them down from the instructions given at the Normal school (an IIL, or 1794-95), and again (an VII, 1798-99), also in the collected edition of the 'Leçons de l'École Normale,' 1800; and finally in the well-known work, 'Géométrie Descriptive' (fourth edition, 1820), which, in simplicity, style, and choice of details, in a subject which might have easily been overloaded with them, stands second to no elementary work whatever. Monge was unrivalled in the communication of instruction, and in the interest which he could excite in the minds of his pupils: M. Dupin relates, that in his walks with them in the neighbourhood of Mézières, both professor and pupils would walk through the brooks without the least attention to where they were going, all intent on the subject upon which he was conversing.

In 1780 he was elected of the Academy of Sciences, and in 1783 he succeeded Bezout as examiner of the naval aspirants: he then quitted Mézières entirely, at which place, since his partial removal to Paris, he had hitherto been occupied during half of the year. For his new pupils he wrote his treatise on Statics ('Traité élémentaire de Statique,' first edition, 1786; fifth edition, 1810); a short and purely synthetical treatise, which is even yet, we think, the best introduction from geometry to that subject. He was forbidden (in instructions from Borda) to employ any other method; and though Dupin cites this in excuse, we must take the liberty of thinking that the mathematical taste for which Monge was so conspicuous would secure his ready acquiescence in the restriction, considering the class of pupils for whom he was to write; if indeed, which is very likely, it was not suggested by himself.

When the wars occasioned by the revolution were on the point of breaking out, Monge was appointed minister of marine. If we were writing his political life, we should have to look for information elsewhere than from M. Dupin, who simply states the appointment, touches on the misfortune which happened at sea during his administration, commencing the whole with an indignant denial of Monge having been concerned in any of the cruelties of the period. He quitted this post without remaining long in it, and became busily engaged in the operations for the equipment of the army. The enormous exertions which were made, and the singularity of the crisis, are well known: war had been declared, twelve hundred thousand soldiers were to be called into the field, and the steel which was to form their bayonets

had not yet left the ore, nor was the saltpetre which was to give them powder manufactured. Many articles for which France had hitherto depended on foreign countries were unattainable, and the raw material was to be procured, the methods of working it in some cases even invented, in all to be described and taught; while the enemy was almost upon the frontiers. M. Biot, in his 'Essai sur l'Histoire Générale des Sciences pendant la Révolution Française,' Paris, 1803, has given a summary of what was done: he does not appear to go too far in saying that the means of procuring iron, steel, saltpetre, gunpowder, and weapons, were created during the reign of terror. And while the ordinary manufactures were deprived of their materials and of their workmen, all the branches of engineering were also at a stand, from those who could by any process be converted into military men being required for the army. The schools of instruction in these branches had been shut up; and in such a state was the hope of future public officers when, in great part by the exertions of Monge, the Normal and Polytechnic schools were established: the first for the exigencies of the moment, to accelerate the formation of a supply of good teachers; the second for the permanent means of formation of every department of engineers. Monge himself taught in both. Considering the present state of theoretical instruction in France, we may form an idea of the improvement which has taken place from the computation of Vauban, who estimated that one-sixth of the expense of fortified places in that country was incurred in providing and instructing proper persons to superintend the constructions.

Monge accompanied the army in the invasion of Italy, and was largely concerned in those wholesale robberies for which restitution was made in 1815. These however must be charged on the general: while to the commission, of which Monge was one, must be allotted the merit not only of having safely conveyed enormous pictures and statues to Paris, but of having repaired the ravage of time and carelessness. In some instances pictures painted on wood were planed at the back until the design was shown, and the remainder was then fired upon another tablet. Monge also accompanied the expedition to Egypt; and to him, with Berthollet and Fourier, all the scientific fruit of that undertaking are due, not only as the collectors, but even as the manual defenders of what they had gained. On the occasion of a revolt at Cairo, in which the communication was cut off between the house of the Egyptian Institute and the military power, the savans, headed by Monge and Berthollet, defended their premises until assistance arrived. During this expedition a strong friendship grew up between Monge and the future emperor, which made the former a zealous partisan of the latter to the end of his career. The consequence of this attachment was, that Monge was among those who were expelled from the Institute at the final restoration of Louis XVIII. This, and the destruction of the École Polytechnique (since revived), are placed by Dupin among the causes of his death, which occurred on the 28th of July 1818.

Besides the works already mentioned, we have the 'Description de l'Art de Fabriquer les Canons,' Paris, an II.; and 'Feuilles d'Analyse appliquées à la Géométrie,' an III. The latter work in the subsequent editions was called 'Application d'Analyse à la Géométrie' (fourth edition, 1809).

There is also a large number of memoirs in the 'Mémoires de Turin,' 'Mémoires des Savans Étrangers,' 'Mémoires de l'Académie des Sciences,' 'Journal de l'École Polytechnique,' 'Correspondance Polytechnique,' 'Annales de Chimie,' and 'Description de l'Égypte.'

The science of descriptive geometry, with its numerous applications to the description of machines, to perspective, architecture, fortification, &c. &c., might be explained at length, but not with much profit to the general reader. The analytical discoveries of Monge are hardly less remarkable. He first applied the differential calculus to the general theory of surfaces, in doing which he enlarged the bounds of that science materially, and added many useful theorems, giving to the consideration of the calculus of three variables all that illustration and clearness which his predecessors had, by means of plane geometry, imparted to the less difficult case of two variables. In this field however he had predecessors and rivals; in that of geometry, such as he made it, he had neither the one nor the other. Since the time of Euclid and Archimedes, that science had received no such accession as he furnished; and the epoch, which will be known by the name of Monge, will divide its history.

(Ch. Dupin, *Essai Historique sur les Services, &c., de Gaspard Monge*; Brisson, *Notices Historiques sur Gaspard Monge*; &c.)

MONK, GEORGE, DUKE OF ALBEMARLE, second son of Sir Thomas Monk of Potheridge, in the parish of Merton, in Devonshire, was born on the 6th of December 1608. His father's estate was much encumbered, and his circumstances so distressed, that when Charles I. visited Plymouth to inspect the equipment of a Spanish expedition, he was afraid of joining the gentlemen of the county who were desirous of assembling round the king, on account of the menaces of a creditor who threatened to arrest him. George Monk was despatched to offer the under-sheriff money to delay the execution of the warrant. "The under-sheriff accepted the money, promised what was asked, and a few days after, paid doubtless on the other side, caused Sir Thomas to be publicly arrested in the midst of the gentlemen assembled on the king's way." ('Memoirs of Monk,' by M. Guisot, translation, p. 5.) This circumstance had an immediate influence on young Monk's life: he

dealt so violently with the treacherous under-sheriff, that it became prudent for him to leave England. Sir Richard Greenville, his relative, was on the point of sailing on a cruise before Cadix, and he embarked with him as a volunteer. Upon the failure of this expedition, he enlisted during the following year in the equally unsuccessful attempt on the Isle of Rhé. Soon after his return from the Isle of Rhé he entered the service of Holland: "Germany and the Low Countries were at this period the resort of those young Englishmen whose taste or the state of whose fortunes drove them to the profession of arms. He returned to England about the thirtieth year of his age, when the first Scotch war began, enlisted in the king's army, and obtained the rank of lieutenant-colonel in Lord Newport's regiment." (Skinner's 'Life of Monk.') The conduct of the war, and the manner in which it was concluded, made him discontented and inclined to emigrate to Madagascar; but he abandoned the scheme, and was appointed colonel of Lord Leicester's troops sent to quell the Irish rebellion (1642). In the irregular warfare that followed he had considerable success, his power being augmented by the devoted attachment of his troops; there was not, it was said, a soldier ever so sick or so ill shod, who would not make an effort to follow George Monk. When the civil war began, these troops were recalled, and Monk, being suspected of favouring the parliament, was sent under a strong military guard to Bristol. Lord Hawley, the governor of the town, passed him on parole to the king; and the king, satisfied with his professions, permitted him to rejoin his troops, which had reached England, and were engaged in the siege of Nantwich. At Nantwich he was defeated by Fairfax (January 1644), was taken prisoner, and, after some delay, confined in the Tower of London. During the two years that he suffered the miseries of imprisonment aggravated by excessive poverty, events pursued their course; the king became a prisoner, and the civil war ceased. His known abilities made him now desirable as a partisan. The parliament actively strove to gain him, and at length, overcome by persuasion and gifts of money (Clarendon, vii. 382), he forsook his party, which was no longer in a condition in which he could serve it.

Monk was now sent to Ireland to command in Ulster, where he served his new masters greatly to their satisfaction, leaving only one cause for censure, a league with the rebel O'Neill. He had gained the confidence of Cromwell, who determined, on account of his military talents, to make him general of the ordnance, and to provide him a regiment with which he might accompany him in the meditated Scotch campaign. In this service Monk distinguished himself at Dunbar, and was left by Cromwell with 6000 men to complete the reduction of Scotland. It is in this campaign that he is accused of having in cold blood put to death the governor of Dundee and 800 of the garrison. After a short residence at Bath for the benefit of his health, he returned to Scotland (1652) with other commissioners to promote the union of the two nations. Fresh and novel services were soon required of him. He was associated with Blake and Dean in the command of the fleet which was engaged in the war against Holland. Two engagements took place, in both of which the English were victorious: Van Tromp, the Dutch admiral, was killed, and his fleet damaged and dispersed. After being rewarded with many honours at the hands of Cromwell and the parliament, he resumed the command in Scotland, where fresh troubles had broken out.

Before we proceed further with the account of Monk's public acts we must mention some occurrences in his private history, by which his condition was immediately affected. These are—the death of his father, which occurred before his imprisonment; the subsequent death of his elder brother without male heirs; his succession to the family estates, which he soon relieved from their embarrassments; and his marriage. When this last event took place it is difficult to ascertain, but it was not acknowledged until 1653, though asserted to have been previously solemnised. His wife was Anne Clarges, the sister of Dr. Thomas Clarges, a physician, a vulgar imperious woman who had previously cohabited with him. "She was a woman," says Lord Clarendon (who must however be pointed out as Monk's assiduous detractor), "Nihil muliebri præter corpus gerens; a person "of the lowest extraction, without either wit or beauty." ('Hist. Rebel,' vii. 383.) The pressing solicitations of the lady, and the probable or actual birth of a child, gained Monk's consent to the union.

It was in April 1654, after all these circumstances connected with his private history had taken place, that Monk, under the orders of the Protector, marched northwards with the most restless and fanatical portion of the army. He had to contend with Lord Middleton, with whom the royalists had risen in the Highlands, and the people generally, who were discontented and ready for rebellion. His vigilance and activity were remarkable, "The country submitted; the army did not quit it, till it had, by means of a certain number of garrisons, secured the payment of taxes, which the Highlanders had hitherto thought they could refuse with impunity; and order was established in those sanctuaries of plunder, with such effect, that the owner of a strayed horse, it is said, recovered it in the country by means of a crier." (Guisot, p. 80.) In the autumn he returned to Edinburgh. For five years his residence was at Dalkeith, where he was "ever engaged in business, or in his planting, which he loved as an amusement and occupation; he gave access to every one; listened to everything; had a language for all conditions, all ranks, and all parties; kept himself well informed on all subjects; and ascertaining what he

might have to fear or to promote, directed by his own personal knowledge the numerous spies whose reports never missed his ears or hands." Monk, who was (1655) one of the commissioners for the government of Scotland, now stood in a very curious position: for though he was the agent and confidant of Cromwell, he was also the hope and favourite of the royalists. It was always his care in advocating the cause of one party to give as little offence as possible to that to which he was opposed. That he might not commit himself, he was silent when speaking was not absolutely necessary; when he was forced to speak, he did so with caution and artful duplicity. A letter which the king wrote to him expressive of confidence, Monk forwarded to Cromwell; but notwithstanding this apparent devotion, the Protector feared him, and used various expedients for neutralising his power.

After Oliver Cromwell's death, when Richard Cromwell was proclaimed Protector in Edinburgh, many exclaimed, in allusion to Monk, "Why not rather 'Old George?'" but Monk would neither assume the power nor attach himself to any party. The new Protector's friends offered him 20,000*l.* a year for his support; but, avaricious as he was, he would make no engagement: his policy was to render himself an object of importance to all parties, and through his duplicity he succeeded in being treated with by all. When at length circumstances compelled him to act, he declared for the parliament against the army, and decided upon marching to London. There were many, even at the time when he thus declared himself, who altogether discredited his sincerity, and believed him to be at heart a royalist, seeking to restore the king as soon as it might be done with safety: and there is reason to suppose that he had already determined to promote the Restoration. We give Mr. Hallam's opinion on this point. ('*Const. Hist.*' ii. 384.) "I incline, upon the whole, to believe that Monk, not accustomed to respect the Rump parliament, and incapable, both by his temperament and by the course of his life, of any enthusiasm for the name of liberty, had satisfied himself as to the expediency of the king's restoration from the time that the Cromwells had sunk below his power to assist them; though his projects were still subservient to his own security, which he was resolved not to forfeit by any premature declaration or unsuccessful enterprises." The power of Lambert and the army was now rapidly demolished. Fairfax, the city of London, the fleet, and the governor of Portsmouth, all declared against them, and Monk's party gained the ascendancy in Ireland. Every office and every command Monk filled with friends whom he could trust; it was observed that many of these persons were royalists, yet Monk still persevered in protesting for the parliament and a commonwealth. The expectation of the Restoration was somewhat general, but, if there were any, the number was small who suspected through whose agency it would be brought to pass.

When Monk arrived in London he was lodged in the apartments of the prince of Wales. He addressed the parliament, was invited to occupy his place there, was made a member of the council of state, and charged with the executive power. With his usual address, he continued to use the power of his army as a means of awing parliament, and the assertion of duty owed to the parliament as a means of controlling his army. At length the 'Rump' became so unpopular, and the cries of a free parliament so loud, that the city of London refused the payment of taxes. Monk obeyed an order from the parliament to march into the city and subdue it: but his subservience to them did not last long. He sent them a harsh letter, ordering them immediately to fill up the vacant seats, fixing a time for their dissolution, and the 6th of May for the election of a new and free parliament. The restored members appointed him general of the forces of England, Scotland, and Ireland; and the republicans, as a last resource, listened to his continued protestations against the king, the House of Lords, and the bishops, and allied themselves to him. Every day his personal power increased; he was offered the protectorate, which he declined; continuing the line of conduct he had always followed, "that is to say, steadfast in varying his language according to the individual—he gave no handle to any definite opinions with respect to himself." The expectation of the Restoration daily increased, and some indications in the conduct of Monk, who was gradually dismissing persons and removing objects that might prove obnoxious to the king, showed plainly that the event was not far distant.

At length the farce was brought to a close. Monk received Sir John Greenville, the king's messenger, and having read the despatches, and agreed to his return, directed the manner in which he wished it to be brought about. The king, by Monk's advice, went from Brussels to Breda, and Sir John Greenville, on the 1st of May, returned with letters to the new parliament drawn up as Monk desired, and the king was immediately acknowledged and proclaimed. On the 23rd of May, Monk received him on the beach at Dover, was embraced by him, and addressed with great affection. He had a grant of money, together with many offices and titles, of which the principal was the Duke of Albemarle.

After the Restoration Monk resided principally in London, with his wife, who was the laughing-stock of the court, and gave general disgust. (Pepys, iii. 75, &c.) In 1664 Monk presided at the Admiralty. In 1665, when, on account of the plague, the court left London, he governed the city, braved all danger, and, as far as he was able, provided for all exigencies and quelled all confusion. In 1666 he com-

manded the fleet with Prince Rupert, engaged the Dutch, and gained credit for his courage. On his return his health failed, and he died of dropsy on the 3rd of January 1670. He was buried in Westminster Abbey, in Henry VII.'s chapel: the king attended the funeral. He was succeeded in his titles by Christopher his son, who married Lady Elizabeth Cavendish, granddaughter of the Duke of Newcastle, and died childless.

Monk had considerable capacity for civil as well as military government: the former he proved in Scotland, the latter in all his campaigns. He had the faculty of gaining the good-will and confidence of the troops and sailors that he commanded, with whom no man was more popular than "Old George." He had a remarkable power of advancing his fortunes with the prevailing party, without giving offence to those that might supplant them. He was silent and cautious, shrewd and phlegmatic: he was profoundly skilled in dissimulation, ever dissembling, treacherous, and false. "He was a man capable of great things," says M. Guizot, "though he had no greatness of soul."

(Skinner, *Life of Monk*; Guizot, *Memoirs of Monk*, ably edited by the late Lord Wharncliffe; Maseres' *Tracts*; Pepys and Evelyn.)

MONK, JAMES HENRY, BP. OF GLOSTER. [*See* vol. vi. col. 1014.]

MONMOUTH, DUKE OF. [CHARLES II.; JAMES II.]

MONNOYER, JEAN BAPTISTE, a very celebrated fruit and flower painter, was born at Lille, in 1635. He was educated as an historical painter at Antwerp, but he afterwards adopted flower-painting and went very early to Paris, where he was noticed and employed by Le Brun, and in 1665 was elected a member of the French Academy of Painting. He was employed by Le Brun in the decoration of the palace of Versailles, in which he painted many festoons of flowers and other similar pieces. It was owing to the beauty of these works that he was invited, about 1680, to London by the Duke of Montague, then English ambassador at Paris, to decorate Montague House (the late British Museum) in a similar manner; and the free and beautiful flower decorations of this palace, which is now pulled down, must still be fresh in the recollections of many.

Monnoyer painted in many other noblemen's houses in London and at other places; at Burlington House, at Lord Carlisle's, at Hampton Court, and at the Duke of St. Alban's at Windor. One of his most remarkable works is a looking-glass painted in Kensington Palace for Queen Mary, who took such delight in seeing him paint that she spent nearly all the time that he was at work in watching him. There are fourteen flower-pieces by Monnoyer, or Baptiste as he is now commonly called in England, in the apartment named George II.'s private chamber, at Hampton Court. Monnoyer was commonly styled 'the flower-painter' in England in his own lifetime. He paid a few visits to Paris after his first arrival in London, but his permanent abode was in London, where he died in 1699, and was buried in St. James's. The French offended him by allowing his son-in-law, who was a painter and living at Paris, to touch and alter some of his works.

Monnoyer's style, though not by far so minute or highly finished as that of Van Huysum, is more free and brilliant, yet equally true and effective. His selection of flowers, his grouping, his colouring, and light and shade, and touch, are all equally excellent: his works in their perfect condition must have almost rivalled nature herself. The brilliancy of his colouring is extraordinary. He was particularly fond of grouping roses, poppies, peonies, tulips, and a few white flowers together in a marble vase, and there are several etchings of such groups by his own hand: the vases are placed on pedestals or tables. His best works are in this country. The prints after his works amount to about 80, and make a good folio volume: his own etchings are marked J. Baptiste, sculpt., whence probably his now common name of Baptiste. His son ANTOINE MONNOYER, likewise a good flower-painter, was called the younger Baptiste in England. There is a portrait of Monnoyer engraved by White from a picture by Sir Godfrey Kneller.

MONRO, ALEXANDER, M.D., was born in 1697. He was a pupil of Cheselden, and afterwards studied at Paris, and under Boerhaave at Leyden. In 1718 he returned to Edinburgh, where his father practised as a surgeon, and in the following year was appointed Professor of Anatomy to the Company of Surgeons. He soon after, in conjunction with Dr. Alston, commenced giving public lectures on anatomy, and thus laid the foundation of a school of medicine in Edinburgh, which was soon attached to the university. It was also at the suggestion and under the direction of Dr. Monro that the Royal Infirmary of Edinburgh was established, in which he delivered clinical lectures on surgery, Dr. Rutherford at the same time lecturing on medicine. In 1759 he resigned the lectureship on anatomy to his son, from whom it descended to his grandson; but he retained his clinical lectureship till within a short period of his death in 1767. He was a Fellow of the Royal Society of London, and a member of the Royal Academy of Surgery in Paris; and it is chiefly to his talents as a lecturer that the Medical School of Edinburgh first owed the celebrity which it has since maintained.

The greater part of Dr. Monro's writings are contained in the Transactions of different scientific societies, especially in those published by a Society of which he was the founder, under the titles of 'Medical Essays and Observations,' and 'Essays Physical and Literary.' The work by which he is chiefly known is his 'Osteology,' which was first published in 1726, and which has been since reprinted in a great

variety of forms, and with various additions, both in this country and on the Continent. His complete works were published by his son, in one volume &co, in 1781.

MONROE, JAMES, was born in the county of Westmoreland, Virginia, on the 16th of March 1751 of a Scotch family. Nothing is known of his early life, but he seems to have shown great decision of character, having entered the army as a volunteer at the age of sixteen. In 1777, in the retreat through the Jerseys, he was wounded at Trenton. He was then a lieutenant, and on his recovery was made an aide-de-camp to Lord Stirling, with the rank of major. Just before the close of the war he was appointed colonel on the recommendation of General Washington. He then went to the college of William and Mary in Virginia, where he studied law, and soon after represented his native county in the legislature, and was also appointed to the council of state. In 1788 he was a member of the Virginia Convention, and was opposed to the adoption of the constitution. After it came into operation he became a candidate for a seat in the house of representatives, in opposition to Mr. Madison, and lost his election. He was however soon after chosen a senator of the United States by the state of Virginia, and after continuing in that body about three years, he was appointed by General Washington minister to France in the place of Mr. Gouverneur Morris, who had become unacceptable to the ruling party in that country. It was thought that a well-known member of the party friendly to the French revolution might be able to restore that confidence between the two countries which was already diminished by the supposed leaning of Hamilton and his party towards Great Britain.

Monroe accordingly endeavoured to fulfil this object of his mission, and, as some thought, at too great a sacrifice of the rights and interests of his own country. Such was the opinion of the administration, especially after the avowed change of policy by France in consequence of Mr. Jay's treaty, and he was accordingly recalled in August 1796. It was considered by the Opposition, French, or Democratic party, for it was called by all these names, that he had been sacrificed for his attachment to liberal principles; and as the majority in Virginia belonged to this party, he was appointed governor of that state in 1798-99. He held the office for three years. In 1802 he was appointed minister to France, and, in conjunction with Mr. R. R. Livingston, who was already in Paris and engaged in negotiating the purchase of New Orleans, he succeeded in effecting the purchase of Louisiana. From France he went to Spain, and thence to Great Britain, as minister, where, with his adjunct Mr. Pinckney, he concluded a treaty in 1807, which Mr. Jefferson, disapproving, refused to lay before the senate. Mr. Monroe returned home in 1808, much dissatisfied that the treaty, which had been with great difficulty effected, had been received with so little respect; and that his return had been delayed, as he supposed, for the purpose of preventing his competition with Mr. Madison for the presidency. He was accordingly supported by the opposition in Virginia, and great efforts were made to enlist the popular sympathies in his favour; but all these efforts failed, and he obtained no votes in his own state or elsewhere. By means of Mr. Jefferson a reconciliation was brought about, and Mr. Monroe was then made secretary of state under Madison, in which office he continued until he was chosen president, in 1816, by 123 votes against 34. So prudent and conciliatory had been his conduct, and so little had the course of public affairs interfered with his popularity, that he was re-elected in 1821 unanimously, with the exception of a single vote. After his term of office expired he lived a short time in Loudon county in Virginia, where he accepted the office of justice of the peace. He was also a visitor of the University of Virginia. Towards the close of his life he removed to New York, where he died on the 4th of July 1831. He left two daughters, Mrs. Hay and Mrs. Gouverneur, who resided in New York, in which he had married while member of Congress in 1790.

Mr. Monroe was not endowed with any shining qualities, but he had great prudence, united to great firmness, great regard to reputation, sound though slow judgment, and unwearied perseverance; and there has seldom been so striking an example of what steadiness of purpose and untiring perseverance can accomplish. His manners were mild and amiable, but, considering the society he had always kept, he was strangely awkward in almost all that he said and did: he used odd inappropriate expressions, and often said what might have been better omitted. But all this was only in minor matters: he generally acted wisely and sagaciously. He was however even a worse manager of money matters than Mr. Jefferson. He was always in debt, and always in want of money; but by the grants which he obtained from Congress, and an inheritance derived from an uncle, he left to his daughters a competent fortune.

(Communication from Virginia.)

MONSTRELET, ENGUERRAND DE, a celebrated French chronicler writer, lived in the 15th century: the date of his birth is unknown, but it is believed to have been towards the close of the 14th century. His quotations from Livy, Sallust, and Vegetius lead to the opinion that he must have had a tolerable acquaintance with Latin literature. M. Dacier supposes that either from bodily weakness or a pre-occupied taste for study, he altogether abstained from the profession of arms, which at the time when he lived was almost essential to the character of a gentleman. The same author is also of

opinion that he belonged to neither of the factions of Armagnac or Burgundy, nor indeed acted in any of the events of his time, but was a quiet spectator of the circumstances which he has recorded. In all his work Monstrelet only once alludes to himself, where he describes the capture of the Maid of Orleans before Compiègne (livre ii, chap. 86), and then he merely tells us that he was present at the interview between the Pucelle and the Duke of Burgundy, and almost implies that he was not present at the skirmish in which the capture was made. He had on this occasion (says Dacier) accompanied the Duke Philip perhaps as historian. The rest of his life he passed in the city of Cambrai, where he held several offices, being bailiff of the chapter of Cambrai, provost of the city, and bailiff of Wallaincourt. He died July 14, 1453.

The first book of the *Chronicles of Monstrelet* begins with the year 1400, and ends with the year 1422; the second concludes with 1444. The early editions contain a third and fourth book, which are both rejected by M. Buchon, a modern editor; the latter for the obvious reason that the events which it records did not take place till after the death of the chronicler, and the former on the authority of M. Coney, who declares that Monstrelet stopped at 1444, as well as from the result of certain critical investigations on the part of M. Buchon himself.

Monstrelet is greatly commended for his minuteness of detail, his fidelity, and the extended view he takes in his '*Chronicles*;' for, like Froissart, his predecessor, he does not confine himself to France alone, but gives all the circumstances relative to the affairs of the other countries of Europe which were within the compass of his knowledge. He has however little of the picture-queeness of Froissart, or the sagacity of Comines. His principal object was to give a history of the wars of his time, and of the persons engaged in them, but he adds much valuable information, both political and ecclesiastical.

In France there are several manuscripts of Monstrelet. The first printed edition is a quarto, dated 1512, which was followed by four others, the last dated 1603, all containing the additional books rejected by Buchon, who however praises the third edition (1572) for its beauty. The edition by Buchon was published in 1836, and forms part of a series of the '*Panthéon Littéraire*.' In 1810 an English version of Monstrelet was published by M. Johns, the translator of Froissart in 13 vols. 8vo; and it has been reprinted in a cheaper form.

MONTAGU, BASIL, Queen's Counsel, was born April 24, 1770, in London. He was a natural son of John Montagu, fourth earl of Sandwich, and was brought up in his house. His mother was Miss Ray, who was shot in 1779, in the Piazza of Covent Garden, by the Rev. Mr. Hackman, who had fallen in love with her, and destroyed her in a fit of jealous frenzy. Basil Montagu received his early education at the Charter-house School, London, of which the Earl of Sandwich was one of the governors. In 1786 he was sent to the University of Cambridge, where he was soon distinguished for his love of literature, and where he remained till after he had taken his degree of M.A. His father died in 1792, leaving him a competent income, of which however he was deprived by a suit in the Court of Chancery. Having selected the law as a profession, he entered himself of Gray's Inn, where he was called to the bar in 1798, but some years afterwards he became a member of Lincoln's Inn. After he had settled in London he formed an intimacy with Coleridge and others of that literary connection, and became so zealous a convert to the opinions of Godwin that he had serious thoughts of relinquishing the profession of a lawyer, as "injurious to society in proportion to the power and attainments of the individual." Sir James Mackintosh however, with whom he travelled for some years on the Norfolk circuit, convinced him that the dogma of Godwin was not founded in truth, and he continued in the legal profession. He never rose to eminence as a pleader, but having devoted his attention chiefly to the bankrupt laws, acquired a high reputation and good practice in that department.

His first work was '*A Summary of the Law of Set-Off, with an Appendix of Cases argued and determined in the Courts of Law and Equity upon the Subject*,' 8vo, 1801. It had not appeared many weeks before it was noticed with approbation by Sir Vicary Gibbs, who thus extended the practice of the young lawyer, then almost unknown. His most important legal work was '*A Digest of the Bankrupt Laws, with a Collection of the Statutes, and of the Cases argued and determined in the Courts of Law and Equity upon that Subject*,' 4 vols. 8vo, London, 1805, 2nd edition, 1811. This '*Digest*' became a standard work, and many other editions of it were published. He published also '*Law and Practice in Bankruptcy*,' 2 vols. 8vo, with '*Supplement*,' 1 vol.; '*The Law of Partnership*,' 8vo; and '*The Law and Practice of Parliamentary Elections*,' in conjunction with Mr. W. Johnson Neale, 8vo, 1839. His other legal works and compilations, partly in his own name, partly in conjunction with others, are too numerous to be quoted. Lord Erskine, during his brief tenure of the office of lord chancellor (1806-7) made Mr. Montagu a commissioner of bankrupts. While holding this appointment, and deriving a considerable income from it, he became so convinced of the delay and expence to suitors of this mode of administering the law, that he published a yearly detail of these injurious results, which, together with his statements before a Committee of the House of Commons, finally put an end to those

commissionerships. A new law was made (1 & 2 Wm. IV. c. 56), under which three judges constituted a Court of Review, and six commissioners exercised functions similar to those previously exercised by the commissioners under the great seal. Mr. Montagu was very much dissatisfied with the new law, but he accepted the office of accountant-general in bankruptcy, which he held during ten years. While in this office he demanded from the governors of the Bank of England interest for the bankruptcy moneys in their possession, which had never previously been paid. His demand was at first resisted, but ultimately he obtained 20,000*l.* for the bankruptcy fund.

The works and compilations by which Mr. Montagu is best known to general readers are the following:—'Selections from the works of Taylor, Hooker, Hall, and Lord Bacon, with an Analysis of the Advancement of Learning,' 12mo, 1805. The analysis is carefully executed, and very useful for those who wish to study Lord Bacon's treatise. 'The Opinions of different Authors on the Punishment of Death,' 3 vols. 8vo, 1809-13. In furtherance of these 'Opinions,' he formed a society for "the diffusion of knowledge upon the punishment of death." His efforts for the abolition of hanging for forgery and other crimes without violence, in conjunction with those of Sir Samuel Romilly, Mr. Wilberforce, and others, were at length rewarded by complete success. 'Inquiries into the Effects of Fermented Liquors, by a Water-Drinker,' 8vo, 1814. 'The Works of Francis Bacon, Lord Chancellor of England,' 16 vols. 8vo, London, 1825-34. This work was commenced while he was at the university by the translation of Bacon's Latin works, in which he was assisted by Archdeacon Wrangham and others. The 16th volume, in 2 parts, contains Montagu's 'Life of Bacon,' which, though not distinguished by much power of thought or beauty of style, is a useful exhibition of the leading events and labours of Bacon's life, active and contemplative. 'Essays and Selections, by Basil Montagu,' 12mo, 1837. He published altogether about 40 volumes, and is stated to have left about 100 volumes of manuscripts, a Memoir of himself and his contemporaries, and a Diary.

Basil Montagu assisted in the establishment of several mechanics institutes, and frequently gave lectures in them. He seems to have been not only an industrious and useful lawyer, but an honest, liberal-minded, and benevolent man. He died November 27, 1851, at Boulogne, in France. At the age of thirty-five he had been twice a widower, both wives having died in childbirth, leaving him four children. In 1808 he married the widow of Thomas Skipper, Esq., who survived him, and by whom he had four children. Of his eight children only a son and a daughter are living. His daughter-in-law, Miss Ann Skipper, is the wife of Mr. Procter (Barry Cornwall).

MONTAGU, LADY MARY WORTLEY, by birth Lady Mary Pierrepont, was the eldest daughter of Evelyn, earl of Kingston (afterwards Marquis of Dorchester, finally Duke of Kingston), by his wife the Lady Mary Fielding, daughter of William, earl of Denbigh, and was born at her father's seat of Thoresby in Nottinghamshire, about the year 1690. Displaying great attractions of person as well as sprightliness of mind from her earliest years, she was the favourite and pride of her father, who, having lost his wife in 1694, and continuing a widower, introduced his daughter to society, and made her preside at his table, almost before she had well outgrown her childhood. It does not appear however that there is any truth in the common account of his taking pains to have her talents cultivated by a learned education. What Latin she knew she seems to have acquired of her own accord; and there is no reason to suppose that she ever studied Greek, a translation made by her, when a girl, of the 'Encheiridion' of Epictetus, which has been referred to as a proof of her knowledge of that language, having been in fact made from the Latin. She was at least however an eager reader of whatever fell in her way in her mother-tongue.

In August 1712 without the consent of her father, with whose views in regard to a settlement his proposed son-in-law had refused to comply, Lady Mary married Edward Wortley Montagu, Esq., eldest son of the Hon. Sydney Montagu, and grandson of the first Earl of Sandwich. Her letters to Mr. Montagu before their marriage, which have been published entire for the first time in the complete edition of her works by her great grandson, the late Lord Wharcliffe, prove that she had already attained much of that sharpness both of style and thought for which her writings are remarkable, as well as a maturity of judgment far beyond her years. Soon after the accession of George I., Mr. Wortley, who had been for some years in parliament, obtained a seat at the Treasury Board, of which his cousin, Charles Montagu, earl of Halifax, had been appointed first commissioner; and from this time Lady Mary resided principally in London, where her wit and beauty immediately acquired her a brilliant reputation. Her husband had long been on terms of intimate friendship with Addison and other eminent literary men of the day, and in that society she moved with the same lustre as in the circles of rank and fashion.

In 1716, Mr. Wortley Montagu was appointed ambassador to the Porte; and in August of that year he set out for Constantinople, accompanied by his wife. They remained abroad till October 1718, and it was during this absence from her native country that Lady Mary addressed to her sister, the countess of Mar, Mr. Pope, and other male and female friends, the celebrated Letters upon which her fame prin-

cipally rests. The picture of Eastern life and manners given in these letters is admitted by all who have since visited the Levant to be in general as correct as it is clear, lively, and striking; and they abound not only in wit and humour, but in a depth and sagacity of remark, conveyed in a style at once flowing and forcible, such as has rarely proceeded from a female pen. Although they were not given to the world during her lifetime, they were evidently written with a view to publication; copies of all of them were preserved by Lady Mary, and some time before her death she presented two complete transcripts of them, the one, in her own handwriting, to the Rev. Benjamin Sowden, minister at Rotterdam, "to be disposed of as he thinks proper;" the other, in a different hand, to Mr. Molesworth. Both these copies were procured immediately after her death by her daughter, Lady Bute, the first-mentioned having been purchased for the sum of 500*l.*; but it appeared that a transcript had been previously taken (as Mr. Sowden affirmed, without his knowledge) and from this the Letters were published, in three volumes 12mo, in 1763, the editor, it is said, having been the notorious Captain Cleland. A fourth volume appeared in 1767, composed of letters of which no manuscript is known to exist, but of the authenticity of which no doubt was ever entertained by Lady Mary's family. As they originally appeared, the Letters were introduced by a 'Preface by a Lady,' dated 1724, and signed M. A., which now turns out to have been written by a person once of considerable literary reputation, Mrs. Mary Astell, the Madonella of the Tatler (see Nos. 32 and 63), who was a particular friend of Lady Mary, and who had drawn up the said preface after perusing the Letters in manuscript. The authenticity of the Letters was not considered to be conclusively established till the publication of the first collected edition of Lady Mary's works in 1803, in five volumes 12mo, "by permission, from her genuine papers," by Mr. Dallaway, who prefixed to the whole a Life of her ladyship, of very little merit in every respect. A second edition of this publication appeared in 1817, containing some additional letters; but its value has been since entirely superseded by the publication of 'The Letters and Works of Lady Mary Wortley Montagu,' edited by her great-grandson, Lord Wharcliffe, 3 vols. 8vo, London, 1836, and again in 1837. Besides presenting the letters formerly printed in a much more correct shape, this publication contains several letters and other pieces which had not before been given to the world; but it derives its chief value and interest from a new Life of Lady Mary, modestly entitled 'Biographical Anecdotes' (understood to be from the pen of her granddaughter, Lady Louisa Stuart), which is as able and spirited as anything Lady Mary herself ever wrote.

Lady Mary's visit to Turkey, besides producing the Letters, is famous for having been followed by the introduction, through her means, into this country, and thence into the rest of Europe, and also into America, of the practice of inoculation for the small-pox. [MATHER, COTTON, vol. iv. col. 150.] Of the next twenty years of her life, which she passed in England, the most memorable incident is her quarrel with Pope, an affair which is involved in considerable mystery, but in which it appears probable that the vanity of the poet was at least as much to blame as the levity of the lady. During this interval also she composed a considerable quantity of verse, which was handed about in society, and some of which got into print; but she had not much of the poetical temperament, and her rhymes, though not without sprightliness, contained nothing which could ensure them a long life. Among those of her performances in this line of greatest pretension were six satirical sketches, entitled 'Town Eclogues,' which have been often printed; others of her poetical pieces, or that have been generally attributed to her, are in so free a style, as to make it necessary to exclude them from the modern editions of her works. For reasons, the nature of which is not well known, she again left England in 1739, but this time without her husband, from whom however she seems to have parted on very good terms, although they never met again. She directed her course to Italy, where she lived first on the shores of the Lake of Iseo, and afterwards at Venice, till 1761, when she was prevailed upon, by the solicitations of her daughter, to return to England. She only survived her return to her native country a few months, dying of a cancer in the breast, on the 21st of August 1762. Besides a son, the subject of the next article, she left a daughter, Mary, who had been married in 1736 to John, third earl of Bute (George III.'s celebrated minister), and who died in 1794.

MONTAGU, EDWARD WORTLEY, son of Edward Wortley Montagu, Esq., and his wife Lady Mary, the subject of the preceding article, was born in 1713, at Wharcliffe, in Yorkshire. His niece, Lady Louisa Stuart, in her biographical sketch of his mother, describes him as "betraying from the beginning that surest symptom of moral (or mental) disease, an habitual disregard of truth, accompanied by a fertile ready invention never at fault." When very young he was sent to Westminster School, from which he repeatedly ran away, till at last, making his escape altogether from his friends, or abandoned by them as irreclaimable, he gave himself up to the lowest vices, and after going through a variety of adventures, hired himself for a cabin-boy in a ship sailing to Spain, where he was after some time discovered by the British consul at Cadix, and once more restored to his family. He was then sent to travel on the Continent in charge of a private tutor, and it was while abroad that he published his first work, a tract entitled 'Reflections on the Rise and Fall of Ancient Republics.' His

literary labours however still left him leisure for pursuits of a very different kind; and while at Paris he got involved in a dispute with a Jew, which subjected him to a criminal prosecution. We presume it was after he returned to England that, while still under age, he married, as we are told by his niece, a woman of very low degree, considerably older than himself, whom he forsook in a few weeks, and never saw again. His wife, who gave him no ground for divorcing her, lived nearly as long as himself; but nevertheless, it is added, several other ladies successively passed by his name, some of whom were married to him, others possibly not; the last of them, at any rate, had, like himself, been married before to a person who was still alive.

Notwithstanding all this profligacy and disregard of reputation, Mr. Montagu, having procured a seat in the House of Commons, retained it for two parliaments, till at last his extravagant expenditure involved him in such pecuniary embarrassments that he deemed it expedient once more to go abroad. He never returned to England, but proceeding first to Italy, made himself remarkable there by becoming a convert to popery, and then transferring himself to Egypt, excited a still greater sensation by turning Mohammedan. The rest of his life he spent in the Levant, having in the mean time been disinherited by his father and mother; but he was on his way back to England when his death took place at Padua in 1776. Besides his early tract he wrote another entitled 'An Examination into the Causes of Earthquakes;' and he also contributed some papers to the 'Philosophical Transactions.' Niebuhr, in his *Travels* (Hamburg, 1837), tells a curious anecdote about Montagu marrying another man's wife in Egypt; and states some other facts which throw light on the character of this eccentric man, who seems to have had more ability than his family gave him credit for. The dislike between the father and son appears to have been mutual.

MONTAGUE, GEORGE, was descended from an ancient family residing at Lackham, in the central part of Wiltshire, where he had an estate. He was distinguished for his love of natural history, and was one of the early members of the Linnean Society of London. In 1802 he published an 'Ornithological Dictionary, or Alphabetical Synopsis of British Birds,' 2 vols. 8vo. This work exhibited much research as well as an extensive knowledge of the department of natural history to which it was devoted, and may be consulted with advantage at the present day by the ornithological student. In 1803 he produced his 'Testacea Britannica; or Natural History of British Shells, Marine, Land, and Fresh-water, including the most minute; systematically arranged and embellished with Figures,' London, 4to. This work also contained a great mass of valuable information on the subject on which it treated. A 'Supplement' was published in 1809, containing several plates and descriptions of new species. Besides these two great works he published several papers in the 'Transactions of the Linnean Society.' Of these the following are the principal:—1. 'Description of Three rare Species of British Birds.' Vol. iv., 1796. 2. 'Description of several Marine Animals found on the south coast of Devonshire.' Vol. vii., 1802. 3. 'On some Species of British Quadrupeds, Birds, and Fishes.' Vol. vii., 1803. 4. 'Of the larger and lesser Species of Horse-shoe Bats, proving them to be distinct, with a Description of *Vespertilio Barbastellies* taken in the south of Devonshire.' Vol. ix., 1805. 5. 'On the Natural History of the Falco *Cyanens* and *Pygargus*.' Vol. ix., 1807. 6. 'Of several New or Rare Animals, principally Marine, discovered on the south coast of Devonshire.' Vol. xi., 1811. 7. 'Of some New and Rare British Marine Shells and Animals.' Vol. xi., 1811. During the latter part of his life Mr. Montague lived at Knowle, near Kingsbridge, in Devonshire, where he died in 1815.

MONTAIGNE, MICHEL, LORD OF, born in 1533, was a younger son of a nobleman whose estate, from which he took his name, was situated in the province of Perigord, near the river Dordogne. His father, an eccentric blunt feudal baron, placed him under the care of a German tutor, who did not speak French, and the intercourse between tutor and pupil was carried on entirely in Latin; and even his parents made it a rule always to address him in that language, of which they knew a sufficient number of words for common purposes. The attendants were enjoined to follow the same practice. "They all became Latinised," says Montaigne himself; "and even the villagers in the neighbourhood learnt words in that language, some of which took root in the country, and became of common use among the people." Thus without the aid of scholastic teaching, Montaigne spoke Latin long before he could speak French, which he was afterwards obliged to learn like a foreign language. He studied Greek in the same manner, by way of pastime rather than as a task. He was afterwards sent to the college of Guienne at Bordeaux; and at the age of thirteen he had completed his college education. He then studied the law, and in 1554 he was made "conseiller," or judge, in the parliament of Bordeaux. He repaired several times to court, and enjoyed the favour of Henri II., by whom, or, as some say, by Charles IX., he was made a gentleman of the king's chamber and a knight of the order of St. Michel.

When he was thirty-three years of age Montaigne married Françoise de la Chassaigne, in order, as he says, to please his friends rather than himself, for he was not inclined to a married life. He however lived on good terms with his wife till his death. He had only one

daughter by his marriage. He managed his own estate, on which he generally resided, and from which he derived an income of about 6000 livres.

In 1569 Montaigne translated into French a Latin work of Raymond de Sebonde or Sebon, a Spanish divine, on 'Natural Theology.' France was at that time desolated by civil and religious war, and Montaigne, disapproving of the conduct of the court towards the Protestants, and yet being by education a Roman Catholic, and by principle and disposition loyal to the king, was glad to live in retirement, and take no part in public affairs except by exhorting both parties to moderation and mutual charity. By this conduct he became, as might be expected, obnoxious to both sides. The massacre of St. Bartholomew plunged him into a deep melancholy, for he detested cruelty and the shedding of blood. It was about this dismal epoch of 1572 that he began to write his 'Essays,' which were published in March 1580, and met with great success.

With the view of restoring his health, which was not good, Montaigne undertook a journey to Germany, Switzerland, and lastly to Italy. At Rome he was well received by several cardinals and other persons of distinction, and was introduced to Pope Gregory XIII., and received the freedom of the city of Rome by a bull of the pope, of which he appears to have been very proud. Montaigne was delighted with Rome; he there found himself at home among those scenes and monuments which were connected with his earliest studies and the first impressions of his boyish years. He wrote a journal of his tour, evidently not intended for publication, but the manuscript, being discovered after nearly two centuries in an old chest in the château of his family, was published in 1774, under the title of 'Journal du Voyage de Michel de Montaigne en Italie, par la Suisse et l'Allemagne, en 1580-81.' It is one of the earliest descriptions of Italy written in a modern language.

While he was abroad he was elected mayor of Bordeaux by the votes of the citizens, an honour which he would have declined had not the king, Henri III., insisted upon his accepting the office. At the expiration of two years Montaigne was re-elected for an equal period. On his retiring from office he returned to his patrimonial estate. The war of the League was then raging in the country, and Montaigne had some difficulty in saving his family and property from the violence of the contending factions.

At this time the plague also broke out in his neighbourhood (in 1586), and obliged him to leave his residence and wander about various parts of the country. He was at Paris in 1588, busy about a new edition of the 'Essays.' It appears from De Thou's account that about this time Montaigne was employed in negotiations with a view to conclude a peace between Henri of Navarre, afterwards Henri IV., and the Duke of Guise. At Paris he became acquainted with Mademoiselle de Gournay, a young lady who had conceived a kind of sentimental affection for him from reading his book. Attended by her mother she visited him, and introduced herself to him, and from that time he called her his "fille d'alliance," or adopted daughter, a title which she retained for the rest of her life, as she never married. Montaigne was then fifty-five years of age. This attachment, which, though warm and reciprocal, has every appearance of having been of a purely Platonic nature, is one of the remarkable incidents of Montaigne's life. At the time of his death Mademoiselle de Gournay and her mother crossed one half of France, notwithstanding the civil troubles and the insecurity of the roads, to repair to Montaigne's residence and mingle their tears with those of his widow and daughter.

On his return from Paris in the latter part of 1588, Montaigne stopped at Blois with De Thou, Pasquier, and other friends. The States-General were then assembled in that city, in which the Duke de Guise and his brother the cardinal were treacherously murdered, on the 23rd and 24th of December of that year. Montaigne had long foreseen that the civil dissensions could only terminate with the death of one of the great party leaders. He had also said to De Thou that Henri of Navarre was inclined to adopt the Roman Catholic faith, but that he was afraid of being forsaken by his party; and that on the other side Guise himself would not have been averse from embracing the Protestant religion, if he could thereby have promoted his ambitious views. After the catastrophe Montaigne returned to his château. In the following year he became acquainted with Pierre Charron, a theological writer of considerable reputation, and formed an intimate friendship with him. Charron, in his book 'De la Sagesse,' borrowed many ideas from Montaigne's 'Essays.' Montaigne by his will empowered Charron to assume the coat of arms of his family, as he himself had no male issue.

Montaigne's health was in a declining state for a considerable time before his death; he was afflicted with the gravel and the colic, and he obstinately refused to consult medical men, of whom he had generally an indifferent opinion. In September 1592, he fell ill of a malignant quinsy, which kept him speechless for three days, during which he had recourse to his pen to signify to his wife his last wishes. He also requested that several gentlemen of the neighbourhood should be invited, in order that he might take leave of them. When they were all assembled in his room, a priest said mass, and at the elevation of the host, Montaigne half raised himself up in his bed, with his hands joined together as in prayer, and in that attitude he expired, on the 13th of September 1592, in the sixtieth year of his age.

His body was buried at Bordeaux in the church of the Feuillans, where his widow erected a monument to him.

Montaigne's 'Essais' have been the subject of much conflicting criticism. If we consider the age and the intellectual condition of the country in which the author lived, we must consider them a very extraordinary production, not so much on account of the learning contained in the work, although that is very considerable, as for the clear good sense, philosophical spirit, and frank liberal tone which pervades its pages, as well as for the attractive simplicity of the language. Literature was then at a very low ebb in France, the language was hardly formed, the country was distracted by feudal turbulences, ignorant fanaticism, deadly intolerance, and civil factions, and yet in the midst of all this a country gentleman living in a remote province, himself belonging to the then rude, fierce, feudal aristocracy, composed a work full of moral maxims and precepts, conceived in the spirit of the ancient philosophers of Greece and Rome, and founded on a system of natural ethics, on the beauty of virtue and of justice, and on the lessons of history; and this book was read with avidity amidst the turmoil of factions, the din of civil war, and the cries of persecution and murder.

The morality of the 'Essais' has been called, and not unreasonably though not correctly in the expression, a pagan morality: it is not founded on the faith and the hopes of Christianity, and its principles are in many respects widely different from those of the Gospel. Montaigne was a sceptic, but not a determined infidel; his philosophy is in a great measure that of Seneca and other ancient writers, whose books were the first that were put into his hands when a child. Accordingly, Pascal, Nicole, and other Christian moralists, while they do justice to Montaigne's talents and the many good sentiments contained in his work, are very severe upon his ethics taken as a system. A living moralist of our own time, Professor Vinet of Basel, has given a fair analysis of the spirit of Montaigne's ethics. ('Essais de Philosophie Morale Religieuse suivis de quelques Essais de Critique Littéraire, par A. Vinet, Paris, 1828.') In the 64th chapter of the 1st book of the 'Essais,' Montaigne, after distinguishing two sorts of ignorance, the one which precedes all instruction, and the other which follows partial instruction, goes on to say, "that men of simple minds, devoid of curiosity and of learning, are Christians through reverence and obedience; that minds of middle growth and moderate capacities are most prone to doubt and error; but that higher intellects, more clear-sighted and better grounded in science, form a superior class of believers, who, through long and religious investigations, arrive at the fountain of light of the Scriptures, and feel the mysterious and divine meaning of our ecclesiastical doctrines. And we see some who reach this last stage through the second, with marvellous fruit and confirmation, and who, having attained the extreme boundary of Christian intelligence, enjoy their success with modesty and thanksgiving; unlike these men of another stamp, who, in order to clear themselves of the suspicions arising from their past errors, become violent, indiscreet, unjust, and throw discredit on the cause which they pretend to serve." And a few lines after, he modestly places himself in the second class, namely, of those who, disdain the first state of uninformed simplicity, have not yet attained the third and last exalted stage, "and who," he says, "are thereby rendered inept, importunate, and troublesome to society. But I, for my part, endeavour, as much as I can, to fall back upon my first and natural condition, from which I have idly attempted to depart." In his chapter on prayers (b. i., 56), he recommends the use of the Lord's prayer in terms evidently sincere; and in the 'Journal of his Travels,' which was not intended for publication, he manifests Christian sentiments in several places.

Montaigne has been censured for several licentious and some cynical passages in his 'Essais.' This licentiousness however appears to be rather in the expressions than in the meaning of the author. He spoke plainly of things which are not alluded to in a more refined state of society, but he did so evidently without bad intentions, and only followed the common usage of his time. Montaigne combats earnestly the malignant feelings frequent in man—injustice, oppression, inhumanity, uncharitableness. His chapters on pedantry, on the education of children, and on the administration of justice, are remarkably good. He also throws much light on the state of manners and society in France in his time.

The 'Essais' have gone through very many editions and been translated into most European languages: the edition of Paris, 8 vols. 4to., 1725, is perhaps the most complete. Cotton's, the best English translation is somewhat coarse, though characteristic. Vernier published, in 1810, 'Notices et Observations pour faciliter la Lecture des Essais de Montaigne,' 2 vols. 8vo., Paris. It is a useful commentary.

\* MONTALEMBERT, CHARLES-FORBES, COUNT DE, is descended from one of the most ancient families of Poitou. His father, the head of the family, who was raised in 1819 to the dignity of a peer of France, and was for some time minister of Charles X. at the court of Sweden, married a Scotch lady of strong character and remarkable ability. Of this marriage Charles was the eldest child: he was born in London, May 29, 1810, and spent a portion of his youth in Sweden. He was also the élève of the University of Paris. At nineteen years of age he published a brochure on Sweden, which brought him for the first time into intimacy with M. Guizot, as

we learn from an interesting passage in the reply of the latter to Montalembert on his reception into the French Academy. He first came into public notice early in the year 1831, when he was scarcely twenty-one years of age. Under a charter recently given, which promised liberty of instruction, though the government delayed to grant it, Count Montalembert joined with M. de Coux and the Abbé Lacordaire in opening a free-school for Roman Catholic instruction in Paris; the school however was closed by the interference of the police, and as the ordinary tribunals were not competent to sit in judgment upon the case, the matter was carried before the Chamber of Peers. His father's death, which had happened a short time previously, gave him a seat in the Chamber of Peers—the last instance, we believe, of an accession to an hereditary title in France. On this occasion he made his first speech, and pleaded with extraordinary eloquence the cause of the Church under the circumstances mentioned above. His speech produced a great sensation on the Chamber, and the police were fined for their interference. In the course of the next ten years he gained himself a considerable literary reputation by his 'Life of St. Elizabeth of Hungary,' a work on 'Medieval Art,' and his 'Life and Times of St. Anselm.' In 1843 he again threw himself actively into the debates in the Chamber of Peers, in which he delivered some masterly speeches on such general questions as the liberty of the Church, instruction and education, the theory and constitution of the Monastic Orders, and the affairs of Poland, in which he always took a deep interest. Towards the close of the same year, while staying at Madeira for the sake of his health, he published 'Du Devoir des Catholiques dans la Question de la Liberté d'Enseignement.' This was followed by his celebrated 'Letter to the Cambridge Camden Society,' designed to 'disprove the attempts made by that society to identify the reformed Church of England with that of the middle ages and of continental Europe.

Since that period, Count Montalembert has been the champion of the Roman Catholic Church, aiding and extending its cause in France by his powerful pen and still more powerful oratory. In 1847 he delivered his celebrated speech on the affairs of Switzerland, in which he distinctly foretold the revolution which broke out among the continental nations in the year following, and his brilliant 'Discours sur les affaires de Rome,' delivered shortly after the popular outbreak, was received with a triple salvo of applause by an audience which sympathised but coldly with his views. After the revolution of February 1848 the department of Doubs, in which he possessed some property, elected Count Montalembert as its representative in the National Assembly, from which he passed into the Legislative Assembly, in which he has uniformly acted as the exponent of the views and interests of the Roman Catholic Church.

Count Montalembert's name has been made more generally known in England by his essay on 'Catholic Interests in the Nineteenth Century,' and his 'Political Future of England.' The former of these gives a rapid and brilliant, though one-sided, review of Catholicism throughout the whole of Europe in the present day as compared with what it was some fifty years ago, maintaining that upon the whole the progress made is deep, sound, and likely to be lasting: in the same work he expresses himself strongly on the political changes that had taken place in France, and on the language of the French press in their regard. The object of the latter work is to show that the future prospects of England would be improved by a resumption of intercourse with Rome; and this leading idea he pursues through an infinity of digressions and speculations, interspersed with various particulars of English life, as exhibited in its schools, its journalism, and its political institutions. These two works have been translated into English, and published in 1855 and 1856. He has since republished two articles from the 'Correspondant,'—to which periodical he is a contributor—one entitled 'Pie IX. et Lord Palmerston,' the other, 'La Paix et la Patrie.' [See SUPPLEMENT.]

MONTALEMBERT, MARC-RENÉ, MARQUIS DE, a distinguished military engineer of the 18th century, was born on the 16th of July 1714 at Angoulême, department of Charente, France. He was descended from an ancient and noble family; and, having received an education in which both literature and science were judiciously conjoined, he entered the army at eighteen years of age.

In the course of his first campaign (in 1733), he was present at the siege of Kehl, and in the following year he distinguished himself at the siege of Philippsburg. He served afterwards with considerable reputation in Bohemia, when a French army under Marshal Broglie and Belleisle was in that country; and on the retirement of the army thence he returned to Paris, where he devoted himself to the study of subjects which have relation to the military art. He was admitted a member of the Académie des Sciences in 1747; and he wrote several 'Mémoires,' which were inserted in the volumes published by that body. About the same time he established a foundry at Perigord for the purpose of casting heavy ordnance, which was then much wanted for the French navy. During the Seven Years' War, Montalembert was attached as an agent for the French government to the staff of the Swedish and Russian armies; and he appears to have been consulted by the allied generals respecting the arrangements of the plans for the different campaigns. In 1777 he published a small work entitled 'Correspondance pendant la Guerre de 1757,' which contains much interesting matter relating to that war. In 1779 he was

appointed to construct a fort for the purpose of securing the isle of Aix against the English fleet; and this fort, which was built entirely of wood, is said to have borne, without experiencing any damage, the shock occasioned by the simultaneous firing of all the artillery which was mounted on it: the experiment seems to have been made in order to disprove the assertion of several engineers that the fort would fall in ruins by the fire of its own guns.

Montalembert published in 1788 a small work in 4to, entitled 'Mémoire Historique sur la Fonte des Canons;' and in 1786 one under the title of 'Cheminée-Poêle.' He also published in 8vo a pamphlet designated 'Relation du Siège de Saint-Jean d'Acra.' But the work by which his name will be remembered is his great treatise, entitled 'La Fortification Perpendiculaire, ou l'Art Défensif supérieur à l'Offensif,' which was published at Paris in eleven 4to volumes (1776 to 1796). In the first volume, having shown the defects of the bastioned fortifications which are constructed according to the principles of Vauban, he proposes to suppress the flanks of the bastions, continuing the faces of these works till they meet in the middle of each front of fortification, and, at the place of meeting, to have a casemated work like a small ravelin. The advantage to be gained by this project is, chiefly, a diminution of the expense of construction; and, after proposing some other modifications of the existing fortifications, Montalembert dwells at length on that system which gives its name to the treatise. The perpendicular fortification consists of four lines of rampart, the branches of which form right angles with one another at the re-entering parts, and three of these are defended by a powerful fire of artillery, which, being placed in casemates, is not liable to be dismounted by the enemy; while spacious terrepleins, at the foot of each rampart, afford room for the troops of the garrison to engage the besiegers with forces superior to any which can be brought against them.

In the second volume, after giving an interesting account of the war in 1741, in which the importance of fortified positions is pointed out, he describes the construction of redoubts or small forts. In the third volume there is a project for the construction of a simple fortification, consisting of a crenelated wall covered by a rampart on which are constructed casemated traverses: this is proposed as a good kind of defensive works for sea-ports, and it is said that some of the forts which defend Cherbourg were executed on that principle. The fourth volume contains an abridged history of the reign of Louis XIV., together with sundry projects relating to the formation of lines of intrenchments for the defence of the frontiers of a state. In the fifth are some details concerning the construction of batteries for the defence of sea-coasts, and the sixth and seventh volumes are occupied with refutations of the objections which had been made to his systems. The eighth contains some observations on the forts at Cherbourg and on the isle of Aix. The ninth volume, which is particularly entitled 'L'Art Défensif supérieur à l'Offensif,' contains sundry projects for circular redoubts and for a casemated star-fort. The tenth and eleventh consist of memoirs relating to fortification and artillery.

The leading principle on which the projects of this engineer are founded is, that a fortified post should contain an abundance of casemates for the security of troops and artillery: Montalembert considers that these alone will enable a small number of men to resist with success the attack of a numerous army, and that a few guns so protected are capable of dismounting all that an enemy can place behind parapets made merely of earth. His projects were severely criticised during his life; but, though some parts of his constructions are open to objections, the principles are unexceptionable; and it is important to observe that many of his ideas have been adopted by the Prussian and Austrian engineers in the works constructed a few years back for the defence of Western Germany.

In 1770 Montalembert married a lady who was distinguished by her talents as a performer on the French stage, and who wrote a novel entitled 'Elise Duménil,' which was printed in London in 1798. It is said that Montalembert composed for the theatre some small pieces which had a certain success; and his attachment to the muses is proved from the fact that his biographer, Lalande, had in his possession a number of his songs and tales in verse, which are said to have been characterized by grace, elegance, and imagination.

In publishing his great work, and in making his experiments for the improvement of the military art, he seems to have incurred expenses which injured his fortune. He had given up to the government his foundries at Perigord, and his applications for the sum of money which he claimed as an equivalent were fruitless; he was even deprived of a pension which he enjoyed for the loss of an eye in the service of the country. About the year 1790 he came to London; but, after remaining here a few months, he returned to Paris, leaving his wife in this country. It is said that, in order to save some of his property, he joined the revolutionary party; and it is painful to record that he entered so far into the prevailing spirit of the time as to divorce his wife in order to marry the daughter of an apothecary. He sold an estate for the purpose of satisfying his creditors, but receiving payment in assignats, which immediately afterwards suffered an enormous depreciation, he became involved in serious difficulties. He continued however to employ an artist on a work with which he had long been occupied—the construction of a considerable number of models relating to fortifications and artillery, and the valuable collection, when completed, he presented to the

Committee of Public Safety. At the same time, with other eminent engineers, he was constantly consulted by Carnot on subjects relating to the military affairs of the republic. He died of a dropsy, March 29, 1800, being then eighty-six years of age.

MONTANUS, the founder of the sect of Christian heretics known as MONTANISTS, or CATAPHRYGIANS. They were called Montanists from their leader Montanus, and Cataphrygians, or Phrygians, from the country in which they first appeared. Of the personal history of Montanus little is known. He is said to have been born in the second quarter of the 2nd century at Ardaba, a village in Mysia, and to have been only a recent convert when he first made pretensions to the character of a prophet, about A.D. 170. (Euseb., 'Hist. Ecc.' v. 16.) His principal associates were two prophetesses, named Prisca, or Priscilla, and Maximilla. According to some of the ancient writers, Montanus was believed by his followers to be the Paraclete, or Holy Spirit. Probably this is an exaggeration, but it is certain that he claimed divine inspiration for himself and his associates. They delivered their prophecies in an ecstasy, and their example seems to have introduced into the church the practice of appealing to visions in favour of opinions and actions, of which practice Cyprian and others availed themselves to a great extent. (Middleton 'Free Enquiry,' p. 98, &c.) Tertullian, who belonged to this sect, informs us that these revelations related only to points of discipline, and neither affected the doctrines of religion nor superseded the authority of Scripture. The doctrines of Montanus agreed in general with those of the Catholic Church, but some of his followers appear to have embraced the Sabellian heresy. The Montanists were chiefly distinguished from other Christians by the austerity of their manners and the strictness of their discipline. They condemned second marriages, and practised fasts. They maintained that all flight from persecution was unlawful, and that the church had no power to forgive great sins committed after baptism. They held the doctrine of the personal reign of Christ on earth at the Millennium. They are accused by some of the early writers of celebrating mysteries attended by deeds of cruelty and lewdness, but it appears quite certain that these charges are unfounded.

The Montanists were warmly opposed by the writers of the Catholic party, though they were once countenanced for a short time by a bishop of Rome, whose name is unknown, but who is supposed by some to have been Victor. Tertullian wrote several works in defence of their opinions. [TERTULLIAN.]

The sect was numerous, and lasted a considerable time. They still existed in the time of Augustine and Jerome, the latter of whom wrote against them.

MONTANUS, ARIAS. [ARIAS MONTANUS.]

MONTECALM, MARQUIS. [WOLFE.]

MONTEAGLE, LORD. THOMAS SPRING RICE, LORD MONTAGLE OF BRANDON, is the only surviving child of Mr. Stephen Edward Rice of Mount Trenchard, county Kerry, by Catherine, only daughter of Thomas Spring, Esq., of Castlemaine, in the same county. He was born at Limerick, February 8, 1790. Having graduated B.A. at Trinity College, Cambridge, in 1811, and studied for the bar, he entered Parliament in 1820 as member for his native city, which he continued to represent in the Whig interest down to the dissolution which followed the passing of the Reform Act in 1832. During this time he had lent his support to every liberal measure that was proposed by his party, including the repeal of the Test and Corporation Acts, and the Roman Catholic Relief, and Reform Acts. He filled the office of under-secretary of state for the Home Department for a short time in 1827; and from 1830 to 1834 held the secretaryship of the Treasury. In the latter year he was for a few months secretary for the Colonies. On the return of Lord Melbourne's administration to office in April 1836, he was appointed chancellor of the Exchequer, which office he resigned in September 1839, succeeding the late Sir J. Newport as comptroller of that department, and being at the same time raised to the peerage. He had represented the borough of Cambridge since December 1832. His lordship has frequently acted as a member of Royal Commissions on matters of taste and art, and is understood to have bestowed considerable pains in examining and reporting upon the proposed system of decimal coinage. Lord Montagle married, first in 1811, Theodosia, daughter of the first Earl of Limerick, by whom he has issue five sons and three daughters; and second in 1841, Mary Anne, daughter of J. Marshall, Esq. [See SUP.]

MONTECUCULI, RAYMOND, COUNT DE, Prince of Melit, Knight of the Golden Fleece, and Generalissimo of the Imperial armies, was born at Modena in 1608, of a noble family of that duchy. Following the example of some of its members, he entered the service of the house of Austria in the Thirty Years' War; and after bearing arms as a simple volunteer under one of his uncles, and rising through the usual gradations of rank, he first signalled his military talents at the head of 2000 horse by surprising and cutting to pieces a body of 10,000 Swedes, who were engaged in the siege of Numslau, in Silesia. But he soon after experienced the inconstancy of fortune, being himself defeated and made prisoner, in 1639, by the Swedes under the

celebrated Banner, near Prague. He is said to have beguiled the two years of his captivity in cultivating the taste for letters which he subsequently evinced; and, after his release, he resumed his service, with increasing reputation, in the defence of Silesia and Bavaria, and in the defeat of the Swedes under Wrangel at Triebel, in 1647; until the termination of hostilities by the peace of Westphalia, in the following year, enabled him to revisit his native duchy. There, at the marriage festivities of the duke Francesco I., he had the misfortune to kill one of his dearest friends, Count Manzani, in a tournament; perhaps the latest recorded catastrophe which attended the dangerous games of chivalry.

In 1657 Montecuculi was sent by the emperor to assist John Casimir, king of Poland, against Ragotski, prince of Transylvania, and the Swedes, whom he drove out of Poland, and compelled to conclude a peace. He was subsequently employed in Hungary in the war between the Imperialists and the Turks, of which he has himself given a relation in his memoirs; and in 1664 he gained so decisive a victory over the latter at St. Gothard as to compel them to sue for a truce of twenty years.

In 1673 he reached the climax of his fame by being opposed to the illustrious Turenne, in the war between the empire and France on the Rhenish frontier. The nicely balanced operations of these two great generals, who, without committing the event to a battle, displayed more science in marches and encampments than other commanders have exhibited in a whole series of victories, were the admiration of their contemporaries; and when the fall of Turenne by a chance shot, in 1675, gave free scope to the genius of his opponent, Louis XIV. could find no one but the great Condé competent to arrest the progress of Montecuculi. Another most able though undecided campaign closed the services both of Condé and Montecuculi: the latter of whom, claiming no victory, deemed it his highest honour to have encountered without defeat the two greatest French generals of their century. The remaining few years of his life were passed in peace at the imperial court, and he died October 16, 1680.

As a general, Montecuculi was accused of excessive caution and want of enterprise, qualities which he himself held to be no reproach. He had profoundly studied the art of war; and the memoirs which he composed upon its general principles and practice, as well as upon the peculiarities of warfare against the Turks, and on the operations of the Turkish war of 1681-64, still retain their value, not only as the most interesting and instructive records of the martial establishments and service of his times, but for the soundness of the maxims which they contain, applicable to all ages of the military art. He was a zealous and generous patron of letters, as well as a great strategist; and to him principally the Academy of Naturalists at Vienna owes its establishment.

A good French translation of the 'Memoirs of Montecuculi' was published at Amsterdam, in 1752, with a 'Life of the Author' prefixed.

MONTEN, DIETRICH, an eminent German battle painter, was born at Düsseldorf in 1799. He showed from his earliest youth a great love for accounts of wars and battles; and Homer, Tasso, and Ariosto were his favourite authors, from which he used to sketch the most striking scenes of arms. In order that he might have some practical knowledge in military matters he enlisted into the Prussian army as a volunteer in 1818, and served accordingly for twelve months. At the expiration of his term of military service, he entered the Academy of Arts of Düsseldorf, and after studying two years in that institution he removed to Munich, in order to benefit himself by the study of the works of Peter Hess, who almost rivals Horace Vernet as a battle painter, and is still resident in Munich.

Monten was not long in attracting the attention of Cornelius, then the head of the Munich school of painters, and the notice of the late king of Bavaria, Ludwig I. He was intrusted by Cornelius, in 1827, with the execution of three of the frescoes of the arcade of the Hofgarten—the storming of a Turkish entrenchment by the Bavarians at Belgrade in 1717, under the elector Carl Albrecht and his brother Ferdinand; the battle of Arco sur Aube, in which the Bavarians under Wrede were engaged; and the granting of the Bavarian constitution by Maximilian Joseph I. in 1818. These works, though hard and much too positive in colour, have great merit, and allowance must be made for the comparative infancy of the then only reviving art of fresco-painting in Munich. After these works Monten painted for the king a picture of the battle of Saarbrück, 1815, for the Hall of Victory (Siegesaal) in the state apartments of the new palace; and for the same patron of the arts, the departure of the Poles from their fatherland in 1831. These were followed, in 1836, by the death of Gustavus Adolphus in the battle of Lützen, now in the King of Hanover's collection; in 1833, by George I. in the battle of Neerwinden; and in 1839, by the great camp in 1838 at Augaburg, for the Emperor Nicholas, at which that emperor was present. He painted besides these principal works many smaller pieces, which are all conspicuous for extraordinary spirit in the incidents and in the execution, and display much fine drawing and good colouring, though in many parts too sketchy and undefined; he wanted the necessary patience for elaborate modelling and uniform finish. But when the exact degree of this technical excellence is missed, its absence is more agreeable than its excess; and all Monten's works have a very agreeable effect:

their greatest defect is an occasional extravagance of action. His horses are always very spirited. He died after a short but severe illness, in December 1843, in the prime of life, being in his forty-fifth year only, universally regretted by all who knew him. Several of his works have been lithographed by Bodmer, Hanfstängel, and others.

(*Kunstblatt*, 1836-1844; Von Hormayr, *Geschichtlichen Fresken in den Arkaden den Hofgartens zu München*.)

MONTESQUIEU, CHARLES DE SECONDAT, BARON DE LA BRÈDE ET DE, was born on the 18th of January 1689, at the Château de la Brède, in the immediate neighbourhood of Bordeaux. He was descended from a noble and otherwise distinguished family of the province of Guienne. His grandfather had filled the post of 'président à mortier' in the parliament of Bordeaux, a post which Montesquieu himself afterwards filled. His father entered the same service, but quitted it early. The nobility which Montesquieu inherited was conferred upon his great grandfather by Henri IV.

Montesquieu gave in youth the promise of his future fame. His habits were most studious, and his desire for learning was encouraged in every way by a fond and judicious father. At the time that he was engaged in a most laborious study of the civil law, with a view to the profession for which he was destined, he was also preparing a work on a theological subject, namely, "Whether the idolatry which prevailed among the heathen deserved eternal damnation?" He attained the rank of 'conseiller' in the parliament of Bordeaux in 1714, and three years afterwards, on the death of a paternal uncle, he succeeded at the same time to his fortune and to his post of 'président à mortier' in the same parliament. With the most assiduous and conscientious discharge of his duties as a judge, he united the pursuit of literature. In 1716 he had become a member of the Academy of Bordeaux, and he was very zealous in endeavouring to direct the attention of this body more to physical science. He seems at this time to have been very much impressed with the importance of physical science, which he afterwards neglected altogether for the pursuit of moral science. About this time he wrote his 'Physical History of the Ancient and Modern World,' which was published in 1719. He shortly returned however, and allowed the Academy likewise to return, to literature; and he now wrote several small essays on literary subjects, which were read at meetings of the Academy. In 1721 appeared the work which first brought him fame, the 'Lettres Persanes,' which was published anonymously, but the author soon became known. The popularity of these letters was so great, that, as Montesquieu says in a preface to a later edition, "Booksellers used to go about the street, catching every one by the sleeve, and begging, 'Pry'these, write for me some Persian Letters.'"

His classical romance, called 'Le Temple du Guide,' was published in 1725. In the course of the next year Montesquieu formed the resolution of retiring from his judicial duties, and of devoting himself entirely to literature. He accordingly sold his presidentialhip. A vacancy occurring shortly after in the French Academy, on the death of M. de Sacy, Montesquieu became a candidate for the vacant place. His principal claim to the distinction was derived from the 'Lettres Persanes,' but these seemed likely for a time to be the chief obstacle to his success. Notwithstanding their general popularity, an outcry had been raised against them by many on the ground of irreligious tendency; and the Cardinal de Fleury, the chief minister, now wrote to tell the president of the Academy that the king would refuse his consent to the election of the author of so irreligious a work as the 'Lettres Persanes.' The course taken by Montesquieu for the purpose of overcoming the royal opposition does not seem to have been the most straightforward and manly. He immediately published, according to Voltaire, a new edition of the 'Lettres,' in which the passages objected to were omitted or softened; and having carried this edition to the minister, and having disavowed all the obnoxious passages of the earlier editions, he succeeded in changing the king's resolution. ('*Ecrivains Français du Siècle de Louis XIV.*')

D'Alembert gives a somewhat different account: but inasmuch as this appears in an 'éloge,' it is to be received with suspicion. There seems indeed to be no authority for the statement which D'Alembert makes, and which is indeed unnecessary if the contents of the book were such as the minister could approve of, that several letters by another hand were inserted by the printer of the book. The result however was that Montesquieu gained the support of the minister, and was elected a member of the Academy. He shortly after set out on an extensive course of travels. He went first to Vienna, where he had much intercourse with the celebrated Prince Eugene; then travelled through Hungary and Italy, staying for some time at Venice, at Rome, and at Genoa. He next travelled through Germany into Holland, and thence, in company with Lord Chesterfield, he came to England. In England he stayed two years, receiving much attention from the great, whether by rank or by reputation, and collecting materials, as he had done also in the other countries which he had visited, for his great work.

On his return to France he spent two years in studious retirement in the country. He published in 1734 his work 'Considérations sur les Causes de la grandeur des Romains et de leur Décadence;' and immediately after its publication he set to work to prepare the 'Esprit des Loix.' He was engaged upon this for fourteen years; and he tells us that very often, frightened with the greatness of his task, he was

disposed to abandon it. When at last it was completed, he submitted it to the judgment of his friend Helvetius, who, by reason principally of its desultory unconnected character, strongly dissuaded him from publication. But whatever misgivings Montesquieu may have had while the work was in progress, were now entirely removed; and undeterred by the remonstrances of Helvetius, he published, and he had his reward in an almost universal admiration. Montesquieu did not very long survive the publication. He died February 10, 1755, after a short but severe illness.

The personal character of Montesquieu was in every respect excellent. He had married at the age of twenty-six, and his family consisted of a son and two daughters. Through life he practised a rigid economy, on the principle, as we are told by M. d'Alembert, that he ought to transmit his patrimony unimpaired to his children; but he took care that his economy should not stand in the way of charity. In the intercourse of society Montesquieu appears to have been agreeable without being brilliant.

The writings of Montesquieu show much variety of talent. Even if the 'Esprit des Loix' had not been written, the author of the 'Lettres Persanes,' remarkable for their refined humour, and of the 'Temple du Gvide,' an exquisite little romance, could not have been forgotten. And without disparaging at all the merits of Montesquieu's great and best known work, it may be said that these smaller productions are much more perfect in their kind than is the 'Esprit des Loix' as a treatise on political science. The chief merits of this work are its agreeable style, its various knowledge, its ingenious and at the same time sensible mode of treating the art of government, and its enlightened advocacy of what, not very definitely or correctly, are called the principles of civil liberty. The last-mentioned merit is greater on account of the time at which the work appeared. The defects of the work, on the other hand, are want of system, shallowness, not so much of knowledge as of thought, and (what is at once a sign and a consequence of this shallowness) an undue exaltation of experience over principles. The time again at which the work appeared will serve in the way of extenuation of these defects; and it is to be remembered also that the plan of the work is professedly inductive rather than scientific. The 'Esprit des Loix' has given occasion to a work by M. Destutt de Tracy, which, though partaking in some degree of the vagueness of Montesquieu's work, is very valuable both in itself and as a commentary on the 'Esprit des Loix.' Its title is 'Commentaire sur l'Esprit des Loix.'

MONTFAUCON, BERNARD DE, a Benedictine of the congregation of St. Maur, and a very learned antiquary, was born January 17th, 1655, at Soulage in Languedoc. He was the son of Timeoleon de Montfaucou, lord of Roquetaillade and Conillac, and was the second of four brothers. He has himself preserved, in his 'Bibliotheca Bibliothecarum MSS.' the pedigree of his family, which was originally from Gascony. His early studies were conducted first in his father's castle at Roquetaillade, and afterwards among the religious at Limoux. His first profession in life was military, and he served in one or two campaigns in Germany under Marshal Turenne. The death of his parents however, and an officer of distinction under whom he had fought, induced him, after two years, to change his plan of life, and at the age of twenty, in 1675, he entered the congregation of St. Maur. In this learned Society he had every opportunity to improve his early education.

His first work was a supplement to Cotelierus, entitled 'Analecta Græca,' 4to., Paris, 1688, with notes by him and the fathers Anthony Pouget and James Lopin. In 1690 he published a small volume entitled 'La Verité de l'Histoire de Judith,' 12mo. His next important work was a new edition of St. Athanasius, in Greek and Latin, 3 vols. folio, a labour which established his reputation as a profound scholar. In the same year Montfaucou, who had turned his thoughts to more extensive collections of antiquities than had then appeared, determined to visit Italy for the purpose of consulting the manuscripts in the Italian libraries. In this pursuit he passed three years, and upon his return in 1702, published an account of his journey and researches in his 'Diarium Italicum.'

During Montfaucou's residence at Rome he held the office of procurator-general of his congregation at that court; and while there, in 1699, published a little volume in vindication of the Benedictine edition of the works of St. Augustine, in 11 vols. fol., the publication of which had been begun by some able men of his Order, at Antwerp, in 1679, and was not completed till 1700. In 1706 Montfaucou published, in 2 vols. fol., a collection of the ancient Greek ecclesiastical writers, with a Latin translation, notes, dissertations, &c., and in 1708 his 'Paleographia Græca.' In 1709 he published 'Philo-Judæus on a Contemplative Life,' in French, 'Le Livre de Philon de la Vie Contemplative,' &c., translated from the Greek, with notes, and an attempt to prove that the Therapeutæ of whom Philo speaks were Christians; and in 1710 an 'Epistola' on the fact mentioned by Rufinus that St. Athanasius baptised children when himself a child. This was followed in 1713 by an edition of what remains of the 'Hexapla' of Origen, 2 vols. fol., and an edition of the works of St. Chrysostom, begun in 1718, and completed in 1738, 13 vols. fol.

In 1715 he published his 'Bibliotheca Coeliniana,' fol., Paris; and in 1719, the year in which he was chosen a member of the Academy of Inscriptions and Belles-Lettres, his great work, entitled 'L'Anti-

quitè Expliquée et Représentée en Figures,' Paris, 5 vols. fol., to which in 1724, was added a Supplement in 5 vols. This work has proved an almost inexhaustible mine of wealth to succeeding students of the history of art. It was followed by another interesting work, 'Les Monuments de la Française,' 5 vols. fol., Paris, 1729-1738. His last and not the least important of his works was his 'Bibliotheca Bibliothecarum MSS. nova,' 2 vols. fol., Paris, 1739. Montfaucou died suddenly at the Abbey of St. Germain de Pres, December 21, 1741, at the advanced age of eighty-seven. Besides the works already enumerated, he contributed many curious and valuable essays on subjects of antiquity to the Memoirs of the Academy of Inscriptions and Belles-Lettres, as well as to other literary journals.

MONTFORT, SIMON DE. [HENRY III.]  
MONTGOMERY, ALEXANDER, an old Scottish poet, was a younger son of a good family in Ayrshire. The Bannatyne Manuscript, written in 1568, contains some of his verses: but the very few events of his life which are exactly known fall within the reign of James VI. of Scotland. He is described as having been a captain, probably in the guard of Morton the regent. King James quotes some of his poems in a work of his own, published in 1582; and he obtained a pension of five hundred Scottish marks, which led him into a troublesome law-suit on his return from a continental tour, begun in 1586. He appears to have died between 1607 and 1611. In the former of those years was published his principal work, an allegorical poem, called 'The Cherry and the Slae' (or Sloe). This poem is still popular in Scotland, and has been very frequently reprinted in a cheap form. It, and the author's sonnets and other poems, are both lively in fancy and pleasing in versification. In 1822 there appeared at Edinburgh a neat edition of all his poems, edited by Mr. Laing, with a biographical preface by Dr. Irving.

MONTGOMERY, JAMES, was born at Irvine in Ayrshire, where his father was a Moravian preacher, on November 4, 1771. When only four years of age his parents removed to Grace Hill in the county of Antrim, Ireland, where he was first placed at school. In 1778 he was sent to the Moravian settlement at Fulneck near Leeds, in Yorkshire, to complete his education, and in 1783 his father and mother went to the West Indies as missionaries, where they died in 1790. At Fulneck the instruction was excellent, but the seclusion was monastic, and James Montgomery, during his ten years' residence there, distinguished himself for nothing "but indolence and melancholy." He had taken a fancy for poetry, which was utterly forbidden in the school; he had clandestinely read 'Robinson Crusoe,' which had greatly interested him; and he wrote, when only thirteen, some poor imitations of Moravian hymns. Though characterised by his teachers as indolent, he had contrived to procure and read a copy of Cowper's poems, and these he thought he could excel, so he wrote a mock-heroic poem of a thousand lines, and commenced a serious epic, to be called 'The World,' and this before he was fourteen. He also wrote other small poems, but his teachers, who wished him to become a Moravian preacher, were dissatisfied with his inattention to his studies. In the school-diary of July 3, 1787, it is recorded that, as "J. M., notwithstanding repeated admonitions, has not been more attentive, it was resolved to put him to a business, at least for a time." A situation was soon afterwards found for him with a shopkeeper at Mirfield. He was probably not much more attentive there, for it is stated that he continued to write poetry and compose music till June 1789, when he ran away. He had only a trifle of money when he started; but on reaching Wentworth, he presented one of his smaller poems to Earl Fitzwilliam, who gave him a guinea. He then settled for a twelvemonth at Wath upon Dearne as assistant in a general shop. The brethren at Fulneck discovered him, and wished him to return; but he refused. He continued in this situation, silent and recluse, but no doubt pondering over thoughts for which as yet he wanted fitting powers of expression.

He continued to write, and at the end of the year having sent a volume of manuscript poetry to Mr. Harrison, the publisher in Paternoster-row, London, followed it himself. Mr. Harrison declined publishing the poems, but engaged him as shopman. In London he led the same solitary and retired life as in the country. His sole amusement was writing, and he is stated to have never entered a theatre, or even the British Museum, to which it might have been thought his habits and disposition would have led him. While in London his first production, a tale in prose, entitled 'The Chimera,' appeared in 'The Bee,' an Edinburgh periodical work, in November 1791. He also wrote a novel, which he offered to Mr. Lane, of Minerva-press celebrity, who declined it, because the characters swore too much. The novel was never published, but the objection greatly hurt the religious feelings of Montgomery, who thought he had only imitated Fielding and Smollett. This disappointment made him resolve to return to his old shopkeeping occupation at Wath. He did go, but not to remain long. Towards the end of 1792 (having replied to an advertisement for a clerk), he entered the service of Mr. Joseph Gales of Sheffield, who was printer, bookseller, auctioneer, and editor, publisher and proprietor of a newspaper, 'The Sheffield Register,' which advocated principles at that time designated as revolutionary. Montgomery formed an attachment to his employer; wrote political articles for the paper; and when Gales, learning that a warrant had been issued to apprehend him for treason, fled to America, he started

a new weekly paper, on "peace and reform" principles. The first number of 'The Sheffield Iris,' appeared on July 4, 1794, which he continued to edit till September 27, 1825, and it maintained its existence, with a few changes, till January 1857. The 'Iris' was at first very successful, but it was a singular position for Montgomery to fill, with his reclusive habits, his mild and almost timid feelings, his dislike to the practical details of business, and his poetical and refined taste. He evidently felt it to be so. "I hate politics," he said, "and would as soon meet a bear as a ledger." Almost immediately after starting the newspaper, a poor man employed him to print a few quires of a ballad, for which he was charged eighteen-pence. It was 'On the Fall of the Bastille,' as mere doggerel as can be well conceived; but the attorney-general, Sir John Scott, afterwards Lord Eldon, discovered it to be seditious, indicted the printer, and in January 1795 he was tried at Doncaster, found guilty, fined twenty pounds, and sentenced to three months' imprisonment. He gave an account in his newspaper of a riot in Sheffield, to quell which the military had been called in and had fired on the people; for this, in 1796, he was again tried, again found guilty of sedition, fined thirty pounds, and sentenced to six months' imprisonment. During his confinement, which was in York Castle, he wrote a small volume of poems, entitled 'Prison Amusements,' which was published in 1797. After his release from prison his life flowed smoothly to its end. His honest sincerity, his gentle manners, and perhaps his increasing literary celebrity, won him the regard of even his political opponents, and secured him the esteem and love of the rest of his townsmen. He continued to write short poems, several of which are very pleasing; and in 1806 he published 'The Wanderer in Switzerland'—a work of which he thought so little himself, that he occupied three years in printing it at his own press, but which obtained so great a popularity, that a second and third edition were quickly demanded. His own estimate was probably juster than that of the public, and the 'Edinburgh Review,' in noticing the third edition, characterised it as "very weakly, very finical, and very affected." This censure is overcharged; the poem has not much power, but it cannot justly be styled affected, and it is very melodious. In 1809 'The West Indies' was published—a great advance on the former—containing some exquisite descriptive passages, and others of considerable power and pathos. In 1812 appeared 'The World before the Flood,' a work which enjoyed a great and deserved popularity; and in 1810, having by this time rejoined the Moravian community, he wrote 'Greenland,' commemorating their exertions in that desolate establishment, which contained much of beauty and of pathos. In 1827 'The Pelican Island and other Poems' was published, which fully maintained his poetic character. In 1836 a collected edition of his poems was issued in three volumes; another in four volumes in 1849; and another in one volume in 1851. In 1853 'Original Hymns, for Public, Private, and Social Devotion,' concluded the series of his poetical works. Of the smaller poems contained in the collected works, many are of great excellence. His restricted education, and his early habit of writing had given him a dangerous fluency; and the ideas, though frequently original, are generally too much expanded: his imagination seldom soars, nor does his fancy sparkle; but his sympathies with all that is good and holy are ever ardent and sincere; his pathos is touching, and his style melodious, though in his longer poems occasionally too ambitious and magniloquent. Such faults as they have are least likely to occur in his shorter poems; and in some of them, as 'The Common Lot,' and 'The Prayer,' they entirely disappear.

We have pursued Mr. Montgomery's poetical career to the end in order to give a collected view of it. We now return to the few remaining events of his life. His publication of 'The Wanderer in Switzerland' led to an engagement on the 'Eclectic Review.' He had few qualities for an able critic—indeed none but a poetical taste and good principles. His praise or blame depended more upon his feelings than his judgment of the character of the work or its literary attributes; consequently one of his earliest reviews was an onslaught on Moore's early poems, whom he termed in a private letter "a deliberate seducer." This feeling led him later in life to decline being introduced to Moore, who sought his acquaintance. In 1825, as we have said, he resigned the editorship of the 'Iris,' on which occasion a public dinner was given to him by the inhabitants of Sheffield, and funds were subscribed to establish a mission-station in Tobago, where his parents had died, which has been named Montgomery. When released from his constantly-required attention to the newspaper, he took a lively interest in municipal affairs, and was a frequent speaker at religious meetings. In the spring of 1830 he delivered a course of lectures at the Royal Institution on the 'History of English Literature,' a subject on which he was not well qualified to speak, and which therefore fell somewhat dull and flat. Later in the year he published 'A History of Missionary Enterprise in the South Seas,' for which he was better suited, and which is an interesting and valuable work. In 1835 he discreetly declined the office of Professor of Rhetoric in the University of Edinburgh; and in the same year a pension of 150*l.* was bestowed on him by the Queen, through Sir Robert Peel. In 1836, after having lived forty years in the house occupied by his old employer, Gales, with three of Gales's daughters, who kept the bookseller's shop, on the death of one of them he removed, with the remaining two, to a more convenient residence; and in the same year he delivered a course

of lectures 'On the British Poets' at Newcastle-on-Tyne, and for some years added to his income by delivering similar courses at other places. In 1841 he visited Scotland on a missionary tour. He was received everywhere with great distinction, particularly in his native town of Irvine, where he had a public reception, and was made a burgess. In 1842 he visited Ireland on a similar errand, saw his old abode at Grace Hill, and while occupied in these religious labours often lamented his not having become a Moravian minister. In 1852 he delivered a lecture 'On some Passages of English Poetry but little known,' but was so feeble as greatly to excite the compassion of his audience. On April 30, 1854, he died; and on the day of his burial the shops and manufactories of Sheffield were all closed, many members of the municipality attending the funeral, as did also the vicar of Sheffield and twenty-four clergymen. By his will he left 900*l.* to be distributed to various charities. His memoirs have been published in seven octavo volumes by John Holland and James Everett, to which we have been indebted for most of the facts in this notice.

MONTGOMERY, ROBERT, was born at Bath in 1807. Of his boyish years we know nothing, but he appeared before the world as an author at an early age, conducting in his native city a weekly publication called 'The Inspector,' which had but a short existence. His next publication was 'The Stage-Coach,' dated 1827 in his collected works; and in the same year he issued 'The Age Reviewed: a Satire,' an octavo volume, the poem being very fully illustrated with notes. The work was very decidedly directed against irreligion and scepticism, and this has formed the key-note of all his subsequent poems. In 1828, though stated to have been written two years earlier; he published 'The Omnipresence of the Deity'; it became astonishingly popular, and eight editions are said to have been sold in as many months. In the same year appeared another volume, 'A Universal Prayer; Death; a Vision of Heaven; and a Vision of Hell,' a second edition of which appeared in 1829, dedicated to Sharon Turner. 'Satan' quickly followed. All were successful; and encouraged by this success, and the advice and assistance of Mr. S. Turner and the Rev. W. L. Bowles, he entered himself in 1830 at Lincoln College, Oxford, with the intention of devoting himself to the Church. He graduated B.A. in 1833, passing in the fourth class, and M.A. in 1838. His residence at the university provided him with a new subject for his prolific muse, and in 1831 he produced a poem, with historical notes and engraved embellishments, under the title of 'Oxford,' which, though extremely laudatory, created more ridicule than applause among the members of the university. In 1832 he published 'The Messiah, a Poem, in Six Books,' which was dedicated to Queen Adelaide; and in 1833 'Woman, the Angel of Life.' In 1835 Mr. Montgomery was ordained, and for a time his ministerial labours seem to have nearly superseded his poetic efforts, a small volume on the local associations and scenery around his first curacy, Whittington in Shropshire, being the only exception until 1842. He quitted Whittington in May 1836, and became minister of Percy-street chapel, London; whence he removed, about the beginning of 1838, to St. Jude's episcopal chapel in Glasgow. Here he continued until December 1842, drawing large audiences; but his preaching excited so much controversy and bitterness of spirit that he resigned the incumbency, and returned to London, where he immediately published 'Luther, or the Spirit of the Reformation.' In October 1843 he resumed his ministry at Percy-street Chapel, where he continued till his death. He now began the publication of a number of prose theological works, the issue of which was continued till 1854. Neither was poetry altogether neglected. Besides some smaller things, he wrote in 1842 a series of 'Meditations' upon engraved Scripture subjects, published by Fisher; 'Sacred Meditations and Moral Themes,' 8vo, 1847; 'The Christian Life, a Manual of Sacred Verse,' 12mo, 1849; 'Lyra Christiana—Poems on Christianity and the Church,' 32mo, 1851; 'Lines on Wellington,' and 'The Hero's Funeral,' 8vo, 1852; and 'The Sanctuary, a Companion in Verse for the English Prayer-Book,' 1855. On December 3 of this year he died at Brighton in his forty-ninth year, all his exertions in the cause of religion having been unrecognised by any preferment in the Church.

That Montgomery's poetical works should have been so successful as they undoubtedly have been, has excited much surprise. As early as 1830 Mr. Macaulay, in noticing a third edition of 'The Omnipresence of the Deity' in the 'Edinburgh Review,' ascribed it to unblushing puffery. That his works have been most inordinately puffed is certainly true; but no amount of puffery would have carried a poem through twenty-six editions (which the 'Omnipresence' has reached), without some other qualities. These we think may be found in the gravely-important nature of the subjects he has generally chosen, and the class, a numerous one, which he peculiarly addressed. This class, rejecting poetry usually as secular or profane, were pleased with his mediocrity; they welcomed him on account of his themes; he was earnest and sincere; and, prejudiced in his favour, to them his tardidity appeared eloquence, his obscurity assimilated to the mysterious, his vagueness kept him clear from points of doctrinal difference, his poetical adornments, though often selected without taste and scattered without fitness, kept attention alive; and as in so voluminous a writer it would be scarcely possible not to find some passages containing good thoughts happily expressed, these were produced as answers to objecting critics. As a preacher he drew large audiences, and his

services were often asked and given in favour of charitable purposes. His style of preaching in some measure resembled that of his poetry; he ranted, was affected, and vague; but his ranting was accepted as earnestness, his affectation as refinement, and his vagueness as a happy generalising. His manners were engaging, and he always acquired the esteem and regard of his congregations, who on more than one occasion gave him substantial marks of their attachment.

MONTI, RAFFAELLE, an eminent sculptor, was born in 1818, at Milan. His father, Gaetano Monti, a sculptor of some celebrity at Ravenna, was his first instructor, and he completed his studies at the Imperial Academy of Milan, where his group of 'Alexander taming Bucephalus' gained the gold medal for the most meritorious work in sculpture. A group, 'Ajax defending the body of Patroclus,' executed in his twentieth year, attracted notice and procured him an invitation to Vienna, where he found many royal and noble patrons. He returned to Milan in 1842, and there also met with considerable success. His first visit to England was made in 1847 in order to superintend the conveyance, among other works, of his statue of the 'Veiled Vestal,' executed for the Duke of Devonshire. This statue being exhibited in London attracted a good deal of notice, and procured him several other commissions. But he returned to his native city, and there took an active part on the popular side in the insurrectionary movement of 1848. Compelled on its suppression to quit Milan he came to England, and fixed his studio in London. He met with extensive patronage among the aristocracy and wealthy amateurs, but his name was scarcely known to the general public till the Great Exhibition of 1851, when the room in which his 'Veiled Vestal,' his groups of 'Innocence,' 'Angelica and Medora,' and 'Two Girls,' his statues of a 'Circassian Slave,' his statuettes of 'Ancient and Modern Love,' 'A Boy catching a Grasshopper,' &c., proved to be by far the most attractive of those devoted to the Fine Arts. It was of course not on account of their grandeur or refinement that his works were so remarkably popular. With the crowd generally it was the deceptive imitation of the veil which covered the face of the vestal, yet in its seeming transparency permitted the features to be partially seen, that excited such intense admiration. But the works he then exhibited really had many of the higher qualities of art, and so have many of those he has executed since; though in his constant striving after the picturesque he in too many cases fails to avoid the meretricious. When the plans for erecting the Crystal Palace at Sydenham were fully matured, M. Monti entered into contracts for the execution of a large number of statues and fountains which were to adorn the interior and grounds of the palace; and he was induced in consequence to set up a sculpture manufactory on a large scale. The manufactory proved commercially a failure, and M. Monti became bankrupt; in good time however he obtained a first class certificate, and was enabled to return to the practice of his profession. The great bronze fountains in the north save of the Crystal Palace are very favourable examples of Monti's chisel, which is always happiest in subjects which admit of a free, bold, and picturesque treatment. Several of the colossal statues on the upper terrace of the Crystal Palace grounds are by Monti; and inside the building are casts of some of his best works. M. Monti has delivered in London some courses of lectures on sculpture, which attracted very fashionable audiences.

MONTI, VINCENZO, was born in 1754, near Ferrara, in the Papal States, and studied at Ferrara under the poet Minzoni. He gave early indications of poetical genius, as well as a correct taste in refusing to join the effeminate race of sonneteers and courtly versifiers, and resorting to the good old racy style of Dante for his model. From Ferrara Monti repaired to Rome, the capital of his native country, and the general resort of aspiring unprovided provincials who looked for patronage and support. In that metropolis he was fortunate enough to be introduced to Don Luigi Braschi, the favourite nephew of the then reigning Pope Pius VI., and was retained by that nobleman as his secretary, an office well suited to the habits and disposition of the young poet. He assumed the convenient costume of an Abbé, which at Rome was a general passport into society, and did not bind the wearer to any clerical duties or vows. Monti was now in a fair way to favour: he wrote amatory verses for the fair and sacred elegies for the church; was noticed by prelates and cardinals; was admitted into the Academy of Arcadians; and had disputes with several members of that pedantic assembly. He was abused and slandered because he took no pains to conceal his contempt for his brother versifiers. He bore the annoyance for some time, but at last his spirit, naturally intolerant, rose under the persecution of mediocrity, and he repaid his adversaries with interest in a 'Sonetto colla Coda,' or 'sonnet with a tail,' a satirical composition addressed to Father Quirinus, in which he draws, in a few angry satirical strokes, a sketch of his enemies, using the plainest vituperatives, and a phraseology compared with which Byron's 'English Bards and Scotch Reviewers' might be called a model of urbanity. Alfieri's dramas were at that time the subject of general discussion in Italy. With all their faults, they bore the stamp of a superior mind, and Monti readily acknowledged the powers of the writer, but he disapproved of the abruptness and stiffness of his diction, and of the frequent inharmoniousness of his verse. Monti thought, and with reason, that the language of Italy was fully capable of expressing energy without harshness, and in order to demonstrate this he composed in 1786 his tragedy of 'Aristodemo,'

which was received with great applause, and established his literary reputation. The 'Aristodemo' is a strictly classical drama, and is a fine specimen of that species of composition. The subject, taken from Pausanias, is the voluntary death of the king of Messene, after having concluded peace with Sparta. Remorse for an atrocious though secret crime, the murder of his own daughter, committed by Aristodemus in his younger years, through the force of disappointed ambition, and a gloomy belief in the unavoidable decrees of fate, are the leading features of the character of the king, which is delineated with fearful and solitary grandeur. Touches of softer feeling appear here and there like wild flowers amidst a barren desert, and serve to relieve the deep shade of terror which pervades the whole drama. Monti dedicated his drama to the Duchess Braschi, his patron's consort, who was then the reigning beauty of Roman fashionable society, and to whom he addressed also other minor compositions, among which is his beautiful allegory of 'Amor Pellegrino.'

When Pius VI. proceeded to Vienna to remonstrate with Joseph II. on his ecclesiastical reforms, Monti wrote a poem on the subject of that journey, entitled 'Il Pellegrino Apostolico,' which, like all Monti's works, contains great beauties of execution. The tragical death of Hugo de Basville, the agent of the French republic, who while endeavouring to excite a revolution at Rome was murdered in the streets by the populace, in January 1793, suggested to Monti the idea of a poem in terza rima, which he entitled the 'Basvilliana.' Some of its descriptions are truly magnificent, such as that of the gigantic cherub watching over the Vatican, the account of the horrors of Marseille, the description of Paris under the reign of terror, and the tragedy of the 21st of January, when the poet introduces the shades of former regicides and of the infidel writers exulting at the execution of Louis, and the phantoms of the ancient Druids rejoicing in the sight of bloody holocausts renewed. The poem, which was left unfinished, ends with *canto iv.*, when war is proclaimed in heaven, and echoed throughout Europe, against France. The 'Basvilliana' had an astonishing success: eighteen editions of it appeared in the course of six months. Fantastic as the conception may appear, it is still considered as Monti's best work.

When the French armies invaded North Italy and occupied Ferrara, the country of Monti, the poet left Rome and repaired to Milan, the capital of the new Cisalpine republic. Here he was in a new atmosphere, and he wrote in favour of republics and revolutions: among others he composed a savage song for the theatre of La Scala on the occasion of the festival of the 21st of January 1799, the anniversary of the day of the execution of Louis XVI., an act which he had so violently execrated a few years before in the 'Basvilliana.' About the same time he wrote his notorious sonnet against England, beginning "Luos ti nieghi il sol, erba la terra," and in which, after a shower of invectives and curses, he foretells the day when, stripped of all her ill-gotten wealth, Britain shall be reduced to the primitive occupation of fishing to support herself.

At the epoch of Suwarrow's invasion of Italy in 1799, Monti, with many others, took refuge in France, from whence he returned after the battle of Marengo. On his return he wrote a beautiful song in praise of his native country, which was set to music and became very popular. He also wrote his second political poem, which he styled a 'Cantica,' on the death of his friend Mascheroni, a man of science and letters, who had died in France, in exile, in 1799. It is a vision, like the 'Basvilliana,' but the sentiments are more placid and humane. There is the same difference between the two as there is between the 'Inferno' and the 'Purgatorio' of Dante. Monti's drama called 'Caio Graccho' contains some impressive scenes, but the play is altogether inferior to the 'Aristodemo.' His third tragedy, 'Galeotto Manfredi,' founded upon an incident of the Italian middle ages, is still weaker.

Monti was appointed professor of eloquence at Pavia; and in 1805, Napoleon having made himself king of Italy, appointed Monti to be historiographer of the new kingdom. The poet, instead of history, wrote verses; and in 1806 he published six cantos of a poem in praise of Napoleon, which he entitled 'Il Bardo della Selva Nera.' It related the war of 1805, the great battle of Austerlitz, the exaltation of the Elector of Bavaria (the ally of Napoleon) to the dignity of king, and the marriage of his daughter with Eugène. In this composition Monti indulged, as usual, in vituperations against the Austrians and other enemies of France. But the Austrians were soon after reconciled to Napoleon, whose interest it was not to allow them to be insulted. The Russians however still remained at war, and Monti might revile them as "northern barbarians;" but after the peace of Tilsit, their emperor, having become the ally of France, could no longer be abused with impunity. Monti, supple as he was, appears to have been puzzled with these continual transformations of friends into enemies and vice versa, and he left his poem unfinished. He might however still find means of eulogising Napoleon without offending others: accordingly he wrote his praises and those of his brother Joseph; he wrote on the birth of Eugène's children, and on the second marriage of Napoleon himself: he was, in fact, court poet to the whole dynasty. He did not remain unrewarded: he was made a knight of the iron crown and of the legion of honour; he received another decoration and a pension from Murat; and he became also a member of the Institute of the kingdom of Italy. He enjoyed quietly

his honours till 1814, when another "northern storm" again came to disturb the good people of Milan. Monti was now growing old, and, accustomed to political vicissitudes, he bowed to the new conqueror. Being requested by the authorities to write something for the imperial dynasty of Austria, he complied, and sang the praises of the "just and pacific government of Francis," in two short dramatic pieces: one in May 1815, on the occasion of the Archduke John of Austria receiving the oath of the Lombard authorities; another in January 1816, on the occasion of the visit of the emperor himself to Milan. His pension was continued to him by the Austrian government, and he remained at Milan. After the marriage of his only daughter with Count Perticari of Pesaro, both father and son-in-law engaged in a philological work, entitled 'Proposta di alcune correzioni ed aggiunte al Dizionario della Crusca,' which became the signal of a paper war between the Tuscan and the Lombard literati, or rather between the ultras of both parties, the Crusca and the Anti-Crusca. Monti's 'Proposta' is valuable, not only as a supplement to the Italian Dictionary, but as a store of erudition: it contains several disquisitions or essays upon questions connected with philology and history.

Monti was a classicist, and, as such, waged war against the "Romantic," as they are called, or that school of writers who have undertaken to modernise the literature of Italy. In one of Monti's later effusions, 'Sermone sulla Mitologia,' we find condensed, in elegant verse, Monti's creed concerning poetical composition. He exclaims against the "northern school," that has "decreed the death of all the gods of Olympus." Monti pleads, in short, for mythology and classicism like an able advocate in a weak cause. Monti may be considered as the last of a list of writers who form the connecting link between the old and modern literature of Italy. He was the contemporary of Alfieri, Parini, Pindemonte, Foscolo, and, in the latter part of his career, of Manzoni. With these his name will go down to posterity for his poetical genius, his feeling of beauty, and the fluency and harmony of his verse, whatever may be thought of the versatility of principle which his poetry has embalmed.

Monti died at Milan, October 13, 1828. His works were collected and published at Bologna, in 8 vols. 12mo, 1828; and another edition of his choice works, including some inedited ones, was published in 5 vols. 8vo, Milan, 1832.

MONTMORENCY, the name of an old and illustrious French family, so called from the little town of the same name situated a few miles north of St. Denis, near Paris. The oldest of this family on record is Bouchard de Montmorency, who lived about 950, and was one of the great feudal lords of his time. He married Hildegarde, daughter of Thibaud, count of Chartres and Blois. His son Bouchard II. was one of the principal lords of the court of King Robert about the year 1000. Matthew I., lord of Montmorency, was high constable of France under Louis the Young; he married Aline, a natural daughter of Henry I. of England, and died in 1080. His grandson Matthew II. of Montmorency was the friend of Louis VIII., and the chief support of his government, and of that of Queen Blanche, during the minority of Louis IX. The lord of Montmorency ranked as first baron of France, and was styled First Baron of Christendom. The family afterwards became divided into several branches, one of which, though not the eldest, obtained the ducal title from Henri II. of France in 1551. The first who bore the title of duke was Anne de Montmorency, marshal and high constable of France, who distinguished himself in the wars of Francis I., was in great favour with his successor Henri II., but after his death was set aside by Catherine de' Medici and the Guises, was recalled to court in 1560, fought against the Calvinists, was mortally wounded at the battle of St. Denis in November 1567, and died three days after at his house in Paris, at seventy-four years of age. He was a brave but ferocious warrior, was totally illiterate, and yet, through his natural talent and the experience of a long life, he was an able statesman and counsellor. His grandson Henri II. duke of Montmorency, marshal of France, fought with distinction under Louis XIII., but being dissatisfied with Richelieu, he conspired and revolted in Languedoc in favour of the Duke of Orleans. He was seized, tried, and beheaded at Toulouse in October 1632. The house of Montmorency continues to this day in several of its branches, namely, the princes of Montmorency, the dukes of Laval Montmorency, and the Montmorency dukes of Luxembourg.

MONTORSOLI, FRA GIOVANN' ANGELO, a celebrated Italian sculptor, was born in 1497, or about the beginning of the 16th century, at Montorsoli, near Florence, on the road to Bologna, a villa belonging to his father Michele d'Angelo da Poggibonsi. He was first instructed by Andrea da Fiesole, with whom he lived three years. After the death of his father he found employment at Rome, at Perugia, and at Volterra, where he assisted in the making the monument to Raffaello Maffei. He was next employed by Michel Angelo in the church of San Lorenzo at Florence, and gained the admiration and lasting friendship of the great Florentine. In 1527 Montorsoli had a strong disposition to turn as it appeared to him to the only life in which peace was to be obtained; but after trying in vain several convents, he fixed, in 1530, upon the brotherhood of the Nunziata at Florence, and became a friar of the order dei Servi della Nunziata. Shortly after he had taken up his abode in this convent, having been

recommended to the pope by Michel Angelo, he was called to Rome by Clement VII. to restore several ancient monuments, much to the dissatisfaction of his brothers of the Nunziata. Montorsoli restored the Laocoon, to which he made the right arm, and he made the left arm of the Apollo, and executed other restorations. When these and a statue of the pope were finished, he returned to Florence with Michel Angelo to complete the statues and other sculptures of the sacristy and library of San Lorenzo, of which his best is 'San Cosimo.' After the death of Clement, Montorsoli again joined Michel Angelo at Rome, and assisted him in the works of the monument of Julius II.; but while engaged on this work he was invited by Cardinal Turnone, and advised by Michel Angelo, to go with the cardinal to Paris, to Francis I., who commissioned him to make four great statues, but owing to difficulties with the treasury and servants of the court in Francis's absence, Montorsoli left Paris and returned to Florence without executing these works. After completing several good works in Florence and its neighbourhood, he went by Rome to Naples, and there constructed the tomb of Jacopo Sanazzaro. He next finished at Genoa the statue of Andrea Doria which was commenced by Baccio Bandinelli, and ornamented the church of San Matteo there with many works. Upon the completion of these works he returned to Michel Angelo at Rome, but departed again soon afterwards, in 1547, for Messina, where he was employed to make a grand fountain for the place in front of the cathedral. The successful completion of this great work induced the Messinese to commission Montorsoli to erect another fountain in the front of the Dogana (Custom-house), close to the sea. He designed also at Messina the church of San Lorenzo, a lighthouse, aqueducts, and many other considerable works in architecture and in sculpture. But in 1557, by a decree of Pope Paul IV., all religious persons, or all who had taken holy orders and were living at large in the world without respect to their religious character, were ordered to return to their convents and reassume their religious habits; and Montorsoli was accordingly obliged to leave many works unfinished, which he intrusted to his pupil Martino, and he returned to his convent at Florence. He was however shortly afterwards called to Bologna to construct there the high altar of the church of his own order Dei Servi, which he completed with great magnificence in twenty-eight months. He returned to Florence in 1561, and being rich he built a common sepulchre for artists in the chapter-house of the convent of the Nunziata, with the requisite endowment for regular masses at appointed times, and gave the whole sepulchre, chapter, and chapel, to the then almost decayed society of St. Luke, or company of painters, &c., which upon the completion of the sepulchre, was at a solemn feast celebrated by forty-eight of the principal artists of Florence, re-established by the consent and authority of the Duke Cosmo I. upon a firmer and permanent basis; and the society still subsists as the Academy of Florence, though since that time it has been considerably enriched and endowed by successive dukes of Tuscany. Montorsoli died, says Vasari, on the last day of August 1568, aged sixty-five.

MONTROSE, JAMES GRAHAM, MARQUIS OF, born in the year 1612, was descended from one of the most ancient families in Scotland. His grandfather, John, third earl of Montrose, was some time lord high chancellor of Scotland, and afterwards appointed viceroy of the kingdom—'supremus regni Scotiæ procurator'—for life; and he succeeded his father, John, fourth earl of Montrose, in 1626, being then just fourteen years of age. The following year he was served heir to his father in his several estates in the counties of Dumbarton, Forfar, Linlithgow, Perth, and Stirling. He married soon after, and then went on foreign travel till about 1633, when, at the age of twenty-one, he returned to Scotland, with the reputation of being one of the most accomplished gentlemen of his time. He was probably present at the coronation of King Charles I., which took place in the above year, though he does not appear to have immediately taken any prominent part in the quarrel of which that splendid ceremonial was the commencement.

He soon joined the popular party however in opposing the canons and other arbitrary innovations of the court on the established religion of the country; and on the 15th November 1637, when the celebrated Tables were made up, that is to say, committees for managing the popular cause, his name was added to the table of the nobility, to the great dismay of the bishops, who, according to Guthrie, "thought it time to prepare for a storm when he engaged." He was indeed the most ardent and zealous of his party, displaying at times a heat and enthusiasm which set form and gravity at utter defiance. Such was his behaviour on occasion of the king's proclamation approving of the 'Service Book.' On that occasion Montrose stood for some time beside Johnston, while the latter was reading a protestation in name of the Tables, but at length, that he might see the whole crowd, he got up on the end of a puncheon, which made his friend the earl of Rothes say, "James, you will never be at rest till you are fairly lifted up above your fellows;"—a remark uttered in mere jest, but recorded with great solemnity by Gordon of Straloch, who adds that the prophecy was "accomplished in earnest in that same place, and some even say that the same supporters of the scaffold on which it occurred were made use of at Montrose's execution." In the preparation of the National Covenant, which was projected by the Tables, Montrose was also a leading actor; and in swearing and imposing it on indi-

viduals there was none more zealous than he. This course of conduct, springing from the natural ardour of his temper, continued for some time: till at length, conceiving, as it would seem, his importance and military talents undervalued by the Covenanters when Argyle and Leely were allowed to lead, the one in the senate, the other in the field, Montrose determined on going over to the king. With that view he entered into a secret correspondence with Charles; but this being detected, the Covenanters threw him into prison, where he was when Charles made his second visit to Scotland, in 1641. As the principal object of the royal visit was to gain the Scots over to his interest, Charles made various concessions, and Montrose was set at liberty with his adherents, in the beginning of 1642.

From that time he retired to his own house in the country, living privately till the spring of 1643, when the queen returning from Holland, he hastened to wait on her majesty at Burlington and accompanied her to York. He embraced this opportunity to urge on the queen, as he had formerly done on the king, what he termed the dangerous policy of the Covenanters, and with the impetuosity natural to his character, solicited a commission to raise an army and suppress them by force of arms. The marquis of Hamilton however thwarted him for the present, and he returned home; but neither his ceaseless activity, nor his deadly hatred against the party with whom he had formerly acted, and particularly against their leaders, whose recent imprisonment of him had roused him to revenge, and who filled the place which his ambition had long aimed at, could be laid asleep. Accordingly he took another opportunity of waiting on the king with his proposals on behalf of his majesty, by whom he was favourably received; and at length, in the month of April 1644, he was created Marquis of Montrose, and constituted captain-general and commander-in-chief of all the forces to be raised in Scotland for the king's service under prince Rupert. The royal arms were for some time unsuccessful however, and the prince seems to have regarded Montrose in no other light than that of a fearless but somewhat wrong-headed enthusiast. Montrose's counsels indeed were almost always of a desperate character, and no failure ever destroyed his confidence of ultimate success. His army was reinforced from all quarters, its attacks were desultory and violent, and its progress was marked by depredation and waste. At Tippermuir, a wide field about five miles from Perth, where Montrose came in sight of the enemy drawn up in one long line, with horse at the flanks, the Covenanters' horse were overpowered, according to Wishart, by a shower of stones. The flight of the horse threw the ill-disciplined foot into irremediable confusion, numbers were killed through fatigue and fear, and the whole of the artillery and baggage of the vanquished fell into the hands of Montrose and his men; and the defeat of Tippermuir was but the beginning of a series of conquests, which laid all Scotland open to the victorious Montrose. The last of the series was the battle (or rather, massacre) of Killybrath, fought in the month of August 1645. On this occasion Montrose had the advantage of selecting his ground with deliberation, whereas the Covenanters came up after a toilsome march, and were even ordered to remove from their first position in the very presence of the enemy. While this change was taking place, Montrose cast his eye upon a company of cuirassiers, and, pointing them out to his men as "cowardly rascals cased in iron," he threw off his coat and waistcoat, tucked up the sleeves of his shirt, and drawing his sword with ferocious resolution, cried out, "Let us fight the fellows in our shirts." The example was instantly copied by the enthusiastic and sanguinary troop, and, falling upon the enemy before they had taken up the places assigned them, the battle which ensued became a mere massacre—a race of 14 miles, in which 6000 of the Covenanters, if we are to believe the royalists, were cut down and slain.

Montrose now carried such of his men as would accompany him to the borders, presuming on the continued success of his arms. He was however mistaken: at Philiphaugh, near Selkirk, he was surprised by General Leely on the 13th of September 1645; and upon the panic-struck royalists was that day inflicted a fearful retaliation for their previous enormities. Montrose regained the Highlands with a few followers, but was perfectly unsuccessful in all his endeavours to excite sympathy towards either his person or cause; and on the king's surrender to the Scots, Montrose capitulated, and was permitted to embark in a small vessel for Norway, on the 3rd of September 1646. On this occasion he put on the disguise of a menial, and passed for the servant of his chaplain. When on the continent at this time he had the offer of the appointment of general of the Scots in France, lieutenant-general in the French army, and captain of the *gens-d'armes*, with an annual pension besides his pay; but he declined all appointments, saying he wished only to be of service to his own sovereign.

He remained abroad till the death of Charles I., when he received a commission from his son for a new invasion of Scotland. Accordingly, selecting the remote islands of Orkney for his rendezvous, he despatched thither a part of his troops, consisting of foreign auxiliaries, in the month of September 1649; and in the month of March following, he himself arrived there. In their very first encounter with the enemy however on the mainland, his forces were utterly routed; and after some time he himself was discovered on foot in the disguise of a Highland rustic. In this condition he escaped to the house of McLeod of Assint, by whom he was delivered up to General Leely, and then conducted towards Edinburgh in the same

BIOG. DIV. VOL. IV.

mean garb in which he was taken; but in Dundee a change of raiment was allowed him. His reception in the capital was that of a condemned traitor, sentences of excommunication and forfeiture having been pronounced by the General Assembly and parliament so far back as the year 1644; and many barbarous indignities were heaped upon him. But throughout his dignity remained undiminished, and he now excited a sympathy which had never before been felt for him. He received sentence of death with the same firmness; and on Tuesday, the 21st of May 1650, the sentence was executed upon him: he was hanged on a gibbet thirty feet high; and his limbs, after being severed from his body, were affixed to the gates of the principal towns in the kingdom. He retained his heroism and self-possession to the last.

On the Restoration, King Charles II. reversed the sentence of forfeiture which had been passed by the parliament; and his scattered remains were collected and buried with great solemnity in the cathedral church of St. Giles, Edinburgh.

MONTUCLA, JEAN-ETIENNE, was the son of a merchant at Lyon, in which city he was born, 5th of September 1725. At the age of sixteen he became an orphan, and his grandmother, who had been left guardian of his education, died shortly afterwards. At the Jesuits' College of Lyon his attention was chiefly directed to the study of the ancient classics, although a decided taste for philological pursuits in general, assisted by a peculiarly retentive memory, enabled him to become acquainted with several of the modern languages, among which the Italian, English, Dutch, and German are mentioned as those with which he was more particularly conversant. At this college also, under Le Père Béraud, the subsequent tutor of Lalande, he attained to considerable proficiency in those sciences of which he was afterwards the historian. From Lyon he went to Toulouse, in order to qualify himself for the legal profession, and having taken the usual degrees, he thence proceeded to Paris. At the public libraries of that metropolis, and at the scientific soirées of M. Jombert, he made the acquaintance of Diderot, D'Alembert, Cochin, Lalande, and others. To his intercourse with D'Alembert, in particular, he probably owed much of his mathematical knowledge; and Lalande, if he did not suggest a history of the mathematical sciences, at least gave him considerable encouragement to carry out the design when once it had been formed. In 1754 he published in 12mo, anonymously, the 'History of the Researches for determining the Quadrature of the Circle,' to which was appended 'An Account of the Problems of the Duplication of the Cube, and the Trisection of an Angle.' A second edition of this work appeared in 1831, in 8vo, edited by Lacroix. The following year (1755) he was admitted a member of the Academy of Berlin, and in 1758 he published, in two vols. 4to, the first part of the 'History of the Mathematics.' After this he began to be employed by the government—first, as intendant-secretary at Grenoble, where he became acquainted with the family of M. Lomand, whose daughter he married in 1763; and then (1764) as secretary and astronomer-royal to the expedition for colonising Cayenna. Upon his return to France the following year he obtained, through the instrumentality of his friend Cochin, the situation of 'premier commis des bâtiments,' the duties of which he discharged most assiduously for twenty-five years. To the above appointment was added the honorary one of censor-royal of mathematical books. His leisure was devoted to the education of his family and to scientific pursuits; but the latter he is said to have conducted with extreme secrecy, lest he should be suspected of neglecting his official duties. In this way he edited in 1778 a new and greatly improved edition of Ozanam's 'Mathematical Recreations,' in 4 vols. 8vo; and so carefully had he concealed his connection with the work, that a copy was forwarded to him, in his capacity of censor, for examination and approval. The income he derived from his situation under the government, though small, was sufficient for the immediate wants of himself and family; but by the events of the revolution he lost his situation, and was left little short of destitute.

In 1794 Montucla was employed in forming an analysis of the treaties deposited in the archives of the foreign department, and about the same time he was nominated professor of mathematics to one of the central schools of Paris; but his health not permitting him to fill the appointment, a situation in the 'Jurés d'Instruction' was assigned to him. In 1798 he published a second edition of the first part of his 'History of the Mathematics,' in which he introduced many improvements and augmentations. With the exception however of the profits, if any, which he may have derived from this work, his only resource for two years, from which he could provide for his family, was an insignificant situation in the office of the National Lottery. Upon the death of Saussure in 1799, the minister Neuchâteau conferred upon him a pension of 2400 francs, which he lived but four months to enjoy. He died on the 18th of December 1799. His modesty and benevolence were no less conspicuous than his erudition and the smallness of his fortune. When Lalande, deputed by the Academy, offered him some situation in that society, he declined the honour on the ground of incompetency.

Before his decease he had occupied himself with the second part of his 'History.' The completion of the work was confided to Lalande, who, with the assistance of several scientific individuals, among whom was Lacroix, published the remaining two volumes in 1802. The whole work is divided into five parts, and these are subdivided into books and chapters. Part I. contains the History of the Mathematics

Y

up to the destruction of the Grecian empire. Part II. comprises the History of the Sciences among the Arabs, Persians, Jews, Indians, Chinese, and other Oriental nations. Part III. contains the History of the Sciences among the Latins and the Western nations up to the commencement of the 17th century. These three parts form the first volume. Part IV., forming the second volume, and comprehending the History of the Sciences during the 17th century, is divided into nine books, namely, 1, Progress of Geometry, as treated after the manner of the Ancients; 2, Progress of Analytical Geometry; 3, Progress of Mechanics about the middle of the 17th century; 4, Progress of Optics about the middle of the 17th century; 5, Progress of Astronomy during the 17th century; 6, Rise and Progress of the Differential and Integral Calculus in the latter part of the 17th century; 7, Progress of Mechanics during the same period; 8, Progress of Optics during the same period; 9, Progress of Astronomy during the same period. The remaining two volumes form the fifth part. It comprises the History of the Sciences during the greater part of the 18th century, and is likewise divided into nine books, namely, 1, Geometry and Analysis; 2, Optics; 3, Analytical Mechanics; 4, Practical Mechanics and Machines; 5, Plane Astronomy; 6, Physical Astronomy; 7, Astronomical Tables, Instruments, Observatories, &c., and Judicial Astrology; 8, Progress of Navigation, as regards the Construction and Management of Vessels; 9, Progress of Navigation, as regards the Piloting of a Vessel and the Determination of its Geographical Position. The work concludes with a series of supplements on the Capstan; on the History of Geography; on that of the Quadrature of the Circle; on the History of Music; a Defence of the Philosophers of Antiquity; Notice concerning the Calculus of Derivations by Arbogast; and a short notice of the Life of Montucla.

As a whole, it contains treatises upon almost every branch of the pure and applied sciences, and abounds with interesting details concerning the various discoveries and improvements which have contributed to their progress. Bonycastle, speaking of Montucla, in his preface to the translation of Boesut's 'History of the Mathematics,' justly remarks:—"If he be not so profound as some other writers, he is frequently less obscure, and may often be consulted with advantage upon points where the original writers would be nearly unintelligible to common readers; in short, there is perhaps no work which is capable of affording more pleasure and instruction to those who propose to devote themselves to those studies, or which is likely to create a more earnest desire to prosecute them." On the other hand it may be said that the subjects treated do not succeed each other in so elementary and natural an order as might be wished, and that the language is sometimes excessively diffuse, and burdened with much repetition.

MOORE, EDWARD, a writer of some dramatic and poetical reputation, was born in 1712, and bred to the business of a linen-draper, which he followed for some time in London, until he deserted it for the pursuit of literature. He married a lady named Hamilton, of a strong poetical vein, who was supposed to assist him in his writings. His first metrical work was 'Fables for the Female Sex,' which, though in humour and elegance far inferior to those of Gay, have numbered him, by their pleasing versification and well-pointed morals, among the happiest imitators of that writer. These fables were succeeded by 'The Trial of Selim the Persian,' an ingenious complimentary siffusion on Lord Lyttelton, in return for some favourable notice from that nobleman. Moore's dramatic pieces were—two unsuccessful comedies, 'The Foundling' and 'Gil Blas;' and a tragedy, 'The Gamester,' which, without any striking touches of genius, still retains its place on the stage, and its hold on the feelings, by a natural and affecting exhibition of domestic misery. The last literary undertaking in which Moore became engaged, was the editorship of 'The World,' a miscellaneous weekly paper, to which Lords Lyttelton and Chesterfield, Horace Walpole, and other distinguished persons of the day contributed. The series closed with the death of Moore, which occurred February 28, 1757.

MOORE, DR. JOHN, M.D., better known as a miscellaneous writer than a physician, was the son of a minister of the Scotch Church, and was born at Stirling in the year 1780. In his youth, after having studied in the University of Glasgow, he served for a time as a medical officer in the British army in Flanders, in 1747-48, and subsequently became surgeon to the household of the Earl of Albemarle, English ambassador at the court of Versailles. Having passed some years abroad in these stations, he returned to Scotland, and entering into partnership as a surgeon, settled at Glasgow, from whence, after taking his degree as physician, he was induced, in the year 1772, to accompany the young duke of Hamilton to the continent, in the joint capacity of medical attendant and travelling tutor. With his charge he spent five years in visiting some of the most interesting parts of Europe; and returning home in 1778, and establishing himself in London, he gave the result of his observations of foreign countries to the world in two lively works, under the title of 'A View of Society and Manners in France, Switzerland, and Germany,' and 'in Italy.' These, his first literary productions, were followed by a volume of 'Medical Sketches,' and by 'Zeluco,' the ablest and most popular of his novels, in which he has powerfully portrayed the dreadful effects of indulgence upon a disposition naturally selfish and cruel. His succeeding works, 'A Journal of a Residence in France during the Revolution of 1792,' 'A View of the Causes and Progress of the French

Revolution,' 'Edward,' a novel, 'Mordaunt, or Sketches of Life, Character, and Manners in various Countries,' and an edition of Smollett's works, with a memoir of the author, had upon the whole inferior merit. His personal character is said to have been adorned with many estimable and pleasing qualities; the knowledge of the world which he had acquired in foreign travel, caused his society to be much courted; and his conversation, aided by a countenance full of expression, was distinguished by the same tone of moral sentiment, as well as by the same shrewdness of remark and caustic humour, which appear in his writings. He died at Richmond, near London, February 21, 1802.

A complete edition of Dr. Moore's works, in seven volumes, with an apparently accurate Memoir of his Life, by Robert Anderson, M.D., was published in Edinburgh in 1820.

MOORE, SIR JOHN, a lieutenant-general and knight of the bath, one of the most distinguished British officers of modern times, was the eldest son of Dr. John Moore, the author of 'Zeluco.' He was born at Glasgow in 1761, and received his first commission in the army at the age of fifteen years. The aristocratic connections formed by his father secured his rapid advancement; and before he found the earliest occasion of proving his personal merit, he had already been some years a lieutenant-colonel, and had also sat in parliament for the Lanark district of burghs. It was in the descent of the British troops upon Corsica, in 1794, in concert with the patriotic Paoli, that Moore first distinguished himself; and in subsequent services, in the West Indies in 1796, in Ireland during the rebellion of 1798, and in the disastrous expedition to Holland in the following year, in which he received two severe wounds, he fully established for himself the reputation of an officer of the highest promise. A more auspicious duty now awaited him; and in the expedition to Egypt in 1801, with the rank of major-general, he commanded the reserve of the army, and highly distinguished himself at its head. For his services in this campaign, in which he was again wounded, he was deservedly created a knight of the bath.

On the recommencement of hostilities, after the short peace of 1802, Moore was usefully employed, by his own desire, in a camp of instruction on the Kentish coast, in training his own and several other regiments as light infantry; and these troops, of which the renowned light division of the Duke of Wellington's army in the Peninsular War was afterwards composed, gave by their achievements the best proof of the value of the system on which they had been instructed in the school of Moore. The freedom and simplicity of movement, which he had substituted for some of the pedantries of the German tactics, were found as desirable and as well calculated for the general service of the infantry as for light troops alone; and these improvements have accordingly been incorporated into the existing regulations for the exercises of the British army.

From the business of tactical instruction Moore was called to more active service; and after being for some time employed in the occupation of Sicily, he was sent, in May 1808, at the head of a body of about 10,000 men, to Sweden, with a view of aiding the gallant but unreasonable sovereign of that country, Gustavus Adolphus IV., in the defence of his dominions against the designs of Napoleon I. On this arduous mission, he became involved in a serious dispute with the eccentric king, from which he, not without some difficulty, extricated himself and his troops; and he returned with them to England at that crisis in the war against France, which opened to the British arms a new field of action in the Spanish Peninsula; a field destined to witness his calamitous struggle and victorious fall, and to immortalise at once his misfortunes and his glory.

Moore landed in Portugal, in August 1808, too late to share in the battle of Vimiero; but after the expulsion of the French from that kingdom, and the recall of the British generals who had negotiated the Convention of Cintra, he was appointed to the command of the army which, to the number of 5000 cavalry and 30,000 infantry, was intended to co-operate with the Spanish forces in the north of the Peninsula, against the French invaders. Of this auxiliary army part was to arrive direct from England under Sir David Baird, and to land at Coruña, while the greater proportion, composed of troops already in Portugal, was to be led by Moore himself to the scene of operations. He accordingly began his march from Lisbon in October 1808; but he had scarcely entered Spain before the defeat and destruction of the Spanish armies at all points on their northern line, utterly extinguished the prospect of a successful campaign. On a false report that the direct northern road through Almeida, by which his infantry had advanced, was impassable for artillery, he had imprudently been induced to send his cavalry and guns, under Sir John Hope, by a circuitous southern route through Badajoz; to the north, a long tract of country still divided him from the troops which had landed under Baird at Coruña; and with forces thus widely disjointed, he found himself exposed to the assaults of victorious and rapidly advancing French armies of immense numerical superiority. In this critical position he remained for some time inactive at Salamanca, urged by his own desponding views of the contest to retreat into Portugal, and goaded by the sanguine temper of the British ambassador in Spain, Mr. Frere, to advance, with assurances that his presence might yet preserve Madrid from falling into the hands of the enemy. The surrender of that capital soon dispelled so much of the ambassador's

illusions: yet the intelligence was followed by some indecisive movements on the part of the British general against the advanced corps of the enemy under Soult, until he suddenly ascertained that the whole of the disposable French armies in the Peninsula were gathering to surround him. Rejecting all hope of the defence of Portugal, he commenced a rapid, if not too precipitate, retreat to Coruña: the sufferings and disorders of which, conducted as it was in the depth of a severe winter, and through the mountainous region of Galicia, will long be remembered in our military annals. Its disasters were closed, on the 18th of January 1809, by the battle of Coruña, in which the troops, though previously to all appearance exhausted and disorganised, were reanimated, by the exertion of their gallant leader and their own native valour, to inflict a decisive repulse upon their pursuers. Their triumph was dearly purchased by the loss of their commander: the circumstances of whose death may challenge and support a comparison with the most illustrious examples of heroism in ancient and modern times, with the last moments of an Epaminondas, a Bayard, or a Wolfe. He probably had little desire to survive the mental agony which he had suffered in so disastrous a retreat; he expressed great satisfaction that the enemy were beaten; he reminded his sorrowing friends "that he had always wished to die in that way;" and his expiring words breathed a hope that "the people of England would be satisfied—that his country would do him justice."

The personal history of Sir John Moore has been written at some length in a memoir contained in the third volume of Gleig's 'Lives of British Military Commanders'; and in a Life of him by his brother, in 2 vols. 8vo, 1834: but elaborate investigations of his last campaign may be found in the justificatory 'Narrative' of his brother (London, 4to, 1809), and in a criticism on it in the second volume of the 'Quarterly Review'; in Southey's 'History of the Peninsular War,' vol. ii. (8vo ed.); in Sir John Jones's 'Account of the War in Spain and Portugal'; and in the first volume of Napier's 'History of the War in the Peninsula,' which the author, a zealous and ardent partisan, has consecrated to the eulogy of Moore, and to the able defence of his operations.

The operations of the memorable campaign in which Moore had so gallantly fallen were canvassed after the event with all the virulence of faction by conflicting parties, who either desired to shift the blame of failure from the government on the general, or to transfer it from him to his employers. Scarcely indeed has the question, which must determine Moore's claims to the character of an able commander, been impartially treated even to this day. The noble and graceful virtues of his private life, his lofty and generous sense of honour, his chivalrous courage, his forgetfulness of himself, and his enthusiastic devotion to the service of his country, even his enemies have been unable to deny. In stations of subordinate command, he had also unquestionably displayed very considerable talents, and a perfect acquaintance with the science of his profession. But until the campaign of 1808-9 he had never held the chief command in the field; and the fact whether he possessed the highest qualities of military genius must be tried by his conduct in that arduous service. He was placed in a position of the utmost difficulty; with an army which, though full of courage, was young in action, and not inured to privation; with an inexperienced staff, and a commissariat wretchedly defective; without the means of obtaining either information or supplies, in a country where warfare has, in all ages, been attended by peculiar difficulties; called upon to aid a nation, as full of blind presumption and ignorance as its rulers were of imbecility and treachery; and opposed to armies ably commanded, thoroughly organised in every department, long seasoned to warfare, and immensely superior in numbers. These were difficulties under which any but the commander of first-rate ability and unshaken confidence in the resources of his own comprehensive intellect was sure to sink; and that Moore was not found equal to them is no more a subject of reproach upon his zealous and gallant spirit, than that nature had not endowed him with the genius of a Fabius or a Wellington. He wanted in fact that perfect undoubting trust in himself, in every adversity, which is characteristic of the greatest commanders, and belongs to the very highest order of minds. He disbelieved in his own ability, and overrated that of his opponents. From the first to the last, he desponded of fortune, and foresaw only disasters: he hesitated only in vigorous action, and decided upon nothing but failure. The Duke of Wellington has generously said, that he could discover only one error in Moore's campaign, in not providing for retreat when he advanced against Soult: but the neglect of preparation for an orderly and gradual retrograde movement through the strong country of Galicia was only indicative of the same absence of all hopefulness, which had already pronounced Portugal itself indefensible. How the events of the following campaigns refuted this opinion need not here be said; but Moore, in his despair and dread of responsibility, abandoned every thought except the preservation of the army.

That he achieved this object without dishonour is sufficient to redeem all the errors, if such there were, which had attended his career; and it should ever be gratefully remembered to his glory, that, when there were those under his command at Coruña who dared to utter hints of a convention with the French for obtaining permission to embark unmolested, he indignantly spurned the proposal, as unworthy of a British army which, amidst all its sufferings, had never

known defeat. He welcomed indeed a battle as the surest means of clearing every stain from the dubious character of his retreat; he was as doubtless of victory on the coast of Coruña, as he had been apprehensive of destruction in the interior of Spain; and in that last act of undaunted firmness, he put a seal with his blood to a whole life of magnanimous devotion.

MOORE, THOMAS, was born in Aungier-street, Dublin, on the 28th of May 1779. His father was a small tradesman, and both his parents were Roman Catholics. He was early placed at school under a Mr. Whyte, who paid much attention to elocution, who was fond of dramatic representations, and in whose school R. B. Sheridan had once been. Moore, a quick and lively boy, became a favourite pupil, and as early as 1790 exhibited his talents in reciting an epilogue at a private theatrical entertainment: other dramatic exhibitions were got up by his parents, for which he wrote epilogues or prologues. When he first began to rhyme, he says, he cannot remember; but in 1793 he contributed two poems to the 'Anthologia Hibernica,' a Dublin magazine, which were inserted, to his intense gratification. In this year the restrictions which prevented Roman Catholics from studying at the Dublin University were removed, though all honours and offices were still denied them. His mother, who wished him to be a lawyer, induced his father to enter him at Trinity College in the summer of 1794. At college he pursued the usual studies with tolerable success, gaining several marks of distinction, though, feeling an inability to write Latin hexameters, he substituted on one occasion some English verses, which were approved of by the judges, and for which he received a reward. He continued also to write verses for the 'Anthologia' while it existed, and afterwards for other publications. He learned to play the piano from his sister's teacher, Italian from the priest of the family, and French from an emigrant acquaintance. In the second year of his college attendance he soared yet higher, and wrote a masque with songs, which was performed in his father's drawing-room.

Born a Roman Catholic, accustomed from infancy to hear the wrongs of his fellow-religionists deacanted on, influenced by his friendship with Emmett and others, and perhaps soured by his pretensions to a scholarship in the university being unavailable on account of his faith, it is little to be wondered at that he took a lively interest—though fortunately he was too young to be made an active participator—in the plots preparatory to the rebellion of 1798. He was examined before Fitzgibbon, the vice-chancellor; but as he could honestly avow himself ignorant of any plot, he was discharged. He at length took his degree of B.A., and left the university; but he had already commenced a translation of the so-called odes of Anacreon, a specimen of which he laid before the provost of the college, Dr. Kearney, with a hope to obtain a classical premium. Dr. Kearney thought the translation good, but that the subject was not likely to be patronised by the Board. Moore was then entered at the Middle Temple in London, whither he went, scantily supplied with money, to study law. In London he was introduced to Lord Moira, Lady Donegal, and others; he moved in a fashionable circle; he published in 1801 his 'Odes of Anacreon,' and of course paid little attention to his legal studies. His next publication, in 1802, was 'The Poetical Works of the late Thomas Little,' for which he received 60*l.* They were severely blamed and much read, and their somewhat loose morality did not prevent them from securing him friends, on account of their poetical ability. In 1803, by Lord Moira's influence, he was appointed to a government situation at Bermuda. In January 1804 he arrived there, having stayed upwards of a month at Norfolk in Virginia. He at once found that the situation did not suit him, and in March he left Bermuda, appointing a deputy to fulfil his functions. He then journeyed over a part of America, going from New York to Virginia, and back by Philadelphia and Boston to Niagara and Quebec. With the society in America he was much dissatisfied, and recorded his sentiments in some satirical poems. In November 1804 he was back in England. Here he expected much from Lord Moira's patronage, but only succeeded in getting the appointment of barrack-master in Dublin for his father. In 1805 he published 'Odes and Epistles,' which being in a similar style to the Little poems brought upon him the castigation of Jeffrey. This occasioned a bloodless duel, the cause of much merriment at the time, and led to a firm friendship between the combatants. He was now leading a life of fashionable excitement among the aristocracy of England, a visitor to Lord Moira at Donington Park, and a constant guest at Lansdowne House and Holland House. As early as 1797 Moore's attention had been attracted to Bunting's collection of Irish melodies, and at intervals he had written words for several of them, which he was accustomed to sing himself with much effect. In 1807 he entered into an engagement with Mr. Power to produce a work founded on them, in which he was to adapt the airs and furnish the words, while Sir J. Stevenson was to provide the accompaniments. This work was not completed till 1834, and upon it his true fame will rest. His amatory poems, though sweetly and playfully written, will always give offence to persons of good taste; his satires, however successful in attacking ephemeral subjects, will perish with the events to which they allude; but the melodies, combining beautiful words, pure morals, and good music, will have a lasting existence. They have an entirely original character; they have not the vigour, the truth to nature, and the deep passionate feeling of our other great

lyrical poet, Burns, but they are never, as he sometimes is, coarse; they have a uniform elegance, a lightness, a pathetic tenderness, a play of wit, a brilliance of fancy, and a richness of adornment, which, though too often giving the impression of being artificial, are always pleasing. In the same class may be included the songs written under the title of 'National Airs,' published in 1815. We cannot however place the 'Sacred Songs,' which he published in the same year, in the same category. In them there is a strained adaptation of scriptural words and ideas, with a lack of earnestness, that renders them distasteful. In 1808 he published, anonymously, two poems, 'Intolerance' and 'Corruption;' and in 1809 'The Sceptic.' They were not very successful. Moore's muse was too sportive, his fancy too playful, his heart too genial, for him to excel in severe satire which he here attempted.

In 1811 he married Miss Bessy Dyke, a truly estimable woman, to whom he ever continued fondly attached, and who was the source of all his purest happiness for the remainder of his life. In the autumn of the same year his opera of 'M.P., or the Blue Stocking,' was produced on the stage. It was but moderately successful, ran a few nights, and has never been repeated, though some of the songs, published separately in his collected works (from which the opera is omitted), well maintained his lyrical reputation. Moore had now made up his mind to live by his pen; he quitted London, and went to reside with his family at Mayfield Cottage, near Ashbourne in Derbyshire, where in 1813 he produced the 'Twopenny Post-Bag, by Thomas Brown the Younger.' The wit, the variety, the ease, and the playfulness of these satires, directed against the Prince Regent and his ministers, made them immediately popular, and fourteen editions went through the press in a twelvemonth.

As early as 1812 Moore had contemplated the writing of an oriental poetical romance, and his friend Mr. Perry of the 'Morning Chronicle' stipulated for him with Messrs. Longman, the publishers, that he should receive for a quarto volume the sum of three thousand guineas: this was agreed to; but it was not till 1817 that 'Lalla Rookh' at length appeared. It was eminently successful; it has passed through many editions, and it has been frequently translated. It may however be doubted whether it will contribute to his permanent fame. It is brilliant, melodious, in the 'Fire Worshippers' it is energetic, but it wants dramatic consistency and characterisation; it is untrue to nature, it is cloying with its sweetness, it is oppressive with its imagery; the feelings described are almost uniformly sensuous, and the art of the composition is painfully apparent. Immediately after the publication of 'Lalla Rookh,' he made a trip to Paris in company with Mr. Rogers, and this enabled him to produce 'The Fudge Family in Paris,' a series of poetical epistles, an entertaining collection of satirical remarks on character and political events, which was published in 1818. While seeing 'Lalla Rookh' through the press he had removed to Hornsey near London, and here in September 1817 he lost one of his children. Early in 1818 he learned that his deputy in Bermuda, "after keeping back from me the proper receipts of my office," he writes in one of his letters, "has now, it seems, made free with the proceeds of a ship and cargo deposited in his hands, and I am called upon by a motion from Doctors' Commons, to be accountable for it." The claim was for about 6000*l.*, of which little was hoped to be recovered from the deputy. On this occasion his friends flocked round him with offers of assistance, but he declined receiving any, as he preferred paying the money, whatever it might be, by the earnings of his pen. In 1819 he accompanied Lord John Russell to Paris, and extended his journey to Italy, visiting Rome in company with Chantrey the sculptor, and Jackson the painter. This expedition was recorded in 'Rhymes on the Road,' published together with 'Fables of the Holy Alliance,' the same year; they were said to be 'extracted from the Journal of a Travelling Member of the Pocomurante Society,' and are serious, political, artistical, and satirical by turns. As the law proceedings respecting the defalcations were still pending, he did not return to England; but, sending for his family, took up his abode at Paris, where he continued until 1822. He purposed to work hard; but the gaiety of the place, the interruption of visitors, and probably anxiety as to his ultimate loss, prevented his carrying his intentions into full effect. He had entered into an engagement to write a life of Sheridan; but in Paris he found himself, or thought himself, so unfurnished with materials, that he gave it up, and 'The Loves of the Angels,' a poem, issued in 1823, and the prose-poetical romance of 'The Epicurean' (not published till 1827), were the only additional works produced during his residence abroad.

The claim with regard to the Bermuda defalcation had by this time been settled by Mr. Moore's friends in London, having been reduced to 740*l.*, which was paid by a cheque from Lord Lansdowne, and repaid by Moore, chiefly from the proceeds of his 'Loves of the Angels' and his 'Fables of the Holy Alliance.' He now settled at Sloperon Cottage, near Bowood, the residence of the Marquis of Lansdowne; and in 1824 issued the 'Memoirs of Captain Rock.' He at once began in earnest his 'Life of Sheridan,' which was published in 1825. In 1827 'The Epicurean' was published, with some fragments of a poem called 'Alciphron,' on the same materials.

Before 1821 Lord Byron had presented Moore with his manuscript autobiography, for his especial benefit, but not to be published till after his death. In this year, in order to raise money, Moore had sold

it to Mr. Murray, with an engagement to edit it, for 2000 guineas; and the manuscript was assigned to, and deposited with him, in April 1824. In this month Byron died; and on the news reaching England, Moore was anxious to redeem the manuscript, which he considered he had a right to do: Lady Byron and the family were desirous that the manuscript should be destroyed, as they considered its publication would be alike hurtful to their feelings and injurious to the character of his lordship, and offered to repay Mr. Murray the sum he advanced. Moore refused to accede to this; he was willing to defer to their feelings, to suppress or alter what was unfit to be made public, or even to burn it if competent persons should decide that its publication would be improper; but insisted that in any case he alone should be the loser. After a long and unpleasant altercation he repaid the 2100*l.* with interest to Mr. Murray, the manuscript was burnt, and he engaged for the like sum to write a 'Life of Lord Byron' for the Messrs. Longman. This he did, but ultimately the copyright was transferred to Mr. Murray, by whom it was published in 2 vols. 4to in 1830. In 1831 he wrote 'The Life of Lord Edward Fitzgerald,' and 'The Summer Fête,' celebrating an entertainment given at Boyle Farm in 1827. To this followed 'The History of Ireland,' which appeared in 'Lardner's Cyclopaedia' in successive volumes. This was his last work of importance. In 1835, during the administration of Lord Melbourne, a pension of 300*l.* a year was bestowed on him by the Queen as a reward for his literary merits. It was bestowed in good time: he had become unwilling or unable to labour as he had done, and family bereavements distressed him. Of his two sons, one died in Algeria in the service of the French; the other died of consumption in 1842. In 1841 he commenced an edition of his collected poetical works, including the scattered pieces with which he had enriched almost every newspaper and magazine of the metropolis, and they were issued in ten monthly volumes. For the last three years of his life he was afflicted with a softening of the brain, which reduced him to a state of mental incapacity, though without pain, during which the sedulous attention of his wife was most exemplary. He died on the 25th of February 1852, and was buried in the churchyard of Bromham, near Devizes.

Of Moore's poetical genius we have already spoken. To his prose there is less praise to be given. His biographies, with many sparkling passages, are all faulty, diffuse, and uncharacteristic. His 'History of Ireland' is his best work, as it is an interesting and careful production, though not an impartial one. His character in many respects was truly estimable. His affection for his parents was unfeeling and indelible: it carried him in early life safely through the seductions of fashionable society, as he would commit no extravagance that might require them to contribute to his expenses; it induced him to postpone his own hopes of official advancement to the provision of a small place for his father; and of the 3000*l.* received for 'Lalla Rookh,' 2000*l.* was left in the hands of the publisher to pay the interest to his parents. To his wife and family he showed the fondest attachment, and it was duly reciprocated. It has been urged against him that he too often left his wife in solitude while he was fluttering in fashionable circles; but it should be remembered that he believed much of his fame, and consequently his fortune, depended on his keeping himself well before that world which alone could become purchasers of the expensive quartos in which shape his works first appeared; nor should it be forgotten that even in these circles he always avowed himself proud of his wife, introduced her to all his aristocratical friends, and frequently urged her to mix more with them, which her native good sense made her decline as much as possible, while she ever willingly submitted to those absences she considered useful to their mutual interests. As a friend he was faithful, kind, and generous; and he secured the esteem of many of the most eminent men of his day. As a politician he was consistent in his principles, though not always right or always unchanging in his opinions. He was vain; but few men have had so much pains taken to make them so, petted as he was from his boyhood till old age withdrew him from the world, and his vanity was harmless and never obtrusive. The strongest proofs of it are given in his own private journal, published after his death in the 'Memoirs, Journal, and Correspondence of Thomas Moore,' by Lord John Russell, in 1853-55, in 8 vols.

\*MORA, JOSÉ JOAQUIN DE, an eminent Spanish poet and miscellaneous author, was born at Cadiz in 1784, the son of an advocate and magistrate of that city. He studied at the University of Granada, and early became a professor at the college of San Miguel, where one of his first pupils was Martínez de la Rosa, with whom he formed a friendship, which has now lasted for upwards of half a century. At the great outbreak on the occasion of the French invasion, Mora took up arms in the patriotic cause, and was at the battle of Baylen; but he had soon afterwards the misfortune of falling into the hands of the French, by whom he was sent to Autun, where he resided for some years as a prisoner of war, and married a French lady. In 1814 he returned to Spain, and practised as an advocate at Madrid, where he also edited the 'Cronica Científica y Literaria,' afterwards 'El Constitucional,' a periodical, some articles of which brought him in communication with Jeremy Bentham, whose address to the Spanish Cortes he translated in 1820. Though looked upon with some favour by King Ferdinand, who on one occasion sent him on a mission to Rome, he took a share in the constitutional movement, which was

crushed by the second French invasion, and in 1823 found it advisable to emigrate to England. Here he declined to receive any share of the allowance made by the English government to the emigrants, and relied for support on his literary exertions. He was recommended by his friend Blanco White to Mr. Ackermann of the Strand, who was at that time directing his attention to a branch of literary commerce, which has been extensively cultivated by several publishers in France, and almost totally neglected by those of England—the supply of Spanish books adapted to the wants of the natives of Spanish America. For this purpose he set up an establishment in Mexico, and others in Columbia, Buenos Ayres, Chili, Peru, and Guatemala, and procured at once from the Congress of the Spanish American republics a privilege which the English American republics have not yet been persuaded to grant—the recognition of his sole right of publication and sale of the works whose copyright he paid for. Mr. Ackermann had just achieved a brilliant success by his introduction into England of the annuals which had been so long fashionable in Germany. His 'Forget-me-Not,' the earliest of a legion, whose career has turned out as short as it was splendid, was made the basis of a Spanish work of the same kind, under the title of 'No me Olvides,' to which De Mora contributed the whole of the literary matter, partly original and partly translated. The first of the set was published in 1824, and the last we believe in 1827. He also wrote for the 'Repertorio Americano,' a periodical issued by Ackermann for the American market. Among his separate works in prose were a history of the Arabs, chiefly of their career in Spain ('Cuadros de la historia de los Arabes,' 2 vols, London, 1826), and several anonymous catechisms of the sciences; he also wrote in verse a volume of 'Meditaciones Poéticas,' London, 1826, 4to. By his translations of 'Ivanhoe' and 'The Talisman' he was the first to introduce to the Spanish reader the novels of Sir Walter Scott. In a few years his name was well-known and popular in Spanish America, and he received several invitations from the governments of that part of the world to enter their service. In 1827 he went to Buenos Ayres at the desire of the president Rivadavia, who had previously represented the state in London, and whose government he supported in a 'Cronica política y literaria.' On the fall of that government he went to Chili, where for some years he directed an educational establishment bearing the name of the 'Chilian Lyceum,' and edited in conjunction with Don José Pasmaman the 'Mercurio Chileno,' an amusing periodical unconnected with politics. In Chili he was under-secretary of state, and he drew for the Congress the present constitution of that state. Being an ardent free-trader, he availed himself of his influence on the Chilian government to establish a free-trade tariff as far back as 1830; and to this liberal move is due the astonishing prosperity of that country and its pacific progress during the last twenty-five years. It is worth mentioning likewise that he was the first person to press on the government of Chili the necessity and policy of paying regularly the English creditors, and it was through his influence that the first remittance of money to Europe for that purpose was made. Another change of affairs drove him to Peru, where he gave a course of lectures on law at Lima, and endeavoured to introduce in another course the Scotch system of philosophy, to which he has always been much attached.

In 1834 he went to Bolivia as private secretary to General Santa Cruz, the president of that republic; and in 1838 he returned to Europe as consul-general of the Peru-Bolivian Confederation at London. It was partly during his residence in South America, and partly on board of English vessels, in which he made several voyages, that he composed his most important poetical work, a volume of 'Leyendas Españolas,' or 'Spanish Legends,' which were published in London in 1840. In 1843 he returned to Spain, residing first at Seville and then at his native city of Cadiz, where he had the direction of the college of San Felipe. A 'Revista Hispánica-Americana,' or 'Spanish and American Review,' on the plan of the French 'revues,' which answer to English 'magazines,' was commenced by him in the year 1843 at Madrid, but was brought to a speedy close by a crisis in the publishing trade, occasioned by the agitations of that year. In 1848 he also edited, for Rivadeneyra's collection of the Spanish classics, the works of Luis de Granada, one of the most celebrated of the four thousand and forty-four religious authors who are enumerated by Nicolás Antonio in his 'Bibliotheca Hispania,' and whose 'Guide to Sinners' has been translated even into Japanese. Towards the end of 1856 Señor de Mora was appointed Spanish consul in London—a post which he occupied once before, and which he held for some years to general satisfaction.

De Mora's merits as a poet have been highly spoken of by Ferdinand Wolff in his 'Floresta de Rimas Modernas Castellanas.' "All his compositions," says the German critic, "display lightness, grace, and elegance; but his talents are displayed to most advantage in the line of satire." Even in the 'Spanish Legends' the tone is often light and sportive, and some of the octaves in 'Don Opas,' as for instance the ludicrous history of the capture of Gibraltar by the English, appear to be modelled on those of Byron's 'Don Juan.' One of the finest passages in the volume is the description of Illimani, a mountain in Bolivia, within sight of which it was written; and the reader feels some regret that the poet has not made more frequent use of the poetical material supplied by his very extended travels. Señor de Mora, it should be mentioned, is a determined advocate of rhyme, and a foe to the 'Asonantes;' the fatal facility of which has, he main-

tains, been of much more detriment than service to Spanish poetry. A volume of his poetry has been lately published at Madrid. To the prose works already mentioned must be added a treatise on 'Castilian Synonymes,' which has received the approbation of the Spanish Academy, of which Señor de Mora is a member.

MORALES, AMBROSIO, a Spanish historian and antiquary, was born at Cordova, in 1518. His father Antonio was an eminent physician, whom Cardinal Ximenez appointed principal professor of philosophy at Alcala, and to whom the Marquis of Priego presented the house which tradition pointed out as the one that Seneca had inhabited, in order, said the donor, that it might become again the dwelling of the wisest Cordovan. Ambrosio had for his maternal grandfather Fernan Perez de Oliva, who left him a valuable source of information in his geographical work, 'Imagen del Mundo.' Another Fernan Perez de Oliva, who was Ambrosio's maternal uncle, and a professor of philosophy and theology at Salamanca, took a prominent part in his education. He was also indebted to Juan de Medina, and to Melchior Cano, two great writers and eloquent professors of divinity of that time, the former at Alcala, the latter at Salamanca, where he was the great antagonist of his eminent colleague Bartholomew Carranza, and a still greater opponent of the Jesuits. This Cano, or Canus, is the author of the excellent treatise 'De Locis Theologicis,' and was a great reformer of the schools, from which he banished many futile and absurd questions.

While yet a youth Morales produced a translation of the Pinax or Table of Cebes. But a religious enthusiasm rose far above all his literary aspirations, and pervaded all his actions. At the age of nineteen Morales became a Jeronymite, when his religious fervour being no longer controllable, in order to secure himself against temptation, he attempted to follow the precedent of Origen. The excruciating pain inseparable from this self-mutilation drew from him a shriek which brought a brother monk to his cell in time to give him effectual aid. In order to obtain a papal dispensation for his conduct, he set out for Rome, but fell into the sea, and was saved, according to his own account, by a miracle. Considering this accident as a warning not to proceed, he joined his friends at court, and lived thenceforward as a secular priest. After the death of his father he became a professor at Alcala, where he had, among others, Guevara, Chacon, Sandoval, and the first Don Juan of Austria, among his pupils. He sustained the high literary credit of his family by his investigations into the antiquities of Spain. He began to collect materials in 1541, and to arrange them in 1560. On the death of his friend Florian de Ocampo, he obtained the vacant place of royal chronicler; but his first appearance as an author was in defending the historian Zurita. When the relics of Justus and Pastor were translated to Alcala, Morales was called upon to record that event and the ceremony on the occasion, together with the martyrdom of those saints. On the death of the chronicler Castro, he was sent to inspect his papers, as belonging in virtue of his office to the king. The following year he had to examine the Codex Albedensis, which was a collection of councils given to Philip II. by the Conde de Buendia. At the death of the Bishop of Plasencia, the collector of manuscripts for the Escorial, Morales succeeded him in that office, which he exercised with zeal and discrimination. He made indices to his fresh acquisitions, such for instance as the Codex Emilianensis, another collection of councils.

In the meantime he extended the 'Coronica general de España,' which Ocampo had carried no further than the death of the Scipios. After he had continued the history to the end of the Gothic period, Morales was sent to Leon, Galicia, and Asturias, to examine sepulchres and temples, archives and libraries: he collected much curious matter, which was published from the original manuscript in the Escorial, by the antiquary Florez in 1765, and has been since inserted in the complete collection of Ambrosio's works, Madrid, 1791-92. It was important to explore all those places, in which alone information could be obtained as to the restoration of the Gothic kingdom, and the centuries immediately following; papers and documents belonging to less ancient times might be found everywhere, since by the reconquest of Toledo the Moors were soon driven to southern Spain. In his seventieth year (1588) Morales finished the third volume of his history, which completed the work to 1037. By way of relaxation he printed a volume of the works of his uncle Fernan Perez de Oliva; and he inserted at the end of it fifteen essays of his own, his juvenile version of Cebes, and an exposition of Don Juan of Austria's device. The Inquisition suspended the publication of this book till certain passages in his uncle's works should be corrected, but as the Inquisitors neglected to make the corrections, the work remained unpublished. The late editor of Morales had a copy before him; and the pieces of Morales himself are included in the last and the only complete edition of his writings. In his seventy-second year he recast his favourite manual, 'Arte para servir a Dios,' the production of an unlettered Franciscan, Alonso de Madrid, adhering however as closely as he could to the mode in which the subject had been treated. In spite of its religious merits, Morales could not help wishing the work had been in better Spanish, and accordingly he undertook the labour of amending the language. He died in 1591, in his seventy-eighth year, and was buried at Cordova pursuant to his directions. Cardinal Sandoval, his pupil, erected a fine monument to his memory, which was not completed till after his own death. Southey has expressed

a high opinion of the works of Morales, though he blames at the same time his religious enthusiasm.

Ambrosio is the Leland of Spain, but, happier than Leland, he lived to make use of the materials which he collected, and he brought down the history of his country from its early Roman period (where Ocampo had left off) to the middle of the 11th century. He accomplished this task with great fidelity and industry, though the reader may smile at his credulity. There is perhaps no historian whose personal character is better developed in his works, a circumstance which gives them a particular interest. Although any good historian of Spain must be more indebted to Morales than to any of his predecessors, it has been wrongly supposed that Garibay drew much from Morales. Estevan de Garibay y Zamalloa wrote first, and Morales himself praises Garibay's diligence in consulting documents, and commends the good use which he made of them. This testimony is honourable both to Garibay and Morales, since both had pursued the same course of research among the archives and the deeds belonging to monasteries and churches.

MORALES, CRISTOBAL, or CRISTOFORO, a great Spanish singer, who, about the middle of the 16th century, became the most eminent composer at the Roman Pontifical chapel. His masses and other sacred musical works were standard compositions till they were superseded by those of Palestrina, who followed soon after.

MORALES, LUIS, surnamed "El Divino," from having devoted his pencil exclusively and most successfully to sacred subjects—in which respect however he is far from standing alone among the numerous Spanish painters—was born at Badajoz about the year 1509. His paintings of Saviours and Magdalens exhibit the extreme of human suffering endured with a celestial meekness. The same works badly imitated, or rather caricatured, by his son and several scholars, have created a prejudice against Morales, such performances having been imputed to him either ignorantly or wilfully. Thus Pacheco (*'Arte de la Pintura'*) considers him as a man who had a reputation which he did not deserve. Also Palomino, by whom Bryan (*'Diet. of Paint.'*) has been misled, has affirmed that Morales never drew the human figure at full length. He must have done it however in some cases, according to the description of Morales's principal works given by the industrious Cean Bermudez (*'Diccion. de Profesor. de Bell. Art. en España'*). This tasteful and judicious critic moreover finds in Morales correct design, knowledge of the naked form, a fine gradation of tints, and the most perfect expression of sorrow, or true Christian grief. Philip II., passing through Badajoz on his return from Lisbon, in 1581, relieved Morales, who was then suffering from poverty and old age, with a yearly pension of 300 ducats. He thus made some slight amends for having dismissed him, and refused to employ his talents at the Escorial, after Morales had gone there by the king's express command. Morales died at Badajoz at a very advanced age, in 1586.

MORATIN, NICOLAS FERNANDEZ (the elder Moratin), was born at Madrid in 1737. Coming shortly after the poetical reformers Luzan and Montiano, Nicolas Moratin became the practical reformer of the Spanish theatre in the last century. His comedy *'La Pelmestra'* contains some fine passages, but wants comic power. In his tragedy of *'Lucrecia'*, which has greater merit, the style is not always adapted to the dignity of the subject. Neither of these pieces was performed; such was the prejudice against what was denominated French taste. Moratin's three discourses, *'Desengaños al Teatro Español'*, drove from the stage, with the aid of an injunction from government, the *'Autos Sacramentales'*. Besides remodelling the drama, Moratin was a still more successful restorer of lyric poetry in Spain. His talents and his amiable character gained him the friendship of the learned of the time—the Maestro Flores; the minister Llaguno, the translator of the *Athalie*; the botanist and humanist Ortega; the eloquent Clavijo Fajardo, the translator and annotator of Buffon, and the editor of *'El Pensador'*; the best periodical of that time; his own competitors or rivals, as it were, Montiano, Ayala, Cadahalso, and others—in a word, natives as well as foreigners all sought Moratin's friendship. The Arcadians of Rome gave him the name of Fluminio Thermodoncio as a fellow-member. In 1764 he published periodically some of his light poetry, under the title of *'El Poeta'*. Soon after appeared his didactic poem on the chase, *'La Diana'*, which threw into the shade *El Piscador Salmantino*, Castro, Nito, Cernadas, and many other writers of that class, who were then corrupting the public taste and disgusting the lovers of genuine poetry.

In 1770, through his patron the Conde de Aranda, he overcame the opposition of the anti-reformist performers to exhibiting on the stage his *'Hormesonda'*, a tragedy which is far from being perfect, though it is the best of his dramas. This great effort of Moratin encouraged Ayala to write his *'Numancia destruida'*; Cadahalso, his *'Sancho Garcia'*, and Huerta, his *'Raguel'*, in order to support tragedy in her new garb on the Spanish stage. From a like impulse the *'Hacer que hacemos'*, *'El Señorito Mimado'*, and *'La Señorita mal criada'* of young Thomas Iriarte or Yriarte, and *'El Delincuente honrado'* of Jovellanos, advanced that reform in comedy which Moratin's son Leandro accomplished. Moratin wrote another tragedy, *'Guzman el Bueno'*, which contains several fine passages, but it was not performed.

LEANDRO, son of too retired habits to make his way in the world,

totally helpless when brought among place-hunters, Moratin never importuned the great, not even those to whom he had free access. He asked nothing, and he got nothing. He practised the law merely for the sake of providing for his wife and son. From this uncongenial labour he was at last released by his friend Ayala, who, quitting Madrid for the benefit of his health, selected Moratin as the person best qualified to fill his chair of Poetics, a situation for which these two friends had before been competitors. A poet is hardly at home in the field of practical utility. However, by a *'Memoir on the means of encouraging Agriculture in Spain without injuring the breed of Cattle'*, Moratin attracted the attention of the Economical Society of Madrid, and soon became an active member of it. He always refused to make any application to the Spanish Academy and to that of History to become a member of those bodies. "What absurdity," he once wrote to Llaguno, "to compel an aspirant to literary honours to beg for them, just as a person wanting a place in the Excise has to petition for it." Accordingly his beautiful canto, *'Las Naves de Cortés'*, passed unnoticed when the Spanish Academy crowned a much inferior composition of José Vaca de Guzman. He died at Madrid in 1780.

Many of Moratin's prose writings, and the whole of his interesting correspondence with Bayer, Conti, Llaguno, Cadahalso, and others, have been lost in consequence of repeated searches and seizures of the family papers in Ferdinand's reign. Among them was perhaps his *'Historical Letter on Bull-fights'*, proving them to be not derived from the Romans, but peculiar to Spain. This work however is not mentioned by his son Leandro Moratin, in the biographical notice of his father, which he prefixed to the *'Obras Postumas de Don Nicolas Moratin'* (Barcelona, 1821, and London, 1825). This edition is founded on a collection of the author's poetry, which he himself gave in a corrected form, a few months before his death, to his friend Bernascone. Interspersed in it are the following pieces, which have particular merit;—*'Las Naves de Cortés'*, *'Amor y Honor'*, *'Don Sancho en Zamora'*, *'Abdelcadir y Gathana'*, *'Con suelo de una Ausencia'*, *'Fiestas de Toros en Madrid'*, *'La Empresa de Micer Jaques Borgofon'*. There is a collection of Dramas and other works of Moratin, but it is a very rare book.

MORATIN, LEANDRO FERNANDEZ, son of the preceding, a greater dramatist than his father, and also one of the Arcades of Rome under the poetical appellation of Inarco Celenio. He was born at Madrid, on the 10th of March, 1760, began to versify at six or seven years of age, and obtained at the age of eighteen a second prize or *'accesit'* from the Spanish Academy for his heroic poem entitled *'Toma de Granada'*. In order to obtain this precocious success, he secretly availed himself of the few leisure moments which he could steal from the mechanical occupation of a jeweller, to which his father had bound him, in order to divert his mind from poetry, and save him from the evils of poverty. Fortunately, the daily wages of eighteen reals (about 8s. 6d. of our money), which he gained by his humble occupation, enabled him, after the early loss of his father, to support himself and his mother. But soon losing her also, Moratin joined an uncle, who was a jeweller of the king, without however discontinuing his intercourse with the learned, such as Melon, and Fathers Estala and Navarrete. Directed by these distinguished individuals, his muse was further encouraged by the above Society with another *'accesit'* for his *'Leccion Poetica'*, a satire, as it was required to be by the academical programme, against poetasters. It is in fact a short *'Ars Poetica'*, far more methodical and critical than the previous metrical compilation of rules by Juan de la Cueva, but it was superseded in its turn by the more appropriate and didactic *'Poética'* of Martínez de la Rosa, in 1827.

At the suggestion of Jovellanos, Moratin became secretary to Cabarrus, who was sent, in 1786, by the Spanish government to Paris. On his return in 1789, the young poet chastised, in witty prose, the intruders into Parnassus, in his anonymous *'Derrota de los Pedantes'*, written in the fashion of the *'Viage al Parnaso'* of Cervantes. In the same year, the minister Floridablanca rewarded his ode to the new king, Charles IV., with a small pension; but he was at last raised to independence by a much greater patron, *'El Principe de la Paz'*,—Godoy. To Moratin's credit, it ought to be remembered, that he never kicked, as so many did, the fallen political lion.

In 1790 he brought out on the stage his play of *'El Viejo y la Niña'* (which shows the consequences of great disparity of age in marriages), his first and most felicitous drama. In 1792 followed *'La Comedia Nueva'*, or *'El Café'*, a very comic satire against stage absurdities and bad taste. About this time Moratin travelled through France, England, Belgium, Germany, Switzerland, and Italy, both to observe society and the art of reflecting it on the stage. He returned in 1796, and in 1798 he published his translation of Hamlet, which is a complete failure. More fortunate afterwards, he produced in 1803 *'El Baron'* (or the Impostor), which though not one of his best performances, eclipsed the similar piece of *'La Lugareña orgullosa'*; in 1804, *'La Mogigata'* (a hypocritical young lady preparing herself for the cloister in order the better to carry on her intrigues); in 1806, *'El Si de las Niñas'*, the subject of which also is a female who defeats all her mother's attempts at restraint, and the object of her previous instructors. It was represented twenty consecutive days, reprinted four times in the same year, and afterwards translated into many languages.

Elated by his popularity, Moratin was preparing some new pieces, when the suspicions of the Inquisition checked his ardour. Although powerfully shielded by Godoy, his 'Escuela de los Maridos,' Molière's 'Ecole des Maris' (admirably adapted to Spain and modern times), was not represented till the 17th of March, 1813, under Joseph Bonaparte, who made the author chief royal librarian. On the restoration of Ferdinand in 1814, Moratin's property was seized, and himself reduced to actual starvation. Still, before the close of that year, friendship and gratitude, the prominent features of his character, induced him to prepare, for the benefit of the actor Blanco of Barcelona, 'El Médico á Palos,' a piece which was modelled, with proper adaptations, on Molière's 'Médecin malgré lui.' Beloved as he was in that city, the dread of official and concealed persecutors made him leave it in 1817 for Paris, where he lived with his early friend Melon, till the restoration of the popular Spanish constitution in 1820, when he returned to Barcelona. After editing there his father's works in 1821, as stated in the previous article, he left that city again on account of the yellow fever, and went to join his friend Silvela at Bordeaux. He now devoted himself exclusively to the improvement of his own 'Origenes del Teatro español,' a work of vast and rare erudition and research, but which is discontinued by the author just before the appearance of the exuberant Lope de Vega and his prolific school. At the end of 1825 Moratin's health began to decline. Accompanied by Silvela, he returned in 1827 to Paris, where he died on the 21st of June 1828, and was buried near Molière's monument in Père la Chaise.

Although a lyric poet of equal genius and more taste than his father, and though he had the credit of having improved the blank verse (*verso libre*) so suitable to the Spanish ear, and of having moreover used new combinations of metres and rhymes, Moratin did not consider himself entitled to the double title of a lyric and dramatic poet. A severe correctness, an excessive caution against all flights of imagination, and a strict submission of all other powers to the control of judgment, deprived L. Moratin of that originality and freedom which are necessary for one who would aspire to be a first-rate poet. Instead of intricacy, the great object of former dramatists, L. Moratin was poetically fond of simplicity, as an element of beauty. Moreover, it was by constant observation in the ranks of middle life that he attained the power of correctly representing the faults and feelings which characterise that class of society. It would be out of place here to touch on the dispute between the classical and romantic schools, in which the two Moratins were involved. Several editions of both the poetical and dramatic works of Leandro Moratin have been published.

MORCELLI, STEFANO ANTONIO, born at Chiari, near Brescia, in 1737, studied at Rome, entered the Order of the Jesuits, was sent to Ragusa, and afterwards returned to Rome, when he was made Professor of Rhetoric in the Roman College. After the suppression of the Order of the Jesuits in 1773, he became librarian to Cardinal Alessandro Albani, and then wrote his work 'De Stilo Inscriptionum Latinarum Libri III.,' Rome, 1781. In 1790 he was elected Provost of the Chapter of his native town, Chiari, where he busied himself in doing good to his townsmen, and for their sake he afterwards refused the see of Ragusa, which had been offered to him. He founded an institution for the gratuitous education of young girls; he gave in his life-time his own select library to the town of Chiari; he repaired and embellished the churches of the same town, and was very charitable towards the poor. He died at Chiari, in 1821. Besides his work on inscriptions already noticed, he wrote: 1, 'Inscriptiones Commentariis subjectis.' 2, 'Parergon Inscriptionum Novissimarum.' 3, 'Kalendarium Ecclesie Constantinopolitane cum Commentariis illustratum,' from an ancient manuscript anterior to the schism between the Eastern and Western churches. Morcelli translated the manuscript from Greek into Latin, adding his own commentaries, and rendering it a valuable work on church history. 4, 'Explanatio Ecclesiastica Sancti Gregorii.' This Gregory was one of the earliest bi-hops of Agrigentum. 5, 'Africa Christiana,' 8 vols. 4to, Brescia, 1816. This is another important work on church history, from A.D. 197 till A.D. 697. It may be styled the *Fasti* of the Christian Churches in Northern Africa.

Morcelli's works on Inscriptions have been collected and published together: 'Opera Epigraphica,' 5 vols. Padua, 1813-25, and Professor Schiassi has added to them a 'Lexicon Epigraphicum Morcellianum,' in Latin and Italian. Morcelli wrote also a book of epigrams—'Electorum Libri II.,' and various dissertations on Roman antiquities.

MORDAUNT, CHARLES, EARL OF PETERBOROUGH, a nobleman famed for his romantic exploits in the war of the Spanish Succession, as well as for his lettered tastes and personal eccentricities, was the son of John lord Mordaunt, whom he succeeded in his title and estates. He was born in 1658. In his boyhood he served in the navy; but afterwards exchanged that profession for the army, and was present in 1680 at the siege of Tangier. He first obtained historical notice however by the decided part which he took in politics, during the reign of James II., against the despotic government of that king. Passing over to Holland, he attached himself to the Prince of Orange, upon whom he warmly urged the project of the expedition to England; and, on its success, was immediately created, in 1689, Earl of Monmouth, a title which he subsequently exchanged for that

of Peterborough, as the heir of his uncle, second earl of the latter name. Of the questionable though comparatively unimportant share of the new earl in the political transactions of the reign of William III., a full account may be collected from Bishop Burnet's 'History of his own Time,' but it was only after the opening of the Spanish Succession war that he obtained a more creditable field of action, by his appointment, in 1705, to the command of a naval squadron and body of 5000 English and Dutch land forces, with discretionary powers to act on the coasts of Spain and Italy. Receiving on board his fleet at Lisbon the Archduke Charles of Austria, claimant of the Spanish crown, he sailed to the eastern coast of the Peninsula, and entered on a career of daring and successful adventure unparalleled in modern warfare. The capture of Barcelona, the reduction of Valencia, and the gaining over of all the eastern parts of Spain to the cause of the archduke, were among the fruits of his brilliant successes; and there can be little doubt that, if his plans had been followed, Charles might have been seated, for a time at least, on the throne of that kingdom. But the conduct of Peterborough himself was intolerably overbearing and arrogant; and his real services, as well as his presumption, rendered him an object of envy and dislike to the archduke and the other allied commanders. When therefore at length Peterborough petulantly resented the repeated neglect of his counsels, by declaring his intention of quitting Spain, Charles showed an ungrateful readiness to be rid of him.

The remainder of his public life was chiefly passed in hurrying from one court to another, so that he was humorously said to have "seen more kings and more postillions than any man in Europe." This spirit of locomotion however was anything but harmless: it engaged him in negotiations for which he had often no authority, and led him frequently to sow the seeds of intrigues, the more dangerous as they were supported by his singular talents, and were designed only to minister to a love of action and of personal display as reckless as his vanity was insatiable. In the struggle of parties, during the last days of Queen Anne, Peterborough, through hatred to Marlborough, sided violently with the Tories, and received the order of the Garter and other dignities and offices. On the accession of George I. therefore he had rendered himself too obnoxious to the Whigs to be employed in public business during their ascendancy; and the remainder of his existence (he died October 25, 1735) was distinguished only by his affectionate intimacy with some of the most eminent literary men of his age—Pope, Swift, Prior, Atterbury, Berkeley, and others.

Gay, volatile, and generous to profusion, and with a mind as full of careless wit and negligent grace as of chivalric courage, ingenious expedient, and adventurous stratagem, Peterborough was equally fitted to dazzle in society and in the field. But, both for civil and military life, his qualities were more brilliant than solid; his best actions were the result of an inordinate passion for fame; and, in the gratification of this pursuit, his means were as unscrupulous as his appetite was greedy. With strong impulses of patriotic feeling therefore he was often regardless of his country's good; with the persuasive faculties of a diplomatist, he wanted the dignity and consistency of a true statesman; and with undoubted genius for war, he displayed the qualities of an admirable partisan rather than those of a great general.

A lively sketch of the character of Peterborough will be found in Horace Walpole's 'Catalogue of Royal and Noble Authors,' which may be compared with that drawn by Lord Mahon ('Hist. of Eng.,' vol. i. c. x.). The political and military actions of his life are to be gathered from Burnet's 'History of his own Time;' from the 'Account of the Earl of Peterborough's Conduct in Spain,' by his physician, Dr. Friend; and from Captain Carlton's 'Memoirs.' A full account of his whole career is contained in the modern compilation of the 'Lives of British Military Commanders.'

MORE, HANNAH, was born in 1745, and was the daughter of a village schoolmaster, one of the humbler persons of his class, who had the care of the charity-school at Stapleton, near Bristol, but who, some time after the birth of his daughter Hannah, removed to Bristol, where he had a private school. There were other daughters, and the family soon began to be taken notice of as one in which there was a display of talent that was unusual; so that some exertions were made by persons to whom they were known, and the sisters became early in life established in a school for the education of girls, which continued for many years the most flourishing establishment of the kind in the west of England.

Hannah was from the beginning the most remarkable of the group. She wrote verse at a very early age, and in 1773 was prevailed upon to publish a pastoral drama, which was entitled 'The Search after Happiness.' In the next year she published a regular tragedy on the story of Regulus, and two tales, in verse, and her turn being then thought by her friends to incline to the drama, means were taken to obtain an introduction for her to Garrick, by whom she was very kindly received. This introduced her to the acquaintance of Dr. Johnson, Burke, Sir Joshua Reynolds, and other persons who at that time formed what was considered the best literary society of London. During this period of her life she produced two tragedies, 'Percy' and 'The Fatal Falsehood,' with other poems.

Such was the beginning of the life of Mrs. Hannah More. But

educated as she had been with a deep impression of the truths of the Christian religion, the life which she now led began to appear to her as something unlike that which befitted a creature with such glorious prospects before it as those which Christianity opens to man. She therefore determined on forsaking the drama and retiring from London to devote herself to a life befitting better, as she thought, the child of God and heir of immortality. In this her transitive state she produced her 'Sacred Dramas,' a publication more favourably received perhaps than her former works. By the year 1786, when she was full forty years of age, she had effected her plan for retiring into the country. She chose the part of the kingdom, Gloucestershire and Somersetshire, in which she had been best known in her youth, and there the rest of her long life was passed in circumstances made easy by the profits of her various publications, which were considerable, and in the enjoyment of the pleasures which arise from literary exertion, and from efforts to raise the condition, by means of education, of the labouring population.

We cannot undertake to enumerate all the publications of Mrs. More, in this the larger of the two portions into which her life may be divided. But we shall mention the chief of them. The work in which the serious turn which her mind had taken first manifested itself was her 'Thoughts on the Manners of the Great,' 1788, which was followed in 1791 by her 'Estimate of the Religion of the Fashionable World.' In 1799 appeared her 'Strictures on the Modern System of Female Education.' Not long after the appearance of this work there was an intention, which Porteus, then bishop of London, is supposed to have greatly promoted, of committing to her the education of the Princess Charlotte of Wales. This however was not effected, but it led to the publication of her 'Hints towards forming the Character of a young Princess,' 1805. Then came what has perhaps been her most popular work, 'Cœlebs in Search of a Wife,' very entertaining as a novel, and full of shrewd remarks on men and manners, and in which we find fully displayed the kind of character which, to the mind of Mrs. More, it appeared desirable that our young countrywomen should possess. In 1811 her 'Practical Piety' appeared; in 1812 her 'Christian Morals'; in 1815 her 'Essay on the Character and Writings of Saint Paul.' We ought not to omit that she was the writer of one of the first of what were called the 'Cheap Repository' tracts. She called it 'The Shepherd of Salisbury Plain.' It may be regarded as, if not the best, one of the best of its class.

Age had now come upon her with some of its infirmities. In 1828 she left Barleywood, the place in which many years had been spent, and took up her abode at Clifton. Here she continued till her death on the 7th of September 1833, with very many to honour her and many also to love her; who looked up to her as one of the great reformers of the manners of English society, one who had asserted very successfully the right of Christianity, or, in other words, the right of the Christian scriptures, to have a larger share than it had been wont to allow them, in forming the character and directing the course of human beings while in this state of their probation. 'The Memoirs and Correspondence of Mrs. Hannah More, by William Roberts,' were published in 4 vols. 8vo, in 1834. A collected edition of her works has been published in 11 vols. 8vo.

MORE, HENRY, was born at Grantham, in Lincolnshire, in the year 1614. He was sent to Eton, and afterwards to Christ's College, Cambridge, which he entered at the age of seventeen. At college he devoted himself with great zeal to the study of philosophy. He says himself, "I immersed myself over head and ears in the study of philosophy, promising a most wonderful happiness to myself in it." Dissatisfied with all other systems, he found rest for his mind only when he came to the writings of Plato; whence, as he tells us, he learnt that something better and higher than the knowledge of human things constitutes the supreme happiness of man, and that this is attainable only through that purity of mind and divine illumination which raise him to a union with God.

More took his degree of B.A. in 1635, and of M.A. in 1639. He published in 1640 his 'Psychozoa, or the First Part of the Song of the Soul, containing a Christiano-Platonical Display of Life' which was reprinted in 1647, and, together with some additional pieces, published under the title of 'Philosophical Poems.' He had been elected in the meantime a fellow of Christ's College, and he continued to reside there, performing the duties of a private tutor. His next published work was the 'Conjectura Cabalastica,' written, it is said, at the request of Lady Conway, a Quaker lady, with whom he had formed an intimate friendship, and who at her death left him a legacy of 400*l*. He refused in 1654 the office of the mastership of his college, when his friend Cudworth was consequently elected. He refused also many offers of church preferment, limiting his desires to a life of quiet at Cambridge, and to the pursuit of philosophy. He was one of the first fellows of the Royal Society. He died in 1687, in the seventy-third year of his age.

More's chief works, in addition to those which have been mentioned, are—'The Mystery of Iniquity,' 'A Key to the Revelations,' 'Enchiridion Ethicum,' 'Enchiridion Metaphysicum,' 'An Apology for Descartes,' and 'The Immortality of the Soul.'

"More was strongly under the bias of the opinion so common among his contemporaries, that the wisdom of the Hebrews had been transmitted to Pythagoras, and from him to Plato; and consequently

that the true principles of divine philosophy were to be found in the writings of the Platonists. At the same time he was persuaded that the ancient Cabalistic philosophy sprung from the same fountain, and therefore endeavoured to lay open the mystery of this philosophy by showing its agreement with the doctrines of Pythagoras and Plato, and pointing out the corruptions which had been introduced by the modern Cabalists. The Cartesian system, which sprung up at this time, was embraced by More, as on the whole consonant to his ideas of nature; and he took much pains to prove that it was not inconsistent with the Cabalistic doctrine. His penetrating understanding however discovered defects in this new system, which he endeavoured to supply. In short the writings of this great man, though not without a deep tincture of mysticism, are eminently distinguished by profound erudition, an inventive genius, and a liberal spirit." (Enfield's 'Hist. of Philosophy,' b. viii., c. 3, s. 3.)

MORE, SIR ANTONY. [MORO, ANTONI.]

MORE, SIR THOMAS, born in Milk-street, London, in 1480, was the son of Sir John More, one of the justices of the Court of King's Bench. He was educated at St. Anthony's School in Threadneedle-street, under Nicholas Hart, a person of some celebrity in his day; and about his fifteenth year was placed, according to the custom of the times, in the house of Cardinal Morton, archbishop of Canterbury, where he became known to Colet, dean of St. Paul's, who used to say, "there was but one wit in England, and that was young Thomas More." In 1497 More went to Oxford. He had rooms in St. Mary's Hall, but carried on his studies at Canterbury College (afterwards Christ-church). Here under Grocyn he studied Greek, which was then publicly taught in the university, though not without great opposition. During his residence at Oxford he first became acquainted with Erasmus, who resided there during the greater part of 1497 and 1498, and formed an intimate friendship with More, which continued during the whole of his life. It was also at Oxford that the greater number of his English poems were composed, which, though deficient in harmony and ease of versification, are spoken of by Ben Jonson as some of the best in the English language.

After More left Oxford he prosecuted the study of the law, first at New Inn, and afterwards at Lincoln's Inn, and soon acquired great celebrity for his legal knowledge. He was appointed reader at Furnival's Inn, where he delivered lectures on the law for three years; and about the same time he also delivered lectures at St. Lawrence's church in the Old Jewry, on the work of St. Augustine, 'De Civitate Dei.' More was always fond of theology, and for some time thought of taking orders; but he finally relinquished this intention, and was called to the bar, though at what time is uncertain. More appears to have soon acquired an extensive practice. He was appointed one of the under-sheriffs of London, which at that time was an office of considerable importance, since the under-sheriff was judge of the sheriff's court, which then possessed far greater jurisdiction than it does at present. More was considered one of the most eloquent speakers of his day; and his reputation became so great towards the latter part of the reign of Henry VII., that it is said that there was no case of consequence before any court of law in which he was not engaged as counsel. About the same time he was elected one of the burgesses of parliament, in which he opposed a subsidy which had been demanded by Henry VII. for the marriage of his eldest daughter. In consequence of this opposition More incurred the displeasure of Henry VII., a prince who never forgave an injury; and had not the king died soon afterwards, More had determined to leave the country.

After the accession of Henry VIII., More was called upon to take a still more active part in public affairs. In 1514 and 1515 he was sent, in conjunction with Tunstall, master of the rolls, and afterwards bishop of Durham, to Bruges, on business of considerable importance. In 1516 he was made a privy-councillor, and received from Henry marks of the greatest favour. So great a favourite had he become, that the king used frequently to come to his house unexpectedly, and spend the day with him.

About this time More composed his 'History of Richard the Third,' and his 'Utopia,' the work by which he is most known to modern readers. The 'Utopia' is written in very good Latin, and was published first at Louvain in 1516, and afterwards at Basel in 1518. The object of this work was to delineate More's ideas of a perfect commonwealth, which is placed in the imaginary island of Utopia. The society which is supposed to exist in this island is constructed on the principle that no one in the state shall have a right to separate property, since separate property is said to involve the unequal distribution of property, and thus occasions great suffering to those who are obliged to labour, and mental deprivation to those who live on the labours of others. It is difficult to determine whether the opinions expressed in the 'Utopia' are to be considered as More's real sentiments.

In 1519 More resigned his office of under-sheriff, and in 1521 he was knighted, and made treasurer of the Exchequer. He was frequently employed by Henry in various public missions to France and the Netherlands; and he bitterly complains to Erasmus, in many of his letters, of being obliged to leave his friends and his books to discharge what were to him the most disagreeable commissions. In the parliament which met in 1523 More was chosen speaker, and in the discharge of his duties he offended Wolsey, who endeavoured to injure him in the king's opinion. Henry however still continued

to show the greatest marks of favour to More, and, as a proof of his esteem, appointed him, in 1525, chancellor of the duchy of Lancaster.

On the downfall of Wolsey, More was made chancellor, on the 25th of October 1529. He discharged the duties of his new dignity with the greatest impartiality and integrity, and was never accused by his bitterest enemies of any corrupt exercise of power. The only charge ever brought against him was first promulgated by Fox, in his 'Martyrology,' and copied by Burnet, in his 'History of the Reformation.' According to these writers, More was guilty of great cruelty in persecuting the Protestants; but we have, on the contrary, the testimony of Erasmus, that "whilst More was chancellor no man was put to death for these pestilent 'dogmas,' which is confirmed by More's express declarations in his 'Apology,' published in 1533, after his downfall from power, when he was surrounded by enemies, and his assertions, if false, could have been easily contradicted.

More continued chancellor till the 16th of May 1532. Henry had doubtless advanced More to the chancellorship with the hope that he would assist him in his divorce, and marriage with Anne Boleyn, and therefore pressed him strongly for his opinion on the subject. But More was sincerely attached to the Roman Catholic Church; he looked with a certain degree of horror upon a project which was denounced by the supreme head of the Church, and therefore begged Henry to excuse him from giving an opinion. This was granted for the time; but as it was evident that Henry had determined to effect the divorce, and would soon require the active co-operation of his chancellor, More asked and obtained permission to retire from the office. From this time Henry, who never seems to have recollected any former friendship when his purposes were in the least degree thwarted, appears to have resolved upon the destruction of his old favourite. More was originally included in the bill of attainder which was passed against Elizabeth Barton and her accomplices; but his innocence in this case was so clear, that his name was afterwards omitted. The court party however soon found an opportunity of gratifying their vindictive master. By a law passed in the session 1533-4 it was made high treason, by writing, print, deed, or act, to do anything to the prejudice, &c. of the king's lawful matrimony with Queen Anne; and it was also provided that all persons should take an oath to maintain the whole contents of the statute. At the end of the session commissioners were appointed to administer the oath, and on the 15th of April 1534, More was summoned before them to take it. This More declined doing, but at the same time offered to swear that he would maintain the order of succession to the throne as established by parliament. In consequence of his refusing to take this oath, More was committed to the Tower; and in the same year two statutes were passed to attain More and Fisher [FISHER] of misprision of treason, with the punishment of imprisonment and loss of goods. More remained in prison during thirteen months, during which time several efforts were made to induce him to take the oath and also to subscribe to the king's ecclesiastical supremacy; but as he refused to do so, he was, at the end of that time, brought to trial for high treason. He appears to have been indicted under the statute alluded to above, which made it high treason to do anything to the prejudice of Henry's lawful marriage with Queen Anne, and also for refusing to admit the king's ecclesiastical supremacy; and although the evidence against him completely failed, he was found guilty and condemned to death. He was beheaded on the 6th of July 1535, and met his fate with intrepidity and even cheerfulness.

More's character was singularly faultless. His sweetness of temper and amiable disposition are frequently mentioned by his contemporaries. His piety was unaffected and sincere; and it was his love of truth alone which occasioned his death. In private life his conduct was most exemplary; he was a kind husband, an affectionate father, and a faithful friend. Erasmus, who often visited his house, says, that "with him you might imagine yourself in the academy of Plato. But I should do injustice to his house by comparing it to the academy of Plato, where numbers and geometrical figures, and sometimes moral virtues, were the subjects of discussion: it would be more just to call it a school and an exercise of the Christian religion. All its inhabitants, male and female, applied their leisure to liberal studies and profitable reading, although piety was their first care. No wrangling, no angry word, was heard in it; no one was idle; every one did his duty with alacrity, and not without a temperate cheerfulness." (Translated by Sir J. Mackintosh, in 'Life of Sir T. More,' p. 15.) More was married twice; first to Jane Colt, the daughter of a gentleman of Essex, who left a son and three daughters; and afterwards to Alice Middleton, a widow seven years older than himself. The last male descendant of Sir T. More was Thomas More, a Jesuit, who was principal of the College of Jesuits at Bruges, and died at Bath in 1795.

The English works of Sir T. More were collected and published at London in 1557, and his Latin works at Louvain in 1556. His letters to Erasmus are printed in the collection of Erasmus's letters published at London, 1642. His 'Utopia' has been translated into English by Robynson, London, 1551, by Bishop Burnet, and more recently by Arthur Cayley, Lond., 1808.

The Life of Sir T. More has been written by his son-in-law, Roper, who married his favourite daughter Margaret; by his great-grandson T. More; by Hoddeston, London, 1652; by Cayley; and by Sir James

Mackintosh, in 'Lives of Eminent British Statesmen,' published in Dr. Lardner's 'Cabinet Cyclopædia.'

MOREAU, JEAN VICTOR, a general who rose to celebrity in the wars of the French revolution, was born in 1763, at Morlaix in Brittany, of highly respectable parents, who designed him for the legal profession. But at the age of eighteen years, he had conceived such a passion for military service, that he enlisted as a private soldier; and though his father purchased his discharge, and sent him to study law at Rennes, where he soon made himself conspicuous and popular in defending the privileges of the provincial parliament against the government, he never cordially followed this profession. When therefore the Revolution burst forth, his spirit also broke its fetters; and, accepting the command of a volunteer legion of the Breton youth, he joined at its head the army of the North. From that hour he devoted himself so ardently to the science and practice of arms, that he soon attracted the favourable notice of Pichegru, and rose in two years, by his recommendation, to the rank of general of division. In this capacity, in the campaign of 1794, he signally distinguished himself at the head of a separate corps of 25,000 men, by the rapid reduction of several strong places in Flanders. Moreau himself was politically attached to the Girondists: yet, though the Jacobins brought his unoffending father to the guillotine, he continued to serve under the government of that detestable faction until its overthrow.

After assisting Pichegru in the conquest of Holland, Moreau was appointed commander-in-chief of the army of the Rhine and Moselle, and opened the campaign of 1796 by the defeat of the Austrian general Wurmser, whom he drove across the Rhine, and pursued into Germany. The Archduke Charles of Austria, who attempted to arrest his course, met, for some time, with no better success; until the Austrians were so largely reinforced, that Moreau was compelled to yield to numbers, and he then finished this memorable campaign by a masterly retreat through the defiles of the Black Forest, in which, though assailed on all sides by a hostile peasantry, and with a superior army hanging on his rear, he triumphantly fought his way to the Rhine, and covered himself with more glory than by his preceding victories. At the commencement of the next campaign Moreau was placed in a most embarrassing situation, by the discovery, through some intercepted despatches, that his old friend Pichegru was in correspondence with the Bourbon princes. He concealed the fact for four months, until Pichegru had been arrested on other information; when he made a show also of denouncing the plot to the republican government. But he found himself so justly an object of suspicion, that he solicited and obtained leave to retire from the army. His services however were too necessary to be long dispensed with; and he was again actively employed, both in Italy, where he distinguished himself in the campaign of 1799, so disastrous to the French, and also on the Rhine, whither he was recalled to oppose the Austrians.

On Bonaparte's return from Egypt, Moreau proffered and rendered him his services in effecting the revolution of the 18th of Brumaire, and almost immediately afterwards received the command of the armies of the Danube and Rhine; at whose head, at the close of the year 1800, he won from the Austrians the sanguinary and decisive battle of Hohenlinden. The first consul loaded him, on his return to Paris, with eulogy; but Bonaparte and Moreau were each too eager on the same career of ambition to pursue it without dangerous collision. Bonaparte affected to speak of the victor of Hohenlinden as "the retreating general;" Moreau retaliated with bitter justice by terming the first consul "a general at ten thousand men a day." And when he was invited to become a member of Napoleon's new legion of honour, he openly refused, with the contemptuous sarcasm—"The fool! does he not know that I have been enrolled in the ranks of honour these twelve years!"

But the impatient spirit of Moreau was no match for the ascendant genius and fortune of his rival; and in the beginning of 1804 a charge which pretended to implicate him in the royalist conspiracy of Pichegru and Georges Cadoudal was sufficient to decide his fate. He was condemned, without a shadow of evidence, to an imprisonment for two years, which, by his own request, was commuted into banishment. He retired to America, where he lived tranquilly, with his wife and child, for several years, until, in an evil hour for his fame and his fortunes, he accepted, in 1813, a proposal from the Russian Emperor Alexander to assist the allied armies by his counsels against his country. He had scarcely arrayed himself in their ranks when he was mortally wounded at the battle of Dresden, and died in a few days, after bearing the amputation of both legs without a groan.

MORELL, THOMAS, was born at Eton in 1703. He studied first at Eton College, then at Cambridge, where he became a fellow of King's College, and in 1743 took his degree of D.D. He was a distinguished classical scholar; he edited several tragedies of Æschylus and Euripides with notes, and made English translations of the 'Prometheus' of the former, and of the 'Hecuba' of the latter. He also edited improved editions of the Greek Lexicon of Hederich, and of Ainsworth's Latin Dictionary. His other works are—1, 'Thesaurus Græcæ Pœsæ, sive Lexicon Græco-Frosodiacum,' 4to, 1762; republished since, with considerable additions, by Dr. Maltby, Cambridge, 1815; 2, 'Annotations on Locke's Essay on the Human Understanding,' 8vo, 1793; 3, 'A Sermon on the Death of Queen Caroline,

consort of George II., 8vo, 1739, and other Sermons. Dr. Morelli died February 19, 1784.

**MORELLI, COSIMO**, an Italian architect of considerable note among those of the last century, was born at Imola in 1732. He was the son of Domenico Morelli (an architect also), and studied under Domenico Trifogli, who executed several works of merit at Imola. It was Cosimo's good fortune to obtain powerful patronage at the very outset of his professional career—first, that of Gioan-Carlo Bandi, bishop of Imola, for whom he made designs for rebuilding the cathedral of that city, and through him, that of his nephew Giovanni Antonio Braschi, who was elevated to the papal throne in 1775, with the name of Pius VI. The new pontiff, who entertained a personal regard for Morelli himself, almost immediately appointed him city-architect at Cesena (the pope's native town), and among various other commissions commanded from him designs for a new sacristy at St. Peter's. If that and some other projects were not realised, the designs themselves obtained universal though transitory admiration. Yet, as far as mere employment and number of works go, Morelli had no reason to complain—rather to consider himself favoured beyond most of his contemporaries, as will appear from an enumeration of the principal structures executed by him, namely, the cathedral of Imola, the metropolitan church at Fermo, the duomo at Macerata, and the conventual church at Fossombrone, St. Petronio at Castel Bolognese, a church at Barbiano, that of the nuns of St. Chiara at Imola, and St. Maria in regolia in the same city, and another church at Lugo, also some alterations in the metropolitan church at Ravenna. It happens too, rather singularly, that Morelli was almost as much employed in theatrical as in ecclesiastical architecture. The buildings of this class erected by him are—the theatre of Imola (destroyed by fire a few years afterwards, but preserved in the volume of engravings of it published in 1780), Fermo, Jesi, and Osimo; also that of Ferrara, which is confidently claimed for him by some, although Foschini was employed upon it. [FOSCHINI, ANTONIO.] Besides the above works, he built the Palazzo Braschi at Rome, the Anguisola at Piacenza, the Berio at Naples, and the Cappi at Bologna; and the façade of the Ridotto at Cesena, and the hospital at Imola, the façade of the Palazzo Pubblico, and the Palazzo Vescovile. He would probably have done more, but for the unpropitious state of things in Italy for architecture towards the close of his life. He died, after a severe paralytic attack, in February 1812. (T. Papotti, in *Tipaldo's Biographia*.)

**MORELLI, GLA'COMO**, one of the most distinguished librarians of modern times, was born at Venice on the 14th of April 1745. He was the son of poor parents, who were unable to give him a liberal education. It was against their will that he resolved to enter the church, although in all other respects he always showed the greatest deference to their wishes. He afterwards supplied the deficiencies of his education by private study; and the knowledge which he thus acquired was more substantial and extensive than that of any of his Italian contemporaries, though it was not till late in life that he became acquainted with the Greek and French languages. At an early period he pursued his private studies in the library of the family of the Zaniani, and his unremitting perseverance attracted the attention of the librarian de Rubois, who soon became his adviser and faithful friend. After having read through the greater part of that library, his avidity to acquire knowledge led him to examine the other libraries of his native city to which he could gain access. His love of independence induced him to refuse several very advantageous offers that were made to him both by the church and by wealthy collectors of books at Venice, and he continued to live as a simple abbé. He formed however an intimate friendship with the patrician Farsetti, of whose rich collection of manuscripts he published a catalogue, under the title of '*Biblioteca Manuscripta del Bali T. G. Farsetti*,' Venice, 1771-80, 2 vols. 12mo. While this work was in course of publication he also wrote '*Dissertazione Storica intorno alla Publica Libreria di S. Marco*,' Venice, 1774, in which he discussed and solved a great many questions connected with the history of literature. He then prepared a similar work on the history of the library of the academy at Padua, whither he had accompanied his friend Farsetti; but the materials which he collected for that purpose were unfortunately left in the hands of Colle, the historiographer of that institution, through whose carelessness they were lost. In 1776 he published a catalogue of the manuscripts of ancient writers which were in the library of the Narni family; and somewhat later a catalogue of the manuscripts of Italian works contained in the same library. These works alone would have sufficed to secure to Morelli an honourable place among the eminent bibliographers of modern times; but he acquired a still greater reputation as librarian of the library of St. Mark—an office which he received in 1778, and which he held until his death, which happened on the 5th of May 1819. He devoted himself with the greatest zeal to the completion and arrangement of that famous library; but during the French rule in Italy he had, to his great vexation, to superintend the removal of the library from its venerable ancient building to a new one, the splendour and convenience of which however consoled him in some measure for the loss of the former building. In 1795 he discovered a considerable fragment of the 55th book of Dion Cassius, which he published at Bassano, together with new various readings of other books of the same historian. This little work was afterwards (in 1800) republished

at Paris, uniform with Reimar's edition of Dion Cassius. The work which exhibits his extensive knowledge and his critical acumen in the strongest light is his '*Bibliotheca Manuscripta Græca et Latina*,' of which however only one volume was published at Bassano (1802), although he had collected materials for several more volumes. His last production was '*Epistolæ Septem varis Eruditionis*,' Padua, 1819. Abbé Morelli is acknowledged by all who had occasion to visit the library of St. Mark during the time that he was at the head of it, to have been the most amiable, kind, and obliging person, and his vast learning was equalled only by his extraordinary modesty. After his death there appeared '*Operette ora insieme con Opuscoli di Antichi Scrittori*,' Venice, 3 vols. 8vo, 1820. (Bettio, *Orazione recitata nelle solenne Esquie nella Chiesa Patriarcale di Venezia*, Venice, 1819.)

**MORERI, LOUIS**, born in Provence in 1643, studied at Aix and Lyon, and became doctor of divinity. He conceived the idea of compiling a universal Dictionary, biographical and geographical; for the accomplishment of which he had collected a considerable stock of literary information. He knew also several languages, and was assisted by several friends, who procured him materials for his work, which he published in 1671, in 1 vol. folio, '*Grand Dictionnaire Historique et Critique de Louis Moreri*.' Although its contents are miscellaneous, the biographical part, both in respect of quantity and execution, exceeds the rest. Moreri's Dictionary may be considered as having suggested the idea of subsequent biographical dictionaries. Moreri undertook a new and enlarged edition of his Dictionary, of which he published the first volume, but the second was not entirely printed when the author died in 1680. His constant application hastened his death.

Numerous editions of his Dictionary, considerably altered, revised, and enlarged by several editors, among others by Leclerk and Bayle, have appeared; the last is that of Paris, 1759, in 10 vols. folio. Notwithstanding its many imperfections, Moreri's '*Dictionary*' is still a useful work; the genealogical articles are the most complete; the geographical are the most defective. Moreri published also '*Rélations Nouvelles du Levant, ou Traité de la Religion, du Gouvernement, et des Coutumes de Perse, Arméniens, et Gaures, composées par le P. G. D. C. G.*' (Père Gabriel du Chignon Capucin.)

**MORGAGNI, GIOVANNI BATTISTA**, was born at Forlì in 1682. He studied medicine at Bologna under Albertini and Valsalva, and in 1701 obtained his Doctor's degree. He afterwards went to Venice and to Padua, to study chemistry and natural philosophy, and in 1715 he was appointed chief professor of anatomy in the University of Padua. He died in 1771, having been elected a member of all the chief scientific societies in Europe, and having received the highest honours from the contemporary popes and the sovereigns of adjacent nations.

Morgagni's chief works are, '*Adversaria Anatomica prima*,' Bononia, 1706, a small work in which Haller ('*Bibl. Anat.* ii. 34) says there is scarcely anything which is not new, or at least more clearly described than it had been previously. Five similar collections of miscellaneous observations were afterwards published under similar titles, and in 1719 they were all printed together at Padua—'*Epistolæ Anatomicæ*'—amounting altogether to twenty, which were published together at Venice in 1762. He edited also the life and works of Valsalva, his former preceptor and friend, whose opinions he constantly and warmly maintained. But Morgagni's most celebrated work was that which he first published in his eightieth year, '*De Sedibus et Causis Morborum per Anatomen Indagatis*,' Venice, 1761, in two vols. folio, which contains records of an immense number of observations on morbid anatomy, and which conferred nearly as great benefit on pathology as the contemporary works of Haller conferred on physiology. It has been since frequently republished and translated, and is still a standard work of reference.

**MORGAN, SIR THOMAS CHARLES, KNIGHT, M.D.**, was born about 1783. He was the eldest son of John Morgan, Esq. of London. He was educated at Eton College, the Charterhouse School, London, and St. Peter's College, Cambridge, which he entered in his eighteenth year, and where he took his degrees of M.B. in 1804 and M.D. in 1809. He established himself as a medical practitioner in London, became a Fellow of the College of Physicians, and married the eldest daughter of William Hamilton, Esq. of Queen Square, London. His wife died after giving birth to one daughter. He was knighted in Ireland in 1811, and when on a visit to the Marquis of Abercorn at his residence, Baron's Court, near Newtonstewart, in the county of Tyrone, he became acquainted with Miss Owenson, whom he married in 1812. He afterwards established himself in Ireland, and during a residence there of about twenty-five years devoted much of his time to the cause of Catholic Emancipation, which he advocated at public meetings, and in newspapers and periodicals. Not long after his marriage with Miss Owenson he relinquished his professional practice, and applied his talents to literature, chiefly as a contributor to the *New Monthly Magazine* and other periodicals. He became well known for the light and piquant style in which he conveyed valuable truths combined with curious fancies. In 1818 he published '*Sketches of the Philosophy of Life*,' 8vo, and afterwards '*The Philosophy of Morals*,' 8vo, both of which were translated into French and Italian. To Lady Morgan's '*France*' he added '*Four Appendices on the State of Law, Finance, Medicine, and Political Opinion in France*.' After the accession of the Whigs to office in 1831 Sir Charles Morgan was

appointed one of the Commissioners of Irish Fisheries, and his Reports were remarkable for clearness and accuracy. 'The Book without a Name,' 2 vols. 8vo, published in 1841, is a collection of essays and sketches by himself and Lady Morgan, partly new, and partly consisting of stray pieces which had appeared in different periodicals during the previous ten or fifteen years. He died August 28th, 1843. He signed his name Sir T. Charles Morgan, and is generally known as Sir Charles Morgan.

MORGAN, LADY. MISS SIDNEY OWENSON was born about 1786 in Dublin, where her father was a performer at the Theatre Royal, a writer of songs, and a composer of music for them. She was the eldest daughter, and the late Lady Clarke was her sister. She became an authoress at a very early age, having published, it is stated, a volume of poems at the age of fourteen. In 1804 she published her first novel 'St. Clair, or The Heiress of Desmond,' 2 vols. 12mo, London, and in 1805, 'The Novice of St. Dominick,' 4 vols. 12mo. In 1805 she resided for a time in the western part of the province of Connaught, and soon afterwards made a short tour in England, where, as she states, the terms of reproach in which her country was spoken of induced her to give a sketch of the condition and manners of the inhabitants of that part of Ireland where she had been residing. This she thought it best to do in the form of a narrative, and the 'Wild Irish Girl, a National Tale,' 3 vols. 12mo, 1806, was produced, which not only obtained an extraordinary degree of popularity, but introduced her to the society of persons of rank and fortune. She also published a collection of Irish Melodies which she had obtained from the singing of the natives of Connaught. In 1807 she published 'Patriotic Sketches in Ireland,' 2 vols. 12mo, which was the result of another visit to Connaught in 1806. The applause which she received seems to have stimulated her to great activity of mind, for in 1807 she also published 'The Lay of an Irish Harp, or Metrical Fragments,' 8vo, and produced 'The First Attempt, or The Whim of a Moment,' a comic opera, which was acted for the first time, March 4, 1807, at the Theatre Royal, Dublin, and was very successful. She does not seem to have made a second dramatic attempt, notwithstanding the favourable reception of the first. In 1809 she published 'Woman, or Ida of Athens,' a novel, 4 vols. 12mo, which was treated with brief severity in the first volume of the 'Quarterly Review.' In 1811 appeared 'The Missionary, an Indian Tale,' 3 vols. 12mo. Sir T. Charles Morgan, while on a visit to the Marquis of Abercorn at his seat, Baron's Court, in the county of Tyrone, formed an acquaintance with Miss Owenson, and married her in 1812. In 1814 Lady Morgan published 'O'Donnel, a National Tale,' 3 vols. 12mo; and in 1816 'Florence McCarthy, a National Tale,' 4 vols. 12mo.

In 1816-17-18 Lady Morgan visited France, and resided in the capital, where she was on terms of intercourse with the best society. The result of this residence was the publication of her work entitled 'France,' 4to, and 2 vols. 8vo, 1817-18, which is chiefly a description of Paris and of Parisian society, intermixed with sketches of the scenery and inhabitants of the vicinity. From France Lady Morgan proceeded to Italy, through which she journeyed in 1819-20, and in 1821 published her 'Italy,' 3 vols. crown 8vo. This work is properly a book of travels composed from her journals. Having crossed over Mount Cenis she descended into Piedmont. After residing some time in Turin, she passes through Lombardy, describes Milan and other places, and then proceeds successively to Genoa, Piacenza, Parma, Modena, Bologna, Florence, Rome, Naples, and Venice. This work is mostly occupied with the manners and customs of the inhabitants, the decorations of the cathedrals and churches, and the religious and other ceremonies and shows which she witnessed. 'The Life and Times of Salvator Rosa,' 2 vols., 8vo, a sort of biographical romance, or romantic biography, was published in 1823. A new edition of it was published in 1855, as one of the volumes of a new edition of her works. In 1825 she published a work on the evils of 'Absenteeism' to Ireland. 'The O'Briens and O'Flahertys,' 4 vols. post 8vo, another picture of Irish manners, appeared in 1827. In 1829-30 she again resided in France, and produced 'France in 1829-30,' 2 vols., 8vo; 'The Book of the Boudoir,' 2 vols., post 8vo; and 'Dramatic Scenes from Real Life,' 2 vols., post 8vo. In 1833-34 she visited Belgium, and produced the 'Princess, or the Béguine,' 3 vols., post 8vo, 1835. Her next work was 'Woman and her Master,' 2 vols., 8vo, 1840, a disquisition, historical and philosophical, on the state of subjection and humiliation in which woman has been held by her Master from the earliest times to the present, commencing with Adam and Eve, and proceeding through the periods of the patriarchal age of the Hebrews, the Jewish kingdoms, the Greek and Roman republics, and the Roman Empire till its extinction. Lady Morgan in this work appears as the advocate of her sex, contending that woman throughout the whole of this long extent of time, though condemned to unmerited obscurity, ignorance, and passive obedience, has been the chief agent in promoting the moral improvement of man, of which fact she exhibits numerous examples. 'Woman and her Master,' 2 vols., crown 8vo, 1855, forms the second of the series of the new edition of Lady Morgan's 'Works.' 'The Book without a Name,' is noticed under MORGAN, SIR THOMAS CHARLES. In 1846 Lady Morgan republished 'The Wild Irish Girl,' in Colburn's 'Standard Novels,' with a preface, in which, alluding to certain reproaches of her being her self 'an absentee,' she says that the only territorial

possession she ever had in Ireland was a bed of mignonette in a drawing-room balcony; and that her removal was "at the desire of one who had left his own great and happy country for the adoption of hers, and for the sake of that cause to which for more than a quarter of a century he devoted his time, his fortune, his talents, and his prime of life. It was after the battle of Catholic Emancipation had been fought and won, and the great league formed for its consummation had been broken up and dispersed, that he became desirous to return 'to die at home at last' (alas); and where he placed his solitary survivor she hopes to pass the scanty fragment of life still reserved to her, without reproach, as without the consciousness of deserving it." Lady Morgan receives a government pension of 300*l.* a-year, as a reward for her literary services. One of her latest productions was a 'Letter to Cardinal Wiseman, in answer to his Remarks on Lady Morgan's Statement regarding St. Peter's Chair,' 8vo, 1851. In her work on 'Italy,' when describing the Festa di Cattedra, or Festival of the Chair, in St. Peter's Cathedral, at Rome, she stated in a foot-note that the French, when they were in possession of Italy, had taken the liberty of examining the so-named chair of St. Peter, and had found on it an inscription in Arabic characters, which with some difficulty they deciphered, and ascertained to be the well-known confession of faith, "There is but one God, and Mahomet is his Prophet." They supposed that the chair had been brought from the East in the time of the Crusades, and the meaning of the inscription being unknown, it had been placed behind the high altar as the actual chair in which St. Peter was accustomed to sit when instructing his converts. Lady Morgan in this pamphlet states, with regard to the examination of the chair and discovery of the inscription, that her informant was Baron Denon, who told her that he and Champollion were present, and assisted in translating the inscription.

Lady Morgan's early works (the works of an inexperienced girl), romantic and rhapsodical as they are, afford proofs of that acuteness of observation, sprightliness of remark, and freshness of feeling, which distinguish her more matured productions. Her descriptions of scenery, which are too often overcharged with poetical expressions, are less pleasing than her exhibitions of character, manners, and customs. In matters political and ecclesiastical, and others less important, she is a decided liberal, sometimes indeed a radical, and her thoughts and opinions are expressed with unrestrained freedom and unflinching boldness. Her style of composition is elaborate and ornate, but never heavy or obscure, and is rarely without something of a musical flow. All her works, except perhaps two or three of the earliest, had a very extensive circulation. [See SUPPLEMENT.]

MORGHEN, RAPHAEL SANZIO, Cavaliere, one of the most celebrated engravers of recent times, was born at Florence, June 19, 1758. His father, Filippo Morghen, a native of Florence, was an engraver, who had settled early in Naples, and married there the daughter of Francesco Liani, court-painter to Charles III. By her he had several daughters and an only son, the subject of this notice. Filippo must have made a visit with his wife to Florence some time after his marriage, and before the birth of Raphael, as Florence was his birthplace by his own account.

Raphael Morghen was very early instructed by his father in the first principles of his art, and he could engrave a tolerable plate as early as his twelfth year. His first works were small landscapes and prints of the neighbourhood of Naples, but his first engravings of consequence were seven plates from the masks of the carnival of 1778, the Pilgrimage of the Grand Signor to Mecca. This was a work of such extraordinary merit for a youth of twenty, that his father deemed it right that he should have the benefit of the best instruction that could be procured, and sent him accordingly to the celebrated Volpato at Rome, who gave him at first a print of E. Sadeler's, of Christ and Mary Magdalen in the Garden, to copy. He engraved also about this time Gavin Hamilton's allegoric figure of Painting, for the brothers Hackert. In 1781 he engraved Raffaele's allegoric figures of Poetry and Theology, from the Vatican. In the same year he married Volpato's only daughter Domenica; and assisted Volpato on his plate of the Parnassus of Raffaele, in the Stanza of the Vatican. In 1787 he engraved the Aurora, painted in fresco by Guido for the garden-house of the Palazzo Rospigliosi; but this, though one of his principal works, is not one of his best. Though some of its parts are better, the Hours around the chariot of the Sun are less graceful and less buoyant than those in the print by Fry, executed long before it. The extremities, especially the hands, are in both badly drawn, but those of Morghen's print are inferior to Fry's, and the faces want regularity and beauty. This plate however was retouched by the school of Volpato, and is said to have been damaged. The impressions without the words 'In Aedibus Rospigliosis,' and those taken before the retouch, are much more valuable than any of those taken afterwards. In 1790 Morghen visited Naples, and engraved a portrait of his father. The Neapolitan court wished to persuade him to reside at Naples in 1792, and offered the inducement of a salary of 600 ducats; but Morghen accepted in preference an invitation from the Grand Duke of Tuscany to Florence, and established himself there in 1793, with a salary of 400 scudi and free apartments in the town, under the sole condition that he should keep a public school; with the privilege of engraving what he might choose, and his prints remaining his own property.

The first print engraved by him in Florence was the Madonna della Seggiola. In 1795 he commenced the celebrated Madonna del Sacco, after Andrea del Sarto, and Raffaele's Transfiguration; but his time was much taken up by portrait commissions from the royal family of Florence. The first picture is in Florence; the Transfiguration he engraved from a drawing by Tofanelli: he had commenced one from a copy by A. del Era; but upon comparing this with the original he found it very faulty, and he was forced to abandon what he had already done. This practice of engraving from copies and publishing the works produced as engraved from the original pictures, may be a custom with engravers, but it is a practice that cannot be justified, unless the original is not within the reach of the engraver, or unless the source be acknowledged upon the print. An engraver may commence his print from the print of another man if he has compared the copy with the original and found it to be exact; but an acknowledgment of the availed assistance is imperative in point of honour. A print which is sold as a faithful copy of a certain work of art, and is only the copy of a copy, without reference to the original, is virtually a forgery. Jordan, the Russian engraver, for his large and excellent engraving of the Transfiguration, was engaged thirteen months in the Vatican making his chalk drawing from the picture, to execute his engraving from, and it was pronounced by all who saw it as exact a copy as could be made. All engravers cannot do this, but they can all ascertain whether the drawings they work from are approved copies or not.

Morghen's Transfiguration was not completed until 1812, when it appeared with a dedication to Napoleon I., and the emperor invited the engraver to Paris, and honoured him with various presents. This print was originally sold at about twenty scudi, or four guineas, but the price afterwards very much increased, and reached, in some impressions, from 20*l.* to 30*l.* The cast-away plate was also finished by Morghen's brother, Antonio, but it is said that only two hundred impressions of it were ever printed: the plate came into the possession of Artaria and Co., at Mannheim. Though less correct, it has more technical effect as an engraving than the second print. Of the second print there are eight different kinds of impressions:—etchings, in five degrees of progress, in which additional portions are finished; fifteen impressions in which all is finished but the book in the hand of St. Andrew; impressions in the same degree of progress, with the inscription, 'Et transfiguratus est ante eos,' written with the needle; and, lastly, the completely finished prints. The engraving is a work of great labour, of great skill, and of extraordinary merit as far as the execution of the lines goes, yet it leaves much to be desired; it wants tone and aerial perspective, it is hard and metallic, and, as a whole, is flat, though the individual parts are beautifully rounded. Morghen was engaged while this work was in progress, three years, upon a print of the Last Supper by Lionardo da Vinci, and this is his masterpiece. The flatness and equality of his general execution is not perceptible or detrimental to this work, as the picture is comparatively in one plain, and it is sufficiently large to admit of great detail of expression: it was made from a drawing by Teodoro Matteini. Later impressions are retouched; the first and by far the most valuable have no comma after the word 'vobis—dico vobis,' &c. The last impressions are also without the comma, which was removed.

Raphael Morghen died at Florence, April 8, 1838, and an extravagantly eulogistic inscription was placed upon his tomb. His pupil Palmerini published at Florence, in 1824, a life and portrait of him, with a list of his works, 'Catalogo delle Opere d'Intaglio di Raffaello Morghen, raccolte ed illustrate da N. Palmerini,' &c. Morghen has engraved, according to this list, 73 portraits; 47 biblical and religious pieces; 44 historical and mythological pieces; 24 views and landscapes; and 18 vignettes and crests, &c.; in all 201 pieces: there are probably others omitted in the catalogue. Dr. Nagler has reprinted the list entire in his 'Künstler Lexicon.'

MORHOF, DANIEL GEORGE, is well known as the author of a very useful work, entitled 'Polyhistor.' A life of him, extending to 78 closely-printed quarto pages, is prefixed, under the title of 'Prolégomena,' to the second volume of that work, by the editor, John Moller, rector of the grammar-school of Flensburg in Schleswig. From this copious dissertation it appears that Morhof was born at Wi-mar, in the duchy of Mecklenburg-Schwerin, on the 6th of February 1639. His father was Joachim Morhof, notary public, assistant-clerk to the town council (Senatus urbano a iudicii inferioris secretis), who had been born of humble parentage in the Mark of Braunschweig, and is described as distinguished both for his probity and his learning; his mother was Agnes, daughter of Daniel Hintzius, a respectable merchant. Young Morhof was taught his Latin rudiments at home by his father, who also made him early familiar with the Bible, and with the elements of general history. Before he knew his alphabet he was fond of music, in which he afterwards made remarkable progress. When he was in due time sent to the Athenæum, or academy, of his native town, he distinguished himself not only in Latin and Greek, but in history and in the mathematical sciences. In March 1655 he was sent to the Royal Pädagogium of Stettin, whence after two years he proceeded to the University of Rostock to study law. He continued however to give a great part of his time to elegant literature, and especially to poetry, composing verses both in Latin and German with great facility, and much to the admiration of his friends. In 1660 he obtained the professorship of

poetry in the university. In the end of the same year, before commencing his public prelections, he visited Holland and England, remaining for some time in this country that he might have the use of the Bodleian Library. He also addressed a congratulatory Latin poem to Charles II. on his restoration. On his return to the Continent he was made Doctor of Laws by the University of Franeker in Friesland, on the 26th of September 1661. He greatly distinguished himself by the manner in which he performed the duties of his professorship; and in 1665 he was invited and induced to accept the appointment of Public Doctor of Eloquence and Poetry in the newly-founded University of Kiel in Holstein. In the summer of 1670 he made a second journey to Holland and England, and stayed for a considerable time in London, where he enjoyed the society, among others, of Boyle, Isaac Vossius, and Oldenburg, the secretary of the Royal Society. On the 23rd of October 1671 he married, at Kiel, Margaret, daughter of Caspar a Deginck, senator of Lübeck. She died in 1687, after having brought him four sons, of whom the second, George Marquard, and the fourth, Eric George, died young; the first, Caspar Daniel, and the third, Frederic, survived their father.

In 1673 Morhof succeeded to the professorship of history; and in 1680 he was appointed librarian to the university. The latter charge to so devoted a reader was peculiarly gratifying. From the time of the loss of his wife however his health began to break down. In 1690 he was attacked by a serious illness; and when he had partially recovered, in the spring of the following year, he undertook an ill-advised journey to the mineral waters of Pyrmont, from which he never returned; he only got back as far as Lübeck, and there breathed his last, on the 30th of July 1691, in the fifty-third year of his age.

Morhof was a very voluminous author. The account of his writings, published and unpublished, fills nearly 50 pages of the memoir by his friend Moller. His first production consisted of two Latin poems, published together in 1657. This was followed by an academical disquisition entitled 'Diatriba de Morbis et eorum Remediis Juridica,' in 1658; and afterwards, among other works, by an octavo volume entitled 'Epigrammatum et Jocorum Centuria Prima,' in 1659; 'Diatriba Philologica de Novo Anno ejusque Ritibus,' in 1663; a curious defence of the miraculous powers claimed by the kings of England and France in the cure of the king's-evil, under the title of 'Princeps Medicus,' in 1665; a volume of 'Miscellanea Poetica,' in 1666; another entitled 'Venerum, sive Epithalamiorum, Liber,' in 1667; another entitled 'Funerum Liber,' in the same year; several other volumes of Latin verse at various times; a translation into Latin of several of Boyle's tracts, in 1671; 'Disputatio de Sole Igneo Academica,' in 1672; in 1673 'Epistola de Transmutatione Metallorum,' (from which it is evident that he was a believer in the philosopher's stone); in 1682, an 8vo volume, in German, on the history of the German language and poetry ('Unterricht von der Deutschen Sprache und Poesie,' &c.), with a collection of his own German verses ('Teutsche Gedichte'); in 1684, 'Liber de Patavinitate Liviana'; in 1686, 'Otiarum Divinarum, seu Carminum Sacrorum Liber'; and the first and second books of his 'Polyhistor,' in 1688. After his death appeared, among other works, in 1694, 'D. G. Morhofii CVIII. Quæstiones Chymicæ, ex variis Autoribus Chymicis collectæ'; in 1697, 'Morhofii Opera Poetica Latina omnia'; in 1698, 'Morhofii Orationes et Programmata'; in 1699, 'Morhofii Dissertationes Academicæ et Epistolice.' For the works which he left in manuscript, mostly in an unfinished state, and which have never been printed, we must refer to the ample pages of his biographer. They are far too numerous to be noticed here. So great a quantity of literary production in so short a life sufficiently attests Morhof's diligence and facility. His judgment however appears to have been hardly in proportion to his acquirements; and even his learning was more remarkable for its superficial extent than for its depth. Of all the mass of authorship to which his name is attached, his 'Polyhistor' is, we believe, the only portion that is still held in any esteem.

The full title of this work is 'Polyhistor Literarius, Philosophicus, et Practicus.' Of the 'Polyhistor Literarius,' intended to form the first volume, Two Books, as already mentioned, were published by the author himself in 1688. They were brought out in 4to at Lübeck. The first is entitled 'Bibliothecarius'; the Second, 'Methodicus.' As reprinted in the last edition of the work, they make together 588 pages. A Third Book, entitled *Παρασκευαστικός*, was printed from Morhof's manuscript at Lübeck in 1692, with a re-impression of the two preceding Books: it extends to 156 pages. The remainder of the first volume, consisting of Book IV., entitled 'Grammaticus' (206 pp.); Book V., entitled 'Criticus' (20 pp.); Book VI., entitled 'Oratorius' (60 pp.); and Book VII., entitled 'Poeticus' (72 pp.), were compiled from notes of Morhof's lectures, by Moller and John Frickius, professor of theology at Ulm; they also added the 'Polyhistor Philosophicus,' in Five Books; and the 'Polyhistor Practicus,' in Seven Books; and published the completed work in 2 vols. 4to in 1704. A new edition of the whole work was produced in 2 vols. 4to, by John Albert Fabricius, in 1731; and another edition in 4to, by the same editor, in 1747. All the editions have been published at Lübeck. With the ample indexes which Fabricius has appended (though the plan of notation is rather complicated), and with the corrections and additions which it has received from his extensive and accurate learning, the

'Polyhistor' is still a useful survey of universal literature down to the middle of the last century. As in almost all such works, however, some subjects which happened to be favourites with the author or his editors are treated at disproportionate length, while others of greater real importance are too summarily dismissed.

\*MORIN, GENERAL ARTHUR-JULES, Director of the Conservatoire Impériale des Arts et Métiers of Paris, eminent as an investigator in practical mechanics and the strength of materials, and the author of several works relating to those subjects, was born at Paris on the 19th of October 1795. In 1813 he became a pupil of the École Polytechnique, and after completing his studies for his branch of the service, he attained the rank of captain of artillery. About 1828-29 he was charged by the Minister of War with an investigation relative to the motive power used in the government manufactories as compared with private establishments. The results were published in 1830 in the third number of the 'Mémoires de l'Artillerie,' a work issued under the care of a committee of the corps. In 1831, at Metz (where he was some time professor of mechanics at the École d'Application de l'Artillerie et du Génie), he made some experiments on friction, which were printed by order of the Academy of Sciences (4to, 9 plates, Paris, 1832); and in the next year he resumed them (the results being again published—4to, 4 plates, 1833); and also in 1833 (4to, 9 plates, 1835). He then entered upon experiments on various kinds of water-wheels, the results of which were laid before the Academy, and published in the 'Comptes Rendus' of 1836, under the title, 'Expériences sur les Roues hydrauliques à Aubes Planes, et sur es Roues hydrauliques à Augets,' with 3 plates; and with the Report, in which they are regarded as of great value. The results of further experiments on water-wheels 'à axe vertical,' called 'turbines,' were published in 1838. In 1837 he published his 'Aide-Mémoire de Mécanique Pratique,' for the use of artillery officers and civil and military engineers (8vo, Paris), containing rules and formulæ in various subjects. This work has gone through four editions, the last being published in 1847. In 1838 appeared the results of some experiments made at Metz in 1834, on the adherence of the parts of masonry and brickwork, on the friction of axes of rotation, and on the variation of tension in endless straps or cords employed for transmission of motive power, and other subjects ('Nouvelles Expériences sur l'Adhérence,' &c.). In 1841, or 1842, he published more than one edition, with 5 plates, of a small work describing a self-registering apparatus, which might be employed in measuring the work performed by various kinds of 'prime-movers' ('Notices sur Divers Dynamométriques,' &c.). In 1842 he also published the second edition of a work which gave the results of certain experiments on traction, and the destructive effect of carriages upon roads (4to, 4 plates, 2nd edition, Paris). These experiments had been made partly in 1837 and 1838 by order of the Minister of War, and in 1839 and 1841 for the Minister of Public Works. His most recent works are included under the head, 'Leçons de Mécanique Pratique,' and they comprise the 'Résistance des Matériaux' (8vo, 6 plates), of which the first edition was published in 1833, and a second has been printed with the date 1857; the 'Notions Géométriques sur les Mouvements et leurs Transformations' (2nd edition, 8vo), of which the first edition appeared under the title 'Cinématique'; the 'Notions fondamentales et données d'Expérience' (2nd edition); the 'Hydraulique'; and the 'Machines à Vapeur.'

About the year 1841, the subject of this notice is mentioned as professor of industrial mechanics in the Institution of which he is now Director. His elevation, in military rank, up to that of general of division, is of recent date. He is a member of the Institute of France, and of the Committee of Artillery; and a corresponding member of the academies of Berlin, Madrid, Turin, Florence, and Metz; of the Société Industrielle at Mulhausen, the French Society of Civil Engineers, and the Literary and Philosophical Society of Manchester; and he was a commissioner of the French Exposition of 1855. English men of science are indebted to him for his having given particulars to the French world of the recent investigations, with which he is well acquainted, by Hodgkinson and others, and for his own researches, which have merited and received attention here.

MORLAND, GEORGE, born June 26, 1763, was the son of Henry Robert Morland, an indifferent painter, from whom he received his first instructions, but very soon surpassed his master. He first painted landscapes, and one or two small conversation pieces; his favourite subjects however were domestic animals—horses, dogs, pigs, &c.—which he painted in a loose but very skilful manner. In the exhibition of the Royal Academy in 1791 he had a picture representing the interior of a stable, with horses, draymen, &c., larger than a half-length: it is an excellent performance, and may perhaps be considered as his masterpiece. Morland was a considerable proficient in the mechanism of the art, but his feeling for colour was very indifferent, and his taste was coarse and uncultivated. With a correct eye for effect, he observed and executed with equal rapidity; and though without imagination or refinement, rendered his subjects interesting by a faithful though coarse expression of their essential character and picturesque arrangement. Edwards regrets that "his low and vulgar propensities led him into society ill calculated to improve his mind or manners." On which Fuseli remarks:—"It is surely one of the favourite paradoxes of the age to wonder at the association of a man's favourite objects of amusement with his favourite objects of study.

It would be a disgusting idea, if it were a possible one, that the man who, with congenial satisfaction, spends the day in pencilling, to a degree of deception, a sow amid her litter, could long for the recreation of elegant society in the evening." But this is a shallow fallacy. It would indeed be idle to refute the suggestion that, whatever the subjects which a painter selects for the exercise of his pencil, he must be expected to choose the companions of his social hours from the same associations: a flower-painter surely is not supposed to be the companion of gardeners, nor a painter of horses the intimate of ostlers and stable-men. Morland spent his days in reckless and brutal dissipation, and he died at last at a sponging-house in Eyre-street-hill, Cold Bath Fields, on the 29th of October, 1804, his death being no doubt accelerated by his excesses.

MORLAND, SIR SAMUEL, was the son of the Rev. Thomas Morland, of Sulhamstead-Bannister, near Reading in Berkshire, and was born somewhere about the year 1625. He received his education at Winchester school and Cambridge. He remained at Cambridge for ten years, but never took a degree. Soon after his departure from college, we find him sent on the famous embassy to the queen of Sweden in company with Whitelocke and a retinue of other gentlemen. Whitelocke, in his Journal, calls him "a very civil man, and an excellent scholar." On his return, Morland became assistant to Thurloe, the secretary of Oliver Cromwell. He also took a prominent part in the attempt to relieve the sufferings of the poor people of Piedmont, being appointed "commissioner extraordinary for the distribution of the collected moneys" by the Protector, who also made him one of the clerks of the signet, in March 1665.

Morland is said to have been privy to the plot usually known as Sir Richard Willis's plot, and, as it is so intimately connected with Morland's history, we give an abstract of the narrative as arranged by Birch in his 'Life of Thurloe,' although we think that it is far from being altogether supported by proper evidence.

In the beginning of the year 1659, Thurloe, Cromwell, and Sir Richard Willis formed a design of ruining King Charles at one blow, by sending over messengers with plausible letters "to invite him to come over in a single ship, with only his two brothers and a few more, to a certain port in Sussex, upon an appointed day, where they were promised to be received and supported by 500 foot at their first landing, and 2000 horse within one day after." This plot was discussed in Thurloe's office, when Morland was at his desk apparently asleep: Welwood says that Cromwell, when he saw him, drew his sword, and was only dissuaded from despatching him on the spot by the earnest solicitation of Thurloe, who assured him that Morland had sat up two nights together, and was certainly fast asleep. Disgusted at this proceeding, Morland immediately determined to divulge the plot to the king, which he did by means of one Major Henshaw, who was then imprisoned in the Tower. The king, being thus cautioned, answered, that "he could not be ready so soon as the appointed day," which gave the three projectors some apprehension and suspicion of the discovery. Not being satisfied however with this answer, Willis was appointed to contrive other letters, urging his majesty "to use expedition, and not lose so fair an opportunity for his happy restoration." The king answered, that he was not very well, or something that appeared so frivolous, that they justly concluded their whole project was discovered, and Willis was suspected of having divulged it. Under these circumstances Willis sent for Morland, who went, not considering it safe to decline the meeting, but took two pistols with him. At the appointed place, he was met by another person, by whom he was conducted with the utmost caution into a dark deep cellar, where, by the light of a candle, he saw Sir Richard by himself with a Bible before him. Sir Richard told him plainly that "he had sent for him on account of the discovery of a secret of the highest importance, which could not possibly be known to more than three persons beside himself." Then, recounting the particulars, he laid his hand upon the Bible, and solemnly swore that he had not been the discoverer, and requested him to do the same. Morland told him, "he was ready to do so, if he would give him a reason why he should suspect him." All this he did with such a remarkable presence of mind, that Willis was completely damped, and Morland escaped from further interrogation. In May 1660, he went to the king at Breda, in Holland, who received him kindly, made him a knight, and soon afterwards a baronet.

Echard, in his 'History of England,' produces a letter from Sir Samuel to Willis, dated March 10, 1660, in which he expressly denies the whole of the above statement; but Morland's own testimony in his autobiography is to the contrary: if he did write it at all, it was merely as a means of safety from the wrath of Sir Richard Willis.

On the restoration of Charles, Morland was made master of mechanics to his majesty, who also presented him with a medal as an "honourable badge of his signal loyalty." He was soon afterwards made a gentleman of his majesty's privy-chamber. In 1677 he took the lease of a house, called Copped-Hall, by the Thames at Vauxhall, for twenty-one years. Two years afterwards, he had a pension of 400*l.* settled upon him, but embarrassments in his affairs, owing to an imprudent marriage, obliged him to dispose of it. He afterwards removed to a house at Hammersmith, near the water-side, where he died, December 30, 1695, and was buried in Hammersmith chapel on January 6 of the following year. The three last years of his life were spent

very wretchedly. Poverty and loss of sight compelled him to rely almost solely on the charity of Archbishop Tenison. In a letter dated March 5, 1694, he returns him thanks for his kindness, "which was far greater," says Sir Samuel, "than such a poor wretch as I could ever hope for." This letter, written when he was blind, is a very curious relic, and is now preserved in the library at Lambeth Palace. John Evelyn, in his 'Diary,' gives an interesting description of him when suffering under this accumulated load of misfortunes:—"25th Oct., 1695. The archbishop and myself went to Hammersmith to visit Sir Samuel Morland, who was entirely blind, a very mortifying sight. He showed us his invention of writing, which was very ingenious, also his wooden calendar, which instructed him all by feeling, and other pretty and useful inventions of mills, pumps, &c., and the pump he had erected, that serves water to his garden, and to passengers, with an inscription, and brings from a filthy part of the Thames, near it, a most perfect and pure water. He had newly buried 200*l.* worth of music-books, being, as he said, love-songs and vanity. He plays himself psalms and religious hymns on the theorbo." The inscription which Evelyn refers to was on a stone-tablet fixed in the wall, and is we believe still preserved; the following is a copy of it:—"Sir Samuel Morland's well, the use of which he freely gives to all persons: hoping that none who shall come after him will adventure to incur God's displeasure by denying a cup of cold water (provided at another's cost and not their own) to neighbour, stranger, passenger, or poor thirsty beggar. July 8, 1695."

Sir Samuel married three times; he was divorced from his last wife in 1688. The monument to his two first wives is in the nave of Westminster Abbey, and commemorates them in inscriptions in Hebrew, Greek, Ethiopic, and English.

It now remains briefly to notice his writings and mechanical inventions. From some correspondence between Morland and Dr. John Pell, preserved in Birch's collection of manuscripts in the British Museum, it appears that Sir Samuel, as early as 1666, had intended to publish a work on the quadrature of curvilinear spaces, and had actually proceeded to print a portion of it, when, by the advice of the latter, he was persuaded to lay it aside altogether. It was about this period that he invented his arithmetical machine, which he makes mention of in a letter dated May 13, 1666. He did not however publish an account of it before the year 1678, when, "by the impetuosity of his very good friends," it was made public. The little work in which it is described is illustrated with twelve plates, in which the different parts of the machine are exhibited. Its operations are conducted by means of dial-plates and small indices, moveable with a steel pin. By these means the four fundamental rules of arithmetic are very readily worked, and, to use the author's own words, "without charging the memory, disturbing the mind, or exposing the operations to any uncertainty." His 'Perpetual Almanac' is given at the end, which was often printed separately.

We are indebted to Morland for the speaking-trumpet in its present form, an account of which useful instrument he published at London in 1671, under the title of 'A Description of the Tuba Stentorophonica, an instrument of excellent use as well by sea as by land.' In this rare tract, consisting of eight leaves, he gives an account of the various experiments made by him before his instrument attained a certain degree of perfection. The first trumpet that he constructed, "although," says Sir Samuel, "the invention had been long before digested in my thoughts," was made in glass in the year 1670, being about 2 feet 8 inches in length, the diameter of the greater end 11 inches, and that of the other end 2½ inches: "with this," he says, "I was heard speaking at a considerable distance by several persons, and found that it did very considerably multiply the voice." After giving a description of some experiments with other trumpets, he enters into a philosophic disquisition on the nature of sound, and the best form of the speaking-trumpet, which he leaves doubtful, and concludes with "an account of the manifold uses" of his instrument, which are very excusably exaggerated: he appears also to have overrated the power of his trumpet; for, in his 'Urim of Conscience,' he says that he has no doubt but that it might be improved so as to carry the voice for the distance of ten miles. A French translation of Morland's treatise was published at London in 1671; and, in an advertisement prefixed, it is stated that Morland's tubes were sold by Moses Pitt, a bookseller in St. Paul's Churchyard, at the price of 2*l.* 5*s.* The invention excited much general interest at the time; so Butler makes Hudibras say,

"I heard a formidable voice,  
Loud as the Stentophonic noise."

There is one of Morland's original trumpets, now preserved in Trinity College Library, Cambridge, about six feet long; but it is in bad condition.

All former biographers of Sir Samuel Morland have asserted that he invented the fire-engine, but he ought to be considered rather an improver than an inventor of that machine. As early as 1590, Cyprian Lucar, in his treatise named 'Lucar-Solace,' gave a description of a rude fire-engine, which he designated by the name of a squirt, and which acted precisely on the principle of that instrument. Evelyn also mentions a fire-engine invented by Greatorex in 1656, which was ten years after he saw the 'quench-fires' of Sir Samuel.

The principal objects of Sir Samuel's study were water-engines,

pumps, &c., which he carried to a high degree of perfection: his pumps brought water from Blackmore Park, near Winkfield, to the top of Windsor Castle. A bill to enable him "to enjoy the sole benefit of certain pumps and water-engines by him invented," was read the first and second times in the House of Commons on the 12th and 13th of February 1674, but it did not pass; he obtained however a patent for them in the course of the following year. In 1697, two years after his death, a tract by him was published at the expense of his son. It is entitled 'Hydrostatics, or Instructions concerning Waterworks,' and contains an account of his various methods of raising water, besides tables of square and cube roots: from the close of Joseph Morland's preface, it appears that many of his father's works were left unpublished. There is also a treatise by Sir Samuel, in the Harleian collection of manuscripts, which is entitled 'Élévation des Eaux, par toute sorte de Machines, réduite à la mesure, au poids, et à la balance: Présentée à sa majesté très Chrétienne,' 1683: at page 25 commences a very short tract on the steam-engine, entitled 'The Principles of the New Force of Fire invented by Chev. Morland in 1682, and presented to his most Christian Majesty, 1683,' and these principles are explained as follows:—

"Water being converted into vapour by the force of fire, these vapours shortly require a larger space (about 200 times) than the water before occupied, and, rather than be constantly confined, would split a cannon. But being duly regulated according to the rules of statics, and by science reduced to measure, weight, and balance, then they bear their load peacefully (like good horses), and thus become of great use to mankind, particularly for raising water, according to the following table, which shows the number of pounds that may be raised 1800 times per hour, to a height of six inches, by cylinders half filled with water, as well as the different diameters and depths of the said cylinders:" then follows his table of the effects of different-sized cylinders. This evidently indicates a perfect knowledge of the subject, and to his great credit also, let it not be forgotten that he has correctly stated the increase of volume which water occupies in a state of vapour, which must have been the result of experiment: his researches however seem to have had little influence on the progress of the practical application of steam.

In 1658 he published his 'History of the Evangelical Churches of Piedmont,' which was drawn up at the request of Archbishop Usher, but it is not a very creditable performance. According to Boughem, in his 'Bibliographia Mathematica,' he wrote 'articles and rules for the better government of his majesty's forces by land during this present war.' His 'Doctrine of Interest, both Simple and Compound,' published in 1679, is a praiseworthy little volume, and the tables are very accurately calculated; but his 'New Rule for the Equation of Payments' is erroneous. Another tract by him, consisting of four leaves, and entitled 'The Count of Pagan's Method of Delineating all manner of Fortifications (Regular and Irregular) from the exterior Poligone reduced to English Measure and converted into Mercatoric Lines,' was published in 1672, in Venn's 'Military and Martial Discipline.' The 'Urim of Conscience' was written during his blindness, and is a very singular piece of composition: it contains reflections on the fallen state and insignificance of man, and the uncertainty of life. By one of his letters to Archbishop Tenison, dated 28th of July 1688, and preserved in the archiepiscopal library at Lambeth, it appears that he once had an intention of publishing the first six books of Euclid for the use of public schools.

Morland is said to have written a treatise on the barometer, which was answered by Lord North in another tract on the same subject. He is also said to have invented the capstan to heave up anchors, but he must be considered rather an improver than the inventor of that machine: the same remark will apply to various other performances, which have elsewhere been attributed to him.
