In the library at Lambeth Palace is an autobiography of Sir Samuel Morland, written by him in the latter part of his life, together with several other letters and papers: it is from this original source that we gave several particulars for the first time in this article as originally published in the 'Penny Cyclopædia.' We have also made use of the biography of Sir Samuel in Chalmers's 'Biographical Dictionary,' which is a good piece of biography, considering that he had no foundation to rest on; as also of a separate account of his life, writings, and inventions by J. O. Halliwell, Esq.

MORLEY, THOMAS, one of the most distinguished of our early composers, and author of the first regular treatise on the art of music that appeared in the English language, was born probably about the middle of the 16th century, but the exact time is unknown. All that is known of this eminent professor is gathered from Wood, who, in his 'Athens Oxoniensis,' tells us that he was a disciple of Birde, to whom he dedicated his book in very reverential and affectionate terms; that he obtained a Bachelor's degree in 1588, and was sworn into his place as gentleman of the royal chapel in 1592. He died, Dr. Burney supposes, in or near the year 1604.

Morley produced many compositions that are still well known, among which are, canzonets of different kinds, particularly for two voices, madrigals for five voices, and services and anthems, including the fine 'Funeral Service' published in Dr. Boyce's collection, the first that was set to the words of our reformed Liturgy. He also published 'Consort Lessons, made by divers exquisite authors, for six

different instruments to play together, viz., the Treble Lute, Pandora, Citterne, Bas-Viol, Flute, and Treble-Viol,' 2nd edition, 1611. He likewise collected and edited that collection so familiar to madrigalists, 'The Triumphs of Oriana' 1601. In Queen Elizabeth's 'Virginal Book' are five sets of lessons by Morley. But the work on which his fame is chiefly built is that alluded to above, 'A Plaine and Easie Introduction to Practical Musicke,' fol., 1597, which continued in use above a century and a half, and is still read and esteemed by most well educated musicians; for though it contains much that is become obsolete, and the language is quaint and often obscure, yet it exhibits a full knowledge of the subject, great acumen, a bold spirit, and much curious learning. It was translated into the German language by John Caspar Trost, a profound musician of the seventeenth century; and the scientific Florentine patrician, Doni, mentions the author as "il erudito musico Inglese."

Morley obtained of Queen Elizabeth an exclusive patent for the printing of music, under which William Barley published most of the music books that appeared during its continuance. This was granted in 1598, in lieu most probably of some bounty which ought to have been forthcoming from the privy-purse of the discerning but paranoious queen.

MORMON. [SMITH, JOSEPH.]

MORNINGTON, GARRET WELLESLEY, EARL OF, whose claim to be numbered and ranked high among the musical composers of the British Isles is freely acknowledged, was born in the county of Meath in or about the year 1720, and advanced from the dignity of an Irish baron, which he inherited, to that of an earl, in 1760. Devoting much of his time to his favourite art, his life seems to have been quite domestic and devoid of those incidents which contribute so largely to the page of biography; but success of a very decided kind attended his chief pursuit. All we know of the early history of this distinguished nobleman is from a paper printed among the 'Miscellanies' of the Honourable Daines Barrington, whence we derive the following curious particulars. The earl's father played tolerably well on the violin, and by his performance delighted the babe while yet in the nurse's arms. But even at that infantine period he seemed to be capable of distinguishing the difference between tolerable and excellent; for Dubourg, a celebrated violinist, being on a visit at the family seat "the child would not permit him to take the violin from his father, till his little hands were held;" but having heard the professor, he did his utmost to prevent the return of the instrument to his father. Nearly at the same age he could beat time to every piece of music, and the most sudden changes in the measure were immediately perceived and followed by him. Yet he never attempted to perform on any instrument till his ninth year: he then took up the violin, and soon was able to play the second part in Corelli's sonatas. Shortly after he attempted composition, and achieved a minuet, which however evinced more enterprise than genius. At fourteen he discarded the violin for the harpsichord. About that time his father ordered an organ for his chapel, telling his son that he should at once have been appointed organist, had he been qualified. The instrument was finished in eighteen months, when it was found that the young dilettante had fully prepared himself for the situation which his noble parent had jocosely wished he could fill. Unrelaxing in his musical studies and labours, Lord Mornington so distinguished himself, that the University of Dublin conferred on him the degree of Doctor in Music, and subsequently elected him professor of that faculty. He died in 1781.

Lord Mornington's compositions are chiefly vocal: some are for the church, and are to be found in the choir-books of St. Patrick's Cathedral. But he excelled most in what is undeniably our own national music, the glee. His four-voiced glee, 'Here in cool Grot,' which gained the gold prize-medal given by the Catch Club in 1779, is a work of genius and a masterpiece of art. 'Gently hear me, charming Maid!' another of the same kind, published in Warren's 25th collection, is, it has been truly said, "overflowing with taste and feeling." 'Come, fairest Nymph,' likewise for four voices, has always been, and most likely will continue to be, admired for its brilliancy and skill; and 'O, Bird of Eve,' a glee for five voices, is, though short, one of the most elegant effusions that vocal harmony can boast.

The Earl of Mornington was married to Anne, daughter of Arthur first Viscount Dungannon, and had by her a large family. He carefully superintended the education of his sons, and their eminence is so great that their father's name would be sure to be remembered if even his own genius had been insufficient to procure it. His sons were the Marquis of Wellesley, Lord Maryborough, our greatest general the Duke of Wellington, Lord Cowley, and the Rev. Gerard Wellesley.

MORO, ANTONI, or SIR ANTONY MORE, was born at Utrecht, about 1525, and was the pupil of Jan Schoorel. He obtained, while still young, a great reputation at Rome, especially as a portrait painter, and when the Emperor Charles V. requested the Cardinal Granvelle to send a painter to Lisbon, to paint the future bride of his son Philip, the cardinal selected More. He was introduced to the Emperor, at Madrid, in 1552, painted Philip's portrait there, and, at Lisbon painted besides the Infanta Mary, King John III., and the emperor's youngest sister, Queen Catharine of Portugal; for which he received 600 ducats and a very valuable gold chain as a present. Van Mander says that

his usual price for a portrait was 100 ducats, which at that time was a very large sum.

After a short interval, in 1554, More was sent to paint another bride of Philip's, Queen Mary of England: for this picture he was also richly rewarded, says Van Mander, and had a salary of 100*l.* per annum settled upon him, as painter to the King and Queen (Walpole says 100*l.* per quarter). More remained in England during the reign of Queen Mary, by whom he was probably knighted, and he painted several portraits of her and many of the English nobility of the time, some of which are at Hampton Court, and many others are still in the private collections of the descendants of the families. Some of his works doubtless pass as Holbein's, but More was much inferior to Holbein. After the death of Mary, in 1558, More rejoined Philip in Spain, and appears to have lived on such terms of familiarity with the king, that, upon an occasion, in the year 1560, when Philip struck him with his open hand on the shoulder, the painter ventured to return a blow with his mahlstick, but he soon repented of his familiarity, and was heartily glad to escape with temporary banishment. Philip, however, sent to recal him, and the king's messenger overtook More on his way, but the painter excused himself, not daring to trust himself again within Philip's power. Philip wrote to him in the Netherlands, but, through the Duke of Alva, with a similar result. More had entered the service of the Duke of Alva, who sent for him from Utrecht, and he was appointed by the duke receiver-general of the revenues of West Flanders, an appointment, says Van Mander, which so elevated him, that he made a bonfire of all his painting materials at Utrecht, and made presents to all his friends. Some suppose from this that he gave up painting; but so far from this, he was constantly painting, especially portraits of women, for the duke, at Brusola, whose high position enabled him to reward the painter with a public office for private services. The whole of More's family was also richly provided for, by Philip, or by the duke.

More died at Antwerp, in 1581, aged fifty-six, while engaged on a picture of the Circumcision, for the church of Notre Dame there, and it was left unfinished. More painted chiefly portraits; there are, however, also several good figure pieces by him, but they are painted in the prevailing dry style of that time in the Netherlands, and with its hard positive colouring. Yet he made a good copy for Philip, of Titian's Danaë, which is now at Madrid. There is much confusion about the dates of More's birth and death, some placing his birth in 1512; the above however is the account in the second edition of Van Mander, 'Het Leven der Schilders,' where it is fully explained in a note. In the National Gallery is a portrait by him of Jeanne d'Arche (No. 184), dated 1561.

MORONI, GIAMBATTISTA, a celebrated Italian historical and portrait painter, was born about 1510, at Albino in the territory of Bergamo, and was the scholar of Moretto da Brescia, whom he did not equal in composition, but surpassed as a portrait painter. In this last branch he was inferior to Titian only in his time, and that great painter is said to have repeatedly recommended applicants to him to go to Moroni. The heads and draperies of his portraits are beautiful; the hands might be improved. In his historical pieces he belongs rather to the Milanese school than the Venetian. He died at Bergamo, February 5, 1573. The National Gallery possesses two fine specimens of his pencil: 'A Portrait of a Tailor' (No. 697), and 'A Portrait of a Lawyer' (No. 742).

MOROSINI, an illustrious family of Venice, which had several doges and other distinguished individuals among its members. Paul Morosini, born in 1406, wrote an 'Apology' for the Venetian government, and other works. Andrea Morosini, who died in 1613, wrote a continuation of Paruta's 'History of Venice,' down to the year 1615.

But the most illustrious of the family is FRANCESCO MOROSINI, who was born in 1618, served in the navy of the republic against the Turks, and was appointed commander of the fleet in 1651, and general-in-chief for the defence of Candia against the Turks. He made a most gallant resistance against very superior forces, and at last concluded an honourable capitulation with the grand-vizir Coprogli in 1669. On his return to Venice, his conduct, having being made the subject of an inquiry, was fully justified. In 1684, war having broken out again between Venice and the Porte, Morosini was appointed captain-general of all the forces of the republic. After sailing to Corfu, he attacked and took the island of Santa Maura, and also the town of Prevesa on the coast of Epirus. In the following year he landed in the Morea with 10,000 men, took Coron by storm, and, being joined by the Mainotes, took Calamata, and defeated a Turkish army which was sent against him. In the year after he took Navarino and Modon, defeated the seraskier, and gained possession of Napoli after an obstinate defence. In 1687 he again defeated the seraskier in a pitched battle near Patras, and seized his standard. This victory was followed by the reduction of Patras, Lepanto, Corinth, and the whole of the Morea. Morosini then landed at the Piræus and attacked the Acropolis of Athens. It was in this siege that a shell, thrown by the Venetians, fell on the Parthenon, where the Turks had deposited their powder, and partly destroyed it. The Turkish garrison then surrendered. In 1688 Morosini landed on the island of Euboea, but was obliged to re-embark his troops, owing to the malaria fever having broken out in his camp. That same year the doge Giustiniani died, and Morosini, though absent, was elected in his place, retaining his

command in the Levant, a thing unusual in the suspicious aristocracy of Venice. In 1689 Morosini returned to Venice; the senate in a body went to meet him at sea, and escorted him in triumph to the landing-place at the square of St. Mark, amidst the acclamations of the whole population. This was a proud day for Venice, the last day of triumph in her history of a thousand years. A few years after, Morosini, then old and infirm, was sent again to the Morea, when illness terminated his glorious career, January 6, 1694. A statue of bronze was erected to him in the hall of the Council of Ten. In imitation of the great captains of antiquity, the adjunct 'Peloponnesiacus' was added to his name. His tomb is in the church of S. Stefano at Venice, with the inscription 'Francisci Mauroceni Peloponnesiaci Venetiarum Principis Ossa.'

\* MORREN, CHARLES-FRANÇOIS-ANTOINE, a distinguished Belgian botanist and naturalist. He was born at Ghent, and educated in the university of that city. Having taken his degree of M.D., he was appointed when very young professor of botany in the University of Liège. He is known throughout Europe for his researches, more especially in Vegetable Physiology. One of his earliest papers was published in the 'Nova Acta Naturæ Curiosorum,' consisting of notices of the natural history collection in the University of Liège. In 1836 he published an essay upon the influence of light on the manifestation and development of animal and vegetable organisms. In this essay he showed the influence which physical agents exerted upon the development of the ova and spores of animals and plants that had long lain dormant. This paper was followed by a series of researches on the movements of the stamens and other parts of the reproductive apparatus of such plants as *Goldfussia anisophylla*, *Styloidium graminifolium*, and *Sparmannia Africana*. He also pointed out the sensitive nature of the leaves of the various species of *Oxalidaceæ*. In many departments Professor Morren has worked successfully with the microscope, and has contributed many papers on the functions and structure of the lower plants and animals to the 'Transactions of the Royal Academy of Brussels.'

In his physiological researches Professor Morren has never lost sight of their practical bearing. In 1837 he was present at the meeting of the British Association at Newcastle-upon-Tyne, and gave an account of his researches on the structure of the flowers and fruit of the Vanilla plant, and showed that it might be successfully cultivated for commercial purposes in Europe. In 1844 he published a work on those facts and principles of the natural sciences which were available for the use of man. He took also an active part in the investigation of the nature of the disease of the potato, and wrote several papers on that subject.

Professor Morren has not confined himself to botany in his researches. The 'Transactions of the Royal Brussels Academy' contain many papers from his pen on 'Zoology' and 'Palaontology.' A series of these papers are on the fossil bones of elephants, whales, and other animals that have been found in various parts of Belgium.

MORRISON, REV. ROBERT, D.D., the first Protestant missionary to China, was born at Morpeth, Northumberland, January 5 1782. His parents were respectable and worthy persons in humble life. After receiving some elementary instruction in English, writing, and arithmetic, in a school conducted by a maternal uncle at Newcastle, he was apprenticed at a very early age to his father. In 1799 he commenced a course of religious reading and study. In 1801 he studied Hebrew, Latin, and theology, under the superintendence of a Presbyterian minister of the town, by whom he was introduced, in 1803, to the committee and tutors of the Independent Theological Academy at Hoxton, as a fit person to be received into that institution. In May, 1804, he offered his services as a missionary to the London Missionary Society, and being accepted, he removed from Hoxton to the Mission College at Gosport. In August 1805 he commenced the study of Chinese under a native teacher. In January 1807 he was ordained as a missionary, and in September of the same year he arrived at Canton.

Before leaving England Mr. Morrison had procured from the British Museum a 'Harmony of the Gospels,' and the 'Pauline Epistles,' translated into Chinese by an unknown Roman Catholic Missionary; and the Royal Asiatic Society lent him a manuscript Latin and Chinese dictionary. In 1808 he was appointed translator to the East India Company's factory at Canton. In 1810 the Acts of the Apostles in Chinese, which he had brought with him, were printed, after he had carefully revised and amended the text. In 1811 a Chinese grammar, which he had prepared about three years before, was sent to Bengal to be printed, but after many delays, it did not issue from the press until 1815, when it was printed at Serampore, at the expense of the East India Company. In 1812 the Gospel of St. Luke in Chinese was printed, and by the beginning of 1814, the whole of the New Testament being ready for the press, the East India Company sent out a press and materials, and a printer to superintend the printing of the work. In 1813 the London Missionary Society sent out the Rev. (afterwards Dr.) Milne to assist Morrison, and they proceeded with the translation of the Old Testament. In 1815 the Book of Genesis and Psalms were printed. In the following year the Chinese dictionary was finished, and before the end of 1821 was printed by the East India Company at a cost of 15,000*l.* In 1817 the University of Glasgow conferred upon Mr. Morrison the degree of D.D. The Anglo-

Chinese College, for Chinese and English youth, which he had projected, was also commenced. He published in the same year 'A View of China for Philological Purposes,' in English, and a translation of 'Morning and Evening Prayers of the Church of England' into Chinese.

His great work, the translation of the Bible, was completed in 1818. From 1810 to 1818 the British and Foreign Bible Society had voted the sum of 6000*l.* at seven different times, to assist in the printing and publication. The Old Testament formed 21 vols. 12mo. The Book of Job and the Historical Books were translated by Dr. Milne, and the other portions by Dr. Morrison. Of the New Testament Dr. Morrison had translated the four Gospels, and from Hebrews to the end. In 1824 Dr. Morrison came to England, and was introduced to King George IV., to whom he presented a copy of the Scriptures in Chinese. During his visit he endeavoured to promote the study of Chinese literature in England. His first wife, whom he married in 1808, having died in 1821, he married Miss Armstrong, of Liverpool, in 1826, and soon afterwards sailed for China. His time was now occupied in preaching, translating, superintending the distribution of printed works, and promoting education. In 1832 he wrote to his friends in England:—"I have been twenty-five years in China, and am beginning to see the work prosper. By the press we have been able to scatter knowledge far and wide." In the midst of these occupations Dr. Morrison died at Canton, August 1, 1834. His coadjutor, Dr. Milne, who died some time before, said of Morrison, that "his talents were rather of the solid than the showy kind; fitted more for continued labour than to astonish by sudden bursts of genius; and his well-known caution fitted him for a station where one false step, at the beginning, might have delayed the work for ages."

The translation of the Scriptures, the great object of Dr. Morrison's life, was given to the world "not as a perfect translation." Dr. Morrison says he studied "fidelity, perspicuity, and simplicity;" "common words being preferred to classical ones." The authorised English version was followed. Dr. Morrison always explicitly stated that the Chinese manuscript in the British Museum was "the foundation of the New Testament;" which, he says, "I completed and edited."

The translators contemplated the improvement of their work at some future period, "expecting that they should be able to sit down together and revise the whole." This expectation was never realised; Dr. Milne died in 1822, and the correction of errors and the verbal alterations made by Dr. Morrison were not of great importance. Towards the latter part of his life, Dr. Morrison became more and more confirmed in the necessity of a thorough revision, and he anticipated the probability of this being effected by his son, who however, on the death of his father, was selected to succeed him as the translator to the Superintendents of British Trade at Canton, and could not therefore devote his time to this object. It is no disparagement to Dr. Morrison to assert that his work required revision: it was a first version into the most difficult language in the world.

It may serve to give an idea of the exertions of Dr. Morrison and his colleagues to state that from 1810 to 1836, 751,763 copies of works, consisting of 8,000,000 pages, were printed in the Chinese and Malay languages at Canton, Malacca, Batavia, Penang, and Singapore. This includes 2075 complete Chinese Bibles, 9970 New Testaments, and 81,000 separate portions of Scripture in Chinese.

(*Memoirs of the Life and Correspondence of Robert Morrison, D.D., compiled by his Widow, to which is appended A Critical Essay on the Literary Labours of Dr. Morrison, by the Rev. S. Kidd, Professor of Chinese in the University College, 2 vols. 8vo. London, 1839.*)

MORRISON, SIR RICHARD, architect, was born about the year 1767, and was the son of John Morrison, architect, of Cork. He was at one time intended for the Church, but subsequently became a pupil of James Gandon, the architect, in Dublin. Through his godfather, the Earl of Shannon, Morrison obtained a government appointment in the Ordnance department, but had to relinquish it in consequence of reductions, when he got into practice as an architect, and in the course of his life erected a large number of buildings. For a few particulars of some of these, reference may be made to Weale's 'Quarterly Papers on Architecture' (vol. i.), in which there is a memoir of WILLIAM VITRUVIUS MORRISON, son of Sir Richard, who was some time in practice conjointly with his father, and who died at the age of forty-four. Sir Richard Morrison was last employed for Lord Longford and the Earl of Howth. His knighthood was received during the viceroyalty of the Earl de Gr-y. He left considerable property, including a well-stocked library, and died on the 31st of October 1849, at the age of eighty-two. He was president of the Irish Institute of Architects.

\* MORSE, SAMUEL F. B., the inventor of the American system of telegraphs, was born in Charlestown, Massachusetts, on April 12, 1791. Desiring to become an artist, he came to England in 1811, and was a student at the Royal Academy, where in 1813 he gained a prize for a sculpture model. On his return to America he practised his art with some success. In 1829 he again visited England, and in 1832, while on his return to the United States, the experiment of Franklin upon a wire some four miles in length was recalled to his mind in the course of conversation with a passenger, and it occurred to him that "if the presence of electricity could be made visible in any part of

this circuit, it would not be difficult to construct a system of signs by which intelligence could be instantaneously transmitted." The subject occupied his thoughts during the remainder of the voyage, and within a week after his arrival in America he commenced operations with a view of testing the theory he had formed; but the pressure of other duties, and the want of ampler means, compelled him to postpone his experiments. It was not until the summer of 1837 that he practically satisfied himself of their success; and in October 1838, this result was more publicly demonstrated on a line half a mile in length. At this period he estimated that "five words could be transmitted in a minute." At the present time vastly more can be accomplished. Congress had liberally granted 80,000 dollars to enable the inventor to carry on his experiments; but he had still to await during long and anxious years for that extensive development of his invention which should render it one of the most striking improvements of modern times. Not till June 1844 had he the gratification of witnessing all his most sanguine hopes realised in the establishment of a telegraphic line forty miles in length between Baltimore and Washington. Almost immediately afterwards the advantages of telegraphic communication were extended to the remotest parts of the Union.

The peculiar advantage of Morse's system consists in its great simplicity. A single wire only is necessary, with a galvanic battery as the source of power at the transmitting station, and an electromagnet of iron at the receiving station to record the passage or presence of the power. The process is self-recording or self-printing. Attached to the magnet is a steel pricker, which effects marks (signs) on paper as it is unrolled by clock-work mechanism from a coil. The alphabet is formed of a combination of dots and strokes: thus, *a* —, *b* — — —, and so on. Visible signals are liable to be inaccurately read off, and misreadings render repetitions necessary; but an indelible transcription on paper avoids these disadvantages. In point of celerity Morse's single wire apparatus exceeds the two-line wire and double-needle in the ratio of 8 to 2: his single perfecting wire is capable of a celerity three times greater than that of double-needle instruments. In 1854, out of 41,392 telegraphic wires in the United States, 36,972 were worked under Morse's patent. It has been applied with some modifications on the Continent, but with little or no advantage to the inventor.

The long interval which elapsed between the suggestion of the principle in 1832 and its practical test on a small scale in 1838, and a period of equal length from that year until 1844 when the invention was triumphantly in operation, was one of those severe trials to which inventors are proverbially liable. In America he is now without a rival, and his honourable claims are fully recognised in Europe. The income he derived from his patents soon placed him in affluent circumstances, and he now enjoys the well-merited reward of his labours at Poughkeepsie, in the State of New York, where he lives in comparative retirement. He is married, and has one son and one daughter. He occupies the post of "electrician" of the New York and Newfoundland Telegraph Company, and the still more distinguished situation of electrician of the New York, Newfoundland and London Telegraph Company, for connecting the continents of Europe and America by a submarine electric cable. He is also Professor of Natural History at Yale College. In 1856 Professor Morse visited England for the purpose of promoting the project of a submarine cable across the Atlantic. On the night of October 2nd, in conjunction with Mr. Charles T. Bright, C.E., engineer of the Magnetic Telegraph Company, and Dr. Whitehurst, experiments were made at the Company's offices in London, which established the practicability of the scheme. In a report dated 5 a.m., Oct. 3, written at the close of the night's labours, Professor Morse stated that, upon a single continuous conductor of more than 2000 miles in extent, the telegraphic register had counted signals at the rate of 210, 240, and even 270 per minute. A few days afterwards, Oct. 9, a public dinner was given in his honour in London by the several telegraph companies, and others interested in telegraphic communication. Shortly afterwards he returned to the United States.

MORTIMER, JOHN HAMILTON, an artist of high repute in his day, was born in 1741, and was the son of a miller who afterwards became a collector of the customs at Eastbourne, Sussex. John was the youngest of four children, and having discovered a taste for drawing, which he is supposed to have acquired from an uncle who was an itinerant portrait-painter, he was at about the age of eighteen or nineteen, placed under Hudson, who had been the instructor of Reynolds. With him however he did not continue long, but, after having studied awhile in the gallery of the Duke of Richmond, began to make himself known by his productions. One of his earliest works, founded on an incident in the life of Edward the Confessor, painted in competition with Romney, obtained from the Society for the Encouragement of Arts a premium of fifty guineas, and that of St. Paul preaching to the Britons one hundred guineas. He was further distinguished by the notice and friendship of Reynolds, which friendship has been attributed not to the sympathy but to the opposition of their tastes in art. Mortimer was no colourist, and but an indifferent portrait painter, although he produced many admirable heads and likenesses in black and white chalk. His talent lay in design, and in wild and fantastic quite as much as in historical subjects. His

BIOG. DIV. VOL. IV.

groups of banditti are masterly; and his 'King John signing Magna Charta,' 'The Battle of Agincourt,' &c., show him to have possessed original power in the higher walk of art; and he possessed considerable knowledge of the human figure. The 'Brazen Serpent in the Wilderness,' in the great window of Salisbury cathedral, and the cartoons for that in Brasenose College, Oxford, were designed by him.

In person Mortimer was handsome, his figure of athletic mould, and his constitution was naturally very strong, but he greatly impaired it by the excesses of what is called free living. About the year 1775 his health began to decline, his former exuberant gaiety abandoned him, and he became altogether an altered man; but though he in some degree recovered, and was able to employ his pencil both industriously and profitably, realising by it nine hundred pounds in the course of a single year, his life was soon out short, for he died on the 4th of February 1779, in the thirty-eighth year of his age. He was buried in the church at High Wycombe, near the altar; where is his painting of 'St. Paul preaching to the Britons.'

MORTON, JAMES DOUGLAS, FOURTH EARL OF, and Regent of Scotland, was a younger son of the great family of Angus, which, besides other honours, had more than once held the office of lord-high-chancellor of Scotland, and by the marriage of the sixth earl of Angus with Margaret of England (widow of King James IV.) had recently been brought into intimate connection with Henry VIII., the brother of that princess. Morton was nephew to the above earl, being second son of the earl's younger brother, Sir George Douglas of Pittendreich. These two brothers had mutually assisted each other in their struggle for power during the minority of King James V.; and on the earl's fall in 1528, Sir George fled and remained an exile during the remainder of James's reign. He then returned to his native country, and in 1543 was appointed a privy-councillor to the Regent Arran.

Previous to this period, but at what precise time is uncertain, the younger son of Sir George had married Lady Elizabeth Douglas, daughter of the third earl of Morton, by a natural daughter of King James V.; and on that occasion the earl, having no male issue, obtained a new reversionary clause to his patent, transferring the earldom to this fortunate son-in-law. In consequence of this provision he was styled the Master of Morton; and on his father-in-law's death, in 1553, he became Earl of Morton. Up to this time he followed undoubtedly the footsteps of his father, who was an active promoter of the Reformation, and a friend of King Henry VIII. in the designs of that monarch in reference to Scotland. His name however does not often appear in the public transactions of the period; and although one of the original lords of the congregation in 1557, yet afraid perhaps of the consequences, in a personal point of view, of casting off the queen-regent, from whom he had already received considerable favours, he long held a doubtful and irresolute course. It was this which made Sadler, the English envoy, describe Morton as "a simple and fearful man." From the time of the queen-regent's death however that description was inapplicable to him; and on the 7th of January 1568, he was constituted lord-high-chancellor of the kingdom, in the room of the forfeited Earl of Huntly, who had been the great head of the Roman Catholic party in Scotland. He had been only a few years in that office however when he was obliged to lay it down and fly into England, on occasion of Rizzio's murder, in which cruel and lawless affair he took an active and prominent part. He remained in England, under the protection of the English monarch, till the end of the year, when he was restored to Mary's favour by the intercession of Bothwell, whose ambitious designs needed all the aid which could be drawn together from every quarter. Bothwell soon opened to him the plot which he meditated for the murder of Darnley, expecting, no doubt, his ready acquiescence. In this however Bothwell was mistaken; Morton refused to concur. But neither did he inform Darnley of the plot, nor take any measures to prevent its being executed; and he was one of those who subscribed the famous bond, to protect Bothwell against the charge of being concerned in the murder, and to use every endeavour to promote his marriage with the queen. Yet when this latter event took place, and when Bothwell became odious to the nation, Morton was the great leader in opposition to him; and it was to the castle of his relative, the lady of Lochleven, that Mary was conducted when she delivered herself up at Carbery Hill.

When Mary was securely lodged in this place of confinement, the Earl of Murray was made regent of the kingdom, and Morton reinstated in the office of lord chancellor. He continued in this situation during the regencies of Murray, Lennox, and Mar, and was indeed a principal actor in all matters of importance which took place in their time; and on Mar's death at the end of the year 1572, Morton was himself appointed regent of the kingdom. Here his ability and vigour indeed, but at the same time his ambition, his avarice, and rapacity, and his general want of principle, became apparent to all; he was now at once feared and hated; and finding himself becoming odious to the nation, he conceived the idea of retrieving his reputation by resigning, or rather offering to resign, the government into the king's (James VI.) own hands, his majesty being now in his twelfth year. Accordingly on the 12th of September 1577, he made resignation of his office, and the king, by the advice of Athol and Argyle, accepted it, to the great joy of the people. Morton, thus unexpectedly taken at his word, retired in a sort of pet to Lochleven, which, from his for-

2 A

midable character, was then commonly called the 'Lion's Den;' and from this retreat he watched a favourable moment to regain his power. An opportunity presented itself, and he immediately became master both of Stirling Castle and of the king's person. He then resumed power, and by the help of Queen Elizabeth retained it for some time, but at length the king's new favourite, Captain Stewart, who, as Robertson says, shunned no action however desperate, if it led to power or favour, charged him, in the king's presence, with being accessory to the murder of Darnley. Upon this charge Morton was committed first to his own house, then to the castle of Edinburgh (2nd of January 1581), and then to Dumbarton, of which Lennox, the father of Darnley, had the command. Elizabeth used every endeavour in favour of Morton, but the greater the solicitude which she showed for his safety, the more eagerly did his enemies urge his destruction; and being carried by Captain Stewart, then earl of Arran, into Edinburgh, he was, on the 1st of June 1581, brought to trial, found guilty, and condemned. When that part of the verdict was read which, besides finding that he had concealed, found that he was also accessory to the murder, he repeated the words with vehemence, and then exclaimed, "God knows it is not so." The next morning, speaking of the crime for which he was condemned, he admitted that on his return from England, after the death of Rizzio, Bothwell had informed him of the conspiracy against Darnley, which the queen, as he told him, knew of and approved, but he had no hand in it. And as to revealing the plot, "To whom," said he, "could I reveal it? To the queen? She was aware of it. To Darnley? He was such a babe, that there was nothing told to him but he would tell to her again; and the two most powerful noblemen in the Kingdom, Bothwell and Huntly, were the perpetrators. I foreknew and concealed the plot, but as to being art and part in its execution, I call God to witness, I am wholly innocent." When his keepers told him that the guards were attending, and all was in readiness, he replied, "I thank my God, I am ready likewise." On the scaffold his behaviour was calm, his countenance and voice unaltered, and after some time spent in acts of devotion, he was beheaded by the instrument called the Maiden, on the 3rd of June 1581. His head was placed on the public jail; and his body, after lying till sunset on the scaffold, covered with a beggarly cloak, was carried by common porters to the usual burial-place of criminals. None of his friends accompanied it to the grave—they did not venture to discover their gratitude or respect by any expressions of sorrow.

MORTON, JOHN, cardinal and archbishop of Canterbury, was the eldest son of Richard Morton, of Milbourne St. Andrews, in Dorsetshire, and was born at Bere in that county, 1410. He received his earliest education at the abbey of Cerne, whence he removed to Balliol College, Oxford. Of his progress there we know but little, till he became principal of Peckwater Inn. His practice as an advocate in the Court of Arches subsequently recommended him to the notice of Cardinal Bourchier. The cardinal, beside conferring upon him various preferments, introduced him to King Henry VI., who made him one of his privy-council. He adhered to this unfortunate prince with so much fidelity, that even his successor Edward IV. could not but admire his attachment, which he rewarded by taking Morton into his councils. In 1473 Morton was appointed Master of the Rolls; and between this time and 1477 the list of his promotions to prebendal stalls and other preferments in different quarters of the kingdom proves the high esteem in which he was held. In 1478 Edward IV. made him Bishop of Ely and Lord Chancellor of England, and at his death appointed him one of his executors. He was viewed in no favourable light by Richard III., who, at the same time that Lord Stanley was arrested, gave Morton in ward to the Duke of Buckingham. He escaped however from the duke's castle at Brecknock, and concealed himself for a time in the Isle of Ely; soon after which, passing in disguise to the Continent, he joined the Earl of Richmond, and is said to have been the person who first proposed the coalition of the two houses of York and Lancaster by the marriage with the eldest daughter of Edward IV. As soon as Henry VII. was seated on the throne, he also made Morton one of his privy-council, and on the death of Cardinal Bourchier, in 1486, joined with the Pope in promoting him to the archbishopric of Canterbury. In August, 1487, if not earlier, he was again constituted Lord Chancellor, and in 1493 created a cardinal by Pope Alexander VI. He died September 15th, 1500. Morton was a man of great talents, learning, and probity. The cut or drain from Peterborough to Wisbeach, known by the name of Morton's Leame, was made entirely at his expense while he was Bishop of Ely. It has been argued with some appearance of probability, that the English Life of Richard III., usually attributed to Sir Thomas More, was really written by Morton: but if Morton did not really write the Life, it seems to be quite clear that More (who was in early life a page in Morton's house) must have derived part of his information directly from the archbishop. (Tanner, *Bibl. Brit. Hib.* pp. 532, 533; Bentham, *Hist. of Ely*, 4to, Cambr., 1771, pp. 179-181; Chalmers, *Biog. Diet.*)

MORTON, SAMUEL GEORGE, M.D., celebrated as an Ethnologist, was born at Philadelphia in the United States of North America in 1799. His parents were members of the Society of Friends, and he had the misfortune to lose his father early in life. His mother however married a second time when young Morton was thirteen years

old, and from his step-father he seems to have derived a liking for the study of natural history. After leaving school he was placed in a counting-house, but his taste for natural science led him to abandon business and enter the medical profession. He was accordingly placed with Dr. Joseph Parrish of Philadelphia, who, although unconnected with any public medical office, had the highest reputation for the management and education of young men studying the medical profession. He attended the lectures and passed through the course of instruction prescribed for the student of medicine in his native city, and received his diploma of Doctor of Medicine in March, 1820. He was at the same time admitted a member of the Academy of Sciences (Philadelphia). Soon after this event he sailed for Europe, and, after visiting an uncle—Mr. James Morton of Clonmel, in Ireland,—he repaired to the University of Edinburgh. Here he studied two years, and graduated in medicine in 1823. His inaugural thesis was entitled, 'Tentamen inaugurale de Corporis Dolora.' During his period of preparation for graduating in Edinburgh he visited France and Italy, and made a stay in Paris. He returned to America in the summer of 1824, just in time to witness the departure of some of the most eminent literary and scientific men in Philadelphia to join in the ill-starred social experiment of Mr. Robert Owen at New Harmony in Indiana. He became immediately an active member of the Academy of Sciences, and commenced his contributions to its transactions by a geological paper. It was entitled, 'Analysis of Tabular Spar from Bucks County.' He subsequently contributed many papers on Geology and Palaeontology to the transactions of the Academy. Several of the most important of these papers were published in a separate volume entitled, 'Synopsis of the Organic Remains of the Cretaceous Group of the United States.' This was a very valuable contribution to Geology, and was received with the warmest commendations by European geologists. He cultivated generally the natural history sciences, and wrote several papers on zoological subjects.

Whilst pursuing natural history with success, he did not neglect to cultivate professional knowledge. In 1834 he published a work entitled 'Illustrations of Pulmonary Consumption; its Anatomical Character, Causes, Symptoms, and Treatment.' He also edited an edition of Dr. Mackintosh's 'Practice of Physic,' with notes and additions. From 1839 to 1843 he filled the chair of anatomy in the medical department of Pennsylvania College. In 1849 he published 'An Illustrated System of Human Anatomy, Special, General, and Microscopic.'

His previous labours, however, were but preparations for the great works on which his reputation as one of the first ethnologists of his day is founded. The line of his research on the races of man lay more particularly in their anatomical configuration, and especially in the structure of the skull. During his researches, he made one of the most valuable collections of skulls extant, and which is now in the possession of the Philadelphia Academy of Practical Sciences. The origin of this collection may be given in his own words:—"Having had occasion," he says, "in the summer of 1830 to deliver an introductory lecture to a course of anatomy, I chose for my subject 'The different Forms of the Skull as exhibited in the Five Races of Men.' Strange to say, I could neither buy nor borrow a cranium of each of these races, and I finished my discourse without showing either the Mongolian or the Malay. Forcibly impressed with this great deficiency in a most important branch of science, I at once resolved to make a collection myself." The result of this determination was not only his great collection, but the two magnificent works, entitled 'Crania Americana,' and 'Crania Egyptiaca.' These works embraced not only an account and illustrations of the skulls, but general ethnological observations on the races of men. The collection on which these works were founded contains 951 human crania, collected from all parts of the world, 278 crania of mammals, 271 of birds, and 88 of reptiles and fishes.

Although in his earlier writings he maintained the specific unity of the human race, in the latter part of his life he was led to doubt this view, and to express his conviction of the existence of a diversity of species amongst men. This view has been strongly insisted on, in a work published since his death, under the title of 'Types of Mankind.' This work, edited by Messrs. Nott and Gliddon, contains a large mass of matter by the editors and others, with many "Excerpta" from Morton's inedited papers. In these he undoubtedly avows his belief in an "aboriginal plurality of races;" and expresses his conviction, that "man will yet be found in the fossil state as low down as the Eocene deposits, and that he walked the earth with the megalonyx and palaeotherium." It is only right to add that these views have not been generally received; and that our most distinguished ethnologists, palaeontologists, and geologists have not endorsed his later doctrines. Dr. Morton died at Philadelphia, after a short illness of five days, on the 17th of May, 1851.

MORTON, THOMAS, was born in 1764, in the county of Durham. His parents having died while he was young, his uncle, Mr. Maddison, a stockbroker in London, took him into his care. He was educated at the Soho Square Academy, celebrated for the annual theatrical performances of the pupils, several of whom became distinguished actors. He was afterwards entered a student of Lincoln's Inn, but the fondness for theatrical amusements which he had contracted at school was not to be subdued; he became a constant play-goer, and directed his studies to the drama rather than the law. Having written a

dramatic piece which was favourably received, he abandoned the legal profession without having been called to the bar.

Morton thenceforward devoted himself entirely to play-writing, and became one of the most successful of modern dramatists. So great was his reputation and the confidence of managers in his power of pleasing an audience, that when his comedy of 'Town and Country' was to be brought out in 1807, Mr. Harris, the lessee of Covent-Garden Theatre, gave him 1000*l.* for the play before the parts were written out for rehearsal, taking on himself all risk of failure. Out of fourteen or fifteen comedies, comic-operas, and farces, five or six still continue to be stock-pieces.

The following is a list of his plays, perhaps incomplete as to two or three of the later productions: 'Columbus,' 1792; 'Children in the Wood,' 1798; 'Zorinski,' 1795; 'Way to get Married,' 1796; 'Cure for the Heart Ache,' 1797; 'Speed the Plough,' 1798; 'Secrets worth Knowing,' 1798; 'The Blind Girl,' 1801; 'School of Reform,' 1805; 'Town and Country,' 1807; 'Roland for an Oliver,' 1819; 'School for Grown Children,' 1826; 'Invisibles,' 1828.

Morton was a respectable man, of regular and orderly habits. His conversation was sprightly, and abounded in anecdote. He was fond of cricket playing and was a constant attendant at the cricket-grounds, where he enjoyed his favourite exercise. He died March 28, 1838, in his seventy-fourth year, leaving a widow, three sons, and a daughter.

To those who are acquainted with Morton's plays only by reading them, his uniform and great success will probably be matter of surprise; to those who are engaged in dramatic writing, it must be no less a matter for investigation. Morton has no claim to the reputation of a great dramatist. He is deficient in the higher qualities of the art. He gives no true representations of character either in its broad and strong markings or in its nicer discriminations; he shows nothing of the real operation of motives, nothing of the genuine workings of feeling; his serious and his comic characters are alike artificial and exaggerated; they are strictly and peculiarly stage-characters, and anything resembling them in real life will rarely if ever be met with. But he has remarkable dramatic tact: he foresees distinctly what may be effected in the performance, and the situations as well as the characters are admirably contrived for displaying an actor's skill, abounding as they do in sudden transitions of feeling and bursts of passion, overflows of excessive liveliness, or exhibitions of strange peculiarities, such indeed as have never been witnessed, but which, when well performed, are exceedingly amusing. His dialogue has no wit and little genuine humour, but is never languid or heavy; and the very speeches which when read produce a smile of contempt or a feeling of incredulous disgust, afforded to Lewis, Munden, Quirk, Fawcett, Emery, John Kemble, and Edmund Kean, the medium by which they were enabled to exhibit the triumphs of the actor's art.

MORVEAU, GUYTON DE. [GUYTON DE MORVEAU.]

MORYSON, or MORISON, FYNES, was a native of Lincolnshire, and born in 1566. He matriculated as a student at Cambridge in 1580, and received his degree of M.A. in 1587; after which he set out on a course of travel, in part on foot over a large portion of the European Continent. His travels extended over a period of ten years, and on his return, in 1598, he went to Ireland as secretary to Mountjoy, the lord deputy of that country. His account of his journeyings was not published till some three years after his death, when it appeared in the form of a large folio volume of 900 pages, entitled—'Itinerary, containing his Ten Years' Travel through the dominions of Germany, Bohmerland, Switzerland, Netherlands, Denmark, Poland, Italy, Turkey, France, England, Scotland, and Ireland, in 8 parts,' London, 1617. This work was first written in Latin, and then translated by himself into English. It contains some minute and interesting details of Continental and English manners of that time, but as a whole the work is very formal and wearisome. 'A History of Ireland, from the year 1599 to 1603, with a short Narration of the State of that Kingdom from 1169; to which is added a Description of Ireland,' was published at Dublin in 1735 in 2 vols. 8vo, and is commonly described as a distinct work; but it is merely a reprint of the second part of the 'Itinerary,' which is there described as containing "the rebellion of Hugh, earl of Tyrone, and the appeasing thereof." Like the first part of the 'Itinerary' it is written in the form of a journal, and it includes an account of the country, as well as of the rise and suppression of the insurrection; altogether it is an important source of information respecting the state of Ireland at the close of the 16th and beginning of the 17th centuries. Fynes Morison died about 1614.

MOSCHELES, IGNATZ, a celebrated composer and pianist, born at Prague, Bohemia, May 30, 1794. His father was an eminent merchant of that city, and he himself was destined, and at first educated for the same profession. But his precocious genius and propensity for music induced his family to yield to a bent which could not be resisted; and his father resolved to give him the best musical instruction the country could afford. After having acquired the rudiments of the art he was placed at eight years old under Dionysius Weber, director of the Conservatory of Prague, then, as now, one of the greatest music-schools in Europe; and there he laid the foundation of that deep and solid learning by which he is characterised as an artist. At eleven years old he was the first pianoforte player in Prague. At the same time he made many essays in composition, and produced ambitious works, which however were never given to the public. He was fourteen

when he first went to Vienna, which then presented a constellation of musical greatness. Haydn was still above the horizon, and Beethoven was in his zenith. The young aspirant was kindly received by these illustrious men; and by their counsels placed himself under Albrechtsberger, Beethoven's former teacher, and the most renowned theorist of his day. By indefatigable study and application his progress was rapid. He became the great attraction of the principal concerts of Vienna, and soon divided with Hummel the honour of being reputed the greatest pianoforte performer in Germany; while his compositions for that instrument began to take the high place they still hold among the classical music of the age.

After making the tour of Germany, Holland, and France, Moscheles came to England in 1820; and what was intended as a mere visit became a fixed residence of more than a quarter of a century. His arrival was heralded by a brilliant reputation; and he at once made an impression on the public which has not been equalled by any of his successors. In his hands the pianoforte appeared almost a new instrument; he had developed its powers in a manner of which few persons in this country had at that period any conception. The pianoforte music of Beethoven, with its great masses of harmony and endless variety of effects, rivalling the grandeur and richness of a great orchestra, was as yet little known in England. Moscheles, by his performance of the sonatas and concertos of that great master, and of his own compositions belonging to the same school, excited astonishment and delight whenever he appeared in public. Through his achievements the pianoforte not only became, in this and other countries, a more and more fashionable instrument, but assumed increasing importance in the estimation of musicians. Its successful cultivation became an object of the highest ambition; and a host of pianists sprang up, who contended throughout Europe for the palm of victory. As types of this class it is sufficient to mention the names of Thalberg and Liszt, who (the first especially) have carried the mechanism of execution to a height which Moscheles certainly did not reach; and the consequence was, that Moscheles was at length eclipsed in the eyes of the multitude, by a race of more wonderful performers, in the same manner as he had eclipsed those who had gone before him. But there was this great difference between him and his successors. He, while, by his surprising execution, he enlarged the powers and capacities of the pianoforte, remained a firm adherent of the great classical school of music, and he constantly proved his adherence by the pure style both of his compositions and performances. Those who succeeded him carried pianoforte-playing beyond him; but in music they fell far short of him. His influence has been salutary, theirs has been injurious; his has been permanent, theirs transitory.

During his long residence in London, and while he added many masterly and well-known compositions to our permanent stock of classical music, Moscheles was probably the most successful teacher we have ever possessed. His lessons were looked on as indispensable by every student of the piano, amateur or professional, who wished to acquire a real mastery of the instrument; and his industry, consequently, was persevering and indefatigable almost beyond example. At length, when he was beginning to feel the fatigues of so laborious a life, he was offered the situation of professor in the Conservatory of Leipzig, and accepted the post. He left England accordingly in 1846, having immediately before his departure conducted, jointly with Mendelssohn, the great Birmingham musical festival of that year. He has continued ever since to reside at Leipzig, discharging his quiet but important duties; and such has been his influence on the prosperity of the Conservatory, that the number of students since 1846 has gradually trebled. Having obtained comparative leisure for the exercise of his genius, he has produced many compositions in a greater variety of styles than formerly, including several German songs, and other pieces of vocal music.

MOSCHEROSCH, JOHANN MICHAEL, a German writer of the 17th century, generally known under the pseudonym of PHILANDER VON STRZEWALD, was born on the 5th of March 1600 at Willstadt, a small town in Hanau-Lichtenberg, where his father was preacher. Respecting his life few particulars of any interest are known, for all may be comprised in the statement that, after studying at Strasbourg, he filled successively a variety of appointments, until in 1656 he was made president of the Consistory at Hanau; and that he died, April 4, 1669, at Worms, while upon a journey to visit his son at Frankfurt-on-the-Main.

As a writer, Moscherosch obtained much popularity in his time by his 'Wunderliche und wahrhafte Gesichte Philanders von Sittewald,' in 2 vols., 1650, a collection of satirical pieces in the form of visions, a species of fiction greatly in vogue at that period as the vehicle of satire and allegory. He may in fact be termed the German Quevedo, his 'Gesichte' being to a certain extent a paraphrase of the Spaniard's 'Sueños,' with adaptations to the manners and foibles of his own countrymen. Notwithstanding too that his style falls short of the concise terseness and energy which mark his original, he may be considered one of the best German prose-writers of the 17th century, gifted with great humour, and displaying not only considerable knowledge of the world, but also great force of satire and ridicule, both serious and comic.

MOSCHOPULUS, MANUEL. Several treatises on grammar, attributed to a Greek writer of this name, are extant; but there is some difficulty in saying who he was and when he lived. The opinion

generally received appears to be that there were two of the name: an elder, called Moschopulus of Crete, or the Grammarian; and a younger, who is called his nephew. The elder probably lived under Michael VIII., Palaeologus, about 1270. Some writers have spoken of a third Moschopulus, who taught Greek in Italy in the latter part of the 15th century; but this fact does not seem well established, and we may perhaps attribute all the works extant under the name of Moschopulus to the uncle and nephew above mentioned.

Among these works are:—'Erotemata, or Grammatical Questions,' Basel, 1540; 'A Collection of Atticisms;' 'On Grammatical Exercise;' 'A New Epitome of Grammar;' 'On the Construction of Nouns and Verbs;' 'On Prosody;' 'Scholia on Hesiod and Pindar,' &c. Titze published at Leipzig and Prague, in 1822, 'Manuelis Moschopuli Cretensis Opuscula Grammatica,' 8vo, which contains several pieces attributed to Moschopulus which were never before printed. See also Bachmann's 'Anecdote,' vol. ii.

MOSCHUS, a native of Syracuse, and a pastoral poet, probably lived in the third century before Christ, and was the friend, and some say the disciple, of Bion of Smyrna, whose death he deplores in pathetic strains in one of his compositions, entitled the 'Epitaph of Bion.' We know nothing more of Moschus. There remain of his compositions four Idylls and a few other small pieces. The Idylls are characterised by great elegance and delicacy, but are perhaps somewhat too highly polished and overloaded with ornament. The Idyll entitled 'Cupid Runaway' is a lively little composition. The Idylls of Moschus were published, together with those of Bion, at Bruges in 1565; and the Idylls of Moschus and Bion have since been usually printed together. There have been other editions of Moschus: one of the best is by Manso, 1784 and 1807. Bion and Moschus have been inserted in most editions of Theocritus, and are also in the collections of Brunck, Gaisford, and Boissonade. Moschus has been translated into most modern languages.

MOSER, GEORGE MICHAEL, R.A., a gold-chaser and enameller, the first keeper of the Royal Academy of Arts in London, was born at Schaffhausen in Switzerland, in 1704. He came young to London, and was first employed as a chaser in gold and also of brass for the ornaments of cabinet-work, in which he obtained a great reputation. He was also an excellent medallist and a good painter in enamel, but he did not carry his works in this respect much beyond enamels for watchcases, in one of which he painted, for the king, George III., portraits of the Prince of Wales, and the Bishop of Osnaburg. Moser's chief services were as keeper of the Royal Academy, who by virtue of his office is principal teacher of the students: the superintendence of and the instruction in the antique academy are the principal duties of the keeper. Before the foundation of the Royal Academy in 1768, Moser was for many years treasurer and manager of the private academy in St. Martin's Lane. He died January 23rd, 1783, and Sir Joshua Reynolds wrote a eulogium upon him, which is printed in Malone's 'Life of Sir Joshua.' As a chaser in gold, says Sir Joshua, Moser was the first in his profession; and he had a universal knowledge in all branches of painting and sculpture. "He may truly be said," he continues, "in every sense to have been the father of the present race of artists." Hogarth, Ryabrack, Roubilliac, Wills, Ellis, and Vanderbank, were Moser's early companions, all of whom he outlived.

MARY MOSER, his only daughter, was a very distinguished flower painter, and is the only lady, besides Angelica Kauffman, who has ever been elected an Academician: she became afterwards Mrs. Lloyd. Mary Moser decorated an entire room with flowers at Frogmore for Queen Charlotte, for which she received 900*l.*: the room was called Miss Moser's room. After her marriage she practised only as an amateur: she died at an advanced age in 1819. When West was reinstated in the chair of president of the Royal Academy, in 1803, there was one voice for Mrs. Lloyd, and when Fuseli was taxed with having given it, he said, says Knowles, his biographer, "Well, suppose I did; she is eligible to the office; and is not one old woman as good as another?" West and Fuseli were ill-according spirits.

MOSES (מֹשֶׁה, *Mosé*, *Mosés*), the lawgiver of the Hebrew people, was an Israelite of the tribe of Levi, and the son of Amram and Jochebed (Exod. ii. 1; vi. 20). He was born in Egypt, in the year 1571 B.C., according to the common chronology. To evade the edict of Pharaoh, the king of Egypt, that all the male children of the Hebrews should be killed (Exod. i. 22), he was hid by his mother three months, and then exposed in an ark of rushes on the banks of the Nile. Here the child was found by Pharaoh's daughter, who adopted him for her son, entrusting him to his own mother to nurse, by which circumstance he was preserved from being entirely separated from his own people. He was probably educated at the Egyptian court, where he became "learned in all the wisdom of the Egyptians." (Exod. ii. 1-10; Acts vii. 20-22; Heb. xi. 23.) At the age of forty years Moses conceived the idea of freeing his Hebrew brethren from their bondage in Egypt, and on one occasion, seeing an Egyptian (probably some officer) maltreating an Israelite, he interfered, slew the Egyptian, and buried him in the sand. The next day, upon his attempting to reconcile two Hebrews who had quarrelled, his services were scornfully rejected, and he was upbraided with the murder of the Egyptian. Finding that his secret was known, he fled from Egypt, and took refuge with a tribe of Midianites in Arabia

Petrea, among whom he lived as a shepherd forty years, having married the daughter of their priest Jethro or Reuel. (Exod. ii. 11-22; Acts vii. 23-30; Heb. xi. 24-27.)

As Moses fed his father-in-law's flocks in the desert of Sinai, God appeared to him at Mount Horeb in a bush which burnt with fire, but was not consumed—an emblem of the state of the Israelites—and commanded him to return to Egypt and lead out his people thence into the land of Canaan. His elder brother Aaron was joined with Moses in this mission, and the power of working certain miracles was conferred upon him. On his arrival in Egypt, the Israelites accepted him as their deliverer, and after bringing ten miraculous plagues upon the land of Egypt before he could gain Pharaoh's consent to the departure of the people, he led them out through the Red Sea, which was miraculously divided for their passage, into the peninsula of Sinai. (Exod. iii., xv.) While the people were encamped at the foot of Sinai, God delivered to them through Moses, the law which, with some additions and alterations, was ever after observed as their national code. (Exod. xx.) After leading the Israelites through the wilderness for forty years, Moses appointed Joshua as his successor in the command over them, and died at the age of 120 years, on Mount Pisgah, on the east side of the river Jordan, having first been permitted to view the land of Canaan from its summit. God buried him in the valley of Bethpeor in the land of Moab, but his tomb was never made known. (Deut. xxxiv.; Jude v. 9.)

The following points in the history of Moses require further explanation.

1. The name of Moses (מֹשֶׁה) was given him by the Egyptian princess, "because," she said, "I drew him out (ἐκτρέψω, from τρέψω, to draw out) of the water." (Exod. ii. 10.) Now, under the circumstances of the case, the name is much more likely to be Egyptian than Hebrew, and its real derivation is probably that given by Jablonaky ('Opuscula,' i. 152-57), from the Coptic 'Mo,' 'water;' and 'Oudache,' 'saved.' This is confirmed by the form *Mosé*, which is always used in the Septuagint, and by the testimony of Josephus ('Antiq.,' ii. 9, 6) and Philo ('De Vita Mosæ,' ii. 83).

2. The gap left by the Scripture narrative in the early history of Moses has been filled up by Josephus, Philo, and other writers, with various legends, some of them highly improbable, of which an outline is given in Milman's 'History of the Jews,' vol. i., p. 61, &c.

3. The miracles of Moses have been made the subject of much discussion, and many divines of the Rationalist school have attempted to explain them as an advantage cleverly taken of natural phenomena, or as ingenious jugglery. Even if it were admitted that most of the ten plagues were visitations to which Egypt was subject, they would still retain all the essential characters of miracles in their increased extent and the unusual time of their occurrence, in the exemption of the Israelites in Goshen from most of them, and in their immediate cessation at the prayer of Moses. The imitation of the first three plagues by the Egyptian magicians has generally been ascribed by Jewish and some ancient Christian writers to diabolical agency, and some modern writers have considered that it can be satisfactorily accounted for by the known skill of the Egyptian priests in legerdemain. But assuredly their inability to imitate the later plagues, when they confessed, "This is the finger of God" (Exod. viii. 13, 19), is a much stronger argument for the miraculous character of these visitations, than their imitation of the earlier ones is against it. Several writers have shown how greatly the sufferings of the Egyptians from these plagues were aggravated by their physical circumstances and religious opinions. (Bryant's 'Observations upon the Plagues inflicted on the Egyptians;' Rosenmüller's 'Scholia,' Exod. vii., &c.; Milman's 'History of the Jews,' vol. i., p. 68, &c.) Other difficulties connected with this part of the life of Moses are mentioned in Winer's 'Biblisches Realwörterbuch,' vol. ii., p. 133-139. Respecting the king of Egypt in whose reign Moses led out the Israelites, and the destruction of the Egyptians in the Red Sea, see Wilkinson's 'Manners and Customs of the Ancient Egyptians,' vol. i., c. 2, p. 54. The part which Moses took as a leader of the Israelites is stated in the Scripture record to have been owing to the direct command of God (Exod. iii.), and the laws which he gave them are asserted to have emanated from God himself. (Exod. xx. 1, 22, &c.) The truth of these facts, or, as theologians express it, of the 'Divine Legation of Moses,' depends chiefly on the authority of the books ascribed to Moses.

The legislation of Moses.—The chief authority for the following account of the Mosaic legislation is the 'Mosaïches Recht' of Michaelis. The references are to the English translation of that work by Dr. Alexander Smith.

The Law is laid down in the books of Exodus, Leviticus, and Numbers, and repeated with modifications in the book of Deuteronomy, but in neither case in any systematic order. (Exod. xx.-xxiii., xxv.-xxxi., xxxiv., xxxv.; Levit. i.-viii., xi.-xxv., xxvii.; Numb. v.-x., xviii., xix., xxvii.-xxx.; Deut. iv. &c.)

The Mosaic laws must be viewed throughout as enacted for a people who stood in the peculiar situation of having been chosen by Jehovah out of the nations to preserve the knowledge and worship of the true God, and to exhibit in their history the providential dealings of God with his people.

The whole law rested on two fundamental principles, one of which was religious, and the other partly religious and partly political.

The first fundamental principle of the Mosaic law is the worship of Jehovah as the one true God; and consequently an uncompromising opposition to polytheism and idolatry, which were at that time the prevailing religious errors. Other nations, while acknowledging the supreme God as the Creator, associated with him subordinate deities, to whose agency they looked for temporal blessings. All such worship was prohibited by the first words of the Law, "I am Jehovah, thy God, which brought thee out of the land of Egypt, out of the house of bondage. Thou shalt have no other gods with me." (Exod. xx. 2, 3; Deut. iv. 35, 39.) The second commandment is an equally decisive prohibition of idolatry of every kind. (Exod. xx. 4, 6.) To render this fundamental law the more binding, Jehovah, who was already the founder of the nation of Israel by delivering them from Egypt, was represented as their king, with the consent of the people themselves, and thus idolatry became high-treason. (Exod. xix. 4-8; Deut. vi. 22-24, xxxiii. 5; 1 Sam. viii. 7; x. 18, 19; xii. 12; 1 Chron. xxix. 23; Isaiah, xxxiii. 22.)

The land of Palestine too was represented as the property of God, held under him by the people, who consequently had not the power to alienate it for ever. (Levit. xxv. 23.) This fundamental principle was carried out in the form of government which is commonly called a 'theocracy,' that is, a government under the direct superintendence of God. The laws were given by God, and could only be repealed by his command (Deut. iv. 2; xii. 32); the judges were selected usually from the caste of the priests, and are represented as holy persons, sitting in the place of God, to whose decision they submitted difficult cases by means of the Urim and Thummim. (Deut. i. 17; xix. 17.) God often made known his will concerning state affairs through the prophets, of whom a constant succession was promised (Deut. xviii. 15-22), and he promised to reward the people with prosperity if they kept the law, and threatened to punish them with calamity if they broke it. In these particulars the Israelites were distinguished from other nations as being under the more direct government of God; but nevertheless they had a well-defined civil constitution, as we shall presently see.

The second fundamental principle of the Mosaic law is the discouragement of intercourse between the Israelites and other nations. This principle was not carried so far as to prohibit the settlement of foreigners in Palestine, or of Israelites in foreign countries; but both practices were discouraged, and the latter much more than the former. Each man had his hereditary possession in land, which, as he could not sell it, he of course forfeited upon settling in a foreign country; and many of the practices enjoined upon the people were such as could hardly be observed in a strange land. To prevent their indulging in conquest, and thus running the risk of becoming subject to foreign powers, Moses confined them within certain boundaries, and also prohibited their choosing a foreigner as king. (Deut. xvii.)

This state of isolation was well suited to a nation who were sufficiently numerous to people the country assigned to them without the aid of foreigners, and who had neighbours, such as the Sidonians, who were able to conduct their commerce for them; but above all this arrangement was necessary for the preservation of the worship of Jehovah among them, prone as their history proves them to have been to follow the idolatry of the surrounding nations.

The nature of the occupations followed by the citizens of any state affects the whole complexion of its institutions. Among the Israelites, trades do not appear to have been followed to any extent as the means of gaining a livelihood. Mechanical labour was probably left to the slaves, who, in the houses of the wealthy, appear to have carried on extensive manufactures (1 Chron. iv. 21), and to the women (Prov. xxxi.); though in the building of the tabernacle we find some of the more noble mechanical arts practised by freemen. Hence it followed that there were no cities dependent on trade or manufactures, and no separate classes of citizens, or burghers, and peasants. The cities of Palestine were only fortified villages, and most of them appear to have been small.

Neither was commerce the occupation of the Hebrew people. The necessary internal commerce was provided for by the three great fairs, to celebrate which all the men were assembled at Jerusalem thrice a year, and which, in this respect, answered the purpose of modern fairs. But foreign and maritime commerce was not at all encouraged by the Mosaic institutions, many of which tended directly to obstruct it, especially the making each man a landholder and cultivator, and the law against lending money on interest. Besides the example which Moses had before him in the case of Egypt, of a powerful and civilised nation flourishing almost without foreign commerce, he was probably influenced by the following reasons in discouraging it. It would tend to introduce idolatry, to tempt many citizens to leave the country, to foster luxury, and to involve the Israelites in quarrels with other nations; while on the other hand they had all the advantages of commerce within their reach through the Sidonians and the Asiatic trading caravans. In later times Solomon pursued commerce to a great extent, though his seamen were not Israelites, but Phœnicians.

The practice of freebooting to obtain a livelihood, so common among the Arabs, and by no means unknown among their Hebrew brethren (Judges ix., xl.), was discouraged by Moses, both by the

allotment of land to every citizen, and by the little encouragement which he gave to hunting.

The real foundation of the Mosaic polity was in agriculture. The whole territory of the state was so divided that every Israelite (that is, every head of a family except those of the tribe of Levi) received a portion of land, which became the inalienable property of himself and his heirs. They had previously been a nomadic people, and a trace of that condition was long after preserved in the extent to which they pursued the breeding of cattle. This freehold basis, as we may call it, prevented the formation of classes of burghers and nobility. There was no distinction of 'caste,' except in the case of the Levites (the descendants of Levi), who were devoted to the offices of religion and learning; but even they could not be said to form a class of nobility, for they had no landed property, but were supported by the tithes of all the land.

In consequence of the equality of the citizens, the 'constitution of the republic' had a democratic character. When Moses made known any laws, he called together the whole 'congregation of Israel.' When we consider that the number of adult males was then about 600,000, it becomes probable that those whom Moses addressed on such occasions were certain persons deputed to represent the rest. Such persons are mentioned in Exod. xix. 7, 8, and Numb. i. 6; and in other passages there are enumerations of the classes of persons of whom these representatives consisted, namely, 'elders, heads or captains of tribes, judges, and officers or scribes.' (Deut. xxix. 10; Josh. xxiii. 2; xxiv. 1.)

The lowest rank of officers in the republic were the 'heads of tribes and heads of families.' These orders were a remnant of the patriarchal state, and are still kept up among the Beduin Arabs. Each of the twelve tribes had its chief. (Numb. ii.) The tribes were subdivided into greater and lesser families, called 'families and houses of fathers,' which had their respective heads. (Numb. i. 2; Josh. vii. 14.) These heads of families are in all probability the persons called 'elders' in Deut. xix. 12; xxi. 1-19; and Josh. xxiii., xxiv. It is uncertain whether the elders were chosen with reference to their age, as the word would seem to denote if it were not constantly used in other languages as a title of office or of honour, without reference to age, as in the Roman 'senator,' the Greek *πρωτόβουλος*, and the Arabic 'sheik.' It is equally uncertain in what way the heads or princes of tribes were chosen. The princes of tribes are found as late as the reign of David.

Thus the twelve tribes formed twelve distinct commonwealths, governed by the princes of tribes, and under them by the heads of families; and they sometimes acted as separate states, carrying on war independently of each other, even as late as the time of the kings. (Josh. xvii. 11-15; Judges iv. 10; xviii.-xx.; 1 Chron. iv. 41-49; v. 18-23.) The descendants of Levi were not reckoned among the twelve tribes, but were scattered over the territory of their brethren; and the number of the tribes was made up by the division of the descendants of Joseph into two tribes, which were named after his sons Ephraim and Manasseh. (Numb. i.) A certain number of persons appears to have been necessary to constitute tribes and families. (1 Chron. xxiii. 11.)

These twelve tribes were united in one republic, which generally, though not always, had a chief magistrate, whether a lawgiver as Moses, or a general as Joshua, or a judge as those whose history is recorded in the book of Judges, or a king as Saul and his successors. With regard to the judges however, it is highly probable that some of them ruled not over all Israel, but only over single tribes. The twelve tribes met in general diets (Josh. xxiii., xxiv.), and united in war against a common enemy. We have striking instances of the independence of the separate tribes in the fact that David reigned several years over the tribe of Judah alone; in the revolt of ten of the tribes from Rehoboam; and in the standing rivalry between the tribes of Judah and Joseph, which led to that revolt.

The next rank of officers, the 'Judges,' did not represent their tribes. Before their appointment Moses was sole judge, and it was to relieve him from the burden of that office that a class of judges was instituted. (Exod. xviii.) There was a judge over every ten persons, another over every hundred, and another over every thousand. From each of these orders there was an appeal to the one above, and from the last to Moses himself. Moses further ordained that when the people were settled in Palestine, judges should be appointed in every city. The choice of them appears to have been left to the people, as Moses lays down no rules for their election. In subsequent ages it generally happened that they were Levites.

In Numb. xi. 16, we have an account of the appointment of seventy men out of the elders of the people to assist Moses. These are commonly supposed to have been judges; and the foundation of the Sanhedrim, so well known in the later Jewish history, is traced to their appointment. Michaelis takes a very different, and, we think, more correct view of their office. He considers that they were a senate chosen to take part with Moses in the government, and that the institution was but temporary. We do not find them mentioned in the subsequent history of the people, and the real Sanhedrim was not founded till after the Babylonian captivity.

The 'Scribes' were an order of officers quite distinct from the judges. This office was instituted during the Egyptian captivity. (Exod. v.)

They were to be appointed in every city. (Deut. xvi. 18.) In the time of the kings they were generally taken, like the judges, from the tribe of Levi. Their name (*שֹׁפְטִים*) is derived from a root, which still exists in Arabic ('satar'), meaning 'to write.' From this and other circumstances it is concluded that they were the officers who kept the genealogical registers and apportioned the public burdens to every individual. They also conveyed to the people the general's orders in time of war. (Joah. i. 10.)

Such was the Israelitish state, consisting of the congregation of the people, governed by the heads of families, the princes of tribes, the judges, and the scribes. To this democratic constitution the tribe of Levi formed a counterpoise. They had no landed property, but received the tithes of all the other tribes. Besides these they received the first fruits of all produce, probably about a sixtieth part of the whole crop; they had a part of every sacrifice; and while the people were in the wilderness every beast killed for food was offered as a sacrifice, and afterwards the priest received a portion of every slaughtered beast that was not brought to the altar; they had everything that was devoted to God, and the redemption fees of the first-born of men and unclean cattle, a share of the spoils taken in war, and some minor articles. A calculation of these items would show that their revenues were enormous, and far more than is needed for the support of a body of religious instructors. But this was not the office of the Levites; and the circumstance of their living in cities of their own made the discharge of such an office impossible. They were indeed, in a different sense, the ministers of religion; for they performed all religious ceremonies, preserved copies of the law, explained it in doubtful cases, and were bound to read it over to the people once every seven years; but a body of religious teachers or 'doctors' did not exist till after the Babylonian captivity. The Levites were the 'literary class' of the nation, and filled all the learned professions. Difficult questions of law were to be referred to them for judgment. (Deut. xvii. 8-13; xxi. 5.) In the wilderness they formed a guard to the tabernacle and to Moses. The occasion of their obtaining the priest's office is related in Exod. xxxii. 25-29.

The head of the Levitical order was the high-priest, who was always taken from the family of Aaron. He possessed great influence in the state. He was the supreme legal authority. In Deut. xvii. 12, he is placed on a level with the judge or chief magistrate; and when there was no king or judge, the high priest was the chief magistrate, as in the case of Eli.

Moses did not determine what should be the nature of the supreme magistracy. Before his own death he appointed a successor in the person of Joshua, who was a 'military leader,' and whose office it was to put the people in possession of Palestine. Joshua was succeeded at intervals of time by the 'judges' (who must not however be confounded with the ordinary judges mentioned above). The office is mentioned by Moses (Deut. xvii. 12), but he gives no command for the appointment of the judge. The judges seem to have been somewhat analogous to the Carthaginian *suffetes*. They were not the ordinary and permanent magistrates, but they governed Israel in times of trouble. There was no regular succession of them, and it is by no means clear that all of them governed the whole nation.

The judges were succeeded by *kings*, of whom there was a regular succession from Saul to the Babylonian captivity.

Though Moses evidently desired that the state should remain a free republic under the supreme government of Jehovah, and though when the people actually asked for a king, God, by Samuel, represented their desire as both foolish and sinful (1 Sam. viii.); yet as Moses foresaw that they would wish for a king, in imitation of the surrounding nations, he gave the people power to choose one, and prescribed his duties. (Deut. xvii. 14-20.) This is one of the many instances in which Moses shows one of the highest qualities of a good legislator, in making the best provisions which the circumstances allowed, instead of attempting to carry out his views of what was best where the character of the people made those views impracticable. The following are the chief laws respecting the king:—The election of the king was left to the people (Deut. xvii. 14), with the restriction that he must be an Israelite by birth, not a foreigner (ver. 15); the appointment must be one which had the sanction of God (ver. 15), whose will on this subject was made known through a prophet, as we find from history. (1 Sam. ix., x.) He was not to keep a strong body of cavalry, nor a great number of horses (ver. 16). This law was well suited to the physical condition of Palestine, a mountainous country, which could be defended without cavalry, and where the keeping up of such a force could only arise from a spirit of conquest. This, like some others of the Mosaic laws, was disregarded by Solomon, who had an enormous number of horses. The king was forbidden to lead the people back to Egypt (ver. 16), which probably means that he was not to attempt to reconquer the land of Goshen. (Michaelis, vol. i., pp. 64-67.) He was not to take many wives, "that his heart turn not away" (ver. 17), as happened to Solomon, whose wives seduced him to idolatry. Another reason of this law was probably to discourage polygamy by the example of the king. This law was constantly broken by the kings of Israel. He was not to collect excessive quantities of gold and silver (ver. 17). He was to be well acquainted with the law, of which he was to have a copy written out at his accession, which he was to read daily (ver. 18, 19). On his obedience to these commandments depended the continuance of his kingdom (ver. 20). Besides

this fundamental law, there was an agreement or covenant between the king and the people, which was sworn to by every king at his accession. (1 Sam. x. 25; Michaelis, Art. 55.) The kingly power was therefore not unlimited; but we find that the government of the kings had always a tendency to despotism, which may be ascribed to the want of an hereditary military noblesse, and to the notion which prevailed among the Israelites, in common with other Oriental people that it was the office of the king in person to be supreme judge. As to the latter point, it certainly was not the intention of Moses that the burden of deciding causes should rest upon the kings, and very mischievous consequences resulted from their assuming the office.

The king had the power of enacting new laws, provided they were not at variance with the fundamental principles of the constitution, and of dispensing with the punishments prescribed by Moses. He had the power of life and death over the priest, even the high-priest; and it was part of his duty to reform abuses in religion. These powers, which are not mentioned in the Mosaic code, are inferred from the constant exercise of them by the kings. Such matters probably formed part of the covenant between the king and people mentioned above. It is uncertain whether he had the right to declare war at his own pleasure.

On the subject of the royal revenues Moses left no ordinance. They consisted of presents (1 Sam. x. 27; xvi. 20), of tithes from all the land (1 Sam. viii. 15), and of a *demesne* which was probably acquired by confiscations. The kings had a right to demand bond-services of the people (1 Sam. viii. 12-16; 1 Kings v. 18-18), which at first however were chiefly performed by the Canaanites who remained in the land. In later times a poll-tax was exacted on pressing occasions. They took advantage of the neighbouring Arabian deserts to rear cattle. (1 Chron. xxvii. 29-31.) Solomon derived a considerable revenue from foreign commerce. The monarchy was hereditary, for the election by the people mentioned above referred not to every individual, but to the family from which the king was to be taken. The crown did not necessarily descend to the eldest son; thus David appointed which of his sons should succeed him, and the people evidently expected him to do so. (1 Kings i. 20.) But this right of selection was afterwards abrogated.

The 'foreign relations' of the Israelites were of a simple character. Although, as stated above, it was a fundamental principle of the Mosaic law to avoid foreign intercourse, yet alliances with foreign nations were not forbidden. The alliances which were afterwards made, in the time of the kings, with Assyria and Egypt were sufficiently imprudent in their own nature to account for their being opposed by the prophets. There were however some nations whom the Israelites were commanded to exterminate—those Canaanites, namely, who dwelt in the land which they were to possess; this command was never perfectly obeyed, and in later times it was mitigated. Other nations, as the Amalekites, Ammonites, and Moabites, were represented by Moses as the hereditary enemies of the people of Israel, on account of the injuries which they had done them, and which it was their duty to revenge when an opportunity occurred. The laws regulating war against other nations (Deut. xx.) were exceedingly severe, but not more so than the international law then recognised is sufficient to account for, and the cruelties exercised by their heathen enemies are known to have been greater than any that the Israelites can be charged with. If a city resisted after being summoned to surrender, all the men in it were put to death, and the women and children made slaves. This law however only applied to the cities "which were very far off;" but as to the cities of the Hittites, Amorites, and others, which were given as an inheritance to them by God, they were commanded to save alive nothing that breathed. The spoil was to be divided among the soldiers, except in some cases, when it was devoted to God and destroyed. Horses were to be hamstrung. The fruit-trees in the enemy's country were to be spared.

During the three great festivals, when every male went up to Jerusalem, there was a suspension of arms, the assurance being given by God that during these periods no man should desire their land. (Exod. xxxiv. 24.) Michaelis endeavours to show that this truce was observed by all the surrounding nations except the Canaanites, who were therefore destroyed.

Embassies were only resorted to on particular occasions, and the persons of ambassadors were sacred. When the Israelites wanted to pass through the territories of other people, Moses asked permission of the inhabitants.

The foundation of the 'civil law' of Moses is laid in the command, 'Thou shalt love thy neighbour as thyself.' (Levit. xix. 18.)

1. *Laws relating to Property.*—Moses ordained that after the conquest of Canaan the land should be divided by lot in equal portions among the Israelites, and should then be inalienable for ever. This law was invested with a religious sanction, by representing God as the proprietor of the whole land, which the people only held as tenants under him. (Levit. xxv. 23.) The land might be sold 'nominally,' but as it reverted to the original owner or his heirs in the year of 'jubilee,' which was every fiftieth year, such a sale amounted only to the sale of the crops for fifty or fewer years. Land so sold might be redeemed on certain conditions before the year of jubilee. (Levit. xxv. 25, &c.) The law against the alienation of land admitted of exceptions, the chief of which was that land vowed to God, if not redeemed before the jubilee,

became the property of the priests. (Levit. xxvii. 16.) Moses however plainly intended that the land sold or vowed should always be redeemed before the jubilee.

A provision was made for avoiding litigation respecting the crops upon the ground at the jubilee, by the institution of the *sabbatical year*, during which there was to be neither sowing nor reaping, but all the land was to lie fallow. Every seventh year, and likewise the year of jubilee, was a sabbatical year. A promise was annexed to the law that the crop of the sixth year (or perhaps we should read of the *six years*) should be sufficient to afford food while the land lay fallow. (Levit. xxv. 20-22.) Michaelis is of opinion that the tendency of this law was to increase the national wealth by affording a strong inducement to store up corn during the six years of plenty, part of which might be sold at an increased price to the neighbouring commercial nations in the seventh year; but this seems a very unsatisfactory explanation of the matter. He also mentions other incidental advantages, as he considers them, of this institution. (Mich., Arts. 74, 75.)

The laws of the jubilee and sabbatical years do not appear to have been long observed; indeed it is plain from Levit. xxvi. 34, that Moses expected them to be disregarded. From 2 Chron. xxxvi. 21, it appears that up to the Babylonian captivity there had been seventy sabbatical years neglected. This would carry us back nearly 500 years, namely, to the reign of Saul or David, as the time at which the observance ceased.

A man's property descended to his sons, of whom the eldest had a double share. (Deut. xxi. 17.) The exclusion of daughters from the inheritance was established long before the time of Moses. (Gen. xxxi. 14.) No provision is made in the law for the support of unmarried daughters. On the occurrence of a case in which a man died leaving only daughters, Moses made the law that in all such cases the daughters should inherit their father's property, but that they must not marry out of their own tribe. The husbands of such heiresses were reckoned as the sons of their father-in-law, and took his name. Failing daughters, the inheritance passed to a man's brethren; failing them, to his father's brethren; and failing them, 'to the next of kin' of the deceased. (Numb. xxvii. 1-11.) But the law gives no directions as to determining *who* are the next of kin: probably this was already determined by custom. The Mosaic law contains nothing on the subject of wills; but we find that the right of bequeathing property other than land existed both before and after his time, and he nowhere prohibits it.

**2. Laws relating to Persons.**—The laws of Moses inculcate the most complete filial obedience. (Exod. xx. 12; compare Ephes. vi. 1-3.) The power of fathers over their sons was great, and does not appear to have ceased as they grew up. We have here a remnant of the patriarchal state. Flagrant acts of disobedience were punished with death (Exod. xxi. 17; Levit. xx. 9), which however could only be inflicted by a judicial process, and not at the pleasure of the father. (Deut. xxi. 18-21.) Fathers, and even mothers, whose wives for their sons. Next to the father, the first born had the greatest power over the family, though it does not clearly appear in what this consisted, nor whether it was exercised in his father's lifetime. Though what ever opened the womb was a first-born (Exod. xiii. 12), yet it is clear from Deut. xxi. 15, and 1 Chron. v. 1, 2, that the first born of a family was the first born to a man of all his children, and not the first born by each of his wives.

**Marriage Laws.**—Among the Hebrews, as among other Oriental nations, wives were generally bought (Gen. xxix. 15-30; xxxiv. 12; Hosea iii. 1-2), and in certain cases their price was fixed by law (Exod. xxii. 16, 17; Deut. xxii. 28, 29). Some wives were not bought, and these enjoyed greater freedom than the others. In certain cases concubines were allowed. (Exod. xxi. 7-11; Michaelis, Arts. 87, 88.)

The marriage law of Moses had in general a tendency to promote marriage, and this chiefly by his sanctioning the notion, which he found already prevailing among the people, that it was highly honourable for a man to have posterity who might perpetuate his name, and by his engraving upon this notion the law of *levirate marriages*, by which it was enacted that when a man died leaving a widow, his brother should marry her, and raise up children to his brother; that is, children who were to be accounted as belonging to the first husband, and who were enrolled in the genealogical registers in his name.

The Mosaic law prescribes no marriage ceremonies. We may conjecture from history (Gen. xxix. 22-28) that ceremonies much resembling those of the Arabians in the present day (Lane's 'Modern Egyptians,' vol. i. c. 6) were already in use, which Moses left as he found them. He connected no religious ceremony with the solemnisation of matrimony. The bridegroom might put away his wife if the *signa virginitalis* were wanting (Deut. xxii. 18-21). A right understanding of this law is very important to the explanation of the doctrine of Christ concerning divorce (Matt. v. 31-32), which has had no small influence on the marriage laws of Christian countries. (Michaelis, Arts. 92, 93.)

Moses permitted polygamy, as is proved by the laws in Exod. xxi. 9, 10, Levit. xviii. 18, Deut. xxi. 15-17; by the constant practice of it both before and after his time, connected with the fact that he nowhere prohibits it, and by the small number of the first-born compared with the whole number of males, namely, about 1 in 42 (Numb. iii. 43).

But he permitted it only as a matter of policy, "on account," as Christ said, "of the hardness of the people's hearts," that is, the difficulty of rooting out inveterate customs, and perhaps for other reasons, which are pointed out by Michaelis (Art. 96). Some of his laws have a strong indirect tendency to prevent it, for example, the buying of a wife; and notwithstanding some striking examples of its practice, as that of Solomon, it does not appear to have prevailed extensively among the Israelites. (Mich., Art. 95.) After the Babylonian captivity it ceased entirely. Moses however set limits to the practice of polygamy, not allowing *many* wives. (Deut. xvii. 17.) Moses prohibited marriages between certain near relations, some of which, those namely between parents and children, brothers and sisters, he considered as opposed to natural morality, for he calls them *abominations*, and represents them as sinful in themselves. Other marriages between relations were probably forbidden only for reasons connected with the character and habits of the people. (Levit. xviii. 20; Michaelis, book iii. c. 7.)

Of *divorce* Moses was no favourer, at least if we may judge by the way in which he speaks of the marriage bond in Gen. ii. 24; but he allowed it to a greater extent than he altogether approved, "because of the hardness of their hearts." (Matt. xix. 8.) The law of divorce is in Deut. xxiv. 1-4. If a man disliked his wife, he might put her away by giving her a writing of divorcement. She might then marry again; but if her second husband put her away or died, she might not return to her first husband. (Mich., Arts. 119, 120.) No provision is made for the support of the divorced wife. In certain cases the husband forfeited his right of divorce. (Deut. xxii. 19, 29.) The support of a widow after her husband's death was provided for, if she had no children, by the law of levirate marriages; if she had children, it was left to filial piety.

**Laws respecting Slaves and Servants.**—Moses found slavery already existing among the Israelites and their neighbours. He permitted it to continue, under certain restrictions, and his laws on this subject are conceived in the most merciful spirit (see especially Deut. xxiii. 15, 16). Slaves were acquired by capture in war, by purchase, and by the marriage of slaves. Of purchase there were four kinds: 1, when a slave was transferred from one master to another; 2, when a man under the pressure of poverty sold himself for a slave; 3, when parents sold their children; 4, when an insolvent debtor, or a thief unable to make restitution, was sold as a punishment. The value of slaves was of course variable, but in two cases it was fixed by law. (Exod. xxi. 32; Levit. xxvii. 1-8.) Besides the slaves of private individuals, there were others who belonged to the public; these were employed in menial labours for the service of the sanctuary. Slaves might have property of their own. A master might beat his slave, but not so as to kill him (Exod. xxi. 20, 21); if he even maimed him the slave was to be set free. (Exod. xxi. 26, 27.) A Hebrew slave possessed this advantage over a foreign one: he was entitled to his freedom in the Sabbatical year and in the year of jubilee, and he might be redeemed before the year of jubilee, while the stranger might be held in slavery for ever. The manumitted slave received presents from his master. (Exod. xxi. 2-11; Levit. xxv. 39-55; Deut. xv. 12-18.) Slaves had to conform to some of the principal religious ceremonies observed by the Israelites.

Besides the slaves, there were day labourers, who were to share in the rest of the seventh day, and in the spontaneous produce of the Sabbatical year, and whose hire was to be paid every day before sunset. (Levit. xix. 13; xxv. 6; Deut. xxiv. 14, 15.) The statute in Deut. xxv. 4, besides its literal meaning, probably meant also that servants were to share in the food they prepared for their masters.

**The Goel, or Blood-Avenger.**—There was a custom of ancient standing among the Israelites, and which exists to this day among the Arabs, which made it the duty of the nearest relation of a murdered person to pursue the murderer and kill him with his own hands. This relation is called in Hebrew 'Goel,' in Arabic 'Tair.' This usage, which was probably of high antiquity, is dangerous to any state, from the haste and passion in which vengeance is exercised, and from the hereditary feuds which it causes between families. Moses dealt with this as he dealt with other long-established customs of which he disapproved, not making the vain attempt to root it out, but surrounding it with provisions calculated to mitigate its evils. Six cities of the Levites were appointed as cities of refuge for the manslayer, and every facility of access to them was provided. If he escaped to one of these, he was safe from the avenger of blood. (Exod. xxi. 12, 13; Numb. xxxv. 9; Deut. xix. 8.) But these cities afforded no asylum to the wilful murderer, who, when proved to be guilty, might be torn even from the altar. (Exod. xxi. 14; Deut. xix. 11-13.) At the death of the high-priest, the person who had taken sanctuary might leave the city of refuge in safety. These laws seem to have acted as an effectual check on the practice of blood-avenging, for an instance of it rarely occurs in the later history of the Israelites.

The Mosaic law commanded kindness to be shown to strangers, who, unless they belonged to certain nations that had been guilty of flagrant outrages against the Israelites, might "enter the congregation of Jehovah," that is, might be naturalised in Israel. Moses inculcates veneration for old age, and kindness to the deaf and blind. (Levit. xix. 14, 32; Deut. xvii. 18.) He made laws in favour of the poor (Deut. xv. 11), besides adopting usages already in existence for

their benefit; though many of his laws discourage begging. He recommended the people to lend to them (Deut. xv. 7-11), he gave them the right of gleaning, and of collecting the spontaneous produce of the earth during the Sabbatical year (Levit. xix. 9, 10; xxv. 5, 6; Deut. xxiv. 19-21; Ruth, ii. 2-19), and the remains of the second tithes and firstlings, which were sacrificed as thank-offerings, were given as entertainments to the poor. (Deut. xii. 5-12, 17-19; xiv. 22-29; xvi. 10, 11; xxvi. 12, 13.)

*Personal Rights and Obligations.*—*Vows to God* were declared binding, though the making of them was neither encouraged nor discouraged. They were remissible in certain cases. (Levit. xxvii.; Numb. xxx.; Deut. xxiii. 21-23.)

On many points relating to *debt* the Mosaic law is silent. An insolvent debtor was liable to have his hereditary lands seized, also his houses and other property, his clothes (but with a humane restriction, Exod. xxii. 26, 27), and his person; he might be sold into slavery with his wife and children (Levit. xxv. 39). Of imprisonment for debt the Mosaic law knows nothing, and still less of torture, though both have been attributed to it from a misunderstanding of some passages in the New Testament (Matt. v. 26; xviii. 30, 34.)

*Pledges* were allowed to be taken, under certain regulations which were meant to secure the debtor from the rapacity of his creditor. (Deut. xxiv. 6, 10-13; Exod. xxii. 26, 27.) Of *suretyship* the Mosaic law says nothing, but it is frequently referred to in the Proverbs of Solomon. *Interest* on loans, whether of money or produce, was forbidden to be taken from Israelites, but it might be received from strangers. (Exod. xxii. 25; Levit. xxv. 35, 37; Deut. xxiii. 19, 20.) The reasons for this prohibition appear to be founded entirely on the peculiar polity of the Israelites. (Michaelis, Art. 155.) Loans are regarded by Moses as *alms*. In the seventh year a poor debtor could not be sued, as there were no crops on the ground. (Deut. xv. 1-11.) It does not appear to be the meaning of this law, that debts were cancelled in the seventh year, though perhaps such a release took place in the year of jubilee. Injuries done to property were to be compensated, and things found were to be restored to the owners; there are several laws on the details of these cases. (Michaelis, book iii. c. 12, pt. 3.)

The Mosaic law contains several enactments on behalf of beasts, many of which have a tendency to preserve the breed of such as are useful to man.

*Police Law.*—1. *Civil Police.*—The population was to be ascertained by a periodical census, the time of which is not specified in the statute. Every individual numbered paid a capitation tax of half a shekel. (Exod. xxx. 11-16.)

2. *Military Police.*—Every man above 20 years old was liable to be called out to war. (Numb. i. 3-46; xxvi. 2.) But generally a selection was made by the Scribes, who also appointed the officers. Under the kings permanent officers were appointed. Exemption from military service was allowed to the man who had built a house and not yet occupied it, to him who had planted a vineyard or oliveyard and not yet enjoyed its fruit, to him who had betrothed a wife, and to him who had married within a year. (Deut. xx. 5-7.) Cowardice was also a ground of exemption, but attended with disgrace. The spoil taken in war was divided into two parts; that in persons and cattle was collected and distributed among the people, those who went to war and those who remained at home having equal portions, and that in effects was the property of the soldier who seized it. Many regulations are made to promote cleanliness and discipline in the camp, which with this object was declared to be sacred.

3. *Ecclesiastical Police, or the Ceremonial Law.*—In this part of the Mosaic law many ceremonies are ordained which appear frivolous and unmeaning, unless we keep in view the fact asserted both in the Psalms and in the New Testament, and fully explained in the Epistle to the Hebrews, that most of the Levitical rites were only types of the blessings to be enjoyed under the Christian dispensation. We do not enlarge on this subject, as we are not here regarding the Mosaic laws in their theological aspect.

*Circumcision*, which had long before been given by God to Abraham, was adopted in the Mosaic law as the ceremony by which every male was admitted to the civil and religious privileges of the people of Israel. (Gen. xvii. 9-14; Levit. xii. 13.) Every bond-servant among the Israelites was obliged to submit to this rite, and also every stranger who wished to be naturalised among the people and to partake of the passover.

*Offerings* were of three kinds: 1. *Bloody*, consisting of slaughtered animals, which must be those regarded by the law as *clean*. They were either *burnt-offerings*, which were wholly consumed on the altar; *sin-offerings*, made on account of any sins committed through ignorance, of which only a part was laid on the altar; or *feast-offerings*, or *peace-offerings*, of which only the fat parts were burnt and the rest eaten. 2. *Unbloody, or meal-offerings*, consisting of meal, bread, &c. 3. *Drink-offerings*, consisting of wine, of which part was poured on the victim and part given to the priests. Sacrifices might only be offered at the place which God might appoint, which in the Wilderness was the tabernacle: this law was doubtless intended to prevent idolatry. Besides their typical significance, these sacrifices had important moral and physical advantages, which are pointed out by Michaelis. (Arts. 189-191.)

Two *tithes* of all the produce of the land were due to God. The first was paid to the Levites for their support, and the second went to provide the feast-offerings. In addition to the tithes, the *first-born* of all animals, including man, were sacred to God, and belonged to the priests. This law had its origin in the sparing of the first-born of the Israelites when those of the Egyptians were slain. The first-born of beasts that might be offered in sacrifice were not to be redeemed, but those of other beasts and of man might be redeemed at a fixed price. (Exod. xiii. 1, 2, 11-16; Levit. xxvii. 26; Numb. xviii. 15-19.) The first-fruits of crops and other produce belonged also to the priests. (Levit. xxiii. 9-14; Numb. xv. 19-21; xviii. 11-13; Deut. xviii. 4-5.) There was another sort of firstlings which were employed for feast-offerings. (Deut. xii. 6; xiv. 23; xv. 19-23.)

*The Sabbath.*—Every seventh day was a day of rest and of religious worship. This was no new law of Moses; it had been enjoined upon man, at the creation of the world, to celebrate the resting of God on the seventh day. (Gen. ii. 3.) In the Mosaic law it was also a commemoration of the deliverance of the Israelites from Egypt, and some of the peculiarities in the Jewish observance of the day are undoubtedly connected with that fact. No servile work whatever was to be done on the Sabbath, except what was necessary for the service of the sanctuary. The punishment for transgressing this law was death. (Exod. xvi. 22-30; xx. 8-11; xxiii. 12; xxxi. 12-17; xxxiv. 21; xxxv. 1-3; Numb. xv. 32-36; Deut. v. 12-15.)

There were three *annual festivals*, each lasting seven days, during which all the males in Israel were obliged to assemble at the place where the sanctuary stood. (Exod. xxiii. 14-17.) These were—1, The passover, to commemorate the *passing over* of the Israelites by the destroying angel when he slew the first-born of the Egyptians. It fell on the evening after the 14th day of the first month of the year, that is, very near the vernal equinox, and at the beginning of harvest. 2, The feast of pentecost was held at the end of harvest, on the 50th day after the 16th of the first month. It was a feast of thanksgiving for the harvest. 3, The feast of tabernacles began on the evening of the 14th day of the seventh month, about October. It was a feast of thanksgiving for the fruitage and vintage. Remarks on the uses of these festivals and an account of the other feast days will be found in Michaelis (Arts. 197-201). He reckons that in the whole year there were 30 feast days, besides the 52 Sabbaths.

Many circumstances of the *private life* of the Israelites are regulated by the Mosaic law with great precision. The laws on this subject may be divided into two classes. 1, Regulations respecting meats, and their distinction into clean and unclean, with the prohibition against eating blood. 2, Laws relating to defilements, including those concerning leprosy. Both these classes of laws conducted greatly to the preservation of health and morality, and formed a strong barrier against idolatry. (Michaelis, Arts. 202-217.) For an account of several miscellaneous precepts of the Mosaic police law the reader is referred to Michaelis, book iv. c. 5.

Respecting the *criminal law* of Moses we have not space to enter into details. It is ably treated by Michaelis (book v.). This part of the Mosaic institutions is distinguished by equal justice, and by a careful gradation of punishment according to the enormity of crimes. Some offences, especially those of a religious character, were punished with a severity which to us may appear excessive; but this is only the carrying out of the principle by which the people were regarded as set apart to preserve the worship of the true God, and according to which it was a matter of the first importance to remove every defilement from among them. The Mosaic penal law introduced a vast improvement, by abolishing the practice of punishing children for the crimes of their fathers, and fathers for those of their children. (Deut. xxiv. 16.) The punishments are not cruel. They were—1, Death by the sword, or by stoning, followed in some cases by inflictions on the corpse of the criminal. There were no capital punishments which inflicted torture. 2, Exile, or excision from 'the congregation of God.' 3, Corporal punishments. 4, Fines. 5, Offerings to make atonement for sin: these kept up the idea that all offences were committed against God. None of the punishments for the living were degrading; for stripes are not considered so by Oriental nations, nor were they by the Hebrews.

Of the form of judicial procedure little is known, except that it was extremely simple. The purity of the judgment-seat is guarded by several statutes against bribery and partiality. Causes were heard in the gate of the city, according to immemorial usage in the East; and thus publicity was secured, as the city-gate was the common place of resort. Moses makes no mention of advocates. Witnesses, of whom two or three were necessary in capital cases, were examined upon oath. (Levit. v. 1; Numb. xxxv. 30; Deut. xvii. 6, 7.) In some cases oaths of purgation were required from the accused. (Levit. vi. 2, 3.) Sometimes a reference was made to God by lot in civil cases; and in criminal cases the lot was occasionally resorted to, but only for the discovery and not the conviction of the criminal. A criminal's confession might convict him capitally. (Josh. vii. 14-21; 1 Sam. xiv. 37-45; 2 Sam. i. 13-16.) Moses nowhere appeals to rewards and punishments in another life as a sanction for his laws.

The greatest care was taken to preserve the law. One copy of it was written in a book which was deposited in the sanctuary beside the ark of the covenant (Deut. xxxi. 26), and another copy was

engraven on stones, which were fixed on Mount Gerisim or Mount Ebal (probably the former) with solemn ceremonies, in which the people swore to keep the law, blessings were invoked on the obedient, and curses denounced on the transgressors. (Deut. xxvii., xxviii.)

Viewed as a whole, the laws of Moses seem perfectly adapted to the character of the people for whom he legislated, and to the physical and political country they were to inhabit. No mistake can be greater than that which is made by many people when they suppose that because these laws came from God, therefore they are the best code that can ever be formed. Had they possessed this ideal excellence, they would have been really bad laws, because they would have been unsuited to the nation they were intended to govern. They were not meant to be unalterable; indeed some of them were altered by Moses himself. They were only intended to last for a time, and therefore, when considered with reference to our present experience of human affairs, they appear to have many imperfections.

The origin of the Mosaic legislation is declared in Scripture to be from God, by which we must understand that these laws were sanctioned by God and published by his command. It has already been observed that many of the laws did not originate with Moses, but were ancient observances which he adopted in his code by the command of God. (See also Iken, 'Diss. II. de Institutis et Ceremoniis Legis Mosaicæ ante Mosem;' Reimar, 'Cogitationes de Legibus Mosaicis ante Mosem.')

And moreover, when we remember that he was brought up in Egypt, and was "learned in all the wisdom of the Egyptians" (Acts vii. 22), when we compare various parts of his laws with similar institutions which existed in Egypt (for example, the freehold basis of the constitution, the separation of the caste of priests from the rest of the community, the discouragement of commerce, and the measures resorted to for keeping the Israelites distinct from other nations), it becomes highly probable, if not certain, that the Mosaic institutions were largely modelled on those of Egypt. This opinion, which is held by nearly all the best critics who have examined the laws of Moses, has been unaccountably regarded as opposed to the divine character of these laws, as if divine inspiration must necessarily deprive a legislator of the wisdom which he already possesses, and prevent him from adopting, under the sanction of that inspiration, whatever good he may find in the institutions of other nations. On the other hand there are many points of opposition between the Mosaic and Egyptian laws which it is impossible to overlook. Several of these are adduced by Michaelis, in a paper in the 'Comment. Soc. Götting,' vol. iv., 'De legibus quibusdam a Mose eo fine latæ, ut Israelitis Ægypti cupidis Palestinam caram faceret.' The spirit of the whole law was, as Moses himself asserts (Levit. xviii. 3), diametrically opposed to that of the Egyptian as well as the Canaanitish institutions. For these reasons it is impossible to regard the Hebrew legislation as a mere copy of the Egyptian.

Some divines of the Rationalist party have maintained that Moses was not the author of the whole of the legislation of the Pentateuch. This opinion is opposed to the evidence which exists in favour of the genuineness and authenticity of the books of Moses.

MOSHEIM, JOHANN LORENZ VON, was born of a noble family at Lübeck, October 9, 1694. He was educated at the gymnasium of Lübeck and the university of Kiel. At Kiel he succeeded Albert zum Felde as professor of philosophy in the university. At the invitation of the duke of Brunswick he became professor of theology in the university of Helmstedt, where he remained from 1725 to 1747, when he was appointed professor of theology at Göttingen and chancellor of the university. Here his lectures on theology attracted all classes of students. He died on the 9th September 1755, at the age of sixty-one. He was thrice married. By his first wife he had two sons and one daughter, and by his third wife one daughter, afterwards Duchess of Noailles.

Mosheim was greatly distinguished as a preacher. His style was formed on the model of the English and French preachers, Tillotson and Watts, Saurin, Massillon, and Fléchier. He has been compared to Fénelon for the graces of his style, and he is considered one of the founders of the modern German literature. His talents were of a very high order, his learning was immense, and his character was exemplary.

The whole number of Mosheim's works is 161. He himself published at Helmstedt, in 1731, a catalogue raisonnée of the works which he had published up to that time. His best known work is the 'Institutionum Historiæ Ecclesiasticæ, Antiquioris et Recentioris, libri iv.' This work, which is written in Latin, was first published in 2 vols. 12mo., in 1726, and the enlarged edition, in composing which he examined the original authorities, was published in 4to, in 1755, just before Mosheim's death. Another edition was published in 1764, with an account of Mosheim's writings by Miller, one of his pupils. It was translated into German by Von Kiem, and by J. R. Schlegel. Schlegel's translation is the better, and is enriched with valuable notes. It has also been translated into French, Dutch, and English. The first English version was made in 1764, by Dr. Maclaine, an assistant minister at the Hague, and has been frequently reprinted. It is very unfaithful. Dr. Maclaine's professed object was to improve Mosheim's style, by adding words and rounding off periods. His alterations and additions constantly express his own sentiments instead of Mosheim's, and sometimes flatly contradict his author. In

RIOA. DIV. VOL. IV.

1832 a faithful translation, with valuable notes, was published by Dr. Murdock, of New Haven, Connecticut, United States. Mosheim's 'Ecclesiastical History' extends from the birth of Christ to the beginning of the 18th century. Each century is treated of separately, under the two heads of External and Internal History. The External History comprises 'prosperous events,' or the extension of the Church by the efforts of its public rulers and private members, and 'calamitous events,' such as persecutions and infidel attacks. The Internal History includes the history—1, of the Christian doctors; 2, of the doctrines and laws of the Church; 3, of its ceremonies and worship; 4, of heresies. This arrangement is open to several objections, of which the chief are, that it is too artificial; that what Mosheim calls external and internal history constantly run into each other (and indeed it is not easy to understand how any part of the history of a community can be said to be 'external' to it); and lastly, it imposes on the historian the necessity of deciding what no human mind can decide, namely, what events are prosperous and what calamitous to the Church. But the work of Mosheim is open to a graver objection. He has not treated his subject with the proper spirit of pious interest, though his own orthodoxy is undoubted. Nevertheless, his deep knowledge, his patient research, his general candour and impartiality, and his philosophical spirit, entitle Mosheim to a place among the best Church historians. His works gave an impulse to the study of Church history in Germany, which has produced, among other works, those of Pfaff, Baumgarten, Walsh, Semler, Schröckh, Henke, Schmidt, Neander, &c. Of these, that of Schröckh, a pupil of Mosheim, is the fullest, extending to 45 vols. 8vo. Neander's 'Kirchengeschichte' is however a far superior work.

Mosheim published several works on Church history, besides the 'Institutiones,' of which the most important are, his tract 'De Rebus Christianorum ante Constantinum,' and 'Institutiones Historiæ Christianæ Majores,' 1739, which is a full Church history of the first century. Among his other works are, a Latin translation, with notes, of Cudworth's 'Systema Intellectuale,' Jena, 1738; six volumes of sermons, 1747; and nine volumes on the 'Morals of Holy Scripture,' 1773.

MOTHE-LE-VAYER, FRANÇOIS DE LA, was born at Paris in 1688, and in 1625 succeeded his father as substitute to the procureur-général; but he soon abandoned his profession to pursue his favourite study of history. In 1639 he was admitted into the Academy. Cardinal Richelieu being pleased with his work on the education of a prince, intended to appoint him preceptor to the dauphin, but the queen, Anne of Austria, refused her consent. Notwithstanding this, in 1649 he was entrusted with the education of the young Duke of Orleans, whose astonishing progress under the tuition of Le Vayer induced the queen to acknowledge the talents of the master, and confide to him the completion of the king's (Louis XIV.) education. He died in 1672, in the eighty-fifth year of his age.

Of his numerous works, which obtained extraordinary success, the most important are—1, 'Discours de la Contrariété d'Humeurs qui se trouve entre certaines Nations, et singulièrement la Française et l'Espagnole,' 8vo, Paris, 1636. The title-page states it to be a translation from the Italian of Fabricio Campolini. 2, 'Considerations sur l'Eloquence Française,' 12mo, 1638. 3, 'De l'Instruction de Mons. le Dauphin,' 4to, 1640. 4, 'De la Vertu des Païens,' 4to, Paris, 1642; 3rd edition, 1647. Several collections of his works have been made; but the best is that of Dresden, 14 vols. 8vo, 1756-59, the materials of which were furnished by Roland le Vayer, nephew of the author. La Mothe is styled the Historiographer of France by Voltaire ('Siècle de Louis XIV.'). who also mentions him as a notorious Pyrrhonist.

The great diversity of opinion which La Mothe observed in the world seems to have laid the foundation of that scepticism which pervades his writings. His society was eagerly sought by all the learned and witty of his time, and he was readily admitted into the brilliant circles of Mademoiselle Gournay, who at her death bequeathed him her library. La Mothe was nearly fifty years of age before he published his first work. From that time (1636) he published regularly every year. His work 'De la Vertu des Païens' was answered by Arnauld, in a tract entitled 'De la Nécessité de la Foi en Jesus Christ.' La Mothe's book not selling so fast as the bookseller desired, he made grievous complaints. "I have a method that will facilitate its sale," said the author, and immediately procured a prohibition against the reading of it, which had the desired effect, for the work was read with admiration, and every copy sold off. The story is very characteristic of the man. His writings were of little real value.

MOTTE, A. H. DE LA. [LA MOTTE.]

MOTTEUX, PETER ANTHONY, was born at Rohan in Normandy, in 1660, at which place he also received his education. After the revocation of the Edict of Nantes he came over to England, and succeeded in establishing himself in business, and kept a large East India warehouse in Leadenhall-street. Being master of several languages, he obtained a situation in the foreign-letter department of the Post-office. His death, which was attended with suspicious circumstances, took place on his 58th birth-day the 19th February 1718, in a disorderly house in the parish of St. Clement Danes. His remains were interred in the church of St. Mary Axe, London. Motteux so completely acquired the English language as to be able to produce a

translation of 'Don Quixote,' and subsequently to write several songs, prologues, and epilogues, one of the latter of which will be found at the end of Sir John Vanbrugh's comedy of 'The Mistake.' He also wrote several plays, namely: 'The Loves of Mars and Venus,' London, 1697, 4to; 'Beauty in Distress,' a tragedy, Lond., 1698, 4to; 'The Temple of Love,' 1706, 4to; 'The Amorous Miser,' a comedy in 3 acts, 1705, 4to; also a poem on Tea, 1712, 8vo, with several French works translated from the English. With respect to the Don Quixote however it is necessary to remark that it would appear from the title-page of an edition of 'Don Quixote,' London, 1706, 4 vols. 8vo, that Motteux was only the publisher, and that the work was translated by several hands, and printed for Samuel Buckley, at the Dolphin, Little Britain: he has however been generally termed the translator, and he probably was one of the several hands engaged in the work.

MOWBRAY, SIR ROGER DE, of Barnbougle, son of Geoffrey de Meubray, lord justiciar of Lothian in the end of the 13th century. Sir Roger was lord justiciar of Scotland from 1319 to 1321; when, having engaged in a conspiracy against King Robert Bruce, he was seized and put in prison. He died here before trial; but notwithstanding, process was led against him, and sentence pronounced on his dead body. (Fordun xiii. l.)

MOZART, JOHANN - CHRYSOSTOMUS - WOLFGANG - GOTTLIEB, was born at Salzburg, January 27, 1756. His father, Leopold, the son of a bookbinder, was sub-director of the chapel of the prince-archbishop of Salzburg, and employed the hours not devoted to the duties of his office in teaching the rules of musical composition, and also in giving lessons on the violin. His 'Violinschule,' a work in quarto, published at Augsburg, in 1769, was much esteemed in its day, and may still be profitably read by scientific students. He married Anna-Maria Pertl, and what has been pointedly noticed by M. Schlichtegroll (whose 'Necrology' has proved highly useful to us in the present instance), will not perhaps be thought altogether unworthy of remark by those who investigate moral and physical causes and effects, namely, that this couple, the parents of one so admirably organised for creating beautiful harmonies, were distinguished by personal beauty of the rarest kind. They had several children, all of whom died when but a few months old, except the subject of this notice and a sister four years his senior. The latter received instructions on the harpsichord from her father when her brother had scarcely completed his third year, and at that early period the child evinced in the most decided manner the pleasure afforded him by combined sounds, as well as his aptitude for music generally. His amusement was to seek out 'birds' on this instrument, and his success was followed by the strongest demonstrations of infantile joy.

When the young Mozart was four years old, his father, at first hardly in earnest, taught him a few easy minuets and simple lessons, each of which he learnt in about half an hour. In less than two years more appeared the first dawn of his talent for composition; he invented short pieces of music, which his father noted down; but it is to be regretted that not one of these curiosities was preserved. That great sensibility which almost invariably is a concomitant of genius, and which never forsook him, was apparent from the moment he could express himself. 'Do you love me?' was a question he frequently put to those about him; and when he was ironically answered in the negative, his tears began to flow. In all his pursuits his ardour was extraordinary. "While learning the elements of arithmetic, the tables, the chairs, even the walls, bore in chalk the marks of his calculations. And it may not be irrelevant to state," says the author of his Memoir in 'The Gallery of Portraits,' "what we believe has never yet appeared in print—that his talent for the science of numbers was only inferior to that for music: had he not been distinguished by genius of a higher order, it is probable that his calculating powers would have been sufficiently remarkable to bring him into general notice."

Not long after he had completed his sixth year, the child excited the astonishment of his father by the production of a harpsichord concerto, methodically and correctly written, and wholly unobjectionable, except that it contained too many difficult passages. The appearance of such a phenomenon (for as such it could only have been viewed) determined the father to let the youthful prodigy be seen at some of the German courts. He at first took him to Munich, where the elector received him and his family with every kind of encouragement. In 1762 the party proceeded to Vienna, and performed before the emperor Francis I., who was not less pleased by the vivacity of the boy than amazed by his powers. In the following year the Mozart family made an extensive European tour: in Paris they resided many months, where the youthful wonder performed on the organ in the Chapelle du Roi, before the whole court. There the party gave public concerts, and in that city, in the same year, Mozart published his two first works, when he had not finished his eighth year!

In 1764 the Mozarts arrived in London, and remained till the summer of 1765. "Here," says the above-mentioned memoir, "the boy exhibited his talents before the royal family; and underwent more severe trials than any to which he had been before exposed, through which he passed in a most triumphant manner. So much interest did he excite in this country, that the Hon. Daines Barrington drew up an account of his extraordinary performances, which was read before the Royal Society, and declared by the council of that body to be

sufficiently important to be printed in the 'Philosophical Transactions,' in the 60th volume of which it appears." And in the 69th volume of the same work, Dr. Burney remarks:—"Of Mozart's infant attempts at music I was unable to discover the traces from the conversation of his father, who, though an intelligent man, whose education and knowledge of the world did not seem confined to music, confessed himself unable to describe the progressive improvements of his son during the first stages of infancy. However, at eight years of age I was frequently convinced of his great knowledge in composition by his writings; and that his invention, taste, modulation, and execution in extemporary playing, were such as few professors are possessed of at forty years of age." During this residence in our metropolis, he composed and published six sonatas, which he was permitted to dedicate to the queen of Great Britain. The family then returned to the Continent. At the Hague, Mozart published six more sonatas. The party now paid a second visit to Paris, and returned to Salzburg in 1768. In the same year Mozart, by desire of the emperor Joseph II., composed an entire opera, 'La Finta Semplice,' which was much commended by Hasse, who was then in high repute, and by Metastasio, but as it never was publicly performed, it is now unknown either as a whole or in part, and probably its chief merit was of a relative kind.

In 1769 Mozart, at the age of fourteen, was appointed director of the archbishop of Salzburg's concerts. Soon after he went with his father to Italy, and at Rome gave a remarkable proof of the power he possessed of fixing his attention, and of memory, by noting down the famous 'Miserere' of Allegri, after his return from the pontifical chapel, where he had heard it performed. At Bologna he was introduced to the celebrated Padre Martini, who, after testing the youth's abilities, became one of his warmest admirers. While in that city, he was unanimously elected a member of the Academia Filarmonica; and at Rome the pope conferred on him the order of the Golden Spur. At Milan, 1770, he wrote and brought out his second opera, 'Mitridate,' which was performed twenty nights consecutively. In 1773 appeared his 'Lucia Silla,' which had twenty-six successive representations. In the same year he produced other works, among which were, an opera buffa, 'La finta Giardiniera,' two Masses for the chapel of the elector of Bavaria, &c. In 1775, at the desire of the archduke Maximilian, he composed the cantata 'Il Re Pastore;' and from that period till the year 1779 he continued to labour with his pen, though but few of its products then obtained, or ever will obtain, a celebrity at all equal to that which his subsequent productions have so justly acquired.

In November 1779 Mozart finally settled in Vienna, the inhabitants and manners of which city were very agreeable to him; and now, having reached his twenty-fourth year, he exhibited the rare example of one who had been astonishing as a child, had disappointed not even the most sanguine hopes, and become proportionately great as a man. "In his twenty-fifth year he was captivated by the charms of Madlle. Constance Weber, a very amiable person, and an accomplished, celebrated actress, to whom he soon made a proposal of marriage. This was courteously declined by her family, on the ground that his reputation was not then sufficiently established. Upon this he composed his 'Idomeneo,' in order to prove what means were at his command, and, animated by the strongest passion that ever entered his heart, produced an opera which he always considered as his highest effort: certainly it was the first that showed his matured and positive strength. Portions of it are in his most original and grandest manner, but parts show that he had not quite emancipated himself from the thralldom of custom. Some of the airs, though far superior to those of his contemporaries, are too much in the opera style then prevailing, a style now become nearly obsolete. . . . To Madlle. Weber, on whom the composer's affections were unalterably fixed, was assigned the principal character in the opera; and the high reputation which the author acquired by his work having immediately silenced the objections of Constance's family, her hand was shortly after the reward of his efforts." ('Gallery of Portraits.') The union proved a happy one: in his wife he found an affectionate, active, zealous friend, a useful counsellor, and, when his health began to decline, a patient, unwearied, devoted attendant.

In 1782 Mozart produced 'Die Entführung aus dem Serail' ('L'Enlèvement du Sérail'). It was at a rehearsal of this opera that Joseph II. said to the composer, "My dear Mozart, this is too fine for our ears; it has too many notes." "I beg your majesty's pardon," replied Mozart, with his characteristic independence, "there are precisely as many notes as are necessary, and no more." Joseph said nothing, though evidently embarrassed by the reply; but when the opera was performed and heard in a perfect state, he loaded it with praises. 'Le Nozze di Figaro,' the libretto of which is well abridged from Beaumarchais's admirable comedy, was produced in 1786 by command of the emperor. In the same year was brought out his 'Schauspiel Direktor' ('Director of the Comedy'), a short opera, possessing little merit.

In 1787 appeared at Prague the chef-d'œuvre of Mozart, his 'Don Giovanni,' the libretto made up, with considerable ability, by Lorenzo Da Ponte, from the many dramas founded on the same popular subject. This was received with enthusiasm by the Bohemians, but was then above the comprehension of the Viennese. Indeed the composer, aware of its superiority, and conscious that it would prove 'caviare to the general,' said, "I have written this opera to please myself and my friends." And when it was performed, more than thirty years after

wards, at the Académie Royale at Paris, it was so little understood on the stage and in the orchestra that Garat, the celebrated singer, exclaimed, "Don Juan a paru incognito à l'opéra!" It did not find its way to our Anglo-Italian stage till the year 1817, "when it was performed in a manner that surpassed all former representations. The production of 'Don Giovanni' at the King's Theatre, which put ten thousand pounds into the lessee's pocket, and forms an era in our musical history, was so strenuously opposed by an Italian cabal, that but for the courage and perseverance of the director of that season it would have been put aside, even after all the expense of getting up and trouble of rehearsing had been incurred." The comic opera, 'Così fan tutte,' was composed in 1790; 'Die Zauberflöte' ('The Magic Flute'), in 1791, for M. Schikaneder, the proprietor of a theatre in the suburbs of Vienna, who himself wrote the almost incomprehensible libretto; and 'La Clemenza di Tito' (abridged from Metastasio's beautiful drama) in the same year, for the coronation of Leopold II.

Had Mozart's life been extended but a few years longer, he would have repeated his visit to this country. When the spirited and liberal Salomon engaged Haydn to write symphonies for his concerts, and to repair to London in order to superintend their first performance, it was settled that Mozart should succeed his illustrious friend the following year, an agreement which death alone prevented from being carried into effect. Of Mozart's symphonies, quintets, quartets, sonatas, &c.—of his masses, motets, detached vocal pieces, and many other works—we cannot afford space for even a bare list. His additional accompaniments to 'The Messiah,' which exhibit such knowledge of effect, so refined a taste, so congenial a spirit, and withal such respect for a composer whom he considered the greatest that had ever lived, were written for the Baron von Swiſten in 1788.

The last, and, taken as a whole, the most sublime work of Mozart, his 'Requiem,' was written on his death-bed; and having been left in rather an unfinished state in regard to minor details, his pupil, Süßmayer, filled up some of the accompaniments. This led, a few years ago, to a dispute concerning its authorship, an indiscreet friend of the latter having claimed as Süßmayer's composition the best parts of the Mass. The assertions by which the claim was supported, and the arguments in its favour, proved unavailing against the convincing evidence afforded by the work itself, and the controversy can never be successfully renewed. A story too that an anonymous mysterious stranger commissioned Mozart to compose the 'Requiem,' raised many idle conjectures, some of them of the most grossly superstitious kind. The matter however has since been satisfactorily explained.

In bestowing on Mozart so abundant a share of genius, and such exquisite sensibility, Nature seems to have thought that she had been sufficiently bountiful. Physical strength she denied him: small in stature, slight in construction, and feeble in constitution, he was not calculated to reach even the middle period of life. His health gradually declined, though his imagination continued in full vigour to the last; and an attack of fever, prevalent at the time in Vienna, hastened his dissolution, which took place on the 6th of December, 1791. He left a widow and two sons, one of whom adopted his father's profession; the other entered the employment of the Austrian government, at Milan. Madame Mozart, at the expiration of many years, married Baron von Nissen.

"It has been said of Mozart, that his knowledge was bounded by his art; and that, detached from this, he was little better than a nonentity. That his thoughts were almost wholly bent on music was not a matter of choice, but of necessity. Had not his ill-remunerated labours occupied nearly all his time, his means would have been still more limited than they were, for a salary of less than a hundred pounds from the imperial court was all the permanent income he had to depend on. But his acquirements were far greater than is generally supposed, in proof of which we have the best authority for saying that once, at a court masquerade given at Vienna, Mozart appeared as a physician, and wrote prescriptions in Latin, French, Italian, and German, in which not only an acquaintance with the several languages was shown, but great discernment of character and considerable wit. Assuming this (communicated to us by the late Mr. Attwood, his pupil and companion on the occasion) to be true, he could not have been very ignorant man, nor always a dull one, out of his profession. But still stronger evidence in favour of his understanding may be derived from his works. That he who, in his operas, adapted his music with such felicity to the different persons of the drama—who represented the passions so accurately—who coloured so faithfully—whose music is so expressive that without the aid of words it is almost sufficient to render the scene intelligible—that such a man should not have been endowed with a high order of intellect is hard to be believed; but that his understanding should have been below mediocrity is incredible."

MUCIUS. [JUSTINIAN.]

MUCIUS SCEVOLA. [SCÆVOLA.]

MUDGE, WILLIAM, LL.D., F.R.S., a major-general in the army, the third in succession of the directors of the series of geodetical operations, which resulted in the Trigonometrical Survey of Great Britain and Ireland, the production of the "Ordnance Maps" by its means, and the measurement of the English Arc of the Meridian. The history of family and hereditary talent, and the occupation of certain offices

by a succession of gifted men, have frequently been illustrated in this work. They are again forcibly recalled by the name now commemorated. The Rev. ZACHARY MUDGE, sometime master of the Grammar School at Bideford, in Devonshire, and vicar of Abbots-ham, afterwards a prebendary of Exeter and vicar of St. Andrews, Plymouth, was the author of an 'Essay for a New Version of the Psalms,' and of a much admired volume of sermons, published in 1727. He died April 3rd, 1769, and was eulogised by Dr. Johnson, whose intimate friend he had been. THOMAS MUDGE, his second son, born at Exeter in 1715, was apprenticed to the celebrated watchmaker, George Graham, and became himself one of the most eminent mechanists of his time: a select committee of the House of Commons, assisted by a committee of men of science, philosophical instrument-makers, and watchmakers, including Atwood, Ramsden, Troughton, and De Luc, declared in 1793, that it was "admitted on all hands that Mr. Mudge was one of the first watchmakers which this country has produced." In consequence of a report made by the select committee, a reward of 3000*l.* was granted by parliament for his improvement in the construction of chronometers. His decease took place shortly after, in 1794. A full account of his invention, and of the circumstances in the history of chronometry connected with it, will be found in a work published by his son, Thomas Mudge the Younger, entitled 'A Description, with Plates, of the Time-keeper invented by Mr. Thomas Mudge,' &c., Lond., 1799, 4to.

The fourth son of the vicar of St. Andrews was Dr. JOHN MUDGE, F.R.S., for many years an eminent physician at Plymouth, who published treatises on the inoculated small-pox, and on catarrhus coughs. But he acquired a higher reputation in practical optics, founded on a paper in the 'Philosophical Transactions,' vol. lxvii., "containing directions for making the best composition for the metals of reflecting telescopes, together with a description of the process for grinding, polishing, and giving the great speculum the true parabolic form." For this paper, in which an anticipation of Newton was verified, the council of the Royal Society awarded him the Copley Medal for the year 1777, on which occasion Sir John Pringle, M.D., Bart. [PRINGLE, JOHN], the president, delivered one of his celebrated discourses. He died in 1793.

WILLIAM MUDGE, the subject of the present article, son of Dr. John Mudge, was born at Plymouth in 1762, and having received his principal education as a cadet in the Royal Military Academy at Woolwich, was appointed to the Royal Artillery, in which corps he served abroad for some time. After his return to England, the Trigonometrical Survey of England and Wales, which had been commenced by General Roy [ROY, WILLIAM], was placed by the recommendation of Lieut. Col. Hutton [HUTTON, CHARLES], under the superintendance of Lieut. Col. Edward Williams, R.A., Lieut. Mudge, also on Dr. Hutton's recommendation; being appointed his personal associate in the work, and being promoted shortly afterwards to the rank of Captain. The survey which had suffered some interruption after the decease of the former director, was actively resumed in 1791. In the 'Philosophical Transactions' for 1795 and 1797, are two papers of great length, by Lieut. Col. Williams, Captain Mudge, and Mr. Isaac Dalby [DALBY, ISAAC], giving an account of the Survey as carried on from 1791 to 1796. Not long afterwards Captain Mudge succeeded to the office of superintendent, and in 1798 he became a Fellow of the Royal Society. In the 'Philosophical Transactions' for 1800, he continued the account of the progress of the survey during the years 1797, 1798, and 1799; and having attained the rank of Major, R.A., he gave in the volume for 1803, 'An Account of the Measurement of an Arc of the Meridian, extending from Dunnose in the Isle of Wight . . . to Clifton, in Yorkshire . . . in course of the operations carried on for the Trigonometrical Survey of England, in the years 1800, 1801, and 1802.' Major Mudge, who united with energy of character, mathematical talent and culture, and the valuable faculty of readily observing and appreciating the existence of corresponding qualities in others, recognising a kindred spirit in Lieutenant Colby, R.E. [COLBY, THOMAS], conferred an inestimable benefit upon the national work which he conducted, by securing his services as his chief personal assistant. In 1802, with Colby's assistance, he measured the base on King's Sedgmoor; in 1806, that on Rhuddlan Marsh; and during his superintendance a third base was measured by Colby on Belhelvie Links, near Aberdeen, in 1817.

In 1799 had appeared, as a kind of semi-official publication, in 4to, vol. I. of an 'Account of the Survey from the commencement in 1784, to the end of the year 1796,' revised from the 'Philosophical Transactions,' by Captain Mudge and Mr. Dalby. The second volume, published in 1801, was edited by Captain Mudge alone, and continued the account to the end of the year 1799; it was in fact a separate issue of the paper communicated to the Royal Society in 1800, already noticed. The third volume, 'by Lieut. Col. William Mudge, of the Royal Artillery, F.R.S., and Capt. Thomas Colby, of the Royal Engineers,' published in 1811, continues the account of the survey, as carried on from 1800 to 1809. But a very small proportion however of the whole body of observations was contained in these volumes, and no further account of the survey was made public until long after the decease of Mudge, when, in 1842, his successor Colby published all the observations made with Ramsden's zenith sector. The maps however, known as those of the Ordnance Survey, on the scale of one

inch to a mile, were first produced under Mudge's superintendence, and were issued from time to time (after an interval during the war, in which they were withheld from publication), admirably executed, and of the highest value in reference to the topography of the country.

Whilst General Mudge was superintendent, but by the personal exertion of Captain Colby, the principal triangulation of the survey was extended, as just indicated, to the north of Scotland. But in that of South Britain, as it had been carried on under his orders in former years, his successor had to correct errors and supply many omissions. These, as we are informed by competent authority, "had resulted from the hurried manner in which the work was performed, from the very imperfect means placed at General Mudge's disposal, and from the want [since supplied] of a legislative enactment for the preservation of the various trigonometrical observing stations throughout the country, which want sometimes led to a failure of identity between the observing and observed points; so that, all things taken into consideration, it is rather to be wondered at that the work should, generally speaking, be so good as it is known to be." (*Mem. Roy. Ast. Soc.*, vol. xxii., p. 213.)

General Mudge was afterwards appointed lieutenant-governor of the Royal Military Academy at Woolwich; into the administration of which he is stated to have introduced many excellent regulations, which were afterwards extended, under his direction, to the Military Seminary founded by the East India Company at Addiscombe. In addition to the public employments and distinctions which have been mentioned, he was a member of the Board of Longitude, a Fellow of the Society of Antiquaries, a member of the Geological Society, and Honorary LL.D. of the University of Edinburgh. The Royal Academy of Sciences of Paris elected him a correspondent, and the Academy of Sciences of Copenhagen a Fellow. He died at his house in Holles-street, London, on the 17th of April 1821, in his fifty-eighth year, leaving a widow, with three sons and a daughter. One of the sons, Richard Zachary, who entered the army in 1807, and served in the Peninsula, became eventually a lieutenant-colonel in the royal engineers and F.R.S. He also was attached to the trigonometrical survey, in which, after Captain Colby had been appointed superintendent, he was entrusted for some years with the local charge of the 'drawing-room' in the Tower of London—where the results of the survey were laid down, and the maps actually constructed—during the absence of his chief on other duties. He afterwards retired from the service, and entered into business as a banker in Devonshire. He died at Teignmouth on the 24th of September 1854, aged sixty-five.

MUGGLETON, LUDOWICKE, was, along with one John Reeve, the founder of the MUGGLETONIANS, a sect of Christians which arose in England in the year 1651. Ludowicke Muggleton was by trade a journeyman tailor; he asserted that he and John Reeve had been appointed by an audible voice from God, as the last and greatest prophets of Jesus Christ, that they were the two witnesses mentioned in the 11th chapter of the Revelation, and that they had power to bless or damn to all eternity whomsoever they pleased. They published a great number of works, one of which is entitled the 'Divine Looking-Glass of the Third Testament of Our Lord Jesus Christ,' and they obtained many followers. The chief writers against them were the Quakers, and among these, George Fox and William Penn. On the 17th of January 1676 Muggleton was tried at the Old Bailey, and convicted of blasphemy. He died on the 14th of March 1697 at the age of eighty-eight.

It is impossible here to give a full account of the strange doctrines of this sect. The chief articles of their creed appear to have been, that God has the real body of a man, that the Trinity is only a variety of names of God, that God himself came down to earth, and was born as a man and suffered death, and that during this time Elias was his representative in heaven. They held very singular and not very intelligible doctrines concerning angels and devils. According to them the soul of man is inseparably united with the body, with which it dies and will rise again.

The Works of Ludowicke Muggleton with his portrait prefixed were published in 1756; and 'A complete collection of the works of Reeve and Muggleton, together with other Muggletonian Tracts,' was published by some of their modern followers, in 3 vols. 4to, 1832. Among the works written against them are the following: 'The New Witnesses proved Old Heretics,' by William Penn, 4to, 1672; 'A True Representation of the Absurd and Mischievous Principles of the Sect commonly known by the name of Muggletonians,' 4to, London, 1694.

MULCASTER, RICHARD, was a native of Carlisle, and of an old family in Cumberland. He received his earliest education on the foundation at Eton, under the celebrated Udal, whence, in 1548, he was elected scholar of King's College, Cambridge. From Cambridge he removed to Oxford, and in 1555 was chosen student of Christ Church. In the next year he was licensed to proceed in Arts, and about the same time became known for his proficiency in Eastern literature. He began to teach in 1559; and on September 24, 1561, for his extraordinary attainments in philology, was appointed the first master of Merchant Taylors' school in London, then just founded. Here he continued till 1586, when he resigned; and some time after was appointed upper master of St. Paul's School. Here he remained twelve years; and then retired to the rectory of Stanford Rivers, in

Essex, to which he had been instituted at the presentation of the queen, and where he died, April 15th, 1611. Several of his smaller compositions, commendatory verses, &c., are prefixed to works of his contemporaries; and Gascoigne has printed some Latin verses of his composition, which were spoken before the queen at Kenilworth, in 1576. His separate works were:—1, his 'Positions, wherein those primitive circumstances be examined which are necessarie for the training up of Children, either for skill in their book or health in their bodie,' 4to, Lond., 1581 and 1587; to which a second part was promised. 2, 'The first part of the Elementarie, which entreateth chiefly of the right writing of the English tung,' 4to, Lond., 1582, a book which Warton ('Hist. Engl. Poetr.') says contains many judicious criticisms and observations on the English language. 3, 'Catechismus Paulinus, in usum Scholæ Paulinæ conscriptus, ad formam parvi illius Anglici Catechismi qui pueris in communi Præseum Anglicarum libro ediscendus proponitur,' 8vo, 1601. This is in long and short verse, and, though now forgotten, was once esteemed. Fuller relates that Mulcaster was a severe master, but much beloved by his pupils in after-life, and by none more than by Bishop Andrews.

\*MULDER, G. J., a celebrated Dutch chemist, professor of chemistry in the University of Utrecht. Professor Mulder is best known in this country by the translation of his 'Chemistry of Vegetable and Animal Physiology.' This work was translated by Dr. Fromberg, and introduced to the English public by a preface from the late Dr. Johnston, professor of chemistry in the University of Durham. This work contained a vast amount of original matter, and embraced chemical and microscopical researches, in which the author had been engaged for many years. It is divided into four parts. The first embraces the general facts of chemical science bearing on the physiology of plants and animals. The second contains an account of a series of original enquiries into the chemical nature of the proximate principles of plants and animals. In this part of the work he gives an account of his discovery of the nature of the substance which he first called "protein," and of his great deduction that this substance, although found so largely present in animals, was alone formed in plants. In the third part he gives the result of an elaborate examination of the tissues of plants and animals by chemical reagents and the microscope. In the concluding part he lays down certain principles on the nutrition of plants and animals which lie at the foundation of modern physiological science.

Whatever may have been the diligence of French and German organic chemists, there is no doubt that to Mulder is due the great merit of having discovered protein, and followed this discovery to its consequences. These as stated by Professor Johnston are as follows:—1, That this protein formed the bones of a large group of animal substances—the albuminous group—comprising fibrin, albumen, casein, the crystalline lens of the eye, the hair, horn, &c. 2, That in these substances the protein was combined with oxygen, sulphur, or phosphorus, or with two of these bodies or with all the three, and that the proportions of these several elements determined the special qualities of each compound of the albuminous group. 3, That the sap and leaves but especially the seeds of plants contained protein in combination with sulphur and phosphorus, as it is found in the animal body,—and that the gluten of wheat, the legumin of the bean, and the nitrogenous substances generally which are found in the seeds of plants, were compounds of this kind. 4, That these substances were formed by the plant out of the food drawn by its several parts from the air and from the soil,—that it produced them for the purpose of diminishing the digestive labour so to speak of the animal, of supplying it with food fitted directly to form and nourish its muscular and albuminous parts, and that the animal received its whole supply of the raw material out of which those parts were to be built up from the vegetable food on which it lived.

Although the difficulty of obtaining protein, such as described by Mulder, has led Liebig and his followers to doubt its existence as an independent chemical compound, there is no question of the merit and importance of Mulder's conclusions with regard to the formation and vital characteristics of the substances of which he maintains it forms the basis. This subject has led to a controversy, and Mulder's "reply" to Liebig has been translated into English by Dr. Fromberg. No one can read the works of Professor Mulder without being impressed with his caution and truthfulness, and though perhaps eclipsed in brilliancy and energy by some of his contemporaries, his name must be inseparably connected with the development of the most brilliant generalisation of the 19th century.

MULINARI, or MOLINARI, STEFANO, an Italian engraver, known for his numerous prints, after drawings by the early Italian masters. He was born at Florence towards the middle of the 18th century, and was the pupil of A. Scacciati, whom he assisted in a series of engravings after the most beautiful drawings in the Florentine collection. Forty-one only were executed during Scacciati's life: the remaining fifty-nine were executed entirely by Mulinari. These were succeeded, in 1775, by a collection of prints after drawings of the earliest masters, from Cimabue to Pietro Perugino, under the title 'Istoria Pratica dell' Incominciamento e Progressi della Pittura, o sia Raccolta di 50 Stampe estratte da ugual numero di disegni originali esistenti nella Galleria di Firenze,' which was followed, in 1780, by a still more interesting work on the five great Italian schools

of painting, 'Saggio delle Cinque Scuole di Pittura Italiana.' Mulinari died near the close of the 18th century, aged about fifty-five. Among the above-mentioned works are four after L. da Vinci, five after Michel Angelo, twenty-two after Raffaele, eight after Julio Romano, six after Polidoro da Caravaggio, twenty-six after Parmegiano, five after Daniele da Volterra, eight after Barocci, seven after Cesare Procaccini, three after Guido, three after Sacchi, thirteen after Guercino, and many others. Nagler has given a list of about two hundred of them in his 'Künstler Lexicon.'

MÜLLER, the name of two very celebrated German engravers, father and son.

JOHANN GOTTHARD VON MÜLLER, the elder, was born at Bernhansen, near Stuttgart, in 1747. His father, who held an official situation under the government of his native country, wished to educate Müller for the church, but the youth showed so much ability for art in the newly-established (1761) Academy for the Arts at Stuttgart, that the duke himself urged him to follow art as his profession. Accordingly, in 1764, Müller, under the immediate patronage of the duke, entered the school of the court painter, Guibal, who recommended him to follow engraving, which he pursued for six years (1770-76) at Paris under Wille, with such success that, in 1776, he was elected a member of the French Academy. He was recalled in the same year by the Duke Carl to Stuttgart. His last work in Paris was a good portrait of his master, J. G. Wille. The first engraving which he completed at Stuttgart was 'Alexander, Conqueror of Himself,' after Flink, which he took in 1781 to Paris to be printed, not venturing to work off so valuable a plate at the then inexperienced copper-plate press established by himself in Stuttgart. In 1785 he was invited to Paris to engrave the portrait of Louis XVI. painted in 1774 by Duplessis; but the picture of Louis, which Bervic engraved, was painted ten years later, and Bervic's is accordingly a more characteristic portrait of what that monarch eventually was. In 1803 Müller was made professor of engraving in the academy at Stuttgart, where he instructed several of the best engravers of Germany, during the earlier part of the 19th century, among whom his own son, Christian Frederick, is the foremost. He was elected successively a member of the principal German academies; was presented in 1808, by the king Frederick of Würtemberg, with the Order of Civil Merit; and in 1818 was made a Knight of the Würtemberg Crown by Frederick's successor, King William. He died at Stuttgart, March 14, 1830: the same year a biography of him was published in the 'Schwäbische Merkur,' No. 71. Müller engraved only thirty-three plates, a small number, but some of them are large and elaborate works; they are however chiefly portraits. His principal works, besides those already mentioned, are—'The Battle of Bunker's Hill,' after Trumbull, engraved in 1799; the 'Madonna della Soggiola,' for the Musée Français, engraved in 1804, by many considered superior to the print of the same subject by Raphael Morghen; a 'St. Catherine, with two Angels,' after L. da Vinci; and the portrait of Schiller, after A. Graf.

CHRISTIAN FRIEDRICH VON MÜLLER surpassed his father, but, owing to the extreme shortness of his career, his prints are even less numerous than those of the elder Müller. He was born at Stuttgart in 1783, and he died at Pirna, near Dresden, in 1816, aged only thirty-three. He was carefully educated by his father in all those branches of the arts which, by his own experience, he knew to be requisite to constitute an excellent engraver; and in 1802 he sent him to complete his studies at Paris, where at that time the majority of the finest works of art in Europe were collected together in the Louvre. Here, in 1808, Müller engraved the 'St. John about to write his Revelation,' after Domenichino, in which the eagle brings him his pen; and 'Adam and Eve under the Tree of Life,' after Raffaele. He was commissioned shortly afterwards by Rittner, a printseller of Dresden, to engrave his last and greatest work, the 'Madonna di San Sisto' of Raffaele, in the Dresden Gallery. He was wholly occupied for the remainder of his short life on this plate, which he just lived to complete, but he never saw a finished print from it. He removed to Dresden in 1814, and was appointed professor of engraving in the academy there. His existence seems almost to have been wrapped up in the execution of this plate: he was occupied with it day and night, and, always of a sickly constitution, the infallible result of such constant application and excitement soon made its appearance. He was however in vain advised to desist for a while from his work. He completed the plate and sent it to Paris to be printed; but with his plate the artificial excitement which supported him departed also: he had just strength enough left to admit of his being carried to the Sonnenstein, near Pirna, where he died May 3, 1816, a few days before the proof of his plate arrived from Paris. It was suspended over the head of his bier as he lay dead, thus reminding us of the similar untimely fate of the great master of the original, above whose head, as he lay in state, was hung also his last work, 'The Transfiguration.' Müller left a wife and two young children. Christian Müller engraved only eighteen plates, but the 'Madonna di San Sisto' is in itself a host, and exhibits him at least the equal of Raphael Morghen, to whose 'Transfiguration' it serves as a good pendant: there are several lithographic copies of it. His other works are nearly all portraits: among them are—Jerome Bonaparte, Schiller, Jakobi the poet, Professor Hebel, Dr. Hufeland, William, king of Würtemberg as Crown-Prince, and a medallion of Napoleon.

MÜLLER, CARL OTTFRIED, one of the most learned scholars of modern times, was born in 1797, at Brieg, in Silesia, where his father at the time held the office of preacher to a division of the Prussian army. Müller received his early education in the Gymnasium of Brieg, and in 1813 he entered the University of Breslau, where he devoted himself to the study of philology. From 1816 to 1817 he studied at Berlin, and as soon as he had taken his degree and had given evidence of his mythological studies and researches in a little work entitled 'Ægneticoorum Liber' (Berlin, 1817), he was appointed teacher of the ancient languages in the gymnasium (called the Magdalenum) of Breslau. While engaged in teaching, he employed all his leisure hours in mythological inquiries, endeavouring to analyse the various mythical cycles and trace them to their earliest and simplest elements. The great work containing the results of these researches is a history of Hellenic races and cities ('Geschichte Hellenischer Stämme und Städte'), of which the first volume, on 'Orchomenos and the Minyans' ('Orchomenos und die Minyer'), appeared at Breslau in 1820, 8vo.

It was in consequence of the advice of Heeren and a recommendation of A. Boeckh, that in 1819 Müller was invited to a professorship in the university of Göttingen, with the special object that he should lecture on archaeology and ancient art. His activity created a new era in the history of Göttingen, and under his and Dissen's auspices the study of philology and ancient literature received an impulse which was soon felt in all Germany, and was extended over a great part of Europe by the valuable works published by Müller in rapid succession. In order to acquire a more intimate knowledge of ancient works of art than could be obtained from mere descriptions, he spent in 1819 some time at Dresden, and in 1822 he visited France and England. But although his attention was more particularly directed to ancient art, he never lost sight of the fact that the arts of the ancients represented only one side of their intellectual activity, and formed only one source among the many from which a complete knowledge of antiquity is to be derived. In order to show fully the connection of religion, manners, politics, and history, in the case of one of the Greek races, Müller wrote his work on the Dorians ('Die Dorier,' Breslau, 1824, 2 vols. 8vo), which forms the second and third volumes of his 'Geschichte Hellenischer Stämme und Städte,' and was translated into English by H. Tuffnell and G. C. Lewis, Oxford, 1830, 2 vols. 8vo, with additions and corrections furnished by the author. A new edition of the 3 vols. of the whole work was published after Müller's death by F. W. Schneidewin, Breslau, 1844, and a new edition of the English translation of the 'Dorians' appeared in 1840. Müller intended to continue this series of works by a history of Attica, but certain scruples induced him to defer the execution of this task, and it was unfortunately never executed. The year after the publication of the 'Dorians' Müller published his Introduction to a scientific system of Mythology ('Prolegomena zu einer wissenschaftlichen Mythologie,' Göttingen, 1825, 8vo), of which an English translation by J. Leitch was published in London, 1844, 8vo, and another work on the early history of Macedonia ('Ueber die Wohnsitze, die Abtammung und die ältere Geschichte des Makedonischen Volkes,' Berlin, 1825). These productions were soon followed by a great work on the Etruscans ('Die Etrusker,' Breslau, 1828, 2 vols. 8vo), and a manual of the history of ancient art ('Handbuch der Archæologie der Kunst,' Breslau, 1830; a second edition appeared in 1835). This last work was the first of the kind that had been produced in Germany. About the same time he was requested by the Society for the Diffusion of Useful Knowledge, to compose a history of Greek Literature, of which the first volume appeared in 1840; of the second only a portion was published: after Müller's death all that had appeared in England was published in Germany under the superintendence of his brother Julius Müller. Besides these greater works Müller also wrote 'Minervas Poliadia Sacra et Ædem in Aree Athenorum illustravit,' &c., Göttingen, 1820; 'De Phidias Vita et Operibus,' Göttingen, 1827; and a great number of articles in periodicals and encyclopedic works. The first correct edition of Festus that was published is that of Müller (Leipzig, 1839, 4to), and his edition of Varro's work 'De Lingua Latina' (Leipzig, 1833, 8vo), and of the Eumenides of Æschylus, are equally valuable.

In 1840 Müller, who had long desired to see the countries to the investigation of whose history, literature, and art his whole life had been devoted, resolved to visit Italy and Greece, partly to convince himself of the correctness of the results at which he had arrived, and partly to collect new materials. His activity in Greece was very great; one hot day in July, 1841, while engaged in making some excavation at Delphi, he was seized with a fever, in consequence of which he died soon after he had returned to Athens. He was buried in the Ancient Academy at Athens, the most appropriate place for a scholar like Müller that could have been devised.

Müller was a man of the most extensive and varied acquirements, and of a keen and penetrating judgment. He acquired a European reputation at a comparatively early age. His numerous works however are not all of equal merit, and the two faults more particularly to be noticed are his great haste in the composition of his works, and a tendency to theorise and generalise on insufficient grounds. But in extent of knowledge and reading there scarcely ever was a scholar who surpassed him.

(*Neuer Nekrolog der Deutschen für 1841*; F. Lücke, *Erinnerungen*)

already mentioned, the following works at the Royal Academy:—In 1841, 'Sketch of an Egyptian Slave-market;' 'Convent, Bay of Naples;' and the 'Sphinx;' in 1848, 'Arabs seeking Treasure;' 'Prayers in the Desert;' and 'Welsh Mill on the Dolgarey.' He published in 1841 a beautiful work entitled 'Picturesque Sketches of the Age of Francis I.' Shortly after his death about 300 of his sketches and other works were sold by auction by Christie and Manson, and realised the remarkable sum of 4360*l.*; a small sketch of his apartment at Macri alone brought 65 guineas. For a time indeed the works of Müller were eagerly sought after, and though now less popular, they still fetch high prices.

MULREADY, WILLIAM, R.A., was born at Ennis, Ireland, in 1786. Having as a boy shown a strong inclination for painting, he was entered in his fifteenth year as a student in the Royal Academy. There he made satisfactory progress, and was regarded by the more observant as one likely to secure a high place as an artist. But after he had passed through the schools it was some time before he struck on the right path. Like most young students Mulready's thoughts were in the first instance directed towards the classic and 'high historic' branches of his profession. From these he turned however in good time to humbler courses. Perceiving his deficiency in technical skill and knowledge, he set himself resolutely to the study of the leading masters of the Dutch school whom Reynolds had pointed out to the Academy students as the painter's great exemplars in the management of his tools. He also painted many small landscape and other studies from common every-day sources. Kensington Gravel-pits and other places in the suburbs of London, which the ordinary student would scarce glance at a second time, were in those days, about 1807-9, Mulready's favourite painting fields, and some of the little pictures which he painted there have within the last few years attracted a good deal of notice at the exhibitions of the Royal Academy and the Society of Arts. The good effect of these studies was evinced even in Mr. Mulready's early pictures. With all their immaturity of thought, uncertainty of touch, and general incompleteness, there was shown a feeling for the simplicity and directness of nature, mellowness and truth of colour, and sober breadth of effect, which pleased the ordinary spectator, yet satisfied the instructed eye that the picture was the result of careful observation and of diligent study.

Mr. Mulready's early pictures were of small size. Many of those he first exhibited were the landscapes and exteriors and interiors of old houses and rustic cottages to which we have already alluded. One of the first of his efforts in the style which has won him his high reputation was 'The Rattle,' which was exhibited at the Royal Academy in 1808, with a 'Carpenter's Shop and Kitchen.' 'The Music Lesson,' 1809, 'The Roadside Inn with Horses Baiting,' and the 'Barber's Shop,' exhibited in 1811, showed a great advance in power, and every successive year witnessed steady progress. His 'Punch,' 1812, though still hardly equal in brilliancy and vigour to the productions of some other of our more eminent painters at the same age, showed that Mulready was now paying much more attention to the study of character, and that and the 'Boys Fishing,' 1813, assured his position as an artist. In 1815 he exhibited his 'Idle Boys,' which secured his election in the following November as A.R.A. In 1816 he exhibited 'The Fight interrupted,' and was elected R.A. He was now one of the most popular of our painters, but his popularity never led him to fall into careless or slovenly habits; nor when he was thrown for awhile somewhat into the shade by the greater popularity of Wilkie did he endeavour to attract notice by any exaggeration of style or meretriciousness of ornament. 'Lending a Bite,' exhibited in 1819 and purchased by Earl Grey, and 'The Wolf and the Lamb,' exhibited in 1820 and purchased by George IV., marked the maturity of his power. Both pictures displayed rare artistic merits with a quiet but true humour, and both have become generally known by the engravings. Mr. Mulready's subsequent more important works were:—'The Careless Messenger,' 1821; 'The Convalescent,' 1822,—one of his first efforts in a more poetic style, and in many respects one of his finest works; 'The Widow,' 1824; 'The Origin of a Painter,' 1826; 'The Cannon,' 1827, an admirable picture, purchased by Sir Robert Peel; 'The Interior of an English Cottage,' 1828, purchased by George IV.; 'Return from Hastings,' and 'The Dog of Two Minds,' 1830; 'A Sailing Match,' 1831; 'The Forgotten Word,' and 'Peregrine Touchwood breaking in upon the Rev. Josiah Cargill,' 1832; 'The First Voyage,' 1833; 'The Last In,' and 'The Toy Seller,' 1835; 'Giving a Bite,' 1836; 'Brother and Sister (Pinch of the Ear),' 1837; the very elaborate design representing the Seven Ages of Shakspeare, under the title of 'All the World's a Stage,' 1838; 'Open your Mouth and Shut your Eyes,' and 'The Sonnet,' 1839; 'First Love,' the 'Artist's Study,' and 'Fair Time,' 1840; 'Train up a Child in the Way he should go,' 1841; and 'The Ford,' 1842.

In 1840 Mr. Mulready prepared a series of twenty designs illustrative of the 'Vicar of Wakefield;' they were engraved on wood by Thomson, and published by Van Voorst, and are, as examples of woodcut book illustrations, quite unrivalled; indeed, in their way they are almost perfect. The general admiration which these designs excited soon led to commissions for the embodying of some of them in more durable materials. For Mr. Baring he accordingly painted in 1843 'The Whistonian Controversy,' and in 1847, 'Burchell and Sophia, haymaking;' and for Mr. Sheepshanks, his master-piece, 'Choosing

the Wedding Gown.' In all that concerns the thorough mastery over the materials of art, in drawing, composition, light and shadow, and colour, and in firmness and neatness of touch, these pictures are perhaps as nearly perfect as any works of their size in modern art. Nor are they less admirable for their possession of the higher mental qualities. Numerous as are pictures from the 'Vicar of Wakefield,' it would be probably by no means saying too much to affirm that there is more of the true spirit of the author in these three small works than in all the others put together, and certainly no other Wakefield pictures have approached them in technical merit.

In 1848 the Society of Arts inaugurated a scheme for exhibiting annually "the pictures of some one eminent living artist, his studies and sketches, and engravings from his works," by collecting in their great room in the Adelphi the works of William Mulready. About a hundred of his paintings—including almost every one named above—were then brought together, and a like number of his studies, sketches, and finished drawings. They were the work of some three and forty years placed side by side for examination and comparison. Never before had an eminent living English artist been subjected to such an ordeal; but it was passed triumphantly. There it was seen with what constant and thoughtful labour that great success had been achieved; with how steady and assured a progress the final result had been arrived at. And instructive as well as interesting in no common measure was it to trace the effects of a knowledge, growing year by year more thorough, of the resources and of the limits of the painter's art; and to observe therewith the steady enlargement of style, the growing refinement of taste, and delicacy and grace of sentiment and expression, and of a humour ever ripening yet bordering constantly on tenderness, or even verging on the pathetic. To understand his singular artistic power it was necessary to examine his studies and sketches, as elaborate and faithful as photographs, with a felicity of selection and expression evidencing the possession of no ordinary amount of mental power. His academy studies in red and black chalk were seen to be something wonderful in their way. The works of Etty succeeded those of Mulready, being exhibited at the rooms of the Society of Arts in 1849 (not 1848, as was by a clerical error stated under ERR, where also it should be read, col. 823, "the chief work possessed by the nation of Etty's painting is," &c., and not as is printed, "the only work," there being in fact several of his pictures in the Vernon collection). No similar exhibition has since taken place—a circumstance very much to be regretted, for probably no other art exhibition would afford more genuine gratification to the general visitor, or so much instruction to the student.

Since the exhibition of his collected works Mr. Mulready has been but little before the public eye. In the same year he had at the exhibition of the Royal Academy his excellent picture of 'The Butt;' in 1849, 'Women Bathing,' and a drawing of 'The First Voyage;' and in 1852 'Blackheath Park;' he has not exhibited since.

The nation already possesses three of Mulready's best pictures, the gift of Mr. Vernon:—'The Last In;' 'Fair Time;' and 'Crossing the Ford,' remarkable for the peculiar manner in which it is painted. But besides these a great addition to the national treasures may be anticipated from the munificence of Mr. Sheepshanks, whose almost unrivalled collection of English pictures, which he has signified his intention of presenting to the nation, contains no less than thirteen of Mulready's paintings, including his most perfect work, 'Choosing the Wedding Gown;' 'The Sonnet,' 'Open your Mouth and Shut your Eyes,' 'The Intercepted Billet,' 'The Pinch of the Ear,' 'All the World's a Stage,' and several of his earlier works. [See SUPPLEMENT.]

MUN, THOMAS, is the name of an English writer on political economy, who lived in the earlier part of the 17th century, but of whose personal history scarcely anything appears to be known. His best known work, a small 8vo volume published at London in 1664, is entitled 'England's Treasure by Foreign Trade; or, the Balance of our Foreign Trade is the rule of our Treasure.' Written by Thomas Mun of London, merchant, and now published for the common good by his son John Mun of Bearsted, in the county of Kent, 'Require.' This title-page comprehends nearly all the particulars we have been able to discover respecting Mun. The book is dedicated to Thomas, earl of Southampton, in an address in which Mun's son says—"It was left me in the nature of a legacy by my father, for whose sake I cannot but value it as one of my best moveables, and as such I dedicate it to your lordship. He was in his time famous amongst merchants, and well known to most men of business for his general experience in affairs and notable insight into trade; neither was he less observed for his integrity to his prince, and zeal to the common-wealth. The serious discoveries of such men are commonly not unprofitable." A passage which occurs in the body of the work may give some indication of the nature and extent of Mun's dealings. Having observed that Ferdinand I, the grand-duke of Tuscany, was very rich in treasure, and enlarged his trade by lending to merchants great sums of money at a low interest, he adds—"Myself had 40,000 crowns of him gratis for a whole year; although he knew that I would presently send it away in specie to Turkey, to be employed in wares for his country; he being well assured that in this course of trade it would return again, according to the old saying, with a duck in the mouth. By his thus encouraging of commerce, within these thirty years the trade of his port of Leghorn is so much increased, that, of a poor

little town, as I myself knew it, it is now become a fair and strong city." Ferdinand I. died, after a reign of twenty-two years, in 1609; it is strange therefore that Mr. Macpherson, who quotes this passage in his 'Annals of Commerce,' should place it under the year 1630, remarking that "probably Mr. Mun was in Løghorn about this time, and may have written his book about 1660." The conjecture of Mr. M'Culloch ('Principles of Political Economy,' p. 30), that the book was probably written about 1635 or 1640, is likely to be much nearer the truth. Mun, being, as we have seen, a foreign merchant of the highest eminence before 1609, can hardly have been born later than 1580, and most probably was dead long before 1660. His 'England's Treasure' is addressed to his son, and begins—"My son, in a former discourse I have endeavoured, after my manner, briefly to teach thee two things: the first is piety; . . . the second is policy; . . . so am I now to speak of money." But whether this former discourse was ever published we do not know. Mun, however, has always been understood to be the writer of a work entitled 'A Discourse of Trade from England to the East Indies, by T. M.' 4to, London, 1621.

The object of this last-mentioned work is to defend the East India trade from the charge brought against it of exhausting the national wealth by occasioning an annual exportation of treasure, or of gold and silver. Mun does not deny, or for a moment doubt, that the true profit of the country upon any branch of commerce is to be measured by the balance of money which it annually brings into the country; but he contends, that, although the trade with the East Indies, considered by itself, would upon this principle be a losing trade, yet it became in reality profitable in consequence of the exportation of certain commodities which it enabled us to make to other European countries, from which in this way we drew back every year a much larger amount of treasure than we sent out to India. The reasoning is the same that was afterwards employed by Sir Josiah Child in his anonymous pamphlet, 'The East India Trade, a most profitable Trade to this Kingdom,' published in 1677. The same doctrine is also expounded in Mun's other work, his 'England's Treasure by Foreign Trade,' the fourth chapter of which, principally relating to the East India trade, is headed, 'The exportation of our monies in trade of merchandize is a means to increase our treasure.' The fundamental principle of that work is stated in the second chapter:—"The ordinary means to increase our wealth and treasure is by foreign trade, wherein we must ever observe this rule—to sell more to strangers yearly than we consume of theirs in value." Perhaps the principle of what has been called the mercantile or balance of trade system had scarcely before been so distinctly avowed, at least by any English economist. The work, which extends to 220 pages, contains twenty-one chapters in all. It was long looked upon as a great authority, and was reprinted at London in 1669, in 1698, in 1700, in 1713, and again in 'A Select Collection of English Tracts,' in 1856. Also at Glasgow in 1755.

MUNCH, PETER ANDREAS, an ingenious and indefatigable Norwegian antiquary and philologist, was born at Christiania on the 15th of December 1810. He received his first education from his father, who was parish-priest of Gjerpen near Skien, was then sent to the Latin school at Skien, and after 1828 pursued his studies at the University of Christiania, where, in 1834, he passed his examination in jurisprudence. The law however had less attractions for him than language and history; and in 1837 he obtained the post of 'lector,' and in 1841 of professor of history at the University of Christiania. He has since then passed his life in literary labours, and has paid visits to different countries, including England and Scotland. The elucidation of the ancient history and languages of Norway and the North is his favourite subject, on which he has advanced some ideas of a novel character, which he defends with spirit if not with success. He opposes the usual notion that one language formerly prevailed over all Scandinavia during historic times, and that that language is still preserved in Iceland—contending that the three kingdoms of the north, Sweden, Denmark, and Norway, had formerly three distinct dialects, and that the literature called Icelandic is the literature of ancient Norway, of which kingdom the modern Icelanders have preserved one dialect, and the Feroe islanders another. He therefore refuses to give the name of Icelandic to the language in which the ancient Sagas were written, and insists on calling it 'Old Norwegian.' Even if his views were admitted to be historically correct, which is by no means the case, it is obvious that his proposal is open to the same objections as one for changing the name of the Anglo-Saxon language to 'Old English.' The inconvenience and confusion that arise from giving two names to one language, are in fact conspicuously shown by the operation of another Norwegian whim now in fashion. The modern language of Christiania is precisely the same as that of Copenhagen; but while in Denmark and the rest of Europe this language is called Danish, in Norway it is considered patriotic by many to call it Norwegian. The principle on which this is done is diametrically opposite to that on which Icelandic is called Old Norwegian, but as yet both the old and the modern party have resolutely refused to concede an inch to their opponents.

Professor Munch's works are numerous and important. An 'Old Norwegian' Grammar and an 'Old Norwegian' Reading-book are among the number. He has published an edition of the 'Kongs Skuggsjø,' or 'Icelandic Royal Mirror;' of the elder 'Edda,' of 'Alak Bol's Jordebog,' the 'Terrier' of an old archbishop of Drontheim, of the 'Fagr-

BIOG. DIV. VOL. IV.

kinna,' a chronicle really of Old Norway, and of the 'Ancient Laws of Norway,' 'Norges Gamle Love' (3 vols. 4to), in conjunction with Professor Keyser. His 'Historical and Geographical Description of the kingdom of Norway during the Middle Ages' (Christiania, 1849), and his extended 'History of the Norwegian People' ('Det Norske Folkes Historie'), begun in 1851, and still in progress, are standard works of their kind. He has not disdained to write also a 'History of Norway, Sweden, and Denmark, for the use of Schools,' 1838; and a series of 'Entertaining Stories from Norwegian History,' 1847. Professor Munch is an antagonist to 'Scandinavism,' or the project of uniting the three Scandinavian kingdoms under one sceptre, and has had a paper-war on the subject with Professor Worsaae the Dane, which has not however prevented the exchange of courtesies between the two antiquarians. Munch has at least on one occasion written in Swedish in the 'Forn-Svenskans och Forn-Norskans Språkbygd,' Stockholm, 1849, an essay on the construction of the Old Swedish and Old Norwegian languages. Essays from his pen appear in English in the volume for 1852 of the translated series of the Transactions of the Northern Antiquaries Society—one 'On the Runic Inscriptions in Sodor and Man;' another, 'Geographical Elucidations of the Scottish and Irish local names occurring in the Sagas.' It is to be regretted that it should be so little known that this series, bearing a French title, 'Mémoires de la Société des Antiquaires du Nord,' contains more articles in English than in French. It is a set of books that ought to find its way into all our large libraries. [See SUPPLEMENT.]

ANDREAS MUNCH, a cousin of Professor Peter Andreas Munch, is a Norwegian poet of some note. He is the son of the Bishop of Christiansand, was born in 1811, and has been since 1830 an amanuensis in the University Library of Christiania. His 'Digte gamle og nye' ('Poems Old and New,' Christiania, 1848), and his 'Nye Digte' ('New Poems,' Christiania, 1850), are spoken of as of merit. He has also written a drama on the subject of Solomon de Caus, respecting whom a ridiculous story has been put in circulation by a French wag, that the Marquis of Worcester conceived the notion of the steam-engine from his ravings when a madman confined in the Bicêtre.

MÜNCHHAUSEN, ADOLPHUS, BARON, born in Hanover in 1688, studied at Jena, Halle, and Utrecht, and afterwards filled several important official stations in the electorate. He was an active agent in founding the University of Göttingen, of which he was appointed curator, which situation he held till his death. He devoted himself with great assiduity and zeal to the advancement of that institution, which rose under his care to a high rank among the universities of Germany. He established the chairs of geography, literary history, and political science, and improved the system of teaching philosophy and theology, by doing away with the old scholastic methods. Heyne says that Münchhausen introduced into the university freedom of thinking, feeling, and writing. He promoted the establishment of the Royal Society of Sciences of Göttingen. He increased the library of the university from 10,000 to 60,000 volumes, which number afterwards, whilst Heyne was librarian, was brought up to 200,000. All these things Münchhausen did with very moderate means, and chiefly by his activity, judgment, and perseverance. More ample particulars of what Münchhausen effected for the benefit of the University of Göttingen are given in Heyne's 'Oratio in Honorem ac Memoriam Münchhausianam,' inserted in the 2nd volume of his 'Opuscula Academica,' and in his other oration on the same subject delivered before the Royal Society of Sciences of Göttingen, inserted in the second volume of 'Novi Commentarii Societatis Göttingensis;' and also in Heeren's 'Life of Heyne.'

Münchhausen was for many years privy-counsellor to the elector of Hanover, George II. of Great Britain, and in the latter years of his life was appointed first minister, by his successor, for the electorate of Hanover, which situation he filled to the general satisfaction, though only for a short time. He died at Hanover, November 26, 1770.

MUNDAY, ANTHONY, must, according to his epitaph, have been born in 1553. His early life is almost totally unknown; but he was at one time abroad, and describes himself as having been "the pope's scholar in the seminary at Rome." In 1582 he was one of the instruments in the detection of the popish conspiracy; he was a witness against some of the prisoners; and he published 'A breefe and true Reporte of the Execution of certain Traytours at Tiborne the 28th and 30th days of May, 1582; gathered by A. M., who was there present.' He had, it appears, held a dispute at the foot of the gallows with one of the victims. This pamphlet was not Munday's first publication. His tract, called 'The Mirror of Mutabilitie,' had appeared in 1579; and he published, after this date, a large number of pieces in prose and verse, originals and translations. Lists will be found in the 'British Bibliographer' and elsewhere. His dramatic productions are now more interesting than any of the others. He is said, but on equivocal authority, to have been a player and an unsuccessful one: he was at any rate a frequent writer of plays, and also of pageants for the corporation and companies of London. Ben Jonson, in 'The Case is Altered,' written early in 1599, ridicules him and his city-shows in his character of Antonio Balladino, making this personage to say of himself, that he "supplies the place of pageant-poet to the city of Milan when a worse cannot be had," and that he "uses as much stale stuff as any man does." Perhaps Ben's critical acumen was a little sharpened by the fact that Munday had just been called "our best

plotter" in Meres's 'Palladis Tamia,' in which Jonson's own name is not mentioned. Mr. Collier enumerates fourteen plays which Munday wrote, or assisted in writing, desiring however to add to this list the then newly-discovered play called 'The Two Italian Gentlemen,' which he attributes to Munday, and infers to have been acted about 1584. The following other plays of Munday have been printed:—1, 2, 'The Downfall of Robert, Earl of Huntingdon,' by Anthony Munday; 'The Death of Robert, Earl of Huntingdon,' by Anthony Munday and Henry Chettle, both acted in February 1593, and printed in 1601. Both are reprinted in Mr. Collier's 'Supplementary Volume to Dodaley's Old Plays.' They are rude and irregular pieces, possessing much vigour of painting, and presenting, in the scenes with Robin Hood's band in Sherwood Forest, some pleasing poetry. 3, 'The Widow's Charm,' acted in July 1602, and supposed to be the comedy of 'The Puritan, or the Widow of Watling Street,' which was printed in 1607, and has been absurdly attributed to Shakspeare. 4, 'The First Part of the Life of Sir John Oldcastle,' by Anthony Munday, Michael Drayton, Robert Wilson, and Richard Hathways; published twice in 1600, one of the editions attributing it to Shakspeare. Munday died Aug. 10, 1633, and was buried in the church of St. Stephen, Coleman-street.

MUNSTER, SEBASTIAN, born at Inglesheim, in the palatinate of the Rhine, in 1489, became a Franciscan monk, but afterwards adopted Luther's reformation, and repaired to Basel, where he was made professor of Hebrew, in which language he was very learned. He was also well acquainted with mathematics. He died of the plague, at Basel, in 1552. His works are—1, 'Biblia Hebraica Characteres Singulares apud Judaeos Germanos in usu recepto, cum Latina Planeque Nova Translatione, adjectis insuper e Rabbiorum Commentariis Annotationibus,' &c., fol., Basel, 1584-85; reprinted in 2 vols. fol., in 1546, with considerable additions and corrections. 2, 'Grammatica Chaldaica,' 4to. 3, 'Dictionarium Chaldaicum non tam ad Chaldaeos interpretes, quam ad Rabbiorum intelligenda Commentaria necessarium,' 4to. 4, 'Dictionarium Trilingue,' Latin, Greek, and Hebrew, fol. 5, 'Captivitates Judaeorum incerti aetatis,' Hebrew and Latin, 8vo. 6, 'Catalogus omnium praeceptorum legis Moisaicae, quae ab Hebraeis sexcenta et octodecies numerantur, cum succincta Rabbiorum expositione et additione traditionum,' &c., Hebrew and Latin, 8vo. 7, 'Organum Uranicum; theoria omnium planetarum motus, canones,' fol. 8, 'Cosmographia Universalis,' fol., 1544, which was translated into German, French, Italian, English, Bohemian, and other languages. It is one of the first universal geographies published in modern times, and is remarkably well executed considering the age in which it was written. The author is most diffuse in treating of Germany and Switzerland. He gives a description of the principal towns, their history, the laws, manners, and arts of the people; the remarkable animals of the country, the productions of the soil, the mines, &c.; and the whole is illustrated by woodcuts, with a portrait of the author. Munster mentions several learned men of his time who furnished him with an account of their respective countries, of Sardinia, the Illyrium, &c. He also gives specimens of several languages. 9, 'Rudimenta mathematica in duos libros digesta.' 10, 'Horologigraphia,' being a treatise of gnomonics.

Munster translated into Latin several works of the learned Hebrew grammarian Elias Levita on the Massorah, and on Hebrew grammar. He also wrote notes to Pomponius Mela and Solinus. His Commentaries upon several books of the Old Testament are inserted among the 'Critici Sacri.'

MURAD (AMURAT) I. son of Orkhan, Sultan of the Ottomans, succeeded his father in 1360, when he was forty-one years of age. He fixed his residence at Adrianople, where he raised a handsome mosque, which still exists. He conquered part of Macedonia and Thessaly, concluded a treaty of peace and alliance with John Palaeologus, emperor of Constantinople, and married the daughter of the despot or prince of Servia. Murad paid great attention to the discipline of his army, and especially of his infantry; he founded the corps of Janissaries, which afterwards contributed so greatly to the extension of Turkish conquest. Contus, the son of Murad, and Andronicus, the son of John Palaeologus, fought together against the Bulgarians and other Slavonian tribes, whom they defeated at Sirmium on the Danube. An intimacy grew up between the two young princes, of which Andronicus availed himself to persuade his friend to revolt against his father; and whilst both Murad and John Palaeologus were in Asia, the two younger princes jointly assumed the sovereign authority in Europe. Murad however soon came back, bringing with him the Greek emperor; the troops, which were chiefly Turkish, returned to their allegiance; and the two young men, having shut themselves up in the town of Demotica, were taken prisoners. Murad sent Andronicus to his father at Constantinople, insisting upon his immediate punishment. John Palaeologus ordered the eyes of Andronicus to be put out, but the operation was performed only upon one. Murad caused both his son's eyes to be put out, after which we hear no more of the young prince. Some time after, Manuel, the second son of John Palaeologus, whom his father had associated with him in the empire, having given cause of suspicion to Murad, was besieged by the sultan in Thessalonica, whilst his own father did not dare to assist him. Manuel surrendered the town, and cast himself on the mercy of the sultan, who forgave him. John Palaeologus, ashamed of his humiliating condition, proceeded to Western Europe, leaving

Manuel to govern in his absence. In the meantime Murad extended his power into Asia Minor, and annexed Phrygia to his dominions; whilst his general Karatine conquered a great part of Albania, sending an immense number of women and children across the Straits of Gallipoli as slaves into Asia. Lazarus, prince of Servia, alarmed at the progress of the Ottomans, formed a league with the Hungarians, Dalmatians, and other neighbouring nations, and led his troops in person against Murad, who met him in the plains of Cassovia. A fearful battle took place in 1389, in which the Turks had the advantage, and totally defeated the Christians. Lazarus himself was taken prisoner. Murad, while inspecting the field of battle after the fight was over, received a deadly blow from a wounded Albanian who was lying on the ground near him. The Turkish soldiers, in revenge, massacred all the prisoners, including the Prince of Servia. Murad himself died in a few hours, after a reign of thirty years, and was succeeded by his son Bayasid. He was a strict observer of the religion of the Koran, severe but just, and simple in his dress and habits. His body was interred with those of his ancestors, at Brusa, in Bithynia.

MURAD II, son of Mahomet I., succeeded his father in 1421, being then twenty-two years of age. An impostor had made his appearance in his father's lifetime, pretending to be Mustapha, Bayasid's eldest son, who had fallen in the battle of Angora in 1401 against Tamerlane. The Greek emperor, pretending to believe him, protected him against the wrath of Mahomet; and, after the death of the latter, actually entered into a treaty with him, and acknowledged him as sultan. Murad was then at Brusa. The pretended Mustapha established his court at Adrianople, and was acknowledged by several pashas and other officers. The first army which Murad sent against him was defeated; but Murad soon after took the field in person, and being assisted by the Genoese, who furnished him with vessels to carry his army across the Straits of Gallipoli, he defeated the troops of Mustapha, took Adrianople, and, having seized the pretender, had him hanged in 1422. Murad then turned against Manuel, ravaged Macedonia and Thracia, and threatened Constantinople; but Manuel succeeded in stirring up another insurrection in Asia in favour of another Mustapha, Murad's younger brother. Murad was obliged to leave Europe to quell the insurrection, and soon after the Greek emperor died (1424), leaving to his successor, John Palaeologus II., the broken remains of his empire. Murad dispersed the insurgents at Nissa, and had his two brothers strangled, in order to take away all pretext for further insurrections. On his return to Europe, he obliged John Palaeologus to pay him tribute. Meantime the Venetians had taken possession of Thessalonica with the consent of the inhabitants. Murad laid siege to it, and took it, after a long resistance, in 1429, when the town was sacked, and all the surviving inhabitants were carried into slavery. Murad afterwards marched against Servia, although one of his wives was Mary, sister of George, the despot or prince of that country. He took Semendria, and obliged George to take refuge at the court of Ladislans, king of Hungary and Poland, to whom he gave up the stronghold of Belgrade. The gallant Hunnyades, at the head of the Hungarians, having defeated the Turks, Murad entered into a truce of ten years with Ladislans, who swore to observe it faithfully; but being encouraged by the Venetians, by the voyvode of Valachia, and by the pope himself, Eugenius IV., who sent him Cardinal Julian Cesarini to quiet his scruples, by telling him that an oath taken to an unbeliever was not binding, Ladislans broke the truce, and advanced with a large army of Hungarians, Valachians, and others, to Varna, where he was met by Murad. A desperate battle followed: Hunnyades defeated the left wing of the Turks, but, not being supported by the rest, the whole Christian army was cut to pieces, 1444. Ladislans himself fell, together with the legate Cesarini.

Murad soon after abdicated the throne in favour of his son Mahomet, then fifteen years old, and retired to Magnesia. But seeing the disorders which broke out in the empire, owing to the youth of his son, he resumed his authority, quelled the incipient anarchy, and turned his arms against Scanderbeg, who however repulsed him at the siege of Croia. He then marched against Hunnyades, whom he defeated with great loss. Murad died of illness at Adrianople, in 1451, after a reign of thirty years. Murad possessed several great qualities, but was sensual and cruel. He was succeeded by Mahomet II.

MURAD III, son of Selim II., succeeded his father in 1575, being then thirty-one years old. In 1578 he began a war against Persia, which lasted till 1590, when peace was made, Persia being obliged to resign to the Turks the towns of Tabriz, Genge, Shirvan, and Khara, with their territories. In 1592 he sent an army into Hungary, which repulsed the Austrians near Gras, and took the fortress of Raab. But afterwards the Turkish armies met with reverse, and the prince of Transylvania having joined the emperor, and the voyvode of Valachia having revolted against the sultan, the Turks lost Orsova and Siliestria, with a vast number of men. In the midst of these disasters, Murad died of the stone, at Constantinople, in January 1595, and was succeeded by his eldest son Mahomet. Murad was fond of war, and yet never went to the field in person.

MURAD IV., nephew of sultan Mustapha I., who was deposed, in 1622, by the Janissaries, succeeded his uncle when fourteen years old. The first years of his reign were marked by reverses on the side of Hungary as well as on the frontiers of Persia, the Ottomans being then at war both with the emperor and the shah; but in 1627, Sultan

Murat being now of age, and having concluded peace with the Emperor Ferdinand II., turned all his attention towards Persia, and laid siege to Baghdad, where the Persians had a garrison. Meantime the Janissaries having broken out into insurrection, Murat showed great spirit, and succeeded in restoring obedience. In 1635 he repaired in person to the army against Persia, but was obliged to retire. In 1637, having made great preparations, he again took the field in person, and in the following year captured Baghdad after an obstinate defence, when he ordered the whole population, without distinction of age or sex, to be massacred. In 1639 he returned to Constantinople, and made peace with Persia, Baghdad remaining in the possession of the Turks. In 1640 Murat died of a debauch in drinking, to which he was much addicted. His severity repressed the disorderly spirit of the soldiers, and the rebellions of the pashas during his reign, which was upon the whole a successful one: but his cruelty and debauchery have marked his character as one of the worst princes of the Ottomans.

MURAT, JOACHIM, one of the most celebrated of the French imperial marshals, and by Napoleon I. created king of Naples, was born at a village in Perigord, in 1768. His father was a country innkeeper, who had been a steward to the great family of the Talleyrands, and through their interest young Joachim was placed at the college of Cahors, and destined for the church; but his disposition and conduct little fitted him for the sacred profession, and an amour led him to discard the ecclesiastical habit and enlist into a regiment of chasseurs, from which he was soon after dismissed for insubordination. Returning to his native village, he took charge of his father's horses until the breaking out of the Revolution, when he obtained his enrolment into the constitutional guard of Louis XVI., from which he passed as a sub-lieutenant into a regiment of chasseurs. During the reign of terror he professed himself an enthusiastic champion of liberty and equality, and rose rapidly to the rank of colonel; but his Jacobin predilections did not prevent him from making himself useful to Bonaparte in the affair of the Sections in 1795; and he was rewarded by being placed on the personal staff of the future emperor in his brilliant Italian campaign of 1796.

From that hour the fortunes of Murat closely followed those of his patron. The fiery valour which the "handsome swordsman" (beau sabreur), as he was called, showed in a hundred fights, the splendid though somewhat fantastic costume in which he delighted to figure, and the love of daring achievement which threw an air of ancient romances over all his actions, invested him, in the eyes of his admiring fellow-soldiers, with the renown of some paladin of old; and his enterprising talents in the field obtained for him the graver distinction, in the cool judgment of Napoleon himself, of "the best cavalry officer in Europe." He commanded that arm in the campaigns of Egypt, Italy, Austria, and Prussia; and in all, at Aboukir, Marengo, Austerlitz, Jena, Eylau, and Friedland, his services were brilliantly conspicuous.

After the Egyptian campaign, he obtained the hand of Caroline, youngest sister of Napoleon I.; and in 1806 was raised to the dignity of a sovereign prince, and recognised by the continental powers as grand-duke of Berg and Cleve.

In 1808 he commanded the French army in Napoleon's unprincipled invasion of Spain; from which country he was recalled and sent to Naples to ascend the throne of that kingdom, vacated by the elevation of Joseph Bonaparte to the Spanish crown. In 1812 he accompanied Napoleon on the expedition to Russia, in the command of the cavalry of the grand army—the most numerous and splendid body of horse perhaps which the world has ever seen arrayed in the ages of civilised warfare. During the advance to Moscow, Murat displayed his accustomed prodigies of personal valour; but the reverses of the retreat disgusted him; reproaches which passed between Napoleon and himself aggravated the recollection of some former slights and wrongs of which he deemed that his brother-in-law had been guilty to him; and although he again served the emperor in the campaign of 1813, he finally, after the disastrous battle of Leipzig, deserted his waning fortunes, and allied himself with his enemies. By this defection he for a time saved his own throne; but the delay of the Congress of Vienna to recognise his regal title alarmed his suspicions, and hurried him, on the re-appearance of Napoleon in France, in 1815, into hostilities against the allied powers. In an attempt to induce the Italians to arm for their national independence, he signally failed; he was compelled to flee from his kingdom; and desperately landing again in arms on the coasts of Calabria with a few followers, he was captured, and shot by the base sentence of a Neapolitan court-martial. As a sovereign Murat had shown himself mild, liberal, and merciful; as a politician he was weak, vacillating, and faithless; in the field the "best cavalry officer in Europe" was assuredly no general; as a man he had many warm and noble feelings; but of fixed principle, either in private or public life, he was utterly destitute. His wife, CAROLINA MARIA ANFUSIATA BONAAPARTE, sister of Napoleon I., was born at Ajaccio, in 1782. She married in 1802 General Murat, then aide-de-camp to the First Consul, and became Grand Duchess of Berg, and afterwards Queen of Naples in 1808. She was the only sister of Napoleon who became a queen. She took a considerable part in the public affairs in the kingdom of Naples, and was several times regent in the absence of her husband, who was

obliged to follow Napoleon in his never-ending wars. She displayed much ability, prudence, and firmness; she encouraged education and learning, and founded several useful institutions, among others one for the education of young ladies at Naples, which still remains. At various times she had a difficult task in acting the part of a conciliator between her spirited but imprudent husband and her imperious brother. After seven years of reign, she was obliged, through the reverses of her husband in 1815, to leave Naples on board of an English man-of-war, and to retire to Austria, where she lived for many years under the title of Countess of Lipano (the anagram of 'Napoli'). After the tragical death of her husband, she bustled herself with the education of her four children. In course of time the two sons went to settle in America, one daughter married the Italian Count Rasponi, and the other Count Pepoli of Bologna. Madame Murat made a journey to Paris after 1830 for some family interests, and was well received by Louis-Philippe and his family. She afterwards went to Italy, and died at Florence, in May 1839. Napoleon had a very favourable opinion of his sister Caroline. The elder of the two sons of Murat, Napoleon Achille, died in 1847. Lucien Charles Joseph François Napoleon, the second son, after the declaration of a republic in France in 1848, was elected a representative of the National Assembly for the department of Lot. By some parties his name was put forward during the revolutionary excitement in Italy as having hereditary claims to leadership in that country, and he himself was led to publish a sort of manifesto, stating that he held himself ready if Italy called him to serve her; but the appeal appears to have excited little sympathy.

MURATORI, LUDOVICO ANTONIO, born in 1672, at Vignola, the birthplace of the architect Barocci, in the Modenese territory, studied at Modena, and showed an early aptitude for historical and philological studies. He entered holy orders, and at the age of three-and-twenty he was appointed one of the librarians of the Ambrosian Library at Milan. In that collection he discovered several inedited manuscripts, from which he made extracts, which he published with notes and comments, under the titles of 'Anecdota Latina,' and 'Anecdota Græca.' Some years after he was recalled to Modena by the Duke Rinaldo, who gave him the situation of librarian of the rich library of the house of Este, a place which he retained for the rest of his life.

After this appointment Muratori devoted himself entirely to the study of the Italian records of the middle ages; and after many years of assiduous labour he produced his great work, 'Rerum Italicarum Scriptores, ab anno sæcæ Christianæ quingentesimo ad millesimum quingentesimum,' 28 vols. fol. The first volume of this immense collection was published in 1728, and the last appeared in 1751. Several princes and noblemen defrayed the expenses of the publication; sixteen of them contributed 4000 dollars each. In this collection Muratori has inserted all the chronicles of Italy during the middle ages which he could discover, most of which were inedited, and has accompanied them with valuable commentaries. Some of the texts had been already published by Grævius in his 'Thesaurus Antiquitatum et Historiarum Italicæ,' but they were mostly confined to the last century or two of the period of a thousand years embraced by Muratori. In seeking after the historical records of the middle ages, Muratori collected also a vast number of documents concerning the social, civil, intellectual, and political condition of Italy during that long period, which he transcribed and commented upon, and he published the whole in seventy-five dissertations: 'Antiquitates Italice mediæ sævi, sive Dissertationes de moribus Italici populi, ab inclinatione Romani Imperii usque ad annum 1500,' 6 vols. fol., 1788-42. "I have treated first," says the author in his preface, "of the kings, dukes, marquises, counts, and other magistrates of the Italian kingdom; after which I have investigated the various forms of the political government, and also the manners of the private citizens; the freedom and franchises of some classes and the servitude of others; the laws, the judicial forms, the military system; the arts, sciences, and education; the progress of trade and industry; and other matters of social and civil history."

Muratori has been truly called the 'Father of the history of the middle ages.' Subsequent historians, such as Sismondi and others, are greatly indebted to Muratori, without whose previous labours they could not have undertaken or completed their works. Muratori wrote an abridgement of his Dissertations in Italian, which was published after his death: 'Dissertazioni sopra le Antichità Italiane,' 8 vols. 4to, 1766. He also wrote in Italian, 'Annali d'Italia dal principio dell' era volgare sino all' anno 1750,' 12 vols. 4to, 1762. It is the first general history of Italy that was published, and is a useful book of reference. It has been continued by Coppi down to our own times: 'Annali d'Italia in continuazione di quelli del Muratori, dal 1750 al 1819,' 4 vols. 8vo, Rome, 1829. Another work of Muratori is his 'Novus Thesaurus veterum Inscriptionum,' 4 vols. fol., 1739, in which he has inserted many inscriptions unknown to Gruter, Spon, Fabretti, and other archaeologists who had preceded him.

His work entitled 'Antichità Estensi,' in 2 vols. fol., Modena, 1718-40, is the Fasti of the house of Este in its various branches. He also wrote several historico-political treatises in support of the rights of his sovereign the Duke of Modena over the towns of Ferrara and Comacchio, which had been seized by the court of Rome: 'Questioni Comacchiesi,' Modena 1711; 'Piana esposizione dei Diritti della Casa

d'Este sopra la Città di Comacchio,' 1712; 'Ragioni della serenissima Casa d'Este sopra Ferrara,' 1714.

Among Muratori's other works we must mention—1, 'Governo politico, medico, ed ecclesiastico della Peste,' 1720, written on the occasion of the plague of Marseille, and showing the methods required to counteract it. 2, 'Difetti della Giurisprudenza,' 1742, in which he shows the defects of judicial forms in most countries. 3, 'Morale Filosofia,' 1735. 4, 'Istituzioni di pubblica felicità,' 1749. 5, 'Della regolata divozione dei Fedeli.' In this last treatise, Muratori, who, though sincerely pious, was too enlightened to be superstitious, combated several popular devotional practices which were merely external, and recommended in preference internal habits of self-examination and prayer. His enemies accused him of heresy. Muratori wrote to the pope Benedict XIV., to explain his meaning and ask for his judgment on the matter of contention. That enlightened pontiff wrote him a kind letter in answer, telling him that "those passages in his works which were not found acceptable to Rome did not touch either the dogma or the discipline of the church; but that had they been written by any other person the Roman congregation of the Index would have forbidden them; which however had not been done in the case of Muratori's works, because it was well known that he, the pope, shared in the universal esteem in which his merit was held," &c.

The character of Muratori is clearly seen in his works. Modest though learned, indefatigable, intent upon the improvement of mankind, charitable and tolerant, sincerely religious and strictly moral, he was one of the most distinguished and yet most unobtrusive among the learned of Italy. He was rector of the parish of Pomposa at Modena, but his literary occupations did not make him neglect his flock: he assisted his parishioners with his advice and his money; he founded several charitable institutions, and rebuilt the parish church. He died at Modena, in 1750. His minor works were collected and published at Arezzo, in 1787, in 19 vols. 4to. His tomb is in the church of S. Agostino at Modena, near that of his illustrious countryman Sigonio.

MURAVIEV, MIKHAEL NIKITITCH, a Russian author of some distinction, was born at Smolensk, October 15-27, 1757. His literary acquirements and talents obtained for him the notice of Catherine the Great, by whom he was appointed, in 1785, preceptor to the young grand-dukes Alexander (afterwards Alexander I.) and Constantine; and it was for the instruction of his imperial pupils that he wrote the greater portion of his prose works, consisting of historical and moral pieces, among which are his 'Epochs of the Russian Empire,' and 'Geographical Sketches of North and South Russia.' His 'Dialogues of the Dead' are also intended to characterise the more remarkable personages of Russian history, and are therefore altogether in a different spirit from those of Lucian, Fontenelle, and their imitators, who employed that form of composition chiefly as the vehicle of satire. One of his most admired productions is his 'Oakold,' which describes the march of the northern nations against Constantinople, and which, though in itself a mere fragment, proves its author to have possessed talents capable of giving his countrymen a prose epic. To these productions, all of which are distinguished by great correctness and energy of style, and no less by the moral feeling which pervades them, may be added his 'Letters of Emilius,' and a series of reflections or sketches, entitled 'The Solitary of the Suburb.' His poetical compositions are of less importance; for though admired in their day, they now possess little interest. Muraviev died June 29 (11th July), 1807, and his historical pieces were collected and edited by Karamzin in 1810. The first complete edition of his works appeared in three large volumes 8vo, 1829, to which is prefixed a biographical and critical sketch, written by his nephew and pupil, Constantine Bastiushkov, the distinguished poet.

\* MURCHISON, SIR RODERICK IMPEY, BART., D.C.L., F.R.S., Director-General of the Geological Survey of the United Kingdom, and Director of the Metropolitan School of Science applied to Mining and the Arts; eldest son of Kenneth Murchison, Esq., of Tara-dale, in Ross-shire, by the sister of General Sir Alexander Mackenzie, Bart., of Fairburn, in the same county. He was born on the 19th of February 1792, and in 1799 was placed in the Grammar school of Durham, whence he proceeded, in 1805, to the Military College at Marlow, where he remained till 1807, when he received a commission in the 36th regiment of infantry. For some time he was permitted to pursue his studies in the University of Edinburgh, but joined his regiment at Cork in the winter of 1808, and shortly after embarked with the army under Sir Arthur Wellesley for Portugal. He carried the colours of his regiment at the battle of Vimiera; afterwards accompanied the army in its advance to Madrid, its junction with the force under Sir John Moore, and retreat—sharing in all the dangers of the battle of Corunna. He was subsequently removed to the staff of his uncle, Sir Alexander Mackenzie, in Sicily; served also at the siege of Cadix, and afterwards in Ireland, as a captain in the Inniskillen, or 9th dragoons. In 1815 he married the daughter of General Hugonin and left the army, seeking for amusement and instruction in foreign travel, or, when at home, in the occupations of the sportsman. His wife first attracted him to scientific pursuits, and when, in company with Sir H. Davy, engaged with him in field-sports at the mansion of the late Mr. Morrill at Rokeby, he was encouraged

by Sir Humphry to devote himself to science. By his advice, Murchison attended the lectures at the Royal Institution, between 1822 and 1824; and he afterwards received private instructions in practical chemistry from the late Richard Phillips, F.R.S. [PHILLIPS, RICHARD.] In 1825 he was elected a Fellow of the Geological, and in 1826 of the Royal Society. Having selected geology, for the effective prosecution of which, in the field and on the large scale, his previous military and other active habits had peculiarly fitted him, he applied himself with great energy to his new pursuit. His first contribution to the science, we believe, was read before the Geological Society on the 16th of December in the former year, under the title of 'Geological Sketch of the North-Western extremity of Sussex, and the adjoining parts of Hants and Surrey.' It was published in the Society's 'Transactions,' second series, vol. ii.

After examining the coal of Brora, in Sutherlandshire, and showing, in 1827, that it was a member of the Oolitic series, being the equivalent of the impure coal in the oolite of Scarborough and Whitby, Mr. Murchison visited the Highlands in the following year with Professor Sedgwick, when they succeeded in showing that the primary sandstone of Macculloch was nothing more than the true old red-sandstone, now also called 'Devonian.' The results of all these researches were read before the Geological Society, and published in its 'Transactions,' second series, vols. ii. and iii.

Prepared by his geological investigations at home, he set out in 1828, accompanied by Mrs. Murchison and Mr. (now Sir C.) Lyell [LYELL, SIR CHARLES], to study the extinct volcanoes of Auvergne, and the geology of the north of Italy, visiting Paris, Auvergne, the south of France, Nice, and Turin. A portion of the results of this journey was made public in three memoirs, the joint production of the two geologists—in part read before the Geological Society in 1828, and in part inserted in the 'New Edinburgh Philosophical Journal' for 1829. The subjects of these memoirs are the excavation of valleys, as illustrated by the volcanic rocks of Central France, the tertiary strata of the Cantal, and the tertiary fresh-water strata of Aix, in Provence.

Mr. Lyell continuing his own journey southwards, Mr. Murchison crossed the Alps from Venice by Bassano, and succeeded in discovering a key to the order of sequence of the Jurassic or Oolitic, and incumbent cretaceous rocks, and of the tertiary strata which overlap them. In 1829 he explored the same mountain-chain with Professor Sedgwick, and again by himself in the following year; and they published jointly a memoir on the Eastern Alps, accompanied by a geological map of the chain.

After these explorations of the Alps, Mr. Murchison redirected his attention to the geology of Great Britain. He was induced by his friend and instructor, the late Dr. Buckland [BUCKLAND, WILLIAM], to explore the banks of the Wye between Hay and Builth, in the hope of discovering evidences of order among those masses of rock to which the unmeaning term of 'grauwacke' had so long been, and still continued to be, applied. He was thus led to study those vast and regular deposits of a remote age, which are most clearly displayed in that part of Wales and England which was occupied by the tribe of Britons called by the Romans the 'Silures,' and to which he afterwards gave the appellation of the 'Silurian System.' He finally discovered the entire succession of the upper and lower Silurian rocks in the sea-cliffs to the west of Milford Haven—"The only place in the British Isles where the whole series, down to an unfossiliferous base, is seen to be regularly surmounted by the old red-sandstone" belonging to the superincumbent 'Devonian' system. The views consequent upon these researches were announced in 1831 at the first meeting of the British Association for the Advancement of Science, and they were first published in the 'Proceedings of the Geological Society,' and in the 'Philosophical Magazine,' from 1832 to 1835, both years inclusive, the term 'Silurian' having been applied to the series in the last-mentioned year.

In 1839 Mr. Murchison made public the assemblage of results thus obtained on the palaeozoic geology of England and Wales in a large volume of 800 pages, of which we now cite the entire title, as indicating the extent of the researches on which it was founded—"The Silurian System, founded on Geological Researches in the counties of Salop, Hereford, Radnor, Montgomery, Caermarthen, Brecon, Pembroke, Monmouth, Gloucester, Worcester, and Stafford; with Descriptions of the Coal-fields and overlying Formations."

Prepared by the previous researches of Mr. Austen (now Mr. Godwin-Austen) communicated to the Geological Society, and in some degree by still earlier indications of Sir H. F. de la Beche, Mr. Murchison and Professor Sedgwick definitively ascertained that the stratified rocks of Devonshire and Cornwall were the equivalents of the old red-sandstone, and gave them the name of Devonian; an objection founded on the difference between the characteristic organic remains of the old red-sandstone in Scotland and those of the strata in Devonshire, being subsequently removed by the discovery of both in the Devonian strata of Russia, by Mr. Murchison and his associate geologists in the exploration of that country, to which we shall presently advert.

In 1835 and 1839 two journeys were performed by Mr. Murchison and Professor Sedgwick, for the verification of propositions previously advanced by the former, into the Rhenish provinces, including the

Hartz district and Franconia on the one side, and Belgium and the Boullonnais on the other; in the latter of these they were accompanied by M. de Verneuil, who in 1840 was invited by Mr. Murchison to assist him in exploring the geological structure of Russia, at that period very little known. They visited the banks of the rivers Volkoff and Sias, and the shores of Lake Onega, then proceeded to Archangel and the borders of the White Sea, and followed the river Dwina into the government of Vologda. After traversing to the Volga, they returned by Moscow to St. Petersburg, examining the Valdai Hills, Lake Ilmen, and the banks of the rivers which they passed. Mr. Murchison returned to England in 1840; but having, together with M. Verneuil, been invited by the late Emperor Nicholas to superintend a geological survey of Russia, the two geologists returned to St. Petersburg in the spring of 1841, and being joined by Count Keyserling and Lieutenant Kotsharof, they proceeded to explore the Ural Mountains, the southern provinces of the empire, and the coal districts between the Dnieper and the Don. In 1842 Mr. Murchison travelled alone through several parts of Germany, Poland, and the Carpathian Mountains, and, with the same object of rendering his great work on the geology of Eastern Europe as perfect as possible, he explored in the summer of 1844 the Palaeozoic formations of Sweden and Norway. After his return to England he completed in 1845, in conjunction with M. de Verneuil and Count von Keyserling, his magnificent work on the 'Geology of Russia and the Ural Mountains.' This consists of two volumes in quarto; the first relating specifically to the geological part of the subject, consisting of above seven hundred pages; the second, in the French language, relating to the 'Paléontologie,' occupying more than six hundred pages; the whole copiously illustrated by geological maps and sections, and by accurate figures of organic remains. In 1846, not long after the publication of this work, Mr. Murchison was knighted by her Majesty, the Emperor Nicholas having previously conferred upon him several Russian orders, including that of St. Stanislaus. The 'Geology of Russia' was translated into the Russian language by Colonel Oseraky, and published in 1849. In the same year the author received the Copley medal from the Royal Society, for the establishment of the Silurian system in geology.

In the 'Quarterly Journal of the Geological Society,' vol. v., is Sir Roderick's memoir, of more than three hundred pages, 'On the Geological Structure of the Alps, Apennines, and Carpathians,' published after a sixth visit to the Alps. In this he establishes the fact of a graduated transition from secondary to tertiary rocks, and clearly separates the great Nummulite formation from the cretaceous deposits with which it had been confounded. Of this memoir a translation into Italian has been published by Professors Savi and Meneghini, in their work on the Alps and Apennines.

The uppermost series of the palaeozoic rocks, reposing immediately upon the carboniferous system, consists of those formerly known in England as the lower new red-sandstone, and the magnesian limestone, and marl-late. Sir R. Murchison having satisfied himself that they constituted one natural group only, which from its organic contents must be entirely separated from all formations above, proposed in 1841 that the group should receive the name of the 'Permian' system, from its extensive development in the ancient kingdom of Permian, in Russia, and this denomination has been universally adopted by geologists. In a recent memoir (1855), produced in conjunction with Professor Morris, on the German palaeozoic rocks, he has returned to the subject of the Permian system, and shown that there is no break between it and the lowest system of the mesozoic strata—the triassic—which succeeds it in the ascending series; a fact which harmonises, it has been remarked, with an hypothesis in palaeontology enunciated by the late Professor Forbes [FORBES, EDWARD] that has not yet received the attention it merits.

The latest separate publication of Sir Roderick is an 8vo volume of 538 pages, published in 1854, entitled 'Siluria: the History of the oldest known Rocks containing Organic Remains, with a Brief Sketch of the Distribution of Gold over the Earth.' This volume, besides the subjects indicated in the title, includes a brief general view of the structure of the earth's crust, and more particularly of the more ancient series of strata, of which the Silurian system is the lowest; and also a summary exposition of the author's views of geological theory, in which, it may be noticed, he differs almost wholly from his friend and contemporary Sir C. Lyell, except indeed as to the immensity of the time which they both believe to have been required for the deposition of the sedimentary rocks, though they differ again perhaps in their estimate of this. The following extracts from an article in the 'North British Review,' founded upon the statements of 'Siluria,' gives a condensed view of the subject of the discussions respecting the nomenclature of the oldest strata, which have for some years taken place between Sir Roderick and his former fellow-labourer Professor Sedgwick, and which have attracted a considerable degree of public attention. At the time when the term 'Silurian' was applied, "it was believed that the great slaty masses of North Wales, which had been under the survey of Professor Sedgwick, but whose fossils had not been made known, were inferior in position to the formations which had been classed and whose fossils had been identified as Silurian. This belief continued to be in force when the large work entitled the 'Silurian System' was published (1839); the supposed lower rocks having been termed 'Cambrian' in 1836 by their explorer,

Professor Sedgwick, it being then presumed that this would prove to contain a distinct group of organic remains. When the masses however to which the name Cambrian had been given were examined in detail by the numerous geologists of the Government Survey, and were thus for the first time placed in correlation with the previously-established Silurian strata, it was found that the great and apparently chaotic pile of Snowdon, though full of porphyry and other igneous rocks, was nothing more than the absolute physical equivalent of the Llandeilo formation of the Lower Silurian, and hence these gentlemen, with the entire approval of [the late] Sir H. T. de la Beche, . . . . . restricted the term Cambrian to the underlying grauwacke without fossils." Silurian fossils being alone found in what were called Cambrian rocks, the opinion expressed by Sir R. Murchison after his first return from Russia—"that the so-called Cambrian rocks which contain fossils are merely geographical extensions (under those different mineral characters so admirably described by Professor Sedgwick) of the Lower Silurian deposits of the typical region . . . . in Shropshire and the adjacent counties"—must be regarded to be fully verified. But it has been truly remarked that all territorial designations in geology can only be provisional, and that the dawn of an era in the science is already perceptible, when the terms Silurian and Cambrian must both be merged in some purely philosophical appellation. The name of Sir Roderick Murchison will ever be associated in the genuine records both of science and of commerce with the discovery of the gold-fields of Australia. The actual discovery of the precious metal in New South Wales was made by Count Strzelecki; but to Sir Roderick belongs the merit, first, of having made the inductive theoretical discovery of gold in the Australian Cordillera, guided by the observations he had made in the Urals, but without any knowledge of what had previously been effected; and secondly, of having endeavoured (though without success) to awaken the attention of the home government to the great importance of the subject. The Rev. W. R. Clarke's indications upon it in Australia seem to have been contemporaneous with those of Sir R. Murchison in England.

Referring the reader to the 'Bibliographia' of Agassiz and Strickland for a catalogue of Sir Roderick's papers, exceeding a hundred in number, inserted in the Transactions of societies and in scientific journals, we may appropriately conclude this article by noticing some of his more general labours in the promotion of science and its objects. "After having for five years discharged the arduous duties of secretary to the Geological Society, he filled the office of president in the years 1831 and 1832, and 1842 and 1843. When the British Association assembled at York for the first time in 1831, he was one of the few geologists that responded to the invitation of its founder, Sir David Brewster [BREWSTER, DAVID]; and, fully appreciating the value of such an institution, he discharged the arduous duties of general secretary for several years, and was president of the Southampton meeting in 1846. In the important discussions which took place in the geological section he took an active part; he communicated many important papers to its different meetings; and at Ipswich, in 1851, he succeeded in establishing the new section of physical geography, ethnology, and philology, thus removing geography from the geological section, in which it was overborne by more popular topics of discussion." In connection with the British Association, he has also taken an active part in pressing upon the government and the legislature the importance of carrying on the Ordnance Trigonometrical Survey of Scotland with greater speed.

In 1844 Sir R. Murchison was elected President of the Royal Geographical Society, and was re-elected in the following year. In 1852 he again became president, and succeeded in obtaining from the government a grant of 500*l.* annually in aid of its maintenance and public objects. On the decease of Rear-Admiral Beechey, in 1856, he was made president of this important society for the third time.

Sir Roderick has received the honorary degrees of M.A. from the universities of Cambridge and Dublin and D.C.L. from that of Oxford; he is a trustee of the British Museum. He is also a member of all the principal scientific academies of Europe, including the Imperial Institute of France. In 1855, in consequence of a memorial which had been presented to the government after the decease of Sir H. T. de la Beche, signed by the leading geologists and men of science in every department, the direction of the National Geological Survey, and of the School of Practical Science in connection with it, including that of the Museum of Practical Geology in Jernyn-street, London, was conferred upon Sir Roderick Murchison. He was created a baronet in 1863.

MURE, SIR WILLIAM, of Rowallan, in the county of Ayr, was born about the year 1594. He was the eldest son and heir of a knight of the same name, and the family to which he belonged was one of the most ancient and distinguished in that part of the country. Of the poet's early life few memorials have been preserved. It would appear however that his character and genius were soon developed: there is a specimen of his verses in English, dated in 1611, when he could be little more than seventeen years old. Before his twentieth year he attempted a version of the classic story of Dido and Æneas; and in 1617, when he was scarce four-and-twenty, he addressed the king at Hamilton, on his progress through the country, in a poetical piece which is embodied in the collection entitled 'The Muses' Welcome.' Previous to this time, when he came of age, yet before he

had succeeded to his paternal estate, he married for his first wife Anna, daughter of Dundas of Newbiston, by whom he had five sons and six daughters. His second wife was dame Jane Hamilton, lady Duntreath, and of this marriage there were two sons and two daughters.

During the civil war, Sir William took the popular side and in the first army raised against the king, he commanded a company of the Ayrshire regiment. He was a member of the convention in 1648, when the solemn league and covenant was ratified with England; and the next year he accompanied the troops, which, in terms of that treaty, were despatched in aid of the parliament. He was also present and was wounded, in the decisive battle of Long Marston Moor; and in the succeeding month he was engaged at the storming of Newcastle, where, in consequence of the superior officer being disabled, he had for some time the command of the regiment. Little further is known of him, except that on the revision of Roos's Psalms by the General Assembly in 1650, a version by Mure of Rowallan is spoken of as employed by the committee appointed for the improvement of the psalmody. He died in 1657.

By far the greater portion of Sir William's writings remain in manuscript. Various specimens of his compositions however may be found in a small volume entitled 'Antient Ballads and Songs, chiefly from Tradition, Manuscripts, and scarce works, with Biographical and Illustrative notices, including Original Poetry, by Thomas Lyle,' London, 1827; to which Chambers owns himself indebted for the materials of his notice concerning Sir William in his 'Biographical Dictionary of Eminent Scotsmen.' To this latter we also refer.

MURET, MARC ANTOINE FRANÇOIS (MURETUS in the Latinised form of his name), was born near Limoges in 1586. He learnt, with great facility, Greek and Latin, and at the age of eighteen gave lectures on Cicero and Terence in the college of Auch. He afterwards went to Paris, where he taught philosophy and civil law in the college of St. Barbe with great success. Being accused, according to Scaliger and some others, of an unnatural vice, he quitted Paris for Toulouse, which he was also obliged to leave. He proceeded to Italy in the greatest distress, and on his journey fell ill at an obscure inn on the road. The medical men of the place, having examined his condition, proposed among themselves in Latin (which they thought he did not understand) to try upon him some new experiment: 'Faciamus experimentum in corpore vili.' Muret was so alarmed at hearing this, that he mustered strength enough to pursue his journey.

All this account however is contradicted, or rather discarded with disdain by his biographers, F. Benel and Lasari, whose notices of Muret's life are annexed to Ruhnken's edition of Muret's works, 4 vols. 8vo, Leyden, 1789. It is certain however that Muret repaired to Venice in 1564, where he became intimate with Paolo Manuzio, who published several of his commentaries on the classics. In 1569 he accepted the invitation of Cardinal Ippolito d'Este, and went to live with him at Ferrara, and afterwards accompanied the cardinal to Rome, from whence he repaired to France with the papal legate in 1562. In the following year he returned to Rome, where he was highly esteemed by Pope Pius V. and his successor Gregory XIII.

He entered into holy orders, obtained several benefices, and was appointed professor of philosophy, and afterwards of civil law at Rome. He died at Rome in 1655. His principal works are,—1, 'Commentarius de Origine Juris;' 2, 'Commentarius de Legibus, Senatusque Consultis, et longa Consuetudine;' 3, 'Commentarius in Titulos ad Materiam Jurisdictionis pertinentes;' 4, 'Notæ in Justiniani Institutiones;' 5, 'Orationes.' Several of these are funeral eulogies in the usual laudatory style of such compositions. In that on the occasion of the death of Charles IX., king of France, delivered at Rome in 1574, he praises that king for having extirpated heresy in his kingdom. His 'Poemata' have grace and fluency, but little of invention or poetical genius, excepting perhaps some of his epigrams. But his commentaries and scholia upon Aristotle's 'Ethics and Rhetoric,' on Plato's 'Republic,' on Cicero's 'Catilinarias' and 'Philippicas,' on Seneca's 'Epistles,' on Sallust and Tacitus, on Terentius, Catullus, and Horace, are valuable, as well as his nineteen books 'Variarum Lectionum' of different classical authors.

MURILLO, BARTOLOMEO ESTEBAN, the most eminent artist of the school of Seville, and the most distinguished colourist of the Spanish painters, was born at Seville January 1, 1818. As he manifested at a very early age an inclination to painting, he was placed under his uncle, Juan del Castillo, an artist of merit, whose favourite subjects were fairs and markets, and whose pupils, Alonso Cano, Murillo, and Pedro Moys, rank as the best Andalusian artists. Under him Murillo made rapid progress, and painted several pictures while he remained with his uncle. After leaving him he continued to improve in drawing as well as in painting. For some time he painted in the Florentine style, which then prevailed in Spain, and several works of this his first period are still preserved at Seville. In order to improve himself in drawing, he was on the point of going to England to see Vandyck, when he heard of the death of that great master. He then applied with great diligence to the painting of small pictures of saints, for the trade with America, by which he obtained funds sufficient to undertake, in 1643, a journey to Madrid. Here he derived great advantage from the instruction of his countryman Velas-

quez, who likewise obtained for him permission to copy the masterpieces of Titian, Rubens, Vandyck, and Ribera, in the royal collection. Returning to Seville in 1646, he excited general admiration by his paintings in the convent of St. Francis. They were in the style of Spagnoletto (Jose Ribera) and Velasquez, then unknown at Seville, and procured him many commissions. He painted several historical pictures for the king of Spain, which gained him great reputation in his own country, and, being sent to Rome as a present to the pope, so highly pleased the Italians, that they called him a second Paul Veronese. He likewise painted many grand altar-pieces for the churches and convents in Madrid, Seville, Cordova, Cadiz, and Granada. Among these are eight large pictures representing the works of Mercy, for the church of St. George in the hospital De la Caridad of Seville, which are distinguished for their admirable composition and force of colouring: two of those works are now in this country, in the collection of the Duke of Sutherland, and one in that of Mr. Tomlina. Other equally excellent works adorned the church of Los Venerables and the Capucin Convent, for which latter he painted twenty-eight pictures, which were afterwards sent to America. He was engaged on an altar-piece representing the 'Marriage of St. Catherine,' for the Capucin convent at Cadiz, when he met with an accident on the scaffolding, from which he never recovered, and he died at Seville, on the 3rd of April 1682.

But though Murillo was thus eminent in the higher departments of the art, his favourite subjects were beggar boys as large as life engaged in various amusements, which he generally designed after nature. His pictures of such subjects are highly esteemed for their merit, and may be seen in the collections of the English nobility; but there are numberless copies. Murillo excelled likewise in portraits and landscapes. His works are distinguished by their striking character of truth, nature, and simplicity; by the entire absence of the servility of imitation; and by the delicacy of his touch, and the mellowness of his colouring, which in fact seem perfect in every particular. Among his finest pictures are—'Moses striking the Rock,' and 'Christ feeding the Five Thousand,' in the convent of St. Francis, at Seville; and 'St. Anthony of Padua,' in the cathedral of that city and in the National Museum at Madrid. Many of his works are in France. The Dresden Gallery has a fine 'Virgin and Child' by his hand. Several of his pictures are at Munich, and others at Vienna, in the possession of Prince Esterhazy. By the collection of several Murillos from the convents of Seville, a museum has been formed in the cathedral of that city; and there are many more in the National Museum at Madrid. The picture which Murillo preferred to all his other works was that of 'St. Thomas de Villa Nueva distributing Alms to the Sick and the Poor.' But Murillo has always been a favourite with English collectors, and a large number of his works, and among them some of the best, are in this country; they will be found pretty fully noticed in Waagen's 'Treasures of Art in Great Britain.' In the National Gallery are three Murillos—a 'Spanish Peasant Boy,' a 'St. John and the Lamb,' and a 'Holy Family,' one of his latest works. Murillo raised the art of painting in Spain not only by his own works, but by founding an academy at Seville, of which he was president from the year 1680 till his death.

MURPHY, ARTHUR, a dramatic and miscellaneous writer, was born near Elphin, in the county of Roscommon, Ireland, December 27, 1727. His father was a merchant in Dublin. In 1740 Arthur Murphy was entered at the college of St. Omer, where he remained nearly seven years, and, on his return to Ireland, passed two years in a merchant's counting-house at Cork. From thence he came to London, and obtained a situation as clerk in a banking-house, shortly after which he commenced his career as a public writer. On the 21st of October 1752 he started 'The Gray's Inn Journal,' a periodical in the style of the 'Spectator,' which he carried on to October 12, 1754. On the 18th of the same month he tried his fortune as an actor on the stage of Covent Garden Theatre, and in the character of 'Othello.' His success was but moderate, and after a second season, during which he acted at Drury Lane Theatre, he quitted the boards for ever, and resumed his former occupation as a writer by commencing a periodical political journal called 'The Test.' He also began to study the law, but was refused admission to the societies of the Temple and of Gray's Inn on the ground of his having been an actor. He succeeded finally in obtaining admission to Lincoln's Inn, was called to the bar, appointed a commissioner of bankrupts, and died at Knightsbridge, June 18, 1805, in the seventy-fifth year of his age. His principal works were a translation of Tacitus, which is in a diffuse style, and is a somewhat loose and inaccurate performance; the Lives of Fielding (whose works he edited), Johnson, and Garrick, and upwards of twenty dramatic pieces. The most esteemed of his dramatic pieces are the comedies of 'The Way to Keep Him,' 'All in the Wrong,' 'Know your own Mind,' and 'Three Weeks after Marriage.' His plays, poems, and miscellanies, in seven volumes octavo, edited by himself, were published in 1786.

MURPHY, JAMES CAVANAH, architect, the author of 'The Arabian Antiquities of Spain,' appears to have been the same individual as James Murphy, the author of works on Portugal and its antiquities, though the occurrence of the name of James Murphy without the Cavanah, earliest in date, would seem to tend to an opposite conclusion. We know little of his life further than may be

gathered from his works, which had the merit of giving information of the state of Portugal, and minute particulars of some of the chief antiquities of the Peninsula, when comparatively little attention had been paid to the subject. Murphy, who appears to have been born in Ireland, was residing in Dublin in 1788. Here he was acquainted with the Right Honourable W. Conyngham, who had been in Portugal in 1783, and brought home some sketches of the church of Batalha, a building which though greatly inferior in points of detail to works of the same class in other parts of Europe, is interesting from its construction, its style (a version of the Gothic which is exceptional in the Peninsula), and from its authorship, ascribed to an Irish architect. Murphy arrived at Oporto in January 1789, and he then started for the monastery of Batalha, which he reached in seven days. Being kindly received by the prior, he spent some time in getting together materials for his future work. He subsequently visited Lisbon, and he collected many particulars of the country by observation or from Portuguese writers.

Shortly after his return he published in 1795, 'Travels in Portugal through the provinces of Entre Douro e Minho, Beira, Estremadura, and Alem-tejo in the years 1789 and 1790, consisting of Observations on the Manners, Customs, Trade, Public Buildings, Arts, Antiquities, &c., of that kingdom' (London, 4to, 24 plates). A French translation of the work by Lallemand appeared in 1797; and the researches, though impugned somewhat too severely by the Doctor Ranque in his 'Lettres sur le Portugal,' were regarded with general interest, and also were presented in the German language by M. C. Sprengel. His chief work of that time appeared in 1792-95, under the title, 'Plans, Elevations, Sections and Views of the Church of Batalha in the province of Estremadura in Portugal, with the History and Description by Fr. Luis de Sousa, with remarks: to which is prefixed an Introductory Discourse on the Principles of Gothic Architecture' (folio, 27 plates). The description is translated from the Portuguese of De Sousa. The expense of the work, amounting to 1000*l.*, was borne by Mr. Conyngham. In 1797 or 1798, Murphy published 'A General View of the State of Portugal, containing a Topographical Description thereof, in which are included an Account of the Physical and Moral state of the Kingdom; together with Observations on the Animal, Vegetable, and Mineral productions of its Colonies, the whole compiled from the best Portuguese writers, and from notices obtained in the country' (4to, 15 plates, and map). The plates here are poorly executed. All these works have the author's name as James Murphy.

Regarding a later work as due to the same hand, though far more elaborate in appearance, we find that the author of it, "James Cavanah Murphy," arrived at Cadiz in May 1802, whence he proceeded to Granada, to make drawings of the Alhambra. Afterwards he went to Cordova, and altogether spent seven years in Spain. After 1809, when he says he returned to England, he was occupied nearly an equal length of time in preparing his work, of which some portion appeared in 1812 or 1813, but the larger portion in 1815. The work is entitled 'The Arabian Antiquities of Spain,' and contains ninety-seven plates in large folio, by Le Keux and others, with descriptive letterpress, and is of great value as a record; though, in regard to the Alhambra, omitting all illustration of coloured enrichment, since supplied in his work by Mr. Owen Jones. In 1816 the same author published in 4to 'The History of the Mahometan Empire in Spain, containing a General History of the Arabs, their Institutions, Conquests, Literature, Arts, Sciences, and Manners, to the Expulsion of the Moors; designed as an Introduction to the Arabian Antiquities of Spain,' with a map of the countries conquered by the Arabs. He died in the same year, 1816, during the publication of this work.

MURPHY, ROBERT, was the third of the seven children of a shoemaker; parish clerk of Mallow in Ireland: he was born in 1806. His father intended to have brought him up to his own trade; but the son's destination was changed by an accident which nearly cost him his life. When eleven years of age, while playing in the streets of his native town, he was run over by a cart, and lay on his bed for twelve months with a fractured thigh-bone. During this confinement, his family supplied him with such books and newspapers as they could procure; and among them there happened to be a Cork almanac, containing some mathematical problems. These attracted the child's attention, and made him desirous of possessing Euclid and a work on algebra. The books were procured with some difficulty, and before he was again able to walk, and before he was thirteen years of age, young Murphy was an extraordinary instance of a self-taught mathematician. A gentleman of the name of Mulcahy, of Cork, who was the tutor of most of those from the south of Ireland who got fellowships at Dublin College, was in the habit of proposing problems (or 'cuts,' as they are called in Cork) in the newspapers. At a certain time, he began to receive answers by return of post, from Mallow, without any signature. Surprised at the extraordinary talent displayed in these answers, Mr. Mulcahy went to Mallow to find out his unknown correspondent. After some difficulty, he found that the asserted author of the answers was a boy on crutches, so young that he could not believe the story. A few minutes' conversation however put it beyond a doubt. On coming away, in amazement, he happened to meet a gentleman to whom we are indebted for this account, J. Dillon Croker, Esq., of Mallow, one of his first patrons, to whom he said, with natural exag-

geration, "Mr. Croker, you have a second Sir Isaac Newton in Mallow: pray look after him." It was then agreed that the boy should give up learning his father's trade, and pursue his studies. Mr. Hopley, who kept a classical school in Mallow, had the generosity to take him as a pupil without any charge: and he, in after life, had the satisfaction of transmitting to the widow of his teacher, then reduced to poverty, the sum which an ordinary pupil would have paid.

When he attained the age of seventeen, great exertions were made to get him entered as a student of Trinity College, Dublin, but without success. The examinations for sizarships being classical, he had no chance: and some mathematical papers—which were sent to the authorities as the productions of a boy who had never had a teacher, and which, to judge by what we shall presently see, must have been of no common merit—received no attention. At this time Mr. Mackey, a Roman Catholic priest, published a duplication of the cube, the plausibility of which attracted attention, and, it is said, even obtained the assent of the teachers at Maynooth. Young Murphy, then eighteen years of age, answered this duplication in a pamphlet, entitled 'Refutation of a pamphlet written by the Rev. John Mackey, R. C. P. entitled "A method of making a cube double of a cube, founded on the principle of elementary geometry," wherein his principles are proved erroneous, and the required solution not yet obtained; by Robert Murphy, Mallow, 1824' (20 pp.). The matter and style of this production are really extraordinary under the circumstances: with the exception of a little too much acerbity of expression, and a mere slip in a point of history, a critic would not find anything to attack in it, even as the work of an educated person of mature age. The young author had a confusion in his head between Lord Brounker and Dr. Brinkley, when he says that 'Dr. Brounklej,' had expressed the circumference of a circle by a continued fraction.

The gentleman to whom we have several times referred now determined to try to get young Murphy sent to Cambridge. He applied to the clergyman who presented the boy with his Euclid and algebra, Mr. Brown, who was then employed in a parish of which Mr. McCarthy, a Cambridge Master of Arts, was the proprietor. This last-named gentleman, being then about to visit England, promised to take some of Murphy's papers with him, and to do what he could to induce his old tutor, Professor Woodhouse [WOODHOUSE], to interest himself in the matter. The first answer was not very encouraging. Mr. Woodhouse would say no more than that if they would send the boy he would look after him. On being requested to look over the papers, he declined, saying, that he had no time, and made it a rule not to do so. He desired that the papers might be taken away, and on being requested to allow them to remain, to meet the case of his possibly being able to look at them, he predicted for them the fate of waste paper, and the interview ended. In six weeks from that time, however, Mr. Woodhouse wrote a hurried letter to Mr. McCarthy, stating that at the moment when he was about to tear the papers, in fulfilment of his prophecy, his attention was struck by something that was almost new to him—that on turning page after page, he saw with delight so much talent that he was really unable to say how long he remained fixed to the subject that he intended should occupy him but a moment—that suddenly, recollecting it was the last day for entrance, he hastily went and placed the name of the writer on the boards of Caius College. He concluded by promising that if his friends would send him with fifty or sixty pounds in his pocket, he would take care that they should not be called on again: and this promise was faithfully kept. Mr. Croker immediately obtained about seventy pounds by subscription, and Mr. Murphy began his residence at Caius College, in October 1825. During his residence, the college supplied him with money, in addition to the proceeds of his scholarship. In 1829 he took the degree of Bachelor of Arts, and came out third wrangler. The highest place is sometimes not to be gained by any amount of genius and industry, unaccompanied by strict attention to the University course of reading; and Mr. Murphy's time was much occupied by speculations of his own, which would not turn to much account in an examination. In May 1829, he was elected Fellow of Caius; he shortly afterwards took deacon's orders (he did not proceed farther), and was made dean of his college (the dean is, at Caius, an officer who, under the master, regulates the chapel discipline) in October 1831.

Of what he did in mathematics we shall presently speak: we could wish there were nothing more to say of his private life. He gradually fell into dissipated habits, and in December 1832, left Cambridge, with his fellowship under sequestration for the benefit of his creditors. There is much excuse for a very young man, brought up in penury, and pushed by the force of early talent into a situation in which ample command of money is accompanied by even more than proportionate exposure to temptation. His college admitted the excuse to its fullest extent: and though it could not tolerate the continued residence of an officer who had shown such an example, yet it was understood that his ultimate promotion to one of the more valuable fellowships would take place, on the amendment of his excesses. After living some time among his friends in Ireland, he came to London in 1836, to begin life again as a teacher and writer. Among other things, he obtained from the Useful Knowledge Society an engagement to write the work on the Theory of Equations presently mentioned. In October 1838, he obtained a small permanent income

by his election to the examinership in Mathematics and Natural Philosophy in the University of London; but burdened as he was with debt, this was rather an addition to the instalments of his creditors than an increase of his own means of comfort. He submitted with resignation to the effects of his own misconduct, and showed himself most willing to make every exertion, though well knowing that many years must elapse before he could, by any effort, redeem the ground he had lost. He died March 12, 1843, of a disease of the lungs.

Mr. Murphy's writings were as follows:—'Cambridge Philosophical Transactions': vol. iii. part 3, General Properties of Definite Integrals; vol. iv. part 1, On the Resolution of Algebraic Equations; part 3, On the Inverse Method of Definite Integrals, with Physical Applications; vol. v. part 1, On Elimination between an Indefinite Number of Unknown Quantities; part 2, Second Memoir on the Inverse Method of Definite Integrals; part 3, third memoir on the same; vol. vi. part 1, On the Resolution of Equations in Finite Differences. 'Philosophical Transactions': 1837, part 1, Analysis of the Roots of Equations; part 2, First Memoir on the Theory of Analytical Operations. Separate works: 'Elementary Principles of the Theories of Electricity, Heat, and Molecular Actions, part 1, On Electricity,' 8vo, Cambridge, 1833; 'A Treatise on the Theory of Algebraical Equations,' 8vo, London, 1839 ('Library of Useful Knowledge'): to these must be added some brief communications to the 'Philosophical Magazine,' and various articles on subjects of physics in the 'Penny Cyclopædia,' beginning with the letter D.

Mr. Murphy's character as a mathematician is too well known to require any comment of ours, while the facts of his life, and in particular those of his removal to Cambridge, have not been recorded; we have therefore preferred to devote our space to the insertion of the latter. What he might have been if the promise of his boyhood had not been destroyed by the unfortunate circumstances we have described, it is difficult to say, for he had a true genius for mathematical invention. Before however he had more than commenced his career, his departure from Cambridge, and the necessity of struggling for a livelihood, made it impossible for him to give his undivided attention to researches which, above all others, demand both peace of mind and undisturbed leisure.

MURRAY, DR. ALEXANDER, was born at Dunkitterick, in the stewardry of Kircudbright, Scotland, on the 22nd of October 1775. He was the eldest child of his father's second marriage. His father Robert Murray had by his former marriage, which had subsisted full forty years, a numerous family; and in course of about four years after his wife's death, himself now entering his seventieth year, he married again, and had two children more. Robert was a healthy and vigorous shepherd or pastoral farm servant in one of the mountain districts of Galloway, and distinguished for his sagacity and habitual good conduct: his whole property consisted of four muirland-cows and some two or three scores of sheep, his reward for herding the farm of Kitterick for Mr. Laidlaw in Clatteringshawa. He had been a shepherd all his days, like his father before him, and both had constantly remained in the same neighbourhood. His wife was the daughter of a neighbouring shepherd: all the sons of his first marriage became shepherds; and to the same line of life he designed Alexander.

Alexander however was, in his father's opinion, a lazy useless boy, always committing some blunder or other when sent to herd or bring in the cattle. He was in fact a weakly child, not unhealthy, yet not stout; and he had neither the rapidity nor reach of vision which are indispensable to form a good herd: he was also of a sedentary and reclusive turn; and thus quite unfitted for the vacant, indeed, but vigilant life of a shepherd. It was not till he had reached his sixth year that he was taught the alphabet of his mother-tongue. His father in that year laid out a halfpenny in the purchase of a catechism, and from the letters and syllables on the face of the book he began to teach his son the elements of learning. It was however emphatically 'a good book,' and only to be handled on Sundays or other suitable occasions; it was therefore commonly locked up, and throughout the winter, the old man, who had been himself taught reading and writing in his youth, drew for his son the figures of the letters in his written hand on the board of an old wool-card with the black end of a burned heather-stem. In this way young Murray was initiated into literature; and working continually with his board and brand, he soon became both a reader and writer. The catechism was at length presented, and in a month or so he could read the easier parts of it. In the summer of 1782 he got a Psalm-book, then a New Testament, and at last a Bible, a book which he had heard read every night at family worship, which he often longed to get hold of, but which he was never allowed to open or even touch. He now read constantly, and having a good memory, he remembered well and would repeat numerous psalms and large portions of scripture. In 1783 his reading and memory were become the wonder of the rustic circle in which he lived; and a wish began to be generally entertained that he should be sent to school. The idea of school-wages however frightened his father; and in all likelihood nothing would have been done, had not William Cochrane, a brother of his mother's, paid a visit to the place in the harvest of the above year. He had made a little money as a travelling merchant, and being informed of the genius, as it was called, of his young nephew, he generously undertook to place him

next spring at the New Galloway school, which was about six miles off, and to lodge him in the house of the boy's grandfather by the mother's side, who lived about a mile from New Galloway. Accordingly at the Whit-Sunday term of 1784, young Murray, then in his ninth year, was brought to the New Galloway school; where, for a month at least, his pronunciation and awkward gait were a source of perpetual merriment to the scholars. They soon however began to regard him with other feelings. Being utterly neglected by his aged grandfather, he learned to curse and swear, to lie and do all sorts of bad tricks; but before the vacation in August he was also repeatedly dux of the Bible class. He continued at school for about a fortnight after the vacation had ended; but in the beginning of November he was seized with an illness which obliged him to be taken home. Here, so soon as his health got a little better, he was put to his old employment of a herd, with the rest of the family; and this course of life now continued for about three years. During all that time he spent every penny which he procured from friends or strangers in the purchase of books and ballads, carried bundles of these in his pockets, and read them in the glen or on the hills when tending the cattle, and was ever puzzling and surprising his illiterate neighbours with recitals of what he had learned. In 1787 he borrowed from a countryman Salmon's 'Geographical Grammar,' which delighted him beyond measure, particularly by the specimens it contained of the various languages of the world. In the winter of that year, being able to read and write, he was engaged by the heads of two families in a neighbouring parish to teach their children. He returned home in March 1788, and with part of his fees, which were 15s. or 16s., he bought books of history and arithmetic. The following year his father and the family left Kitterick, and went by engagement to herd at a place four miles above Minnigaff, the school of which place Murray immediately resolved to attend. He entered himself accordingly, and during the summer months walked three days every week to Minnigaff school. Here he read incessantly, not only his own books, but, by coming an hour before the school met, the books of all the other scholars which were left in the school. At Martinmas, 1789, he was engaged by three families in the moors of Kells and Minnigaff to teach their children; and during that winter he migrated about, remaining six weeks in one family at a time, the families living at considerable distances from each other. He returned home a little before Whit-Sunday, 1790, and found that from that term his father was engaged as a shepherd on a farm within two miles of Minnigaff. To this farm the family accordingly removed, and Murray, having now easy access to the school, went thither regularly, and also determined on adding to his former acquisitions a little French, which he found was necessary for a clerk intending to go to America or the West Indies, a situation he had some thoughts of obtaining. He immediately borrowed a French grammar, and set to learning the language so hard that in less than a fortnight, his indulgent master giving him whole pages of lessons at a time, he could read portions of the 'Diable Boiteux.' He then found one of the boys in possession of a Latin Rudiments: he borrowed it too, and by incessant reading and a little help from the master, before the vacation in August he beat a class of scholars who had been a considerable time at the study. At Martinmas he went to teach in a family reading, writing, arithmetic, and Latin.

In this situation he applied to his books with his usual zeal; and having, among other works, bought an old and bulky edition of Ainsworth's 'Dictionary' for eighteenpence, he literally read it through from A to Z, and again from Z to A. On Whit-Sunday 1791 he returned to school, and finding a schoolfellow in possession of a Greek grammar, he commenced that language, after spending part of his winter's wages in the purchase of a grammar and lexicon. He had also by this time mastered the Hebrew alphabet, at first from an old Psalm-book, where the letters were marked in succession in the 119th psalm; and afterwards, together with some Hebrew vocables, from his Ainsworth. He now determined on learning that language also, and accordingly sent to Edinburgh for a grammar by the man who rode with the post: the man brought him the first edition of Robertson's 'Grammar,' which, over and above the Hebrew, contained on the last leaf the Arabic alphabet, to which without delay Murray next applied. At Martinmas of the above year he was again engaged to teach, but at the increased fee of 35s. or 40s.; and in this situation he devoted every spare moment to French, Latin, Greek, and Hebrew. In summer he was again at school, and again, in the winter, teaching in a family; but on this occasion at a somewhat lower allowance than before, Murray having chosen the place from its convenience to a school which he wished to attend in the winter evenings. In this school he got hold of Bailey's 'English Dictionary,' which introduced him to the Anglo-Saxon language. He proceeded in this way, taking advantage of every circumstance to increase his knowledge of languages; and at length, in November 1794, he came to Edinburgh, under the countenance and protection of the Rev. Dr. Baird of that city. Murray was at this time in the nineteenth year of his age.

His subsequent progress was comparatively easy. In the course of two years he obtained a bursary, or exhibition, in the University of Edinburgh; and never relaxing in his pursuit of knowledge, he soon made himself acquainted with all the European languages, and began to form the design of tracing up all the languages of mankind to one

source. His acquirements as a linguist pointed him out to Constable, the well-known publisher, as a fit person to superintend a new edition of Bruce's 'Travels;' and in the preparation of that work he was employed for about three years, from September 1802, Murray residing during that time chiefly at Kinnaird House, where he had access to the papers left by the traveller. He was also at different times employed in contributing to the 'Edinburgh Review' and other periodicals. By the advice of his friends he prosecuted the studies necessary for the Church, to which his attention was directed as a permanent source of employment; and at length, in December 1806, he was appointed assistant and successor to Dr. Muirhead, minister of Urr, in the stewartry of Kirkcudbright, a charge to which he in 1808 succeeded as full stipendiary. Within six months after, he married the daughter of a farmer in the neighbourhood. He still continued his philological pursuits. In 1811 an incident occurred which brought him into prominent notice as a linguist: on the recommendation of Mr. Salt, envoy to Abyssinia, he was applied to by the Marquis Wellesley as perhaps the only person in the British dominions qualified to translate a letter, written in Gees, from the governor of Tigrè to his Britannic Majesty; and he performed the task in the most satisfactory way. The following year a vacancy occurred in the chair of Oriental languages in the University of Edinburgh, of which the town-council of the city are the patrons. The income from this chair was small; the post was however perfectly suited to Murray's taste and habits. It brought him to Edinburgh, where his literary labours could be both assisted and valued; and there was a great probability that some other situation would soon be conjoined with it. Great exertions were accordingly made to secure his election, and, notwithstanding some fears of his health giving way under it, his appointment took place. ('Scots Mag,' July, 1812.) He was elected on the 8th of July 1812, and on the 15th the university conferred on him the degree of Doctor in Divinity. On the 26th of August he was formally inducted to the chair, and he began to lecture on the 31st of October following. Soon after that he published, for the use of his students, a small work entitled 'Outlines of Oriental Philology,' which is known to have been both composed and prepared for publication after his arrival in Edinburgh: the subject indeed was perfectly familiar to him. He continued to teach his class with little interruption till the end of February or the beginning of March; and at such times as his health would not permit him to attend his public lecture, he taught a small Persian class in his own room. The pulmonary complaint however, with which he had been struggling through the winter, at length compelled him to suspend his prelections; yet, with its characteristic deceit, it always flattered him with hopes of resuming them; and, quite unconscious of his real situation, he continued engaged in his favourite studies till within a few days of his death, which took place on the 15th of April, 1813, in the thirty-seventh year of his age. His body was interred in the Grey Friars' Churchyard, at the north-west corner of the church.

This great linguist was an eminent example of the pursuit of knowledge under difficulties. His life however may be described rather as the preparation for some result than as having accomplished much; and the performance by which he will be known in the literary world, though distinguished by profound and various learning, was both imperfect and posthumous. It appeared under the auspices of the Rev. Dr. Scot of Corstorphine, and is entitled a 'History of the European Languages, or Researches into the Affinities of the Teutonic, Greek, Celtic, Slavonic, and Indian Nations.' An extensive acquaintance with these languages convinced the author that all the European languages were closely connected; and in the work now named it is his object to show that they all derive from, and may be traced to, nine euphonic primitives, which primitives he states to be "ag, bag, dwag, gwag, lag, mag, nag, rag, and swag." "By the help of these nine words and their compounds," says he, "all the European languages have been formed."

MURRAY, JAMES STUART, EARL OF, known in Scottish history by the name of the 'Good Regent,' was the eldest of three illegitimate brothers, children of King James V. His mother was the Lady Margaret, daughter of John, lord Erskine of Mar, a nobleman of rank and influence at court, and one of those to whom the custody of the king when an infant had been committed.

Murray is supposed to have been born about the year 1533, but the precise time of his birth is not known, nor any particulars of his early life, except only this, that when but a few years old his father made him prior of St. Andrews, with all the revenues of that rich benefice. He afterwards acquired also the priory of Pittenweem, and, after obtaining a dispensation from the Holy See to hold three benefices together, that of Mazon in France in commendam; and in 1544 he took the oath of fealty to Pope Paul III. In 1548 however he gave proof of that intrepidity and military genius for which he was afterwards so distinguished. This was on occasion of the descent into Scotland by the lords Grey de Wilton and Clinton. When the fleet of the latter landed at St. Monan, on the coast of Fife, the Lord James (as he was then called) collected a little band as determined as himself, and, placing himself at their head, attacked the invaders and drove them back to their ships. Shortly before this he had been in France, having gone thither in the retinue of his youthful sister, Queen Mary, when it was resolved she should be sent over to the Continent for her

BIOG. DIV. VOL. IV.

education; and at different times afterwards we find him again abroad. He was also present at Mary's marriage with the Dauphin of France, and was soon afterwards deputed to carry to the latter the crown and other ensigns of royalty. Circumstances occurred however in Scotland which prevented the execution of this appointment: the Reformation was now rapidly diffusing itself among all classes of the community, and dissolving in its mighty progress the nearest and tenderest ties. In these struggles the Prior of St. Andrews joined the reformers, or, as they were called, the 'congregation,' among whom, by his courage and military skill, the success of his undertakings, the sanctity or rather austerity of his character, and the bluntness of his manner, aided by the advantages of birth, countenance, and person which he possessed, he gradually acquired a very high degree of consideration. The queen-regent (to whom he was opposed) of course endeavoured to destroy his influence, representing him in particular as an aspiring ambitious man who, under pretence of a reformation in religion, sought to overturn the existing government. That argument however had little weight, or rather it worked a contrary way: his influence continued to increase; and when, in the end of the year 1559, the congregation resolved on taking the government into their own hands, he was one of the council appointed for civil affairs. On the death of the queen-regent he was made one of the lords of the articles, and on the dauphin's death he was directed by the convention of estates to proceed to France and invite Mary to return to her native country. Such an appointment suited the views of the prior well; for previous to the death of Francis the Lord James had entered into a correspondence with the young queen, soliciting the renewal of his French pension; and in reply Mary had assured him not only of that but of the highest favours, civil or ecclesiastical, which could be conferred upon him, provided he would return to his duty. He had also at the same moment applied through Throckmorton to Cecil, the English minister, requesting some pension or allowance in recompence for the losses he had sustained in the cause of the Reformation. He therefore willingly undertook the proposed mission, and setting out on the service accordingly, reached the palace and quickly gained admittance to the queen. He then found that an envoy from the Roman Catholic party in Scotland had preceded him; and in the interview which the prior had with his sister, he learnt that the disturbed state of the country and his own ambitious views had been strongly insisted on. Mary however adopted her brother's suggestions, and agreed to return to Scotland without that armed force which the Roman Catholic envoy had represented as wholly indispensable. The Lord James immediately communicated the result of the conference to Throckmorton, the English ambassador, but in a secret manner; and, contrary to Mary's express wishes, in returning home he waited on Elizabeth, to strengthen no doubt the friendship which subsisted between her and the reformers in Scotland, and no doubt also to acquaint her with the determination which Mary had been induced to form. It is observable that the letters from Throckmorton at this period strongly urge upon Elizabeth to secure the Lord James's regard; and from one of them it may even be inferred that Elizabeth had done him some "good turn," as Throckmorton expresses it, for this very end.

The Lord James returned to Edinburgh in the beginning of June 1561, having been absent on his mission about two months. In ten weeks after, Mary embarked from Calais, and after a voyage of five days arrived in the port of Leith. On her arrival she found the prior among the first men in the kingdom; and he then naturally became her prime minister, confidant, and adviser. In this situation he acted with great tact and judgment, and at the same time with much tenderness to the queen. He protected her in the exercise of her own religion, and in return obtained from her a proclamation highly favourable to the reformers. He restrained the turbulence of the borders, moderated the zeal of the people against popery, and at once kept down the enemies of Mary's dynasty and strengthened the attachment of her friends. Mary rewarded his services by conferring on him the title of Earl of Mar, and honoured his marriage with the Lady Agnes Keith, eldest daughter of the earl marshal, which took place about the same time, with a series of splendid entertainments. The greatness of the banqueting indeed, and the vanity thereof, offended the more strict of the reformers, and Knox took occasion to read the Lord James a solemn admonition; "for," said the preacher, "unto this day the Kirk of God hath received comfort by you and by your labours, in the which if hereafter ye be found fainter than before, it will be said your wife hath changed your nature."

The earldom of Mar, which the prior had just obtained from Mary, having been claimed by Lord Erskine as his peculiar right, was soon after resigned with the property belonging to it; but in its place the prior received the earldom of Murray, which had been long the favourite object of his ambition. This grant was scarcely a less matter of jealousy to the prior's great rival, the Roman Catholic Earl of Huntley, than the grant of Mar was to the Lord Erskine. But all dispute on that head was soon ended; for Huntley was shortly after proclaimed a traitor for various overt acts of insubordination and rebellion, originating in disappointed ambition, and not long after that he suddenly expired. Murray was now left in undisputed possession of the chief authority in the kingdom next to the queen, who reposed in him almost unlimited confidence. An incident occurred about this period which showed the influence he possessed in the government,

2 D

and at the same time how he was thought occasionally to use it. His services in the cause of the Reformation were manifest and important, yet the Lord James was not all that the reformers wished; his religious zeal was not hot enough; and they lamented the protection he afforded to the queen in her use of the mass. But they were not prepared to find him now extending his protection to her and her ladies in what Knox calls "the superfluities of their clothes," which he said would bring down the vengeance of God "not only on the foolish women but on the whole realm." Knox imputed Murray's conduct on this occasion to a selfish fear of offending the queen, lest she should repent of her munificence and refuse to confirm her grant of the new earldom; and denouncing such motives in strong terms, accused him of sacrificing truth to convenience, and the service of God to the interests of his ambition. Murray was so incensed at this attack that for a year and a half Knox and he scarcely exchanged words together. The queen's marriage with Darnley seems to have been among the first things to bring them together again, as it was also the first step in the subsequent estrangement between Murray and the queen. To this marriage Murray, Knox, and Elizabeth, and their respective followers, were all opposed. Knox and the reformers were opposed to it on religious grounds; and it was opposed by Murray and Elizabeth partly on the same grounds, but partly also on personal or political considerations. Murray was not accessory however to Darnley's murder; he is stated however to have known of it, but to have said, as he did not wish to meddle with the business, he would neither aid nor hinder it. Accordingly, he left Edinburgh abruptly on the morning of Sunday, the 9th of February 1567, the last day of Darnley's life, alleging his wife's illness at St. Andrews as the cause of his departure; and we do not hear of him in Edinburgh again till about a fortnight after all was over, when he had Bothwell (the perpetrator of the horrid deed) and Huntley, Argyle and Lethington, all parties to it, at dinner at his house. Nor did Murray remain in Edinburgh so as to be present at Bothwell's trial, for in the beginning of April he asked leave to go away to the Continent, but on what grounds is not known; and on the 9th, which was just two days before the trial, he set off, visiting London and the court of Elizabeth on his way. He remained abroad till the end of July, returning only a few days after the coronation of the young Prince James. He was therefore absent from the parliament which was held immediately after Bothwell's acquittal, and from the famous supper at Ainslie's, when the principal nobility signed the bond acquitting Bothwell of all concern in Darnley's murder, and engaging to support him in obtaining Mary's hand in marriage; and he was thus also absent during the important occurrences attendant on the queen's marriage with Bothwell. He was not ignorant of all that was going on: Cecil too was in constant communication with him; and soon after the queen's surrender of herself to "the prince's lords" at Carberry Hill, he sent an accredited agent into Scotland to attend to his interests. He was at length proposed as regent of the kingdom. Before agreeing however, he resolved to visit Mary in person; and accordingly repaired to Lochleven Castle, where she was now a prisoner. When Mary saw her brother she burst into tears, and they had afterwards a private conference together, the particulars of which are not fully known, but it is said that Mary was frequently bathed in tears with his upbraidings.

On the 22nd of August 1567 he was proclaimed regent; and with his usual vigour he immediately proceeded to establish himself in the government. He now held the situation even against the queen herself; for when, having made her escape from Lochleven, she called on him to resign the regency, he at once refused, and took the field against her at Langside, where she sustained a complete defeat. Nor did his determination end here; for being summoned by Elizabeth to bear testimony in the trial which had been instituted by that queen against Mary, he immediately repaired to the appointed place, and did not hesitate in bearing witness against the unhappy prisoner. His own fate however was settled before that of his sister; for while passing through the streets of Linlithgow, on the 23rd of January 1570, he was shot through the body by a bullet fired from a window by James Hamilton of Bothwellhaugh, nephew to the Archbishop of St. Andrews, in revenge for some personal injury committed by the regent years before. Murray survived till midnight, when he died, in the thirty-eighth year of his age.

MURRAY, JOHN, publisher, was born November 27, 1778. His father, originally an officer of Marines, whose name was MacMurray, purchased (1768) the business of Paul Sandby, 32, Fleet-street. John Murray was educated at several schools—at the High School of Edinburgh, at Kensington, at Dr. Burney's at Gosport, where he lost the sight of an eye by the accident of the writing-master's penknife running into it, and finally at Loughborough House, Kennington. At the age of fifteen he lost his father, a great misfortune, as it left him without control and direction; his mother married again, and his guardians neglected him. He had commenced business as a medical bookseller, in partnership with Mr. Highley, but having dissolved the partnership in 1808, he soon devoted his attention to a wider field of literary business. The son of an old friend and neighbour, Dr. Rennell, Master of the Temple, Mr. Stratford Canning, with some other youths at Eton, had commenced a periodical called 'The Miniature,' which brought them some fame, but left them under loss. Mr. Murray,

with a good-nature which always distinguished him, and with something of that tact which enabled him, in his subsequent career, to seize upon occasions of cultivating powerful friends, on hearing of their situation took the copies off their hands, paid their expenses, and, though he found little demand for the work, offered to print a new edition. Through the friends thus made, he became known to Mr. Canning. In September 1807, he wrote to that gentleman opening to him the plan of the 'Quarterly Review,' as a means of counteracting the political influence of the 'Edinburgh Review.' While maturing his project—the most important undertaking of his life—it chanced that a severe criticism on Scott's 'Marmion' (condemning the author for writing for money) appeared in the 'Edinburgh Review.' Mr. Murray instantly started for Scotland, was introduced to Scott at Ashiestiel, in September 1808, found in him a warm supporter of his intended review, and with Scott's co-operation and that of his friends, the Hebers, George Ellis, Canning, Barrow, and Mr. Gifford, the editor, the publication commenced in 1809, and soon attained the circulation of 12,000 copies.

The closest alliance of business and friendship long subsisted between Mr. Murray, and Mr. Constable of Edinburgh, and the Ballantynes; but he early perceived the result of the reckless mode of business to which they had resorted, and foregoing the great advantages of the connection, after repeated and strong warnings and remonstrances, he separated from them. He published however 'The Tales of My Landlord,' and had no difficulty in discovering the real author of 'Waverley,' nor did he ever entertain any doubts on the subject. In 1810 he sought and made the acquaintance of Lord Byron, giving 600*l.* for the first two cantos of 'Childe Harold,' which had been refused by another publisher. In 1812 he removed to Albemarle-street, where, increasing the number of his friends and literary connections, he soon surrounded himself with a circle of distinguished literary characters. In the afternoon might be found in his drawing-room, Scott, Byron, Campbell, Wm. Spenser, R. Heber, Gifford, D'Israeli, Mr. Ward (Lord Dudley), Canning, Hallam, Croker, Barrow, Madame de Staël; and, a few years later, Crabbe, Southey, Belzoni, Washington Irving, Lockhart, and many more.

His acquaintance with Byron extended over a period of more than ten years, and the poet's correspondence with him is printed in Moore's 'Life of Byron,' where will be found more than one proof of his liberal mind. Having heard in 1815 that Lord Byron was in pecuniary difficulties, he sent him a draft for 1500*l.*, promising another for the same amount in the course of a few months, and offering to sell the copyright of Byron's works for his use, if that were not sufficient. He abandoned the publication of Lord Byron's Autobiography, at a considerable sacrifice, because it was thought that parts of it might hurt the feelings of the living, and not do credit to the dead. [MOORE, THOMAS.] Soon after Mr. Murray commenced printing a series of cheap works in parts, consisting of 'Modern Voyages,' the publication of which was delayed by circumstances;—a specimen however given by him to Captain Basil Hall was taken to Edinburgh, and suggested to Constable the notion of his 'Miscellany.' In 1826, trusting to others more sanguine than himself, and allowing his own good judgment, perhaps, to be misled by partiality for the projector, he commenced 'The Representative,' a daily newspaper—almost the sole undertaking of his life which proved a failure. Among his valuable and successful publications were the expeditions of Mungo Park, Belzoni, Parry, Franklin, Denham, and Clapperton—the 'Family Library,' begun April 1829—the 'Domestic Cookery,' of which nearly 300,000 copies have been sold, the fortunate title having been suggested by himself—Markham's 'Histories'—the 'Sketch Book'—and 'Death-bed Scenes.' The last three works, originally published by others, proved failures until Mr. Murray, perceiving their merits, took them into his own hands. Further particulars redounding to his credit as a liberal-minded man of business and a gentleman, will be found in the Lives of Byron, Scott, and Crabbe, and especially in his modest 'Answer to the Calumnies of Captain Medwin,' appended to Byron's works.

Mr. Murray was an excellent man of business; and, when he really applied, could get through more work than most men. No one better understood how to measure the calibre of an author's genius, or the extent of his popularity, and few could be more skilful in timing a publication, so as to secure its favourable reception. His eminent merit—that which distinguishes him above the majority of his class—was that he dealt with the commercial department of literature in a spirit far above that of the mere dealer and chapman. He was distinguished too, by his careful avoidance of the low arts of puffing; he published, for the most part, books of worth, and his imprint alone gave a recommendation to a book which raised it above the necessity of advertising quackery. Mr. Murray continued to take an active share in his business until within a short time of his death. Although his health had been in a precarious state for some months preceding it, no danger was apprehended until two or three days before this occurred. He died June 27, 1848. Mr. Murray married in 1807 the daughter of Mr. Charles Elliot, bookseller, of Edinburgh, by whom he left one son, the present Mr. John Murray, who continues his business, and three daughters.

MURRAY, LINDLEY, was born in 1745, at Swetara, near Lancaster, Pennsylvania, North America. His parents belonged to the

Society of Friends, and he was the eldest of twelve children. He received the rudiments of education at Philadelphia, in the academy of the Society of Friends. In 1758, his father, who was an enterprising merchant, removed with his family to New York, where Lindley was sent to a good school. At an early age he was placed in his father's counting-house, in order to be trained up to the mercantile profession, but having taken a decided dislike to it, he prevailed on his father to allow him to have a private tutor to instruct him in classical learning, and afterwards to place him under an eminent lawyer, in order to receive instruction in the law, to which profession he had resolved to devote himself. John Jay, afterwards governor of the state of New York, was his fellow-student. About the age of twenty-one he was called to the bar, and having obtained a good practice he soon afterwards married. He was sedulous in his application to his business as a lawyer, and very successful till the disputes commenced between Great Britain and America. The law then ceased to be lucrative, and he entered into the mercantile profession, with such success that about the time of the establishment of American independence he had acquired sufficient property to allow him to gratify his wish of retiring from business.

Lindley Murray purchased a beautiful seat on the banks of the river about three miles from New York, but before he removed to it he had a severe attack of illness, which left him in a very debilitated state. In 1784 he embarked for England, with his wife, in hope that a climate where the summers are more temperate and less relaxing than they are in the United States, might contribute to the restoration of his strength. He purchased a house and garden at Holdgate, a small village about a mile from the city of York, where he resided during the remainder of his life. For a short time his muscular strength increased, but afterwards diminished till he could no longer take exercise except in a carriage, or in a vehicle in which he was drawn about his garden, but for many years before his death he was entirely confined to his room. In the sedentary state to which he was reduced he occupied himself by reading and the composition of works chiefly intended for the instruction of youth.

Lindley Murray's first work, 'The Power of Religion on the Mind,' was published anonymously in 1787. It is a selection of passages from various authors, and was very favourably received. The first edition of his 'English Grammar' was brought out in 1795. A second edition was soon required, and the book was revised and enlarged by the author, and then reprinted. 'Exercises,' to correspond with the 'Grammar,' and a 'Key' to the Exercises, were published in 1797, in which year he also published an Abridgment of the Grammar for the use of minor schools and those beginning the study of grammar. The four volumes were adapted to each other, and were soon introduced into many schools. The sale of them has been extremely large, and unfortunately still continues. Murray's 'Grammar' and 'Exercises' however are entitled to little praise beyond the care with which the materials have been arranged; they do not even approximate to a high standard in point of clearness of exposition, and are besides based on a wrong principle, that of teaching the pupil how to write good English by placing before him specimens of bad English: a principle unhappily perpetuated in several of the most recent common school grammars. Definitions are given by Murray, which are frequently very obscure, and rules are laid down without explanation of the principles on which they are founded, and if the pupil commits the definitions and rules to memory, believes in them, and can apply them, his grammatical education, as far as these works are concerned, is considered to be complete. But grammars of this class ill supply the wants of the present age, even for the purposes of common school instruction, and ought to be superseded by others of a better kind, in which the principles of the language should be explained, as well as illustrated by specimens selected from the best writers. Murray's 'Grammar' is altogether deficient in the etymological part, and the student can derive from it no knowledge of the true forms of words and their historical deduction from the early state of our language. His next publication was a series of extracts called 'The English Reader,' to which he soon afterwards added an 'Introduction,' and a 'Sequel;' the three volumes containing respectively selections suited to pupils of different degrees of maturity. The success which attended these publications induced him to publish the 'Lecteur François' in 1802, and in 1807 an 'Introduction au Lecteur François.' In 1804 he published a 'Spelling-Book.' For the copyright of all these works he received a liberal price, and as he had no children, and his property was as much as he and his wife required, the entire sum was devoted to charitable purposes. All these editions were in 12mo. In 1808 he published an enlarged edition of the 'Grammar' and 'Exercises,' in 2 vols. 8vo, designed for the use of persons who might deem it worthy a place in their libraries. He also published a 'Selection from Horne's Commentary on the Psalms,' 12mo, and a little work, published in 1817, 'On the Duty and Benefit of a Daily Perusal of the Holy Scriptures.'

Lindley Murray, though subject for so many years to bodily infirmity as well as to some severe attacks of disease, continued to live till his eighty-first year. He died February 16, 1826, with the reputation of being an exceedingly kind and good man. His wife survived him.

(*Memoirs of the Life and Writings of Lindley Murray, in a Series of Letters written by himself; with a Preface and Continuation of the Memoirs, by Elizabeth Frank, York, 8vo, 1826.*)

MURRAY, PATRICK, FIFTH LORD ELIBANK, eldest son of Alexander, fourth lord, was born in February 1703, and on the 22nd of June 1723, he passed advocate. He did not prosecute the legal profession however. The same year he entered the army; and in 1740, which was about five years after he had succeeded by his father's death to the family honours, we find his lordship a lieutenant-colonel in the expedition to Carthage, of which expedition he wrote an account, which remains in manuscript, it seems, in the library of the Board of Trade. From that time he frequently committed his thoughts to paper, and was known among the literati of Edinburgh, his contemporaries, for the acuteness of his understanding and the varied nature of his information. In 1758 he published 'Thoughts on Money, Circulation, and Paper Currency;' and soon afterwards an 'Inquiry into the Origin and Consequence of the Public Debts.' In 1765 he published 'Queries relating to the proposed Plan for altering Entails in Scotland;' and in 1773, a 'Letter to Lord Hailes on his Remarks on the History of Scotland.' The same year, when Dr. Johnson visited Scotland, he addressed a letter to him, and had afterwards various interviews with him. In 1774 he published some 'Considerations on the present State of the Feerage of Scotland.' In political life he was an opposition lord; and is now known to have maintained a correspondence with the exiled house of Stuart. His younger brother Alexander Murray was likewise so enthusiastic a Jacobite as to propose leading an insurrection in favour of the Pretender. That brother, it may also be mentioned, was in 1750 confined, by order of the House of Commons, for violent interference with a Westminster election; and as he refused to express contrition on his knees according to the order of the house, he was detained in confinement upwards of a twelvemonth, when a prorogation of parliament occasioned his release. The fourth and youngest brother of Lord Elibank likewise attracted considerable notice, distinguishing himself greatly as an officer in high command during the Canadian war. Lord Elibank died without issue, 3rd August 1778, in the seventy-sixth year of his age.

MURRAY, SIR ROBERT, son of Sir Robert Murray of Craigie, entered in early life into the French service, where, by the favour of Cardinal Richelieu, he soon obtained the rank of colonel. He returned to Scotland when the difficulties of King Charles I. were beginning to assume their most alarming aspect; and at Newcastle he had a design for the king's escape, which seems to have been frustrated only by Charles's want of resolution. "The design," says Burnet, "proceeded so far that the king put himself in disguise and went down the back stairs with Sir Robert Murray; but his majesty, apprehending it was scarce possible to pass through all the guards without being discovered, and judging it highly indecent to be caught in such a condition, changed his resolution and went back, as Sir Robert informed the writer." (*Mem. of Duke of Hamilton, 807.*)

On the fall of the royal cause he appears to have gone again to France; and on the 22nd of May, 1650, two letters from that kingdom were read to the parliament of Scotland, one from the young king, the other from the queen-regent, in answer to a letter from the parliament in favour of Sir Robert Murray, in both which they promised, "from their respect and love to the Scots nation, that they would see their desire performed, so far as possibly the convenience of their affairs would permit, and that he should be paid off his arrears." (*4 Balf. Ann., 17.*)

He must have returned to Scotland soon after this; for on the 21st of May, 1651, while Charles was in command of the army there, Murray was appointed justice-clerk, an office which appears to have remained vacant since the deprivation of Sir John Hamilton, in the month of February 1649. A few days after this appointment Sir Robert was sworn a privy-councillor; and on the 6th of June 1651, he was nominated a lord of session; but the court being suspended by Cromwell's proceedings, he never sat on the bench. At the Restoration his appointments as a lord of session and justice-clerk were renewed. He was then also made one of the lords-auditors of exchequer. In speaking of the second of these appointments, Mr. Laing falls into an error: he says, "Sir Robert Murray, whom the Royal Society should revere as its father, was appointed justice-clerk, and the people were pleased and gratified when a judicial office so important and dangerous was conferred on the most upright and accomplished character which the nation produced." (*Laing, Hist. of Scotland, iv. 51.*) At that time however the office of justice-clerk was not the important situation which it now is; nor was it for a dozen years after that the justice-clerk became vice-president of the justiciary court. He was however an assessor to the justiciar or justice-general; he was the first who had the style of lord-justice-clerk; and it is highly probable that his character and reputation paved the way for the advancement of his successors. It does not appear that Murray ever sat on the bench at all. He was made a judge of three courts at one time, not perhaps that he might be a judge in any, but that the emoluments might attach him as a partisan. He was not bred to the law, and does not appear ever to have been in circumstances to acquire a knowledge of it. In the above passage however Laing refers to an event in Sir Robert's life of great interest and importance: he was the father of the Royal Society. That body had existed as a debating club previous to the time of the Commonwealth, when its members were dispersed. At the Restoration the Society assembled

again, and conducted their proceedings on a more extensive scale. On the 28th of November 1660, we find Sir Robert present at what was probably the first meeting, when it was proposed "that some course might be thought of to improve this meeting to a more regular way of debating things; and that, according to the manner in other countries, where there were voluntary associations of men into academies for the advancement of various parts of learning, they might do something answerable there for the promoting of experimental philosophy."

It was Sir Robert Murray who undertook to communicate the views of the Society to the court, and at the next meeting he returned an answer indicative of encouragement from that quarter; and after rules for the government of the Society were established, Sir Robert was chosen first president. He was a member of almost all committees and councils, contributed several papers, and prepared and exhibited various experiments. The authors of the 'The Historical Account of the Senators of the College of Justice' say he was re-appointed justice-clerk in 1667, and sent down to Scotland, which he continued to rule with a gentleness quite unknown to the counsels of his predecessors. But this is scarcely correct. Sir John Home of Renton, who was a great zealot in the cause of episcopacy, which Charles wished to introduce into Scotland, was appointed justice-clerk in 1663, in the room of Sir Robert Murray; and on his death, in 1671, he was succeeded by Sir James Lockhart of Lea. Sir Robert Murray died suddenly, in the month of June 1673.

MURRAY, WILLIAM. [MANSFIELD, EARL OF.]

MUSA, ABU-ABDALLAH-MOHAMMED-BEN, of Khowarezm, the earliest Arabic writer on algebra, whose treatise on that science, 'Al Jebr e al Mokābalah' ('Restoration and Reduction'), was composed for popular use at the command of the kalif Al Mamun. It contains rules and illustrations (rather than demonstrations) for the solution of simple and quadratic equations, with their application to various questions, mostly of a mercantile character. From internal evidence it appears to be drawn from Hindu writings, with which the author is known to have been acquainted; and the works of Diophantus were not translated into Arabic till after the time of Mohammed-Ben Musa.

This work was (partially at least) translated into Latin at an early period; and M. Libri ('Hist. des Sci. Math. en Italie,' vol. I., note 12) has printed all the part of Ben Musa's treatise which the Latin manuscripts in the Bibliothèque du Roi at Paris contain. The complete work, in Arabic, with an English translation and notes by the late Dr. Rosen, was published by the Oriental Translation Society, in 1831, from a manuscript in the Bodleian Library.

It is from this work that (so far as Europe is concerned) algebra derives both its name and introduction; and the writings of Leonard Bonacci, Lucas di Burgo, and the earlier Italians, bear strong marks not only of their Arabic masters, but even of the particular work before us. Accordingly Mohammed-Ben Musa was frequently called the inventor of algebra, a title to which he has no claim.

MUSA, ANTONIUS, was a physician of some celebrity at Rome. He was at one time the medical attendant of the Emperor Augustus, whose slave he had formerly been; and he gained considerable reputation by the benefit which the emperor obtained when, having been long under the care of Æmilius for arthritic pains, which had been unsuccessfully treated with warm applications, Musa ordered him cold affusions, and some other means equally contrary to his previous prescriptions. He prescribed a similar remedy also for Horace. (Epiat., i. 15.)

MÚSA, IBN-NOSSEYR, Governor of Mauritania. The origin and genealogy of this conqueror are differently stated by the Arabian writers. Some make him the son of Nosseyr, son of Abd-el-rahman, son of Zeyd, of the tribe of Bekr; others assert that he belonged to the illustrious tribe of Lakhm; while there are not wanting genealogists who deny his ever having had any connection with either of the above-mentioned tribes, and suppose him to be the son of a liberated slave of Muawiyah-Ibn-Abi Sufyán, the first kalif of the race of Umeyyah in the East. All however agree that his father Nosseyr was a 'mauli,' or adherent of Muawiyah; that he served under his banners against Ali, and, as a reward for his services, was raised to the post of commander of the kalif's body-guard.

According to all accounts, Músa's birth is placed in the year 19 of the Flight (A.D. 640). He seems to have made his first campaigns under his father, and to have been present at almost all the battles then fought by the Moslems. His bravery, and the military talents which he displayed on several occasions, made him a favourite with 'Abd-el-'aziz Ibn Merwan, a prince of the royal family, then governor of Egypt, who attached him to his person, raised him in command, and, having previously obtained leave from his brother the kalif, appointed him general of the armies destined to achieve the conquest of Africa, in the year 79 of the Flight (A.D. 698-9). What the first expeditions of Músa were, is not satisfactorily explained. The Arabian writers say, in vague terms, that he pushed his conquests far into the West, and penetrated into the interior of Africa, returning with a rich spoil and thousands of captives. But he seems to have achieved nothing brilliant until the year 83 (A.D. 707), when the kalif Al-walid named him governor of Mauritania, with instructions to complete the conquest of the country.

Músa took his departure from Egypt at the head of a numerous

army, and partly by persuasion, partly by force, succeeded in reducing to obedience the motley tribes that inhabited the northern shores of Africa. He seems to have experienced no difficulty in uniting under his standard men whose habits were not dissimilar from those of the Arabs, and who, relying on ancient traditions current among them, believed themselves to be sprung from the same stock as their invaders. Under such a belief, which Músa dexterously tried to strengthen, whole tribes flocked to his banners, embraced the religion of the Prophet, and, led by his lieutenants, marched to new conquests. Tangiers, Arzila, and Ceuta, three insulated fortresses which still held out for the Goths, were speedily reduced; a fleet commanded by Abdullah, Músa's eldest son, scourged the Mediterranean, and ravaged the islands of Sicily, Sardinia, and Mallorca; and in the year 91 of the Flight (A.D. 709) the whole of northern Africa, from the Pillars of Hercules to the delta of Egypt, acknowledged the laws of the conqueror.

At this critical moment, when the restless ambition of the African governor had been stimulated by so much success, a favourable occasion presented itself to satisfy his appetite for conquest. Gothic Spain was a prey to the most horrible anarchy. After the death of King Wittiza, Roderic, the son of a provincial governor, had usurped the throne to the prejudice of Eba and Sisebut, the two sons of that monarch, who had taken up arms in support of their rights. Unable however to keep the field against Roderic, the sons of Wittiza and the noblemen who followed their party (among whom was a certain Julian or Ilyán) despatched a messenger to Músa, inviting him to invade Spain, and promising to aid him in his enterprise. No sooner was Músa made acquainted with the divisions among the Goths, than he eagerly seized on the opportunity of interfering in them. By his orders, Tarif Ibn Malik, one of his servants, made a slight incursion in the month of Ramadhán, A.H. 91 (July, A.D. 710), and returned to Africa loaded with spoil. A second expedition, commanded by Tárik Ibn Zeyd, landed on the coast of Spain in April 711, and two months afterwards Roderic was defeated and killed in the battle of Guadaleta.

On the news of this signal victory reaching Africa, Músa, who was far from expecting so complete success, felt a desire to share in the laurels reaped by his lieutenant; and while he hastily made the necessary preparations to cross over into Spain, he sent orders to Tárik not to move from his position, and to wait for further instructions. But the Arabian general had gone too far to be stopped by a mere message from his master. Eager for plunder, and bent on the subjugation of the whole country, he penetrated into the heart of Spain, and, before his master Músa had set his foot on the peninsula, the opulent city of Toledo, the capital of the Gothic monarchy, together with an immense booty, had fallen into his hands.

At this period Músa arrived in Spain, breathing vengeance against the man who, by disobeying his commands, had deprived him of so rich a harvest of glory and wealth. He landed at Algeiras, in June 712, at the head of 18,000 men. He took with him three of his sons, Abdulaziz, Merwán, and Abdulola, leaving his eldest son Abdullah to govern Africa in his stead. His first step was to subdue such provinces as, by Tárik's precipitate march upon Toledo, had remained untouched. He laid siege to Sevilla, which he reduced in a month (July 712). Carmona and other neighbouring cities shared the same fate. Thence he passed into Lusitania, and, almost without halting in his rapid march, seized on Niebla, Beja, and other considerable cities (August 712). His victorious career was stopped for a time before the walls of Merida, which he reduced, after an obstinate defence on the part of the garrison, towards the end of November 712. From Merida, Músa marched to Toledo, where, having had an interview with Tárik, he publicly reproached him with his disobedience, caused him to be beaten with rods, confiscated his property, and had him cast into a dungeon, where he remained until orders came from the kalif to release him, and give him, as before, the command of one of the divisions of the army.

The remainder of Spain was speedily subdued. Tárik, at the head of his troops, marched eastward, and, after reducing the intermediate provinces, laid siege to Saragossa. Músa took a northern direction, reduced Salamanca, advanced as far as Astorga, and thence, returning to the Douro, followed the course of that river to Seria, passed the mountains, and arrived in sight of Saragossa, which Tárik was then investing, and which surrendered in July 713. Thence Tárik proceeded to Valencia, which, together with Murviedro, Xativa, and other considerable cities of those districts, were reduced with amazing rapidity; while Músa himself, after detaching some forces under the command of his son Abdulaziz to subdue and plunder the plains of Murcia, marched towards the Pyrenees, reduced on his passage the cities of Calahorra, Lerida, Barcelona, and, crossing that mountain-barrier, penetrated into France. How far Músa advanced into that country is not satisfactorily ascertained. According to Al-makkari, an Arabian writer, who compiled a history of Spain from the best sources (Arab. manuscripts, in the Brit. Mus., 7384), Músa subdued not only Narbonne, but the greatest part of the province known by the name of Gallia Gothica; but, as other Arabian historians are silent on the subject, and as the Christian chroniclers of France have not made the slightest mention of this invasion, we are authorised in thinking that if Músa did really cross the Pyrenees, his invasion was unattended with any important results. On his return from this expedition to

the Pyrenees, a messenger from the kalif Alwalid, who now became alarmed at Músa's increase of power, reached his camp, and summoned him, together with Tárik, to the royal presence.

Tárik hastened to obey the orders of the kalif, and departed immediately for the East (September 713); but Músa—who, if any faith can be placed in the Arabian writers, had conceived the ambitious project of subduing Gaul, Italy, and Germany, and forcing his way from Spain to Constantinople, thus connecting the eastern and western possessions of the Arabs—refused to comply with the summons. Having prevailed upon the envoy Mugheyth to accompany him in his conquests, by promising him a large share of the spoil, he directed his course towards Asturias and Galicia, which the Moslems had not yet visited. But his reluctance to obey the imperial mandate added to the suspicions already entertained about his views, which were represented as aiming at independence, and a more peremptory order was sent for his return. The kalif's second messenger, whose name was Abú Naar, reached him at Logo, in Galicia, caught the bridle of his horse, and, in presence of the army, commanded him to repair to Damascus. Músa did not venture to disobey the order of the kalif, and, entrusting the government of Spain to his son Abdulaziz, reluctantly commenced his journey in March 714.

On arriving in Africa, where he made some stay, he confirmed his son Abdullah in his government of Cairwán, gave to his son Abdulola the command of Tangiar and other important fortresses on the coast, and taking the road to Egypt, proceeded to Syria with a numerous escort, and long trains of camels heavily laden with the spoil of the conquest, besides being followed by thousands of captives, among whom were 400 gothic nobles sumptuously arrayed. Músa did not reach Syria until the end of 714 or the beginning of 715. Tárik had arrived many months before, and not only had justified himself against the charges brought against him, but had succeeded in throwing all the blame upon Músa. To this must be added that Al-walid was then suffering under an acute disease, which soon after caused his death, so that Músa's reception was not so brilliant as he had anticipated. But if Al-walid's treatment of the man who had added so rich a jewel to his crown was tainted with deep ingratitude, that of his brother and successor Suleymán was not only unjust but cruel. It is generally asserted that while Músa and his escort were approaching the capital, he received from that prince an intimation not to enter Damascus in his brother's lifetime, but to delay his entrance until the commencement of the new reign, in order that the Spanish treasures and captives might grace his accession. This command, Músa, from motives of fidelity towards his sovereign, imprudently disregarded; and on the accession of Suleymán, remained exposed to all his vengeance. He was cast into prison, beaten with rods, exposed to the sun until he was nearly dead, and lastly, fined 200,000 pieces of gold, a sum which all his treasures amassed in Spain were insufficient to satisfy, and which was raised among his friends. Suleymán's vengeance did not stop there: the two sons whom Músa had left to govern Africa in his absence were deprived of their governments, and orders were despatched to Spain (August, 716) to put to death Abdulaziz, whose head was brought to Damascus and shown to his disconsolate father by Suleymán himself, who asked him, with a bitter smile, if he recognised it. The afflicted father turned away at the sight, exclaiming, "Cursed be he who has slain a better man than himself."

Músa died in the greatest poverty at Wádí-l-korá, in the Hejás, in 717, at the age of seventy-nine lunar or Arabian years.

(Conde, *Hist. de la Dom.*, Mad., 1820-21; Cardonne, *Histoire de l'Afrique*, Paris, 1765; *The History of the Mohammedan Empire in Spain*, London, 1816; Casiri, *Bibl. Arab. Hisp. Ec.*, Madrid, 1760; Ibn Khallékán, *Wafyatu-l-a'yán* (or the 'Lives of Illustrious Moslems'), manuscript; Al-makkari, and other historians of Mohammedan Spain.)

MUSÆUS. Two, if not more, Greek poets of this name are known. 1. The oldest of them lived in the mystic ages of Greece, and is said to have been by birth an Athenian, and the son, or at least the disciple, of Orpheus. Plato and Hermesionax, in a passage quoted by Athenæus (xiii. 597), state him to have been the son of Selene, or the moon. Diogenes Laërtius says that he was buried at Phalerum, and mentions his epitaph. His works, which are lost, have been quoted by Plato, Philostratus, Pausanias, Clemens Alexandrinus, and other ancient writers: they consisted of religious hymns, a poem on the war of the giants, a theogony, a work of mysteries, and moral precepts to his son. A few scattered lines, gathered from the quotations of the above writers, were inserted by Henry Etienne in his collection of philosophical poetry.

2. Musæus, styled the Grammarian in the manuscript, is the author of the very interesting Greek poem entitled 'Hero and Leander.' The age in which the author lived has been a subject of much dispute. Scaliger, against all probability, ascribed the poem to the Musæus of the mythic ages. The most general opinion is, that he lived in the lower ages of the Roman empire. Schrader, Schoell, and other critics suppose him to have lived in the 5th century of our era, and to have been a contemporary of Nonnus, the author of the 'Dionysiaca.' (Schrader's 'Preface' to his edition of Musæus, Leuwarden, 1742.) The poem of 'Hero and Leander' was first discovered about the 13th century. It consists of 340 hexameter lines, which contain the whole account of the beginning of the loves of Leander and Hero, the daring

of the former in swimming by night across the strait from Abydos to Sestos, to visit his mistress, and the tragical end of both lovers. Ovid has treated the same subject in Latin verse in one of his *Heroides*, in which Hero writes to Leander to urge him to swim across the Hellespont, as formerly, although the winter had set in, and yet at the same time expresses her fears of his risking his life. The story appears to have been an old tradition of a real fact. The poem of Musæus has been a favourite with scholars, and has been repeatedly published, commented on, and translated into various languages. Heinrich's edition, Hanover, 1793, and Schäfer's edition, Greek and Latin, Leipzig, 1825, which is an improved republication of Schrader's edition already mentioned, are among the best. The poem has been translated into Italian by Salvini, Pompei, and others; French by Marot, Gail, and Mollevant, Paris, 1805; English, with notes by Stapylton, in 1649, and again in 1797; and into German by Passow, Leipzig, 1810.

MUSÆUS, JOHANN KARL AUGUST, was born at Jena in 1735, in which university he studied theology with the intention of taking orders, but did not do so. His first literary production, which appeared in 1760, was his 'Grandison the Second,' a parody on Richardson's celebrated novel, at that period extravagantly admired in Germany. This satirical performance was so well received as to pass through several editions; yet, notwithstanding its success, several years elapsed before the author resumed his pen as a candidate for literary fame; for, in order to eke out his small salary as a professor at the gymnasium of Weimar, he took pupils into his own house, and had consequently little leisure for studious occupation. At length, after an interval of eighteen years, he published his 'Physiognomical Travels,' intended, if not as a satire upon Lavater's system, to correct by wholesome ridicule the extravagant abuse of it into which his countrymen had fallen. The success of this work induced him to throw off his incognito and avow himself the author; whereupon he became the literary idol of the day, and was for awhile an object of attraction to 'lion-hunting' visitors, anxious to have a sight of the retired schoolmaster who had mystified them by his pleasantries. This sudden acquisition of celebrity and importance had no other effect upon Musæus than to encourage him to proceed. Accordingly, he forthwith set about his 'Volksmärchen der Deutschen,' or 'Popular Legends of Germany,' which were actually what they professed to be, for he is said, while composing them, to have collected all the stories of the kind he could, from old women at their spinning-wheels, and even from children in the street. But if this circumstance in some measure deprives him of the merit of invention, the fascinating charm of narrative with which he dressed up such homely materials, the humour and naïveté which he imparted to them, were all his own. The success of these popular tales was immediate and complete, for they have become a classical and standard work of their kind. His next production was that entitled 'Freund Heins Erscheinungen, in Holbeins Manier,' a kind of literary 'Dance of Death' (Freund Hein being a jocular appellation for that grim personage), where, in a series of moral and satirical sketches, he shows how many human projects and follies are suddenly cut short by the unwelcome yet inevitable visitor. Excepting a collection of novellettes and tales, entitled 'Straussfedern,' and another for the use of children, 'Freund Hein' was his last work, for he himself had his summons from him about two years after, October, 28, 1787.

In 1791 a collection of his posthumous pieces, to which was prefixed 'Some Traits of the Life of the Good Musæus,' was published by his pupil Augustus von Kotzebue. To the epithet so markedly bestowed upon him few have had a better claim than Musæus: a mild philosophy, of which his own life furnished a practical example, together with shrewd good sense and quiet humour, pervades all his writings.

MUSGRAVE, WILLIAM, was born in 1657, in the county of Somerset, and studied at Oxford, where he took his degree of M.D. In 1684 he became secretary to the Royal Society of London. In 1691 he fixed his residence at Exeter, where he practised as a physician, and died December 23, 1721. Dr. Musgrave was a good scholar, and well versed in antiquity. He published—1, 'Geta Britannicus,' being the life of Geta by Capitolinus, with notes, to which he added a dissertation by way of commentary. 2, 'Julii Vitalis Epitaphium, cum Notis Criticis H. Dodwelli, et Commentario Guil. Musgrave.' This is a commentary on a Roman epitaph found near Bath. 3, 'De Aquilis Romanis Epistola.' 4, 'De Legionibus Epistola.' 5, 'Belgium Britannicum, in quo illius Limes, Fluvii, Urbes, Viae Militares, Populus, Lingua, Dei, Monumenta, aliaque per multa clarius et uberius exponuntur,' 8vo, 1719. He wrote also several medical works.

MUSGRAVE, SAMUEL, M.D., the grandson of the above, also practised as a physician in Exeter, and died there in 1782. Besides a few works on medical subjects, he was the author of 'Exercitationes in Euripidem,' 8vo, Leyden, 1762; 'Animadversiones in Sophoclem,' 3 vols. 8vo, Oxford, 1800; and 'Two Dissertations—1, On the Mythology of the Greeks; 2, An Examination of Sir Isaac Newton's Objections to the Chronology of the Olympiads.' He also assisted in the edition of Euripides, 4 vols. 8vo, Oxford, 1778. Schweighäuser, in his edition of Appian, has cited many of Musgrave's emendations and conjectures on that author from the marginal notes in Musgrave's copy of Appian. Schweighäuser justly calls him a good Greek scholar and an acute critic.

## MUSIS, AUGUSTINUS DE. [VENEZIANO AGOSTINO.]

MUSONIUS RUFUS, CAIUS, a Stoic philosopher of the 1st century of our era, is mentioned with praise by Tacitus ('Ann.' xiv. 59), and also by Pliny the younger, Philostratus, Themistius, and others. He was a native of Vulsinii in Etruria, and belonged to the Equestrian order. He was a friend of Thræsea Paetus, Barea Soranus, Rubellius Plautus, and other stoics, who were the victims of Nero's suspicion and cruelty. Musonius was banished to Gyarus, where he is said to have been visited by many Greeks for the purpose of listening to his lessons. Being recalled after Nero's death, he lived at Rome under Vespasian, who excepted him from the sentence of exile pronounced by that prince against the Stoic philosophers. This scanty information is all that we have concerning the biography of Musonius Rufus. (Nieuwland, 'Dissertatio de Musonio Rufo, Philosopho Stoico.') Fragments of his works are found in Stobæus, and have been collected and published, with the above dissertation and copious notes, under the title of 'C. Musonii Rufi, Philosophi Stoici, Reliquiæ, et Apophthegmata, cum Annotatione, edidit T. Venhuizen Peerlkamp, Conrector Gymnasii Harlemensis,' 8vo, Haarlem, 1822. These fragments of Musonius are full of the purest morality and wisdom.

MUSSCHENBROEK, PETER VAN, was born at Leyden, March 14, 1692. He received a good classical education in the University of his native city, being a pupil of Perizonius and Gronovius, and afterwards applied himself to the study of medicine, which science, as well as those of chemistry and natural philosophy, he studied under Senguerd, Bidloo, Le Clerc, Burnard, Albinus, Boerhaave, and Rau. He was excessively fond of the mathematical sciences. In 1717 he formed an intimacy with the celebrated s'Gravesande, and their tastes being similar, they pursued their studies together. The introduction into Holland of the Newtonian system of philosophy, and the science of experimental physics, was principally owing to the labours of these two men. They worked together with equal zeal and success, but in different paths; s'Gravesande took the mathematical or theoretical part of physics, while Musschenbroek applied himself more particularly to experimental physics, in which he excelled, and in which he made a great many discoveries.

On the occasion of taking his degree of Doctor of Medicine, in 1718, Musschenbroek wrote an inaugural dissertation, 'De æris præsentia in humoribus animalium;' a very clever production, which contains a description of many careful experiments, from which accurate conclusions were drawn, and, though published nearly a century and a half ago, it may still be read with interest. The author showed in this dissertation both a fondness and talent for experimental philosophy, and he was luckily placed under favourable circumstances for the development of this talent. At the commencement of his career the speculations of Descartes were rapidly dissipating before the lights of the Newtonian philosophy, but they still retained some supporters; Musschenbroek therefore determined to visit England, for the purpose of seeing Newton and making himself fully acquainted with his system. While in London, he was introduced to Dr. Desaguliers, and other scientific men besides Newton; and on his return to Holland, he soon came into public notice. In 1719 he was appointed professor of philosophy and mathematics, and professor extraordinary of medicine in the University of Doesburg on the Rhine, where he gained great reputation by his lectures. In 1723 he was invited to fill the chair of philosophy and mathematics in the University of Utrecht, which had been long distinguished as a school for legal studies, and which Musschenbroek soon rendered equally well known in the department of natural philosophy. He remained at Utrecht many years, and this city was the seat of his principal labours. The curators of the university were so fully impressed with the importance of keeping his services, that they conferred on him, in 1732, the professorship of astronomy. In 1737 George II. of England, elector of Hanover, offered to Musschenbroek a professorship in the newly established University of Göttingen. The offer was refused, but two years afterwards he accepted the professorship of mathematics in his native city, Leyden, which had become vacant by the death of Wittichius. Musschenbroek remained attached to the University of Leyden for the remainder of his life, though he was successively invited to fill other appointments by the kings of Prussia and Spain, and by the emperor of Russia. He died on the 19th of September 1761, in the seventieth year of his age.

The following are Musschenbroek's principal works:—

1. 'Epitome elementorum physico-mathematicorum,' 12mo, Leyden, 1726. This work went through several editions, each succeeding edition being considerably altered and improved. It was reprinted in 1734, under the altered title of 'Elementa Physicæ,' 8vo, Leyden. An English translation was made of this work by Colson in 1744, 2 vols. 8vo. The last edition of this work appeared after the death of the author in 1762, and was named 'Introductio ad Philosophiam Naturalem.' This edition is much more complete than either of the former, and contains a very good summary of all that was then known on natural philosophy. These three editions are often spoken of as distinct works, though it is only the titles that are different.

This introduction to natural philosophy (the last edition is here referred to, which is the most complete) contains many original researches, on the cohesion of bodies, on the phosphorescent properties which many substances acquire from exposure to light, and on various

points in experimental physics. It also includes a much more complete table of specific gravities than had before been published, entirely formed from the author's own investigations. Rigaud de Lafond translated the 'Introductio ad Philosophiam' into French (1769, 3 vols.). This translation must not be confounded with another which appeared at an earlier date (1739) with the title of 'Essai de Physique,' which was translated by Dr. Massuet from a Dutch edition of the same work, published by Musschenbroek, which Dutch edition (containing many researches which were not included in the later Latin ones) was written in a popular style for the purpose, which it fully answered, of diffusing a taste for natural philosophy in Holland among those who were not acquainted with the learned languages.

2. The work which has gained the author most celebrity is his 'Physicæ Experimentales, et Geometricæ Dissertationes,' Leyden, 1729, 4to. This work consists of four treatises: one on the magnet, one on capillary attraction, one on the size of the earth, and one on the cohesion of bodies. All these dissertations contain many interesting researches and new experiments, which were conducted with great care. The labours of Musschenbroek on the power of cohesion between different bodies were very great; and he afterwards rendered his observations on this subject more complete in the introduction to natural philosophy mentioned above. He greatly extended the science of magnetism by his memoir in the present work, though he improved his knowledge at a later period respecting the laws of magnetic attraction, and in 1754 published,

3. 'Dissertatio Physicæ Experimentalis de Magnete,' 4to, Vienna.

4. In 1731 Musschenbroek published at Leyden, in 4to, a Latin translation of the 'Saggi di Naturali Esperienze fatte nell' Accademia del Cimento,' which appeared at Florence in 1687. This work, valuable in itself, was rendered much more so in the translation by the numerous notes and additions of Musschenbroek, which contain an account of some new experiments on the dilatation of different bodies by heat, and also a description of a pyrometer which he had invented, and which was the first instrument of the kind which had been made.

Besides the above works Musschenbroek delivered several public orations, which have been published. He also wrote many papers on meteorology (a subject to which he paid considerable attention), some of which appeared in the 'Memoirs of the French Academy of Sciences,' and some in the 'Transactions of the Royal Society of London.' He published some observations on the Leyden phial, in the 'Memoirs of the French Academy of Sciences' for 1746; and a 'Dissertation on Barometers,' which was printed in the 'Memoirs of the Academy of St. Petersburg.'

MUSTAPHA or MUSTAFA I., Sultan of the Turks, succeeded in 1617 his brother Ahmed I.; but a few months after was deposed by the janissaries, who placed on the throne his nephew Othman. A few years later the janissaries revolted again, deposed Othman, put him to death, and recalled Mustapha to the throne in 1622. Shortly after a fresh revolt deposed him again, and he was taken to the castle of the Seven Towers in 1623, where he was strangled some years afterwards.

MUSTAPHA II., son of Mahomet IV., succeeded his uncle Ahmed II. in 1695. In the following year he defeated the Austrians at the battle of Temeswar, but was defeated in September 1697 by Prince Eugene, near Zenta, in Hungary. The seraskier in the meantime had reconquered Chios from the Venetians. By the peace of Carlowitz in 1699, the sultan acknowledged the dominion of Venice over the Morea and several districts in Dalmatia; and gave up Azof to Russia, and Kaminiek to Poland. Mustapha then withdrew to Adrianople, where he gave himself up to sensuality. His neglect of the public affairs caused a formidable revolt to break out in the capital, and the insurgents marched upon Adrianople, and at the same time offered the throne to Ahmed, Mustapha's brother, who took the title of Ahmed III. Mustapha died in confinement, it was reported by a natural death, six months after his deposition, in 1703.

MUSTAPHA III., son of Ahmed III., succeeded his cousin, Othman III., in 1757. He had been strictly confined in the seraglio ever since the deposition of his father in 1730, but after ascending the throne he showed considerable firmness of character, and effected several reforms in the administration. He engaged in 1769 in an unlucky war against Russia, in which he lost the Crimea and Bessarabia, but did not live to see its termination. He died in 1774, and was succeeded by his brother, Abdul Hamid. His son, Selim III., afterwards succeeded Abdul Hamid in 1789.

MUSTAPHA IV., son of Abdul Hamid, was placed on the throne by the janissaries, who had deposed sultan Selim III. in May 1807. Mustapha was ignorant, weak, and cruel, and a tool in the hands of the janissaries. Mustafa Bafraktar, pasha of Rudshuk, and a friend of Selim, collected an army and marched to the rescue of his master. He entered Constantinople and attacked the seraglio, demanding that Selim should be restored to him. Mustapha gave him up, but it was only the dead body of Selim, for he had been strangled by order of Mustapha at the approach of his deliverers. Bafraktar deposed Mustapha, and placed his brother Mahmud on the throne in July 1808. [MAHMUD II.] In the following November a revolt of the janissaries broke out which lasted three days, and a great part of Constantinople was burnt down. Bafraktar, Mahmud's grand vizier, perished; and the janissaries, being triumphant, were shouting for

the deposed Mustapha when Mahmud gave orders to put his brother to death. Mahmud was now the sole remaining prince of the Ottoman dynasty, and the janissaries submitted to him, after making their own conditions.

MUSURUS, MARCUS, a native of the island of Candia, emigrated to Venice about the end of the 15th century, and taught Greek in that city with great success. He edited several Greek works, which were printed by Aldus Manutius. Afterwards he proceeded to Rome, where Leo X. showed him great favour, and nominated him Bishop of Epidaurus in the Morea. He died at Rome in 1517. He published the first edition of *Athenæus*, printed by Aldus, Venice, 1514. Musurus published also the '*Etymologium Magnum Græcum*,' folio, Venice, 1499, reprinted in 1549, in 1594, and 1710; and some Greek epigrams and other poetry, among others a poem in praise of Plato, which he prefixed to his edition of that philosopher's works, and which was translated into Latin verse by Zenobio Acciajoli, '*Carmina in Platonem*,' Cambridge, 1797.

MUZIANO, GIROLAMO, an eminent Italian painter, was born at Acquafredda near Brescia, in 1580. He was first instructed by G. Romanino at Brescia; he then turned his attention to the colouring of Titian, and particularly to his landscape backgrounds. About 1550 he went to Rome, where he first attracted notice as a landscape-painter, and he was known there as the *Giovane de' Paesi*, or *Girolamo de' Paesi*, '*landscape Jerome*.' He however soon showed that he was equally capable not only in all departments of painting, but in other kindred arts likewise; and he became one of the first painters of his time, and even in the characteristic grand style of the Roman school he obtained a place in the ranks of the greatest masters. Michel Angelo himself pronounced Musiano to be one of the first painters of the age, when he saw his large picture of the Resurrection of Lazarus, which he painted for the church of Santa Maria Maggiore. This picture was afterwards removed to the Appartamento de' Principi in the Quirinale, or papal palace of Monte Cavallo, where it still was, according to Titi, in 1763, but it was not seen there by Ramdohr a few years afterwards. There was a Resurrection of Lazarus by Musiano in the Orleans Gallery at Paris, but as this piece was engraved by S. Vallée for the '*Cabinets de Cromat*,' in 1729, as a part of the Orleans collection, it cannot be the picture so much approved of by Michel Angelo, unless the account of Titi is incorrect. When the part of the Orleans collection, of which it was one, was sold by auction in London in 1800, it fetched only fifty-six guineas: who the purchaser was, or where it is now, is not publicly known.

There are many of Musiano's works in the churches and palaces of Rome, in oil and in fresco; there are also works by him in the cathedrals of Orvieto and Foligno, and in the church of the Madonna at Loreto. There is likewise a very celebrated picture by him of Christ washing the feet of his disciples, in the cathedral of Rheims, which has been engraved by L. Desplaces. Musiano painted many historical landscapes, or landscapes with historical personages or events so introduced into them as to be secondary objects, and of little service beyond affording subject for a title to the landscape. Several of these pictures have been engraved by C. Cort, who executed also some prints after other works by Musiano.

Muziano superintended the Roman mosaic-works, and executed some parts of pictures himself in this style. He performed great services in the art of working in mosaic: what was merely a crude and ornamental art of inlaying coloured stones, he brought almost to the perfection of painting. As an architect, he built the Capella Gregoriana, or the chapel of Gregory XIII. in St. Peter's, in which are two of his best pictures, which however he did not live to complete; they were finished by his most distinguished scholar Cesare Nebbia, a painter of Orvieto. Musiano also completed the series of drawings which Giallo Romano had commenced from the sculptures of the Colonna Trajana at Rome, and the first prints of these bas-reliefs were made from these drawings: the prints of Bartoli were engraved from drawings by himself. The foundation of the Academy of St. Luke at Rome is also due chiefly to the exertions of Musiano: he procured the brief of its establishment from Gregory XIII., and it was confirmed by Sixtus V.

Muziano died at Rome in 1590, according to Baglione (Ridolfi says 1592), and was buried in the church of Santa Maria Maggiore, near the spot where his picture of the Resurrection of Lazarus was placed. His style was severe, and more than ordinarily correct for his time, though he may be reckoned among the imitators of Michel Angelo, whose anatomical display seems to have had its due share of influence on the taste of Musiano. Many of Musiano's works have been engraved by some of the best engravers of the 17th and 18th centuries, and by his contemporaries Ch. Alberti and C. Cort.

(Baglione, *Vite de' Pittori*, &c.; Titi, *Pittura*, &c. di Roma; Ramdohr, *Maleret und Bildhauerarbeit in Rom*; Lami, *Storia Pittorica*, &c.; Waagen, *Treasures of Art in England*.)

MYLNE, ROBERT, architect, was born at Edinburgh, where his father was an architect, in the year 1734. In early life he visited Italy, where he was elected a member of the Academy of St. Luke at Rome. On his return in 1759 he designed and built Blackfriars Bridge, and was not only much engaged as an architect, but also in duties appertaining to the more re-ently apportioned special calling of the civil engineer. In this latter capacity he was called on to

examine into the conservancy and navigation of the Thames, and in 1791 he presented a report to the Commissioners on the Navigation from Lechlade to Whitechurch; and he published a report in 1792 on the proposed improvement of the river Ouse, by executing a straight cut from Eau Brink to King's Lynn. He held the appointment of engineer to the New River Water-Works Company, in which he has been succeeded by members of the same family up to the present time. He is however best known as the architect of Blackfriars Bridge, which structure he commenced in 1760; and it was completed and opened in 1769, having cost ultimately nearly 800,000*l.*, inclusive of the temporary bridge and the approaches, although the bridge itself, for which Mylne's estimate was 158,000*l.*, only cost 152,840*l.* 3*s.* 10*d.* When first built, the bridge had considerable architectural effect; but this was impaired by the subsequent removal of the balustrades. As to the structure, it was till lately supposed that the architect had provided for durability with somewhat unusual care and skill; and the morticing of the *vousoirs* or arch-stones to one another, had been particularly adduced in evidence of this care. It does not appear however that it was possible to foresee the extraordinary changes which have taken place in the bed of the river, which, it is thought, endanger bridges built more recently than Blackfriars. Considerable settlement had taken place in portions of the foundation of the bridge; some of the arches had required to be supported by centering; and the removal of the bridge became (1865) absolutely necessary. It is believed that there was a radical defect in the foundations, in the want of a sufficient number of piles throughout the area of support,—and in drawings certainly they appear to be much less numerous, and therefore farther apart than in London, Southwark, and Waterloo bridges. Mylne's reputation was greatly increased by the building of the bridge. He became an F.R.S., and was appointed Surveyor of St. Paul's Cathedral. To him is owing the noble memento of Wren—"Si monumentum requiris, circumspice," placed over the entrance to the choir. Mylne died on May 5th, 1811, and his remains were deposited near those of Wren.

MYRON, one of the most celebrated artists of ancient Greece, and the sculptor of the Discobolus, or Quoit-thrower, of which that among the Townley Marbles in the British Museum is supposed to be an ancient marble copy, was born at Eleuthera in Bœotia about a.c. 480. Myron was the fellow-pupil of Polycletus under Agelades; he was therefore in the prime of life at about the time that Phidias died; and he lived at the height of his fame in Athens, where he was domiciliated at the commencement of the Peloponnesian war.

Pliny gives the following account of Myron:—He first obtained reputation by a brazen heifer, much celebrated by the poets, which gives Pliny occasion to reflect that men derive more good from the wit of others than from their own. He also made a dog, a quoit-thrower, Perseus killing Medusa, and, as Böttiger explains *priætes*, sea-monsters; also a satyr admiring a flute, Minerva, Delphic pentathletes, pancratiasts, a Hercules which was in the temple of Pompeius in the Circus Maximus, and also a statue of Apollo which Marcus Antonius brought from Ephesus, and Augustus restored to the Ephesians, being warned to do so in a dream.

Myron is said to be the first who represented in sculpture Nature in her multiplicity of forms; he represented man and animal with equal success; he almost, says Petronius ('*Satyria*,' c. 88), gave the souls of men and animals to brass. He was, says Pliny, more numerous and various than Polycletus, but was not so exact in his proportions: he was curious in all corporeal detail, but paid little regard to expression. Whether Pliny means this or not by the words "*ipse tamen corporum tenuis curiosus, animi sensum non expressisse*," it is a characteristic which would very probably distinguish a sculptor who was excellent in representing animals, a quality indicating a strong love of the variety of forms. Myron seems to have adhered in the head and face to the earlier type, as rendered sacred by age; for he kept the hair, beard, and features in the formal manner of the earlier artists, which he much more probably did from taste than from any want of perception, as Pliny seems to imply.

From an observation of Pliny's, Winckelmann placed Myron back to the time of Anacreon and Erinna: Pliny supposed that an epigram of Erinna spoke of a monument to a grasshopper and a locust by Myron; this epigram is in the Greek Anthology, and is ascribed to Anyte; but the Myro, not Myron, there spoken of, says Sillig, is a virgin whose charms were sometimes fatal to her rivals. Myron executed many works besides those mentioned by Pliny, though some of them were preserved at Rome. Augustus placed four oxen in the portico of the temple of Apollo on the Palatine Mount, and a statue of Hercules is mentioned by Cicero as one of the works plundered by Verres. A statue of Apollo also, with the name of Myron on the thigh in silver letters, was plundered by Verres from the temple of Æsculapius at Agrigentum, where it had been consecrated by Publius Scipio. Pausanias mentions the Perseus killing Medusa. A great work by Myron was a group in the Herseum at Samos, of Jupiter with Minerva and Hercules, one on each side, of which the figures were colossal. It was removed to Rome by M. Antonius, but the Minerva and Hercules were restored to their place again by Augustus: the Jupiter he placed in the Capitol. A Bacchus is mentioned by Pausanias, which, he says, after his Eretheus, was Myron's best work at Athens. The Athletes by Myron must have been very numerous,

as he was particularly distinguished for works of this class; there is mention of several in Pausanias and other ancient authors; as Ladas, a celebrated Lacedæmonian runner; two of Lycinus, a Lacedæmonian charioteer, at Olympia; Timanthes of Cleonæ, a pancratiast; Philippus of Pallene, a juvenile pugilist; and one supposed to be Chionis of Lacedæmon, also an Olympic victor, but denied by Pausanias to be Chionis (vi. 13).

All the above works were executed in bronze of Delos; Polyclethus used the Ægina bronze. But Myron was also a sculptor in marble, a carver in wood, and an engraver of metals. Pliny mentions a celebrated marble statue of a drunken old woman, at Sinyrna, by Myron; and Pausanias describes by him a single-bodied Hecate with one head, in wood, which he saw on the island of Ægina: she was the chief divinity of the Æginetans according to Pausanias (ii. 30).

The most celebrated of all Myron's works was his Cow, lowing, and according to some suckling a calf; there are no less than thirty-six epigrams on this work in the Greek Anthology. No human figure has attracted so much notice, and doubtless much of the admiration this work excited was owing to its novelty. Athens was full of gods and men, but bronze animals were certainly rare, and this Cow may have been the first good work of its class that was set up in Athens: the horses of Phidias were mere bassi-relievi placed under a colonnade and of a small size, and, however excellent, would have little effect compared with an isolated bronze, perhaps gilded figure, of the natural size, and fixed upon a marble pedestal in the centre of a public place. So, according to Cicero, it still stood in his time, though it was removed before Pausanias visited Athens, for he did not see it. In the time of Procopius it was in the temple of Peace at Rome.

Sonntag has collected all the numerous epigrams on this work of art. The Discobolus by Myron was one of the most celebrated works of ancient art: the original was in bronze, but there are still several ancient copies of it in marble, though not one entire: one in the Campidoglio, one in the Vatican, and a third was in the Villa Massimi at Rome; that in the British Museum was found in the villa of Hadrian near Tivoli, in 1791, and passed into the possession of Mr. Townley through the hands of Mr. Jenkins, a well-known dealer in works of art of that time. Some other trunks of ancient statues, which have been variously restored, are also said to be marble imitations of this work of Myron. The Townley copy according to some critics has been incorrectly restored, and the head is said not to belong to it. In Lucian's description of the Discobolus of Myron the head is noticed as being turned and looking back, as it does in some others of the reputed copies of this celebrated work. It must be observed however that there is no proof whatever that any of these marbles are copied from the celebrated Discobolus of Myron. The Abbate Fea appears to have been the first to suggest the identity, which occurred to him from the similarity between the Massimi Discobolus found in the Villa Palombara in 1782, and a Discobolus by Myron as described by Lucian and in part by Quintilian. Quintilian (ii. 13) merely alludes to its distorted position and elaborate execution; Lucian (Philopseudes 18) describes it more in detail: he says—"The Discobolus, in the twisted posture with the hand reversed and one knee bent, as if about to vary his attitude and rise with his throw, his head being turned to τὴν or τὸν διακοφάρον—the quoit-bearer,"

which Fea interprets by "the hand in which he has the quoit." These words are however sometimes rendered "the girl or boy who holds the quoit;" implying that the thrower was not yet in action, having only assumed his position, turned his head back, and extended his hand to receive the quoit from the bearer in attendance, who is implied only by the attitude of the Discobolus, not expressed. The Townley marble is however throwing the quoit, both knees are bent, and the toes of the left foot, on which the figure partly rests, are turned back: the action is perfectly momentary, and he is already giving the impetus to his throw. Barry preferred the forward direction of the head, as in this statue, to the turn spoken of by Lucian and seen in other statues of this subject, as much more consistent with the necessary impetus of the throw. Myron had a son Lycius who was likewise a sculptor. He is mentioned by Pliny, and Pausanias (i. 23) says he saw in the Acropolis at Athens a brazen boy holding a laver, by Lycius the son of Myron (Kühn and Amaseus read *Avκτωρ* instead of *Avκτωρ* in this passage): Pliny calls Lycius the pupil of Myron.

See also *Specimens of Ancient Sculpture*, published by the Society of Dilettanti, vol. i. and vol. i. of *The Townley Gallery of the Society for the Diffusion of Useful Knowledge*, in both of which the Discobolus is engraved.)

MYTENS, DANIEL, a native of the Hague, where he was born about 1590, was the best portrait-painter in England during the reign of James I., and previous to the arrival of Vandyck, to whom he was little inferior. He was in England in the time of Van Somer, but he did not attain to great celebrity until he was appointed one of his court painters by Charles I. in 1625, with a salary of 20*l.* per annum, and in the following year he received in addition 125*l.* for pictures painted for the king. Mytens now executed many portraits of royal and distinguished personages, some of which are at Hampton Court; and he was in great favour until about 1632, when he was so much disconcerted at the favour shown by the king to Vandyck, that he solicited Charles for leave to retire to his own country; but the king, learning the cause of his dissatisfaction, entreated him to remain, and told him that he should have work enough both for him and Vandyck. Mytens remained, but apparently for a short time only, as none of his works in England bear a date subsequent to the arrival of Vandyck. The two rivals however parted apparently on good terms, for Vandyck painted the portrait of Mytens, and it is engraved in the collection of Vandyck's portraits, by Pontius. Mytens returned to the Hague, and was still living there in 1656, when he painted a portion of the ceiling of the town-house of that place. His style was bold, firm, and natural, his colouring mellow and harmonious, and his pictures are frequently enriched by warm landscape backgrounds. There are many of his portraits at Hampton Court, of which the full-length of James, first Marquis of Hamilton, is an excellent picture: there are here also Prince Rupert when a boy, and the dwarf, Sir Jeffrey Hudson. Mytens introduced this dwarf in a large portrait of Charles and his queen, which was in the possession of the Earl of Dunmore.

## N

NABIS, tyrant of Sparta, attained the supreme power after the death of the tyrant Machanidas, who was killed about B.C. 206. He proved a cruel despot, and put to death a number of citizens. He had an ingenious engine of torture, described by Polybius (xiii.), which was called 'Nabis's wife,' and which he applied to those who would not deliver up their money to him. He allied himself with Philip II. of Macedon, and took possession of Argos and other parts of the Peloponnese. After the defeat of Philip, and the peace which followed between him and Rome, the consul Flaminius marched against Nabis, defeated him, but afterwards granted him peace, taking his son as hostage to Rome. After the departure of the Romans, Nabis having begun to annoy his neighbours afresh, the Achæans sent against him their general Philopomen, who defeated him and drove him back into Sparta, where Nabis was soon after treacherously killed by his own Ætolian auxiliaries, B.C. 192. (Livy, xxv. 35.) He appears to have been a very able commander in war.

NADAB, the son of Jeroboam, became king of Israel on the death of his father B.C. 968, and adopted the worship that his father had established. In the second year of his reign, while besieging Gibbethon, which belonged to the Philistines, and against which he had led "all Israel," Baasha, the son of Ahijah, one of his captains, formed a conspiracy against him, and slew him. Baasha then occupied the throne, which he continued to do for twenty-three years, during which time, according to the oriental custom, "he smote all the house of Jeroboam; he left not to Jeroboam any that breathed;" thus fulfilling the prophecy of Ahijah the Shilonite.

NÂDIR SHAH was born on the 11th of November 1688, at the small village of Abuver, near Killaat, about 80 miles north-east of

Mushed in the province of Khorassan. He was originally called 'Nâdir Kouli,' that is, 'a slave of the Wonderful,' or 'of God.' When he entered the service of Tâmasp, king of Persia, he assumed the name of 'Tâmasp Kouli Khân,' that is, 'Khan, slave of Tâmasp;' but on his accession to the throne he resumed his original name of 'Nâdir.'

The father of Nâdir belonged to the tribe of Afeshâr, which was one of the seven Turkish tribes which had attached themselves to the kings of Persia. He was a person of no note or rank, and earned his livelihood by means of making coats and caps of sheep-skins. Nâdir after his elevation to the throne, used frequently to allude to his low birth. When the royal house of Delhi required that his son, who was about to marry a princess of that family, should give an account of his male ancestors for seven generations, Nâdir exclaimed, "Tell them that he is the son of Nâdir Shah, the son of the sword, the grandson of the sword, and so on till they have a descent of seventy instead of seven generations."

Nâdir was distinguished in early years by his boldness and intrepidity. At the age of seventeen he was taken prisoner by the Uabegs, who made annual incursions into Khorassan; but he effected his escape after a captivity of four years. On his return to Khorassan, he entered the service of a petty chief of his native country; but he became soon afterwards the leader of a formidable band of robbers. From this employment he rose, by a transition by no means uncommon in the East, to a high rank in the service of the governor of Khorassan; but having displeased his master, he was degraded and severely punished. After this he resumed his occupation as a robber; and in consequence of the unsettled state of the country, he acquired in a

short time no small degree of power. In order to understand clearly the circumstances which facilitated the rise of Nádir, it is necessary to make a few remarks on the internal state of Persia at that time.

In the early part of the 18th century, Persia was attacked and eventually conquered by the Afghans. In 1722 Shah Hussein, the Suffavean monarch of Persia, abdicated the crown to Mahmud, the Afghan conqueror. Mahmud was succeeded in 1725 by Ashráff; who reigned at Isphahan and had the supreme power, though Támásp, the son of Hussein, maintained a precarious independence in a distant part of the empire. Though the power of the Suffavean monarchs had been entirely overthrown by the Afghans, yet the latter had not been able to establish their own authority in the distant provinces of the kingdom; and the consequence was, that Khorassan and other remote provinces were left without any regular government. Nádir was thus enabled to prosecute his schemes without interruption; and having at length raised a body of 5000 men, he joined Támásp in 1727, and declared his intention of expelling the Afghans from his native country. The oppressive rule of the Afghans and the renown of Nádir quickly brought great numbers to his standard; and having been invested with the supreme command by Támásp, which he had acquired by putting to death Futteh Ali, who had previously commanded the forces of the king, he marched against the Afghans and took Mashed in the same year. He followed up his first success with several brilliant victories; Isphahan fell into his power; Ashráff was taken and put to death; and by the close of the year 1729 few if any Afghans were left in Persia.

Such sudden and unexpected success rendered Nádir exceedingly popular; and he appears from this time to have resolved upon seizing the royal power as soon as circumstances would allow him to do so. In 1730 he received from Támásp a grant of the four finest provinces of the kingdom, Khorassan, Masanderan, Seistan, and Kerman; and was requested at the same time to assume the title of sultan. This honour however he declined; but at the same time he ordered money to be struck in his own name, which in the East is regarded as a virtual assumption of the sovereignty of the country.

In 1731 Nádir was engaged in a war with the Turks, whom he defeated on the plains of Hamadan; but having been obliged to march to Khorassan to quell a rebellion, Támásp seized the opportunity of assuming the command of the army, and marched himself against the Turks. Being defeated in battle, he concluded a treaty with the Turks, by which he ceded to them several provinces of the Persian empire. As soon as Nádir heard of this treaty, he took advantage of the discontents which it excited, to carry into execution the plans he had long meditated for seizing the royal power. He published a proclamation, in which he bitterly inveighed against the peace, and announced his intention of prosecuting the war. Having thus secured the good will of the people, he invited Támásp to his camp; and on his arrival, he caused him to be seized and carried away to Khorassan. Instead however of proclaiming himself king, he considered it more prudent for the present to place on the throne the son of Támásp, who was an infant eight months old.

Having completed these arrangements, Nádir continued the war against the Turks, and after experiencing some reverses, he obliged them to sue for peace, which was granted in 1735. The infant sovereign of Persia having died about the same time, Nádir summoned a grand council, consisting of almost every person of rank and consideration in the kingdom, to meet in the plains of Chowal Mogám, which extend from the neighbourhood of Ardebil to the mouth of the Cyrus, in order to take into consideration the state of the kingdom. Upwards of 100,000 persons are said to have attended this assembly, in which the sovereignty was offered to Nádir, who accepted it with apparent reluctance, on the 26th of February 1736, on condition that the Sheah sect, which had hitherto been supported by the great majority of the Persians, should be entirely abolished, and the sect of the Sunnees established in its place. He also stipulated that the Imaum Jaaffer should be placed at the head of the national religion; and that as there were four orthodox sects among the Sunnees, the Persians should be considered as a fifth, under the name of the sect of Jaaffer. It is difficult to determine the reasons which induced Nádir to make this violent change in the religion of the country; but it appears most probable that he wished to destroy the Sheah sect, since it had always warmly supported the dynasty of the Suffavean princes. All the religious property of this sect, which was very considerable, was confiscated by Nádir, and this impolitic attack upon the established religion tended to produce discontents at the very commencement of his reign. Nádir himself appears to have possessed little or no religion; and the Korán as well as the Gospels, which were translated into Persian by his order, were frequently the subjects of his merriment and sarcasm.

Soon after his accession to the throne, Nádir made vigorous preparations for the extinction of the Afghans as a separate power; and as this object could not be accomplished without the reduction of the city and province of Candahar, which were then in the possession of the brothers of Mohammed, the late Afghan monarch of Persia, he commenced the war by the invasion of this province. The city of Candahar fell into his power in 1738, and many of the Afghans fled into the northern provinces of Hindustan, where they were hospitably received. Nádir required of the Emperor of Delhi that none of the

Afghan fugitives should find shelter in his dominions, but as no attention was paid to his demands, he marched into Hindustan in the following year, and after defeating the Mogul troops, entered Delhi on the 8th of March, where he seized the imperial treasures which had been amassed in the course of nearly two centuries by the Mogul monarchs. Soon after his arrival, a report having been spread through the city that Nádir was dead, the inhabitants made a general attack upon his soldiers. Nádir in vain endeavoured to undeceive the populace; his moderation only inflamed the fury of those whom, according to Hindoo historians, it was his desire to save; and at length, unable to restrain the people, he gave orders for a general massacre. These commands were too well obeyed; and from sunrise till noon the inhabitants were butchered by his soldiery without any distinction of sex and age. At the intercession of Mohammed, the emperor of Delhi, Nádir at length commanded the massacre to be stopped; and it is recorded as a proof of the high state of discipline of his troops, that his commands were immediately obeyed. The number of those who perished in this massacre is variously stated by different writers. Fraser says that 120,000 persons were killed; but a Hindoo historian reduces the number to only 8000. (Scott's 'Translation of the History of the Dekkan,' vol. ii. p. 207.)

Nádir did not attempt to make any permanent conquests in Hindustan. He returned to Persia in the following year, and directed his attention towards the reduction of the nations on the north of Persia. He crossed the Oxus in order to punish the sovereign of Bokharah, who had, during his absence in Hindustan, made incursions into Khorassan. This monarch having submitted to his power, Nádir next marched against the king of Khaurizm, whose dominions extended westward of Bokharah along both banks of the Oxus as far as the Caspian. The king of Khaurizm, refusing to submit to Nádir, was defeated in battle, taken prisoner, and put to death, 1740.

By these conquests Nádir had completely secured the peace of Persia. He had delivered his native country from the tyranny of the Afghans, and had extended its dominions to the Indus on the east, the Oxus on the north, and almost to the plains of Baghdad on the west. The Turks, who frequently endeavoured during his reign to extend their dominions, were always repulsed with loss; and the Russians were glad to enter into alliance with this all-powerful conqueror. Hitherto Nádir had ruled with moderation and justice; but the latter part of his reign was disgraced by acts of the foulest tyranny and oppression. His conduct during this period has been described, even by a partial historian (Mirza Mahadi), as exceeding in cruelty and barbarity all that has been recorded in history of the most bloody tyrants. In 1743 his eldest son, Rezá Kouli, who had distinguished himself by his bravery in many actions, was deprived of sight by order of his father. The possession of absolute power appears to have called forth in the mind of Nádir, as it has often done in the minds of other absolute monarchs, some of the worst passions of human nature—avarice, jealousy, and cruelty. During the early part of his reign Nádir was distinguished by the greatest liberality; and after he had obtained the immense wealth of the imperial house of Delhi, he at first remitted three years' taxes. But the possession of such enormous wealth appears to have excited in him the desire of accumulating more; and the taxes were increased to meet the insatiable demands of the royal treasury. It has been already stated that the proscription of the Sheah sect had tended to render him unpopular. Nádir, aware of this, ceased to trust any of the native Persians, who belonged almost entirely to the Sheah sect, and placed his chief dependence on the Turks and Afghans in his army, who were Sunnees. So great was his suspicion of his own subjects, that he is said to have formed the design of putting to death every Persian in the army. Some of the principal officers of his court, having learnt that their names were included in the proposed massacre, resolved to save themselves by the assassination of the tyrant, and, having entered his tent during the night, put him to death, on the 19th or 20th of June 1747. Nádir was succeeded by his nephew Ali.

The life of Nádir Shah was written in Persian by his secretary, Mirza Mohammed Mahadi Khan, who attended him in all his expeditions, and has been translated into French by Sir W. Jones. Fraser also published from Persian manuscripts, which he obtained in India, 'The History of Nádir Shah, formerly called Thamas Kuli Khan, the present Emperor of Persia,' London, 1742. Many interesting particulars relating to Nádir are given by Hanway in his 'Historical Account of the British Trade over the Caspian Sea,' London, 1763-54, which have considerable value, since Hanway had personal knowledge of many of the facts which he has recorded. A detailed life of Nádir is also given by Malcolm in his second volume of the 'History of Persia.'

NÆVIUS, CNEIUS, a native of Campania, and one of the earliest Roman poets, was older than Ennius, and the contemporary of Livius Andronicus. He served in the first Punic war, and afterwards wrote an epic poem on the same, 'De Bello Punico,' and another called 'Ilias Cypria.' He also wrote several dramas in imitation of the Greek, and other comedies on national or Roman subjects, such as 'Macchus exul,' 'Vindemistores,' &c. Of all these, the titles and a few scattered lines are all that have come down to us. ('Fragmenta Poetarum Latinorum, quorum Opera non extant,' by Stephanus, 1564; and also Maittaire, 'Corpus Poetarum.') Cicero, 'De Oratore,' ii. 69, 70, and iii. 12, praises him for his unaffected simplicity and native humour. It appears that

he had a genius for the satirical, which proved unlucky to him; for, having exposed in his plays some of the leading men at Rome, among others some of the Metelli family, he was imprisoned and banished as an alien. He is said to have retired to Utica in Africa, where he died about B.C. 204, according to the chronicle of Eusebius. Aulus Gellius (iii. 3) says that, being imprisoned at Rome, he composed two comedies in his prison, through which he was restored to liberty.

NAHUM, one of the twelve minor Hebrew poets, was called the Elkoshite (Nahum i. 1), probably from the place of his birth, Elkosh, a village in Galilee. (Hieronymus, 'Proem. in Nahum;' Eusebius, 'Onomasticon,' art. 'Ελκωσι'). He prophesied in the kingdom of Judah, whither we may suppose he had gone after the overthrow of Israel. His age can only be conjectured from certain indications contained in his prophecy, from which it appears that both the kingdoms of Israel and Judah had been subject to severe attacks from the Assyrians (chap. i.), and that the captivity of Israel had already taken place (chap. ii. 2). He is thought to allude to the destruction of Sennacherib's army (i. 11-14), as having occurred recently (ii. 1). He also prophesies the speedy restoration of Judah to prosperity (i. 15; ii. 7), which happened in the reign of Josiah. These circumstances would place his prophecy towards the close of Hezekiah's reign, about B.C. 705. Some suppose that the destruction of Thebes and the captivity of the Egyptians and Ethiopians, spoken of in Nahum (ii. 8-10), are the same events to which Isaiah refers (chap. xx.); but this is uncertain.

Nahum's prophecy is a complete poem, the subject of which is 'the burden of Nineveh' (i. 1), that is, the destruction of Nineveh and the Assyrian empire, as the punishment of its wickedness and oppression. The prophecy commences with a sublime description of the power of Jehovah in punishing his enemies and protecting his people, and proceeds to foretell the impending destruction of Nineveh (chaps. i. ii.), which is described in the most vivid poetry in chap. iii. The event which he prophesies took place in the year B.C. 625, in the reign of Chyniladanus, king of Assyria, when Nineveh was destroyed and the Assyrian empire overthrown by Cyaxares I. and Nabopolassar.

"None of the minor prophets seem to equal Nahum in boldness, ardour, and sublimity. His prophecy too forms a regular and perfect poem; the exordium is not merely magnificent, it is truly majestic; the preparation for the destruction of Nineveh, and the description of its downfall and desolation, are expressed in the most vivid colours, and are bold and luminous in the highest degree." (Bishop Lowth, 'Prælect.,' xxi.) Some expressions and images which are peculiar to him occur in i. 10; ii. 4-9; iii. 17. The canonical authority of Nahum's prophecy is undisputed.

NAKHIMOV, AKIM NIKOLAEVITCH, a Russian poet, was born at Kharkov, of wealthy parents, in 1782, and educated at the University of Moscow. According to the usual custom of that period, he entered the military service at an early age, but did not long continue in it; for, on the new university being opened at Kharkov, he enrolled himself among the students, and applied himself to literature with such zeal and diligence as to excite general astonishment. Having taken his degree, he retired to his own estate to indulge in that fulness of literary enjoyment which his fortune permitted him, and in that domestic society which he shortly after secured to himself by his union with a very amiable young lady. Thus eminently favoured in every respect, the tranquil felicity of his life met with no other interruption than that of a premature death, for he was suddenly carried off by a fever, July 17-29, 1814, in the thirty-second year of his age, leaving behind him two infant children, to whom he had looked as pledges of the increasing happiness in store for him.

Though of amiable disposition, and possessed of a fund of good sense and philosophy, Nakhimov had many singularities, and was at times morbidly shy even among his most intimate acquaintances. Another trait in his character was his singular diffidence of his own literary talents, notwithstanding that his favourite subjects, and those in which he best succeeded, were of a satirical cast. This turn for caustic observation displays itself also in his 'Fables,' which are remarkable for their epigrammatic point. Besides his satires in verse, he wrote many pieces in prose that partake more or less of the same spirit, more particularly that entitled 'The Speaking Monkeys,' which was composed in derision of the attempted conquest of Russia by Napoleon I., and which may challenge comparison with Voltaire's 'Micromégas.' A short memoir of him, with a critical notice of his chief productions, was published at St. Petersburg in 1818 by Dr. Maslovitch.

NANNI, GIOVANNI, called Giovanni di Udine, was born at Udine in 1487. He studied first in the school of Giorgione, and afterwards passed to that of Raffaello, under whose direction he executed the greater part of the stuccoes and grotesque ornaments in the loggie and other apartments of the Vatican. He is considered as the most eminent in this branch of the art. His bowers, plants, and foliage, his aviaries, with birds of every description, are so true to nature as almost to deceive the eye by the closeness of the imitation. After the sack of Rome he visited other parts of Italy, and many of his works are at Florence, Genoa, and Udine. He died in 1564. Vasari frequently calls him 'Ricamatore.'

NANTEUIL, ROBERT, a celebrated French engraver and draftsman, was born at Rheims in 1630, and was the pupil of his brother-in-law, N. Regnesson. He engraved chiefly portraits, in which class he is one of the most distinguished engravers, though he generally

engraved the head only, without accessories; but he frequently executed them of the size of life. He also took portraits from the life in pastel in a very able manner; but as he used these chiefly to engrave from, few of them have been preserved. He engraved in line and in stipple, and generally combined both styles, stippling the middle tints; and he contrived to express colour to a considerable degree in his prints. Nanteuil died in 1678, and though he lived to the age of forty-eight only, he has engraved nearly three hundred plates, almost exclusively portraits, and comprising many of the princes of Europe, and most of the celebrated men of France during the reign of Louis XIV., of whom alone he engraved nineteen portraits, all in different periods of his life. His master-pieces are J. B. van Steenberghe, after Duchatel, known as 'L'Advocat de Hollande,' 1668; M. de Pomponne, after Le Brun; F. M. la Mothe le Vayer, 1661; and Marshal Turenne, besides some others.

NAPIER, JOHN, baron of Merchiston, was born at Merchiston Castle, near Edinburgh, in the year 1550, at which time his father was but sixteen years old. His lineage is traced from John de Napier, who, in 1296, swore allegiance to Edward I. of England; and among his more immediate ancestors are mentioned William Napier, governor of the castle of Edinburgh, and Alexander Napier, vice-admiral of Scotland. His father, Sir Archibald Napier, was master of the mint of Scotland. Napier was never raised to the peerage, as might be inferred from the writings of some authors, Briggs among others. ('Letter to Archbishop Usher,' vol. v. p. 422.) His name has been variously written. Besides the Latinised forms Neper and Neperus, we meet with Naper, Napier, and Nepar. The last is the orthography adopted in the title-page of Wright's translation of the logarithmic canon, which work was revised by Napier himself the year before his death. The name at the head of this article appears to have been the family name, and is certainly that by which he is now generally known.

Napier's matriculation into the University of St. Andrews took place in the year 1562-63, as appears from the books of the university. That it took place early also appears from the following passage in the preface to his 'Plain Discovery of the Revelation of St. John,' published at Edinburgh in 1593, 4to. Speaking of the university, he says, "In my tender years and bairn age at schools, having on the one part contracted a loving familiaritie with a certain gentleman, a papist, and on the other part being attentive to the sermons of that worthy man of God, maister Christopher Goodman, teaching upon the Apocalyps, I was moved in admiration against the blindness of papists, that could not most evidently see their seven-hilled citie of Rome pointed out there so lively by St. John as the mother of all spiritual whoredom: that not only bursted I oute in continual reasoning against my said familiar, but also from thenceforth I determined with myself, by the assistance of God's spirit, to employ my study and diligence to search out the remanent mysteries of that holy booke, as to this houre, praised be the Lord, I have bin doing at all such times as convenientlie I might have occasion." One object of the 'Plain Discovery' was to show that the doctrines of the pope were antichristian, which so accorded with the views of the French Huguenots, that a translation of the work, stated in the title-page to have been revised by Napier, appeared at Rochelle in 1603, and the same year the council of Gap formally declared the pope to be Antichrist. In the same work he fancies he has determined the dates at which the completion of the prophecies will take place, and he assigns the destruction of the world to the year 1786.

From the time of his entering the university to the publication of the above work, scarcely anything is known concerning him. His biographers, David Stewart, earl of Buchan, and Walter Minto, about the close of the last century made inquiries among the descendants of Napier for letters or other documents which might throw light on his history during this long interval. Their exertions in this respect seem to have been attended with little success. MacKenzie, in his 'Lives and Characters of the most eminent Writers of the Scottish Nation,' folio, published at Edinburgh in 1708-22, informs us, but without mentioning any authority, that Napier passed some years in France, the Netherlands, and Italy, and that while absent he applied himself to the study of the mathematics. This is confirmed by his biographer, Mark Napier, who supposes him to have left Scotland as early as the year 1566, and adds that his college residence had been too short to entitle him even to the degree of B.A. In 1571 he had returned to Scotland. In 1593 he was chosen by the General Assembly one of the commissioners appointed to assemble at Edinburgh to counteract the attempts of the Roman Catholics to put aside Protestantism, then recently established. We are left to conjecture at what time prior to the year 1594 the mind of Napier first became occupied with the discovery of a method which should supersede the long and laborious arithmetical operations which the solution of the most simple trigonometrical problems then exacted. That he was thus occupied in the year 1594 is probable from a letter written by Kepler to Crugerus, dated 1624, wherein, speaking of Napier's logarithmic tables, which had then been published ten years, he says, "Nihil autem supra Napierianam rationem esse puto: etsi quidem, Scotus quidam, literis ad Tychonem anno 1594 scriptis, jam spem fecit canonis illius mirifici." (Kepl., 'Epist.,' Lips., 1718, fol., p. 460.) The Scotchman here alluded to was Dr. Craig, of whom a circumstance is

related by Wood, in his 'Athens Oxoniense,' under the article 'Briggs,' upon the authority of Oughtred and Wingate, and cited by several authors with reference to Napier's invention. The substance is this:—Craig, coming out of Denmark, called on Napier at Merchiston, and informed him, among other things, of a rumoured discovery by Longomontanus, "as 'tis said," whereby the tedious operations of multiplication and division in astronomical calculations were avoided; and intimated that this was effected by means of proportional numbers, of which information Napier availed himself so skilfully, that upon Craig repeating his visit a few weeks after, he showed him a draught of what he called canon mirabilis logarithmorum. The correctness of this story, as regards Longomontanus, is disproved by the fact that Longomontanus attributes the invention to Napier. ('Astronomia Danica,' p. 7, &c., quoted by Dr. Hutton.) There appears however to be no doubt that Craig did write to Tycho Brahe at the time stated, acquainting him with the progress which Napier had then already made.

Besides Longomontanus, several authors have been mentioned, and their works referred to, with a view to detract from the merit of Napier by bringing him in debtor to some of his contemporaries. All these attempts appear to proceed more or less on the supposition that the principle of logarithms was in Napier's time a novelty. The fame of Napier however does not rest on the discovery of that property of numbers upon which all the advantages of logarithms depend. Long before his time it was known that if the terms of an arithmetical and geometrical series were placed in juxtaposition, the multiplication, division, involution, and evolution of the latter would answer to and might actually be effected by a corresponding addition, subtraction, multiplication, and division of the former. To a certain extent this property was employed by Archimedes, in his 'Arenarius,' or treatise on the number of the sands. Stifel also, in his 'Arithmetica Integra,' Nürnberg, 1544, p. 35, exhibits its principal uses, and evinces so clear a conception of the nature of logarithms, only not under that name, that had he been furnished with a table of such numbers, he would doubtless have been able to make use of them. He might even have constructed a table, but the natural numbers would not have been consecutive, and the omissions would have been by far more numerous than the insertions, and this would have happened simply because he, in common with all other mathematicians previous to Napier, possessed no means of determining the logarithm corresponding to any proposed number, but merely those corresponding to particular numbers. Until such means were supplied, no table of any practical utility could have been constructed. Napier discovered the means, but had he not been of a peculiarly ardent disposition, he would have shrunk from the labour which their application required, and his discovery would perhaps have remained a mere sterile truth. It happened to him, as it has happened to most original discoverers, that the view which he took of the problem was not the most natural, and consequently not the most simple. The problem itself was purely arithmetical; Napier arrived at its solution through geometrical considerations. But notwithstanding this circumstance and the disadvantages he must have laboured under, arising from the imperfect methods of analysis then in use, and the almost total absence of notation, his processes even now are to a certain extent the most eligible, and are analogous to those employed in the construction of the great 'Tables du Cadastre.' "Modern formulae," says Delambre, "have furnished processes more sure and exact, but not more convenient." ('Astronomie Moderne.') Concerning Napier's principles we have not further to speak; the reader will find them explained in the article LOGARITHMS, in ARTS AND SCIENCES DIVISION.

With regard to the importance of the invention, and the claim of its author on the gratitude of his successors, we may cite the words of Laplace ('Exposition du Système du Monde'). "By reducing to a few days the labour of many months, it doubles, as it were, the life of an astronomer, besides freeing him from the errors and disgust inseparable from long calculations. As an invention it is particularly gratifying to the human mind, emanating as it does exclusively from within itself. In the arts man avails himself of the materials and forces of nature; in this instance the work is wholly his."

His tables were published in 1614, by the title of 'Mirifici Logarithmorum Canonis Descriptio,' Edinb., 4to. As their principal object was to facilitate trigonometrical computations, they contained only the logarithms of the natural sines corresponding to each minute of the quadrant and to a radius = 10<sup>7</sup>. The principle of their construction Napier at first withheld, "waiting the judgment and censure of mathematicians before exposing the remainder to the malignity of the envious." This explanation was given in a posthumous work, edited by his son, and published in 1619, Edinb., 4to. It is entitled 'Mirifici Logarithmorum Canonis Constructio: una eum annotationibus aliquot D. Henrici Briggsii.' The two works were reprinted at Lyon in 1620.

From the date of the publication of the logarithmic canon until the death of Napier, which took place the following year, there is little recorded of him which demands particular notice, except his connection with Briggs, already noticed. [BRIGGS, HENRY.] His 'Rabdologiae, seu Numerationis per Virgulas, libri duo,' Edinb., 1617, 12mo, was the last of his literary productions. [NAPIER'S BONES, in ARTS AND SC. DIV.]

Napier died at Merchiston on the 3rd or 4th of April 1617 (not 1618), old style, and was interred in the cathedral church of St. Giles at Edinburgh. On the eastern side of the cathedral is a stone tablet with a Latin inscription, indicating the spot of his interment. He was twice married. By his first wife, the daughter of Sir James Stirling of Kier, or Keir, he had one child, Archibald, who became privy-councillor to James VI., and was raised by Charles I. to the peerage in 1627, by the title of Lord Napier. By his second wife, the daughter of Sir James Chisholm of Crombie, he had five sons and five daughters. To his third son Robert, to whom he had taught the mathematics, he confided the care of publishing his posthumous works.

Of Napier's improvements in trigonometry it is sufficient to refer to the elegant theorems known as Napier's 'Analogies,' and to his theorem of the 'five circular parts,' which furnishes a ready solution of all the cases of right-angled spherical triangles.

The only work of Napier not already mentioned is a letter to Anthony Bacon, entitled 'Secret inventions profitable and necessary in these days for the defence of the island, and withstanding strangers, enemies to God's truth and religion' (the original is in the archbishop's library, Lambeth; two copies are in the British Museum; it is also printed in Tyloche's 'Philosophical Magazine,' vol. xviii.). Watt, in his 'Bibliotheca Britannica,' adds 'Arithmetica Logarithmica,' Lond., 1624, fol.; but this is a mistake, Briggs being the author of that work.

(*Life, Writings, and Inventions of John Napier*, by David Stewart, earl of Buchan, and Walter Minto, LL.D., Perth, 1787, 4to; Hutton, *Tracts*, &c.)

NAPIER, VICE-ADMIRAL SIR CHARLES JOHN, K.C.B., M.P., is the eldest son of the late Hon. C. Napier of Merchiston Hall, N. B., and consequently grandson of the sixth Lord Napier, whose family has enjoyed the Barony of Merchiston for upwards of three centuries, and who was sixth in lineal descent from the renowned inventor of Logarithms. Sir Charles was born March 6, 1786, and entered the Navy in 1799, on board the *Martin* sloop, then stationed in the North Sea. In 1800 he was transferred to the Mediterranean station. Here he took part in several minor actions between this date and August 1808, when in command of the *Recruit* brig he had his thigh broken by a shot in action with a French corvette. Next year he assisted in the reduction of Martinique, and was the first to scale the walls. For his gallantry here and in a subsequent action he obtained post rank; for a short period after this he served on land as a volunteer in Spain. In 1811 we find him engaged on the coast of Sicily, near Talmiuro, the heights of which he carried under a galling fire, a success which he afterwards followed up by the capture of several merchantmen and ships of the enemy. In 1818 he served in North America, and earned the thanks of Captain Gordon for his support in the expedition against Alexandria and the operations against Baltimore. Having been paid off at the close of the war in 1816 and nominated a C.B., he remained unemployed until 1829, when he was sent on a special service to the Portuguese coast for the purpose of compelling Don Miguel to restore certain ships which he had seized contrary to the law of nations. A narrative of this expedition will be found in his 'History of the War of Succession in Portugal.' Being appointed to the command of the Portuguese Fleet in 1838, he engaged the fleet of Don Miguel, and gained for Don Pedro a decisive victory, for which the emperor rewarded him with the post of admiral of the Portuguese fleet and the title of Viscount of Capo S. Vincent, and the Order of the Tower and Sword. The subsequent treatment which he experienced in Portugal was such as to determine him to resign his post and return to England.

In 1839 he was nominated second in command under the late admiral Sir Robert Stopford, then commander on the Mediterranean station. Here he took a prominent part in all the operations on the coast of Syria, the storming of Sidon, the defeat of Ibrahim Pasha near Beyrout (which was speedily followed by the surrender of that city), and finally the siege of Acre, which was taken almost by a 'coup de main.' By his conduct here, as well as by his Portuguese services Captain Napier had gained a high reputation for personal courage and daring, which seemed always successful, though too often spoiled by great vanity and excessive self-confidence. After the reduction of Acre, he went on to Alexandria, where he put himself at the head of the British squadron and made terms with Mehemet Ali. For his Syrian and Egyptian services he received the thanks of Parliament, was made a K.C.B., and was presented with the ribands of most of the military and naval orders of Europe. In the following year he gained flag-rank, and for two years held the command of the Channel fleet. Sir Charles Napier had been from his early days an advocate of Naval Reform, on which subject he had frequently written letters in the public papers. These letters he reprinted in 1851; they are caustic and severe, but they lost much of the influence that they might otherwise have exerted from their extreme personality against the ministers of the day; still there was much of sterling common sense in many of his suggestions, several of which he has lived to see carried into effect. Among the more valuable of his remarks were those urging the abolition of flogging, and the introduction of a system of registration. In 1849 he was superseded in his command of the Channel fleet; but when the war with Russia broke out in 1854, the popular tide ran so strongly in his favour that the ministry were induced to entrust to him the command of the Baltic Fleet. He left the shores of England with boasts, in which he was not alone, of all that was to be

performed in the regions of the Baltic, declaring, among other things, that within a month he would be in Cronstadt. On reaching those parts however he found or fancied that the fortress of Cronstadt was impregnable; he returned home without having gained any laurels except by the destruction of the petty town and fort of Bomarsund; but he was able to announce that he had brought home his ships uninjured—a valuable service no doubt, but the first time probably that such a claim to honour was put forward by an English admiral in time of war.

On returning to England however in November 1855 he was elected to represent the borough of Southwark in the place of the late Sir William Molesworth. He had sat for Marylebone in the parliament of 1841-47, when he had signalled himself by repeated attacks on the ministry of the day. He now commenced a system of attacks on Sir James Graham and the rest of the ministry of Lords Aberdeen and Palmerston, declaring that his failure at Cronstadt was owing to the fact that he was fettered by unfair restrictions and not adequately supplied with stores from home, while his fleet was inadequately manned. The result was the waste of much valuable time in fruitless recriminations between the home ministry and their commander-in-chief. He has also lost no opportunity of assailing his employers, and everyone who differs from him, through the columns of the 'Times.' He has since visited Russia and declares that the Russian admiral Constantine quite agreed with him as to the impregnability of Cronstadt: he has also announced his intention of publishing an account of his Baltic expedition, with notes of his recent visit to Russia. As a member of the House of Commons he is a supporter of the ballot, an extended suffrage, and administrative reform in all departments. [See SUPPLEMENT.]

NAPIER, SIR CHARLES JAMES, G.C.B. (cousin of the preceding), was the eldest son of Colonel the Hon. G. Napier, comptroller of accounts in Ireland, by the Lady Sarah Lennox, daughter of Charles, second duke of Richmond. He was born at Whitehall on the 10th of August 1782. Having received his early education under his father in Ireland, he obtained his first commission as ensign in the 22nd foot before he had completed his twelfth year, and first saw active service during the Irish rebellion of 1798, and again in the insurrection of 1803. In 1806, having obtained his company, he joined the British forces in Spain, and commanded the 50th regiment of foot during the terrible retreat on Corunna under Sir John Moore, on which occasion he received five wounds and was taken prisoner. Being allowed to go to England on parole, he found his friends actually in mourning for him as dead, and administering his effects; and he employed his period of compulsory inactivity by writing on colonies, colonisation, and military law, and an essay on the state of Ireland. In 1809 he again joined the British army in the Peninsula as a volunteer; he had two horses shot under him at Coa, and was severely wounded at Bussaco; he also took part in the hard-fought battle of Fuentes de Oñoro, and in the second siege of Badajoz, as well as in a considerable number of lesser skirmishes. In 1813 we find him serving in a floating expedition on the coast of the United States, and occupying his time by the capture of American vessels, and frequent descents upon the coast. He returned to Europe a few days too late to be present at the battle of Waterloo, though he took part in the storming of Cambray, and accompanied the British army to Paris.

Not long after this, while stationed in the Ionian Islands, he was appointed governor of Cephalonia. Here his administrative powers were first developed; and the success of his governorship is proved by the fact that to the day of his death the Cephalonese called him their 'father,' and sent to him an annual tribute of the produce of their vines. While holding this post he joined with Lord Byron in a scheme for the deliverance of Greece. He was shortly afterwards superseded—an event which he regarded, whether rightly or wrongly, as a great affront and indignity.

After a short command of the military district of the north of England, in 1838 and 1839, Sir Charles Napier, now a major-general, was ordered in 1841 to take command of the army in Bengal. This was the turning-point of his career. At Bombay he attracted attention by his energetic plans of military reform, to which he continued to devote himself until the appointment of Lord Ellenborough to the governor-generalship of India. At his suggestion Sir Charles Napier drew out the plan of an Afghan campaign. Scinde at this time was in a very disordered condition, and the British influence and prestige had been much impaired by the disasters in Cabul. The Ameers of Scinde were perfidious, and as they would be bound by no treaty he resolved to subdue them by open attack. From the first his plans were eminently successful. He blew up the fortress of Emaum Ghur, which was always deemed impregnable. Having accomplished this exploit, which was characterised by the late Duke of Wellington as one of the most curious and extraordinary of all military feats, he pressed on, and with a very inferior force in point of numbers routed the Ameers at Meeanee, February 17, 1843. In a few days the army took possession of Hyderabad, and outflanking Shere Mohammed (surnamed the Lion) by a dexterous manœuvre, drove him from the field with prodigious slaughter. Having now become master of the fair territory of Scinde, Sir Charles Napier set vigorously to work to improve its condition. He re-organised the native society, re-distributed the collectorates of taxes, ameliorated the native law, put

down the 'suttee' system, and set the tenure of land on a more equal and judicious footing. Whilst in the midst of carrying out these reforms Lord Ellenborough was recalled by the East India Company, and Sir Charles Napier felt that he had lost his best friend and supporter. His Indian services are thus summed up, in the words of his brother Sir William Napier, in his 'Narrative of the Administration of Scinde':—"Two years only elapsed since he quitted Sukkur to make war on the Ameers, and in that time he had made the march to Emaum Ghur in the great desert, gained two great battles, reduced four large and many smaller fortresses, captured six sovereign princes, and subdued a great kingdom. He created and put into activity a permanent civil administration in all its branches, conciliated the affection of the different races which inhabited Scinde, had seized all the points of an intricate foreign policy, commenced a number of military and other well-considered public works, and planned still greater ones, not only suited to the exigencies of the moment, but having also a prospective utility of aim." And all these works he performed in spite of a press of correspondence, long journeys on camels and horseback beneath a tropical sun, and under frequent and severe attacks of illness, at the age of sixty-three, and in spite of every mortification that malice and intrigue could devise against him. Unwilling to leave Scinde without some permanent proof of his ascendancy over the popular mind, and the consciousness of having contributed to its temporal prosperity, he persuaded the people to change the feudal system of land-tenure for that of landlord and tenant, considering that such was the best plan of forming loyal subjects by raising a class of farmers and small landholders attached to the government by ties of a personal and pecuniary interest.

In 1847 Sir Charles Napier returned home, and met with an enthusiastic reception; but ever ready at the call of duty, he re-embarked for India in March 1849, at the suggestion of the Duke of Wellington, on hearing of the then recent reverses which we had sustained in the Sikh campaign. Happily however on his arrival at Bombay he found that the tide had turned, and that his military services were no longer needed. There was no enemy to contend with in the field, and no principality to administer; so he set his active mind to work forthwith to carry out a system of military reform, his immediate object being to school the luxury and extravagance of the British officers into a simple and severe mode of living. In this work he was partially successful.

He returned to England in 1850, but his health and spirits were fast failing, and the last time that he appeared in public was on the occasion of the funeral of his friend and patron the Duke of Wellington, in November 1852. He died of a gradual decline at Oaklands, his seat, near Portsmouth, on the 29th of August 1853, like a gallant soldier, under the old colours of the 22nd regiment and other trophies of his European and Indian career, and was buried in the ground attached to the garrison chapel at Landport, near Portsmouth. Sir Charles Napier was twice married—first, in 1827, to Elizabeth, daughter of John Oakley, Esq., of Deal, Kent, by whom he had two daughters; and secondly, in 1835, to Frances, daughter of William Phillips, Esq., and widow of Captain R. Alcock, R.N. A bronze statue of the conqueror of Scinde has been erected by subscription in Trafalgar-square.

NAPIER, LIEUT.-GEN. SIR WILLIAM FRANCIS PATRICK, K.C.B., was born in 1785 at Castletown, near Celbridge, in the county of Kildare, Ireland. He is the third son of the Hon. Colonel George Napier, by his second wife, Lady Sarah Lennox, seventh daughter of the second Duke of Richmond, and is brother to the late Generals Sir Charles James Napier and Sir George Thomas Napier. He entered the army as ensign June 14, 1800; became lieutenant April 18, 1801; and captain June 2, 1804. He served at the siege of Copenhagen and battle of Kioge in 1807, in Sir John Moore's campaign in Spain in 1808-9, and in the subsequent war in the Spanish peninsula from 1809 to its termination in 1814. He was present in 1810 at the combat of Almeida on the Coa, where he was wounded, and at the battle of Bussaco. In March 1811, during Massena's retreat from Portugal, he was engaged in the combats of Pombal, Redinha, Casal Nova (where he was severely wounded), and Fos de Aronco; and in May at the battle of Fuentes de Oñoro. He attained the rank of major May 30, 1811. He was engaged in the battle of Salamanca in July 1812. He became lieutenant-colonel November 22, 1813. He was at the passage of the Huebra in November 1812, and of the Bidassoa in October 1813. He was engaged in the combat of Vera, at the battles of the Nivelle and the Nive, and was wounded in defending the churchyard of Arcangues. He was again engaged in the battle of Orthes. He served also in the campaign of 1815, but does not appear to have been at the battle of Waterloo. He received the gold medal and two clasps for his services in the battles of Salamanca, the Nivelle, and the Nive, in which he commanded the 43rd regiment of light infantry; and the silver medal with three clasps for Bussaco, Fuentes de Oñoro, and Orthes. He was present in many minor actions, and received other wounds besides those before mentioned.

In 1828 Lieutenant-Colonel Napier commenced the publication of his 'History of the War in the Peninsula and the South of France, from the year 1807 to the year 1814.' The volumes came out in succession till the work was completed in 1840 in 6 vols. 8vo. He attained the rank of colonel July 22, 1830; and that of major-general November 23, 1841. From April, 1842 to January 1848 he was

lieutenant-governor of the island of Guernsey, and in 1848 was created a knight-commander of the Order of the Bath. In 1845 Major-General Napier published 'The Conquest of Scinde,' 8vo, in 2 parts. He became lieutenant-general November 11, 1851; and colonel of the 22nd regiment of foot September 19, 1853. In 1851 he published his 'History of General Sir Charles Napier's Administration of Scinde, and Campaign in the Cutch Hills, with Maps and Illustrations,' 8vo; and in 1855 'English Battles and Sieges in the Peninsula,' crown 8vo, extracted from his 'War in the Peninsula.' He has also published two pamphlets: 'Six Letters in Vindication of the British Army, exposing the Calumnies of the Liverpool Reform Association,' 8vo, 1848; and 'Comments upon a Memorandum of the Duke of Wellington, and other Documents, censuring Lieut.-Gen. Sir Charles James Napier; with a Defence of Sir C. Napier's Government of Scinde, by Captain Rathbone, late Collector in Scinde,' 8vo, 2nd edit., 1854. He has recently announced (January, 1857) 'The Life and Opinions of the late Sir Charles Napier, by Sir William Napier.' Sir William Napier married in 1812 the second daughter of the late Hon. General H. E. Fox, uncle to the third Lord Holland.

Sir William Napier's 'History of the War in the Peninsula,' has passed through several editions, and is now a standard work. Of all the wars in which Great Britain has been engaged that war of six years was the most important, difficult, and expensive, and Sir William Napier's History is worthy of the transactions it records and the skill and heroism it celebrates. Perhaps no military history of equal excellence has ever been written. It cost the author sixteen years of continuous labour. He was himself a witness of several of the series of operations, and was engaged in many of the battles. His wide acquaintance with military men enabled him to consult many distinguished officers, English and French, and he was especially supplied with materials and documents by the Duke of Wellington and Marshal Soult. The ordinary sources of information were embarrassing from their abundance. One mass of materials deserves especial mention. When Joseph Bonaparte fled from Vittoria he left behind him a very large collection of letters, which however were without order, in three languages, many almost illegible, and the most important in cipher, of which there was no key. It was the correspondence of Joseph Bonaparte while nominally king of Spain. Sir William Napier was in a state of perplexity, and almost in despair of being able to make any use of these valuable materials, when his wife undertook to arrange the letters according to dates and subjects, to make a table of reference, and to translate and epitomise the contents of each. Many of the most important documents were entirely in cipher; of some letters about one-half was in cipher, and others had a few words so written interspersed. All these documents and letters Lady Napier arranged, and with a rare sagacity and patience she deciphered the secret writing. The entire correspondence was then made available for the historian's purpose. She also made out all Sir William Napier's rough interlined manuscripts, which were almost illegible to himself, and wrote out the whole work fair for the printers it may be said three times, so frequent were the changes made. Sir William Napier mentions these facts in the preface to the edition of 1851, and in paying this tribute to Lady Napier, observes that this amount of labour was accomplished without her having for a moment neglected the care and education of a large family. The military history thus laboriously constructed, is doubtless destined to descend to a late posterity. The historian is skilled in the science and practice of war, is well informed in the politics of the time, and has written the work honestly and in good faith, from excellent materials, and in a tone of lofty and severe morality. The narrative is exceedingly interesting. The leading events are distinctly traced and connected, and the leading characters briefly but vividly sketched. The sites of the battles are clearly described, and the arrangements, manoeuvres, and evolutions, made intelligible even to non-military readers. The descriptions of the combats, battles, and sieges, are in the highest degree forcible and animated, fix the attention, and excite the feelings. The style is original, clear, and vigorous, and though somewhat laboured and declamatory, has a peculiar charm from its seeming to be obviously the outpouring of his own carefully collected thoughts and well considered convictions. Sir William Napier's account of his brother's 'Administration of Scinde,' though somewhat diffuse, and too much mixed up with controversial matter, defensive and accusatory, is full of information and interest. The account of the 'Campaign in the Cutch Hills' (a stupendous mass of lofty rocks, more than one hundred miles in length and eighty in width, intersected by difficult ravines, and then the stronghold of skilful and daring robbers) resembles a narrative of eastern romance, so wild is the scenery and so wonderful are the details.

\* NAPIER, ROBERT, of the firm of Robert Napier and Son, ship-builders and mechanical engineers of Glasgow—to whom the growing success which has attended steam-navigation during the last twenty years is largely owing—was born at Dumbarton, in Scotland, on the 18th of June 1791. His father, a blacksmith by trade, had a proper regard for the value of a good education, and sent his son to the grammar school of the town, where there were then masters of more than ordinary ability, and where young Napier acquired besides the usual branches of an English education, the Latin and French languages, the elements of Greek, mathematics and landscape drawing.

About the end of this time a gentleman named Trail, connected with Messrs. Dixons' works, who had many varied accomplishments, formed an acquaintance with Mr. Napier, sen., and from him Mr. R. Napier learnt architectural and mechanical drawing, and to him he believes he was indebted for his taste for mechanical pursuits and works of art. He had an ardent desire to become a good practical mechanic, and when he was about the age of fourteen, urged his father to allow him to leave school and begin to work. His father wished him to go to college, but eventually the son prevailed, and was apprenticed in the trade of a blacksmith to his parent. Here his spare time was chiefly occupied in making small tools, and drawing instruments, and in making and repairing guns and gun-locks. He remained with his father some years after his regular apprenticeship; and about the same time, executed the smith's work for the extensive calico printing works of Messrs. Stirling, where he had the opportunity of seeing a great variety of ingenious machinery, and of coming in contact with the best millwrights of that period,—millwrights in fact then being the only practical engineers. About the end of the year 1811, Mr. Napier being desirous to get experience in new fields, left Dumbarton for Edinburgh, with the sum of 5*l.*, and a certificate of character from the parish minister. In Edinburgh he could get no employment for a fortnight, and then, although an expert workman, at the wages of only 10*s.* 6*d.* per week: he supported himself however on this for about nine months, though prices made living excessively dear. At the end of the time he got employed in works in which Mr. Stevenson the constructor of the Bell Rock lighthouse was a partner, and where he had greater advantages of every kind. At this time so little was the manufacture of steam boilers understood in Edinburgh, that on Mr. Napier's employers happening to have one to make, their men were completely foiled. The manager applied to Mr. Napier to get a new hand; but this was not to be done; so Mr. Napier was induced to try himself, but as it proved, without sufficient knowledge,—for the caulking of the joints being omitted, the boiler which had appeared perfect, leaked after it was fixed in its place, so much that the fire was extinguished. At this Mr. Napier was mortified: he left Edinburgh, again joined his father, and afterwards went to Glasgow, where he was for a short time with Mr. W. Lang, whose principal articles of manufacture were jacks and machinery for calender works.

In May 1815 Mr. Napier, having received from his father the sum of 50*l.*, purchased with 45*l.* of it, the tools and goodwill of a small blacksmith's business in the Gallowgate of Glasgow, and thus started with 5*l.* of clear capital. He began with two apprentices,—he has now the control of works in which 3000 people are frequently employed.

It was in 1823 that Mr. Napier made his first marine-engine, which was worked for many years in a vessel on the Clyde, and was then put into a new vessel, and is believed to be still at work on one of the Mersey ferries. This commenced a course in which both the magnitude and the success of the works executed have been remarkable—although not purchased without difficulty and trouble, and strict attention to business. Mr. Napier himself attributes his success less to merit as an inventor, than to his efforts in all cases to execute the work best for the purpose; money, his friends say, never having been his idol. Thus he justly feels that there is cause for satisfaction in the fact that, although he has had many heavy contracts, not an accident of any importance has happened to machinery or vessels constructed by him, or the firm of Robert Napier and Sons; to which reference—properly made here—we may add one to the proverbial immunity from danger of the Cunard steamers, as suggestive of a right line of inquiry into the calamities in other cases. In 1827, in a steam-boat race on the Clyde, the fastest boats were two which had been provided for a Glasgow company by Mr. Napier. In 1830 Mr. Napier, in conjunction with the City of Glasgow Steam-Packet Company, established a line of vessels which were many years unequalled, till superseded by railways. In 1834 he supplied the Dundee and London Shipping Company with the Dundee and Perth steam-ships, and in 1836 the East India Company with the *Berenice*, for the Bombay and Suez voyages. In 1839 he furnished the machinery for the *British Queen*. He subscribed 100*l.* towards the trial voyage of the *Syrius*,—the first steam-vessel to cross the Atlantic, at least at the regular commencement of the Atlantic steam-navigation, which had been spoken of as an impossibility. In the same year he built the *Fire-King*, after the model of Mr. Ashton Smith, and the vessel proved to be the fastest steamer then afloat.

In 1840 the Hon. Samuel Cunard and his partners were supplied by Mr. Napier with their first four steamers. Since that time he has constructed the machinery for nine other Atlantic steamers; and in 1856 he built and supplied with machinery, for the same company, the *Persia* of 3600 tons, and 900 horse-power, the first iron vessel belonging to the Cunard company; and believed to be at present the fastest and strongest steamer afloat.

In 1853, it should have been said, Messrs. Robert Napier and Sons fitted up the machinery on board the first-rate ship of war, the *Duke of Wellington*, and that the *Black Prince* was constructed in their yard.

Mr. Napier is a member of the Institution of Civil Engineers, and of the Institution of Mechanical Engineers. At the Paris Exposition of 1855, the International Jury awarded him the great gold medal of honour, and the Emperor Napoleon III. conferred on him the

decoration of the Legion of Honour, in testimony to the success which had attended the vessels fitted out by him for the Atlantic navigation.

NAPOLEON. [BONAPARTE.]

NARBOROUGH, SIR JOHN, an English naval commander of some distinction, was descended from an old family in Norfolk, and received his first commission, as lieutenant of the Portland, in the year 1664. In the ensuing Dutch war his bravery and good services soon became so conspicuous that, within two years, after the long and desperate action, in June 1666, between the English fleet, under Prince Rupert, and Monk, duke of Albemarle, and the Dutch under De Ruyter and Van Tromp, he was promoted to the command of the Assurance, a fourth-rate. After the conclusion of peace he was selected to conduct a voyage of discovery to the South Seas, for which destination he sailed in 1669, in the Sweepstakes, of 86 guns, attended by the Bachelor pink. In the following year he passed the Strait of Magalhães; and, after being impeded in the ports of the Pacific, by the jealousy of the Spanish authorities, with the usual obstacles to either intercourse or research, from which he extricated himself with remarkable prudence, he returned home in 1671. Captain Philip Parker King, in speaking of the early navigators who explored the Strait of Magalhães, observes that, "among the numerous plans of it that are extant, those of Sir John Narborough and Cordova are the most correct."

On the breaking out of the second Dutch war, in 1672, he was taken by the lord-high-admiral, the Duke of York, into his own ship, the Prince, as second captain; and in the obstinately contested battle of Solebay with the Dutch fleet under De Ruyter, in which the first captain of the Prince, Sir John Cox, was killed, and the vessel so disabled that the Duke of York was compelled to shift his flag into the St. Michael, Narborough's energy and ability in refitting the ship for action in a few hours, as well as his courage during the fight, were deemed sufficiently meritorious to be made the subject of special commendation in the account of the action published by authority of government. After being next successfully employed in convoys and other duties, he was raised, in 1673, to the rank of rear-admiral, and received the honour of knighthood. In 1674 he was appointed commander-in-chief of a fleet sent to the Mediterranean, for the purpose of overawing the Tripolines and other piratical states, and obtaining redress for their depredations upon the national commerce; and he acquitted himself with so much spirit, address, and success in this duty, that he compelled the Bey of Tripoli to release all his British captives, to pay 80,000 dollars in reparation for injuries to the British trade, and to grant to British subjects more honourable and valuable privileges than any other nation had before possessed or claimed. Having achieved these objects, Sir John Narborough returned to England with his squadron in 1677: but the skill and gallantry with which he had fulfilled his instructions, caused him almost immediately to be despatched again to the Mediterranean, in command of another fleet, with a similar commission to chastise the piracies of the Algerines. In this expedition he acted with his accustomed vigour; burnt or sunk many Algerine vessels of war; cannonaded the city of Algiers itself with good effect, though without being able to bring the pirates to terms; and concluded his operations by capturing and carrying into Cadiz a whole squadron of five Algerine frigates, which the Dey had equipped to obtain satisfaction for his previous losses. This exploit, after which he returned home in 1679, was Sir John Narborough's last important service at sea; but in the following year he was made a commissioner of the navy, and continued to hold that office both during the remainder of the reign of Charles II., and throughout the whole of that of his patron James II., until his death, which occurred towards the close of 1688.

(Charnock, *Biographia Navalis*; Captain P. P. King, in the *London Geographical Journal*, vol. i.; Sir John Narborough, *Journal*.)

NARDI, JA'COPO, born at Florence in 1476, served first in the troops of the republic, and afterwards in a civil capacity. He was sent in 1527 as ambassador to Venice. He died at a very advanced age, after the fall of the republic. He wrote 'Storia della Città di Firenze dell'anno 1494 al 1531,' published at Lyon in France, 4to, 1582: another edition was published at Florence in 1584. Some passages which were expunged in both editions, but especially in that of Florence, on account of the political feelings of the author, are found in the manuscripts in the libraries of Strozzi of Florence and Naul of Venice. Nardi was warmly attached to the republican constitution of his country, of which he witnessed and described the overthrow, whilst his contemporary Nerli, who composed a general history of Florence including the same period ('*Commentarii dei Fatti Civili occorsi in Firenze dall'anno 1215 all'anno 1537*,' fol. Augsburg, 1728), wrote in a manner favourable to the Medici, and accepted office under the grand-duke Cosmo I. The history of Nardi forms a sequel to that of Machiavelli, which ends with the death of Lorenzo the Magnificent in 1492, and the two together form a complete history of the Florentine republic from its rise till the overthrow of its independence.

Nardi wrote also 'Vita di Antonio Giacomini,' 4to, 1597. Giacomini was one of the most distinguished captains of the Florentine republic. He was also the author of an Italian translation of Livy, and a comedy, 'L'Amazizia,' one of the earliest comedies in Italian verse.

NARES, JAMES, Mus. Doc., was born at Stanwell in Middlesex, in 1715, and received his musical education first as a chorister in the King's Chapel, under Bernard Gates, and afterwards under the celebrated Dr. Pepusch. At an early age he was chosen organist of the cathedral of York, and in 1756 was appointed organist and composer to George II., on the decease of Dr. Greene; and about the same time the degree of Doctor in Music was conferred on him by the University of Cambridge. In 1757 he succeeded Mr. Gates as master of the children of the Chapels-Royal, which office he held till 1780, when declining health induced him to resign it to his friend Dr. Ayrton, who had been his pupil. He died in 1783, "regretted," says his eldest son, the late Archdeacon Nares, "not only by the family he left, but in a proportionate degree by all related to or connected with him." Among these were, his younger brother, Sir George Nares, one of the judges of the court of Common Pleas, and his nephew, the Rev. Edward Nares, D.D., author of the 'Life and Administration of Cecil, lord Burleigh;' also of Sermons and other works.

Dr. Nares published several musical works, the most important of which are:—'Twenty Anthems in Score, composed for the Use of the Chapels-Royal,' and now constantly heard in every cathedral in England and Ireland; 'A Collection of Catches, Canons, and Glee,' dedicated to the Earl of Mornington, including the prize-gee, "To all Lovers of Harmony," and "Fear no more the Heat of the Sun;" 'A Treatise on Singing,' with a set of English duets; and 'The Royal Pastoral, a Dramatic Ode.' After his death a second set of anthems, six in number, together with his popular Service, were, as he had directed, published by his son; and though these anthems have not obtained the same celebrity as those in the former set, they are not inferior in merit, and ought to be brought into notice by the influential persons in our choirs.

NARRIEN, JOHN. The subject of the present notice, though he may not be considered as one whose annals are likely to interest posterity, may justly be ranked among the many who have cultivated knowledge under difficulties. He was born in August 1782 at Chertsey, where his father, a stonemason and builder, was then employed on the bridge over the Thames. Before he was three years old his parents removed to Kew, and they remained there till the year 1792, his father being during seven years employed on the construction of the bridge at that place. In a private school at Brentford, Narrien gained the first steps in education, which however extended only to the elementary parts of arithmetic and algebra, with the rudiments of Latin and English. An intelligent father gave him instruction in elementary geometry, and before the boy was ten years of age he had acquired some knowledge of the first books of Euclid.

The bridge at Kew being completed, his parents in 1792 removed to London, where his education was continued at a school which then existed near the church of St. Mary Overy; but his father dying two years afterwards, his education was for a time suspended: his mother being now a widow with four children, of whom John was the eldest, was compelled to seek some employment for him by which he might contribute to his own support. He was so fortunate as to be taken in 1796 into the office of a gentleman connected with the legal profession, where, during three years, he was employed chiefly in copying papers relating to the prizes captured on the seas by British cruisers. He was at this time enabled to extend his acquirements in mathematical science and in the Latin grammar, as well as to begin the study of the French language, by means of those useful establishments, the night-schools for persons in humble circumstances, whose occupations prevented them from attending the seminaries for education during the day; and two folio volumes of an old 'Historical Dictionary,' which were placed under him in order to raise the seat of his office-chair to a height which would enable him to write at the desk, were the means by which he acquired his first knowledge of general history and geography. This work he diligently studied during the intervals of his regular employment, while the construction of maps, representing the principal parts of the ancient world, became his chief pleasure.

About the middle of the year 1799 an opportunity presented itself of gratifying a wish he had long entertained of making a sea-voyage, and for a time he may be said to have been "a ship-boy on the high and giddy mast." He was at St. Petersburg in the reign of the Emperor Paul, but the knowledge he acquired during this trip was only so much of practical navigation as the narrow limits of the "blown Baltic" could afford. At his return to England in the beginning of the year 1800, on the recommendation of a friend of the family, he engaged himself with an optician in London with a view to establish himself ultimately in a branch of art, and thus obtain opportunities of rendering his taste for scientific studies available for his future benefit. In this capacity he continued during ten years, and he employed this interval in extending his acquirements in science by the study of the works then recently published in England and France, both on pure and mixed mathematics and on natural science; at the same time, by his intercourse with civil engineers and men professing the liberal arts, he in some measure qualified himself for the exercise of any employments in which the pure sciences are rendered subservient to purposes of practical utility.

Mr. Narrien followed the occupation of a mathematical and philosophical instrument maker, after the retirement of his friend and patron, from 1810 to 1817, but with a constant aspiration after a state

more congenial to a man of retired habits and moderate desires, and one in which the prosecution of his studies might be more immediately consistent with his daily occupations; and having given some lessons in mathematics to the late General Sir Charles Napier, he was, by the kindness of that distinguished officer, then a major in the army, recommended as an Englishman competent to teach the art of fortification in the Royal Military College at Sandhurst; and to that post, which had till then always been filled by natives of France or Germany, he was appointed in the beginning of 1817. A reduction in the number of teachers in that branch of military art taking place shortly after his appointment, he was transferred to the department of mathematics in the same institution, and he continued to act in that capacity till 1820, when the senior department of the college, which had been till then a separate establishment, located at Farnham, was united to the junior department at Sandhurst; and from that time he conducted, in mathematics, natural philosophy, and military science, the studies of commissioned officers who enter the institution for the purpose of qualifying themselves to serve on the general staff of the army.

In 1833 Mr. Narrien published 'An Historical Account of the Origin and Progress of Astronomy' (Baldwin and Cradock), in which an effort is made to trace the gradual advances made by the human mind in the attempt to account for the phenomena of the heavens, from the first rude conceptions of an untaught spectator, through the complex machinery invented by the Egyptians or Greeks, to the sublime simplicity of the system devised by Copernicus, Kepler, and Newton. The work had only a limited sale, but it has not been without its use in having been the means of directing many to the study of astronomical science. He subsequently published a 'Treatise on Practical Astronomy and Geodesy' (Longmans, 1845), in which are contained descriptions of the principal instruments employed in making astronomical and nautical observations, and investigations of the rules by which the principal phenomena of the heavens, the problems of nautical astronomy, and the figure of the earth are computed.

This last work is more immediately intended for the purposes of instruction; and for the like purpose he published his 'Plane and Solid Geometry' (Longmans). Part of this work is from the text of Simpson's Euclid, the rest consisting of tracts embodying in propositions the subject of proportion, the geometry of circles, and the elementary solids, to which is added a tract on spherical geometry: the first edition was published in 1842. He afterwards published a work on 'Analytical Geometry and the Conic Sections,' to which is appended a tract on 'Descriptive Geometry' (Longmans, 1847). He also contributed largely to the 'Outlines of Lectures on Fortifications,' which was printed only for circulation among the students at the Royal Military College.

Mr. Narrien wrote the article 'Architecture' which is published in the 'Encyclopædia Metropolitana'; a review of the 'Life of Napier of Merchiston' in the 'Westminster Review'; of Colonel Sabine's 'Pendulum Experiments' in the 'Monthly Review'; and the article 'Army' in the 'Dictionary of Greek and Roman Antiquities.' In the year 1835 he began to write for the 'Penny Cyclopædia'; and to that work he contributed the articles on Fortification and the Military Art in general. Many articles relating to natural philosophy in the 'Penny Cyclopædia' were written by him, together with notices of the lives of many celebrated scientific men. He was employed on that work till its completion.

Mr. Narrien was elected a Fellow of the Royal Astronomical Society in 1833, and of the Royal Society in 1840.

Except himself, and a sister who lived to the age of fifty-five, and died in 1843, all the children of his father died at early ages. In 1814 he married the daughter of a medical gentleman, and had the misfortune to become a widower, without a child, in 1852. [SUPPLEMENT.]

NARSES, the name of a eunuch who became one of the most successful generals of the emperor Justinian I., and rivalled Belisarius in his military triumphs. His origin and parentage are unknown. He was probably by birth an Asiatic, emasculated, and sold, according to the old barbarous custom of that part of the world, and employed in his youth in menial services in the imperial household of Constantinople. His natural abilities and insinuating manners attracted the attention of Justinian, who had certainly the tact of discerning merit in those about him. Justinian employed Narses about his person, and raised him successively to the office of 'cubicularius,' or 'groom of the bedchamber,' and afterwards to that of keeper of the emperor's privy purse.

Narses seems to have known and practised the arts of a courtier, but at the same time he was also capable of better things. He was sent on several missions, and at last, in A.D. 538, he was appointed to the command of a body of troops which were sent to Italy to act under Belisarius. [BELISARIUS.] The two generals acted in concert at first, and obliged the Goths to raise the siege of Ariminum; but they soon quarrelled, and Narses, who was supported by a party at the court of Justinian, chose to act for himself: the consequence was, that Belisarius was cramped in his operations, and meanwhile the Goths and Burgundians took and ravaged Milan. (Procopius, 'De Bello Gothico,' xi. 21.) In the year 539 Justinian recalled Narses, who resumed his place at the imperial palace. Several years after, Belisarius having been recalled from Italy, the state of that country fell

again in utter confusion; the Goths under Totila overran the whole country; and Germanus, a nephew of the emperor, being sent with an army to prevent the total loss of Italy, fell ill in Dalmatia and died. In 552, Justinian determined to make a last effort: he appointed Narses commander-in-chief of the Italian expedition, and supplied him plentifully with money, with which he collected a number of auxiliaries, Herculi, Longobardi, Gepida, and others, whom he united with the army of Germanus, and assembled them all near Solona. Not having sufficient vessels to embark his troops, he marched along the shores of the Adriatic, through Dalmatia, Istria, and Venetia, and thus arrived at Ravenna, from whence, after some days' rest, he moved on across the Apennines, and met Totila, who was advancing from Rome, at a place called Tagina, or Tadinga, where a desperate battle took place, in which the Goths were completely defeated and Totila was killed. Narses advanced to Rome, which he took, whilst the Goths, having retired to Pavia, elected for their king Teias, who moved with a fresh army to encounter Narses. The two armies met on the banks of the river Sarno, near Nocera in Campania: Teias was killed in the fight, and the remaining Goths entered into a convention with Narses, by which they laid down their arms and withdrew to North Italy, where they dispersed in various parts of the country. Not long after however part of them joined a host of Franks and Alemanni who had crossed the Alps, under two brothers, called Lothar and Bucelin, and the whole made an irruption into South Italy whilst Narses was besieging Lucca. The barbarian host advanced as far as Calabria, plundering and committing all sorts of excesses; but on returning northwards loaded with booty, they were met by Narses on the banks of the Volturno, and totally destroyed. The Gothic kingdom in Italy was now at an end, and the whole country acknowledged the authority of Justinian, who appointed Narses exarch of Italy, A.D. 558. Narses fixed his residence at Ravenna, as the most convenient place for a prompt communication with Constantinople.

During his fifteen years' administration, Narses did much to re-establish order throughout Italy; he checked the licentiousness of his troops, dismissed the most turbulent of his barbarian auxiliaries, appointed governors with the title of dukes to the different provinces, and repressed faction and religious schism. He has been accused of only one vice—avarice; he is charged with accumulating a large treasure during his residence in Italy. After the death of Justinian, in 565, the enemies of Narses obtained his recall from the emperor Justinus II., who sent Longinus to supersede him as exarch of Ravenna. It is said that Sophia, the wife of Justinus, added to the letters of recall an insulting message to the purport that he ought to leave to men the command over other men, and return to the use of the distaff among the women of the palace; to which Narses is said to have retorted, that he would spin her a thread that she should not be able to unravel. He is accused of having entered into a correspondence with Alboin, king of the Longobards, inviting him to invade Italy. This however rests upon dubious report. Narses, after giving up his command, withdrew to Naples; but soon after, upon the urgent application of the Roman people, forwarded through their bishop, he removed to Rome, where he died at a very advanced age in 568. About the same time Alboin was crossing the Noric Alps to invade Italy. (Agathias; Paulus Diaconus; Gibbon.)

NARUSZEWICZ, ADAM STANISLAUS, a voluminous Polish writer, was born October 20th, 1733, and at the age of fifteen entered a seminary of the Jesuits, where his abilities and application so greatly recommended him to his instructors that he was sent to the college of Jesuits at Lyon, and on quitting it was enabled, by the liberality of his patron, Prince Czartorysky, to travel through Italy, France, and Germany. Having employed the opportunity thus afforded him in acquiring information and perfecting himself in various branches of study, on his return to his native country he was appointed professor of poetry at the University of Wilna. Within a short time afterwards he was promoted to a similar professorship in the College of Nobles at Warsaw. The reputation of his talents now procured for him also the notice of the king, Stanislaus Augustus, who, besides other repeated marks of his favour, conferred upon him the bishopric of Smolensk after the suppression of the order of the Jesuits, and in 1790 that of Lukow. He died on the 6th of July 1796 in his sixty-third year.

Besides his poems, which consist of fables, satires, pastorals, and books of odes and other lyrical pieces, including several imitated from Anacreon and Horace, he wrote a 'History of Poland,' in 6 vols., a translation of Tacitus, a description of Taurida, a history of the Crim Tartars, a translation of all the odes of Horace, and Stanislaus Augustus's Journey to Kaniow in 1786, which contains an account of the origin of the Kosaks.

NASH, JOHN, architect, was born in London in the year 1752, of Welsh parents. His father was an engineer and millwright in Lambeth, who died when Nash had not reached seven years of age. Nash appears to have commenced the preparation for his profession at an early period of life, when he was articled to Sir Robert Taylor, and he served his time in company with other young men who became afterwards well known as architects. He could scarcely however have had the opportunity which might have been open to him for profiting from the school in which he was, at least as regards the grammar of architecture, in which—whatever were his merits other

wise—he always showed defective training. But he is said to have attracted the attention of his master, when very young, by his extraordinary determination and perseverance. It was probably about the same time, that he began to acquire the skill in sketching which gave rise to the statement that he had once practised miniature painting, and which is now denied. He commenced in London when still young rather as a measuring surveyor and speculative builder than an architect. He then retired to a small property at Caermarthen, but having taken some woods near there, on lease in partnership with another, he lost much money; and in 1790, on receiving a visit from his friend and fellow-student, Mr. Cockerell, sen., he was induced to return to architecture as a profession. His first works after this change were in Wales, and included the reinstatement of the west end of St. David's cathedral by shoring and buttresses; and he acquired a large business. About 1792 he settled in London, and speedily assumed a prominent position.

In 1797 a patent was granted to John Nash, "of Duke-street, St. James's," for a method of constructing the arches and piers of bridges of hollow iron boxes, to be filled with earth, gravel, or other materials, and in which system he dispensed with a coffer-dam of the ordinary description—thus in some measure anticipating by suggestion the improvement made practically in the foundations of the new Westminster and Chelsea bridges. Whether there is any bridge existing, built on the principle of the patent, is doubtful; but Mr. Nash always claimed much of the credit of the introduction of iron into bridge-building, on the general principle of solid arch-ribs, or girders, as employed in Sunderland bridge. From this time to 1812 we have no precise information of his works, but they included a large number of 'castles' in Ireland, and houses in England, for Lords Foley, Caledon, Gage, and Ravensworth; Mr. Stuart, Mr. Hoare, and others.

In 1812 were commenced the plans for the Marylebone (afterwards Regent's) Park, and Regent-street. The former had been laid out for streets in continuation of Baker-street and Harley-street, and of the same stamp. The 'London Gazette' of September 19, 1812, helps us to the date of the great street improvements, which are shown in the present form—with the exception of the portion of Regent-street north of Oxford-street, and a few portions of the locality of Pall Mall East and Cockspur-street—in a plan "ordered by the House of Commons to be printed, 10th of May, 1813." On the 18th of February 1815 a formal agreement was entered into, amended three years later, between John Nash and the Board of Woods and Forests, by which he was appointed their architect, valuer, and agent, for letting land, at a specified rate of remuneration. The line of Regent-street chiefly was in progress during the next four years; and in 1819, the crown-leases of ground at Pall Mall East and Cockspur-street being about to fall in at Michaelmas, Nash, in pursuance of his duty, estimated and reported the probable rental, and at the end of the year was instructed to proceed with the letting. Nine years afterwards, at the instance of Lord Lowther, a select committee was appointed to inquire into his conduct as regards the leases or sale of crown-lands in that locality, and Regent-street, and adjoining the Regent's Canal—for in the course of his management he had been enabled to make some profitable speculations, chiefly by the purchase of leases from an original lessee who happened to be a near connection of his, and by the unexpectedly great improvement which occurred in their value. In another case, he was the representative of the Regent's Canal Company, of which he had been a chief promoter from somewhere about the year 1815. The committee however, after a very careful investigation, were able to report entirely in his favour; as it was proved, by independent testimony, that the ground had not only realised what was estimated, but that there had been no collusion between the parties.

As surveyor to the crown estates, a considerable number of designs had to be made by Nash: but it may be erroneous to suppose, as is not uncommonly done, that all those connected with the improvements were his; though as surveyor, he was required to exercise a general supervision. What he chiefly did towards improving street architecture was in laying out the routes, contriving the general masses in the buildings, and fixing their sites—so as to contribute to an effect, which if not free from drawbacks, had not before been attained in London. As instances of this, the positions of the Haymarket Theatre, of the church in Langham-place, and the plans of the Quadrant and Circus, might be mentioned. In conjunction with Mr. Repton, he remodelled the Opera House in 1820, and in the same year commenced the Haymarket Theatre. The terraces in the Regent's Park, of which Chester and Hanover terraces are the chief of those from his designs, were in progress during the next eight or nine years, and in 1826 Buckingham Palace, twice altered subsequently by Mr. Blore, was commenced. The entrance to the Royal Mews is the chief portion of the original now visible. About the same period, he planned the improvements in the garden of St. James's Park, and in 1828 was engaged upon Carlton House terrace.

It is impossible to name all his works. The Pavilion at Brighton (with the exception of the stables), one of the whims of George IV., should however be mentioned. Nash published a work on that building, at an expense of 1000*l.*, with the architecture drawn by Augustus Pugin, who was much associated with him, the figures by Stephanoff, and the other portions by Copley Fielding. He made a book of designs for churches, now in the hands of the Church

Building Commissioners; and supplied a design in competition for Windsor Castle.

In 1834 Nash retired from the practice of his profession, and on May 13, 1835, he died at his residence, East Cowes Castle. He had also a residence in Regent-street, part of the building with a recessed centre, of which the other half is now occupied by the Parthenon Club, and here he had a number of valuable works of art arranged in a gallery, which is represented in 'Britton and Pugin's Public Buildings of London,' and which is one of the best specimens of his skill in the architecture of interiors, in which he is considered to have had more skill than in exteriors.

The taste displayed in Regent-street and the Regent's Park, has perhaps not contributed to raise our national character in regard to architecture, indeed may have tended to bring into vogue a sketchy, showy, and meretricious style, wherein, though richness is affected, poverty and meanness are the prevailing qualities. Notwithstanding all their pretension and finery, the terraces in the Regent's Park appear still as ranges of common-place houses, garnished with columns and pilasters, insipid enough in themselves, and rendering the poverty of all the rest disagreeable. To this it may be added that in his use of the orders, he constantly disregarded the structural principle—especially the requirement in architectural art—placing his colonnades where they have obviously no use, and where they indeed interfere with the use of the building. In like manner, his application of the newly introduced Roman cement and mastic was imitative of stone-work, and therefore suggestive of inferiority; and the clauses which it was sought to introduce in the leases to ensure simultaneous colouring of the fronts have proved inoperative. Still, what Nash did for the architecture of London was a step, and one that in some respects has hardly yet been improved upon—for he certainly possessed pictorial power of composition and grouping, which is precisely what is most needed still for the improvement of our streets and buildings.

There is a portrait of Nash by Lawrence, in Jesus College, Oxford, painted after some gratuitous services rendered by the architect in connection with the college estate, when Waterloo Bridge was built; and there is a bust of him in marble by Behnes, in the possession of Mr. John Pennethorne.

NASH, RICHARD, commonly known as BEAU NASH, was born at Swansea in Glamorganshire, on the 18th of October 1674, the son of a gentleman of small income. He was educated at Caermarthen School, and thence sent to Jesus College, Oxford, with a view to his following the profession of the law. At college, though not deficient in talent, he distinguished himself more by dissipation than attention to his studies. Before he was seventeen, an improvident marriage which he contemplated occasioned his being sent away from the university. His father then purchased him a commission in the army. He soon quitted the military profession, and entered himself at the Middle Temple, but instead of studying law became a fashionable "man about town." While at the Temple however he made himself popular with its members, and was entrusted with the conduct of a pageant, the last there given, in honour of King William, who it is said, was so well pleased with his exertions, that he offered to knight him—an honour which he declined, unless he were made one of the poor knights of Windsor, because, as he avowed, he had no property, and that would give him some. In truth, he was now living by gaming. Nash was skilful, and he is said to have relied on his skill, and never to have had recourse to cheating. At length, in 1704, he visited Bath, where some people, for the sake of their health, assembled to drink the waters, and danced occasionally on the bowling-green. Dr. Ratcliffe, who had been offended there, had just then threatened to "cast a toad into the spring," that is, to write down the waters. Nash offered his assistance to counteract this attempt, and he was appointed master of the ceremonies in succession to Captain Webster, who had already removed the balls to the town-hall. Nash had tact and confidence, and he succeeded in establishing the place as a fashionable resort by instituting rules that ensured civility in behaviour and decency in dress, to which rules he enforced an inflexible adherence. This was a great benefit to society, though the instrument was insignificant, and the means apparently frivolous. The deference to women, which had reached perhaps an extravagant height in the reign of Elizabeth, had been extinguished by the puritanism of the civil wars, while the profligacy introduced after the Restoration had reduced them to objects of licentious intrigue, and exposed them to the coarsest behaviour. Men attended balls in boots and armed with swords. Nash succeeded, partly by ridicule and partly by firmness, in removing these customs, and restoring at least outward politeness. His position was a singular one. However apparently ill-suited for his office, for he was big, clumsy, and awkward in his person, with harsh and irregular features, and tawdry though expensive in his dress, he established an authority almost despotic. At no other period could this have happened. Though the manners we have spoken of were those of the gay world, there were abundance of unobtrusive families who felt that their prevalence was disgraceful to the nation and oppressive and dangerous to themselves. He was therefore, though a fop and a gambler, supported in his reforms, and Bath became a prosperous and much frequented place. He caused an elegant assembly-room to be built, and Wood commenced his handsome buildings. Nash shared in

the general prosperity. During the height of his power he travelled in a chariot with six horses, outriders, footmen, and French horns, and this although he was still without any ostensible means of supporting the expense. From such a man it would scarcely be expected that much attention would be paid to morality, but Nash had some virtues. It is said that in many cases he took pains to warn thoughtless young men against gambling; he was particularly sedulous in preventing young women from becoming the prey of adventurers; moreover, he was charitable even to profusion. Anstey, a severe satirist of the follies of the time, in his 'Bath Guide,' has noticed these honourable points of his character.

To him and Dr. Oliver, with the assistance of Mr. Allen (the Allworthy of Fielding), Bath Hospital owes its foundation. His reign was long and without a rival. But gaming was suppressed by act of parliament; he grew old, poor, and peevish; his popularity gradually waned, until revived by his death on February 3, 1761, when he was honoured by a public funeral, as the patron and benefactor of the city. Of his benevolence and wit many anecdotes are told, but they are not well authenticated, and his audacity and arrogance must have often offended many. Smollett, in his 'Roderick Random,' has introduced him as displaying his conversational powers to one of his characters, a lady, whom he asks "if she could inform him of the name of Tobit's dog?" and she answers "His name was Nash, and an impudent dog he was." Probably the question was an unfair representation of Nash's wit, but the answer clearly implies Smollett's estimate of his character.

NASH, THOMAS, was born about 1584, at Lowestoft, in Suffolk, and closed a calamitous life of authorship in or about 1601. Dr. Beloe has given a list of his works, and Mr. Disraeli an account of his privations and miseries. As a wit and a satirist, he was perhaps superior to all his contemporaries; but as a dramatic poet, much below most of them. He has left only one dramatic performance entirely of his own composition, 'Summer's Last Will and Testament,' which is not to be regarded so much in the light of a play as of a spectacle. It was exhibited before Queen Elizabeth at Nonsuch in the autumn of the year 1592, but not printed till eight years afterwards. Nash was concerned with Marlow in writing 'Dido, Queen of Carthage,' 1594, which was also acted before the queen by the children of her chapel.

He had a vigorous understanding, well stored with learning, and was capable of giving powerful descriptions of things and striking characters of persons, as will be found by his 'Supplication of Pierce Penniless to the Devil,' 1592: this latter work was followed up, though with less effect, by his 'Christ's Tears over Jerusalem,' 1598. 'Summer's Last Will and Testament' has been reprinted in the last edition of Doddeley's 'Old Plays.' It has no pretension to diversity of character in the persons, nor to interest in the plot, the only part that approaches to anything like individuality being that of Will Summers (or Sommers), the jester of Henry VIII.; the piece depends upon a sort of pun between the name of the jester and the division of the year which corresponds with that name.

NASIR-ED-DIN, MOHAMMED-BEN-HUSSEIN-AL-THUSSI, a Persian and an astronomer, who died in 1274, aged about seventy. Having met with some slight from Al-Mustassem, the kalif, he left his country and went into Tartary. Here he obtained the friendship of Hulaku (commonly written Hologu), surnamed Ilkhan, the brother of the reigning prince. It is said that Hulaku, being on the point of leading an army against Constantinople, was deterred by Nasir-ed-din, and induced to prefer an invasion of Persia. D'Herbelot treats this as a fiction so far as the astronomer is concerned; but whether this be so or not, Hulaku overran Persia, put Mustassem to death, and fixed his seat of government at Maragha in Azerbaijan, where he collected men of science, built an observatory, and placed Nasir-ed-din at the head of both. The instruments there used are described by Delambre, from an Arabic manuscript, in the 'Hist. de l'Astron. du Moyen Age,' page 199, &c. The tables made at this observatory are called the Ilchanic Tables, from the name of their author's patron. They enjoyed great reputation in the East, and are known in Europe from the 'Synopsis Tabul. Astron. Persicarum' of George Chrysocoococ, printed by Bouillaud in 1645, and the Commentary of a Persian, whose Latinised name is Shah Cholgius, printed by Greaves in 1642. The Ilchanic Tables, according to Delambre, differ from those of Ptolemy only in the correction of some of the mean motions.

Nasir-ed-din also wrote a work on geography, which was printed by Greaves in 1652, and which we believe was long the authority for many Asiatic longitudes and latitudes; also a work on ethics, and several other writings.

NASMITH, DAVID, was born in Glasgow, on the 21st of March 1799, of respectable parents, who educated him with a view to his entering upon a course of college study at the university of that city. Finding however that he was averse to the study of the learned languages, this intention was abandoned, and he was early placed in a mercantile establishment. In 1818 he commenced the efforts by which he subsequently became distinguished, by taking an active part in the formation of a 'Youths' Bible Association at Glasgow, of which he became secretary; and having at the age of sixteen joined the church of the late Rev. Greville Ewing, he shortly afterwards made great exertions to prepare himself for the Christian ministry. His

BIOG. DIV. VOL. IV.

friends did not however encourage the attempt, and he returned to secular employment, but engaged with much zeal in Sunday-school teaching, in the establishment of adult-schools, the religious instruction of prisoners, and other philanthropic efforts. In the autumn of 1821 an event occurred which, by affording enlarged scope for his benevolent desires for the religious and temporal welfare of his fellow-men, led to the fuller development of a character which, for disinterested devotedness, has been rarely equalled. "The conductors of the various religious and benevolent societies in Glasgow," observes Nasmith's biographer, "with a view to concentration, economy, and efficiency, had procured a large and commodious edifice, which was divided into rooms and offices, suitable to their respective objects;" and the completion of their plan required the services of an active secretary, who should be common to them all. Nasmith was elected to this office at the low salary, for the first year, of 60*l.*, though the interests of twenty-three societies thus devolved upon him. In this office he was brought into frequent communication with committees composed of ministers and laymen of all sects and parties in religion and politics, and he gained the personal esteem of many of the most eminent men of Glasgow; and the remarkable course of mental training thus afforded had the effect of fitting him for the singular career he was subsequently to pursue. Not only did he become unusually familiar with the conduct of religious and benevolent societies, and the direction of committees, but he obtained also a remarkable insight into the actual condition of city society, and thus discovered its wants, as well as the amount and character of the agency required for the supply of those wants.

While faithfully discharging his onerous duties in connection with the existing philanthropic societies of Glasgow, Nasmith applied himself also to the formation of such new associations as appeared needful for the moral and religious welfare of that and other populous places. Young Men's Societies, or associations for promoting the religious interests of young men, for protecting them from the temptations incident to a residence in large towns, and for directing their united energies into channels of benevolent exertion, occupied then, as in his later years, a large share of his attention; and in a letter upon the subject addressed by him to Professor Buchanan in February 1826, he states that he had been the means of forming about seventy such societies in the United Kingdom, France, and America, since the close of the year 1823. A still more important project, and one which has proved far more extensively successful in practice, was the formation of city and town missions, or societies for carrying religious instruction, by means of lay agents wholly devoted to the work, into the homes of the neglected poor, and even into the very haunts of vice and dissipation. Attempts had been previously made in a few instances, and on a small scale, to accomplish this object; but the difficulties of the task, especially those arising from the mutual jealousies of various sections of the Christian Church, had impeded their success. In spite of such difficulties, Nasmith succeeded in establishing, at the commencement of 1826, the "Glasgow City Mission," which, though commenced by the congregation to which he belonged, was constituted on so catholic a footing that, before the end of its first year, eight evangelical denominations of Christians were united in its management, and eight missionaries were employed. The success of this society encouraged Nasmith to print and circulate widely, not only in the British Islands and America, but also in France and other parts of the continent of Europe, a brief account of its design, with testimonials of its usefulness. In the same year Nasmith married Miss Hartridge, a native of Kent, who was then residing in Glasgow, and who became a most valuable coadjutor in his benevolent designs.

In 1828, his health being impaired by the arduous duties of his office, Nasmith resigned his connection with the Institution House at Glasgow, and from that time until his death he devoted himself wholly to the exercise of what he deemed his peculiar vocation, that of a kind of moral agent or missionary, travelling from place to place to promote the establishment of city and town missions, young men's societies, and other kindred associations. The self-denial and moral courage necessary for such an undertaking was of no ordinary character, since it involved the relinquishment of any settled means of obtaining a livelihood, and of all prospect of attaining a station to which his talents entitled him; while he had no property on which to rely even for travelling expenses, nor any society on which to fall back for support. His first removal was to Dublin, where he succeeded in establishing a prosperous city mission. On a second visit to Dublin, he formed a society for promoting the establishment of local missions in Ireland; and thence, in 1829, he proceeded on a tour through the south of Ireland, establishing missions in Cork, Limerick, Waterford, and several other places. In the following year he performed a similar journey, with the like results, in the north of Ireland, after which he returned to Glasgow, and prepared for a voyage to the United States on the same benevolent errand. Arriving at New York in September 1830, he formed a city mission there, and performed a journey of about three months' duration, visiting and establishing similar societies at many towns in the United States, after which he returned to New York, sailed to New Orleans, made some stay in Philadelphia, and afterwards, pausing for a third time at New York, proceeded to Canada. How completely disinterested Nasmith was in these travels may be seen from the fact that while his necessary expenses from

27

May 1828, when he first left his native country for Ireland, to December 1831, when he returned from America, where he travelled about 3000 miles, amounted to rather more than 671*l.*, a sum wonderfully moderate when it is considered what he accomplished during the three years and seven months over which the expenditure was spread, the sums received by him from friends who took an interest in his efforts amounted only to 439*l.*, leaving a deficiency of 232*l.* to be provided from his own very scanty resources. Pecuniary difficulties however, could not repress his ardour, and it was not long before he visited Paris and established a city mission there, and set on foot a similar institution at Havre.

He subsequently resided for some time in Glasgow, and, in March 1835, fulfilled a long-cherished intention of removing his residence to London, for the purpose of establishing a city mission. So many difficulties intervened here, that to all but himself his enterprise seemed hopeless: he persevered however, and eventually surmounted all obstacles. The London City Mission was therefore commenced, in conformity with the design of its founder, on a humble scale. At first only four missionaries were employed, with salaries amounting in the whole to 297*l.* per annum; but such has been the progress of the institution that, in 1856, at the date of the twenty-first annual report, the number of missionaries employed was 320, and the expenditure in salaries alone for the preceding year had been upwards of 28,000*l.*, exclusive of all other expenses incident to the mission. In the same year the number of domiciliary visits, and visits to hospitals, asylums, and other places where the poor and ignorant are congregated together, paid by the missionaries, amounted to 1,499,391, of which 174,321 were to the sick and dying. In a large majority of the latter class of visits the agents of the city mission were the only individuals by whom religious instruction and consolation were carried to the bedside of the sufferers. The distribution of Bibles and religious tracts, the holding of religious services in neglected neighbourhoods, and various other benevolent operations, are also carried on by the missionaries. During the year referred to 11,564 children had been sent to school by the missionaries, 6544 copies of the Scriptures and 2,278,584 religious pamphlets and tracts had been distributed, and 73,949 volumes lent to read. By gaining the confidence even of the most wretched and abandoned, the missionaries have obtained access, and often with the best results, to haunts of misery and vice which no other agency has been able to reach. They therefore constitute a kind of moral police, of the efficacy of which the reports of the society and the documents published monthly in the 'London City Mission Magazine' afford abundant proof.

The establishment of so excellent an institution might have been supposed sufficient to satisfy the desires even of Nasmyth; but such was not his feeling. He could not rest without devising further means of usefulness, and therefore he set on foot several kindred societies, one of which was the London Female Mission, a society designed to operate upon the condition of prostitution in the metropolis, both by reclaiming women, and by preserving destitute females from degradation. The English Monthly Tract Society and the Adult School Society also appear on the long list of philanthropic institutions established by him; but that to which he appears to have been most personally devoted in his latter years was a society originally called the British and Foreign Mission, and intended to promote the establishment of city missions and other similar associations. The name was afterwards altered to the British and Foreign Town Mission, but which subsequently, under the modified title of the Town Missionary and Scripture Readers' Society, chiefly confined its efforts to the establishment of local missions. In connection with this society Nasmyth visited and formed missions at Cambridge, Birmingham, Manchester, Leeds, Bradford, Halifax, Huddersfield, Wakefield, and York; and subsequently visited Scotland for the same purpose. He afterwards travelled in Wales, revisited Dublin, and made several other tours in various parts of England, of which Dr. Campbell gives full particulars. During these efforts he was supported, but in a very humble and precarious way, by the contributions of a few friends who appreciated his character and services, but he was often reduced to great pecuniary difficulties, the effect of which, coupled with incessant exertion, undermined his health; and at length he was seized at Guildford, whither he had gone with the intention of establishing a Town Mission, with a sudden illness, of which he died on the 17th of November 1839. His body was brought to London, and interred in the presence of a large assemblage of ministers and others of various denominations, in Bunhill-Fields burying-ground: and a subscription of 2420*l.* was very shortly raised by his friends for the benefit of his widow and children. A very full account of his remarkable career is given in Dr. Campbell's 'Memoirs of David Nasmyth; his labours and travels in Great Britain, France, the United States, and Canada,' 8vo, 1844.

NASMYTH, ALEXANDER, a distinguished Scotch landscape-painter, was born at Edinburgh in 1758. He came early to London, where he was for some time the pupil of Allan Ramsay, painter to George III. He resided afterwards several years in Rome, where he studied portrait, history, and landscape. He settled in Edinburgh as a portrait-painter, and his well-known portrait of Robert Burns is the only authentic likeness of the great poet. Having however a decided taste for landscape-painting, he ultimately confined himself to this branch; but much of his time was occupied in teaching, in which he

was very successful. His landscapes, which are very numerous, are many of them, reminiscences of Italian scenery, or compositions in which themes from the classic land of art are treated in a manner founded on a careful study of the famous old landscape-painters. They are wanting consequently in originality and vigour; but they are picturesque and simple, have much quiet beauty and grace, and are remarkably popular with his countrymen. In England his works were comparatively little known. Mr. Nasmyth was a favourite in society, and the leading teacher in art of the higher classes of Scotland; his practice was ample, and his emoluments large. During his later years he was commonly looked up to as the patriarch of Scottish art; and he not only took much interest in the proceedings of the artistic societies of Edinburgh, but often raised an influential voice in respect to the alterations making in that city, many of the more admired improvements in which are said to have been suggested by him. He died at Edinburgh, April 10, 1840.

Soon after his return from Italy Mr. Nasmyth married the sister of Sir James Foulis of Woodhall, Colinton, by whom he had a large family, and he lived to see all his children distinguish themselves by talents of no common order. His eldest son, Patrick, the landscape-painter, and a younger son, James, the celebrated engineer, are noticed separately below. His daughters, like their brothers, all possessed both natural taste and artistic culture; and all of them, we believe, at some period or other, practised painting as a profession. The eldest, Anne, prior to her marriage with Mr. Bennett, the engineer of Manchester, had acquired considerable notice for her very charming little picturesque rustic scenes. Another daughter, the wife of Sir Walter Scott's friend Terry, after the death of her husband, also successfully practised painting prior to her second marriage. Barbara and Margaret Nasmyth have likewise been honourably recognised as painters of very graceful and pleasing landscapes; whilst Jane Nasmyth, the youngest of the gifted sisters, stands perhaps at the head of contemporary female landscape painters: her "wild woods and bosky bourns" displaying, with the quiet truth and refinement characteristic of the Nasmyth pictures, a firmness and precision of handling not usual among English lady painters.

NASMYTH, PATRICK, or PETER, as he is frequently called in catalogues and biographies.—Peter being merely the Scottish familiar equivalent for Patrick,—eldest son of Alexander Nasmyth, was born in Edinburgh, in 1786. He showed an early decided predilection for landscape painting, and his zeal in the pursuit of his favourite art left him little opportunity as he evinced little inclination for acquiring other instruction. Early in life he injured his right hand, and learned to use the pencil and brush with equal readiness with his left. At the age of twenty he went to London, and his productions soon became very popular, obtaining for him the designation of the English Hobbima. It cannot be said however that he had much in common with the great Flemish master, excepting the minuteness of his details in landscape scenery. He had not the same firmness and largeness of touch as Hobbima, producing his results by an apparent multiplicity of detail. He improved however on the style of his father, and his pictures have less of the spotted chalky character, which, from its having been followed by other members of this clever family, is somewhat characteristic of what is called 'The Nasmyth School.' Notwithstanding a certain air of feebleness, Peter Nasmyth's landscapes are eminently pleasing. Though he often painted Scottish scenes, and his works are perhaps more admired in his native country than elsewhere, the character of his landscapes is eminently English. His style was not sufficiently massive properly to represent the wild mountain scenery and striking atmospheric peculiarities of Scotland. Light clouds, sunshine, smooth water, or small pattering brooks, meadows, gentle rising ground, and green trees, are the objects which his style was best calculated to represent. He was passionately attached to his art, and the eagerness with which he pursued it, as well as a certain recklessness of disposition, led him to expose himself in wet and inclement weather, by which he caught cold, which in the first instance brought on deafness, and ultimately resulted in consumption. He died in lodgings in South Lambeth, London, on the 17th of August 1831, during a memorable thunder-storm, which—his ruling passion for the contemplation of natural objects 'strong in death'—he was lifted up in his bed to behold, that he might as he said make notes of the 'effects' in his memory.

\*NASMYTH, JAMES, practical engineer, inventor of the steam-hammer, steam pile-driver, and many other self-acting tools, was born in Edinburgh, on the 19th of August 1803. He is one of a remarkable family, two of whom, his father Alexander Nasmyth, and his elder brother Patrick Nasmyth, are noticed above. Mr. James Nasmyth when very young had a liking for mechanism, choosing to spend much of his time about workshops, where he was allowed to "lend a hand" in any work that was in progress. His father having previously acquired a taste of a similar kind, was accustomed to divert himself from the more sedentary occupation of his art in a small workshop which he had fitted up; and this place afforded the son the means of putting into form ideas which he had gathered out of doors. He thus acquired dexterity in the manipulation of tools, as well as that habit of extemporising resources which appears to form the true basis of the efficiency of the mechanical engineer. Attendance at the High School was an interruption to the pursuits of the young Nasmyth not

at first welcomed by him, but it served to afford the usual branches of elementary education—though by his skilful use of pen and ink in pictorial and artistic illustrations on the margins of the ‘classics,’ he often purchased from his monitors, exemption from the exercise of the day—whilst ‘steels’ for striking lights, which he had forged over night out of old files, judiciously dealt out, “commanded the services” in his tasks of any of his schoolfellows. One of his favourite companions was the son of an iron-founder, whose yard, littered over with the *débris* of obsolete machinery, formed perhaps the best school for a boy of a scientific and practical turn. Here the young engineer also could observe the chief operations in casting and forging metals, and bringing them into the forms of their mechanical application; and here also his observation gave him the mechanism of many a device of pipes, wheels, and pinions, which, if applied sometimes in the way of mischief, was not less the useful medium of instruction for his future pursuits. Another of his associates was the son of a colour-manufacturer, and this led to the study of practical chemistry in the laboratory of the works. The companions made it a rule to employ no substance (such as acid or alkali) in their experiments, which they had not themselves formed from its elements; and if this was in one respect a round-about method of proceeding, it perhaps gave the best groundwork, and the habit of facility, in experimental research. The institution of the School of Arts afforded Mr. Nasmyth the opportunity for studying the principles as well as the practice of various branches of science; and after four years spent there, he joined the University classes, where his diligence procured him the friendship of the eminent men who were then professors. Leslie indeed availed himself of Mr. Nasmyth’s practical skill in the construction of the apparatus required in some of his investigations in natural philosophy. Meanwhile, the fine arts were not forgotten; and Mr. Nasmyth acquired a power of readily delineating objects, such as would be another of the most valuable qualifications for the mechanical engineer.

The construction of steam-carriages to run on common roads was about this time the great engineering problem, and Mr. Nasmyth made a small locomotive of simple construction, in which the draught was obtained by the waste steam sent up the chimney—this arrangement forming perhaps the earliest application of a now vital principle in locomotive engines. This subject occupied Mr. Nasmyth the greater part of the years 1827 and 1828. The cost out of pocket was under 70*l*. Mr. Nasmyth then proceeded to London with the object of gaining admittance into the establishment of Messrs. Maudsley and Co. A difficulty with him was the premium, but armed with a cargo of steam-engine models and mechanical drawings which he had brought, he at once was able to show that he was worth what he asked for—the moderate pay of 15*l*. a week. With Maudsley and Co. he continued from 1829 as private workman or assistant to Mr. Maudsley, till the death of the latter in 1832, when he returned to Edinburgh. His object now was to construct a stock of tools and machinery, in which preparatory work he was occupied till the end of 1834, when he visited Liverpool and Manchester to inquire into the probable opening for a small engineering establishment, and deciding in favour of the latter town, he took one floor of an old cotton-mill, with the use of two horse power supplied from the engine of his landlords at a distance. Here he brought the results of his two years’ labours in Edinburgh, got employed, and by 1835 had such an accumulation of machinery in progress of construction that the floor of his room failed, and he had “notice to quit.” On the evening of that same day he visited a site (which he had fixed his eye upon in 1830) at Patricroft, a few miles from Manchester, and which now had the advantage of immediately adjoining both the Bridgewater Canal and the Manchester and Liverpool Railway; and two days afterwards he obtained a lease of it for 999 years. Timber was bought and sawn at Liverpool, and a temporary workshop, sufficient to complete the work in hand, was run up. The Bridgewater Foundry, on the site, soon appeared as a group of buildings somewhat superior in their architectural effect, at that day, to what was the common character of such manufactories; a successfully resisted turn-out helped to the advantage of the new undertaking; and speedily, by excellence of workmanship and a number of successful inventions, the concern (which was for a short time known as that of “Nasmyth, Gaskell, and Co.”) made the name of its author widely known, and yielded him other and substantial results. With these latter he was enabled to retire from commercial affairs at the end of the year 1856, hoping to devote the rest of his days to the pursuit of art and science, and to those investigations for which his training has made him so well fitted.

Amongst the inventions of Mr. Nasmyth, the two which have been named at the head of this notice are perhaps the most important. Though very different as to the form, the machines are applications of the same principle. By the steam-hammer a vast increase of concussive force can be applied to the forging of iron,—whilst the hammer is under such control, that with the greatest ‘momentum’ it can be arrested at any point as easily as the lightest instrument used by hand. One especial advantage in the case of the pile-driver, is the immense saving which it effects in time,—it being now possible to drive a pile in a mere fraction of the time formerly needed in the process of working a machine by hand. But this is not all. There is not that destruction of the heads of the piles which formerly was the cause of much trouble and frequent renewals. Thus the invention has contributed

greatly to the speedy and successful completion of the chief harbour works of late years.

Some years ago, Mr. Nasmyth put forth a very simple but ingenious suggestion, as to a method which was perhaps used in forming the letters of the old arrow-headed inscriptions, which he showed might all be made with the greatest facility by one three-sided tool or ‘stylus,’ held and pressed on the soft clay at various angles of inclination. Practical astronomy has also much engaged his attention; and he has constructed for his own use telescopes of considerable power, by which he has pursued investigations into the physical structure of the moon; and these investigations have received the approbation of eminent astronomers, and the deductions in elucidation of some of the chief cosmical laws of the universe, have been published in most of the scientific journals in Europe and America.

NASSAU, HOUSE OF, an ancient and illustrious German family, which having distinguished itself throughout Europe, during the 16th and 17th centuries, in the cause of civil and religious liberty, has in our own times attained the regal title with the sovereignty of the Netherlands. The counts of Nassau on the Rhine had, in the middle ages, acquired sufficient power at one period to dispute the pre-eminence with the House of Austria, and to give a sovereign (Adolphus of Nassau, elected emperor in 1292) and five ecclesiastical electors to the German empire. Early in the 16th century the family of Nassau obtained, through marriage and bequest, the French principality of Orange in Provence, from whence their most celebrated title has been derived: but the possession of several large domains and hereditary dignities in the Netherlands had meanwhile numbered the counts of Nassau among the vassals whom the House of Austria gained by the marriage of Maximilian with Mary of Burgundy; and William I. of Nassau, prince of Orange, the true founder of the glories of his race, was the subject of the emperor Charles V. Besides William I., the most remarkable personages of his house were his son Maurice, the ablest general of his age, and his great-grandson William III., stadtholder of the United Provinces and king of England; the lives of each of these three individuals will claim a separate notice.

I. WILLIAM I. OF ORANGE was born in the year 1533, at Dillenburg in Nassau. His father having embraced the reformed doctrines, he was at first educated in those principles; but the emperor Charles V., who early interested himself in his fate, removed him to his court, and had him brought up in the Roman Catholic faith. The emperor, who is said to have foreseen and predicted the great statesman in the boy, placed him about his person, allowed him alone to be present when he gave audience to foreign ambassadors, and soon honoured him with a confidence far above his years. William merited his favour by a discretion which had already obtained for him his famous surname of ‘The Silent;’ and the emperor did not blush publicly to avow, that to so young a man he had often been indebted for suggestions which had escaped his own sagacity. In the last solemn act of his public life, when he abdicated his throne to his son Philip II., Charles leant on the shoulder of William of Orange; and to him also, still only in his twenty-third year, the retiring monarch committed the honourable mission of delivering over his imperial crown to his brother Ferdinand.

The esteem of Charles seems to have been sufficient of itself to excite the jealousy and distrust of his son; and, from the commencement of Philip’s reign, William became to that gloomy and suspicious despot an object of hatred and fear, which he repaid with deep though dissembled indignation. The state of religion in the Netherlands enabled him to convert those provinces into a theatre of action for projects which have been variously attributed to his patriotism or revenge, but which perhaps may with more probability be ascribed to the mixed motives that usually influence human conduct. While his benefactor Charles was on the throne, William had adhered to the Imperial creed; but after the abdication of that monarch we find him embracing Calvinism with the same facility with which he had in earlier years deserted the Lutheran for the Roman Catholic faith. This last transition was yet undecided or unknown when he was resident at the court of France as a hostage for the peace of Cateau-Cambresis; and the French king, Henri II., believing him to be as deep in the confidence of Philip II. as he had been in that of Charles V., incautiously spoke to him of the secret treaty which the crowns of France and Spain had recently concluded for the extirpation of the Protestants in the dominion of both.

This disclosure had a double consequence; for William hastened to communicate it to the leaders of the Protestant party in Brussels, and Philip II. discovered that he had given the information. The existence of this treaty and its detection served to increase the antipathy between William and his sovereign; but the dissimulation which belonged to their characters in common long prevented any open rupture, and for several years, while the Netherlands remained under the feeble administration of Margaret of Parma, the Prince of Orange, as a member of the Flemish council of state, and as stadtholder of Holland, Zealand, and Utrecht, covertly but indefatigably employed himself in undermining the tyrannical designs of Philip. At length the approach of the energetic and sanguinary Duke of Alva, to whom Philip had transferred the government of the Netherlands from the hands of Margaret of Parma, warned William that it was time to throw off the mask; and he avoided the tragical fate of his friends,

the counts Egmont and Hoorn, by retiring from the Low Countries to his paternal domains of Nassau.

In the following year, 1568, the detestable tyranny and inhuman cruelties of Alva against the Protestants in the Netherlands, his own wrongs, and the appalling sufferings of a people whom he loved, roused William from his retreat, and thenceforward he stood forth the fearless and zealous champion of the great cause, which he is supposed to have embraced less from religious than from political motives. His efforts in arms were for the most part unsuccessful; for the raw and heterogeneous levies which he was enabled to make among the German and French Protestants for the succour of the unwarlike people of the Netherlands were no match for the veteran Spanish and Italian bands which Alva had led into the Low Countries. But every disadvantage under which William contended in the field with Alva and his skilful successors, Don John of Austria and Alessandro Farnese of Parma, was more than counterbalanced by his consummate abilities as a statesman, which enabled him finally to triumph, not only over his Spanish enemies, but over every rival in the councils of the revolted provinces. The archduke Mathias of Austria and the Duke of Anjou, both of whom had been invited by the party opposed to William to assume the government of the insurgent states, found their authority less durable than his influence; and it was by his suggestions and under his auspices that the seven Protestant provinces of Holland, Zealand, Utrecht, Friesland, Groningen, Overijssel, and Guelderland, concluded, in 1576, the famous Union of Utrecht, which formed the lasting basis of the Dutch republic.

Philip II. no sooner heard of this decisive measure than he showed his sense of its importance and his dread of its author by setting a price upon his head. So atrocious a temptation, combined with fanatical zeal, soon produced two attempts upon the life of William, from the first of which he escaped with a wound. The second was more successful, and he fell at Delft, in the year 1584, by a pistol-shot from the hand of one Balthazar Gerard, a Burgundian, who had been instigated or encouraged to the deed by Roman Catholic priests. William was four times married, and left, besides daughters, three sons, of whom Philip William, the eldest, having been seized in his youth by Alva, sent to Spain, and educated in that country in the Roman Catholic faith, was ultimately restored to the principality of Orange, and the two others, Maurice and Frederic Henry, successively attained the dignity of stadtholder of the United Provinces.

II. MAURICE OF NASSAU, the second surviving son of William I., was born in 1567, and named after his maternal grandfather, the celebrated Elector Maurice of Saxony, whose military genius he inherited. Although only seventeen years of age when his father was assassinated, the states of Holland and Zealand showed their gratitude to the memory of their deliverer by immediately electing young Maurice their governor or stadtholder; and though the Count of Hohenloe was at first appointed his lieutenant to aid his inexperience, he soon proved himself capable of the unassisted conduct of military affairs. For a time indeed his further rise was impeded by his extreme youth, and by the desire of the States to gratify Queen Elizabeth of England through the elevation of the Earl of Leicester to the supreme command of their forces. The proceedings of that nobleman however soon gave them just grounds of suspicion and disgust, and in 1587 they solemnly elected Maurice to fill, in his absence, the office of captain-general of the whole Seven United Provinces, a dignity which accordingly devolved altogether upon him, when the misconduct of Leicester had at length compelled the queen of England to recall him from the Netherlands. At this epoch a great part of the territory of the Seven United Provinces was still in the hands of the Spaniards; but Maurice began vigorously though gradually to make head against them. In 1591 he displayed his skill and activity by the capture of Zutphen, Deventer, Nimeguen, and other important places; and his successes had now infused such confidence into the States and people, that he was received at the Hague with transports of public joy. In 1593 he took Gertruydenberg, after a memorable siege, and Groningen in the following campaign. The progress of the republican arms was marked during some years principally by the reduction of those and other fortified places; but in 1597 Maurice, with the aid of the English auxiliaries under Sir Francis Vere, completely defeated the Spaniards in his first ranged battle at Turnhout in Brabant; and three years later, in 1600, he obtained at Nieuport, with the same confederates, a second and more brilliant victory over the Archduke Albert of Austria.

Thenceforth, until the recognition by Spain of the independence of the Seven United Provinces in the truce for twelve years, which was concluded in 1609, Maurice continued to extend the successes of the states, and to raise the glory of their arms. The undoubted talents of the great generals to whom he was opposed, and over whom he gained many advantages, signally enhanced his own reputation: for, after having baffled in his youth the enterprises of the renowned Duke of Parma, Alessandro Farnese, he found, in his later career, another worthy opponent, in the equally famous Italian, Spinola, who had succeeded to the command of the Spanish forces. Under such leaders, the operations of the hostile armies in the Netherlands riveted the attention of the world; and the camp of Maurice, as well as that of Parma and Spinola, being thronged with volunteers from every quarter of Europe, became the great school of military instruction.

The cessation of hostilities exhibited the qualities of Maurice in a less favourable light. He had laboured from selfish views to obstruct the conclusion of the truce with Spain, and was successfully opposed in these and other ambitious designs upon the liberties of the republic, by the pensionary Barneveldt, a man of real patriotism, eminent ability, and incorruptible integrity. But the religious disputes, which arose in the republic at this juncture between the Calvinists and Arminians, enabled Maurice to revenge himself upon the pensionary. Barneveldt being attached to the Arminian opinions, Maurice placed himself at the head of the opposite faction, the Calvinists, or Gomarists, as they were called after Gomar, the professor of theology at Leyden, who had been the antagonist of Arminius. As the Gomarists composed the great mass of the people, that party at length prevailed; the Arminian preachers were banished; and in 1619, at the age of seventy-two years, the virtuous and venerable Barneveldt, who had for nearly half a century served the republic as successfully in the cabinet as Maurice had done in the field, was, by the machinations, and to the eternal dishonour of that prince, brought to the scaffold after being convicted on various false charges, of which the principal was, that he had "troubled the state and religion." [BARNEVELDT.] The stadtholder, who by the decease of his elder brother had succeeded in 1618 to the principality of Orange, gained little by his persecution of Barneveldt. After the death of the pensionary the people awoke to a sense of their injustice and ingratitude to that patriot, and his oppressor Maurice suddenly became as hateful and suspected in their eyes as he had hitherto been popular. His designs of acquiring the sovereignty of the states were perceived and frustrated, and whenever he appeared in public, groans and execrations pursued him as the murderer of Barneveldt.

The resumption of hostilities with Spain, at the expiration of the truce in 1621, turned the tide of public indignation; and Maurice again appeared in arms to measure himself against his old antagonist Spinola. The fortune of the contest however between these two great commanders was now so nicely balanced, that it would be difficult to assign the palm of victory to either. In 1622 Maurice compelled the wily Genoese to raise the siege of Bergen-op-Zoom, after having expended on it the lives of 10,000 of his veteran troops; but three years later, Spinola succeeded in reducing Breda, notwithstanding all the efforts of Maurice; and so much to his mortification, that the circumstance is believed to have produced or hastened his death, which occurred on the 23rd of April 1625, and in the fifty-eighth year of his age. He left no legitimate offspring, and was succeeded, both in the principality of Orange and stadtholderahip of the United Provinces, by his half-brother, Frederic Henry.

The character of Maurice of Nassau was favourably distinguished only by military genius. As a statesman, he was without the sagacity and prudence of his father; as a man, in his treatment of Barneveldt and his family, he showed himself devoid of honour and humanity; and the violence and grossness of his nature were redeemed by no virtue of private life. But as a general he must ever be numbered among the greatest masters of his art, and may in fact be regarded as the founder of the military science of modern Europe. He was the first to methodise the practice of sieges, encampments, and marches; and he introduced numberless reforms in the armament, training, and formation of troops. He taught the cavalry of inferior physical weight to engage in close encounter, and to overthrow the ponderous masses of the old gens-d'armes; he first accustomed the infantry to a systematic management of their arms; and to his institutions must be referred that uniformity of exercise and regularity of movement which have become the simplest elements of martial discipline. To this may be added, that the celerity, as well as good order of his marches, the able arrangements by which he husbanded the lives and health of his troops, and the felicitous skill with which his camps were chosen and secured from assault, are the constant subjects of contemporary eulogy. He excelled particularly in the art of fortifying, besieging, and defending places; and, as the circumstances and localities of the contest in which he was engaged rendered such operations less perilous for the States than the hazard of decisive encounters in the field, his successes were gained more by a war of sieges, marches, and entrenched camps, than of great battles: but the victories of Turnhout and Nieuport were not the less the triumphs of his tactical system. Those actions were the first important defeats inflicted upon the Spanish bands, who had so long been the terror of Europe; and it was in the school of Nassau that the fundamental rules of military science were established which, within less than half a century, finally prevailed over the slow and cumbersome array of the Imperial and Spanish service, in the plains of Lutzen and Rocroi.

William III. of Nassau, prince of Orange, stadtholder of the united provinces, and ultimately king of England, will be found fully noticed under WILLIAM III. With the death of William III. the male line of William the Silent became extinct; and the States-General were not sorry to leave the stadtholderahip vacant, and tacitly abolished. But William had named for his personal heir his cousin John William Friso, prince of Nassau-Dietz (grandson of his aunt Albertina Agnes by William Frederic of Nassau-Dietz), from whom the present regal line of Orange is descended.

NAUCYDES (Ναυκύδης), a Greek sculptor, who was born at Argos, and was in repute, according to Pliny, about OL. 95; he was the son

of Mophon and the brother and master of the younger Polyctetus of Argos, and, says Thiersch, was one of the most important artists between Alcámenes and Praxiteles. Pliny mentions a Mercury, a Discobolus, and a man sacrificing a ram, by him. Pausanias notices six other of his works: a Hebe, in ivory and gold, placed near the celebrated chryselephantine statue of Juno at Mycenæ by Polyctetus; the rest were in bronze—a Hecate at Argos, and four victors at the Olympic games, one of Eules at Rhodes, two of Chimon, one of which was at Olympia, the other in the Temple of Peace at Rome, and the fourth of Bacis the wrestler. A tenth work by Naucydes, a bronze statue of Erinna, is mentioned by Tatian. The two statues of Chimon were, according to Pausanias (vi. 9), his best works. He was the master of Alypus of Sicyon. The well-known Discobolus in repose, standing with the quoit in his hand, is sometimes called the Discobolus of Naucydes, but without the slightest foundation. (Junius, *Catalogus Artificum*; Thiersch, *Ueber die Epochen der Bildenden Kunst unter den Griechen*.)

NAUDÉ, GABRIEL, was born at Paris in 1600; and displayed at an early age a great aptitude for philological and critical studies. In 1622-23 he studied medicine, but it was not till several years later that he took his Doctor's degree in that science at Padua. In 1624 he made his first journey into Italy, and on his return to Paris he published his work, 'Apologie pour les grandes Personnes fausement accusés de Magie,' 1625. In 1631 he accompanied the papal nuncio Cardinal de' Bagni on his return to Rome, and was appointed his librarian. While he was at Rome the controversy concerning the authorship of the book 'De Imitatione Christi' began. [KEMPIS, THOMAS A.] The Benedictines claimed the authorship for one of their order, John Gersen, abbot of Vercelli; whilst the regular canons of St. Génévieve claimed it for Thomas à Kempis. Naudé, being in Italy, was requested to examine several manuscripts of the work in question. His report was unfavourable to the claims of the Benedictines, who were much incensed against him, and accused him of bad faith. The affair then came before the courts in the shape of a charge of defamation; the suit lasted for years, and was at last compromised. In 1640 Cardinal de' Bagni died, and Naudé, after remaining some time with Cardinal Barberini, the nephew of the reigning pope Urban VIII, was recalled to Paris in 1642, and appointed librarian to Cardinal Mazarin. In this capacity he travelled through several parts of Europe to collect books and manuscripts to enrich his patron's library, which was afterwards sold according to a sentence of the parliament of Paris, during the civil war of La Fronde, to the great sorrow of Naudé, who attempted to prevent what he considered an act of barbarism, 'Avis à Nosseigneurs du Parlement sur la Vente de la Bibliothèque du Cardinal Mazarin,' 1652. On receiving an invitation from Queen Christina of Sweden to be her librarian, Naudé went to Stockholm in 1652, where he was very well received. The climate of Sweden not agreeing with his health, he set out to return to Paris, but died on his way, at Abbeville, in July 1653.

Naudé wrote numerous works in French and Latin, a catalogue of which is annexed to the 'Naudeana, ou Singularités remarquables prises des Conversations de M. Naudé,' 1701 and 1703; the latter edition is by Bayle. His principal works are—1, 'Instruction à la France sur la Vérité de l'Histoire des Freres de la Rose Croix,' 1628, in which he shows the absurdity of the wonderful stories concerning the Rosicrucians, which had begun in Germany, and were then spreading into France; 2, 'Bibliographia Politica,' being a list of the principal writers upon politics, with his own remarks; 3, 'Avis pour dresser une Bibliothèque,' 1627; 4, 'Additions à l'Histoire de Louis XI,' 1630; 5, 'De Studio Militari Syntagma,' 6, 'Jugement de tout ce qui a été imprimé contre le Cardinal Mazarin,' 4to, 1650; 7, 'La Marfore, ou Discours contre les Libelles,' 8, 'Considérations politiques sur les Coups d'Etat,' Rome, 1639. Naudé says that he wrote this work at the request of and for the private perusal of his patron Cardinal de' Bagni, who however for his own convenience had twelve copies of it printed. The work was afterwards reprinted in Holland in 1667, and again in 1678, with comments by way of refutation, by L.D.M. (Louis Dumaz). The principles broached in this book are of a similar nature with those of the 'Principe' of Machiavelli. Among other things Naudé (in ch. iii.) approves of the massacre of St. Bartholomew, not on religious but on political grounds, considering the Huguenots as obstinate rebels, and says that the obloquy which has been thrown upon it is, "because it was done only by half; for had all the heretics in France been cut off, the country would afterwards have enjoyed perfect tranquillity."

Naudé appears however to have been in himself a man of irreproachable morals, of great learning, but self-opinionated and somewhat paradoxical. Father Jacob, in his 'Gabrielis Naudæi Tumulus,' 1659, has collected all the eulogies and epitaphs that have been written in his honour.

NAUNTON, SIR ROBERT, a diplomatic statesman, was born in 1563, and was the son of Henry Naunton of Alderston, in Suffolk. He studied at Trinity College, Cambridge. He attended his uncle, William Ashby, when he was sent as ambassador by Queen Elizabeth to Scotland in 1589, and being sometimes trusted with the management of important business connected with the mission, he was thus initiated in diplomatic life. In 1596, he was sent by Essex to France, with letters to Antonio Perez, formerly Spanish secretary, probably

with a view of securing the services of that statesman to the English government, or at least of sounding his intentions. Returning home, he was, in the same year, appointed tutor to a young gentleman named Vernon, of whom the Earl of Essex was guardian. He proceeded with his pupil to the Hague, and thence to France, in company with the French ambassador, the Duc de Bouillon; and it is manifest that the object hidden under his appointment, and his journey, was to give Essex the services of so able a man as a spy on the French court. He seems to have been naturally of a candid disposition, which did not easily mould itself into the pliant morality necessary for successfully conducting the service required of him. He wrote many complaining letters to his patron. "The best allowance of credit I can have," he says in one of them, "is but in nature of betwixt a pedagogue and a spy; both trades I know not whether more odious or base, as well in their eyes with whom I live as my own." After the fall of Essex, little seems to be known of him, until 1614, when he reappears as member of Parliament for Helstone; a favourite of King James on account of his scholarship; and one of the persons patronised by Buckingham. He was sworn secretary of state, on the 8th of January 1618. Having afterwards opposed the favourite's friend, Gondomar, the Spanish ambassador, he was deprived of office, but he was subsequently appointed master of the Court of Wards. He died on Good Friday, 1635. His 'Fragments Regalia; memoirs of Elizabeth, her court, and favourites,' was greedily perused in manuscript and frequently copied over, until it was printed in 1641. It has passed through several editions. This little book is remarkable as one of the very few which in that age noticed political events and characters in their relation to the progress of the constitution; a purpose on which the writer brought to bear a sagacious spirit and animated style.

NAVARRETE, JUAN HERNANDEZ, was born at Logroño in Castile. He is commonly known by the name of 'El Mudo,' from having been rendered deaf and dumb by an illness in the third year of his age. This misfortune probably led to the choice of the profession of a painter, in which he made such rapid progress in the school of Fr. Vincente, at Madrid, that he was soon able to visit Italy, and especially to study at Venice the works of Titian. After his return to Madrid in 1668, he was appointed painter to the king, for whom he painted his finest works, which are preserved in the Escorial. Among them are a small picture of the Baptism of our Saviour in the Stable, the celebrated 'Presepico,' in which the principal light proceeds from the infant; the 'St. Hippolytus, in search by night of the body of St. Lawrence;' and a Holy Family, generally considered as his masterpiece, in which the singularity of the accessories attracted as much notice as the beauties of the composition. These accessories were a cat, a dog, and a partridge. They were perhaps the cause of his being obliged to bind himself in a contract with King Philip not to introduce cats, &c., again in such subjects: "Y en las dichas pinturas non pongo, gato, ni perro, ni otra figura que aia deahonestas." His works at Valencia, Salamanca, and Estrella are scarcely inferior to the preceding, and all are distinguished by a brilliancy of colouring which justly gained him the appellation of 'El Ticiano Español.' He died in 1577, aged fifty-three years.

NAVARRETE, DOMINGO FERNANDEZ, a learned Spanish Dominican, born about 1610, was sent in 1647 as missionary to the Philippine Islands, whence he afterwards proceeded to China, where he remained many years as head of the missions of his order, studying at the same time the language and the history of the country. He was at last put in prison by the Chinese authorities, but succeeded in escaping to Macao, whence he returned to Europe in 1673. He went to Rome, and was well received by the pope, to whom he gave an account of the missions in China, in which he exposed the latitudinarianism of the Jesuits in accommodating themselves to several of the superstitions of the natives, in order to increase the number of their pretended converts. This practice had already been denounced by Morales, another Dominican, and condemned by a papal decree of the 12th of September 1645, of which Morales was the bearer to China. The Jesuits however, having obtained from Rome several modifications of this decree, persisted in their practices, which Navarrete himself appears to have winked at while in China. In 1678 he was appointed archbishop of Santo Domingo in the West Indies, where he died in December 1689.

Navarrete wrote a work in Spanish, which has become very scarce, on the history and the moral and political condition of China, the first volume of which was published at Madrid in 1676; but the second volume, which contained an account of the disputes between the Jesuits and the Dominicans in China, is said to have been suppressed by the Inquisition. This work is entitled 'Tratados historicos, politicos, ethicos, y religiosos de la Monarchia de China,' fol., Madrid, 1676. It contains many curious particulars. At the end of the first volume are several decisions and decrees of the popes concerning the regulation of the Chinese missions.

NAVARRETE, MARTIN FERNANDEZ DE, a Spanish scientific naval officer and historical investigator, who had the good fortune to bring to light materials of unusual value. He was born at the town of Abalos in Old Castile, on the 9th of November 1765; and his uncle, who was afterwards grand master of the Knights of Malta, being high in influence among them, he was received into the order of St. John of Jerusalem on the 9th of August 1768, or three months before he was

three years old. The Count of Peñaflores, the patron of the school of Vergara, where he studied Latin and mathematics, took a fancy to send to Don Tomas Iriarte, the then fashionable poet, the verses in which some of the boys had celebrated his popular poem of 'Music,' and Iriarte was so pleased with those of Navarrete that he began a literary correspondence with him, and invited the young scholar to visit him at his house at Madrid. Soon after, in 1780, Navarrete entered the naval service, and became a 'guardia marina,' or midshipman, at Ferrol. In the next year, on board of the *Concepcion*, he was one of the Spanish fleet under Cordova which, during that part of the American war, cruised unassailed in the English Channel; and he was at the disastrous attack of the Spanish floating batteries on Gibraltar, in September 1782. After some cruises against the Moors and Algerines, Navarrete was, in 1789, obliged to quit active service for some time on account of the state of his health, and his character of a naval and literary man combined procured for him the commission from the new king, Charles IV., to examine the national archives to form a collection of documents relative to the naval history of the kingdom, and in particular that of the voyages of discovery which have conferred such immortal honour on Spain. This was the commencement of Navarrete's great work, the first volume of which did not appear till thirty-six years after. In 1793 the Spanish declaration of war against the French republic recalled him to sea, and in 1796 the declaration of war with England kept him there; but his health was still weak, and when in 1797 his friend Langara became minister of marine he provided Navarrete (now risen to the rank of captain in the navy) with a post in his office at Madrid. His life after this appears to have been as undisturbed by violent changes as a life in that country and time could possibly be. At the outset of the war of independence he refused to accept office under the French, and he removed to Seville, but he took no active share in the war. He was re-instated in office as soon as Ferdinand returned, and for many years continued to be the great naval authority of Spain, the moving power of the Admiralty, although the title he bore was that of chief of the Hydrographic department, to which he was appointed in 1823. In the midst of his official duties his zeal for literature never slackened: he left behind him two volumes of poems, though he never showed them to any but his most intimate friends. As a member of the Spanish Academy, he proposed, about 1815, the new system of orthography which was adopted for its Dictionary, and has been followed by many of the Spanish writers. As secretary of the Academy of San Fernando, which is that of the Fine Arts, he was always at his post, and to their 'Transactions,' and those of the Academy of History, he was a contributor of valuable papers. He was also the author of numerous works, some of which are of great importance from the information they contain. He held his offices and also a distinguished place in the literary society of Madrid through several revolutions; and in 1834, when the *Estatuto Real* established a chamber of peers on the French model, he was one of the first peers created. He died at Madrid, on the 8th of October 1844, at the age of seventy-eight.

The great work of Navarrete is the '*Coleccion de los Viages y Descubrimientos que hicieron por mar los Españoles desde fines del siglo XV.*' ('Collection of the voyages and maritime discoveries made by the Spaniards since the close of the 15th century'). The work was to consist of seven quarto volumes: the first and second were published in 1825, the third in 1829, the fourth and fifth in 1837, the sixth and seventh, chiefly consisting of documents relating to Columbus, have not yet appeared in print, but the materials for them were left by Navarrete at his death, arranged for publication and only awaiting the introductions and notes he intended to add to them. The book is described by Humboldt as "one of the most important historical monuments of modern times." Washington Irving, who went to Madrid expressly for the purpose of translating it, afterwards changed his intention and wove the new matter which it supplied into the '*Life of Columbus*,' in which in fact little belongs to Irving, except the style. This mode of dealing with the materials was perhaps the best that could have been adopted under the circumstances. A French translation of Navarrete's works which was commenced never advanced beyond a few volumes. Navarrete was a man who let no day go by without searching into something, who habitually read with a pen in his hand, who had an excellent memory for names and dates, and other small facts of all kinds, and a talent for combining their results; but he lacked the power of condensation; he was not a man to write a European classic; his prejudice as a Spaniard of the old school influenced not only his writings, but in its absolute theory interfered with his dignity as an historian. Perhaps he did himself an injury by the learning with which he loaded his volumes. In his '*Coleccion*' the number of new documents brought forward in the first two volumes, is said to have been five hundred, and while the work is one which is absolutely indispensable in every large library, and necessary to be consulted by every inquirer into the subject of which it treats, it is little read and is mainly known as a mine for others to dig in. One of the most interesting volumes of the Hakluyt Society, Mr. Major's letters of Columbus, is for the most part taken from it, but there are few other documents in the collection of such surpassing interest as these.

The other great work with which Navarrete was connected was the '*Coleccion de Documentos Ineditos para la Historia de España*,' or

'Collection of Unpublished Documents for the History of Spain,' commenced by him in 1842 in conjunction with Don Miguel Salvá and Don Pedro Sainz de Barauda. It was and is published in numbers, and one of the editors on bringing a number to Navarrete once remarked, "Well, volume three is done at last;" "Three," the old man replied with vivacity, "I wish there were three hundred, and that I saw them on my shelves. Without such publications we shall never have a history of Spain." He died when it had reached the fifth volume, and the last numbers we have seen belong to the twenty-fifth, and were issued in 1855, by Don Miguel de Salvá and the Marquis de Pidal, the latter a member of the Spanish cabinet, and also eminent as a man of letters. This collection is one of the most important now publishing in Europe, and is, like Navarrete's previous one, indispensable in every large library. It has been frequently laid under contribution by English and American writers; in particular by Mr. Helps, Mr. Prescott, and Mr. Stirling.

Among Navarrete's other works is the most copious life of Cervantes yet written, originally prefixed to a new edition of '*Don Quixote*,' and afterwards separately published in 1819. It contains a very large number of new facts which he had unearthed by patient research. A work entitled '*The Life and Writings of Cervantes*,' by Thomas Roscoe, which was published by Tegg in 1839 as a portion of Murray's '*Family Library*,' appears to be entirely taken from Navarrete without acknowledgment; at least, in several passages that we have compared we have been unable to discover any difference. A history of the part that the Spaniards took in the Crusades, which was contributed by Navarrete to the '*Memoirs*' of the Spanish Academy of History, and a translation of which was inserted by Michaud in his '*Histoire des Croisades*,' was a portion of a general history of maritime affairs in Spain which he left behind him complete, and which is likely to be published by the Spanish Academy of History in two or three volumes quarto. That academy issued in 1846 a '*Dissertation on the History of the Nautical and Mathematical Sciences in Spain*,' which Navarrete had, it is said, been at work upon occasionally for fifty years. His next important work after that is a view of the discoveries of the Spaniards on the western coasts of North America, prefixed to a narrative of the '*Voyage of the Sutil and Mexican on the Coasts of California*,' published in 1802. The book was frequently referred to in the disputes between the English and American governments respecting the Oregon territory.

A collection of the smaller works of Navarrete, '*Coleccion de Opusculos*,' was commenced in 1848 by his sons, but has not been carried farther, we believe, than two volumes, though it was intended to consist of five or six, comprising a selection from his correspondence, and an extended account of his life and times. The two volumes mainly consist of short biographies of Spanish literary men and seamen, which had mostly been scattered in periodicals and transactions of academies.

NEAL, DANIEL, an English dissenting divine and writer of considerable eminence, was born in London on the 14th of December 1678. His early education was received at Merchant Taylors' School. In 1697 he entered the academy of the Rev. Thomas Rowe; and after having continued there about three years, went to prosecute his studies at Utrecht and Leyden. On returning to England he became assistant to Dr. Singleton, the pastor of an independent congregation in Aldersgate-street; and at the death of the latter in 1706 was chosen his successor. Notwithstanding his official duties, in discharging which he was eminently faithful, he found leisure for literary labours. In 1720 he published a '*History of New England*,' and subsequently edited a '*Narrative of the Method of Inoculating for Small-pox*,' as practised in New England. His printed discourses also are numerous. But his chief work is the '*History of the Puritans*,' which is written with great minuteness and accuracy. It was originally published in 4 vols. 8vo, the first of which appeared in 1732, and the second, third, and fourth in 1733, 1736, and 1738 respectively. It has since passed through many editions. The first volume was reviewed by Dr. Maddox, bishop of St. Asaph, and the remaining volumes by Dr. Zachary Grey. To the former Neal himself replied; and an answer was given to the latter by Dr. Toulmin, in an edition of Neal's '*History*,' published in 1797. Neal died at Bath in April 1743, highly esteemed by the dissenting body both as an author and a divine. (Neal's *Life*, by Toulmin.)

NEALCES (Νεάλκης), probably of Sicily, a celebrated Greek painter, contemporary with Aratus of Sicily, about B.C. 213. Few of his works are mentioned, but he was the most celebrated painter of his time. Pliny mentions a Venus by him, and a battle between the Egyptians and Persians on the Nile. To show the locality of his battle, Nealces painted an ass drinking at the side of the river, and a crocodile lying in wait for him—an ingenious application of accessories, of which there are also many other examples in the history of Greek painting. Nealces is one of the painters whom tradition represents as having succeeded by accident in painting the foam on a horse's mouth with his sponge.

Aratus, in his zeal against the tyrants, waged war even against pictures, and resolved to destroy all their portraits which were preserved at Sicily. This he did with one exception: Nealces saved the portrait of Aristratius by Melanthius and Apelles from the common destruction, but only partially. Aristratius was represented standing by a

chariot of Victory; Nealees painted out the figure of Aristratius, and substituted a palm-tree in its place. "The piece was so admirable," says Plutarch, "that Aratus could not avoid feeling the art that was displayed in it; but his hatred of tyrants soon overruled that feeling, and he ordered it to be defaced." Nealees the painter, who was honoured with his friendship, is said to have implored him with tears to spare that piece; and when he found him inflexible, said, "Aratus, continue your war with tyrants, but not with everything that belongs to them; spare at least the chariot and the Victory, and I shall soon make Aristratius vanish." Aratus gave his consent, and Nealees defaced the figure of Aristratius, but did not venture to put anything in its place except a palm-tree.

Anaxandra, the daughter of Nealees, was likewise distinguished for her paintings; and his colour-grinder, Erigonus, became a painter, and acquired great honour through the celebrity of his pupil Pasius.

(Pliny, *Hist. Nat.*, xxxv. 11, 40; Plutarch, *Aratus*, 18.)

NEANDER, CHRISTOPHER FREDERIC, deservedly esteemed as the author of some of the best specimens of devotional poetry in the German language, was equally estimable as a man. He was born at Ekau in Courland, on the 26th of December 1724, and lost his father when about eight years old, but was so fortunate as to possess in his surviving parent not only a tender guardian, but a model for those virtues by which he afterwards distinguished himself. Having completed his studies at the University of Halle, he first became tutor in a private family, and in 1750 was appointed pastor of a small congregation in a retired part of the country, to whom, and to the duties of his office, he became so attached, that when a professorship at Halle was pressing offered him he refused to accept it, preferring to remain in obscurity, where he felt that he could be eminently useful. He afterwards however accepted the more lucrative living of Gränzhof, that he might thereby be enabled to support a widowed sister and her five children. By this change too the sphere of his usefulness was greatly enlarged, for he became generally followed as a preacher. In 1775 he was made dean of the diocese of Doblen, and in 1784 superintendent of church matters in the duchies of Courland and Semgallen; but he still continued to reside among his congregation at Gränzhof. He died on the 21st of July 1802. As a writer, his fame rests chiefly upon his 'Geistliche Lieder,' a collection of devotional songs, which may be regarded as models of that apparently easy, yet in reality exceedingly difficult species of composition. At once animated, simple, dignified, and breathing heartfelt piety, they are the genuine effusions of devotional feeling regulated by cultivated taste.

NEANDER, JOHANN AUGUST WILHELM, Professor of Theology in the University of Berlin, and a member of the Consistory of the province of Brandenburg, was born of Jewish parents, at Göttingen, on the 15th of January 1789. His early youth was spent in Hamburg, where he was educated at the Gymnasium, and at the Johanneum, a college founded on the site of the old cathedral, in which is placed a large public library. While pursuing his studies here he became a sincere and zealous convert to the Christian faith, assuming the name of Neander ('a new man,' from the Greek) on his baptism. He then, in 1806, repaired to the University of Halle to study theology, and thence removed to that of Göttingen. After a short stay in Hamburg, in 1811, he transferred himself to the University of Heidelberg, where his remarkable theological attainments obtained him in 1812 the situation of Professor Extraordinary of Theology; and in the same year his reputation occasioned him to be called to a similar office in the University of Berlin. From that time his whole life was devoted to the advancement of Christianity by his writings, which have continued to gain an ever-extending influence, and to the interests of the university and of the students under his care. The earliest published work which established his reputation was 'The Emperor Julian and his Times,' which at once showed that in this branch of Church history he was a master of his art. This appeared in 1812; in 1813 was issued 'St. Bernard and his Times,' and others followed—on the principal Gnostic systems, on St. Chrysostom and the Eastern Church, on Tertullian and his writings, 'Memorable Occurrences from the History of Christianity and Christian Life,'—between 1818 and 1826. These however were only the preparatory labours for his valuable work, 'Universal History of the Christian Religion and Church,' in 5 vols., issued successively between 1825 and 1845. This history, he says, is at once "a speaking proof of the divine power of Christianity; a school of Christian experience; a voice sounding through centuries for the edification, the instruction, and the warning of all who are willing to hear." The development of the Christian Church and faith during the Apostolic times formed the subject of his next work, 'Geschichte der Pflanzung und Leitung der Kirche durch die Apostel,' in 2 vols., published in 1832-33. In these works he has with great ability combated the neologism and rationalism so prevalent in Germany, to which he was ever as active an opponent as Schleiermacher, Hengstenberg, or Tholuck. In 1835 he issued 'Das Leben Jesu in seinem geschichtlichen Zusammenhange' ('The Life of Jesus in its historical relations'), a work which was written in direct refutation of that of Strauss bearing a similar title, and which with his 'General History of the Church,' and the 'History of the Apostolic Church,' have had great influence in England, and been highly valued. His reputation as a lecturer was also great, and his lectures were numerously attended.

After a short illness he died on July 14, 1850. His smaller occasional writings were collected by himself, and published in 1829 under the title of 'Kleinen Gelegenheitschriften,' for the benefit of the Bible Society of Berlin, of which he was always an earnest supporter. The 'Life of Christ,' 'History of Christianity,' 'History of the Planting of Christianity and of the Apostolic Church,' and other of his works have been translated into English, and form a part of Bohn's 'Ecclesiastical Library.'

NEARCHUS, the son of Androtimus, was a Cretan by birth, but an inhabitant of Amphipolis on the Strymon. He accompanied Alexander in his invasion of Asia, and was appointed by him to conduct to the Persian Gulf the fleet which had been built on the Hydaspes. The narrative of this voyage, the earliest of which any account is given, was written by Nearchus himself; and though the original journal has been lost, Arrian appears to have given us, in his 'Indica,' everything of importance which it contained. Strabo and Pliny have also preserved some account of this voyage, but their narratives are full of mistakes and inconsistencies, and cannot be compared with the full and accurate account of Arrian.

Dodwell and some other modern critics have considered the journal of Nearchus, as preserved by Arrian, to be spurious; but its authenticity has been fully established by Gosselin ('Géographie des Grecs,' p. 25), Sainte Croix ('Examen Critique,' p. 250), and especially by Vincent ('Commerce and Navigation of the Antients in the Indian Ocean,' vol. i., p. 68-77.)

The fleet under Nearchus took its departure from a station south of Pattala, about nine miles from the mouth of the Indus, in the beginning of October, B.C. 326. After getting clear of the mouths of the Indus, the first place which they reached in the Indian Ocean was Krokela, which Arrian describes as a sandy island. This place appears to correspond to the modern Curachee, or Crotohey Bay, in which there is a sandy island, dry at low-water. At Krokela, Arrian places the commencement of the territory of the Arabii, an Indian nation, and its termination at the river Arabia.

After remaining one day at Krokela, the fleet proceeded to the west, keeping a promontory named Eirus (C. Monze) on the right, and a low island, almost level with the sea, on their left, which ran so near the coast as to leave only a narrow channel between both. Having cleared this passage and doubled the cape, they came to a bay, or harbour, protected from the ocean by an island called Bibacta (Churna, or Chilney). This harbour Nearchus called by the name of Alexander, and here he determined to remain till the season should be more favourable for his progress. It has been already remarked that he left the mouths of the Indus at the beginning of October; and as the north-east monsoon does not commence till November, and only becomes settled in December, a delay of some time was almost unavoidable. Having remained at this place for twenty-four days, he continued his voyage, though the monsoon had not yet completely changed; but he proceeded very slowly for some days. The fleet anchored successively at Doma, Saranga, Sakala, and Morontobara, or Morontobara, the position of which places cannot be determined, and afterwards arrived at the mouth of the river Arabis (Sonmeany), which separates the country of the Arabii from that of the Oritæ. From the Arabis they proceeded twelve miles and a half to Pagala, and from Pagala nineteen miles to Kabana, an open and desert shore: between Pagala and Kabana they lost two galleys and a transport. From Kabana they proceeded twelve miles to Kokala, where Nearchus disembarked his men and formed a camp on the shore. Here Leonnatus, who had been left in the country of the Oritæ by Alexander with a particular charge to attend to the preservation of the fleet, joined them, and supplied them with provisions.

After remaining some days at Kokala, they proceeded thirty-one miles to the river Tomerus. This was the longest distance they had sailed yet in a day; and their progress corresponds to the change of the monsoon, which would become more fixed about this time. They remained six days at the Tomerus, where they found barbarians, shaggy on the body as well as on the head, and with nails sharp and long like the paws of wild beasts. Thence they proceeded nearly nineteen miles to Malana (Ras Malin), where Arrian fixes the boundary of the Oritæ and the commencement of Gadrosia. The whole of the coast from Malana to Cape Jask, a distance of 450 miles in a right line, was inhabited by the Ichthyophagi (fish-eaters), who lived almost entirely on fish. Their bread was dried fish, pounded and made into loaves or cakes; and even the few cattle which they had fed upon dried fish. Arrian's description of the coast and the people is confirmed by modern travellers, one of whom, quoted by Vincent, informs us that "they have few ports, little corn or cattle; their country is a low plain and desert; their chief support is fish, of which they take some of a prodigious size: these they salt, partly for their use, and partly for exportation; they eat their fish dry, and give dried fish likewise to their horses and cattle."

From Malana the fleet proceeded thirty-seven miles to Bagisara; and on the following day they sailed round a rock, or promontory, which extended a considerable way into the sea (probably Cape Arubah), and proceeded successively to Kolta and Kalama (Kalyba), where they found the dates green. Opposite to Kalama was an island called Karnina, which appears to be the same as the modern Aahula, or Sungadeep Island. From Kalama they proceeded twelve miles to

Karbis; and thence, after doubling a high rocky promontory, which projected nine miles into the sea, and which is probably the modern Cape Passeenos, they reached a safe harbour, called Mosarna, which must be looked for a little to the west of this cape.

At Mosarna Nearchus found a pilot, who undertook to conduct the fleet to the Persian Gulf, and from this time they sailed on each day a much greater distance. From Mosarna they proceeded in succession to Balomus, Barna, Dendrobosa (perhaps the Dendrobilla of Ptolemæus), and Kophas, the position of which places is uncertain, with the exception of Kophas, which is perhaps the same as the modern Koppah. From Kophas the fleet sailed round Cape Gwadel, and proceeded fifty miles to Kyiza, where they did not land, as the coast was rocky and barren. On the following day they surprised a small town, probably situated on Gutter Bay, and obtained some corn, which they were greatly in want of. They afterwards anchored at a cape in the neighbourhood called Bageia: and thence proceeded about eighty-seven miles in two days to Kanasis, a town in ruins, probably situated on Choubar Bay. From Kanasis Nearchus sailed twenty-four hours without intermission to a desert coast, where he was obliged to anchor at some distance from the shore, as the distress of the people was now risen to such a height that, if he had suffered them to land, he had reason to suspect that they would not have returned on board. From this place they proceeded, in great want of provisions, to Kanate (Tanka), Troi, and Dagasira, and at length reached Badis, a place on the western side of Cape Jask, which separated the country of the Ichthyophagi and Karmania. At Badis they found corn, vines, and fruit-trees of every kind except the olive, a town inhabited, and the inhabitants ready to relieve their wants.

From Badis they proceeded fifty miles, and came to an anchor on an open coast, opposite Cape Maketa (Ras Mussendon), from which point Nearchus considered that the Persian Gulf commenced. From Badis they proceeded forty-four miles, to Neoptana (near Karroon), in the Persian Gulf. From Neoptana they sailed on the following day six miles to the river Anamis (Ibrahim), at the mouth of which was a town called Harmozeia, the name of which is still preserved in the celebrated island of Ormuz, in the neighbourhood. Near this place Nearchus landed his men, and ordered the ships to be drawn on shore; and learning that Alexander was only distant a journey of five days, he went with a few attendants to his camp, and was received by the king with marks of the greatest honour and respect. At first Alexander would hardly believe that the fleet had arrived in the Persian Gulf in safety; and when he was assured by Nearchus of the fact, he is reported to have said, "By the Grecian Zeus and the Libyan Ammon, I swear to you that I am more happy in receiving this intelligence than at being the conqueror of all Asia; for I should have considered the loss of my fleet, and the failure of this expedition, as a counter-balance to all the glory I have acquired." So anxious was Alexander to establish a commercial intercourse between India and the western provinces of his vast empire.

After remaining a few days with Alexander, Nearchus returned to the fleet, and set sail again about the beginning of the following year (B.C. 325). During the third day's sail, three of the ships grounded during a storm on a shoal off the western coast of the island of Oaracta (Kishma); but they got off when the storm ceased, and joined the fleet on the following day. The remainder of the fleet escaped the danger by sailing to the south-westward, and anchored at the islands called at present the Great and Little Tomb. On the following morning they sailed again to the mainland, leaving on their left the island Pulora (Polior), and after a sail of two or three days arrived at Katea (Kaish, Guase, or Kenn), a low desert island, opposite to which, according to Nearchus, is the boundary of Persis and Karmania on the coast.

From Katea they proceeded along the coast of Persis, anchoring successively at Illa, opposite the island of Kaikandros (Inderabia); at Ochus, under a high mountain; at Apostani (Shewar f), where they found many ships at anchor; at a bay, probably the same as the modern Nabend, on the borders of which were many villages with palm and other fruit-trees; at Gogana (Congoon), situated at the mouth of a mountain-stream called Areon; and at the river Sitacus, west of the modern Ras Khann, where Nearchus remained twenty-one days in order to repair and refit several of his ships, during which time he received a large supply of corn from Alexander. About the 1st of February they sailed from the Sitacus to Hieratis (Khoré), a place well inhabited, and thence to Mesambria, and anchored at the mouth of a river called Padargos. Arrian describes the whole of this country as a peninsula, which corresponds most correctly with Aboushehr, generally called Bushire. Thence they proceeded to Taoke, near the mouth of the river Granis (Khisht), on which there was said to be a palace of the Persian kings, about 200 stadia up the country. Strabo (xv. p. 728. Casaub.) also mentions a Persian palace near the sea, called Oke, which apparently is a shortened form of Ta-oke. From Taoke they proceeded in succession to Rhogonis (Bunder Reight), to Brizana, a winter torrent, and to the river Arosis, called Oroatis by Strabo, Pliny, and Ptolemæus ('Tab.'), which, according to Arrian, divided Persis from Susiana.

At the Arosis they took in a supply of water for five days, as the pilots told them that no harbour could be gained without considerable danger, in consequence of the number of shoals which extended from the land far out into the sea. The whole of the navigation along the

coast of Susiana was attended with great difficulty and danger; but the fleet eventually passed through the shoals in safety, and sailed up the river Pasitigris (Karoon), when Nearchus joined Alexander and his army, who were on their march from Persepolis to Susa. Vincent supposes that the expedition was concluded on the 24th of February, B.C. 325.

After the death of Alexander, we find that Nearchus was governor of Lycia and Pamphylia (Justin, xiii. 4), and that he attached himself to the fortunes of Antigonus, whom he accompanied in several of his expeditions. The time and manner of his death are unknown. He is last mentioned as one of the generals selected by Antigonus in B.C. 314 as advisers of his son Demetrius in his first military expedition.

A very complete and interesting examination of the voyage of Nearchus is given by Vincent in the first volume of 'The Commerce and Navigation of the Ancients in the Indian Ocean,' from which the preceding account has been chiefly taken.

NEBRUS, one of the family of the Asclepiadæ, and the most eminent physician of his day, lived in the island of Cos, about B.C. 580. The Amphictyons, having consulted the oracle of Delphi, in consequence of the plague breaking out among their army while besieging the town of Crissa in Phocis, were directed to fetch from Cos "the young of a stag, together with gold." This was interpreted to mean Nebrus and his son Chrysus—[νεβρος, in Greek, signifies 'a fawn,' and χρυσος, 'gold']—who accordingly joined the camp of the Amphictyons, where the former helped to reduce the town by poisoning the water; and the latter was the first person who mounted the wall at the time of the general assault. (Thessali 'Oratio ad Athen., apud Hippocratis Opera.') For the Crissean war see Strabo, ix. p. 418; and Pausan., 'Phoc.,' 37, who attributes the poisoning of the water to Solon.

NECKER, JAMES, son of a professor of law at Geneva, was born in 1732. He was sent to Paris in his youth, and was employed in the house of Thelsson, the great banker, who, after a time, in consequence of his abilities and the services which he had rendered to the house, took him into partnership. In the course of twelve or thirteen years, Necker realised a very large fortune by various successful speculations, and retired from business at forty years of age. He now began to aspire to official situations, and wrote several works on financial affairs, which made him favourably known. He wrote concerning the French East India Company, and also upon the corn-laws, 'Sur la Législation des Grains.' His 'Eloge de Colbert' obtained a prize from the French Academy. He afterwards wrote a memoir upon the French finances, suggesting the means of making up the deficiency in the revenue, and forwarded it to the minister Maurepas, the president of the council of finances. The president, being delighted with it, obtained for the author, from Louis XVI., after some hesitation on account of Necker being an alien and a Protestant, the appointment of director of the treasury in 1776. This was a new office, and was created for the purpose of giving assistance to that of comptroller-general, which was filled by the counsellor of state Taboureaux de Réaux, a mild and unassuming man, who, feeling his inferiority to Necker, resigned his place in the following year. Necker was appointed director-general of finances in June 1777, but without a seat in the council. That was a critical period; the finances had been long in a state of great embarrassment, and the impending war with England on account of the American colonies required a great increase of expenditure. Necker, being averse to imposing new taxes, endeavoured to make up the deficiency by economy and loans. [LOUIS XVI.] In 1781 he published his 'Compte Rendu,' which disclosed for the first time the state of the revenue and expenditure of France, and made him numerous enemies.

In order to counteract their intrigues, Necker asked for a seat in the council as a mark of the king's confidence, but this being refused on the score of his religion, he tendered his resignation, which was accepted, in May 1781. He withdrew to Switzerland, where he purchased an estate at Copet, on the banks of the Lemman Lake, and here he wrote his work, 'Sur l'Administration des Finances,' 1784. "Both Necker and his predecessor Turgot," says a contemporary writer, "worked for the public good, and both made war against abuses. But Turgot had the disinterestedness of a philosopher and a philanthropist who entirely forgot himself for the good of the state and of mankind. Necker was disinterested, but only in money matters, for he was tormented by the ambition of fame and popularity. Turgot had faith in his principles; Necker confided in himself. Turgot had fixed ideas on legislation, and he wished to give a durable government to France; Necker combated only partial abuses, and appeared to have no settled notions of the science of government. . . . Turgot wished to give to the French a political and moral education; he wished to form public opinion; Necker believed that public opinion in France was very enlightened, and he bowed himself before it. The former spoke to the people as a legislator, the other as a courtier of the people." In his retreat however, after his second resignation, he altered his tone. "Public opinion," he says, in the preface to his work 'De l'Administration de M. Necker, par lui-même,' 1791, "appears to me no longer as it did once. The respect which I felt for it has been weakened since I have seen that opinion influenced by the arts of the wicked, since I have seen it waver and tremble before men whom it ought to have rightly estimated and marked with its scorn and reprobation."

"Necker's first resignation however was much to be regretted; it was a loss to France at a critical moment, and it was a great fault on his part, for he might have maintained himself in office; but his unconquerable self-love prevented him. He fancied that they could not do without him, and that he would be soon recalled, and thus become all-powerful. He was mistaken; and when at last he returned to office, the situation of the state was greatly changed, and circumstances had become such as to require talents very superior to his." (Droz, 'Histoire du Règne du Louis XVI.' b. 11, 1839.)

In 1787 Necker returned to Paris, where he wrote against Calonne, who had just been dismissed from his office of comptroller-general of the finances, and he was, in consequence, banished from the capital, but was soon after recalled. In the following year (August 1788), on the resignation of Brienne, and at the suggestion of that minister, Louis XVI. appointed Necker director-general of finances, as the only man capable of restoring order in the administration. The king had already promised the convocation of the states-general, and Necker urged him to keep his promise. But he failed as a statesman, in not arranging beforehand a plan for the sittings of those states, so as to prevent the collision that took place on their first meeting. In fact Necker was a financier, but no general statesman; he was a philosopher and a man of letters, but not a jurist or a legislator, and he was thus considered by a man well qualified to judge of these matters. [MIRABEAU.] His second ministry was short. Unable to check or direct the popular storm, and not enjoying the confidence of the court, Necker, unwilling to become a watchword of the agitators, offered privately to Louis XVI. to quit his place and the kingdom, if he thought his absence would tend to calm the public effervescence. On the 11th of July 1789 the king wrote him a confidential note, requesting him to set off quickly and privately. Necker obeyed, and set off for Switzerland that very night. But this step, instead of preventing, only precipitated the Revolution. After the taking of the Bastille, the National Assembly demanded the recall of Necker, and Louis complied. Necker was received in triumph, but his popularity was short-lived. He did not go far enough to please the movement-men. In December of the following year, 1790, he gave in his resignation to the National Assembly, which received it with cool indifference. He spent the remainder of his life in Switzerland, in retirement and study, and wrote several political tracts. He had written, several years before, a work, 'De l'Importance des Opinions Religieuses.' He died in April 1804. His daughter became celebrated as Madame de Staël. [STAËL.]

NEEFS, PETER, called 'the Old,' born at Antwerp in the year 1570, was a disciple of the elder Henry Steenwyck, whose manner he closely imitated. He painted views of churches and convents, especially interiors, preferring those in the Gothic style of architecture. He possessed a profound knowledge of perspective, and represented his subjects, with all their rich ornaments, and every member of the architecture, with strict truth, and yet without betraying the appearance of anxious labour. Every object is marked with minute precision, and finished with an exquisite touch and a light pencil. His bright clear pictures, in which he avoided the darkish brown colouring sometimes observable in the works of his master Steenwyck, are the most esteemed. Being an indifferent designer of figures, he often got F. Francks, Van Thuiden, Velvet Breughel, or Teniers, to paint the figures; those of the two last greatly enhance the value of the pictures of Neefs. He died in 1651. His son PETER MARTIN (called 'the Young') painted in the same style, and chose the same subjects as his father. He was born in 1601, and died about 1660.

NEER, ARNOLD VANDER, born at Amsterdam in 1619, is well known to connoisseurs and artists both by the peculiarity of his style and by the handling and transparency of his landscapes. His subjects are chiefly views of villages with fishermen's huts on the low banks of rivers and canals. His pencilling is remarkably neat, his touch free and clear, and his imitation of nature faithful. His reputation is founded on his moonlight scenes, in which he has never been excelled, and perhaps scarcely equalled. The lustre of his skies about the moon, and the reflection of the beams on the water, whether calm or slightly rippled, are admirable. His genuine pictures are highly prized all over Europe. In some instances they are rather too black, probably from the effects of time. He died in 1688.

NEER, EGLON HENDRICK VANDER, son of the preceding, was born at Amsterdam in 1643. He studied first under his father, and afterwards under Jacob Vanloo. He was well versed in all the branches of the art. In history, his composition is skilful and his drawing correct; his portraits both large and small are spirited and well coloured; and his conversations have all the excellencies of Terburg. He lived first at Paris, then at Orange, and lastly at the court of the elector palatine at Düsseldorf, where he died in 1703.

NEHEMIAH, the author of one of the canonical books of the Old Testament, gives what we may call his autobiography. He was the son of Hachaliah, and filled the high and confidential office of cup-bearer to Artaxerxes, king of Persia, then residing at Susa. After his countrymen had been released by Cyrus, had returned to Jerusalem under Zerubbabel, and were endeavouring to rebuild the Temple under the guidance of Ezra, Nehemiah was informed of the interruptions occasioned by the intrigues of the enemies of the Jews, and the oppressions and insults to which they were subjected. This

MOG. DIV. VOL. IV.

intelligence occasioned a sadness which was remarked by his royal master, who, when informed of the cause, sent him to Jerusalem as civil governor, in succession to Zerubbabel, who died about this time, B.C. 445. He zealously assisted Ezra in enforcing his religious reforms, but his own special charge seems to have been to secure Jerusalem from the attacks of foreign enemies, and to re-organise the civil government. This he effected: he built walls and gates to the town, with a palace for himself and future governors, in despite of much vexatious opposition; each builder "with one of his hands wrought in the work, and with the other hand held a weapon." The walls were at length dedicated with much solemnity, and Ezra read the book of the law. Nehemiah had obtained leave of absence from Artaxerxes for twelve years, which were now expired; he therefore appointed his brother Hanani, with Hananiah the ruler of the palace, to be the civil governors, and returned to Susa. During his residence he states that he accepted of no salary as governor, and, in addition, kept a liberal public table, at which a hundred and fifty visitors, Jews and strangers, attended daily. Soon after his return to Susa, he learned that his regulations were disregarded, the Temple service neglected, and the Temple itself desecrated; that the high-priest was corrupt, the sabbath profaned, and marriages with heathen women encouraged. He obtained a re-appointment to his former office, returned, and proceeded vigorously to the correction of the evils grown up in his absence. His second residence continued about four years, till B.C. 420. The contents of the book of Nehemiah are to a considerable extent the same as that of Ezra, with which it was formerly united under the title of the First and Second Books of Esdras [EZRA], and some writers have contended, though we think without foundation, that Ezra was the author of both.

NELEDINSKY-MELETZKY, YURII, the most eminent song-writer Russia has yet produced, was born in 1751. He served in the campaigns against the Turks, from the year 1770 to 1774, and, after the peace between the two countries, accompanied the Russian mission to Constantinople. Subsequently an office in the civil department was bestowed upon him by the emperor Paul, and in 1797-98 he accompanied that sovereign in his journey to Kasan and White Russia. This last mark of the imperial favour was followed by others of a more substantial nature, for an estate with several hundred peasants was shortly after allotted to him as the reward of his services, besides the order of St. Anne, to which that of St. Alexander Nevsky was added in 1809. Though, considered singly, his songs and ballads may appear merely elegant poetical trifles, and indicate no very high literary effort or ambition, they prove him to have possessed a decided talent for that species of composition, and the power of infusing into it a gracefulness and charm for which the language afforded no previous models. To great simplicity they unite great tenderness and warmth of feeling. He died in 1829, at the age of seventy-eight.

NELSON, HORATIO, son of Edmund Nelson, rector of Burnham Thorpe, and Catherine his wife, was born at his father's residence in Norfolk, on the 29th of September 1758. His mother died in 1767, leaving eight children, for whom an early provision was desirable, on account of the slender income of their father. Nelson had neither a strong frame nor a hardy constitution, yet his weakness did not disincline him to leave home: he embraced willingly the opportunity of going to sea, which was offered through the position in the navy which was held by his uncle, Captain Suckling, who had been appointed to the *Raisonné*, 64, in which Nelson was entered as midshipman. The *Raisonné* was soon afterwards paid off, and service in a guard-ship, to which his relation was appointed, being objectionable for a boy, he entered the merchant service, and sought active employment in an outward-bound West Indiaman. Mr. Southey says, "He returned a good practical seaman, but with a hatred of the king's service, and a saying then common among sailors, 'aft the most honour, forward the better man.'" To remove this hatred, his uncle received him on board his guard-ship in the Thames, and though this service was less enterprising than might have been desired, it was advantageous to Nelson in two respects: it enabled him to overcome his prejudice against the navy, and to acquire skill in pilotage, which he afterwards turned to good account. By his uncle's influence he obtained a rating on board the *Carcass*, Captain Lutwidge, in the North Polar expedition under Captain Phipps: on his return he was placed on board the *Seahorse*, and went to the East Indies in her, whence he was invalided.

Recovering his health on the passage home, he was appointed acting-lieutenant to the *Worcester*, and subsequently lieutenant of the *Lowestoffe* and the *Bristol*; commander of the *Badger*, brig, in December 1778; and post-captain to the *Hinchinbroke*, June 11, 1779. He distinguished himself in the siege of Fort San Juan, Nicaragua, and took the island of St. Bartolomeo. Pestilence reduced his crew from 200 to 10 men, and Nelson, crippled by disease, was obliged to return home. The Bath waters having restored him, he was appointed to the *Albemarle*, in which he cruised during the winter of 1781-82 in the North Sea, whence he was ordered by Lord Sandwich to Quebec. On this station he remained until peace was concluded, when he went for a short time to St. Omer. He was appointed to the *Boreas*, 28, and sent to the Leeward Islands, in March 1784.

The Americans were then trading with the British colonies on the footing of British subjects, but as they had become foreigners by their separation from Great Britain, and as such were not allowed to trade

with those islands, Nelson determined to put a stop to these proceedings; and induced Sir R. Hughes to issue orders to enforce the navigation act, which orders however were subsequently recalled. Nelson then found he must either disobey his orders or the acts of parliament: he determined on the former, and seized four American vessels with freight at Nevis, carrying island colours. The whole colony rose against him, but the ships were ultimately condemned in the Admiralty court. He married at Nevis, 4th of March 1787, the widow of Dr. Nisbet, a physician, and daughter of Mr. Herbert, president of that island, who had one son, named Josiah. He returned to England in June 1787, and lived in retirement till the eve of the French revolutionary war, when he applied for employment.

On the 30th of January 1798, he was appointed to the *Agamemnon*, of 64 guns, and took with him his step-son Josiah Nisbet as midshipman. The fleet, under Lord Hood's orders, reached the south of France at a time when it would willingly have become a separate republic under the protection of England. Nelson was sent with despatches to the court of Naples, where he became acquainted with Sir William and Lady Hamilton. He afterwards joined Commodore Linzee at Tunis, to expostulate with the dey on the impolicy of supporting France. On the passage, he fell in with three French frigates, a corvette, and brig; a running fight of three hours ensued, when a change of wind enabled the enemy to get out of reach of the *Agamemnon's* guns, which ship had received so much damage in her sails and rigging, that she was unable to renew the action, and the enemy left her unmolested. Subsequently Nelson was detached with a small squadron to co-operate with Paoli in Corsica. The French having withdrawn from St. Fiorenzo to Bastia, Lord Hood, with Nelson as his senior captain, determined to reduce that place with a naval force, General Dundas having refused to co-operate. The garrison capitulated to Lord Hood, May 19, 1794. At the siege of Calvi, whither the *Agamemnon* was sent to co-operate with Sir Charles Stuart, Nelson lost an eye, from a shot striking the ground near him and driving the sand into it. Here the dog-days and an epidemic thinned his crew, whose health was previously impaired with hard service. Admiral Hotham had now succeeded Lord Hood in the Mediterranean command, and in the partial action with the French fleet which took place soon after, the *Agamemnon* engaged the *Ça Ira*; the action was renewed on the following day, when the *Agamemnon* again engaged the same ship, which was taken, together with the *Censeur*. Nelson was desirous of continuing the action with the rest of the fleet, but the admiral was satisfied with this slight success. The next service on which he was employed was the blockade of Genoa, in co-operation with the Austrian army, in order to drive the French out of that state. He had a squadron of frigates under his orders, and narrowly escaped capture by the French fleet within sight of the English fleet, which was becalmed in St. Fiorenzo Bay. Another partial action succeeded, in which the French ship *L'Alcide*, 74, was taken, but burnt by the explosion of some combustibles then in use among the French. Only 200 of her crew were saved. The Austrians, being beaten, gave the French possession of the Genoese coast, and Nelson sailed for Leghorn to rest. Sir John Jervis took command of the Mediterranean fleet in 1795, and Nelson resumed his station in the Gulf of Genoa. He next superintended the evacuation of Bastia, and having effected this, proceeded in the *Minerva*, Captain George Cockburn, to perform the same service at Porto Ferrajo. On the passage they fell in with two Spanish frigates, took one, and compelled the other to haul off, when a squadron, of which these frigates formed a part, hove in sight, and the prize was retaken. From Porto Ferrajo Nelson took convoy to Gibraltar, fell in with the Spanish fleet at the mouth of the Straits, and joined Sir J. Jervis with the intelligence. He hoisted his broad pendant as commodore on board the *Captain*, 74 guns, Captain R. W. Millar, and was eminently distinguished in the general action of February 14, 1797, with the Spanish fleet, in which the *Captain*, after engaging, with the *Culloden*, three first-rates and three others, being at length crippled, fell alongside the *San Nicolas*, of 80 guns, and carried her by boarding. Nelson himself on this occasion boarded through the cabin windows. The *San Josef*, of 112 guns, was lying on the other side, and he led the boarders from the *San Nicolas* to her, with the cry of "Westminster Abbey or victory!" Their efforts were crowned with success, and on the quarter-deck of this Spanish first-rate Nelson received the swords of the rear-admiral and his officers.

Before the news of the action reached England, Nelson had been promoted to the rank of rear-admiral; the order of the Bath was now bestowed on him, and the freedom of Norwich was voted to him, to which city he gave the sword of the Spanish rear-admiral. He now hoisted his flag in the *Theseus*, and commanded the in-shore squadron employed in the blockade of Cadiz. On the 3rd of July 1797 Lord St. Vincent bombarded that town. In withdrawing the bomb-vessel out of gun-shot, the Spanish gun-boats and launches endeavoured to capture her, but were successfully met by a similar force under Nelson, in which the Spanish commander attempted to carry his boat, and both distinguished themselves personally in a hand to hand fight. His next service was an unsuccessful attack on the town and fort of Santa Cruz, Teneriffe, with three sail of the line, one fifty-gun ship, and three frigates: the British gained a footing on the mole, but were repulsed. In the act of stepping out of his boat, Nelson received a

shot through his right elbow. He was with difficulty carried on board his ship, where the arm was immediately amputated. Notwithstanding the failure of this enterprise, fresh honours awaited him. He was rewarded with a pension of 1000*l.*, on which occasion he was obliged to present a memorial, which exhibited a singular catalogue of services. He stated that he had been in four actions with hostile fleets, in three with boats employed in cutting out, and at the taking of three towns; employed at Bastia and Calvi; had assisted in capturing seven sail of the line, six frigates, four corvettes, and eleven privateers, taken fifty merchant vessels, and been in action 120 times; lost his right eye and arm, and received other severe wounds. He also received the freedom of the cities of London and Bristol. Early in 1798, Sir Horatio hoisted his flag in the *Vanguard*, 74, and joined Lord St. Vincent at Gibraltar, by whom he was detached on the 9th of May, to watch the port of Toulon, where the expedition for Egypt was then fitting. The *Vanguard* was dismasted in a heavy gale of wind off Toulon, on the 20th, and, during the thick weather that followed, the French fleet escaped. Having refitted his ship, and being reinforced by eleven sail of the line, he went in pursuit of the French fleet, with the following ships:—*Culloden*, *Goliath*, *Minotaur*, *Defence*, *Bellerophon*, *Majestic*, *Zealous*, *Swiftsure*, *Alexander*, *Orion*, *Theseus*, *Audacious*, and *Leander*, all of 74 guns.

Nelson heard of the enemy's armament at Malta, and shaped his course to Candia, but getting no tidings there, he returned to Sicily. Having obtained supplies at Syracuse, he sailed for the Morea on the 25th of July, obtained intelligence at Coron which caused him to shape his course for Alexandria, where he arrived August 1, 1798, and found the French fleet lying in the bay of Aboukir. The haziness had prevented the two fleets from perceiving each other, although they actually crossed in the night of the 22nd of June. The French had reached Alexandria on the 1st of July, and Brueys, unable to enter the long-neglected port, moored his fleet, consisting of one first-rate, three second-rates, nine seventy-fours, and four frigates, in Aboukir Bay. On perceiving the enemy's position, Nelson adopted the plan projected by Lord Hood in Gourjean Road, but which he had there found impracticable, of stationing his ships one on the outer bow, and another on the outer quarter of each of theirs. The action commenced at 6h. 20m. P.M., August 12th, and at noon of the 13th, of the French fleet one ship had blown up, eight had surrendered, two escaped, and two were aground, of which one yielded, and the other was burnt by her crew. The loss sustained by the English was 218 killed, and 678 wounded; that of the French is variously stated, but it probably amounted to 2000 killed, wounded, and missing. Brueys, after being thrice wounded, was blown up in his ship *L'Orient*, part of whose mainmast was made into a coffin by order of Captain Hallowell, and by him presented to Nelson. Nelson received a severe wound in his forehead from a piece of langridge-shot. The *Culloden* grounded at the commencement of the action, and was unable to take part in it. On this occasion Nelson was created Baron Nelson of the Nile, and pensions of 3000*l.* per annum were settled on him and his two next heirs male. The thanks of the parliament and gold medals were voted to him and all the captains engaged.

From this time Nelson remained chiefly employed on the Neapolitan coasts, during which period he permitted that which must ever remain a blot on his character, and which tarnished the honour of the British flag—the judicial murder of Prince Carraccioli. Capua and Gaëta now surrendered to the naval force under Nelson's orders. In February 1800 Nelson sailed for Malta, and captured the French ship of the line *Généreux*, which escaped from Aboukir, and also a frigate. On Lord Keith's return from England, Nelson came home, leaving Captain Trowbridge in command of the squadron blockading Malta, which island capitulated in September 1800. Within three months after his return, he separated from Lady Nelson, in consequence of his infatuated attachment to Lady Hamilton. He sailed, March 12, 1801, as second in command to Sir Hyde Parker, to the Baltic, with a fleet of eighteen sail of the line, frigates, bombs, fire-ships, &c., amounting in all to fifty-three sail, having on board the 49th regiment, two companies of rifles, and a detachment of artillery. The fleet arrived in the Sound, and after some time lost in negotiation by Mr. Vanittart, anchored between the island of Huen and Copenhagen. Lord Nelson having offered his services in the attack on the Danish fleet, he was detached with twelve ships of the line and smaller craft, making thirty-six sail, 1st of April 1801, and anchored at dark off Dracø Point, two miles from the Danish line. The formidable force opposed to the British consisted of eighteen vessels, mounting 628 guns, chiefly 86 and 84 pounders, manned by 4849 men, moored in a line a mile in length, flanked by two batteries, called *Trekroner*, of thirty 24-pounders and thirty-eight 36-pounders, with furnaces, commanded by block-ships. The action commenced at nine A.M., and lasted five hours, when a truce was agreed upon by the crown-prince sending the Danish adjutant-general to the commander-in-chief to settle the terms, in reply to Lord Nelson's celebrated note: "Vice-Admiral Lord Nelson has been commanded to spare Denmark when she no longer resists. The line of defence which covered her shores has struck to the British flag; but if the firing is continued on the part of Denmark, he must set on fire all the prizes he has taken, without having the power of saving the men who have so nobly defended them. The brave Danes are the brothers, and should never be the enemies of the English." The

British killed and mortally wounded were 850; and the wounded 850. The Danish loss was estimated at between 1600 and 1800 men killed and wounded: of the eighteen floating batteries, thirteen were taken or destroyed.

Amicable relations having been restored between England and the northern powers, Lord Nelson returned in command of the squadron to England (Sir Hyde Parker having been recalled), when the thanks of parliament were voted to him for Copenhagen. To allay the public alarm excited by Bonaparte's proposed invasion, Nelson took the command of the shores, reconnoitred Boulogne in the *Medusa* frigate, attacked the flotilla in the mouth of the harbour, and withdrew with a loss of 172 men, having gained no advantage. From this time he lived in retirement in Surrey, till he was called on to assume the Mediterranean command. He hoisted his flag in the *Victory*, on war breaking out in 1803. His chief employment was watching the French in Toulon. On the 17th of January 1805, the French fleet put to sea under vice-admiral Villeneuve, but was driven back by heavy gales. Villeneuve sailed again on the 29th of March, received a reinforcement at Cadix, and made for Martinique with seventeen sail of the line, seven frigates, and four sloops. On the 12th of May Lord Nelson sailed for the West Indies in pursuit of Villeneuve with ten ships of the line and three frigates, and arrived at Barbadoes on the 4th of June, on which day Admiral Villeneuve sailed from Martinique, and having effected nothing except the re-capture of the Diamond rock, and made prizes of a convoy of fifteen sail of West Indianmen, returned to Europa, and arrived off Cape Finisterre July 9th. Lord Nelson quitted Antigua June 18th, and made Cape St. Vincent on the 17th of July, having been absent sixty-six days. Thus frustrated in his plans, he judged best to reinforce the Channel squadron, lest the enemy should bear down on Brest.

With this view he joined Admiral Cornwallis off Ushant, and leaving his fleet there, he went home, and struck his flag. He hoisted it again in the *Victory* on the 15th of September, 1805, and arrived off Cadix on the 28th (his birth-day), to take command of the Mediterranean fleet. The force under him consisted of twenty-seven sail of the line, and four frigates, which he withdrew from the vicinity of Cadix to a station sixteen or eighteen leagues to the westward, in the hope of inducing the enemy to put to sea. On October 21st, at day-break, the combined French and Spanish fleets, consisting of thirty-three sail of the line and seven frigates, were seen a-head twelve miles to leeward. At 11h. 40m., while bearing down in two lines on the enemy, whose position was in the form of a crescent, concave towards the British, Lord Nelson hoisted the celebrated telegraphic signal, 'England expects every man to do his duty.' At ten minutes past noon Collingwood, in the *Royal Sovereign*, commenced the action on the part of the British. At one P.M. the *Victory* passed under the stern of the *Bucentaur*. In the heat of the action, about 1h. 25m., while in the act of turning in his walk on the quarter deck, Lord Nelson received his death-wound by a musket-ball fired from the *Redoubtable*, which entered his left shoulder, and lodged in the spine. He expired in three hours and a half, but not before he knew that the victory was complete. The total British loss was 450 killed, 1250 wounded. Seventeen French and Spanish ships were captured, and one burnt. Admiral Dumanoir escaped to the southward with four sail, which were shortly after taken by Sir R. Strachan. Admiral Gravina, with the remaining eleven ships, got into Cadix.

"The death of Nelson," says Southey, "was felt in England as a public calamity; yet he cannot be said to have fallen prematurely whose work was done, nor ought he to be lamented who died so full of honours and at the height of human fame." On the 9th of January 1806, the body of Nelson was buried at St. Paul's. His brother, the Rev. William Nelson, was created an earl, with a grant of 6000*l.* per annum; 10,000*l.* were voted to each of his sisters, and 100,000*l.* for the purchase of an estate. The unhappy Lady Hamilton, and his 'adopted child' Horatia, whom he had "left as a legacy to his country," both with his dying words, and in a codicil to his will—which codicil was most improperly concealed by his brother William till the parliamentary grant to himself was completed (see Pettigrew's *Memoirs of Nelson*, ii. 624-5)—remained without the smallest provision. Lady Hamilton died a few years later in extreme poverty at Calais. Horatia Nelson married a clergyman, and within the last few years a sense of the wrong done in levying almost the whole of the large parliamentary grant upon Nelson's very undeserving brother has caused an attempt to be made in some measure to atone for the original neglect by rendering easier the outset in life of Horatia Nelson's children.

Nelson's Despatches and Letters, edited by Sir Harris Nicolas, were published in 1844 in 7 vols. 8vo.

NELSON, ROBERT, author of various works in practical divinity, which have long been held in very high estimation by serious and pious persons, was born June 22, 1656. He was the grandson of Lewis Roberts, a merchant of London, who is believed to be the person of that name who wrote 'The Merchant's Map of Commerce,' printed in 1638, and whose descendants, the Roberts, Nelson, and Hangers, were very extensively engaged in the trade to the Levant. How far he was himself connected with commerce does not appear; but he was of Trinity College, Cambridge, and while a young man elected a Fellow of the Royal Society. He was intimate with Halley,

with whom he travelled in France and Italy. While at Rome he met with, and married in 1682, Lady Theophila Lucy, widow of a baronet and daughter of the earl of Berkeley. This lady some time after their marriage became a Roman Catholic, to his great grief; his mind having been much occupied with the consideration of both the practical and controversial points in divinity, and his chief friends being eminent divines in the English Church, particularly Bull, Hicke, Lloyd, and Tillotson—the last especially was his intimate friend. Nelson not only employed his own powers of persuasion, both verbal and literary, but called in the aid of his friend Dr. Tillotson; both were however unsuccessful, the lady continuing in the Romish communion till her death. His first work 'Transubstantiation contrary to Scripture: or the Protestant's Answer to the Seeker's Request,' 1688, appears to be the substance of his considerations on this subject.

At the Revolution he scrupled to take the oath to king William, and remained a non-juror till the year 1709, when on the death of Dr. Lloyd, the last survivor of the deprived non-juring bishops, except Dr. Keen, he, by Dr. Keen's advice, returned to the Church of England as then established. He died January 18, 1715, at Kensington, and was buried in the cemetery of St. George the Martyr, by the Foundling Hospital.

The following are his principal works:—'Practice of True Devotion, in relation to the End as well as to the Means of Religion'; 'Companion for the Festivals and Fasts of the Church of England'; 'Great Duty of frequenting the Christian Sacrifice'; 'An Account of the Life and Writings of William Kettlewell'; 'Letters to Dr. Clarke on the Trinity'; 'Whole Duty of a Christian,' &c. He also published the English works of Bishop Bull, who had been his tutor, with an account of his life and writings. He is also remarkable for having been a bountiful contributor, both during his life and at his death, to institutions for the education of the poor and the diffusion of Christian knowledge.

NEMESI'ANUS, MARCUS AURELIUS OLYMPIUS, a Latin poet, said to have been a native of Carthage, lived towards the close of the 3rd century, under the reigns of Carus and his sons Carinus and Numerianus. Nothing more is known of the particulars of his life. He wrote a poem on hunting, 'De Venatione,' which he dedicated to Carinus and Numerianus, and which has come down to us unfinished. He also wrote four eclogues, which have considerable poetical merit, and have been repeatedly published, together with the eclogues of his contemporary Calpurnius. Mairault has made a French translation of Nemesianus's eclogues, with copious notes, 8vo, 1744. The writings of Nemesianus have been inserted in the collection 'Poetae Rei Venationis,' with notes, by G. Kempher, Leyden, 1741; the best edition of them is that of Stern, Hal. Sax., 8vo, 1832.

NEMESI'US, Bishop of Emesa in Syria, and one of the ablest of the ancient Christian philosophers. Of his life very few particulars are known; and even the time when he lived is uncertain, though this is generally supposed to have been during the reign of Theodosius the Great, towards the end of the 4th century. He has been accused of holding some of Origen's erroneous opinions, but has been defended by Bishop Fell ('Annot.,' p. 20, ed. Oxon. 1671), who however confesses, with regard to the pre-existence of souls, that he "differed from the commonly received opinion of the Church." But it is as a philosopher and physiologist that Nemesius is best known, and his work 'De Natura Hominis' is one of the most accurate treatises of antiquity. Some persons (among whom we may mention Bishop Fell, in edit. Oxon.; Fabricius, 'Biblioth. Gr.:' and Brucker, 'Hist. Philos.')

have even supposed that he was acquainted with the circulation of the blood; but in the opinion of Freind ('Hist. of Physic'), Haller ('Biblioth. Anat.),' and Sprengel ('Hist. de la Médecine'), he has no right whatever to be considered as the author of this discovery. Still the passage which has given rise to the discussion is certainly remarkable: "The motion of the pulse," says he, "takes its rise from the heart, and chiefly from the left ventricle of it; the artery is with great vehemence dilated and contracted, by a sort of constant harmony and order. While it is dilated, it draws with force the thinner part of the blood from the next veins, the exhalation or vapour of which blood is made the aliment for the vital spirit. But while it is contracted it exhales whatever fumes it has through the whole body and by secret passages, as the heart throws out whatever is fuliginous through the mouth and nose by expiration" (cap. 24, p. 242, ed. Matth.). There is another passage equally curious respecting the bile, which is constituted, he says, "not only for itself, but also for other purposes; for it helps digestion, and contributes to the expulsion of the excrements, and therefore it is in a manner one of the nourishing powers; besides, as a vital faculty, it imparts a sort of heat to the body. For these reasons therefore it seems to be made for itself; but because it purges the blood it seems to be made partly for the sake of the blood" (cap. 28, p. 260, ed. Matth.). From this passage Nemesius has been supposed to have known all that Sylvius afterwards discovered with respect to the functions of the bile; but his claim in this case is no better than in the former, and indeed Haller and Sprengel both say that his physiology is not at all more perfect than that of Galen. But even if we cannot allow Nemesius all the credit that has been claimed for him, still from his general knowledge of anatomy and physiology (which is quite equal to that of the professional men of his time), his acuteness in exposing the errors of the

Stoics and the Manichees, the purity and elegance of his style compared with that of his contemporaries, and the genuine piety which shows itself throughout his work, he has always ranked very high in the list of ancient Christian philosophers. The following opinions in his book are recorded by Sprengel ('Hist. de la Méd.') as worthy of notice:—1. He calls the substance of the lungs "frothy flesh" (cap. 28, p. 256). 2. He distinguishes the nerves from tendons, and says that the former possess the power of sensation, which the latter do not (cap. 27, p. 251). 3. He says that the semen is prepared in the brain, that it descends by certain vessels (which he calls "two veins and two arteries") situated behind the ears, which he says is the reason why "when those two veins that are near the ears and those near the carotid arteries (or, as some read, 'the parotid glands') are wounded, the animal becomes barren;" that it is distributed throughout the whole body, and is deposited at last in the testicles (c. 25, p. 244). 4. He explains the senses, like Aristotle, by an intelligent spirit, which is propagated from the organ of sensation to those of the senses (c. 6, p. 176). 5. He places the sensations in the anterior ventricles of the brain, the intellect in the middle, and the memory in the posterior (c. 18, p. 204). 6. He says that the elements composing the human body are in a manner mutually opposed to each other, and that the assistance of certain intermediate substances is necessary in order to effect their union (c. 5, pp. 151-156). 7. That food and medicines only differ inasmuch as the former is similar to the elementary particles of our body, while the latter are opposed to them (c. 1, p. 49). The treatise *περί φύσεως ἀνθρώπου*, 'De Naturâ Hominis,' was first edited by Valla in Latin, Lugd., 1538, ap. Seb. Gryphum; the first Greek edition was by Ellebodius, 8vo, Antwerp, 1565, ap. Christ. Plantin; the next was by Dr. (afterwards Bishop) Fell, 8vo, Oxon., 1671; the most complete is by Matthæi, Halsæ Magd., 8vo, 1802. There is an English translation by George Wither, 12mo, Lond., 1636; a German one by Osterhammer, 8vo, Salzburg, 1819; and a French one by J. B. Thibault, 8vo, Paris, 1844.

**NEMOURS, DUKES OF**, a title derived from a town of France in the department of Seine et Marne. It was borne first by a branch of the Armagnac family, the last of whom, Louis d'Armagnac, duke of Nemours, held a command in the army of Louis XII. in Italy, against the Spaniards under Gonsalo of Cordova, and was killed at the battle of Cerignola in Apulia, in April 1503. With him ended the line of Armagnacs, which was descended from Caribert son of Clotharius II., who died in 630. The duchy of Nemours was then bestowed by Louis XII. upon Gaston de Foix, son of Mary, the sister of the king. Gaston fell, at twenty-three years of age, in the battle of Ravenna, against the Spaniards and Italians, in 1512. The duchy of Nemours was afterwards given by Francis I. to his uncle Philip of Savoy, duke of Nemours, died, the last male descendant of Philip. His widow, Mary of Orléans, daughter of the duke of Longueville, survived him many years. She inherited in 1694, from her brother the Abbé de Longueville, the county of Neuchâtel, in Switzerland, and died in 1707: with her ended the line of Orléans Longueville. The title of Duc de Nemours is now borne by the second and eldest surviving son of the late king of the French, Louis Philippe.

**NENNIIUS**, according to several passages of the work 'Historia Britonum,' was, if these passages are genuine, a monk of Bangor, in Wales, who lived in the first part of the 9th century. Vossius ('De Historicis Latinis') says that he lived in the early part of the 7th century, but he assigns no authority for this assertion. In the history Nennius states himself to have been a Briton, and not a Saxon, and a disciple of the holy bishop Elbodius, or Elvodug. He wrote a history of Britain, 'Historia Britonum,' or, as it is sometimes styled, 'Eulogium Britannicæ,' which, he says at the beginning, he compiled from all he could find; "from the Roman annals and the chronicles of the Fathers, as well as from the writings of the Scots and the Angli, and from the traditions of our ancestors." The history begins with a fabulous genealogy of Brutus, grandson of Æneas, who reigned in Britain. The author afterwards relates the arrival of the Picts in North Britain, and of the Scots in Ireland; and after a brief and confused narrative of the Roman conquest and empire in Britain, he comes to the Saxon invasion and gradual subjugation of the country. The manuscript of Nennius was mutilated and interpolated by a transcriber, who signs himself "Samuel," and "a disciple of Beularius Presbyter," and who acknowledges that he left out what he thought useless in Nennius's work, and added what he gathered from other writers concerning the towns and wonders of Britain: see end of chap. lxiv. of Nennii Banchoriensis 'Eulogium Britannicæ,' edited by C. Bertram, and published together with 'Gildas' and 'Richard the Monk of Westminster,' 8vo, Copenhagen, 1757.

Such is the common account of Nennius, but it is, to say the least, doubtful whether such a person ever existed, and whether the work ascribed to him was not the fabrication of a much later age. Though the work existed earlier, the name of Nennius is not mentioned in connection with it earlier than the 18th century. The work is in any case of little value, but even that little is of course greatly reduced if it be the production of an age much later than it professes to be. The question will be found fully discussed in Mr. Wright's 'Biographia Britannica Literaria: Anglo-Saxon period; and the Introduction to Mr. Stevenson's valuable variorum edition of the 'Historia Britonum.'

A translation of Nennius, by the Rev. W. Gunn, was published in London, 8vo, 1819, and reprinted in the 'Six Old English Chronicles,' published as a volume of Bohn's 'Antiquarian Library,' 1848.

**NEPOS, CORNELIUS**, a native of Hostilia (now Ostiglia) on the Po, was a Roman writer and a friend of Cicero, who speaks of Nepos in several of his Letters. ('Epist. ad Attic.,' xvi. 5 and 14.) Macrobius ('Saturn.,' xi. 1) quotes the second book of Cicero's Epistles to Cornelius Nepos, which have not come down to us. Lactantius mentions Nepos's Letters to Cicero, and Aulus Gellius (xv. 28) speaks of Nepos's 'Life of Cicero.' Catullus dedicated his poems to him. Nepos however was most intimate with Pomponius Atticus, whom he survived a few years, and whose life he wrote. He also wrote a short notice of Cato the Censor, in which he says that, at the particular request of T. Pomponius Atticus, he had written a more extended biography of Cato, which however has been lost. According to the old scholiasts, the lives of Atticus and Cato formed part of a larger work of Nepos, 'De Historicis Latinis.' In a passage in the Life of Dion, in the 'Vitæ Imperatorum,' attributed to Nepos, the author mentions a work which he had written 'On the Greek Historians,' and the grammarian Charisius ('Instit. Grammat.,' lib. 1) quotes a sentence of the sixteenth book 'Illustrium Virorum' of Cornelius Nepos.

The work styled 'Vitæ Imperatorum,' which is put into most school-boys' hands, not being mentioned by any ancient writer, was for a long time attributed to Æmilius Probus, who lived in the 4th century, and who in the manuscripts appears as having presented a copy of the book to the emperor Theodosius I., and prefixed to it some verses in which he seems to claim the authorship. Accordingly the earlier editions of the 'Vitæ Imperatorum,' the first by Janson, 1471, that of 1506, and others, were entitled 'Probi Æmili Excellentium Imperatorum Vitæ.' But afterwards the critics began to question the claims of Probus to the authorship of the work. The style and especially the sentiments of the lives certainly appear not suited to a writer of the age of Theodosius, such as the manifest disapprobation of a monarchical government, which is exhibited in many passages, among others in the lives of Timoleon (i. 3) and Dion (ix. 5). It is remarkable that the author in his preface addresses the work to Atticus; and yet at the end of the last life, that of Hannibal, when speaking of the uncertainty about the date of that great commander's death, he says that "Atticus, in his 'Annals,' had left it written ('scriptum reliquit') that Hannibal died under the consulship of M. C. Marcellus and Q. F. Labeo;" speaking thus of Atticus as of a person dead. After the first editions of the 'Vitæ Imperatorum' were published, Petrus Cornerus found in an old manuscript containing the letters of Cicero to Atticus, the life of Atticus, and the short notice of Cato the Censor above mentioned. These two biographies were published together with the 'Vitæ Imperatorum,' and the whole under the name of Æmilius Probus, contrary to all evidence, as the author of those two biographies speaks of Atticus as a personal acquaintance. At last Lambini, in the commentary to his edition of the 'Imperatorum Vitæ,' 1568, asserted the claims of Nepos as author of the whole. But several solecisms and barbarisms which occur in the 'Vitæ' appearing to invalidate Lambini's supposition, as not being likely to occur in a writer of the Augustan age, Barth and some other critics have supposed that Probus abridged the original work of Nepos in the same manner as Justin has epitomised the history of Trogius Pompeius. Vossius however ('De Historicis Latinis,' i. 14), Funccius ('De Virili ætate linguæ Latinæ,' part 11, ch. 14, sec. 38), and others, maintain that there is nothing in the 'Vitæ Imperatorum' which could not have been written by the Cornelius Nepos of the Augustan age, and that neither Probus nor any writer of the Theodosian age could have written in so pure a Roman style. The Introduction, &c. of Tschucke, Roth, and Benscke, to their edition of Nepos, noticed below; Schoell, 'Abrégé de l'Histoire de la Littérature Romaine;' and Dunlop, 'History of Roman Literature,' may be consulted as to this controversy.

The 'Vitæ Imperatorum' are short biographies of twenty Greek commanders, and of two Carthaginian, Hamilcar Barca and Hannibal. From a passage at the end of the last it appears that the author intended to write also the lives of the great Roman commanders, "that their exploits might be compared with those of the Greek, in order to judge which were the greatest." These lives of the Roman commanders, if ever written, have not come down to us, but it seems that some of them at least were written, and, it would appear, by Nepos, as Plutarch quotes the authority of Nepos for facts concerning the lives of Marcellus and Lucullus. The 'Vitæ Imperatorum,' besides the faults in language which are pointed out by Tschucke in his proemium and in the commentary which follows the text, contain many erroneous statements of facts, such as mistaking Miltiades, the son of Cypselus, for the great Miltiades, the son of Climon, confounding the battle of Mycale with that of the Eurymedon, and others which are noticed by Tschucke and Schoell. The author however gives many details of private life and manners, which are curious, as in the life of Epaminondas. The sentiments expressed by the author of the 'Vitæ' are generous and virtuous, though often puerile and trifling. The sketch of the character of Alcibiades has been admired for its graphic touches; but the life of Pomponius Atticus is much better both for the matter and manner than any of the rest, and although too panegyric, gives a lively description of his character. It has

been translated into English by Sir Matthew Hale, 1677, and by the Rev. E. Berwick, 1818.

The editions of the 'Vite Imperatorum' are numerous: those of Longolius, 1548; Lambinus, 1569; Boius, 1657; Van Staveren, 1734, 1773; Tschucke, 1804; Harles, 1806; Fischer, 1806; Breme, 1827; Roth, Basel, 1841, and Benecke, Berol. 1843, are reckoned the best.

NEPOS, FLAVIUS JULIUS, was the nephew of the patrician Marcellinus, who, in the confusion into which the affairs of the Western Empire had fallen after the death of Majorianus, A.D. 460, made himself independent sovereign of Dalmatia, was acknowledged as such by Leo I. emperor of the East, and was afterwards killed in Sicily in an expedition against the Vandals. Leo, having given his niece in marriage to Nepos, named him Emperor of the West, A.D. 473, after the death of Olybrius. But a certain Glycerius, supported by the Burgundian and other barbarian auxiliaries who were then the real masters of Italy, had already been proclaimed emperor at Ravenna. Nepos sailed from Constantinople with some troops in 474, and landing at Ostia, surprised Glycerius in Rome, made him prisoner, and, having stripped him of the imperial garments, caused him to be ordained bishop of Salona in Dalmatia, which was considered as a kind of exile. Nepos made peace with Euric, king of the Visigoths, by ceding to him the provinces of Gaul which lay west of the Rhone. But soon after, A.D. 475, Orestes, a native of Pannonia, who had long served in the Roman armies, revolted against Nepos, and marched upon Ravenna, when the emperor, unable to oppose him, fled across the sea to Dalmatia, over which province he seems to have retained his authority, with the title of Augustus; whilst Orestes had his own infant son Romulus proclaimed emperor of the West. Nepos applied in vain to Zeno, emperor of the East, to assist him in recovering Italy. In the year 480 he was murdered at Salona by two officers of his court, upon which Odoacer, who then ruled over Italy, passed over into Dalmatia and conquered that province. Nepos is said to have been a good and amiable but weak man, and unfit for the times. Sidonius Apollinaris praises him for the excellent choice which he made of those whom he employed under him.

NERATIUS PRISCUS, a Roman jurist who lived under Trajanus and Hadrianus. Spartianus ('Hadrianus' 4) states that there was a general opinion that Trajanus once intended to make Neratius Priscus his successor in the empire, instead of Hadrianus. However, Priscus was employed by Hadrianus as he had been by Trajanus. A case is mentioned (Dig. 37, tit. 12, a. 5) in which Trajanus acted on the advice of Neratius Priscus and T. Aristo. Pomponius (Dig. 1, tit. 2, s. 2, § 47) states that Neratius was elevated to the consulship, but the year of his consulship is not certain.

Neratius succeeded Celsus the father, and was therefore of the school of Proculus. His writings which are mentioned in the Florentine Index, are fifteen books of *Regulæ*, seven of *Membranae*, and three books of *Responsa*. There are sixty-four excerpts from Neratius in the Digest. Neratius is often cited by the subsequent jurists. He is also mentioned by Gellius (iv. 4) as the author of a treatise *De Nuptiis*, but in place of Neratius some manuscripts have Veratius in this passage of Gellius.

NERI, FILIPPO DE', was born in 1515 of a noble Florentine family. After studying in his native country he proceeded to Rome, where he fixed his residence. Naturally of warm feelings and benevolent disposition, he turned his whole attention to the relief of the poor, the instruction of children, and the reclaiming of vicious persons. In the pursuit of these objects he displayed a sincerity and a single-heartedness which exposed him to the sneers and the slanders of the worldly, the prudish, and the sticklers for outward decorum. The particulars of his life, some of which are very curious, have been fully narrated by his biographers Bacci and Gallonio. He founded an asylum for poor and sick strangers, and other houseless or helpless persons, in which they were sheltered until they were able to return to their home. Having taken holy orders, he associated with himself several pious friends, among whom was Baronius, afterwards a cardinal. They performed spiritual exercises together, and instructed the poor, and especially youths, in the streets, at the doors of the churches, and in the market-places. He attended the sick and the dying, visited the prisoners, and pleaded in the courts of justice for the oppressed.

Neri was not gloomy or morose; his piety was not repulsive; he conversed freely with all kinds of people; and being a man of education and general information, he entered into the spirit of their respective pursuits, and joined in their harmless mirth, whilst he checked any excess or vicious tendency. He was the founder of the oratorios, or sacred musical entertainments, the object of which was to attract the youth, and wean them from the public theatres and their temptations. At first the oratorios were hymns which were sung after the sermon, accompanied by music. Afterwards dramas were introduced, founded upon scriptural subjects, and some of them were written by distinguished writers, such as Zeno and Metastasio, and the parts were sung like those of an opera, with this difference, that there was no acting or stage, the singers being stationed in a gallery of the chapel. The chapel being called in Italian 'Oratorio,' that is, a place of prayers, gave its name to the performance; and the congregation, or order, constituted by Neri took the name of 'Fathers of the Oratory.' But Neri, more prudent in this than other founders of monastic orders, did not bind the members of his congregation by perpetual vows: he

said that the spirit of charity should be the only common bond. The institution was approved of by Gregory XIII. in 1575, and it soon spread over Italy, France, and other countries. The congregation 'De l'Oratoire' has produced many distinguished men, Baronius and Masillon among others. Study, preaching, and the education of youth, are the chief occupations of its members. Their handsome church at Rome, Santa Maria in Vallicella, has a good library, and the oratorios continue to be performed in a chapel devoted to the purpose. Neri, after resigning the generalship of his congregation to his disciple Baronius, died in 1595. He was canonised by Gregory XV. Some of his letters, and his 'Ricordi,' or advice to youth, have been published, as well as two sonnets out of many which he composed. He was an amiable, virtuous, and religious man, and his example had a great influence on the clergy of Rome.

NERI, POMPEO, was born at Florence in 1707. After studying in the University of Pisa, he was made professor of law in that institution. He was afterwards appointed by Francis of Lorraine, the new Grand Duke of Tuscany, secretary to his council. In 1749 Maria Theresa called him to Milan, and made him president of the Giunta di Censimento, or commission for the valuation of all the landed property in Lombardy. This undertaking was effected, and the tax was laid equally upon all landed property: the new 'Cadaastro,' or register, was published in 1759. The communal administration was at the same time re-organised. This example was followed by several Italian and other governments. The empress also commissioned Neri to confer with the Sardinian minister for a concordat concerning the currency of both states. It was in consequence of this commission that Neri wrote and published his book on currency, 'Osservazioni sopra il Presso Legale delle Monete,' 1751. In 1758 Neri, being recalled to Florence, was named one of the counsellors of the regency during the minority of Leopold. He died at Florence in 1776. Besides the work above mentioned, he wrote other treatises on political economy, on taxation, on the municipal laws in Tuscany, and on the former contrasted with the actual condition of the nobility in that country. Neri ranks among the first Italian economists of the 18th century, with Carli, Verri, Genovesi, and others.

NERO, CLAUDIUS CÆSAR, the sixth of the Roman emperors, was born at Antium in Latium, in the latter end of A.D. 37, nine months after the death of Tiberius. (Suet., 'Nero,' c. 6.) He was the son of Domitius Ahenobarbus and Agrippina, the daughter of Germanicus, and was originally named Lucius Domitius. After the death of Domitius and of a second husband, Crispus Passienus, Agrippina married her uncle the Emperor Claudius, who gave his daughter Octavia in marriage to her son Lucius, and subsequently adopted him with the formal sanction of a *Lex Curia*. (Tacit., 'Ann.,' xii. 26.) The education of Nero was carefully attended to in his youth. He was placed under the care of the philosopher Seneca, and he appears to have applied himself with considerable perseverance to study. He is said to have made great progress in the Greek language, of which he exhibited a specimen in his sixteenth year by pleading in that tongue the rights or privileges of the Rhodians and of the inhabitants of Ilium: but he possessed little oratorical skill. (Suet., 'Nero,' c. 7; Tacit., 'Ann.,' xii. 58.)

On the death of Claudius, A.D. 54, Nero succeeded to the sovereign power. Agrippina, who had paved the way for the accession of her son by the murder of her husband, endeavoured to obtain the chief management of public affairs; and her vindictive and cruel temper would have hurried Nero, at the commencement of his reign, into acts of violence and bloodshed, if her influence had not been counteracted by Seneca and Burrus, to whom Nero had intrusted the government of the state. Through their counsels, and whilst he submitted to their control, the first five years of Nero's reign were distinguished by justice and clemency. He discouraged public informers, refused the statues of gold and silver which were offered him by the senate and people, and used every art to ingratiate himself with the people: but his mother was enraged to find that her power over him became weaker every day, and that he constantly disregarded her advice and refused her requests. His neglect of his wife Octavia, and his criminal love of Acte, a woman of low birth, still further widened the breach between him and his mother. She frequently abused him with the most contemptuous language; reminded him that he owed his elevation to her, and threatened that she would inform the soldiers of the manner in which Claudius had met his end, and would call upon them to support the claims of Britannicus, the son of the late emperor. The threats of his mother only served to hasten the death of Britannicus [BRITANNICUS], whose murder forms the commencement of that long catalogue of crimes which afterwards disgraced the reign of Nero.

But while the management of public affairs appears from the testimony of most historians to have been wisely conducted by Burrus and Seneca, Nero indulged in private in the most shameless dissipation and profligacy. He was accustomed, in company with other young men of his own age, to sally into the streets of Rome during the night in order to rob and maltreat the passengers, and even to break into private houses and take away the property of the owners. But these extravagancies were comparatively harmless: his love for Poppæa, whom he had seduced from Otho, led him into more serious crimes. Poppæa, who was ambitious of sharing the imperial throne, perceived that she could not hope to obtain her object while Agrippina was

alive, and accordingly induced Nero to consent to the murder of his mother. The entreaties of Poppæa appear to have been supported by the advice of Burrus and Seneca, and the philosopher did not hesitate to palliate or justify the murder of a mother by her son. (Tacit., 'Ann.,' xiv. 11; Quint., 'Inst. Orat.,' viii. c. 5.)

In the eighth year of his reign Nero lost his best counsellor Burrus, and Seneca had the wisdom to withdraw from the court, where his presence had become disliked, and where his enormous wealth was calculated to excite the envy even of the emperor. About the same time Nero divorced Octavia and married Poppæa, and soon after put Octavia to death on a false accusation of adultery and treason.

In the tenth year of his reign, A.D. 64, Rome was almost destroyed by fire. Of the fourteen districts into which the city was divided, four only remained entire. The fire originally began at that part of the Circus which was contiguous to the Palatine and Cælian hills, and raged with the greatest fury for six days and seven nights; and after it was thought to have been extinguished, it burst forth again and continued for two days longer. Nero appears to have acted on this occasion with the greatest liberality and kindness; the city was supplied with provisions at a very moderate price; and the imperial gardens were thrown open to the sufferers, and buildings were erected for their accommodation. But these acts of humanity and benevolence were insufficient to screen him from the popular suspicion. It was generally believed that he had set fire to the city himself, and some even reported that he had ascended the top of a high tower in order to witness the conflagration, where he amused himself with singing the destruction of Troy. From many circumstances it appears improbable that Nero was guilty of this crime. His guilt indeed is expressly asserted by Suetonius and Dion, but Tacitus admits that he was not able to determine the truth of the accusation. In order however to remove the suspicions of the people, Nero spread a report that the Christians were the authors of the fire, and numbers of them were seized and put to death. Their execution served as an amusement to the people. Some were covered with skins of wild beasts, and were torn to death by dogs, others were crucified, and several were smeared with pitch and other combustible materials, and burned in the imperial gardens in the night: "Whence," says the historian, "pity arose for the guilty, though they deserved the severest punishments, since they were put to death not for the public good, but to gratify the cruelty of one man." (Tacit., 'Ann.' xv. 44.)

In the following year, A.D. 65, a powerful conspiracy was formed for the purpose of placing Piso upon the throne, but it was discovered by Nero, and the principal conspirators were put to death. Among others who suffered on this occasion were Lucan and Seneca; but the guilt of the latter is doubtful. In the same year Poppæa died, in consequence of a kick which she received from her husband, while she was in an advanced state of pregnancy. On the death of Poppæa Nero wished to marry Antonia, daughter of the emperor Claudius, and his sister by adoption, but she refused, and was in consequence put to death. He however married Statia Messalina, having first caused her husband Vestinus to be killed.

During the latter part of his reign Nero was principally engaged in theatrical performances, and in contending for the prizes at the public games. He had previously appeared as an actor upon the Roman stage; and he now visited in succession the chief cities of Greece, and received no less than 1800 crowns for his victories in the public Grecian games. On his return to Italy he entered Naples and Rome as a conqueror, and was received with triumphal honours. But while he was engaged in these extravagancies, Vindex, who commanded the legions in Gaul, declared against his authority; and his example was speedily followed by Galba, who commanded in Spain, and who had just learnt that Nero had issued orders for his death. The Prætorian cohorts espoused the cause of Galba, and the senate pronounced sentence of death against Nero, who had fled from Rome as soon as he heard of the revolt of the Prætorian cohorts. Nero however anticipated the execution of the sentence by requesting one of his attendants to put him to death, after making an ineffectual attempt at suicide. He died, A.D. 68, in the thirty-second year of his age, and the fourteenth of his reign.

Nero was a licentious voluptuary, and he scrupled at committing no crimes in order to gratify his lust or strengthen his power; but that he was such a monster as Suetonius and Dion have described him, may admit of doubt. The possession of absolute power at so early an age tended to call forth all the worst passions of human nature, while the example and counsels of his mother Agrippina must have still further tended to deprave his mind. Though he put to death his adoptive brother, his wife, and his mother, his character appears to have been originally rather feeble than sanguinary; and he never equalled in his worst actions either the capricious cruelty of Caligula or the sullen ferocity of Domitian. Nero was a lover of the arts, and appears to have possessed more taste than many of the emperors, who only resembled him in their profuse expenditure. The Apello Belvedere is supposed by Thiersch ('Epochen der bildenden Kunst unter den Griechen,' p. 312), and some other writers, to have been made for this emperor.

During the reign of Nero the Roman empire enjoyed in general a profound state of peace. In the East the Parthians were defeated by Corbulo; and in the West the Britons, who had risen in arms under

Boadicea, were again reduced to subjection by Suetonius and Paulinus. [BOADICEA.]

Reverses of Coins of Nero.

NERVA, MARCUS COCCEIUS, the thirteenth Roman emperor, was born at Narnia, in Umbria, in A.D. 27, according to Eutropius (viii. 1), or in A.D. 32, according to Dion (lxviii. 4). His family originally came from Crete; but several of his ancestors rose to the highest dignities in the Roman state. His grandfather Cocceius Nerva, who was consul A.D. 22, and was a great favourite of the Emperor Tiberius, was one of the most celebrated jurists of his age. We learn from Tacitus that he put an end to his own life. ('Ann.,' vi. 28.)

Coin of Nerva.  
British Museum. Actual size. Copper.

Nerva is first mentioned in history as a favourite of Nero, who bestowed upon him triumphal honours, A.D. 66, when he was prætor elect. The poetry of Nerva, which is mentioned with praise by Pliny and Martial, appears to have recommended him to the favour of Nero. Nerva was employed in offices of trust and honour during the reigns of Vespasian and Titus, but he incurred the suspicion of Domitian, and was banished by him to Tarentum.

On the assassination of Domitian on the 18th of September, A.D. 96, Nerva succeeded to the sovereign power, chiefly through the influence of Petronius Secundus, commander of the Prætorian cohorts, and of Parthenius, the chamberlain of the palace. The mild and equitable administration of Nerva is acknowledged and praised by all ancient writers, and formed a striking contrast to the sanguinary rule of his predecessor. He discouraged all informers, recalled the exiles from banishment, relieved the people from some oppressive taxes, and granted toleration to the Christians. Many instances of his clemency and liberality are recorded by his contemporary the younger Pliny; he allowed no senator to be put to death during his reign, and practised the greatest economy in order to relieve the wants of the poorer citizens. But his impartial administration of justice met with little favour from the Prætorian cohorts, who had been allowed by Domitian to indulge in excesses of every kind. Enraged at the loss of their benefactor and favourite, they compelled Nerva to deliver into their hands Parthenius and their own commander Petronius, both of whom they put to death. The excesses of his own guards convinced Nerva that the government of the Roman empire required greater energy both of body and mind than he possessed; and he

accordingly adopted Trajan as his successor, and associated him with himself in the government. Nerva died in the beginning of A.D. 98, after a reign of sixteen months and nine days. (Dion. lxxviii. 4.)

(Dion; Aurelius Victor; Eutropius; the younger Pliny.)

NESSELRODE, KARL ROBERT, COUNT VON, whose name is largely identified with the diplomacy of Russia during the first half of the 19th century, is a nobleman of Hanoverian extraction, though a Russian subject, his ancestors having settled in Livonia a few generations since. He was born December 14, 1780, at Lisbon, where his father was ambassador from Russia. He was early devoted to the diplomatic service, and acted in subordinate capacities at Berlin, Stuttgart, and the Hague, where in 1805-6 he became charge d'affaires. In 1807 he was sent to Paris as ambassador, where he negotiated with the then Emperor Napoleon I. the securing of Malta as a Russian outpost in the Mediterranean. He also assisted the French emperor in forming the great northern confederacy. On the accession of Alexander he became his secretary, and in that capacity shifted his political opinions from side to side, in accordance with Russian policy, appearing at one time as the advocate of France and Napoleon, and at another being ready to sacrifice them in any way that could subserve the interests of Russia. In 1814 he was a party to the convention by which Marmont surrendered Paris to the Allies, and afterwards signed the peace of Paris. He was sent as Russian plenipotentiary to the congress of Vienna, and in that capacity took part in the dismemberment of Poland; and accompanied Alexander, as a member of the Holy Alliance, at the congresses of Aix-la-Chapelle, Troppau, Laybach, and Verona. Since that period, till a recent date, Count Nesselrode has served under three successive emperors of Russia as minister for foreign affairs. The part which he took in the political intrigues which preceded the late war against Russia is too recent to need repeating here. Count Nesselrode bears a European reputation as a sagacious but perhaps somewhat unscrupulous minister, when supporting what he considers the interests of his country. [See SUPP.]

NESTORIUS, a celebrated heresiarch of the 5th century, the founder of the NESTORIANS, an important and early sect of Christians. He was a Syrian by birth, and became patriarch of Constantinople in 428, under the reign of Theodosius II. He showed himself very zealous against the Arians and other sectarians; but after some time a priest of Antioch named Anastasius, who had followed Nestorius to Constantinople, began to preach that there were two persons in Jesus Christ, and that the Word, or divinity, had not become man, but had descended upon the man Jesus, born of the Virgin Mary, and that the two natures became morally united as it were, but not hypostatically joined into one person; and that when Jesus died it was the human person and not the divinity that suffered. This doctrine, being not only not discountenanced, but supported by Nestorius, was the origin of the Nestorian schism. Nestorius refused to allow to the Virgin Mary the title of Theotokos, or Mother of God, but allowed her that of Christotokos, or Mother of Christ. Nestorius met with numerous opponents, among others Eusebius of Dorylaeum; and the controversy occasioned great disturbances in Constantinople. Cyril, bishop of Alexandria in Egypt, with his characteristic violence, anathematised Nestorius, who in his turn anathematised Cyril, whom he accused of degrading the divine nature and making it subject to the infirmities of the human nature. [CYRIL OF ALEXANDRIA.] The Emperor Theodosius convoked in 431 a general council at Ephesus to decide upon the question. The council, which was attended by 210 bishops, condemned the doctrine of Nestorius, who refused to appear before the council, as many Eastern bishops, and John of Antioch among the rest, had not yet arrived. Upon this the council deposed Nestorius. Soon after John of Antioch and his friends came, and condemned Cyril as being guilty of the Apollinarian heresy. The emperor, being appealed to by both parties, after some hesitation sent for Nestorius and Cyril, but it appears that he was displeased with what he considered pride and obstinacy in Nestorius, and confined him to a monastery. But as his name was still a rallying word for faction, Theodosius banished him to the deserts of Thebais in Egypt, where he died some time after 439, as he was living when Socrates wrote his history. His partisans however spread over the East, and have continued to this day to form a separate church, which is rather numerous, especially in Mesopotamia, where their patriarch resides at Diarbekr.

The Nestorians at one time spread into Persia, and thence to the coast of Coromandel, where the Portuguese found a community of them at St. Thomé, but they persecuted them and obliged them to turn Roman Catholics.

Eutyches, in his zeal to oppose the Nestorians, fell into the opposite extreme of saying that there was only one nature in Christ, namely, the divine nature, by which the human nature had become absorbed. [EUTYCHES.]

(*Histoire du Nestorianisme*, by Father Doucin, a Jesuit, 1698; and a *Dissertation on the Syrian Nestorians*, in the fourth volume of the *Bibliotheca Orientalis* of J. S. Assemani.)

NETSCHER, CASPAR, was born in 1639 at Heidelberg, from which place his family removed to Arnheim. In this city he was adopted by Dr. Tullekens, a rich physician, who placed him first under Koster, a painter of poultry and dead game, and afterwards under Gherard Terburg, at Deventer. On the completion of his studies he set out on his travels, intending to pass some time in Italy, but he got

no farther than Bordeaux, where he married, and after the birth of his eldest son, in 1661, returned to Holland and settled at the Hague.

Caspar Netscher was one of the best painters of the Dutch school on a small scale. The necessity of providing for a numerous family obliged him to devote a considerable portion of his time to portrait-painting, in which he acquired great reputation. His most admired works are however his Conversation pieces. His colouring is true; he is a master of chiaroscuro; and his touch is delicate. Above all however he is remarkable for his skill in representing linen, white satin, silks, and velvet, the draperies of which are cast in large and elegant folds. All the accessories—the furniture, ornaments, Turkey carpets, &c., are painted with fidelity and minuteness, yet they do not divert attention from the figures, with which they form a harmonious whole. King Charles II. invited him to London, but he declined that honour, preferring the enjoyment of an established reputation in his own country. He died in 1684, aged forty-three years.

THEODOR NETSCHER, his eldest son, who was born in 1661, was his father's disciple. He went at an early age to Paris, where he remained twenty years, highly esteemed, and acquiring considerable wealth by possessing the art of taking an agreeable likeness. He was employed to paint a vast number of portraits of the principal persons about the court, especially the ladies. In 1715 he came to London as paymaster of the Dutch forces, and was introduced to the court by Sir Matthew Decker. He remained in England six years, and acquired large sums of money by his painting. After his return to the Hague he lost a considerable sum through some deficiency in his accounts, and retired in disgust to Hulst, where he died in 1732.

CONSTANTINE NETSCHER, the second son of Caspar, born in 1670, closely imitated the style of his father, but he did not neglect the study of nature. He attained to a considerable degree of excellence, and was solicited by the Duke of Portland, whose portrait he had taken, to go with him to England, but he was too infirm to undertake the voyage, being severely afflicted with the gravel, which at last carried him off, in 1722, at the age of fifty-two years.

NEUBECK, VALERIUS WILHELM, was born at Arnstadt in Thuringia, January 21, 1765. He studied at Göttingen and Jena, at which latter university he took his degree as doctor of medicine, and practised first at Liegnitz, and afterwards at Steinau. His only professional production was his thesis, 'De Natatione frigida, magno Sanitatis Praesidio;' it being as a poet that he acquired his literary reputation, chiefly however by his didactic poem entitled 'Die Gesundbrunnen' (or Mineral Springs), a production that has been extolled by Schlegel as the very best that had then appeared in the language, enriched with admirable descriptions and imagery, and one in which the German hexameter verse is treated with the greatest ability. It was first published at Breslau in 1795, and in 1798 a splendid folio edition of it appeared at Leipzig. Among his other productions is a translation of Dr. F. Sayer's 'Dramatic Sketches of the Ancient Northern Mythology,' and several contributions, both in prose and poetry, to various literary journals. He died September 20, 1850.

NEUHOFF, THEODOR VON, known at one time as King Theodore, a German adventurer, was born towards the end of the seventeenth century, of the noble family of the counts of La Mark in Westphalia. His father was an officer in the French service, and he himself obtained a lieutenant's commission in the regiment of Alsace. He afterwards went to Spain, and gained the favour of Cardinal Alberoni, who gave him the rank of colonel in the Spanish service. In Spain he married a lady of honour to the queen, whom he deserted, and carried off her jewels. He then travelled through Sweden, Holland, Italy, &c., under different names and titles, and at last was put in prison for debt at Leghorn. On coming out of prison, he met with several Corsican leaders, among the rest with the canon Ortoconi, who had known him at Genoa in 1732, and he proposed to undertake the cause of the Corsicans, who were then at war with the Genoese; he spoke of his high connections and his means of being useful in various ways. The Corsicans were in the predicament of drowning men catching at straws. Ortoconi believed or seemed to believe the adventurer, and promised to use his influence to have him named king of Corsica, on condition that he should first bring substantial assistance to his countrymen. Neuhoff upon this sailed for Tunis, where he succeeded in persuading the Bey to lend him arms and ammunition, promising him in return the exclusive trade of the island and a station there for his piratical vessels. The Bey entered into his views, and gave him ten pieces of cannon, four thousand muskets, with ammunition, shoes, corn, and about ten thousand gold sequins. He sailed from Tunis on board an English vessel with his cargo and a retinue of sixteen persons, including two French officers, and several Turks, and arrived on the 12th of March 1736, in the roads of Alesia, on the eastern coast of Corsica. In the following April the general assembly of Corsicans elected Theodor for their king, and he swore to the draught of a constitution for the new kingdom which was then proclaimed. (Botta, 'Storia d'Italia,' b. 42.) He exercised the regal power for some months, coined money, distributed patents of nobility, instituted an order of knighthood, and, to evince his firmness, put to death three persons, members of distinguished families. He undertook many enterprises against the towns still held by the Genoese, captured Porto Vecchio, but failed before Bastia. Before long however, through the failure of his

promises, his popularity diminished, and he determined to leave the island, to solicit as he said, the succour of which he had been disappointed. Having arranged for conducting the government during his absence, he quitted Corsica, and visited successively Italy, France, and Holland. Being arrested for debt at Amsterdam, he was released by a Jew and his associates, who furnished him with funds to fit out three merchant vessels and a frigate, with which he appeared off the island in 1738; but the Genoese had by this time called in the aid of the French, who had under M. de Boisseux made great progress in putting down the insurgents; and Theodor was afraid to land, though he set on shore some warlike stores. The next year the French, under the Marquis de Maillebois, a man of great promptitude and severity, forced the insurgents to lay down their arms. Theodor again appeared off the island in 1742; but the natives did not show any inclination to receive him. He afterwards went to London, where he was imprisoned for debt, but obtained his release through the kind interference of Horace Walpole, and made over his kingdom of Corsica as a security to his creditors. Theodor died in London, in December 1756, and was buried in St. Ann's churchyard, Westminster, where the epitaph on his tombstone records the singular events of his life.

NEUKIRCH, BENJAMIN, a German poet of the 17th century, was born at Reinke, a village in Silesia, March 27, 1665. His earlier productions partake of the bad taste which stamps that period of German literature; yet although he greatly improved after his literary acquaintance with Canitz at Berlin, and was considered a reformer in poetry during his own day, he possessed few of the requisites that recommend a writer to posterity. Hence, though deserving a notice in literary history, it is chiefly on account of having contributed to bring a new mode of writing into vogue. His poetical translation of Fénelon's 'Telemachus' may be classed with the Russian one of Trediakovsky, a work of most unenviable celebrity in the language to which it belongs. His best productions are his satires and poetical epistles. He died at Anspach, August 15, 1729, in his fifty-sixth year.

NEUKOMM, THE CHEVALIER SIGISMUND, a celebrated German composer, was born at Salzburg in 1778. Being related to the family of Haydn, he received his early musical education from Michael Haydn, the elder brother of the author of 'The Creation.' From him Neukomm acquired that predilection for sacred music which has distinguished him throughout his career. At the age of twenty he went to Vienna. Joseph Haydn received his young relative most kindly and made him his pupil: and the friendship, thus begun, lasted without interruption during the whole of the great master's life. Neukomm's close and unbroken intercourse with Haydn, and admiration of his genius, had a sensible effect on the formation of his own style, which is marked not only with Haydn's regularity, symmetry, and clearness, but with many of Haydn's characteristic traits of musical phraseology.

After having gained a high reputation in Germany, Russia, and France, Neukomm came to England for the first time in 1829; and his reception by the public was such as to induce him to pass much time in this country. His residence in England was an active period of his life. It was here that his greatest works, the Oratorios of 'Mount Sinai' and 'David' were produced. 'Mount Sinai,' originally composed to German words, was afterwards adapted by himself to an English version of the text, and performed for the first time at the Derby Musical Festival of 1831. 'David,' the poem of which was originally written in English, was composed expressly for the Birmingham Musical Festival, and performed in 1834. During the same period he gave the English public many vocal pieces, both sacred and secular, which obtained general popularity. Among these, his sacred cantatas, 'Miriam,' 'The Prophecy of Babylon,' and 'Absalom,' are remarkable for their grandeur, expression, and perfect adaptation of the music to the English poetry, for Neukomm is a perfect master of our language. 'The Sea' was for a long time the most popular song of the day; and though it has given place to newer favourites, it is still frequently heard, and always with pleasure. Neukomm's most recent work is 'Twenty Psalms selected from the authorized English version,' for the use of singing-schools, choral societies, churches, and chapels of every persuasion. It was written for the Association for the revival of sacred music in Scotland, and published by that body at Edinburgh in 1853. It possesses great value. The most beautiful of the Psalms are selected, and the music in a plain and simple style, has the grand and solemn beauty which characterises Neukomm's sacred works. A collection of Voluntaries for the Organ—an instrument on which Neukomm was one of the greatest performers in Europe—is among the most important works produced by him in England. There is scarcely a branch of his art which he has left untouched. His instrumental compositions, symphonies, quartets, sonatas, &c. are very numerous and of much merit; but it is on his great sacred works that his permanent fame will rest.

In the course of his long life Neukomm has received many of the honours due to the highest distinction in his art. He has been invested with several orders of knighthood, in France, Portugal, and Prussia. He is a member of the Royal Academy of Arts in Prussia, and most of the principal musical institutions and societies in Europe and the United States. He is a Doctor of Music in the University of Dublin, and he was one of the jury of our great London Exhibition in

1851. For several years he has been afflicted with an ophthalmic complaint, at one time almost amounting to deprivation of sight; but he has partially recovered from it, and he now resides at Bonn, enjoying, on the verge of fourscore, a green old age. [See SUPPLEMENT.]

NEWCASTLE, DUKE AND DUCHESS OF. [CAVENDISH, MARGARET.]

NEWCASTLE, HENRY PELHAM CLINTON, DUKE OF, eldest son of Henry, fourth duke, was born in 1811, and educated at Eton and Christ Church, Oxford. On reaching his majority he was as Earl of Lincoln returned to parliament for the Southern Division of Nottinghamshire in the first reformed parliament. He was a Lord of the Treasury from 1834 to April 1835, and Chief Commissioner of Woods and Forests from 1841 to 1846, when he became for a few months Chief Secretary for Ireland. In that year, being ejected by his old constituency for supporting Sir R. Peel's measure for the repeal of the Corn Laws, he was returned by the Falkirk burghs, which he represented until succeeding to his father's dukedom in 1851. In 1852 he took office under Lord Aberdeen as Secretary of State for the Colonies, in which capacity the duties of War Minister devolved upon him. Shortly after the outbreak of the war with Russia, the war business was separated from that of the colonies, and the Duke of Newcastle chose the former and more arduous post. The mismanagement of the army during the first winter in the Crimea and the deficiency in the stores and supplies sent out to them, caused the administrative capacity of the war minister to be seriously impeached. In a speech however, delivered at the opening of the following session, the Duke of Newcastle succeeded in removing much of the odium into which he had fallen, but in deference to the popular feeling he resigned or was superseded. Lord Panmure, his successor, has however more than once publicly stated that the arrangements carried out by himself with success were for the most part commenced by his predecessor. The Duke of Newcastle after his resignation visited the Crimea in order to make himself personally acquainted with the real state of affairs, and remained there some time pursuing his investigations. [See SUPPLEMENT.]

NEWCOME, WILLIAM, Archbishop of Armagh, one of the eminent divines of the 18th century belonging to what was called the Liberal school, was born in 1729. His father was a clergyman at Abingdon, Berkshire, and he was educated at the Grammar school in that town, from whence he passed to the University of Oxford, where he became in due time a Fellow and tutor of Hertford College, and had Charles James Fox for one of his pupils. In 1765 he became Doctor in Divinity, and in that year accompanied his patron, the Earl of Hertford, when he went as lord-lieutenant to Ireland. Newcome went as chaplain, and a bishopric of Dromore in that country soon falling vacant, he was placed in it. Entering the episcopal order thus early in life, it is not extraordinary that he had several translations, which were first to Ossory, then to Waterford, and finally, in 1795, to Armagh. He died in 1800. A writer of some account of his life assures us that he "diligently and faithfully discharged the duties of his episcopal office, and secured the respect of all parties and of all religious persuasions by the affability, prudence, candour, and moderation which were the invariable guides of his conduct." But his chief title to remembrance is, that he was during the whole of his life a most assiduous biblical student, and that he did not suffer those studies to end in themselves, but laid before the world results which ensued upon them. He did not do this till he had maturely considered them, for he was nearly fifty before he printed any considerable work. His first work was 'The Harmony of the Gospels'—a work the title of which affords but an inadequate idea of its nature and contents, as, besides the results of his inquiries on a very difficult and important point of sacred history, it contains a great mass of valuable criticism and useful information. Out of this work arose a controversy with Dr. Priestley, on the duration of the ministry of our Saviour; Bishop Newcome contending for three years, and Dr. Priestley limiting the time to one year. In 1782 he published his 'Observations on our Lord's Conduct as a Divine Instructor, and on the Excellence of his Moral Character'—a work of great beauty; and in 1785 a new version, with critical remarks, of the Twelve Minor Prophets. This was followed in 1788 by a similar work on the prophet Ezekiel. In 1792 he published his 'Review of the Chief Difficulties in the Gospel History relating to our Lord's Resurrection'; and in the same year 'An Historical View of the English Biblical Translations.' This was his latest publication, except an Episcopal Charge; but after his death there was given to the world a very important work, which he had himself caused to be printed four years before his decease, entitled 'An Attempt towards revising our English Translation of the Greek Scriptures,' in which he set the example of taking the benefit in an English version of those changes in the Greek text which the critical examination of existing manuscripts has shown to be expedient and necessary.

NEWMAN, REV. JOHN HENRY, D.D., was born February 21, 1801, in Old Broad-street, in the city of London. He was the eldest of six children; his father was a partner in a banking-house in Lombard-street; his mother belonged to a Huguenot family which left France for England on the revocation of the Edict of Nantes. Shortly after the peace of 1815 the banking-house wound up its accounts, and paid its creditors in full; but the effort involved his father personally in difficulties, which ended in his premature decay

and death. The subject of this memoir was sent in 1808 to Dr. Nicholas's school at Ealing, near London, where he remained above eight years, having among his contemporaries Richard Westmacott, the sculptor, the present Bishop of New Zealand, Sir Frederick Theobald, and Lord Dalsell. In December 1816 he matriculated at Trinity College, Oxford, gaining in 1818 one of the scholarships, then lately thrown open to university competition. He passed his examination for the B.A. degree in 1820; and, though he was a candidate for first-class honours in classics and mathematics, his name appears only in the third class in the former order of merit. In 1822 he was elected to a fellowship at Oriel College, then at the height of its literary fame, under the provostship of Dr. Copleston, afterwards bishop of Llandaff. This success brought him to the knowledge of Dr. Whately, archbishop of Dublin, who at that time was resident at Oxford. Dr. Whately employed him in turning into a synthetical form his manuscript 'Dialogues on Logic,' and his composition became the rough draught of the celebrated treatise which was published some years afterwards. Dr. Whately introduced him also to the late Mr. Smedley, at that time editor of the 'Encyclopædia Metropolitana;' which led to his writing for that work the articles 'Cicero' and 'Apollonius Tyannus' in 1824 and 1826. The former of these was written at a brief notice to supply the place of an article expected from the late Archdeacon Hare. In the course of 1824 Mr. Newman was ordained a deacon and priest, and in the next year he was appointed vice-principal of Alban Hall, by his friend Dr. Whately, who had succeeded to the headship on Professor Elmsley's death. This office he held with his fellowship, but resigned it in the following year, on becoming one of the tutors of his college. In 1827 and 1828 he held the office of Public Examiner. In 1828, on Dr. Hawkins being elected provost of Oriel, in the place of Dr. Copleston, promoted to the see of Llandaff, he succeeded him in the vicarage of St. Mary's, which he held till 1843. In 1829 his name occurs in the list of the majority who placed Sir Robert Inglis in the representation of the university instead of Mr. Peel, in the contest occasioned by the conversion of the latter statesman to the cause of Roman Catholic Emancipation. At this time he was a member of the Bible and Church Missionary Societies. From 1830 to 1832 he was one of the Select University Preachers. He resigned his tutorship at Oriel in 1831.

In July 1833 the 'Oxford movement' commenced with a sermon preached by Mr. Keble before the judges of assize, and afterwards published under the title of 'National Apostacy.' In the early part of that year the publication of the 'Oxford Tracts' had been commenced by Mr. Newman, in conjunction with Messrs. Pusey, Keble, Williams, Palmer, Perceval, and others, for the purpose of enforcing upon the English nation the exclusive claims of the Established Church to the spiritual charge of the people. The publication of these bold and startling tracts, whose tendencies gradually became more and more Roman Catholic in proportion as they "receded from the principles of the English Reformation," was continued at intervals, Mr. Newman being the largest contributor, down to the early part of 1841, when Mr. Newman published the 90th number of the series, for the purpose of proving that an English clergyman might honestly subscribe the Thirty-nine Articles in a sense compatible with the holding of Roman Catholic doctrines. The Heads of Colleges in the University of Oxford having censured this publication, the Bishop of Oxford thought it time to interfere, and at his request the publication of any further tracts was abandoned.

Mr. Newman, who was vicar of St. Mary's church in Oxford, and of the hamlet of Littlemore, near that city, now retired to the latter place with a few of his followers, in whose company he led a life of ascetic retirement and theological study. About this period he published his celebrated work on 'Religious Development,' to prove that in the nature of things there must be a progress or growth in revealed truth, and that consequently the religious teaching of the first three centuries, to which the High Church party were accustomed to appeal as their standard of orthodoxy, was not by itself of necessity an adequate rule of faith in the 19th century. In the autumn of 1845, Mr. Newman was admitted into the Roman Catholic Church, and in 1848 introduced into England from Rome under Papal sanction, a branch of the Congregation of the Oratory, founded by St. Philip Neri.

He resided at Birmingham as head of the oratory until 1852, when he was appointed rector of the new Roman Catholic University which was established at Dublin, in obedience to the decrees passed by the Roman Catholic prelates of that country at a synod held at Thurles in 1849. In 1851 Dr. Newman delivered and published some 'Lectures on Catholicism in England,' in which he commented severely on the private character of the Rev. G. Achilli, formerly a priest in the Roman Catholic Church. An action for libel was brought against Dr. Newman, who was fined 100*l.* In 1864 he published 'Apologia pro Vita Sua,' and in 1865, a 'History of My Religious Opinions.'

\* NEWMAN, FRANCIS W., a younger brother of John Henry Newman, was born in London in 1805. After being educated at home and at the academy at Ealing, where his brother had been educated, he was sent in 1822 to Worcester College, Oxford, where in 1826 he took first-class honours in classics and mathematics. In the same year he was chosen a Fellow of Balliol College; and he kept his fellowship till 1830, when he resigned, in consequence of conscientious scruples about signing the Thirty-nine Articles, prior to

BIOG. DIV. VOL. IV.

taking the degree of Master of Arts. On leaving the university he travelled to the East, and spent nearly three years (1830-1833) in residing in various parts of Turkey. An account of this portion of his life, and of his observations and reflections in the East, and on the state of the Turkish empire as he then found it, has been recently (1856) published by him, under the title of 'Personal Narrative, in Letters, principally from Turkey, in the years 1830-33.' Shortly after his return to England (1834), Mr. Newman became classical tutor in Bristol College; and in the following year he married a daughter of Sir John Kennaway, formerly British resident at Hyderabad. In 1840 he exchanged the tutorship at Bristol College for the classical professorship at Manchester New College; and in 1846 he was appointed to the chair of the Latin language and literature in University College, London. This chair he still holds, with a high reputation for classical scholarship and for acquirements in general philology, as well as for accomplishment in a wide range of studies beyond those immediately connected with his chair. Mr. Newman's name however has chiefly become known through his numerous publications, and, among these, chiefly through that considerable portion of them by which he has sought to impress his peculiar theological and political views on the opinions of his time. In this respect there is a remarkable contrast between the intellectual career of Mr. Newman and that of his elder brother—the latter having, after being one of the leaders of the Tractarian party in the English Church, transferred himself to the Church of Rome, and made the defence and extension of the system of that Church in Britain, and even the world, the one great aim of his activity; whereas the younger brother has worked in the contrary direction, as a leader in what, with reference to established churches and creeds, has been called the 'sceptical' movement, though, in another sense, he might himself disown that name. Among the chief publications in which he has progressively expounded and enforced his views of this speculative order (in themselves progressively developed), may be mentioned, 'Catholic Union: Essays towards a Church of the Future and the Organisation of Philanthropy,' 1844; a tract entitled 'A State Church not Defensible,' 1846; 'A History of the Hebrew Monarchy, from the Administration of Samuel to the Babylonian Captivity,' 1847 (2nd edit., 1853); 'The Soul, its Sorrows and Aspirations,' 1849; and 'Phases of Faith, or Passages from the History of my Creed,' 1850. More directly political in their tenor are, 'Four Lectures on the Contrasts of Ancient and Modern History,' 1847; 'An Appeal to the Middle Classes on the urgent necessity of numerous Radical Reforms, Financial and Organic,' 1848; 'On the Constitutional and Moral Right or Wrong of our National Debt,' 1849; a tract entitled 'The Crimes of the House of Hapsburg against its own Liege Subjects,' 1851; 'Lectures on Political Economy,' 1851; and an edition of the 'Select Speeches of Kossuth,' 1858. Besides these and numerous other shorter publications, of which it is impossible to take note individually—including contributions to the 'Westminster,' 'Eclectic,' and 'Prospective' Reviews, and also, we believe, to newspapers, all written in the same energetic vein of peculiar opinion—Mr. Newman is the author of 'A Collection of Poetry for the Practice of Elocution,' 1850; of a work entitled 'Regal Rome: an Introduction to Roman History,' 1852; of 'The Odes of Horace, translated into Unrhymed Metres,' 1853; and of 'The Iliad of Homer, faithfully translated into Unrhymed Metres,' 1856. He also assisted in editing in 1843 a translation of Huber's work on 'The English Universities;' and he is the author, we believe, of 'Lectures on Logic,' of 'A Grammar of the Berber Language,' and of a work entitled 'The Difficulties of Elementary Geometry, i.e., on Straightness, Levelness, Curvature, and Parallelism; treated in a method wholly peculiar.' This mere enumeration of Professor Newman's writings will indicate the width of his intellectual tastes and accomplishments: for an idea of his abilities, and of the peculiar combination of intellectual and moral endowments which has enabled him to exert so much influence on his contemporaries, the works themselves must be consulted.

NEWPORT, GEORGE, distinguished as a comparative anatomist and physiologist, was born in the county of Kent in 1803. His parents were in humble circumstances, and with but little education he commenced following his father's business. He was indebted to a mechanics institute at Canterbury for first exciting in him a taste for the study of natural history. He became so well known for these pursuits that, when a natural history museum was opened at Canterbury, he was at once appointed curator. Without any one to guide or direct him, he pursued the study of animals in his own way; and was particularly fond of dissecting any fresh specimen that came under his notice. His love of anatomy and natural history paved the way for his entering the medical profession, and after having served his apprenticeship, according to the requirements of the Apothecaries' Society, with Mr. Weeks of Sandwich in Kent, he finished his medical education at the London University, now University College. Here he attended the lectures of Professor Grant, and soon found that the work he had been pursuing in the country had qualified him for communicating the results of his labours to the world. His first paper was sent to the Royal Society, and was published in the 'Philosophical Transactions.' It was entitled, 'On the Nervous System of the Sphinx Ligustri, Linn.; and on the changes which it undergoes during a part of the metamorphosis of the Insect.' This was speedily followed by other papers, which were read before the Royal Society,

Z B

and published in the 'Philosophical Transactions.' The principal of these were entitled, 'On the Respiration of Insects;' 'On the Temperature of Insects, and its connection with the functions of Respiration and Circulation in this class of Invertebrated Animals;' 'On the Organs of Reproduction and Development of the Myriapoda;' 'On the Structure, Relations, and Development of the Nervous and Circulating Systems, and on the existence of a complete circulation of the blood in vessels, in Myriapoda and Macrourous Arachnida;' 'On the Reproduction of lost parts in Myriapoda and Insecta.' He also published a series of papers on kindred subjects in the 'Transactions' of the Linnæan Society.

The labours of Newport, as a comparative anatomist, were chiefly confined to the insect tribes. Of all classes of animals they present the greatest variety of forms, and the largest number of adaptations of structure, to the circumstances in which they are placed. They hence afford a wide field for research to the comparative anatomist. It is however few who are endowed with the patience and delicate manipulative skill which the dissection of their delicate organisms demand. From his youth Newport had taken a delight in investigating the structure of insects, and his paper on the nervous system of the *Sphinx* was received with astonishment, on account of the skill and labour it displayed. In this paper he not only gave a minute account of the anatomy of the nervous system of this insect, but pointed out the relation which existed between the parts of the nervous system in insects and other animals. In the same philosophical spirit he pursued his researches in other departments of insect life. His papers on the respiration and temperature of insects, showed the relation between these two functions long before the chemical changes by which they are accompanied were understood. In his papers also on the reproduction of limbs in articulate animals, the structure of the blood-globule in insects, and the development of the ovum in the same class of animals, will be found a series of researches bearing on all the modern progress of physiology. A resumé of his own researches upon insect anatomy and physiology, with those of other comparative anatomists, will be found in his article 'Insecta,' in the 'Cyclopædia of Anatomy and Physiology.'

Whilst it is as an anatomist and physiologist that Newport takes a first position, his minor works and papers claim for him the highest merit as an entomologist. He was most diligent in his observations on the habits of insects, as is proved by his prize essay on the 'Habits and Economy of *Athalia centifolia*, the Sawfly of the Turnip.' Besides this paper he published many others on the habits of insects. In one of these he announced the discovery of a new genus of Parasites, and worked out their history in the most accurate and beautiful manner. This paper was published in the 'Transactions' of the Linnæan Society, and was entitled, 'The Anatomy and development of certain Chalcididæ and Ichneumonidæ, compared with their special economy and instincts; with descriptions of a new genus and species of Bee-Parasites.' As a systematic entomologist, he devoted his attention to the description and classification of the family *Myriapoda*. The specimens of these animals in the British Museum were arranged, and the catalogue descriptive of them published by the authorities of that institution was drawn up, by him.

Newport early joined the Entomological Society, and contributed many papers to its 'Transactions.' In 1844 he was elected president of this society, and in 1846 he was re-elected.

During the last few years of his life he had devoted great attention to the development of the ova in various kinds of animals. He published two series of papers on the development of the embryo in the ova of the *Aspithia*, and at the time of his death was engaged in drawing up a third. It was in consequence of pursuing this subject that he met with his death. In the spring of 1854, being desirous of obtaining some frogs for the purpose of pursuing his researches, he exposed himself to the malaria of the ponds which these creatures inhabit, and on the 6th of April sunk under a fever thus contracted.

Although Mr. Newport became a member of the College of Surgeons in 1835, and was made an honorary fellow in 1843, he was too devoted to his scientific pursuits to follow his profession. But England has no positions to offer her men of science, and during the latter years of his life he maintained himself on a pension of 100*l.* a year granted him by the government. Even the luxury of belonging to a scientific society has to be paid for, and out of his small pension Newport maintained his connection with the Royal and Linnæan societies, of which he was so distinguished a fellow, and to whose 'Transactions' he contributed so largely. He was twice rewarded with the royal medal of the Royal Society, and was a member of the councils of both the Linnæan and Royal societies. His works were highly appreciated by continental philosophers, and he was an honorary member of several foreign societies. He was an amiable, retiring man, little known beyond the limited sphere of men who cultivate the sciences of comparative anatomy and physiology; but his name will become more widely known as these sciences are more studied, and the true value of his researches be more widely appreciated.

NEWTON, GILBERT STUART, R.A., was born in 1795 at Halifax, in Nova Scotia, where his father was collector of the customs. He came to England about 1817, and, after making a tour in Italy, entered as a student of the Royal Academy. He adopted Watteau in some degree as his model, and produced several excellent small pictures

much in the style of that master as regards the figures, yet at the same time displaying great expression and character. His first works which attracted notice were 'The Forsaken,' and 'The Lovers' Quarrel,' engraved in the 'Literary Souvenir' for 1826. He painted the Prince of Spain's Visit to Catalina, for the Duke of Bedford, for 500 guineas: it was engraved in the 'Literary Souvenir' for 1831. In 1830 he painted Shylock and Jessica, from the 'Merchant of Venice,' Forick and the Grisette, from the 'Sentimental Journey,' and the Abbot Boniface from the 'Monastery'; all in the exhibition of the Royal Academy in 1830. In 1831 he exhibited Portia and Bassanio, another scene from the 'Merchant of Venice;' and 'Lear attended by Cordelia and the Physician.' In 1832 he paid a visit to America, and married there; and in the year following, in which he was elected an Academician, he exhibited a small picture of Abelard sitting in his study—a work full of expression and sentiment. Besides these he painted the Vicar of Wakefield restoring his daughter to her mother, 'Macheath,' and a few portraits. His 'Macheath' was purchased by the Marquis of Lansdowne for 500 guineas.

His 'Abelard' was the last picture that he exhibited in the Royal Academy, in 1838, and it was about this time that he evinced signs of aberration of mind, and these were followed by unequivocal insanity, which however he recovered from four days before his decease, and he died with calmness and resignation on the 5th of August 1835, at Chelsea, aged forty.

NEWTON, ISAAC, was born on the 25th of December 1642 (old style), at Woolsthorpe, a hamlet in the parish of Colsterworth and county of Lincoln, eight miles south of Grantham. From the pedigree registered upon oath in the Herald's Office, by Newton himself, in the year 1705, it appears that he was descended from a family of that name which was resident at Westby in Lincolnshire until about the year 1870 ('Biog. Brit.'). when it became possessed of the manor of Woolsthorpe. His father, Isaac Newton, married the daughter of James Ayscough, of Market Overton in Rutlandshire, and the subject of this article was their only child. The mother was left a widow during her pregnancy, and appears to have given premature birth to her child, which was of extremely diminutive size. Mrs. Newton, whose income was little more than 80*l.* per annum, soon contracted a second marriage with the Rev. Barnabas Smith, rector of North Witham, whereupon young Isaac, then about three years old, was confided to the care of his maternal grandmother, by whom he was sent to two day-schools at Skillington and Stoke, until he attained the age of twelve years, when he was admitted into the free grammar-school of Grantham. While here he evinced considerable aptitude for mechanical contrivances, and among other things he constructed a windmill and water-clock; but in the prosecution of his regular scholastic studies he for some time took little interest, and accordingly stood very low in the school. At length however "the boy who was above him, having one day given him a severe kick upon the stomach, from which he suffered great pain, Isaac laboured incessantly till he got above him in the school, and from that time he continued to rise until he was the head boy." (Brewster's 'Life.') The decease of Mrs. Newton's second husband in 1656 induced her to return to the manor of Woolsthorpe, and in that year Isaac was taken from school to assist in the management of the farm. Accordingly on market-days he was sent to Grantham, accompanied by an aged domestic, either to dispose of farm produce, or to purchase such things as were needed by the family. But on these occasions it more frequently happened that Isaac stopped by the way-side, watching the motions of a water-wheel, or some other piece of machinery; or, if he reached the town of Grantham, it was only to resort to the apothecary's garret in which he had resided while he attended the grammar-school, and where a few old books afforded him ample entertainment until his trusty companion summoned him to return home. These and other instances having shown the inutility of thwarting his studious disposition, he was shortly after sent back to Grantham school. How long he remained at school this second time does not appear, but when he had attained his seventeenth year it was determined to send him to Trinity College, Cambridge, at the recommendation of his uncle, the Rev. W. Ayscough, who had been himself educated there. His matriculation took place on the 5th of June 1660, the year in which Dr. Barrow was appointed to the Greek professorship.

It is a matter of regret that no definite information exists as to the order in which Newton pursued his mathematical studies before entering the university. Biot gives an unauthenticated although very probable anecdote to the effect that, while Newton was yet a lad, "one of his uncles found him beneath a hedge, wholly absorbed in the solution of a mathematical problem;" but we find no mention of any mathematical work which had occupied his attention, with the exception of the 'Elements' of Euclid. It has been asserted that a glance at the fundamental propositions was immediately followed by a knowledge of the numerous consequences which may thence be deduced; but the fame of Newton is not enhanced by stating as true what is in the highest degree improbable. There is no doubt that he had read the 'Elements,' though not perhaps with that attention which he afterwards acknowledged their importance deserved. As to his knowledge of natural philosophy, his water-clock, windmill, and sun-dials may be considered as evidence of his early acquaintance with the principles of mechanics and with the doctrine of the sphere; for

it is difficult to suppose that a mind such as his, so ardent in the pursuit of truth, could have contented itself with following a few rules of authority without understanding the reasons upon which they were based. But if these considerations be not thought conclusive, we have only to look to the nature of his discoveries during the first six years of his residence at Cambridge, that is, before the completion of his twenty-fourth year, in order to be convinced that he must either have pushed his studies to a very considerable extent before entering the university, or that his subsequent progress was perfectly unparalleled; for in this period of six years he invented his Binomial Theorem, established the fundamental principles of his doctrine of Fluxions, and demonstrated the law of the force in virtue of which the planets gravitate towards the sun, although, in consequence of the erroneous measurement of the earth then in use, it was not till afterwards that he was able to show that the same law holds with respect to the moon, and that the force manifested at the earth's surface in the fall of a pebble is identical, as to its nature, with that which pervades the whole planetary system.

Descartes had already laid open a vast field of research by the successful application of algebra to geometry, and his writings, both mathematical and speculative, were then much read at Cambridge. After the perusal of Saunderson's 'Logic' and the 'Optics' of Kepler, the attention of Newton was directed to the 'Geometria' of Descartes, a work which doubtless exercised considerable influence over his subsequent pursuits, by furnishing him with general methods of direct investigation, such as, till the time of Descartes, were totally unknown. Upon the whole however he was much less indebted to the analytical writings of Descartes than he was to those of his countryman Wallis. He seldom read without making comments upon the text or marginal notes of such parts as appeared to him susceptible of extension or improvement. In this way he completed the perusal of Descartes's 'Geometry,' after which he passed on to the 'Arithmetica Infinitorum' of Wallis. In this work the author had suggested a method of obtaining the quadrature of the circle, the practicability of which depended upon an interpolation. Newton set about effecting this, notwithstanding the discouraging declaration of Wallis, that he believed it to be impracticable. The attempt however proved not merely successful, but in the course of his inquiry he was led (1663-64) to a discovery of greater moment, the history of which is given under BINOMIAL THEOREM, in ARTS AND SC. DIV. This theorem, combined with the previous labours of Wallis and others, supplied Newton with a method of determining the area and rectification of curves, the surface and content of the solids formed by their revolution, and the position of their centre of gravity; and by similar means he solved with comparative ease a number of problems which had hitherto baffled the attempts of mathematicians, or of which solutions had been obtained only under particular circumstances, whereby the real difficulty had been rather evaded than overcome. The almost indefinite application which he continued to make of this method, computing even the numerical values of the formulæ to which his investigations gave rise, as if he regarded the occupation rather as a source of amusement than of labour, may possibly have been suggested by the view, as novel as it was important, which he took of the mode whereby magnitudes of every kind may be conceived to be generated, and by the notion he early entertained of the possibility of deducing the definite value of a variable magnitude from the velocity of its increase or diminution.

The fluxionary calculus to which this opinion gave rise was invented by Newton in or before the year 1665. Its history is given in the article FLUXIONS, in ARTS AND SC. DIV. The following year he composed his 'Analysis per Equationes Numero Terminorum Infinitas,' a tract which afterwards caused much discussion as to the extent to which it contained the method of fluxions. For some reason, which it is now difficult to assign, he thought proper to conceal the substance of this tract from the public, and even from his friends. However on the appearance of Mercator's 'Logarithmotechnia' in 1668, in which work Newton, having recognised two of the many results to which his binomial theorem had previously conducted him, namely, the development of  $\log(1+x)$  and the determination of the quadrature of the hyperbola, he communicated the tract above mentioned to his friend Dr. Barrow. This was not till the month of June 1669. The 31st of July following, Barrow, with Newton's permission, transmitted the manuscript to Mr. Collins, at the same time acquainting him that it was the production of a young friend of his who possessed a fine genius for such inquiries. Collins took a copy of the manuscript, and returned the original to Dr. Barrow. The copy was afterwards found among Collins's papers, and attested the year in which the original treatise had been composed. It was first formally published in 1712, but long previous to that its contents must have been pretty widely diffused through Collins's correspondence with many of the principal mathematicians of the day, both in England and upon the Continent.

Newton was admitted sub-sizar in 1661, became scholar in 1664, and took his degree of B.A. in 1665. In 1664-65 he was a candidate with Mr. Robert Uvedale for the law-fellowship of Trinity College; when Barrow, having found the candidates on an equality as regarded attainments, conferred the appointment on Mr. Uvedale, he being the elder. In 1667 he became junior fellow, took the degree of M.A., and became senior fellow in 1668. He succeeded Dr. Barrow as Lucasian professor of mathematics in 1669.

The raging of the plague in 1665-66, induced Newton to quit Cambridge and retire to Woolsthorpe. Here it was that he began to reflect more particularly upon the nature of the force by which bodies at the earth's surface are drawn towards its centre, and to conjecture that the same force might possibly extend to the moon, and there be of sufficient intensity to counteract the centrifugal force of that satellite, and thereby retain it in its orbit about the earth. To compare this hypothesis with observation, it was necessary to determine the law according to which the intensity of such a force would vary with the distance from the earth's centre; for although no sensible variation can be detected within the narrow limits of direct observation, namely, the summit of the highest mountains or the bottom of the deepest mines, it was reasonable to presume that some variation would be appreciable at the distance of the moon, and in such case only could the force be just sufficient to counteract the centrifugal tendency of the revolving satellite. To a mind so habituated to generalise, it was a natural extension of his hypothesis to suppose that the same kind of force which incessantly deflects the moon from a rectilinear path, might likewise act upon the planets so as to retain them in their orbits about the sun. Now, the assumption of an attractive force emanating from the sun was at this time far from being a novelty, and it had even been asserted by Bouillaud that, if such a force really existed, its intensity would vary inversely as the square of the distance from the attracting body; but neither Bouillaud nor those who entertained similar opinions had given any proof, either empirically or otherwise, of what they had asserted; and certainly none appear to have attempted to establish that the forces which retain the planets in their orbs were identical, as to their nature, with that which draws a stone, when let fall, to the surface of the earth. Newton showed that the law of the inverse square of the distance is that which really exists in nature; and further, that this law was a necessary consequence of the analogy already discovered by Kepler between the periodic times and the mean distances of the planets. The following will convey a notion of the line of reasoning by which Newton arrived at this result. The intensity of the force, whatever may be its nature, which counteracts the centrifugal force of a planet, is proportional to the versed sine of the arc described in a given time; so that, if the time be small, the force will be proportional to the square of the arc divided by the planet's mean distance, or to the square of the linear velocity by the distance. If therefore for the velocity we substitute the ratio of the mean distance to the periodic time, which is proportional to it, we shall find that the force varies as the distance by the square of the periodic time, that is, by Kepler's law, as the distance by the cube of the distance, that is, inversely as the square of the distance. Having thus established the law whereby the planets gravitate towards the sun, he proceeded to examine whether the same law regulated the gravitation of the moon towards the earth. At this point it is that Newton's reasoning first rests upon conjecture, namely, that the force manifested at the earth's surface in the fall of a stone, is identical with that which is constantly deflecting the moon towards the centre of the earth; and that the law of its variation was the same as that which he had determined for the planets. If such were the case, the distance fallen through by the moon in one second of time ought to bear the same ratio to the distance fallen through by a body at the surface of the earth in one second, which the square of the earth's radius bears to the square of the moon's mean distance. The length of the earth's radius, which entered as a necessary element in the verification of his conjecture, was at that time very imperfectly known (a degree of latitude being estimated at only 60 miles, instead of 69½ miles, its more correct length); the consequence of which was, that the result of his calculation indicated a force at the distance of the moon greater, by nearly one-sixth, than that deduced from direct observation. This difference, which many would have considered sufficiently small to establish the correctness of the hypothesis, was regarded by Newton rather as a direct refutation of its truth. He therefore laid aside further consideration of the subject, suspecting, says Whiston ('Memoirs' of himself), that some unknown cause, perhaps similar to the vortices of Descartes, modified, in the case of the moon, the law which he had satisfactorily established with regard to the planets.

In 1666, the plague having subsided, he returned to Cambridge, but without mentioning to any of his friends the interesting inquiry which, during his absence, had occupied so much of his attention. In this way the discarded hypothesis lay dormant for sixteen years. In 1682, when attending a meeting of the Royal Society, he casually heard of the measurement of an arc of the meridian which had been executed by Picard three years before. Having taking a note of the result, and thence deduced the length of the earth's radius, he resumed his former calculation; but in the course of the work, observing that the conclusion he had formerly anticipated was about to be realised, his ardour is said to have brought on a state of excitement and nervous irritability which precluded his further progress, so that the completion of the calculation was confided to a friend. The following year he transmitted to London a few propositions on the motion of bodies acted on by centripetal forces, which were shortly after communicated to the Royal Society, and constitute the leading propositions of the 'Principia.' The manuscript of this work, entitled 'Philosophiæ Naturalis Principia Mathematica,' was presented to the Royal Society

by Dr. Vincent in 1686. Its perusal gave rise to many remarks from Dr. Hooke respecting the deduction of the law of the inverse square of the distance from the second law of Kepler, to which he laid claim. Hooke's pretensions upon this head were never made out; and from the known mediocrity of his mathematical attainments, as well as his general disposition to appropriate every new discovery to himself, they are looked upon as very doubtful. Newton however having apparently replied to his remarks with more warmth than discretion, he (Newton) afterwards expressed a willingness to compromise the dispute by the insertion of a scholium (lib. i. prop. iv. cor. 8), wherein the controverted deduction is attributed independently to Sir Christopher Wren, Hooke, and Halley. The printing of the 'Principia' was superintended by Dr. Halley, and the expense defrayed by the Royal Society. It appeared in 1687, London, 4to. For an account of this memorable work, the reader is referred to PRINCIPIA, in ARTS AND SC. DIV.

The theory of universal gravitation advanced by Newton, wherein each particle of matter is supposed to attract all other matter in the direct proportion of its mass, and inversely as the square of the distance, is, from its nature, insusceptible of direct demonstration, and could only be established by showing that the phenomena of nature were in no instance opposed to such a supposition, and that it was sufficient to the explanation of those phenomena. Newton did much towards this; but the completion of the proof required the labours of many succeeding mathematicians and astronomers, and this may, in some measure, account for the qualified reception which the theory met with at the hands of Huyghens, who, though he acknowledged the mutual gravitation of the masses of matter, refused his assent to the assumed attraction between their ultimate particles. The opposition to the theory made by Leibnitz, the erroneous and unphilosophical principles which he endeavoured to substitute in its stead, and the meanness with which he sought to injure the reputation of Newton by designating the theory subversive of true religion, are equally prejudicial to his scientific and moral fame. The long interval that elapsed before the writings of Newton began to be generally understood and his doctrines appreciated, is attributable exclusively, as regards England, to their inherent abstruseness. On the Continent they had further to contend with established prejudices in favour of the doctrines of Descartes.

The latter half of the 17th century is not less remarkable for its optical discoveries than for the zeal with which the physical sciences generally were prosecuted. The proportionality of the sines of the angles of incidence and refraction, which furnishes an easy explanation of all the circumstances attending the simple refraction of homogeneous light, had been discovered, and the discovery attributed to Descartes, though now known, on the authority of Vossius and Huyghens, to have been due to Snell, a Dutch physician, who died in 1626. From this law Descartes had been able to explain the theory of the refracting telescope, but had fallen into error by attributing the defects of such instruments solely to the spherical aberration of the lenses employed in their construction. Had such been the case, it is obvious that the whole of the aberration might have been removed by merely varying the form of the lenticular surface. Descartes accordingly, in his 'Dioptrice,' published in 1629, and James Gregory, in his 'Optica Promota,' published in 1663, had investigated the forms which they believed it would be necessary and sufficient to give to the lenses, in order that parallel rays transmitted through them should converge to a point or focus with mathematical accuracy. The aberration of sphericity was however but a trifling impediment to the perfection of dioptrical instruments, compared with what is now designated chromatic aberration, or the aberration of refrangibility, which arises from the then undiscovered fact that light is not a homogeneous substance, but composed of rays, some of which are more susceptible of refraction than others. In the year 1666 we learn ('Letter of Newton to Oldenburg,' 'Phil. Trans.')

that Newton, in common with many other philosophers at that time, occupied himself in the attempt to grind object-glasses in conformity with the precepts of Descartes and Gregory, and while thus occupied he seems to have conjectured that the defects of refracting telescopes might arise from some other cause than that which had hitherto been exclusively assigned. Either this conjecture or accident led him to consider the phenomena of the prismatic spectrum, which was then well known to philosophers, although it had been explained by none. In doing so he remarked that the angle subtended at the aperture of his shutter by the length of the spectrum was considerably greater than that subtended by the sun's diameter, though, according to the received law of refraction, these angles ought to have been sensibly equal. After modifying the experiment in various ways, and assuring himself that this discrepancy did not arise from any irregularity in his prism, the thought fortunately suggested itself of trying the separate effect of the prism upon each of the coloured lights of the spectrum. Accordingly, having transmitted them successively through a second prism at the same angle of incidence, he found—1, that the colour was in no degree affected by this second refraction; 2, that the spectrum formed by each colour occupied a distinct position on the screen, so that the deviation from the direction of the primitive ray was different in all, being greatest in the violet and least in the red. He therefore came to the important conclusion "that light was not homogeneous, but composed of rays, some of

which were more refrangible than others." This discovery must have been made subsequent to the publication of Wallis's optical lectures, which appeared in 1669, for otherwise it is improbable that Newton, to whom the revival of the manuscript was confided, and who receives the author's acknowledgments for having "corrected several oversights, and made some important corrections," would have permitted his friend to promulgate views so erroneous.

In the above year however Newton began to deliver a course of lectures on optics at Cambridge, and the composition of white light formed part of the course. Seeking the complete development of the consequences of his discovery, "he was conducted," says M. Biot, "to a multitude of observations no less admirable for their novelty and importance, than for the sagacity, address, and method with which he contrived, executed, and linked them one with the other. He thence composed his system of optics, wherein the fundamental properties of light were for the first time unveiled and established, and classed according to pure experience alone, without the slightest intermixture of hypothesis; a method of procedure which was then as surprising and as little heard of as the properties themselves: . . . both the physical and natural sciences were at this time so mixed up with mere opinions, that few persons were capable of discriminating between a vague conjecture and a precise idea, between a physical hypothesis and a law of nature rigorously demonstrated."

Although Newton had been thus successful in his optical inquiries, and had detected the principal source of indistinctness in refracting telescopes, he not only did not see how this indistinctness might be removed, but even designated any attempt as 'desperate' ('Optics,' lib. i. prop. 7); and the long interval which elapsed before the discovery of the achromatic telescope may be attributed to the unmerited reliance which in this instance was placed in his decision. He regarded as a self-evident truth, which it therefore needed neither reason nor observation to confirm, that the spectra formed by different refracting media were always of equal length whenever the refraction of the mean ray was the same; in other words, that the dispersive powers of different media were the same where their indices of refraction corresponding to the mean ray were equal; and although the fact was controverted by some of the more respectable continental philosophers who assailed his doctrines, the circumstance appears to have neither shaken his belief, nor to have suggested the propriety of convincing his opponents by an appeal to experiment. An apparent analogy also between the lengths of the colours of the spectrum and the divisions of the harmonic chord, led him to suppose that the refractive indices of any medium corresponding to the different coloured rays might be deduced from a knowledge of the index of refraction corresponding to the mean. Had he happened to have repeated his experiments with different refracting substances, he could scarcely have failed to recognise the difference of their dispersive powers even when the refraction of the mean ray is the same. Many of his experiments he did repeat with a prism of water, but in this instance he mixed with the water "a little sugar of lead" (Brewster), his object being merely to increase the refractive power of the water; but he thereby unknowingly also increased its dispersive power, and probably rendered it sensibly equal to the dispersion of the glass prism previously employed. By these mistakes he was induced to forego all attempts to perfect the refracting telescope, and directed his attention to the construction of reflecting telescopes on the principles pointed out by James Gregory, in his 'Optica Promota.'

In 1668-69 he had succeeded; and in 1671 he executed a second telescope "with his own hands," which is still carefully preserved in the library of the Royal Society. It was in order to explain the phenomena exhibited in investigating the colours of thin transparent substances, and the partial reflexion and transmission of light incident upon diaphanous surfaces, that Newton devised his theory of "fits of easy reflexion and transmission." [LIGHT, in ARTS AND SC. DIV.] Speaking of Newton's theory of colour, Sir John Herschel remarks, "It is a theory of extraordinary boldness and subtlety, in which great difficulties are evaded by elegant refinements, and the appeal to our ignorance on some points is so dexterously backed by the weight of our knowledge on others, as to silence if not refute objections which at first sight appear conclusive against it." ('Encyc. Metrop.' art. 'Light.')

In 1672 Newton was elected member of the Royal Society. In 1675 he received a dispensation from Charles II. to continue in his fellowship without taking orders. About the year 1687 he was appointed one of the delegates to defend the privileges of the University of Cambridge against the attacks of James II. In 1688 he took his seat in parliament as one of the representatives of the university, and was resident in London until the dissolution of parliament, which took place the following year. He was again returned in 1703, but lost his election in 1705. On no occasion does he appear to have taken any conspicuous part in the debates of the House. Prior to the year 1695, when he was appointed warden of the mint, with a salary of from 500*l.* to 800*l.* per annum, his pecuniary circumstances are said to have been rather straitened, and whatever may have been his own expectations, his friends seem to have reckoned upon some token of liberality from Charles II. and his successor. The profligate reign of the former, and the opposition which Newton had given to the wishes of James, sufficiently account for their expectations having

been disappointed. His sole income is stated to have been derived from his Lucasian professorship, and from the produce of the manor of Woolsthorpe, the amount of which, though aided by habits remarkably temperate and abstemious, ill accorded with the natural generosity of his disposition and the frequent occasions which he probably had of relieving the necessities of his poorer relations. His fellowship however must have been an additional source of income, though we find no mention of its amount, and the notion of his having been in narrow circumstances most probably arose from the fact that in the 'Journal of the Royal Society' there is entered an order in council, dated January 21, 1674-75, whereby he is excused from making the customary payment of one shilling a week "on account of his low circumstances, as he represented." (Birch, 'Hist. of Royal Society,' iii. p. 179.) Four years after receiving the appointment of warden of the mint, he was promoted to the mastership of that establishment, with a salary of from 1200*l.* to 1500*l.*, and at his death his personal estate was valued at 32,000*l.*

About the year 1676, Leibnitz having heard of many new results obtained by Newton by means of an infinite series (the Binomial Theorem), he expressed to Oldenburg his wish to be made acquainted with it. This led to a correspondence between Newton and Leibnitz, wherein the former also communicated many beautiful theorems on the quadrature, rectification, &c., of curves, to which he had been led by the aid of his method of fluxions, but at the same time withheld all information concerning the principles of that method except in the form of anagrams, which were very unlikely to be deciphered. The letters of Leibnitz in reply showed that he was already in possession of a method analogous to that of fluxions, and equally extensive in its applicability. An account of the dispute which afterwards arose between the English and foreign mathematicians, relative to the claims of Leibnitz as an independent inventor of the calculus, and the part which Newton himself took in the controversy, will be found in the articles FLUXIONS and COMMERCIIUM EPISTOLICUM, in ARTS AND SO. DIV. Sir David Brewster, who has carefully investigated this matter, states the following as the results of his investigation:—

"1. That Newton was the first inventor of the Method of Fluxions; that the method was incomplete in its notation; and that the fundamental principle of it was not published to the world till 1687, twenty years after he had invented it. 2. That Leibnitz communicated to Newton, in 1677, his Differential Calculus, with a complete system of notation, and that he published it in 1684, three years before the publication of Newton's method." ('Memoirs,' ii. 78.)

The five years preceding Newton's appointment to the wardenship of the mint were passed chiefly at Cambridge. During parts of the years 1692 and 1693 he has, on the authority of Biot, been commonly supposed to have suffered under temporary mental aberration, although it was between December 1692 and February 1693 that he wrote his four celebrated letters on the existence of the Deity, at the express request of Dr. Bentley, and various scientific essays, which Brewster has printed in an appendix to his 'Life.'

Mr. Van Swinden, while examining the manuscripts and autograph letters of Huyghens, met with a small journal in the hand-writing of the latter. It is deposited in the library of Leyden, and contains the following note, communicated by Mr. Van Swinden to M. Biot, and first published by the latter in the 'Biographie Universelle':—"29th May 1694. Mr. Colin, a Scotchman, informs me that the illustrious geometer Isaac Newton has been insane for the last eighteen months, either from excess of study, or from the grief occasioned by the destruction of his chemical laboratory, together with many important MSS., by fire. Mr. Colin adds, that when he came to the Archbishop of Cambridge, his conversation indicating an alienation of mind, he was immediately taken care of by his friends, confined to his room, and remedies applied, by means of which he has now so far recovered as to again be able to comprehend the Principia." Huyghens having mentioned this circumstance to Leibnitz, the latter, in his reply, dated 23rd of June 1694, expresses his gladness at receiving the account of Newton's convalescence at the same time that he received that of his illness, and adds, "It is to men like you and him, Sir, that I wish a long life." Sir David Brewster has been at considerable pains to determine how far the foregoing statement is consistent with fact, and has succeeded in bringing to light many interesting documents which bear immediately upon this and other points. ('Memoirs,' ii. 131-56.) Among these is a MS. diary of Mr. Pryme, a student at Cambridge at the time that Newton was fellow of Trinity. It commences in the year 1685, and under Feb. 3, 1692, the writer mentions having that day heard of the destruction of Newton's manuscripts on the theory of colours, "established upon thousands of experiments which he had been twenty years of making, and which had cost him many hundreds of pounds," and he goes on to say that it took place on a winter's morning while Newton was at chapel, adding that "when Newton had come back and seen what was done, every one thought that he would have run mad; he was so troubled thereat that he was not himself for a month after." Another version of the story is, that Newton left in his study a favourite dog, which overturned a lighted taper upon his papers, and on his return, finding the extent of his loss, he exclaimed, "Oh! Diamond, Diamond! little do you know the mischief you have done me!" The above extract from the diary of Mr. Pryme, while it

in some degree corroborates the statement in the Journal of Huyghens, seems to show that the indisposition of Newton was neither so intense nor of so long continuance as has been supposed, and that 'insanity' was inapplicable in the strict sense of that word, although there certainly existed some doubt as to what state of mind he was really in. This view is supported by letters in the hand-writing of Newton, of Mr. Pepys (secretary of the Admiralty), and of Mr. Millington (of Magdalen College, Cambridge), which have also been published by Sir David Brewster from the originals in the possession of Lord Braybrooke. Among these is the following from Newton to Pepys, excusing himself from fulfilling a promise he had made to see the latter when next in London. Pepys entertained a very high esteem of Newton, and appears to have been very anxious for his health and longevity:—"September 13, 1693. Sir,—Some time after Mr. Millington had delivered your message, he pressed me to see you the next time I went to London. I was averse; but upon his pressing consented, before I considered what I did, for I am extremely troubled with the embroilment I am in, and have neither ate nor slept well this twelvemonth, nor have my former consistency of mind. I never designed to get anything by your interest, nor by King James's favour, but am now sensible that I must withdraw from your acquaintance, and see neither you nor the rest of my friends any more, if I may but leave them quietly, &c.—Isaac Newton." The wording of this letter excited in Mr. Pepys the suspicion that Newton was suffering from "discomposure of head or mind, or both," and he in consequence addressed himself for explanation to Millington, who in reply says, ". . . . he (Newton) told me of his own accord that he had writ to you a very odd letter, at which he was much concerned; added that it was a distemper that much seized his mind, which he desired I would represent to you and beg your pardon, he being very much ashamed he should be so rude to a person for whom he hath so great an honour. He is now very well, and though I fear he is under some degree of melancholy, yet I think there is no reason to suspect it has at all touched his understanding, and I hope never will." While labouring under the same melancholy and nervous affection, he had characterised the writings of Locke as immoral, and designated their author as a Hobbist. In a letter to Locke, dated "At the Bull in Shoreditch, September 16, 1693," he says, "Being of opinion that you endeavoured to embroil me with women, I was so much affected by it, that when one told me you were sickly and would not live, I answered, 'twere better if you were dead.'" He then asks forgiveness for this uncharitableness, and for the ill opinion he had entertained of his writings, and concludes, "I beg your pardon also for saying or thinking that there was a design to sell me an office, and am your most humble and unfortunate servant, Ia. Newton." To this letter Locke replied very kindly, and Newton again wrote from "Cambridge, October 15th, 1693," a letter which clearly indicates the nature of his disorder, and that at that time its effects had passed away:—"The last winter, by sleeping too often by my fire, I got an ill habit of sleeping; and a distemper, which this summer has been epidemical, put me farther out of order, so that when I wrote to you I had not slept an hour a night for a fortnight together, and for five days together not a wink. I remember I wrote to you, but what I said of your book I remember not. If you please to send me a transcript of that passage I will give you an account of it if I can." In 1694 he appears to have recovered his former tranquillity and strength of mind; for in that year we find him actively occupied in testing his lunar theory by the observations of Flamsteed, with whom he had hitherto been on the most intimate terms. The quarrel which subsequently took place between Newton and the astronomer-royal is noticed under FLAMSTEED.

In 1699 Newton was chosen foreign associate of the Royal Academy of Sciences at Paris; in 1703 he was elected president of the Royal Society, to which office he was annually re-elected till his death; and in 1705 he was knighted by Queen Anne. In 1722 he became subject to a disorder of the bladder, accompanied with cough and gout. He presided for the last time at the Royal Society on the 23th of February 1727, and died at Kensington on the 20th of March following, in the eighty-fifth year of his age. His body was interred in Westminster Abbey, the funeral being attended by several of the nobility and the principal members of the society. In 1731 a magnificent monument, designed by Kent and sculptured by Rysbrack, was erected in the abbey at the expense of his relatives. It is situated immediately behind the organ, and bears an appropriate inscription ending with "Sibi gratulentur mortales tale tantumque existitiæ humani generis decus." It is not true that the binomial theorem is also engraven upon it, though it is so stated by several writers. The same year a medal was struck at the Tower, bearing on one side the head of Newton, with the motto, "Felix cognoscere causas;" and on the reverse a personification of the mathematical sciences. In 1755 a full-length statue, by Roubilliac, was erected in Trinity College chapel, bearing the word 'Newtonus' with the inscription from Lucretius, "Qui genus humanum ingenio superavit." There is also a bust of Newton in Trinity College library, by the same sculptor. Besides these memorials of Newton there exist several portraits of him by Vanderbank, Ritts, Sir Godfrey Kneller, and Sir Peter Lely; the last was taken when Newton was a B.A. The manor-house of Woolsthorpe, visited a few years since by the writer, is built of stone, and seated in a valley on the west side of the river Witham. It was repaired in 1798 by

Mt. Turnor, the proprietor, by whom also a marble tablet was placed over the mantelpiece of the room in which Newton was born. It bears the inscription, "Sir Isaac Newton, son of Isaac Newton, lord of the manor of Woolsthorpe, was born in this room on the 25th of December 1642." At foot are the lines from Pope—

"Nature and Nature's Laws lay hid in night;  
God said 'Let Newton be,' and all was light."

In a room on the same floor is preserved his oaken study. The two dials engraved upon the southern wall were then very distinct, but the styles of both were wanting. The larger dial, about a foot in diameter, was in 1844 taken down and presented to the Royal Society. The celebrated apple-tree, the fall of one of the apples of which is said by Pemberton to have turned the thoughts of Newton to the subject of gravitation, was thrown down by the wind about two-and-twenty years since.

In his person Newton was short, but well-set, and inclined to corpulence. His hair was abundant, and white as silver, without baldness. His eye was bright and penetrating till within the last twenty years of his life; but his countenance, though thoughtful, seldom excited much expectation in those to whom he was unknown. In his conversation there appears to have been little either very remarkable or agreeable; but we have the testimony of Dr. Pemberton that "neither his age nor his universal reputation had rendered him stiff in opinion, or in any degree elated." Ascribing whatever he had accomplished to the effect of patient and continuous thought rather than to any peculiar genius with which nature had endowed him, he looked upon himself and his labours in a very different light from that in which both he and they were regarded by mankind. "I know not," he remarked, a short time before his death, "what I may appear to the world; but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me." (Turner, 'Collections relative to the Town of Grantham.') But while he thus contrasted the littleness of human knowledge with the extent of human ignorance, he was fully conscious of the importance of his own labours, when compared with those of his predecessors and contemporaries, and evinced a natural readiness to assert and vindicate his rights whenever occasion might require. It were to be wished that, by an earlier publication of his discoveries, he had adopted the most eligible mode of establishing the undoubted priority of his claim. Such a course, by changing the current of events, would have left him less open to the charge of having disregarded the claims of others, or of having suffered their reputations to be prejudiced by his silent acquiescence in the acts of his colleagues. To judge of Newton from the life of him recently published by Sir David Brewster, we should almost infer that his moral character had suffered from no instances of human infirmity, and that every action had been dictated by feelings of benevolence and the love of truth. These were indeed the general motives by which he was actuated. His behaviour towards Leibnitz, relative to the discovery of the calculus, and the part which he took in the persecution of Flamsteed by the Royal Society, are however certainly exceptions.

The following is a list of the works of Newton, in the order of publication;—

1. 'Principia,' 1687, Lond., 4to; 1713, Camb., 4to, edited by Cotes; 1728, Lond., 4to, edited by Pemberton; 1730, Lond., 2 vols. 8vo, illustrated by Donick; 1729, Lond., 2 vols. 8vo, Englished by Motte. Besides these, several editions have been published on the Continent. The best edition is that of Messrs. Le Seur et Jacquier, 1739-42, Genev., 4 vols. 4to, comprising a valuable running commentary on the text, and generally known as the 'Jesuits' edition. The same, 1780, Colon. Allobrog.; the same, 1822, Glasgow, 4 vols. 8vo, edited by Wright. (Horsley, tom. ii. and iii.) 2. 'Optics,' Lond., 1704, 4to. To the first edition, written in English, were appended two Latin treatises, namely, 'De Quadratura Curvarum,' containing an exposition of his method of fluxions; and 'Enumeratio Linearum tertii Ordinis,' containing an elegant classification of seventy-two curves of the third order, with an account of their properties, but without any information as to the method whereby those properties had been investigated. These treatises, which had little connection with the principal work, were omitted in the subsequent editions. A Latin translation of the 'Optics,' by Dr. Clarke, appeared in 1706, Lond., 4to, for which Newton presented the doctor with 500*l*. The other editions are—in English, Lond., 1714, 1721, 1730; in Latin, Lond., 1719, 1721, 1728, Lausanne, 1740, Padua, 1773. (Horsley, tomes i. and iv.) 3. 'Arithmetica Universalis,' 1707, Camb., 8vo, comprising the algebraical lectures delivered by Newton at the university, printed under the inspection of Whiston, and, according to some authorities, without the author's consent. Translated by Raphson, 1728, Lond., 8vo. There are several later editions, both English and foreign. That by Castillon, Amat., 1760, is in 2 vols. 4to. (Horsley, tom. i.) 4. 'Analysis per Equationes Numero Terminorum Infinitas,' 1711, Lond., 4to. Translated by Stewart, 4to, Lond., 1745. This work was written by Newton, about the year 1672, and intended as an introduction to Kluickhuysen's 'Algebra,' of which he had undertaken to publish a new edition. Motives now unknown induced him to abandon this design. (Horsley, tome i.) 5. 'Methodus Differen-

hialia,' a small tract on interpolation. (Horsley, tome i.) 6. 'De Mundi Systemate,' 1728, Lond., 4to. This is a popular account of the truths contained in the third book of the 'Principia.' An English translation from the original manuscript had been published the previous year in 8vo. There are later editions. (Horsley, tome iii.) 7. 'The Chronology of Ancient Kingdoms amended: to which is prefixed a Chronicle from the first memory of things in Europe to the conquest of Persia by Alexander the Great,' 1728, Lond., 4to. It had been surreptitiously translated and published at Paris in 1725. The reader will find an able review of this work, by M. Daunon, appended to Biot's Life of Newton in the 'Biographie Universelle,' tome xxi., pp. 180-86. (Horsley, tome v.) 8. 'Table of Assays,' printed in Dr. Arbuthnot's 'Tables,' 1728, Lond., 8vo, comprising those delivered in the years 1669-70-71. Translated into Latin, 1729, Lond., 4to. (Horsley, tome iii.) 10. 'Observations on the Prophecies of Daniel and the Apocalypse of St. John,' 1733, Lond., 4to. (Horsley, tome v.) 11. 'A Method of Fluxions and Analysis by Infinite Series,' translated into English from the original Latin by John Colson, to which is added a Commentary by the translator, 1736, Lond., 4to. 12. 'An Historical Account of two notable Corruptions of Scripture,' written prior to 1691, but first published in 1754, Lond., under the title of 'Two Letters from Sir Isaac Newton to M. Le Clerc.' (Horsley, tome v.) Newton contributed some papers to an edition of Varenus's 'Geography,' printed at Cambridge in 1672, 8vo.

The papers communicated by Newton to the Royal Society are comprised in vols. vii.-xi. of the 'Transactions.' The principal works of Newton were collected and published by Dr. Horsley, under the title of 'Newtoni Opera quæ extant omnia,' 1779-85, Lond., 5 vols. 4to. In the foregoing list, where a work had been reprinted in Horsley's edition, reference is made to the volume. The following were, with few exceptions, first printed in Horsley's edition:—Tome i. 'Excerpta quædam ex Epistolis Newtoni ad Series Fluxionesque pertinentia;' 'Artis Analyticæ Specimina, vel Geometria Analytica.' Tome iii., 'Theoria Lunæ.' Tome iv., 'Letters on various Subjects in Natural Philosophy, published from the Originals in the Archives of the Royal Society;' 'Letter to Mr. Boyle on the Cause of Gravitation;' 'Tabule duæ, Colorum altera, altera Refractionum;' 'De Problematibus Bernouillianis;' 'Propositions for determining the Motion of a Body urged by two Central Forces;' 'Four Letters to Dr. Bentley;' 'Commercium Epistolicum D. Johannis Collins, et aliorum, de Analysis Promota' (first published by the Royal Society in 1713; a new edition appeared in 1722); 'Additamenta Commerci Epistolici.' Tome v., 'A short Chronicle from a Manuscript, the property of the Rev. D. Ekina, dean of Carlisle.' The minor works of Newton have been collected and published under the title of 'Opuscula Mathematica, Philosophica, et Philologica; collegit partimque Latine vertit ac recensuit Joh. Castilloneus;' Lauz. et Genev., 3 tomes, 4to. After the death of Newton, Dr. Fellet was appointed by the executors to examine his manuscripts and papers, and to select such as he deemed adapted for publication. They are eighty-two in number, and consist of a great number of sheets. But many of those on theological subjects are mere copies over and over again, with very slight variations. Of these manuscripts, the only ones which Dr. Fellet deemed fit to be printed were the 'Chronology,' and 'An Abstract of the Chronology,' the former in ninety-two, the latter in twelve half-sheets folio. At the same time he recommended for further consideration those entitled 'De Motu Corporum;' 'Paradoxical Questions concerning Athanasius;' 'History of the Prophecies;' and a bundle of loose mathematical papers. A catalogue of these manuscripts was appended to a bond given by Mr. Conduit to the administrators of Newton, wherein he binds himself to account for any profit he may make by their publication. A list of them will be found in Hutton's 'Dictionary.' Those on theological subjects are with many other Newton papers in the possession of the Earl of Portsmouth. The valuable collection of letters between Newton and Cotes, relative to the publication of the second edition of the 'Principia,' preserved in the library of Trinity College, Cambridge, was published in 1851 under the editorial care of Mr. J. Edleston; the Correspondence of Newton with Mr. Pepys and Mr. Millington, is in the possession of Lord Braybrooke; and other manuscripts are in the Bodleian Library, Oxford.

(Brewster, *Life of Newton*, Lond., 1831 12mo, entirely rewritten under the title of *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton*, 2 vols. 8vo, 1855; Biot, *Life*, in the *Biog. Univers.*; Turner, *Collections for the Hist. of Grantham*, containing the Papers forwarded to Fontanelle by Conduit, the husband of Newton's niece, and Dr. Stukeley's Account of the Infancy of Newton, written in 1727; Fontanelle, 'Eloge de Newton,' *Œuvres diverses*, La Haye, 1729, 4to, tome iii.; *Biographia Britannica*; Birch, *Hist. of the Royal Society*, Lond., 1756-57, 4to, vols. iii. and iv.; *Heads of Illustrious Persons of Great Britain, engraved by Houbraken and Vertue, with their Lives*, by Birch, Lond., 1743, fol., tome i., p. 147. The reader may further consult Montucla, *Hist. des Mathem.*, tomes ii., iii., iv.; Pemberton, *Account of Newton's Philosophy*; Maclaurin, *Account of Newton's Discoveries*; Priestley, *History of Optics*; Laplace, *Exposition du Système du Monde*, chap. v.; Lord King, *Life and Correspondence of Locke; Life of Newton*, in the *Library of Useful Knowledge*, &c.)

NEWTON, THOMAS, bishop of Bristol, was born in 1704. Bishop

Newton's course of life was very like that of other divines who have risen to the episcopal bench. He was the son of a person engaged in trade, was a pupil in the grammar-school at Lichfield, and afterwards at Westminster, from whence he removed to Trinity College, Cambridge. He was for some years a city preacher, and tutor in the Tyrconnel family, and was in 1744 presented by Pulteney earl of Bath, who was his great friend and patron, to the living of St. Mary-le-Bow. He next became lecturer at St. George's, Hanover Square, prebendary of Westminster, dean of Salisbury, sub-almoner, about 1762 bishop of Bristol, and in 1768 dean of St. Paul's. He died in 1782. Bishop Newton was a prelate of not very remarkable powers, natural or acquired; but personally he was without reproach, acceptable in the society of the great, and possessed of a certain amount of general and professional knowledge.

Bishop Newton is chiefly known by two works: an edition of the 'Paradise Lost,' with notes, first published in 1749, and his 'Dissertation on the Prophecies,' of which the first volume appeared in 1755. Both had a certain, perhaps a high, celebrity in their day, but we look in them in vain for much of either acuteness or learning. Both however may be perused by those who are not critical scholars with advantage; and the critical scholar in English or in biblical literature may meet occasionally with useful suggestions.

NEY, MICHAEL, Prince of the Moskowa, Duke of Elchingen, and Marshal of France, was born at Sarre-Louis in Lorraine, on 10th January 1769. At the age of thirteen he was articled to a notary of that town, but this occupation not being suited to his disposition, he enlisted in 1787 in a regiment of hussars. He there soon distinguished himself by his courage and activity, and, after passing through the inferior grades, he became a lieutenant in 1793, and a captain the year following. The skill which he displayed in conducting some partisan warfare in 1794 attracted the attention of General Kleber, by whom he was surnamed 'The Indefatigable,' and raised to the rank of adjutant-general. In 1796 he greatly contributed to the victory obtained at Neuwied, and distinguished himself in the engagements of Altenkirchen [LEFEBVRE], Montabour, and Dierdorf, in which last he was made a prisoner. After his exchange he served in 1796 with the army of the Rhine, and after a brilliant exploit at Würzburg, where with a small body of cavalry he took two thousand prisoners, and obtained possession of that town, he was nominated general of brigade. In the course of this campaign his courage was enhanced by his humanity towards the French emigrants who had been taken prisoners, and he enabled them to elude sanguinary decrees of the Directory. In 1799 he again served as a general of division with the army of the Rhine under General Moreau. We can only enumerate the principal achievements which in this memorable campaign added to his celebrity. These are the capture by surprise of Mannheim (12th March, 1799), the engagements at Worms and Frankenthal, and the seizure of all the enemy's artillery at the battle of Iller (5th June 1800). He was also present at the battle of Hohenlinden [MOREAU], and his bold attack of a column of the Austrians, which he drove back into the forest, greatly contributed to the victory. At the peace of Luneville he returned to Paris, where he was received with distinction by Bonaparte, who, the better to attach him to his interest, caused him to marry Mademoiselle Auguis, a friend of Hortense Beauharnais. In 1803 he was appointed minister plenipotentiary of the French Republic in Switzerland; on leaving that country the inhabitants presented him with a medal in testimony of their esteem for his character and conduct, and the moderation with which he carried into effect the measures of his government. On his return to Paris the command of a division of the army encamped near Boulogne was given him, and in 1804 he was raised to the dignity of a Marshal.

On the renewal of hostilities with Germany in 1805 the direction of the eighth corps of the army was confided to Marshal Ney. A brilliant achievement in this campaign, the capture by storm of the village of Elchingen (October 4th, 1805), in which the Austrians, under General Laudon, lost fifteen hundred men killed and wounded and two thousand taken prisoners, was attended with the most important results. The impetuous courage and persevering skill which this marshal displayed on that occasion had been witnessed by Napoleon, who in commemoration of it afterwards bestowed upon him the rank and title of Duke of Elchingen.

But it was perhaps during the Prussian campaign of 1806 that Ney's military reputation rose to its greatest height. Of the many splendid actions by which he distinguished himself, the chief are, the capitulation of the towns of Erfurt (October 15th, 1806) and Magdeburg (November 11th, 1806) in which 23,000 prisoners were taken and 800 pieces of cannon fell into his possession; the passage of the Vistula, the taking of Thorn, the total destruction of a Prussian corps at Deppen (February 5th, 1807), the combat of Schmoditten, by which the retreat of the Russians on Königsberg was cut off, and, finally, the defeat of the left wing of the enemy at the battle of Friedland, which more than any other movement contributed to the victory. In September 1808, he was appointed to a command of the army in Spain, and he distinguished himself in the various engagements by which Galicia and the Asturias were subjected. In Portugal, though under the orders of Marshal Masséna, the merit of the capture of Ciudad-Rodrigo (July 10th, 1810) and of Almeida (August 27th, 1810) have generally been attributed to him. He was also of great assistance to

Masséna in conducting his skilful retreat, after his failure in attempting to force the lines of Torres Vedras. [MASSÉNA.] The different dispositions however of these two great generals soon brought on differences of opinion, which ended in a serious dispute. The result was unfavourable to Ney, who was deprived by Napoleon of his command and recalled to France.

In 1812 he joined the disastrous expedition to Russia, and had the command of the third corps of the grand army. In the course of it he appears to have freely expressed to Napoleon his dissatisfaction at some of his movements, and advised him to winter at Smolensko. At the taking of this city (August 17th, 1812), at the combat of Valentina (August 19th), and, above all, at the sanguinary battle of the Moskowa (September 14th), from which he derived his title of Prince of the Moskowa, he eminently proved himself worthy of the surname by which he was known to the army, of 'Bravest of the Brave.' But it was during the calamitous retreat of the French army that he rendered it the most important service. [BONAPARTE, NAPOLEON I.] One incident in this retreat is peculiarly characteristic of Ney's intrepidity and perseverance. General Dumas relates that as he was sitting down to breakfast at Gaubinnen, a man in a brown coat, long beard, and a weather-beaten countenance, entered his room, exclaiming, "I am at last here; General Dumas, do you recognise me!" The general having answered that he did not; "I am the rear-guard of the grand army," he continued; "I have fired the last musket-shot on the bridge of Kowno; I have thrown the last of our arms into the Niemen, and have come here through the woods. I am Marshal Ney." (Colonel Mitchell's 'Fall of Napoleon,' vol. ii.)

In the campaign of 1813 Ney displayed his usual courage and ability, and was chiefly instrumental in obtaining the victories of Bautzen, Lützen, and Dresden. He met however with some severe reverses, and at the battle of Dannowitz (September 6th, 1813) he was signally defeated by the Prussians and Swedes under Bernadotte, then Crown Prince of Sweden, with a loss of thirteen thousand men, forty-three pieces of cannon, and three standards. After this disastrous engagement Napoleon had an interview with Ney's aid-de-camp, whom he interrogated respecting the particulars of this misfortune, and explained the causes which led to it to the generals present, without giving expression to any feeling of dissatisfaction at the conduct of his lieutenant. "The emperor," says St. Cyr, who is quoted by Alison ('Hist. of Europe,' x. 585), "explained at once lucidly and satisfactorily the causes of the reverse, but without the slightest expression of ill-humour, or any manifestation of displeasure at Ney or any of the generals engaged. He ascribed the whole to the difficulties of the art of war, which he said were far from being generally known. He added that, one day or other, if he had time, he would write a book in which he would demonstrate its principles in a manner so precise they should be within the reach of all military men, and enable them to learn the art of war as they learn any other science."

After the abdication of Napoleon, in 1814, Ney withdrew from public life and retired with his family to his country-seat. It was there that, on the 6th of March 1815, he received orders from the minister of war to join the eighth military division, of which he was commander, and which was stationed at Besançon. Ignorant of the motives of the order, he immediately proceeded to Paris, where for the first time he learned the return of Napoleon from Elba. He then willingly undertook the duty which had been imposed upon him to lend his aid for the purpose of opposing the invasion of his former chief; and on taking leave of Louis XVIII he assured him that he would bring back Bonaparte in an iron cage. As some doubts have been cast upon the truth of this boastful assertion of Ney, it may be well to state that he himself acknowledged on his trial that he used the expression. On leaving the king he travelled rapidly to Auxerre, where he alighted at the residence of his brother-in-law, the prefect of the department, who had zealously joined the cause of Napoleon, and who made Ney acquainted with all the difficulties likely to attend any support of the Bourbon dynasty, and his own doubts on the subject increased as, advancing towards Lyon, he became more aware of the popular feeling in that part of France. The character of Ney was more fitted for the field of battle than for a political struggle, and it was only in the presence of danger that he showed resolution. Of this Napoleon was well aware, and he skilfully threw the weight of his influence and entreaties into the balance of Ney's already vacillating opinions. An earnest appeal to the early and glorious reminiscences of the prosperous days of the Empire, coming from his ancient chief, the creator of his fortunes, completely overcame the pledged loyalty of this marshal. "In the night of the 13th of March," said he at his trial, "down to which time I solemnly declare my fidelity, I received a proclamation drawn by Napoleon, which I signed." On the ensuing morning this fatal proclamation was publicly read to the troops, who received it with the most enthusiastic approbation. His defection was speedily followed by that of his whole army.

On the 10th of June he joined the army at Lille, and was soon actively but unsuccessfully engaged with the British at Quatre-Bras. His conduct at Waterloo elicited equal praise both from friend and foe. His fruitless but resolute attempts at the head of the columns of the guard to overwhelm the British before they could receive succour from the Prussians, are well known. Five horses were shot

under him in this terrible conflict: still, on foot, his clothes pierced with balls, he gallantly headed the impetuous charge. In the disastrous retreat which ensued, he was among the last to leave the field, and, as on the plains of Russia, he was the rear-guard of the last Imperial army.

After the defeat of Napoleon at Waterloo, Ney returned to Paris, and remained there after the capitulation of that city to the allies, considering himself it is said safe by virtue of the twelfth article of the convention for the capitulation, which was as follows:—"In like manner shall be respected persons and private property, and in general all individuals who are at present in the capital, shall continue to enjoy their rights and liberties, without being disquieted or subjected to any enquiry, in regard to the functions which they occupy, or may have occupied, or to their conduct or political opinions." ('Convention,' July 3rd, 1815.) On the 24th of July however appeared a Royal ordinance, in which, among several others, he found himself proscribed as a traitor to his country. Fouché and Talleyrand had furnished Ney as well as Labédoyère and most of the other persons in the proscribed lists with passports; and he now, to escape the danger, endeavoured to leave France. He reached the frontiers in safety, when he was led by some trifling circumstances to turn back, and he was arrested on the 5th of August, at the château of Beauson near Aurillac. He was at first cited before a council of war, which, on his advocates demurring to its power, Ney being a peer of France, declared its incompetency to sit in judgment on him. His trial was then removed to the Chamber of Peers by another Royal ordinance of the 12th of November. His defence was most ably conducted by his eloquent advocates, Berryer and Dupin, and ultimately was made to rest mainly on the article of the capitulation above alluded to. The result however was that he was found guilty by one hundred and fifty-seven voices to one, and condemned to death by a very large majority of the peers.

On the 7th of December 1815, the day after his condemnation, an officer presented himself to Ney to communicate to him the sentence, which was to be carried into immediate execution. On hearing his titles enumerated, he exclaimed, "Call me simply Michael Ney, now a French soldier, and soon about to be a heap of dust." A spot in the garden of the Luxembourg was selected for the execution; he there met his fate at eight o'clock in the morning with calm courage. "He who had fought five hundred battles for France—not one against her—was shot as a traitor." (Napier, 'History of the Peninsular War,' vol. ii. p. 406.)

That Ney had been guilty of the greatest political crime which the commander of an army could have committed, there can be no question; yet the feeling of regret and indignation is universal at the execution of such a man; and, as has often been remarked, the heroism of his death has in effect transferred the sense of shame and guilt from him to his sovereign. But several French and some English writers have adopted the view of the 12th article of the convention put forth by Ney's advocates at the trial, and have advanced the opinion that Wellington and Blucher, who, on the part of the allies, approved and ratified the convention, ought to have interfered and claimed for Ney the benefit of that article. It is however but fair to say that such is hardly the conclusion to which an impartial examination of the convention and the circumstances of the case will lead. The convention was not an amnesty, and never professed to be one; nor in fact was it understood to be one by either party when made. Neither Ney nor his advocates thought of urging that plea till the middle of his trial; and when his wife went to the Duke of Wellington to request his intervention, the duke told her that the 12th article of the convention had no reference to the King of France, but was solely intended to assure the inhabitants of Paris of protection against the fury of a victorious army. It was in short simply a convention for the surrender of the city, and Wellington and Blucher could have had neither authority nor power to grant amnesty or pardon for political offences as between the sovereign and his subjects, and they never pretended to have had any such power. That it would have been more politic of Louis to have merely banished, if he did not pardon, the most brilliant and devoted of French soldiers, there can be little doubt; and none that a man of generous feelings would have done so. That either Wellington or Blucher should have interfered very strenuously to save him, however much it might be desired, was hardly to be expected when their stern sense of military duty is considered. The blame of his death to us seems to rest solely, however heavily, on his countrymen.

NICANDER, a physician, poet, and grammarian, of whose life very few particulars are found in ancient authors, and even those few are doubtful and contradictory. Upon the whole it seems most probable that his father's name was Damnaeus (Eudocia, 'Viol., ap. Villos. Anecd. Gr.,' vol. i. p. 308; and 'Anonymi Scriptoris, "Vita Nic.,"'); that he lived about Ol. cixi. ii., B.C. 185, in the reign of Attalus III., the last king of Pergamus, to whom he dedicated one of his poems which is no longer extant (Suidas; Eudoc., 'Viol.;' 'Anon. Vita'); that he was a native of Claros (Nicandri, 'Theriaca'), a small town near Colophon, whence he is commonly called Colophonius (Cic. 'De Orat.,' lib. i., cap. 16; Suidas, 'Anthol. Gr.'). and that he succeeded his father as hereditary priest of Apollo Clarus (Eudoc., 'Viol.;' 'Anon. Vita.'). He appears to have been rather a voluminous writer, as the titles of more than twenty of his works have been preserved;

but of all these we possess at present only two in a perfect state, with a few fragments of some of the others. The 'Theriaca' is a poem consisting of nearly 1000 lines in hexameter verse, on the wounds caused by different venomous animals, and the proper treatment of each: it is characterised by Haller ('Biblioth. Botan.') as "longa, incondita, et nullius fidei farrago." It contains however several curious passages relating to natural history, of which the following may serve as a specimen. He mentions (v. 147, &c.) a species of serpent, called *σφίς*, which always assumes the colour of the ground over which it crawls. (Compare Pliny, 'Hist. Nat.,' lib. viii., cap. 35; Aristotle, 'De Mirab. Auscult.,' c. 178, and Ælian, 'De Nat. Anim.,' l. xvi., c. 40.) He places (v. 183, &c.) the venom of serpents in a membrane surrounding the teeth, which is not very far from the truth. He describes the ichneumon (v. 190, &c.) and the asp, and the way in which the former fights with the latter and destroys its eggs; all of which is described in very nearly the same terms by Pliny ('Hist. Nat.,' lib. viii., cap. 35, 36), and in a great measure confirmed by modern naturalists. (See Cuvier's notes on the above-mentioned chapters of Pliny, in the French translation, 20 vols., 8vo, Paris, 1829-33.) In speaking of the amphispæna, he falls into the vulgar error of his day, and describes it as having two heads. (v. 372, &c.) The same error is found in Pliny. ('Hist. Nat.,' lib. viii., cap. 36.) He divides scorpions into nine species, distinguishing them chiefly by their colour (v. 769, &c.), a mode of division probably taken from Apollodorus (Pliny, 'Hist. Nat.,' lib. xi., cap. 30), and followed by Ælian ('De Nat. Anim.,' lib. vi., cap. 20). He is the first person who describes the moths that flutter about a candle at night, and calls them *φάλαρα* (v. 759, &c.) He gives a fabulous account of the basilisk (v. 396, &c.), which is followed, as might be expected, by Pliny ('Hist. Nat.,' l. viii., cap. 38, and l. xxix., c. 19), and by Ælian ('De Nat. Anim.,' lib. ii., cap. 7), though it should be observed that the animal spoken of by them could not be the same that is called by that name by modern naturalists, which is found only in America. He declares the bite of the field-mouse to be poisonous (v. 815, &c.), and that the animal dies if it should fall into a wheel-rut; both which circumstances are repeated by Pliny ('Hist. Nat.,' lib. viii., cap. 83) and Ælian ('De Nat. Anim.,' lib. ii., cap. 37). He is one of the earliest writers who mentions the fable of the salamander (v. 817, &c.). See Pliny, 'Hist. Nat.,' lib. x., c. 86, and Ælian, 'De Nat. Anim.,' lib. ii., c. 31. He says that wasps (v. 738, &c.) are generated by the putrefaction of the carcass of a horse (comp. Pliny, 'Hist. Nat.,' lib. xvii., cap. 18, and Ælian, 'De Nat. Anim.,' lib. i., cap. 28), and bees by that of an ox (comp. Ælian, 'De Nat. Anim.,' lib. ii., cap. 57).

The 'Alexipharmaca' is a rather shorter poem, written in the same metre, on poisons and their antidotes, and may be considered as a sort of continuation of the 'Theriaca.' Haller's judgment on this work is as severe as on the preceding. Among the poisons of the animal kingdom Nicander mentions (v. 115, &c.) the cantharis of the Greeks, which is not the *Lytta Vesicatoria*, but the *Meloe Chicorii*; the buprestis (v. 335, &c.), *Carabus Bucidon*; the blood of a bull (v. 312); the coagulated milk in the stomach of mammiferous animals (v. 364, &c.); a species of tetraodon (v. 465, &c.), *Tetraodon Lagocephalus*; the leech (v. 495, &c.), *Hirudo venenata*; and a species of gecko *σαλαμάνδρα* (v. 550, &c.). Among the vegetable poisons we find the aconite (v. 12, &c.), 'Aconitum Lycocotonum'; the coriander (v. 157, &c.), which has sometimes been fatal in Egypt; the hemlock (v. 186, &c.), 'Conium'; the colchicum (v. 249, &c.), *εφήμερον*; the Lotos dorychnium (v. 376, &c.); the henbane (v. 415, &c.), 'Hyoscyamus'; opium (v. 433, &c.); and the different species of fungi (v. 521, &c.), the growth of which Nicander attributes to fermentation. Of mineral poisons he mentions only white lead, or carbonate of lead (v. 74, &c.), and litharge, or protoxide of lead (v. 607, &c.).

To counterbalance in some degree Haller's unfavourable opinion of Nicander's extant works, it ought in justice to be stated that his knowledge of natural history appears to be at least equal to that of other writers of his own or even of a later age, while on the subject of poisons he was long considered a great authority: Galen several times quotes him, and Dioscorides, Aëtius, and Johannes Actuarius have borrowed from him largely.

With respect to his merits as a poet, the most opposite opinions are to be found both in ancient and modern writers. In the Greek anthology Colophon is congratulated for being the birth-place of Homer and Nicander (t. iii., p. 270, ep. 567, ed. Brunck.). Cicero ('De Orat.,' lib. i., cap. 16), alluding to his 'Georgics' (a poem not now extant), praises the poetical manner in which he treats a subject of which he was entirely ignorant; while Plutarch ('De Aud. Poëtis,' cap. 2) says the 'Theriaca' only escapes being prose because it is put into metre, and will not allow it to be called a poem, because there is in it "nothing of fable or falsehood." This very point Julius Cæsar Scaliger thinks worthy of especial commendation, and says, "Magna ei laus quod ne quid ineptum aut ineptè dicat." ('Poëticea,' lib. v., cap. 15.) He goes on to praise the accuracy of his expressions and versification, and declares that among all the Greek authors a more polished poet is hardly to be found. M. Merian, on the other hand, in an essay 'Comment les Sciences influent dans la Poésie' ('Mém. de l'Acad. Roy. de Berlin,' l'an 1776, p. 423) mentions Nicander to show the antipathy that exists between the language of poetry and the subjects of which he treated. He calls him 'a grinder of antidotes, who sang of

scorpions, toads, and spiders,' and considers his poems as fit only for the apothecaries. Probably his poetical genius has been a good deal cramped by the prosaic character of the subjects that he has chosen for his theme; and we may fairly say that his writings contain quite as much poetry as could be expected from such unpromising materials. As for his style and language, probably every one who has ever read half a dozen lines of either of his poems will agree with Bentley, who says that he studiously affected obsolete and antiquated words, and must have been an obscure writer even to his contemporaries. ('Cambridge Museum Critic,' vol. i., p. 371.)

The 'Theriaca' and the 'Alexipharmaca' were first published in Greek, with the Scholia to both poems, by the elder Aldus, Venet., 1499, fol., at the end of his edition of Dioscorides. The best editions are Schneider's, who published the 'Alexipharmaca' in Greek and Latin, with the Scholia and copious notes, Halm, 1792, 8vo, and the 'Theriaca,' edited in the same manner, and containing also the fragments of Nicander's other poems, in 8vo, Lips., 1816; and that of Lehrs (in Didot's Greek Classics) large 8vo, Paris 1846. The 'Theriaca' was published in the 'Cambridge Museum Criticum,' with Bentley's emendations, vol. L, p. 370, &c. There is extant a Greek paraphrase in prose of both poems (printed in Schneider's editions) by Eusebius, of whom nothing is known, except that he has done the same to Oppian's 'Cynegetica' and 'Halieutica.'

NICANDER, KARL AUGUST, a recent Swedish poet of considerable celebrity, was born at Stregnäs, on the 20th March, 1799. He was educated at the University of Upsala, where he made his literary début in 1820, first under the pseudonym 'August,' in the 'Kalender für Dame,' and almost immediately afterwards by his 'Runesvärde, eller den förste Riddarn' ('The Runic Sword, or the First Knight'), a tragedy which manifested great power. His next production, which was illustrated with designs by his friend Baron von Hamilton, was that entitled 'Runor' (the 'Runes'), a series of sixteen legendary 'romants,' among which that which has for its subject Erik Vasa is the most interesting. Another production of the same kind, though founded not upon northern but southern story,—namely, his 'Enzio,' an historical lyric in eleven romants, appeared in a collection of poems by him in 1825-26; and in each of those years he obtained a prize medal from the Swedish academy, the latter of which was for his poem on the 'Death of Tasso,'—a subject previously treated with great beauty and energy by the Russian poet Batushkov. Admirable and touching as are the strains in which the tragic tale of 'King Enzio' are poured forth,—deep as is the pathos, rich as is the poetic colouring, pure and graceful as is the language,—this piece did not become a favourite with the public. It was however translated into German by Mohnke (1829), and the collection in which it appeared procured for its author the applause and patronage of the academy, which enabled him to travel and visit Italy in 1827. Of this journey the literary fruit was the poet's 'Minnen från Södern' ('Recollections of the South, after a Tour through Denmark, Germany, Switzerland, and Italy'). Its chief merit lies in the poetical pieces with which it is interspersed. Among his minor poetical compositions, that on 'Silence' is a piece of singular beauty and pathos. Nicander died February 7, 1839.

NICCOLA DI PISA, or PISA'NO, is a celebrated name in the history of art. He was among the very earliest restorers of sculpture: he quitted the hard, dry, and mechanical manner of his predecessors, and introduced a style which, though it falls short of the antique, was based upon similar principles, and in which he displayed a vigorous mind and much feeling, if not always the most refined taste. None of his biographers have been able to ascertain the precise date either of his birth or death; but he must have been born very near the commencement of the 13th century, as he was greatly advanced in age, and became quite decrepid in the year 1273, after which date no certain mention of him can be traced. That he had attained to great skill in his profession in 1225 may be taken for granted, as he was in that year employed to execute the 'arca' or tomb of San Domenico at Bologna, which he embellished with a series of bas-reliefs and figures truly admirable for that time. Several of these subjects are given by Ciognara, in his 'Storia della Scultura,' and many of the heads and countenances are finely expressed. This work clearly shows that Niccola had diligently studied the antique, and also that he must then have been almost in the maturity of his powers. For a description of and remarks on this masterly production, we refer to Ciognara and to Moronna's 'Pisa Illustrata.'

Nicola appears to have continued at Bologna till 1231, when he began the celebrated church of San Antonio, or Il Santo, at Padua, which acquired for him no less fame as an architect. He had previously given evidence of his skill in architecture by the church and convent of San Domenico at Bologna, which were designed by him during his residence in that city, and supposed to have been his first works of the kind. Immediately after completing the building at Padua, he was engaged to erect the church Dei Frari at Venice, and his reputation as an architect became so great that he was successively employed on many other buildings at Florence, Pistoja, Volterra, Naples, and in his native city. Among those which he executed at Florence, the most celebrated is the church and monastery of Santa Trinita, which edifice was extolled by Michel Angelo as one of surpassing excellence for its simple grandeur and the nobleness of its

MUG. DIV. VOL. IV.

proportions. He begun the cathedral of Pistoja in 1240, and likewise improved and embellished that at Volterra. At Arezzo, the convent of S. Domenico,—at Viterbo, the church and convent of the Dominicans, where he did much in the way of repairs and restorations,—and at Naples, the Church of Lorenzo, besides the magnificent abbey on the plain of Tagliacozzo, erected by Charles I. of Anjou (1268) in commemoration of his decisive victory over Corradino, and thence called Santa Maria della Vittoria,—testify to the repute in which his architectural talents were held and how extensively he was employed. Besides the Palazzo degli Anziani and S. Michele, among the edifices by him at Pisa the most noted is the campanile of S. Niccola, or the Augustines, which is an octangular structure externally, except at its upper story, which has sixteen sides, with as many arches springing from columns, and forming an open gallery around it, and above this is a lesser story crowned by a short spire, or rather a steep roof, where the octagonal form is resumed. The interior is circular, and forms an open well-staircase with arches resting upon columns, of which latter there are altogether four and twenty, fifteen of oriental granite, and the rest of various marbles. Moronna gives an elevation and section of this structure, but they are so wretchedly executed, that they cannot be relied upon for anything further than the general idea and shape of the design.

Another very celebrated work by him at Pisa, though of a different class, is the pulpit in the Baptistery—a hexagon supported on seven columns, there being one in the centre beneath it, besides those at the angles. It was executed by him in 1260; and in 1266 he was employed to make another for the cathedral at Sienna, which latter is considerably larger and richer, and octagonal in plan, so that instead of five there are seven sides occupied with compartments, in bas-relief, and likewise nine columns instead of seven. Had he produced nothing else, these two works alone (as to which Ciognara enters into a minute description), would suffice to establish Niccola's fame as a sculptor, and show the great perfection to which he advanced the art from what he found it in the hands of his immediate predecessors. Another work, of which the historian of Italian sculpture speaks at great length, is the representation of the Last Judgment and Inferno, in the façade of the Duomo of Orvieto, which has been generally attributed to Niccola, but is asserted by that critic to have been the production of

GIOVANNI DI PISA, the son and pupil of Niccola. He may have been born somewhere about 1235, as at the time of his death, in 1320, he is said to have been 'vechissimo,' exceedingly old. We may at least suppose him to have been nearly twenty-five when he was invited to Perugia to erect a splendid monument to Urban IV., who died in that city in 1264. That work gave such satisfaction, that he was employed also upon the embellishments of the fountain in front of the Duomo, wherein he displayed extraordinary ability in the architecture, the sculpture, and the bronze. Scarcely had he completed this work, when his father died, and he returned to Pisa to take possession of his patrimony. One of the first tasks committed to him by his fellow-citizens was that of adorning the small but celebrated church of Santa Maria della Spina, one of the richest and most remarkable specimens of its peculiar gothic style in Italy. For the façade and other parts of the exterior he executed a number of statues, bas-reliefs, and other ornaments of sculpture, and is said in one of the figures to have portrayed his father Niccola. What he there did however were merely the embellishments to a building, in which others shared with him; but it was not long before opportunity was afforded him of displaying his architectural ability on an ample scale, for in 1273 he began, and in 1283 completed, the renowned Campo Santo, or cemetery, one of the most remarkable monuments of its period, and that which, together with the adjacent cathedral, campanile, and baptistery, offers a most interesting group of studies to the architect. The edifice is of marble, and forms a cloister of sixty-two arches (five at each end and twenty-six on each side), inclosing the inner area or burial-ground; but neither this latter nor the exterior is a perfect parallelogram, the cloister being fifteen feet longer on one side than on the other, namely 430 and 415 feet, and consequently the ends not at right angles to the sides. This defect would almost seem to have been occasioned by oversight, as it could not have been worth while to sacrifice regularity for the sake of a few feet.

After this, according to Vasari, he went to Sienna, where he made a model or design for the façade of the Duomo; this however is questionable. One of the first commissions he received after finishing the Campo Santo was from Charles I. of Anjou, who invited him to Naples, where he erected the Castel Nuovo, and built Santa Maria Novella. In 1286 he was employed to erect the high altar in the Duomo at Arezzo, an exceedingly sumptuous work, in the Tedesco style, with a profusion of figures and sculptures, all in marble. This work, and his Virgin and Child, on one side of the cathedral of Florence, are reckoned by Ciognara as his best productions; but another of great celebrity is the marble pulpit by him in the church of San Andrea, at Pistoja, which, like that by Niccola in the Duomo at Pisa, is a hexagon supported by seven columns. He also executed many of the sculptures of the Duomo of Orvieto, where he employed various assistants and pupils, some of the latter of whom afterwards became celebrated, particularly Agostino and Agnolo di Sienna. At the instance of the Perugians, he returned to their city, and executed the mausoleum of Benedict XI. He was also invited by the citizens

21

of Prato, in 1309, to build the Capella della Cintola, and to enlarge their Duomo. Loaded with honours and distinctions as well as years, he in 1320 closed his life in his native city, and was there buried within that monument which he had himself constructed about forty years before, the Campo Santo, which for others was a burying-place, for himself a mausoleum.

NICEPHORUS, born in 758, was the son of Theodorus, the chief secretary of state to the Emperor Constantine V., and was made patriarch of Constantinople in the year 806. He warmly defended the worship of images against the Iconoclasts, and was consequently banished to the convent of St. Theodore, on one of the islands of the Propontis, by the emperor Leo the Armenian, in 816. He died in his retirement in June 828. Nicephorus wrote several historical and theological works. 1. 'Chronographia Brevis,' being a short chronicle of events from the beginning of the world to the time of the author's death, with the series of kings, emperors, patriarchs, bishops, &c. It was translated into Latin, and published with notes, by Father Goar, Paris, 1652. 2. 'Breviarium Historicum,' or historical abridgment from the end of Maurice's reign, 603, till the beginning of the reign of Irene and her son Constantine, 780. Father Petau published a Latin translation of it in 1616, and M. Cousin has given a French translation of it in the third volume of his 'History of Constantinople.' Both the above works of Nicephorus form part of the collection of the 'Byzantine Historians.' 3. 'Stichometria Librorum Sacrorum,' or enumeration of the books of Scripture, with the number of verses in each, inserted in the eighth volume of Pearson's 'Critici Sacri.' 4. Several treatises against the Iconoclasts. 5. Seventeen canons inserted in the Collection of Councils and other 'Opuscula.' The 'Life of the Patriarch Nicephorus,' by Ignatius, a contemporary writer, has been translated into Latin, and inserted in the 'Acta Sanctorum.' Nicephorus is numbered among the saints both of the Greek and Roman Church.

NICEPHORUS I., Emperor of Constantinople, was Logotheta, or intendant of the finances of the empire under the reign of the Empress Irene and of her son Constantine VI., in the latter part of the 8th century. Irene, having deprived her son of his eyes, usurped the throne. After reigning alone for six years a conspiracy broke out against her, headed by Nicephorus, who was proclaimed emperor, and crowned at Santa Sophia in 802. He banished Irene to the island of Lesbos, where she lived and died in a state of destitution. The troops in Asia revolted against Nicephorus, who showed himself avaricious and cruel, and proclaimed the patrician Bardanes emperor; but Nicephorus defeated and seized Bardanes, confined him to a monastery, and deprived him of his sight. The Empress Irene had consented to pay an annual tribute to the Saracens, in order to stop their incursions into the territories of the empire; but Nicephorus refused to continue the payment, and wrote a message of defiance to the kalif Harun-al-Rashid. The kalif collected a vast army, which devastated Asia Minor, and destroyed the city of Heraclea on the coast of the Euxine. Nicephorus was obliged to sue for peace and pay tribute to the kalif. In an attack which the emperor made on the Bulgarians he was utterly defeated by them and killed, July 25, 811. His son Stauracius succeeded him, but reigned only six months, and was succeeded by Michael Rhangabe, master of the palace.

NICEPHORUS II. (called PHOCAS, but who must not be confounded with the usurper Phocas, who reigned in the beginning of the 7th century) was descended of a noble Byzantine family, and distinguished himself as a commander in the field. After the death of Romanus II., in 959, his widow Theophano, who was accused of having poisoned him, reigned as guardian to her infant son, but finding herself insecure on the throne, she invited Nicephorus to come to Constantinople, and promised him her hand. Nicephorus came, married Theophano, and assumed the title of Augustus, in 963. He repeatedly attacked the Saracens, and drove them out of Cilicia and part of Syria. In 968, Otho I., emperor of Germany, sent an embassy to Nicephorus, who received it in an uncivil manner. [LUITFRANDUS.] But his avarice made him unpopular, and his wife, the unprincipled Theophano, having formed an intrigue with John Zimisceas, an Armenian officer, conspired with him against her husband. Zimisceas, with other conspirators, was introduced at night into the bedchamber of the emperor, whom they murdered, in 969.

NICEPHORUS III., called BOTANIATES, an old officer of some military reputation in the Byzantine army in Asia, revolted against the emperor Michael Duca in 1078, and with a body of troops, chiefly composed of Turkish mercenaries, marched to Calchedon, upon which Michael resigned the purple, and Nicephorus was proclaimed emperor at Constantinople. Michael was sent to a monastery with the title of Archbishop of Ephesus. Another aspirant to the throne, Nicephorus Bryennius, was defeated, taken prisoner, and deprived of his sight. A fresh insurrection, led by Basilacius, was likewise put down by the troops of Nicephorus under the command of Alexis Comnenus. Alexis himself, who had an hereditary claim to the throne, was soon afterwards proclaimed emperor by the soldiers. Having entered Constantinople by surprise, he seized Nicephorus and banished him to a monastery, where he died soon after, in 1081. [ALEXIS COMNENUS.]

NICESTRATUS, a physician mentioned by Dioscorides ('Præf.' lib. i. p. 2, ed. Spreng.), as one of the followers of Aesclepiades, who attended particularly to materia medica. None of his writings remain, but his

prescriptions are several times mentioned by Galen ('Opera,' ed. Kühn, t. xii. p. 634; t. xiii. pp. 87, 96, 98, 110, 180, 232, 233; t. xiv. p. 197), and once by Pliny ('Hist. Nat.' l. xxiii. c. 31). We learn from Celsus Aurelianus ('Morb. Chron.' l. ii. c. 5) that he wrote also on cataplepy. He flourished about the year a.c. 40.

NICERON, JEAN-PIERRE, was born at Paris in 1685. He entered the regular order of Barnabites, and devoted himself to the study of languages and biography. He led a life without incident, and died at Paris on the 8th of July 1738. He is chiefly known as the author—or in some parts rather the compiler—of 'Mémoires pour servir à l'Histoire des Hommes Illustres dans la République des Lettres,' of which thirty-nine volumes were published by Nicéron, and four were added after his death. All who have had occasion to study the earlier literary history of France must be under obligations to this laborious and meritorious work. Its merits are never very high in criticism, philosophy, or the essential elements of spirited and descriptive biography. Nicéron was however a curious and laborious reader, and in those instances where he exhibits the fruit of his own original research, his matter is highly valuable. Many of the lives however are mere compilations from other sources, and appear to have been hastily prepared to suit the order of publication. There is little attempt at a proportional distribution of space, secondary authors sometimes receiving notices as elaborate as the most distinguished men of their age. This is a defect sometimes not unpleasing, as it generally attends enthusiasm in some particular walk of literature, and marks the original investigator. Nicéron published some translations from the English. (*Mémoires*, tom. xl. 379-396; *Nouveau Dictionnaire Historique*.)

NICE'TAS, a physician of Constantinople, supposed to have lived in the reign of Isaac Comnenus, about the middle of the 11th century, of whom nothing is known, except that he formed the collection of surgical works that bears his name. It exists at present only in manuscript, of which there are three copies, one at Florence and two at Paris; but part of it was published at Florence, 1754, folio, with the title 'Græcorum Chirurgici Libri, Sorani unus de Fracturarum Signis, Orisæii duo de Fractis et de Luxatis: e Collectione Nicetas ab antiquissimo et optimo codice Florentino descripti, conversi, atque editi ab Antonio Cocchio,' &c. Perhaps he is the person to whom Theophrastus's fifty-fifth letter is addressed, who is styled "Physician to the King." (*Fabr. Bibl. Gr.*; *Haller, Bibl. Chirurg.*)

NICETAS, ACOMINATUS. [BYZANTINE HISTORIANS, vol. i. col. 1070.]

NICHOLAS I., a Deacon of Rome, was elected pope, mainly through the influence of the emperor Louis II., who was then at Rome, in April 858, and was consecrated in St. Peter's church in presence of the emperor. The new pope sent legates to Constantinople to urge the emperor Michael III. to restore Ignatius to the patriarchal see, into which Photius had intruded himself, and at the same time to reclaim the dioceses of Illyricum, Apulia, Calabria, and Sicily, which the court of Constantinople had detached from the see of Rome during the schism of the Iconoclasts, and which, after that schism had been put down by the Eastern emperors, had not been restored. (Thomasin, 'Discipline de l'Eglise,' vol. i.) The allegiance paid by the Roman pontiffs to Charlemagne and his successors as emperors of the West had greatly widened the breach between the Roman see and the Byzantines, and the schism of Photius completed the separation of the two churches. Nicholas excommunicated Photius, who in return, at a council assembled at Constantinople, anathematized Nicholas and his followers, asserting at the same time, that "since the seat of the empire had been removed from Rome to Constantinople, the primacy and privileges enjoyed till then by the Roman see had become transferred unto that of the new capital." The legates of Nicholas returned to Rome without effecting anything. In the year 865 Nicholas had the satisfaction of receiving into the bosom of the church Bogoris, king of the Bulgarians, with part of his nation. But on the other side he involved himself in a serious dispute with his former patron the emperor Louis, on account of Lotharius, king of Lorraine, having repudiated Theobert his wife and married his concubine Waldrada. The pope had appointed the archbishops of Treves and Cologne as his legates to examine into the affair; but the legates, in a council held at Metz in 863, obtained a decision in favour of Lotharius, upon which Nicholas assembled a council at Rome in 864, in which the two archbishops were deposed, and Lotharius's divorce and marriage were declared null. The emperor Louis took the part of the archbishops, and marched with troops to Rome to oblige the pope to revoke the sentence. An affray took place in front of St. Peter's church between the soldiers of the emperor and the pope's followers, but the emperor soon after consented to withdraw his troops. In 867, Basil the Macedonian having murdered the emperor Michael, succeeded him on the throne, and shortly after restored Ignatius to the patriarchal see and banished Photius. Nicholas himself died at Rome, November 13, 867, and was succeeded by Adrian II. Nicholas has left a number of letters upon questions of church doctrine and discipline, which are inserted in Colet's 'Collection of Councils.'

NICHOLAS II., Gerard of Burgundy, succeeded Stephen IX. as pope in 1059. An opposite faction chose John bishop of Velletri, who took the name of Benedict X., but the council of Sutri disavowed him, and Benedict was obliged to resign his claim. Nicholas assembled a

council at Rome which passed a decree concerning the mode of electing the pope. This important decree is in the Collection of councils, and also in Muratori's 'Rerum Italicarum Scriptores.' Nicholas entered into negotiations with the Normans, who had occupied Southern Italy, and bestowed on Robert Guiscard the duchy of Apulia and Calabria, as a fief of the Roman see. He died soon after, in 1061, and was succeeded by Alexander II.

NICHOLAS III., Giovanni Gaetani, of a noble Roman family, succeeded John XXI. in 1277. He prevailed on the emperor Rudolf of Habsburg, who was little acquainted with Italian affairs, to confirm the various grants of territory alleged to have been made to the see of Rome by former emperors, and the Exarchate of Ravenna among the rest. (Fontanini, 'Del Dominio Temporale della Santa Chiesa,' and his controversy with Muratori on the subject.) Nicholas quarrelled with Charles of Anjou, king of Naples, and deprived him of the dignity of senator of Rome. He has been accused of nepotism, that is to say, of having enriched his nephews and other relatives. He died in 1280, and was succeeded by Martin IV.

NICHOLAS IV., a Franciscan monk, and a native of Ascoli in the Marche, was raised to the papal see after the death of Honorius IV. in 1288. He favoured the pretensions of Charles II. of Anjou upon the island of Sicily, and excommunicated James of Aragon and his partisans in that island. He received an embassy from a Tartar khan who promised to assist the Christians in the recovery of Palestine. Nicholas died in 1292, and was succeeded by Celestine V. Nicholas left several theological works.

NICHOLAS V., TOMMASO DA SERRAVALLE, was elected pope after the death of Eugenius IV. in 1447. He soon after terminated the schism in the Western Church by prevailing upon Felix V., who had been elected pope by the council of Basel in 1439, to abdicate in his favour, and thus restore peace to the Christian world: Felix did this with a good grace in the year 1449. [AMADEUS VIII.] At the same time, as if influenced by the example of the heads of the church, the sovereigns and states of Italy seemed for awhile to forget their feuds, and Italy enjoyed several years of internal peace, a rare occurrence in the history of the middle ages. The pope, who was a patron of learning, availed himself of this period of repose to collect books and manuscripts, and to have translations made of the Greek classics and of the fathers of the Eastern Church; he received and patronised learned men from various countries, and especially from Greece, at that time overpowered and devastated by the Turks; and he embellished Rome with sumptuous as well as useful buildings. He enlarged the university, restored the bridges as well as the aqueduct of the Acqua Vergine, and founded the Vatican library. In 1450 he proclaimed a jubilee, which drew a prodigious number of strangers to Rome. In March 1452, Frederic III. of Germany came to Rome, where he was crowned by the pope with the crown of Lombardy; after the coronation he married Leonora of Portugal, and both Frederic and his consort received the imperial crown from the hands of the pontiff. In the following year, 1453, the news of the taking of Constantinople by the Turks deeply affected Nicholas, who had urged the Christian princes to succour the Byzantines, and who now impressed with great earnestness upon the Italian and other states the necessity of giving up their mutual jealousies and forming a league for their common defence against the Ottomans. He also corresponded with Mahomet II. Nicholas died in March 1455, at fifty-seven years of age. He is one of the most distinguished individuals who have filled the Papal chair, and he was free from the charge of nepotism. He was succeeded by Calixtus III.

NICHOLLS, CHARLOTTE. [BRONTË, CHARLOTTE.]

\*NICHOLLS, SIR GEORGE. In looking at the lives of men who have made great discoveries in science, accomplished remarkable improvements in art, or carried out important principles of social reform, not being led to their inquiries and pursuits in the ordinary range of professional avocations, we shall find that some accidental circumstance, very frequently of local position, has determined the course of their usefulness. The early training of Sir George Nicholls, beyond giving him habits of prudence, firmness, and self-reliance, would not appear such as would have formed one who has been foremost in originating and superintending that great change in the condition of society, the present system of Poor Law Administration in England and Ireland. Born in 1781, the son of Solomon Nicholls, Esq., of St. Kevern, Cornwall, who was of an ancient family in that county, and educated at Helstone Grammar-school, under Dr. Otter, afterwards bishop of Chichester, and at Newton Abbot, Devonshire; he entered the maritime service of the East India Company at the age of fifteen. In 1809 he commanded a ship; in 1815 he quitted the service. The middle period of life thus reached, with few opportunities of intercourse with the humbler classes, Mr. Nicholls, after his marriage with the daughter of Brook Maltby, Esq., of Southwell, in Nottinghamshire, in 1813, and upon his retirement from the navy, settled at Southwell. He was here to furnish an example of what an observant, active, and benevolent resident in a country town can do for the improvement of the population, and through such an example for the surrounding district. In 1821 Mr. Nicholls undertook the then very unpleasant office of overseer of the poor of Southwell. The parish contained 3000 inhabitants. The land was rated at 19s. 6d. in the pound; the buildings at

18s. The annual sum actually spent in parochial relief was above 2000*l.* In this parish, as in almost every other in England, the workhouse was the resort of the idle and profligate of both sexes; the sums raised by the heavy tax upon capital and industry were lavished upon all applicants by a bench of magistrates; nearly the whole labouring population were paupers. The stocking-makers of the town, the farmers' labourers, instead of living upon their independent earnings, had their wages eked out by the paupers' rate. Mr. Nicholls saw the evil, and determined to apply a remedy. He called public attention to the subject by eight letters, signed "An Overseer," published in 'The Nottingham Journal;' which were afterwards republished as a pamphlet. But no mere economy would have effected a cure for this wide-spread disease. Mr. Nicholls may be considered the discoverer of the principle which was to form one of the main correctives of the pauperism which had reached so fearful an extent. He has himself described it. "This principle consisted in so regulating the distribution of parish relief, as to ensure its non-acceptance unless under circumstances of actual want, such want being at the same time always certain of finding the relief of which it stood in need. A well-regulated workhouse answers these two conditions." Mr. Nicholls left Southwell soon after 1823; but in three years the rates had been nearly reduced to one-fourth of their former amount. More important still, the aged and infirm were better cared for; the poor children were educated; and when, after a short period of absence, he returned to visit his old neighbours, "he was greeted in the market-place by a number of labourers with expressions of hearty good-will, and with declarations of his having been their best friend, for that he had compelled them to take care of themselves."

From 1827 to 1834 Mr. Nicholls was occupied in a position of responsibility, which was a fit preparation for his more important public labours—he was superintendent of the Branch Bank of England at Birmingham. The large financial questions with which he thus became familiar were of essential service when, in 1834, he was appointed one of the commissioners under the Poor Law Amendment Act. Never was any appointment more honestly made, with the determination to have the right man in the right place. Mr. Nicholls had most effective colleagues in Sir Frankland Lewis and Mr. John Lefevre, with Mr. Chadwick as secretary. The progress of this great reform has been most clearly and impartially traced in 'A History of the English Poor Law,' by Sir George Nicholls. In January 1836 the active mind of the early reformer of a parish extended to the possibility of alleviating the miseries of a kingdom. Mr. Nicholls submitted to Lord John Russell 'Suggestions' for the application of the amended Poor Law to Ireland, with various modifications. A commission had been occupied three years in preparing a 'Report upon the condition of the poorer classes in Ireland.' Their recommendations were so complicated and impracticable that the government could not venture to prepare a measure founded upon them. In August 1836 Mr. Nicholls was directed to proceed to Ireland, to inquire into all the various circumstances bearing upon this great and difficult question. On the 15th of November he delivered his first report. It was finally adopted by the cabinet, and a bill founded upon it was introduced in parliament. It had passed through various stages, when the death of William IV. suspended all measures in progress. Mr. Nicholls again visited Ireland, and prepared a second report in 1837. In 1838 he made a tour through Holland and Belgium in company with Dr. Kay, to obtain information as to the management of the poor in those countries, in connection with the subject of an Irish Poor Law. After a violent opposition in the House of Lords, the 'Act for the more effectual relief of the Poor in Ireland' was passed, in July 1838. The working of the new system was intrusted to Mr. Nicholls, with four assistant-commissioners. The energy and prudence of the commissioner were essentially needed to encounter the severe trials to which a measure so opposed to the habits of the Irish people, yet so calculated to advance their social well-being, was exposed in its first stages.

Mr. Nicholls after a few years returned to his position in the administration of the English Poor Law; but upon the new organization of a 'Poor Law Board,' under a president having a seat in parliament, he became secretary. In 1843 he received the honour of Companion of the Bath; and upon his retirement from office in 1851, that of Knight-Companion. Sir George Nicholls has most worthily employed his comparative leisure by writing the 'History of the English Poor Law,' in 2 vols. 1854; the 'History of the Scotch Poor Law,' in 1 vol. 1856; and the 'History of the Irish Poor Law,' 1 vol. 1856. These works exhibit the whole course of legislation on this important branch of social economy, "in connection with the condition of the people." The same powers of labour, the same good sense, the same practical benevolence, which the author has manifested in his life of public activity, are displayed in these fruits of his retirement—valuable to the statesman, the lawyer, and the historical student—especially valuable to all who are engaged in the local administration of laws, which so materially affect the safety and prosperity of the kingdom. [See SUPPLEMENT.]

NICHOLS, JOHN, the printer, was born at Islington in 1745. He was originally intended for the navy, but the death of a relation led his friends to change their design, and when not quite thirteen he was placed with Bowyer, "the last of the learned printers." [BOWYER, WILLIAM.] He soon gained the confidence of his master, and was

intrusted by him with the management of his printing-office. In 1766 he was taken into partnership by Mr. Bowyer, and on Mr. Bowyer's death in 1777, the whole business fell into his hands.

From this period may be dated the commencement of that career of literary exertion which was pursued with an ardour that was unabating to the close of his life. We can only enumerate a few of the prominent and celebrated works of which he was the author or editor as well as printer (for according to his own enumeration they had amounted, in 1812, to fifty-seven). In 1782 he published a quarto volume, entitled 'Biographical and literary Anecdotes of William Bowyer, Printer, F.S.A., and of many of his Learned Friends,' a work which, far more than any other work of his time, and far more than any work which had appeared since the 'Athenæ Oxonienses' of Anthony Wood, abounded in biographical information at once for the most part authentic and original. This work, many years after, was recast and greatly enlarged, appearing in six octavo volumes, entitled 'Literary Anecdotes of the Eighteenth Century,' in 1812, to which two supplementary volumes were added, and they have been followed at intervals by seven large octavo volumes more, of the same kind of material, with the new title, 'Illustrations of Literary History.' These works form a fund on which critics in time to come will draw for accounts of the county in the 18th and beginning of the 19th centuries, just as the 'Athenæ' is the fund of biographical knowledge for the men of the 16th and 17th centuries. But after all something more is wanted than both these works supply. This however is the work on which Mr. Nichols's literary reputation will chiefly rest; and next to it may be placed his 'History of the County of Leicester,' which is in eight large folio volumes, and was in course of publication from 1796 to 1811. The work is in general exact and accurate, but the author seems not to have known so well what might be omitted in a work of that nature, as what ought to find a place in it. To the people of the county it must be invaluable. In 1788 he published, in two volumes quarto, 'The Progresses and Processions of Queen Elizabeth,' an original and happy conception, affording an opportunity for the introduction of much minute historical information, and much that illustrates the manners of a period on which we always look with a peculiar kind of interest. In 1797 he published 'Illustrations of the Manners and Expenses of Antient Times in England.'

It will be seen by what has been said that the turn of Mr. Nichols's mind was to that species of literature which is called antiquarian, but which is in fact minute history, dealing with equal attention, and often it must be admitted with little power of selection or discrimination, with things of modern and of ancient date. The same turn of mind is perceptible in two other publications of Mr. Nichols's. The first of these was entitled by him 'Bibliotheca Topographica Britannica.' It consists of tracts in English history and topography, printed by him from originals, and extends, when the set is complete, to eight or ten quarto volumes, bound variously; and there is a Supplement, which may or may not be regarded as part of the work. The other work, which was strictly periodical, is 'The Gentleman's Magazine,' which passed, in a great measure, into the hands of Mr. Nichols in 1778, remained under his direction till the time of his death; and was then continued in like manner by his son. He greatly raised the reputation of the work, and during the more vigorous period of his management it was remarkable for the value of some of the articles which it contained, and for the preservation of a multitude of minute pieces of information, likely to be of great value to the future inquirer into the literary or political history of the period.

Mr. Nichols passed a life honourable as it was useful, and happy as it was industrious; experiencing only one calamity besides such as ordinarily fall to the lot of human nature, but that a severe one,—the destruction by fire of his printing-office and warehouses, with the whole of their contents, on the 8th of February 1808. He died in 1826.

\* NICHOLS, JOHN GOUGH, the grandson of the preceding, was born in London in 1806, and was educated at Merchant Taylors' School. He inherited a taste for antiquarian and topographical researches, and became early a fellow of the Antiquarian Society, to whose publications he has been a frequent and valuable contributor. His first separate publication was a collection of 'Fac-similes of Autographs of Royal, Noble, Learned, and Remarkable Personages, conspicuous in English History, from the Reign of Richard II. to that of Charles II., with Biographical Memoirs,' 4to, 1829. In 1834 he issued a new edition, in 8 vols. 8vo, of the 'Collectanea Topographica et Genealogica,' first edited by Sir F. Madden. In 1841 he prepared for the Ashmolean Society 'The Unton Inventories,' with a memoir of the Unton family. His next publications were—'Examples of Encaustic Tiles,' 4to, 1842; 'The Fishmongers' Pageant on Lord Mayor's Day,' fol., 1844; and 'The Topographer and Genealogist,' 1846. He then commenced editing a series of interesting works for the Camden Society, among which are—'The Chronicle of Calais,' 1846; 'Inventories of the Wardrobe, &c., of H. Fitzroy, Duke of Richmond; and of the Wardrobe Stuff at Baynard's Castle of the Princess Dowager,' 1847; 'The Diary of H. Machyn,' 1848; 'The Chronicle of Queen Jane,' 1850; and 'The Chronicle of the Grey Friars, of London,' 1852. He also published in 1849 a translation from Erasmus of his 'Pilgrimages to Walsingham and Canterbury,' and in 1852 he edited and published 'The Literary Remains of J. S. Hardy.' For many years also he was the chief

manager of, and an active contributor to, 'The Gentleman's Magazine,' in which the valuable obituaries are said to have owed much to his care in selection and in obtaining correct information. This position he resigned in 1856, but has since furnished its pages with 'The Autobiography of Sylvanus Urban, Gent.,' an interesting detail of matters and persons connected with that long-established periodical, particularly in the earlier stage of its existence.

NICIAS (*Nicias*), a distinguished Athenian general and statesman, the rival of Cleon and Alcibiades, was the son of Niceratus, a lessee of the silver-mines at Laureium, from whom he derived great wealth. In early life he obtained a certain amount of consideration, and acquired some military reputation; but he seems to have been even then noted for caution rather than daring in war, and for prudence verging on timidity in civil affairs. According to Plutarch, being afraid of accusers, he purchased their silence by bribes; and whereas Pericles by his virtue only and great eloquence ruled the people, Nicias, in default of these commanding qualities, sought to win their favour by liberality and sumptuousness in providing public games and entertainments, and by costly sacrifices. When choregus, he not only conducted the chorus to Delos with unusual splendour, but, after the ceremonies were concluded, erected a bronze palm-tree, which he dedicated to Apollo, with a tract of land that cost him 10,000 drachmas, the proceeds of which were to be laid out by the Delians upon an annual sacrifice and feast, in which they were to pray for the prosperity of Nicias as the founder.

Having joined himself to the aristocratic party, he on the death of Pericles was put forward as the chief opponent of Cleon, and elected to various offices: but even here he let his wariness overrule his ambition, for not only was he careful not to seek the more prominent posts, but managed even to avoid engaging in any enterprises where much risk was to be run. This is the statement of his gainsayers; but, looking at the various accounts of his conduct, it would appear that he shrunk from the danger to which the men distinguished by unusual honours were at that time exposed in Athens, and was willing to work his way more slowly to the higher dignities, and disarm opposition as far as possible by his mild and apparently unambitious demeanour, rather than by sudden success to challenge general enmity. Perhaps it was with this view that he kept himself from places of popular concourse, and even from indulgence in the usual social intercourse; though we are told he was careful, through his dependents, to let it be known that it was from his devotion to the public concerns that he was compelled to live so reserved and laborious a life. His gravity of manners extended also to his religion. Every day it was said he sacrificed to the gods, and he kept a soothsayer in his house that he might consult their will as well in the public as in his private affairs. Many statues of the gods erected by him were remaining in Athens even in Plutarch's time. These two qualities of his—his prudence and his devotion, or, as they were termed by his enemies, his timidity and his superstition—afforded ample materials for the sarcasms of the comic poets from Aristophanes downwards.

But Nicias's caution in his earlier years stood him in good stead in his military career. There, being coupled with considerable military skill, constant watchfulness, and a bravery that in action was never wanting, it secured him almost invariably ultimate success. One of the most famous of his early successes was his capture of the island of Minoa, B.C. 427. In B.C. 426 he obtained a considerable victory at Melos, and ravaged the coasts of Locria. He was one of the board of generals at the siege of Sphacteria, and he it was who urged that Cleon should be called upon to make good his boast of being able to take the island, and bring all the Spartans on it prisoners to Athens in twenty days. [CLEON.] Cleon's success increased the growing feeling against the diffidence of Nicias, but he retrieved his popularity by a successful inroad into Corinth (B.C. 425), defeating the Corinthians in a pitched battle, and extending his ravages to Epidauria. He next, B.C. 424, captured the island of Cythera, amerced the inhabitants in a tribute of four talents, and placed over them an Athenian garrison; then ravaged the coasts of Laconia; and, having taken Thyrea, he burnt the city, and carried the Ægineteans, whom the Spartans had settled there, to Athens, where they were all put to death. The next year, being sent with Nicostratus to Chalcidice, he took Mende, and laid siege to Scione.

The death of Cleon having removed his most powerful rival, and broken the spirit of the war party, Nicias found little difficulty in persuading the Athenians to agree to terms of peace, while the death of Brasidas had removed the chief obstacle to its acceptance by the Spartans. Nicias, as now their chief statesman, and also as being acceptable to the Spartans, whose esteem he had secured by his generous treatment of the Spartan prisoners, was commissioned to conclude the treaty on the part of Athens. Notwithstanding the efforts of Alcibiades, he succeeded in concluding, B.C. 421, a treaty in which the Athenians and Spartans agreed to a suspension of hostilities for fifty years. This, from his share in bringing it about, was called the Peace of Nicias.

Alcibiades now came more prominently forward as the head of the great democratic party, and he made it the chief object of his policy to induce the Athenians to break through the peace which Nicias and the aristocratic party had accomplished. For the next five or six years the history of Athens is a history of the struggle of the two

parties in this matter. Under ALCIBIADES we have related at sufficient length the circumstances and the result of the vote of ostracism, which was carried with a view to the removal of one or other of these leaders, but which, by a sudden combination of both parties—each being at the moment doubtful of the issue—resulted in directing the votes against Hyperbolus, the successor of Cleon as the leader of a third or extreme democratic party. The machinations of Alcibiades having at length succeeded in putting an end to the peace, it was, in spite of the most energetic protests on the part of Nicias, determined to send an expedition against Sicily; and Nicias, Alcibiades, and Lamachus, were appointed to conduct it. It was in vain that Nicias remonstrated against the whole proceeding, and urged his ill-health as a reason for his not being sent in command. He was compelled to go, and after the recall of Alcibiades to answer the charge of profanation, the chief conduct of the expedition—which he had come now to deem utterly hopeless—devolved upon him. He appears indeed to have become both mentally and physically unequal to an undertaking which would have tasked the energies of a far greater general. Had his conduct been always such as it now was, he might well be stigmatised as both timid and superstitious, but he really appears to have been weighed down by disease and hopeless depression.

In the spring of B.C. 414, Nicias having embarked his troops at Catania, landed a party of them in the Bay of Thapsus, north of Syracuse, which, without being perceived, ascended the heights of the Epipolis, took possession of them, and built there a fort which they called Labdulum. They then began to build a wall from Port Trogilius to the Great Harbour, so as to enclose Syracuse on the land side whilst their fleet blockaded it by sea. In executing this work, Lamachus was killed in a fight against a party of Syracusans. In the mean time Gylippus, the Spartan commander, arrived in Sicily, collected some troops from Gela, Selinus, and other towns allied to Syracuse—marched towards Epipolis, seized the fort Labdulum, and annoyed the Athenians in their encampment. The Syracusans now attacked the Athenian fleet at the entrance of the Great Harbour: the fight was not decisive; but Gylippus, with his land forces, surprised the forts which the Athenians had raised on the peninsula of Plemmyrium. Another sea-fight took place, in which the Athenian galleys were worsted. Soon after Demosthenes and Eurymedon arrived from Athens with a new fleet of 73 galleys and about 8000 soldiers. Demosthenes attacked the heights of Epipolis by night, but was repulsed with great loss. Gylippus went round to the Sicilian towns to collect fresh forces against the Athenians. After several discordant councils among the Athenian generals, who saw their land troops dwindle away both by sickness and by the hand of the enemy, who was superior to them in cavalry, he was resolved to embark the soldiers secretly and sail away with the fleet. Nicias, though as we have seen never sanguine about the success of the expedition, now opposed the raising of the siege from a feeling of honour, as well as from fear of responsibility, but at last gave way to the opinion of his brother-commanders. An eclipse of the moon however being interpreted by the soothsayers as an injunction of the gods that the army should not depart till the next full moon, Nicias gave in his adhesion to their decision, and the last chance of escape from destruction was lost. The Syracusans having heard of this determination, made demonstrations against the Athenian camp, and at the same time attacked their fleet in the Great Harbour and defeated it. The Syracusans then blocked up the entrance of the Great Harbour by means of galleys and other vessels lying at anchor and connected by means of chains, and thus shut up the Athenians. Nicias then resolved to fight his way out with the fleet. The Athenian vessels were heavy—those of the Syracusans light; the former, in trying to break through the chain, got crowded in one mass, and became unmanageable; the crews were exposed to showers of stones from the enemy, and at last the Athenian fleet was driven against the shore, and the greater part of it was taken or sunk. There remained 60 vessels, with which Demosthenes proposed to escape, whilst the Syracusans in their rejoicing were off their guard; but the sailors were discouraged, and refused to sail. At last the Athenians resolved to abandon their remaining vessels and stores, their sick and wounded, and retire by land to Catania. The army broke up on the third day after the sea-fight in two bodies, with the baggage in the centre. After crossing the Anapus they were much harassed in the plain by the Syracusan cavalry and light troops, and after short marches and continual fighting for several days the corps of Demosthenes, which was in the rear, was surrounded and overpowered; part of the Sicilian auxiliaries who served with the Athenians were allowed to return to their homes, and the rest of the soldiers, about 6000, surrendered at discretion, and were taken prisoners with Demosthenes to Syracuse. Nicias, who had throughout these evil days displayed the most heroic bravery, and incessantly endeavoured to sustain the courage of his soldiers, arrived that very evening on the banks of the Erineus, and, crossing the river, encamped on a mountain. The next day he was informed of the surrender of Demosthenes, and was himself attacked. After fighting all that day, his men having neither provisions nor water, he moved on the following morning and reached the river Asinarus, where, the men rushing to the water to drink, the Syracusans fell upon them and slaughtered them without resistance. After a great massacre, Nicias, seeing no chance of safety, implored Gylippus to

stop the slaughter; and the order being given to that effect, the survivors were taken prisoners to Syracuse. Of 40,000 men who had been engaged in the expedition, all were killed or taken prisoners, and not one of 200 vessels returned to Athens.

Of the prisoners, all the free-born Athenians, and the Sicilians who were with them, were confined in the quarries; the rest, servants, followers of the camp, &c., were sold as slaves. Nicias and Demosthenes were put to death. The prisoners in the quarries receiving but a small pittance of barley-bread and water, and having no shelter by day or night, diseases broke out among them. The bodies of the dead were left to putrefy among the living, and this created contagion, of which most of them perished. Thus ended this formidable expedition, the ill success of which broke down the power of Athens, and had a great influence on the result of the Peloponnesian war. At Athens the news of the loss of that magnificent armament excited the bitterest grief, and, though he had constantly foretold the result, the public indignation was chiefly directed against Nicias. On the monument raised to the memory of those who fell in Sicily, the name of Demosthenes was inscribed, but that of Nicias was omitted.

(Plutarch, *Nicias*; Thucydides, vi., vii.; Thirlwall, *Hist. of Greece*, vol. iii.; Grote—who has judged Nicias very severely—*Hist. of Greece*, vols. vi., vii.)

NICIAS is the name commonly given to the physician of Pyrrhus, king of Epirus, who went to Fabricius, the Roman consul, offering for a certain reward to take off his master by poison, A.U.C. 474, B.C. 280. Fabricius not only rejected his offer with indignation, but immediately sent him back to the king with notice of his treachery; and Pyrrhus, upon receiving the information, is said to have cried out, "This is that Fabricius whom it is harder to turn aside from justice and honour than to divert the sun from its course." (Eutropius, lib. ii., cap. 14.) Zonaras adds ('*Annal.*' tom. ii., p. 50, l. 10, ed. Basil., 1557) that Nicias was put to death, and his skin used to cover the seat of a chair.

Historians (as was hinted above) are not agreed as to the traitor's name. He is called Nicias by Claudius Quadrigarius (ap. Aul. Gell., lib. iii., cap. 8) and Zonaras (tom. ii., p. 48, l. 45), and Cineas by Ælian ('*Var. Hist.*' lib. xii., cap. 33). But Ammianus Marcellinus (lib. xxx., cap. 1), Valerius Antias (ap. Aul. Gell., lib. iii., cap. 8), and Valerius Maximus (lib. vi., cap. 5, § 1) tell the story of one of the friends of Pyrrhus, whom the first-named author calls Demochares, and the two others Timochares.

NICIAS (*Nicias*) of Athens, the son of Nicomedes, and the pupil of Antidotus, was one of the most celebrated painters of antiquity. He was, though probably younger, contemporary with Apelles. His particular excellence was in the general effect of the picture: in elegant design, in beautiful colour, and in effective chiaroscuro; in fact in the characteristic qualities of the Bolognese school subsequent to the Caracci. He also excelled in painting females; but this would be the necessary result of his mastery over the instrumental and technical parts of art.

It is remarkable, that though Athens was so long the principal seat of the arts among the Greeks, about two centuries, Nicias and Apollodorus are the only two Greek painters of the greatest fame who were natives of Athens. Yet the case is very similar with modern Rome; of all the great painters of that central city of art, two only were natives—Giulio Pippi, called Romano, and Carlo Maratti.

The most celebrated work of Nicias was the *Nekyia*, or the region of the shades, of Homer ('*Necromantia Homeri*'); from the passage of the *Odyssey* where Ulysses invokes the shades of the dead. Nicias, says Plutarch, refused to sell this picture to Ptolemy I., of Egypt, who offered him sixty talents for it; he presented it to his native city, Athens. If Plutarch speaks here of the Attic talent, the price offered was enormous, though not unprecedented in ancient times—nearly 15,000*l.* according to the received computation of Attic money; but if the Egyptian talent is signified, which is however unlikely, the amount would be diminished to nearly one-fourth.

Nicias must have been old when Ptolemy was king of Egypt; and from his refusal of this offer, probably very rich also, as Pliny says he was. Ptolemy ascended the throne of Egypt in 306 B.C., and Nicias, about half a century earlier, was employed by Praxiteles to colour some of his statues. Pliny intimates a doubt whether the same artist in these two cases is alluded to; and Sillig, in his '*Catalogus Artifum*,' has concluded that they cannot be the same. Only one Nicias, however, is known and spoken of by ancient authors; and the only reason for doubting the identity of these two is founded on Pliny's method of assigning their dates to artists and their scholars, mentioning only a single year or olympiad for each, which, vaguely expressed as it always is, need not give us the exact time of an artist within half a century. If we consider such a given date as the commencement of his career, we make him probably contemporary with a generation of artists who succeeded him; and if as the end of his career, as probably with one which preceded him; but if we presume such date to be the middle of his career, he may still have been born half a century before it, and may have painted pictures a quarter of a century after it. Thus if we suppose Nicias, when he refused to sell his picture to Ptolemy, to have been about seventy years of age, and he was doubtless old, with such a reputation and such independence, he may very easily have many years before painted the statues of Praxi-

teles. Praxiteles flourished, according to Pliny, in Olymp. 104; and if this date is to be understood as the beginning of his career, he was essentially the contemporary of Nicias; and if as the middle, he was about one generation his senior. This is in all probability the case; for it reconciles all the facts recorded of Nicias, and it is much more probable that Praxiteles would employ a young man to colour his statues for him, who was only rising in his profession, than a great painter, his equal in age and reputation. Statue-painters, *εγκαυσταί* *εγκαυσταί*, constituted apparently a class of themselves, and Nicias may have been one of these in his youth: this is more probable than that one of the greatest painters of his time should be thus employed. One of Sillig's difficulties in identifying these two as one, is, that Nicias was the pupil of the pupil of Euphranor, who was the contemporary of Praxiteles. It is a mere assumption however to suppose that there must necessarily be a generation between master and pupil; the master is frequently only a very few years older than his pupil, and is sometimes even younger. But if we suppose that Nicias was a generation younger than Praxiteles, there is not the slightest difficulty in the way of his having been the pupil of the pupil of a contemporary of Praxiteles.

Nicias painted in encaustic, and besides the one already mentioned Pliny notices the following pictures by him:—an Alexander (Paris), a sitting Calypso, an Io, an Andromeda, and another Calypso, in the hall of Pompey; a Bacchus, a Diana, and a Hyacinthus, in the temple of Concord. The Hyacinthus was brought to Rome by Augustus from Alexandria, and was consecrated afterwards by Tiberius in the temple of Augustus, on account of his great delight in it: it is mentioned by Pausanias (iii. 19), who says that the figure of Hyacinthus was very elegant.

Augustus dedicated and fixed in the wall also a picture by Nicias in the Curia Julia, of Nemea sitting on a lion, holding in her hand a palm twig; and by her side was standing an old man, resting upon his staff; above him was hanging a picture of a Biga. It was brought from Asia by Silanus, and was most probably the same of which a Teutonic ambassador, being asked his opinion, said, according to Pliny, "That he would not have him even if he were real and living," alluding to the old man with his staff: entirely overlooking the art which embodied the picture, and measuring the man apparently by his sinews. Lessing ('Laocoon,' p. 280, note) proposes to substitute in the place of the 'picture of the Biga' ('*tabula bigæ*'), hanging above the man's head, which he supposes to be a corruption of the text, a 'name tablet,' called by the Greeks *πρυχίον*. Nicias wrote on this picture that he had burnt it in, *Nicias ἐνέκαυσεν*, that is painted it in encaustic. These words were, in the opinion of Lessing, written upon the small painted tablet which was hanging over the head of the old man—*cujus supra caput tabula bigæ dependet*. Nicias scripsit *se inuasiase*; *tali enim usus est verbo*. The passage is obscure; only one picture is spoken of, the words '*tabula bigæ*' may be corrupt; it is certainly difficult to give them a suitable meaning. The Bigæ, says Lessing, can have no respect to the Nemean games, because in them four-horse chariots were used. (Schmidius, 'in Prol. ad Nemeonias,' p. 2.)

Nicias painted also the interiors of tombs, as that of Megabysus, high priest of Ephesus, and one at Tritea. Pausanias says, before you come to Tritea from Phars there was a sepulchre of white marble, which was particularly worthy of inspection on account of the paintings of Nicias upon it—a beautiful young woman was represented seated on an ivory chair, and behind her was a female servant holding an umbrella; a beardless youth also was standing near her, dressed in purple; by the youth was an attendant with hunting spears and a leash of dogs (Nicias was, according to Pausanias, the most excellent animal painter of his time); the names of these people were not known: Pausanias supposed them to be man and wife. Nicias was honoured with a public burial, and was interred in the road from Athens to the Academy, the cemetery of all great Athenians: Pausanias notices his tomb there. He appears to have been a very studious and absent man. Elian says he used to forget to take his meals ('Var. Hist.,' iii. 81).

It has been said above that Nicias painted some of the statues of Praxiteles: this requires some explanation. Pliny relates that Praxiteles being asked which of his marble statues he preferred, answered, "those which Nicias had had a hand in; so much did he attribute to his *circumlitio*." This word '*circumlitio*' has been variously interpreted: Fusell supposed it signified the outlining of the clay model; but Pliny is speaking of marble statues, and the *circumlitio* must have been some superficial application, and cannot be applied to a correction of form; the question is also about a process which the marble statues have undergone at the hands of a painter. Cicero has "*Perseæ mortuæ cera circumlitos condunt*." ('In Tusc.,' l. 45.) There is a prejudice against the idea that the Greeks painted their statues; that they did so however is an indisputable fact, though it was not a universal practice. The statue-painters, *οἱ ἀρδιδότας γράφορες*, as Plato calls them, are definitely spoken of by Plutarch ('De Glor. Athen.' 6), as *Ἀγαλμάτων ἐγκαυσταί*—the encaustic painters of statues—and the art itself as *Ἀγαλμάτων ἐγκαυσις*. Statues seem to have been sometimes entirely painted, which appears from the following words of Plato ('De Republ.' iv. 420. c.). He observes, in speaking of statue-painters—"It is not by applying a rich or beautiful colour to any particular

part, but by giving every part its local colour, that the whole is made beautiful." That it was not however the common practice to paint the marble entirely is evident from the conversation between Lycinus and Aristrotus, in the dialogue of the 'Portraits,' or 'Panthea,' in Lucian; from which it is plain the Venus of Cnidus, by Praxiteles, and other celebrated statues, were not painted, though parts may have been coloured, and the whole body covered with an encaustic varnish. (Lucian, 'Imag.' 5-8.)

We may infer therefore in this case that the '*circumlitio*' of Nicias, applied to the marble statues of Praxiteles, was the *Ἀγαλμάτων ἐγκαυσις* of Plutarch, and that Nicias was himself an *Ἀγαλμάτων ἐγκαυστής*, or painter of statues, in his youth. In his '*circumlitio*' the naked form was probably merely varnished, the colouring being applied only to the eyes, eye-brows, and lips, to the hair, the draperies, and the various ornaments of dress; and there can be little doubt that marble statues, especially of females, must have had a very beautiful appearance when carefully coloured in this way.

(See *Dictionary of Greek and Roman Antiquities*, article *Painting*, (*Pictura* in 2nd edit.), by the author of this article; Pliny, *Hist. Nat.*, xxxv. 10, 38-40; Pausanias, i. 29, iii. 19, vii. 22; Plutarch, *Mor.* 'Epicurus,' c. II.; Junius, *Catalogus Artificum*.)

NICOLAI, CHRISTOPHER FREDERIK, a writer to whom German literature is greatly indebted, not only on account of what he himself contributed to it from his own pen, but also what he did for it by establishing several critical journals, and exciting the talents of others. He was born at Berlin, March 18th, 1733, where his father was a bookseller. At the age of sixteen, just as he was beginning to make some proficiency in his studies, he was obliged to abandon them, being sent to Frankfurt-on-the-Oder for the purpose of learning the bookselling trade; yet such was his eagerness for information, his love of reading, and his perseverance, that he employed every moment of leisure, his evenings and the early part of every morning, in study, and, without other assistance than that of books, made himself a proficient in Greek, Latin, and English, and likewise acquired a knowledge of some parts of mathematics and philosophy. He was an instance of what may be accomplished by self-instruction, which, great as may be the disadvantages it has to contend with, has that in its favour which all advantages can hardly make amends for, namely, willingness and resolution to learn; while at the same time, if it occasionally may lead astray, self-instruction leads also to numerous inquiries that never present themselves to those who merely proceed along the path chalked out for them.

On his return to Berlin, in 1752, his attention to business did not interrupt his self-imposed studies, of which both English and German poetry then formed a considerable share; and in 1755 he produced his '*Letters*,' wherein he impartially discussed the pretensions of the two literary sects headed by Bodmer and Gottsched. This work excited considerable attention, and led to his intimacy with Lessing and Moses Mendelssohn. After the death of his father, he withdrew himself from the business, leaving it to his brother, and determined to content himself with his own slender means, in preference to the pecuniary advantages to be reaped by sacrificing his literary leisure and enjoyment. The unexpected death however of his elder brother, in 1758, put an end to this short interval of tranquil study, he being obliged to carry on the business for the benefit of the family in general. But while on the one hand this only increased his diligence and economy of time, it led, on the other, to entering upon literary plans which he had before projected. In conjunction with Mendelssohn he had already commenced (1757) the '*Bibliothek der Schönen Wissenschaften*,' one of the earliest and best belles-lettres journals in the language, which was afterwards continued, till the end of 1805, under the title of the '*Neue Bibliothek*,' &c. With Lessing and Mendelssohn he established, in 1759, the '*Briefe der Neuesten Literatur*;' and in 1765 projected the '*Allgemeine Deutsche Bibliothek*,' of which periodical he continued to be editor till it reached its 107th volume. He did not contribute much to it himself, but the management alone of such a periodical, so eminently useful in its day, shows him to have been most indefatigable, as in the meanwhile, notwithstanding all his other avocations, he produced many original works. Among them are his '*Anecdotes of Frederick the Great*,' 1788; an excellent and elaborate '*Description of Berlin and Potsdam*,' 3 vols., 1786; the '*Life and Opinions of Sebaldus Nothanker*,' 1793, a sort of novel, which went through many editions, and was translated into English, French, Dutch, Danish, and Swedish; '*Life and Opinions of Sempronius Gundibert*,' 1793, intended to set the doctrines of Kant and his disciples in a ridiculous light. Besides these, his '*Essay on the Templars*,' his '*Remarks on the History of the Rosicrucians and Freemasons*,' his '*Tour through Germany*,' &c., to say nothing of a number of smaller pieces contributed by him to different journals, prove the variety of his information and the activity of his mind. He died in 1811, at the age of seventy-eight.

NICOLAS I., PAVLOVICH, Emperor of Russia (styled also Czar and Autocrat of All the Russias), was born in the city of St. Petersburg, July 7, 1796 (June 25, Old Style). He was the third son of the Emperor Paul, Alexander I. having been the first son, and the Grand Duke Constantine the second son. His mother, Sophie Dorothea, a daughter of Friedrich Eugen, duke of Württemberg, when she became the second wife of the Emperor Paul, became also a member of the

Greek Church, and, as is the usage, changed her names to those of Maria Feodorowna.

The Emperor Paul having been assassinated March 28, 1801, Nicolas was left entirely to the care of his mother, who appointed General Lamsdorf his governor, and selected the Countess Lieven and the German philologist Adelung as his principal teachers in languages and literature, and Counsellor Storch as his instructor in general politics and other sciences and arts suitable to his rank and station. He acquired the power of speaking the French and German languages with as much facility as the Russian, and early manifested that preference for military display, military tactics, and the art of fortification, which distinguished him through life.

After the termination of the great European war in 1814, Nicolas was sent to travel, and visited some of the principal battle-fields. In 1816 he came to England, where he met with a cordial reception. He afterwards made a tour in the chief provinces of the Russian empire. On the 18th of July 1817 he married Frederica-Louisa-Charlotte-Wilhelmina, eldest daughter of Frederic William III, king of Prussia, and sister of Frederic William IV, the present king. She was born July 13, 1798, and her distinguishing name was Charlotte, but on her marriage and entering the Greek Church she assumed the names of Alexandra Feodorowna.

The Emperor Alexander I. having no issue, his next brother Constantine was the legitimate heir to the throne; but, by a document signed August 28, 1823, Constantine renounced his right, reserving to himself the dignity of Viceroy of Poland; so that, when Alexander died at Taganrog, December 1, 1825, Nicolas immediately succeeded him. He did not however become emperor without a struggle attended with much danger. An extensive conspiracy had been organised a considerable time before the death of Alexander among the officers of the Russian army and those of the nobility who were friendly to a constitutional government; and the soldiers and people were taught to believe that the abdication of the Grand Duke Constantine had been obtained by forcible means. When the troops were assembled in the great square fronting the Imperial Winter Palace of St. Petersburg, in order to make a manifestation of their allegiance to the new emperor, the officers, just as the ceremony was about to commence, stepping forward out of the ranks, denounced Nicolas as a usurper, and proclaimed Constantine as their rightful czar. The soldiers followed their officers, with cries of "Constantine and the Constitution!" Milardowich, governor of St. Petersburg, a veteran favourite of the army, and the archbishop, in his ecclesiastical robes, endeavoured to suppress the hostile demonstration, but in vain, and the people showed signs of sympathising with the troops. At this critical moment Nicolas came forward, and, boldly confronting the officers and soldiers, called out with a loud voice, "Return to your ranks—obey—kneel!" The czar's majestic form and undaunted bearing, his pale but calm and stern countenance, and the reverence with which the Russians habitually regard their sovereign, caused most of the soldiers to kneel and ground their arms. The first outbreak was thus checked, but the conspiracy was not suppressed till artillery and musketry had poured freely their missiles of destruction among the gathering masses of the insurrectionists. Colonel Pestel and four other leaders of the conspiracy were executed. Others were sent to the mines of Siberia, where Nicolas continued their punishments with unappeasable severity. [CONSTANTINE PAVLOVICH.] He was crowned at Moscow with great pomp and ceremony, September 3, 1826; and at Warsaw, May 24, 1829.

Soon after his coronation, in 1826, the Emperor Nicolas commenced a war with the Shah of Persia, which lasted till the victory over the Persians by Field-Marshal Paskevich, February 28, 1828, led to the treaty of Turkmanchai, by which the Shah, besides undertaking to pay about three millions sterling, ceded to Russia the provinces of Erivan and the countries situated on the lower Kour and the Aras. A war between Russia and Turkey ensued in 1828, during which the Russian army crossed the Danube and took the fortresses of Braila and Varna. In the campaign of 1829, General Diebitch took the fortress of Silistria, defeated the main army of the Turks at Shumla, crossed the Balkan, and advanced to Adrianople, where a treaty of peace was signed September 14, 1829. By this treaty, Nicolas obtained for Russia, besides a large sum as indemnification for the expenses of the war, liberty to trade in all parts of the Turkish empire, trading navigation on the Danube, free passage of the Dardanelles, the fortress and pashalic of Anapa on the eastern coast of the Black Sea, and other additions of territory as well as of political power.

On the 29th of November 1830 an insurrection broke out in Poland. The Polish troops having joined the insurrectionists, the Grand-Duke Constantine, as commander-in-chief, was allowed to retire from Poland with 8000 Russians. In January 1831 the Polish Diet declared the throne vacant, organised a national government under Prince Adam Czartoryski, and prepared for a vigorous defence of their country. They assembled about 60,000 troops; but the Russian armies which advanced against them numbered about 180,000, and had about 400 pieces of artillery. The Poles fought bravely, and were successful in several actions, but sustained an enormous loss at the battle of Ostrolenka, May 26, 1831. The Prussian government prevented the Poles getting supplies of arms and ammunition across their frontier, while the Russians were allowed to have magazines within the Prussian

territory. General Diebitch died suddenly on the 9th of June, and was succeeded by Paskevich. Warsaw was besieged on the 6th of September, and surrendered on the 8th. The failure of this insurrection was disastrous to the Poles. The Emperor Nicolas treated them with rigorous severity: several were sent to the mines of Siberia, and many to serve as soldiers in the Caucasus; the Polish constitution was formally abrogated; the chief universities were suppressed, and the libraries removed to St. Petersburg; and on the 17th of March 1832, by a decree of the emperor, the kingdom of Poland was incorporated with the Russian empire.

In 1837 the Emperor Nicolas made a tour in his Trans-Caucasian provinces. He travelled with great rapidity, but remained at Tiflis from the 20th to the 24th of October, reviewed the troops, gave dinners and a grand ball, and held a levee, which was attended by all persons of distinction in the provinces. He paid a visit of inspection to the fortress of Gumri, since named Alexandropol, near the frontier of Turkish Armenia, and about 45 miles E. by N. from Kara. It was then in process of construction, and is now a fortified position of great strength either for defence or offence against the Turks in Asia Minor. A desultory conflict was at this period carried on between the Russians and Circassians, but in 1839 war was formally declared by Russia against the Circassians, and has continued with little intermission ever since. In 1844 the Emperor Nicolas paid a second visit to England, and was entertained by Queen Victoria at Buckingham Palace and Windsor Castle from the 1st to the 9th of June. In 1849 he sent a Russian army into Hungary in aid of the Austrians, and the subjugation of that country was accomplished in the month of August of that year.

The last and most important event in the reign of the Emperor Nicolas was the recent war with Turkey and the Western Powers. It was the only unsuccessful and disastrous war in which he had engaged, and the reverse his army experienced probably occasioned a degree of excitement and irritation which shortened his life. It was commenced by the emperor's minister Mensikoff in March 1853 demanding a right of protectorate over those subjects of the sultan who belong to the Greek Church. The claim was refused, and a Russian army occupied Moldavia and Wallachia as a 'material guarantee' for enforcing it. In October the same year the Porte declared war against Russia, and applied to France and England for their promised aid. A Turkish army under Omer Pasha occupied Shumla and the fortresses on the Danube; in November he threw a body of troops across the river opposite Widin, and fortified a position at Oltenitza, on the left bank, which was retained till the termination of the war. The destruction of the Turkish fleet at Sinope in the same month was followed by the advance of the French and English fleets into the Black Sea. The English and French armies were next landed and encamped near Constantinople, whence they removed to the vicinity of Varna. In March 1854 the Russian army crossed the Danube, and besieged the fortress of Silistria, but after great efforts and an enormous loss of men was compelled to raise the siege on the 15th of June, and to retreat across the Danube. The Anglo-French army landed in the Crimea Sept. 14, 1854; won the battle of the Alma; by a flank march seized a position on the south side of Sebastopol, and commenced the siege, which, after a severe struggle, the facts of which are well known, was terminated on the 8th and 9th of September 1855, by the capture of the town and all the forts on the southern side of the harbour of Sebastopol.

Meantime, before this great feat had been accomplished, the Emperor Nicolas died at St. Petersburg on the 2nd of March 1855, and was succeeded by the present Emperor Alexander II. The Empress Alexandra survives him, and he has left issue four sons and two daughters: Alexander, born April 29, 1818; Maria, born Aug. 18, 1819; Olga, born Sept. 11, 1822; Constantine, born Sept. 21, 1827; Nicolas, born Aug. 8, 1831; and Michael, born Oct. 25, 1832.

The Emperor Nicolas was upwards of six feet in height, muscular and well-proportioned, with handsome features. In his personal habits he was simple, abstemious, and indefatigably industrious. He had a taste for the fine arts, and for music, and is stated to have composed some military airs; but his favourite pursuits were connected with the military sciences and military operations. In his political principles he was professedly despotic. He had been heard to say, "Despotism is the very essence of my government, and it suits the genius of my land." The great objects of his public life were the increase of the power of Russia and the extension of her territories to the east, west, and south, by unscrupulous diplomacy, and when that failed, by war. His grand purpose is now known to have been the possession of Constantinople. By means of that unrivalled military and political position, he trusted to have superseded the Sultan in his empire, and to have become the dominant power in Europe and Asia.

NICOLAS, SIR NICOLAS HARRIS was born on March 10, 1799, the fourth son of John Harris Nicolas of Cornwall. He entered the navy early, and attained the rank of lieutenant on September 15, 1815, after having distinguished himself in the capture of several vessels on the coast of Calabria. As he ceased to be employed after the close of the war he turned his attention to antiquarian literature, and his first production was 'The Life of William Davison, Secretary of State and Privy Councillor to Queen Elizabeth,' published in 1823, occasioned probably by his having married in 1822 a daughter of John

Davison, a descendant of the family of the secretary. He had entered himself at the Middle Temple, and in 1825 he was called to the bar, but his practice was almost entirely confined to claims of peerage before the House of Lords. About the same time he became a Fellow of the Society of Antiquaries, a member of the council, and a frequent contributor to the 'Archæologia,' but he soon disagreed with them, and wrote several pamphlets against the administration of the affairs of the society, and also pointing out defects in the proceedings of the Record Commission. His industry was extraordinary, and though many of the works he published were those of others, such as 'The Poetical Rhapsody, and other poems by Francis Davison,' reprinted from the edition of 1608; 'The Literary Remains of Lady Jane Grey,' 'Journal of the Embassy of Thomas Beckington to France in 1442,' 'The Siege of Carverock,' 'The History of the Battle of Agincourt,' 'The Privy Purse Expenses of Henry VIII from November 1529 to December 1552,' 'A Chronicle of London from 1089 to 1483,' from manuscripts in the British Museum; 'Memoirs of Lady Fanshawe, written by herself,' and others; they were all so enriched with memoirs of the persons mentioned, with annotations and other matters, as to assume the character of original works, and are all highly valuable to the historical student. In 1826 he became joint editor with Henry Southern of the new series of the 'Retrospective Review,' of which however only six numbers were published.

Among his most generally useful historical works are—'Notitia Historica, containing Tables, Calendars, and Miscellaneous Information for the Use of Historians, Antiquaries, and the Legal Profession,' 8vo, 1824; afterwards remodelled for 'Lardner's Cabinet Cyclopædia,' under the title of 'The Chronology of History; containing Tables, Calculations, and Statements indispensable for Ascertaining the Dates of Historical Events, and of Public and Private Documents, from the earliest period to the present time,' 1835, a most valuable work, which has been more than once reprinted. In his 'Controversy between Sir Robert Grosvenor and Sir Richard Scrope in the Courts of Chivalry, A.D. 1385-1389,' a magnificent work in 2 vols. 8vo, but which was never completed, he had given a memoir of Geoffrey Chaucer; this he afterwards extended to a life, to accompany Pickering's Aldine edition of Chaucer's 'Works,' by far the best life which had hitherto appeared. For the same work he also furnished lives of the Earl of Surrey, Sir Thomas Wyatt, Collins, Cowper, Thomson, Burns, and Henry Kirke White. In 1844 he published 'The Despatches and Letters of Admiral Lord Viscount Nelson,' in 7 vols. 8vo. He had also commenced 'The History of the British Navy,' of which he only lived to complete two volumes. Among his numerous other works were several on the statutes of various orders of knighthood, for which in 1831 he was made a knight of the Hanoverian Guelphic Order, and in 1832 chancellor of the Ionian Order of St. Michael and St. George. After a life of indefatigable industry, spent in producing works nearly every one of which has great historical or professional merit, he died at Cape Curé, near Dalmagne, on August 3, 1848.

#### NICOLAUS DAMASCENUS. [DAMASCENUS, NICOLAUS.]

NICOLAUS MYREPSUS (Gr., *δ μυρεψός*, 'the ointment-maker'), author of a work, 'De Compositione Medicamentorum,' written in Greek, but of which hitherto only a Latin translation has been published. Very little is known of the events of his life, and of this little the greater part is to be gleaned from hints and expressions scattered up and down in his own work. He is generally considered to be the last of the Greek medical writers (if indeed, as Friend says, his barbarous language deserves to be called Greek), and his date can be ascertained with tolerable precision. His work was probably compiled towards the end of the 13th century, A.D., as he is quoted by Petrus de Abano, who died in 1316, and also by Matthæus Sylvaticus and Franciscus de Pede Montium, both of whom were physicians to Robert king of Naples, and wrote very early in his reign, which began in 1309. He himself mentions Mesue (sec. xxxii. cap. 117), who lived in the 12th century; Michael Angelus, who is probably the first emperor of the Palæologi, and began to reign in 1260 (sec. i. cap. 295); Pope Nicolas (sec. ii. cap. 9), who seems to be the third of that name, and who died in 1280; and Joannes Actuarius (called 'Dominus' Joannes, sec. x. cap. 103; and 'Magister' Joannes, sec. xxxii. cap. 99), who is generally supposed to have flourished in the 13th century. He appears to have visited or lived at Nicæa (sec. xxiv. cap. 12) and Alexandria (sec. i. cap. 241; sec. xvii. cap. 17; sec. xxiv. cap. 85), whence he is sometimes called Nicolaus 'Alexandrinus;' he afterwards settled at Constantinople, where he attained the dignity of Actuarius (Georg. Acropol.). Several passages in his work prove that he practised as a physician (sec. i. cap. 66; sec. xvii. cap. 17, &c.), and Georgius Acropolita, his contemporary, mentions him ('Hist. Byz.' ed. Paris, fol. 1651, cap. 39, p. 34) as eminent in his profession, but as very ignorant of natural philosophy.

He was evidently a person of great piety, as appears throughout the whole of his work, though in many places it deserves rather to be called the most absurd superstition. He orders the patient in some places (sec. i. cap. 419, and sec. i. cap. 405) to repeat three "Paters, Credos, and Aves;" he often prescribes the baptismal water (sec. vii. cap. 6; sec. xiv. cap. 8, &c.) as a powerful medicine; he directs a verse out of the Psalms (sec. i. cap. 405) to be "written on paper on the first day of the week before sunrise, and to be tied on the right arm," as a remedy against menorrhagia; and many other examples of

the like or even greater absurdity might be given (sec. xxxvii. caps. 66 and 67; sec. i. cap. 405, &c.). Though a great part of the work is sensible enough, yet upon the whole it is not of much value. It consists of an immense number of medical formulæ, arranged alphabetically, and divided into forty-eight sections; it is almost entirely a compilation from other works, especially from Nicolaus Præpositus; the names of the medicines are often very much corrupted, and the author now and then falls into great mistakes from ignorance of the language of the writers whom he quotes. It was translated from the Greek by Leonhardus Fuchsius, and first published, Basil, fol. 1540; it is inserted in the second volume of the 'Medicæ Artis Principes,' Paris, ap. H. Stephanum, fol. 1567; the best edition is that published, Norimb. 8vo, 1658.

NICOLAUS PRÆPOSITUS, called also 'Salernitanus,' was at the head of the famous medical school at Salerno about the beginning of the 12th century, and has left behind him a treatise on the composition of medicines under the title of 'Antidotarium.' This has very often been confounded with a work on the same subject by Nicolaus Myrepsus, who indeed must either have copied a great portion of his book from Nicolaus Præpositus, or else they both drew their materials from some common source. It may be useful to mention the marks by which the two works may be distinguished. The treatise of Nicolaus Præpositus is much shorter than that of Nicolaus Myrepsus, and contains only about 140 or 150 formulæ, in alphabetical order; whereas the other consists of more than 1000, and is divided into forty-eight sections. Nicolaus Præpositus has prefixed a short preface to his work; in Nicolaus Myrepsus there is none. Nicolaus Myrepsus often quotes several prescriptions for the same remedy; Nicolaus Præpositus never more than one. Both works begin with the 'Aurea Alexandrina,' but the formulæ are often very different. This work is of very little value, and contains many absurdities, though with the exception of Mesue, perhaps no work of the kind enjoyed a higher reputation during the middle ages. It has been several times reprinted; the first edition was published, Venet., 1471, fol., in the editio princeps of Mesue, to whose works it has generally been appended. (Choulant, *Handb. der Bücherkunde für die Art. Medicin.*)

NICOLAY, BARON LUDWIG HEINRICH, born at Strasbourg December 29th, 1737, was, though not of first-rate talent, one of the most pleasing among the minor poets of Germany. His style is easy and natural, his versification flowing, and his narrative interesting. All these qualities display themselves in his 'Romantic Tales,' which, although their subjects are chiefly derived from Ariosto and Bojardo, are remodelled and treated with much originality, and manifest considerable fancy, skill in the management of the story, and truth of expression, both in the comic and serious parts. Of his abilities, both as a didactic and satiric writer, proof is afforded by his 'Poetical Epistles,' which have much of the spirit and gracefulness of Wieland, with not a little of his manner. His 'Fables' too, and minor 'Tales,' though not always of his own invention, show genuine talent, and frequently no small power of humour. Nicolay resided for the greater part of his life at St. Petersburg, where he was invited in 1769 to undertake the office of preceptor to the Grand-Duke (afterwards Emperor) Paul. Besides being honoured with several Russian orders, he was made Director of the Imperial Academy of Sciences in 1798, which office however he afterwards resigned, and in 1801 was raised to the rank of imperial privy-councillor. He died in 1820.

NICOLE, PIERRE, one of the distinguished recluses of Port-Royal, was born at Chartres on the 19th of October 1625. At the age of fourteen, when he is said to have had an ample command over Greek and Latin, he was sent to study at Paris, where he was persuaded to join the community of the Port-Royal. There he occupied himself in instructing the pupils confided to the institution. He formed an intimate acquaintance and a species of alliance with Anthony Arnauld, with whose fiery zeal and restless energy his placid disposition and clear systematic mind afforded a strong contrast. [ARNAULD, A.] The angry disputes regarding the five points of the Jansenists prompted him to remain for several years a simple clerk, but in 1676 he was induced to seek holy orders. He was refused the necessary consent however of the Bishop of Chartres, who disliked his opinions; and he was evidently rather rejoiced than saddened by an excuse for remaining in a position where he was not too near the van in the battle of controversy. In his own province however of a clerical or polemical logician, he was bold and uncompromising; and it was not from the defence of his principles, but their too conspicuous championship, that he shrunk. He was obliged in 1679 to retire from France, but returning soon afterwards, he entered with some keenness into two of the celebrated disputes of his age—that of the studies suited to monastic institutions, where he joined Mabillon in defending a devotion to science and learning in place of pure asceticism; and the discussion regarding quietism, in which he opposed the devotees of that mental epidemic. He was a man of simple habits and candid mind, and some ludicrous incidents have been told as arising out of his absent habits. He died on the 16th of November 1695.

Nicole's works are many and voluminous. He was the principal author of 'La Logique, ou l'Art de Penser' (1683), known as the Port-Royal Logic. Of the first three volumes of 'La Perpétuité de la Foi de l'Eglise Catholique touchant l'Eucharistie,' which is generally associated with the name of Arnauld, he is known to have been the

principal writer. Hume admired the logical clearness with which Nicole in this work showed the impossibility of one mind sufficiently examining all subjects connected with religion to form a creed for itself on the principle of private judgment; and stated that the difficulty so ingeniously set forth suggested to him the sceptical argument in his 'Dialogues on Natural Religion.' He wrote also 'Traité de l'Unité de l'Eglise;' 'Les Prétendus-Réformés convaincus de Schisme;' 'Les Lettres imaginaires et visionnaires,' &c. He was eminent as a translator and composer in Latin, and in 1659 published 'Epigrammatum Delectus.'

(Niseron, *Mémoires*, t. xxix. 285-333; *Nouv. Dict. Hist.*, &c.)

NICOLL, ROBERT, a poet distinguished by the precocity of his talents, was born at Tullybeltane, in Perthshire, on the 7th January, 1814. His parents were in too humble circumstances to afford him any education beyond the rudiments of reading and writing; and at a very early age he was set to the occupation of herding cattle. At the age of seventeen he was apprenticed to a grocer in Perth, and at the conclusion of his service endeavoured to earn a livelihood by keeping a circulating library in Dundee. During this interval he had been acquiring the elements of knowledge. He was a devourer of books, and at the age of twenty had acquired both knowledge and cultivation without being educated. In 1835 he published a small volume of 'Poems,' which became very popular, were extensively noticed by the newspaper press, and passed through three editions. They are less remarkable for energy or originality than as the fruit of a fine-toned and sensitive mind. In prose his writing was of a different character. In 1836 he undertook the editorship of the 'Leeds Times,' a paper of strongly liberal sentiments; and by the spirit and energy of his political articles, and their adaptation to the feelings of the surrounding community, he soon more than tripled the circulation of the paper. His early struggles had probably undermined his constitution, and he soon sank under the excitement of his editorial labours. When on his death-bed he was removed to the neighbourhood of Edinburgh, where, amidst the attentions of kind friends, he died on the 9th of December 1837, in his twenty-third year. (*Memoir*, by Mrs. Johnstone, prefixed to a third edition of his *Poems*.)

NICO'MACHUS, a physician of Stagira in Macedonia, and one of the family of the Aesclepiads, flourished about B.C. 400, 'Ol.' xcv. 1. He was the friend and physician of Amyntas, king of Macedonia, but is now only known as the father of Aristotle. (Ammonius, and Diogenes Laertius, in *Vita Aristot.*; Suidas, in voce *Nicomachus*.)

NICO'MACHUS (*Nuroμάχος*) of Thebes, son and pupil of Aristodemus, was a celebrated Greek painter, who lived between B.C. 360 and 300. He is classed by Cicero with Apelles and Protogenes, and his paintings are compared by Plutarch with the lines of Homer: he was the most celebrated of all the Greek painters for rapidity of execution. In illustration of the rapidity of his execution, Pliny mentions the decorations of the monument which Aristrotus, tyrant of Sicily, had erected in honour of the poet Telestes, which were executed in a few days by Nicomachus, with remarkable beauty, and to the entire satisfaction of Aristrotus, who shortly before was exceedingly angry with him, for, as he supposed, neglecting his contract, which was to have the tomb finished by a certain day.

The notices of Nicomachus are few, and what there are contain but little information about him. Pliny mentions by him—a Rape of Proserpine in the Temple of Minerva on the Capitol, hanging above the niche or shrine of Juventas or youth; a Victory in a quadriga, in the Capitol, which was dedicated by Planus; also Apollo and Diana; a Cybele, the mother of the gods, sitting upon a Lion; Bacchantes, with Satyrs creeping up to them; and a Scylla, which was in the Temple of Peace. Pliny notices also an unfinished picture of the Tyndarides by Nicomachus; he instances it as an example of the unfinished works of painters being in greater repute than their finished works, when left unfinished through death, or perhaps other circumstances impeding their completion: he mentions four pictures—the Tyndarides of Nicomachus, the Iris of Aristides, the Medea of Timomachus, and a Venus of Apelles. Nicomachus is the first who represented Ulysses with the pileus or cap of liberty. He is one of the painters who from an error of Pliny is said to have used only four colours. Cicero, in speaking of the cruder performances of the early artists, notices that in the works of Echio, Nicomachus, Protogenes, and Apelles, all things are perfect. He is, however, enumerated by Vitruvius among those artists who though of the greatest ability met with little substantial success in life. Stobæus relates of Nicomachus that, hearing some one say that he saw no beauty in the Helen of Zeuxis, he observed, "Take my eyes, and you will see a goddess." He had several scholars: Aristides, the celebrated painter, his brother; Aristocles, his son; Philoxenus of Eretria; Nicophanes; and a certain Corybas. Philoxenus imitated Nicomachus in celerity. Nicophanes was notorious for licentious pictures.

(Pliny, *Hist. Nat.* xxxv. 10, 36; 11, 40; Cicero, *Brutus*, 18; Plutarch, *Timol.* 36; Vitruvius, iii. *in proæm.*; Stobæus, *Serm.* 61.; Junius, *Catalogus Artificum*.)

NICOME'DES (*Nικαμήδης*), the name of several kings of Bithynia.

1. NICOMEDES I. succeeded his father Zibistes, B.C. 278. His succession was disputed by his brother Zibistes; and he called in the Gauls to support his claims, B.C. 277. With their assistance he was

BIOG. DIV. VOL. IV.

successful; but his allies became his masters, and the whole of Asia Minor was for a long time overrun by these barbarians. He probably died about B.C. 250, and was succeeded by his eldest son Zieias.

2. NICOMEDES II., surnamed Epiphanes, succeeded his father Prusias II., B.C. 149. He accompanied his father to Rome, B.C. 167, where he appears to have been brought up under the care of the senate. (Liv. xlv. 44.) Prusias becoming jealous of the popularity of his son, and anxious to secure the succession to his younger children, formed a plan for his assassination; but Nicomedes, having gained intelligence of his purpose, deprived his father of the throne, and subsequently put him to death. Nicomedes remained during the whole of his long reign a faithful ally, or rather obedient subject, of the Romans. He assisted the Romans in their war with Aristonicus, brother of Attalus, king of Pergamus, B.C. 181; and he was applied to by Marius for assistance during the Cimbric war, about B.C. 108. During the latter part of his reign, he was involved in a war with Mithridates, of which an account is given in the life of that monarch. [MITHRIDATES VI.] He died B.C. 91.

Coin of Nicomedes II.

British Museum. Actual size. Silver.

3. NICOMEDES III., surnamed Philopater, succeeded his father Nicomedes II., B.C. 91. During the first year of his reign, he was expelled from his kingdom by Mithridates, who placed upon the throne Socrates, the younger brother of Nicomedes. He was restored however to his kingdom in the following year by the Romans, who sent an army under Aquilius to support him. At the breaking out of the Mithridatic war, B.C. 88, Nicomedes took part with the Romans, but his army was completely defeated by the generals of Mithridates, near the river Annias, in Paphlagonia (Strabo, xii. p. 562); and he himself was again expelled from his kingdom, and obliged to take refuge in Italy. At the conclusion of the Mithridatic war, B.C. 84, Bithynia was restored to Nicomedes. He died B.C. 74, without children, and left his kingdom to the Romans.

NIEBUHR, CARSTEN, a celebrated modern traveller, and a native of the duchy of Lauenburg, on the southern confines of Holstein, was born March 17, 1733. His family had been farmers in easy circumstances, but he lost his parents early; and, through some mismanagement in the division of their property, he was so utterly deprived for a time of the means of continuing his education, that he passed several years of his youth in the condition of a mere peasant, and was even prevented from cultivating a taste for music, which had given him hopes of obtaining the situation of organist. But, in his twenty-first year, an occasion arose which elicited his natural energy of spirit, and decided the direction of his fortunes. Some legal proceedings rendering it necessary to employ a land-surveyor in his native district, he resolved to qualify himself for the office, and for this purpose applied zealously to the study of geometry. With the thirst of knowledge thus excited, being now of age to dispose of the wreck of his little patrimony, he was led to employ a portion of it in acquiring higher instructions in the mathematics, first at Hamburg, and subsequently in the university of Göttingen. Here, as his views enlarged and his pecuniary resources diminished, he gladly embraced an opportunity, in his twenty-fourth year, of entering the corps of Hanoverian engineers: but he was soon diverted from that service by an offer from the Danish government of employment in a scientific expedition to Arabia.

The idea of this enterprise, which forms the most honourable event in the reign of Frederic V. of Denmark, was suggested to his minister Count von Bernstorff, by the learned Michaëlis, for the purpose of illustrating some passages in the Old Testament; and the original project, which contemplated the mission only of a single Arabic scholar, was liberally extended by the Count to include a mathematician for purposes of astronomical and geographical observation, a naturalist, a draughtsman, and a physician. When the first of these appointments was offered to Niebuhr, he showed his conscientious character by stipulating for a delay of eighteen months, in order to improve his scientific qualifications. This period of preparation he employed chiefly in gaining practice as an astronomical observer, and also in studying Arabic for a time with Michaëlis; though, under that instructor, he made but small progress in overcoming the difficulties of a language which he afterwards learned to speak fluently in the country. He modestly declined the title of professor, not considering that his acquirements were sufficient for that distinction; and he accompanied the expedition therefore only as a lieutenant of engineers, in the capacity of mathematician or geographer, to which the Danish minister,

2 K

who had received some proofs of his disinterestedness in pecuniary affairs, added the responsible office of treasurer to the mission. Its other members were Frederic Christern von Haven, as professor of the Oriental languages, Peter Forskäl as naturalist, Christiern Charles Cramer as physician, and George William Baurenfeind as painter or draughtsman. By the royal instructions for the expedition, a perfect equality was established among the five members; and they were enjoined to decide every difference of opinion regarding their course by plurality of voices, or, if votes should be equal, by lot.

The expedition sailed from Copenhagen, in January 1761, in a frigate of the Danish royal navy, and arrived, not without some accidents, at Constantinople; whence, after a short residence, the travellers proceeded in a merchant vessel to Alexandria, ascended the Nile, and reached Cairo in November 1761. Having carefully explored the pyramids and other antiquities of Lower Egypt, they crossed the desert to Mount Sinai and Suez, embarked at that port in an Arab vessel, and landed at Loheia, in Arabia Felix, the destined seat of their mission, in December 1762. They crossed the country, mounted on asses, the usual conveyance, and after visiting several places of interest, finally arrived at Mocha, where the philologist Von Haven unfortunately died, in May 1763. The surviving travellers proceeding from thence to Sana, the capital of Yemen, were favourably received by the Imam; but they had meanwhile lost another of their number, the naturalist Forskäl, who died on the road. His companions returning to Mocha, there embarked in an English vessel for Bombay, on the voyage to which place the painter Baurenfeind expired; and at Bombay, Niebuhr had the affliction to bury the last of his fellow-travellers, the physician Cramer. The fact is admitted by Niebuhr, that his ill-fated friends persisted in living after the European manner under the burning sun of Arabia; and it may be surmised that they lost their lives through that disregard to necessary habits of abstinence for which the Danes in their tropical colonies are remarkable, even above all other northern people. Niebuhr himself, who had suffered severely from illness with the rest of his party, after their decease adopted the same diet as the natives of the countries in which he was travelling, and thenceforth enjoyed excellent health. Sailing from Bombay, he visited Persia, including the ruins of Persepolis; ascended the Euphrates; proceeded by way of Baghdad and Aleppo to the Syrian coast; embarked for Cyprus, returned from that island to the continent; saw Jerusalem and Damascus; passed through Aleppo, and over Asia Minor to Constantinople; and finally returned to Copenhagen, in November 1767. The whole of the travels of the mission, which occupied six years, and extended over so many countries, is said, by the good management and conscientious economy of Niebuhr, who indeed defrayed every expense that could be considered personal to himself out of his own narrow income, to have cost the Danish government only the incredibly small sum of about four thousand pounds.

Niebuhr was welcomed in Denmark as he deserved. The government undertook at its charge the engraving of all the plates of his travels, which were to be presented to him as a free gift; and he was left to publish the result of his labours at his own cost and for his own profit. Resolving to commence with the 'Description of Arabia,' he printed, in the year 1772, his volume under this title, which became the text-book of every writer, from the historian Gibbon almost down to the present day, who had occasion to treat of the ancient and modern aspect of that country. The depth of research, the fidelity of delineation, and the accuracy of detail which it exhibits on the geography of Arabia, and the enduring character and condition of its inhabitants, have rendered this work of Niebuhr classical. He has sometimes been compared, and the comparison is just and appropriate, with the historian of Halicarnassus: both travellers were characterized by accuracy of observation, strict veracity, and a simplicity of narrative which art alone can never attain. [HERODOTUS.] The appearance of this work was followed in 1774-76, by two volumes of equal merit and interest, narrating his 'Travels in Arabia and Circumjacent Countries.' To these volumes it was his intention to add a third, enriched with the result of his inquiries into the state of the Mohammedan religion and Turkish empire, and containing his astronomical observations: but some causes, not sufficiently explained, delayed this publication, until a fire, which in 1795 destroyed the king's palace at Copenhagen, and with it the original plates both of his published and unedited works, put an end to his design. This third volume was however published in 1837, owing to the liberality of the bookseller Perthes of Hamburg, and the affection of Niebuhr's family, particularly of his daughter, under the title of 'Reisebeschreibung nach Arabien und andern umliegenden Ländern: it contains his remarks on Aleppo, his voyage to Cyprus, and his visits to Jaffa and Jerusalem, his return to Aleppo, and journey thence through Kóniyeh to Constantinople, and an abridged account of his route through Bulgaria, Wallachia, Poland, and Germany, to Denmark. After the publication of the first two volumes of his travels, he contributed to a German periodical journal, among other papers, two on the 'Interior of Africa,' and the 'Political and Military State of the Turkish Empire.' His principal works, which were published in German at Copenhagen, have been translated into French and Dutch, and reprinted at Amsterdam and Utrecht. Niebuhr himself likewise edited and published, in his usual generous spirit, at his own cost,

the contributions to natural history ('Descriptiones Animalium' and 'Flora Egyptiaco-Arabica') of his deceased friend Forskäl, which were also among the fruits of the mission to Arabia.

Niebuhr, whose life was prolonged to a great age, survived his return from his Oriental travels for nearly half a century. He had, about 1772, some thoughts of undertaking another journey of discovery, at the instance of the Tripoline ambassador at Copenhagen, into the interior of Africa: but a happy marriage induced him to abandon this project; and tired of military service and a residence at Copenhagen, he obtained, in 1778, a civil situation under the government at Meldorf in Holstein, to which he withdrew, and where he passed the long remainder of his existence. He did not however suffer his mind to be idle in retirement; for he maintained an extensive correspondence with the learned in several countries of Europe, and continued so active a public officer, that, at the age of seventy-two years, notwithstanding the failure of his eye-sight, he assisted in a new territorial survey ordered by the Danish government. His long services were rewarded with the cross of Danebrog and the title of councillor of state; and when he became quite blind, the government liberally refused to accept his resignation, and appointed a friend to assist him in his duties until the end of his life, which terminated on the 26th of April 1815.

NIEBUHR, BARTHOLOMEO GEORGE, son of the preceding, was born at Copenhagen, on the 27th of August 1776. His father had returned from the East about nine years before that time, and was residing at Copenhagen as a captain of engineers; however, two years after Barthold's birth, he received the appointment of land-surveyor, which made him remove to Meldorf, a town of Dithmarsh, in Holstein, the native province of the Niebuhrs. It was here that Barthold Niebuhr spent the whole of his infancy and boyhood, living in great retirement, and necessarily contracting studious habits, as well from the absence of all outward interruptions, as because a weakly constitution, produced by a marsh-fever, had incapacitated him for the boisterous amusements of more robust children. He derived great advantages from the society of Bojes, then well known in the literary world, who came to settle at Meldorf as landvogt in the year 1781. The wife of Bojes taught him French, his father instructed him in geography, in the English language, in the elements of mathematics, and in the Latin accidence. He began to learn music in 1783, but never made any great progress in it. In other branches of knowledge so great was his proficiency that Bojes describes him as a juvenile prodigy in 1788, when Niebuhr was only seven years old, and when he was sent to the public school of the place, in 1789, he was placed at once in the first class. He also gave considerable assistance to his father about the same time in making some long calculations connected with his office of surveyor. After having been at school from Easter 1790, to Michaelmas 1790, he became the private pupil of the head-master, Dr. Jäger, with whom he read for an hour every day till Easter, 1794, with the exception of three months which he spent at Hamburg, in 1792, at a kind of commercial school kept by his father's friend Professor Büsch. He also received some advice with regard to the prosecution of his classical studies from the celebrated J. H. Voss, who paid occasional visits to his father, and he acknowledges with gratitude the benefit which he had derived, in common with all Germans, from Voss's excellent translations.

Carsten Niebuhr's wish was that his son should engage in some active business; he even entertained the hope for some time that his son might follow in his own footsteps, and become celebrated as an Eastern traveller. But Barthold's tendencies were from the first in favour of a studious life, and his father was unwilling to oppose his inclinations. It was resolved then that after spending two years at Kiel, he should go to Göttingen, and study under Heyne. He had already had communication with the last-named scholar, and had collated for him some manuscripts after his return from Hamburg, in 1792. He studied at Kiel from Easter 1794, to the spring of 1796. Here he formed an intimacy with the family of Dr. Hensler, professor of medicine, which had the greatest influence on his subsequent career. The widow of Dr. Hensler's son, a lady from Dithmarsh, was residing in his house, and Niebuhr's acquaintance with her ripened into a friendship which lasted till his death. By far the greater part of his numerous letters are addressed to her. Niebuhr wished to marry her, but finding that she adhered to a resolution formed on her husband's death not to marry again, he requested her to recommend a wife to him. After some consideration she named her sister, Amalie Behrens, to whom Niebuhr soon became greatly attached, and who subsequently became his first wife.

In January 1796 Count Solms-Leeb, the Danish minister of finance, proposed to Niebuhr to become his private secretary. His father accepted the offer for him, and thus Niebuhr was introduced into the best circles of his native city. His bashfulness and studious habits however rendered him unhappy in this situation, and he soon exchanged it for that of supernumerary-secretary to the Royal Library, which he entered upon in May 1797, and held till April 1798, when he paid a visit of two months to his family in Holstein, and then sailed for England. He resided in London and Edinburgh for about a year and a half, and returned to Holstein towards the end of 1799. About the middle of April 1800 he went to Copenhagen, and after a stay of a few weeks obtained the appointment of assessor in the college of

commerce for the East Indian department, and of secretary and accountant to the African consulate. The income arising from this appointment enabled him to marry Amalie Bekrens in May 1806, and he resided with her at Copenhagen till the year 1806, performing his duties with the greatest punctuality and diligence, and to the entire satisfaction of his employers. He did not however altogether neglect his literary pursuits; they formed his evening amusement, and he found time in the midst of his business avocations to give lessons to the nephew of his friend Count Schimmelmann, and to translate part of an Arabic history of the conquest of Asia. In the spring of 1808 he had to make a journey into Germany on public business connected with the administration of the Danish finances. An offer was made to Niebuhr at the end of 1805 to enter into the service of the Prussian government, and his dissatisfaction at the prospect of having some one appointed over his head, and the advantages held out by the situation proposed to him, induced him to accept the situation of joint-director of the first bank at Berlin, with the promise of further promotion.

Niebuhr arrived at the Prussian capital on the 5th of October 1806, shortly before the battle of Jena. A few days after that event he was obliged to take flight with all the other officials. He resided till April 1807 at Memel and Königsberg, and then became one of the secretaries of the prime-minister Hardenberg, having chiefly to attend to the supply of the army then in the field. This office kept him with the head-quarters of the army till the battle of Friedland, after which he went to Riga. The provisions of the peace of Tilsit having exacted the dismissal of Hardenberg, his office was put into commission, which consisted of Von Altenstein, Von Schön, Stagemann, Von Klewitz, and Niebuhr. Upon the accession of Stein to the administration, Niebuhr was despatched to Amsterdam to negotiate a loan, and he resided there till April 1809. In December 1809 he was nominated privy-councillor, and received a high appointment in the administration of the funds. This brought him to Berlin, where and at Königsberg he resided through the winter of 1809-10. The opposition to a financial plan of his made him however more anxious than ever to retire from public life; and after some fruitless attempts on the part of the government to retain him in office, he exchanged his public situation for the post of historiographer to the king, vacant by the death of J. Von Müller. About the same time he was elected member of the Royal Academy of Sciences.

The opening of the University of Berlin at Michaelmas 1810 brought forward Niebuhr as a lecturer on Roman history; and the lectures which he delivered in this and the following year were published in 1811, and contain the germs of those new combinations and discoveries for which Niebuhr will be best known to posterity. The time which he spent at Berlin, from 1810 to 1813, seems to have been one of the happiest periods of his life. He formed a small philological society, consisting of Spalding, Buttman, Heindorf, Schleiermacher, Ancillon, Süvern, Savigny, Schmedding, and Nicolovius, and with these distinguished scholars he spent all his spare hours. He felt very acutely the loss which this society sustained in the death of Spalding (on the 7th of June 1811). How greatly Niebuhr valued his intercourse with these highly-gifted men may be presumed from the way in which he speaks of them at the end of the preface to his 'History'; and there can be no doubt that many valuable hints in that work were suggested to him by his friend Savigny in particular.

Niebuhr's studious life was interrupted by the war of liberation, as it was called, in 1813-14. He took an active part in these events. He was chiefly with the head-quarters of the allied army till February 1814, when he was again sent to Holland on public business. He returned to Berlin in the October of that year, and resided there till the summer of 1816, when he proceeded as ambassador to the court of Rome. During this residence at the capital he wrote, besides some political tracts, a biography of his father, who died in April 1815, and some essays for the Royal Academy of Sciences, and resumed his intercourse with his philological friends. He also instructed the Crown-Prince of Prussia in the principles of political economy.

His wife died on the 20th of June 1815, shortly before he received his appointment as ambassador. Her sister, his friend the widow Henalar, came to Berlin in April 1816, accompanied by her niece and adopted child Margaret Henalar, the orphan daughter of Christian Henalar, who had been professor of theology at Kiel; the young lady became his second wife before he started for Rome, and the widow returned to Holstein.

Niebuhr did not receive his final instructions till after he had been four years in Rome. By his interest however with the pope and his secretary, the Cardinal Consalvi, he contrived to bring the negotiations to a close in seven months after the arrival of his instructions. The Prussian minister, Hardenberg, went to Rome himself in February 1821, and Niebuhr gave him the credit of completing the concordat, though his own services in the matter were fully acknowledged by his court; and he received from the King of Prussia, as a mark of his satisfaction and approbation, the order of the Red Eagle of the second class, to which the Emperor of Austria added the first-class decoration of the Leopold order of knighthood.

The climate of Rome had always disagreed with his wife, and as the business which had brought him to the papal court was now finished, he wrote for his recall. This was after the birth of his third daughter, in February 1822. He was advised in the first instance to

apply for leave of absence for a year, which left his return open to him. He spent part of the autumn of 1822 at Albano, and also made a journey to Tivoli. In March 1823 he went to Naples, in order to visit his friend De Serre, who was French ambassador in that city; and after staying there till the beginning of May, set out for Berlin.

In consequence of some slight difference with the leading men in the capital, Niebuhr retired to Bonn, where a university had been recently established, and where his friend and former secretary, Brandis, was a professor. Here he was attached to the university as an adjunct professor, and gave lectures on Roman antiquities and various subjects. At the same time he availed himself of every opportunity of promoting and encouraging the labours of other scholars. It was partly with this view that he set on foot the 'Rheinisches Museum,' a philological repository, in which the shorter essays and scattered thoughts of learned men might be given to the world. The first volume of this periodical appeared in 1827, under the joint editorship of Böckh, Niebuhr, and Brandis. The new edition of the Byzantine historians, which was commenced under his direction, was intended only as a diversion, taken up to relieve his mind from the severer studies required by the revision and correction of his 'History of Rome.' His brought out the first volume of the new edition of this history early in 1827; the alterations in this edition are so numerous that it may almost be considered as a new work. The publication of the second volume was delayed by a fire, which burned his house to the ground and consumed all the manuscript with the exception of a leaf that he happened to have lent to a friend, and it did not appear till the end of 1830. Niebuhr's sensitive mind was much affected by the revolution which took place in Paris in the July of that year, and by the subsequent revolt of Belgium. He looked forward with the deepest anxiety to the probable consequences of these events; he expected the renewal of that devastating war which had been the result of the first French revolution; and feared that his own happy dwelling-place by the Rhine would be the first to suffer from the invaders. These considerations preyed upon his spirits, and he sunk under the continued agitation of mind produced by them. He died on the 2nd of January 1831, leaving behind him several children. A son, whose education Niebuhr superintended with the greatest anxiety, and whose remarkable precocity is frequently spoken of in his letters, now holds a high office in the Prussian civil service.

It is difficult to conceive a more excellent and delightful person than Barthold Niebuhr appears to have been; there is perhaps no one, of whom we have read, who has combined so blameless a character and so amiable a disposition with such boundless acquirements and such brilliant intellectual qualities. His 'History of Rome' is perhaps the most original historical work that this age has produced. To understand what he has done in this work, we should keep in mind the state of knowledge on the subject before his time. The disjointed ruins had lain for ages in a confused heap, though there was hardly a child in Europe who was not familiar with their rude outlines, and though many a skilled and laborious workman had endeavoured to reduce them to symmetry and order. Niebuhr, by a series of combinations which will appear most surprising to those who are most capable of appreciating works of genius, succeeded in reconstructing from the scattered fragments a stately fabric, which, if it is not identical with the original structure, is at least almost perfect and complete in itself. There cannot be a greater mistake than to suppose, as some have done, that Niebuhr was a sceptic whose sole delight was to render insecure the basis of historical evidence. He has actually done more than any one that ever lived towards extracting truth and certainty from the misty and mystical legends of early tradition, and toward substituting rational conviction for irrational credulity. The great object which he proposed to himself, in all his philological speculations, was to reproduce a true image of the past by getting rid of the deceitful influence of the present. This view he often expresses in very plain terms. Thus, he says in his introductory lecture on Roman history ('Kleine Schriften,' p. 93), "As there is nothing which Eastern nations find more difficult to conceive than the idea of a republican constitution, as the people of Hindustan cannot be induced to regard the East India Company as an association of proprietors, or in any other light than as a princess, just so it is with even the acutest of the moderns when they study ancient history, unless they have contracted by critical and philological studies to shake off the influence of their habitual associations." And in a letter to Count Adam Moltke, he exclaims ('Lebensnachrichten,' H. p. 91), "O, how people would cherish philology did they but know how delightfully it enables us to reveal to life the fairest periods of antiquity. Reading is the most trifling part of it; the chief business is to domesticate ourselves in Greece and Rome at the most different periods. Would that I could write history so vividly that I could so discriminate what is fluctuating and uncertain, and so develop what is confused and intricate, that every one, when he heard the name of a Greek of the age of Thucydides or Polybius, or a Roman of the days of Cato or Tacitus, might be able to form a clear and adequate idea of what he was." The very existence of such a general design presumes a lively fancy and active imagination; though these are qualities often possessed by shallow and superficial persons, they are very rarely combined with that extensive and minute learning for which Niebuhr was so distinguished. The range of his acquisitions was really wonderful. He

had got together a mass of statistical information relative to the modern states of Europe, which would have sufficed of itself to gain a reputation for any man; there was hardly a stray hint in the whole series of classical writers which had escaped his searching eye, and the whole of his knowledge lay before him so as to be comprehended at one glance. In the words of one of his most ardent admirers, "While his horizon was ever widening before him, it never sunk out of sight behind him; what he possessed he always retained; what he once knew became a part of his mind, and the means and instrument of acquiring more knowledge; and he is one of the very few examples of men gifted with a memory so tenacious as to seem incapable of forgetting anything, who at the same time have had an intellect so vigorous as in no degree to be oppressed or enfeebled by the weight of their learning, but who, on the contrary, have kept it in orderly array, and made it minister continually to the plastic energy of thought." (*Philol. Mus.*, i. 271.)

Some deductions must however be made from this general eulogy. While Niebuhr's great work has been neglected or censured, with equal injustice, by persons who have been too indolent to encounter the labour of studying it or incapable of appreciating the method of critical investigation which the author has adopted, it may be doubted, on the other hand, whether many scholars, both in Germany and England, have not been too willing to acquiesce in all Niebuhr's results, to adopt whatever he has written, and sometimes even to receive as established truths assertions unsupported by evidence or directly opposed by express testimonies. Some recent German writers have indeed taken a middle course; they adopt the general views and critical method of the historian, but they find much in the details that is defective or erroneous. This appears to us to be the true spirit in which Niebuhr's work should be studied. The young students of Roman history should be told that they will prove themselves worthy disciples of Niebuhr rather by following his method than by assuming his results; it must be impressed upon them that the original authorities should in all cases be carefully sifted and compared, and that they cannot rely implicitly on the authority of their master in cases where the theory depends on philological interpretation. It cannot be denied that the ardent imagination of Niebuhr, and his power of combining and constructing, sometimes led him to form a complete theory before he had examined all the evidence; one consequence of which is, that, under the influence of his own creations, he will sometimes extract a meaning from a passage which the words do not contain, and at other times arbitrarily reject evidence when it interferes with his own hypothesis. It is true that this same power and his intuitive sagacity have sometimes enabled him to supply a link in a chain when all direct evidence was wanting, and the certainty of his conjectures in such cases is at once felt by the symmetry and consistency which they impart to the whole fabric of the theory. The writings of Savigny, the illustrious friend of the historian, also furnish examples of the certainty which historical conjecture may attain when it is founded on complete knowledge and directed by a matured judgment. It must also be remarked that Niebuhr's style is very faulty. It is generally deficient in perspicuity, and though eloquent passages and striking descriptions are found here and there, it wants that sustained dignity which we remark in the writings of some other distinguished historians.

Considering the long time which Niebuhr spent in public life, it is somewhat strange that he should not have been better acquainted than he seems to have been with the modern science of political economy; and he occasionally betrays very crude and ill-formed opinions on the internal polity of other countries; witness his remarks on the relative position of England and Ireland. But with all the drawbacks which the most rigorous criticism can exact, the feeling with which we contemplate his character and attainments is one of almost unmixed admiration. He was in fact a rare combination of the man of business, the scholar, and the man of genius. If he had had no other claim to celebrity, he would have deserved to be mentioned among the general linguists whose attainments have from time to time astonished the world. His father, writing in December 1807, states that he was then acquainted with twenty languages (*Lebensnachrichten*, i. 30), and there is no doubt that he subsequently added to the list. No man has ever borne his faculties more meekly than Niebuhr. Though he had been trusted and honoured by a powerful sovereign, and rewarded for public services in a situation of dignity and importance, and though he was recognised as the chief of philologists in the most learned country of Europe, his habits were to the last those of a retired student, and his manners those of an unassuming domestic man. A very pleasing picture of his mode of living has been given by the late Professor Sandford, who visited him at Bonn in 1829 (see *Blackwood's Magazine* for January 1838, p. 90, &c.); a warm testimony to the benevolence of his character and the goodness of his heart is furnished by Lieber, in his *Reminiscences of Niebuhr*; and we see the whole man, in all his relations—social, literary, and political—in the highly-interesting collection of his letters edited by Madame Henler (*Lebensnachrichten über Barthold Georg Niebuhr, aus Briefen desselben*, &c., Hamburg, 1838, &c., or even more completely in Miss Winkworth's admirable translation of that work (with important additions and valuable essays by Bunsen, &c.), 3 vols. 1852.

The following is a list of Niebuhr's principal works:—1. *Römische Geschichte*, 2 vols. 8vo, Berlin, 1811. This edition was translated

into English by Mr. Walter, London, 1827. 2. *Frontonis Reliquiæ*, ab A. Maio primum editæ, notis variorum edidit B. G. Niebuhrus; accessunt C. Aurel. Symmachi octo Oratorum Fragmenta. Berol., 1816. 3. *Cicero pro Fontio et Rabirio*, 8vo, Romæ, 1820. 4. *Flavii Merobaudis Carmina*, St. Galli, 1823, 2nd edition, Bonnæ, 1824. 5. *Römische Geschichte*, Erster Theil, Berlin, 1827; Zweiter Theil, Berlin, 1830; Dritter Theil (posthumous), 1832. The first two volumes have been translated into English by J. C. Hare and Connop Thirlwall, 1828-32. The third volume was translated by Dr. W. Smith and Dr. L. Schmitz. Of this translation Niebuhr himself has expressed his opinion in dedicating his *Bysantine Historians* to the translators—"quorum ope Historia mea Romana à Britannis prorsus ita ut eam animo concepi patrioq; sermone conscripsi legitur." 6. *Corpus Scriptorum Historiæ Byzantinæ, editio emendatior et copiosior, consilio B. G. Niebuhr, C. F. instituta*, &c., Bonnæ, 1828. Of this edition Niebuhr published the *Agathina*, and joined with Bekker in publishing *Dexippus*, *Eunapius*, and other shorter histories, which appeared together in one volume. 7. *Kleine Historische und Philologische Schriften, Erste Sammlung*, Bonn, 1828. This was the first volume of a collection of his shorter essays, which had appeared in the *Transactions of the Berlin Academy* or in the *Rheinisches Museum*; it also contained his biography of his father and his introductory lecture on Roman history. Many of these treatises have been translated into English, some of them in the *Classical Journal* and the *Philological Museum*. The essays *On the Geography of Herodotus* and *On the Scythians* have appeared in a separate form at Oxford.

Besides these works, which he published in his own name, Niebuhr has conferred a most important benefit on Roman jurisprudence by his discovery of the fragments of Gaius. [GAIUS.] He was unable to stay at Verona long enough to copy the manuscript himself, and as he says in a letter to the widow Henler (*Lebensnachr.* ii. 240), was obliged to content himself with the merit, which would soon be forgotten, of having made the discovery, not by accident, but after a diligent search. Niebuhr interested himself very much in the restoration of passages from lost writings contained in palimpsests, and in consequence became involved in a controversy with his rival discoverer, Mai, with regard to some emendations which he had proposed in certain fragments discovered by Mai, which emendations were subsequently confirmed by a manuscript at Turin. Mai charged Niebuhr with having borrowed his emendations from the manuscript, and it was not without difficulty that Niebuhr prevailed upon the authorities at Rome to grant an *imprimatur* to his justification. Niebuhr's *Lectures on the History of Rome* have been published from notes made by his pupils, in German by Dr. Marcus Niebuhr and Dr. L. Schmitz, and in English in 3 vols. 8vo, 1848-52, under the editorship of Dr. L. Schmitz, and another version by MM. Chepmell and Demmler, 2 vols. 16mo, 1849; and his *Lectures on Ancient Ethnography and Geography*, also from his pupils' notes, in German by Dr. Isler, and in English by Dr. L. Schmitz, 2 vols., 1853. Some of his other courses of lectures have likewise been published from the notes of pupils.

NIEMCEWICZ, JULIAN URSIN, an eminent Polish poet, dramatist, historian, and patriot, was born in 1757 at Skoki, in the palatinate of Brzesc in Lithuania. His name in Polish is equivalent to 'Germanson' in English, and his family was of course originally German; but according to Niesiecki, whose *Herbarz Polaki* is the great authority on Polish genealogies, it had been settled in Lithuania from the commencement of the 16th century. At the time of the first partition of Poland in 1772, Niemcewicz was a boy of fifteen, pursuing his studies at the institution for cadets in Warsaw. At the age of twenty he commenced military service in the Lithuanian army, as adjutant to one of the Princes Czartoryski. Kosciuszko, who was one year older than Niemcewicz, was an officer in the same corps; they became intimate friends, and continued so till Kosciuszko's departure from Europe to offer his services to the Americans in the war of independence. A few years later Niemcewicz made an extended tour to France, England, and Italy. Among his early poems occurs an *Ode on quitting England* in 1787, in which he expresses his regret at leaving the "too beloved shores" of the "land of equality, happiness, and freedom." In the next year he quitted the army with the rank of major to enter on political duties as *nuncio* or *deputy* of Livonia, at the Polish diet. It was a critical period in the annals of Poland, when a daring effort was made by the patriotic party to arrest the too obvious progress of the country to ruin and dismemberment. The constitutional diet, which lasted from 1788 to 1792, did much to arrest this progress, and Niemcewicz was one of its most conspicuous members. In 1791 he commenced with his friend Mostowski, a *Castellan* at the diet, and with Weyssenhoff, his colleague for Livonia, the publication of the *Gazeta Narodowa i Oboj*, or *National and Foreign Gazette*, which had a marked influence on the march of affairs. In the same year he had a principal hand in drawing up the constitution known as the *Constitution of the Third of May*, which on that day was presented by King Stanislaus Poniatowski to the diet as emanating from himself, and accepted on the spot. By this constitution the monarchy from elective became hereditary, and the oppressive privileges of the nobility over the peasantry were abolished. It received the approbation of Fox and the warm panegyric of Burke. Niemcewicz had at the same time the most brilliant success in endeavouring to reform the national political feelings by the drama.

His comedy of the 'Deputy's Return' ('Powrot Poła'), according to Bentkowiak in his 'Historia Literary Polakiej,' "made an epoch in the annals of the Polish comic stage." Singularly enough, this play was afterwards indirectly the cause of the formation of the great lexicon of the Polish language by Linde [LINDEN]. On the 3rd of May 1792, the anniversary of the constitution, another play by Niemcewicz, entitled 'Casimir the Great,' was acted at the national rejoicing. It was the last great day of rejoicing in the annals of Poland. The confederation of Targowica succeeded in overthrowing the new constitution, and Niemcewicz and others of its eminent supporters were driven to take refuge in Germany. The second partition of Poland followed, and an insurrection was commenced against it at Craoow by Kosciusko in 1794, which had six months of success. Niemcewicz, who was Kosciusko's constant adviser and became his aide-de-camp, was at his side during the whole campaign, and wrote most of the proclamations and bulletins issued in the general's name. On the 10th of October 1794 the cause of Poland was ruined by the fatal battle of Macielowice, rashly commenced by Kosciusko against an immensely superior force of Russians under Fersen. Niemcewicz, while charging the enemy at the head of the militia of Brzesco, received a wound which disabled his right arm, was surrounded by a band of Cossaks and taken prisoner on the field. Kosciusko was found the same evening lying among the dead, but he still breathed, and in a few days the friends were sent captives to the Russian capital.

For two years Niemcewicz remained a prisoner in the fortress of St. Petersburg, in a damp room, without any company but his servant and two guards, who remained with him day and night to prevent escape or suicide. He was never permitted to go out in the open air, and his only exercise was to pace his room, in which his tread wore a diagonal rut in the floor. This unusual severity was attributed to his having spoken disrespectfully at the diet and in his 'Gazette' of the Empress Catherine, and to his having exercised what the Russians considered a pernicious influence on the mind of Kosciusko. He was however after a time allowed books and the use of pens and paper, but his mind was too harassed by his confinement and its causes to be able to turn these indulgences, such as they were, to advantage. In composition he thought himself equal in captivity to translation only. Having received a volume of Pope's 'Works' to read, which he was only to keep for three days, he transcribed the whole of the 'Rape of the Lock' in English in the course of that time with his left hand, his right arm being still disabled from his wound, and then made his translation at leisure. This he dedicated in a few lines of verse to his friend and co-editor Mostowaki, who he had discovered was for a time confined in the next cell. The imprisonment of the Polish patriots was put an end to by the death of the Empress Catherine and the accession of Paul in November 1796. The new emperor went in person to Kosciusko to tell him he was free; and when Kosciusko asked if his friends were to be free also, Paul replied that they were, though there had been great opposition in his council to the liberation of Potocki and Niemcewicz, the two great orators of the diet. Before they were finally allowed to depart, however, all the Poles were obliged to take an oath of fidelity to the czar. During their captivity the third partition of Poland had taken place, and they could now scarcely be said to have a country to return to. Kosciusko, though still suffering from his wounds at Macielowice, determined to emigrate to America, and asked Niemcewicz to accompany him. They passed through London, where they were the object of universal sympathy, and arrived at Philadelphia in 1797.

In the United States Niemcewicz remained some years, and in 1800 was married to Mrs. Livingston-Kean, a lady of one of the most distinguished families in New York. He kept a diary of his travels in America, which he at one time expressed an intention of publishing, but of which nothing has we believe yet appeared, except an account of a three weeks' visit to General Washington at Mount Vernon, containing details of his conversation, which is annexed to a brief biography of the general. Among Niemcewicz's acquaintances in America were Jefferson, who was elected president during his stay, and the young Duke of Orleans, then like himself an exile, who afterwards became King Louis-Philippe.

In 1802 Niemcewicz was permitted to return for some time to Poland, on occasion of the death of his father, to settle the family affairs. His friend Mostowaki was at that time publishing at Warsaw a select collection of Polish writers, 'Wybor Pisarzy Polakich,' in five-and-twenty octavo volumes, and prevailed on Niemcewicz to allow his own works to be included in the number, with, among them, the 'Rape of the Lock,' which was written, as has been already mentioned, when the editor and the translator were the inmates of contiguous cells. Niemcewicz returned to the United States, but did not long continue there. When Napoleon I. entered Poland in the campaign of 1806 the hopes of the Poles were powerfully excited; Niemcewicz came back to Europe, and on the establishment of the grand-duchy of Warsaw he was named by the King of Saxony, to whom Napoleon I. gave it, secretary of the senate, member of the supreme council of public education, and inspector of schools. The hopes of the Poles were raised still higher by the campaign of 1812, when Niemcewicz endeavoured to animate his countrymen against the Russians by a periodical work entitled, 'Lithuanian Letters.' The triumphant success of the Russians drove the government of the grand-duchy into Germany, but

Niemcewicz was recalled under more propitious circumstances than he anticipated. The Emperor Alexander, who had agreed at the Congress of Vienna to grant a constitution to Poland, named a committee to prepare one, and Niemcewicz was appointed president of the committee. It was the second time he had been concerned in drawing up a Polish constitution, and the second attempt was destined to fail as the first, less from its own inherent faults than from the powerful opposition it had to encounter. The Emperor Alexander, who had first known him at his liberation in 1796, named him, in recompense of his services, perpetual secretary of the senate and member of the council of public education; and though, when the Russian reaction against the Polish constitution commenced in 1821, he was dismissed from the latter post, he still retained the former. As the senate only met once in three or four years his duties did not occupy much of his time, and his leisure was chiefly spent in literary pursuits. This period of his life was, in spite of bad health, one of great literary activity. The Society of Friends of Learning at Warsaw (Towarzystwo Przyjaciol Nauki), the leading scientific body of Poland, elected him their president after the death of Staszyo; and when it was resolved that several of their members should undertake to write portions of a continuation of Narussewicz's 'History of Poland,' the reign of Sigismund III. was assigned to Niemcewicz, and so executed that the work became instantly popular. A volume of 'Spiewy Historyczne,' or 'Historical Ballads,' commemorating the glories of ancient Poland, and illustrated with historical notes, had very great success; the poems were set to music, and both poetry and music are still universally popular throughout the country. In 1817 he pronounced at the cathedral of Craoow a funeral oration over Kosciusko, whose remains had been removed there for interment from the place of his death in Switzerland. In 1829 he presided at the inauguration of the statue of Copernicus by Thorwaldsen, in front of the mansion of the Society of Friends of Learning, in one of the principal squares of Warsaw.

His time was being spent in these peaceful pursuits, with the character of 'the Nestor of Polish literature,' when the insurrection of the 29th of November 1830 [CONSTANTIN PAVLOVICH] suddenly burst upon Poland. On the day after, when it was sought to give a national character to the outbreak by associating with it the first names of the country, the crowd at Warsaw was impatient at the slowness with which the procession of the newly-constituted provisional government moved along the streets; but when it was explained that the delay arose because the infirmities of Niemcewicz, who was one of them, prevented him from moving faster, the mob at once slackened its pace, and hailed with enthusiasm the veteran's accession to the cause. He had soon an opportunity of rendering service by opposing the attempts of the revolutionary clubs to control the government [MOCHNAKOWSKI], and this he did on more than one occasion. In July 1831 he was sent on a mission from the Polish government to urge the interposition of the English cabinet; but some delays, interposed by the Prussian authorities, prevented him from reaching his destination so early as he wished, and even if the English government had been induced to assist, the capitulation of Warsaw, preceded by lamentable excesses of the revolutionary party, soon put it out of their power. Niemcewicz remained in London an exile for the fourth time, and, as it proved, the last. In 1832, we find by a passage in Moore's diary that Niemcewicz saw him at Bowood, and paid him a visit at Sloperston Cottage; but the bard of the 'Irish Melodies' seems to have been quite unconscious that his visitor—whose name is printed by Lord John Russell 'Nimycyeh'—was the author of a volume whose national poetry, united with music, presented no small analogy to his own. Niemcewicz was about the same time Prince Adam Czartoryski's agent in presenting to the British Museum a small collection of seventy or eighty Polish books; and these were, we believe, the first books in the language, with the exception of a few versions of the Scriptures, that ever entered the national library, which has since become comparatively rich in the literature of the Slavonic languages. He also took a part in the establishment of the Literary Society of Friends of Poland in London, and made some speeches at meetings in Freemasons' Hall. About 1834 he removed to France, where he published in French a 'Life of Prince Adam Czartoryski,' and was the most conspicuous member of the party which recognized that prince as their head. Active to the last, in spite of his advanced age, he established at Paris the Central Polish Historical Committee. He resided for nine years at Montmorency, near Paris, and on the 21st of May 1841 breathed his last in that capital, at the age of eighty-four. His old friend Mostowaki, who, like himself, had been driven into exile by the events of 1830, had taken up his residence in France, and was engaged in writing Polish lives for the 'Biographie Universelle,' but died in 1842, before the supplement had reached the letter N, and thus the life of Niemcewicz, which he would probably have written at length, is in that work singularly meagre. The remains of the poet were honoured with a public funeral in the cemetery of Montmorency.

Numerous as are the works of Niemcewicz, it is said that not one of them failed in producing an immediate effect, and that all were popular at least for a time, while many have continued so. The 'Spiewy Historyczne,' already mentioned, are the best known of all; they have been repeatedly issued in illustrated editions, and an illustrated edition in French appeared at Paris in 1833, in which, as in the

case of Krullov's 'Fables,' the translation had been verified by various distinguished authors. English translations of a few of these ballads, 'Specimens of the Polish Poets,' were published in 1827. It has been remarked however, that while most of Niemcewicz's works bear marks of talent, not one of them has the decided stamp of genius. Though he lived in stirring times, and took an active part in them, his literary creed appears to have been singularly tame. He apologises at some length in the preface to one of his tragedies, 'Ladislaws at Varne,' for a violation of some of the most conventional rules of the French critics. He was well acquainted with English literature, and fond of it, but it appears to have been chiefly the English literature of the 18th century in which he found his models. He translated not only the 'Rape of the Lock,' but Pope's 'Ode to St. Cecilia's Day,' Dryden's 'Alexander's Feast,' Cato's 'Fireside,' Gray's 'Elegy' and 'Ode to Adversity,' and the 'Children in the Wood,' changing the scene however to the banks of the Dnieper. Of modern English we only notice Wordsworth's 'We are Seven,' and Byron's 'Fare thee well.' With German literature his acquaintance must have been slender, as a modification of Bürger's 'Lenora' figures in his poems as 'Malvina, from the English.' Among his own poems, after the Ballade, a collection of Fables enjoys the highest reputation. Of his novels, 'Levi and Sarah,' a delineation of Jewish life in Poland, was translated into English in 1830, through the medium of the German; 'Jan z Teosyna,' or 'John of Tenchin,' a picture of Poland in the 16th century, was at first popular, but has none of the requisites for permanent fame. One of his least ambitious but most meritorious works is his 'Zbiór Pamietnikow historycznych o dawnej Polasze,' or 'Collection of Historical Memoirs on Ancient Poland,' in 5 vols., the first published at Warsaw in 1822, the last at Pulawy, the seat of Prince Czartoryski, in 1830. It comprises a selection of interesting matter bearing on the subject, taken from manuscripts and from printed foreign sources, of which the earliest date is 1037 and the latest 1792. A second edition was issued by J. N. Bobrowicz, at Leipzig, in 1838-40. Most of his other works of importance have been noticed in the narrative of his life. A complete collection of his 'Poetical Works,' in prose and verse, appeared in 12 small volumes, under the superintendence of Bobrowicz, at Leipzig, in 1838-40. At his death he left a large number of unpublished manuscripts to the Polish Historical Committee at Paris; they comprised four volumes of 'Travels in Poland,' and several volumes of memoirs, which the committee stated to be of the highest interest. In 1843 the committee published his 'Notes on his Captivity at St. Petersburg in 1794-96,' written by himself, in French, in 1800, at Elisabethtown, in New Jersey. A translation of it into English, by Alexander Leask, appeared at Edinburgh in 1844. The volume is interesting in many respects, and the manly and unaffected tone in which it is written commands the confidence of the reader. A volume of memoirs of his own times, in Polish, 'Pamietniki czasow moich,' appeared at Paris in 1848. The life of Niemcewicz is especially interesting as presenting in miniature, in the shape of the biography of a man of honour and literary taste, the contemporary history of Poland.

NIÉPCE DE SAINT-VICTOR, to whom the photographic art is indebted for some of its greatest and most remarkable developments, was born at Saint-Cyr, near Chalons-sur-Saone, on the 26th of July 1805. Educated at the school of Saumur for the army, he, according to the 'Préface Biographique' of M. Ernest Lacan, prefixed to the 'Recherches Photographiques,' devoted himself zealously to his military duties, and was quietly waiting for professional advancement when a trifling occurrence led to an entire change in the direction of his ambition, and may be cited as perhaps the remote cause of his eminent discoveries. He was a lieutenant in the 1st Regiment of Dragons, stationed at Montauban, when one day his gay uniform received some stains from lemon-juice. After trying several substances he succeeded with some drops of ammonia in restoring the lost colour. Though fond of the sciences, he had not previously paid any close attention to any one in particular, but he now began to be interested in chemistry, and an order from the minister of war directing that the facings, cuffs, and collars of thirteen cavalry regiments should be changed from crimson and rose colour to orange, led him to resume his investigations on dyes. He soon found that by applying the colouring matter extracted from the Indian pink (millet d'Inde), for which he afterwards substituted fustic wood, combined with an acid, he could first discharge the red colour, and then produce the desired orange tint. The proposed change had been estimated to cost six francs the suit: M. Niépce showed that by his method it would only cost half a franc. The young officer was summoned to Paris, his method was examined, approved, and adopted, and the government was saved an expenditure of upwards of 100,000 francs. Fraises were lavished upon him, the Duc de Nemours himself expressed his warm interest in him, and he was encouraged to request as a reward an exchange into the municipal guard, that he might, though at the cost of professional advancement, establish himself at Paris.

He returned to his regiment, and—while waiting for his promised removal to Paris—to the more earnest pursuit of his chemical studies. His attention soon became irresistibly directed towards the experiments and researches of his uncle JOSEPH NIÉPCE, to which it will be necessary for us briefly to turn in order to understand the real claims of the nephew.

As was noticed in the article DAGUERRE, M. Nicéphore Niépce, then resident at Chalons-sur-Saone, commenced his researches on the action of light upon various prepared surfaces in 1813. He discovered that by spreading a thin film of bitumen on a polished metal plate and exposing it to the action of the sun, certain changes would take place; and he eventually not only succeeded in obtaining by this means copies of various objects, but in rendering them to a great degree unchangeable by subsequent exposure to the light. M. Nicéphore Niépce formed the highest estimate of the importance of his discovery, which he termed 'héliographie,' and laboured hard to bring it to perfection. He appears to have looked in the first instance chiefly to the production of engraved plates; though he is said to have fully anticipated the obtaining of images in the natural colour, or, as he expressed it, that the sun would paint portraits that should be as true in all respects as the reflections in a looking-glass. In 1827 he came to England, and laid the results of his experiments before the scientific societies of this country, where they produced a great sensation. But the chemical and manipulative difficulties were only in a very small measure overcome when he found that M. Daguerre had proceeded to an almost equal extent in a parallel course, and after some correspondence the two experimenters agreed, in 1829, to unite in partnership with a view to the more effectual accomplishment of their object. Before they had succeeded in bringing their process into a practicable shape M. Nicéphore Niépce died, in 1838, and M. Daguerre, to whom is due the application of the camera, abandoned the use of the bitumen—which was Niépce's peculiar medium—but preserved the name of the original inventor of the process by styling his the 'Méthode Niépce perfectionnée.' As was stated in the article before referred to [DAGUERRE, vol. ii., col. 477], the French government also recognised the importance of M. Niépce's labours by according to the representative of M. Niépce a pension of 4000 francs, at the same time that it gave one of 6000 francs to M. Daguerre.

Though the peculiar process of M. Niépce seemed finally abandoned for the more facile one of M. Daguerre, in England and elsewhere experiments were being diligently prosecuted with a view to the discovery of a less costly material for receiving the sun-pictures than Daguerre's silvered plates, and in 1840 Mr. Talbot succeeded in obtaining impressions on iodized paper; and M. Bayard, in France, about the same time or soon after obtained like results by a process somewhat similar, and a new and far more widely applicable art, Photography, sprung into existence.

The Daguerreotype, or 'Méthode Niépce perfectionnée,' and the Calotype, or Talbotype—photography in fact, though as yet but in its rudimentary stages—were in full operation and attracting universal attention, when M. Niépce de Saint-Victor resolved to dedicate himself to the completion of the task which his uncle had left unfinished. But he was beginning to despair of obtaining his removal to Paris, where alone he believed that he could with his humble means properly carry on his experiments. Three years had passed and the promised appointment had not arrived. Female intercession is thought to have a superior chance of attention in Paris. A lady of his family volunteered to proceed to the capital and lay his claims before the proper official. Introduced by a relation, a deputy, she was listened to with respect, and had the good fortune to find her advocacy successful. In April 1845 Niépce was incorporated as a lieutenant in the garde municipale. On the 25th of October 1847 he presented to the Academy of Sciences, in two papers, the results of the experiments which he had been diligently prosecuting. The first was in the form of a 'Note sur les propriétés particulières a quelques Agents Chimiques,' and chiefly related to the reproduction of designs by the use of vapours of iodide, &c. The other was a 'Premier Mémoire de la Photographie sur Verre,' in which he announced his grand discovery of the method of obtaining images on glass prepared with starch, gelatine, or, as he found best, with albumen.

He had announced his process as but imperfect, and this as merely a first paper on the subject, and he now set to work to perfect it. But Niépce had little unbroken time to give to science. His room in the barracks of the Faubourg St. Martin he had converted into a sort of humble laboratory, and there (says M. Lacan) the studious officer, his police uniform covered with a blouse, spent the rare intervals of leisure between his official engagements busily occupied in his remarkable researches. The revolution of February 1848 came however, the barracks were attacked and burnt, his laboratory and all its priceless contents destroyed. Yet though he had lost all that he had been so long collecting, Niépce was not discouraged, and, profiting by his enforced leisure, he was able on the 12th of June 1848 to present to the Academy his second memoir on photography upon glass, in which he detailed very great improvements in the process. The process excited general interest, and was speedily adopted by photographers throughout Europe. His principal subsequent papers on this branch of the art were a 'Note sur des Images du Soleil et de la Lune obtenues par la Photographie sur Verre,' presented to the Academy June 3, 1850; and a 'Note sur quelques faits nouveaux concernant la Photographie sur Verre,' August 19, 1850.

Meanwhile under the new order of things his professional position had somewhat improved. In July 1848 he was made lieutenant in the 10th regiment of dragons, and captain in the following November; and, by transfer to the same rank in the garde républicaine he was in

April 1849 restored to Paris. In December 1849 he was nominated chevalier of the Legion of Honour in consideration of his scientific labours.

Contemporaneously with his researches in photography upon glass, M. Niépce had been endeavouring to arrive at a means of effecting his uncle's idea of producing photographic images in colours. Stimulated by the experiments of Sir John Herschel and M. Besquerel, who had obtained, the one on silver plates and the other on paper, the colours of the solar spectrum, and the somewhat similar results obtained by Professor Böttiger of Frankfurt-on-the-Main, M. Niépce commenced a series of beautiful experiments upon coloured flames and their photographic images. He laid before the Academy a detailed memoir upon the subject on the 4th of March 1851. This was followed by others on June 2, 1851; February 9, 1852; and November 6, 1852. By the method described in these papers, M. Niépce succeeded in obtaining upon silvered plates which had been rendered sensitive by a chloride of copper, images which faithfully reproduced the colours in coloured engravings, flowers both artificial and natural, lay-figures dressed in stuffs and gold and silver lace, precious stones, &c. These were obtained both by the process of photographic printing and in the camera; the light and brilliant colours being obtained with comparative ease, but the darker and more sombre colours more slowly. The colours he rendered more vivid and at the same time more lasting by the action of ammonia. But beautiful as were the results, and much more nearly as they seemed to approach the solution of the problem of photographing the colours of nature, they proved to be only comparatively permanent. The colours soon began to fade, and eventually disappeared altogether. This method M. Niépce named Heliochrome. We have not heard that he has recently made any further progress in fixing the colours, or removing the manipulative difficulties.

The third and perhaps the most important discovery of M. Niépce de Saint-Victor is that of producing photographically engraved steel plates. In his first memoir on this art, which he calls Heliography, presented to the Academy in May 1853, he claims merely to have, in conjunction with M. Lemaitre the engraver, made a new application of the process of his uncle, described in the communication of M. Arago to the Academy August 19, 1839. M. Niépce spread a coating of varnish formed of bitumen dissolved in essence of lavender upon a copper plate, and by the usual process of exposure to the action of light obtained on it a copy of an engraving, which was afterwards to be engraved by the burin, or bit in in the manner of an etching. He tried tin in the place of copper, and subsequently the silvered Daguerre-plate. M. Niépce de Saint-Victor exhibited on this occasion two impressions obtained from tin plates prepared by his uncle in February 1837, thus establishing the title of M. Niépce de Saint-Victor to the original idea. At his death he left his method in a very unsatisfactory state, but in process of time other photographers sought to obtain the same end, and before M. Niépce de Saint-Victor published his process, Messrs. Berres and Donnes in the first instance, and subsequently Messrs. Fizeau and Hurliman on the Continent, and Messrs. Claudet and Grove in London, had endeavoured to produce photographic engraving on Daguerre-plates. In some instances the results were pleasing, but in all the processes were tedious and uncertain, and seem to have been speedily abandoned. In March or April 1858 Mr. Talbot published an account of some successful experiments he had made with steel plates faced with gelatine and bichlorate of platinum. The images, which he obtained by contact, were merely of friends of ferns, lace, and other simple objects, and the manipulative difficulties have proved practically insurmountable. M. Niépce de Saint-Victor published his process a month or two later, but in a far more complete form, and he has since so far improved it, that it has been made commercially available.

Niépce's first paper on heliographic engraving was presented to the Academy on the 23rd of May 1853, and he has continued to report his progressive improvements in 'Notes' and 'Memoirs' to the same body down almost to the present time. At first he operated by means of bitumen, but he was soon led to adopt a varnish of which benzine is the chief ingredient, and, as now employed, it is perfectly fluid, and when spread over the polished steel plate forms a thin film so nearly transparent as to be scarcely perceptible, and so sensitive that on being placed in contact with the photographic positive and exposed in the usual manner to photographic printing it receives the perfect impression in about ten minutes, or placed in the darkened chamber of the camera receives the image directly from the object in very nearly the same time. After the impression is obtained on the plate it is covered with an acid, which acts freely on the sun-picture, and when the more delicate parts are sufficiently 'bit in' they are covered with a composition not susceptible to the action of the acid, exactly as in etching, and the process is repeated until every part is adequately acted upon, when of course the engraving is completed. In his early plates M. Niépce employed fumigations, as in aquatint engraving, to produce the proper 'grain,' but this, we believe, he does not now find necessary. M. Niépce and his coadjutors have produced very beautiful impressions from plates wholly engraved thus, both of portraits and designs obtained from positives by contact and directly on the steel by sunlight in the camera (he presented a plate and prints obtained in this last way to the Academy, October 6, 1856); but generally it is found necessary to touch the plates with the burin.

This method of engraving is now being practised to a considerable extent in Paris, several skilful artists and engravers having devoted themselves to the process, and there can be little doubt that it will eventually produce a great change in the method of illustrating works on art, science, and natural history, as well as books of travels and descriptions of places.

It ought perhaps to be mentioned here that the mode of photographic engraving called 'photo-galvanography,' by which many very effective engravings of a considerable size have been produced (under a patent) in this country, and for the carrying on of which a company has been formed, is entirely different from as well as more recent than that of M. Niépce. Photo-galvanography is the invention of Herr Pretsch, late manager of the Imperial (government) Printing-Office at Vienna—the productions of which while under his direction were one of the features of the Great Exhibition of 1851. The photo-galvanographic process is a somewhat complex as well as a very curious one. From an ordinary positive on glass or paper a reversed picture is obtained on a glass plate coated with gelatine; this is acted on in a peculiar way so as to form a raised picture, from which a mould is taken; from this, in the galvanic trough, a copper matrix is obtained; and from this again a second copper plate, which, after being touched upon with the burnisher and burin, or scraper, yields the impression, being in fact like an ordinary engraved copper plate. The process admits of various modifications, one of which produces plates for surface-printing, like wood-blocks, that is, along with ordinary type.

The scientific merits of M. Niépce having been brought under the notice of the Emperor Napoleon III., he, in order that Niépce might be enabled to pursue his researches more freely, named him, in February 1854, Commandant of the Louvre. M. Niépce has since steadily prosecuted his labours, chiefly seeking to perfect his photographic process. In 1855 he published the various memoirs which he had drawn up on his three grand discoveries—photography upon glass, heliochrome, and heliographic engraving—under the title of 'Recherches Photographiques;' and in 1856 he published a 'Traité Pratique de Gravure sur Acier et sur Verre.' From the title of the last work it will be seen that he has conceived the practicability of engraving photographically on glass as well as on steel, and he appears to have thus arrived at some very pleasing results. He has also by another modification of his process obtained photographic etchings on marble, and by filling the incised parts with mastic, oxychloride of zinc, or different colouring matters, produced the effects of beautiful mosaics; and it is said that the process promises to afford a new method of ornamentation to the architect and decorator. It only remains to add that M. Niépce de Saint-Victor, though described by his friendly biographer as a poor man,—“and one who will probably always remain poor, for he possesses two qualities which win esteem and respect, but do not enrich, modesty and disinterestedness”—has in every instance not only nobly refused to secure his inventions for his own benefit, but published in ample detail the processes by which he has obtained his results.

NIEUWELANDT, WILLEM VAN DEN, a Dutch author and artist, was born at Antwerp in 1684. He at first followed the manner of Paul Brill, whom he accompanied to Italy, but after his return, when he fixed himself at Amsterdam, he chiefly painted architectural compositions—ruins, baths, mausoleums, triumphal arches, and other subjects of that class. These works of his pencil, in which he showed how diligently he had studied the ancient monuments of Rome, were eagerly sought after, and many of them were engraved. He himself also possessed considerable skill in engraving and etching.

His literary works consist of six tragedies, namely, 'Saul,' 'Claudius Domitius,' 'Nero,' 'Livia,' 'Cleopatra,' and 'Sophonisba;' all of which display talent. The 'Nero,' which was brought out at Antwerp in 1618, at the expense of the city, met with extraordinary success. He also wrote a poem entitled 'Von den Mensch' ('Man, or the Vanity of the World'), wherein he expatiates on the emptiness of all human pursuits. He died at Amsterdam in 1636.

NIEUWENTYT, BERNARD, was born on the 10th of August 1654, at Westgraafdyk, a village of North Holland. His education was conducted with a view to his entering the church, of which his father was a minister; but evincing an early indifference to an ecclesiastical life, he was left by his parent to the free choice of a profession. He accordingly commenced the study both of law and physic, having previously applied himself to the study of logic, in order the more effectually "to restrain and fix his imagination, and acquire the habit of reasoning correctly." He appears to have excelled as a public speaker, to which circumstance, and the general amiability of his character, may be attributed his influence in the provincial states, as also in the government of the town of Purmerend, wherein he resided, and of which he was burgomaster. As a physician he is said to have been celebrated; and able and equitable as a magistrate. He was a zealous but not very able supporter of the doctrines of Descartes, and his mathematical writings, though now valueless, obtained a temporary popularity in consequence of their author being one of the first opponents of the infinitesimal calculus. His objections, which Montucla designates "a mere tissue of absurdities," were replied to, first by Leibnitz ('Leipzig Acta,' 1694), and afterwards by M.H. Bernoulli and Herman, the latter of whom showed to the satisfaction of mathematicians, that their adversary knew little or nothing of the calculus.

against which he had written so freely. A work of much greater merit was published by him at Amsterdam in 1715, in one volume 4to, entitled 'The right use of Contemplating the Works of the Creator'; the object of the author is first to convince atheists of the existence of a supreme and benevolent Creator, by contemplating the mechanism of the heavens, the structure of animals, &c.; and secondly to remove the doubts of Deists concerning revealed religion. It was originally published in Dutch, but has passed through several editions, in German, French, and English. The English editions, translated by Chamberlayne, under the title of the 'Religious Philosopher,' appeared at London in 1718-19 and 1730, in 3 vols. 8vo. This work, as was first pointed out in the 'Athenæum' for 1848, pp. 303, 307, 338, served as the basis for Paley's 'Natural Theology,' the general argument, and many of the illustrations in that remarkable work being directly copied—and without the slightest acknowledgment, though Paley was acquainted with the book—from the 'Religious Philosopher.'

Nieuwenhuyt died May 30, 1718, not in 1730, as stated in Hutton's Dictionary. The following are the titles of his mathematical works: 'Considerationes circa Analyseos ad Quantitates infinitè parvas applicatas Principia, et Calculi Differentialis Usus in resolvendis Problematis Geometricis,' Amst., 1694, 8vo; 'Analysis Infinitorum, seu Curvilinearum Proprietatis ex Polygonorum Natura deducta,' Amst., 1695, 4to; 'Considerationes Secundæ circa Differentialis Principia, et Responsio ad Virum Nobilissimum G. G. Leibnitium,' Amst., 1696, 4to; 'A Treatise upon a New Application of Tables of Sines and Tangents,' 1714 (printed in the 'Journal Littéraire de la Haye').

NIEUWLAND, PIETER, an eminent Dutch poet and natural philosopher, was born in 1764, at Diemermeer, where his father was a carpenter, and a man of some information for one in his class of life. From him he acquired some insight into arithmetic and geometry; read all the books which the house contained, and at the age of seven began to display a turn for making verses. His verses were considered by others, besides his father, as very extraordinary productions for such a mere child, and caused him to be greatly noticed by many, and especially by Bernardus de Bosch, who not only stood high among his countrymen as a classical scholar, but who was a lover of poetry, and had himself some pretensions to be a poet. By him the boy was taken into his own house and placed under the tuition of his brother Jeronimo de Bosch, by whom he was instructed in Greek and Latin, in both which he soon made great proficiency, as well as in other studies. He was then sent to the Athenæum at Amsterdam, where he had Tollius and Wytténbach for his instructors, and where, in 1780, he gave proofs of his learning and acquirements, by a dissertation on Terence, and another on the Stoic philosopher Musonius. After attending Ruhnkenius's lectures at Leyden, he became "candidate" of philosophy, and so distinguished himself, that in 1787 the post of head-master at the school of Utrecht was offered him. In the following year he increased his fame by the publication of some of his poetical pieces, including that entitled 'Orion,' one of his noblest productions. In these, and his subsequent poems, there are marks of real genius and originality, striking thoughts and ideas expressed with great power of language. Their chief defect is, that many of them possess little interest of subject, being of the class denominated "occasional poems," and therefore charm only by their beauties of execution. But as his translations from Anacreon are unrivalled in the language for their sprightliness and elegance, so is his elegy on the death of his wife for its simple pathos.

Nieuwland's high poetical talent was the more remarkable because combined with other talents which have generally been considered incompatible with an ardent imagination. In conjunction with Van Swinden he published a nautical almanac; and also wrote a treatise (1787) on the means of ascertaining the longitude at sea, which has been frequently reprinted. Besides this he had begun a work on navigation, of which only the first volume appeared (1792), his death preventing him from completing it. An account of his other scientific and philosophical writings may be found in his Eloge by Van Swinden. That he possessed very extraordinary mental powers and rapidity of apprehension admits of no doubt, when the extent of his studies and attainments is compared with the shortness of his life and the variety of his avocations. In 1789 he was lector in navigation and natural philosophy at Amsterdam; in 1792 he became head-teacher at Leyden, in the mathematical and physical sciences; and in 1793 professor of mathematics, physics, architecture, hydraulics, and astronomy. He died on the 14th of November 1794, about eight months after the death of his wife and child.

NIGER, CAIUS PESCENNIUS, appears to have been of humble origin; but his great military talents recommended him successively to the notice of Marcus Aurelius, Commodus, and Pertinax, by whom he was employed in offices of trust and honour. He was consul together with Septimius Severus, and obtained the government of Syria.

On the murder of Pertinax, A.D. 193, the empire was exposed for sale by the Prætorian guards, and was purchased by Didius Julianus, whom the senate was compelled to acknowledge as emperor. The people however did not tamely submit to this indignity; and three generals, at the head of their respective legions, Septimius Severus, who commanded in Pannonia, Clodius Albinus, in Britain, and Pescen-

nus Niger, in Syria, refused to acknowledge the nomination of the Prætorians, and each claimed the empire. Of these, Niger was the most popular, and his cause was warmly espoused by all the provinces of the East. But he did not possess the energy and activity of his rival Severus. Instead of hastening to Italy, where his presence was indispensable, he quietly remained at Antioch, while Severus marched to Rome, dethroned Didius, and made active preparations for prosecuting the war against him in Asia. Roused at length from his inactivity, Niger crossed over to Europe and established his headquarters at Byzantium; but he had scarcely arrived at this place, before his troops in Asia were defeated near Cysicus by the generals of Severus. He was soon however able to collect another army, which he commanded in person; but being defeated successively near Nicæa and at Issus, he abandoned his troops, and fled towards the Euphrates with the intention of seeking refuge among the Parthians. But before he could reach the Euphrates, he was overtaken by a detachment of the enemy, and put to death on the spot.

Coin of Niger.

\* NIGHTINGALE, MISS FLORENCE, the younger of two daughters, was born in 1820, in the city of Florence, "whence," says the author of a 'Stroll to Lea Hurst,' "her first name is derived." Her father, William Edward Nightingale of Lea Hurst, Derbyshire, was descended from an ancient Yorkshire family, named Shore, and went by that name himself so recently as 1815, when in compliance with the wishes of an uncle by the mother's side, he adopted the present family name. He married in 1818 a daughter of Wm. Smith, Esq., M.P. for Norwich. Florence Nightingale appears to have been instructed at home; where, besides the usual accomplishments, she acquired a knowledge of the German, and other modern languages, which, during her travels on the Continent, to examine the hospitals and asylums for the poor and aged, were of essential service. In early childhood, a marked sympathy with every kind of affliction declared itself in her; and it was fostered both by the encouragement of her friends, and the means for its exercise which her father's fortune placed at her disposal. From the first, her benevolence took the aspect of method, being quiet, thoughtful, and serious; she seemed from natural instinct to have adopted her own vocation. Her reading mainly consisted of the writings of pious Christians of different countries and ages, who have had their missions of charity. From Lea Hurst, where much of her early life was spent, she visited the schools and hospitals of the neighbourhood, and when time had lent its impulse to this benevolence, she longed to extend its sphere by exploring the great hospitals of England. With this view, she was taken to the metropolis, where she examined with rigid care the several systems of treatment pursued in the hospitals, reformatory institutions, and workhouses. She took great pains in observing the nursing of patients in the Middlesex hospital, whence afterwards she selected some of the nurses who accompanied her to the East. After this she gathered new experience by inspecting the principal hospitals in the country towns.

During this protracted course of study, the observation which most frequently recurred to her, was the want of competent nurses, and a school for the training of them. This deficiency she often complained of; the complaint has since been repeated by medical men as well as by voluntary sisters of charity, and it forms the basis of that important movement in favour of the sick and poor, which Mrs. Jameson, Mrs. S. Austin, and other ladies are now engaged in promoting. At length, she learned that such a training school as she desired, though not to be met with in the United Kingdom, existed in Germany. This was the institution at Kaiserswerth, founded by Pastor Fliedner, for the practical training of deaconesses, or visiting nurses, who go out to visit the sick and poor. This humble pastor had the charge of a community of Protestants, working people belonging to a large factory near Düsseldorf on the Rhine; the proprietors of which having been ruined by the late war, the artisans were reduced to extreme misery. But this great disaster did not subdue the spirit of their minister. Unwilling to desert his flock, he travelled through Germany, Holland, and England to raise subscriptions, partly to build a church for their use. Whilst in this country, he was introduced to the late Mrs. Fry. The objects which then engrossed that lady's mind, at once gave a new direction to the zealous charity of the German pastor, who, on his return home, formed at Düsseldorf the first society existing in Germany for the improvement of prison discipline. But his aims and purposes expanding, in 1833, he opened the first branch of Kaiserswerth institution by founding his penitentiary in a summerhouse in his garden: he began with one frail female, and one voluntary assistant. In 1835, his establishment comprised a

general hospital, a lunatic asylum, an asylum for orphans, and an infant school. He too felt the deficiency which afterwards impressed Miss Nightingale, the want of skilful nurses; and to remedy this evil, new departments were formed for the proper training of hospital nurses, of teachers to instruct nurses, and of deaconesses, or out-door nurses. Indeed the whole foundation assumed the character of a training school. It is however the hospital above all, opened in 1836, which distinguishes this institution. In little more than twenty years, this establishment, begun with only one patient and one nurse, has so far increased, that it contained in 1855 no less than 190 sisters, 97 of whom having become efficient, after a full course of training, were distributed over Germany, England, Turkey, Greece, and the United States.

In the year 1849 Miss Florence Nightingale resolved to enter the Kaiserswerth institution as one of the voluntary nurses. Accordingly she placed herself under the guidance of Pastor Fliedner, went through the regular course of training, and surrounded by skilful sisters, whom she has since described, acquired that aptitude in nursing and surgical dressing, which has since been practised on a far more extensive field. She spent upwards of six months in the hospital of Kaiserswerth; witnessing the devotion of Protestant German ladies when risking their lives in the infected wards. She saw more than one of them die. It was there she acquired that abhorrence of all dread of cholera cases, which made the sick soldiers at Scutari look upon her with admiration. On leaving Kaiserswerth in 1850, she visited a number of other hospitals and asylums for the poor in Germany, France, and Italy, but more particularly those institutions formed on the model of Pastor Fliedner's, for the training of Protestant nurses and teachers. Among the many sisters of charity she met with in her progress was a German lady, the Baroness Rantzen, directress of a royal benevolent institution at Berlin, patronised by the Queen of Prussia. Like herself, the baroness had adopted the vocation of voluntary nurse, and had qualified at Kaiserswerth.

After her return to England, Miss Nightingale remained some months at Lea Hurst, to recruit her health. Her next service was the direction of the Sanatorium for Invalid Ladies in Upper Harley-street, London, where she remained from August 1853 to October 1854, when the progress of the war, and the distress of the British army, had roused the sympathy of the nation. The question having been strongly urged, with a pointed reference to the assistance rendered by the Sisters of Charity in the French camp, "Are there no women in Protestant England to go forth?" Mr. Sidney Herbert, secretary at war, determined to send out to the East a staff of voluntary nurses; and it was in consequence of his urgent request that Miss Nightingale, who endeavoured to shun notice and fame, was induced to take upon herself the onerous duty of its superintendence. Having reached Constantinople a day or two before the battle of Inkermann, November 5th, 1854, accompanied by her friends and coadjutors, Mr. and Mrs. Braebridge, and forty-two competent nurses, some of them ladies of rank and fortune, she took up her quarters in the great barrack hospital at Scutari. The battle of Inkermann sent down to that hospital, in a single day, upwards of 600 wounded soldiers; and so great was the rapidity with which sickness spread through the camp, that the number of patients at Scutari rose in two months, from September 30th to November 30th, from 500 to 3000, and on the 10th of January 1855 nearly 10,000 sick men were scattered over the various hospitals on the Bosphorus. Miss Nightingale remained nearly two years in the East. It is needless to speak of the services she and other English ladies rendered there; for their value is universally acknowledged. Her devoted assiduity was only interrupted by an attack of hospital fever, in May 1855. Immediately on her recovery she resumed her good work, nor did she relinquish it, until nearly the last of the great army had been re-embarked. Then she came back, and reached her father's seat at Lea Hurst, on the 8th of September 1856. Her services have been warmly, ungrudgingly, and gratefully recognised from the Queen down to the peasant, with a unanimity only accorded to such rare, unostentatious, and truly admirable conduct. A subscription to found an institution for the training of nurses, under the direction of Miss Nightingale, has been raised by the country as the most appropriate testimonial of her services; it reached 50,000*l.*

A pamphlet written by Miss Nightingale, and published in 1850 for the benefit of the establishment for invalid ladies in Upper Harley-street, is entitled—"The Institution at Kaiserswerth on the Rhine, for the Practical Training of Deaconesses, under the direction of the Rev. Pastor Fliedner."

Miss Nightingale has embodied much of the results of her experience and study of the treatment of the sick in two brief but very valuable works: "Hints on Hospitals," and "Hints on Nursing."

NIKON, a celebrated personage in the annals of Russia, and the sixth patriarch in the Russian church, was born in May 1605, in a village near Nischnei-Novgorod, where his father was a husbandman. A natural inclination for study led him to become the pupil of a monk in the convent of St. Makarius. The taste which he there acquired for monastic life and discipline was so strong, that although he married, in compliance with the pressing instances of his family, he separated from his wife after ten years' union, and prevailed upon her to enter the convent of St. Alexis at Moscow, while he himself retired to a

BIOG. DIV. VOL. IV.

small island in the White Sea, not far from Solowetz, where there was a brotherhood of hermits living in detached cells. The desolation of the place and the severity of the discipline served rather to increase than to abate the ardour of the new recluse; but the zeal of the brethren led to dissensions that terminated in his expulsion, or at least his flight.

Being desirous of replacing their wooden church by a stone edifice, Nikon, and Elizar, the founder and head of the community, proceeded to Moscow, where they collected contributions for the purpose; but on their return, Elizar took the money into his own keeping, and manifested no intention of applying it to the intended purpose. This led to remonstrances and altercations; and to such persecution on the part of Elizar, that Nikon pushed off from the island in a small boat; and after incurring great danger, was driven to the island Kij, at the mouth of the Onega, where he set up a wooden cross. At the same time he made a vow to erect a monastery on that spot, in fulfilment of which may now be seen the magnificent cloister of the Holy Cross. Associating himself with a community called the Koschooser hermits, he so distinguished himself by his superior sanctity and severity of life, that on the death of their abbot, or principal, he was elected in his place, in 1645. Being compelled three years afterwards to take a journey to Moscow, to arrange some affairs of their community, he there became known to the Czar Alexis Mikalovich, who was so struck with his eloquence and understanding, that he caused him to be appointed archimandrite of the Novospasky Convent. A new career was thus suddenly opened to him: his influence with the sovereign increased daily, and he employed it in behalf of the distressed. On being appointed metropolitan of Novgorod, in 1648, he attached the people of that city to him no less strongly: his eloquence drew crowds to hear his discourses in the cathedral, and his bounty maintained numbers during a severe famine. Besides this he appeased a violent popular insurrection at Novgorod in 1650, at very imminent peril to his own person. In the meanwhile he continued in high favour with the Czar, who frequently corresponded with him, and who, on the death of the patriarch Joseph, in 1652, appointed him his successor. It was about this time that he commenced his reforms in the books, as he had previously done in the liturgy, of the church; and held several councils relative to the translations of the Scriptures. But herein his zeal led to his disgrace: his reforms were regarded as dangerous innovations; and notwithstanding the Czar had shown such friendly confidence in him as to place his own family under his care during the pestilence at Moscow in 1653-54, and had attended at the consecration of the Voskresensky monastery (erected by Nikon) in 1657, the patriarch's enemies contrived to prejudice him in the good opinion of his sovereign, and in 1658 he retired to the monastery just mentioned, situated about forty versts from the capital, whence he refused to return. The feeling against him increased, till at length, in 1667, a council was held at Moscow, at which the Czar himself presided, and which was attended by the patriarchs of Alexandria and Antioch, those of Constantinople and Jerusalem having excused themselves. The result was that Nikon was deposed from his dignity, and was banished to the Bielozersky monastery, with the rank of a simple monk. There he remained until after the death of Alexis, whose successor, Phœdor Alexievich, granted him permission to return to the Voskresensky monastery; but he died on the journey thither, at Yaroslavl, August 17th, 1681, at the age of seventy-five.

Nikon compiled a collection of ancient Russian chronicles to the year 1630, which were printed by the Academy of Sciences of St. Petersburg, in 8 vols. 4to, 1767-92. He also wrote several dogmatical and theological pieces, which were printed in his lifetime.

NILEUS, a surgeon of the Alexandrian school, celebrated for the invention of a machine called the 'plinthium,' which was employed with success in reducing luxations of the femur. (Celsus, 'De Med.' lib. viii., cap. 20; Oribasius, 'De Medicinis,' cap. 8, p. 617.) Some of his medicines are quoted by Galen, Aëtius, Celsus, Paulus Ægineta, Cœlius Aurelianus, and Oribasius. The exact time when he lived is not known; but as he is mentioned by Celsus, we may perhaps safely place him a little before the beginning of the Christian era.

\* NILSSON, SVEN, professor of natural history in the University of Lund, and the most distinguished living zoologist in Sweden, was born in 1787. He studied at Lund, and in 1812 was appointed a teacher of natural history in connection with that university. In 1818 he took his degree of M.D., and in 1821 was appointed a titular professor. In 1828 he was appointed superintendent of the natural history collections of the Academy of Sciences. In 1832 he became ordinary professor of natural history in the University of Lund. He was also at this time, in accordance with the custom in Denmark and Sweden, where men of science are advanced to positions in the Church, made a prebend. In 1836 he visited England and France, and at this time was deeply interested in the studies of archæology. His works on natural history have been very numerous, and he has especially devoted himself to the illustration of Scandinavian zoology. One of his earliest and most important works was his 'Scandinavian Fauna,' the first volume of which was published in 1820 and the third in 1828. His other works have been mostly expansions of this, and he has at various times published papers on the comparative anatomy, habits, and structure of Scandinavian animals. He has also devoted much attention to the subject of archæology, and has published a

work on the origin and history of the Scandinavian races. His researches have extended to the extinct races of animals, and he has published several papers on the subjects of geology and palæontology.

NITHARD, born in 790, was son of Angilbertus, and of Bertha, daughter of Charlemagne. He lived at the court of Charles the Bald, grandson of that prince, fought in his service, and died of wounds received in it, about 859. Nithard wrote in Latin a history of the wars between Charles the Bald and his brothers, which is inserted in Duchesne's collection, 'Historiæ Francorum Scriptores.' In his history Nithard gives the text of the treaty between Charles the Bald and his brother Louis the Germanic, which was sworn to by them at Strasbourg, and is dated on the 16th kalends of March 842. This treaty was written both in the Latin and Romance languages, and is the oldest existing monument of the latter. It has been often quoted as an interesting document for the history of the modern languages which were formed in Western and Southern Europe after the fall of the Roman empire. The Romance text begins thus:—"Pro Deo amur, et pro Christiano populo et nostro commun salvement, disi di avant, in quant Deus savir et podir me dunat, si salvarai, io eiat meon fradre Karlo," &c.

NOAILLES, DE, the title of an old and illustrious family of the French nobility, which originally belonged to the province of Limousin, where it had a château and hereditary domain not far from Brives. Mention is made of the lords of Noailles in old documents as far back as the beginning of the 11th century. Moreri ('Dictionnaire Historique') gives the genealogy of the lords of Noailles, beginning with Hugues, who lived in the first part of the 13th century, and who went to the Holy Land with Louis IX. and died on the journey. Many individuals of this family figure in the history of France as filling high offices, both civil and military. The most distinguished are—1. Anne Jules, duke of Noailles, peer and marshal of France, who served in the armies of Louis XIV., and died in 1708. 2. Adrien Maurice, duke of Noailles, son of the preceding. He distinguished himself in the Spanish campaigns during the war of the Succession, took the strong fortress of Gerona in Catalonia, was made grandee of Spain by Philip V., and minister under the regent D'Orléans. He afterwards commanded the French armies in Germany and Italy in 1733-35, and again in 1741-43. He died at Paris in 1766. His wife was Françoise d'Aubigné, niece of Madame de Maintenon. Millot published after his death 'Mémoires Politiques et Militaires pour servir à l'Histoire de Louis XIV. et Louis XV., composés sur les Pièces Originales recueillies par Adrien Maurice, duc de Noailles.' These memoirs contain many interesting particulars. 3. Louis Antoine, cardinal de Noailles, uncle of the preceding, was made archbishop of Paris in 1695. He became involved in the wearisome disputes between the Jansenists and the Jesuits, displeased both parties, and at last incurred the displeasure of Louis XIV. on the subject of the famous papal bull 'Unigenitus.' [CLEMENT XI.] After the death of Louis XIV. the regent recalled Cardinal de Noailles to court and showed him great favour. The cardinal died at Paris in 1728, highly esteemed for his learning and regretted for his sincere piety and his great charitableness. 4. Louis, viscount of Noailles, was returned in 1789 to the States-General for the order of nobility by the bailliage of Némours, and, like several others of his order, cordially adopted the principles of the revolution. On the memorable night-sitting of the 4th of August, Noailles proposed and carried the suppression of feudal rights, and of all other privileges enjoyed by the nobility and clergy, and on the 19th of September he moved for the suppression of all titles of nobility, which motion was also carried. After the end of the session of the National Assembly he repaired to the army on the Rhine, but when the Jacobin party obtained the ascendancy he emigrated. He returned under the consulate, was sent by Bonaparte to St. Domingo as general of brigade, and was killed, in 1803, in a sea-fight against the English.

NODIER, CHARLES, was born at Besançon in France, on the 29th of April, 1780 or 1783. Under his father, a man of stern principles and of a cultivated mind, he evinced in early life a considerable disposition for the acquirement of knowledge. At a very early age he entered on a course of classical study, which was however soon interrupted by the events of the revolution, the principles of which his father, at that time mayor of Besançon, warmly espoused. During the Reign of Terror young Nodier employed himself in writing poetry and composing tragedies on classical subjects. These early compositions he was accustomed to read to an aged friend, who advised him to devote himself to more serious pursuits. The beneficial consequence of his advice became manifest, when five years after he published a work of considerable research and great critical acumen, entitled 'Le Dictionnaire des Onomatopées,' that is, a dictionary of words which derive their signification directly from the action which they represent (*δρῶμα*, 'a name,' and *ποιέω*, 'to make'), as the verb 'to hiss' in our language, and 'siffler' in French. At the suggestion of Fourcroy [FOURCROY], it was used as a class-book throughout France, and a copy of it, by order of government, was placed in the library of every Lyceum or public school. During the same period of the Reign of Terror he formed an acquaintance which terminated in the most intimate friendship with M. de Chantrains, a Royalist officer, who was compelled to seek for safety in a retired country life; through him Nodier acquired a taste for the study of natural history, to which he

afterwards devoted a considerable portion of his time; it was especially to the minute examination of insects and flowers that he attached himself, and his taste for them is strongly marked in all his after-productions. He published in 1798 the result of his studies in a dissertation on the organs of hearing in insects, and in 1801 in a small work entitled 'Bibliothèque Entomologique.'

In 1796 Nodier had gone to Paris, where, furnished with numerous recommendations, he had been introduced into the best literary societies of that time. Two years afterwards he retired to his native town; but soon becoming wearied of the monotony of a provincial life, he sought for novelty in the society of the political prisoners and suspected Royalists, who at that time abounded at Besançon. His imprudence, however, became the fortunate means of bringing his talents more prominently into notice. The company he was keeping brought him under the suspicions of the government, and his room was one night forced open and searched by the police agents, and his papers placed in the hands of the prefect, Jean Debry, one of the deputies of the French Republic, who was imprisoned at Rastadt by the Austrians. While searching among his papers for some traces of a political plot, Debry met with the manuscript of 'Le Dictionnaire des Onomatopées,' and was surprised to discover the deep research and learned disquisitions contained in a work of a young man whose habits were apparently so frivolous. With just discernment he perceived to what important uses might be applied the power of a mind so brilliant in imagination and so persevering in study. Under his influential auspices the work was published, with the success already mentioned.

At the revolution which placed Napoleon on the throne, Nodier, who during the most turbulent periods of the Republic had expressed opinions favourable to the Royalists, became under Napoleon a stern Republican. Indeed, in the strict acceptation of the term, he had no political opinions. The disposition of his mind always prompted him to oppose the prevalent tendencies of the age. Thus, under the Republic, which discountenanced religion, Nodier professed openly the most rigorous sentiments; under the Consulate, he was at one time a Girondist, at another a Vendean; under the Empire, he was a discontented Liberal; under the Restoration, he sung the praises of the political party which had brought to the scaffold the brother of the reigning king.

His first poem, 'Napoleone,' is consecrated to the defence of liberty, and appeared in 1800, when military power was assuming the ascendancy; the last lines are a tribute of praise to "the martyred Sidney." An imprisonment of some months was the result, at the expiration of which he was sent back to his native town, and placed under the inspection of the police. Thus secluded from society, he devoted more time to literature, and he especially attached himself to a critical study of his own language. It was during this period that appeared his 'Examen critique des Dictionnaires de la Langue Française;' a work replete with learned and instructive remarks. To this period also is to be assigned his 'Peintre de Saltzbourg,' which he composed while wandering over the country to avoid the watchful persecution of the government agents. After some years spent in this manner of life, he retired to Dôle, where he gave public lectures on French literature, which met with success unprecedented in a small country-town. It was there that he first became acquainted with Mademoiselle Desirée Charvée, a lady of great accomplishments and personal attractions, whom he afterwards married.

Nodier spent the first years of his married life at Quintigny, near the Jura; it was amongst the picturesque woods and meadows, which adorn the neighbourhood of that town that most of the poems which have added so much to his celebrity were composed. The necessity of providing for the subsistence of his family obliged him to abandon the charms of a country life in order to settle in Paris, he having in vain solicited the vacant situation of public librarian of Dôle, to which was attached the small salary of 1000 fr., about 40l. a year. In Paris he soon made himself known by his numerous publications, and became a regular contributor to the 'Journal des Débats.' A short interruption to his residence at Paris was caused by the acceptance of the office of librarian at Laybach in Illyria, with a salary of 1800 fr., half of which he generously bestowed upon an aged German who had been his predecessor. The restoration of the Bourbons produced little change in the fortunes of Nodier; he continued attached to the 'Journal des Débats,' which paper he afterwards left to undertake the direction of the 'Quotidienne.' This period of Nodier's life was rich in literary labour; each successive year he produced a work, which, taken by itself, was sufficient to confer celebrity on the author. In 1818 appeared his 'Jean Sbogar,' in which he displays an intimate knowledge of German literature; in 1819 'Thérèse Hubert,' a short romance remarkable for the unaffected beauty of its style and the simple development of its plot; in 1820 'Adèle,' another imitation of the German; in 1821 'Smarr,' derived from the writings of Apuleius, and 'Trilby' in 1822.

Nodier was shortly after this nominated to the important situation of librarian to the Arsenal at Paris. Nodier's rooms at the Arsenal soon became the resort of the most distinguished literary men of the capital, who were attracted thither by the affability of the librarian, and by the charms of his brilliant and learned conversation. Among the most constant of his visitors were Victor Hugo, Lamartine, Alexandre Dumas, and Ste. Beuve. It is not the least surprising fact connected with the life of Nodier, that amidst the incessant occupations of his

situation, and the time which he devoted to the society of his friends, he should have produced so many works which bear the stamp of original genius. It would be here impossible even to enumerate all his productions. He was a contributor to the 'Biographie Universelle' and other publications, and the originator of the 'Grand Dictionnaire Historique,' while almost daily publishing various works of a more popular character, such as his 'Souvenirs de la Jeunesse,' 'Inès de las Serras,' 'Les Fantaisies du Docteur Néophobus,' 'Dernier Banquet des Girondins,' and 'Franciscus Columna,' his last and perhaps most remarkable novel. In 1834 the French Academy did him the tardy justice of electing him a member of their body in the place of Mons. Laya.

At length, under the effects of constant application, Nodier's health gradually gave way. The evening before Christmas, 1843, was the last in which he was permitted to enjoy the society of his literary friends. Three days after he was taken with a serious illness, more lingering than painful, and expired on the morning of the 27th of January 1844.

Nodier's peculiar characteristic as a 'littérateur' is that he devoted the energies of his mind to no special subject, but wrote on almost every subject, and that in a way which leads one to suppose that, had he attached himself to it, he might have attained great eminence. As a poet his merit consists in the purity of his style and diction, his hostility to the innovations which have been introduced in French literature, and his faithful adherence to their best classical models. In one respect he deserves especial praise, the substance and moral of his writings are as pure as his style.

There is a short but very interesting biography of Nodier by his friend Francis Wey, Paris, 1845; and also in the 'Portraits littéraires de Sta. Beuve;' to these two works we are chiefly indebted for the materials of this article.

NOETUS, a native of Ephesus or Smyrna, and contemporary with Origen, is chiefly known in ecclesiastical history for the heterodox opinions which he advanced respecting the Trinity. He appears to have believed in only one divine person, and to have denied the distinct and proper personality of the Word and Spirit. He is said by Epiphanius to have asserted that the Father was begotten, suffered, and died, and that in reality he was Christ. From this opinion Noetus and his followers were called Patripassians, that is, persons who believed that the Father alone had suffered for the sins of men; but it has been remarked by Beausobre ('Hist. de Manichéus,' p. 533) with considerable truth, "that this opinion is so absurd and so manifestly contrary to many texts of the New Testament, that it appears scarcely possible that it should be maintained by any reasonable man; which makes him suspect that this was not the opinion of those persons, but a consequence which the orthodox drew from their principles." Noetus is also said to have maintained that he was Moses and that his brother was Aaron; but it is more probable, as Beausobre has remarked, that Noetus and his brother only pretended to defend the unity of God, as it had been taught by Moses and Aaron.

The followers of Noetus probably joined Sabellius, whose explanation of the doctrine of the Trinity was nearly the same as that of Noetus appears to have been.

NOLAN, LEWIS EDWARD, Captain in the 15th Hussars, was the son of the late Major Nolan of the 70th Regiment, and for some years Vice-Consul at Milan. He entered the Austrian army at an early age, and served in Hungary and on the Polish frontier. In 1839 he obtained a commission as ensign in the 4th Foot, from whence in the following month he exchanged into the 15th Hussars, then stationed at Madras. Here his talents and energy attracted the attention of the late Sir Henry Pottinger, then governor, who appointed him to a post on his staff. In addition to his knowledge of the languages of modern Europe, he mastered the native dialects, and entered actively into the details of the military system in the East. On returning home he proceeded on a tour through Russia, and inspected most of the military posts in that empire. The results of his professional studies were published by him in 1853 in a work of some merit, on the 'Organization, Drill, and Manœuvres of a Cavalry Corps.' Upon the breaking out of the war with Russia in the following year, he was commissioned to proceed to Turkey for the purpose of making arrangements for the purchase and support of horses for the cavalry regiments. On reaching the Crimea he was placed on the staff of Brigadier-General Sir R. Airey, K.C.B., and was the bearer of the written command from Lord Raglan, ordering the cavalry to make the fatal charge at the battle of Balaklava, in which the gallant captain was one of the first to fall, October 25, 1854.

NOLLEKENS, JOSEPH, was born in Dean-street, Soho, London, August 11, 1737; his father, Francis Joseph Nollekens, who was an artist of much ability for compositions of landscape and figures after the manner of Watteau, was a native of Antwerp. The senior Nollekens died January 21, 1748, and his widow soon after married again and went to reside in Wales. These circumstances may serve to account for Joseph's neglected education, for his literary attainments scarcely extended to an ordinary knowledge of reading and writing; nor does he appear to have endeavoured in after-life to make up for his deficiencies. At the age of thirteen he was placed with Sotheby, the sculptor, and while with him obtained some prizes from the Society of Arts, who afterwards voted him fifty guineas, while he

was at Rome, for his Timoclea before Alexander. He set out for Rome in 1760, and while there was noticed by some of his countrymen, among others, by Garrick and Sterne, both of whom sat to him for their busts. That of Sterne, which was in terra-cotta, was, for likeness and character, equal to any which he afterwards produced. In Rome he turned his attention also to a rather lucrative if not particularly dignified branch of art, namely, that of manufacturing antiques, by vamping up fragments, finding either heads and limbs for bodies, or bodies for heads and limbs; one of the statues thus compounded was the Minerva, afterwards purchased for a thousand guineas, and now in the Newby collection in Yorkshire. His dexterity and skill in repairs of this kind were subsequently displayed in some of the Townley Marbles. While at Rome he also purchased for a trifle, of the workmen by whom they were discovered, a number of fine terra-cottas, which he afterwards disposed of to Mr. Townley, and which are now let into the walls at the British Museum. Among those whose patronage he obtained during his stay in Italy were Lord Yarborough and the Earl of Besborough, for the first of whom he executed a group of 'Mercury and Venus chiding Cupid.'

After about ten years of study in Italy, which had been profitable to him in all senses of the term, he returned to London with habits of economy well calculated to keep what he had acquired and to ensure still further wealth. He established himself in Mortimer-street, became an associate of the Royal Academy, and was shortly afterwards honoured by the king's sitting to him for his bust. The royal patronage and the celebrity which his busts of Garrick and Sterne had previously obtained, perhaps as much on account of their subjects as of their own merit, caused him to be almost overwhelmed with employment of that kind: he had sometimes three or four sitters in the course of one day. This constant application to the mere taking of likenesses, if it tended to render him more studious of the mechanical than the intellectual part of his art, was certainly congenial to his inclination, being productive of immediate profit, and suited also to his abilities. The tide of fashion being once in his favour, the peculiarity of address and bluntness of manners and speech, which might else have proved disqualifications for that branch of his profession, probably contributed in no small degree to recommend him to those who, accustomed to courtesy and polish of manners in their own circle, were willing to amuse themselves with the oddities of one who had obtained a kind of privilege for freedom of tongue, and however deficient in education, Nollekens was by no means wanting either in shrewdness or tact.

He had also a good deal of employment in a branch of the art still less favourable than that of bust-making for the display of its higher powers, namely, that of common-place monuments of common-place people. In such subjects almost the only inspiration that an artist can feel springs out of pecuniary remuneration; yet there were exceptions even in this case, for the monument to Mrs. Howard of Corby Castle is one of his best productions, pathetic in conception, elegant and tasteful in execution; as a work of art, very far superior to that by him of Captains Manners, Bayne, and Blair in Westminster Abbey, which, though a sumptuous, is but a frigid and mechanical work. Notwithstanding both his occupations of this kind and his numerous commissions for busts, Nollekens found time to undertake several statues and pieces of poetic sculpture, among which were no fewer than five Venuses, one of them since known by the name of the Rockingham Venus, and one representing the goddess anointing her hair, which last was reckoned by the artist himself to be his master-piece, and hardly inferior to the antique. Among his groups were a Pegasus and Arria and a Cupid and Psyche.

While wealth was pouring in upon him year by year, his expenses by no means kept pace with it, nor were they at all increased by his marriage; for the lady he selected, Miss Mary Welch, though of some beauty and accomplishments, was still more remarkable for her rigid economy; and though wealthy and childless, both the husband and wife carried their notions of frugality even to penuriousness. Nollekens died on the 23rd of April 1823, at the age of eighty-six, dividing with the exception of a few legacies (amounting to about 6000*l.*), the whole of his vast property (somewhat more than 200,000*l.*) between his friends Francis Palmer, and Francis Douce, the well-known antiquary, and leaving to each of his executors, Sir W. Beechey and Thomas Smith, only 100*l.* each. Smith, who had been in the sculptor's studio, had expected a very considerable legacy; consequently it is not a matter of much surprise if his biography of the old sculptor is entirely free from that admiration of his subject which most biographers entertain.

NOLLET, JEAN ANTOINE, a distinguished French philosopher, was born at Pimpré, in the Noyonnais, in 1700. It being the intention of his father, who held a farm in that part of France, that he should embrace the ecclesiastical profession, he was sent to the college of Beauvais, in order that he might prosecute the study of theology; but his taste inclining him to cultivate the physical sciences the intention was abandoned, and he was never otherwise connected with the church than by holding deacon's orders with the title of Abbé. On leaving the college he went to Paris, where he attended a course of lectures on natural philosophy, the subjects of which he studied with great diligence, repeating in his humble dwelling the experiments which he had seen performed in public. He passed many of his leisure hours

in the practice of enamelling; and he is said, at one time, to have superintended the education of a son of M. Taitbout, who held the post of recorder.

The Abbé Nollet applied himself particularly, in conjunction with M. Dufay, to the subject of electricity; and he soon became distinguished by the number as well as the ingenuity of his experiments with relation to that science, performing them in the laboratory of M. Réaumur, who generously permitted him to make use of his valuable apparatus. He was the first who observed that pointed bodies, when electrified, gave out streams of light, but did not exhibit in other respects such powerful indications of electricity as were shown by blunt bodies; and he found that the smoke of burnt linen and wood, and the vapour of water, were better conductors of electricity than the smoke of gum-lac, turpentine, or sulphur. He ascertained that an excited tube lost none of its electricity by being placed in the focus of a concave mirror when the sun's light was concentrated in that point; that glass and other non-conductors were more strongly excited in the air than in vacuo; and that oil of turpentine on a woollen cloth was capable of producing the electric fluid in abundance: he observed also the diffusion of the electric light in vacuo. He discovered that electricity augments the natural evaporation of fluids, and that the effect is the greatest when the fluids are contained in non-electric vessels.

In repeating the experiments of M. Boze on the effects of electricity in promoting the discharge of fluids through tubes, Nollet found that no acceleration took place when the bore of the tube exceeded  $\frac{1}{4}$  inch in diameter: he ascertained however that if the bore was very small the electrified fluid divided into several streams and acquired considerable velocity, presenting a brilliant appearance when the experiment was performed in the dark. He electrified, during several days, the mould in a garden pot, in which seeds had been sown, continuing the operation three or four hours each day; when it appeared to him that the plants grew faster and produced shoots earlier than the plants obtained from the like seed in a pot containing the same kind of mould, but which was not electrified. Nollet electrified in the like manner cats, pigeons, sparrows, &c.; and he imagined that the animals were lighter than those of the same kind which were not so treated: from thence he concluded that electricity increases the insensible perspiration of animals. Accounts of these experiments will be found in the 'Philosophical Transactions' for 1748; but it ought to be observed that experiments relating to the effects of electricity on plants and animals have, since, been frequently repeated without verifying the conclusions of the French philosopher; and it may be added, that the attempts which have been made to promote the growth of vegetables by an apparatus for conveying to the ground the electric fluid in the atmosphere, have signally failed.

In 1784 the Abbé Nollet, accompanied by his friend M. Dufay, made a visit to England, when he was elected a Fellow of the Royal Society of London: he went from hence to Holland for the purpose of conversing with the philosophers of that country; and, on his return to Paris, he delivered a course of lectures on physics, which was well attended. In 1789 he was elected a member of the Académie des Sciences: and, during the same year, he went to Turin, where he repeated his electrical experiments in presence of the Duke of Savoy. In 1742 he went by invitation to Bordeaux, where he delivered a course of lectures; and he subsequently delivered a course at Versailles in presence of the dauphin of France, the son of Louis XV.

Nollet made many experiments to ascertain, at various depths under water, the intensity of sounds excited in the air; and he perceived that the striking of a clock and the blowing of a hunter's horn were heard distinctly, but very faintly, at two feet below the surface. He was not fortunate however in his hypothesis concerning the nature of the electric fluid: he imagined that this fluid has two motions, namely, an afflux to the electric body and an efflux from it, and he supposed that, in consequence of the former, all light bodies are attracted or carried towards the electric; while, in consequence of the latter, they are repelled from it. Hence he considered that all bodies have two different kinds of pores, one kind for receiving and the other for emitting the electric fluid. This hypothesis has never been admitted by philosophers.

In 1747 Signor Pivati, of Venice, published a pamphlet in which it was stated, that a man who had suffered from a pain in his side had by him been cured on being electrified with a machine in the glass cylinder of which was contained some balsam of Peru; and that two persons of great age had been cured of the gout by the like means; the benefit was supposed to have arisen from the effluvia of the balsam, which was stated to be so great that the bed and even the whole apartment of one of the patients who had received it was strongly perfumed with it. Professor Winkler of Leipzig also stated, about the same time, that he had performed similar experiments with equal success, by means of sulphur or cinnamon enclosed in the globe of the machine. These extraordinary reports induced the Abbé Nollet to make a journey to Italy for the purpose of obtaining information respecting the nature of the experiments; and the result of his inquiry was that, though in some cases the patients might find relief from electricity, its effects had been greatly exaggerated. All attempts in England to obtain results corresponding to those which were said to have been produced on the Continent entirely failed; and the reports of the pretended cures soon ceased to obtain credit.

In 1756 the king of France founded a chair of experimental philosophy at the college of Navarre, and he appointed the Abbé Nollet to superintend it: the zeal and ability with which he fulfilled the duties of this post gave full satisfaction to the king, who conferred on him the title of Master of Philosophy and Natural History to the Royal Family. Nollet was subsequently appointed Professor of Experimental Philosophy to the School for Artillery, which then existed at La Fère, and which was afterwards removed to Mézières.

He died April 24, 1770, in the Louvre, where the king had assigned to him a suite of apartments: the amiability of his character was equal to his talents; and it is said that he devoted nearly all the profits of his labours to the support of his parents while they lived. Besides being a Fellow of the Royal Society of London and a member of the Académie des Sciences at Paris, he was a member of the Institut of Bologna and of the Académie of Erfurt.

The Abbé Nollet published at Paris, in 1743 and the succeeding years, a work entitled 'Leçons de Physique Experimentale,' in 6 vols. 12mo; this is considered as the most methodical work on that subject which had till then appeared, and it was the first in which the discoveries of Newton respecting the phenomena of light were stated in a popular form. His second work is entitled, 'Recherches sur les Causes particulières des Phénomènes électriques,' in 12mo, 1749; and the third, 'Essai sur l'Electricité des Corps,' 12mo, 1750. He also published, in 1753, his 'Recueil de Lettres sur l'Electricité,' in 3 vols. 12mo; and a work by him entitled 'L'Art des Expériences,' was published in 1770, also in 3 vols. 12mo; this work contains the elementary principles and the practice of the mechanical arts.

(*Biographie Universelle; Philosophical Transactions for 1748.*)

NOMSZ, JAN, a Dutch poet, born at Amsterdam in 1738, acquired some distinction by his epic or rather historical poem of 'William I., or the Foundation of the Freedom of the Netherlands,' in twenty-four books, 1779. This production contains passages of much force and beauty, but for what interest it possesses as a whole it is indebted to the materials themselves. As a dramatic writer, Nomasz showed greater talent, especially in his tragedies 'Cora,' 'Zoroaster,' the 'Duchess of Coralli,' and 'Maria van Lelain.' This last-mentioned piece became exceedingly popular, and retained possession of the stage for a long while, the part of the heroine being frequently performed by Madame Wattier-Ziesenis (born at Rotterdam April 13, 1762, died April 23, 1827), one of the most accomplished women and one of the greatest tragedians of her time, though a Siddons and a Talma were her contemporaries.

Besides some other original tragedies, Nomasz translated several from the French; among the rest, 'Racine's Athalie.' He also produced a comedy which is mentioned with commendation by Van Kampen. His miscellaneous pieces and translations, among which that of La Fontaine's 'Fables' ought not to be forgotten, display likewise much talent, and charm by a certain happy ease and naturalness, and by their merits of style and versification. Like Camoens, he breathed his last within the walls of an hospital, St. Peter's Almshouse at Amsterdam, where he died in 1803, at the age of sixty-five: the poverty of his later years appears however to have been in some measure occasioned by his own want of prudence.

NONIUS MARCELLUS, a Roman grammarian, was probably born at Tibur, in the 4th century, but nothing is known with certainty of his life. He was the author of a small work entitled 'Compendiosa Doctrina per Litteras ad Filium,' or, as it is entitled in some editions, 'De Proprietate Sermonum,' which was written for the use of his son, and is chiefly valuable for the quotations which it contains from old Latin writers. This work has been edited by Mercier, Paris, 1614, which edition was republished at Leipzig in 1826; but the best edition is that of Roth, 8vo, Basel, 1842.

NONNUS. [NUNEE FERNAN.]

NONNUS, an inhabitant of Panopolis in Egypt, lived at the beginning of the 5th century of the Christian era. We have no particulars respecting his life, except that he became a Christian when he was advanced in age. He was the author of two works in Greek, which have come down to us, the 'Dionysiaca,' and a paraphrase in verse of the Gospel of St. John. The 'Dionysiaca' gives an account of the adventures of Dionysus from the time of his birth to his return from his expedition into India; and the early books also contain, by way of introduction, the history of Europa and Cadmus, the battle of the giants, and numerous other mythological stories. This work, which consists of thirty-eight books, and is written in hexameter verse, has been condemned by Daniel Heinsius, Joseph Scaliger, and other critics, for its inflated style, and has been pronounced to be unworthy of perusal; but it must be admitted that it contains passages of considerable beauty, and supplies us with information on many mythological subjects which we should not be able to obtain elsewhere. It appears probable that this work was written before Nonnus became a Christian. The best edition of the 'Dionysiaca' is that by Graefe, 2 vols. 8vo, Leip., 1819-26. D. Heinsius wrote a dissertation on this author, which was published at Leyden, in 1610, with the text of the 'Dionysiaca.' Six books of this poem, from the eighth to the thirteenth inclusive, were published by Moser, with a preface by Creuzer, Heidel., 1809. A French translation of the 'Dionysiaca' was published at Paris in 1625. The 'Paraphrase of St. John,' which is a poor performance, and has been roughly treated by Heinsius, in his 'Aristarchus

Sacer,' Leyden, 1627, was published for the first time at Venice in 1501. The best edition of it is by Passow, Leip., 1834. This work however is of some value, as it contains a few important readings which have been of considerable use to the editors of the Greek Testament. It omits the history of the woman taken in adultery, which we have at the beginning of the eighth chapter of St. John's Gospel, and which is considered by Griesbach and many other critics to be an interpolation. In chap. xix. 14, Nonnus appears to have read "about the third hour," instead of "about the sixth." There are also extant a 'Collection of Histories or Fables,' which are cited by Gregory Nazianzenus, in his work against Julian, and which are ascribed by some critics to the author of the 'Dionysiaca;' but Bentley, in his 'Disertations on Phalaris,' has given good reasons for believing that this 'Collection' was composed by another individual of the same name. There were several other writers of the name of Nonnus, of whom an account is given in Fabricius, 'Bibl. Græca,' vol. viii., pp. 601, 602, ed. Harles.

NONNUS (sometimes called NONUS), a Greek physician, and author of a medical work still extant, entitled *Ἐπιτομή τῆς ἰατρικῆς ἀρώγων ῥήμων*, 'Compendium totius Artis Medicæ.' Nothing is known of his life, except that he composed his work at the express command of the Emperor Constantinus Porphyrogenetus (to whom also it is dedicated), who was most probably the seventh of that name, who died A.D. 959. His real name is supposed by Freind ('Hist. of Physic'), Sprengel ('Hist. de la Méd.'), and Bernard ('Præfat. ad Theoph. Non-'), to be Theophanes, as he is called so in one manuscript, and a physician of that name is found to have lived in the 10th century. In three manuscripts the work is anonymous, and there is only one which mentions the name of Nonnus. This epitome is divided into 297 chapters, and contains a short account of most diseases and their treatment. It contains very little that is original, and is almost entirely compiled from Aëtius, Alexander Trallianus, and Paulus Ægineta; from whom whole sentences are sometimes transcribed with hardly any variation. The greater part of the chapter on Pleurisy (ch. 129) is taken from Paulus Ægineta, lib. iii., cap. 33; part of that on Melancholy (ch. 33) from Alexander Trallianus, lib. i., cap. 16; and all that is valuable about Hydrophobia (ch. 271) is contained in Paulus Ægineta, lib. v., cap. 3. Almost the only point worthy of notice in the work is, that it is the first medical treatise in which any mention of distilled rose-water is to be found: it seems to be meant by the word *ροδοδάγμα*, in the ninety-seventh chapter. The first edition of this work was by Jeremiah Martinus, Argentor., 8vo, 1568, Gr. and Lat.; the next and best was by J. S. Bernard, and published after his death, in 2 vols. 8vo, Gotha and Amsterdam, 1794-95, Gr. and Lat.

NOODT, GERARD, was born at Nimwegen in 1647. He studied first in his native town, and afterwards at Leyden, Utrecht, and Franeker, where he took his degree in law. He distinguished himself as a jurist, and was made professor of law successively at Franeker, Utrecht, and at Leyden. He studied and taught jurisprudence in an enlightened and philosophical spirit. Averse from dogmatism, he readily acknowledged his ignorance on questions which he could not solve. He was well acquainted with the Roman jurists, as well as with the other Roman writers, especially the historians, upon whose model he formed his own Latin style, which is remarkably pure. His chief works are:—1, 'Probabilium Juris Civilis Libri iv.:' 2, 'De Jurisdictione et Imperio Libri ii.:' 3, 'Ad Legem Aquiliam Liber Singularis;' 4, 'De Fœnore et Usuris Libri iii.,' in which he contends that usury is not contrary to the natural law, and is not forbidden by divine law: the author traces the history of the Roman law on this subject; 5, 'Diocletianus et Maximianus, sive de Transactione et Pactione Criminum Liber Singularis,' in which he refutes the opinion of some, that a transaction or compromise in capital or felonious criminal cases was allowed by the Roman law; 6, 'Observationum Libri Duo, in quibus complexa Juris Civilis aliorumque Veterum Scriptorum Loca aut illustrantur aut emendantur;' 7, 'De Usufructu Libri ii.:' 8, 'Ad Edictum Prætoris de Pactis et Transactionibus Liber;' 9, 'Julius Paulus, sive de Partus Expositione et Nece apud Veteres Liber,' in which he maintains that the Roman laws gave to parents the power of exposing or putting to death their infant children, and that this power was only taken away by the emperors Valentinianus, Valens, and Gratianus: this assertion being combated by Bynkershoek, Noodt replied to him in his 'Amica Responsio,' in which he confirms his former assertion by new arguments and authorities; 10, 'De Causis Corruptæ Jurisprudentiæ;' 11, 'De Jure Summi Imperii et Lege Regia Dissertatio;' 12, 'De Religione ab Imperio Jure Gentium Libera' (these last dissertations were translated into French by Barbeyrac, and published under the title of 'Du Pouvoir des Souverains et de la Liberté de Conscience,' Amsterdam, 1707); 13, 'Commentarius ad Digesta, seu Pandectas,' which he continued to the 27th book, when he was stopped by death. Noodt died at Leyden in 1725. He ranks among the most distinguished jurists of modern times, and his works display a deep acquaintance with the law and social state of the Romans. His works have been collected and published in 2 vols. fol., Leyden, 1735, with a biography of the author by Barbeyrac.

NORDBERG, GEORGE, was born at Stockholm in 1677. He studied at Upsala, took holy orders, and in 1703 was appointed almoner to the Swedish army under Charles XII., then at Thorn in Prussia. He followed Charles XII. into Poland, Saxony, and Russia,

and in 1707 was made chaplain to the king. Being made prisoner by the Russians at Pultawa in 1709, he was sent into Russia, together with Count Piper, but was exchanged in 1715, when he again joined Charles XII. at Lund in Scania. Not long after however Nordberg was appointed incumbent of the parish of St. Clair and Olaus at Stockholm, where he spent the remainder of his life. After the death of Charles XII. he was commissioned by Queen Ulrica Eleonora to write his history under her own inspection, and the manuscript was afterwards submitted to the revision of a royal commission. The work was published at Stockholm in 1740, 2 vols. fol., and translated from the Swedish into French, and published at the Hague, 'Histoire de Charles XII., par M. de Nordberg,' 3 vols. 4to, 1742. The documents from which Nordberg compiled his history are authentic, and he had himself witnessed many of the facts which he relates, and which he had noted down in his journal. His work is therefore a book of authority; the style however is heavy and diffuse. Nordberg speaks slightly of Voltaire's 'History of Charles XII.,' which is written in a more amusing style, but is inferior to the work of Nordberg in point of correctness. Nordberg died at Stockholm on March 14th, 1744.

NORDEN, FREDERIC LOUIS, was born at Glückstadt in Holstein in 1708, was educated for the navy, and entered the naval school of cadets at Copenhagen. He made great progress in mathematics, and became a very expert draughtsman. In 1732 he obtained the rank of lieutenant in the Danish navy, and soon after, King Christian VI., having been made acquainted with his ability in drawing, gave him permission to travel abroad for his improvement, and allowed him a pension for the purpose. Norden went to Italy, where he spent about three years, after which he was commissioned by the king to proceed to Egypt for the purpose of examining the ancient monuments of that country. He arrived in Egypt in July 1737, and having visited Alexandria and Cairo, he proceeded up the Nile as far as Derr in Nubia, after which he retraced his steps towards Alexandria, where he re-embarked for Europe in May 1738. On his return to Copenhagen he was well received by the king, and was made captain in the navy. In 1740 he proceeded to England to offer his services as a volunteer in the war against Spain. He sailed with an English squadron for South America, and returned to England in the autumn of 1741. On being made a member of the Royal Society of London he published in English a memoir on the colossal statues and other remains of antiquity at Thebes. He died at Paris in September 1742. His papers and drawings concerning Egypt were arranged by his friends and published in French, 'Voyage d'Égypte et de Nubie,' 2 vols. fol., Copenhagen, 1752-55. The first volume consists entirely of plates, being a series of maps of the course of the Nile from Cairo to Derr, and a succession of views of the scenery along the banks of the river, forming a kind of panorama of the Nile; besides plans and sections of the pyramids, temples, and other remarkable buildings. The second volume contains Norden's journal, which is written in a plain unpretending style. The editors have added a biographical notice of the author. Norden was the first traveller who explored Egypt as an artist, and his drawings gave the first tolerably correct idea of the stupendous monuments of that country. His work was translated into English, and published in London in 2 vols. fol. Langlès published a new edition of the original French, in 3 vols. 4to, Paris, 1795-98, with corrections.

NORMANBY, CONSTANTINE HENRY PHIPPS, FIRST MARQUIS OF, the eldest son of Henry, first earl of Mulgrave, was born on the 15th of May 1797, and received his education at Harrow, and at Trinity College, Cambridge. His father and family had always supported the Tory school of politics; but shortly after he left Cambridge he entered parliament as Liberal member for Scarborough in 1818. His first speech was in favour of granting the Roman Catholic claims, and in his next speech he seconded Lord John Russell's resolutions in favour of Parliamentary Reform. Retiring for a while from parliament, he spent a couple of years in Italy, filling up his leisure with political and literary studies. On his return to England he re-entered the House of Commons as member for Higham Ferrers. In the course of his career in the lower house he succeeded in abolishing the sinecure of the joint postmaster-generalship, and warmly advocated the enfranchisement of our large manufacturing towns. Having succeeded to the honours of the peerage in 1831, he was sent out soon afterwards as governor of Jamaica, where he succeeded in suppressing a rebellion of the soldiery without bloodshed, and he gained a good deal of credit by the manner in which he carried out the act for the emancipation of the slaves. In 1833 he returned to England, and in 1834 succeeded the late Earl of Carlisle as Lord Privy Seal. He held the post of Lord Lieutenant of Ireland from 1835 to 1839, and in that capacity administered strict and impartial justice, so as to secure the approval even of O'Connell himself. Meantime he had been raised to the marquise at her Majesty's coronation in 1838. He was Secretary of State for the Colonies for a few months in 1839, and for the Home department from that date till 1841. In 1846 he went as ambassador to Paris, and remained there until after the election of Prince Louis-Napoleon as emperor. He has been ambassador at the court of Tuscany since 1854. Lord Normanby's name is known in the literary world as the author of 'Matilda,' 'Yes and No,' 'The Contrast,' and one or two other novels, to which the writer's name lent a temporary

celebrity; and he also published early in life one or more political pamphlets. [See SUPPLEMENT.]

\*NORRIS, EDWIN, an eminent ethnological and philological writer, was born at Taunton on the 24th of October 1795. In 1814, immediately after the peace, he travelled on the Continent as private tutor in a family, and remained for some time abroad, chiefly in the south of Italy. After his return to England he was appointed in 1826 to a post in the East India House, from which he retired with a pension in 1836, in consequence of the arrangements connected with the renewal of the charter. In the same year his extensive knowledge of languages led to his election as assistant-secretary to the Royal Asiatic Society; an office which involved the chief share in the editorship of the Society's 'Transactions.' In 1847 he received from government the appointment of Translator to the Foreign Office. He was appointed in 1856 principal secretary to the Royal Asiatic Society.

Mr. Norris is the editor of the 'Ethnographical Library,' commenced in 1853, to embrace accounts of voyages to savage countries and other contributions to ethnographical science. The last edition of Prichard's 'Natural History of Man' appeared with additions under his superintendence in 1855. A 'Grammar of the Fulah Language, from a MS. by the Rev. R. M. Macbrair in the British Museum,' is also 'edited with additions by E. Norris,' and a 'Grammar of the Bornu or Kapuri Language' (8vo, London, 1853), was developed by him from a series of dialogues sent home from Bornu by Richardson the African traveller, who died before his return to England. In addition to these acknowledged works, Mr. Norris has been frequently engaged in superintending the publications of the Bible Society in the Tahitian and other languages, and has been a contributor to the 'Penny Cyclopaedia,' the 'Penny Magazine,' and other works of large circulation. His present reputation is however chiefly founded on papers which have appeared in the 'Transactions of the Royal Asiatic Society.' In one in 1845 'On the Kapur-di-Giri Rock-inscription,' he pointed out the method of deciphering an alphabet which was previously unknown, and the discovery was characterised by Professor H. H. Wilson, in a paper which accompanied that of Mr. Norris, as "an unexpected and interesting accession to our knowledge of the palaeography and ancient history of India." A paper 'On the Assyrian and Babylonian Weights,' and another 'On the Scythic Version of the Behistun Inscription,' are also of peculiar value. The whole of Sir Henry Rawlinson's papers on the cuneiform inscriptions, sent from Persia and published in the Society's 'Transactions,' passed through Mr. Norris's hands as editor, and it is stated in a recent number of the 'Athenaeum' that he is now engaged with Sir Henry in preparing for publication the series of Nineveh inscriptions, to be issued under the sanction of the Trustees of the British Museum. These labours have within the last few years raised Mr. Norris's name to a high position, and it is perhaps still better known abroad than at home. The University of Bonn spontaneously conferred on him in June 1855 the honorary degree of Doctor of Philosophy.

NORTH, FRANCIS, BARON GUILDFORD, lord keeper of the great seal of England, the immediate elder brother of the following, was born on the 22nd of October 1637. He acquired the rudiments of education at a school at Ialeworth, where he appears to have been taught some rigid Presbyterian principles, which left very little trace on his mind in subsequent life. In 1653 he was admitted fellow-commoner of St. John's College, Cambridge. He afterwards became a member of the Middle Temple. He passed his time gravely and studiously, and appears early to have resolved not to leave any plan untried, whether by intellectual exertion or less commendable means, to obtain wealth, power, and distinction. His relaxation consisted of music meetings, hearing Hugh Peters preach, and occasional convivial suppers with fellow-students—very small items of dissipation, the nature of the times and the habits of the young lawyers of the Restoration considered. He was well connected, and received some aid and auspices from his relatives in his early struggles. His practice however was for some time insufficient to satisfy his expectations, and he was sunk in despondency when he was taken in hand by Sir Jeffrey Palmer, the attorney-general, who saw in the character of the young barrister something for which the crown lawyers of such times might find use. Sir Jeffrey's son dying about this time, much of the business destined for him fell to the lot of his father's favourite, young Francis North. He went on the Norfolk circuit, which brought him into the neighbourhood of his family interest; but he was careful to let no influence that seemed likely to aid him slip from his hands. "He was exceeding careful," says his brother, "to keep fair with the cocks of the circuit, and particularly with Serjeant Earl, who had almost a monopoly. The serjeant was a very covetous man, and when none would starve with him in journeys, this young gentleman kept him company."

The memoir of the lord keeper by his brother, Roger North, is one of the most ample developments of private life and habits during the 17th century which our literature possesses. We are let into all the hopes and fears of the young aspirant—his paltry and dishonest tricks, his intense selfishness, his moral cowardice, his trimming politics, and his readiness to do any work that persons well entrenched in power might set before him. The book is all the more curious because its author treats these qualities as prudential virtues, and exhibits them as that patient perseverance in well doing which finally

brought him who practised them to solid honour and wealth. Standing between a Shaftesbury and a Jeffreys, North's character had some features which may well have appeared commendable, and perhaps the not unnatural indignation which his character has elicited from Lord Campbell, seems rather disproportionate when the nature of the times is considered. The brother is particularly instructive in describing his attempts to obtain a rich wife, bestowing hearty commendation on the skill and intrepidity with which he foiled every effort to ally him to any one under the desired standard of wealth. Other qualifications appear not to have given him much concern.

North brought himself into notice at court by pleading against the privileges of parliament in the Writ of Error brought into the House of Lords upon the judgment of the King's Bench in the old case of the prosecution of the five members for holding the Speaker in the chair. On this occasion he was rewarded with a silk gown. On the 20th of May 1671, he was made solicitor-general; and on the promotion of Sir Heneage Finch to the woolsack, he succeeded him as attorney-general on the 12th of November 1673. On the 25th of January 1675, he was made lord chief justice of the Common Pleas. This was at the period of the curious disputes for jurisdiction between the Common Pleas and the King's Bench, founded on no higher motive than the fees paid by the suitors. The King's Bench had engrossed so much business by the fictitious use of the writ of 'latitat,' that "the proper court sat idle, and had scarce enough to countenance their coming to Westminster Hall every day in the term." North retaliated by a dexterous use of the 'capias;' and we are told that "after this process came into common use, it is scarce to be conceived how the court revived and flourished, being, instead of vacation in term, rather term in vacation, so large was the increase of trials by nisi prius out of the court, as also of motions and pleas in the court." These struggles are well known to have had great influence in the practical extension of the jurisdiction of the three courts of Westminster Hall to all ordinary questions of civil right.

On the death of Lord Nottingham, the great seal was confided to North's keeping on the 20th of December 1682. On this occasion, and in the presence of the king and some of the most accomplished courtiers of the age, he was not so much dazzled as to lose sight of his own ultimate interest. Knowing that, from the difficulty felt by the king in obtaining parliamentary supplies, it was intended that the new lord keeper should have no salary beyond the fees of his office, and conscious that he was the only person who had at that juncture a substantial claim on the appointment, he refused to touch the seal until, "for his Majesty's honour," they were accompanied by a pension of 2000*l.* a year. As a judge, he was almost invariably in favour of the prerogative, and seldom if ever endangered his influence at court by his independence. A bolder and still less scrupulous instrument of power was however gradually undermining him in his latter days in the person of Jeffreys, whose ascendancy and presumption seem to have completely broken the spirit of the lord keeper. He died on the 5th of September 1685. He was, in private life, a moral man even for an ordinary age, and a miracle in the reign of Charles II. On his professional merits, Lord Campbell emphatically says, "He had as much law as he could contain, but he was incapable of taking an enlarged and commanding view of any subject."

(North, *Lives of the Norths*; Campbell, *Lives of the Chancellors*, vol. iii.)

NORTH, SIR DUDLEY, the third son of Dudley, Lord North, Baron of Keltling, was born on the 16th May 1641. In childhood he was lively and active, and having strayed from his custodiers, he was stolen by a gipsy or beggar, and with difficulty recovered. He made little progress in literary education, and his brother and biographer tells us that he "had a strange bent to traffic, and while he was at school, drove a subtle trade among the boys by buying and selling. In short, it was considered that he had learning enough for a merchant, but not plegm enough for any sedentary profession, which judgment of him was made good by the event." Being "bound to a Turkey merchant upon the ordinary terms to be sent abroad," he was sent as supercargo to Archangel and Smyrna. He left an animated and curious journal of his voyage to Archangel, and his subsequent progress by Italy to Smyrna, published by his biographer. It is not the production of a scholar, but it is full of amusing descriptions and sagacious remarks. After a residence for some time in Smyrna, where he suffered from disease, he removed to a factory at Constantinople. He acquired a knowledge of Turkish, of which he said "that for scolding and railing it was more apt than any other language." He left some curious information about Turkish manners, particularly as to the administration of justice, with which he had some practical experience. His experience and observations are generally printed in his memoirs as he wrote them; but on some occasions, when his brother professes to render them in his own language, the biographer being a practising English barrister, makes a singular jumble of the Turkish administration by putting his allusions to it into the technical phraseology of the English law.

Very few dates are given in his biography, but it is stated that Dudley on his way home having touched at Smyrna, left that place on 25th March 1680. He wrote, as to his journey homeward, a 'Voyage from Smyrna, with an Account of Turkey, containing Matters little known in Europe,' left unfinished. He spent his latter years in London. Soon after his return he was chosen sheriff, and knighted,

and was afterwards elected alderman of Basinghall. By the interest of his brother, the lord keeper, probably as much as by his own merits, he was made a commissioner of the customs. Towards the end of the reign of Charles II. he was made a commissioner of the treasury, but on the accession of James II. he was sent back to his office in the customs. He made himself somewhat unpopular in his office by suggesting a tax on sugar and tobacco. In the mean time he had been chosen member of Parliament for Banbury, and took considerable interest in politics, with, apparently, a far more independent spirit than his brother, the lord keeper. His biographer claims for him the merit of having offered resistance to the crown under the operation of 'closeting.' He lost his office at the Revolution, and was subjected to a pretty rigorous examination by both Houses of Parliament. He died on the 31st of December 1691. (North, *Lives of the Norths*.)

NORTH, ROGER, the sixth son of Dudley, Lord North, was born about 1650. He studied in the Middle Temple, and became steward of the courts to Archbishop Sheldon. It is sometimes stated that he was attorney-general to James II., but his name does not appear in the list of attorney-generals in Beaton's Political Index. He died in 1734. He left in manuscript, some 'Memoirs of Music,' which met with approbation from Dr. Burney (Article 'North, Roger' in Rees's Cyclopaedia). In 1740, a quarto volume was published called 'Examen, or an Enquiry into the Credit and Veracity of a pretended complete History, showing the perverse and wicked Design of it, and the many Falsties and Abuses of Truth contained in it, together with some Memoirs occasionally inserted, all tending to vindicate the Honour of the late King, Charles II., and his happy Reign, from the intended Aspersions of that foul Pen.' The work against which this volume is levelled is Kennet's 'Complete History.' Notwithstanding its purely partisan object, much insight may be had into the state of society and politics during the reign of Charles II., by a perusal of the Examen, and when measured by a higher tone of public feeling, the author, in his vindications, often, in pure simplicity, embodies the severest censures. The work by which Roger North is now best known was published after his death—1740, 1742—in two volumes quarto, with the title, 'The Lives of the Right Hon. Francis North, Baron Guilford, Lord Keeper of the Great Seal under King Charles II. and King James II.; the Hon. Sir Dudley North, Commissioner of the Customs, and afterwards of the Treasury, to King Charles II.; and the Hon. and Rev. Dr. John North, Master of Trinity College, Cambridge, and Clerk of the Closet to King Charles II.' The life of the lord-keeper was republished in 8vo, and the whole work was re-edited in 1826. It will be seen, that besides the two of whom notices are given above, he commemorated a third brother, John, who lived the life of a retired student. The nature of the book has been already characterised, and it only remains to be stated that whatever opinions may be formed of the author's general notions of right and wrong, it is a memorial of very strong fraternal affection.

NORTH, FREDERIC, EARL OF GUILDFORD, better known by the title of LORD NORTH (as he did not succeed to the earldom until within two years of his death), was born on the 13th of April 1732. He was educated first at Eton, and afterwards at Trinity College, Oxford. On leaving the university he went abroad for three years, and during that time resided successively in Germany, Italy, and France, cultivating the foreign languages. Almost immediately after his return to England, he married, in 1756, Miss Ann Speke, an heiress of an ancient Somersetshire family.

In 1763 Lord North was appointed one of the lords of the treasury. Two years after, on the formation of Lord Chatham's (as it was called by Mr. Burke) 'tesselated' ministry, Lord North received the office of joint-paymaster of the forces, his colleague being Mr. George Cooke. In the speech in which Mr. Burke so happily described the general composition of this ministry, he thus specially alludes to the joint appointment of Lord North and Mr. Cooke:—"I venture to say, it did so happen that persons had a single office divided between them, who had never spoke to each other in their lives until they found themselves, they knew not how, piggling together, heads and points, in the same truckle-bed." ('Speech on American Taxation.') Lord Rockingham had previously offered him the chancellorship of the exchequer and the vice-treasurership of Ireland, both of which appointments he had refused. He became chancellor of the exchequer in 1769, and at the same time leader of the House of Commons, on Charles Townshend's unexpected death. This too he at first declined: but he was afterwards prevailed on, we are told, by the Princess of Wales and by his father, Lord Guildford, to accept this situation. In 1770, on the Duke of Grafton's retirement, he became first lord of the treasury, still holding the chancellorship of the exchequer. George III. felt himself under an obligation to Lord North for extricating him, by the acceptance of the premiership, from the embarrassment which the Duke of Grafton's retirement had caused; he warmly expressed his gratitude, became greatly attached to his new prime minister, and never forgot the obligation, nor ceased to have a regard for him, till the coalition of 1784. It is an interesting trait recorded by his daughter, Lady Charlotte Lindsay, in her letter appended to Lord Brougham's 'Historical Sketches' (first series), that Lord North would never allow himself to be called prime minister, "saying there was no such thing in the British constitution."

Lord North's ministry lasted from 1770 to 1782. Being defeated

on the 22nd of February 1782, in the House of Commons, on the question of the continuance of the American war, he gave way to Lord Rockingham. That war is the chief characteristic of his ministry. There are two different questions to be considered in connection with this war, the question of its justice and the question of its expediency. The ministry and the opposition joined issue on both these questions. The opposition, including, with the exception of Lord North himself, and his supports Thurlow and Wedderburn, nearly all the intellect of the House—Burke, Fox, Dunning, and latterly Pitt (who entered parliament in 1780)—contended, first, that the British parliament had no right to tax the American colonies, and therefore that a war in enforcement of British taxation was unjust; and secondly, that even if parliament had the right, it was inexpedient to enforce the right by war. Lord North maintained both the justice and the expediency of the war. But every year introduced of course new elements into the question of expediency; and it is now understood that Lord North himself disapproved of the continuance of the war for at least three years before his resignation in 1782, but that he persevered in its defence only in deference to the wishes of George III. Lady Charlotte Lindsay, in the letter already quoted, says, "Although I do not believe that my father ever entertained any doubt as to the justice of the American war, yet I am sure that he wished to have made peace three years before its termination." This statement is not inconsistent with the fact that Lord North, in the very last speech that he ever made, defended the American war; and this circumstance again renders it improbable that he should ever have thought or admitted it to be unjust, as has sometimes been supposed.

It was at the time the general opinion that Lord Bute retained his early influence with George III., and that Lord North, nominally prime minister, was but a puppet in his hands. This opinion, which contributed greatly to the general unpopularity of Lord North's administration, is now known to be entirely erroneous. [BURN, LORD.]

The Rockingham ministry, which succeeded Lord North's, was soon followed by an administration under Lord Shelburne, in which Mr. Pitt was chancellor of the exchequer, and which placed Lord North by the side of his former adversary, Mr. Fox, in opposition. In a short time arose the well-known and much-abused coalition. In April 1783 a ministry was formed by the Duke of Portland, in which Lord North and Fox were appointed secretaries of state. This ministry ended its career in December of the same year. The universal unpopularity of the coalition, and the king's unconstitutional opposition to Mr. Fox's India Bill, killed it. We are informed by Lady Charlotte Lindsay that the coalition was principally brought about by the agency of Lord North's eldest son, and of Mr. Eden, afterwards Lord Auckland. [FOX, CHARLES JAMES.] In reply to the abuse which has been heaped upon this coalition, it may be observed, that because statesmen have once differed they are not to be precluded from afterwards combining, when the questions on which they have differed are set at rest, and others have arisen in which they conscientiously agree; but it is not to be denied that this league, formed against the peace which Lord Shelburne had obtained, was hated by the whole country, and deeply injured the character of the parties.

When Lord North retired from the premiership in 1782 he had been appointed lord-warden of the cinque ports. He succeeded to the title of Earl of Guilford and to the family estates in 1790. Two years after, he died, on the 5th of April, 1792. In the last five years of his life he was afflicted with blindness. "Lord North, when he was out of office," says his daughter, "had no private secretary. Even after he became blind, his daughters, particularly the two elder, read to him by turns, wrote his letters, led him in his walks, and were his constant companions."

Lord North's position as a statesman is in a very low rank: as a politician he displayed somewhat higher ability. His administration of the finances, in his character of chancellor of the exchequer, was generally approved of. And again, though he cannot lay claim to the title of an orator, he spoke clearly, sensibly, with much wit, and with an uniformly good humour, which made him the great favourite of the House. In his private capacity and in his family he was thoroughly admirable. The picture which Lady Charlotte Lindsay draws of him at home with his children, is a singularly pleasing one.

NORTH, SIR THOMAS, Knight. There appears to be no available materials for a biographical notice of Sir Thomas North, the first translator of the Lives of Plutarch into English. North had previously published two other works:—1, 'The Dial of Princes; compiled by the Reverend Father in God, Don Anthony of Guevara, and Englyshed out of the Frenche; right necessary and pleasant to all gentlemen and others which are lovers of vertue,' London, 1557, folio; 1558, folio; 1582, 4to; 'Reformed of faulces in the first edition, with an amplification also of a fourth book annexed to the same, entitled the Favoured Courtier; never heretofore in our vulgar tongue; right necessary and pleasant to all noble and virtuous persons.' 2, 'The Morall Philosophie of Doni, drawne out of the auncient writers; a work first compiled in the Indian Tongue, and afterwards reduced into divers other Languages; and now lastly Englyshed out of the Italian,' London, 1570, 4to. Watt (Bibl. Brit.) observes that 'the word Doni seems to be of like import with that of Magi,' a strange blunder of the learned bibliographer. Doni is the name of an old Italian writer,

and the original work is called 'La Filosofia Morale del Doni, tratta dagli antichi Scrittori, ovvero, La Filosofia de' Sapienti Antichi, scritta da Sendebat, moralissimo Filosofo Indiano,' Venice, 1552, 4to.

North's translation of Plutarch was made, as he states in the title, from the French version of Amyot, which is generally very exact, and has considerable merit in point of expression. Indeed it is said that Amyot's translations did much towards fixing the French language. Amyot's dedication to Henry II. of France is dated 1559. North's dedication to Queen Elizabeth is dated January 6th, 1579; his address to the Reader is dated January 24th, 1579. North's version is often inaccurate, where that of Amyot's is correct, which is somewhat strange, for he tells us that he translated Amyot. The book, besides the Lives of Plutarch, contains 'The Lives of Epaminondas, of Philip of Macedon, of Dionysius the Elder, and of Octavius Cæsar Augustus, collected out of good Authors; also the Lives of Nine excellent Chieftaines of Warre, taken out of Latine from Emylius Probus, by S. G. S., by whom also are added the Lives of Plutarch and of Seneca; gathered together, disposed, and enriched as the others. And now translated into English by Sir Thomas North, Knight.' This part of his book is also dedicated by North to Queen Elizabeth, to whom he seems to have been indebted for some kind of pension or means of subsistence, for he says, "The princely bounty of your blessed hand (most gracious Sovereigne), comforting and supporting my poore old decaying life, of right challengeth the travel of my study, the labor of my body, and the prayers of my devotions, to be wholly employed for your Highnesse, and altogether dedicated to your service."

NORTHCOTE, JAMES, an English artist and writer on art, was born in 1746, at Plymouth, where his father was a watchmaker. Having been introduced to Sir Joshua Reynolds through Dr. J. Mudge, he went to London at the age of twenty-five to study painting under him, and was for five years not only his pupil but his inmate. This circumstance was of no small advantage to him, as it not only tended to refine his manners, but brought him into contact with the best society of the day. On quitting Reynolds he at first set up as a portrait-painter, and would no doubt have become eminent in that branch of the art, as he possessed much insight into and power of describing individual character. But his ambition prompted him to aspire to something higher than taking likenesses. He accordingly set out for Italy, where he spent about five years, and was made a member of the academies of Florence and Cortona. On his return he was encouraged by Boydell, who published many engravings after subjects painted by him, and among others that called the Village Doctress, which was for a long time an exceedingly popular print. For the Shakspeare Gallery he produced two of his best works, the Murder of the Two Princes in the Tower, and Hubert and Arthur, besides some other subjects. Yet although he displayed considerable skill in composition and colouring, together with vigour of expression, his ability in art was by no means equal to his enthusiasm and his application. For nearly half a century he existed almost entirely in his painting-room in Argyle-street, and would have been content, as he himself said, to live on so for ever in what was to him all-sufficient enjoyment. In the latter part of his life he was quite a recluse, and independent both in spirit and circumstances—the latter chiefly owing to his prudence and frugality. He was apt to be somewhat cynical, though really kind-hearted. Hazlitt's 'Conversations' with him afford the best portraiture of his character and of the qualities of his mind. His literary productions are far from being inconsiderable. Many papers of his appeared in a work entitled 'The Artist,' and in 1813 he published his 'Memoirs of Sir Joshua Reynolds, with an Analysis of his Discourses,' a quarto volume, to which he afterwards added a supplement. In 1828, at the age of eighty-two, he again appeared as an author, with his 'One Hundred Fables, original and selected,' which, though of little interest as a literary performance, is a book of great attraction on account of the very numerous and admirable wood-cuts, all which were executed after designs, prepared though not drawn by himself, and were superior to any embellishments of the kind that had then appeared. A second set was published after his death, according to his instructions in his will. As if to convince the world that he was not only still living, but unwearied by his long career, he published, in his eighty-fourth year, his 'Life of Titian,' a work which contains much information relative to painting and to art generally; but this work though embodying his views is known to have been written by Hazlitt: it is however in a literary point of view a strangely immethodical and unsatisfactory performance. To the last Northcote continued to use his pencil; he may indeed almost be said to have died with it in his hand, since he continued to amuse himself with it till within a day or two of his death, which happened at his house in Argyle-street, July 13, 1831. Northcote was never married, but lived with his maiden sister, who survived him.

\* NORTON, THE HON. CAROLINE ELIZABETH SARAH, is one of three daughters of Thomas Sheridan, the son of the famous Richard Brinsley Sheridan—her two sisters, both also still (1857) surviving, being the present Duchess of Somerset and Lady Dufferin. She was born in 1808, and her father dying while she was still very young, the care of her education and that of her sisters devolved on their mother, who was a daughter of Colonel and Lady Elizabeth Callander. Residing sometimes at Hampton Court, sometimes in Scotland, the three sisters

received every advantage of education, intellectual and social; and while still in her girlhood, Miss Sheridan was a writer of verses and of plays for private performance in the family circle. A satire called 'The Dandies' Rout' was conveyed by her to a bookseller then in the habit of publishing such things, and by him printed and circulated. In July 1827, at the age of nineteen, Miss Sheridan married the Hon. George Chapple Norton (born 1800), brother of the present Lord Granley, and now recorder of Guildford and a police magistrate of London. Of three children, all sons, the issue of this marriage, two survive—Fletcher Cavendish Charles Conyers, born in 1829, and Thomas Brinsley, born in 1831. It was after her marriage that Mrs. Norton became known in literature. In 1829 she published anonymously 'The Sorrows of Rosalie, a Tale; and other Poems,' written before her marriage; and this was followed in 1830 by 'The Undying One, and other Poems,' which at once gave the authoress a rank among the poetesses of the time, and caused the 'Quarterly Review' to compare her to Byron. In 1836, in consequence of circumstances which were much talked of at the time, a separation took place between Mrs. Norton and her husband. In that year she published 'A Voice from the Factories;' in 1840 'The Dream and other Poems;' in 1845 'The Child of the Islands: a Poem;' in 1847 'Aunt Carry's Ballads for Children;' and in the same year a novel called 'Stuart of Dunleath, a Story of Modern Times.' In some of these works, besides the poetical power, there was discernible a keen feeling of social wrongs and anomalies; and to one class of such wrongs and anomalies—those relating to the position of women—Mrs. Norton has recently addressed herself very eloquently in two publications—'English Laws for Women in the 19th Century' (privately printed), 1854; and 'A Letter to the Queen on Lord Chancellor Cranworth's Marriage and Divorce Bill,' 1855. Mrs. Norton has also contributed extensively to annuals and other periodicals, as well as occasionally to newspapers.

NOKWOOD, RICHARD, a mathematician of the earlier part of the 17th century, of whose personal history we know nothing. He is principally famous for having been one of the first who measured a degree of the meridian with any accuracy. His method was this:—in the year 1635 he measured the distance between London and York, taking the bearings as he proceeded along the road, and reducing all to the direction of the meridian and to the horizontal plane. The difference of latitude he found by observation of the solstices to be 2° 58', and from that and his measured distance he concluded the degree to be 367,176 feet English, or 57,800 toises. This has been found to be a near approximation, but his method was necessarily not capable of much accuracy, nor did he measure the distance in the best manner. "Sometimes," says he, "I measured, sometimes I paced, and I believe I am within a scantling of the truth." He is the author of the following works:—1, 'Trigonometry, or the Doctrine of Triangles,' 4to, 1631, 1685; 2mo, 1651, 1667, 1669; 2, 'Fortification, or Architecture Militaire,' 4to, 1639; 3, 'The Seaman's Practice, containing the Mensuration of a degree of the Earth,' 4to, 1637, 1655, 1667, 1668, 1678; 4, 'Epitome: being the Application of the Doctrine of Triangles in certain Problems concerning the Use of the plain Sea Chart,' 8vo, 1674; 5, 'Logarithmic Tables,' 12mo, n. d. He also published letters and papers, in the 'Philosophical Transactions,' on the tides, on his mensuration of an arc of the meridian, and on other subjects of minor importance.

NOSTRADA'MUS, or NOTRE-DAME, MICHEL, a singular personage, who appears to have enjoyed some reputation as a physician, but is now only remembered as the author of the most celebrated predictions published in modern times, was descended from a noble family in Provence, and was born at St. Rémy, a small town in the diocese of Avignon, on the 14th of December 1508. His father was a public notary; his paternal grandfather was astronomer and physician to René, count of Provence and titular king of Sicily and Jerusalem; and his maternal grandfather (from whom he acquired the elements of the sciences and mathematics) was also astronomer and physician to John duke of Calabria, the son of King René. After having finished his courses of humanity and philosophy at Avignon, he went to study medicine at Montpellier, but was driven away by the plague in 1522. For more than four years he travelled about in the south of France, and stayed some time at Toulouse and Bordeaux, during which period he seems to have paid particular attention to botany, and also to have undertaken the treatment of all such patients as were willing to put themselves under his care. He then returned to Montpellier, took the degree of doctor of medicine in his twenty-seventh year (1529), and then again proceeded on his travels. At Agen he remained four years, and married. Here too he became acquainted with Julius Cæsar Scaliger, with whom he appears to have been intimate, and whom he calls a Virgil in poetry, a Cicero in eloquence, and a Galen in medicine; and declares that he owed more of his scientific attainments to him than to any other person. After the death of his wife and two children whom he had by her, he left Agen, and went first to Marseille, and then (in 1544) to Salon, where he married a second time.

Two years afterwards, the plague having broken out at Aix, he was invited thither by a public deputation from the inhabitants, and was of so much service (particularly by means of a powder of his own invention, of which he has given the formula in the eighth chapter of his treatise 'Des Fards'), that he received a pension from the town during several years after the cessation of the disease. He has left

upon record a curious instance of the modesty of the women of Aix, who, as soon as they perceived themselves attacked by the contagion, began to sew themselves up in their winding-sheets, in order that their naked bodies might not be seen after their death.

The next year (1547) he was sent for to Lyon on a similar occasion, and appears to have succeeded equally well. On his return to Salon, where he was less esteemed than elsewhere, he employed part of his leisure time in composing some medical works, chiefly consisting of receipts and preparations. It was about this time that he first began to represent himself as divinely inspired, and endued with the gift of prophecy. His predictions were first written in prose; but, upon revising them afterwards, he thought they would look better if expressed in verse, and accordingly he threw them all into the form of quatrains, and then arranged them in three Centuries. When this was done, he was in some doubt about the safety and propriety of publishing the work; but as the time of many of the events foretold in his predictions was near at hand, he at last resolved to print them. The first edition was published at Lyon (1555), and appeared with a dedication to his son Cæsar, then an infant. As might be expected, the work was very differently received by different persons: at home he was generally considered an impostor, but in other parts of France he was looked upon either as a person really and truly inspired by God, or else as one who held communication with the devil. However Henri II. and his superstitious mother Catherine sent for him to Paris, received him at court very graciously, made him a present of 200 crowns, and sent him to Blois to see the king's children there, and to try to find out their future destinies. The result of this visit is not known, but it is certain that Nostradamus returned to Salon loaded with honours and presents. Encouraged by his success, he increased his quatrains to the number of a complete thousand, and published a new edition of them, with a dedication to the king, in 1558. The next year that prince received a wound at a tournament, of which he died, and it was thought that so unusual an accident could not have been omitted in Nostradamus's predictions; accordingly his book was immediately consulted, and in the thirty-fifth quatrain of the first Century were found the following lines:—

"Le lion jeune le vieux surmontera,  
En champ bellique par singulier dual  
Dans cage d'or les yeux lui crevera.  
Deux plaies une, pais mourir; mort cruelle."

So remarkable a coincidence greatly increased his fame, and he was honoured shortly after with a visit from Emanuel duke of Savoy, and his wife the princess Margaret of France. Charles IX. on a progress through Provence, sent for him, and upon his complaining of the slight respect in which he was held by his fellow-townsmen, publicly declared that he should hold the enemies of Nostradamus to be his own. He afterwards presented him with a purse of two hundred crowns, together with a brevet constituting him his physician in ordinary, with the same appointment as the rest.

Nostradamus died about sixteen months after, July 2, 1566. He was buried at Salon, in the church of the Cordeliers, under a monument inscribed with an epitaph asserting in the most confident terms his prophetic skill. After his death two more Centuries were collected from his papers, &c., and added to his quatrains, and the whole work was translated into various foreign languages. Since that time his pretensions to the gift of prophecy have been variously estimated; most persons probably consider him to have been either an impostor or a lunatic, and attribute the fulfilment of some of his predictions to chance; others have accused him of magic, from which charge he is defended by Naudé, in his 'Apologie pour les grands Hommes soupçonnés de Magie'; while some of the believers in animal magnetism have classed him among other "crisaaques" who exercised "la faculté physique de prévision somnambulique et de prévoyance ou clairvoyance instinctive." ("Archives du Magnétisme Animal," t. viii.)

Even in 1806 there appeared at Paris a work by Théodore Bouys, with the following singular title: 'Nouvelles Considérations sur Nostradamus et sur ses Prédications concernant: 1, la Mort de Charles I., Roi d'Angleterre; 2, celle du Duc de Montmorency, sous Louis XIII.; 3, la Persécution contre l'Eglise Chrétienne en 1792; 4, la Mort de Louis XVI., celle de la Reine, et du Dauphin; 5, l'Élévation de Napoléon Buonaparte à l'Empire de France; 6, la Longueur de son Règne; 7, la Paix qu'il doit procurer à tout le Continent; 8, sa puissance, qui doit être un jour aussi grande sur mer qu'elle l'est actuellement sur terre; 9, enfin, la Conquête que ce Héros doit faire de l'Angleterre.' The (so called) prediction of the death of Charles I., mentioned in the above title-page, is one of the most singular in the whole collection; it occurs in the forty-ninth quatrain of the ninth Century, and is as follows:—

"Gand et Bruxelles marcheront contre Anvers;  
Sénat de Londres mettront à mort leur Roi;  
Le sel et le vin lui seront à l'envers;  
Pour eux avoir le règne en désarroi."

In the dedication of his work to Henri II. he predicts that the Christian church will suffer from a cruel persecution: "et durera ceste oy jusques à l'an mille sept cent nonante deux, que Fon verra ceste une renouacion de siècle." the latter part of this sentence is certainly remarkable when we recollect that the French republic dated its

1804. DIV. VOL. IV.

existence from September 22, 1792; and that in all public acts time was reckoned from that day as from the commencement of a new era.

The 'Centuries' of Nostradamus have been frequently reprinted, and numerous commentators have endeavoured to explain his predictions. The best editions are those of Lyon, 1568, 8vo, and Amsterd., 1668, 12mo. Of Commentaries (besides that of M. Bouys, already noticed) the most celebrated are: 'Commentaire sur les Centuries de Nostradamus,' par Chavigny, Paris, 1596, 8vo; 'Concordance des Prophéties de Nostradamus avec l'Histoire,' par Guynaud, Paris, 1693, 12mo; 'La Clef de Nostradamus,' par un Solitaire, Paris, 1710, 12mo, and an English translation, with notes, by Theophilus de Garencières, Lond., fol. 1672.

Before he wrote his 'Centuries' Nostradamus had published during several years an almanac, containing predictions about the weather, &c., besides a few other works, of which only the names are now remembered: 'Traité des Fardemens,' Lyon, 1552; 'Des Confitures,' Anvers, 1557; both contained in 'Opuscule de plusieurs exquis Recettes, divisé en deux parties,' Lyon, 1572, 16mo; 'Le Remède très utile contre la Peste et toutes Fièvres pestilentiales,' Paris, 1561, 8vo; 'Paraphrase de Galien, sur l'Exhortation de Ménodote aux Etudes des Beaux Arts,' Lyon, 1588, 8vo.

For more particulars of the life and works of Nostradamus see 'Abrégé de la Vie de Michel Nostradamus, par Palamède Trone de Condroulet, de la Ville de Salon,' 4to, no date; his 'Life,' by Haitas, Aix, 1712, 12mo; and 'Nostradamus,' by Eugène Barest, Paris, 1840. Adelung has given him a place in his 'Histoire de la Folie Humaine,' vii. 105.

NOTTINGHAM, EARL OF. HENEAGE FINCH, whose father was recorder of the city of London, and a member of the family of the earls of Winchelsea, was born in 1621. He was educated at Westminster school, and was afterwards removed to Christchurch, Oxford. After leaving the university he became a member of the Society of the Inner Temple, London. On the restoration of Charles II. he was appointed solicitor-general, and distinguished himself in the prosecution of the regicides. He published 'An exact and most impartial Account of the Indictment, Arraignment, Trial, and Judgment (according to law) Twenty-nine Regicides, 4to, 1660; 8vo, 1679. In 1661 he was made member of parliament for the University of Oxford, and about the same time was created a baronet. In 1665 the diploma of LL.D. was presented to him by the University of Oxford. He took a prominent part in the impeachment of the Earl of Clarendon in 1667; and in 1670 was appointed attorney-general. He succeeded the Earl of Shaftesbury as lord-keeper of the great seal in 1673, and in 1675 was made lord-chancellor of England. He presided as lord high steward on the trial of Viscount Stafford, in 1680, and pronounced judgment against that nobleman in a speech of extraordinary eloquence. He was created Earl of Nottingham in 1681, and died in 1682.

Besides the account of the trial of the Regicides, he published 'Speeches in both Houses of Parliament,' 1679; 'Speech at the Sentence of William Viscount Stafford,' 1680; 'Arguments upon the Decree in the Cause between the Hon. Charles Howard, Esq., Plaintiff; Henry, late duke of Norfolk; Henry, lord Mowbray, his son; Henry, marquis of Dorchester; and Richard Marriot, Esq., Defendants; wherein the several ways and methods of limiting a trust of a term for years, are fully debated,' Lond., 1685, fol.: 'An argument of the Claim of the Crown to Pardon on Impeachment,' fol.; and 8vo, 1791: there is a volume of 'Reports of Cases decreed in the High Court of Chancery during the time Sir Heneage Finch, afterwards earl of Nottingham, was Lord Chancellor,' 1725. Some valuable Chancery Reports, written with his own hand, were left by him. Lord Nottingham had a high reputation for eloquence, sound judgment, and integrity. His character is drawn by Dryden, in his 'Absalom and Achitophel,' under the name of Amri—

"To whom the double blessing does belong,  
With Moses' inspiration, Aaron's tongue."

NOUREDDIN, (MALEK-AL-ADEL NOOR-ED-DREN MAHMOOD), one of the most celebrated and powerful of the Moabite rulers of Syria in the age of the Crusades, born A.D. 1117, A.H. 511, was a younger son of Amad-eddin Zenghi, the second of the dynasty of the Atabeks of Irak and Syria. At the death of his father, who was murdered by his own Mamlukes at the siege of Jabbar, A.D. 1146, A.H. 541, Nouredin, hastening to Aleppo with the signet of the deceased prince, secured the possession of that city and of his father's Syrian dominions; while Mesopotamia, with Moosool for a capital, fell to the lot of the elder brother Saif-ed-deen; and the feeble attempts of Alp-Aralan, a prince of the house of Seljuk, to assert his ancestral claims to the dominion of these provinces, were easily frustrated by the combined power of the two brothers. The earliest exploits of the reign of Nouredin were in continuance of the Holy War which his father had assiduously waged against the Latin Christians of Palestine: Joceline de Courtenay, whose capital of Edessa had been taken by Zenghi a few years previous, was signally repulsed in an attempt to recover it, and the Christian inhabitants, who had aided the enterprise, were put to the sword without mercy by command of Nouredin, who even levelled the fortifications of the town to prevent its ever again becoming a bulwark to the kingdom of Jerusalem. The recovery of this important fortress was the avowed object of the second crusade, undertaken A.D. 1148, under

2 M

Louis VII of France and the Emperor Conrad: but of the mighty hosts which they led from Europe, only a miserable and dispirited remnant escaped the arrows of the Seljuk Turks in their march through Anatolia to Palestine; the project of retaking Edessa was abandoned as hopeless; the siege of Damascus, which was attacked by the crusading monarchs in conjunction with Baldwin III of Jerusalem [BALDWIN III.], was foiled when on the eve of success by the address with which the minister of the Moslem prince Modjir-ed-deen fomented the mutual jealousies of the Christian leaders; and this vast armament, which if properly directed might have overwhelmed the rising power of Nouredin, only served by its failure to extend and confirm it. Resuming the offensive immediately after the departure of the crusaders, he invaded the territory of Antioch, and in a pitched battle (June 27, 1149) routed and slew the prince Raymond, whose head was sent as a trophy to the kalif at Baghdad; and though he sustained a severe defeat in the following year from his ancient opponent Joceline de Courtenay, who surprised his camp, this disgrace was amply compensated by the captivity of that active leader, who was soon after seized while hunting by a marauding party of Turkmans, and died in confinement, while the remaining dependencies of Edessa, the fortresses of Aintab, Tellbasher, Ravendan, &c., fell almost without resistance into the power of Nouredin, whose dominions now included the whole of Northern Syria. Modjir-ed-deen was still the nominal ruler of Damascus and the southern portion, but the government was entirely in the hands of his vizier Mo'in-ed-deen Anar, whose daughter Nouredin had married; and after the death of this able minister, the inhabitants, alarmed at the capture of Ascalon by Baldwin III. in 1153, and dreading an attack from the Christians, voluntarily offered their allegiance to Nouredin (1154) as the price of his protection; the weak Modjir-ed-deen resigned his power, and sought an asylum at the court of the kalif of Baghdad, which then seems to have been the usual retreat of deposed princes; while Nouredin, the circuit of whose realms now encompassed on all sides by land the Latin territories in Palestine, and extended to the frontiers of the Fatimite possessions in Egypt, fixed his capital at Damascus, which he raised from the ruinous state in which it had been left by an earthquake, and adorned with mosques, fountains, colleges, and hospitals. Several years of continual but varied warfare against the Christians followed the union of all the Moslem power of Syria under a single head; the sway of Nouredin was from time to time enlarged by acquisitions, not only from the enemies of Islam, but from the sultan of Iconium and the minor Moslem princes of Mesopotamia; but a malady which attacked him in 1159, followed by a false report of his death, might have occasioned a fatal reverse in his fortunes, but for the prudence of Ayoob (the father of the famous Salah-ed-deen, or Saladin), who controlled the impatience of his brother Assed-ed-deen Shirakoh to take advantage of the supposed decease of their patron. The Greek Emperor Manuel Comnenus was preparing at this time to attack Aleppo in concert with the Franks of Antioch; but this new enemy was diverted by negotiation, and by the release of 8000 Greek captives; and the only advantage reaped by the Christians from this crisis was the capture of the fortress of Al-Harem near Antioch. The death of Baldwin III. in 1162 released Nouredin from the ablest of his antagonists, his brother and successor, Almaric, or Amaury, being far inferior to Baldwin both in prowess and abilities; the war however was prosecuted with unabated vigour and various success: on one occasion, at the siege of Hian-al-Akrad (the castle of the Koords), the Moslem leaguer was surprised by the Templars, and their monarch himself escaped death or captivity only by the self-devotion of an attendant; but this discomfiture was speedily retrieved by a victory in which the famous Reginald de Chatillon, prince of Antioch, was taken prisoner, and which was followed by the recapture of Al-Harem. But the state of affairs in Egypt, where the Fatimite kalfate was now tottering to its fall, opened new views of aggrandisement and a wider field of ambition to both the Christian and Moslem rulers of Syria; the descendants of Ali had become puppets in the hands of their vizier, or Emir-al-Joyush (generalissimo), who wielded all the real authority of the state: two emirs, Dargam and Shower, had contested in arms this high dignity; and the latter, defeated and expelled from Egypt, sought refuge and aid from Nouredin. The sovereign of Damascus eagerly embraced the opportunity of obtaining a footing in Egypt, and despatched a force under Shirakoh and his nephew Salah-ed-deen to reinstate Shower (1163); whose rival called in the Christians of Palestine to his support: but ere Amaury could enter Egypt, Dargam had been overpowered and slain by Shirakoh, who replaced Shower in his former power. But Shower, faithless alike to friend and foe, now entered into arrangements with the Franks to elude the fulfilment of his engagements with Nouredin; and Shirakoh, after maintaining himself for some time in Belbeis against the joint forces of Jerusalem and Egypt, was compelled to enter into a convention with Amaury and evacuate the country. But he was soon recalled by Shower to deliver him from the vengeance of his new allies, to whom he had proved as perfidious as to those of his own faith; Cairo was closely besieged by the Franks, and the Fatimite kalif Aded Ledini'lla sent the hair of his women, the extreme symbol of Oriental distress, to implore the succour of Nouredin (1168). Shirakoh again entered Egypt with an army, forced Amaury to retreat, and after beholding

the double traitor Shower, installed himself in the twofold office of vizier to the Fatimite kalif, and lieutenant of Egypt in the name of Nouredin; but dying the same year, was succeeded in his dignities by his famous nephew Salah-ed-deen. [SAHAR-ED-DEEN.]

While these events were passing in Egypt, Nouredin in person pushed his successes in Syria against the Christians, from whom he took Paneas and many other important places. Mesopotamia, ruled by his nephews, acknowledged his supremacy as head of the family. He was now, by his officers, absolute master of Egypt, and the fleets of Damietta and Alexandria were directed against the sea-coast of the kingdom of Jerusalem; but a religious conquest was yet wanting to complete his triumph. As a rigid adherent of the orthodox or Sunni sect of Islam, he revered the Abbaside kalif of Baghdad as the legitimate commander of the faithful; and the schismatic kalfate of the Fatimites, of which a phantom still remained secluded in the palace of Cairo, was an abomination which he determined to destroy. In obedience to his repeated commands, Salah-ed-deen (A.D. 1171, A.H. 537) substituted the name of the Abbaside kalif Mostadi in the public prayers for that of Aded, who died eleven days after, in ignorance, it is said, of his deposition; the Shiah heresy was for ever abrogated in Egypt, and Nouredin, as the champion of orthodoxy, received from the gratitude of Mostadi the direct investiture of Egypt and Syria as fiefs of the kalfate; and he exchanged the title of emir, or sahib, for the higher appellation of sultan, which the etiquette of that age conceived to be attached to an immediate grant from the head of the Moslem faith. His name was recited with that of the kalif in all the mosques throughout his dominions, and even in the holy cities of Mekka and Medina, which Turan-shah, brother of Salah-ed-deen, had reduced as dependencies of Egypt. But the power and glory of Nouredin had now attained their highest pitch; the three remaining years of his life were unmarked by any memorable achievement, and disquieted by forebodings of the future downfall of his house by the ambition of Salah-ed-deen, who, though still ostensibly acting as his lieutenant, and making public professions of loyalty and obedience, had in fact become independent master of Egypt, and eluded or disregarded all the orders of his nominal sovereign. The reluctance of Salah-ed-deen to join his forces with those of Nouredin in an expedition which the former had planned against the fortress of Karak, or Mont-Royal, at length brought these smouldering jealousies to the verge of an open rupture; and Nouredin was preparing to march into Egypt to reduce or expel his refractory vassal when an attack of quinsy terminated his life at Damascus, May 26, 1173 (Shawal 21, 569). His son Malek-al-Salah Ismail, a youth eleven years old, succeeded to the titular sovereignty of his extensive dominions, but was speedily stripped by Salah-ed-deen of Damascus and the greater part of Syria, and died eight years afterwards, reduced to the sovereignty of Aleppo and its dependencies, which were then absorbed, after an ineffectual attempt to claim them on the part of his cousins, the atabeks of Moosool, into the wide-spread realm of Salah-ed-deen. Nouredin is described by Abulfeda as tall and well-proportioned in person, of olive complexion, and with little or no beard; in the estimate of his character he has had the rare good fortune to unite the suffrages of his adversaries to those of his friends: William of Tyre ('Gesta Dei per Francos') describes "Noradin" as "a prudent and discreet man, who feared God according to the faith of his people;" and the eulogies of the Moslem writers prove that the titles of Malek-al-Adel ('the just prince') and Noor-ed-deen ('light of the faith') were not idle or groundless assumptions. Abulfeda sums up his character by declaring that his virtues were both too numerous and too splendid to be comprehended within the limits of his history; and the sentence of future ages, which has placed him among the number of the Moslem saints, has ratified the judgment of his contemporaries.

(Abulfeda; Abul-Faraj; De Guignes, *Histoire des Huns*; D'Herbelot, *Biblioth. Orient.*; Von Hammer, *History of the Assassins*.)

NOUREDDIN (MALEK-AL-AFDAL NOOR-ED-DEEN ALI), the eldest of the seventeen sons of Salah-ed-deen; born A.D. 1170 (A.H. 565). In the partition of his father's extensive dominions, which followed his death in 1193, Damascus and Southern Syria, with Palestine, fell to the lot of Nouredin; but in the dissensions which soon followed he was stripped of his kingdom by his uncle Seif-ed-deen Abubekr (the Saphadin of Christian writers), and his brother Othman, sultan of Egypt (1196). In a poetical address to the Kalif Nasser, he lamented the similarity of his own fate to that of the Kalif 'Ali' Ebn Abu-Taleb (his namesake), in being thus excluded from his rights by 'Abubekr' and 'Othman'; the kalif in his reply consoled him by the assurance that in him he should find the 'nasser' (protector) whom Ali had sought in vain; but the intercession of the kalif was unavailing to procure the restitution of any part of his territories; in 1198 however, on the death of his brother, the sultan of Egypt, Nouredin became 'atabek,' or guardian, to his infant nephew Malek-al-Maneer, and attempted, by the aid of another brother, the sultan of Aleppo, to recover Damascus from his uncle; but the expedition failed, and Seif-ed-deen retaliated by invading Egypt, and expelled both the young sultan and his guardian. The unfortunate Nouredin now retired to Samosata, where he died, apparently without issue, A.D. 1224 (A.H. 621). He is generally mentioned by Eastern writers under his assumed title of Malek-al-Afdal ('the excellent prince').

**NOUREDDIN (NOOR-ED-DEEN ARSLAN SHAH)**, Atabek, or Prince, of Moosool and Mesopotamia, of the family of Zenghi, and grand-nephew of the famous Nouredin, sultan of Aleppo and Damascus, succeeded his father **AZZ-ED-DEEN MAASOOD**, A.D. 1193 (A.H. 589), the year of the death of Salah-ed-deen. During a reign of eighteen years he re-established in some measure the declining power of his house, and compelled the minor princes of his family, who occupied appanages on the frontiers of his territories, to acknowledge his supremacy as lord paramount. An attack with which he and his relative Kootbed-deen, prince of Sandjar, were threatened in 1209 from the overwhelming power of Seif-ed-deen, brother of Salah-ed-deen, was averted by the mediation of the Kalif of Baghdad; and Nouredin died the next year, A.D. 1210 (A.H. 607), regretted by his subjects as a mild and beneficent ruler. His son **AZZ-ED-DEEN**, after a reign of between seven and eight years, was succeeded by an infant son bearing the title of Nouredin Arslan II, who survived only a few months. (Abulfeda; Abul-Faraj; De Guignes.)

**NOUREDDIN (MALIK-AL-MANSSOR NOOR-ED-DEEN ALI)**, the second sultan of the dynasty of Tartar or Baharite Mamlukes in Egypt, was placed on the throne by the emirs after the assassination of his father **IBEK**, A.D. 1257 (A.H. 655), at the age of fifteen. His short reign of two years was troubled by continual feuds among the Mamluke chieftains, and attempts on the part of the Ayoobite princes of Syria to recover the lost away of their family in Egypt; and the apprehension of an irruption of the Moguls under Hulaku, who had taken Baghdad and destroyed the kalifate, showed the necessity of substituting a ruler of matured years and experience. The Emir Kotuz accordingly assumed the reins of government, A.D. 1259 (A.H. 657), and no more is heard of Nouredin.

**NOVALIS**, the literary name assumed by Friedrich von Hardenberg, who was born in 1772, at a family estate in Mansfeld. His father, Baron von Hardenberg, had been a soldier in his youth, and was director of the Saxon saltworks. Himself and his wife, the mother of Novalis, belonged to the religious society of Hermhuters. Novalis was the eldest of eleven children, and was very delicate in his earlier years. He was of a dreamy nature, and displayed no extraordinary talent, till a dangerous illness, which attacked him in his ninth year, and could only be cured by painful remedies, awoke him from a kind of intellectual slumber, and he appeared thenceforward as a lively and intelligent child. His diligence was great, and in his twelfth year he possessed considerable knowledge of the Latin and some acquaintance with the Greek language. He displayed a great predilection for tales (*Märchen*), some of which he invented for the amusement of his brothers. In 1789 he attended a gymnasium, and in the following year went to study at Jena, where he remained till 1792, when he went with his brother Erasmus to the university of Leipzig. In the succeeding year he removed to Wittenberg, where his studies were completed.

At this time he became acquainted with Frederic Schlegel, and also with Fichte, whose system of philosophy he studied with ardour. On leaving Wittenberg he went to Arnstadt, to attend for the first time to practical business. He soon became acquainted with a neighbouring lady, called by his biographer Sophia von K., of whom he became violently enamoured. In 1795 he went to Weissenfels, and was made auditor of the department of which his father was director. The death of Sophia and of his brother Erasmus, both in the year 1797, was a great shock to Novalis; he however pursued his business with activity, and it is about this time that his 'Hymns to Night' are supposed to have been written. In 1798 he was betrothed to a lady called Julia von Ch., and about this time he wrote his 'Pupils at Saïs.'

Returning to Jena, he became acquainted with August Wilhelm Schlegel, and with Tieck, the romance writer, and author of the biography to which we are indebted for all the information that we have respecting the life of Novalis. In 1800 the romance 'Heinrich von Ofterdingen' was commenced by Novalis, and was, as he explains in a letter to his friend Tieck, designed to be an apotheosis of poesy. This singular work was never finished, although the plan of its conclusion is preserved. The hero, Heinrich, is an old German poet, supposed by some to be the author of the 'Nibelungen-lied,' and the purpose of the work is to show the whole world, with every profession and pursuit, on its poetical side. It would little suit most romance readers, as the story is too wild to be interesting, and is merely a thread to connect the author's own thoughts and opinions. The conclusion of the work, as given by rough notes, was to have been eccentric even for a German enthusiast. Heinrich was to have come into a land where men, beasts, minerals, and even tones and colours held converse, where the world of tales (*Märchenwelt*) was to become visible, and the real world to be considered as a tale. It may be observed that Novalis regarded the '*Märchen*,' or popular traditions, with singular respect, and discerned in them, or fancied he discerned, a deep meaning. He was accustomed, says his biographer, to regard the most ordinary occurrence as a miracle, and the supernatural as something ordinary.

In 1800 he was subject to spitting blood, and fell into a weak state. The books which he then constantly studied were the Bible, and the works of Zinsendorf and Lavater. He loved to talk of all his projected works, and professed that he now for the first time knew what poesy was, and designed to re-write 'Ofterdingen.' On the 25th

March 1801 he died, in the presence of his friend Frederic Schlegel, before he had completed his twenty-ninth year.

Novalis is a writer who will either be read with some degree of enthusiasm or not read at all. Hence while almost idolised by the partisans of the romantic school, he is mentioned with a kind of benevolent contempt by the opponents of that school. His imagination and enthusiasm are most boundless: he darts from prodigy to prodigy with a celerity that cannot be followed, unless the reader allows himself to sympathise with the author. The effects of the ideal philosophy of Fichte, and the love of tales so predominant in the romantic school, are plainly discernible in Novalis's works. He had literally constructed an unreal world of his own, and seems to have breathed an atmosphere utterly unlike that of the actual world. A desire of combining religious fervency with philosophy is also apparent; and thus that combination of speculation and enthusiasm which is found in the writings of the Alexandrian Platonists and the Mystics was very acceptable to him. The 'Hymns to Night,' and the latter part of 'Ofterdingen,' are equally remarkable for the vast power manifested in the construction and the dimness of the construction itself, while here and there the acuteness of some remarks is not to be mistaken. The 'Pupils at Saïs' is another fragment of a romance, the object of which was to reveal Novalis's views of physical science, for which and mathematics he had a great taste. If however the works above mentioned are remarkable for singular combination, his spiritual songs ('*Geistliche Lieder*') are no less so for their perfect simplicity and pure spirit of devotion. The posthumous works of Novalis contain numerous aphorisms, which show the direction of his studies, a most remarkable turn of thought, and a love of startling paradox, combined with singular acuteness. The whole works of Novalis were collected and edited by his friends Tieck and F. Schlegel, with a biography prefixed by the former.

**NOVIKOV, NIKOLAI IVANOYITCH**, born April 27th 1744 at Tikhvensk, near Moscow, was, if not particularly eminent as a writer, one to whom Russian literature is greatly indebted, on account of what he did for the book-trade, and for printing, and for diffusing a taste for reading among his countrymen. Though his parents were wealthy, he did not receive the very best education, being brought up at home until the age of eighteen, when he entered the government service, and then first began to apply himself to study. Having thus conceived a passion for literary pursuits, he determined upon devoting himself to them exclusively, and accordingly he retired from the service. One of his first productions was his '*Zhivopisets*' ('The Painter'), a work somewhat on the plan of 'The Spectator,' and displaying considerable talent and satiric power in sketches of manners and characters; and which was long very popular, and has been frequently reprinted. He shortly afterwards published his '*Opuit*' (Specimen or Essay of a Lexicon of Russian Authors), which has preserved notices of many writers respecting whom little would otherwise now be known. These works procured him the notice of the Empress Catherine, and he soon after settled at Moscow, where a wide field opened itself to him. With the consent of the government, he established in that capital a Typographical Society, having for its object the printing of useful books at a cheap rate, and diffusing them through the empire. He also set up the first circulating library, and did very much both to improve the character and increase the sale of journals and other periodicals. Neither was his attention confined to such improvements, for he helped to introduce many into the system of school-education. His activity and that of his associates was however looked upon with suspicion, and they were represented as favouring the principles of, if not themselves actually in league with, the philosophers and revolutionists of France. The consequence was that the society was broken up, and Novikov received a command to retire to a distant province. After the Emperor Paul's accession he was permitted to return, but he from that time lived almost in retirement from the world, and devoted to mystic speculations, upon his estate at Tikhvensk, where he died, July 31 (August 11), 1818.

Novikov has been compared to Franklin, and he was certainly a very active and useful person. He is said to have possessed in a very extraordinary degree the art not only of gaining over others to his schemes, but of rendering them as eager and zealous in them as himself. Hence, notwithstanding the vast sums which his speculations required, they never were hindered by want of funds. He himself was quite disinterested, his object being not to enrich himself, but that his schemes should succeed for the benefit of the public: at all events, it is certain that he died poor.

Among his own publications, in addition to those already mentioned, was a collection of historical documents and materials, entitled 'The Old Russian Library,' 1773-75, in ten volumes, and afterwards continued to twenty more.

**NOY, WILLIAM**, a lawyer, whose professional career had a considerable influence on British history, was born about the year 1577. "He was," says Fuller, "for many years the stoutest champion of the subjects' liberty, until King Charles entertained him to be his attorney." He was made attorney-general on the 31st of October 1631. He had for some years been member of parliament, first for Hampton, and subsequently for St. Ives. He was a profound lawyer and judicial antiquary; but, as Clarendon says, "he could not give a clearer testimony that his knowledge in the law was greater than all other men's,

than by making that law which all other men believed not to be so." It was to his researches in the older constitution, conducted in this perverse spirit, that the court owed the project of ship-money. Noy drew the writ for levying this illegal tax, but he did not live to see the momentous effects of his exertions, and died on the 6th of August 1634. In private matters he seems to have been fond of startling novelties adverse to received opinions and feelings. He bequeathed a fortune to his son, "to be squandered as he shall think fit—I leave it him for that purpose, and I hope no better from him." The young man responded to the anticipation, and, after a brief and wild career, was killed in a duel. There are several traditional anecdotes of Noy's ingenuity as a lawyer. He was the author of several legal works, which seem generally to have been published posthumously. Among these are—'A Treatise of the Principal Grounds and Maxims of the Lawes of England,' 4to, 1641, which has passed through several editions; 'The Compleat Lawyer, or a Treatise concerning Tenures and Estates in Land of Inheritance for Life, and other Hereditaments and Chattels, real and personal, together with Observations on the Author's Life,' 8vo, 1674; 'A Treatise on the Rights of the Crown, declaring how the King of England may Support and Increase his Annual Revenues,' 8vo, 1715. He collected 'Reports and Cases taken at the time of Queen Elizabeth, King James, and King Charles,' folio, 1669.

NUMA POMPILIUS, the second king of Rome, was, according to tradition, a native of the Sabine town of Cures. On the death of Romulus the senate at first chose no king, and took upon itself the government of the state; but as the people were more oppressively treated than before, they insisted that a king should be appointed. A contest however arose respecting the choice of the king between the Romans and Sabines, and it was at length agreed that the former should choose a king out of the latter. Their choice fell upon Numa Pompilius, who was revered by all for his wisdom and knowledge, which, according to a popular tradition, he derived from Pythagoras.

Numa would not however accept the sovereignty till he was assured by the auspices that the gods approved of his election. Instructed by the camena, or nymph, Egregria, he founded the whole system of the Roman religion; he increased the number of augurs, regulated the duties of the pontifex, and appointed the flamines, the vestal virgins, and the Salii. He forbade all costly sacrifices, and allowed no blood to be shed upon the altars, or any images of the gods to be made. To give a proof that all his institutions were established by divine authority, he is said to have given a plain entertainment in earthenware dishes to the noblest among his subjects, during which, upon the appearance of Egregria, all the dishes were changed into golden vessels and the food into viands fit for the gods.

Numa also divided among his subjects the lands which Romulus had conquered in war, and secured their inviolability by ordering land-marks to be set on every portion, which were consecrated to Terminus, the god of boundaries. He divided the artisans, according to their trades, into nine companies, or corporations. During his reign, which lasted thirty-nine years, no war was carried on; the gates of Janus were shut, and a temple was built to Faith. He died of gradual decay, in a good old age, and was buried under the hill Janiculum; and near him, in a separate tomb, were buried the books of his laws and ordinances.

Such was the traditional account of the reign of Numa Pompilius, who belongs to a period in which it is impossible to separate truth from fiction. According to Niebuhr and the writers who adopt his views of Roman history, the reign of Numa is considered in its political aspect only as a representation of the union between the Sabines and the original inhabitants of Rome, or, in other words, between the tribes of the Titienses and the Ramnes.

(Livy, i. 18-21; Dionysius of Halicarnassus, ii. 58-76; Cicero, *De Republica*, ii. 12-16; Plutarch, *Life of Numa*; the *Histories of Rome*, by Niebuhr, Arnold, and Mommsen.)

NUMERIANUS, MARCUS AURELIUS, succeeded to the throne conjointly with his elder brother Carinus, after the death of their father, the Emperor Carus, at the beginning of A.D. 284. Numerianus was with the army in Mesopotamia at the death of Probus; but instead of following up the advantages which his father had gained over the Persians, he was compelled by the army to abandon the conquests which had been already made, and to retreat to Syria. During the retreat a weakness of the eyes obliged him to confine himself to the darkness of a litter, which was strictly guarded by the Prætorians. All orders were issued by Arrius Aper, the præfect of the Prætorians, who was the father-in-law of the emperor. The absence however of Numerianus excited the suspicion of the soldiers; and when the army, after a march of eight months, arrived at Chalcedon on the Bosphorus, they insisted upon seeing their prince, and accordingly burst into the imperial tent, where they only found the dead body of Numerianus. Suspicion naturally fell upon Arrius; and an assembly of the army was accordingly held for the purpose of avenging the death of Numerianus and electing a new emperor. Their choice fell upon Diocletian, who immediately after his election put Arrius to death with his own hands, without giving him an opportunity of justifying himself, which might perhaps have proved dangerous to the new emperor.

The virtues of Numerianus are mentioned by most of his biographers. His manners were mild and affable; and he was celebrated

among his contemporaries for his eloquence and poetry. He successfully contended with Nemesianus for the prize of poetry, and the senate voted to him a statue, with the inscription, to "Numerianus Cæsar, the most powerful orator of his times." (Vopiscus, *Numerianus*; Aurelius Victor, *De Cæsaribus*, c. 38; Eutropius, ix. 12; Zonarus, book xii.)

Coin of Numerianus.  
British Museum. Actual size.

NUMESIANUS, or NOMISIANUS, a physician, born at Corinth, who deserves to be recorded as one of Galen's tutors ('Galen's Anatomical Administration,' lib. i., cap. 1), who informs us in another place ('Comment. in Hippoc.' lib. 'De Naturâ Hominis,' Comment. 2), that Pelopoe, another of his tutors, was also one of this physician's pupils. He lived in the 2nd century after Christ.

NUÑEZ or NOÑIUS, FERNAN, born about 1470, was of the house of Guzman. He is also called EL PINCIANO, from Pintia Vaccosorum, the former name of Vallisoletum, now Valladolid, where he was born. Although a knight of the military order of Sant' Iago, he devoted all his ardour to literary pursuits and the diffusion of learning through Spain, where he promoted the study of the Greek, after that of the Latin language had been rendered easy by Nebriensis (Antonio Lebrija, or Nebrija). Among the many eminent literary persons who followed Nebrija's steps, Pinciano stood conspicuous, even before he went to Italy to receive further instruction from Philippus Beroaldus and Govian, a celebrated Greek refugee. On his return to Spain, Nuñez brought back numerous Greek books with him; and Cardinal Cisneros, who admired his talents, appointed him and Demetrius the Cretan professors of Greek at the University of Alcalá, and moreover intrusted to him and to Lope de Astuñiga the Latin version of the 'Septuagint.' Endowed with a lofty spirit and a high patriotic feeling, which were fostered by the writings of antiquity which he expounded, he fought in 1521 with the unsuccessful Commons of Castile against the tyranny of Charles V., or rather his courtiers, a set of unprincipled foreign adventurers, who took advantage of the young prince's vanity and inexperience. Being obliged to leave Alcalá, he took refuge at Salamanca, in which university he taught Greek, Latin, rhetoric, and the natural history of Pliny. He died in 1558, above the age of eighty, at Salamanca, and left to that famous seminary his select library. He wrote for himself the following epitaph—'Maximum vites, bonum mors!'

Besides the share that he had in the 'Complutensian Polyglot,' Nuñez published 'Annotationes in Senecæ Philosophi Opera,' the text of which writer he restored; 'Observationes in Pomp. Melam;' 'Observat. in Hist. Nat. C. Plin.,' which have often been reprinted; 'Glosa sobre las Obras de Juan de Mena,' which is full of classical learning; 'Letters to Zurita;' 'Refranes y Proverbios Glosados,' which he left incomplete in the midst of his infirmities, a valuable book to the commentator of Cervantes, as Nuñez was well acquainted with Spanish proverbs, and skilful in applying them.

This writer must not be confounded with Alonso Lopez Pinciano. [PINCIANO, A. L.]

NUWAYRI is the patronymic of a celebrated Arabian historian of the 8th century of the Hejira, whose complete name was Ahmed Ibn Abd-al-wahhab Al-bekri Al-teymi Al-kindî, and who was further distinguished by the honourable surname of 'Shehâbu-d-dîn' (bright star of religion). He was born at Nuwayrah, a small town of the province of Bahassa in Egypt, in the year 682 of the Hejira (A.D. 1283-84). Nuwayri distinguished himself as a theologian of the sect of Shâfi'î, and also as a rhetorician and grammarian, and he wrote several works on these subjects, the titles of which have not reached us. But the work which has made Nuwayri known among European scholars is his 'Nehâyetu-l-ârab fi fonûni-l-adab.' It is a sort of cyclopædia, consisting of thirty books or volumes, and divided into five 'fenn' (subjects), each of which is further subdivided into 'kaam' (sections), containing each a certain number of 'bab' (chapters). The first four 'fenn' treat of the physical sciences and the several branches of natural history and moral philosophy. The fifth and last, which is likewise the most valuable for Europeans, is wholly occupied with a history of the Mohammedan settlements both in the east and west. The sixth 'bab' (chapter) of the same contains a narrative of the conquest of Africa, Spain, and Sicily by the Saracens, together with a chronological history of the sultans of the family of Umeyyah, who filled the throne of Cordova from A.H. 188 to 428 (A.D. 755 to 1036), and a short account of the principal events of their reigns.

Nuwayri died, according to Haji Khalfah, in the year 732 of the Hejira (A.D. 1333-34). Among his other accomplishments his biographers say that his handwriting was very fine; indeed he seems to have made a trade of it, for Soyûtti, in his 'History of Egypt' (Ar.

manuscript in the Brit. Mus., 7831, f. 127), says that he made eight transcripts of the large collection of Mohammedan traditions, by Bokhari, entitled 'Sahih,' for each of which he was paid the enormous sum of one thousand dirhema, or about sixty-five pounds sterling. He dedicated his large work to Almalek An-nasser Kalaun, sultan of Egypt (reigned from A.H. 678 to 689), a liberal patron of letters, by whom he was munificently rewarded.

Complete copies of Nuwayri's work are exceedingly scarce. We are however assured that it is entire in the library of the University of Leyden. The Eccecurial library possesses one volume, containing parts xi. and xii. ('Catal.' No. 1687.) There are also several loose volumes at Paris belonging to different sets, and among them one supposed to have been written by Nuwayri himself. ('Bib. Reg. Pari. Cat.' No. 702.)

Various extracts from the work of Nuwayri have been published at different periods. Reiske was the first who mentioned the work, in his 'Prodigmata ad Hagi Khalife Tabulas,' Leyden, 1766. Albert Schultens next gave a slight notice of the historical part of his work, together with a few extracts from it, at the end of his 'Monumenta Vetustiora Arabum,' published at Leyden, in 1740. Again, in 1786, Reiske made use of it for his 'Historical Notes,' published as a continuation to his translation of Abû-l-fedâ (Hafnia, 1789-94). Schultens published also a Latin translation of some fragments of Nuwayri in the collection entitled 'Historia Vetustissimi Imperii Jocanidarum in

Arabia Felice.' That chapter of the fifth 'fenn' which treats of the conquest of Sicily by the Mohammedans was next translated, first into Latin, by Rosario Gregorio, and printed in folio at Palermo, 1790, and inserted in the collection entitled 'Rerum Arabicarum quæ ad Historiam Siculam spectant, amplissima collectio,' and then into French, by Mr. J. J. A. Caussin; and Mr. James Lassen Rasmussen published, in his 'Additamenta ad Historiam Arabum ante Islamismum,' Copenh., 1821, some fragments of the same work, in Arabic and Latin, respecting some curious customs of the Arabs who preceded Mohammed.

(Haji Khalfah, *Kashfu-dh-dhanân*, a bibliographical dictionary, in the British Museum; *At-royûtti, History of Egypt*, ib.; *Bib. Rich.*, No. 7831, fol. 70, v. et passim.)

NYMPHODORUS, a surgeon, whose date is not exactly known, but who must have lived some time before Christ. He is mentioned by several ancient authors as the inventor of a machine for reducing luxations of the femur (Cels. 'De Med.' lib. viii. cap. 20; Gal. 'Comment. in Hippocr. de Artia. Libr.' tom. xviii. pars i. p. 736, ed. Kühn), and also of a sort of box (*γλασσοκομειον*) for fractures of the limbs (Oribes, 'De Machinam,' cap. 24.) He is probably the same person as Nymphodotus mentioned by Ætius ('Tetrab.' iii., Serm. i. caps. 45, 49), Paulus Ægineta (lib. vii. cap. 12), and Galen ('De Composit. Medicam. per Genera,' lib. vi. cap. 14, tom. xiii. p. 926, ed. Kühn).

## O

OATES, TITUS, was born about 1620. He was the son of a riband-weaver, who, having seceded from the Anabaptists, among whom he was a preacher, conformed to the doctrines of the English established church, took orders, and held a benefice. He was educated at Merchant Taylor's school in London, and at the University of Cambridge. Having received ordination, he became chaplain to the Duke of Norfolk, who also settled him in a small living. He was subsequently accused of perjury, but he escaped conviction, and became chaplain in one of the king's ships, from which he was disgracefully expelled. Shortly after he embraced Roman Catholic doctrines, entered the college at St. Omer, and resided for some time among the students. On his return from a mission to Spain in 1677, the Jesuits, who were heartily tired of their convert, dismissed him from their seminary; and it is probable that resentment for this dismissal, combined with a prospect of gain, induced him to contrive the 'Popish Plot,' which alone has preserved his name from being forgotten.

In September 1678 he made a disclosure before Sir Edmundbury Godfrey, a noted and active justice of the peace, and afterwards before the Council and the House of Commons, to the effect "that the pope felt himself entitled to the possession of England and Ireland on account of the heresy of prince and people, and had accordingly assumed the sovereignty of these kingdoms; that power to govern them had been delegated by the pope to the Society of Jesuits, who, through Oliva, the general of their Order, had issued commissions appointing various persons whom they could trust to the chief offices of state, both civil and military. Lord Arundel (he said) was to be chancellor; Lord Powis, treasurer; Lord Bellasis, general of the papal army; Lord Stafford, paymaster; Sir William Godolphin, privy seal; and Coleman, secretary of state. All the dignities too of the church, he alleged to be newly appropriated, and many of them to Spaniards and other foreigners. Two men named Grove and Pickering, he declared, were hired to shoot the king, and that Sir George Wakeman, the queen's physician, had engaged to poison him, the queen herself being privy to the scheme. He also stated that the Roman Catholics were to rise in different districts of the kingdom, and that every means would be adopted for the extirpation of Protestantism." His evidence was confirmed by two men named Tonge and Bedloe, especially the latter, a man of low extraction and bad reputation. For the list of persons, both Jesuits and men of importance in this kingdom, who suffered imprisonment and execution through the accusations of Oates, we must refer to the general histories of the time.

Notwithstanding the almost universal credence which was given to him at the time, it has subsequently been placed beyond doubt that the plot which Oates pretended to reveal was an infamous fabrication. His circumstances, his character, the nature of his evidence, the manner of its production, not at one time but at several times, though he had previously professed to have told all that he knew, the mode in which the first disclosure was made, together with inconsistency and errors, evidently betray imposture. It may be urged, that the universal credit given to Oates's evidence at the time is a strong proof that his story was true. There are circumstances however which account for the ready belief with which his accusations were received, although they do not prove their truth.

The English Protestants had long apprehended an attempt on the part of the Roman Catholics to restore their religion and re-establish their power; and their anxiety on this account had lately been augmented in some degree by the conduct of the king, and in a still greater degree by the Duke of York's open profession of the old religion and his attachment to its adherents. Moreover there were imme-

diately connected with Oates's disclosure two events giving it an apparent corroboration, which was eagerly assumed to be real by the feverish minds of contemporary partisans. The first of these was the sudden and violent death of Sir Edmundbury Godfrey, the magistrate who had taken Oates's depositions. No proofs could be adduced to show the manner of his death—whether he committed suicide or was murdered—but the fact that he had taken Oates's evidence, and had been active in searching out the supposed plot, was sufficient to convince the Protestants, excited as they then were, that he had been murdered by Roman Catholics, partly out of revenge and partly to aid the escape of their conspirators. The second apparent corroboration of Oates's evidence, which, though no real confirmation, had at the time an influence in maintaining its credibility, is, that it led to the discovery of a plot, though not such a plot as he disclosed. (Hallam, 'Const. Hist.' ii. p. 571.) Oates denounced Coleman, the secretary of the Duchess of York; and upon searching his house, there were found, among his correspondence with Père la Chaise, papers which proved a combination for the purpose of re-establishing Roman Catholicism in England. That it was a plot, that it was on the part of the Roman Catholics, and discovered through Oates, was sufficient in the then state of public feeling to reflect credit on his disclosures, though Coleman's plans did not coincide with the schemes which Oates pretended to have discovered.

During the closing years of Charles II.'s reign, Oates was protected by the government, and received a pension of 1200*l.* a year. In the following reign, as might be expected, his enemies revenged themselves. The Duke of York had not long succeeded his brother on the throne, before Oates was tried and convicted of perjury, sentenced to imprisonment for life, and to be whipped and stand in the pillory at intervals. The punishment was enforced with such dastardly brutality, as to leave no doubt that it was intended under cover of carrying out the sentence to take away his life. He lived however until 1705, and after much urgent petitioning received during a part of William's reign, a second pension of 400*l.* a year. Grainger says that there have been published under his name, though for a clergyman he was an illiterate man, 'A Narrative of the Popish Plot;' 'The Merchandise of the Whore of Rome;' and 'Eikon Basilike, or a Picture of the late King James.'

OBADIAH was one of the twelve minor Hebrew prophets. The name corresponds to the common Arabian name Abdallah, meaning 'a servant of God;' it occurs several times in the Old Testament (1 Kings xviii. 3; 1 Chron. iii. 21; vii. 3; ix. 16; 2 Chron. xvii. 7; xxxiv. 12); but neither of the persons mentioned in these passages appears to have been the prophet, about whose personal history we know nothing. His prophecy appears from internal evidence (verses 11-14, 20) to have been written shortly after the destruction of Jerusalem in the year B.C. 587. He was therefore contemporary with Jeremiah; and we find a striking resemblance between some passages in these two prophets (compare Obadiah 1-4, 5, 6, 8, with Jer. xlix. 14-16, 9, 10, 7). The question here is, which of these writers copied from the other? We know that Jeremiah quoted other prophets, and therefore it is nothing strange to find in him a quotation from Obadiah; and critics who have carefully examined the passages in question have thought that those in Jeremiah bear marks of having been copied from Obadiah. The reason why the book of Obadiah has been placed so much out of its chronological order in the Hebrew Bible is thought to be, because its subject is so closely connected with the last verses of the prophecy of Amos, which immediately precedes it.

The prophecy of Obadiah is the shortest book in the Old Testament, consisting of only one chapter. The prophet denounces the destruction

of Edom, on account of their insolent triumph in the day of the captivity of their Hebrew brethren and in the destruction of Jerusalem (verses 1-16), and foretells the restoration of the Jews, the subjection of their enemies, and of Edom among the rest, and the setting up of the kingdom of the Lord (verses 17-21). The conduct of the Edomites at the fall of Jerusalem, which is referred to in the former part of this prophecy, is not mentioned in the Old Testament history, but it is alluded to by other prophets and by a writer in the Psalms (Ezek. xxx. 12; xxxv; Jerem. xlix. 7-22; Amos i. 11; Psalms cxxxvii. 7). The latter part is supposed to have been accomplished in the return of the Jews from Babylon and the victories of the Maccabees over the Edomites, but the last words seem to refer to the more remote period when all the world shall become the kingdom of God (compare Rev. xi. 15; xix. 6). The style of Obadiah is clear and energetic; his prophecy forms a short poem.

OBERLIN, JEREMIAH JAMES, elder brother of the philanthropist Oberlin, was born at Strasbourg on the 7th of August 1735, and was educated at the gymnasium of that town. He afterwards spent a few months at Montbéliard for the purpose of learning the French language, and returned to Strasbourg in 1760, where he prosecuted his university studies. He took the degree of Doctor of Philosophy in 1758, and afterwards paid considerable attention to the study of theology. In 1768 he was appointed a teacher in the gymnasium where he had been educated, and in 1763 was entrusted with the care of the library of the University of Strasbourg, and obtained permission to give lectures on the Latin language. In 1770 he was appointed professor of rhetoric, and from this time was accustomed to give lectures on Greek and Roman archaeology, ancient geography, &c. In 1778 he was appointed extraordinary professor in the university, in 1782 ordinary professor of logic and metaphysics, and in 1787 director of the gymnasium. During the revolution his life was in considerable danger. He was imprisoned at the beginning of November 1793, but obtained his liberty at the end of a few months, and again resumed his lectures at Strasbourg, which he continued till his death, which took place on the 10th of October 1806.

Oberlin was an accurate and industrious scholar. He published good editions of several of the Latin classics, of which his Tacitus and Cæsar are considered the most valuable. He had also paid great attention to the study of the ancient French language, and travelled more than once through some of the provinces of France in order to become acquainted with the different patois spoken in the country. He published several works on this subject, of which the most important are, 'Observations concernant le Patois et les Mœurs des Gens de la Campagne,' Strasb., 1791; and 'Essai sur le Patois Lorrain des Environs du Comté du Ban de la Roche,' 1775.

Oberlin was also the author of several other works, the principal of which are—'Dissertatio Philologica de Veterum Ritu condendi Mortuorum,' 1757; 'Rituum Romanorum Tabulæ in usum Auditorum,' 1774 (reprinted in 1784); 'Jugendorum Marium Fluyiorumque omnis ævi Mollimæna,' 1770-75; and 'Dissertations sur les Minnesingers' (the 'Troubadours of Alsace'), 1782-89.

The life of Oberlin has been written by Schweighäuser in Latin, and by Winckler in the 'Magas. Encyclopéd.,' 1807.

OBERLIN, JEAN-FRÉDÉRIC, Protestant pastor in the Ban-de-la-Roche, and younger brother of the philologist Jeremiah James Oberlin, was born at Strasbourg on the 31st of August 1740. His education was conducted with the greatest care by his intelligent and pious parents, and while yet a child he gave striking indications of the benevolence and self-denial which were afterwards so conspicuous in his conduct. He had a strong taste for the military profession; but as it was his father's desire that he should devote himself to one of the learned professions, he pursued his studies at the University of Strasbourg and received holy orders. While he was at the university the preaching of Dr. Lorentz made a powerful impression on his mind, and he has left behind him a record of his strong religious feelings in a solemn dedication of himself to God, similar to that recommended by Doddridge in his 'Rise and Progress,' which is dated "Strasbourg, the 1st of January 1760; renewed at Waldbach, the 1st of January 1770." He remained without a pastoral engagement for some years after his ordination (from 1760 to 1767), and during this period he was private tutor in the family of M. Ziegenhagen, an eminent surgeon at Strasbourg. In the year 1766 he had just accepted the offer of a chaplainship to a French regiment, when he was invited by M. Stouber to succeed him as pastor of the Ban-de-la-Roche. This post afforded to Oberlin the very opportunity which he longed for—to devote all his powers to the good of his fellow-men; and he therefore at once accepted it, and arrived at Waldbach to enter on his duties on the 30th of March 1767.

The Ban-de-la-Roche, or, as it is called in German, the Steinthal (Valley of Stone), was part of the former province of Alsace, in the north-east of France. It is situated on the western slope of the Haut Champ, or Champ-de-Feu, a range of mountains to the east of the Vosges, from which chain it is divided by a deep valley. The Ban contains two parishes, one of which is Rothau, and the other consists of the five hamlets of Foudai, Belmont, Waldbach, Bellefosse, and Zolbach. Nearly all the inhabitants of these hamlets are Lutherans. The soil is sterile, and nearly half of the land is covered with wood. The district was laid waste in the Thirty Years' War, and again in the

time of Louis XIV.; so that in the middle of the 18th century it afforded a bare subsistence to some eighty or a hundred families, who were in a state little removed from barbarism, but who possessed one blessing of which all France except Alsace was deprived, namely, religious liberty, which had been guaranteed to the province of Alsace when it was united with France. In the year 1750 M. Stouber became pastor of this district, and succeeded by great exertions in establishing efficient schools, and in distributing Bibles through the parish, where they had been so scarce before that the former minister had not possessed a copy. Stouber removed to Strasbourg in 1767, after finding in Oberlin a successor well qualified to carry on the work he had begun. Notwithstanding all Stouber's exertions, Oberlin found his parish in a wretched state, and a large party in it obstinately prejudiced against any improvement, and prepared to oppose all his plans. It was only by his great decision and mildness that he escaped personal violence on one or two occasions soon after his arrival. From the moment he set foot in his parish he directed all his energies and learning to the civilisation and religious improvement of his people. His first object was to bring them into communication with their better-instructed neighbours, from whom they were entirely cut off by the want of roads. He assembled the people, and proposed to them to make a road to Strasbourg by blasting the rocks and building a bridge across the river Bruche at Rothau. The peasants with one voice declared the thing to be impossible. Oberlin reasoned with them in vain. At length he took up a pickaxe, and inviting all who saw the importance of his plan to follow him, he set to work with his own hands. The peasants at once joined him, and by their efforts, assisted by the contributions of Oberlin's friends, the road was made and the bridge built by the beginning of the year 1770. The results which Oberlin had foreseen soon followed. The people could now dispose of their produce and supply their wants; agricultural implements were imported; and several young men from his parish were apprenticed in Strasbourg to the most useful mechanical trades, which were thus introduced into the Steinthal. Oberlin next turned his attention to the agriculture of the district, which was in the worst possible state; but he found his people little disposed to be taught their own art by one brought up in a town. He appealed, as before, to their senses, by planting with fruit-trees two large gardens belonging to the pastor's house, which were crossed by public foot-paths. His trees flourished; the people came to him to beg for slips and to learn the art of rearing them; and in a few years the desolate cottages of the Ban-de-la-Roche were surrounded with neat orchards. The potatoes, which were the principal food of the people, had so degenerated that some fields only yielded about one-third of their former crop. The people blamed the land; but Oberlin procured new seed, and as the soil of the mountains was well adapted to the culture of the potato, abundant crops, and of a very superior quality, were soon obtained. He also introduced the culture of flax and Dutch clover, taught the people the value of manure, persuaded them to convert a great quantity of pasturage into arable land, and established an agricultural society and a fund for the distribution of prizes to the farmers.

Oberlin was no less zealous in promoting education in his parish. He procured the erection of a new school-house at Waldbach in place of the log-hut built by Stouber, which had fallen to decay; and in a few years a new school-house was built in each of the other four hamlets. To him also belongs the honour of being the founder of infant-schools, which he established in each commune, placing them under the management of conductresses paid at his own expense. In these schools the children were not allowed to speak a word of patois. In the higher schools the subjects taught were reading, writing, arithmetic, geography, the principles of agriculture, astronomy, and sacred and profane history. Oberlin carefully superintended all the schools, and reserved the religious instruction almost entirely to himself. He made great efforts to supply the people with suitable books, some of which were printed at his own expense: among these was an almanac which he drew up for the use of his parishioners.

None of these schemes for the worldly advantage of his flock ever diverted Oberlin from his peculiar duties as their religious teacher. He constantly laboured to impress upon them that they must do everything from religious principle, and even the planting of trees and the repairing of a road were represented by him as works which were to be performed from love to God. So far did he carry this mode of connecting faith and good works, that he required of all young persons applying for confirmation a certificate from their parents of their having planted two trees. His preaching was simple, impressive, and affectionate, well adapted to the minds of his people, and perfectly orthodox. In the year 1782 he founded a Christian Society for the religious improvement of his flock; and dissolved it in 1788, on account of the opposition it met with from some, whom his gentle spirit did not wish to offend. His own conduct was always influenced by the most sincere piety, and by a strong practical faith in a superintending Providence. This faith he carried so far, that he used to keep by him slips of paper with the words *Oui* and *Non* written on them, with which he drew lots whenever he found himself unable to decide which of two courses to pursue, believing that "the lot is cast into the lap, but the whole disposing thereof is of the Lord." (Prov., xvi. 33.) At the time of the French Revolution, the

Ban-de-la-Roche was not only secured from molestation by the well-known character of the people and their pastor, but Oberlin was even able to afford an asylum to several proscribed persons. Once indeed he was cited before the supreme tribunal of Alsace on a political charge, when he was not only acquitted, but received an assurance from the court of their deep regret that he should have been called from the scene of his labours. In 1795 he remounted his stipend on account of the poverty of his people, leaving each of them to contribute what they could to his support. His economy was as strict as his benevolence was extensive. He was never known to owe a single sou; and he made it a point of conscience to set apart for religious and charitable purposes the three tithes required of the Jews by the Mosaic law. He was a warm supporter of the Missionary Society, and the first foreign correspondent of the British and Foreign Bible Society. When the assignats were issued by the French revolutionary government, he soon foresaw their depreciation, and began to buy them up from his people to prevent them losing by them: in the space of twenty-five years he succeeded in redeeming all that had been brought into the Ban-de-la-Roche.

Among the employments which Oberlin found for his people were straw-plaiting, knitting, dyeing with the plants of the country, and weaving. About 1813 the industry of the district received a fortunate stimulus through the introduction of the ribbon manufactory by M. Legrand, formerly a director of the Helvetic Republic, who was induced by his esteem for Oberlin's character to remove with his two sons from Basel to the Ban-de-la-Roche. In this family Oberlin found faithful friends and able assistants in his plans of usefulness.

Among the old evils under which the Ban-de-la-Roche had suffered, one of the greatest was the remains of the feudal system, out of which had arisen a ruinous lawsuit between the peasantry and the seignours respecting the right to the extensive forests of the district. Oberlin persuaded the parties to come to an agreement, and the pen with which that agreement was signed was solemnly presented to him by the maires of the district on the 6th of June 1813. Nor was this the only civic honour he received, for Louis XVIII. presented him with the decoration of the Legion of Honour as an acknowledgment of the services which he had rendered to a numerous population; and in 1818 he received a gold medal from the Royal and Central Agricultural Society of Paris. His Memoirs contain accounts written by several persons, of very different characters and pursuits, of visits to the Ban-de-la-Roche during Oberlin's life, and all of them bear witness to the astonishing results of his labours, as shown by the intelligence and piety, the politeness and hospitality, the industry, benevolence, and happiness of the people whom he had found wretched, ignorant, and half-savage. Those readers who wish further information as to his character, habits, and personal appearance, are referred to the work mentioned below.

Oberlin died on the 1st of June 1826, in the eighty-sixth year of his age and the fifty-ninth of his residence in the Ban-de-la-Roche. He was buried at Foudai on the 5th of June. Nearly all his flock followed their 'Cher Papa,' as they always called him, to the grave, and several Roman Catholic priests, with all the Protestant clergy in the neighbourhood, joined in the funeral rites. An affectionate parting address to his people, which he had left behind him, was read from the pulpit on the occasion.

Oberlin was married on the 6th of July 1763 to Madeleine Salomé Witter, who died on the 18th January 1784. He had nine children, two of whom died very young. The other seven were brought up under his own care, and lived to help him in his labours. Their names were—Frédéric, who died in 1793; Fidélité Caroline, who was married in 1795 to the Rev. James Wolf, of Mittelberghelm, and died in 1809; Charles Conservé, who became in 1806 pastor of Rothau, in the Ban-de-la-Roche, where he still resided in 1838; Louisa Charité; Henriette, married to the Rev. M. Graf; and Frederica Bienvenue, married to the Rev. M. Rauscher.

(*Memoirs of John Frederick Oberlin*, 8th edit., with a *Short Notice of Louisa Schepler*, London, 1838.)

Any account of Oberlin's life would be incomplete without some notice of LOUISA SCHEPLER, who was originally his servant and a conductress in one of his schools. Upon the death of Oberlin's wife she became his housekeeper, and soon after she begged him to pay her no more wages, but to treat her as one of his children. Her request was complied with, and she lived in Oberlin's family till and after his death, employing all her energies and the whole of a little property which she possessed in works of benevolence. In August 1829 she received one of the 'Prix de Vertu' distributed annually by the Académie Française, amounting to 5000 francs, the whole of which she laid out in assisting the poor and in other benevolent objects. She died on the 25th of July 1837, at the age of seventy-six, having been a conductress fifty-eight years.

OBSSEQUENS, JULIUS, the author of a small work in Latin which is entitled 'De Prodigia.' Nothing is known about the author. Scaliger concludes that Obsequens lived before Hieronymus, because Hieronymus in a particular passage appears to have copied a fact from Obsequens. This passage of Hieronymus was written in the time of Valens, who died A.D. 379. The work of Obsequens is a record of wonderful things that happened during the period from the foundation of Rome to the time of Augustus. The first part of the work is lost,

but it has been supplied by Lycosthenes (Conrad Woolfhart), whose supplement commences with the time of Romulus and extends to the year of the City 563, when the extant work of Obsequens begins. There are various gaps after 563, which Lycosthenes has also supplied. The method of the author is to enumerate the wonderful occurrences under any given year, and then to state what happened thereon. The following is an example (No. KCI.):—"It rained milk on the Graecostasia. At Orotch a flock of sheep with a dog and three shepherds were killed by lightning. At Satura a calf with two heads was born. There was an upbar in the city owing to Graechus proposing his laws." Obsequens chiefly followed Livy, for he uses pretty nearly Livy's words, as appears from a comparison of Obsequens with those parts of Livy which are extant. His work also terminates with an event relating to Drusus, the son of Livia, and the history of Livy terminates with the death of Drusus.

Lycosthenes in his preface argues that the attention which the Romans paid to wonderful occurrences and signs proved their religious feeling, while their blindness is shown by their worship of false deities; and he adds that if they had been acquainted with the true religion, they would have surpassed in religious zeal their posterity, who are Christians rather in name than in fact, and disregard the signs of the times foretold by Jesus Christ (Luke xxi.) as to happen when the end of the world was approaching. Among the signs then recently witnessed the author mentions three or four eclipses happening in a year, stars with hair (comets), burning meteors, and earthquakes and convulsions of the earth in Italy, all which made no impression on the people of that day, to such a height of impiety and wickedness were men come. The consequences of all this were pernicious errors, horrible blindness, and persevering blasphemy; and the divine vengeance showed itself in civil wars, strange diseases, and famine. The author thought that an edition of Obsequens at such a time would be suitable, and would shew men that dreadful signs always portended evil to men, and that by this example they might take warning. The author supplied what is wanting in the manuscript of Obsequens from Livy, Dionysius of Halicarnassus, Orosius, and Eutropius, and other most esteemed authors, so that nothing should be omitted. If his labours should find favour with his readers, he promises to complete his chronicle which he had written of wonderful events from the creation of the world to his own time. The author's preface is dated Basel, 1552.

The edition of Obsequens by F. Oudendorp, Leiden, 1720, contains the notes of Scheffer and the Supplements and Preface of Lycosthenes.

OCCAM, or OCKHAM, WILLIAM, an English scholastic philosopher, was born in the county of Surrey about the end of the 13th century. He was a pupil of Duns Scotus, 'the most subtle Doctor,' and, like his master, a member of the order of Franciscans. He himself attained to the title of the 'Invincible Doctor.' He opposed the Realism of Scotus and his followers, and formed a new speculative sect, bearing the name of Occamists, who revived the tenets of Nominalism. In the early part of the 14th century, he taught at Paris. He was distinguished by his powerful opposition to the papal power. A book which he published, entitled 'De Potestate Ecclesiastica et Seculari,' drew down upon him the censure of the pope. He was protected by the king of France, whose cause he had supported against papal encroachments. When afterwards excommunicated by the pope, he found another friend in the emperor of Germany. He died at Munich, in 1347.

Very little is known of Occam's life. A list of his works, which includes a commentary upon the Predicables of Porphyry and the Categories of Aristotle, and many treatises of scholastic theology and ecclesiastical law, will be found in Fabricius's 'Bibliotheca Latina,' tom. iii., p. 466. Occam's 'Summa totius Logice' was published at Paris in 1483, and at Oxford in 1675, 8vo.

Tennemann gives the following account of the Nominalist speculations of Occam:—"He maintained that general ideas had no objective reality out of the mind, because neither the possibility of judgments nor the possibility of a real science requires this hypothesis, and it only leads to absurd consequences. These general ideas have no objective existence but in the mind; they are a product of abstraction; and are either images (figments) which the mind creates for itself, or subjective qualities belonging to the mind, and which, according to their nature, are the signs of exterior objects. From this doctrine, roughly sketched only, the problem of the principle of individualisation came to lose all interest, and the question of consciousness, to occupy men exclusively. In the theory of consciousness, Occam diverged still more from the Realist opinion; and in maintaining the subjectivity of thought, he has perhaps given more encouragement than he meant to give to scepticism and empiricism." (Tennemann, *Manuel de l'Histoire de la Philosophie*; Cousin; Hallam, *Introduction to the Literature of Europe*, vol. i.)

OCELLUS LUCANUS, a Pythagorean philosopher, was a native of Lucania in Italy, and is supposed to have been a disciple of Pythagoras, but the time in which he lived is uncertain. He wrote many works on philosophical subjects, the titles of which are given in a letter written by Archytas to Plato, which has been preserved by Diogenes Laertius (viii. 86); but the only work of his which has come down to us is 'On the Nature of the Universe.' This work, as we learn from the extracts in Stobaeus, was originally written in Doric Greek, and

appears to have been transferred in later times into the common Greek dialect. Its chief philosophical topic is to maintain the eternity of the universe (ὁ Πᾶς); Ocellus also attempts to prove the eternity of the human race (c. iii., s. 3).

The best editions of Ocellus are by Batteux, Paris, 1768, 8 vols. 12mo; by Rudolphi, Leipzig, 1801-3, which is accompanied with a valuable commentary; and Mullach, Berlin, 1846. The work has been translated into English by Thomas Taylor, 1831; into French by the Marquis d'Argens, Berlin, 1762, and by the Abbé Batteux, Paris, 1768; and into German by Bardili, and J. G. Schulthes, Zürich, 8vo, 1781.

OCKLEY, SIMON, was born at Exeter in 1678, entered Queen's College, Cambridge, in 1698, was presented to the vicarage of Swavesey in 1705, was chosen Professor of Arabic in the University of Cambridge in 1711, and died at Swavesey August 9, 1720.

Ockley had paid great attention to the study of the Oriental languages, and was well acquainted with the Arabic. His principal work, 'The History of the Saracens,' which was originally published in two volumes 8vo, the first in 1708, and the second in 1718, was compiled from Arabic manuscripts in the Bodleian Library at Oxford. This work, which commences at the death of Mohammed, and terminates in the year 705, contains much valuable information respecting the early conquests of the Arabs, and may still be consulted with advantage by those who are unacquainted with the Oriental languages. Gibbon made considerable use of it in his 'Decline and Fall,' and speaks of the author in his autobiography as "an original in every sense, who had opened his eyes." This work however does not appear to have brought Ockley much profit; for he complains, in his inaugural oration in 1711, of his straitened circumstances, and dates the second volume of his history from Cambridge Castle, where he was imprisoned for debt. Ockley wrote several other works, of which the principal are—'Introductio ad Linguas Orientales, in qua iis discendis via munitur, et earum Usus ostenditur,' 1706; 'The History of the present Jews throughout the World,' 1707, translated from the Italian of Leo of Modena, a Venetian Rabbi; 'The Improvement of Human Reason exhibited in the Life of Hai Ebn Yokdhan,' 1708, translated from the Arabic; 'An Account of South-West Barbary,' 1713; a new translation of the second 'Apocryphal Book of Ecdra,' from the Arabic version of it, 1716. He also published sermons upon 'the Christian Priesthood,' and 'the Necessity of instructing Children in the Scriptures.'

O'CONNELL, DANIEL, the eldest son of Morgan O'Connell, was born at his father's residence, near Cahirciveen, Kerry, August 6, 1775. The family of Connell, or O'Connell, is of antiquity in the south of Ireland, but the circumstances of the father of Daniel O'Connell were much straitened. Still he did not neglect the education of his son, according to his means, for he sent him at an early age to a "poor old hedge-schoolmaster," named David Mahony, who first taught the Irish agitator his letters. At the age of thirteen Daniel O'Connell was removed to a school at Redington, near Cove, county Cork, kept by the Rev. Mr. Harrington, a Roman Catholic priest: this school is said to have been the first publicly opened in Ireland after the repeal of the persecuting laws which made it penal for a Roman Catholic to educate his children. In 1790 Daniel, then just fifteen years of age, was removed from Redington with the intention of being sent to Liège; but on reaching that place he was found to be too old for admission, and accordingly was entered at St. Omer's. There he remained till 1792, when he was transferred for a time to the English college of the Benedictines at Douai. Returning after a few months to St. Omer's, he rose speedily to the head of the college; and so arrested the attention of the then president, Dr. Stapylton, that he prophesied that he would hereafter make a remarkable figure in the world. The first outbreak of the French revolution scattered the scholars of the Roman Catholic colleges at Douai and St. Omer's. Daniel O'Connell succeeded in reaching Calais safely, and, embarking on board the English packet-boat, he landed on the shores of England, "half a Tory at heart"—so deep and keen was the impression left upon his mind by the excesses of the revolution in France.

The legal profession having been recently thrown open to members of his faith, he in 1794 entered himself a student at Lincoln's Inn; and four years afterwards was called to the bar, having taken no ordinary pains to qualify himself. His first public speech was against the proposed union between the English and Irish legislatures. It was delivered at a meeting of the Roman Catholics of Dublin, assembled at the Royal Exchange in that city, for the purpose of petitioning against that measure: but the meeting was broken up by the intervention of the military. In 1802 Mr. O'Connell, while his professional prospects were brighter than its realities, was married privately to his cousin Mary, the daughter of Dr. O'Connell of Tralee. The calamitous occurrences however connected with the Irish outbreak of 1803, known by the name of Emmett's Rebellion, found Mr. O'Connell already in possession of a moderate practice. He was now becoming gradually absorbed in the arena of political contention. Emmett's trial was the starting point of a new era in the history of Irish agitation: the cruelty inflicted by the citizen-soldiers made an impression as deep and lasting as it was general, and the 'Catholic question,' as it was called, rose daily in importance. From this time forward Mr. O'Connell took the leading part in the prosecution of the Roman Catholic claims. "For more than twenty years," he writes to the late Lord Shrewsbury,

"before the passing of the Emancipation Bill, the burden of the cause was thrown upon me. I had to arrange the meetings, to prepare resolutions, to furnish replies to the correspondence, to examine the case of each person complaining of practical grievances, to rouse the torpid, to animate the lukewarm, to control the violent and inflammatory, to avoid the shoals and breakers of the law, to guard against multiplied treachery, and at all times to oppose at every peril the powerful and multitudinous enemies of the cause." Day and night he devoted himself with surprising energy to the work, without receiving pay or fee. In 1804 the 'Catholic Board' was dissolved by a proclamation from government, but it was immediately revived under the name of the 'Catholic Committee.' It met in the Exhibition House in William-street, and its debates were reported from January 1808.

In 1815 Mr. O'Connell fought a duel with Mr. D'Esterre, a member of the Dublin corporation, and had the misfortune to inflict upon his adversary a wound which ultimately proved fatal: it is but just to add that for this result he ever afterwards felt and expressed the most painful remorse. Mr. O'Connell's public life henceforth offers very little material for remark until we come to the very eve of the time at which the Roman Catholic Emancipation Bill was carried. In the summer of 1823, when the fever and excitement on the subject then in suspense was at its height, Mr. O'Connell and his friends judged that the time was come for bringing the question to a final decision. In the June of that year a vacancy occurred in the representation of Clare county, and Mr. O'Connell, though a Roman Catholic, was proposed as a candidate against Mr. (afterwards Lord) Fitzgerald. He was returned to parliament by a large majority, and proceeded to Westminster for the purpose of taking his seat in St. Stephen's. As a Roman Catholic, he of course refused to take the oaths drawn expressly against the doctrines of the Roman Catholic Church. Discussions in the house and arguments at the bar ensued; and though the session closed without any practical result, yet the agitation in Ireland began to assume a formidable appearance, and to threaten another outbreak. Alarmed at the probable consequences of further opposition to claims which a large majority of educated Protestants had come to regard as just and equitable, the Duke of Wellington and Sir R. Peel gave way, and early in the following year brought into parliament a bill for the repeal of the last civil disabilities under which the Roman Catholic body laboured. Mr. O'Connell accordingly was re-elected, and took his seat as member of parliament in May 1829. In the following year, at the general election consequent upon the death of George IV., Mr. O'Connell exchanged the representation of Clare for that of his native county of Kerry. He represented Dublin from 1832 to June 1835, when he was unseated on petition, but was immediately afterwards returned for Kilkenny. In 1837 he was once more returned for Dublin, and in 1841 for the county of Cork. To carry on more effectively the agitation, Mr. O'Connell had relinquished his professional practice, and as a compensation for his loss of income, an annual subscription was organized, which afterwards came to be known as the 'Rent.'

The year 1841 witnessed the return of Sir R. Peel and the Conservative party to power, and this was the signal for renewed agitation in Ireland. In the following year Mr. O'Connell commenced his movement in favour of a repeal of the Union, which met with general sympathy from the violent and the ignorant throughout Ireland.

In 1842 and 1843 monster meetings were collected on the royal hill of Tara, on the Curragh of Kildare, the rath of Mullaghmast, and other localities renowned in tradition and song. A monster meeting announced as to be held at Clontarf on Oct. 8th in the latter year was forbidden by government authority, and a state prosecution for high treason was commenced against Mr. O'Connell and the other ringleaders. Mr. O'Connell was convicted of sedition, sentenced to be imprisoned for a year, and to pay a fine of 2000*l.* The judgment was reversed on appeal to the House of Lords; but the prosecution answered its intended end; the prestige and magic influence of the great 'Liberator,' as he was called, was destroyed; he himself henceforth spoke in more measured language, and the funds of the Repeal Association were nearly exhausted in the contest.

The return of the Whigs to power in 1846, and the adherence which Mr. O'Connell gave to their party, introduced dissensions and differences among his immediate followers and supporters, over whom for forty years he had exercised an all-powerful influence. His health began to fail, and he became soured by opposition, as well as depressed in spirits by the evident approach of famine in Ireland. Early in 1847 he went abroad with the intention of spending some months in Italy, and of paying a devotional visit to Rome. He had not however proceeded further on his way than Genoa, when he suddenly sunk and expired on the 15th of May. His heart was embalmed and carried to Rome in compliance with his last wishes; and his body was conveyed to Ireland for interment. Besides three daughters, Mr. O'Connell left four sons, all of whom at one time or other have had seats in Parliament. His eldest son Maurice, many years M.P. for Tralee, died in 1853; and his second son, John, after representing several Irish constituencies, was appointed in 1856 to the Clerkship of the Hanaper Office in Dublin.

(*Life and Times of Daniel O'Connell, by his Son, John O'Connell.*)

ODENATHUS, or ODENATUS. [ZENOBIAN.]

ODEVAERE, JOSEPHUS DIONISIUS, the most celebrated

historical painter of the Flemish school of recent times, was born at Bruges on the 2nd of October 1778. He was brought up in the College of the Augustines of that city, and was destined by his parents for mercantile pursuits, though he had always displayed a decided ability for the graphic art. In 1794, in consequence of the French invasion of Belgium, Odevaere was removed by his parents, and accompanied them into Holland, where he remained fourteen months. They returned to Bruges, and, as Odevaere had a confirmed dislike to a mercantile pursuit, he was placed in the Academy of Bruges, in which he obtained the first prize for drawing in 1796. He went towards the close of the following year to Paris, and studied in the school of his fellow-townsmen until he was appointed director of the French Academy at Rome, when Odevaere entered the school of David. In 1804 he obtained the grand prize of the French Academy of Painting, for a picture of the death of Phocion, and had the honour of being presented to the emperor. He returned in the same year to Bruges, and in 1805 he went as a pensioner for five years of the French government to Rome, but he remained there altogether eight years. According to the regulation of the French government, he sent, after his residence of five years in Rome, an historical picture to the French Academy; the subject was the 'Coronation of Charlemagne,' and it was generally admired. In 1812 he received a commission in Rome to paint two large frescoes for the palace of Monte Cavallo, but political events which followed prevented the execution of these works. He left Rome at the close of 1812, and returned to Paris, and obtained the gold medal for a picture in the exhibition there. He returned finally to Bruges, where he executed several public and private commissions. In 1814 he established himself in Brussels, where he painted his pictures of the 'Peace of Utrecht,' and the 'Battle of Waterloo at the moment the Prince of Orange was wounded,' for the King of the Netherlands, who had created Odevaere his court painter in the spring of 1815. The 'Battle of Waterloo' was exhibited in 1817 and 1818 in many of the provinces of the Netherlands, together with a portrait of the Prince of Orange, which is engraved by Lignon, and a picture of 'Bramante introducing Raffaele to Julius II.' Odevaere was the commissioner appointed on the part of the Netherlands to reclaim the pictures which had been taken by the French to Paris from the collections of Holland and Belgium. Upon the completion of this commission the king created him a Chevalier of the Lion of the Netherlands, and several Flemish cities presented him with medals struck expressly in commemoration of the restoration of their respective works.

His picture of the 'Battle of Waterloo' was followed in 1820 by that of the 'Battle of Nieuwpoort,' and a Narcissus, engraved by Vlamynck. In 1821 he exhibited at Brussels his 'Triumph of Cimabue,' and subsequently, 'David in his Studio,' the 'Establishment of the Power of the House of Orange,' the 'Inauguration of the King at Brussels in 1815,' besides others from classical history, and many Scripture-pieces for various churches in the Netherlands, in some of which are excellent altar-pieces by Odevaere. He died at Brussels, in February 1880, not having completed his fifty-second year. Van Eynden and Van de Willigen, in the third volume of their 'National History of Painting since the Middle of the Eighteenth Century,' published in 1820, have given December 2, 1775, as the date of Odevaere's birth, which is corrected in the fourth volume of appendix, published in 1840, to the date given above. His portrait is published in the work of Eekhout and Burggraaf, 'Portraits des Artistes modernes,' &c., Brussels, 1822; and several of his works are engraved in the 'Annales du Salon de Gand'—as the 'Coronation of Charlemagne,' the 'Confession of Phœdra to Theseus,' 'Narcissus,' and the 'Battle of Nieuwpoort.' Some of the pictures of Odevaere are of very large dimensions. He was a member of the Academy of St. Luke at Rome, and of several other institutes of the fine arts.

ODOACER, a Gothic chief who, according to some authorities, was of the tribe of the Heruli, originally served as a mercenary in the barbarian auxiliary force which the later emperors of the West had taken into their pay for the defence of Italy. After the two rival emperors Glycerius and Julius Nepos were both driven from the throne, Orestes, a soldier from Pannonia, clothed his own son Romulus, yet a minor, with the imperial purple, but retained all the substantial authority in his own hands. The barbarian troops now asked for one-third of the lands of Italy to be distributed among them as a reward for their services. Orestes having rejected their demand, they chose Odoacer for their leader, who immediately marched against Orestes, who had shut himself up in Pavia. Odoacer took the city by storm, and gave it up to be plundered by his soldiers. Orestes was taken prisoner and led to Placentia, where he was publicly executed, in August A.D. 475, exactly a twelvemonth after he had driven Nepos out of Italy. [NĒPOS.] Romulus, who was called Augustulus by way of derision, was in Ravenna, where he was seized by Odoacer, who stripped him of his imperial ornaments and banished him to a castle of Campania, but allowed him an honourable maintenance. Odoacer now proclaimed himself king of Italy, rejecting the imperial titles of Caesar and Augustus. For this reason the Western empire is considered as having ended with the deposition of Romulus Augustulus, the son of Orestes. Odoacer's authority did not extend beyond the boundaries of Italy. Little is known of the events of his reign until the invasion of Theodoric, king of the Ostrogoths, who, at the instigation, as some historians

BIOG. DIV. VOL. IV.

assert, of Zeno, emperor of the East, marched from the banks of the Danube to dispossess Odoacer of his kingdom. Theodoric, at the head of a large army, defeated Odoacer near Aquileia, and entered Verona without opposition. Odoacer shut himself up in Ravenna in 489. The war however lasted several years: Odoacer made a brave resistance, but was compelled by famine to surrender Ravenna (March 493). Theodoric at first spared his life, but in a short time caused him to be killed, and proclaimed himself king of Italy. (Procopius; Cassiodorus.)

ODYSSÆUS. [ULYSSES.]

ECOLAMPADIUS, the Greek translation of his original German name, which was JOHANN HAUSOHEIN, one of the early German reformers, was born at Weinsberg in Franconia, in 1482. His mother was a native of Basel in Switzerland. His father, a merchant, sent him at first to the school at Heilbronn, and afterwards to the University of Heidelberg, where his early proficiency procured him the degree of Bachelor of Philosophy in his fourteenth year. He next visited Bologna in Italy, but soon returned to Heidelberg, and studied divinity. His eminent talents then procured him the appointment of tutor to a son of the Elector Palatine, but he resigned his office in a short time, and resumed his theological studies. He was next appointed to a benefice founded by his parents, and performed the duties for about six months, when deeming himself as yet incompetent for the charge, he resigned. He then visited Tübingen and Stuttgart, where he acquired Hebrew from a Spaniard, and Greek under Reuchlin, and in a short time wrote a Greek grammar, which was published in 1520. While residing at Heidelberg he formed a friendship with Capito, who was then preacher at Bruchsal, and was afterwards the reformer at Strasbourg; this acquaintance introduced him to Erasmus, and the intimacy continued for life. This association produced its effects on the individuals according to their various characters: the ardent Capito soon became a zealous reformer; the mild and studious Ecolampadius hesitated,—he feared the misery which would probably result from a disruption of the church, and changed not till he felt convinced that the cause of truth should overbalance the fear of transient evils; the wary and cautious Erasmus continued an adherent—but a liberal one—of the old faith. For a short time Ecolampadius resumed his clerical duties at Weinsberg; but in 1515, Capito, then settled at Basel, induced him to undertake there the office of preacher; and while there he assisted Erasmus in his 'Annotations on the New Testament,' published in 1516, and the second edition, published in 1517, was issued under his sole superintendance. As a preacher at Basel he exposed many of the abuses of the Popish church, but still felt reluctant to abandon it. To secure time for consideration he entered a monastery of the order of St. Bridget at Altenmünster, near Angsburg, stipulating that he should have liberty for his own studies and opinions. His high reputation induced the fraternity to accede to his terms, but as his convictions gradually tended towards Lutheranism, his preaching and writing became more discordant with the opinions of his fellow monks. At length, shortly before the Diet of Worms in 1521, on the appearance of his work against Confession, his liberty of thinking and writing was denied him, and his friends feared an attempt would be made to imprison him. He therefore left the convent after a residence of nearly two years, and took refuge at Ebernburg with Franz von Seckingen. In the autumn of 1522 he left Ebernburg for Frankfurt-on-the-Main, and thence went to Basel. Before he left the convent he had written to Erasmus that he was thoroughly convinced of the truth of Luther's opinions, and in the spring of 1523 he was made deputy to the preacher of St. Martin's at Basel, upon whose death in the following year he was appointed preacher, and also professor of theology. As marking the progress of his reformatory principles we may state that, in 1524 he wrote against the celibacy of the clergy, in 1525 he baptised in German and discontinued the mass, and in 1526 the Psalms were first used in a German version. When the dispute arose between Zwingli and Luther respecting the real presence in the Lord's supper, Ecolampadius supported the opinions of Zwingli, and published in 1525 'De vero intellectu verborum Domini, Hoc est corpus meum,' a work of which Erasmus says that it was written with much skill, good reasoning, and persuasive eloquence. He was answered by the Lutheran party in 'Syngamma suevica,' to which he replied in 'Antisyngamma.' Fryth, one of our early martyrs, was burnt in 1533, because, as Cramer writes, "he thought it not necessary to be believed as an article of our faith, that there is the very corporal presence of Christ within the host and sacrament of the altar, and holdeth of this point most after the opinion of Ecolampadius." In 1526 and 1529 he attended the conferences at Baden and Marburg; to the first he went alone; at the second he was in company with Zwingli, Bucer, and Hedion. [ZWINGLI.] Neither of the conferences produced any real satisfactory result. In 1530 he had made himself obnoxious to the Anabaptists, and in passing through the village of Laufelfingen his life was endangered by an attack of the mob. In December 1531 he died after a short and severe illness, which, apparently without any foundation, was by some attributed to poison. Ecolampadius was the author of numerous works, some on the polemic disputes of the time directed against Papists, Lutherans, and Anabaptists; others were translations from Chrysostom, Gregory Nazianzen, and others of the early fathers. His original works were—'Annotations in Genesim,' 'Exegemata in librum Job,' 'Commentariorum in Esaiam libri sex,' 'De ritu Paschali,' and 'Quod non sit

merous Christian's Confession.' Mosheim styles him "one of the most learned men of that century;" he was no less distinguished for his modesty, meekness, charity, and self-denial; and he was one of the principal instruments in planting the Reformation successfully and surely in Switzerland.

OECUMENIUS was bishop of Tricea in Thrasy. The time at which he lived is uncertain: but it was after the 8th century and before the 10th. He is generally placed in the 9th century; Cave assigns to him the date A.D. 990, Lardner A.D. 950. He wrote commentaries on the Acts, on St. Paul's fourteen Epistles, on the seven Catholic epistles, and on the Apocalypse, in the form which is called a 'Catena' (chain), that is, containing, besides his own observations, the remarks of other writers. Among the authors thus quoted by him are Chrysostom, Cyril of Alexandria, Gregory of Nazianus, Ildore of Pelusium, Theodoret, and Photinus. The best editions of his works are those of Verona, 1582, and Paris, 1631. (Monsaueon, *Bibliotheca Coisliniana*, pref. and p. 274; Fabricius, *Bib. Græc.*, tom. vii. p. 788; xiii. p. 845; Cave, *Hist. Lit.*, tom. ii. p. 112; Lardner, *Credibility*, in Works, vol. v. p. 154, ed. of 1831; Cramer, *Monitum ad Catenam in Epist. Cathol.*, Oxford, 1840.)

OEHELENSCHLÄGER, ADAM GOTTLÖB, the greatest poet of Scandinavia and one of the greatest European poets of the 19th century, was born on the 14th of November 1779 at Vesterbro a suburb of Copenhagen. The whole of his early life was recorded by himself with singular minuteness, first in an autobiography written to be prefixed to a German edition of his works and afterwards in a series of 'Erindringer' or 'Recollections' which were published immediately after his death by his eldest son. The reader is informed in the 'Erindringer' of the boy's first inclination to swear, and how his mother checked it, of his strong propensity to pull off the bed-clothes, and a variety of similar particulars, the whole of which put together supply a varied picture of the life of a Danish boy at the close of the 18th century.

The name of Oehlenschläger is German, his father was from Krusendorf, a village in Sleswig, where the family had produced a long succession of schoolmasters and organists; and his mother Martha Maria Hansen was of German parentage by the father's side, of Danish by the mother's. "Thus," says Oehlenschläger, "I am descended from both Danes and Germans, and it seems as if Fate had determined I should belong to both nations." His father had fallen much below the respectability of his ancestry by becoming a servant to Count Adam Gottlob Moltke, after whom the poet was named, but on his marriage with the countess's lady's-maid he obtained by the count's patronage the post of organist at Frederiksberg, and afterwards of some subordinate position at the castle of that name, where he finally rose to be steward. Frederiksberg, one of the numerous palaces of the king of Denmark, a building which is said by some to have been erected from the plans of Inigo Jones, stands about two English miles from the western gates of Copenhagen, and is a favourite Sunday resort of the inhabitants of the capital. Here the early life of young Adam was passed amid scenes of great variety. In the summer Frederiksberg was often occupied by the court, and he heard the royal band of music play on Sundays, and saw the royal company at dinner. In the autumn the place of the court was supplied by a legion of workpeople, busy with repairs; and in the winter the building was left in charge of the Oehlenschläger family, with, in addition, two watchmen and two watchdogs. "The whole palace," says Oehlenschläger, "then belonged to us, and I went about in the royal rooms, looking at the paintings and building castles in the air." His chief amusement in the winter was reading novels, which he got from a circulating library in Copenhagen, and of which he tells us that before he was twelve years old he had got through more than three hundred volumes. All that he read was Danish—a circumstance to which he partly attributes the mastery he obtained over his native tongue. His parents, though German was their native language, never used it to their children, and only one to another when they did not wish the children to understand them.

Up to the age of twelve, young Adam had been very unfortunate in the article of schools; he was then taken notice of by Edward Storm, a Norwegian poet, who offered to his father to procure him gratuitous admission to a public school in Copenhagen, if his father would be at the charge of his board. Young Adam soon began to write not only verses but even plays, which were acted by himself, his sister, and some play-fellows, on Sundays, in one of the rooms at Frederiksberg. Storm, who was superintendent of the school to which the boy had been admitted, laughed at his attempts; and Dichmann, another Norwegian, who was one of the masters, told him, to his great mortification, that he was no genius—he would never be another Edward Storm. The education he received was intended to qualify him for a mercantile life, but when he left the school at the age of sixteen he was glad of an accident which prevented his being placed in a counting-house, and readily persuaded his indulgent father, who was now in much better circumstances than he had been, to allow him to study. In a year however he was tired of Greek and Latin, and having for some months spent all his spare time and money at the theatre, was seized with a desire to appear on the stage. Theatrical masters are generally looked upon in a more serious light in a foreign city than in an English one, and at Copenhagen the management of

the drama was treated with unusual solemnity. In Babbe's Lectures on the Drama, delivered to the actors, the stage is regarded as a moral engine hardly secondary in importance to the pulpit. With the exception of the comedies of Heiberg, the Danish Molière [HOLBERG], the plays that were performed were then chiefly translations. "Of English pieces," says Oehlenschläger; "the 'School for Scandal' pleased me much, in which Rosing was an excellent Sir Joseph [Joseph Surface], and 'She Stoops to Conquer,' in which Gielstrup was an incomparable Tony Lumpkin." He soon found however that he was not likely to rise to a much higher position than that of a walking gentleman, and the acquaintance of two young students, who had taken lodgings with the same landlady as himself, led him into a different line. They were the two brothers Oersted, afterwards so well known. Of the three young men who occupied together for some years these obscure lodgings, one, Oehlenschläger, became the greatest poet of Denmark; another, Hans Oersted, became its greatest natural philosopher, and the discoverer of electro-magnetism; the third, Anders Oersted, who married Oehlenschläger's sister, became its greatest lawyer, and for a time the prime-minister of the kingdom. Oehlenschläger infected the future lawyer with a love of poetry, and the lawyer infected him with a taste for jurisprudence. With the consent of his father he relinquished the stage, and entered himself at the University of Copenhagen as a student of law, his friend promising his assistance to help him on a little more rapidly than usual. Literature however soon won the victory over law. The university offered in 1800 a prize for an essay on the subject, 'Would it be an advantage for northern literature if the Scandinavian mythology were made use of in it instead of the Grecian.' It was the very idea which was taking possession of Oehlenschläger, and was destined to occupy him for life; but when he drew up an essay he had the mortification to see the prize carried off by another—receiving himself however the honour of being declared the second best.

On the famous 2nd of April 1801 when Nelson attacked the Danish fleet off Copenhagen, Oehlenschläger saw the fight at a short distance from the balcony of the Sea-Cadets' Academy, and he afterwards held the post of ensign in a volunteer regiment of students. He also published a small dramatic piece, 'The Second of April,' but it was of no great merit. "That battle," he wrote, several years afterwards, "inspired the Danes with a taste for poetry, as the battles of Marathon and Salamis did the Greeks, and the destruction of the Spanish Armada the English in the time of Elizabeth. Some great development of power is requisite to drive the mean, the petty, and parochial out of a nation's mind, and bring it in tune for the great and beautiful." In 1803 he issued a volume of poems, containing among other works, the play of 'The Eve of Saint John,' and at once took rank as a writer of some note. The play, or rather dramatic tale, of 'Aladdin,' which followed, founded on the well-known story in the 'Arabian Nights,' captivated the public, in spite of some very obvious faults, by the general vivacity of its tone, and raised his name very high in the list of the living Danish poets, if it did not place him at their head. He used often to say afterwards that in writing 'Aladdin' he had discovered his own 'wonderful lamp,' the vein of poetry which was to give him fame and fortune. He received in 1805 the usual mark of success for a Danish author—a travelling stipend from the government, procured for him by Count Schimmelmann, and set out on a tour to Germany, to make the acquaintance of the band of literary men who at that time invested Germany with a halo. The second volume of his autobiography is chiefly occupied with an account of his travels, and of his intercourse with Göthe, Wieland, Teck, Hegel, Voss, and other poets and philosophers. Up to his twenty-fourth year he had never written a line of German, but he was now so anxious to impart to his new and illustrious friends some notion of his poetical capacity that he translated his new compositions into German as fast as he wrote them, and somewhat unnecessarily occupied the time of many of them by availing himself of the permission to read his productions to them in manuscript, and take their opinion not only on the merits or defects of the structure and the poetry, but on the correctness or incorrectness of the language. It is not a little singular that productions so thoroughly Scandinavian in their tone and spirit as the earliest of the long line of Oehlenschläger's northern tragedies should have been written in a foreign land and partly composed in a foreign tongue. 'Hakon Jarl' was written at Halle. It is a tragedy in five acts, on the fortunes of Hakon Jarl, the last pagan sovereign of Norway, and the struggle between the two religions, Christianity and the belief in Odin. Nothing can well be more different than a tragedy of the old French school and such a tragedy as 'Hakon Jarl.' As the reader of 'Ivanhoe' finds himself, before he has arrived at the end of the narrative, not only interested in the fortunes of Wilfrid and Rowena, but also well-informed and perhaps not less interested in the whole framework of the country around them, cognisant of the relative position of the Normans and Saxons, of the enmity between the king and the Templars, of the ceremonies of a tournament and an ordeal, of the condition of serfs and Jews, so the reader of 'Hakon Jarl' sees pass before him the old tyrant superstitiously clinging to the wild religion of Valhalla, the young champion eager for the triumph of the Cross, the rude but independent Norwegian boor, the crouching northern slave, the ambitious serf who carelessly espouses the new faith because it

promises him a better career. An unceasing vivacity pervades the whole, and there is not only pathos but humour; nothing can be further removed from the unvarying solemnity and systematic monotony which have by some been thought essential to the character of a tragic drama.

Oehlenschläger, before quitting Germany, was accidentally present at Weimar on the day of the double battle of Auerstedt and Jena, and was in some danger when the victorious French entered the town. From Germany he went to Paris, where he composed what is by some regarded as his finest tragedy, 'Palmstake,' and also 'Axel and Valborg,' the former a sort of companion picture to 'Hakon Jarl,' in which Odinism is shown in a more favourable point of view, and the latter a love tale of the middle ages. At Paris he was welcomed by Baggosen, who had before his own rise occupied the highest position in the Danish Parthenon; and when Oehlenschläger read to him the 'Palmstake' the impetuous poet flung himself at his feet in transports of admiration.

From France he went to Italy, and at Rome, while in daily intercourse with Thorvaldson, composed his 'Correggio,' which, reversing his usual practice of writing his plays first in Danish and then in German, he wrote originally in the German language. This is of a different kind from any of his previous works,—it is the embodiment of the feelings of the great painter who, labouring in obscurity and not conscious of his own value, is subjected to all the emotions of which artistic genius is capable, by a series of ingeniously contrived incidents skilfully grouped on the known facts of Correggio's biography. The introduction of Michel Angelo and Julio Romano as two of the persons of the drama affords the dramatist an opportunity of painting more than one variety of the artistic character. Few of Oehlenschläger's works have met with greater variety of judgments than this. Treated with disdain by Göthe, it was afterwards emphatically criticised by Tieck, and Cotta the publisher of Tubingen, after purchasing the German copyright, kept the play by him for years unpublished. Meanwhile the writer, after staying some time in Italy, beginning to feel homesickness, returned to Denmark after an absence of nearly five years, and read this production in manuscript to many of the most select circles of the capital, among others to the king and queen of Denmark, in presence of the leading members of the court, in the queen's apartments. The play when produced in Germany became one of the most popular on the stage, and had a run of success which caused it to be one of the most frequently acted for thirty years; and it also became a favourite in Denmark. A translation of it into English, by Theodore Martin, published in 1854, has met, we believe, with a general welcome; and all English critics regard 'Correggio' as one of Oehlenschläger's principal titles to fame.

Oehlenschläger had left Denmark in 1805, an eminent rising poet. His reputation had risen higher and higher during every year of his absence, and on his return in 1810 he was without a rival. Before he set out on his travels he had engaged the hand of Christiana Heger, the sister of Camma Rahbek, the wife of Rahbek the theatrical writer, whose House on the Hill (Bakkehus) a short distance outside the city walls, had been since 1800, and continued till 1830, the resort of the choicest literary society of Copenhagen. Rahbek himself had in a fit of vexation just thrown up the post of professor of æsthetics at the university, and Oehlenschläger obtained it, with the privilege from the king of being absent if he pleased during the summer terms, which was a privilege he did not neglect to make use of. Being thus provided with an income, he celebrated his wedding in an unusual way, but precisely in the style that Rogers, the English poet, was accustomed to say would have been his, if he had ever ceased to be a bachelor. "On the 17th of May, 1810," says the Dane's 'Erindringer,' "I dined with Christiana at her father's at Copenhagen, afterwards she and I drove by ourselves to Gjentofte, where Pastor Högh, after I had shown him the necessary papers, went with us to the church and married us. We got into the vehicle again, man and wife, and drove off to the beautiful Christiansholm, to Sölyst, which Count Schimmelmann had had the kindness to offer us for a summer residence." The newly-married lady had a notion that her husband had lost much by his dealings with the booksellers, and under her advice he began to issue his new plays and poems at his own risk, but soon convinced himself that he understood nothing of the publishing business, and his wife no more, a conviction which he says, however, that his wife could never be persuaded to share.

During the next five years he wrote a number of plays of various merit, but none that were equal to those he had composed abroad, and his peace was disturbed by a singular literary feud. Baggosen, already mentioned as formerly the head of the Danish Parthenon, had left Denmark a little before Oehlenschläger, with the deliberate intention, although in receipt of a poetical pension from the government, of never returning to the country, and of never writing another line of Danish. He now changed his mind, came back, and, unable to see with patience the throne of poetry occupied by another, though one whom he had himself applauded, commenced a series of critical onslaughts on Oehlenschläger, in which the animus was painfully apparent. The public became disgusted, Baggosen found himself in general disfavour, again expatriated himself, and finally died abroad. It must however be owned, that Oehlenschläger stood in need of a little criticism not too indulgent, and that he wrote better after these attacks than he did at the time they commenced. In 1816, he made a second foreign tour

to Germany, and to France, still using his pen when he halted, but was driven home by severe sickness after a twelvemonth. A long series of plays and poems followed, among which, the most conspicuous was 'Nordens Guder,' the 'Gods of the North' (published in 1819), an attempt to combine into one convenient whole all the scattered legends of the Eddas. The attempt has been pronounced successful; a translation of the work into English verse of very considerable merit by W. E. Frye was published at Paris in 1845, and the poem supplies much of the material for Pigot's 'Manual of Northern Mythology'; a novel, 'The Island in the South Sea,' written originally in German, was, on the contrary, of an unmistakably inferior character. Oehlenschläger, who at the age of seven-and-thirty took lessons in English from Andersen Feldborg, a Dane long settled in Edinburgh, and well known to Walter Scott, entered into correspondence with Sir Walter to express his warm admiration of his novels; and, on being encouraged, sent the manuscript of his own novel to England to be translated by Mr. Gillies, but in spite of the zealous exertions of Sir Walter, the affair fell through from his inability to find a publisher who would pay 100*l.* to the author and translator for copyright. The failure was a fortunate one for the fame of Oehlenschläger, which would have suffered much in England from a work so unworthy of him.

In 1829, when at the age of fifty, he lost his father. "He was vain of his son," says the poet in the 'Erindringer,' "but, like a sensible father, he never allowed me to see it; only sometimes I detected the feeling when he had been reading my poems. It amused him to get into conversation with strangers, and particularly with students, on the bench at the hill at Frederiksberg, and lead the conversation to bear on me; when, if they said anything in my praise, it tickled him much, as he used to think he remained inognito. Many good-natured people were aware of this, and often afforded this innocent pleasure to the old man."

The death of his father, and the death of Camma Rahbek and her husband about the same time, threw a gloom over Oehlenschläger's spirits, but they were soon afterwards relieved by a singularly pleasing incident. He took for the first time in his life, in 1829, a trip across the Sound to the coast of Scania, thinking, as the steamer approached the Swedish shore, how strange it was that, though it had always greeted his sight over the waves from his earliest childhood at Frederiksberg, he had lived half a century, and been to Rome, without ever passing the straits. A brilliant reception awaited him from all ranks in Sweden: addresses were presented to him; the students at the University of Lund met him in a body in the high road with a professor at their head. He attended the ceremony of the inauguration of a rector of the university at the cathedral of Lund in company with Tegner, the bishop of Wexio, who was acknowledged by all as the first poet of Sweden, and was by many considered to have surpassed in his 'Frithiof' any single work of Oehlenschläger's. Tegner, in the course of the delivery of a poetical address in hexameters, suddenly pronounced the lines—

"Skaldernes Adam är här, den Nordiske Sångarekungen  
Thronarvingen i Diktningens värld ty Thronen är Goethes."

(The Adam of poets is here, the northern monarch of minstrelsy,  
Heir of the sceptre of Song, for now the sceptre is Goethe's.)

and in the presence of the crowd that filled the cathedral, among whom were Oehlenschläger's wife and children, placed a laurel crown on his head, amidst a burst of music and the roar of cannon. The event, from all its circumstances, assumed almost a national significance. Tegner and some other eminent Swedes returned the visit by coming to Copenhagen. A few days after the King of Sweden sent the order of the North Star to Oehlenschläger.

Honours continued to shower on him after this; one of them, the gift of free lodging by the king, seems however to have been obtained only by a sort of stratagem. "King Christian VIII," he tells us, "granted me permission to live for one summer in the house of the castle steward at Frederiksberg" (the house which had been the official residence of his father). "I wished very much to get the permission extended to more summers than one. When I thanked the king for his kindness, he asked me if there was not a garden belonging to the house, and if I was not fond of gardening. This gave me an excellent opportunity of bringing in my petition. I answered that I should like very much to garden if I could hope to gather some of the fruit afterwards. The king said that if it was practicable I should have permission to live there; and I then told him, in the lively tone in which he liked to hear me speak, 'For your Majesty a good deal is practicable.' He then gave me permission to keep the house." Soon after, the poet tells us, he changed it for a better.

In 1844, on another visit to Paris, Oehlenschläger was repeatedly invited to court by Louis-Philippe, and presented on one occasion to a gentleman, whom he afterwards found to be King Leopold, who told him he had read all his works in German, and invited him to Brussels. A visit which he paid to Norway, and another in 1847 to Sweden, were like the triumphal progresses of a sovereign in literature. On his sixty-seventh birthday his play of 'Amléth,' on the same story as Shakspeare's 'Hamlet,' was produced at Copenhagen. It was completely successful, and the King of Denmark wrote him a letter to congratulate him on his triumph. On his seventieth birthday, the 14th of November 1849, a grand festival was given in his honour in

the great saloon of the Royal Shooting-Gallery. All the leading poets of Denmark were present, and many of them wrote a song for the occasion. Oehlenschläger recited a poetical address of thanks, in which he alluded to his being near the termination of his career, but said—

"I quaff a goblet with you as a guest;  
The feast I share is not my funeral feast . . .  
Close to us stands the house where I was born,  
And from it to the churchyard's quiet meads  
Beautiful is the avenue that leads."

In little more than two months he was destined to be borne along the avenue to which he had thus symbolically alluded. An illness which did not at first seem serious soon became so, and about eight o'clock in the evening on Sunday the 20th of January 1850 he felt the approach of death. At half past nine he called to his eldest son and told him, "At the theatre on the occasion of my funeral I wish them to act my own tragedy of 'Socrates.' Read to me now that part of the scene in the fifth act between Socrates and Cebes, in which Socrates speaks of death, it is so unspeakably beautiful." The son read the passage

"How then can Death affright thee!  
It only can be one of two things, Cebes—  
It must be something or it must be nothing," &c.

ending with

"Think what a joy then that must be  
E'en with the gods themselves to live,—to speak  
With Hesiod, with Orpheus and with Homer,  
And all the great men who have been before us."

He heard this passage read with the greatest emotion, looking round him with a smile of pleasure. When it was concluded he put an end to the reading and took leave of his family who were standing around the bed. As the clock struck eleven he expired.

The funeral of Oehlenschläger was a national solemnity, like that of Thorvaldsen a few years before. The funeral procession consisted of about 3000 persons, including representatives of the king and queen, the heir of the throne in person, the foreign ambassadors, the professors of the university, the clergy of the capital, and all that was most distinguished. As it emerged from the western gate of Copenhagen it passed the house in which the deceased was born, and halted while the musical societies executed a solemn 'Farewell,' composed for music by Andersen. The procession closed at the church of Frederiksberg, where lies the poet. Grundtvig and Bishop Mynster spoke over the poet's grave. It is the church where his father was organist, and where the boy had first attended divine service.

The estimation in which Oehlenschläger is held by his countrymen is best shown by the commencement of the life of him in Flamand's 'Galleri af berømte Danske Mænd og Qvinder.' "Small as Denmark is, it must be counted among the great powers in the world of art and poetry, since it has a sculptor to show like Thorvaldsen, whom only the great masters of antiquity can be considered to rival, and a poet like Oehlenschläger, who can worthily take the fourth seat by the side of the three heroes of poetry, Shakspeare, Byron, and Göthe." Foersan the translator of Shakspeare into Danish sent a copy to Oehlenschläger inscribed "To William Shakspeare's Twin-brother." The English writer however to whom Oehlenschläger bears by far the most resemblance is Walter Scott. Though the great Danish writer was unfortunate in pure fiction and the great Scottish writer in the drama, the series of the Scotch novels of the one may be most aptly paralleled by the series of Danish tragedies of the other. In both there is an exuberance of life, a careless felicity, an apparent ease of production, a wonderful 'breadth of effect.'

Oehlenschläger's tragedies are twenty-four in number, and nineteen are on Scandinavian subjects. They are arranged in the last edition in chronological order, and touch upon almost everything of any great interest or importance in Scandinavian history or tradition. Besides those that have been already mentioned there are—'Knud den Store' ('Canute the Great'); 'Væringerne i Miklagord' ('The Væringers in Constantinople'), the hero of which is one of the northern body-guards of the Byzantine monarchs, who were taken as a subject after Oehlenschläger by Sir Walter Scott in 'Count Robert of Paris'; 'Landet fundet og forsvundet' ('Land Found and Lost'), in which are dramatized the incidents of the early discovery of America by the Northmen, latterly brought so prominently before the public by the 'Antiquitates Americanae'; 'Dina,' a very interesting play founded on the extraordinary story of the Danish Alcibiades, Corfits Ulfeld; 'Tordenskiold,' the 'Danish Nelson,' on one of whose adventures Oehlenschläger also composed an opera, was published in 1849. These tragedies are the true monument of the fame of Oehlenschläger. If to the ten octavo volumes which contain them, in the fine edition of his works commenced in 1849, be added his 'Aladdin,' his 'Fisherman and his Daughter,' his 'Twin Brothers of Damascus,' and perhaps his 'Robinson Crusoe in England' (a play on the story of Defoe and Alexander Selkirk), his 'Ludlam's Hole,' his 'Garrick in France,' and a few other operas and comedies, a series of dramatic works will be shown which, for extent and value, no other author of the 19th century can rival.

Oehlenschläger's poems, which are sometimes spirited, are for the most part commonplace; and his prose works are seldom of a character

to claim much attention. His 'Poetical Works,' as they are called, comprising all of his imaginative works, whether in prose or verse, except the tragedies, occupy in the collected edition twenty-seven volumes. If to these be added the 'Erindringer,' four volumes of the same size, the whole series of his Danish works will be found to amount to forty-one volumes. The last edition of his German works reaches to twenty-one. In these sixty-two volumes are not included many translations which flowed from his ever-active pen:—Otway's 'Orphan,' the 'Midsummer Night's Dream,' Beskav's Swedish dramas into Danish, and the whole of Holberg's 'Danish Theatre' into German. In mentioning the 'Midsummer Night's Dream,' it may not be uninteresting to add that Oehlenschläger, though a warm, was not an unconditional admirer of Shakspeare. He professed to belong to the old school, who saw great faults as well as great beauties in the bard of Avon. It may be suspected however that his acquaintance with his works was not perfect—his acquaintance with his biography was singularly defective. In a ballad entitled 'William Shakspeare,' which is entirely devoid of merit, he speaks of him as being born at Warwick, never apparently having heard of Stratford, and of his gaining his fame at "Drury Lane."

In the general character of Oehlenschläger, as shown in his life, it may be seen that a high estimation of himself was a prominent feature; but this in his case, as in many others, was grounded on real merit. The tone of his 'Autobiography' not unfrequently reminds the English reader of that of Hogg, the Ettrick Shepherd. Neither of the two was inclined to overlook or undervalue his own claims to attention. It is a more singular circumstance that the merits of the poet were through the course of a long life generously appreciated and rewarded by his countrymen, who by their conduct did no less honour to themselves than to him.

OERSTED (ØRSTED), HANS CHRISTIAN, celebrated as the originator of the science of electro-magnetism, from which sprung the electric telegraph, Professor of Natural Philosophy, and Director of the Polytechnic School of Copenhagen, was born on the 14th of August 1777 at Rudkjøbing, in the Danish island of Langeland, where his father was an apothecary. He studied in the University of Copenhagen, and was made a Doctor of Philosophy in that university in 1800. At this time he studied the subject of galvanism, and discovered that the power of the opposite poles of the galvanic battery to give off acids and alkalies depended on circumstances, and showed that this power was relative. From 1801 to 1808 he studied in Holland and France, returning to Copenhagen, where he was made professor of physics in 1806. In 1812 he went to Germany, and whilst there he wrote his essay on the identity of chemical and electrical forces, thus laying the foundation for the subsequent identification of the forces of magnetism, electricity, and galvanism. In 1819 he made the announcement of his great discovery of the intimate relation existing between magnetism and electricity. This announcement was made in an essay entitled, 'Experimenta circa efficaciam conflictus electrici in acum magnetica.' By defining the nature of the influence exerted by the galvanic current on the magnetic needle, he laid the foundations of the science of electro-magnetism, and led the way to its practical application in the production of the electric telegraph. Previous to this time the identity of the forces of magnetism and electricity had only been suspected. He now demonstrated "that there is always a magnetic circulation round the electric conductor, and that the electric current, in accordance with a certain law, always exercises determined and similar impressions on the direction of the magnetic needle, even when it does not pass through the needle, but near it." For this discovery he received the Copley medal of the Royal Society of London, and the French Institute presented him with one of its mathematical class prizes worth 3000 francs.

In 1809 he wrote a 'Manual of Mechanical Physics,' a second edition of which was published in 1844. The re-writing this work led him to make many original researches in many departments of natural philosophy, scarcely any of which have not been enriched by his experiments. He made many important experiments on the compression of water, and invented an instrument by which liquids might be compressed with more certainty. He was the first to demonstrate the existence of the metal aluminium in alumina, and made other chemical discoveries. In 1822-23 he again visited Germany and France, and also visited England. On his return to Denmark he founded the Society for the Distribution of Natural Science, one object of which was to send forth a body of popular lecturers to deliver courses of instruction in the most important towns of the country. He took an active part in the Scandinavian Society of Naturalists, which, like our own British Association for the Advancement of Science, assembles annually in different parts of the country. He again visited England in 1846, during the meeting of the British Association at Southampton.

As he increased in years honours increased upon him. He was made secretary to the Royal Society of Copenhagen; a corresponding member of the Academy of Sciences in the French Institute; and Director of the Polytechnic School at Copenhagen, which he had himself founded. In 1837 he was made Knight of the Legion of Honour, and in 1842 Knight of the Prussian order for the reward of Merit in the Arts and Sciences. In early life Ørsted was associated

with the poet Oehlenschläger, whose sister was married to his younger brother, and although devoted to experimental science he took a deep interest in the progress and development of Danish literature. He was a constant writer for the newspapers and magazines. Acting upon the deep conviction that science should be the handmaid of religion, he did all that lay in his power to make the popular mind of his country acquainted with the facts of natural science. He wrote a lyrical and didactic poem called 'The Balloon,' which was translated into German. He was also one of the most popular lecturers of his day. He not only lectured in the university to young students and senior students, but out of the university to citizens and classes of ladies. A variety of Oersted's papers and lectures of a popular kind have been translated into the English language by the Misses Horner, under the title of 'The Soul in Nature, with Supplementary Contributions.' (London, Bohn.)

On the 9th of November 1850 a jubilee was held in honour of the fiftieth anniversary of his services at the University of Copenhagen. On this occasion people of all ranks and opinions assembled round the noble old philosopher. The King of Denmark presented him on the occasion with a country residence at Frederiksberg, near Copenhagen. He lectured through the winter, but the following March he took a severe cold, which terminated in inflammation of the lungs, of which he died on the 9th of March 1851. A biographical sketch of Oersted, to which we are indebted for some of the materials of this notice, was published by P. L. Möller, a translation of which is published with the English translation mentioned above.

\* OERSTED, ANDERS SANDÖE, an eminent Danish statesman and legal writer, whose reputation has been much tarnished by recent events, was born at Rudkjøbing in the island of Langeland, on the 21st of December 1778. His time was constantly passed in company with his elder brother Hans Christian Oersted, and till they were near to man's estate, they had a common purse. When sent to study at the University of Copenhagen, both brothers made the acquaintance of Adam Oehlenschläger the poet [OEHLenschläGER], then an actor at the theatre, and Anders Oersted afterwards in 1802 married Oehlenschläger's sister Sophia. Anders, who adopted jurisprudence as a profession, became very eminent in it, and was editor of three successive legal periodicals, the 'Juridiakt Archiv' (30 vols. 1804-11), the 'Nyt Juridiakt Archiv' (30 vols. 1812-20), and the 'Juridiakt Tidsskrift' (16 vols. 1820-30), as well as another of a more scientific character, the 'Kunomia' (4 vols. 1815-22). He also wrote in Danish a 'Systematic Development of the idea of Theft' (1809), a 'Handbook of Danish and Norwegian Jurisprudence' (3 vols. 1821), and several other works of reputation on law, and several on philosophy, in which he was first a disciple of Kant and afterwards of Hegel. He was appointed to various responsible offices, and in 1825 to a high and important legal situation, which involved the drawing up of all the important ordinances, which, under an absolute government as that of Denmark then was, formed the body of the laws. In 1831 he had an important share in framing the constitutions for the different provincial states, which were then granted by King Frederik VI. to appease the growing discontent of his subjects, who saw Norway, since it had been disunited from Denmark, prospering under a free constitution. Oersted was appointed as high commissioner to represent the king at the assembly of the states in both the main land and the islands, and was for some years very popular in that position; but as ideas of freedom began to prevail, it was found that he was unwilling to make further concessions of the privileges of the crown, and he began to be looked upon as an enemy to popular rights. In 1841 he was appointed to a place in the Danish cabinet, which in 1848 he resigned. On the 21st of April 1853 the present king, Frederik VII., recalled him to office as minister of the interior, of public worship, and of public instruction, and as prime minister of the kingdom. It was then soon found that the suspicions of his disaffection to constitutional progress was well founded, and that he purposed to carry reactionary measures with a high hand. By the treaty of London, signed on the 8th of May 1852, Denmark and the Duchies were to be preserved as one state, but not to be governed by one legislative body, a condition which necessarily implied some alteration in the constitution obtained by Denmark in 1849. On the 4th of October 1853 the Oersted cabinet submitted a proposition to the Diet of an alteration in the constitution of Denmark Proper, which was almost unanimously rejected (on the 24th of February 1854), as of a reactionary character. Oersted now advanced a pretension that the king could grant new constitutions to Sleswig and Holstein without consulting the existing Diet at all, and a great constitutional struggle began. The two chambers, the Landthing and the Folkthing, voted an address to the king (13th of March 1854), urging him to dismiss the Oersted ministry; the king received the presidents of the chambers, asked them to dinner, and promised to comply with their wishes. But time went on; Oersted still continued at the head of the government, and soon began to issue his new constitutions according to the principle which the chambers had repudiated. The chambers voted a different constitution, which the cabinet refused to accept. Public indignation ran high, but was kept with some difficulty in the constitutional track. The cabinet dissolved the Folkthing on the 20th of October 1854, but the only effect was to see the patriotic members returned to their seats. Before the Diet met, the king accepted an invitation from Sir Morten Peto to a banquet

on the occasion of opening the Flensburg and Husum railway, and his reception was so cold that he foresaw the measures he was engaged in would lead to no good end. On the 3rd of December, before the meeting of the Diet, he gave way, and the Oersted ministry was at an end. In March 1855 the Diet decreed the impeachment of Oersted and his colleagues, and a commission was named to try them, composed of eight members of the Supreme Tribunal (Høveste Ret), and eight members selected by the Landthing, or Upper House of the Diet. After numerous legal delays the verdict was returned on the 26th of February 1856. The eight members selected by the Landthing had found the prisoners guilty, the eight members of the Supreme Tribunal had voted for their acquittal; and as by the laws of Denmark, where the votes are equal the decision must be in favour of the accused, the whole of the prisoners were set at liberty.

Oersted is now engaged in continuing an account of his own career, 'Fragments of the History of my Life and Times' ('Af mit Livs og min Tids Historie'), which he commenced in 1851, and dropped during his ministry. The last part that has appeared is the commencement of the fourth volume, published in 1856, and the work, though less of an attractive than an instructive character, contains important materials for the modern history of Denmark. [See SUPPLEMENT.]

\* OERSTED, ANDERS SANDÖE, the nephew of the preceding, and named after him, is the son of a merchant at Rudkjøbing, and was born there on the 21st of June 1816. He has travelled in the West Indies and South America, and published several valuable works on natural history, in particular one on the Annelids of Greenland. In the 'Journal of the Geographical Society of London' for 1850 appears a paper by him, on a 'Survey made for a Canal through the river Sapea to the port of Salinas or Bolones in Costa Rica.'

OETINGER, FRIEDRICH CHRISTOPH, was born on the 6th of May 1702, at Göppingen in Württemberg, and studied successively at the universities of Tübingen, Jena, and Leipsig. Having acted awhile as tutor in Tübingen, and assisted Count Zinsendorf in his project for translating the Scriptures, he was appointed reader in theology in the University of Halle. This post he resigned however in order to travel, and especially to consult some of the eminent theologians of Holland. Returning to Württemberg, he was, in 1738, appointed pastor at Hirschau. He had now fully adopted the views of the Pietists, whose sentiments were then obtaining the adhesion of many of the most learned and pious men in Germany, while they found very general acceptance among persons of a devotional temperament, with whom Oetinger's purity of life, earnestness of manner, extensive theological acquirements, and perhaps his mysticism of style, all combined to give him great influence, so that he soon came to be regarded as the Pietist leader in that part of Germany. Oetinger was an earnest student of the writings of Jacob Böhme; and he became an ardent disciple of Emmanuel Swedenborg, some of whose works he translated into German. His teaching of these mystic doctrines having called forth however some remonstrances from his ecclesiastical superiors, he announced his resolve not to publish any more of his writings, but he continued to furnish such of his followers as applied for spiritual advice with his written instructions. He was nominated in 1752 to the superintendence of the churches in the district of Weinsberg, and afterwards of that of Herrenberg, and subsequently bishop of Murrhard. He died on the 10th of February 1782.

During his life Oetinger was regarded with respect approaching to reverence by his co-religionists as a philosopher as well as a theologian, and he is still held in high estimation. He sought to elucidate the Christian system by the speculations of Böhme and Swedenborg, and he was fond of comparing and contrasting the received systems of secular philosophy with Christian philosophy, as so explained. His views were stated in various commentaries or dissertations on the books of Job, the Proverbs, Ecclesiastes, and Ezekiel, and in treatises entitled the 'Age of Gold,' 'Ancient Philosophy,' &c. He also wrote some devotional works. His autobiography was published by J. Hamberger, 8vo, Stuttgart, 1845, 'Des Württembergischen Prälaten Friedr. Cph. Oetingers Selbstbiographie,' with a preface by G. H. von Schubert; see also Auberlin's 'Die Theosophie Friedr. Cph. Oetingers nach ihren Grundsätzen; Beitrag zur Dogmengeschichte und zur Philosophie,' 8vo, Tübingen, 1847.

OGGIONE, or UGGIONE, MARCO DA, was a Milanese painter and a distinguished scholar of Leonardo da Vinci at Milan about 1490; he was born therefore about 1470, at, as his name imports, Oggione, in the Milanese. He painted in oil and in fresco, and is on the whole one of the best of the Milanese painters. His frescoes of the church della Pace at Milan, which are much praised by Lanzi, are now in the Brera at Milan; they were removed from the wall by Barezzi. Oggione is however now chiefly known for his copy of the 'Last Supper' of Leonardo da Vinci, now in the Academy of Arts in London. This copy is painted in oil, and was executed about 1610 for the Refectory of the Certosa di Pavia; and as it was copied when the original was in a perfect state, the now almost total decay of the latter renders it very valuable. The opinions regarding its merits are various. Giuseppe Bossi does not wholly approve of it; but as the original has been virtually decayed since 1726, when it was first restored, all subsequent judgments of the merits of the copy with respect to the original must be received with due reservation, as they are certainly the result of individual fancies of what the original might have been, rather than

of what it by actual comparison was found to be. Marco da Oggione's copy must be a better criterion of what the original was, than the remains of the original itself, or the speculations of all subsequent critics combined. Oggione made two large copies, both, it is said, from a small copy made by himself for the purpose—that in oil, in the Royal Academy, and one in fresco for the refectory of the convent of Castellazzo, which was copied by the Cav. Giuseppe Bossi, though Bossi's picture was taken chiefly from a copy in the Ambrosian Library made by Andrea Bianchi called Vespino in 1612, when the original was already much decayed. There is an older copy at Ponte Capriasee, made in 1565, and attributed to Pietro Luini. Bossi's copy was made in 1807 for Eugène Beauharnais, viceroy of Italy, to be worked in mosaic; the cartoon is now at Munich, and the mosaic is at Vienna. But this work, made partly from one copy, partly from another, from studying other works of Da Vinci, and from the artist's own feeling of Da Vinci's style, is essentially a restoration or translation, and not a copy: it may have no resemblance to the original beyond size and composition; and to the true lover of art can have little value, compared with the old unassuming copy of Oggione. The mere fact that Oggione's copy was painted for people who must have been well acquainted with the original, and by a distinguished pupil of Leonardo's from the original when in its perfect state, ought to be sufficient guarantee for its fidelity, notwithstanding its imperfections, making of course due allowances for the different capacities of the two men. Marco da Oggione died in 1580.

OGYGES, or OGYGUS, is said to have been the first king of Athens and of Thebes. (*Tæta*, 'Lycoph.,' 1206.) Thus Pausanias tells us that the Ectenes, who were the most ancient inhabitants of Boeotia, were the subjects of Ogyges, and that Thebes itself was called Ogygian, an epithet which is also applied to it by Æschylus. (*Paus.*, ix. 5, § 1; Æsch., 'Pera,' 37.) That Ogyges was closely connected with Thebes as well as Attica appears from the tradition, according to which he was said to be the son of Ecceus. (*Schol. on Apollon.*, iii. 1178.) It may also be mentioned that the oldest gate in Thebes was called Ogygian. (*Paus.*, ix. 8, §.)

The name of Ogyges is connected with the ancient deluge which preceded that of Deucalion, and he is said to have been the only person saved when the whole of Greece was covered with water. We possess scarcely any particulars respecting him; and the accounts which have come down to us are too vague and unsatisfactory to allow us to form any satisfactory opinion on the subject. He belongs in fact to mythology rather than to history. The earlier Greek writers, Herodotus, Thucydides, Xenophon, &c., make no mention of his name; but the accounts preserved by Pausanias and other writers appear to indicate the great antiquity of the traditions respecting him. Various etymologies have been proposed of his name. Mr. Kenrick supposes that the word was derived from the root *γυγν*, signifying darkness or night, and quotes a passage of Hesychius in support of his view, which appears however to be corrupt. The more favourite theory of modern scholars connects the name with Oceanus, which etymology is supposed to be supported by the tradition which places Ogyges in the time of the deluge. The name of Ogygia is supposed to be applied to the island of Calypso because it lay in the ocean. But whatever may be the etymology of the name, the adjective derived from it is frequently employed by the Greek writers to indicate anything ancient or unknown. We learn from the Scholiast on Hesiod, that according to one tradition, Ogyges was the king of the gods; and it is not improbable that the name originally indicated nothing more than the high antiquity of the times to which it referred.

(*Philological Museum*, No. 5, 'On the Early Kings of Attica,' by Mr. Kenrick; No. 6, 'Ogyges,' by Mr. Thirlwall.)

OHLMULLER, DANIEL JOSEPH, a German architect, who held the office of 'Civilbau-inspector' at Munich, was born at Bamberg in 1791. After studying under Karl Fischer, to whom many other architects of celebrity were indebted for their professional education, he visited both Italy and Sicily, where he spent four years in examining the principal edifices. He was summoned home in 1819, to superintend the erection of the Glyptotheca at Munich, after Klense's designs. In 1831 he was commissioned to make designs in the gothic style for a church in the Au suburb, and the first stone of the edifice was laid on the 28th November in that year. Taken altogether this structure is one of the noblest and most successful works in that style which has been produced in modern times in Germany, and is remarkable for the splendour of its lofty windows, filled entirely with painted glass, one of which, whose subject is the Assumption of the Virgin, is represented in colours in Count Raszyneki's 'Art Moderne.' This building alone would suffice for Ohlmüller's fame; but it was not the only one in which he had an opportunity of displaying his talents during his brief professional career, for he erected in the same style both the national monument at Wittelsbach, and the Otto chapel at Kieferfelden, the latter of which was begun in 1834, and the other completed in 1835. The church of St. Theresa at Hallbergmoos, begun by him in October 1833, is in the Italian style. On the death of Domenico Quaglio in 1837, he was employed to complete the works at the castle of Hohenschwangau. He did not, however, long survive his predecessor in that building, for he died at Munich, April 22, 1839.

OHMACHT, LANDELIN, an eminent German sculptor, was born at Dunningen near Rottweil, in Würtemberg, in 1760. He was the

pupil of J. P. Melebius. His first public works were some sculptures for the Kreuzkirche at Rottweil, which still decorate the choir. Among his earlier works is a good bust of Lavater. In 1790 he went to Rome, where he remained two years, and after his return to Germany he was employed on several important monumental works, the first of which was the monument to the Burgomaster Rhode, in the cathedral of Lübeck; but his principal works are at Strasbourg, where he settled in 1801. His first work there was the monument of General Demaix, who was killed at Marsago, erected on the Rhaiminsel near Strasbourg: there are four monuments also by him in the church of St. Thomas, of which that to Professor Oberlin (1810) is one of his principal works: that to the historian Koch (1816) is likewise much admired. He executed also a beautiful monument in the new church to Dr. Blessig; another to General Kleber, in the cathedral; and a colossal figure to Adolph von Nassau, in the cathedral of Speyer. There are also several classical figures by Ohmacht—a Venus; Psyche; Flora; Hebe; the Judgment of Paris (at Nymphenburg), and others. Among his busts are several of Klopstock, with whom he was intimate. He died at Strasbourg in 1834: his portrait is in the Vogel collection of portraits in the possession of the King of Saxony. The celebrated sculptor, David, upon seeing the works of Ohmacht at Strasbourg, is reported to have said that Ohmacht was the Correggio of sculptors.

O'KEEFFE, JOHN, was born at Dublin, on the 24th of June 1747. Being designed for a painter, he was placed, when only six years old, under the charge of Mr. West at the Royal Irish Academy; and his literary education, in Greek, Latin, and French, was received from Father Austin, a learned Jesuit, and his family being Roman Catholics. Two years of his youth, beginning when he was about fifteen, were spent in London with an uncle. From early boyhood he had dabbled in versification: at the age of sixteen he had composed a comedy: and when he was no more than eighteen another comedy of his was brought out by Mossop, at the Smock-alley Theatre in Dublin. His dramatic turn now took entire possession of him. He obtained an engagement from Mossop as an actor, and continued for some years to be a member of the company; acting both in Dublin and in other towns of Ireland. At the same time he exercised himself in dramatic writing, often producing small pieces for his own benefits and on other occasions. In 1774 he married a daughter of Mr. Hespey, proprietor of the Theatre Royal in Dublin, by whom he had three children. Domestic disagreements arose: after seven years of union Mr. O'Keeffe and his wife separated; and the separation lasted for the remainder of their lives.

In 1778 Mr. Colman brought out successfully, at the Haymarket, the farce of 'Tony Lumpkin in Town,' the first piece by which O'Keeffe became known in England. In 1781, on his separation from his wife, he removed to London, and he never again visited his native country. From that time he was a play-writer by profession. The greater number of his pieces were composed for Colman's company at the Haymarket; but he wrote frequently also for Covent Garden under the management of Harris. His dramatic career may be said to have closed in 1798, after which date no new play of his was brought upon the stage. The fruit of his labours was a collection of dramatic pieces, amounting, on his own list, to no fewer than sixty-eight, of which fifty-six were acted, and many of these with great success. Some of them still keep possession of the stage. Such are his comedy of 'Wild Oats,' and his operatic farces of 'The Agreeable Surprise' and 'The Highland Reel.'

O'Keeffe's works do not belong to a high class. Their diction is coarse, and in incident and character they are merely farcical; but the best of them have a flow of spirits, a kindliness of feeling, and a richness of whim and eccentricity, which account adequately for the popularity they so long enjoyed. They were composed in circumstances calling for much indulgence. They were the constant efforts of a very poor man to preserve himself and his children from beggary. And, further, from his twenty-eighth year, when a neglected cold brought on inflammation of his eyes, he suffered under a gradual decay of sight, which speedily made reading and writing alike impossible. He was never entirely blind; but for many years he could do little more than distinguish light from darkness.

In 1798 twenty-one of his pieces were published together, in four volumes octavo. The subscription for the edition scarcely paid the expenses. In June 1800, Mr. Harris gave him a benefit at Covent Garden, at which he himself appeared on the stage and delivered an address: and the receipts enabled him to spend \$300, in purchasing a small annuity. In 1808 he received a life-annuity of twenty pounds from Covent Garden, nominally as the purchase-money of his dramas still unprinted: but this annuity ceased to be paid in 1826. In 1808 he began to receive a pension from the crown, to which another pension of a hundred guineas was added in 1826. From these combined sources he was, during the latest years of his life, in receipt of an income little exceeding two hundred a year; and, in an honourable spirit of independence, he refused a donation sent him by the Literary Fund Society. In 1826 he published 'Recollections of the Life of John O'Keeffe,' written by himself: two volumes 8vo. In 1828 he removed from the neighbourhood of London to Southampton, and there resided thenceforth, attended by a daughter, who was his only surviving child, his eldest son, a clergyman of the church of England, having died of the yellow fever at Jamaica, in 1804. O'Keeffe himself

was a Roman Catholic to the last. He died at Southampton, on the 4th of February 1833. In 1834 appeared a small volume of his verified pieces, entitled 'O'Keefe's Legacy to his Daughter,' and prefaced by notices of his character and domestic circumstances.

OKEN, LORENZ, a celebrated Swiss naturalist, was born at Offenberg on the 2nd of August 1779. He studied medicine and natural history at Göttingen, and held the position of privat-docens in that university. In 1807 he became extraordinary professor of medicine in the University of Jena; thence he removed to Zürich, where he held the post of professor of natural history till his death. At the time he began to study natural science, the writings of Kant, Fichte, and Schelling were producing a deep impression on the minds of the students of natural history. Schelling, who had studied medicine, had applied the principles of the transcendental philosophy to the facts of the natural world, and had by a process of thought endeavoured to give an explanation to the phenomena of nature. It was in this school that Oken studied, and the principles of the transcendental philosophy more or less guided his researches as a naturalist throughout his long life. His first work was published in 1802, and was entitled 'Elements of Natural Philosophy, the Theory of the Senses, and the Classification of Animals founded thereon.' This was followed by a work 'On Generation' in 1806. In these works he endeavoured to apply a general theory of nature to the facts presented by the forms and the development of animals. In his classification he took for his basis the presence of the senses, making each class of animals to represent an organ of sense. In his work 'On Generation' he first suggested that all animals are built up of vesicles or cells. In 1806 he published his 'Contributions to Comparative Anatomy and Physiology,' and pointed out the origin of the intestines in the umbilical vesicle. In this year he made an excursion to the Harz Mountains, which resulted in an important thought. This may be described in his own language:—"In August 1806," he says, "I made a journey over the Harz. I slid down through the wood on the south side; and straight before me, at my feet, lay a most beautiful bleached skull of a bird. I picked it up, turned it round, regarded it intensely: the thing was done. 'It is a vertebral column!' struck me, as a flash of lightning to the marrow and bone; and since that time the skull has been regarded as a vertebral column." This discovery was published in an essay on the 'Signification of the Bones of the Skull.' This essay, although it attracted little attention at first, laid the foundation of those inquiries which in the hands of Cuvier, Geoffroy St-Hilaire, and Owen, have led to the establishment of those laws of homology in the vertebrate skeleton that are now a universally-received branch of anatomical science. It was by the persevering use of the idea that flashed across his mind in the Harz, that Oken has earned for himself the title of "the father of morphological science."

Whilst still a young man and deeply convinced of the importance of an ideal philosophy in explaining the phenomena of the external world, he wrote his 'Lehrbuch der Natur-Philosophie.' This work was published in 1809, and after having gone through three editions, it was translated into English by Mr. Fulke, and published in 1847, by the Ray Society, with the title 'Elements of Physico-Philosophy.' In this work the author takes the widest possible view of natural science, and classifies the mineral, vegetable, and animal kingdoms according to his philosophical views. The transcendental philosophy has never been popular in England, and its language is entirely foreign to that adopted by the generality of writers on natural history in this country, so that this work has been frequently regarded as the offspring of a diseased imagination rather than the cool decisions of a philosopher. Nevertheless, its author was pleased at its translation, and wrote a preface to the English edition. Of however little value this work may be as an introduction to modern science, it is interesting as a document in the history of a great mental movement, and contains the germs of those principles which are now regarded as the secure generalisation of well-observed facts.

From the date of the publication of this work to the day of his death, Oken unceasingly contributed to the literature of natural history. In the year 1817, he started a natural history journal, named 'Isis,' which he conducted for thirty years, and which contains a large series of his papers on every department of natural history. Though a transcendentalist in philosophy, he was an energetic and acute observer, and has contributed largely to the individual history of the animal kingdom.

He was greatly respected throughout Germany, and it was at his suggestion that the first meeting of natural philosophers took place in 1822. The German Association which thus came into existence, has assembled every year in one of the large towns of Germany, whilst every country in Europe has imitated this example with great and increasing success. Oken died full of years and honour, at Zürich, in August 1861.

OLA'US MAGNUS, a native of Sweden, and brother of John Olaus, archbishop of Upsala, was an archdeacon in the Swedish church when the Reformation, supported by Gustavus Vasa, gained the ascendancy in Sweden. In consequence of this change the two brothers, who remained attached to the Roman Catholic faith, left their country and retired to Rome, where Olaus Magnus passed the remainder of his life in the enjoyment of a small pension from the pope. At Rome he

wrote his work, 'Historia de Gentibus Septentrionalibus, earumque diversis Statibus, Conditionibus, Moribus, itidemque Superstitionibus, Disciplinis,' &c., Rome, fol., 1555, and Basel, 1587. Other editions of this work have been published, which, as well as a French translation in 1561, are all incomplete. The work is minute, and contains some curious information, but is uncritically written. Olaus died at Rome in 1568. His brother John wrote a work entitled 'Gethorum Suevorumque Historia, probatissimis Antiquorum monumentis collecta,' Rome, fol., 1554, which is a still more uncritical performance than that of his brother Magnus.

OLBERS, HENRICH WILHELM MATHIAS, an able physician and a distinguished astronomer of Germany, was born on the 11th of October 1768, at Arbergen, near Bremen. He studied medicine at the University of Göttingen, and during all his life his time appears to have been divided between the exercise of his profession and his astronomical researches. It is said that in 1830 he celebrated by a public festival the fiftieth anniversary of his medical labours; and his observatory is described as the most complete of those which at the time of its construction existed in Germany. It consisted of three rooms in the upper part of the house, which was situated in the heart of Bremen: three great windows in the south front gave a view of the heavens almost to the horizon on that side, and one in a closet enabled the observer to look towards the north: openings in the ceiling and roof permitted observations to be made near the zenith. Olbers possessed a five feet achromatic telescope, with a position micrometer by Dollond, and a reflecting telescope of equal length by Schröter. He had also an astronomical clock by Carsten, a quadrant by Bird, and a reflecting sextant by Troughton; but he had neither a transit instrument nor a mural circle; and apparently he determined his time by extra meridional altitudes. Attached to the observatory was an astronomical library, containing, among other valuable works, an extensive collection of documents relating to cometography. This library was, after the death of Olbers, purchased by the Emperor of Russia, and deposited in the observatory of Pulkowa.

Dr. Olbers wrote but little on the subject either of medicine or astronomy; but in 1780 he printed a thesis entitled 'De Oculi Mutationibus Internis,' in which he showed that the eye accommodates itself to the different distances of objects from it by means of a variable action of the muscles, in consequence of which changes are produced in the convexity and the focal length of the cornea; and in 1882 he published, in the 'Annuaire du Bureau des Longitudes,' a memoir entitled 'De l'Influence de la Lune sur les Saisons et sur le Corps Humain.'

In 1779 he became known to astronomers by a series of observations which he made on the comet of that year, and by his determination of the elements of its orbit: the computations were founded on a method which had been given by Euler; but, at a subsequent period, Olbers discovered a method of calculating the orbits of comets from three observations, which, with respect both to facility and accuracy, he considered as having great advantages over the methods before in use. An account of this method, with a preface by the Baron de Zach, was published at Weimar in 1797. It is entitled 'Abhandlung über die leichteste und bequemste methode die Bahn eines Cometen aus einigen Beobachtungen zu berechnen,' and it affords sufficient evidence that the talents of the author as a mathematician were considerable. An outline of the method, with its application to an example, is given in Delambre's 'Astronomie' (tom. iii. Nos. 184, 223, &c.). Olbers computed also the orbits of the comets which appeared in 1781 and 1795; those of two comets which appeared in each of the years 1798 and 1799; of one in 1802; and of the great comet of 1811.

The interval between the orbits of Mars and Jupiter, which appears disproportionately great when compared with the intervals between any two of the other planets belonging to our system, had suggested to the original and inquisitive mind of Kepler the idea that a planet, too small to be seen from the earth, existed in that region: the idea appears to have been little regarded till M. Bode, of Berlin, obtained his empirical formula, for the distances of the planets from the sun, which except with respect to the interval between Mars and Jupiter was found to hold good for all the known planets, including the Georgian; when that which was before considered as the vision of an enthusiast was found to be deserving of serious consideration. With a view therefore of ensuring, as far as possible, a complete examination of the heavens in the parts where the supposed planet might be expected to be found, M. Schröter was induced to form an association of twenty-four astronomers, Olbers being one, who, having divided the heavens into as many zones, were each to confine his observations to one of them. The labours of the association were not however immediately rewarded; and M. Piazzi, of Palermo, who was not one of the number, had the good fortune to discover January 1, 1801, a planet, to which he gave the name of Ceres, and which was found to be between the orbits of Mars and Jupiter, at a distance from the sun nearly equal to that which, in conformity to the law discovered by Bode, it ought to have.

This planet soon afterwards became invisible, from its vicinity to the sun; but Dr. Olbers and M. Gauss, having calculated its orbit approximatively from such observations as had been obtained, sought for it at the time when it was expected again to appear, and the

former was the first to re-discover it. The idea of Kepler and the formula of Bode seemed now to be fully confirmed; but the harmony conceived to exist in the planetary distances was almost immediately, in appearance, deranged; for on the 28th of March 1802, Dr. Olbers, being engaged in examining the northern part of the constellation Virgo, discovered a star which was not in any of the catalogues: this was ascertained to be a new planet, and it received the name of Pallas. Its orbit was soon calculated, and it was found to describe a very excentric ellipse about the sun at a mean distance from it which is nearly equal to that of Ceres. The time of its periodical revolution is also nearly the same as that of the last-mentioned planet, but it has a much greater inclination to the plane of the ecliptic. Dr. Olbers was led, from the fact that these two planets are nearly in the same part of space when they arrive at the places where the planes of the orbits intersect one another, to imagine that they might be dispersed fragments of a large planet which revolved at one time about the sun at nearly the same distance from that luminary; but which, in consequence of an internal convulsion or from some other cause, had been broken up. Pursuing this idea, he considered that there might be other fragments, or small planets, in the same region; and the idea was strengthened when, in September 1804, a third planet of a like kind was discovered by M. Harding of Bremen. This planet, which was named Juno, has the nodes of its orbit nearly coincident with those of Pallas; the excentricities of the two planets are also nearly equal to one another, and both planets revolve about the sun at nearly the same distance. Dr. Olbers now determined to make the discovery of new planets a particular object of research; and from 1804 to 1807 he persevered in examining with the most minute attention, at the times of their opposition to the sun, the parts of the heavens which were near the nodes of the three other planets. On the 29th of March, in the latter year, his sagacity and diligence were rewarded by the discovery of a fourth planet. On the 3rd of April he sent intelligence of the event to his friend M. Bode, and he transmitted the series of his observations to M. Gauss. The latter astronomer immediately computed the figure of the orbit, and, Olbers having requested him to give a name to the planet, he designated it *Vesta*. This is the smallest of the four new planets, or asteroids, as they were designated, and the time of its revolution about the sun is the shortest. As is well known, many other asteroids have been since discovered, affording additional confirmation of the opinion of Olbers.

In 1815 (March 8th) Dr. Olbers discovered, near the constellation Perseus, a comet which presented the appearance of an attenuated nebulosity without any visible nucleus; and he continued to observe it till the end of August, when it ceased to be visible: its orbit was calculated by Bessel and Gauss, and it was found to accomplish its revolution about the sun in 73 years. In 1826, he published a dissertation on the probability that a comet may come in collision with the Earth:—a subject which then engaged the attention of astronomers on account of the near approach of the comet Biela when in one part of its orbit. In 1841 he made a proposal for a re-formation of the constellations and a revision of the nomenclature of the stars; recommending, as models, the figures in Flamsteed's Atlas, but better drawn than they are in that work, and also that the representations of persons and machines which have no relation to astronomy should be cancelled.

Dr. Olbers was elected a fellow of the Royal Society of London in 1804, and a Foreign Associate of the Académie des Sciences at Paris in 1829; he was also a corresponding member of several other learned societies, a knight of the order of Dannebrog and of the Red-Eagle of Prussia. He died at Bremen on the 2nd of March 1840; and, as a proof of the esteem in which he was held during his life, his fellow-citizens of Bremen placed his bust in the public library of the city.

**OLDCASTLE, SIR JOHN, LORD COBHAM**, called 'the good,' the first martyr and the first author among the nobility of England, was born in the 14th century, in the reign of Edward III. He married the heiress of Lord Cobham, by whom he obtained that title. He gained military distinction in the French wars under Henry IV. and V., and was a domestic and a favoured attendant of the latter sovereign. Lord Cobham was a man of extensive talents, qualified for the cabinet or the field, of ready wit in conversation, and of great learning. He examined the writings of Wycliffe as a philosopher, and in the course of his study became a convert to the doctrines of that reformer. He collected and transcribed the works of Wycliffe, maintained preachers of that persuasion, and became a leader of the reformers. Lord Cobham being summoned to appear before the archbishop of Canterbury, refused, was excommunicated, and sent to the Tower, from which he escaped into Wales. The clergy got up a report of a pretended conspiracy of the Lollards, headed by Lord Cobham, whereon a bill of attainder was passed against him, a price of 1000 marks set upon his head, and exemption from taxes was promised to any person who should secure him. At the expiration of four years he was taken, and without much form of trial executed in the most barbarous manner; he was hung in chains on a gallows in St. Giles's Fields, London, and a fire kindled under him, by which he was roasted to death, in December, 1417. He wrote 'Twelve Conclusions addressed to the Parliament of England'; he also edited the works of Wycliffe, and was the author of several religious tracts and discourses.

**OLDENBURG, HOUSE OF.** From the house of Oldenburg, which

boasts itself one of the oldest and most illustrious in Europe, the emperor of Russia, the kings of Denmark, the late royal family of Sweden, and the grand-dukes of Oldenburg, are descended. Christian I. founded the town of Oldenburg in 1156, and assumed the title of count. A large addition to the family possessions and dignity was made by one of his descendants, Dietrich the Fortunate, who obtained with his first wife the county of Delmenhorst, and with his second the duchies of Schleswig and Holstein. After Dietrich's death in 1440, his eldest son, who had for his share Schleswig and Holstein, became in 1448 king of Denmark, with the title of Christian II., in 1450 king of Norway, and in 1458 king of Sweden. He left two sons—John, who succeeded him in the northern kingdoms; and Frederick I., who had Schleswig and Holstein, and who, after the deposition of his nephew Christian II., the son of John, was made king of Denmark and Norway. His eldest son Christian III. inherited in 1513 the two kingdoms, and Adolphus, the younger, founded the house of Holstein Gottorp, which has given sovereigns to Sweden, Russia, and Oldenburg. Dietrich's younger son, Gerard the Warlike, inherited Oldenburg and Delmenhorst; but the male line of this branch becoming extinct in 1667, the counties fell to the Danish crown, or to the house of Holstein, descended from Dietrich's eldest son. In 1773 the Grand-Duke Paul of Russia, who was descended from the elder branch of the house of Holstein Gottorp, made a convention with Denmark respecting his share of Holstein, by which he surrendered all Holstein to Denmark, and received in exchange Oldenburg and Delmenhorst, which he immediately transferred to his cousin Frederic Augustus, of the younger branch of Holstein Gottorp. This convention was sanctioned by the Emperor Joseph II., who gave to the two counties the rank of a duchy; and as the house of Holstein Gottorp had since 1647 given bishops to the see of Lübeck, he assigned it to that family as an hereditary principality. Frederic, the first duke, was succeeded in 1785 by his son, Peter Frederick William; but he being afflicted with mental imbecility, the government was assumed by his cousin, Peter Frederick Ludwig, the bishop of Lübeck, in whose family it has continued—the present grand-duke being his grandson—with the exception of the period from the 14th of December 1810, when it was incorporated with the French empire, to the fall of Napoleon I., when the duke not only recovered his own dominions, but received from the Congress of Vienna and from Russia a considerable addition of territory.

**OLDENBURG, HENRY**, was born about 1626, in the duchy of Bremen. In 1653, or before, he came to London in the capacity of consul from the town of Bremen, but he does not appear to have held that office more than two years. In 1656 he became tutor to Lord Henry O'Bryan, a young Irish nobleman, whom he accompanied to the university of Oxford, and at the same time entered himself as a student, chiefly, it is supposed, in order to obtain access to the Bodleian library. He was afterwards tutor to Lord William Cavendish. While resident at Oxford he became acquainted with several of the more eminent literary and scientific men of the time, among whom were Dr. Wallis, Ward, and the others originators of the present Royal Society. His acquaintance with Milton commenced somewhat earlier, as appears by Milton's letters to Oldenburg, between the years 1654-59, published in his 'Epistolæ Familiares.' In 1662, the Royal Society having obtained a charter of incorporation, Dr. Wilkins and Mr. Oldenburg were appointed secretaries to the society. According to most biographers the nominal appointment of Oldenburg was that of assistant secretary to Dr. Wilkins, but in the list of members who attended the first council held by the society after its incorporation (Thomson's 'Hist. of Royal Society'), we observe only one secretary specified, namely Oldenburg, and it is certain that those duties which demanded the greatest zeal and assiduity devolved exclusively upon him. Dr. Martin Lister, in his 'Journey to Paris,' 8vo. Lond., 1699, speaking of Oldenburg, remarks, "I heard him say that he held correspondence with seventy odd persons in all parts of the world: I askt him what method he used to answer so great variety of subjects, and such a quantity of letters as he must receive weekly, for I knew he never failed, because I had the honour of his correspondence for ten or twelve years. He told me he made one letter answer another, and that to be always fresh, he never read a letter before he had pen, ink, and paper ready, to answer it forthwith, so that the multitude of his letters cloy'd him not, or ever lay upon his hands." In the 'General Dictionary,' Lond., 1789, fol. art., 'Oldenburg,' there will be found several of his letters to Mr. Robert Boyle, who was one of his regular correspondents, and with whom he was always on the most friendly terms. The following extract from one of those letters, dated 17 December 1667, shows that up to that time he had received no salary from the Society, and that his only emoluments were derived from the publication of their Transactions. "I have some grounds to believe," he remarks, "that there are persons who think the 'Transactions' bring me in a sufficient revenue; but I will make it out to any man that I never received more than 40*l.* a year upon this account (and that is little more than my house rent), and now by a new agreement I have been obliged to make, I shall not bring it to above 36*l.* a year at most. How strangely therefore I must needs shift for my subsistence, and with what distraction I must perform my tedious work, let any sober man judge." The following year Dr. Ward, then bishop of Salisbury, suggested to the council of the society the propriety of making some allowance to

their secretary, observing that for his own part he was ashamed that Oldenburg should have been permitted to devote so much time and pains to the business of the Society without any consideration. The result of the application does not appear. The 'Transactions' published by Oldenburg extend from No. 1, dated March 6, 1664, to No. 136, dated June 25, 1677, the year preceding his death. In 1675 he was accused by Hooke of not having done justice to him on the subject of the invention of spiral springs for pocket-watches. The dispute which ensued was at length terminated by a declaration of the council, "that the publisher of the 'Transactions' had carried himself faithfully and honestly in the managing of the intelligence of the Royal Society, and had given no cause for such reflections."

Oldenburg married the daughter of the learned John Dury, with whom he received an estate in Kent valued at 60*l.* a year. His only child was Rupert, named after his godfather Prince Rupert. He died, according to most authorities, in 1678 (Thomson says September 1677) at Charlton, near Woolwich, where his body was interred.

He is author of a few short papers upon medical and other subjects in the 'Philosophical Transactions,' and also of some "twenty tracts, chiefly theological and political, in which he principally aimed at reconciling differences and promoting peace and unanimity." (Hutton.) He published, under the name of 'Grubendol' (an anagrammatised form of his real name), English translations of—1, 'Prodomus to a dissertation by Nich. Steno, concerning Solids naturally contained within Solids,' 1671, 8vo; 2, 'A Genuine Explication of the Book of Revelation, full of sundry new Christian Considerations;' 3, 'The Life of the Duchess of Mazarine,' from the French. It is also stated that he translated several of Mr. Boyle's works into Latin.

The letters of Oldenburg, dated in 1667, leave no doubt that, during some part of that year, he was confined to the Tower upon political grounds.

OLDHAM, JOHN, an English satirical poet, was born August 9, 1653, at Shipton, near Tetbury, Gloucestershire, where his father was minister of a nonconformist church. From his father he received an excellent general and classical education, but was sent to Tetbury grammar-school for two years before proceeding to Oxford. He was admitted bachelor of Edmund Hall, Oxford, where he distinguished himself as a Latin scholar, but became still better known by his English poetry. Soon after taking his B.A. degree (1674) he left the university and was for a while usher in the Free School, Croydon, Surrey. Whilst there some verses of his having fallen into the hands of the Earl of Dorset, Lord Rochester, and Sir Charles Sedley, he was sought out by them and other persons of note, and by their interest appointed tutor to the grandsons of Sir Edward Thurlow of Reigate, Surrey. There he remained till 1681, when he entered in the same capacity into the family of Dr. Lower, an eminent London physician, by whose advice he commenced the study of medicine. But as soon as his engagement with Dr. Lower was ended, he gave up all thoughts of prosecuting his medical studies and devoted himself to poetry and pleasure, becoming the associate of the wits of the day, to whom his poetic talents, conversational powers, and social habits made him very acceptable. His poetry and his wit procured him a special patron in the Earl of Kingston, to whose house he removed, and who is said to have persuaded him to prepare for holy orders, promising to make him his chaplain. He died of small-pox at the earl's seat, Holme Pierpoint, December 9, 1683, at the early age of thirty.

Oldham was greatly esteemed by his contemporaries, though objections were made to the freedom of some of his verses. Dryden has eulogised him in terms of affectionate admiration. His principal poems are 'Four Satires against the Jesuits,' 'Pindaric Odes,' translations from Juvenal, &c. His poetry has great strength and originality, and in the opinion of Hallam "he is far superior in his satires to Marvell, and ranks perhaps next to Dryden." His poems have been several times printed in a collected shape; and they form a volume of Bell's 'Annotated Edition of the English Poets,' 1854.

OLDMIXON, JOHN, one of the heroes of the Dauciad, was born in 1673. The place and kind of his education are unknown. His authorship appears to have begun with the drama, in which he was thoroughly unsuccessful; and his principal productions were historical, political, and critical. He superintended, carelessly and unfaithfully, the first edition of the collection of English historians which bears the name of Bishop Kennett. He himself wrote also, 'A Critical History of England,' 'The History of England during the Reigns of the House of Stuart,' and 'The History of England during the Reigns of William and Mary, Anne, and George I.' These dull and unlearned works are chiefly remarkable for their strong spirit of Whig partisanship. In criticism Oldmixon was distinguished for his unscrupulous abuse of Pope and other eminent men of his day. He found abundant opportunity for venting his bile, not only in contributions to periodical prints, but in his 'Prose Essay on Criticism,' and his 'Arts of Logic and Rhetoric' (a clumsy adaptation from Bouhours). His party-services were rewarded by an appointment to the place of collector of the customs at the port of Bridgewater. He died in London on the 9th of July, 1742.

OLDYS, WILLIAM, an industrious and accurate bibliographer, and a useful biographical writer, was born in the year 1687. He was the natural son of Dr. Oldys, chancellor of Lincoln and advocate of the Admiralty Court. His father left him some property, but he

BIOG. DIV. VOL. IV.

seems to have fallen into extravagant and intemperate habits, and soon dissipated it. He was earning a somewhat precarious livelihood when he was induced to devote his time to the service of the Earl of Oxford, whose library he brought into order, and enriched with various choice printed and manuscript works, which he seems to have diligently sought out in private hands, as well as at auctions. He also made the catalogue of that nobleman's collection of books and manuscripts when it was prepared for sale by Osborne the bookseller. Oldys spent about ten years, at first in part and afterwards entirely, in the earl's service, yet he declares that in all he did not receive from him more than 500*l.* The Duke of Norfolk appointed him to the situation of Norroy King-at-Arms. He died on the 15th of April 1761, aged seventy-four. His dissolute habits continued through life, and he died poor.

He was the author of the following works—'The British Librarian, exhibiting a compendious View of all unpublished and valuable Books in all Sciences, as well in MS. as in Print,' 8vo, London, 1737: anonymous. This work, though long neglected, is now esteemed for its accuracy and usefulness. A 'Life of Sir Walter Raleigh,' prefixed to Raleigh's 'History of the World,' folio, 1738. A translation of Camden's 'Britannia,' 2 vols. 4to, has been ascribed to him, almost with certainty. 'The Harleian Miscellany, or a Collection of scarce, curious, and entertaining Pamphlets and Tracts,' 8 vols. 4to, London, 1753. He wrote in the 'Biographia Britannica' the lives distinguished by the signature 'G,' among which are those of T. and E. Alleyn, Eugene Aram, Caxton, Sir George Etherege, &c. Besides the above works, he published a few others on bibliographical and medical subjects; and several manuscript notes on subjects of bibliography, together with a copy of Langbaine's 'Lives,' filled with remarks, are preserved in the British Museum.

OLEARIUS, ADAM, whose proper name was OELSCHLAGER, was born about the year 1600, in the country of Anhalt. He studied at Leipzig, and made considerable progress in mathematics and philology. Frederic, duke of Holstein Gottorp, having resolved to send an embassy to Russia for the purpose of opening a commercial intercourse through that country with Persia and India, appointed Olearius a civilian, and Brugman, a merchant, as envoys, and named Olearius secretary to the embassy. The envoys left Holstein in October 1683, and arrived at Moscow in August 1684, where they were well received by the Czar Michael Federowits, who was related to Duke Frederic. The czar gave them permission to proceed to Persia by the Volga and the Caspian Sea, and encouraged them in their undertaking. They however returned to Gottorp in April 1685, in order to make further preparations for the journey. In the month of October of the same year the embassy set off again, arrived at Moscow in March 1686, and thence descended by various rivers to the Volga, and down that stream to Astrakhan, where they arrived in September. From Astrakhan they sailed into the Caspian Sea, but were wrecked off Derbent; and in December they pursued their journey by land, passing through Ardabil, Sultanish, Casbin, and Koom. In August 1687 they reached Ispahan, then the capital of the Persian kingdom. After spending several months at Ispahan, the two envoys, with Olearius, retraced their steps to Derbent, and thence by land to Astrakhan, passing through the desert of Leaghistan, and in January 1689 they entered Moscow for the third time. On the following August they returned to Gottorp. In consequence of this mission the Shah of Persia sent an envoy to the Duke of Holstein. Olearius published a narrative of his journey, 'Muscowitische und Persische Reisebeschreibung,' fol. Schleswig, 1647, with plates. It was translated into French by Wicquesfort, 4to, 1656, and both the original and the translation went through several editions. The work was also translated into Dutch, Utrecht, 1651; and into English, 'Voyages and Travels of the Ambassadors sent by Frederic, Duke of Holstein, to the Great Duke of Muscovy and the King of Persia; with John A. de Mandelalo's Travels from Persia into the East Indies,' translated by J. Davis, fol., London, 1662.

Olearius was a judicious observer, and a conscientious but rather diffuse writer. His account of the state of Russia two centuries ago is extremely curious, as well as the information which he gives concerning Persia. He agrees with other modern travellers in describing the Persians as a very corrupt people, and as more debased than the Turks, though at the same time more refined in external behaviour. The then reigning sovereign of Persia, Sain Mirza, called also Shah Sefi, grandson of Shah Abbas, he describes as a monster of cruelty and lust. Olearius also speaks very frankly of the conduct of some of the members of the embassy, especially the envoy Brugman, who behaved in a very improper and intemperate manner on several occasions. (b. iv.)

Olearius also published the narrative of Mandelalo's travels to India, which is annexed to the later editions of the travels of Olearius, as well as to the English translation above mentioned. Mandelalo was a young German nobleman who accompanied the embassy to Ispahan, whence he proceeded to India by Ormuz and Surat. From Surat he went to Agra, where he saw Sultan Kurram, called also Shah Jehan, the then sovereign of the Mogul empire. Returning to Surat, he embarked for Goa, where he remained some time; he then proceeded by sea to Ceylon, whence he sailed again for Europe, where he arrived at the end of 1689. Besides describing the places which he actually

visited, Mandelalo communicated much information which he obtained at Ceylon concerning the Indo-Chinese countries, the empires of China and Japan, and the Philippines, the Moluccas, and Java.

Olearius, after his return, was made councillor and librarian to the Duke of Holstein. He died in 1671. He wrote also a chronicle of Holstein, 4to, Schleswig, 1674.

**OLIVAREZ.** GASPAB GUZMAN, Count Duke de Olivarez, was descended from one of the most illustrious families of Castile, which for three centuries had distinguished itself by courage, honour, and loyalty. Alfonso Perez de Gusman, the first of this name of whom mention is made, was the great captain of the 13th century, and his exploits against the Moors, as well as in the contest between the two princes of Spain, Don Juan and Don Sancho, have furnished some of the most interesting pages of the history of that period. The virtues and military abilities of this family elevated them to the highest dignities of the kingdom; and the Count Duke de Olivarez reckoned in his lineage, besides the noble house of Medina Sidonia, a long line of illustrious ancestors.

The Count Duke de Olivarez was born about 1587 at Rome, where his father had been sent as ambassador of Philip III. He was educated in the University of Salamanca; and on the termination of his studies, his uncle, the Duke of Uceda, introduced him to the prince of Asturias as gentleman of the bedchamber. Olivarez now began to show that love of power which was the passion of his after-life. To gain the affections of him who was to be the ruler of the empire was a great step towards future aggrandisement, and in this he succeeded so completely, that when Philip IV., at the age of seventeen, ascended the throne of Spain, in 1621, Olivarez was intrusted with the management of the affairs of the kingdom. Policy induced him to abstain for a few months from assuming any definite public character, and this apparent disinterestedness endeared him still more to the young king, who, as a token of his increased esteem, conferred on the favourite the title of Duke de San Lucar.

Guzman now laid aside the mask of moderation, and displacing his benefactor the Duke of Uceda, and dismissing all the best servants of the people and the king, he assumed uncontrolled power. The consciousness that he was building his greatness on the ruin of others, made him so suspicious that he saw an enemy in every individual whom the late minister had patronised. Actuated by this feeling, he surrounded himself with men who had scarcely any other claim to his confidence than attachment to his person, and he put them in places of the first responsibility; those who had hitherto occupied these places were dismissed, and often imprisoned. His various acts of jealousy and injustice were however counterbalanced during the first period of his elevation by various regulations, which showed a wish to equalise the rights of the Spaniard and to promote the general prosperity of the country. Grants, both unmerited and profuse, which had been made by preceding kings, were recalled; marriage was encouraged by exemption from taxes; foreign artists and agriculturists were invited by advantageous offers to settle in Spain; about two-thirds of the idle officials were dismissed, and various sumptuary laws were enforced. Thus the revenue of the state was greatly increased, but the mass of the nation, the labouring part of the community, derived no benefit from these measures. Olivarez, while directing his attention to secondary means, neglected the vital principles on which depend the internal prosperity of a nation, the encouragement of agriculture, commerce, and the mechanical arts. These were suffered gradually to decline, an error which afterwards proved fatal to the popularity of the corrupt favourite; and the discontent excited by distress at home was increased by the constant failure of the minister's negotiations abroad.

Cardinal Richelieu, then first minister of France, and the Duke of Buckingham, the favourite and prime minister of Charles I., and particularly the former, possessed abilities which made them more than a match for the unprincipled Spanish minister. Independent of the personal dislike which Olivarez felt towards the cardinal, each of these statesmen entertained views which placed them in constant opposition. The aim of Olivarez was to raise the preponderance of the house of Austria; that of the cardinal, to depress both Austria and Spain. Buckingham sided with the French or Spanish favourite, as it suited his interest. Thus, though Spain exhausted her coffers in spreading her armies over Holland, Germany, and Italy, whatever advantages she obtained were rendered unavailing by the superior combinations of Richelieu. Olivarez was baffled in every attempt to regain the influence which Spain had once exercised all over Europe, and he brought the country to the verge of ruin.

The unpopularity of Olivarez, owing to these reverses and his mistaken policy, had become general, when the insurrections of Catalonia and soon after that of Portugal took place, in 1640, in consequence of the minister's attempts to invade the rights of those states. These events and more particularly his attempts to trample on the privileges of a proud nobility, in which he had only a selfish object in view, were a death-blow to the power of the minister. He still struggled for three years against his falling fortune, but was at length compelled to abandon the affairs of state. In 1643 he was requested by the king to resign, just at the moment when the death of Richelieu opened to him the prospect of success. Olivarez administered the affairs of Spain for the long period of twenty-two years, but more through the

favour of the feeble king whom he governed than by his capacity, and his name has become historical, not for the good which he did, but from the position which he occupied. Detested by the whole nation, he spent the short remainder of his life in obscurity. He died on the 22nd of July, 1645.

(Cespedes, *Hist. de Felipe IV.* This writer is partial to Olivarez.)  
**OLIVER, ISAAC**, an eminent English miniature painter, was born in the year 1556. He studied first under Hilliard, and received further instruction from Frederick Zuccherro. His chief employment was in painting the portraits in miniature of the most distinguished personages of his time, and many very fine portraits by him are preserved in the collections of the English nobility and gentry. Among them there are some portraits of himself, of Queen Elizabeth, Mary queen of Scots, Prince Henry, son of James I., Ben Jonson, and others, which are admirably finished, and fully justify the high reputation which he enjoyed. A whole-length portrait of Sir Philip Sidney is especially admired. It is no mean testimony to his merit that Rubens and Vandyck painted King James I. after a miniature by this master. He was a good and correct designer, his touch was neat and delicate, and his works are still as highly esteemed as they were by his contemporaries. Though he generally worked in miniature, he frequently painted on a larger size, and sometimes attempted historical subjects, in which there is much merit. He occasionally worked in oil as well as in water-colours, but with little success. His drawings, many of which are copies from Parmigiano, are beautifully finished and highly prized. In the apartment called Queen Caroline's Closet at Kensington Palace, there is a fine drawing by Oliver, the subject of which is the Entombment of our Saviour, and another from Raffaele's Murder of the Innocents. He died in 1617 at the age of sixty-one.

**OLIVER, PETER**, the son and disciple of Isaac, was born in 1601, and though so young at the time of his father's death, had so well profited by his instruction and example, that he attained a degree of perfection in miniature portrait painting superior to his father or to any of his contemporaries, especially as he did not confine his subjects to a head only. He likewise painted historical pictures, nineteen of which were in the collection of Charles I. and James II. Seven of these are still preserved in Queen Caroline's Closet at Kensington. He died about 1664.

**OLIVET, JOSEPH THOULIER D'**, was born at Salins, the 1st of April 1682, of respectable parents. Having been admitted among the Jesuits, he was sent to their college at Rheims in 1700, and afterwards to Dijon and Paris. At Paris he became acquainted with some of the most eminent literary men of the time, and took an active part in the controversy which then existed in the French Academy, on the comparative merits of the ancient and modern writers. He warmly supported the claims of the Latin and Greek writers to our attentive study, in opposition to the opinions of Fontenelle, La Mothe, and Perrault. Olivet, about the year 1714, left the society of the Jesuits, much to their regret, who offered him the place of instructor to the Prince of Asturias to induce him to remain. In 1728 Olivet was elected a member of the French Academy. He passed the remainder of his life at Paris, engaged in various literary works, and in occasional squabbles with his associates in the Academy. He died at the advanced age of eighty-six, on the 8th of October 1768. The personal character of Olivet appears, notwithstanding the attacks of some of his enemies, to have been without reproach. Among his numerous friends, who always spoke of him with the greatest respect, no one appears to have had a higher opinion of his talents and virtues than Voltaire, who was introduced by Olivet into the French Academy. ('Discours de M. de Voltaire à l'Académie Française,' *Cœuvres complètes*, vol. 46.) Several letters of Voltaire to Olivet are extant.

The principal work of Olivet is his edition of Cicero, which was originally published at Paris in 1740-42, in 9 volumes, 4to. This edition, which is of little critical value, contains many useful notes, chiefly extracted from preceding commentators. It was reprinted at Geneva in 1758, in 9 volumes 4to, and very incorrectly at Oxford in 1783, in 10 volumes 4to. Olivet's translations of Cicero are some of the best that have been published, though, like most of the French translations, they are deficient in accuracy. Of these the principal are, the 'De Natura Deorum,' 1721, 1732, &c.; the 'Tusculanae Quaestiones,' 1737, 1747, of which the third and fifth books are translated by Bouhier; the Orations against Catiline, together with the 'Philippics' of Demosthenes, 1727, 1736, &c. He also edited extracts from Cicero with a translation into French, under the title of 'Pensées de Cicéron,' which has been frequently reprinted and extensively used in the French schools. The only other work of Olivet worthy of notice is his continuation of Pélisson's 'History of the French Academy' ('Histoire de l'Académie Française'), published originally in 1729, in 2 vols. 4to, and reprinted in 1730, in 2 vols. 12mo.

**OLIVIER, CLAUDE MATTHIEU**, was born at Marseille, September 21, 1701. Having become counsellor to the parliament of Paris, he greatly distinguished himself as a pleader. He was one of the founders of the University of Marseille. He wrote several works, the principal of which is the 'Histoire de Philippe Roi de Macédoine et Père d'Alexandre le Grand,' 2 vols. 12mo, Paris, 1740, published after the death of the author. He wrote also a dissertation

on the 'Critias' of Plato, which is in the 'Mémoires de Desmolets'; two 'Mémoires sur les Secours donnés aux Romains par les Marseillais pendant la Seconde Guerre Punique et durant la Guerre contre les Gaulois'; a 'Parallèle de Tibullus and Ovidius,' and other minor productions. Olivier died at Marseille, October 24, 1786.

OLIVIER, GUILLAUME ANTOINE, was born at Arcs near Frejus, January 15, 1756, and studied medicine at Montpellier, where he took his doctor's degree at the age of seventeen. He afterwards applied himself especially to the study of natural history, and having settled at Paris, published several memoirs which made him known to persons in office. At the time of the Revolution, the Girondin minister Roland, having conceived the idea of sending a mission to Persia for commercial and political purposes, appointed Olivier, and Bruguières, another naturalist. They set off for Constantinople in April 1793, but soon after the Girondins having been replaced by Robespierre and the terrorists, Olivier and his companion were left without resources to prosecute their journey. They however took courage, and with the assistance of the French consuls in the Levant, they visited Egypt, Syria, and other parts of the Ottoman empire, and then proceeded by Mosul and Baghdad to Persia, and arrived at Teheran in July 1796. The ruler of Persia was then the eunuch Aga Mehmet Khan, a ferocious tyrant. His minister however received the French envoys with courtesy, but owing to the distracted state of the country, nothing was effected towards the object of the mission. Olivier and his companion visited Koom, Isphahan, and other places, after which they retraced their steps to Baghdad in November 1796. From Baghdad they returned to Syria, and thence by Cyprus and Asia Minor to Constantinople. They then repaired to Athens, and from thence to Patras and Corfu, where they embarked on board a French frigate for Ancona, at which place they arrived in September 1798. After his return to France Olivier prepared a narrative of his travels, which was published in 3 vols. 4to, with an atlas, Paris, 1807. The style is plain and unassuming; the observations are generally sensible and correct, and the author has added a sketch of the history of Persia from the usurpation of Nadir Shah to the end of the 18th century, when Fetah Ali Khan took possession of the throne. There is also considerable information concerning Mesopotamia, the Koords, and Baghdad, as well as regarding the Greek islands.

Olivier continued his studies of natural history, and published the 'Histoire Naturelle des Coléoptères,' 6 vols. 4to, Paris, 1789-1819; and also 'Dictionnaire de l'Histoire Naturelle des Insectes,' which had been begun, and the first volume written, by Mauduyt, but which Olivier, assisted by Labreille and Godard, carried out on a much larger scale; it was published in 9 vols. 4to. He died at Lyon, October 1, 1814.

OLYMPIODORUS. There were several Greek writers of this name. OLYMPIODORUS of Thebes in Egypt continued the chronicle of Eusebius to A.D. 425. Of the twenty-two books of his history, which he entitled 'Materials for History,' only a fragment is preserved in the Myriobiblon of Photius (80). His history began with the seventh consulship of the emperor Honorius, and was brought down to the accession of Valentinian. The work was dedicated to the younger Theodosius. The historian appears to have been employed on public business, for he mentions being sent on a mission to Donatus, king of the Huns. In his description of the African oases he speaks of wells being made to the depth of 200, 300, and even 500 cubits, and of the water rising up and flowing from the aperture. Some have supposed that these must have been Artesian wells. Olympiodorus was a heathen.

OLYMPIODORUS of Alexandria, who is said to have lived in the latter part of the 6th century A.D., was a Peripatetic, and wrote a commentary on the 'Meteorologica' of Aristotle, which was printed by Aldus, Venice, 1561, fol. He is sometimes called the Younger, to distinguish him from the Peripatetic philosopher of the same name who was the master of Proclus, but who is not known to us by any extant work.

OLYMPIODORUS, a Platonic philosopher, and also a native of Alexandria, lived probably in the latter part of the 6th century A.D. There are extant by him commentaries on the 'First Alcibiades,' 'The Phædon,' 'The Gorgias,' and 'Philebus' of Plato. The first-mentioned of these commentaries contains a life of Plato. His commentary on the 'Gorgias' was published by Routh, in his edition of the 'Gorgias' and 'Euthydemus,' Oxford, 1784; that on the 'Phædon,' by Andreas Mustoxydes and Demetrius Schinas, in the *συλλογή ἀποκαταμένων ἀριστοτέρων*, Ven., 1817; that on the 'Philebus,' by Stallbaum, in his edition of the 'Philebus'; and that on the 'First Alcibiades,' by Creutzer, in the 2nd and 3rd volumes of the 'Initia Philosoph. ex Platonicis Fontibus,' Frankf., 1826.

OMAR I. (Abû Hafssah Ibn-al-Khattâb), successor of Abû Bekr, and second kalif of the Mussulmans, was the third cousin of Abdullah, the father of the prophet. The sworn enemy at first of Mohammed, whose life he attempted, and whose doctrines he opposed, he was converted to Islam in a manner apparently miraculous, and became one of Mohammed's most zealous and ardent followers; he accompanied him in all his military expeditions, and contributed by his experience and abilities to the success of his cause. [MOHAMMED.]

After the death of Abû Bekr (A.D. 634), whose 'hâjeb,' or chamberlain, he was, Omar was sworn kalif according to the express wish of his predecessor. The first act of his administration was to remove

from the command of the Syrian armies the celebrated Khâled Ibn Walid, surnamed 'The sword of God,' who by his rapacity and cruelty towards the vanquished had made himself obnoxious. Omar replaced him by Abû Obeydah Ibn-al-Jerrâh, another brave general who had distinguished himself in the wars against the Greeks; but Khâled had virtue enough to accept the second post in the army, and he continued to serve under the new general. These two commanders prosecuted the conquest of Syria, and took Damascus, its capital, in the month of Rejeb, A.H. 14 (August-September, A.D. 635).

After the capture of Damascus, the Moslems proceeded to the reduction of Emessa, Hamah, and Kennesrin. The emperor Heraclius sent a considerable force to stop the progress of the Arabs, but the Greeks were completely defeated at the bloody battle of Yermûk (636). The following year (637) Omar sent Amru Ibn-al-Ass and Sarjil to besiege Jerusalem. The city was stoutly defended by the garrison, but after a siege of several months the patriarch Sophronius, who commanded in it, agreed to surrender to the Moslems, but refused to treat with any other except the kalif himself. A messenger having been despatched to Omar, who was then residing at Medina, he hastened to Jerusalem followed by a scanty suite. Omar's journey from Arabia to Palestine has thus been described by the historian Tâbari. "He rode a sorrel-coloured camel, and was dressed in an old tattered habit of hair-cloth; he carried with him, in two bags, his provisions, consisting of dry fruits, barley, rice, and boiled corn, besides a skin for the water. Whenever he halted to make a repast, he permitted those who accompanied him to partake of it, eating from the same wooden dish; if he took any rest, the earth was his couch. During his march he administered justice to all applicants; in several instances he corrected the laxity of morals, and reformed several abuses, especially among the new converts; abolishing also many luxurious indulgences which had spread among the Moslems, such as the drinking of wine, the using of silken garments, &c. . . . Arrived at the camp, he caused several Moslems to be seized and dragged through the mud for having, in disobedience to his orders, arrayed themselves in the silken tunics of the conquered Greeks." After a short conference with Sophronius, the terms of a capitulation were agreed upon, and the keys of the holy city were delivered up to Omar. The articles of the capitulation of Jerusalem have already been translated ('Mines de l'Orient,' vol. ii.), but as they were the model upon which the Moslems dictated many others to the subdued cities of Africa and Spain, we shall transcribe them here. "The inhabitants shall retain their lives and property; they shall preserve the use of their churches, but they shall build no new ones; they shall neither place crosses upon those which they already have, nor hinder the Moslems from entering them night or day; they shall not ring their bells, but they shall be allowed to toll them; if a Moslem travels through the city, the inhabitants shall give him hospitality for three days. They shall not be enforced to teach their children the Korân, but they shall not try to convert any Moslem to their religion; they shall in every instance show respect for the Moslems, and give them the precedence; they shall wear turbans and shoes, and use names different from theirs. They shall be allowed to ride on horseback, but without either saddle or arms; they shall never go out without their girdles [the distinctive mark of all Christians then living under the Mohammedan sway]; they shall not sell wine to the Moslems, and shall remain faithful to the kalif, and pay regularly the taxes imposed upon them." Omar made his triumphant entry into Jerusalem towards the middle of the year 16 of the Hejira (A.D. 637). After conversing for awhile with Sophronius, and addressing to him several questions on the antiquities of the place, visiting the Church of the Resurrection, and saying his prayers under its portico, he desired to be conveyed to Bethlehem, where he also performed his devotions. Returning again to the city, he caused a magnificent mosque to be erected on the site of Solomon's temple, the same which still remains an object of great veneration to the Mussulmans. The taking of Jerusalem was followed by the reduction of all the principal cities of Palestine, while Khâled and Abû Obeydah made themselves masters of Laodicea, Antiochia, Aleppo, and Balbek.

Being master of Syria, Omar prepared to invade Persia, a kingdom then ruled by a king named Yesdejerd, against which he had at the beginning of his reign unsuccessfully contended (634). Saad-Ibn-Abi Wakkâs, who was now intrusted with the command of the army, penetrated far into Persia; defeated at Kâdesiyyah a powerful army commanded by Rustam, who fell in the battle; took possession of Bahr-Shir, in the western quarter of the city of Madâyin, the ancient Ctesiphon; founded the city of Kûfah, near the Euphrates (638); crossed the Tigris; and at last took Madâyin, the capital of Yesdejerd's kingdom.

In the meanwhile Amru Ibn-al-Ass, who commanded the armies of Egypt, completed the conquest of that country by the reduction of Alexandria (640). It was then that the famous library, founded by Ptolemy Philadelphus, is said to have been destroyed by the conquerors. Upon an application from Amru to the kalif to know his pleasure concerning its contents, an answer was returned, commanding its destruction; for, said Omar, "if the books of the Greeks agree with the book of God (Korân), they are superfluous, and need not be preserved; and if they disagree, they are pernicious, and ought to be destroyed." In consequence of this decision, we are told, and (not-

withstanding all Gibbon's ingenuity to discredit the account) we are inclined to believe, that the manuscripts were delivered up to the four (others say five) thousand public baths in the city, to which they served as precious fuel for six months.

The conquest of Egypt was followed by that of part of Africa. Amru pushed his victorious arms as far as the deserts of Tripoli and Barca. Armenia was in the meanwhile subdued by Mugheyrâh (641), and Khorassân (642) by Ahnaf-Ibn Kays, another of Omar's lieutenants. In the same year was fought the famous battle of Nehavend, which decided the fate of Persia. Firûz, who now commanded the armies of Yezdegerd, was killed; and the monarch himself obliged to seek an asylum at Farghanah among the Turks, where he died soon after in poverty.

The success which attended the arms of Omar, his unflinching severity towards the vanquished who would not embrace the religion of the prophet, and, more than all, the inexorable justice which he dealt among his own people, excited against him numerous enemies at home and abroad, and several attempts were made upon his life. Iabalâh Ibn Ahyâm, chief of the Arabian tribe of Ghosân, became one of his most implacable enemies. Although a tributary to the Greek emperor, in whose states he lived with his tribe, and though professing the Christian religion, Iabalâh went to see Omar at Medina, swore obedience to him, and embraced Islâm with all his followers. Omar then took him with him on a pilgrimage to Mecca. While the neophyte was making as usual seven times the circuit of the Kaabah, an Arab of low extraction happened to run against him, and was the cause of the prince's cloak falling off his shoulders. Iabalâh resented the incivility by immediately striking the man a blow on the face. The man made his complaint to Omar, who, having summoned Iabalâh to his presence, sentenced him to receive a similar blow from the complainant. Against this sentence, just as it was, Iabalâh most warmly remonstrated, saying that he was a king among his own people, and that the offender deserved to be punished with death. "My friend," said Omar to him, "the religion that thou and I follow makes no distinction between the king and the subject." Rather than submit to the sentence, Iabalâh secretly left Mecca with all his suite, abjured Islâm, and sought the protection of the Greek emperor. He had moreover sworn to revenge the outrage. Having communicated his plans to a resolute young slave of his, Wâthek Ibn Musâfer by name, he promised him his liberty if he should succeed in killing Omar. Having arrived at Medina (638), where the kalif was then residing, Wâthek was informed that Omar was in the habit of sitting down every day under a tree on his way to the mosque. Wâthek, having climbed up the tree, awaited the arrival of Omar, who took his seat beneath it and fell asleep. Wâthek, according to the account of the Mohammedan historians, was upon the point of coming down for the purpose of stabbing Omar with his dagger, when, lifting up his eyes, he saw a lion walking round him and licking his feet. Nor did the lion cease to guard the kalif until he awoke, when the lion instantly went away. Wâthek was so much struck by this circumstance that he came down, kissed the kalif's hand, confessed his intended crime, and embraced the Mohammedan religion.

The life of Omar however was at length ended by assassination. A Persian slave of the Magian sect, whose name was Abû Lûlû Firûz, had been obliged by his master Almugheyrâh Ibn As-shaahab to pay him two dirhems daily, in conformity with the Mohammedan custom, for the free exercise of his religion. Firûz, resenting this treatment, brought a complaint before the kalif, and requested that some part at least of the tribute exacted of him might be remitted; but this favour being refused by Omar, the Persian swore his destruction, and some days afterwards, while Omar was performing his morning devotions in the mosque at Medina, he stabbed him thrice in the belly with a sharp dagger. The people fell upon the assassin, but he made so desperate a defence that, although he was armed with no other weapon than his dagger, he wounded thirteen of the assailants, and seven of them mortally. At last one of the kalif's attendants drew his cloak over his head, and seized him; upon which he stabbed himself, and soon after expired.

Omar languished five days. He died on a Friday, in the month of Dhu-l-hajjah, A.H. 23, answering to the month of November, A.D. 644. He was buried on the following Saturday, close to the prophet and Abû Bekr, in a mosque which he had founded at Medina, where his tomb is still visited with great respect by the Mussulmans. Having been asked, some time before his death, to name his successor, he refused; and upon the suggestion of one of his courtiers that he should leave the kalifate to his son Abdullah, he remarked, "It is enough that one out of my family has been forced to bear this burden, and account afterwards to his God for the command and government of the faithful."

Omar was sixty-three years old when he died. Authors are at variance as to the duration of his kalifate: the best-informed historians however say that he reigned between ten and eleven years. Abû-l-fedâ ('An. Moal,' tom. i. p. 251) says ten years, six months, and eight days. Mohammedanism cannot boast of a more virtuous sovereign or a more zealous apostle. It has been said of him that he contributed more efficaciously to the advancement of the Mohammedan religion than the prophet himself. Khondemir, the celebrated Persian historian, thus recapitulates the praiseworthy acts of this kalif:—"He took

from the infidels 36,000 cities or castles, destroyed 4000 temples or churches, and founded or endowed 1400 mosques." The prophet had the greatest esteem for Omar, whose daughter Hafasah he married. On a certain occasion he was heard to say, "If God had wished to send a second messenger to this world, his choice would undoubtedly have fallen on Omar." The devotion, humility, and abstinence of this kalif had become proverbial among the Mussulmans. He never tasted any other food than barley-bread and dates; water was his only drink; and he was often found asleep under the porch of a mosque or beneath a tree. He complied most strictly with all the precepts of the Korân. Eutyechius tells us that during his kalifate he performed nine times the pilgrimage to Mecca. In order better to conform to the regulations of the Korân, he lived by the work of his hands, supporting himself entirely by the sale of leather belts which he manufactured. But the quality for which Omar was most conspicuous was justice, which he is said to have administered with an even hand to infidels as well as believers. The historian Wâkedî says that the staff of Omar was more dreaded than the sword of his successors. In the lifetime of Mohammed, a Moslem, condemned for his iniquitous treatment of a Jew, happening to appeal to Omar from the sentence of the prophet, he immediately cut him down with his scymitar for not acquiescing in the sentence of so upright a judge. From this circumstance Mohammed gave Omar the surname of Al-farûk, which he retained ever afterwards, a word meaning the divider, or the discriminator, thus doubly alluding to his action and the discernment which prompted it. Several of the best Mohammedan institutions date from the reign of Omar. It was in his time that the era of the Hejira, or flight of Mohammed, by which all Mohammedan nations compute their years, was established, and its beginning fixed on the 16th day of July, A.D. 622. He was the first who kept armies under pay, and assigned pensions to officers out of the public revenue: he instituted a sort of police force to watch at night for the security of the citizens; and he promulgated some excellent regulations respecting the duties of masters towards their slaves. He was also the first who assumed the title of Amir-al-mûmenîn (commander of the faithful) instead of that of Khalifah-rasûli-llahî (vicar of the messenger of God), which his predecessor Abû Bekr had used. Omar's memory is an object of the greatest veneration among Mussulmans of the Sunni, or orthodox sect; not so among the Shiites, or partisans of Ali, who look upon the three first kalifs, Abû Bekr, Omar, and Othmân, as usurpers of the kalifate, to the prejudice of Ali, to whom, they pretend, it belonged as the nearest relative of the prophet.

(Abû-l-fedâ, *Annales Moslemics*, translated by Reiske, Hafnia, 1790, tom. i. fol. 250, et seq.; Al-makin, *Historia Saracenicæ*, apud Erpenium, Lugd. Batav., 1625, p. 20, et seq.; Ibn Shihnah (manuscript), *Raudhatul-mandâbir*; Simon Ockley, *The History of the Saracens*, p. 300; Ibn-alkhattib, *Historia Calipharum*, apud Casiri; *Bib. Ar. Hisp. Ec.* vol. ii. p. 177, et seq.; D'Herbelot, *Bib. Or.*, in voc. *Omar Ben al-Khattab, Khaled, Damaski, Iskandriah*, et alibi; Gibbon, *Decline and Fall*, vol. ix. p. 222; &c.)

OMAR II. (Abû HARIS), the eighth kalif of the family of Umeyyah who reigned in the East, was the son of Abd-al-aziz, and the nephew of Abd-al-malek. He succeeded his cousin Suleymân, in the month of Safar, A.H. 99 (Sept., A.D. 717). This kalif, who on his mother's (Umm-Aâsseem) side was the great-grandson of the first Omar, imitated in every respect the conduct and the virtues of his illustrious ancestor. He was simple, modest, and frugal; he loved justice so much as to sacrifice to it his own interests and those of his family. He was religious and devout, and his mind was always occupied with the idea of a future world. One of the first acts of his administration was to suppress the maledictions which, since the time and by the order of Muawiyah, the first kalif of his family, had been read in all the mosques against the partisans and descendants of Ali: he also restored to the latter the lands which the prophet had given to Ali, and decreed that the produce should be equally divided among their posterity. These and other acts of justice towards the proscribed race raised alarm among the members and partisans of the family of Umeyyah, and especially Yesîd, his cousin and successor. They feared lest Omar, carried away by his love of justice and his respect for the family of the prophet, should appoint a grandson of Ali to succeed him in the empire, and they decided to get rid of him. This they accomplished by administering to him a slow poison, from the effect of which he died at Hâsserah, in Syria, in the month of Rejeb, A.H. 101 (Jan., A.D. 720), after a reign of two years and five months, in the forty-first year of his age. Omar had been extremely economical in his person and household, but his excessive liberality exhausted all his revenues; and at his death there was not in the royal coffers a sum sufficient to cover the expenses of his funeral.

OMAR, IBN AL-AFTTAS AL-MUTAWATEL ALA-ILLAH ('he who trusts in God'), was the fourth and last sovereign of the dynasty of Benî Al-afttas, who reigned in the west of the Peninsula from A.H. 408 to 487 (A.D. 1017-1094). After the death of his brother Yahya Al-mansûr (A.D. 1082), Omar succeeded him in a kingdom which extended over the greatest part of Extremadura and Portugal, and the capital of which was the city of Badajoz. At that time the once powerful empire of the Benî Umeyyah had vanished, and Mohammedan Spain was divided into sundry petty kingdoms, whose rulers were continually waging war against one another. One of the

most active and enterprising of these petty monarchs was Omar, who seems to have possessed all the qualifications of a good Eastern monarch—invincible courage, mild but impartial justice, and liberality touching upon prodigality towards the learned. Soon after his accession to the throne, hearing that Alfonso VII. was besieging Yehya, king of Toledo, in his capital, he sent his son Fadhl to his assistance with a considerable force; but after several sharp encounters, in which he lost the best of his men, Fadhl was obliged to retreat, and Toledo surrendered to the Christian king on the 25th of May A.D. 1085. The taking of that important capital, the rapidity with which Alfonso followed up his conquests, and more than all, his declaration that he would not lay down arms until he had conquered the whole of Mohammedan Spain, threw alarm among the Moorish kings. After a meeting held at Cordova (A.D. 1086) as to the best means of humbling the pride and checking the power of Alfonso, it was agreed that Omar should write a letter, in the name of the other kings, to Yúsauf Ibn Táshefin, the Almoravid sultan of Morocco, and implore the help of his arms against the formidable Christian. Yúsauf, who was seeking for a pretext to leave his native deserts and settle with his ferocious bands in the fertile valleys of Andalusia, immediately seized on the opportunity offered him, and, crossing the strait, landed on the coast of Spain in August A.D. 1086. [ALMORAVIDES.] Omar and the other kings of Mohammedan Spain hastened to join the Africans with their best troops; and four months afterwards (December A.D. 1086) was fought, not far from Badajoz, at a place called Zalaca, one of the most strongly contested and most sanguinary battles on record. The flower of the Spanish chivalry remained on the field. Alfonso himself was severely wounded in the thigh, by the hand, as it is asserted, of Omar Ibn Al-aftas. Elated with success, the African conqueror soon turned his arms against those of his own faith, and the brave Omar became one of his first victims. After defending for some time his kingdom against the superior forces of his adversary, commanded by Seyr Ibn Abi Bekr, Omar was obliged to shut himself up in his capital, where he still held out for a considerable time. The inhabitants having at last obliged him to capitulate, Omar surrendered the city on condition that his life and property should be preserved. The African general agreed to the terms; but scarcely had Omar left Badajoz with his family and a few faithful servants, when a body of cavalry sent by Seyr overtook them, and they were all put to death (February A.D. 1090). This catastrophe has been recorded in a beautiful elegiac poem by an Arabian poet named Ibn Abdún. The poem is in the Bodleian Library at Oxford.

OMAR, IBN HAFSUN, a famous rebel who long defied all the power of the sultans of Cordova, was born at Ronda, of Christian parents, towards the middle of the 3rd century of the Hejira. He was at first a tailor; but finding his profession beneath him, he repaired to Truxillo, a town in Extremadura, and enlisted himself as a soldier. We next hear of him as a captain of banditti in the hills of Andalusia, where he long baffled the pursuit of justice, and defeated all the troops sent for his apprehension. Some time afterwards, scorning his narrow limits, he went to the frontiers of Navarre, seized on a mountain fortress, and thence extended his ravages into Aragon. He appears to have soon subjected the neighbouring country. As his forces increased he assumed the tone of a sovereign, excited the inhabitants to revolt against the sultans of Cordova, and made even an offensive and defensive alliance with Ordoño II., king of Asturias and Leon. Profiting by the internal troubles which at that time (A.D. 859) agitated the kingdom of Cordova, then in the hands of a warlike but unfortunate prince, Mohammed I., this daring rebel, at the head of a powerful army, composed of Mohammedans and Christians, began to ravage the richest provinces of the empire, and to commit all manner of depredations, defeating in every encounter the royal armies sent against him. As might be expected, his success brought all the discontented under his standard: Abd-al-malek, the governor of Lerida, openly embraced his cause, and the example was followed by other local governors. Mohammed advanced to chastise the rebel at the head of his best troops (866); but Omar, who had as much cunning as courage, seeing that he could not contend against the royal forces, had recourse to the following stratagem. By his messengers he persuaded Mohammed that his only object was to deceive their common enemies, the Christians, in order better to turn his arms against them; that he was still a true Mussulman, and a loyal subject. Mohammed praised him for his policy, promised him ample reward if he succeeded in his enterprise, and actually sent his own nephew, Zeyd Ibn Kásim, with a body of cavalry to strengthen Omar (866); but no sooner had the prince and his followers reached the camp than they were barbarously butchered by their treacherous allies.

On receiving the news of this catastrophe, Mohammed swore to be revenged: he ordered his eldest son, Al-mundhir, to take the field against the rebels, enjoining him never to appear again in his presence unless he had completely crushed the perfidious outlaw. Al-mundhir sought Omar, who awaited his arrival without fear. In the bloody battle that ensued (A.D. 867) the rebels were cut to pieces, and their chief was obliged to seek refuge among the fastnesses of the Pyrenees. But Omar had too much spirit to be put down by one reverse, although he could scarcely depend on a few score of followers: he offered his services to the Navarrese, gained for them many fortresses, and received from them the title of king. The governors of Saragossa

and Huesca having taken the field against him, he defeated their united forces, and conquered the whole country as far as the Ebro. This time the Sultan Mohammed in person, accompanied by his son Al-mundhir, marched against the rebel. Omar endeavoured by light skirmishing to prevent a general engagement, but he was unsuccessful; and after a most bloody conflict, in which he himself was dangerously wounded, his army was completely defeated at Aybar, on the frontier of Navarre and Aragon, in 882. Omar contrived to escape from the field of battle, but he died the ensuing year from his wounds. He left a son, named Káleb, who inherited his courage, and who, more fortunate than his father, remained in undisturbed possession of Eastern Spain, where he had founded a kingdom, until he was ultimately put down by Abd-al-rahman III. in 919. Omar and his son Káleb have been often confounded by Cardonne and Casiri; and hence the error committed by M. de Saey ('Biographie Universelle, in voc. 'Omar Ben Hafseoun'), who made one out of the two individuals.

OMAR, an eminent physician and mathematician, whose complete name and titles are OMAR BEN ABDEERAHMAN BEN ALI ABULHAKEM AL-KERMANI (the Carmanian, probably so called from his family having been originally natives of the province of Kerman, or Carmania, a country on the south-east of Persia). He was born at Cordova, A.H. 368 (A.D. 990), and travelled into the East for the purpose of improving himself in geometry and medicine. On his return to Spain he settled at Saragossa, where he died, at the age of ninety, A.H. 458 (A.D. 1080). He was particularly famous for his skill in performing surgical operations, but left no works behind him.

OMAYYADES. [UMAYYADES.]

OMAR, BEN-AHMED BEN-CHALDUN ABU MOSLEM AL-HADHRAMI, was probably born (as his name would seem to imply) in Hadhramaut, a province of Arabia. He gave his chief attention to geometry, astronomy, and medicine, in all of which branches of science he acquired great fame, and was no less eminent for his moral character than for his philosophical attainments. He died A.H. 449 (A.D. 1071), at Seville, in Spain, where he had been for some time settled.

\* OMER PASHA, Commander-in-Chief of the Turkish Forces. MICHEL LATTAS (now Omer Pasha) was born in 1801, at Vlaaki, a village in the circle of Ogulin, in Austrian Croatia. His father was lieutenant-administrator of the circle of Ogulin. He was educated in the school of mathematics at Thurm, in Transylvania, whence he passed into the Austrian army as a cadet in the frontier regiment of Ogulin. He had not been long in the service when he became assistant to the surveyor of roads and bridges. In consequence of a quarrel, when he was about twenty-eight years of age he quitted the Austrian territory and service, and passed into the Turkish province of Bosnia, where he became tutor in the family of a merchant, adopted the Mohammedan creed, and assumed the name of Omer. After some time he accompanied his pupils to Constantinople, where the beauty of his penmanship is stated to have procured him the situation of a master in the new military school. Khoaroo Pasha, seraskier, or minister of war, took notice of his abilities, introduced him into the army, attached him to his personal staff, and after a time sanctioned Omer's marriage with his ward, a rich heiress. About this time he passed two years in Bulgaria and in the Danubian Principalities, and made himself intimately acquainted with the topography of the countries on both sides of the Danube. In 1838 he had become chief of battalion, and received the appointment of aide-de-camp and interpreter to General Chrszanowski, a Pole, who at that time had the command of the Turkish troops encamped in the vicinity of Constantinople. Here he had excellent opportunities of gaining experience in the details of military management. Khoaroo Pasha still continued to be his patron, and introduced him to the late Sultan, who engaged him to give lessons in writing to his son Abd-ul-Medjid, the present Sultan. He is described by Captain Spencer ('Travels in Turkey,' &c.), who saw him at Constantinople in 1836, as a man of handsome person and gentlemanly address, and as speaking with fluency the French, German, and Italian languages.

Omer's first services in actual warfare were during the war in Syria (1839-40), when the Turkish troops were acting against the Egyptian troops under Ibrahim Pasha. In accordance with a treaty signed at London, July 15, 1840, a fleet of English, Austrian, and Turkish ships advanced to the coast of Syria, in order to aid the Sultan's troops, and commenced operations by bombarding and storming Beirut. The strong fortress of St. Jean d'Acre was also bombarded and taken in November 1840. After some negotiations, Mehemet Ali, by treaty, Jan. 11, 1841, consented to relinquish Syria, and retain the government of Egypt as hereditary viceroy.

In 1842 Omer received the title of Bey, and was appointed military commandant of the district of Libanus, in the eyalet of Tarablous, in Syria. He was afterwards sent to suppress an insurrection in Albania. This operation he accomplished successfully, and received the title of Omer Pasha. He afterwards performed a similar service in Kurdistan, in Asia Minor, where the Kurds had to a great extent thrown off their allegiance to the Sultan. In 1848 when a Russian army had entered Wallachia, and threatened the flank of the revolutionary Hungarians, Omer Pasha was sent there by the Sultan in command of an army of occupation. The ability and discretion displayed by him in this critical situation attracted much attention, and received general approval. When the boys and other feudatories

of Bosnia, in 1849-50, refused to receive the Tanzimat, and openly opposed the ameliorations which it was intended to introduce, an expedition under Omer Pasha was sent against them. In a short but energetic campaign he reduced the revolted beys to submission, and by the exercise of much adroitness, and an eloquent address on the 2nd of August 1850, induced them to have the Tanzimat read in the presence of a large assemblage of the chiefs and people, on which occasion they also took an oath to carry out faithfully the principles of the new code. Having accomplished his mission in Bosnia, he returned to Bulgaria in March 1852.

Omer Pasha's next expedition was against the mountaineers of Montenegro, who, at the instigation and under the leading of Prince Daniel, in November 1852, captured the Turkish fort of Zabljac, on the Lake of Scutari, and by subsequent conquests and acts of violence rendered it necessary for the Turkish government to interfere. Omer Pasha led an army of 20,000 men into the country, and having seized all the strong positions, was preparing to complete the subjection of the insurgents, when the Austrian government interposed, and by its influence at Constantinople obtained the withdrawal of the Turkish army at the end of February 1853.

The success which had uniformly attended the military and political operations of Omer Pasha had now placed him in the highest position as a commander of the Turkish armies; and his subsequent campaign on the Danube proved that, as a strategist, he was at least equal to the Russian generals opposed to him.

The Sultan declared war against Russia in a grand council held in Constantinople on the 27th of September 1853. The causes of that war are matters of history. The Russians had entered the Danubian Principalities in the previous July, with an army of 91,000 men, under the command in chief of Prince Gortschakoff, and with 240 pieces of field-artillery and 90 siege-guns. By the end of September Omer Pasha had assembled in Bulgaria an army of 60,000 or 70,000 men, his headquarters being at Shumla, a strong position, the fortifications of which he laboured energetically to improve under his own inspection. On the 28th of October a body of Turkish troops crossed the Danube from Widin, and established themselves on the left bank of the river, at the village of Calafat. Meantime Omer Pasha was making preparations for crossing the river at Rustchouk and at Turtukai. On the 1st of November some Turkish troops crossed from Rustchouk to Giurgevo; they were repulsed by the Russians, but on the 2nd of November a stronger force passed over the river from Turtukai, and intrenched themselves on the left bank, at the village of Oltenitza, where, on the 4th, they were attacked by 20 battalions of Russian infantry and 8 regiments of cavalry, with several batteries of artillery, marched against them from Bucharest. The Russians were repulsed, but renewed their assaults on successive days till the 12th of November, when the Turks destroyed the intrenchments which they had constructed, and withdrew to the right bank of the river. Ismael Pasha, in the mean time, had been completing the fortifications at Calafat, and improving the communication across the Danube with the fortress of Widin. Omer Pasha thus secured the position at Calafat, which was his real object, the conflicts at Giurgevo and Oltenitza having been feints. Prince Gortschakoff then withdrew his troops to Bucharest, and put them in march to Calafat, which, before the Russian army could reach it, had been made very strong. At the end of December the Russians began their assaults, but were always repulsed with loss. They then seized a strong position higher up the river at Citate, where they intrenched themselves. There, on the 6th of January 1854 they were attacked by the Turks, who were at first repulsed, but the assaults were continued on the 7th, 8th, and 9th, when the Russians were driven from Citate, and on the 10th retreated to Radovan. From the 28th to the 31st of January large bodies of Russian troops occupied all the strong positions in the vicinity of Calafat, and completed the investment of the fortifications, but all attempts to take the place were ineffectual. On the 21st of April, the Russian troops were withdrawn, and Little Wallachia was forthwith evacuated.

Meantime, on the 23rd of March, Prince Gortschakoff having received additional forces, crossed the Danube at Galatz, Braila, and Ismail, and entered the Dobrujscha, with artillery and a siege-train, for the purpose of storming the fortress of Silistria, and attacking Omer Pasha at Shumla, before the allied French and English armies, then beginning to move to Varna, could give him assistance. Stupefying efforts were made to take Silistria, but without success. The place was invested by General Lüders, May 19. The last attack was made on the 22nd of June, but failed; on the 26th the siege was raised, and the Russian troops began their retreat across the Danube, and from the Dobrujscha. The Austrian troops soon afterwards advanced to occupy the Danubian principalities; the Russians withdrew from Bucharest on the 30th of July, and began their retreat across the Pruth on the 2nd of August. On the 22nd of August Omer Pasha entered Bucharest as commissioner extraordinary from the Sultan.

On the 14th of September 1854 the allied armies were safely landed in the Crimea, and on the 26th they occupied the high ground on the south side of Sebastopol. In January 1855, while the siege of Sebastopol was in progress, about 30,000 Turkish and Egyptian troops under Omer Pasha were landed at Eupatoria. Intrenchments and other defences were in process of construction there, but were far from

complete, when about 40,000 Russian troops, with about 100 guns, on the 17th of February assaulted the place. After a severe conflict the Turco-Egyptian army, with aid from the guns of an English steamer on the coast, compelled the Russians to retreat with the loss of about 1000 men. Eupatoria was afterwards made stronger and more secure, and the main body of the Turkish army under Omer Pasha was taken to the allied camp at Sebastopol.

The Turkish troops and their commander were kept in a state of inactivity at the allied camp till the news arrived of the siege of Kars, when Omer Pasha proposed to carry the Turkish troops to the eastern coast of the Black Sea to oppose the Russians in Asia, and to endeavour to relieve Kars. This proposal was opposed by the other generals of the allied armies. Omer Pasha was dissatisfied, and proceeded to Constantinople, where he had a personal interview with the Sultan, and stated his views to the Turkish ministers. While at Constantinople he was invested with the Grand Cross of the Order of the Bath by Lord Stratford de Redcliffe, under commission from Queen Victoria. After much delay, and not till after the fortress of Sebastopol had been stormed and taken, the Turkish troops, in the month of October, were landed at Batoum, whence Omer Pasha removed them to Redout Kalé. He made no attempt to march his army to the relief of Kars, perhaps on account of the lateness of the season and the difficulty of the approaches to it, but endeavoured to draw off the Russian army by marching towards Georgia, and threatening Tiflis, the capital. On the 6th of November he forced the passage of the Ingour, a broad and rapid river, in face of the enemy strongly posted on the opposite bank, having a redoubt and other intrenchments, and forced the Russians to retreat with the loss of five pieces of artillery. Omer Pasha advanced to Kutais, but was prevented from proceeding farther by unusually heavy rains, which rendered the roads impassable, and by the surrender of Kars, which took place on the 28th of November, and left the Russian besieging army at liberty to act against him. He made good his retreat to Redout Kalé without sustaining any loss from the enemy. [SUPP.]

OMRI, king of Israel from B.C. 942 to B.C. 931, was apparently one of the commanders of the army of Baasha, whose son Elah succeeded him, and after a reign of two years was assassinated by another of his captains named Zimri, who, in fulfilment of a prophecy, slew all of the race of Baasha, and ascended the throne. The army which was encamped before Gibbethon, a town of the Philistines, revolted against this assumption, and elected their own captain, Omri, who proceeded immediately to Tirzah, then the capital of the kingdom of Israel, and besieged it. The town made no great resistance, but on the entry of the hostile force Zimri set fire to the palace, and was burnt in it, after a reign of seven days. A rival named Tibni disputed the throne with Omri, and "half of the people followed Tibni," but after a civil war of six years Tibni died, and Omri became sole king of Israel. He continued and increased the idolatry of the calves; but the most marked event of his reign was his relinquishing Tirzah, and founding the city of Samaria, which thenceforward continued the capital of Israel as long as it remained a kingdom, and was razed to the ground by Salmanser, king of Assyria, in B.C. 719. Omri after a reign of eleven years died, and was succeeded by his son Ahab.

ONATAS of Ægina, the son of Micon, was alike distinguished as a painter and a sculptor. He was contemporary with Polygnotus, and lived accordingly in the early part and about the middle of the fifth century before the Christian era. His name does not occur in Pliny, and, with the exception of an epigram upon a statue of Apollo by him, in the Greek Anthology, he is noticed only by Pausanias, who however mentions several of his works, and speaks of him in terms of great praise. Pausanias speaks of a group of Homeric heroes near the great temple at Olympia, which were dedicated by the Achæans in common; Thiersch attributes them all to Onatas, but his name was inscribed on one only. Pausanias says that the Achæan people in common dedicated those statues which represent the Greeks who drew lots for the challenge of Hector; they stood armed with spears and shields near the great temple; opposite to them was Nestor with the lots in a helmet. There were eight besides Nestor; the statue of Ulysses, which made the ninth, had been removed by Nero to Rome. Of the remaining eight, only one, that of Agamemnon, had his name inscribed upon it, and it was written from right to left. On the shield of another was represented a cock, and this, says Pausanias, was Idomeneus, the grandson of Minos. In the interior of the shield was an inscription, which stated that—"As well as many others, this is the work of the skilful Onatas: Micon was his father, his birth-place Ægina."

The Thasians also dedicated a bronze statue of Hercules by Onatas at Olympia, with a club in his right and a bow in his left hand; it measured ten cubits, and the name of Onatas, with his birth-place and parentage, was inscribed upon it. Pausanias observes with respect to Onatas that he was not surpassed by any artist that had appeared in the school, or from the workshops of Attica, since Dædalus; that is, from Dædalus to Onatas's own time, which was shortly before Phidias. Pausanias mentions further, by Onatas, at Olympia, a Mercury carrying a ram under his arm; he had on a helmet and a cloak besides a tunic or under robe: he was assisted by Calliteles, whom Pausanias supposes to have been the son or pupil of Onatas.

Onatas cast also in bronze a statue of Ceres the Black, or Demeter Melaina, for the Phigalians, in the place of an old wooden image which

was destroyed by fire. Onatas cast the new statue from a picture or wooden image of the former one, assisted by a vision in a dream: it had a horse's head. He made also a statue of Apollo, at Pergamos, magnificent for its size and its workmanship. Onatas made also the bronze chariot of Hiero, dedicated by his son Deinomenes at Olympia in honour of his father's victories in the games: the horses and riders were by Calamis. He made also, together with Calythus, an artist otherwise unknown, the monument dedicated by the Tarentines at Delphi: they sent a tenth of the spoils taken from the Peucetii, a neighbouring barbarous people. The offerings consisted of several figures of warriors on foot and on horseback: Opie, king of the Iapyges, who assisted the Peucetii, was represented dying; near him stood the hero Taras, and Phalanthus, by whom was a dolphin: Phalanthus was saved from shipwreck in the Crissæan sea and brought on shore by a dolphin.

Onatas is mentioned only once as a painter. He decorated with Polygnotus the walls of the vestibule of the temple of Minerva Areia at Platæa. Onatas painted the first expedition of the Argives against Thebes. He probably also painted at Platæa the picture of Eurýganes lamenting the death of her sons Etæocles and Polynices killed by each other's hands; which, according to Sylburgius, is by a manuscript error attributed to Onasias, otherwise not mentioned. Böttiger supposes Micon the father of Onatas to be the celebrated Athenian painter of that name.

(Pausanias, v. 25, 27, vi. 12, viii. 42, ix. 4, 5, x. 13; Junius, *Catalogus Artificum*; Thiersch, *Epochen der Bildenden Kunst unter den Griechen*; Böttiger, *Ideen zur Archæologie der Malerei*.)

ONKELOS was the author of the most celebrated of the Targums, or Chaldee paraphrases of the Old Testament. The age at which he lived cannot be determined with any certainty. Jahn concludes from his style that he wrote not later than the 2nd or 3rd century. The Babylonian Talmud states that he was contemporary with Gamaliel; this would place him about the time of Christ. From the mention made of him by the Babylonian Talmud, and from the purity of his language, which is much better Chaldee than that used in Palestine, and approaches more nearly than any other extant specimen of the language to the Chaldee in Daniel and Ezra, Eichhorn supposes that he was a native of Babylon. His Targum contains the Pentateuch only. It is a faithful version, and corresponds so exactly with the Hebrew text, that it used to be chanted to the same notes, alternately with the Hebrew, in the Jewish synagogues, down to the beginning of the 16th century. This Targum is not mentioned by Origen or Jerome, which may perhaps be accounted for by the circumstance that Origen did not know Chaldee, and that Jerome only learnt it late in life. The Targum of Onkelos is printed in the *Antwerp and Complutensian Polyglotta*, in Buxtorf's Hebrew Bible, and in Walton's Polyglott. It has been published separately at various times. The edition which has been generally followed is that of Venice, 1518, and 1525-26. It has been translated into Latin by Alfonso de Zamora, Paulus Fagius, Bernardinus Baldus, and Andrew de Leon of Zamora.

ONSLÖW, GEORGE, an eminent French composer, was born at Clermont in Auvergne (now the department of Puy-de-Dôme), in 1784. He was of a noble English family; his father, the Honourable Edward Onslow, the youngest son of the Earl of Onslow, having married a French lady and settled in France. George Onslow, having at an early age shown a musical genius, was carefully instructed in the art. He learned the pianoforte under Dussek and Cramer, and studied harmony and composition under the celebrated Reicha, professor of the Conservatoire. Born of wealthy parents, and himself married to a rich lady of Rouen, he lived, in his native town, the uneventful life of an amateur, devoted to his art, which he cultivated with such ardour and success as to gain a place among the distinguished artists of his time. He died on the 3rd of October, 1843. Onslow's works are numerous. He composed two operas—'L'Alcalde de la Vega,' and 'Le Colporteur,' both produced at the Opéra Comique with great success, the one in 1824, the other in 1827. But his principal compositions are instrumental:—they consist of quartets and quintets for stringed instruments, and sonatas and other pieces for the pianoforte. All of them are known to and prized by the musical world; but the most highly esteemed are his quintets for two violins, viola, and two violoncellos, or violoncello and double-bass. These are remarkable, not only for their peculiar combination of instruments, but for their masterly construction and beautiful effects; and they are consequently in frequent use by our most distinguished concert-performers.

OORT, ADAM VAN, son of Lambert Van Oort, was born at Antwerp in 1557. He derived his instruction from his father, and soon rose into esteem as a painter of history, and likewise as an able painter of landscapes. Van Oort's greatest honour however is, that he was the first instructor of Rubens, whose works have immortalised his master's name as well as his own.

Though in his best time his composition was agreeable and the drawing correct, he neglected the study of nature, and was entirely a mannerist. In his latter time his performances had little to recommend them except freedom of handling and good colouring. Yet, with all his defects, he was looked upon as a good painter; and Rubens used to say that if he had studied at Rome, he would have surpassed all his contemporaries. He died in 1641, aged eighty-four.

OPIE, JOHN, the son of a carpenter at St. Agnes near Truro in

Cornwall, in which parish he was born in 1761, was one of those artists who may be said to have been gifted with an intuitive feeling guiding them towards a destination against which all circumstances appear to conspire. The humble condition of his family was the least obstacle; for besides that, there was nothing around him either to awaken his perceptions of art or to encourage his early attempts in it. Intending to bring him up to his own trade, his father was much more disposed to check what he considered an idle boyish pastime than to foster proofs of dawning talent. Opie however, undeterred by his father's disapprobation, began to take likenesses of his relations and neighbours, the fame of which productions caused him to be regarded as a prodigy, and attracted the notice of Dr. John Wolcot (Peter Pindar), then practising as a physician at Truro. The Doctor possessed some knowledge of painting, and took Opie into his house in the double capacity of his protégé and his footboy. How long he remained beneath Wolcot's roof is uncertain; some time after quitting it he came to the metropolis under the doctor's immediate care and protection. In the time between leaving his service and coming up to town, he pursued his art as an itinerant portrait-painter, and with such success, that though his charges never amounted to the value of any gold coin, he was able not only to make a smart appearance, but to remit money to his mother.

On arriving at London with Wolcot in 1781 he was introduced to Sir J. Reynolds, whom he found more liberal of advice than lavish of expressions of astonishment at the talents of an untaught lad. Wolcot's object however, was to secure immediate fame for his protégé as a miraculous genius, and distinction for himself as a discriminating and generous patron. Aware that the public are always ready to meet any novelty or wonder more than half way, the doctor took his measures accordingly, and with such success, that within a very short time his Cornish lad became almost the rage among the fashionable world. Visitors and sitters so thronged around him, that their carriages literally crowded the street where he resided. But people cannot wonder for ever: the fever of fashionable admiration subsided almost as rapidly as it had come on; and Opie was comparatively deserted. In fact he was ill-suited to become a permanent favourite with the fashionable; there was nothing engaging in his person and address, no flattery either in his language or his pencil, which latter possessed much more of vigour and homely truth than of grace and artificial refinement; and he succeeded far better with male heads and strongly marked countenances than with females and with pretty faces. When it had subsided however, the tide of fashionable patronage left him in comfortable circumstances. He further sought to establish his independence by marrying the daughter of a wealthy pawnbroker, but the match proved a most unhappy one, and he was glad to obtain a divorce. In 1798 he married a second time, to Miss Amelia Alderson, who subsequently became one of the most popular novelists of the day, and in whom he found an intellectual companion and judicious adviser. [OPIE, AMELIA.]

Instead of abandoning portrait-painting on the discouragement immediately following his first success, Opie divided his attention between that and historical painting, in which latter his best known productions are—'The Murder of James I. of Scotland;' the 'Death of David Rizzio;' 'Arthur taken prisoner;' 'Hubert and Arthur;' 'Belisarius;' 'Juliet in the garden,' &c. None of these works affect ideal beauty or refined poetical conception, but they are stamped by energy of style, and by vivid reality; for instead of attending to conventional beauties, the artist adhered closely to his models; one fortunate consequence of which was the striking truth of his colouring.

Opie's education had been exceedingly limited, and was in no degree a literary one. Sensible of his deficiency in that respect, he sought to repair it in after-life by studying the best English authors, and having a clear judgment and a strong memory, distinguished himself in conversation by his force of intellect. Thus qualified he aspired to the professorship of painting at the Royal Academy, having previously delivered a course of lectures at the British Institution; but he withdrew on finding himself opposed by Fuseli. When Fuseli was obliged to resign on being appointed Keeper, Opie again offered himself as candidate, and was elected. He delivered only four lectures (afterwards published by his widow), in the months of February and March, 1807. On the 9th of the following April he died, and was buried on the 20th in St. Paul's cathedral, near Sir J. Reynolds.

OPIE, AMELIA, the wife of the preceding, was the daughter and only child of Dr. James Alderson, a physician of Norwich, where she was born on November 12, 1769. Her mother, a woman of considerable talent, attended to the care of her daughter's education, but she died in 1784, and the daughter assumed the position of mistress in her father's house, and became his companion. Handsome and lively, possessing musical talents, her company was much sought, and she enjoyed society thoroughly, but it did not tend to solidify her mind. Very early in life also she took a fancy to attend the trials in the assize courts, which she continued to frequent even at an advanced age. Her father was an admirer likewise of the principles advocated in the early stages of the French revolution; these his daughter adopted, and she was present at the trial of Horne Tooke and his associates for high treason, of which she wrote home an account. In this whirl of social life, law, and politics, she had the judgment to form her friendships among persons distinguished for their virtues and

talents, and she gave some of her leisure to literature, writing one or two tragedies, which however were never published, some poetry, and a novel, called 'The Dangers of Coquetry,' which was published anonymously, and attracted no attention. In 1798 she married Mr. Opie, and, encouraged by her husband, in 1801 appeared before the world as an author, with "a simple moral tale," as she herself styled it, entitled 'Father and Daughter.' It was very popular at the time, and furnished the plot of the opera of 'Agnese,' by Paer; yet it has little power, even of pathos, but is told in an easy unpretending style, while its chief merit is now that it details, though with no conviction of its impropriety, the harshness with which lunatics were then treated, and the instinctive kindness which led her to show by the fictitious example the possibility of governing them by kindness. In 1802 she published 'Poems,' a volume in which, without striking poetic genius, there is much natural grace and sweetness. In the autumn of 1802 she and her husband visited France, and of this, her first journey, she published an account in 'Tait's Magazine' in 1831. In 1804 she published the novel of 'Adeline Mowbray; or Mother and Daughter,' in 3 vols., which added considerably to her reputation, and some passages of which are highly pathetic; but she still wanted art in grouping and developing her characters, and in combining her incidents. In 1805 'Simple Tales,' in 4 vols. were issued. With virtuous principles and good feelings, an artlessness that steals into the heart, and language easy and simple though not always strictly accurate, there is still the same want of logical coherence; the tales want reality. The characters are ill-defined and often extravagant, yet the 'Ruffian Boy' and 'Murder will out' will always produce an interest. In 1807 after the death of her husband, she returned to the home of her father. In 1808 she published 'The Warrior's Return and other Poems,' and in the following year her husband's 'Lectures on Painting,' to which she prefixed a memoir. In 1812 appeared 'Temper,' a tale in which she introduced many of her impressions of France; and in 1818 'Tales of Real Life,' which however are not more real than her former tales. In 1816 'Valentine's Eve,' a novel in 3 vols. was published, developing some of her religious views, now becoming more decided. In 1818 'Tales of the Heart,' and in 1823 'Madelina,' neither of them rising above the average of the preceding. Her next work, 'Illustrations of Lying,' appeared in 1825, and was dedicated to her father; they consist of short tales, made for her avowed purpose, with dissertations, and show more decidedly than any the great defect in her reasoning powers, though all evince the most praiseworthy intentions.

Early in life Mrs. Opie had been intimate with the Quaker family of the Fry, particularly with Mrs. Fry, and through them with the Gurneys. In 1814 a letter from J. J. Gurney appears to have made much impression on her mind, she commenced attending the Quaker meetings, and in 1825, with her father's consent, she formally joined their society. In 1825 her father died, but she continued to make Norwich her abiding place, varied by frequent visits to her friends, to Scotland, and the Continent. She had adopted the style and dress of the society she had joined, but did not give up her literary pursuits. She still wrote occasional poems, and in 1828 'Detraction Displayed' was published. In 1829 she visited Paris, and her old political feelings seem to have revived. She wrote some verses on the tricolor, addressed to Lafayette, in which she says that at the sight of it, "I seem to feel youth's hours return." In 1830, on the expulsion of Charles X., she again went to Paris, and has given a lively account of what she saw. In 1838 'Lays for the Dead,' a volume of poems, was published. In 1835 she made a tour to Belgium and Switzerland, of which she gave an account in 'Tait's Magazine,' in 1840. She continued active and beneficent for some years, contributing occasionally as she had done through previous years, to various periodical works, and after an illness of some duration, she died at Norwich Dec. 2, 1853. Her Life has been written with much care by an attached friend, Miss C. L. Brightwell, and published in 1854. It may perhaps be added that Mrs. Opie was cousin to Sir E. H. Alderson, the late Baron of the Exchequer, the son of her father's younger brother, who died in 1857.

#### OPILIUS. [MACRINUS.]

OPITZ, MARTIN, considered the father of modern German poetry, was born at Bunslau in Silesia, in 1597. While at the gymnasium at Breslau he produced several Latin poems, which were printed. On quitting Breslau he studied successively at Beuthen, Frankfurt, and Heidelberg; and it was at the first-mentioned place that he composed his dissertation entitled 'Aristarchus, sive de Contemptu Linguae Teutonice,' 1618, in which he vindicates the merits of his native tongue. At Heidelberg he formed many literary friendships, and met with patrons whose attachment afterwards proved highly servicable to him.

Having renounced his legal studies, he began to employ his pen very industriously both in Latin and German composition. Yet, whether from restlessness of disposition or some other cause, he was continually changing his place of abode. Scarcely had he been a year at Heidelberg when he quitted it for Straßburg, and in the course of a short time after (1620) visited the Netherlands, when he became acquainted with Vosius, Rutgersius, and Dan. Heinaius. The example of this last eminent scholar determined him to cultivate his native tongue with still greater assiduity, and to do for the German language and poetry what had already been accomplished in that of

Holland. In the following year he accompanied his friend Heinrich Albert Hamilton, a young Dane of noble family, to Holstein; and while he was his guest composed his 'Trostgedicht,' or poem on Consolation in the Disasters of War, which however he did not publish until nearly thirteen years afterwards (1633), when war was raging in Germany. In 1622 he was invited by the Prince of Siebenbürgen (Gabriel Bethlen) to become teacher of philosophy and humanities at the school of Weissenburg. It was during his residence there that he commenced his 'Dacia Antiqua,' an historical work of great labour and research, on which he employed himself for sixteen years, but which was left incomplete, and lost when his manuscripts were dispersed after his death. He returned to Liegnitz in 1623, and in the following year appeared the first edition of his poems. Not very long after he spent some time in travelling through Saxony, and subsequently proceeded to Vienna, where he was noticed by Ferdinand II., who bestowed a laurel crown upon him for his poem on the death of the archduke, which production however was rather a triumphal song in honour of the Austrian monarchy.

In 1626 he accepted the post of private secretary to Count von Dohna, a nobleman equally eminent as a soldier, a statesman, and a scholar; and notwithstanding his patron was a Roman Catholic and Opitz a Lutheran, with very little taste moreover for military affairs, they lived together upon the best footing, and the poet was enabled to gratify his passion for travelling by accompanying the count to Paris, where he became acquainted with Hugo Grotius and other eminent literary persons. His patron dying shortly after (1633) their return from France, Opitz (who had previously had a patent of nobility conferred upon him by the emperor, with the style of Opitz von Boberfeld) met with another protector in the Duke of Brieg, who enabled him to visit Prussia, in order that he might there pursue his studies at a distance from the troubles which then agitated Germany. For some time he settled at Danzig, where, having recommended himself to Uladislavus IV. of Poland, by a poem on his campaign against Russia—one of his most masterly and energetic productions—he was appointed Polish historiographer. But while his literary reputation was daily increasing, and his circumstances becoming more prosperous, a dreadful plague broke out in Danzig, to which he fell a victim on the 20th of August 1639, in his forty-second year. Owing to the fear of contagion, his papers and manuscripts were put away and irrecoverably lost.

His published works however sufficiently attest the important services he performed for German literature, more especially as regards the language and its mechanical structure. As a poet he can be considered great only by comparison with his predecessors and contemporaries. Though strong native good sense and amiable feelings display themselves in his productions, together with great correctness and purity of style, and occasional felicity of expression, there is more of the orator than of the poet in his compositions—more of elaborate study and sound judgment than impassioned feeling. Still, but for his labours in refining the language, the poets of the 18th century would have had to contend with nearly all the difficulties which the labours of Opitz had helped to remove. Opitz succeeded best in moral and didactic subjects, such as his 'Preis der Gemüthruhe,' 'Vielgut,' &c. Among his lyric productions his version of the Psalms contains some of his most successful efforts. His prose style has also much merit, and recommends itself by the qualities of correctness, precision, and clearness, in which respect his translation of Barclay's 'Argenis' (1626) is a masterpiece, considering in what condition the language was at the time when it was produced.

OPPIAN (*Ὀππιανός*), an eminent grammarian and poet of Cilicia (Hieronymus, in 'Ezek.' 47; Athen., 'Diepnoa,' lib. i. p. 18 b., ed. Casaub.), two of whose works are still extant under the titles 'Cynegitica' and 'Halieutica.' His father's name was Agesilaus, and his mother's Zenodota, but as to the time and place of his birth authorities are not quite agreed. Syncellus ('Chronogr.,' pp. 352, 353) and Jerome (in 'Chronica') place him in the reign of Marcus Aurelius Antoninus; but Sozomen ('Præfat. ad Hist. Ecclæ.'), Suidas (in voce *Ὀππιανός*), and others, state him to have lived in the time of Severus; and though Oppian in both his poems ('Halieut.' lib. i. v. 3; and lib. iv. v. 5; 'Cynegit.' lib. i. v. 3) addresses the emperor by the name 'Antoninus,' it is probable that Caracalla is meant, as this appellation was conferred upon him when he was associated with his father in the empire, A.D. 198 (Herodian, lib. iii. cap. 10), and is the name by which he is commonly designated by the ancient historians, Herodian, Dion Cassius, &c. As to his birthplace, Suidas supposes it to have been Corycus, but the anonymous author of the Greek life of Oppian and most other authorities say that he was born at Anazarba, a city which also gave birth to Dioscorides. Indeed Oppian himself seems to refute the assertion of Suidas, for in the third book of the 'Halieutica,' v. 205, sq., he distinguishes his fellow-countrymen from their neighbours the Corycians. His father appears to have been a person of some consideration in his native city, for he was banished to the island of Melite in the Adriatic by Severus, for suffering himself to be so entirely engrossed by his philosophical studies as to neglect coming in person along with his fellow-citizens to pay his respects to the emperor when, in taking a progress through Cilicia, he made his entrance into Anazarba. He was accompanied in his exile by his son Oppian, who had enjoyed the advantage of an excellent education

under the superintendance of his father, and who now began to devote himself to poetry. Accordingly he composed his poem on fishing, and presented it either to the Emperor Severus (Sosomen, 'Præfat. ad Hist. Koelen.'). or more probably (Suidas; Oppian, 'Halieut.' i. 3, iv. 5) to his son Caracalla, who was so much pleased with it, that he not only repealed the sentence of his father's banishment, but also presented him with a piece of gold for each verse that it contained. He died of the plague shortly after his return to his native country, at the early age of thirty, leaving behind him three poems, on Hawking (*Ἰξευτικά*), Hunting (*Κυνηγητικά*), and Fishing (*Ἀλιευτικά*).

The 'Ixeutics' consisted of two books, according to Suidas, or rather of five, according to the anonymous Greek author of Oppian's life, and are no longer extant; but a Greek Paraphrase in prose, by Eutecnius, of three books, was published, 8vo, Havnia, 1702, Gr. and Lat., ed. E. Windingius, which is also inserted in Schneider's edition of Oppian, 8vo, Argent., 1776.

The 'Cynegetics' are written in hexameter verse, consist of about 2100 lines, and are divided into four books: they display a very fair knowledge of natural history, with which however a good many absurd fables are mixed up. He says expressly that the tusks of the elephant are not teeth but horns (lib. ii., v. 491, sq.), and mentions a report that these animals are able to speak (v. 540, sq.): he states that there is no such thing as a female rhinoceros, but that all these animals are of the male sex (v. 563); that the hioness when pregnant for the first time brings forth five whelps at a birth, the second time four, the next three, then two, and lastly only one (lib. iii., v. 58, sq.); that the bear brings forth her cubs half formed, and licks them into shape (v. 159, sq.); that so great is the enmity between the wolf and the lamb, that even after death, if two drums be made of their hides, the wolf's hide will put to silence the lamb's (v. 282, sq.); that the hyenas annually change their sex (v. 288, sq.); that the boar's teeth contain fire inside them (v. 379, sq.); that the ichneumon leaps down the throat of the crocodile while lying asleep with its mouth wide open, and devours its viscera (v. 407, sq.). He thinks it necessary to state expressly that it is not true that there are no male tigers (v. 367, sq.). He gives a very spirited description of the giraffe, "the exactness of which," says Mr. Holme ('Earlier Notices of the Giraffe,' in 'Trans. of the Ashmol. Soc.' vol. ii.), "is in some points remarkable; particularly in the observation that the so-called horns do not consist of horny substance (*σθῆτι κέρασ κερῆς*); and in the allusion to the pencils of hair (*ἀβληχρῶν κεραιῶν*) with which they are tipped." He adds, "That the animal must have been seen alive by Oppian is evident from his remark on the brilliancy of the eyes, and the halting motion of the hinder limbs."

The 'Halieutics' are also written in hexameter verse, and consist of five books, of which the two first contain the natural history of fishes, and the three last the art of fishing. In this poem, as in the 'Cynegetics,' the author displays considerable zoological knowledge, though it contains several fables and absurdities—more perhaps than we meet with in Aristotle, but certainly not so many as in Pliny and Ælian. He mentions (lib. i., v. 217, sq.) the story of the Remora, or Sucker, being able to stop a ship when under full sail by sticking to the keel, and reproves the incredulity of those who doubt its truth ('Plut. Sympos., lib. ii., Quæst. 7); he was aware of the peculiarity of the Cancellus, or Hermit-Crab, which is provided with no shell of its own, but seizes upon the first empty one it can find (v. 320, sq.); he gives a beautiful and correct description of the Nautilus (v. 338, sq.); he says that the Murena, or Lamprey, copulates with land-serpents, which for the time lay aside their venom (v. 554, sq.); he notices the numbness caused by the touch of the Torpedo (lib. ii., v. 56, sq.; and lib. iii., v. 149, sq.); and the black fluid emitted by the Sepia, or Cuttle-Fish, by means of which it escapes its pursuers (lib. iii., v. 156, sq.); he says that a fish called Sargus copulates with goats, and that it is caught by the fisherman's dressing himself up in a goat's skin, and so enticing it on shore (lib. iv., v. 308, sq.); he several times mentions the dolphin, calls it, for its swiftness and beauty, the king among fishes (as the eagle among birds, the lion among beasts, and the serpent among reptiles) (lib. ii., v. 533, sq.), and relates an anecdote, somewhat similar to those mentioned by Pliny ('Hist. Nat.' lib. ix., cap. 8), and which he says happened about his own time, of a dolphin that was so fond of a little boy that it used to come whenever he called it by its name, and suffered him to ride upon its back, and at last was supposed to have pined away with grief on account of his death (lib. v., v. 448, sq.).

The 'Halieutics' are much superior to the 'Cynegetics' in point of style and poetical embellishment, and it is partly on account of this great disparity that it has been supposed that the two poems were not composed by the same person; but there are other and stronger reasons in support of this opinion (which was first put forth by Schneider in the preface to his first edition of Oppian's works), rendering it almost certain that, though by the universal consent of antiquity Oppian wrote a poem on hunting, yet it cannot be that which now goes under his name. Oppian was (as we have seen) a Cilician; but the author of the 'Cynegetics' tells us distinctly, in two different passages, that his native place was a city on the Orontes in Syria (probably Apames), (lib. ii., v. 125-127, and *ibid.*, v. 156, 157). This has been denied by Belin de Ballu, who published an edition of the

'Cynegetics,' 4to, Argentor., 1786, and 8vo, Gr. and Lat.; but it is only by altering the text in both passages (and that too not very skilfully) that he has been able to reconcile them with the commonly-received opinion that the poem is the work of Oppian. Schneider, in his second edition, replies to the objections of Belin de Ballu. It appears, from an allusion to fishing and the sea-deities in the first book of the 'Cynegetics' (v. 77-80), that this poem was composed after the 'Halieutics,' and as a sort of supplement or companion to it; and this has tended to confirm the common opinion that both poems were written by the same author.

With regard to the poetical merits of Oppian, he seems to be one of those poets whose works have been more praised than read. Julius Caesar Scaliger pronounces him "to be a sublime and incomparable poet, the most perfect writer among the Greeks, and the only one of them that ever came up to Virgil." ('Poet.' lib. v., cap. 9.) Sir Thomas Browne calls him "one of the best epic poets," and "wonders that his elegant lines should be so much neglected" ('Vulgar Errors,' book 1, chap. viii.). His style is florid and copious, the language upon the whole very good, though (as was noticed by Dan. Heinsius, 'Ad Nonni Dionysiaca,' p. 197), it is now and then deformed by Latinisms.

The first edition of the 'Halieutics' was published Florent., 1515, 8vo, Gr., ap. Ph. Juntam. A Latin translation in hexameter verse, by Laurentius Lippius, was published 1478, 4to. They were translated into English verse by Diaper and Jones, Oxford, 8vo, 1722; into French by Limes, Paris, 8vo, 1817; and into Italian by Salvini, Firenze, 8vo, 1728. The 'Cynegetics' were first published (together with the 'Halieutics') Venet., in Ædib. Aldi, 8vo, 1517. They were translated into Latin verse by Bodin, Paris, 4to, 1555; into English by Mawer, Lond., 8vo, 1736 (containing the first book only); into French by Florent Chrestien, Paris, 4to, 1575, and by Belin de Ballu, Straab., 8vo, 1787; into German by Lieberkühn, Leipzig, 8vo, 1755; and into Italian, with the 'Halieutics' noticed above, by Salvini. Fabricius states ('Biblioth. Gr.'), on the authority of Lambecius, that a paraphrase both of the 'Cynegetics' and of the 'Halieutics,' in Greek prose by Eutecnius, still exists in manuscript in the library at Vienna. Schneider's second edition of Oppian's two poems unhappily is unfinished, 8vo, Lips., 1818, Græcè; it is far superior to his first, and contains a Latin verse translation of the 'Cynegetics,' by Pfeifer, published for the first time though executed in 1565. His first and complete edition was published at Argentor., 1776, Gr. and Lat., 8vo, containing also the paraphrase of the 'Ixeutics,' by Eutecnius, mentioned above. Schneider published some addenda to this edition in his 'Analecta Critica,' 8vo, Francof., 1777; Fascic. I., p. 31, sq. The latest edition is that published by Didot (edited by F. S. Lehrs), large 8vo, Paris, 1846.

ORCA'GNA, or L'ARCA'GNUOLO, is the name by which ANDREA DI CIONE, a celebrated old Florentine artist, is generally known; he is by Ramohr first called L'Archagnuolo, which appears to be his proper name. Vasari calls him Orcagna. He was painter, sculptor, and architect; was born at Florence in 1329, according to Vasari, or according to more trustworthy accounts about 1315, and was probably first instructed in art by his father Cione, who was a celebrated goldsmith; from him he passed into the school of Andrea Pisano.

He painted several works, together with his brother Bernardo, in the churches of Florence, and also in the Campo Santo at Pisa, where the 'Triumph of Death' and the 'Last Judgment' were by Andrea, and the 'Hell' by Bernardo; the 'Last Judgment' and the 'Hell' are engraved by Lasinio on a single plate in his 'Pitture del Campo Santo di Pisa.' Orcagna repeated them in Santa Croce at Florence: he had painted previously in the Strozzi chapel in Santa Maria Novella, a picture of Hell from Dante's 'Inferno,' in which he introduced the portraits of several of his enemies. As an architect he built the elegant Loggia de' Lanzi in the Piazza Granduca at Florence, which is still in perfect condition—it and its sculptures are engraved by Lasinio in Misserini's 'Piazza del Granduca di Firenze, con i suoi Monumenti,' Florence, 1830. He built also the church of the monastery of Or' San Michele, and designed the celebrated tabernacle of the Virgin of that monastery. It is a high Gothic pyramidal altar to the Virgin, free on all sides, is built of white marble, and is richly ornamented with figures and other sculptures. The following words are inscribed on the base: 'Andrea Cionis pictor Florentinus oratorii archimagister extitit hujus, MCCCLX.' It is engraved in Richa's 'Notizie delle Chiese di Firenze,' after a drawing by Andrea himself. Orcagna generally signed himself painter upon his sculptures, and sculptor upon his pictures; on his pictures he wrote "Face Andrea di Cione, Scultore;" on his sculptures, "Face Andrea di Cione, Pittore." He was also a poet. Vasari mentions some sonnets which he addressed to Burchiello; and in the works of Burchiello, published in London in 1767, there is a sonnet addressed to Orcagna. He died at Florence according to Vasari in 1389, but according to Manni in 1375: he was dead in 1376.

He was a man of great taste in architecture, and has the credit of having been the first in those ages to adopt the semicircular arch in preference to the pointed; but to this merit, if one, he is not entitled, though his elegant 'Loggia de' Lanzi' may have contributed greatly towards the subsequent popularity of that form of the arch in Italy: Arnolfo di Lapo however, and other earlier architects, used the semi-

circular arch. Those, says Lanzi, who are fond of minute detail in minute things, may consult Baldinucci, Bottari, and Manni, concerning Andrea di Clione: Rumohr however was the first to show his real name, of which Orcagna is a contraction, Lo Archagnuolo Lo 'rohagnio F' orehagno. In painting, Orcagna did not go beyond Giotto; in sculpture he was a worthy follower of the Pisani. His portrait, published in Vasari's work, was taken from one of the figures of the apostles in the above-mentioned tabernacle of the Virgin, which is understood to be his own.

(Vasari, *Vite de' Pittori, &c.*, and the Notes to Schorn's German translation of Vasari; Rumohr, *Italianische Forschungen*.)

ORDERICUS VITALIS, the author of one of the most valuable of our early English or rather Norman chronicles, was an Englishman, as he styles himself in one of his books, born at Attingham (now Atcham), a village near Shrewsbury, on February 16th, 1075. His father, Odelirius, was a native of Orleans, and had been a follower of Roger de Montgomery, one of the Norman nobles who aided William in his conquest, and who, as a reward, was created Earl of Shrewsbury. The few particulars of the life of Ordericus are gathered from incidental notices in his work, from which we learn that his father was an educated man, in clerk's orders, and possessed of considerable property. Ordericus was the eldest son, and when five years of age was placed at school at Shrewsbury, under a "noble priest," as his pupil styles him, whose name was Siegwald. On the death of the Earl of Shrewsbury, Ordericus became a monk in the abbey of Shrewsbury, which he had assisted in founding, and at the same time he devoted to the religious life his son Ordericus, then ten years old. In a short time the boy was sent into Normandy, to the abbey of Onche, founded by St. Evroult. His second brother inherited the family estates; his younger brother became a monk with his father in the abbey of Shrewsbury. In 1086 he received the tonsure, and changed his English name of Ordericus for that of Vitalis, using only the latter name himself; but custom has joined the two in writing of him. He devoted himself to study, but did not take priest's orders till 1107, and he never quitted the convent but three times: he once attended a chapter of the order; once came to England, visiting Worcester and Croiland; and once went to Cambrai—the last two visits being apparently for the purpose of procuring materials for his work. His history is brought down to 1141, in which year, or the succeeding one, it is most probable that he died. 'The Ecclesiastical History of England and Normandy' commences with the birth of Christ, and gives in two books a rapid summary, not always correct, of the succession of the Roman emperors and popes. These two books were an afterthought, and are of no great value. It is with the third book that the interest of the work commences. The early history of the dukedom of Normandy, with the collateral relations of France and Brittany, are given in minute detail. We then enter upon the progress and completion of the conquest of England; and so on to the events of which Ordericus was a contemporary observer. In this Chronicle we see, in the most distinct manner, the actual life of the first Norman kings of England, and how they moved from the Thames to the Seine, and from the Seine to the Thames, in their barbaric pomp, but always intent upon war and aggrandisement. M. Guizot, who wrote an Introduction to the French version of 1826, says, "No book contains so much and such valuable information on the history of the eleventh and twelfth centuries; on the political state, both civil and religious, of society in the west of Europe; and on the manners of the times, whether feudal, monastic, or popular." An excellent translation of the work by Mr. T. Forester was published in 1858-4, in 4 vols., in 'Bohn's Antiquarian Library.'

ORELLA'NA, FRANCISCO, the first European who traversed the continent of South America, was born at Truxillo in Old Spain, about the beginning of the 16th century. He was of a good family, and, like many others of the same class, went to the New World to seek the wealth which he wanted at home. He accompanied the successful expedition of Francisco Pizarro to Peru in 1531. A cacique having reported that a country existed beyond the mountains east of Quito, abounding in gold and silver, cinnamon and other aromatic productions, the love of enterprise and the greediness of the Spaniards were excited. Gonzales Pizarro, brother to Francisco, undertook to penetrate the trackless forests and snowy mountains lying between the city and this desirable country.

Orellana attached himself to Gonzales, and they set forward on their expedition in 1540. The natural impediments they met with were severe, and the earthquakes, thunder, lightning, and torrents of rain which they experienced, by cutting off their communications, reduced them to the greatest extremities. At length they reached the province of Zamaco, where they found the cinnamon-tree growing in great abundance. From Zamaco, Gonzalez explored the country to the east, and followed the course of a river, supposed to be that branch of the Marañon called the Napo, for 200 leagues, when the supply of roots and berries on which they had been living became so scanty, that some expedient was necessary to obtain provisions. Accordingly, Orellana was ordered to proceed down the river in the bark which they had built, and having loaded her with provisions, to return immediately, leaving the baggage behind him. Orellana went forward until he arrived at the confluence of this branch with the main stream. He found however nothing but impenetrable forests and flooded plains. Either the ambition of discovery or the utter inability of his exhausted

crew to row back against the heavy stream induced him to proceed. They were put to the greatest straits; they eat their shoes and saddles, many were killed in frays with the Indians on the shores of the river, and mutinies broke out among his people, which were only quelled by the firmness of Orellana. Having by his skill and perseverance overcome all these difficulties, he reached the sea in August 1541, having navigated this vast river above one thousand leagues. On his return to Spain he spread such wonderful reports of the 'El Dorado' that he had passed through, of the temples roofed with gold, and of the Amazons inhabiting the banks of the river, that he soon obtained numerous followers, and the king of Spain granting him extensive possessions, he returned to the river Amazon in 1549, but shortly after fell a victim to one of the diseases prevalent in the low and swampy situations of the tropics.

ORFILA, P., an eminent French physician and toxicologist, was born at Mahon, in the island of Minorca, on the 24th of April 1787. He was sent to Paris to study medicine, and was naturalised in France in the year 1815. He early displayed a love for the science of chemistry, and in the application of this science to the investigation of poisons and their treatment became the most distinguished man in Europe. He was professor of medical chemistry in the Faculty of Medicine at Paris, and was subsequently for many years dean of that faculty. He was a correspondent of the Institute and a member of the Council of Hospitals. He wrote many works on the subject of toxicology, as well as on medical jurisprudence generally. His first published work was produced in 1817, and was entitled 'Elements of Chemistry applied to Medicine and the Arts.' This work was many times republished. From time to time he published lectures on various departments of legal medicine. In 1821 he commenced the publication of a course of 'Lectures on Legal Medicine,' which was completed in 1823. Another series of lectures on the treatment of persons poisoned or asphyxiated was published in 1818. In 1830, conjointly with M. Lessur, he published a work 'On the Appearances presented by Dead Bodies after Exhumation, Drowning, Suffocation in Cesspools, or by Gases.' He was also one of the editors of the 'Nouveau Dictionnaire des Termes de Médecine, Chirurgie, Pharmacie, Physique, Chimie, Histoire Naturelle,' &c.

His greatest work on medical jurisprudence was his 'Traité de Médecine Légale,' in 4 vols., and published from 1835 to 1847. His special papers on poisoning are very numerous, and those on the absorption of lead, corrosive sublimate, silver, arsenic, and other metals, are most valuable contributions to toxicology. He devoted much attention to the subject of public health, and wrote a little work entitled 'Hygienic Precepts for the Use of Children in Primary Schools' (1845). One of his last papers was 'On the Pernicious Effects of Tobacco, and the Danger of Smoking Havannah Cigars.' He died in the month of March 1858.

ORFORD, EARL OF. [WALPOLE, HORACE.]

ORIBASIVS, an eminent physician and the intimate friend of the Emperor Julian, was born at Sardes, the capital of Lydia, according to Suidas and Philostorgius ('Hist. Eccles.' viii. 15), or rather, according to Eusebius ('De Vita Philosoph. et Sophist.'), who was his contemporary, at Pergamum, a celebrated city of Mysia, and the birthplace of Galen. After enjoying the advantage of a good education, he became a pupil of Zeno, an able physician of Cyprus, to whom the Emperor Julian addressed a letter still extant. ('Epist.' 47.) Oribasius soon became so famous in the practice of his profession as to induce Julian, upon being raised to the rank of Cæsar, to take him with him into Gaul as his physician, A.D. 355. Eusebius seems (in an ambiguous passage) to assert that it was partly by the assistance of Oribasius that Julian was declared emperor, and says that he has given the particulars of the transaction in another of his works, which is lost. But however this may be, it is certain that they were upon the most intimate terms, as is proved by one of Julian's letters addressed to Oribasius, which still remains ('Epist.' 17), and is at the same time a monument of their superstition and pagan idolatry. When Julian succeeded to the empire, on the death of Constantius, A.D. 361, he raised Oribasius to the rank of quaestor of Constantinople (Suidas), and afterwards sent him to consult the Oracle of Delphi, whence he brought back the celebrated answer, that the Oracles had ceased to utter predictions. (Cedrenus, 'Chronica,' p. 304, ed. Paris, 1647.) Oribasius accompanied the emperor in his expedition against Persia, and was present at his death. (Philostorg., loc. cit.) He afterwards fell into disgrace through the envy of his enemies, had all his estate confiscated, and was banished by Valentinian and Valens. He supported his misfortunes with fortitude, and by his medical talents gained so much love and reverence, that the barbarians (as they are called) began almost to adore him as a god. At last the emperors, feeling their loss of his professional skill, recalled him from banishment, restored his confiscated fortune, and loaded him with honours. He was still alive when Eusebius, who was his intimate friend, wrote his account of his life, which is placed by Lardner ('Heathen Testimonies,' &c.) about the year 400 (Isidor. Pelusiot., 'Epist.' lib. i. p. 487, ed. Paris, fol. 1638), and as this was more than fifty years after his attending Julian in Gaul, he must have lived to a good old age. There are in the Greek Anthology two epigrams written in honour of him (lib. i. p. 85, and lib. iv. p. 486).

He was the author, according to Suidas and Photius, of several

works which are no longer extant. A Commentary on the Aphorisms of Hippocrates goes under the name of Oribasius, but it is manifestly spurious. The author, who appears to have been a Christian, quotes the Holy Scriptures, and says in the preface that he wrote his work by order of Ptolemy Euergetes. It is of little value, and was first published at Paris, 8vo, 1533, ed. Jo. Guinterius Andernacus, Lat.

We possess three works bearing the name of Oribasius, which are generally considered to be genuine, viz.: 1, *συναγωγή λατινική*, 'Collecta Medicinalia' 2, *σύνοψις*, 'Synopsis ad Eustathium'; 3, *ἐπιόρνια*, 'Euporista ad Eunapium,' or 'De facile Parabilibus.' The first of these works was composed, as we learn from the preface or dedication preserved by Photius, at the command of Julian, while they were in Gaul together, and consisted originally of seventy books, according to Photius ('Biblioth.' cod. ccxvii.), or, as Suidas says, of seventy-two; whence it is also called *ἑβδομηκοντάβιβλος*, 'Libri Lxx.' Of this large work, which consisted almost entirely of extracts from Galen and other authors, we possess less than half, namely, books 1-15, 21, 22, 24, 25, 43, 44, 49, with fragments of 50 and 51. They are extremely valuable, both as containing passages from authors whose works are no longer extant, and also as serving frequently to correct and explain different sentences in Galen's works. It would be impossible here to give anything like a complete analysis of so large a work, and perhaps this is the less necessary as it contains but little original matter; but it may be useful to give a general idea of its contents, mentioning at the same time anything that may appear especially worthy of notice. The first five books treat of Diætics; lib. vi. contains directions about sleep, exercise, friction, &c.; lib. vii. is on venesection, arteriotomy, cupping, purging, and emetics (he says that the effects of hellebore were first tried upon dogs and afterwards upon men, and that he cured by means of it a woman affected with cancer); lib. viii. is about clysters, with some more remarks on hellebore and emetics; lib. ix. on climate, winds, &c., and also on external applications; lib. x. on natural and artificial baths, containing a particular account of the oil baths and oil and water baths; the five following books are on Materia Medica: the twenty-fourth and twenty-fifth books contain a complete system of anatomy and physiology, taken almost entirely from Galen's great work, 'De Usu Partium Corporis Humani.' It should here however be noticed that Oribasius is the first author who gives an account of the salivary glands, which appear to have been overlooked by Galen; at least no description of them is to be found in any of his extant anatomical works. The passage in Oribasius occurs lib. xxiv., cap. 8, and is as follows: "On each side of the tongue you will find the orifices of the vessels called salivary, large enough to admit the end of a probe; they have their origin at the root of the tongue, where there are the glands of the same nature, for the vessels arise from them in the same way as arteries, by means of which the salivary moisture lubricates the tongue itself, and all the adjacent parts of the mouth." The above seventeen books were for some time supposed to be all that remained of the *ἑβδομηκοντάβιβλος*. They first appeared in Latin about 1550, Venet., 8vo, ed. J. Bapt. Rasarius, ap. P. Manutium, Aldi F. The first fifteen books were published, Mosquæ, 4to, 1808, Gr. and Lat., ed. Matthæi, under the title 'XXI. Veterum et Clarorum Medicorum Græcorum Varia Opuscula,' &c. The 21st and 22nd books were discovered by Diets, Preface to his unedited 'Scholia in Hippocr. et Gal.,' &c., Regim. Pruss., 8vo, 1834, 2 vols, but they have not been published. Of the twenty-fourth and twenty-fifth books there is a good edition, Lugd. Bat., 4to, 1735, Gr. and Lat., ed. G. Dunduss, with the title 'Oribasii Anatomica ex Libris Galeni,' &c. Cocchi however published, Florent., fol., 1754, Gr. and Lat., in his edition of the collection of surgical works by Nicetas [ΝΙΚΗΤΑΣ], two works by Oribasius, *περὶ καταγμάτων*, 'De Fracturis,' and *περὶ ἐκάρθημάτων*, 'De Luxatis,' which he conjectured to be the forty-sixth and forty-seventh books of the *συναγωγή*, and at the same time he expressed his opinion that the forty-third and forty-fifth books had long been before the public under the title 'De Laqueis et Machinamentis Chirurgicis ex Heraeae et Heliodoro,' contained in 'Vidi Vidii Chirurgia,' fol., Paris, 1544, and in the twelfth vol. of Chartier's edit. of Hippocr. and Galen. Angelo Mai discovered in the Vatican library part of lib. xlii., 'De Abscessibus,' lib. xlv. 'De Variis Tumoribus;' lib. xlviii. 'De Laqueis;' lib. xlix. 'De Machinamentis,' and part of lib. l., 'De Pudendorum Morbis.' These he published in the fourth vol. of 'Class. Auctor. e Vatic. Codic. Edit.,' 8vo, Romæ, 1831. The contents of the last-mentioned books are sufficiently expressed by their titles, nor is there anything in them deserving of particular notice.

The second of the extant works of Oribasius (called *σύνοψις*, 'Synopsis,' and addressed to his son Eustathius) consists of nine books; we learn from the preface that it was composed after the former work, and is an abridgment of it. In the first book he treats of various kinds of exercise, baths, external applications, cupping, scarification, leeching, &c., he also gives directions for choosing which vein in the arm to open in phlebotomy, and says that it is dangerous to touch the median, on account of the proximity of the nerve; that arteriotomy should be performed on the temples or behind the ears. He next gives (lib. ii.) a list of simple drugs with their properties; lib. iii. treats of plaisters and other external medicaments; lib. iv. of materia medica; lib. v. of diseases of women and children, &c.; lib. vi. of fevers, contagion, &c.; lib. vii. of surgery; lib. viii. diseases of the

head, eyes, and ears, lycanthropia, and hydrophobia; lib. ix. diseases of the thorax, abdomen, kidneys, &c.; also on diabetes, in which disorder he recommends sudorifics. A Latin translation of this work by J. Bapt. Rasarius appeared, Venet., 8vo, 1554, ap. P. Manutium.

The third extant work by Oribasius bears the title of *ἐπιόρνια*, 'De Facile Parabilibus,' and is addressed to his friend Eunapius (though some copies in the time of Photius read Eugenius), at whose desire it was composed, and who is probably the author of the 'Vite Philosoph. et Sophist.' It consists of four books, which seem to be a short abridgment of his great work, chiefly taken from Galen, Dioscorides, and Rufus Ephesius. Its genuineness is doubted by Sprengel. Of this work also the Greek text has never been published. A Latin translation by J. Sicard came out, Basel, fol., 1529, and another by J. Bapt. Rasarius, Venet., 8vo, 1558. Rasarius also published, Basel, 8 tom. 8vo, 1557, an edition of his translations of all the works of Oribasius, which are inserted in the first volume of the 'Medice Artis Principes,' by H. Stephens, Paris, 2 tom. fol. 1567.

Oribasius has been called 'Galen's ape,' and it is true that he seldom contradicts him; but he has also inserted in his works so much that is original, that it is surprising that he should have confined himself to the office of a mere compiler.

ORIGENES (*Ὀριγένης*), commonly called by English writers ORIGEN, was born in Egypt in the year A.D. 185 or 186. Porphyry states that he was born of heathen parents and brought up in the Greek religion, but this is denied by Eusebius. He received instruction from Clemens of Alexandria, then a catechist at Alexandria, and at a later period he attended the lectures of the celebrated philosopher Ammonius Saccas. In the year 202 his father Leonidas suffered martyrdom. Though not quite seventeen years old, Origenes was hardly restrained by the care of his mother from offering himself also to martyrdom. He sent a letter to his father in prison, containing this sentence:—"Take heed, father, that you do not change your mind for our sake." After his father's death, Origenes was supported for a short time by a rich lady of Alexandria, but he soon became able to maintain himself by teaching grammar. At the age of eighteen, Demetrius, the bishop of Alexandria, put him at the head of the catechetical school in that city, to the duties of which office he devoted himself entirely and with great success. During this period he supported himself by the sale of his library of ancient authors for a daily stipend of four oboles, which he received from the purchaser. We are not told how long this payment was continued. In his twenty-first year, having taken up the opinion that the words of our Saviour (Matthew xix. 12) ought to be understood literally, he castrated himself; in later life he confessed his error in this matter. Soon after this he learned Hebrew, a thing very unusual at that time (Hieron., 'De Vir. Illust.,' c. 56); but his knowledge of the language was never very great. About the year 212 his preaching reclaimed from the Valentinian heresy a wealthy person of the name of Ambrose, who afterwards assisted him materially in the publication of his Commentaries on the Scriptures. He was sent by Demetrius into Greece upon some ecclesiastical business, and on his way thither, in 228, he was ordained a presbyter at Cæsarea in Palestine. This circumstance excited the jealousy of Demetrius to such a degree, that when Origenes returned home he found that prelate violently opposed to him; he therefore left Alexandria and retired to Cæsarea in 231. Demetrius held two councils at Alexandria upon this occasion, by the first of which Origenes was forbidden to teach or even to appear in the city; by the second he was deposed from the office of presbyter, and perhaps excommunicated. Demetrius moreover sent letters to most of the churches, in consequence of which Origenes was condemned by the Bishop of Rome, and by all others except those of Palestine, Arabia, Phenicia, and Achaia. Jerome states that these proceedings were not taken because Origenes was guilty of any heresy, but solely from jealousy of his eloquence and reputation. While Origenes resided at Cæsarea he was resorted to by persons from the most distant places, who were anxious to hear his interpretations of the Scripture. Among his disciples were several who afterwards rose to great eminence in the Church. His advice was now eagerly sought for. Mammas, the mother of the Emperor Alexander Severus, sent for him to Antioch that she might converse with him on religion; and at a later period he had a correspondence with the Emperor Philip and his wife Severa. At two synods which were held about this time in Arabia he again enjoyed the success (rare indeed in religious controversy) of convincing his opponents: these were, Beryllus, bishop of Bostra in Arabia, who denied the pre-existence of Christ, and some who held the opinion that the human soul dies with the body, and will be revived with it again at the resurrection. He also paid visits to the churches of Rome and Athens; the former of these visits was some time before he left Alexandria, and the object of it was, as he himself tells us, "to see the most ancient church of the Romans." When he was sixty years old he permitted his discourses to be taken down in short-hand, and in this way above a thousand of his homilies were preserved.

It was about this time that he wrote an answer, in eight books, to the objections brought against Christianity by Celsus, a philosopher who lived in the reigns of Hadrian and the Antonines, in a work entitled 'The True Word' (*Ἀληθὴς Ἀπόλογος*). The objections of Celsus, as they appear from the answer of Origenes (for the work itself is lost), are of a frivolous and malignant character, and the work of

Origenes has been esteemed both in ancient and modern times, not only as a satisfactory answer to his opponent, but as one of the best apologies for the Christian religion that have been written by the ancients.

In the Decian persecution (250) Origenes was imprisoned and suffered great tortures. He died shortly after his release from prison, some say at Tyre, in 253 or 254, in the sixty-ninth year of his age.

Origenes is undoubtedly one of the most remarkable men among the ancient Christian writers. His talents, eloquence, and learning have been celebrated not only by Christian writers but by heathen philosophers, including Porphyry himself. Jerome calls him "a man of immortal genius, who understood logic, geometry, arithmetic, music, grammar, rhetoric, and all the sects of the philosophers; so that he was resorted to by many students of secular literature, whom he received chiefly that he might embrace the opportunity of instructing them in the faith of Christ." ('De Vir. Illust.,' c. 54.) Elsewhere he calls him the greatest teacher since the apostles. We find this same Jerome however at a later period of his life violently attacking Origenes, and approving of the persecution of his followers. All agree that he was a man of an active and powerful mind and of fervent piety, fond of investigating truth, and free from all mean prejudices, of the most profound learning and of the most untiring industry. His whole life was occupied in writing, teaching, and especially in explaining the Scriptures. No man—certainly none in ancient times—did more to settle the true text of the sacred writings and to spread them among the people, and perhaps few have introduced more dangerous principles into their interpretation. For, whether from a defect in judgment or from a fault in his education, he applied to the holy Scriptures the allegorical method which the Platonists used in interpreting the heathen mythology. He says himself that "the source of many evils lies in adhering to the carnal or external part of Scripture. Those who do so shall not attain to the kingdom of God. Let us therefore seek after the spirit and the substantial fruit of the word, which are hidden and mysterious." And again, "the Scriptures are of little use to those who understand them as they are written."

In the 4th century the writings of Origenes led to violent controversies in the Church. Epiphanius, in a letter preserved by Jerome, enumerates eight erroneous opinions as contained in his works. He is charged with holding heretical notions concerning the Son and the Holy Spirit; with maintaining that the human soul is not created with the body, but has a previous existence; that in the resurrection the body will not have the same members as before; and that future punishments will not be eternal, but that both fallen angels and wicked men will be restored at some distant period to the favour of God. (Hieron., 'Adv. Ruf.,' lib. ii., tom. iv., p. 403.) These opinions were not generally held by his followers, who maintained that the passages from which they were drawn had been interpolated in his writings by heretics. In 401, Theophilus, bishop of Alexandria, held a synod, in which Origenes and his followers were condemned, and the reading of his works was prohibited; and the monks, most of whom were Origenists, were driven out of Alexandria. His opinions were again condemned by the second general council of Constantinople in 553.

The most important works of Origenes were his editions of the Hebrew text and Greek versions of the Old Testament, which were the results of a diligent collation of manuscripts. The 'Tetrapla' contained the four Greek versions of Aquila, Symmachus, the Septuagint, and Theodotus, arranged in four columns. The addition of the Hebrew text in one column, and of the same in Greek characters in another, formed the 'Hexapla.' Of this great work only a few fragments remain, the best edition of which is that by Montfaucon, in 2 vols. fol., Paris, 1713. Of his other works, which were so numerous that one author states that he wrote six thousand volumes, the greater number have perished. His 'Stromata' and 'Principia' (σεπλ ἀρχών) illustrated the doctrines of Christianity according to his peculiar method of interpretation. The 'Stromata' was in ten parts, and illustrated the doctrines of Christianity by comparing them with the opinions of the philosophers. Three fragments of this work are preserved by Jerome. The 'Principia' was in four books, but we only possess a short notice of it in the 'Myrioblon' of Photius (cod. viii.), an extract in Eusebius ('Contra Marcellum Ancyranum,' lib. i., one or two in Justinian's 'Letter to Mela,' and some fragments in the 'Philocalia.' Rufinus, in the 4th century, made a Latin translation of the 'Principia,' which is still extant; but Rufinus has, by his own confession, added so much to Origenes's work, that it cannot be taken as a fair exhibition of his opinions. Indeed all the extant works of Origenes are very much corrupted.

We have still in Greek his treatise 'Of Prayer,' his 'Exhortation to Martyrdom,' his 'Apology for the Christian Religion,' an Epistle to Africanus, another to Gregory Thaumaturgus, and fragments of a few other epistles; part of his 'Commentaries on the Books of the Old and New Testament;' 'Philocalia,' containing extracts from his works made by Gregory of Nazianzus and Basil the Great; and in the 'Catena' there are many notes ascribed to Origenes, which Huet however considers to be spurious. Several of his works remain in Latin translations, made by Jerome and Rufinus, but chiefly by the latter. Complete lists of his extant works are given by Huet, Cave, Bannag,

Du Pin, and Tillemont, and by Fabricius in the 'Bibl. Græc.,' v. i. 26. The standard edition of his whole works is that of De la Rue, in 4 vols. fol., Paris, 1783. Several additional passages by Origen have however been since published in vol. xiv. (App.) of Galland's 'Bibliotheca Patrum;' and vols. ix. and x. of Cardinal Mai's 'Auct. e Vaticanis Codd.' (Huet, 'Origensiana;' Lardner, 'Credibility,' part ii. chap. 38, and the authorities quoted by him.)

ORIGENES, also a pupil of Ammonius Saccas, must be distinguished from the other Origenes. He was a Platonic philosopher. Longinus and Porphyry mention three of his works, entitled, 'On Demons,' the 'Demiurgus,' and 'Galienna.'

ORIZONTE. The name of this artist was JOHN FRANCIS VON BLOEMER, but the Bentvogel Society, consisting of Flemish painters resident at Rome, gave him the name of Orizonte, from the hot and vapoury air of his pictures, it being their custom to give to every new member, on his introduction, a name expressive either of any perfection or defect in his figure and countenance, or some peculiarity in his style, or singularity in his character. Orizonte was born in 1656, at Antwerp, but studied and always resided in Italy. The palaces of the pope and of the nobility at Rome possess abundance of his works, both in fresco and oil. The composition of his landscapes and the character of his trees are almost always in the style of Poussin; but the general tone is a dark green with a cast of red. His selection of subjects is always picturesque, and the pencilling bold; but his pictures are not always equally finished. As he advanced in age his style degenerated into mannerism, but his originality will always entitle him to a place in the first rank of landscape painters. He died in 1740, at the age of eighty-four.

ORLAY, BERNARD VON, called Bernard of Brussels, was born in that city in 1471. He went to Rome, worked under Raffaele, and was employed to superintend, with Michael Coexie, the manufacture of the Vatican tapestries. Returning to Brussels he was made painter to the governess of the Netherlands, and was likewise employed for many years by the emperor Charles V.

The style of his design was noble, and his tone of colouring agreeable. He very frequently painted on a ground of leaf-gold, especially if he was engaged on a work of importance, a circumstance which is said to have preserved the freshness and lustre of his colours: in his hunting-pieces, in which he introduced portraits of Charles V. and the nobles of his court, he usually took the scenery from the forest of Soignies, which afforded him ample variety. He was engaged by the Prince of Nassau to paint sixteen cartoons, as models for tapestry, intended for the decoration of his palace. Each cartoon contained only two figures, a knight, and a lady on horseback, representing some members of the Nassau family. They were designed in an elevated style; and by the prince's order they were afterwards copied in oil by Jordaens. He painted for the chapel of a monastery at Antwerp a picture of the Last Judgment, which was much admired. Bernard von Orlay died at Brussels, January 6, 1541.

Waagen mentions several excellent pictures by him in the collections in this country, especially in those of the Duke of Devonshire at Devonshire House, Piccadilly, and at Chiswick; at Keddleston Hall, the seat of the Earl Scarsdale, where is a picture of the Virgin with the Infant Christ, blessing St. John in the presence of Joseph and Elisabeth—the figures are three-quarters the size of life—which is one of the finest remaining by von Orlay; and at Lord Spencer's, at Althorpe. In the National Gallery is a 'Magdalen, Reading,' by him.

ORLEANS, HOUSE OF, the title of a branch of the royal family of France, which has three times originated in the younger son of a king, and has twice obtained possession of the crown.

I. The first House of Orleans sprang from Louis, second surviving son of Charles V., the earliest prince who appears to have borne the title of Duke of Orleans, and who, after playing a conspicuous and not very creditable part in the troubles which agitated the reign of his imbecile brother, Charles VI., was assassinated at Paris in 1407 by his cousin and rival John (surnamed 'Sans Peur'), duke of Bourgoigne. The results of this crime were most disastrous to France, which was filled with violence and bloodshed by the conflict of the two factions of the Bourguignons and Armagnacs: the Orleans party being distinguished by the latter title, from their leader, the Count of Armagnac, who, as father-in-law of the young Duke of Orleans, undertook to protect his cause, and avenge the murder of his father. The history of the first Duke of Orleans is also memorable for his marriage with Valentina Visconti, daughter of Gian Galeazzo Visconti, duke of Milan, which eventually gave the house of Orleans pretensions to that duchy, and produced the Italian wars of Louis XII. and his successors for its possession.

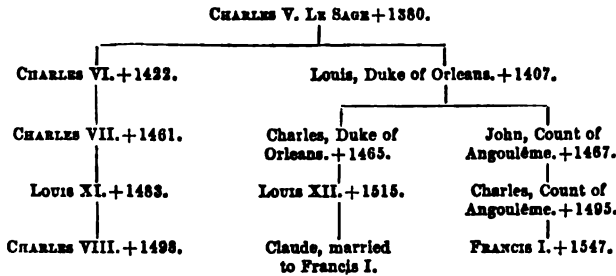

The life of Charles, second Duke of Orleans, was remarkable chiefly for his having been taken prisoner by the English at the battle of Azincourt, in consequence of which he suffered a long captivity, together with his younger brother John, count of Angoulême. Dunois, the famous 'Bastard of Orleans,' and progenitor of the house of Longueville, was his illegitimate brother.

Louis, son of Charles, and third Duke of Orleans, was exposed during the reign of Louis XI. to the splenic jealousy of that gloomy tyrant, whose deformed daughter Jane he was compelled to marry; but on the death of Charles VIII., and the failure of the direct line of Valois, in 1498, the Duke of Orleans succeeded to the crown by the

title of Louis XII. On his own death, without male issue, in 1515 [LOUIS XII.], his cousin Francis, count of Angoulême, to whom he had given his daughter Claude in marriage, ascended the throne under the title of Francis I.; and the royal succession thus devolved upon the second branch of the house of Valois-Orleans—or line of Valois-Angoulême, as it has been called—which contributed five sovereigns to France, namely, Francis I., Henry II., Francis II., Charles IX., and Henry III.

The following table will show the descent of the first house of Orleans:—

II. The only prince of the second House of Orleans was Jean Baptiste Gaston, the younger of the two sons of Henry IV. and Maria de' Medici, who was born in 1608, created Duke of Orleans in 1626, and died in 1680. Of a vain and unquiet, weak and heartless character, his life was a series of troubles and disgraces, which were caused principally by his own misconduct. During the reign of his brother Louis XIII., he was continually engaging in intrigues and conspiracies against Cardinal Richelieu; and, on their failure, purchased safety by his own humiliation and the base sacrifice of his unhappy accomplices. In 1626 he countenanced a plot against the life of the cardinal; and, on its detection, abandoned the Count de Chalais, one of the principal officers of his household, to the vengeance of the minister, who caused him to be beheaded. Five years later, Gaston retired from court on some new quarrel with Richelieu, increased the displeasure of his brother by contracting a marriage with Marguerite, sister of the Duke of Lorraine, and finally withdrew into exile at Brussels, leaving his adherents again exposed to the persecution of the cardinal. At length, he re-entered the kingdom in open arms against the royal authority, but persevered in hostilities only until he was defeated at the combat of Castelnaudary, in which his principal partisan, the Duke of Montmorenci, was made prisoner: when he obtained pardon for himself, without security for his captive friend, who was brought by the relentless Richelieu to the block. Gaston indeed on this catastrophe retired again in terror to Brussels; but with his usual levity he was, after some time, induced to abandon his Spanish protectors and return to the court. Being entrusted with the command of an army against the Spaniards, he formed, in 1636, in conjunction with the Count de Soissons, another plot to assassinate the cardinal, caused the failure of the design by his irresolution, and on its exposure fled to Blois, but was soon after again reconciled with the court. The birth of a son to Louis XIII., by giving an heir to the monarchy, diminished the importance of the Duke of Orleans in the state; and he fell into comparative obscurity for some years, until, in 1642, it was discovered that he had entered into a treasonable treaty with Spain, for the subversion of the monarchy and the murder of the cardinal. The mean-spirited duke saved his own life, according to his custom, by the most abject submission, and by betraying his accomplices, among whom the young Marquis de Cinq Mars, a favourite of Louis XIII. himself, and François Auguste De Thou, son of the famous historian, were the principal victims. Gaston himself, on this occasion, did not escape without the loss of the honours due to his birth. He was deprived of his guards and his principal domains, and banished from the court. But the death of Richelieu and of Louis XIII. shortly changed the aspect of affairs; and in the minority of his nephew, Louis XIV., the Duke of Orleans was called to the post of lieutenant-general of the kingdom, under the regency of the queen-mother, Anne of Austria. He gained some credit in the campaign of 1644 against the Spaniards, and for a time supported the government of the regent and her minister Cardinal Mazarin. But the commotions of the 'Fronde' soon tempted the characteristic levity of Gaston; and he allied himself against the court and Mazarin, successively with the Prince of Condé and with the parliament of Paris. The latter body were moved by his cabals, though Louis XIV. had now attained his majority, to appoint him anew lieutenant-general of the kingdom, as the same title had been factiously conferred on the Duke de Mayenne in the time of the League. But the final triumph of Mazarin and the close of the civil wars produced for Gaston the usual fruits of his vacillation and perfidy, and in 1652 he was banished from the court to Blois, where he passed the remaining eight years of his life in mortification and contempt.

Gaston had no male issue; but he was the father, by his first marriage, with the heiress of Montpensier, of the princess who inherited that title, and who figured so conspicuously in those strange political scenes of her times, of which she has left her own memoirs.

Louise de Montpensier, known among her contemporaries as 'La Grande Mademoiselle,' merited that designation as much by her aspiring character as her illustrious birth. She shone conspicuously in that galaxy of high-born French women who, more distinguished for their masculine spirit and wit than for the becoming virtues of their sex, ruled the ascendant throughout the political storms of the Fronde. While heroes and statesmen bartered their honour and policy for the smiles of beauty, while fortresses were surrendered to fair ladies' eyes, and treaties were made and broken with lovers' vows, these female warriors and politicians openly appeared in the camp and the council. Gaston of Orleans, in a style as much serious as burlesque, addressed a letter to 'Mesdames the countesses, maréchales-de-camp in the army of my daughter against Mazarin.' With more boldness than her father, the Grande Mademoiselle showed her prowess by turning the guns of the Bastille against the royal troops to cover the retreat of the forces of Condé. "That discharge has killed her husband," said Mazarin, in allusion to her well-known anxiety to espouse her cousin, the young king Louis XIV., whose regard was for ever alienated from her by this outrage. After having aspired to be queen of France, and having refused the hand of several other sovereigns, Mademoiselle de Montpensier finished, at the mature age of forty-four years, by desiring to raise a private nobleman, the Count de Lauzun, to the rank of her husband and the title of Duke of Montpensier. Louis XIV. first granted and then unkindly retracted his consent to the union; notwithstanding which it was privately concluded in 1670, an offence for which Lauzun suffered a ten years' imprisonment. After she had obtained his release, by the sacrifice of her finest domains to a natural son of the king, the princess found her marriage neither recognised at court nor happy in itself; and she closed, in 1693, a life of strong passions, embittered by the disappointment both of political ambition and personal affection.

III. The progenitor of the third and existing House of Orleans was Philip, second son of Louis XIII. and Anne of Austria, who was born in 1640; received the title of Duke of Orleans on the death of his uncle Gaston in 1660; and succeeded to the duchy of Montpensier, by the bequest of La Grande Mademoiselle, in 1693. His career was by no means distinguished; but he is said to have had some taste for letters, and he served with honour in several of the most glorious campaigns of the reign of Louis XIV. He was twice married: first, to his cousin Henrietta of England, daughter of Charles I. and, like himself, a grandchild of Henri IV.; and, secondly, to Elisabeth of Bavaria, daughter of the Elector Palatine. The circumstances which attended the sudden death of his first wife, a princess celebrated for personal graces, in the flower of her age, cast upon him the horrid suspicion of having poisoned her; a charge however apparently as unfounded in itself as the imputed crime was at variance with the whole tenor of his character, which, though he was too much addicted to the pleasures of sense, was mild and good-natured. By the Princess Henrietta, Philip had two daughters, one of whom became the queen of Charles II. of Spain, and the other, through her marriage with Victor Amadeus II. of Savoy, transmitted to the House of Sardinia, after the extinction of the male line of Stuart, as much vain pretension to the inheritance of their crown as could be conveyed by mere descent in opposition to constitutional law. By his second marriage Philip had, besides a prince who died young, and a daughter, the son, of his own name, who, on his death in 1701, succeeded him in his titles.

This was the celebrated Regent Orleans, of whom Voltaire has declared that, "famed for his courage, his wit, and his pleasures, he was born for society even more than for public affairs, and was one of the most amiable men that ever existed." The severer judgment of history has branded the memory of Philip II., duke of Orleans, with the reproach of unbounded personal and political profligacy; and the fatal example both of his private life and public administration encouraged that corruption of morals in France which, becoming aggravated throughout the licentious reign of Louis XV., unquestionably produced the worst excesses of the revolution. Nature had endowed Philip II. of Orleans with great abilities, but his mind was early tainted by the lessons of his tutor, the able and infamous Dubois, who was afterwards, under his regency, a cardinal, his favourite, and prime-minister. Philip was a proficient in many sciences and accomplishments; in the mathematics, in poetry, music, sculpture, and painting. He had likewise in his youth displayed considerable talents for war, and some ambition to attain equal distinction in arts and arms. He was wounded on several occasions, signalled himself at the battles of Steinkerque and Neerwinden, commanded the French armies with courage and activity in Italy and Spain during the Succession War, and in the latter country established so much reputation and influence that Louis XIV. is said to have suspected him of a design to supplant Philip V. on the throne of that kingdom. This and other causes of jealousy led Louis XIV., in anticipation of his great-grandson's minority, to meditate the exclusion of Philip of Orleans from the regency; but the death of the aged monarch prevented the completion of this plan. The duke quietly possessed himself of the government; and grievous as were the vices of his administration, he was guilty of no ambitious attempt to abuse the rights of the young king. His frame was worn out by debauchery before he had quite completed his fiftieth year, and a sudden death terminated his career in 1723. He

had been married during the life of Louis XIV. to Françoise Marie de Bourbon, styled Mademoiselle de Blois, natural daughter of that monarch and Madame de Montespan, by whom he had one son, born in 1703, and several daughters.

Louis, duke of Orleans, seemed at first disposed to emulate the vices of his father, whose better tastes for letters and science he also inherited. But his marriage with a princess of Baden, to whom he became tenderly attached, weaned him from early habits of dissipation; and her premature death in 1726 affected his mind so deeply, that he withdrew from the world to a monastery. In this retreat he divided the remainder of his life between works of charity, religious exercises, and literary studies; and here, in 1752, he closed an existence dignified with every virtue that could adorn a recluse. Louis left a son and daughter, of whom the former, Louis Philippe, born in 1725, was his successor in the family honour. His life was remarkable only for his military service, in the early part of which he fought with gallantry at the battles of Dettingen and Fontenoy, and subsequently in some of the affairs of the Seven Years' War. He married a princess of the House of Conti, by whom he had a son and a daughter, and died in 1785.

Louis Philippe Joseph, the only son of the last duke, who was born in 1747, and known during his father's life as Duke de Chartres, became afterwards more unhappily distinguished as the Duke of Orleans of the National Assembly, the Louis Egalité of the Convention, the instrument and the victim of the French revolution. Naturally gifted with a handsome person and superior talents, he had disfigured both mind and body by a youth of debauchery; and in maturer years his infamous reputation exposed him at the court of Louis XVI. to a contempt which he but too well repaid with deadly hatred to the person and family of that monarch. In the year 1778 he was present in the naval action between the squadrons of Admiral Keppel and Count d'Orville off Cape Ushant; and he was accused of having behaved in that engagement with such shameful cowardice that, instead of receiving the advancement to which he aspired in the sea service, he was appointed colonel-general of hussars, a post created for him by the court with the intention, as it was said, of covering him with ridicule. Having in 1785 succeeded to his father's title, he eagerly entered upon a political career, of which it seems to have been the object, by acquiring popularity, to revenge his injuries upon the court and to raise himself into power. He proved himself however utterly destitute of the qualities of a revolutionary leader, and was soon overwhelmed in the political tempest which he endeavoured to direct. At the commencement of the revolution he arrayed himself on every occasion against the royal authority: during the progress of events which raised the Jacobin party into power, he became their associate and dupe; to render homage to their opinions as a member of the National Convention, he solicited and obtained permission to renounce the name of his family and assume that of Egalité; and finally, after having voted for the death of Louis XVI., he was himself dragged to the scaffold towards the close of the year 1793. He was married to Louise Marie de Bourbon-Penthièvre, daughter of the Duke de Penthièvre, grand-admiral of France, by whom he left one son, the late King of the French, and a daughter, styled Mademoiselle d'Orleans. [LOUIS PHILIPPE.]

ORLOV, sometimes spelt ORLOFF, and generally pronounced ARLOFF, is the name of a family remarkable in Russian history. Its founder was a certain Ivan Orel, or Eagle, who in the reign of Peter the Great was a private soldier among the 'Strelitzes,' or Archers, who formed a body in the Russian analogous to the Janissaries in the Turkish empire. At the time their destruction was accomplished Peter the Great employed himself in beheading many of them with his own hand on a long beam of wood, which served as a block for several at a time. It is a current story in Russia that Ivan was one of those doomed to death, and that on being called on to kneel down to receive the blow he kicked away a head which was still remaining on the beam, with the observation, "If this is my place it ought to be clear." Struck with his coolness, Peter spared the intended victim's life, and placed him in a regiment of the line, where by his bravery he won his way to the rank of officer, which brought with it that of noble. His son, Gregory Ivanovich, rose to be governor of Novgorod, and had five sons, of whom two were especially remarkable.

GREGORY GREGORYEVICH ORLOV, born in 1784, entered the army, was engaged in the Seven Years' War, and was sent to St. Petersburg with Count Schwerin at the time the count was taken prisoner. The Grand-Duchess Catherine, at that time the wife of the heir to the throne, saw Orlov, who was distinguished for the manly beauty of his person, and he became her favourite. The Orlovs, both Gregory and his brothers, took part in the sudden revolution of the 9th of July 1762 [DASHKOVA], which put an end to the short reign of Peter III., and raised his wife—soon to become his widow—to the throne, as the Empress Catherine. After that event honours were showered upon Orlov, who was the father of the empress's child, the Count Bobrinski. He aspired to become her acknowledged husband, and share the throne; but this wish, which was apparently at times near to its accomplishment, was finally thwarted by the opposition of her

adversers, if not by her own reluctance. In 1771 Orlov really distinguished himself by the judgment and energy of his measures against the plague in Moscow, whither he repaired in person to give orders on the spot at the time the epidemic was raging. In the next year his haughtiness and assumption in negotiating with the Turks at Fokahani occasioned affairs to take a bad turn, and he himself broke off the conferences to hasten back to St. Petersburg, on hearing that during his absence he was being supplanted by a fresh favourite. He was met on his way by the empress's orders to repair to his seat at Gatchina, and she afterwards sent him to the palace of Tsarskoe Selo, where he lived in oriental splendour, received the title of Prince, and was addressed as 'Your Highness.' When Potemkin rose to the height of power Orlov married, and travelled abroad, but lost his wife, returned to St. Petersburg, where he resided at the Marble Palace, which had been presented to him by the empress, and finally died in 1783, after having been for some time out of his senses.

ALEXIS ORLOV, his brother, was like himself remarkable for his handsome and athletic person. Born in 1737 he first came into notice in the revolution of 1762. In that year, we are told in Bantush Kamenaky's Biographical Dictionary of remarkable Russians, published in 1836, "he proved his unlimited devotion to Catherine, justly sur-named the Great." "Not entering here into a minute examination of the events of that period, with respect to which posterity will form a freer judgment, we will," adds the Russian biographer, "only mention here what is communicated in official documents." The way in which he "proved his devotion" to the Great Catherine was by murdering with his own hands her dethroned husband, a deed of which he is said to have afterwards publicly boasted at Berlin, to the horror of the Prussian court. In the war with the Turks which broke out in 1768, Alexis Orlov was appointed to the chief command over the two squadrons commanded by the Admirals Spiridov and Elphinstone. The Russian success at the battle of Chesme on the 5th of July 1770 and the burning of the Turkish fleet with fireships in the bay of Chesme, four days later, are attributed by Russian biographers with some hesitation to Orlov; by most other writers, not Russian, to the Scotch and English officers under him, Elphinstone, Greig, and Dugdale. Orlov enjoys the undivided credit of having furnished to Philip Hackert, the German painter, the most expensive model recorded in history. Hackert, who was engaged to paint a series of representations of the battles at Chesme, could not delineate to Orlov's satisfaction the blowing up of the Turkish ships, and alleged as a reason for his want of success that he had never witnessed anything similar to such a spectacle. To furnish him with the requisite experience, a Russian frigate was by Orlov's orders, in the month of May, 1772, blown up in the roads of Leghorn, in the presence not only of the painter but of assembled thousands, and the painting was then completed entirely to Orlov's satisfaction.

Leghorn was the scene of another remarkable incident in the life of Orlov. The Princess Tarakanova, the daughter of the Empress Elizabeth by Count Rasumoyaki, had taken refuge in Italy, and was looked upon with apprehension by the Empress Catherine, who feared she might one day assert a claim to the crown. Orlov, some say by means of a feigned marriage, succeeded in enticing the princess—a girl of sixteen—on board his vessel in the harbour, and then threw off the mask, and sent her prisoner to Russia, where she passed the rest of her days in confinement. On the conclusion of the war in 1774, Orlov, who received the name of Chesmensky from the victories at Chesme, received a brilliant welcome at St. Petersburg; but disgusted at the disgrace of his brother, and the power of Potemkin, withdrew to his palace at Moscow. Immediately after the death of Catherine in 1796, he received a sudden order to repair to St. Petersburg, and found that the new emperor Paul, who had disinterred the body of his father, Peter III., to give it a magnificent funeral, peremptorily commanded that Orlov and Prince Barialinaki, who had assisted in despatching the deposed monarch, should assist in bearing the pall at the funeral procession of their victim. Orlov had of course no choice but to obey; and it is said his countenance during the ceremony bore marks of agony—perhaps arising from fear as much as remorse. He was however permitted to leave St. Petersburg on a tour to Germany, and took care not to return till Paul had perished. Orlov died at Moscow in 1808, leaving a daughter in possession of a colossal fortune.

Of the other brothers of the five, Ivan, the eldest, who lived retired, and was nicknamed by Catherine "the Philosopher," died in 1791; the youngest, Vladimir, who was president of the Petersburg Academy of Sciences, survived till 1832. Vladimir had a son, Count Gregory Vladimirovich, who mostly lived out of Russia, and wrote several works in French, 'A History of Music in Italy,' 2 vols. 1823; 'A History of Painting in Italy,' 2 vols. 1823; 'Travels in part of France,' 3 vols. 1824; 'Memoirs on the Kingdom of Naples,' 5 vols. 2nd edition, 1825. He died at St. Petersburg in 1826. The fourth brother of the five, Fedor, born in 1741, distinguished himself in the Turkish war of 1770 by the capture of Navarino, and died in 1796 at Moscow, leaving behind him four illegitimate children, who were authorised to succeed to his estates and to bear the family name. Two of these have had a remarkable career.

MICHAEL ORLOV, born in 1785, distinguished himself in the army in the campaigns against Napoleon, and in 1814 was one of the generals who received the capitulation of Paris. In the latter part of Alex-

ander's reign he drew on himself the displeasure of the emperor by making representations to him in favour of a constitution, and at the same time censuring the constitution granted to the Poles as too great a concession. He was removed from contact with the emperor, by being appointed to the command of the army of the south, and he himself took a part in the secret societies which were formed in the army, with which however it is said that he only coquetted, taking care not to engage himself too deeply. On the outbreak of the insurrection in December 1825 he was imprisoned, but afterwards released with merely a prohibition to reside in either of the two Russian capitals. After this he lived in retirement till his death in 1841. He left behind him some interesting memoirs, part of which have already been published. His name does not occur in the report of the commission to inquire into the military conspiracy of 1825, but this reserve is supposed to be owing to the influence of his brother, whom the events of 1825 raised high in the confidence of the Emperor Nicolas.

ALEXIS ORLOV, born in 1787, served with distinction in the great war against the French as adjutant of the Grand Duke Constantine Pavlovich. On the memorable day of the 26th of December 1825, when he was in command of one of the regiments of the guard at St. Petersburg, he not only preserved it for the emperor, when the others burst into revolt, but hastened to the emperor's aid. He took up his position opposite the imperial palace, and when, after all the attempts at a pacification had failed, the contest was decided by arms, it was Orlov's regiment that most powerfully contributed to fix the victory on the side of the government. The Emperor Nicolas never forgot the assistance he rendered at a moment so critical to the house of Romanov. While Michael Orlov was spared for his brother's sake, Alexis Orlov became the emperor's personal friend, and was often employed in services of weight and honour.

In 1829 he negotiated the treaty of Adrianople, after the successful war against the Turks, concluded by Diebitsch, and went to Constantinople as ambassador extraordinary. Two years after, when the insurrection in Poland was not so rapidly checked as the emperor expected, Orlov was sent by him to the Russian camp to make such arrangements as he should deem advisable; and soon after his arrival, Diebitsch, and afterwards the Grand Duke Constantine, died of cholera. The name of the former Alexis Orlov is deservedly in odium as connected with deeds of darkness, and the living Alexis Orlov did not escape imputations which have not even yet entirely vanished from the popular mind in Russia, though they have been justly stigmatised as baseless and absurd by the rest of Europe. In the revolt of the Russian military colonies, Orlov was again the companion of the emperor, and shared his dangers and success. In the conferences of London on the Belgian question in 1832, he is thought not to have gained any laurels for Russian diplomacy, though the recognition of the Russo-Dutch loan has been by some attributed to his influence. A greater triumph was supposed to be won when, on the 8th of July 1833, Orlov, then commander of the Russian troops at Constantinople, signed the famous treaty of Hunkiar-Skelessi with the Turks; but this treaty, which appears to have been the only advantage reaped by Russia for its assistance to the Sultan against the Pasha of Egypt, led to nothing but dissatisfaction and protests, and was rendered nugatory by the protocol of the 18th of July 1841. In 1844 Orlov accompanied the emperor on his sudden and, as it turned out, untoward visit to London; and in the next year, in his visit to Palermo and Rome. On the death of Nicholas, he recommended Orlov to his successor as a tried friend; and at the Conference of Paris in 1856, Orlov was the representative of Russia, and signed the peace. [See SUPPLEMENT.]

ORMOND, JAMES BUTLER, DUKE OF. From the large territory of Ormond, in the Irish county of Tipperary, was derived the title of a noble house, so ancient and illustrious that its origin has been, perhaps fancifully, ascribed to the ducal blood of Normandy, before the conquest of England. But it is certain that this family, having become established in Ireland, and distinguished by many services to the crown, as well as by several noble intermarriages, was recognised in that country, from the very beginning of the 13th century, as holding the hereditary office of royal cup-bearer or butler: from which, whether then or at an earlier period, their surname appears to have been derived. Edmund le Botiller was raised by Edward II. to the earldom of Carrick; his son James, who espoused Eleanor Bohun, grand-daughter of Edward I., was created by Edward III. Earl of Ormond; and the issue of that marriage, a second James, called, from his royal descent, 'the noble earl,' filled the dignity of Lord Justice of Ireland, the government of which kingdom was administered under various titles by several of his descendants.

The distinguished individual however of the race was JAMES BUTLER, DUKE OF ORMOND, who was born in London in 1610; and, notwithstanding the splendour of family dignities which he was destined to augment, his youth was passed under circumstances sufficiently adverse to have obscured the career of a less energetic spirit. His grandfather, Walter, earl of Ormond, who had succeeded to the title only collaterally, was exposed to the tyranny of James I., and imprisoned for several years, because he refused to submit to an unjust award of that monarch in behalf of one of his Scottish favourites, Sir John Preston, created Lord Dingwall, to whom the king had compelled the late earl to marry his daughter, and was now resolved to

convey the family estates. The eldest son of Earl Walter married, against his consent, a daughter of Sir John Poynts; and being drowned in crossing the Irish Channel, during his father's life, left without provision a large family, of which James Butler, the future duke, was the eldest son. When Earl Walter was thrown into prison, his grandson and heir, young James, now styled Viscount Thurles, was arbitrarily seized in wardship by the crown, but, with some care for his instruction, committed to the tutelage of Archbishop Abbot, the only benefit by which the king may have been designed to mitigate his cruel oppression of the family. The archbishop is said to have neglected the general education of his charge; but he caused him to be well instructed in the Protestant faith, to which we have the testimony of Burnet, in other respects not his panegyrist, that he staunchly adhered throughout his life.

On the death of James I., Earl Walter having recovered his own liberty and the guardianship of his heir, then in his sixteenth year, the young Lord Thurles began soon after to figure at court, where he paid his addresses to his kinswoman, Lady Elizabeth Preston, and having engaged her affections, succeeded, not without many difficulties, in obtaining the royal assent to their union. This marriage, which took place in 1629, and seems to have been produced as much by mutual attachment as policy, was however not the less fortunate in reconciling differences which had been fatal to both their families; and, in 1632, Lord Thurles succeeded, on his grandfather's death to the earldom of Ormond.

It was at this time that Lord Wentworth, better known under his later title of Strafford, entered on the government of Ireland; and the spirited deportment of the young Earl of Ormond soon attracted so much of his notice as to lead him to prophesy, with characteristic penetration, that "that young nobleman would make the greatest man of his family;" and after his own ruin, one of Strafford's last requests to his royal master was, that his blue ribbon of the Garter might be bestowed upon his friend Lord Ormond. On the breaking out of the Irish Rebellion of 1640, Ormond was appointed by the lords-justices to the command of the royal troops; and throughout the disastrous period which followed, he continued, amidst the fury and jealousy of factions embittered both by political and religious hatred, to pursue with unshaken integrity and moderation a course of true patriotism and fidelity to his duty. With very inadequate forces, he repeatedly defeated the rebels, near Dublin, at Drogheda, at Killrush, and at Ross; but notwithstanding these services, in the course of which he was thanked by the Long Parliament, and raised to the dignity of marquis by the king, he was so ill-supported on all sides, that he was unable longer to sustain the unequal conflict in which he had engaged. There were now no fewer than five parties in Ireland:—the Protestants and Roman Catholics well affected to the king, but opposed to each other; the Protestants favourable to the parliamentary cause; the Papists under their priests wholly devoted to the court of Rome; and the Scotch Presbyterians of the north, who had their separate interests and feelings. The exertions of Ormond being paralysed by the dissensions which prevented the majority of these factions from uniting against the common enemy, he was compelled, in 1648, to conclude a treaty for a cessation of arms, which, on account of the previous barbarities committed by the Irish rebels, excited great dissatisfaction in England.

Throughout the next four years, during which the civil war was raging in England, Ormond, who had been invested by Charles I. with the nominal dignity of lord-lieutenant of Ireland, contrived in some measure to hold that kingdom for his master, and even to detach forces to his aid. But when Charles had fallen into the hands of his enemies, the position of the lord-lieutenant of Ireland against the Roman Catholics having become completely untenable, he resigned his authority by treaty into the hands of parliamentary commissioners, and proceeded to render a satisfactory account of his conduct to the king, then a prisoner at Hampton Court. From thence he retired to France; but still directing his attention to Ireland, and receiving encouragement from the portion of the Roman Catholics best affected to the crown, he again landed in that kingdom, and endeavoured to restore the royal authority. Notwithstanding every effort however, he was defeated in an attempt to besiege the parliamentary forces under Colonel Jones in Dublin; and Cromwell himself soon after landing in Ireland with an overwhelming force, Ormond was finally obliged, at the end of the year 1650, to evacuate the island and withdraw to France. From this time until the death of Cromwell, during which interval he was frequently reduced to great straits for the common necessities of life, Ormond was actively and variously employed in many important and dangerous missions for his exiled king, Charles II.; and, on the Restoration, he accompanied Charles to England, and was rewarded for his sufferings and services by his elevation to the ducal title and other honours.

The remainder of the life of the Duke of Ormond was passed, though not without some troubles and reverses, in the dignified enjoyment of a high rank and spotless reputation. These could not always protect him from the royal caprice and the base machinations of court intriguers; and during the reign of Charles II. and James II. he was twice again possessed and deprived of the government of Ireland, which he administered for many years with activity, wisdom, and justice. It was in the interval of his long tenure of this high office,

that in 1670 a singular and atrocious outrage was committed upon his person in the streets of London by the notorious Colonel Blood, who, with five accomplices, waylaid him as he was returning from a state dinner in the city, and dragged him from his coach, with the intention, as it was believed, if he had not been rescued, of hanging him at Tyburn. Blood, who had been engaged in a plot to seize the castle of Dublin during Ormond's government of Ireland, pretended that he was resolved to retaliate upon the duke's person for the execution of some of his associates on that occasion; but it was strongly suspected that he had been instigated to his audacious attempt by the profligate Duke of Buckingham, the bitter enemy of Ormond; and so convinced was his gallant son, the Earl of Ossory, of the guilt of Buckingham, that soon after, at court, seeing that nobleman standing by the king, he said to him, "My lord of Buckingham, I know well that you are at the bottom of this late attempt of Blood's upon my father; and therefore I give you fair warning, that if my father comes to a violent end by sword or pistol, if he dies by the hand of a ruffian, or by the more secret way of poison, I shall not be at a loss to know the first author of it. I shall consider you as the assassin; I shall treat you as such; and wherever I meet you I shall pistol you, though you should stand behind the king's chair. And I tell it you now in his Majesty's presence, that you may be sure I shall keep my word."

Ormond himself, when Charles, strangely infatuated, if not disgracefully intimidated by the language of the ruffian, whom curiosity led him to visit in the Tower, sent to Ormond to desire that he would forgive Blood, for reasons which Lord Arlington should tell him, drily replied to that nobleman, "that if the king could forgive the offender for stealing the crown, he might easily forgive the attempt upon his life; and that if such was his Majesty's pleasure, that was for him a sufficient reason, and his lordship might spare the rest." Ormond lived unmolested for many years after this flagitious attempt, though he had the misfortune to survive the noble-minded Ormsby; and he himself died, full of years and honour, in the year 1688.

Of his numerous children, the eldest who grew to manhood was Thomas, earl of Ossory, the worthy son of such a father, and eulogised by Burnet as "a man of great honour, generosity, and courage." He was also gifted with many intellectual accomplishments; was equally distinguished throughout the reign of Charles II. for his military services by sea and land; and would probably, if his life had been spared, have proved himself even a more perfect character than his parent: but he died of a violent fever in 1680, at the premature age of forty-six years. He was the father of James, second duke of Ormond, who inherited several of the generous and chivalric qualities of his house, and took a conspicuous share both in the military achievements and civil dissensions of the reigns of William III. and Queen Anne. But driven from England, on the accession of George I., by the persecution of his political antagonists, he embraced the cause of the Pretender; and being consequently attainted, he sullied his fame by engaging in the service of the national enemies of his country, and accepting from the king of Spain the command of an abortive expedition for the invasion of Great Britain.

(Carte, *Life of the Duke of Ormond*; Burnet, *History of his own Time*.) OROSIUS, PAULUS, a presbyter of the Spanish church, was born in the latter part of the 4th century, at Tarragona, in Cataluña. He was educated in Spain, but about A.D. 414 he proceeded, by direction of the Spanish bishops Eutropius and Paul, to Africa, for the purpose, as it seems, of consulting St. Augustine (whom he appears from the Introduction to his 'History' to have been in communication with some years before), on several controverted points of belief, which were then discussed by the sects of the Priscillianists and the Origenists, especially concerning the nature and origin of the soul. ('Consultatio sive Commonitorium Orosii ad Augustinum de errore Priscillianistarum et Origenistarum,' together with Augustine's answer, 'Ad Orosium contra Priscillianistas et Origenistas,' both in the collection of the works of St. Augustine.) From Africa, Orosius proceeded to Palestine with a recommendation from Augustine to Jerome, who was then living at Bethlehem. While in Palestine, Orosius wrote a treatise against Pelagius, who was at that time spreading his opinions concerning original sin and grace, 'Liber apologeticus contra Pelagium de Arbitrii Libertate,' which is annexed to the 'History' of Orosius. He was also called upon to oppose Pelagius and his disciple Caesarius in a synod held at Jerusalem, July 30, 415. From Palestine, Orosius returned to Hippo Regius, to his friend Augustine, and thence to Spain. He now employed himself in writing his 'History of the World,' a work which he seems to have undertaken about 410 (see Bosworth's 'Orosius,' Int., p. 14), at the suggestion of Augustine, to whom it is dedicated. The history ends with the year A.D. 416, about which time it appears to have been completed.

The calamities which had befallen the Roman empire, and above all the capture and pillage of Rome by Alaric, A.D. 410, afforded to the heathens and to Symmachus, among the rest, a pretence for accusing the Christian religion of being the cause of all those disasters, and of saying that since the abandonment of the old religion of the state victory had utterly forsaken the Roman arms. It was for the purpose of replying to these accusations that Orosius wrote his history, which may be considered in part as an apology for Christianity against the pagans, as the title, which has been found in several manuscripts, expresses,—'Adversus Paganos Historiarum libri vii.' In some manu-

scripts the title is, 'De totius Mundi Calamitatibus;' in others, 'De Cladibus et Miseriis Antiquorum,' &c. The work consists of seven books, divided into chapters. It begins with a geographical description of the world, then treats of the origin of the human race according to the Book of Genesis, and afterwards relates the various accounts of the mythologists and poets concerning the heroic ages. Then follows the history of the early monarchies, the Assyrian, Babylonian, and Persian, the conquests of Alexander, and the wars of his successors, as well as the early history of Rome, the contents being chiefly taken from Trogius Pompeius and Justinus. The fourth book contains the history of Rome from the wars of Pyrrhus to the fall of Carthage. The fifth book comprises the period from the taking of Corinth to the war of Spartacus. Orosius quotes his authorities, several of which are from works which are now lost. The narrative in the sixth book begins with the war of Sulla against Mithridates, and ends with the birth of our Saviour. The seventh book contains the history of the empire till A.D. 416, including a narrative of the taking and sacking of Rome by Alaric, which was the great event of the age.

Orosius intermixes with his narrative moral reflections, and sometimes whole chapters of advice and consolation, addressed to his Christian brethren, and intended to confirm their faith amidst the calamities of the times, which, however heavy, were not, as he asserts, unprecedented. The Romans, he says, in their conquests had inflicted equal if not greater wrongs on other countries. His tone is that of a Christian moralist impressed with the notions of justice, retribution, and humanity, in which most of the heathen historians show themselves deficient. He deprecates ambition, conquest, and glory gained at the expense of human blood and human happiness. As an historian, Orosius shows considerable critical judgment in general, though in particular passages he appears credulous, as in chap. x. of the first book, where he relates from report that the marks of the chariot wheels of Pharaoh's host are still visible at the bottom of the Red Sea. As an instance of the incidental value of the passages taken by Orosius from older writers, see Savigny, 'Das Recht des Besitzes,' p. 176.

King Alfred made a free translation of the 'History' of Orosius into the Anglo-Saxon language, which was published by Daines Barrington, with an English version of it, 8vo, London, 1778, but of which a much more accurate edition, with a literal translation into English, and valuable notes, was published by Dr. Bosworth in 1855. The very remarkable additions of Alfred are especially valuable, as containing "the only geography of Europe, written by a contemporary, and giving the position and the political state of the Germanic nations so early as the 9th century." A translation of Alfred's version forms a volume of 'Bohn's Antiquarian Library,' 1847.

One of the best editions of Orosius is that of Leyden, 4to, 1788, with Haverkamp's notes.

ORPHEUS, a poet, musician, and philosopher, whose name is very prominent in the early legends of Greece. The traditions respecting him are remarkably obscure. According to Cicero ('De Nat. Deor.,' l. 38), Aristotle believed that no such person as Orpheus the poet had ever existed; but perhaps he only means that the poems ascribed to Orpheus were spurious: he is mentioned as a real person by several of the early Greek writers—the lyric poets Ibycus and Pindar, the historians Hellanicus and Pherecydes, and the Athenian tragedians: he is not mentioned by Homer or Hesiod. Some ancient writers reckon several persons of this name, and Herodotus speaks of two. In later times a number of marvellous stories were connected with his name. The following is an outline of the legendary history of Orpheus:—His native country was Thrace. It is a remarkable fact that most of the legends respecting Greek civilisation are connected with the Thracians, who in later times spoke a language unintelligible to the Greeks, and were looked upon by them as barbarians. Müller explains this by pointing out that the Thracians of these legends were not the same people as those of the historical period, but a Greek race, who lived in the district called Pieria, to the east of the Olympus range, to the north of Thessaly, and to the south of Emathia or Macedonia. ('History of the Literature of Greece,' in 'Library of Useful Knowledge,' p. 26.) The time at which he lived is placed by all writers not long before the Trojan war, and by most at the period of the Argonautic expedition, about twelve or thirteen centuries before Christ. He was the son of Apollo and the muse Calliope, or, according to other accounts, of Eger and a muse. The poets represent him as a king of Thrace, but the historians are generally silent about his station. According to Clemens of Alexandria, he was the disciple of Musæus; but the more common accounts make him his teacher. He was one of the Argonauts, to whom he rendered the greatest services by his skill in music; the enchanting tones of his lyre made the Argo move into the water, delivered the heroes from many difficulties and dangers while on their voyage, and mainly contributed to their success in obtaining the golden fleece. (Orphæi, 'Argonautica.') After the voyage he returned to the cavern in Thrace in which he commonly dwelt. He is said by some authors to have made a voyage to Egypt before the Argonautic expedition.

Orpheus had for his wife a nymph named Eurydice, who died from the bite of a serpent as she was flying from Aristæus. Orpheus followed her to the world beneath, and by the power of his lyre induced Pluto and Proserpine to restore his wife, but upon the condition that he should not look back at her till he had passed the

boundaries of Pluto's realm. He broke the condition, and she vanished from his sight.

His death is differently related. The most common account is that he was torn in pieces by the Thracian women at a Bacchic festival, in revenge for the contempt which he had shown towards them through his sorrow for the loss of Eurydice. (Apoll., i. 8; Virg., 'Georg.', iv. 454.) His limbs were scattered over the plain, but his head was thrown upon the river Hebrus, which bore it down into the sea as far as Lesbos, where it was buried. The Muses gathered up the pieces of his body and buried them at Libethra, where the nightingale was said to sing over his grave more sweetly than in any other part of Greece. His lyre was placed by Jupiter among the stars.

The poets and fabulists have attributed to Orpheus many great improvements in the condition of the human race. Nearly all the ancient writers state that he introduced into Greece the doctrines of religion and the worship of the gods. The foundation of mysteries is ascribed to him. (Aristoph., 'Ranae,' v. 1080; Eurip., 'Rhesus,' v. 945; Plato, 'Protag.', p. 216.) Herod. (ii. 81) speaks of Orphic and Bacchic mysteries: these mysteries seem to have been different from those of Eleusis. Some writers say that the Orphic mysteries were introduced from Egypt into Greece; others think that they sprung up in Thrace, and that they preceded the worship of Dionysius, which was of foreign origin, and that the destruction of Orpheus by the Bacchantes represents the victory of the new over the old religion. The foundation of social institutions and the commencement of civilisation is ascribed to Orpheus. (Horat., 'De Art. Poet.', v. 391.) Aristophanes says that he taught men to abstain from murder. ('Ranae,' v. 1080.) He is said to have been the author of many fables. A passage in an epigram, to which however no authority can be attached, ascribes to him the discovery of letters. (Fabric., 'Bib. Græc.', i. p. 173.) The discovery of many things in medicine is ascribed to Orpheus (Plin., xv. 2); and the recel of Eurydice from the lower world is sometimes explained as referring to his skill in this art. He was said to have been a soothsayer and enchanter. In Lesbos there was a famous oracle of Orpheus. The most remarkable of the legends concerning him are those which relate to his skill in music. The fable that by the tones of his lyre he drew around him wild beasts, trees, and stones, is very old. When, according to a later story, he descended into the infernal regions to recover Eurydice, his music enchanted the world of shadows and suspended the torments of the damned. A share in the invention of the lyre is attributed to him: he received it from Apollo with seven strings, and added to it two more. According to Plutarch, he was the first who accompanied the lyre with singing. The fable that after his death his lyre floated to Lesbos is a poetical mode of representing the skill of the natives of that island in lyric poetry. He is said to have embodied his religious and philosophical opinions in poems, but the works ascribed to him are without doubt spurious.

ORRERY, EARL OF. [BOYLE, CHARLES.]

ORSAY, COUNT D'. [BLESSINGTON, COUNTESS OF.]

ORSINI, an old and illustrious family of Southern Italy, which has had among its members several popes, many cardinals, and other distinguished individuals. Orso Orsini, of Petigliano near the lake of Bolsena, is mentioned as senator of Rome in the years 1190-1200. His son Giovanni Orsini Gaetani, which last was his mother's family name, left two sons: 1, Napoleone Orsini, Count of Tagliacozzo in the kingdom of Naples; and 2, Matteo, styled 'the Great,' senator of Rome, and lord of Anagni, Marino, Galera, and other fiefs in the Campagna of Rome. Matteo left several sons, one of whom Giovanni Gaetani, became pope under the name of NICHOLAS III. A branch of the family entered the service of the Anjou kings of Naples, obtained high honours at that court, and the titles of counts of Nola and dukes of Gravina. The Orsini who remained in the Papal States were often at variance with the powerful family of Colonna [COLONNA] during the middle ages. The castle of Bracciano, on the lake of that name, was the chief residence of the Orsini. In January 1505, Francis Orsini, duke of Gravina, and Paolo Orsini, were treacherously seized and strangled at Sinegaglia by Cesare Borgia, whilst the Cardinal Orsini was poisoned at Rome by order of Cesare's father, Pope Alexander VI. By degrees the various branches of the Orsini became extinct, and their estates passed into other hands, with the exception of the Neapolitan branch of the princes of Orsini-Gravina, which still continues. The palace Orsini at Rome, a vast building, stands on the ruins of the Theatre of Marcellus. The family palace at Naples, belonging to the princes of Orsini-Gravina, is one of the finest private buildings in that capital. (Imhoff, *Genealogies*; Moreri; *Almanach de Gotha*.)

ORSINI, FULVIO, said to have been an illegitimate member of the noble family of that name, was born at Rome about 1580, and became canon of St. John of Lateran. He was well versed in classical literature, both Greek and Roman, and collected a valuable library of manuscripts, which he bequeathed to the Vatican library. He was intimate with the cardinals Alexander and Edward Farnese, and was considered one of the first scholars of his age. He died at Rome, May the 8th, 1600. He wrote several learned works: 1, 'Familie Romane quæ reperiantur in antiquis Numismatibus, ab Urbe Condita ad tempora Divi Augusti, cum adjunctis Antonii Augustini Episcopi

BIOG. DIV. VOL. IV

Ilerdensis,' fol. Paris, 1663; 2, 'Virgilius collatione Scriptorum Græcorum illustratus,' in which he points out the numerous passages in which Virgil has imitated or borrowed from the Greek poets; a very interesting commentary; 3, 'Selecta de Legationibus ex Polybio et Fragmenta ex Historiis quæ non extant Dionysii Halicarnasæ, Diodori Siculi, Appiani Alexandrini, Dionis Cassii, &c.,' 4to, Antwerp, 1582, in Greek, with Latin notes, 4to; 'Carmina Novum illustrium Fœminarum Græcarum,' 8vo, Antwerp, 1568, and other minor publications.

ORTELIUS, ABRAHAM, born at Antwerp in 1527, of a family originally from Augsburg, studied philology and mathematics, and became the first geographer of his age. After travelling through England, Germany, France, and Italy, he published his great work, 'Theatrum Orbis Terræ,' being a description of the globe, or universal geography. He was soon after appointed geographer to Philip II. of Spain. His other works are—1, 'Deorum Dearumque Capita ex veteribus Numismatibus;' 2, 'Aurei Sæculi Imago, sive Germanorum Veterum Mores, Vita, Ritus, et Religio;' 3, 'Itinerarium per nonnullas Gallie Belgicæ Partes.' Ortelius was acquainted with most of the learned men of his age, and was particularly intimate with Justus Lipsius, who wrote his epitaph. He died in 1598. (Sweett, *Vita Ortelii*; Valere André, *Bibliotheca Belgica*.)

OSABIA, or more properly Ibn Abi Os'abia, the name commonly given to an eminent Arabic physician, who is called by Nicoll and Pusey ('Catal. Cod. Manuscr. Orient. Biblioth. Bodl.'), Movaffekeddin Abulabbas Ahmed Ben Alcasem Ben Khalifa Ben Junos Ibn Abilcasem Alsadi Alkhamragi. It may indeed, as few Arabic names have been more corrupted, be useful to mention that it is sometimes spelled Abi, Abou, or Abu Osaba, Osabih, Ossaba, Ossabea, Osaba, Osaba, Obaba, Obaba, Obseiba, &c. He was born A.H. 600 (A.D. 1203), and was (as his name implies) of the family of Al-Chamraj, of the tribe of Al-Azd. (Pococke, 'Spec. Hist. Arab.,' p. 42, ed. Oxon., 1806.) He informs us himself, in the fourteenth chapter of his work, that he was the pupil of the celebrated Al-Beithar. He studied medicine at Cairo in the lazaretto founded by Saladin, and was appointed chief physician to the Emir Ezzaddin, at Sarchad in Syria, A.H. 635 (A.D. 1238). He died A.H. 668 (A.D. 1269). He is the author of a well-known work entitled 'Oïun al-anba fi thabacat al-athebbâ' ('Fontes Relationum de Classibus Medicorum'), containing a biographical history of medicine. It is divided into fifteen chapters, of which the first treats of the origin of medicine; the second, of the earliest discoverers in each branch of the profession; the third of the Greek physicians of the family of Æsculapius (Asklēpius); the fourth, of the physicians of the school of Hippocrates (Bokrath); the fifth, of Galen (Gialinous) and his contemporaries; the sixth, of the Christian physicians who flourished at Alexandria before the time of Mohammed; the seventh, of Arabian physicians in the time of Mohammed; the eighth, of Syrian physicians under the Abbassides; the ninth, of the translators of the Greek physicians into Arabic; the tenth, of the physicians of Irak and Mesopotamia; the eleventh of the Persian physicians; the twelfth, of the Indian; the thirteenth, of the Moorish and Spanish; the fourteenth of the Egyptian; and the fifteenth, of the Syrian. Freind, in his 'History of Physic,' speaks slightly of this work, but he was acquainted with only a very small portion of it, and was unable to read it in the original language. Reiske, on the contrary ('Opusc. Med. ex Monim. Arab. et Ebrae.', 8vo, Halle, 1776), praises it very highly, and gives a tolerably complete analysis of its contents, from which it appears that a great many curious and interesting medical anecdotes and much information relating to the ancient method of practice are to be found in it. It exists at present only in manuscript in several libraries of Europe, viz. at Paris, Oxford, and Leyden; but different small portions of it have been published. The life of Bachtishua, translated into Latin by Salomo N-gri, is inserted by Freind in his 'History of Physic;' that of Adallatif was published at Oxford, 1808, 4to, Arab. and Lat., ed. J. Mousley; and a small extract, containing the diploma of a doctor of theology, is to be found in Adler's 'Collect. Nova Numor. Cuficor.,' 4to, Hafu., 1792, p. 118. There is in the Bodleian at Oxford a manuscript Latin translation by Gagnier of the first five chapters. A manuscript Latin translation of the whole work by Reiske was left by him at his death, in 1774, to Bernard (probably the same physician who edited several Greek medical treatises).

(See Nicoll and Pusey, *loco cit.*; De Rossi, *Dision. Stor. degli Autori Arabi*; and Reiske, *loco cit.*)

\*O'SHAUGHNESSY, SIR WILLIAM BROOKE, K.C.B., F.R.S., &c., is a son of the late Daniel O'Shaughnessy, of the city of Limerick; his mother's name was Boswell. He is thus the representative of an ancient Irish family originally settled in the county of Clare: he is nephew of the late Very Rev. Dr. O'Shaughnessy, Dean of Ennis, and grand-nephew of the Right Rev. Dr. O'Shaughnessy, formerly Roman Catholic bishop of Killaloe. He was born at Limerick in 1809, and received his early education at the University of Edinburgh, where he graduated M.D. At the age of twenty-one he entered the service of the Hon. East India Company as assistant-surgeon, and in 1838 was appointed by the governor-general to civil employment. He was for some time physician to the late Sir C. T. (afterwards Lord) Metcalfe, while he held the command at Agra. He was afterwards appointed professor of chemistry in the Medical

College at Calcutta, and chemical examiner to the government. His position led him to investigate the merits of the electric telegraph as a means of communication between distant places, and readily perceiving the immense services that such an invention would render to the civil and military administration of a country like India, cut up into presidencies, and with no single central government, he published in 1839 a work upon the subject, which however attracted less attention at the time than it deserved. The then governor-general of India, the late Earl of Auckland, was not inclined to forward any extensive innovation; and his successors, Lords Ellenborough and Hardinge, were too much taken up with warlike operations to be able to devote their energies to the improvement of the internal resources of India. The quick eye of Lord Dalhousie however readily noted the vast importance of such an undertaking, and he accordingly engaged Dr. O'Shaughnessy to lay down an experimental line of electric telegraph, and to report on its working. The result was that in 1852 the Court of East India Directors sanctioned the immediate construction of telegraphic lines between Calcutta, Agra, Bombay, Peshawur, and Madras. Dr. O'Shaughnessy was despatched to England to procure the requisite men and materials for carrying out the plan; and returning to India, commenced laying down the line in November of the following year, 1853. Such was the energy of Dr. O'Shaughnessy that in March 1854 the line was in full working between Calcutta and Agra, a distance of 800 miles; and in February 1855 it had reached the extent in all of 3050 miles, connecting forty-one stations, thus placing Calcutta in instantaneous communication not only with Agra but with Bombay and Madras. In his latest report (February 1856), Dr. O'Shaughnessy was able to report that the entire extent of the electric telegraph laid down in India had reached 4000 miles. It is impossible to overrate the difficulties encountered by Dr. O'Shaughnessy in the construction of these gigantic lines, as they have no parallel in the civilised and cultivated countries of modern Europe. There is no metallic road, few bridges, and no police to protect the wires when erected. These too have been carried across seventy large rivers, some by cables and some by wires; one of these rivers is 15,840 feet, and another two miles, in breadth; and through dense jungles, which it is fatal to cross for six months in every year. The total cost has not on the average exceeded 50% a mile, yet no necessary expense has been spared in the work of construction: for instance, for 174 miles the telegraphic wires are carried on stone-masonry pillars capped with granite; and for 332 miles they are sustained on single slabs of granite, each rising sixteen feet above the ground. The chief difficulty however with which Dr. O'Shaughnessy had to contend, to use his own words, lay in the sudden and simultaneous training of 300 persons to be employed in the different offices connected with the working department. As a proof of the military advantages to be derived from the work accomplished by Dr. O'Shaughnessy, it is recorded by Lord Dalhousie that by its means the Indian government was enabled, in the winter of 1854-55, to reinforce the British forces in the Crimea with two troops of cavalry of 1800 sabres, with a promptitude which would have been quite impracticable in the previous year. In the autumn of 1856 Dr. O'Shaughnessy arrived in England, when he was made a Knight Commander of the Bath in acknowledgment of his services, the results of which may challenge comparison with any public enterprise which has been carried into execution in modern times either in Europe or America.

OSSIAN. [MACPHERSON, JAMES.]

OSSOLI, MARCHIONESS. [FULLER, SARAH MARGARET.]

OSTADE, ADRIAN VAN, was born in 1610, in the city of Lübeck; but though a German by birth, he is always considered to belong to the Dutch school of painting, having formed his style in Holland, where he studied under Frank Hals, and is said to have received some instruction from Rembrandt. In the school of Frank Hals he formed an acquaintance with Brouwer, who became his intimate friend and adviser. Like Brouwer, he chose his subjects from low life, such as farm-houses, stables, and the interior of ale-houses; the figures are generally occupied in drinking, smoking, and the like; rural sports, village weddings, and countrywomen engaged in their domestic employments, were the scenes and the characters with which he was familiar. But though in the choice of his subjects he had no regard to elegance, and though he took what he had before him without endeavouring to improve it, his compositions are so spirited, there is such truth, nature, and life in his little pictures, there is such delicacy in his pencil, such warmth, transparency, and brilliancy in his colouring, and such a profound knowledge of the chiaroscuro, that it is impossible not to admire his genius and execution. Ostade's figures were so much admired that he was frequently solicited by the most eminent contemporary artists to paint the figures in their landscapes. His best works are extremely scarce, and sell at very high prices. His works are to be found in every private collection of any importance in England. There is no picture by him in the National Gallery, but the Dulwich Gallery contains several of his works. Ostade died in 1685, at the age of seventy-five.

OSTADE, ISAAC VAN, born at Lübeck in 1617, was the brother of Adrian, from whom he learned the art of painting, and whose manner he imitated so closely that some of his copies after Adrian have been frequently ascribed to the latter. He died young, which hindered him from acquiring the excellence that he would probably

have attained. He is generally characterised as much inferior to his brother; but Dr. Waagen, after carefully examining his pictures in the collections in England, says of him:—"Great injustice is done to Isaac van Ostade by the poor pictures of country life which are frequently ascribed to him in the galleries in Germany. In Holland, in Paris, and above all in England, we may be convinced that in his village-scenes and in his winter-pieces he is a wholly original master, and by no means inferior to his brother." Some of his finest works are in England, in the royal collection and the collections of Sir Robert Peel and Lord Ashburton. Isaac van Ostade died in 1671 (or 1654).

OSTERVALD, JEAN FREDERIC, was born at Neuchâtel, in Switzerland, in the year 1663. Having studied at Saumur, Orléans, and Paris, he returned to his native country, and in 1699 was appointed pastor of the reformed church of the town of Neuchâtel, where he became noted for his zeal in instructing his flock, as well as for his theological learning. He published an edition of the Bible in French, with arguments or explanatory heads to the books and chapters, which became very popular among the French Protestants under the name of 'Ostervald's Bible,' and of which there have been several reprints. He published also—1, 'Abrégé de l'Histoire de la Bible'; 2, 'Traité des Sources de la Corruption qui règne aujourd'hui parmi les Chrétiens'; 3, 'Traité contre l'Impureté'; 4, a Catechism, which is much used in the French Protestant churches, and is known by the name of 'Catechisme d'Ostervald'; 5, 'Ethica Christiana'; and other religious works. Ostervald died at Neuchâtel, in 1747, much regretted. He and his two friends, J. A. Turstin of Geneva and Samuel Werenfels of Basel did much toward the revival of religion in Switzerland: they were styled the 'Triumvirate of Swiss Divines.'

OTHMÁN (IBN AFFÁN), the third kalif of the Moalems after Mohammed, was a direct descendant from Abd-al-menaf, one of the ancestors of the prophet. Having early adopted Islam by the persuasion of Mohammed, he became one of his most zealous 'asháb' (companions), followed him in his flight from Mecca to Medina, and was made, on his return, one of his most confidential friends and secretaries. [MOHAMMED.] Othmán was one of the six individuals to whom the Kalif Omar had by his will entrusted the designation of a successor. After mature deliberation the majority chose Othmán, on condition that he would govern the people according to the rules of the Korán. Othmán solemnly promised to do this, and he was accordingly invested with the supreme power towards the end of Dhi-l-hajjah A.H. 23 (Nov. or Dec. A.D. 644), three days after the death of Omar. His first public act was to send a body of troops under Al-mugheyyrah Ibn Shaabah to complete the reduction of the province of Hamadan (A.D. 645), while another army expelled Jazdegerd from Persia (A.D. 646). [OMAR.] Another body of Arabs (A.D. 647) reduced all that part of Khorassán which had escaped former invasions. In the meanwhile Abdullah Ibn Said invaded Eastern Africa, and after defeating and killing at Yakubiyyah the patrician Gregorius, who commanded in the Grecian emperor's name, subdued its principal cities. Four years afterwards (A.D. 651) the same commander made an incursion into Nubia, and obliged the Christian sovereign of that country to sue for peace and pay him tribute. The islands of Cyprus and Rhodes were attacked and plundered by Muawiyah Ibn Abi Sufyán (A.D. 648): these two maritime expeditions being the first which the Arabs ever made.

While the Mohammedan empire was thus extending on all sides, Othmán was rapidly losing the affections of his subjects by the weakness of his internal administration and his partiality towards the members of his family. Abú-l-fedá, the Arabian historiographer, says, that some one having suggested to Omar on his death-bed to appoint Othmán his successor, he exclaimed, "God forbid that I should; Othmán is too much inclined to favour his own friends and relatives." In this judgment Omar was not mistaken. Othmán began by removing the celebrated Amrú Ibn Al-ás from the government of Egypt—a country which he had conquered—and appointing in his place his own foster-brother, Abdullah Ibn Said. This measure was as disagreeable to the Arabs as to the Egyptians. The people of Alexandria, who bore impatiently the Mohammedan yoke, and were only kept in obedience by the mildness and the justice of their governor, seeing a favourable opportunity, entered into a correspondence with the Greek emperor, and surrendered to him the city; and although Othmán immediately reinstated Amrú, who recovered Alexandria and demolished its fortifications, this was not accomplished without great difficulty and considerable bloodshed (A.D. 646). Saad Ibn Abi Wakkás and Abú Músa Al-ashaari, two of Mohammed's companions, were also deprived by him of their command. Othmán rendered himself further obnoxious by occupying on the 'minbar' (pulpit), and while at prayers in the mosque, the same place which the prophet had used, instead of placing himself, as his predecessors Omar and Abú Bekr had done, a few steps lower down. He had also lost from off his finger a silver signet ring which had once belonged to the prophet, and with which the kalifs his predecessors had sealed their despatches—an ominous circumstance, which was regarded by all zealous Moalems as the greatest blow that could be inflicted on their rising empire; and he had recalled from his exile Hakem Ibn Aas, whom the prophet himself had banished from Mecca. Othmán was further accused of excessive prodigality towards his favourites. These and other complaints against Othmán increasing the public dis-

content, the elders of the Arabian tribes and the most illustrious among the companions of the prophet met at Medina, and having drawn up a memorial in which their charges, nineteen in number, were fully specified, they despatched with it one of their number, Ammár Ibn Isáir, threatening Othmán with immediate deposition unless he gave a satisfactory answer to every one of them. Othmán resented this as an outrage upon his authority, and caused Ammár, the bearer of the memorial, to be so severely beaten by his slaves that he was left for dead on the ground. This act inflamed the passions of the people, who now openly demanded Othmán's abdication. Deputations from all the provinces of the empire, having the same object in view, reached Medina, and Othmán was closely besieged in his palace by a large body of insurgents. In vain did Othmán promise to restore to the treasury the sums he had abstracted, to redress all grievances, and answer all complaints; the fury of the people increased instead of abating, and they would undoubtedly have committed violence upon his person had not All, who had considerable influence among the insurgents, promised in the kalif's name that all causes of complaint should be immediately removed.

The tranquillity by these means restored was but of short duration. Ayesha, the widow of the prophet, who hated Othmán, and who had seen with envy his accession to power, now openly favoured the pretensions of Talhah to the kalifate. By her authority among the Arabian tribes, as well as by her intrigues, she succeeded in creating great disaffection against Othmán, and attaching the most influential people in the empire to her interests. She bribed Othmán's secretary, Merwán Ibn Hakem, to transmit false orders in his master's name. One of these, addressed to Abdullah, governor of Egypt, bid him put to death Mohammed, son of the Kalif Abú Bekr, who was then residing at Alexandria, and followed the party of Ayesha. No sooner was the kalif's order made known than Othmán's enemies eagerly urged Mohammed to revenge the affront. He accordingly marched against Medina, which he entered without opposition, and invested Othmán's palace. After making some resistance, Othmán's soldiers left him to his fate. Placing a Korán in his bosom, the kalif calmly awaited the arrival of the assassins, who, headed by Mohammed, rushed into the room. The incensed youth seized Othmán by the beard, and plunged his sword into his breast; others pierced his body in different parts, and he expired under numerous wounds. For three days his mutilated corpse lay unburied and exposed to the insults of the populace, until it was at length thrown into a hole. This happened, according to At-tabári and Abú-l-fedá, on the 18th day of Dhí-l-hajjah A.H. 35 (18th of June A.D. 656); other historians assign earlier dates to this deplorable event, although all agree in placing it within that month. Othmán reigned twelve years, and was eighty-two, others say ninety, and even ninety-five years old when he died. He had been married to two of the daughters of the prophet, Rakiyyah and Om-al-Kolthúm, owing to which he is generally designated by the Arabian historians under the surname of Dhí-n-núrayn (he of the two lights). Othmán is described as a man of majestic figure and venerable aspect; he was pious and well versed in the Korán, which he is reported to have transcribed several times. He was the first who caused an authentic copy of the Korán to be made, from which all others were to be transcribed. He entrusted the revision of it to Zeyd Ibn Thábit, Abdullah Ibn Zobeir, and other companions of the prophet. Until the 11th century of our era a copy of the Korán called 'Mushafu-l-Othmání' (the volume of Othmán) was preserved in the great mosque at Cordova, being thought by some authors to contain four leaves of the Korán which Othmán placed in his bosom, and stained with his blood, and by others to be one of those copies which the kalif was known to have written himself.

(As-soytáti, *History of the Kalifs*, in manuscript, in the Brit. Mus., No. 7424; Abú-l-fedá, *An. Mosl.*, vol. i. p. 240, et seq.; Al-makin *apud* Erpenium, p. 31, et seq.; Abú-l-faraj, *Hist. Dynast.*, translated by Pococke, p. 57, et seq.; Oockley, *Hist. of the Saracens*, vol. i.; Price (Major), *Retrospect of Mohammedan History*, vol. i.)

OTHMÁN, IBN YAHIA ALCAISI, was born of a noble family at Malaga in Andalusia. He is mentioned as a man of great and varied talents, and as having been eminent in philosophy, law, and medicine. He was made governor of Malaga, and died A.H. 735 (A.D. 1334). He was the author of a work containing many grammatical questions ('*Qussaita Grammatica*'); another, '*De Hæreditate*'; and a third, '*De Mensuris Hispanis*.' (Casiri, *Biblioth. Arabico-Hisp. Ecur.*, t. ii. p. 109.)

OTHMÁN I., surnamed Al-gházi (the Conqueror), the founder of the dynasty now reigning at Constantinople, was born at Súkút in Bithynia in 657 of the Hejira (A.D. 1259). The Turkish and Arabian historians do not agree as to his ancestors and origin, but the most generally received opinion is, that he was the son of Orthogru, a Turkman or Oguzian chieftain, who, having entered into the service of the sultan of Iconium, established himself with his tribe at Surgút, on the banks of the river Sangar. It is further related that his grandfather Suleymán left his native steppes in the Má-wará-l-nahr (beyond the Oxus), passed into Khorassán at the time of the invasion of Genghis Khan (A.D. 1218-19) [GENGHIS KHAN], and settled at Keláth in Armenia. After the death of Suleymán, who was drowned in the Euphrates, his son Orthogru succeeded him in the command of the tribe. He marched farther into Asia Minor, and entered the service of

Also-d-din Caycobad, the ninth sultan of the Seljúkian dynasty, whose reign began in A.D. 1213. Having received lands to settle in with his tribe, Orthogru rendered important services to Also-d-din and his successors, aiding them in their wars against the Tartars and against the Greeks. Orthogru died in A.H. 680 (A.D. 1280), leaving his son Othmán to succeed him in the government of the colony. After the death of Masúd II., the last of the Seljúkides, his dominions being shared among his generals, part of the province of Bithynia fell to the lot of Othmán, who thus found himself the master of a small territory. The first campaigns of this conqueror were directed against the Greeks. In July, A.D. 1299, having first forced the slightly defended passes of Mount Olympus, he invaded the territory of Nicæa, and subdued the whole country, except the capital itself, which fell four years afterwards into his power (1304). In 1307 he invaded and reduced the country of Marmara. The annals of the first years of his reign exhibit the same repetition of successful inroads, until, seeing his army increased by captives and volunteers, he meditated and carried into execution greater undertakings. Instead of retreating as before, after each incursion, to the hills, he maintained the most useful and defensible posts, fortified the towns and castles, and strove to maintain every foot of ground which he gained from the enemy. In the course of many years of warfare he conquered the remainder of Bithynia and the neighbouring provinces; and although he was several times repulsed in his attempts upon Nicomedia and Prusa, he kept those cities in awe by means of strong fortresses which he erected in their neighbourhood. At length his son and successor, Orkhán, gained possession of Prusa, but the welcome news did not arrive till Othmán was almost insensible, owing to old age and infirmities. Othmán died in A.D. 1326, in the sixty-seventh (sixty-ninth year Mohammedan reckoning) of his age and the twenty-seventh of his reign, reckoning from his first invasion of Bithynia. He held his court at Cara-Bissar and coined money in his name, but he never took the title of sultan. Such was the commencement of the Turkish empire, which, from his name, has received the appellation of Othoman or Ottoman Porte. The memory of Othmán is held in such veneration by the Turks, that, on the accession of a new sultan to the throne of Constantinople, no greater compliment can be paid to him than to wish him as happy a reign, as long a life, and all the kindness of Othmán. He was famed for his moderation, his justice, his military talents, and his prudence: he left to his son Orkhán a book of maxims and rules for the government of an empire, which are much esteemed. (Von Hammer's *Journey from Constantinople to Brusa and to the Olympus*, Pesth, 1818, and *Geschichte des Osmanischen Reichs*, Pesth, 1827; D'Ohsson, *Tableaux de l'Empire Othoman*; Abú-l-fedá, *An. Mosl.*, vol. v.; Desguignes, *Histoire des Huns*.)

OTHO, MARCUS SALVIUS, was born on the 28th of April, A.D. 81 or 82. He was descended of an honourable family, which originally came from Ferentinum (Ferentino), and which traced its origin to the kings of Etruria. His grandfather, who belonged to the equestrian order, was made a senator through the influence of Livia Augusta, but did not rise higher in office than the prætorship. His father, Lucius Otho, was advanced to offices of great honour and trust by the emperor Tiberius, whom he is said to have resembled so closely in person as to have been frequently taken for a near relation.

Marcus Otho was an intimate friend of Nero during the early years of his reign, and his associate in his excesses and debaucheries; but Nero's love for Poppæa, whom Otho had seduced from her husband, and to whom he was greatly attached, produced a coolness between them, and ultimately occasioned the honourable banishment of Otho to the province of Lusitania, of which he was appointed governor. In this province, which he governed, according to Suetonius ('Otho,' c. 3), with great justice, he remained for ten years; and afterwards took an active part in opposition to Nero and in placing Galba upon the throne, A.D. 68. Otho appears to have expected, as the reward of his services, that he should have been declared his successor; but when Galba proceeded to adopt Piso Licinianus as his successor, Otho formed a conspiracy among the guards, who proclaimed him emperor, and put Galba to death after a reign of only seven months. [GALBA.]

Otho commenced his reign by ingratiating himself with the soldiery, whom Galba had unwisely neglected to conciliate. He yielded to the wishes of the people in putting to death Tigellinus, who had been the chief minister of Nero's pleasures, and he acquired considerable popularity by his wise and judicious administration. He was however scarcely seated upon the throne before he was called upon to oppose Vitellius, who had been proclaimed emperor by the legions in Germany a few days before the death of Galba. Vitellius, who was of an indolent disposition, sent forward Cæcina, one of his generals, to secure the passes of the Alps, while he himself remained in his camp upon the Rhine. Otho quickly collected a large army and marched against Cæcina, while he sent his fleet to reduce to obedience Liguria and Gallia Narbonensis (compare 'Tac., Agr.,' c. 7). At first Otho was completely successful. Liguria and Gallia Narbonensis submitted to his authority; while Cæcina was repulsed with considerable loss in an attack upon Placentia. But shortly after, Otho's army was completely defeated by the troops of Vitellius in a hard-fought battle near Bedriacum, a village on the Po, south-west of Mantua. Otho, who does not appear however to have been deficient in bravery, had been persuaded for the security of his person to retire before the battle to

Brizellum; a step which tended, as Tacitus has observed, to occasion his defeat. When he was informed of the result of the battle, he refused to make any further efforts for the empire, and put an end to his own life by falling upon his sword, at the age of thirty-seven, according to Tacitus ('Hist.' ii. 50), or at thirty-eight, according to Suetonius ('Otho,' c. 11), after reigning 95 days. Plutarch relates that the soldiers immediately buried his body, that it might not be exposed to indignity by falling into the hands of his enemies, and erected a plain monument over his grave with the simple inscription, 'To the memory of Marcus Otho.' (Tacitus, *Hist.*, books i. and ii.; *Life of Otho*, by Suetonius and Plutarch; Dion Cassius, lib. lxiv.; Tillemont, *Hist. des Empereurs*, vol. iii.)

Coin of Otho.  
British Museum. Actual size. Copper.

OTHO I., son of the Emperor Henry I., and duke of Saxony, was elected, after his father's death, A.D. 937, his successor on the throne of Germany. His reign was long and eventful; a great part of it was occupied in quelling the turbulence of the great feudatories, the dukes of Bavaria, Franconia, and Lorraine, the archbishop of Mainz, and of his own son and son-in-law, who had rebelled against him. He waged also a long and successful war against Boleslas, duke of Bohemia, who, having murdered his own father, had abolished Christianity and thrown off his allegiance to the empire. He conquered the Slavi of the region bordering on the Oder, and founded two bishoprics, Havelburg and Brandenburg, in order that they might furnish missionaries for the conversion of the Slavi to Christianity. Otho defeated also the Danes, for whose conversion he founded bishoprics in Holstein and Schleswig. In the year 955 he gained a great victory over the Huns. In Italy he appeared first as the champion of Adelaide, the young widow of King Lotharius, who had been imprisoned and otherwise ill-used by Berengarius, who, after poisoning Lotharius, had usurped the Italian crown. Otho liberated Adelaide, whom he married at Pavia, in the year 951, and forgave Berengarius, and allowed him to retain the sovereignty of Italy, but as his vassal. Otho then returned to Germany. After some years, fresh complaints of the tyranny of Berengarius induced Otho to recross the Alps: he defeated Berengarius and his son and colleague Adalbert. He was himself acknowledged by a Diet held at Milan as King of Italy, and crowned by the archbishop with the iron crown of the Longobards in the church of St. Ambrose, at the close of 961. In the following year Otho repaired to Rome, where Pope John XII. crowned him Emperor of the West, as being the successor of Charlemagne. Berengarius, who had still some followers, defended himself obstinately in the fortress of St. Leo, in the Romagna; but being taken, was sent prisoner to Bamberg, where he died.

Meantime Otho, having received numerous complaints against Pope John, whose licentiousness and tyranny had become insupportable to the people of Rome, and who moreover maintained secret intelligence with the partisans of Berengarius, again visited Rome, and assembled a council, in which John was deposed, and Leo VIII. elected in his place. John however, after Otho's departure, re-entered Rome, obliged Leo to run away, and committed many acts of cruelty against those who had favoured the exaltation of his rival. [JOHN XII.] John soon after died, in 964, and the Roman clergy, disregarding the former election of Leo, appointed another pope by the name of Benedict V. This brought Otho again to Rome, which he besieged and took. He banished Benedict and re-instated Leo, who however died the year after, when John XIII. was elected with Otho's approbation. But the Romans, revolting against the new pope, banished him into Campania. Upon this Otho again entered Rome, and having put the leaders of the insurrection upon their trial, hanged thirteen of them, and condemned the others to various punishments. The historian Liutprandus justifies the conduct of Otho on this occasion, saying that he merely exercised his imperial prerogative, like his predecessors of the Byzantine and Carolingian dynasties, against men who had violated their oaths and rebelled against his authority. This shows that at that time the duchy of Rome was still considered as subject to the emperors.

In the year 967 Otho had his son Otho II. crowned emperor and his colleague, at Rome, by Pope John XIII. In the following year Otho sent Liutprandus on a mission to Nicephorus Phocas, emperor of Constantinople, which however produced no friendly result. [LIUTPRANDUS.] Otho accordingly invaded the provinces of Campania, Apulia, and Calabria, which were subject to the Byzantines, and laid siege to Bari, which however he did not take. Nicephorus in the

meantime being murdered, his successor Zimisces made peace with Otho, and gave the princess Theophania in marriage to his son in 972. Otho returned to Germany, where he died in May, 973. Otho has been styled 'the Great,' a title which he deserved for his abilities, his success, and his love of justice. His policy towards the see of Rome is worthy of notice; for whilst he showed himself zealous for the interests of the church, endowed abbeyes and convents, and honoured deserving men among the clergy, yet he always asserted his sovereign right in temporal matters, and in the elections of the popes, a right which his successors continued to exercise for a long time afterwards until the pontificate of Gregory VII. In Italy he established the supremacy of the German emperors over the greater part of the peninsula, with the exception of the southern provinces, which remained subject to the Eastern empire.

OTHO II., son of Otho I., was engaged after his father's death in a war with Henry, duke of Bavaria, whom he defeated, and whose fief he bestowed on the Duke of Suabia. He had also to contend against Lotharius, king of France, for the possession of the great fief of Lotharingia, or Lorraine, which had been a subject of contention between France and Germany ever since the separation of the two crowns. Otho divided Lorraine into two fiefs, upper and lower, the latter of which he left to Charles, Lotharius's brother, on condition that he should pay allegiance to the German crown. In the year 979 Otho repaired to Italy, where things were, as usual, in a state of great confusion. At Rome he repressed sedition, and punished several of the leaders. From Rome he proceeded into Campania, and interfered in the interminable quarrels of the various princes of Capua, Benevento, and Salerno; and thence advanced into Apulia and Calabria, where he fought against the Saracens, who had landed in those provinces, and who were encouraged, as it was said, by the Byzantine emperor, who was afraid of losing his Italian dominions through Otho's ambition. Otho occupied Tarentum, and at first was successful against the Saracens; but he afterwards was defeated by them with great slaughter. (Sigonius; Ditmar; Muratori.) Otho, returning to Northern Italy, assembled a general diet of the feudatories of Germany and Italy at Verona, in the year 983, at which his son, then four years old, afterwards Otho III., was acknowledged as his successor. At that diet several laws were added to the Longobard code, and Otho confirmed the franchises and privileges of the republic of Venice by a diploma, in which are enumerated the provinces that were subject to the kingdom of Italy as distinct from those belonging to Venice. The former are Pavia, Milan, Cremona, Vicenza, Ceneda, Verona, Friuli, Istria, Ferrara, Ravenna, Comacchio, Rimini, Pesaro, Cesena, Fano, Sinigaglia, Ancona, Umans, Fermo, Pinna, and Gabella, a statement which contradicts the pretended grant of the Exarchate and Pentapolis, said to have been made by Otho I. to the see of Rome. From Verona, Otho proceeded to Ravenna, and afterwards to Capua and Benevento, intent upon collecting a large army against the Saracens, whom he wished to expel from Sicily. But in the month of December 983 he fell ill at Rome, where he died, and was buried in the atrium of the Vatican Basilica.

OTHO III. spent his long minority in Germany, whilst his grandmother Adelaide, his mother Theophania, and the Archbishop of Cologne administered his dominions in Germany and Italy. In the year 996 Otho entered Italy with a large army, and was crowned Emperor of Germany at Rome by Pope Gregory V., who was his relative. On his return to Germany he defeated the Slavi, with whom he was engaged in a war, and forced Micielas, duke of Poland, to do him homage. He afterwards conferred upon his successor, Duke Boleslas, the title of King of Poland. At the end of 997 Otho returned to Italy; and after staying awhile at Pavia and Ravenna, being desirous of seeing Venice, a city then already celebrated for its wealth and power, he repaired thither incognito with six attendants. The doge Pietro Orseolo II. entertained him splendidly by night, but left him to enjoy his assumed disguise during the day. The doge had just effected the conquest of Dalmatia from the Croatians, with the islands of Curzola and Lesina, and had assumed the title of Duke of Dalmatia. Otho held a daughter of the doge's over the baptismal font, and on that occasion he exempted the Venetians from the pallium, or annual tribute, which they used to pay to the kings of Italy. Having returned to Ravenna, he collected his army and marched upon Rome, from whence Pope Gregory V. had been expelled by the patrician Crescentius, styled consul of Rome; a remarkable character of the dark ages, who aspired to re-establish the Roman republic under a nominal allegiance to the Eastern emperors. Crescentius caused John, a Calabrian Greek, to be proclaimed pontiff, under the title of John XVII. On the arrival of Otho, John ran away; but being seized by those of the adverse party, he was cruelly mutilated; and Crescentius, after defending himself in the castle of St. Angelo, was also made prisoner and beheaded, with twelve of his followers. Otho returned to Germany, but in the year 1001 he was again in Italy. He fought several battles in Campania, besieged Benevento, and afterwards quelled some fresh disturbances in Rome. In the following year (1002) he was taken ill near Civita Castellana, and died. His body was taken to Aquigrana to be buried.

OTHO IV., Duke of Brunswick and son of Henry the Lion, was elected king of the Germans in 1208 and was afterwards crowned emperor at Rome by Innocent III. But he soon quarrelled with that

imperious pontiff about the right of nominating to vacant benefices. Otho returned to Germany, where Waldemar, king of Denmark, was extending his conquests along the southern coast of the Baltic. Soon after, a general discontent, which was encouraged by the clergy, burst out against him, and he was deposed in 1212; and Frederic of Hohenstauffen, king of Sicily, was called to fill the throne of his ancestors. Otho however had still a considerable party, and he protracted the contest till 1215, when he resigned his claims to his rival. [FREDERIC II., EMPEROR.] He died in 1218.

OTHO, or OTTO, OF FREYSINGEN, born about 1108, was the son of Leopold, margrave of Austria, and of Agnes, daughter of the Emperor Henry IV. He studied first at Nürnberg and afterwards in the University of Paris, after which he entered the order of St. Bernard in the abbey of Morimond, of which in 1136 he was made abbot. His relative Conrad III., king of the Germans, recalled him to his native country and made him Bishop of Freysingen in 1138. He afterwards followed Conrad in the crusade to Palestine. On his return he felt a wish to visit the abbey of Morimond again, where he died, after a short illness, in 1158, much revered for his knowledge and piety. He wrote a chronicle of the world in seven books, 'Ottonis Episcopi Frisingensis Rerum ab origine Mundi ad ipsius usque Tempora,' folio, Augsburg, 1515. The first four books of this Chronicle are a mere compilation from Orosius, Eusebius, Isidore of Seville, and other previous writers; but the last three books contain much original information, especially concerning the affairs of Germany in the 10th, 11th, and 12th centuries. Otho is an impartial and trustworthy historian, and judicious for the times in which he lived. His Chronicle was continued down to the year 1210 by another Otho: 'Appendix Ottonis à S. Blasio à fine libri septimi Ottonis usque ad annum Salutis, 1210.' The other works of Otho of Freysingen are—1, A treatise concerning the end of the world, according to the Book of Revelations, which is generally appended to his Chronicle; and 2, A history of the Emperor Frederic I., called Barbarossa, 'De Gestis Frederici Esobarbi libri duo,' which comes down to the year 1159, but has been continued by Radewik, canon of Freysingen, down to 1160.

(Vossius, *De Historicis Latinis*; Fabricius, *Bibliotheca Latina mediæ ætatis*.)

OTTLEY, WILLIAM YOUNG, F.R.S., F.S.A., keeper of the prints in the British Museum, was born in 1771. Early in life his studies were directed towards art, and though he did not eventually follow painting as a profession, he continued till late in life to use his pencil. The only picture which he appears to have publicly exhibited was one of large size 'The Fall of Satan,' which appeared at the Royal Academy in 1823. In 1791 he went to Italy and remained there about ten years, engaged partly in copying paintings and drawings by the great masters, and in procuring copies to be made of them by others, but also in collecting works of art. He was fortunate in procuring numerous fine works of the early masters, and he obtained an excellent collection of drawings and engravings. Soon after his return he set about the preparation of a work illustrative of the progress of Italian art, for which his collections afforded him great facilities. The first part of 'The Italian School of Design: being a Series of Fac-Similes of Original Drawings by the most eminent Painters and Sculptors in Italy, with Biographical Notices and Observations' appeared in fol. in 1808; but the work though much admired was too costly to meet with a ready sale, and the second part was not published till 1812, while the third and concluding part did not appear till 1823. Meanwhile Mr. Ottley was brought into close connection with the leading patrons and connoisseurs of art in England, and came to be regarded as one of the leading authorities in questions of taste, and besides the preparation of the works noticed below he was called upon to advise in the purchase of separate pictures, as well as the arrangement and formation of galleries. His admirable collection of drawings by the great masters he sold to Sir Thomas Lawrence for 8000*l.*, and it formed a considerable portion of the famous collection which the government unfortunately permitted to be scattered on the death of that celebrated painter. Mr. Ottley was in 1833 appointed keeper of the prints in the British Museum. He at once applied himself to the then much-needed task of examining thoroughly the state of the entire collection of engravings in that institution, and preparing a classified index of it. He died on the 26th of May 1836, in his sixty-fifth year.

The chief works of Mr. Ottley, in addition to his 'Italian School of Design' mentioned above are: 'An Enquiry into the Origin and Early History of Engraving upon Copper and on Wood,' 2 vols. 8vo, 1816; 'Engravings of the Marquis of Stafford's Collection of Pictures in London,' 4 vols. fol., 1818; 'Series of Plates engraved after the Paintings of the most eminent Masters of the early Florentine School,' fol., 1826; 'A Collection of One hundred and twenty-nine Fac-Similes of Scarce Prints by the early Masters of the Italian, German, and Flemish Schools, illustrative of the History of Engraving from the Invention of the Art, with Introductory Remarks,' 4to, 1826-28. 'Notices of Engravers and their Works, being the commencement of a new Dictionary, which it is not intended to continue,' 4to, 1831. He also published a brief 'Descriptive Catalogue of the National Gallery.' Some of the works in the above list are of a very splendid and costly character; and all of them have been of use in extending a taste for and increasing a knowledge of art in this country. It must be added

however that Mr. Ottley cannot be placed either as a critic or historian in a very high rank.

OTTMER, KARL THEODOR, an architect to whom Brunswick is indebted for what ranks almost among the largest, and certainly among the most elegant, palaces in Europe, was born in that city, January 19th, 1800. He was the son of a physician, who intended him for the same profession; but his father's death leaving him free to follow his own inclination, he made choice of architecture as his future destination, and certainly had no cause to repent of doing so, being eminently favoured even from the commencement of his career by opportunities that fall to the lot of few. While he was completing his studies in his profession at Berlin, in 1822, he competed for and was employed to erect the new theatre there, called the 'Königsstädter Theater,' which was begun in July 1823, and opened in the August of the following year. This decided success on the part of one so young—it being in fact his 'coup d'essai,'—brought Ottmer forward at once: it should however be mentioned that, although it was not known at the time, his designs were corrected by Schinkel. [SCHINKEL.] In his next work of note, the 'Sing-academie' at Berlin (erected 1826-27), his design obtained preference of that of Schinkel, although the latter was in very superior taste, and indeed one of the happiest ideas of the 'great master,' as may be seen by the published drawings of it in his 'Entwürfe.' Flattering as all this was, it was not without its disadvantages, as by immersing him too early and too completely in matters of mere business, it hindered that calm application to study which is so important to an artist at the outset. There was besides very great danger of his being spoiled by the exaggerated praises bestowed on his first efforts,—praises which, it has been suspected, proceeded partly from a desire to lessen the reputation and keep down the influence of Schinkel. Fortunately Ottmer felt the necessity of improving himself; and after first studying a short time in Paris, he visited Italy, where he remained nearly two years (1827-29); and where he was so far inspired as to conceive the project and work upon the designs for a palace that should surpass every known edifice of the kind in extent and magnificence.

He was recalled to Germany by an invitation from Dresden, when it was intended to build a new 'Theater,' and he proposed designs accordingly; but the scheme was dropped for several years, and then Semper was the architect employed on the noble structure since erected there. The designs produced for that occasion procured however for him, while he was at Dresden, a commission from the Duke of Saxe-Meiningen to make others for a theatre and casino for him, and the buildings were forthwith commenced. On his return to Brunswick he published, in 1830, the first part of his 'Architektonischen Mittheilungen,' containing plans, &c., of his Theatre at Berlin. At that time his professional occupation consisted of little more than his official duties as Hofbaumeister, nor had he much prospect of being called upon to execute any work of importance, when during a popular tumult which took place in September 1830, the palace at Brunswick was set fire to and destroyed. He was thereupon directed by the new duke, Wilhelm (the successor of his brother Karl, who was expelled by the revolution), to make designs for rebuilding the palace; and the edifice was begun the following year, and prosecuted with such activity as to be ready for habitation in 1837. The principal mass is 400 feet in extent, by upwards of 200 in depth, and 80 high, and in the centre considerably loftier; and although Ottmer's design was not fully carried out, it is still a stately and elegant pile; indeed even now it has been objected to it that it is upon too extravagant and costly a scale. The architect's labour must have been very great, for besides that he was obliged to superintend every department of the works personally, from first to last, he designed all the numerous details both of the exterior and interior, which display considerable inventive power as well as good taste. The principal entablature of the exterior—extending altogether 2000 feet in length—is entirely of cast-iron, and much equally excellent and novel construction is displayed in other parts. The interior is distinguished by many striking pieces—the lower entrance vestibule, a Grecian Doric hall 150 feet in length; the parade staircase; the upper vestibule, a rotunda 70 feet in diameter, and 60 high; gallery; theatre; concert-room; banqueting-room, &c.

Besides the palace, Ottmer erected at Brunswick several other structures, both public and private, all of them, more or less, of architectural note: viz. the Theater-Intendantur, the Infantry Barracks, in the Florentine style, with a façade of 350 feet; the Iron Bridge, the Villa Bulow, New Richmond, the Schmidt'sche-Haus, the Interim Railway Station, &c. He also made a design for Cavalry Barracks at Brunswick, in similar style to those for the infantry; which design was published in Ronsberg's 'Zeitschrift für praktische Baukunst,' 1842. Naturally of a delicate constitution, Ottmer sank under the multiplicity of his tasks in the prime of life, August 22nd, 1843.

OTWAY, THOMAS, an eminent English dramatist, was born at Trotten, in Sussex, March 3rd, 1651. He received his education at Winchester school, and was entered a comzoner of Christchurch, Oxford, in 1669. Having left the University without a degree, he went to London, where he commenced player, but met with little success on the stage. The fame which was denied to him as an actor he endeavoured to obtain as an author, and in 1675 he produced

'Alcibiades,' the first of his tragedies. In the same year his 'Don Carlos, Prince of Spain,' made its appearance, of which the popularity was so great that it is said to have been played for thirty nights in succession, and to have produced considerable emolument to the writer. 'Titus and Berenice' and the 'Cheats of Scapin' were published in 1677, the first of which was translated from Rapon, and the latter from Molière. 'Friendship in Fashion' was published during the following year.

Otway's wit procured for him the patronage of the earl of Plymouth, and a cornetcy was obtained for him by this nobleman in the army of Flanders. Not finding the military life agreeable, he gave up his commission, and returned to London, where, being in extreme poverty, he again began to write for the stage. 'The Orphan,' one of the most pleasing of all his plays, was performed in 1680, as was also the 'History and Fall of Caius Marius.' In 1681 appeared the first part of a comedy called the 'Soldier's Fortune,' which was completed by the addition of a second part under the title of 'The Atheist,' in 1684. The greatest of all his dramatic efforts however was his last, 'Venice Preserved,' which was exhibited in 1682, and which still keeps possession of the stage. Its character is altogether of a higher order than that of any of his other performances. Besides the works that have been mentioned, Otway was the author of various translations and numerous miscellaneous poems. An edition of his whole works was published in 3 vols. 12mo, in 1757; and another in 4 vols. 8vo, in 1813. His writings, although so numerous, did not secure him from the miseries of indigence; and one of the accounts of his death, which are various, represents it as having been occasioned by hunger. He died April 14th, 1685, before he had reached his thirty-fourth year. As an author, he shows great tenderness and command over the gentler feelings, and an exact knowledge of human nature. Passages of considerable power also are of frequent occurrence in his writings, which however are disfigured by a prevalent grossness and immorality.

OUDINOT, CHARLES-NICOLAS, DUKE OF REGGIO, Marshal of France, and Grand Officer of the Legion of Honour, was born on the 2nd (some biographers state the 25th) of April, 1767, at Bar-sur-Ornain. Having chosen the career of a soldier, in opposition to his father's wishes, he joined the regiment of Medoc in 1788; but parental influence induced him to withdraw from the army four years after. The general call to arms at the outbreak of the revolution revived his martial spirit, and on offering himself as a volunteer in 1791, his former service at once procured him a battalion. In September 1792 Oudinot defended the fort of Bitche against the Prussians, whom he repulsed with great loss. After this, the government of the Girondists promoted him to the command of the regiment of Picardy, left vacant by its former colonel, whom the Jacobin excesses of the day had induced to emigrate. At daybreak on the 2nd of June 1794, being stationed at a distant outpost, the Austrians fell in great numbers upon his regiment; but he held his ground for ten hours against a corps estimated at 10,000 strong. Surrounded by the enemy's entire cavalry, he formed his men into a square, repulsed every charge of their cuirassiers, till at length, having opened a passage through them with fixed bayonets, he effected his junction with the main army, his lines never once having been broken. Instantly raised to a brigade for this intrepid conduct, he was sent to besiege Trèves, and on the 7th of August 1794 captured the town by a skillful manoeuvre. He next received orders to join the army of the Rhin-et-Moselle, which he did on the 14th of September. During a desperate night-attack, October 14, 1795, he was disabled by five sabre-cuts; and having fainted from the loss of blood, was taken prisoner by the Austrians. Released by exchange a few months later, he joined Moreau's army in 1796, distinguished himself at the battles of Nordlingen and Donauwerth, captured several fortresses on the Danube, and was again most severely wounded at Ingolstadt. On the 19th of March 1797 he attacked the emigrant army of Condé before Constance, and penetrated into the town, in spite of a second corps of Austrians by which it was defended.

Oudinot was created a general of division, April 12, 1799; and on the 4th of June contributed effectually to the great victory of Zurich. Being subsequently appointed head of the staff in Massena's army, he shared with that commander the dangers and sufferings of the siege of Genoa. Twice during this siege he succeeded in passing through the English blockading fleet, bearing with him Massena's despatches to Suchet. In 1800, as head of the staff under Brune, he obtained fresh honours at the battle of Pozzolo and the passage of the Mincio. The First Consul was so highly satisfied with Oudinot's conduct on these occasions that he presented him with a sword of honour, to which he added one of the pieces of cannon captured from the enemy by Oudinot himself. At the opening of the campaign of 1805 Napoleon formed a picked corps of grenadiers, the command of which he intrusted to Oudinot, presenting him at the same time with the grand cordon of the Legion of Honour. At the head of his grenadiers he was the first to enter Vienna; he crossed the bridge over the Danube, though undermined and defended with 180 pieces of cannon. General Oudinot was likewise present at Austerlitz.

The following year he took possession of the counties of Neufchâtel and Valengin, relinquished by Prussia; and during his government, conciliated the inhabitants by his liberality and disinterestedness.

Before he left his office, the burghers of Neufchâtel evinced their esteem by a public address and the present of a sword. After the battle of Jena, October 14, 1806, he marched into Poland, and gained the victory of Ostrolenka, February 6, 1807. The Emperor Napoleon now made him a count, to which he annexed a dotation of a million of francs. But the 14th of June 1807, the morning of Friedland, was the most signal of his life. On that famous ground, with his single corps, he checked for many hours the advance of the whole Russian army; and after the sacrifice of half his men, enabled Napoleon to come up in time to win one of his greatest battles. Meeting the general after the action, Napoleon said to him, with unusual emotion, "General, you have done wonders; but wherever you are, my only fear is for yourself." This incident has since afforded a subject for one of Horace Vernet's best pictures.

In the memorable campaign of 1809 the reputation of Oudinot was fully sustained; for after the death of Marshal Lannes, at Essling, the second corps, formerly commanded by him, was conferred upon Oudinot in these flattering terms:—"Given to you, as a general, tried in a hundred fights, in which equal skill and intrepidity have been displayed." After the battle of Wagram, Oudinot received the marshal's bâton, with the title of Duke of Reggio, and a pension of 100,000 francs. In 1810, Louis Bonaparte, tired of submitting to the dictation of his imperial brother, threw off the ensigns of royalty, and clandestinely left Holland. Upon this defection, Marshal Oudinot was ordered to take military possession of the country; he fixed his head-quarters accordingly at Amsterdam. In this government he continued nearly two years, exhibiting great capacity and justice, and winning the good report of the Dutch people by his integrity and equable behaviour.

Throughout the whole of the subsequent campaigns of 1812, 1813, and 1814, the name of Marshal Oudinot re-appears with undiminished honour, as one of the best-trained and most efficient of the imperial band of generals. After the first abdication he submitted to the restored Bourbons, steadfastly adhered to their cause during the Hundred Days, and was loaded with favours by Louis XVIII. and Charles X. In 1823 he accompanied the Duke of Angoulême in his expedition for the re-establishment of the King of Spain. He was appointed governor of the Invalides in 1842, and died at Paris, September 13, 1847, in his eighty-first year, having been upwards of sixty-four years in the French army.

The marshal's eldest son, Nicolas-Charles-Victor, the present Duke of Reggio, commanded the French army sent in 1849 to support the authority of the present pope in the Roman states. His younger son, an officer of great promise, fell into an ambush in the late wars in Africa, and was killed by the Arabs (June 26, 1835).

OUGHTRED, WILLIAM, an English divine and mathematician, was born at Eton, Buckinghamshire, in 1573. Cole says that he was educated at the school upon its foundation there, and was elected thence, in 1592, to King's College, Cambridge, of which, in regular course he became a Fellow. While he was an undergraduate he invented 'an easy method of geometrical dialling,' but which was not given to the public before the year 1647. He proceeded to the degree of B.A. in 1598, and that of M.A. in 1599. In 1603 or thereabouts, Oughtred was ordained priest, and presented to the rectory of Aldbury, near Guildford in Surrey, upon which appointment he quitted the University and resided upon his living, distinguishing himself by the faithful and diligent discharge of his pastoral duties. In 1628 he was engaged by the earl of Arundel to become tutor to his son, Lord William Howard, the nobleman whose patronage of science holds a distinguished position in the history of its progress during the 17th century. But notwithstanding his high station in the scientific world (and Fuller says that he was "unanimously acknowledged the prince of mathematicians"), he was in danger, in the year 1646, of a sequestration by the committee for plundered ministers, several articles having been deposed and sworn against him, material enough, it is said, to have sequestered him. But upon his day of hearing, William Lilly, the famous astrologer, applied to Sir Bulstrode Whitlocke and all his old friends, who appeared in such numbers on his behalf, that he was acquitted by the majority. Oughtred sometimes amused himself with archery; he was sprightly and active at the age of eighty, and, if we may believe Mr. Collier, died in an ecstasy of joy upon hearing of the restoration of Charles II. Fuller ('Worthies,' i. 145) says that "this aged Simeon had a strong persuasion that before his death he should behold Christ's anointed restored to the throne, which he did accordingly to his incredible joy, and then had his 'dimitis' out of this mortal life, Jan. 30th, 1660." Evelyn, in his 'Diary' of 17th August 1658, mentions meeting with Mr. Oughtred, "the famous mathematician," which shows that his fame was well established.

The following is a list of his principal works:—

1, 'Arithmetice in Numero et Speciebus Institutio; quæ tum Logistica, tum Analytica, atque adeo totius Mathematicæ quasi Clavis est,' 12mo, 1631. This work passed through many editions, and an English translation of it was made by Christopher Wren, and published under the title of 'The Key of the Mathematics new forged and filed.' It was introduced by Seth Ward as a text-book at Cambridge. 2, 'The Description and Use of the Double Horizontal Dial, whereby not only the hower of the day is shewne, but also the meridian line is found; and most astronomical questions which may be done by the globe are resolved,' 12mo, 1636. Another edition appeared in 1652

3, 'A Treatise on Trigonometry,' 4to, 1657. This book was afterwards published in Latin, in 1667, by Stokes and Haughton.

We refer for more particulars concerning Oughtred to Aubrey's 'Lives,' and manuscript addit., Mus. Brit., 4223. Many of his papers are now in the valuable library of the Earl of Maclesfield.

\* OVERBECK, FRIEDRICH, was born at Lübeck on the 3rd of July 1789. His artistic studies were commenced at an early age, and the peculiar bent of his mind is said to have first shown itself, if it was not evoked, in the contemplation of Memling's picture of the Crucifixion in one of the churches of his native city. His academic course was passed through at Vienna, and on its completion he proceeded, in 1810, to Rome. Here in concert with Pforr, a countryman, fellow student, and attached friend, he devoted himself with intense ardour to the study of the early Italian masters. For many years the German school of painting, partly under the influence of the dominant French taste, and partly guided by the maxims and practice of Mengs, had been seeking inspiration almost exclusively from classic sources, and drawing its technical principles from the study of the later painters of Italy. But coincident with the casting off the trammels of modern French criticism and ancient forms in literature, there had been growing up a desire for a return to a less academic or eclectic system in art; and Friedrich Schlegel, a leading critical advocate of the Romantic school in literature, was the herald and prophet of the new school of national German art. Overbeck was well prepared to become one of the founders of such a school. Cornelius had adopted nearly similar views as to the regeneration of German art, and he joined Overbeck at Rome in 1811. Under CORNELIUS (vol. ii. col. 392) we have stated how, with the assistance of Ph. Veith, Schadow, J. von Schnorr, Pforr, and others, the two young painters, in the face of opposition and ridicule, persevered in their great undertaking, till they drew on their side the almost unanimous suffrages of their countrymen, and commanded the homage of the students and lovers of art throughout the world. His 'Madonna,' painted in 1811, was Overbeck's earliest work of importance. Of the famous frescoes in the Villa Bartholdy, which were the first great works painted by the young German artists, Overbeck executed two, 'Joseph sold into Captivity by his Brethren,' and 'The Seven Years of Dearth,' which were generally regarded as justifying his position as the head of the new school; the 'Seven Years of Dearth' is well known from the engraving by C. Barth in the Atlas to Raczyński's 'Histoire de l'Art Moderne en Allemagne.'

Deeply imbued with devotional feelings, Overbeck in giving himself up to the study of the somewhat mystical principles of religious art propounded by F. Schlegel, soon came to adopt also his theological views, and, in company with several other of the band of young German painters, he in 1814 formally abjured Lutheranism and entered the communion of the Roman Catholic Church. From this time he may be said to have devoted himself almost exclusively to the carrying out of his views of Christian art. He fixed his residence at Rome, which he has only once or twice left in order to pay a hasty visit to Germany; and there he has quietly laboured in his vocation, living in comparative retirement, but always exhibiting a warm interest in the progress of art and the fortunes of artists. Overbeck has exerted a vast influence on modern art, and though the present race of rising painters in Germany are quitting the severity of his religious style for a freer and more romantic manner, his influence is still felt and acknowledged by them.

'Christ at the house of Martha and Mary,' 1815, was one of the early works which went far to secure his great reputation; but his grand picture 'Christ entering Jerusalem' (about 8 feet by 5½), finished in the following year for the Marienkirche at Lübeck, was that which may be said to have established it: there can be little hesitation in saying, that despite of its crudeness it was in many respects one of the grandest scriptural pictures which had been painted since the decay of art in Italy. Though a slow worker—his design being first elaborately thought out, and then laboriously corrected—the works of a man who has been for nearly half a century constantly working, are far too numerous to be mentioned here, even if we had the materials for completing the list; but the following are some of the more important. 'Christ bearing his Cross'—a work of great power; 'The Child Christ in the Temple'; 'Christ Blessing Little Children'—through the engravings perhaps the best known of his works in this country; 'The Raising of Lazarus'; 'Christ raising the Daughter of Jairus'; 'Christ on the Mount of Olives'; 'St. John preaching in the Wilderness'; 'Moses and the Daughter of Jethro at the Well'; 'Gathering the Manna'; 'Hagar in the Desert'; and 'The Ascent of Elijah,' may be taken as representatives of his scriptural subjects. Among those illustrative of the traditions of his church may be mentioned, besides Holy Families and Pietas, 'The Marriage of the Virgin'; 'Virgin with the Lily'; 'Death of St. Joseph,'—painted for the Church of Madonna degli Angioli, near Assisi; 'The Three Kings'; 'St. Elizabeth,' &c. He has also painted or drawn various allegorical figures and designs, among which are the 'Germania' and 'Italia.' Among his earlier frescoes was a series of five, painted in the Villa Giustiniani, from Tasso's 'Jerusalem Delivered'; but he has since seldom wandered even so far from religious themes. As one of his most characteristic works may be cited his 'Christian Art' in the Städelsche Institut, Frankfurt-on-the-Maine. In this vast production he has sought to symbolise in a single design the development

of art—including music, architecture, sculpture, and painting—under the influence of Christianity. Christ in the act of blessing, and the Virgin recording the Magnificat, occupy the middle of the upper compartment of the picture, while the saints and prophets of the Old, and the Apostles of the New Testament are assembled around, and the representatives of the several arts fill the different stages or compartments into which the picture is divided. It is a work full of learning, thought, and fine feeling, but one which to understand, much less to do full justice to, it is necessary to study from the artist's own point of view, and with a clear conception of his central idea—to an ordinary spectator by no means an easy matter. He has also made a large number of drawings for engraving, such as 'The Passion of Our Lord,' 'Forty Illustrations from the Gospels,' &c.

The works of Overbeck are marked by unflagging invention, great refinement and delicacy of expression, considerable power of drawing, and a style of composition which presents his design with the greatest conceivable perspicuity. Where there is obscurity, as there sometimes is, it rests in the idea and not in the manner of its presentation. But his treatment of his themes is essentially subjective: in other words, he seems to have always sought to carry out Schlegel's principle, that in all Christian themes the treatment must be spiritual and symbolic rather than human and dramatic. Hence his works display a calm devotional beauty and simplicity rather than energy or brilliancy of style. This spirituality and symbolism of style and thought rise in the works of Overbeck not infrequently into grandeur, and are always impressive; but often, even in his hands, they run into coldness, obscurity, and mannerism. But his nobleness and purity of aim, his great artistic knowledge and power, the fine poetic genius which pervades almost every production of his pencil, and his singleness of purpose, must always secure for the name of Friedrich Overbeck a high place in the history of art, and one of the very highest among the painters of the 19th century.

Although he became first generally known by his frescoes, and though his early practice in that material has influenced all his subsequent productions, he has always expressed a decided preference for oil-painting, and many of his finest works are painted in oil. Of late years however he has chiefly contented himself with making drawings in chalk and charcoal, and a large proportion of the designs made so widely known by engravings are so prepared.

OVERBURY, SIR THOMAS, was born in 1581, at Compton Scorfen, in the parish of Ilmington, Warwickshire, the seat of Giles Palmer, his mother's father. His father was Nicholas Overbury, of Bourton-on-the-Hill, in Gloucestershire, of an ancient family, and who was also a bench of the Middle Temple. Sir Thomas received his early education at home, then proceeded to Queen's College, Oxford, as a gentleman commoner in 1595, and took his degree of B.A. in 1598. His father designed him for the law, and he was entered at the Middle Temple; but feeling a desire for a more stirring life he travelled on the Continent, and returned an accomplished gentleman. In 1601 he visited Scotland, where he became acquainted with Carr (more properly Ker,—he was a descendant of the Kers of Ferniehurast), who was then a sewer or page in the service of the Earl of Dunbar. Carr came to London with Overbury, where he soon afterwards became a favourite with King James, and was rapidly promoted. Carr was a handsome man, but illiterate, and of no great abilities; even on the trial Mrs. Turner said that he "spoke so broad Scottish that she understood him not;" and indeed James is said to have chosen him as favourite in order to teach him Latin. Overbury was a scholar and of varied talent, not of unimpeachable morality, and, probably conscious of his superiority, haughty and presumptuous. At first he shared in his patron's fortune, he was made sewer to James, was knighted at Greenwich in 1608, and his father was made one of the judges in Wales. In 1609 he visited France and the Netherlands, and on his return wrote his 'Observations upon the state of the Seventeen Provinces as they stood in 1609.' In 1610 Jonson had spoken in his praise, but in his 'Conversations' with Drummond of Hawthornden, he calls him his "mortal enemy." The cause is supposed to have been an attempt by Overbury to engage Jonson to forward his suit with the Countess of Rutland, "wherein he did intend a state that was unlawful." In the elegy on her death published with Overbury's works, but which is now said to be by Francis Beaumont, there is nothing to countenance such a charge. It dwells on her virtues, though her marriage is spoken of as "nought but a sacrament of misery."

His good fortune did not last long. Cecil, the minister of Elizabeth and James, to serve his own purposes, contrived in 1606 to marry his own son to one of the daughters of Howard earl of Suffolk; while the other, when only thirteen, was married to the son of his former rival, the Earl of Essex, who was only fourteen. Being considered too young to live together, the lady was remitted to the care of her mother, and the gentleman proceeded to the Continent. In 1610, at the age of eighteen, he returned to claim his bride, whom he found grown into extraordinary beauty, the reigning toast at court, solicited by Prince Henry (Sir Simonds d'Ewes says broadly, that "set on by the Earl of Northampton," she had "prostituted herself to him," but that he had abandoned her) and Carr, then Viscount Rochester, and possessed of an undisguised and violent dislike of himself. It was only by the interference of her father and the king that she consented to live in his house. Overbury appears to have assisted his patron with his pen

and otherwise in his intrigue with the Countess of Essex; but when it was proposed (Rochester reckoning on his influence with the king) to procure a divorce in order that he might marry her, Overbury vehemently opposed the project, applied terms of contumely to the lady, and it is said, on the authority of his father, wrote his poem of 'The Wife,' with the hope of preventing such a measure. Overbury's opposition of course was communicated to the lady by her lover; she was furious; and finding that there was a quarrel existing between Overbury and Sir David Wood, offered Wood 1000*l.* to assassinate him, but he declined, without a previously secured pardon, "saying he would not hesitate to bastinado him, but would not go to Tyburn to please any woman." She then had recourse to her uncle, the ambitious, hypocritical, treacherous, immoral, but clever Earl of Northampton. He was himself jealous of Overbury's influence with the king's favourite, and to get him out of the way suggested that Overbury should be appointed to a foreign embassy by the king, which Rochester should persuade him to refuse. Sir Henry Wotton gives an account of the result of the scheme, and his impressions concerning it "so far as I am able to wade in so deep a water." He says it is conceived that the king had a distaste of him "for too stiff a carriage of his fortune," besides an offence given to the queen; and that he had resolved to "sever him from my Lord of Rochester." Overbury declined the mission proposed, though Sanderson ('Aulios Coquinaria') says he at first accepted it, and on April 21, 1613, he was summoned before the council, before whom, continues Wotton, who was present, he "refused to be sent abroad, with such terms as were by the council interpreted pregnant of contempt," and he was thereupon committed to the Tower. "Now in this whole matter," says Wotton, "there is one main and principal doubt, which doth gravell all understandings; that is, whether the whole was done without the participation of my Lord of Rochester; . . . for if it were done without his knowledge, we must expect of himself either a decadence or a ruin." The decadence or ruin were not yet at hand. Again prompted by Northampton and her own father the Earl of Suffolk, and supported by the king, a suit was commenced against Essex for a divorce on the ground of impotency. A commission of bishops and lawyers, with a jury of women, were appointed to try this scandalous cause. Essex appears to have offered no very strenuous opposition, probably glad to be relieved from such a woman. There is little doubt but that the countess procured a substitute in the examination that took place, and a sentence of divorce was pronounced, though Abbott, the archbishop of Canterbury, argued strongly against it, and thereby drew upon himself a long letter from the king, exhorting him to "reverence and follow my judgment." Abbott was firm, and with four out of the seven lawyers, voted against the divorce, while the four other bishops and three lawyers voted in its favour.

In the meantime Overbury in the Tower, wholly unsuspecting of his patron's baseness, wrote, suing him for his continued favour, and for his deliverance from confinement. But his enemies were implacable. He died on September 15, 1613, under circumstances to be presently told; and on December 26, Rochester, created on the occasion Earl of Somerset, and the Countess of Essex, were married, the bride "in her hair" as a virgin, with all the pomp and splendour that wealth and talent could furnish. Donne wrote an eclogue; Ben Jonson produced 'The Challenge at Tilt'; and Lord Bacon presented 'The Masque of Flowers,' performed by members of Gray's-inn, at an expense to him of 2000*l.*

At length matters took a turn. Villiers was becoming a favourite, and the decadence had commenced. Somerset, with a prescience of his fall, endeavoured to make use of his remaining influence by procuring a general pardon for "all manner of treasons, misprisions of treasons, murders, felonies, and outrages whatsoever, committed, or hereafter to be committed," to which James consented, but to which the Chancellor Ellesmere refused to put the great seal. A suspicion had prevailed ever since the death of Overbury that it had been unfairly procured. Trumbull, the British ambassador in the Netherlands, having procured some evidence, communicated it to Winwood the secretary; and, with James's consent, the Earl and Countess of Somerset were arrested and ordered to be tried. A truly disgusting account of James's hypocrisy in parting with his old favourite is preserved. He kissed him affectionately, and when Somerset was gone to await his trial, exclaimed, "Now the devil go with thee, for I will never see thy face more," and exhorted the judges to see justice done on him. After Coke had taken a number of examinations, the trial commenced on the 24th of May 1616, when the countess, first indicted for the murder of Sir Thomas Overbury, pleaded guilty. The earl's trial began the next day. It was proved that after Overbury's commitment to the Tower the previous lieutenant-governor, Sir William Wade, was removed, and Sir Jervas Elwes (or Helwies) was appointed; but Elwes had had to pay 2000*l.* for the place; and Wotton writes that the appointment was obtained "by the mediation of the house of Suffolk, notwithstanding that my lord of Rochester was the commander of Sir John Keys to that charge." Weston was appointed his attendant, who received no wages as a prison official. He acknowledged receiving poisons from the countess, most of which, he says, he threw away, and a white powder from the earl, who declared that it was only an emetic, and which certainly produced intense sickness; it certainly did not produce death. Both earl and countess expressed

impatience at his surviving so long. Overbury, at the same time, becoming convinced of Somerset's treachery, addressed several threatening letters to him, reminding him of certain secrets of which he was possessed, and telling him, "You owe me for all the fortune, wit, and understanding that you have." Somerset, on the other hand, was irritated, and said, "either he or myself must die for it." Franklyn, another accomplice, acknowledged that he, directed by Mrs. Turner (whose starched ruffs and love philters had given her a dangerous reputation), had procured arsenic for the countess; and that Weston had given Overbury "as much poison as would kill twelve men." Overbury became very ill; and Lobell, a French apothecary, who attended him in the Tower, says that Somerset "willed him to write to Dr. Mayerne," the king's physician, who prescribed a glyster, after administering which Overbury died. An inquest, composed of six warders and six other persons, was held upon the body, and a verdict returned of natural death. Mayerne was not examined. Franklyn, in his confession, says, "the king used an outlandish physician and an outlandish apothecary about him, and about the prince deceased. Therein lyeth a long tale." This Mayerne left a book wherein all his prescriptions were entered, but the leaves relating to Prince Henry's illness are torn out. The king also employed Sir George More to keep Somerset quiet, and if he attempted to reveal anything to remove him from the bar by force. He also wrote to More, that if Somerset would confess his guiltiness, "I will not only perform what I promised by my last messenger, both towards him and his wife, but I will enlarge it, according to the phrase of the civil law, quod gratiæ sunt amplianda." Somerset was found guilty, and after him Elwes, Mrs. Turner, Weston, and Franklyn, who were executed; but Somerset and his wife, after one or two reprieves, were ultimately pardoned—though the earl when offered a pardon refused it, declaring himself innocent. They retired into the country, where James allowed him a pension of 4000*l.* a year. The countess died in 1632; the earl in 1645, but not before (in 1624) his old master had endeavoured to make his peace with him, in order to effect a scheme to release himself from his yoke under Villiers and Prince Charles.

It is a curious story. Questions arise that are not easily answered. Why was Overbury detained so long in prison for so trifling an offence? why was not Mayerne examined? why were the subordinates, whose conduct, however atrocious, was not the immediate cause of Overbury's death, so unhesitatingly executed? and what possible motive could James have had for desiring either the death of Overbury or that of his son, to which suspicion has long pointed?

None of Overbury's works were published in his lifetime. His poems consist of 'The Wife,' 1614; and 'The First and Second Part of the Remedy for Love,' 1620, a paraphrase from Ovid. They are not remarkable as poetry, but they contain good sentiments, occasionally expressed with more vigour than elegance; and his description of a virtuous wife was so just that the work was highly popular. His 'Characters' (published with the second edition of 'The Wife' in 1614) are in a very different vein; they are well drawn, varied, and full of antithesis and wit. His 'Newes from any whence, or Old Truths under a Supposal of Novelty,' are partly in the same strain, and were appended to the 'Characters.' The 'Observations on the Seventeen Provinces' did not appear till 1626, though licensed by the Stationers' Company in 1615-16. 'Crumms fallen from King James's Table, or his Table Talk,' not published till 1715, are a collection of the king's sayings, some of which are remarkable enough; among them are, "The way to make vices less than they are is to make punishments for them greater than they deserve, for so the laws grow to contempt and to be neglected;" and, "The people still desire war till they have it, and they desire it presupposing good success; but one overthrow, an ill journey, or taxes imposed to maintain it, they require peace as much." A new edition of Overbury's works, with a 'Life,' by E. F. Rimbault, was published in 1856. 'The Great Oyer of Poisoning: the Trial of the Earl of Somerset for the Poisoning of Sir Thomas Overbury in the Tower of London, and various matters connected therewith, from contemporary MSS., by Andrew Amos,' was published in 1846. This work contains much curious matter. Mr. Amos has shown that the printed report of the trial varies in many respects from a manuscript report in the British Museum, and that the variations are generally favourable to the opinion of Somerset's minor culpability.

\* OVERSTONE, LORD. SAMUEL JONES LOYD, first Lord Overstone, is the only son of Mr. Lewis Loyd, formerly minister of a Welsh dissenting congregation at Manchester, who married Miss Jones, the only daughter of John Jones, Esq., a wealthy merchant of that city, and afterwards entering into partnership with that gentleman, established the banking house of Jones Loyd and Co. in Lothbury, London. He was born in 1796, and having received his early education at Eton and Trinity College, Cambridge, entered parliament in 1819 as member for Hythe. He did not however retain his seat longer than the year 1826. Though he remained out of parliament, still his great reputation for commercial sagacity, and long connection with banking business, led the government to consult him on important measures of a fiscal nature from time to time. In 1850 Mr. Jones Loyd was elevated to the peerage as Lord Overstone. Since that time he has acted as member of a commission appointed to inquire into the

practicability of a decimal coinage, and in 1856 he warmly opposed the principle of the Limited Liability Act which passed the two houses of parliament, his lordship entering on the occasion his protest against that measure in the journals of the house. His system of political economy is perhaps too exclusively that which is taken from the capitalist point of view. As the time for the renewal of the Bank charter approached, the opinions which Mr. Jones Loyd had expressed before a parliamentary committee in 1840, in favour of a single source of issue of money, and such issue to be concurrent with a definite amount of bullion in the Bank of England, were understood to be those which Sir Robert Peel adopted, with some modifications. In 1844 the Bank Charter Act was passed; and although the principle has met with some opposition from higher authorities than those who are always clamouring for an expansion of the currency, it is likely to be continued in the renewal of the charter in the present year (1857). Lord Overstone has ably advocated its principle in some letters in the 'Times,' signed 'Mercator.'

OVERWEG, DR. ADOLF, was born July 24, 1822, in the city of Hamburg. He was educated at the University of Bonn, and afterwards at the University of Berlin, where he took his degree. His favourite study was geology, which he pursued for some years. In 1849, when Mr. Richardson, at the expense of the British and Prussian governments, was preparing to undertake a journey to Lake Tchad, in Central Africa, application was made in Berlin for a naturalist to accompany him; and Dr. Overweg, who was recommended by the chief scientific men of that capital, received the appointment. Dr. Heinrich Barth also accompanied Mr. Richardson. Dr. Barth was a pupil of the celebrated geographer, Carl Ritter, and previously to his joining the expedition to Central Africa, had travelled in Northern Africa, and had published an account of his journeys in German, under the title of 'Wanderungen,' &c. ('Wanderings along the Punic and Cyrenaic Shores of the Mediterranean,' by Dr. Heinrich Barth'), 8vo, Berlin, 1849. A boat, broad in the beam and exceedingly light on the water, was constructed at Malta for the express purpose of navigating Lake Tchad. It had to be conveyed over the burning sands of Africa to Lake Tchad, during a journey which occupied about twelve months. The expedition left Tripoli for the interior in March 1850, and did not reach Lake Tchad till April 1851. The three travellers were exposed for a considerable time to great danger, and after being plundered of much valuable property, only escaped with their lives by paying a large ransom. Mr. Richardson died when the travellers were within a short distance of Lake Tchad. When Drs. Barth and Overweg had reached Kuka, about ten miles from the western shore of Lake Tchad, they were in safety, under the protection of the Sultan of Bornou and his vizir, who gave them a good house to live in, and supplied them amply with provisions. The boat had been constructed in pieces to facilitate its conveyance, and Dr. Overweg having put it together, on the 18th of June launched it on Lake Tchad, which he navigated, and visited the natives who inhabit various islands in it. Meantime, while Dr. Overweg was preparing the boat, Dr. Barth had started on a journey to the kingdom of Adamaua, south of Lake Tchad, and on the 22nd of June reached the capital, Yola, about 350 miles S.S.W. from Kuka, a distance which it took him twenty days to travel. In this journey he crossed the Benué and the Faro, two very large rivers—the Benué, half a mile wide, flowing from the east; and the Faro, an affluent of the Benué, flowing from the south. He reached Kuka, on his return, on the 22nd of July. The country of Adamaua was found to be beautiful, fertile, and well cultivated. Dr. Barth afterwards explored the country east of Lake Tchad, and also travelled south-eastward into the kingdom of Baghirmi, towards the sources of the White Nile; while Dr. Overweg made a journey from Kuka in a south-westerly direction towards the Kowara (Quorra), and reached to within 150 miles of Yacoba, the capital town of the Fellatah.

The ultimate object of the expedition having been to travel from Lake Tchad in a south-west direction to the shores of the Indian Ocean, it was represented to the British government that it would be expedient to send out another person to join Drs. Barth and Overweg before they started on their final journey. The government assented, and a suitable person was found in Dr. Edward Vogel, of Mr. Bishop's Observatory, Regent's Park, London, who volunteered his services with enthusiasm. He left London, accompanied by two volunteers from the corps of Sappers and Miners, in February 1853. Dr. Vogel is very young, having been born about 1832. He is by profession an astronomer, and is also a scientific botanist. He was provided with astronomical, magnetical, and other instruments suitable for his own purposes, and also to supply the place of those of the other two travellers which might have been injured or lost in their journeys. By a singular coincidence, on the very morning when Dr. Vogel and his two companions went on board the vessel which was to take them to Malta, in route for Tripoli, letters from Dr. Barth were received in London announcing the death of his only companion and friend. Dr. Overweg was attacked by fever at Kuka, and died seven days afterwards, September 27, 1853, at Maduari, which is ten miles east of Kuka, and near the western shore of Lake Tchad.

Dr. Vogel and his companions reached Mourzuk, in Fezzan, Aug. 8, 1853, and remained there till the middle of October. They accomplished successfully their journey across the Great Desert, and reached

BLOG. DIV. VOL. IV.

Lake Tchad on the 6th of January 1854. A revolution had taken place at Kuka, and there was a new sultan and also a new vizir, by whom however Dr. Vogel was received kindly. Dr. Vogel, by astronomical observations, determined the position of Kuka to be 12° 55' N. lat., 13° 22' E. long. The height of Kuka above the sea he ascertained to be only 900 feet—50 feet higher than the surface of Lake Tchad. Dr. Barth was absent on an expedition to Timbuctoo. Dr. Barth left Kuka on the 25th of November 1852. On the 6th of May 1853 he was at Sokatou; on the 4th of April at Wurno, which is about seventeen miles N.E. from Sokatou, and is the residence of the Emperor of the Fellatah. It is thus a more important place than Sokatou, though the population is only about 13,000, while that of Sokatou is about 21,000. Wurno, hitherto unknown, was only founded in 1831. Dr. Barth reached Timbuctoo on the 7th of September 1853. He was detained in Timbuctoo nearly twelve months, owing to the danger he would have incurred if he had attempted to return to Kuka without protection. Nothing was heard of him for many months, and it was reported that he was dead. He however reached Kano, on his return to Kuka, on the 17th of October 1854, and on the 1st of December 1854 met Dr. Vogel at Bundi, which is a small town nearly 230 miles W. from Kuka. He arrived in safety at Kuka, re-crossed the Great Desert to Mourzuk and Tripoli, reached Marseille on the 8th of September 1855, and in a few days arrived in London. In the same month, at the meeting of the British Association for the Advancement of Science, a 'Description of the City of Timbuctoo, its Population and Commerce,' by Dr. Barth, was communicated from the Foreign Office, and read before the members of the Geographical Section. Dr. Barth is a native of Hamburg, where his aged parents were alive to welcome him on his return, after his short visit to London.

Dr. Vogel still continued his explorations in Central Africa. He had visited Yacoba, and April 30, 1855, crossed the Chadda at the same place where the Pleiad steamer, with Messrs. Baikie, May, and Hutchinson, had anchored in 1854. [See VOGEL, DR. EDWARD, vol. vi. col. 432.]

OVIDIUS, PUBLIUS NASO, was born at Sulmo in the country of the Peligni, B.C. 43, the same year in which Cicero was murdered, and on the very day in which the consuls Hirtius and Pansa died. The events of his life are chiefly known from his own writings, and more particularly from the 10th elegy of the 4th book of the 'Tristia.' Ovid was of an equestrian family. He had a brother exactly twelve months older than himself; the two brothers were sent to Rome for their education at an early age. From his boyhood Ovid was fond of writing verses, and, as he says of himself,

"Sponte sua numeros carmen veniebat ad aptos,  
Et quod tentabam scribere versus erat."

His father discouraged his poetic aspirations on the ground that poverty was the condition of poets, and the youth accordingly tried to prepare himself for the career of the bar. The two brothers were educated under the care of some of the best teachers then in Rome—Plotius Grippus, whom Quintilian ('Inst. Or.' ii. 4) considered one of the first teachers of eloquence, Arellius Fuscus, the friend of Horace, Messala, and Portius Latro, the friend and companion of Seneca. Seneca says that he had seen Ovid practising declamation before Fuscus. His brother Lucius died after completing his twentieth year, an event which Ovid most affectionately lamented. On attaining the suitable age, Ovid discharged the office of one of the *Triumviri*, and other public duties subsequently. He also acted as one of the court of the *Centumviri*, and on several occasions as a *judex*. ('Trist.' ii.) But neither his bodily strength nor his disposition was suited to public or active life; poetry was his delight, and he resolved to dedicate himself to it. He accordingly sought the society of his contemporary poets, whose names he has himself recorded. He was acquainted with Maecius, Propertius, Ponticus, Bassus, and Horace, who was about twenty-two years older. He only just saw Virgil and Tibullus, both of whom died B.C. 18. He was married to his first wife when he was very young. The match was not a suitable one, and the wife was soon divorced. A second wife was in like manner put away, though the poet had no serious charge to make against her. Ovid's amours with Corinna, whom he celebrates under this fictitious name, and with other women, may have tended to interrupt his conjugal felicity. However this may be, he ventured to take a third wife, with whom he lived happily to the time of his exile. He had a daughter, probably by his third wife; the daughter was twice married. His father died at the advanced age of ninety, and his mother shortly after; but neither of them lived to see their son's disgrace and exile.

Ovid spent an easy life at Rome in the enjoyment of the society of his contemporary poets and friends, Atticus, Peto Albinovanus, Tuticanus, and others already enumerated, and in the possession of a competent income. He visited Asia and Sicily, but it does not appear at what period of his life ('Ex Pont.' ii. Ep. 10); probably when he was a young man. His residence at Rome was near the Capitol ('Trist.' El. 3), and he had some gardens near the junction of the Flaminian and Claudian roads; he had also a patrimony in the country of the Peligni. Ovid was intimately acquainted with the family of Augustus Cæsar; and an 'Epicædion on the death of Drusus' (B.C. 9), addressed to his mother Livia, which is still extant, is attributed to him. Among his various poetical works which were written and published before his exile, his three books 'Artis Amatoris,'

appeared in the year 2 B.C., the same year in which Augustus banished his daughter Julia. Previous to the 'Ars Amatoria' he had published his three books of 'Amores,' which were originally in five books; and also his 'Heroides.'

At the close of the year A.D. 8, when he had just completed his fiftieth year, he was banished from Rome by Augustus. The sentence was altogether unexpected; it fell on the astonished poet like a thunderbolt. The place of his exile was Tomi, a Milesian colony ('Trist.,' iii. EL 9) in the country of the Getae, on the banks of the Euxina. Ovid has described in a most touching manner ('Trist.,' i. EL 3) the last night which he spent in Rome, and his eternal separation from his wife and friends; his daughter was absent in Libya. His property was not confiscated, but his exile was for life. The cause of the banishment of Ovid is not distinctly stated by himself, nor by any other writer; a circumstance which has led to various conjectures, all of which however are devoid of any historical foundation. The supposition that Ovid was banished for an amour with the emperor's daughter Julia rests on no evidence, and is inconsistent with the fact that Julia was banished ten years before Ovid. He admits ('Trist.,' v. EL 11) that his offence deserved a severer punishment than the emperor inflicted. His sentence was not Exsilium, but Relegatio; and the difference was not unimportant. Exsilium was followed by loss of fortune and citizenship; Relegatio was not followed by loss of citizenship, and only accompanied with loss of property so far as such loss was comprehended in the sentence of Relegatio. The poet himself has expressed this with strict technical accuracy in one of his elegies addressed to his wife, in which he tells her that she cannot be truly upbraided as being the wife of an exile, inasmuch as his sentence was only Relegatio:

"Nec vitam, nec opes, nec jus mihi civis ademitt;  
Quae merui vicio perdere cuncta meo,  
Sed quia peccato facinus non affuit illi,  
Nil nisi me patriis iussit abire focias."

'Trist.,' v., EL 11.

In other passages however ('Trist.,' iii. EL 3, &c.) he calls himself Exsul, but doubtless in the general sense of that term; for Relegatio was one of the species of which Exsilium was the genus.

He admits ('Trist.,' ii. 207) that there were two charges against him, the character of his amatory verses and some fault (error) which he never mentions. The whole of the second book of the 'Tristia,' which is addressed to Augustus, is an apology for his erotic poetry, and he complains that though written long before the date of his banishment it was made the ground or pretext of his punishment.

"Nos quoque jam pridem scripto peccavimus uno:  
Supplicium patitur non nova culpa novum."

'Trist.,' ii. 539.

In various other passages ('Trist.,' iii. EL 14; iv. EL 1; v. EL 1; 'Ep. ex Ponto,' i. 1, &c.) he refers to his poetry as one cause of his misfortune. It may be conjectured that he was punished under the provisions of the Julian Law, De Adulteriis coercendis ('Dig.,' 48, tit. v.), which was passed about B.C. 17; for though the provisions of this law, as known to us, make no mention of obscene poetry, it is clear from the title in the 'Digest,' that the law extended beyond punishing the direct parties to an act of adultery, for it punished, among others, those who lent their houses for adulterous purposes. Ovid himself says that of the two charges brought against him one should be nameless, but the other was founded on his amatory poetry as encouraging to adultery:

"Altera pars superest qua turpi crimine tactus,  
Argor obsceni doctor adulterii."

'Trist.,' ii. 211.

At the time of his banishment the fifteen books of the 'Metamorphoses' were unfinished ('Trist.,' i. EL 1; ii. 555; iii. EL 14); the poet had burned them, as being incomplete, at the time of his leaving Rome, but there were other copies in existence. The twelve books of the 'Fasti,' of which the first six only have been preserved, were also written before his exile, and, as the poet tells us, inscribed to Augustus Cæsar. They were finished during his exile, and, as we now have them, inscribed to Cæsar Germanicus.

The works of Ovid written during his banishment are, the five books of the 'Tristia,' and the four books of his 'Letters from Pontus:' the letters are addressed to his wife, to Maximus, Peto Albinovanus, Græcinus, Rufinus, and others of his friends. The 'Ibis' also was written in his banishment, and apparently soon after his arrival at Tomi.

Notwithstanding the most abject entreaties of the poet and the interest of his friends, Augustus never recalled him from banishment. He died at Tomi, A.D. 18, in the sixtieth year of his age and the tenth of his banishment. Augustus died four years before him. The circumstance of his not being recalled by Tiberius renders it probable, as has been conjectured, that he had incurred the anger of Livia Augusta. The poet who had enjoyed all the pleasures of a luxurious capital and the society of all his most distinguished contemporaries, spent the last years of his life among a barbarous people and in an inhospitable climate, worn out with grief and mental anxiety ('Ex Ponto,' i. Ep. 4). His only consolation in exile was to address his wife and absent friends, and his letters were all poetical. The muses, who were the

cause of his calamity, were also his consolation in misfortune. Though the 'Tristia' and the 'Letters from Pontus' have no other topic than the poet's sorrows, his exquisite taste and fruitful invention have redeemed them from the imputation of being tedious, and they are read with pleasure and even with sympathy.

It shows the versatility of his talent that he wrote a poem during his exile in the Getic language; the subject was the praises of Augustus Cæsar and his family. The rude barbarians to whom Ovid recited this poem were surprised and delighted: their uncivilised minds acknowledged the power of 'immortal verse.' They applauded and anticipated the poet's recall; but the stern master of the Roman world was inexorable. ('Ex Ponto,' iv. Ep. 13.)

The works of Ovid form one of the most valuable parts of the literature of Rome. With the exception of the 'Metamorphoses,' they are all written in the elegiac measure, the restraint of which would have been ill-suited to such long compositions as the 'Fasti' in the hands of almost any other Roman poet. But Ovid was a perfect master of the technical part of poetry, and it is surprising with what consummate skill he has contrived to include in each consecutive pair of verses a full and complete sense. It is rarely necessary to go beyond each pair of verses in order to obtain the meaning of the poet; each couplet is generally complete in itself. And yet the whole of a long poem written in this measure is so artfully and skillfully combined that it exhibits a faultless unity. It is a necessary consequence however of this restraint, that the elegiac poems of Ovid are sometimes expressed with such an epigrammatic brevity as to be obscure; and the antithesis, which seems to be in some measure inseparable from this kind of measure, and certainly was rather sought after than avoided by the poet, is sometimes too frequent.

If we estimate the character of Ovid by his erotic poetry we must admit that he is without excuse. The pleasure of the sex seems to have been the uppermost thought of his mind, and the tendency of his 'Amores' and 'Ars Amatoria' must be considered injurious to the morals of a people. The 'Remedia Amoris' can hardly be viewed, as some are inclined to view it, as a kind of Palinodia, or recantation of his amatory poetry. If we estimate the character of the poet by that of the licentious age in which he lived we shall judge him more favourably: though a man of pleasure he was temperate in eating and drinking, humane, and generally beloved. There are no passages in the extant works of Ovid which approach the gross obscenity of many passages in Catullus, Horace, and other Roman writers; and this is a merit, at least viewed as a matter of taste. In a moral point of view his poetry may be more dangerous. The voluptuous pictures of Ovid are only covered with a transparent veil; and even this is sometimes withdrawn. It is rather singular that the 'Heroides,' which abound in obscure allusions and in voluptuous imagery, and are often difficult to understand, should have been so much used as an elementary schoolbook in modern times.

The two great works of Ovid are his 'Metamorphoses' and his 'Fasti.' The subject of the 'Metamorphoses' is briefly expressed in the opening of the first book:—

"In nova fert animus mutatas dicere formas  
Corpora. Di cœptis (nam vos mutastis et illas)  
Adestrate meis: primaque ab origine mundi,  
Ad mea perpetuum deducite tempora carmen."

The rich mythology of Greece furnished Ovid, as it may still furnish the poet, the painter, and the sculptor, with materials for his art. With exquisite taste, simplicity, and pathos, he has narrated the fabulous traditions of early ages, and given to them that appearance of reality which only a master-hand could impart. His pictures of nature are striking and true; he selects with care that which is appropriate; he rejects the superfluous; and when he has completed his work, it is neither defective nor redundant.

The art of the rhetorician, as well as that of the poet, is perceptible in all the works of Ovid, but particularly in the 'Metamorphoses.' The two speeches of Ajax and Ulysses, in the beginning of the thirteenth book, are in their kind models of oratory. He who could write the speech of Ulysses might himself have become an orator; and if he had lived in the age of Hortensius and Cicero might have shown, as Ulysses did—

"——— quid facundia posset."

The 'Metamorphoses' are read with pleasure by youth, and are re-read in more advanced age with still greater delight. The poet ventured to predict that his poem would survive him, and be read wherever the Roman name was known.

The 'Fasti' of Ovid are in fact a valuable historical monument. He has preserved to us the Roman calendar, with all the ancient stories attached to it, collected from the traditions of the people and the old chroniclers and antiquarians. His own explanations may often be of little value, but they are easily separated from the ancient story or tradition which he relates. He begins with January, and following the days of the month in order, he assigns to each its appropriate festival or solemnities. It shows no small art in a poet to convert the calendar of his country into a pleasing and instructive poem, rich in historical facts, and enlivened and relieved by true poetry. A complete commentary on the 'Fasti' would be a valuable commentary on Roman history. The last six books are unfortunately lost.

Ovid wrote also one tragedy at least, the 'Medea' ('Trist.' ii.), which is highly spoken of by Quintilian ('Inst. Or.' x. 1), and by Tacitus ('De Orat. Dialog.' 12). There are various other small poems attributed to him, perhaps without good reason.

The editions of the collected and separate poems of Ovid are numerous. The best edition of his complete works is by Burmann, 4 vols. 4to, Amsterdam, 1727. The French translations of the various poems, which are very numerous, are mentioned at the end of a long article on Ovid in the 'Biographia Universalis.' There are numerous English translations.

The best translation of Ovid into English verse is 'Ovid's Metamorphosis, in Fifteen Books, translated by the most Eminent Hands,' fol., London, 1717. There have been numerous reprints of this version. The translators were—Dryden, Addison, Congreve, Rowe, Gay, Ambrose Phillips, Garth, Croxall, and Sewall. Sandys translated the first five books, fol., London, 1627; and separate books have been translated by others. There is a literal prose translation by Clarke, 8vo, London, 1735; and there is another prose translation, London, 1748. There are many translations of the 'Art of Love,' one by Dryden, Congreve, &c., as well as of the 'Heroical Epistles,' one by Quarles, 8vo, London, 1673; and there are translations in verse or prose, or both, of the 'Fasti' and the other works.

It is hardly necessary to remark that a translation of Ovid into English can have little value. A great part of his merit consists in his language; and it is impossible to render the meaning of the original, except by periphrasis and paraphrase, which hardly convey the meaning, and most certainly destroy the beauty of that which is a work of consummate art.

OVIEDO Y VALDES, GONZALO FERNANDEZ DE, one of the earliest historians of the New World, was born at Madrid in 1478. Being of noble Asturian descent, he was at the age of twelve introduced into the royal palace as one of the pages of Prince John of Castile, the son of Ferdinand and Isabella. He continued with the court several years, and was present, though a boy, at the closing campaigns of the Moorish war which preceded the surrender of Granada (1490-92). In 1514, according to his own statement, he embarked for the West Indies, where, although he revisited his native country several times, he continued during the remainder of his life. Oviedo occupied several important posts under the government: he was made governor of the fort and harbour of Santo Domingo in the island of Hispaniola, or Hayti, and captain of a company of infantry. Charles V. appointed him also to an office of a literary nature, for which he was highly qualified by his vast learning and his long residence in the New World, that of historiographer of the Indies. It was in this capacity that he produced his principal work, 'Historia General de las Indias,' in fifty books, twenty of which, making the first part, were printed for the first time at Seville in 1525, fol.: a copy of this scarce edition, with the author's signature appended to it, which belonged once to Sir Joseph Banks, is in the British Museum. It was reprinted at Salamanca in 1647, fol.; and again at Valladolid in 1657. A new edition by D. J. Amador de los Rios, was begun to be published by the Real Academia de la Historia, Madrid, 4to, 1851, but is not yet completed. It was translated into French by Jean Poleur, and published at Paris in 1556, fol. A summary of this work is also inserted in Barcia's collection of the 'Historiadores Primitivos de las Indias Occidentales,' fol., Madrid, 1749. Oviedo wrote likewise 'Tratado de la Natural Historia de las Indias,' Toledo, 1526, a summary of which, by B. C. Ariban, in vol. xxiii. of the 'Bibl. Autores Espanoles,' 8vo, 1849; besides two tracts respecting the 'Palo de Guayacan' (the *Guayacum officinale* of Linnaeus) and the 'Palo Santo' (*Lignum vitae*), which are translated into Latin in the first volume of the collection, 'Scriptorum de Morbo Gallico.' But the work for which Oviedo is celebrated, though known only to a few scholars, is his 'Quinquagenas,' so entitled from its consisting of fifty dialogues, in which the author is the chief interlocutor. This interesting production contains a very full notice of the principal persons in Spain, their lineage, revenues, and arms, with an inexhaustible fund of private anecdotes, all which renders it a most valuable addition to the history of that time. This work however still remains in manuscript, in three folio volumes, in the National Library of Madrid, and it is only through the extracts of Navarrete that we are enabled to estimate its contents. Oviedo has been accused of treating the Indians employed in the gold-mines with unjustifiable cruelty. His 'History of India' too has been denounced by no less an authority than Las Casas as a wholesale fabrication, "as full of lies almost as pages;" but there can be no doubt that, though somewhat loose and rambling, he possessed extensive stores of information, by which those who have followed him have greatly profited.

The time of Oviedo's death is uncertain, but he must have lived to a considerable age: he was still alive in December 1556, since the original manuscript above alluded to, preserved in the library at Madrid, is signed by him at the age of seventy-nine.

OWEN, DR. JOHN, was born in 1616, at Stadham in Oxfordshire, of which parish his father, Henry Owen, was for some time minister. At the age of twelve he was admitted a student at Queen's College, Oxford, where he took his first degree in 1632. During the period of his university life he is represented as having so diligently applied himself to study that he never allowed himself more than four hours repose. In 1637 Archbishop Laud, the chancellor of the university,

made some new regulations, of which Owen disapproved, and, as he refused to comply with them, he was obliged to leave Oxford. Brought up by his father in the strictest school of Puritanism he considered the new statutes an attempt to enforce the observance of superstitious rites. On leaving the university he accepted the situation of chaplain to Sir Richard Dormer, of Ascot in Oxfordshire, having been some time previous to his expulsion admitted into holy orders by Bishop Bancroft. He afterwards became chaplain to John, Lord Lovelace, of Hurley in Berkshire, with whom he remained till the outbreak of the civil war, when, as he warmly espoused the cause of the Parliament, he forfeited the protection of his patron. Left to his own resources Owen retired to London, where he appears to have joined the Nonconformists. In 1642 he published his first work, 'A Display of Arminianism,' which soon recommended the author to the notice of the Parliament, and became the foundation of his future advancement. He was shortly afterwards presented by the committee appointed "to purge the Church of scandalous ministers" to the preferment of Fordham in Essex. He enjoyed this living little more than a year, having been deprived of it by the patron, to whom it had reverted on the death of the sequestered incumbent. The Earl of Warwick then bestowed upon him the living of Coggleshall in the same county. Owen had not been long at Coggleshall before he abandoned the Presbyterian party to join that of the Independents. On the 29th of April 1646, one of the frequent fast-days instituted by the Puritans, he was called to preach before the Parliament, and his sermon on that occasion evinced a larger spirit of religious toleration than was prevalent among his party at that period. He still more strongly manifested his tolerant disposition when he was appointed to the critical task of preaching before the same assembly on the day after the execution of Charles I. On the 28th of February following, a day set apart for humiliation and prayer on account of the intended expedition to Ireland, he was again appointed to preach before the Parliament and the chief officers of the army. On that occasion Cromwell, who heard him for the first time, received so favourable an impression of his merit that he named him his chaplain, in which capacity he accompanied the expedition. In 1651 Owen was by an order of the Parliament promoted to the dignity of dean of Christchurch, and the following year he became vice-chancellor of the University of Oxford—Cromwell being at that time chancellor. He appears to have discharged the peculiarly difficult duties of this office with much moderation, and his conduct met with the approval of many of the Episcopalian party. After holding it five years, on the death of Cromwell he was deprived of it, as well as of his deanery, to which Dr. Reynolds, a Presbyterian, was appointed.

At the Restoration, Owen retired to a small estate which he had purchased in his native place, where he employed himself in preaching as often as an opportunity was afforded him. He was however soon obliged to abandon an occupation so congenial to his feelings by the interruption of the Oxford militia, and he determined upon settling in London. It was there that he published a work entitled 'Fiat Lux,' in answer to the writings of a Franciscan friar, which attracted the attention of Lord Clarendon. This statesman, who was anxious to reconcile the most moderate of the nonconformist party, offered Owen immediate preferment if he would conform, which proposal however was firmly though respectfully declined. He then formed a congregation, among which he assiduously laboured, and in conjunction with Baxter, Bates, and other leading men of his persuasion, instituted the Pinner's Hall Weekly Lecture. In 1677 he contracted a second marriage, by which he was enabled to live in comparative affluence on an estate at Kaling in Middlesex, where he died August 24, 1683.

The private character of Dr. Owen has been praised equally by those who were united with him by similarity of religious feeling and by those who differed most widely from him in opinion; they all bear testimony to the temperance of his language and the mildness of his disposition. This character is in a great measure reflected in his works, which, while strongly tinged by the peculiarities of the Calvinistic system, are remarkable for their devotional spirit, and are calculated to encourage practical piety. He certainly belonged to that section of his party whom Lord Clarendon designates as "the more learned and rational." (Clarendon, 'History of the Rebellion,' vol. v. p. 153; see Warburton's note.) His works are very numerous: among the best known of those not already alluded to may be mentioned—1, his 'Exposition of the Epistle to the Hebrews'; 2, 'A Discourse on the Holy Spirit,' 1674; 3, 'Vindiciae Evangelicae, &c., in answer to T. Biddle,' 1655; 4, 'Θεολογία, sive de Natura, Ortu, Progressu et Studio verae Theologiae,' 1661; 5, 'An Exposition of cxxx Psalm,' 1660; 6, 'On the Doctrine of Justification,' 1677; 7, 'The Nature of Indwelling Sin,' 1668; 8, A large collection of Sermons and Tracts. His last production was entitled 'Meditations and Discourses on the Glory of Christ,' which it is stated was sent to the press the day he died.

\*OWEN, RICHARD, a celebrated British naturalist, was born at Lancaster in 1804. When very young he evinced a great love for the sea, a predilection not unfrequently found amongst those whose tastes lead them to the study of natural history. He accordingly entered the navy as a midshipman on board the Tribune. He had not however been long on board when his nautical career was cut short by the termination of the American war, and the restoration

of peace in 1814. He returned to school, and afterwards became the pupil of Mr. Baxendale, a surgeon in Lancaster. In 1824 he repaired to the University of Edinburgh for the purpose of completing his medical education. Here he became a pupil of Dr. Barclay, and under his teaching a taste which he had acquired for comparative anatomy became confirmed. In 1825 he came to London, and entered as a student of St. Bartholomew's Hospital. Here he speedily attracted the attention of John Abernethy, then surgeon to the hospital, and lecturer on anatomy, who discovering the talents of his new pupil at once engaged his assistance in the dissecting-room as prosector. In almost every country but England such ability as young Owen displayed would have advanced him in the institution of which he was so distinguished a pupil. But the system of favouritism pursued in the London hospitals precluded his advancement in the school of St. Bartholomew's, although backed by so great an influence as that of the distinguished Abernethy. The consequence was that British science had a narrow escape of losing one of her greatest names. In 1826 Owen became a member of the College of Surgeons, and now having nothing else to do his old longing for the sea returned. He found no difficulty from his old connection with the Admiralty in obtaining a situation as an assistant-surgeon. Having done this, he called to take his farewell of his eccentric friend and master at St. Bartholomew's. This interview has been narrated in an article on Professor Owen's labours in the 'Quarterly Review,' and is too characteristic to be omitted in this biographical notice. "What is all this?" said Abernethy; "where are you going?" "Going to sea, Sir." "Going to sea—going to the devil!" "I hope not, sir." "Go to sea! you had better, I tell you, go to the devil at once," reiterated glorious John,—dwelling on the temptations, the difficulties, the loss of time and fame, that must be the result of so rash a step, and insisting on another interview after the pause of a week. Owen revisited his rough but downright friend at the expiration of that time, when Abernethy proposed an appointment at the College of Surgeons. This was accepted:—our youthful anatomist found himself happily associated with one of congenial mind, and so the navy lost a good officer, and science gained one of her brightest ornaments."

This appointment arose out of the possession by the College of Surgeons of John Hunter's great museum. This wonderful collection had been entrusted to the care of the College, but except for the devotion of Mr. Clift, the able assistant of John Hunter, who devoted his life to preserving the specimens it contained intact, little of it might have been left for the genius of Owen to work upon. Much of Hunter's manuscript had been lost or destroyed, and in order to make the museum subservient to science, an accurate catalogue was a first necessity. It was to this work that Owen now applied himself. Although a herculean task, no more fitting field for the development of the genius of Owen could have been found. In order to identify the specimens in the Hunterian collection, he was obliged in a large number of cases to dissect and examine fresh specimens. In this manner volume after volume of the catalogue appeared, till at the end of thirty years the whole was printed—a work of scarcely inferior value and importance to the museum itself. This catalogue, which involved the examination of nearly four thousand specimens, was illustrated by seventy-eight plates. It was thus that Owen earned for himself the reputation of the first of curators, and was able to give complete instructions on this, perhaps the humblest department of the labours of the naturalist. In 1835 he published 'Directions for collecting and preserving Animals and parts of Animals for Anatomical purposes' (London, 4to). In 1849 he contributed to a 'Manual of Scientific Enquiry, prepared for the use of H.M. Navy,' 'Instructions for Collecting and Preserving Animals.' This study of the Hunterian specimens yielded however higher results than the vast catalogue itself. Whilst working at the form and structure of the animals which the diligence of Hunter had brought together, new ideas were suggested, new paths of inquiry were opened up, and discoveries were made in every direction. The 'Transactions' of the Royal, Zoological, and Geological societies, the 'Reports' of the British Association, and the 'Annals' and 'Magazine of Natural History,' with numerous independent works, bear testimony to an activity seldom equalled, perhaps never surpassed. Owen's career will bear comparison with the most brilliant names in the past or present generations. Humboldt speaks of him as the greatest anatomist of his age, and another eminent writer calls him the Newton of natural history.

In endeavouring to estimate the services rendered by Professor Owen to science, his writings must be regarded from several points of view: first as a comparative anatomist and physiologist, next as a zoologist, then as a palaeontologist, and lastly as the philosophical exponent of the general laws regulating the forms and development of animal life. As an anatomist, contributing largely to our knowledge of the internal structure of the various members of the animal kingdom, he takes a first place. As examples of his labours in this direction, many of his contributions to the 'Transactions' and 'Proceedings' of the Zoological Society, and the 'Cyclopaedia of Anatomy and Physiology,' may be taken. These works comprise accounts of the dissections of numerous animals not hitherto accurately examined or new to science. Amongst the higher forms of *Mammalia*, the family of *Quadrumanæ* have been most copiously illustrated. The following are some of the most important papers on these animals:—

'On the Anatomy of the Orang Utan' ('Proc. Zool. Soc.,' i.); 'On the Cranium of the Orang Utan' (ibid., v.); 'Dissection of a Female Orang Utan' (ibid., xii.); 'On the Comparative Osteology of the Orang and Chimpanzee' (ibid., iii.); 'On the Dissection of a Female Chimpanzee' (ibid., 1848): also a series of papers in the 'Transactions,' entitled 'Osteological Contributions to the Natural History of the Chimpanzee.' In these papers he established the existence of a second species of *Troglodytes*, the *T. Gorilla*, a gigantic species of Chimpanzee, discovered by Dr. Savage in the Gaboon country, West Africa. A more complete account of this creature was given at the last Liverpool meeting of the British Association, and formed the subject of one of the evening meetings at that place. Several other papers have been devoted to the anatomy of this family.

The next order of *Mammalia* is the *Carnivora*. Papers on the anatomy of the Kinkajou, the Thibet Bear, the *Felis jubata*, the Lion, the Tiger, the Seal, and other forms of this family, indicate the attention which this group of animals has received from our great naturalist. The anatomy of many of these creatures has been studied with reference to extinct forms of the same family. This has also been the case with the *Edentata*, a small order of existing animals, but having the highest interest in relation to extinct forms. The Armadillos and the Sloths engaged the attention of Professor Owen, in order to throw light on the structure of their congeners in the past—the *Megatherium*, the *Mylodon*, and the *Glyptodon*.

The other forms of *Mammalia* have been the subject of many important observations, but we pass over them to draw attention to the interesting family of the *Marsupialia*. These animals, representing in their habits and structure all the other forms of *Mammalia*, were regarded by some naturalists as marsupiate forms of the other orders. It was left for Owen to demonstrate the essential unity of this group of animals. He demonstrated the imperfection of their brain, the structure of the marsupium or pouch; he examined the history of the development of the young, and supplied an amount of information with regard to their structure and habits that has secured their position in the animal scale. The papers devoted to the anatomy of these animals are scattered through the 'Philosophical Transactions,' the 'Proceedings' and 'Transactions' of the Zoological Society, and the 'Reports' of the British Association. A résumé of his labours and views on this family is contained in the article 'Marsupialia,' in the 'Cyclopaedia of Anatomy and Physiology.' Some of the most valuable remarks on the structure of the *Monotremata*, comprising the *Ornithorynchus* and the *Echidna*, have been made by Professor Owen in his papers on these animals. Before leaving the *Mammalia* we ought to refer to the various papers of Professor Owen on the *Ruminantia*, which have thrown much light on the structure and nature of both recent and fossil species of these animals.

The great class of Birds has not received less notice than the *Mammalia*. Numerous notices of dissections of recent birds have been published. These prepared the way for the more searching and exhaustive inquiries with regard to the extinct birds of New Zealand, which resulted in the discovery of the extinct genus, *Diornis*, the most gigantic form of birds, and the detection and description of a large number of species of this genus, and of several other allied genera.

The anatomy of recent Reptiles and Fishes has also been largely illustrated by Professor Owen, especially in their relations to extinct forms.

Amongst his papers on the Invertebrate animals we may especially refer to his 'Memoir on the Pearly Nautilus,' published in 1832, in which the anatomy of this creature was fully described, and a new classification of the family of Cephalopodous *Mollusca*, to which it belonged, proposed. This was followed by other papers on the Cephalopodous *Mollusca*, confirmatory of the views he had originally taken of their structure and organisation. An extensive series of observations on the lower forms of *Mollusca*, including especially a paper on the structure of the *Brachiopoda*, and the articles 'Mollusca' and 'Cephalopoda' in the 'Cyclopaedia of Anatomy and Physiology,' indicated the amount of labour and attention bestowed on this great group of animals.

The second great group of Invertebrate animals, the Articulate animals, has also been extensively examined by Professor Owen. The articles 'Articulata' and 'Entozoa,' in the 'Cyclopaedia of Anatomy and Physiology,' and papers on the 'Crustacea' and 'Arachnida,' are the witnesses of the attention paid to these animals.

In the investigation of the structure of the organization of animals Professor Owen was one of the first in this country to apply the microscope and appreciate its value. He was one of the founders, and the first president, of the Microscopical Society. In his researches on the structure of the higher animals, he was naturally led to study closely the structure of the teeth. Only loose views of their intricate structure prevailed at this time, but by the application of the microscope he laid the foundations of an accurate knowledge of their true structure, and gave to the world a large series of original investigations on this subject. Many of these investigations are contained in separate papers, but his accumulated observations on the microscopic appearances of teeth were published in a work entitled 'Odontology.' This work embraces the entire subject of the structure of the teeth of the animal kingdom, and is copiously illustrated with a series of drawings of their microscopic appearance. The microscope

would have even been more extensively employed in his researches, had not falling eye-sight warned the professor to desist.

In 1836 Mr. Owen was appointed to succeed Sir Charles Bell as Hunterian Professor at the Royal College of Surgeons. In the course of lectures which he delivered in this capacity, an opportunity was afforded him of systematising and arranging the vast mass of information which he had collected on the subject of the structure of the animal kingdom. These lectures embraced the whole animal kingdom, and a part of them, including the Invertebrate animals and Fishes, has been published under the title of 'Lectures on Comparative Anatomy.' A second edition of these lectures was published in 1858.

Anatomical and physiological researches are necessary to the perfecting any systematic arrangement of organic beings, and Professor Owen's anatomical researches enabled him from time to time to suggest improvements in the classification of the animal kingdom. In referring to his anatomical labours we have spoken of their influence on the science of zoology. In his series of articles in the 'Cyclopædia of Anatomy and Physiology,' and in his 'Lectures,' the application of his anatomical knowledge to the classification of animals is more particularly developed. He has however published papers on the classification of special families, as his 'Outlines of the Classification of Marsupialia;' and his paper 'On the Entozoa, and on the Structural Differences existing among them; including Suggestions for their Distribution into other Classes.'

But whatever may be Professor Owen's merits as an anatomist and zoologist, he has probably reaped more laurels as a palæontologist than in any other department of research. John Hunter had clearly apprehended the necessity of studying extinct animals, in order to complete the classification of animals, and Owen was brought in contact in Hunter's Museum with a large number of specimens of the remains of extinct animals. He commenced his studies of these remains at a time when Cuvier's 'Ossemens Fossiles' was beginning to produce an impression upon the scientific world. To follow in the footsteps of Cuvier was the determination of the young naturalist, and posterity will be the judge as to how far the pupil outstripped the master in this line of research. We have seen how he obtained a profound knowledge of the anatomy of recent animals, and this was applied with wonderful skill to the unravelling the structure of the remains of extinct animals. His palæontographical researches present a series of most brilliant discoveries. Extinct creatures of the most difficult structures have been built up with unerring skill, and where only minute fragments have been at first examined, subsequent researches have confirmed the truth of his previous conclusions on these slight materials. The footmarks of the *Cheirotherium* on the New Red Sandstone were rightly judged to be the impressions of a gigantic Batrachian. A fragment of the femur of an unknown animal from New Zealand was immediately referred to the class of Birds, though no bird so large had hitherto been known to exist on the earth. His palæontological researches include all the classes of vertebrate animals. The British extinct Mammalia and Birds have had a special volume devoted to them in 'History of British Mammals and Birds,' published in 1846. This work contains the description of nearly a hundred and fifty species, a large number of which had been detected and described by the author himself. The *Myiodon* and *Glyptodon*, two gigantic forms of edentate animals from America, were first put together and described by Professor Owen, and their skeletons exist in the Museum of the College of Surgeons to attest his skill. An account of the *Glyptodon* is given in the Catalogue of the Museum, and a separate work was devoted to the *Myiodon*, entitled 'Description of the Skeleton of an extinct gigantic Sloth (*Myiodon robustus*, Ow.), with observations on the Osteology, Natural Affinities, and Probable Habits of the Megatheroid Animals in general,' London, 1842.

His researches in fossil birds have been rewarded by the discovery of the great family of *Dinornidæ*. An imperfect skeleton of the *Dinornis giganteus* has been set up in the Museum of the College of Surgeons, whilst more recently a perfect skeleton of another species of these birds, the *Dinornis elephantopus*, has been set up at the British Museum. Descriptions of these birds were published in the 'Transactions' of the Zoological Society of London.

The excessive richness of certain British strata in the remains of fossil reptiles induced the British Association for the Advancement of Science to call on Professor Owen for a report on this subject, and in the volumes for 1839 and 1841 accordingly are two reports by him. These reports contain more particularly an account of those Saurian reptiles, of which the *Ichthyosaurus*, *Plesiosaurus*, the *Ignanodon*, *Pterodactyls*, are types. Since the publication of these reports Professor Owen has published, in the works of the Palæontographical Society, monographs 'On the Fossil Chelonia of the London Clay, and other Tertiary Deposits,' 1849; 'On the Fossil Ophidia of the British Tertiary Formations,' 1851; 'On the Fossil Chelonia of the British Chalk Formation,' 1851; 'On the Fossil Chelonian Reptiles of the Wealden Clays and Purbeck Limestones,' 1853. Besides these he has also published a 'History of the British Fossil Reptiles,' 4to, parts I. to V., 1848-51.

There is still one other department of natural history that has been developed and established by the genius of Owen. Owen had asserted that the typical form of the skeleton of the higher animals was the

vertebra. [Owen.] Geoffroy St. Hilaire, Carus, and others, had worked out this idea in considerable detail. It had however been rejected by Cuvier, and no one of eminence had attended to the subject in this country. Owen determined to investigate the whole question for himself, and soon discovered that in the labours of the transcendental anatomists there lay a great truth. He constructed for himself a typical vertebra, and with this instrument proceeded to investigate the skeleton of the vertebrate animals. The result was a report to the British Association 'On the fundamental type and homologies of the vertebrate skeleton.' In this paper he first used the word 'homology,' as expressive of parts having the same relations throughout any series of organic beings. This subject he further developed in a work entitled 'On the archetype and homologies of the vertebrate skeleton, with tables of the synonyms of the vertebral elements and bones of the head of fishes, reptiles, birds, mammals, and man,' (London, 1848). A popular exposition of this subject was given in a smaller work entitled 'On the Nature of Limbs,' (1849). So completely did he vindicate the discovery of Owen, which had hitherto been looked on with suspicion, that the recognition of a general plan in the structure of the skeleton of the vertebrata, has become one of the fundamental positions of zoological science. It is not however on these researches alone that Professor Owen's claims rest to be regarded as a philosophical anatomist. He was one of the first in this country to recognise the law of Von Baer, of the progressive development of the animal in its growth from the general to the special, and has demonstrated its existence in his papers on the growth of the young of the higher animals. He first promulgated the law of vegetative or irrelative repetition of parts in the animal kingdom, and has by his writings contributed largely to the maintenance of that law of unity of organisation which is now the guiding principle of the naturalist in his investigations of the power of animal life. In his general views of the existence of animal life on the globe, Professor Owen has maintained that the same law is observable in the successive appearance of animals on the earth as in the development of each particular species, and that there is in the history of creation a progress from the general to the special; that the lower and more incomplete forms of animals were first created, and that the higher forms have been the last to appear upon the surface of the earth.

A complete list of the writings and works of Professor Owen will be found in the 'Bibliographia Zoologica et Geologica,' published by the Ray Society. An extended criticism of his works appeared in the 'Quarterly Review,' in two articles, in 1854 and 1855.

After occupying the position of Hunterian Professor at the College of Surgeons for twenty years, Professor Owen was offered by the British Museum the position of chief of the natural history department of that great establishment. In connection with this post he will still deliver lectures on natural history, and a first course on palæontology will be delivered at the School of Mines in Jermyn-street during the ensuing spring (1857).

Professor Owen has received numerous acknowledgments of his scientific merits. In 1843 he received the Royal Medal, and in 1851 the Copley Medal of the Royal Society. From our own government he has received a pension, and Her Majesty has granted him a residence at one of the royal houses in Richmond Park. The King of Prussia bestowed upon him on the death of Oersted in 1851 the distinction of "Chevalier of the Order of Merit." Oxford has conferred on him her D.C.L., and Edinburgh her LL.D., whilst he has been elected a foreign member of almost every distinguished society in Europe and America that cultivates the natural sciences.

In 1835 Professor Owen married the only daughter of his friend and fellow curator, Mr. Clift, by whom he has one son living.

Amidst his laborious scientific labours, Professor Owen has devoted much attention to the practical application of the laws of life to the preservation of the health of the community. He was one of the commissioners of inquiry into the health of towns, and into Smithfield market. He reported to the first on the sanitary condition of his native town of Lancaster, and his exertions in this direction have given a most important impulse to the subject of sanitary reform. He also took an active interest in the establishment of the Great Exhibition in 1851, and was a member of one of the committees and a jurymen.

OWEN, ROBERT, the propounder of new social and some other theories, was born at Newton in Montgomeryshire, in 1771. His parents were in a humble condition of life, but they enabled him to acquire such an education that when he left the elementary school of his native town at ten years of age he had acted as under-teacher for three years. Until he was fourteen he was employed in drapers' shops in his native town and at Stamford. He then procured a situation in London, where he distinguished himself by his talents for business, and at eighteen became a partner in a cotton-mill on a small scale. He was successful in this, and then removed to the Chorlton Mills, near Manchester, where he was equally prosperous. In 1801 he married the daughter of David Dale, a manufacturer of Glasgow, who had established in 1784 a cotton-factory near Lanark, now called New Lanark, on the banks of the Clyde. In this factory not only cotton-spinning but other connected branches of the manufacture were carried on, and at one time as many as 4000 persons were settled here in connection with it. Soon after his marriage Mr. Owen sold the

Chorlton Mills, and undertook the management of New Lanark. As a commercial speculation it was in a high degree successful; but the most remarkable feature was the benevolent care with which Mr. Owen attended to the welfare of the persons employed and to the education of their children. He here introduced many improvements, since adopted in other schools, so as to make instruction at once attractive and useful; and founded, if not the first, one of the earliest of the infant schools. Besides the ordinary routine of education, the children—of whom there were at one time 600—were taught various practical arts, and were indulged in singing and dancing, care being also taken of their health by building well-ventilated school-rooms and providing for active exercise. The character of the establishment spread rapidly, and it was continually visited by persons of rank and influence. In 1812 he published his 'New View of Society, or Essays on the Formation of Human Character,' and subsequently a 'Book of the New Moral World,' in which he developed a theory of modified communism. In 1823, having relinquished his connection with New Lanark, he went to North America, purchased a large tract of land in the state of Indiana on the banks of the Wabash, and founded a settlement called New Harmony, where he endeavoured to carry his theory of the co-operative system into effect. It was an utter failure, and he returned to England in 1827. In this year an attempt was also made to effect an establishment in consonance with his new view of society at Orbiston, in the parish of Bothwell, Lanarkshire. It was intended to purchase 1200 acres of land, and to erect a parallelogram to accommodate 1200 persons. A large sum of money was raised, but the expenses so greatly exceeded the estimates that not more than a fourth of the proposed parallelogram was raised, but it had a theatre, lecture-room, and school-rooms. Less than 200 persons were collected; the labourers were to work on the co-operative system, but were not all paid alike, nor did all fare alike. They took their meals in a common hall, but at four different tables, varying in charge for the total weekly board from 14s. to 10s., 7s., and 5s. 6d. Including English and Irish families, as well as Scotch, it is not strange that their manners and customs gave great offence to their Presbyterian neighbours, and indeed there was much that was objectionable. It terminated in a short time; the society was dissolved; the property sold at an enormous loss; the buildings were pulled down, and the materials sold; and nothing now remains of New Orbiston. A similar experiment was also made at T'ytherley, in Hampshire, and was equally unsuccessful. Mr. Owen's attempts likewise to establish a 'Labour Exchange' in London, in connection with a bazaar and a bank, were alike fruitless; after a short existence the concern became bankrupt. In 1828 he visited Mexico on an invitation from the Mexican government to carry out his scheme there, but nothing was done. Since that time his exertions in England have been devoted to various objects, the foretelling of the Millennium on earth; the establishing of a system of morality, independent of religion; and a vindication of his claims to be able to hold conversations with the spirits of the dead, particularly with the late Duke of Kent. For these purposes he spares no labour, and incurs considerable expense. He lectures, holds public meetings, conducts weekly periodicals, and for a long period omitted no opportunity of appearing before the public, though now increasing years have lessened his activity. Whatever may be thought of the opinions he holds, there can be no doubt of his extreme benevolence, his moral integrity, nor of his business talents. [See SUPPLEMENT.]

\* DAVID DALE OWEN, the son of the preceding, has distinguished himself as a writer on geology in the United States of America, and holds the official situation of geologist to the states of Wisconsin and Iowa, of which states he has published a geological survey.

\* OXFORD, JOHN, was born at Camberwell, near London, in 1812. He was articled to a solicitor, and admitted in 1833; but he soon devoted himself to literature and the drama, and is a member of the Philological Society. He is the author of many pieces, both original and translated, which have been produced at various London theatres. Of the original productions the most popular are—'My Fellow Clerk' (1835), 'Twice Killed' (1835), 'Day well Spent' (1836); and of the translations, that of the 'Tartuffe' of Molière. He became early also a student of German belles-lettres and philosophy; translated part of the 'Autobiography of Göthe,' the 'Conversations of Eckermann with Göthe' (1850), and the 'Hellas' of Jacobs (1855); and he is said to be the author of an article in the 'Westminster Review' on the philosophy of Arthur Schopenhauer ('Iconoclasm in German Philosophy'), which was afterwards translated into German, and spread the reputation of that original thinker. He has bestowed likewise much attention on French literature, and wrote the article 'Molière' in the 'Penny Cyclopædia,' to which he contributed several other biographies. In 1855 he published a collection of songs translated from the French, with the title 'Illustrated Book of French Songs' (1855). His other literary labours have been those of a theatrical critic for many years on the daily press, and a translator of German poems for various magazines. He has also written several poems and songs to music.

OXENSTIERNA, AXEL, COUNT, was born in 1588 at Fanö, in Upland, of a noble Swedish family. He studied in Germany at Rostock, Jena, and Wittenberg, in which last university he took degrees. After his return to Sweden he followed the career of diplomacy under Charles IX., and was made a senator. When

Gustavus Adolphus ascended the throne in 1611 he appointed Oxenstierna chancellor or prime-minister. From that time the name of the minister is closely connected with that of his illustrious master, whose confidence he fully enjoyed, and to whom his abilities as a statesman were of the greatest service. After the death of Gustavus at the battle of Lutzen in 1632, Oxenstierna, who was then on a mission in another part of Germany, immediately repaired to the camp, concentrated the Swedish and allied forces, urged the German princes to remain steady in the cause of the alliance against the political and religious tyranny of the Emperor Ferdinand, and, having received full powers from the senate of Sweden, he became the soul of the Protestant league in Germany. The difficulties which Oxenstierna had to encounter proceeded from the jealousy of his allies more than from the efforts of the enemy. He succeeded however in assembling the states of Lower Saxony at Heilbronn, and he opened the meeting by a speech. After much opposition he obtained a supply of money for the Swedish army, and he was himself acknowledged as the head of the league. A succession of able commanders, the Duke of Weimar, Banner, Torstenson, Wrangel, all formed in the school of Gustavus, led on the Swedish and German forces with various success, while Oxenstierna directed from Stockholm the diplomatic negotiations, until the peace of Westphalia in 1648 put an end to the Thirty Years' War. Count Oxenstierna's son was one of the Swedish envoys who signed that celebrated treaty. It was to him that the chancellor, in reply to the young man's letters, in which he had expressed himself with great diffidence in consequence of his inexperience in matters of state, wrote the following sentence, which has become proverbial:—"Necis, mi filii, quantilla prudentia homines regantur" ("You do not know yet, my son, how little wisdom is exhibited in ruling mankind").

Oxenstierna was at the head of the regency of Sweden during the whole minority of Queen Christina, and he continued to be prime-minister after she had assumed the reins of government. He strongly opposed Christina's intention of abdicating the crown, and being unable to prevent this act he withdrew from public life. Christina's successor, Charles Gustavus, consulted him however on important occasions. Oxenstierna died at Stockholm in August 1654, regretted and honoured by all Sweden. He is said to have been partly the writer of the 'Historia Belli Sueco-Germanici,' published by Chemnitz; and also of the work 'De Arcanis Austriacæ Domus ab Hippolyto à Lapide.'

OXFORD, EARL OF. [HARLEY.]

OXANAM, JACQUES, was born in 1640, at Boulogne, in the present department of the Ain. His family, though of Jewish extraction, had long been members of the Roman Catholic church; and his father was possessed of considerable landed property, to which some ecclesiastical patronage was attached. Jacques, being the younger of two sons, was designed for the church, and accordingly began the necessary studies, but less from his own inclination than to comply with the wishes of his father. His biographers describe him as naturally pious, generous, witty, and gallant; he certainly was too tolerant for a churchman of his day. The theological writings to which his attention was directed gave him little satisfaction. Other subjects of investigation, such as chemistry, mechanics, &c., attracted his notice, and thenceforward his theological studies were attended to solely from compulsion or a sense of duty. The tutor to whose care he had been confided possessed some slight acquaintance with the mathematics, and from him he may have received some assistance in reading them; but, with this exception, he was self-taught; and although he never attained to any great eminence as a mathematician, he was the author of several useful works, which became extremely popular, and passed through many editions.

The death of his father, which took place about four years after he commenced reading for the church, left him free to follow whatever occupation he chose. He accordingly removed to Lyon, where he began teaching the mathematics gratuitously, regarding it as a degradation to receive payment for his instruction. It is probable that he did not long act under this impression, as his pecuniary means were limited, and his attachment to games of chance frequently led him to the gaming-table.

At the invitation of the chancellor of France he removed to the French capital, where his amours soon drew so heavily upon his resources that he determined upon marrying, as the most effectual way of curtailing his expenditure. His wife was without fortune, but possessed of so many excellent qualities, that his greatest affliction was occasioned by her death in 1701. By her he had twelve children. At Paris he had for many years considerable success as a mathematical tutor, though he was patronised much more by foreigners than by his own countrymen. Most of the former were obliged to leave the country upon the breaking out of the war of the Spanish Succession, the same year as that in which his wife died; and from that time, the income he derived from his profession was both small and uncertain. Montucla, speaking of his scientific productions, remarks, "He promoted the mathematics by his treatise upon lines of the second order; and had he pursued the same branch of research, he would have acquired a more solid reputation than by the publication of his 'Course,' 'Recreation,' or 'Mathematical Dictionary;'" but having to look to the support of himself and family, he wisely consulted the taste of his purchasers rather than his own. ('Histoire des Mathém.,' t. i, p. 168.) When far advanced in years he was admitted an élève of

the Academy of Sciences, and died at Paris, of apoplexy, April 8, 1717. The following is a list of his works, in the order of publication:—

1, 'Méthode pour tracer les Cadran, 8vo, Paris, 1673, 1685, 1730; 2, 'Géométrie pratique,' 12mo, Paris, 1684, 1689, 1736, 1764; 3, 'Tables de Sinus, Tangentes, &c., 8vo, Paris, 1685, 1720, 1741; 4, 'Traité des Lignes du premier genre,' 8vo, Paris, 1687; 5, 'Usage de l'Instrument universel pour résoudre promptement tous les Problèmes de la Géométrie pratique,' 12mo, Paris, 1688, 1700, 1736, 1748, 1794 (the instrument referred to is the proportional compass); 6, 'Méthode de lever les Plans et les Cartes de Terre et de Mer,' 12mo, Paris, 1693, 1750 (the same improved by Audierne, 12mo, Paris, 1782); 7, 'Dictionnaire Mathématique,' 4to, Amst., 1691 (the same translated and abridged by Raphson, 8vo, London, 1702); 8, 'Cours de Mathématique,' 5 vols. 8vo, Paris, 1693, Amst., 1699; 9, 'Récréations Mathématiques et Physiques,' 4 vols. 8vo, Paris, 1694, 1720, 1725, 1735, 1777 (the same improved and augmented by Montucla, 8vo, Paris, 1778, 1790; the same in English by Dr. Hutton, 8vo, London, 1803); 10, 'Traité de la Fortification,' 8vo, Paris, 1694, 1720 (the same translated by Desaguliers, 8vo, Oxf., Lond., 1711); 11, 'Trigonométrie,' 12mo, Paris, 1698; 12, 'Méthode facile pour arpenter et mesurer toutes sortes de Superficies, &c.,' 12mo, Paris, 1699, 1725, 1747, 1758, 1779; 13, 'Eléments d'Algèbre,' 8vo, Amst., 1702; 14, 'Géographie et Cosmographie,' 8vo, Paris, 1711; 15, 'La Perspective, théorie et pratique,' 8vo, Paris, 1711, 1720. In the 'Memoirs of the Academy of Sciences' for 1707 there is a paper by him entitled 'Observations sur un Problème de Trigonométrie sphérique.' To the 'Journal des Savans' he contributed:—1, 'Proof of the Theorem that neither the sum nor the difference of two fourth powers can be a fourth power,' May, 1680; 2, 'Answer to a Problem proposed by M. Comiers,' Nov., 1681; 3, 'Proof of a Theorem relative to Imaginary Roots,' April, 1685; 4, 'Method of determining the cubic and sursolid roots of a Binomial.' At his death he left a treatise in manuscript upon the Diophantine Analysis, which came into the possession of M. Aguesseau. He also published a corrected and augmented edition of Vlacq's 'Trigonometry,' 8vo, Paris, 1720, 1765.

(Eloge, par Fontenelle; La Haye, *Œuvres diverses*, 1728-29, fol. iii, p. 260-65; *Biographie Universelle*; &c.)

OZELL, JOHN, an industrious translator, of the early part of the 18th century. He was educated at Ashby-de-la-Zouch, and at Christ's Hospital, London, where he obtained a tolerable knowledge of Greek and Latin. By his friends he was intended for the church, but preferring business he entered an accountant's office, and during his leisure hours acquired the French, Spanish, and Italian languages. Without giving up his calling as an accountant, Ozell made himself well-known by his translations in those languages, he having among other things published poetic versions of several of the plays of Molière, Corneille, Racine, the 'Lutrin' of Boileau, and the 'Secchia Rapita' of Tassoni; and in prose 'Don Quixote,' Rabelais, the 'Persian Letters,' Vertot's 'Revolutions of Rome,' Fénelon on Learning, Nicole's Logic, a Life of Veronica, &c. None of them however are of any very marked excellence, though

in their days they had doubtless a certain value. His Quixote and Rabelais are poor spiritless renderings. Ozell had the ill-luck to get hitched into the Dunciad—perhaps, because his name rhymed with Cornella. He was very angry at the distinction, and vented his wrath at the "envious wretch" who placed him there in an advertisement in the 'Weekly Medley' of September 20, 1739, in which he compares his learning, genius, and poetic skill with Pope's, very much of course to his own advantage: he challenged any one to "show better verses for genius in all Pope's works than Ozell's version of Boileau's Lutrin . . . or better and truer poetry in the Rape of the Lock, than in Ozell's Rape of the Bucket (la Secchia Rapita): surely, surely," he concluded, "every man is free to deserve well of his country." Ozell also published 'Common Prayer and Common Sense, or Faults in the Several Translations of the English Liturgy,' 8vo, 1722, in reference to which he says in the above advertisement "every body knows that the whole bench of bishops were pleased to give me a purse of guineas for discovering the erroneous translations of the Common Prayer in Portuguese, Spanish, French, Italian, &c." Ozell died in 1743. At his death he held the offices of auditor of Christ's Hospital and St. Paul's Cathedral estates, and he was for many years auditor of the Bridge House estates.

OZEROV, VLADISLAV ALEXANDROVITCH, the most distinguished tragic poet that Russia has hitherto produced, was born in the government of Tver, September 29 (October 11), 1770. After passing through the usual course of military service in which, besides otherwise distinguishing himself, he rose to the rank of major-general, he exchanged it for a civil appointment, which he held till 1807, when he retired from public life. Instead however of devoting himself the more closely to literary studies, he shortly after abandoned them, or at least discontinued writing,—disgusted according to his biographer, Prince Viázemsky, by the envy and enmity which his talents had excited. 'Polyxena,' which was first performed in May 1809 was his last dramatic production. From that time to his death, which happened, after a long and very severe illness, in November 1816, he only composed three acts of an unfinished tragedy, entitled 'Medea,' and sketched the plans of two others, one of which had for its subject the siege of Damascus, and is said to have been founded on Hughes's English tragedy of the same name.

Although the pieces upon which his fame rests do not amount to more than four—his first drama, entitled 'The Death of Oleg,' bearing no comparison with his succeeding ones—Ozerov may be considered not merely as the reformer, but as in a manner the creator of Russian tragedy. Kniashin had improved upon Sumarokov, but chiefly in regard to style and manner: neither genuine poetry nor masterly delineation of character is to be met with in their tragedies. It was reserved for Ozerov to infuse vitality into the previously cold and lifeless form. His 'Œdipus,' 'Fingal,' 'Demetri Donaki,' and 'Polyxena,' are all severally masterpieces, full of poetry; and although simple in plan, and with more of dialogue than action, strikingly dramatic in some of the situations.

## P

PACCHIAROTTO, JA'COPO, one of the most distinguished of the old Sienese painters, was born at Siena in 1474, and was the son of Bartolommeo; but though he belongs chronologically to the painters of the 16th century, he is one of the 'quattrocentisti' in style. His works much resemble those of Pietro Perugino; at the same time they are more fully developed in form and of wonderful force of colouring; in expression also many of his heads are admirable.

He lived in Siena until 1535, when, owing to his being one of the principals in a conspiracy of the people against the government, he was compelled to fly, and he took refuge in France. Lanzi says that he would certainly have been hanged had he not been protected by the Osservanti monks, who concealed him for some time in a tomb. He succeeded in making his escape, and joined Il Rosso in France, where he was employed on the decorations of Fontainebleau. In 1536 he returned to Siena, but was again banished in 1539. Pardonned in 1540, he returned to his family, after which nothing is known of him.

There are still several excellent paintings, both in oil and in fresco, by Pacchiarotto, in Siena. There is a beautiful altar-piece in San Cristoforo; and some excellent frescoes in Santa Caterina and San Bernardino. Speth takes particular notice of these frescoes in his 'Art in Italy,' and terms Pacchiarotto the second hero of the Sienese school—Razzi, called Sodoma, being the first. They are highly praised also by Lanzi. In Santa Caterina is the 'Visit of Saint Catherine of Siena to the Body of Saint Agnes of Montepulciano,' in which are heads and figures worthy of Raffaele. According to Speth these works can be justly compared with Raffaele's alone; and he adds, that designating Pacchiarotto as of the school of Perugino is only magnifying the injustice he had already undergone in having his works long reported as the works of Perugino. If therefore he were the pupil of Perugino, "what Perugino supplied was only the spark," says Speth, "which in Pacchiarotto grew into a flame."

Pacchiarotto has suffered the same misfortune that many other

excellent masters have undergone, owing to their being omitted by Vasari—their merits have remained long unrecognised. Pacchiarotto is probably the Girolamo di Pacchia who is casually mentioned by Vasari in speaking of Il Sodoma: they painted together in San Bernardino.

There are two beautiful small easel pictures in oil and on wood in the Pinakothek at Munich by Pacchiarotto—San Francesco d'Assisi, with two angels in the background; and the Madonna and Child, with four angels in the background; half-length figures in both. They are two of the best pictures in the collection, in character, colour, and execution, and are among the best specimens of the beauties of the early Italian schools of painting. They were formerly in the church of San Bernardino at Siena, but were purchased about 1818 by the late king of Bavaria, Ludwig I., then crown-prince. In the National Gallery is a 'Madonna and Child' (No. 246) by him.

PACHECO, FRANCISCO, was born of a good family at Seville, in 1571, according to his own account, which is nine years earlier than the date given by Palomino. He was nephew of Francisco Pacheco, canon of the cathedral of Seville, a distinguished divine and a celebrated Latin poet. Pacheco's master was Luis Fernandez, a painter of serges, &c., at Seville: he never was in Italy, as Palomino has wrongfully inferred from two passages in his treatise on painting; he studied exclusively in Seville. His first works worthy of notice were two large flags or standards for the Spanish fleets of New Spain and Tierraferma, painted in 1594, in oil on crimson damask, each thirty yards by fifty; the paintings were the royal arms of Spain, and St. Iago on horseback, with rich borders and other decorations. He was one of the principal painters employed on the great decorations of the funeral or catafalque of Philip II. of Spain in the cathedral of Seville in 1598. He was also the first, says Ceán Bermúdez, in Seville who properly painted and gilded statues—"el primero en encarnar y estofar bien las estatuas;" thin colour was painted over the gold.

He was the first likewise who painted the figures and grounds of bassi-rilievi; there are several works of both descriptions by Pacheco in Seville.

In 1600 he was appointed, together with Alonzo Vazquez, to paint a series of large pictures illustrating the life of St. Ramon for the cloister of the convent of the Merced. In 1603 he executed some works in distemper in the palace of Don Fernando Henriquez de Ribera, third duke de Alcalá, from the story of Dædalus and Icarus.

It was not till 1611 that he visited Toledo, Madrid, and the Escorial, and saw the great works of Titian and other celebrated Italian and Spanish masters. The sight of the excellent works which he saw on this occasion impressed him forcibly with the varied and incessant application requisite to form a great painter. Accordingly upon his return to Seville he opened a systematic academy of the arts, as well for his own improvement as for the benefit of the rising artists of Seville; and the fact alone that Alonzo Cano and Velazquez were two of his scholars, shows that his system worked with some effect. The improvement he himself acquired by such elementary instruction, and from the true principles of art, is shown by his great picture of the 'Last Judgment,' an altar-piece finished in 1614 for the nuns of the convent of St. Isabel, which he has himself described at great length in his treatise on painting. It was a large work containing many figures and many incidents, but Pacheco received only 700 ducats for it.

In 1618 Pacheco was appointed by the Inquisition one of the guardians of the public morals, in as far as he was made censor of all the pictures which were exposed for sale in Seville; nakedness was prohibited, and it was Pacheco's business to see that no pictures of the naked human form were sold. It is to such formal morality as this that the Spanish school of painting owes its characteristic ponderous sobriety, and is so directly opposed to Italian painting. Prudery was carried so far in Spain, that in the time of Ferdinand VII. even all the great Italian works which could be reproached with nudities were removed from the galleries, and were condemned to a distinct set of apartments called the Galeria Reservada, and only opened to view to those who could procure especial orders. "Nothing," says Mr. Ford in his Handbook of Spain, "gave the holy tribunal greater uneasiness than how Adam and Eve in Paradise, the blessed souls burning in purgatory, the lady who tempted St. Anthony, or the Last Day of Judgment, were to be painted, circumstances in which small-clothes and long-clothes would be highly misplaced. Both Palomino (ii. 137) and Pacheco (201) handle these delicate subjects very tenderly. Describing the celebrated Last Judgment of Martin de Vos, at Seville, Pacheco relates how a bishop informed him that he had chanced, when only a simple monk, to perform service before this group of nakedness; the mitre had not obliterated the dire recollections; he observed (he had been a sailor in early life) that rather than celebrate mass before it again, he would face a hurricane in the Gulf of Bermuda; the moral effect of the awful Day of Judgment was so much counter-balanced by the immoral deahabilla."

In 1623 Pacheco again visited Madrid, in company with his distinguished scholar and son-in-law Velazquez, and he remained two years in the Spanish capital. Velazquez went to Madrid by the invitation of the Duke de Olivares, who procured him the appointment of painter to the king, Philip IV. It was at this time that Velazquez painted his equestrian portrait of Philip, upon which Pacheco wrote a sonnet, in which Philip was compared with Alexander, and Velazquez with Apelles.

Pacheco, during this visit to Madrid, among many other works, executed one which hardly accords with the present notions of the occupation of a great painter, though it has been the practice of great artists from very early ages to paint their statues. [NICIAS.] Pacheco dressed, gilded, and painted (estofó) for the Duchess of Olivares, a statue, probably of wood, of the Virgin, by Juan Gomez de Mora, for 2000 reales. The work was much admired, and by none more than Eugenio Caxes, who, says Cean Bermudez, estimated the decoration at 500 ducats. What this process exactly was it is not evident from this mere mention; but the object generally in these painted wooden images appears to have been to obtain an exact imitation in the minutest detail—perpetual facsimiles. The effect of such images, called 'Pasos,' must be experienced to be comprehended. The Spaniards dress them as well as paint them. Their churches were crowded with such works; but most have now been removed to museums.

Pacheco returned to Seville, where his house became a chief resort of all men of art, of literature, and of taste; and among his most intimate associates were the Jesuits of Seville, who assisted him in his 'Arte de la Pintura,' and were indeed the authors of that part which is devoted to sacred art; and doubtless to them is due the austere morality which characterises Pacheco's principles of art. He is noticed above as having been the first artist who painted images properly. He published an essay partly on this subject in 1622, complaining of sculptors painting their own statues. But the generality of 'Doradores' and 'Estofadores' worked so badly that such sculptors as Juan Martinez Montañes and Alonzo Cano felt compelled to dress and colour their own statues. Pacheco however coloured many statues for Montañes, including the St. Jerome of the monastery of Santiponce. Montañes generally made a contract with his employers to

be allowed to superintend the toilet of his own statues. Mr. Ford gives some curious details about the toilets of these Spanish images. No man is allowed in Spain to undress the 'Paso,' or 'Sagrada Imagen' of the Virgin; and some images had their mistresses of the robes ('camerera mayor') and a chamber ('camerin') where their toilet was made. The duty has however now devolved upon old maids; and "ha quedado para vestir imagines" (she has gone to dress images) has become a term of reproach.

Pacheco died at Seville in 1654. His works, though not vigorous, are correct in form, effective in light and shade, studied in composition, and simple in attitude; but they have little colour, are dry, and rather feeble or timid in their handling. These defects are more apparent when his pictures are seen together with the works of other Andalusian painters, who have generally made colouring their principal study, and have comparatively neglected purity of form. Besides many religious pictures, he painted or drew in crayons nearly four hundred portraits, the best of which is that of his own wife. One of his sitters also was Miguel Cervantes.

His 'Arte de Pintura, su Antigüedad, y Grandezas,' 4to, Seville, 1649, pp. 641, a remarkably scarce book, is considered an indispensable guide by the painters of the school of Seville; it is very elementary, and is said also to be a work of great learning on the subject, and is held throughout Spain to be the best work on painting in the Spanish language: it is in three parts—history, theory, and practice. His works are seldom seen out of Seville, and he is even very inadequately represented in the splendid gallery of the Prado at Madrid. His masterpiece was considered to be the altarpiece of the 'Archangel Michael expelling Satan from Paradise,' which was in the church of San Alberto at Seville. There are still at Seville an altarpiece of the 'Conception of San Lorenzo,' two pictures of 'San Fernando' in San Clemente, and a picture in San Alberto. The methodic system of Cean Bermudez to mention the locale of all the most celebrated works of the great Spanish masters, eventually cost Spain the greater portion of these works, for his dictionary was used by the French generals and others as an inventory of what was valuable, and directed them to the places where these works were to be found. Not a moiety of the works of Pacheco described by Bermudez as at Seville is now to be found there. Pacheco's own portrait by himself is in the Spanish museum in the Louvre.

Pacheco collected the poems of his friend Hernando de Herrera, and published them with a portrait in 1619. His own poems do not appear ever to have been published in a collected form. Bermudez has printed a few in his 'Dictionary.'

PACIO, GIULIO, was born in 1550, at Vicenza, in the Venetian state. He learned Latin, Greek, and Hebrew at an early age, and became well acquainted with every branch of classical learning. Being accused before the ecclesiastical authorities of reading books forbidden by the church of Rome he became alarmed, and escaped to Switzerland, where he earned his livelihood as a teacher. He was afterwards appointed professor of philosophy at Heidelberg, where he assumed the name of 'Pacius à Berigo,' from a country-house belonging to his family near Vicenza. He travelled through Germany and Hungary, and after some years he was invited by the Duke of Bouillon to his newly-established university of Sedan, where he taught philosophy with great success; but the civil wars raging in that part of the country he removed to Nîmes, and thence to Montpellier, where he was made professor of law in that university about the year 1600. The afterwards celebrated Peiresc was one of his disciples. Henri IV. bestowed on Pacius the honorary rank of king's counsellor. Pacius had long professed the reformed religion, and Peiresc earnestly but unsuccessfully attempted to induce him to settle near him at Aix, and to return to the Roman Catholic faith. From Montpellier, Pacius removed to the university of Valence in Dauphiné, where his reputation as a jurist increased and spread throughout Europe. He was offered chairs at Leyden, Pisa, and Padua. He chose the last university, where he was received with great honours, and the Venetian senate made him a knight of St. Mark. After some time however he returned to his family, which he had left at Valence, where he died in 1635.

Pacius wrote many treatises and commentaries on the Roman law; among others: 1, 'De Juris Methodo Libri Duo.' 2, 'Juris Civilis Romani Initia et Progressus,' consisting of a Commentary on the twelve Tables, of Notes on Fragments of Ulpian and Gaius, on Pomponius 'De Origine Juris,' and upon the last two titles of the Pandects. 3, 'Picture duse de Gradibus secundum Jus Civile et Canonium.' 4, 'De Contractibus.' 5, 'De Pactis et Transactionibus.' 6, 'In Decretales Libri V.' 7, 'Consuetudines Feudorum.' Pacius edited also the following works:—8, 'Corpus Juris Civilis cum Notis et Legum Argumentis,' fol., Geneva, 1580. 9, 'Justiniani Imperatoris Institutio-nium Libri IV.' 10, 'Sapientissimi Cæsaropalatæ de Officialibus Palatii Constantinopolitani et Officii Magnæ Ecclesiæ Libellus,' Greek and Latin, Heidelberg, 1588. He also published several editions of the 'Organon' of Aristotle, of which he made a new Latin translation. He also edited the works of Aristotle, in 2 vols. 8vo, 1597. His other works on various subjects are—11, 'In Porphyrii Isagogen et Aristotelis Organum Commentarius Analyticus,' 4to, Frankfurt, 1597. 12, 'De Dominio Maris Adriatici inter Serenissimum Regem Hispaniarum ob Regnum Neapolitanum et Serenissimam Rempublicam

Venetam, Lyon, 1619. In this curious work he defends with great skill the dominion asserted by the Venetian republic over the Adriatic Sea as far as Cape Leuca, on the several grounds of old prescription, of having its territories round the greater part of that gulf, on the obligation of keeping it free from pirates, and maintaining the only naval armament on its coasts. The work is interesting, as affecting other similar questions of 'mare clausum' and the rights of dominion claimed by other powers over the narrow seas near their coasts. 13, 'Doctrina Peripatetica.' 14, Lastly, after Pacio's death, was published at Amsterdam, in 1648, 'Posthumus Pacionus, seu Definitiones Juris utriusque.'

(Lorenzo Crasso, *Elogi di Uomini Letterati*; Thomasini, *Elogia Doctorum*; Gassendi, *Vita Petrescii*.)

PACIOLI, LUCAS, was born at Borgo San Sepolcro, in Tuscany (whence he is frequently called Lucas de Burgo sancti Sepulchri, and Lucas di Borgo), about the middle of the 15th century. He was a Minorite friar, and taught successively at Perugia, Rome, Naples, Pisa, and Venice. He resided some time at Milan, in company with Leonardo da Vinci; they quitted Lombardy together on the arrival of the French, and Pacioli spent his last years at Florence and at Venice. He was certainly alive in 1509; but from after that year M. Libri finds no further mention of him as living.

His 'Summa de Arithmetica, Geometria, Proportioni, et Proportionalita' was printed in Italian, at Venice, in 1494. It contains copious extracts from Fibonacci, to such an extent that Pacioli himself warns his reader, where no other authority is mentioned, to infer that Leonard of Pisa is followed. This work was the first printed on algebra, and though it does not advance the science, contains a large amount of details, and carries the practice of algebraical operations into questions of more complexity than any which had preceded, particularly in operations on surd quantities. M. Libri says that the treatise on book-keeping, which forms part of Pacioli's work, is the first in which what is now called the method of double entry appears in print. Some account of the contents will be found in Hutton's 'History of Algebra' ('Tracts,' vol. ii.). The 'Divina Proportione,' Venice, 1509, is thus described by M. Libri: "Pacioli wished to make a certain proportion, long known to geometers, the base of all the sciences. He deduces from it the principles of architecture, the proportions of the human figure, and even those which ought to be given to the letters of the alphabet. It is a systematic treatise, of which the principal merit consists in the co-operation of Leonardo da Vinci, who engraved the plates, and probably also superintended the parts which concern the arts. There are some propositions of geometry upon the inscription of polyhedra in one another. . . . There is also the use of letters to indicate numerical quantities." On this last sentence M. Libri cites a passage containing the use of letters in a simple proportion; and it seems to us that the point which he is labouring to establish, namely, the virtual existence of 'specious' algebra before Vieta, cannot be more completely overturned than by this, his only direct quotation on the subject. When M. Libri says that Fibonacci used letters for quantities, both known and unknown, he does not cite a passage, but leaves it to be verified by those who will look over his citation of the fifteenth chapter of Fibonacci, of more than 150 octavo pages. On looking through these we do find a few places where numbers are denoted by single letters; but whenever they are to be divided into parts, double letters are used: in fact, Fibonacci does exactly what Euclid does in the fifth book. Of Pacioli's notation, in the professed algebraical work, nothing is said; but in the work we now mention the quotation which is to establish that Pacioli had substantially the idea of Vieta on algebra contains just as much algebraical notation as, and no more than, appears in Pacioli's own translation of Euclid, published in the same year. M. Libri persists in supposing that the mere use of letters to designate numbers is the sole distinction of Vieta's algebra.

Heilbronner infers from the preface to the 'Divina Proportione,' that Pacioli translated Euclid into Italian, and it is now known that he did not publish several of his earlier works: but he himself, in the dedication of the work now under mention, speaking of this very Latin Euclid itself, says, "Leges . . . vernacula lingua per me donatum Euclidem:" whence it is obvious that by 'vernacula' he means the Latin, as opposed to Greek or Arabic. The translation is substantially that of Athelard (which goes by the name of Campanus), and the commentaries of Campanus, or many of them, are added: Pacioli's own additional comments are all headed 'Castigator.' All the fifteen books are given which were supposed to be Euclid's.

Pacioli is not to be looked on as a great improver either of geometry or arithmetic: but his utility cannot be denied. It was he who made Fibonacci useful to the world by his compilations from that writer, and he has shown so much learning on the subject, and has drawn from so many sources, that it is not perhaps too much to say that it was better he should have printed the first book on algebra, than a more original but less erudite teacher.

PACIUS A BERIGA. [PACIO, GIULIO.]

PACUVIUS, MARCUS, a native of Brundisium, a Latin dramatic poet, and the nephew of Ennius, also distinguished himself as a painter. He was born about B.C. 219. Pliny ('Hist. Nat.,' xxxv. 4, 7) mentions some works executed by him in the temple of Hercules, in the Forum Boarium at Rome, which apparently did him considerable

MUO. DIV. VOL. IV.

honour; he remarks at the same time that he was the last who painted with 'hands polite' ('honestis manibus'), with the exception perhaps of Tarpinus Labeo of Verona, a Roman knight of his own times.

Some fragments of the tragedies of Pacuvius are still extant, and, according to Quintilian ('Inst. Or.,' x. 1), they were not without their merits. He died at Tarentum, in the ninetieth year of his age. He wrote a simple epitaph upon himself, which has been preserved by Aulus Gellius (l. 24)—"Adolescens, tamenetsi properas, te hoc saxum rogat, uti ad se aspicias, deinde quod scriptum est, legas. Hic sunt poetae Pacuvii Marci sita ossa. Hoc volebam; necius ne esses: vale." The Fragments of Pacuvius were collected by Henry Stephens, 8vo, Paris, 1664, and have since been printed in several editions of the 'Corpus Poetarum Latinorum.' Cicero, in his treatise 'On Friendship' (c. 7), introduces Lælius as speaking in terms of commendation of the 'Orestes' of his friend Pacuvius. Pacuvius was fifty years older than Attius, who exhibited a play in his thirtieth year, at the same time that Pacuvius, then in his eightieth year, exhibited one. (Cic., 'Brut.,' c. 64.)

PADILLA, JUAN LOPEZ DE, the leader of a popular insurrection in Castile against the ministers of Charles V., known as 'La Guerra de las Comunidades,' was the son of Pedro Lopez, a nobleman who held the high office of 'Adelantado Mayor' of that kingdom. After the death of Ferdinand V. (1516) the crown of Aragon and Castile, together with the extensive possessions dependent on them in Europe, as well as in Africa and America, devolved upon his grandson Charles, then in his sixteenth year. [CHARLES V.] The young prince appointed Adrian of Utrecht to administer the kingdom in his absence, but such was the aversion of the Spaniards to the government of a stranger that Adrian's claim would at once have been rejected, had not the celebrated Cardinal Ximenes [CIBARRIOS] consented to acknowledge him as regent, and carry on the government in conjunction with him. However, Adrian and his Flemish associates in the administration soon rendered themselves exceedingly obnoxious by their utter incapacity, their corruption, and their avarice. The laws of the kingdom were completely disregarded, the high offices of the state either given to foreigners or sold to the highest bidder; and the revenues of Spain, instead of being spent at home, found its way into Germany: the sovereign himself, who was far from his natural dominions, was a candidate for the imperial throne, then vacant by the death of his grandfather Maximilian. All these causes of discontent, increased by Charles's disregard to the remonstrances sent him by the Cortes, spread widely through the Peninsula. The city of Toledo was the first to show symptoms of rebellion. On the arrival of Charles at Valladolid for the purpose of receiving from the Cortes assembled there the oath of allegiance as heir to the crown of Castile, the deputies of Toledo were entrusted by their constituents with a lengthy memorial containing their grievances. Though Charles did not openly deny their petition, he referred them to the Cortes about to be assembled at Santiago, and quitted Spain to take possession of the imperial crown.

When the people of Toledo heard that the deputies assembled in Galicia had voted the emperor a free gift without obtaining redress of any of their grievances they rose tumultuously in arms. Their first act was to seize upon the Alcazar, a royal palace and fortress on an eminence commanding Toledo; and after appointing Padilla to be their leader, to establish a popular form of government. Segovia, Toro, Salamanca, Murcia, and Avila followed the example. A general meeting was convened at Avila, and a solemn league formed for the mutual defence of their rights, the direction of affairs being entrusted to a council composed of the deputies of all the towns, under the name of 'Junta de las Comunidades.' In the meanwhile Adrian, who resided at Valladolid, then the capital of Spain, sent a body of troops under Ronquillo to chastise the rebels; but while he was besieging Segovia, Padilla, with a body of insurgents from Toledo, came to the assistance of the citizens, and defeated the royal troops. The next step of Padilla was to march upon Tordesillas, the place where Queen Joanna, Charles V.'s mother, had resided since the death of her husband. Being admitted to the presence of the princess, who had long been in a state of mental debility, Padilla and his followers renounced the authority of the regent, and placed her at the head of the government. Thence they proceeded to Valladolid, and, deposing Adrian, seized upon the archives and the seals of the kingdom. The Junta then drew up a lengthy remonstrance, containing a state of their grievances, and sent with it two of their number to the emperor. Everything now augured success to the cause of popular liberty, but dissension soon broke out in the ranks of its supporters. The Junta, relying on the unanimity with which the nation had submitted to their authority, and seeing no royalist forces on the field to obstruct their designs, began seriously to think of reforming several political abuses, and various measures were proposed and carried which struck no less at the privileges of the nobles than at the prerogatives of the crown. This produced a union of the nobility with the royalists. The Junta, who now became jealous of Padilla's popularity, deprived him of the command of their forces, and appointed Don Pedro Girón, the eldest son of the Conde de Ureña, a nobleman of high rank, but wholly unequal to the task entrusted to him.

In December 1520 the royalists, under the Conde de Haro, defeated

the popular army, attacked and took Tordesillas, released Queen Joanna, and regained possession of the archives and seals of the kingdom, besides making fourteen members of the Junta prisoners. This severe blow was followed by the immediate disbandment of the insurgents and the loss of their general, who, betraying the cause of the people, passed over to the royalists. Padilla was now raised to the command of the army. He was at first successful in various small encounters, and by means of skilful manoeuvres succeeded in avoiding a general engagement with the veteran troops of Charles; but at length the royalists closing upon him on all sides he was obliged to hazard a battle, in which he was completely defeated at Villalar, on the 23rd of April 1521.

Padilla, who had been severely wounded in the conflict, was made prisoner, together with some of his principal officers, and executed on the day following that on which the battle was fought. Sandoval, and after him Dr. Robertson, have preserved us two letters full of eloquence and manly feeling, which the illustrious martyr of liberty wrote a few hours previous to his execution; one addressed to the city of Toledo, the other to his wife Doña Maria Pacheco, in which are some remarkable passages breathing respect and filial love towards his father Pedro Lopez, who fought against him under the royal banners.

DOÑA MARIA PACHECO DE PADILLA, the offspring of one of the most illustrious families in Spain, was early married to Juan Lopez de Padilla, whose political principles she embraced, and whose cause she most strenuously defended. After the execution of her husband she swore to support the sinking cause of the people, and to revenge his fate. The citizens of Toledo, who had learned on former occasions to appreciate her virtues, intrusted her with the defence of their rights. The prudence and vigour with which she acted justified the confidence placed in her. She wrote to the general of the French, who had just invaded Navarre, to advance into Castile, promising him her powerful aid. In order to procure the money requisite for raising an army, she went in person to the cathedral of Toledo, where a vast treasure of ecclesiastical wealth was preserved; and entering the temple in solemn procession, with all the marks of the deepest sorrow on her countenance, proceeded to take possession of the sacred deposit. She moreover adroitly put into practice every artifice that could interest or inflame the populace. For this purpose she ordered her troops to use crucifixes instead of crosses, and she marched through the streets with her son, a young child, dressed in the deepest mourning, seated on a mule, and having a standard carried before him on which was represented his father's execution. All her efforts were however fruitless: the rebellion, now confined almost within the walls of Toledo, was speedily crushed in other parts of the Peninsula. By the total discomfiture of the French, who were obliged to retrace the Pyrenees in haste, all the royalist forces were brought into operation; and Toledo, the last refuge of the Comuneros, was invested. Though she defended herself with the greatest courage for four months within the walls of the citadel, the clergy, whom she had highly offended by her spoliation, ceasing to give her their support, she was obliged to surrender that fortress. She was however enabled to escape into Portugal, where she passed the remainder of her days. Thus ended this bold though unsuccessful attempt of the commons to assert their rights, which contributed greatly to increase and extend the power of the crown.

(*Relacion de las Comunidades*, MS. Bib. Egerton, in the British Museum, No. 303; *Tratado de las Comunidades*, ib. No. 310; Robertson, *Charles V.*, vol. ii. (sixth edition); Sandoval, *Hist. de Carlos V.*; Martines de la Rosa, *Boquejo de la Guerra de las Comunidades*, vol. iii.)

PADILLA, LORENZO DE, one of the historiographers to Charles V., was born at Antequera, a town of Andalusia, towards the end of the 15th century. When still young he was, owing to his eminent virtues and profound learning, raised to the dignity of Archdeacon of Ronda, in the diocese of Malaga. At the same time he was appointed historiographer to the crown, when he devoted his time entirely to the study of the antiquities and history of his native country. Padilla died in 1540, leaving behind him a general history of Spain, divided into four parts, a few sheets of which have been printed, according to Nicolas Antonio (*Bib. Nov.*, vol. ii.), and the whole work was probably committed to the press, though the impression was never completed. The original manuscript was still existing at the end of the last century in the library of the convent of St. Paul at Cordova, but has since disappeared. Florian de Ocampo, Padilla's successor in office, has been accused of appropriating to himself a voluminous treatise of this writer on the ancient geography of Spain, which he inserted almost entire in the first books of his *Cronica General de España*. Besides the above works, Padilla wrote the following:—*Catalogo de los Santos de España*, fol., Toledo, 1598; and *Libro de las Antiquidades de España*, afterwards edited by Pellicer, 12mo, Valencia, 1689. The following are still inedit:—1, *Geografía de España*; 2, *Nobiliario o Linages de España*; 3, *Origen y Sucesion de los Príncipes de la Casa de Austria hasta el Rey Don Felipe*; 4, *Catalogo de los Arabes de Toledo*. (Nicolaus Antonius, *Bib. Nov. Script. Hisp.*, vol. ii. p. 6.)

PADUANI'NO, FRANCESCO, was born in the year 1552. The name of the master under whom he studied seems not to be known. Judging by his works, he must have acquired his knowledge of the

art in a good school. He was an artist of eminent talents. His historical pictures prove his abilities and taste. His invention was fertile and refined, and his drawing correct and elegant. In the church of the Madonna dei Carmini at Venice there was (and perhaps still is) a picture by this master representing the deliverance of two persons condemned to death, by the interposition of a saint. It is a beautiful performance: the colouring is good, the figures are elegant, and the pencilling is remarkably tender and delicate. As a painter of portraits he was equal to the greatest masters in that branch of the art. There was such dignity, expression, and beautiful colouring in them, as to gain universal admiration. He died in 1617, at the age of sixty-five, leaving a son, Octavio, who studied first under his father, and afterwards for several years at Rome. He painted in the same style as his father, but was inferior to him in invention. His chief excellence was as a portrait-painter. He died at the age of fifty-two, but in what year is uncertain.

PAER, FERDINANDO, was born at Parma in 1774, according to his own account, and received his first instructions in music at the Conservatorio della Pietà, in his native city. It is stated that he produced an opera, 'Circe,' at Venice when he was only ten years of age, and that this was successful; but to relations of so marvellous a kind we are slow in giving credit. After remaining some years at Venice, he visited all the great cities of Italy; then returning to the place of his birth, the grand-duke, his godfather, settled on him a pension, which, by placing him in a state of independence, enabled him to gratify an ardent desire to study the various branches of polite literature, poetry in particular; and to this may be ascribed that judgment in setting words to music which is so conspicuous in all his compositions.

In 1795 Paer accepted an invitation to Vienna, where he produced three or four operas, and also some cantatas for the Empress Theresa. In 1801 he succeeded Naumann as kapellmeister at Dresden, and there brought out his 'Leonora' and 'I Fuorusciti.' Here he was introduced to Napoleon I. after the battle of Jena, and thenceforward was taken into the emperor's service, whom he attended to Posen and Warsaw, and afterwards to Paris, where he was appointed imperial composer and conductor of the chamber-music of the Empress Marie-Louise. The favour he had enjoyed at the court of the Tuilleries was not discontinued on the restoration of the Bourbons, by whom he was not noticed in a marked manner. In 1818 he undertook the direction of the Opéra Italien, which office he held till the year 1825, when, from alleged motives of economy, but in fact through theatrical intrigue, he was superseded. The mortification produced by this dismissal was in some degree alleviated by his election as a member of the Institute. He died at Paris, May 3, 1839.

Among the many operas by Paer, his 'Agnesse,' 'Griselda,' 'Achille,' and 'Sergino,' give him a title to be ranked among the best masters of the age; and all his other works exhibit skill in design, excellent dramatic arrangement, and masterly accompaniments. He knew how to turn his materials to the best advantage, and to a considerable share of genius added that superior taste which is the result of strong natural sense and feeling properly cultivated and directed.

PAEZ, PEDRO, a celebrated Jesuit missionary, was born at Olmedo, a town in New Castile, in 1564. Having completed his studies at the college of his order, he was appointed to form part of the mission at Goa, and sailed for that port in 1587. At that time the numerous Portuguese who had resided in Abyssinia since the invasion of Christoval de Gama, being without a patriarch or spiritual director of any sort, sent to Goa for some priests, when Paez and another Jesuit, named Antonio Montserrat, were despatched by the governor. The two missionaries sailed from Goa in 1588; they touched at Diu, where they made some stay, disguised as Armenians. They then sailed for Muscat, on the 5th of April 1588. From thence they made for the port of Zeila in Abyssinia; but on their passage thither they were boarded by an Arab pirate, in sight of Sofar (14th Feb., 1589), and carried in irons to the capital of the King of Shael (Xaer in the Portuguese writers). They were at first kindly treated by this sovereign; but he himself being a tributary to the Turkish pasha of Yemen, and bound by treaty to send him all the Portuguese who might fall into his hands, Paez and his companions were sent to Sanaa, the capital of Yemen and the court of the pasha, where they passed seven years in the most dreadful captivity. Being at last released by the intercession of the Viceroy of India, who obtained their liberty upon the payment of a thousand crowns ransom for each, the two missionaries returned to Goa in 1596.

The ardour of Paez seems not to have been damped by his past sufferings; on the contrary, after spending several years at Diu and Camboya, he embarked a second time for Abyssinia, and landed at Masawa in April 1603. His first object was to learn one of the most extensively used native dialects, the Gheez, in which he soon acquired such a proficiency as to be enabled to translate into it the compendium of the Christian doctrine written by Marcos George, and to instruct some native children in the dialogues which that work contains. In 1604, Za-Denghal, the reigning monarch of Abyssinia, hearing of the attainments of Paez and the proficiency of his pupils, ordered him to appear at his court with two of them, that he might judge for himself. Paez was kindly received by the king, who conferred upon him all sorts of honours and distinctions. On the following day a

thesis was maintained in his royal presence, when Paes's pupils answered every argument adduced by their opponents: the mass was next celebrated, in conformity with the Roman ritual; after which Paes preached a sermon in Ghess with so much success, that the king himself became a convert to the new religion, and wrote to the pope, and to Phillip III., then on the throne of Spain, praying them to send him a reinforcement of missionaries. This wish of the monarch, having been made public, proved fatal to him; for the Abyssinian priests, dreading the ascendancy which Paes and his followers had attained at court, excited a rebellion, and Za-Denghal was killed in battle with his revolted subjects, on the confines of the province of Gojam (Oct., 1604). Socinos, otherwise called Melek-Seghed, who succeeded Za-Denghal in the empire, was still more favourable to the views of the Portuguese missionary. Soon after his accession to the throne, he summoned to his presence Paes, who celebrated mass and preached before all his court, assembled for the purpose. He granted him, besides, a large piece of ground at Gorgora, on a rocky peninsula on the south side of the lake Dembea, to build a monastery for his order and a palace for himself. On this occasion, without the assistance of any European, but with the mere help of the natives working under his orders, Paes produced a building which was the astonishment of those who beheld it. A spring-lock, which he fixed upon one of the doors, saved the king's life when an attempt was afterwards made to assassinate him. Paes lived in great intimacy with Socinos, whom he accompanied in all his military expeditions. It was on one of these occasions that he visited Naguna, a town three days' march from the sources of the Nile, and surveyed the neighbouring country, a fact which Bruce endeavoured to discredit, for the purpose of appropriating to himself the glory of being the first European who visited the source of the Abawi, then reputed to be the main branch of the Nile. [BRUCE.] Pedro Paes died in the beginning of May, 1622, at the age of fifty-eight, after having the satisfaction of seeing his missionary labours crowned with success, and persuading the king to receive the general confession, and repudiate all his wives but one. The Roman Catholic faith, thus introduced into Abyssinia, did not long remain the religion of the state. After the death of Socinos (1682), his successor, Facilidas, persecuted the Jesuits and re-established the old creed, which was Christianity, though in a corrupt form. Besides the translation of the Catechism written by Marcos George and other tracts into the native dialect of Abyssinia, Nicolas Antonio ('Bib. Nov.' vol. II., p. 225) attributes to Paes a treatise 'De Abyssinorum Erroribus,' a general history of Ethiopia which was supposed to exist in manuscript at Rome, and several letters which have been published in the collection entitled 'Litteræ Annæ.'

PAGAN, BLAISE-FRANÇOIS, COMTE DE, distinguished both as a military engineer and a mathematician, was descended from a noble Neapolitan family, and born at Avignon in France, in 1604. Under the auspices of his relative, the constable De Luynes, he entered the French army very young, and, no less by his gallantry and talents than by his family connections, rose rapidly to rank and reputation. At the siege of Montauban he lost his left eye by a musket shot: but this did not check his zealous career of service; and he continued to increase his celebrity as an officer throughout the wars of the reign of Louis XIII., until, being sent into Portugal in 1642, with the rank of *maréchal de camp*, he had the misfortune to contract a distemper in that country, which entailed the loss of his other eye, and rendered him totally blind, at the early age of thirty-eight years. Being thus incapacitated from further serving his country in the field, he applied himself, with characteristic energy, to study the theory of a profession which he had already successfully practised; and, in 1645, he published his 'Traité de Fortifications,' the ablest essay on the science of defence which the world had yet seen. With no less ardour he had engaged in the kindred pursuit of mathematical research; and the fruits of his labours were exhibited in the publication, in 1651, of his 'Théorèmes Géométriques,' followed, in 1657 and 1658, by a treatise on the planetary theory, and some astronomical tables, all of which were highly esteemed by his contemporaries. He was also the translator of a Spanish account of the river Amazon, accompanied by a chart, the draught of which he is said, though blind, to have drawn with his own hand. With all his mental accomplishments however Pagan was not without that common weakness of his age,—a belief in judicial astronomy. But this foible was redeemed by many estimable qualities of head and heart, for which he lived highly respected both in the courtly and the learned circles of his country and time. He died in Paris, universally honoured, November 18, 1665.

The mathematical works of Pagan have lost their value: but, as an engineer, he must ever be numbered among the great masters of the art of fortification. His belonged in fact to that rare order of minds whose creations form an epoch in the history of any science. He corrected the errors and combined the advantages which he found in the systems of the Italian and Flemish engineers; and though he had been preceded in France by Errard and De Ville, and was followed and excelled by Vauban, he may justly be considered as the founder of the French school of fortifying. He signally improved the old defective construction of bastions; he first gave due proportions to

their faces, flanks, and lines of defence; and he either originated or adopted the idea of a perpendicular flanking fire, which, though neglected by Vauban, has become the great principle of all the modern systems.

PAGANI, GREGORIO, was born at Florence in 1558: his father, Francesco Pagani, died aged only thirty, when his son was but three years old. Gregorio was an excellent colourist, was first the pupil of Santi Titi, and afterwards of Cigoli, and became one of the first and most able reformers of the Florentine school from the low state to which it had been reduced by the mechanical followers of the anatomical school of Michel Angelo. Barocci and Santi Titi were the leaders of the new school, but Cigoli was its principal representative, and Pagani adhered so closely to the style of his friend and master Cigoli, that he used to be termed the second Cigoli. His masterpiece, the Finding of the Cross by St. Helena, in the Carmine, was burnt in the fire which destroyed that building in 1771, and Pagani's reputation has greatly suffered in consequence, though there is a print of it by G. B. Cecchi and B. Eredi. Few of his works still remain; one of the principal is a fresco in Santa Maria Novella: his easel-pictures in oil are also rare. He died at Florence in 1605: Matteo Roselli was his scholar.

PAGANI, NICOLÒ, whose European fame as a violinist entitles him to a notice here, was born at Genoa in 1734. His father, a commission-broker, played on the mandolin, but fully aware of the inferiority of an instrument so limited in power, he put a violin into his son's hands, and initiated him in the principles of music. The child succeeded so well under parental tuition, that at eight years of age he played three times a week in the church, as well as in the public saloons. At the same period he composed a sonata. In his ninth year, he was placed under the instruction of Costa, first violoncellist of Genoa; then had lessons of Holla, a famous performer and composer; and finally studied counterpoint at Parma under Ghirelli, and the celebrated maestro Paer. He now took an engagement at Lucca, where he chiefly associated with persons who at the gaming-table stripped him of his gains as quickly as he acquired them. He there received the appointment of director of orchestra to the court, at which the Princess Elisa Bacciochi, sister of Napoleon I., presided, and thither invited, to the full extent of her means, superior talent of every kind. In 1813 he performed at Milan; five years after, at Turin; and subsequently at Florence and Naples. In 1828 he visited Vienna, where a very popular violinist and composer, Mayseder, asked him how he produced such new effects. His reply was characteristic of the selfish mind:—"Chacun a ses secrets." In that capital it is affirmed he was accused of having murdered his wife. He challenged proofs of his ever having been married, which could not be produced. Then he was charged with having poisoned his mistress. This he also publicly refuted. The fact is that he knew better how to make money than friends wherever his thirst of gold led him. Avarice was his master-passion, and, second to this, gross sensuality in his intercourse with the female sex.

The year 1831 found Paganini in Paris, in which excitable capital he produced a sensation hardly inferior to that created by the visit of Rosini. Even this renowned composer was so carried away by the current of popular opinion, that he is said to have wept on hearing Paganini for the first time. He arrived in England in 1831, and immediately announced a concert at the Italian Opera-House, at a price which, if acceded to, would have yielded \$3911 per night; but the attempt was too audacious, and he was compelled to abate his demands; though he succeeded in drawing audiences fifteen nights in that season at the ordinary high prices of the King's Theatre. He also gave concerts in other parts of London, and performed at benefits, always taking at these a large proportion of the proceeds. He visited most of our great towns, where his good fortune still attended him. He was asked to play at the Commemoration Festival at Oxford, in 1834, and demanded 1000 guineas for his assistance at three concerts. His terms were of course rejected.

Paganini died at Nice in 1840, of a diseased larynx ('*phtisie laryngée*'). By his will, dated 1837, he gave his two sisters legacies of 60,000 and 70,000 francs; his mother a pension of 1200; the mother of his son Achillino (a Jewess of Milan) a similar pension; and the rest of his fortune, amounting to four million francs, devolved on his son. These and other facts before related, we give on the authority of the '*Biographie Universelle*.'

Paganini certainly was a man of genius and a great performer, but sacrificed his art to his avarice. His mastery over the violin was almost marvellous, though he made an ignoble use of his power by employing it to captivate the mob of pretended amateurs by feats little better than sleight-of-hand. His performance on a single string, and the perfection of his harmonics, were very extraordinary; but why, as was asked at the time, be confined to one string when there are four at command that would answer every musical purpose so much better? His tone was pure though not strong, his strings having been of smaller diameter than usual, to enable him to strain them at pleasure; for he tuned his instrument most capriciously. He could be a very expressive player: we have heard him produce effects deeply pathetic. His arpeggios evinced his knowledge of harmony, and some few of his compositions exhibit many original traits.

\* PAGES, JAMES, a distinguished living physiologist. He was born at Great Yarmouth in Norfolk. In his early years he contracted

a taste for the study of natural history, and when quite young he and his brother published a 'Flora and Fauna' of Yarmouth and its neighbourhood. He studied for the profession of surgery at St. Bartholomew's Hospital, London, where he distinguished himself by obtaining prizes in almost every class. In 1836 he became a Member of the College of Surgeons, and in 1844 a Fellow, after passing the College. He was appointed assistant-surgeon to St. Bartholomew's Hospital, and was one of the first who received an appointment at this institution in opposition to the vicious system of giving places only to those who had been apprentices there. He was employed by the council of the College of Surgeons to draw up a catalogue of the pathological preparations in the Hunterian museum. This task he performed with great ability. He was also appointed Hunterian Professor of surgery, and delivered a course of lectures, which were afterwards published under the title of 'Lectures on Surgical Pathology.' He has published many papers in the 'Transactions' of the medical societies, and in the medical journals; and he contributed several articles to the 'Penny Cyclopaedia.' He is a Fellow of the Royal Society, and one of the examiners of the candidates for the medical service of the East India Company. He is also lecturer on physiology and pathology at the school of medicine connected with St. Bartholomew's Hospital.

PAGGI, GIOVANNI BATTISTA, was born of an ancient and noble family at Genoa, in 1554. He was the pupil of Luca Cambiaso, and was distinguished chiefly as a painter, but he was also a sculptor and architect. About 1580 he was obliged to fly from Genoa in consequence of an unfortunate homicide which the absurd conduct of a friend brought upon him. Paggi went to Florence, and, under the protection of the grand-dukes Francesco I. and Ferdinando, there lived in peace and with reputation, until he was recalled through Archbishop Sinsasio, afterwards Cardinal, to Genoa about 1600, where he executed several excellent works, and gave a great impulse, especially in colouring, to the Genoese school of painting, of which he was the best master in his time. His masterpieces are considered two pictures in San Bartolomeo, and the 'Slaughter of the Innocents' belonging to the Doria family, painted in 1606. Paggi died in 1627. In 1607 he published a short treatise on the theory of painting, entitled 'Definizione, o sia Divisione della Pittura.' He wrote it in consequence of his objecting to some of the statements of Lomazzo in his 'Trattato' and his 'Idea del Tempio della Pittura.' Paggi's treatise is extremely scarce.

PAINÉ, THOMAS, was born on the 29th of January 1737 at Thetford, in the county of Norfolk. His father, who was a Quaker, brought him up to his own business, that of a staymaker. At the age of twenty he removed to London, where he worked some time at his business. He then went to Sandwich in Kent, where, in 1760, he married the daughter of an exciseman, and obtained a place in the Excise, but retained it only about a year, and then became an assistant at a school in the neighbourhood of London. After leaving this situation he was again employed in the Excise, and was stationed at Lewes in Sussex. Here he had gained some reputation by various pieces of poetry, and had been selected by the excisemen of the neighbourhood to draw up 'The Case of the Officers of Excise; with Remarks on the Qualifications of Officers, and on the numerous Evils arising to the Revenue from the Insufficiency of the present Salaries,' 1772. The ability displayed in this his first prose composition induced one of the commissioners of excise to give him a letter of introduction to Benjamin Franklin, then in London as a deputy from the colonies of North America to the British government. Franklin advised him to go to America. He took the advice, and having settled himself at Philadelphia in 1774, became a contributor to various periodical works, and in January 1775 editor of the 'Philadelphia Magazine.'

In January 1776 he published in America his 'Common Sense,' which contributed in an eminent degree to make the people of that country of one mind at the time of the Declaration of Independence. Burke, in his 'Letter to the Sheriffs of Bristol,' speaks of it as "that celebrated pamphlet which prepared the minds of the people for independence." For this production the legislature of Pennsylvania voted him 500*l.*; the university of the same province conferred on him the degree of M.A., and he was elected a member of the American Philosophical Society. He was also made clerk to the Committee of Foreign Affairs. During the American war he published at intervals fifteen numbers of 'The Crisis' (Philadelphia, 1776-83), a series of political appeals intended to rouse and keep alive the public spirit. He was obliged to resign his office of clerk in 1779, for having divulged some official secrets in a controversy with Silas Deane, whom he accused of a fraudulent attempt to profit by his agency, in conveying the secret supplies of stores from France.

In 1781 Paine was sent to France with Colonel Lawrence to negotiate a loan, in which he was more than successful; for the French government granted a subsidy of six millions of livres to the Americans, and also became guarantee for a loan of ten millions advanced by Holland. On his return to America he was rewarded for his services by being appointed, in 1785, clerk to the Assembly of Pennsylvania; he received from Congress a donation of 3000 dollars; and the state of New York bestowed on him the confiscated estate of Frederic Davos, a royalist, near New Rochelle, in the state of New York, consisting of 500 acres of well-cultivated land, with a good stone house.

After the peace between Great Britain and America, Paine seems to have employed himself chiefly in mechanical speculations. In 1787 he

went to France, and submitted to the Academy of Sciences at Paris a plan for the construction of iron bridges. Meeting with no encouragement, he crossed over into England, and in prosecution of his project entered into partnership with an iron-founder at Rotherham in Yorkshire, and explained the principles of his proposed construction in a letter addressed to Sir George Staunton, and printed at Rotherham in 1789. The sums which this undertaking required, together with the failure of his agent in America, involved him in difficulties, which however were only temporary.

The first part of his 'Rights of Man,' in reply to Burke's 'Reflections on the French Revolution,' was published at London, in 1791; and the second part early in 1792. An information was laid by the attorney-general against him as the author of the second part, which was designated as "a false, scandalous, malicious, and seditious libel;" and the trial came on in the court of King's Bench before Lord Kenyon. He was eloquently defended by Lord Erskine, then the Hon. Thomas Erskine, but the jury, without suffering the attorney-general to reply, at once pronounced him guilty. Erskine, in consequence of this defence, was dismissed from the office of attorney-general to the Prince of Wales.

In the meantime however Paine had been chosen by the department of Calais as a member of the French National Convention, and having escaped and landed in France in September 1792, was received with enthusiastic congratulations. He took his seat in the Convention, and when the trial of Louis XVI. came on, offended the Jacobins by voting that the king should be imprisoned during the war, and banished afterwards. He published his 'Reasons for wishing to preserve the Life of Louis Capet, as delivered to the National Convention.' Towards the end of 1793 he was excluded from the Convention as a foreigner, though he had been naturalised; and in 1794 was arrested by order of Robespierre, and committed as a prisoner to the Luxembourg.

He had finished the first part of his 'Age of Reason' just before his imprisonment: it was published at Paris under the auspices of his friend Joel Barlow. The second part was completed during his confinement; and it was published at Paris in 1795, after the author had been set at liberty on the fall of Robespierre. When the English publisher of this work was prosecuted in 1797, Erskine appeared for the prosecution, and a verdict of guilty was again pronounced. Bishop Watson's 'Apology for the Bible, in a series of Letters to Thomas Paine,' appeared in 1796.

On his liberation Paine had asserted his right to sit as member of the Convention; and on the 8th of December 1794, he was allowed to resume his place. About this time he gave offence to the people of America by addressing a letter to General Washington, in which he reviled him for not interfering to procure his liberation. In the course of 1795 he published at Paris 'A Dissertation on the First Principles of Government;' 'The Decline and Fall of the English System of Finance;' and 'Agrarian Justice opposed to Agrarian Law and to Agrarian Monopoly: being a Plan for meliorating the Condition of Man, by creating in every Nation a National Fund to pay to every Person, when arrived at the age of twenty-one years, the sum of fifteen pounds sterling, to enable him or her to begin the World; and also ten pounds sterling per annum during Life, to every Person now living of the age of fifty years, and to all others when they arrive at that age, to enable them to live an old age without wretchedness, and go decently out of the World.' We give the full title of this Utopian tract as a curiosity. The fund was to be created by taking, on the death of every individual, 10 per cent. of his property, as 'due to society,' and from 5 to 12 per cent. more if there were no near relations, in proportion as the next of kin was nearer or more remote. He states that this little piece was written in the winter of 1795-96.

Paine remained in France some years longer, but having written to Mr. Jefferson, who had recently been elected President of the United States, and expressed a wish to be brought back to America in a government ship, Jefferson wrote to him, and offered him a passage in the Maryland sloop of war, which he had sent to France for a special purpose. In his letter, dated March 1801, Jefferson expresses his high estimate of Paine's services in the cause of American independence in the following words:—"I am in hopes you will find us returned generally to sentiments worthy of former times. In these it will be your glory to have steadily laboured, and with as much effect as any man living. That you may long live to continue your useful labours, and to reap their reward in the thankfulness of nations, is my sincere prayer."

Paine did not embark for America however till August 1802: he reached Baltimore in the following October. His first wife had died about a year after their marriage; he lived about three years with his second, whom he married soon after the death of his first, when they separated by mutual consent. During his last residence in France he had become intimate with Madam Bonneville, the wife of a French bookseller, who, with her two sons, accompanied him to America. After his return he published four or five treatises on iron bridges, the yellow fever, on the building of ships of war, &c.

He died on the 8th of June 1809, and was buried in a field on his own estate near New Rochelle. Cobbett, some eight or nine years afterwards, disinterred his bones and brought them to England; but instead of arousing, as he expected, the enthusiasm of the republican party in this country, he only drew upon himself universal contempt.

His "political and religious admirers" in America erected in 1839 a showy monument, with a medallion portrait, over his empty grave. Paine bequeathed his estate and the chief part of the rest of his property to Madame Bonneville, conjointly with her husband and her two sons.

Paine, from his first starting in public life, was a republican, uniformly consistent and apparently sincere. His style is vigorous and clear, but somewhat coarse; though simple, it is enlivened with comparisons and illustrations which renders it very popular and attractive. He saw clearly the weak points of any object against which he directed his attack, and accordingly he was a vigorous assailant; but he was not qualified, either by competent knowledge or by habits of patient investigation, for examining any subject in all its bearings. His merits may be briefly summed up: he was a bold original thinker, who exercised a very considerable influence on the political and religious opinions of his day, and that influence is not yet entirely gone. What he saw and felt he expressed clearly and forcibly. In his 'Age of Reason' he shook the religious feeling of all Christians by the grossness and scurrility of his language, without always convincing those who were well inclined to listen to his arguments. Such common difficulties as really exist in the gospel history could not escape his acuteness, but for want of sound knowledge he frequently exposes himself when he thinks that he is exposing the sacred writers. This work alienated from him his friends in America as well as in England, excited feelings of the deepest disgust and abhorrence in the whole Christian community of both countries, and with his coarseness of speech, intemperance, and licentiousness of conduct, exposed him to hatred and calumny to such a degree as to embitter the latter years of his life.

PAISIELLO, GIOVANNI, was born at Tarento in 1741, and entered at an early age in the Jesuits' College of that city, where he manifested so strong a disposition for music, that his father, an eminent veterinary surgeon in the service of Charles III., was prevailed on to place his son in the Conservatorio St. Onofrio at Naples, in which institution he was admitted in 1754, and during the following five years pursued his studies under the celebrated Durante. He there produced among other compositions a comic interlude, which at length became known in Italy, and in 1763 procured for him an order to compose an opera for the Teatro di Maragli at Bologna. From that period the commencement of his professional career is to be dated, and it continued with undeviating success till, warned by approaching age, he wisely determined to relinquish his most active occupations, and enjoy in comparative ease his well-earned honours and moderate independence.

Paisiello's reputation was speedily established, and he soon accepted engagements to compose operas for every great city in Italy; in consequence of which he produced nearly fifty in the short space of thirteen years, the majority of which of course only enjoyed a short-lived triumph. In 1776 he entered into the service of Catherine II. He continued in Russia nine years, and composed several operas, among which was his 'Barbiere di Siviglia'; also an oratorio, 'Il Passione,' and many sonatas, &c. He afterwards produced at Vienna, at the desire of Joseph II., 'Il Teodoro,' and 'La Molinara'; and for the same monarch wrote twelve symphonies.

On his return to Naples the king appointed him his Maestro di Capella, and settled on him a pension of 1200 ducats. The King of Prussia now wished him to visit Berlin, and the Empress of Russia was desirous of his return to St. Petersburg. He declined both engagements, as well as an invitation to London; but he composed for the King's Theatre 'La Locanda,' which opera was subsequently performed at Naples under the title of 'Il Fanatico in Berlino.' On the death of the French general Hoche he produced a funeral symphony, for which he received a handsome present from Bonaparte; and about the same time brought out his 'Zingari in Fiera.'

The revolution at Naples in 1799 gave to that country a republican government, under which Paisiello accepted the office of 'National Director of Music'; for this at the restoration of the royal family he was suspended from all his public functions, but in about two years he was reinstated. Shortly after this he accepted an invitation from Bonaparte, then First Consul of France, to visit Paris, and was received in the most distinguished manner: a salary of 12,000 francs was assigned to him, and 18,000 more were added for his travelling and incidental expenses; besides which he was offered various high and profitable appointments, but declined them all except that of Maître de Chapelle to the head of the government. In Paris he produced thirteen masses, motets, &c.; a 'Te Deum' for Napoleon's coronation; and an opera, 'Proserpine,' for the Académie de Musique. The air of France not agreeing with his wife's health, Paisiello returned in about two years and a half to Naples, but never failed to transmit to the French emperor a sacred composition for the anniversary of his birth.

A second revolution at Naples now placed Joseph Bonaparte on the throne of that kingdom, who confirmed Paisiello—who seems to have been very accommodating in his politics—in all his appointments, with a liberal augmentation of his salary; and the French emperor made him a Chevalier of the Legion of Honour, with a stipend of 1000 francs. Other honours were showered on the composer, some of them not mere distinctions; and, to crown the whole, he was elected an associate of the French Institute. He died at Naples in 1816. The city ren-

dered him funeral honours, and his 'Nina' was given at the great theatre on the evening of his interment, the king and the whole court attending the performance.

"Paisiello," says the Chevalier Le Sueur, "was not only a great musician; he possessed a large fund of information, was well versed in the dead languages, and conversant in all the branches of literature. . . . Endowed with a noble mind, he was above all mean passions; he knew neither envy nor the feeling of rivalry." To which we may add, that his compositions afford the most indisputable proofs of an accomplished and elegant mind. If they do not exhibit the energy of the school of Germany, they are never deficient in pathos; they abound in tenderness, and are invariably characterised by truth of expression—by the admirable judgment with which the sentiments of the poet are illustrated; and as a melodist, he is yet without a superior—witness, among a multitude of instances that might be cited, his 'Nel cor più non mi sento,' and 'Io son Lindoro' (or, 'Hope told a flattering tale,' and 'For Tenderness form'd'), which are known, and will probably continue to be known, in every corner of the world where European arts are cultivated. And though his operas, 'Elfrida,' 'Pirro,' 'Il Barbiere di Siviglia,' 'La Molinara,' 'Nina,' &c., are eclipsed by the grander and more complete instrumentation of that school of which Mozart is the model, yet, with additional accompaniments and skilful management, they might now be brought out successfully; and, thus renovated, would be admitted to have lost few of those charms which beautiful air must always possess, and by which the last age was captivated.

PAIXHANS, HENRI-JOSEPH, General of Artillery in the French Army, was born January 22, 1783, at Metz, in the French department of Moselle. He received instruction in the École Polytechnique, and having entered the artillery, rose by successive gradations to the rank of Colonel, and ultimately of General. He was also elected a member of the French Chamber of Deputies, and spoke occasionally on subjects connected with the army and navy. Several of his speeches in the chamber have been published, as well as the valuable works quoted hereafter. General Paixhans died August 19, 1854, on his domain of Jouy-aux-Arches, near Metz.

General Paixhans made important improvements in the construction of heavy ordnance, and also in the projectiles, in the carriages, and in the mode of working the guns. The Paixhans-guns are especially adapted for the projection of shells and hollow shot, and were first adopted in France about the year 1824. Similar pieces of ordnance have since been introduced into the British service. They are suitable either for ships of war, or for fortresses which defend coasts. The original Paixhans-gun was 9 feet 4 inches long, and weighed nearly 74 cwt. The bore was 22 centimètres (8½ inches nearly). By judicious distribution of the metal it was so much strengthened about the chamber, or place of charge, that it could bear firing with solid shot weighing from 86 to 88 lbs., or with hollow shot weighing about 60 lbs. The charge varied from 10 lbs. 12 oz. to 18 lbs. of powder. General Paixhans was one of the first to recommend cylindro-conical projectiles, as having the advantage of encountering less resistance from the air than round balls, having a more direct flight, and striking the object aimed at with much greater force, when discharged from a piece of equal calibre, whether musket or great gun. As large ships of war, particularly three-decked ships, offer a mark which can hardly be missed, even at considerable distances, and as their wooden walls are so thick and strong that a shell projected horizontally could not pass through them, an explosion taking place would produce the destructive effects of springing a mine, and far exceeding those of a shell projected vertically, and acting by concussion or percussion. In accordance with these views, General Paixhans recommended the use of smaller ships carrying heavier guns suitable for projecting shells and hollow shot; and advised his government to avoid the construction of large ships, and the equipment of any ship for shell-firing to such an extent as to expose her to the great risk of being blown up by her own masses of ammunition. Paixhans-guns were used in the Russian ships of war which attacked the Turkish fleet in the roadstead of Sinopé, and their powerful effects were made manifest by the utter destruction of the Turkish forts as well as the ships.

General Paixhans suggested several other improvements in the French army as well as in the navy, as is shown by the following list of his principal works:—'Considérations sur l'État Actuel de l'Artillerie des Places, et sur les Améliorations dont elle paraît susceptible,' 4to, 1816; 'Nouvelle Force Maritime, ou Exposé des Moyens d'annuler la Force des Marines Actuelles de Haut-Bord, et de donner à des Navires très-petits assez de Puissance pour détruire les plus grands Vaisseaux de Guerre,' 8vo, Paris, 1821, forming the First Book of the next work, 'Nouvelle Force Maritime, ou Application de cette Force à quelques Parties du Service de l'Armée de Terre: ou, Essai sur l'État Actuel des Moyens de la Force Maritime; sur une Espèce Nouvelle d'Artillerie de Mer qui détruirait promptement les Vaisseaux de Haut-Bord; sur la Construction des Navires à Voile à Vapeur de Grandeur modérée, qui, armés de cette Artillerie, donneraient une Marine moins coûteuse et plus puissante que celles existantes; et sur la Force que le Système de Bouches à Feu proposé offrirait à Terre, pour les Batteries de Siège, de Côtes, et de Campagne,' 8vo, Paris, 1822; 'Expériences faites par le Marine Française sur une Arme Nouvelle; Changemens qui paraissent devoir résulter dans le Système Naval, et Examen des

Questions relatives à la Marine, à l'Artillerie, à l'Attaque, et à la Défense des Côtes et des Places, 8vo, Paris, 1828; 'Forces et Faiblesses Militaires de la France: Essai sur la Question Générale de la Défense des États, et sur la Guerre Défensive, en prenant pour Exemple les Frontières Actuelles et l'Armée de la France,' 8vo, Paris, 1830; 'Fortifications de Paris, ou Examen de ces Questions—Paris, doit-il être fortifié! les Systèmes présentés peuvent-ils être admis?' &c., 8vo, Paris, 1834; 'Constitution Militaire de la France: Étude sur les Modifications à apporter au Système de nos Forces de Terre et de Mer, tant pour opérer les Progrès devenus nécessaires que pour diminuer les Défenses, sans que la Puissance Nationale en soit altérée,' 8vo, Paris, 1849.

PAJOU, AUGUSTIN, a distinguished French sculptor, was born at Paris in 1780, and was the pupil of J. B. Lemoine, likewise a sculptor of eminence. Pajou obtained the grand prize for sculpture in the French Academy in 1748, and accordingly went as a pensioner of the French government to Rome, where he remained twelve years. Gabet mentions that Pajou was the sculptor of about two hundred works, in bronze, marble, stone, wood, and even in paper or pasteboard; and he gives a list of some of those which he exhibited. In 1768 he exhibited a sketch of the tomb of Stanislaus, king of Poland, and father-in-law of Louis XV.; a statue in lead, of the natural size, for the Duchess of Mazarin, representing Love as ruler of the elements; and four large colossal figures in stone for the garden of the Palais-Royal, representing Mars, Prudence, Liberty, and Apollo. The following are some of his principal works:—Pluto holding Cerberus, chained (for this work he was elected a member of the Academy); Psyche abandoned (in the Luxembourg); statues of Pascal, Turenne, Boissuet, Buffon, and Descartes; the sculptures of the façade of the Palais-Royal, ordered by Louis XVI. He executed also the sculptures of the Salle de l'Opera at Versailles; the ornaments of the Palais Bourbon, and of the Cathedral of Orleans; and also the Naiades of the south and west faces of the Fontaine des Innocens. He died at Paris May 8, 1809. He was made one of the professors of the French Academy of Arts in 1767; and was subsequently a member of the French Institut. His style was natural and manly, and was so far the exponent of his own character. His son Jacques Augustin Pajou was a painter of great merit.

\* PALACKY, FRANTISEK, or FRANCIS, one of the most eminent living Bohemian authors, was born on the 14th of June 1798, at Hodalowitz in Moravia, where his father Jiri or George Palacky, himself a Bohemian author, was rector of the school. The young Francis received an excellent education, and made himself master of nearly all the European languages to the extent of being able to read them with ease, but showed an ardent attachment to his native tongue. While he was still a youth, the poet Kollar [KOLLAR], who was five years his senior, made his acquaintance, and speaks of him in the notes to his 'Slavy Deera' as the first Bohemian scholar whom he knew. After studying at Presburg and Vienna, he removed in 1823 to Prague, where he obtained the patronage of Count Sternberg, the founder of the Bohemian Museum; and in 1827, when the publication of the 'Casopis Ceskeho Museum,' or 'Journal of the Bohemian Museum,' began, he was appointed editor, and also superintended the publication of a German translation of that periodical. The German translation came to an end after a few volumes; the Bohemian original is still flourishing, after a prosperous career of thirty years, and the long series of volumes which it now extends to comprises a great variety of interesting matter, much of which it would be of advantage to literature to have made accessible in a language more generally read. Palacky gave up the editorship after 1837 to his friend Safarik, who in his turn resigned it to the present editor, Wocel. Palacky took a principal share in establishing the 'Matice Ceska,' or 'Bohemian Fund,' a publishing society, which receives subscriptions and issues books of value. It is still in active operation, and he is, we believe, still one of the directors. Among its sets of works issued under the superintendence of a committee of the Museum is a sort of Cyclopaedia, on the same plan as Larimer's 'Cabinet Cyclopaedia;' another, a set of reprints of successful modern works called the 'Novocéska Biblioteka,' or 'Modern Bohemian Library;' a third, the 'Starocéska Biblioteka,' or 'Ancient Bohemian Library,' comprises editions of older books or of ancient manuscripts, with notes, and of some of these Palacky is editor. In 1831 he received from the states of Bohemia the appointment of historiographer to the kingdom, with a handsome salary, which was afterwards augmented by the Emperor of Austria. As the most interesting features of the history of the country relate to its struggles against the pope, the Germans, and the emperor, it is certainly a remarkable circumstance that the task of recording them should have been officially entrusted to a liberal, a Bohemian, and a Protestant. In pursuance of his task, Palacky found it necessary to examine the archives not only of every part of Bohemia, but of Dresden, Munich, and other of the German cities, and even of the Vatican; an account of his journey to which and his investigations there he published in the 'Transactions of the Bohemian Academy of Sciences,' of which he was a member. The first volume of his 'History of Bohemia,' written in the German language, and published at the expense of the states, appeared in 1836. Its progress, which was slow, was interrupted in 1848 by the share which the country took in the agitations of that year, in which Palacky took a conspicuous part.

The attempt of the Hungarians to suppress or degrade the Slavonic dialects spoken in Hungary led to the assembling of a congress at Prague of the Slavonic subjects of the Austrian empire, to originate a counter-movement, and to urge Slavonic claims in general. Literature was fully represented at this congress. Palacky, Safarik, and Wocel, the three successive editors of the 'Journal of the Museum,' were three of its members, and Palacky was chosen its 'starosta,' or president. On the 2nd of June 1848 a procession moved from the Bohemian Museum, formerly the Sternberg palace, to Sophia island in the Moldau, where, in a temporary pavilion, Palacky delivered his inaugural speech, which is printed in the 'Casopis' for that year. "That," he began, "which our fathers never hoped to see, that which in our youth merely rose before us as a glorious dream, that which a short time ago we did not dare even to express as a wish, is now, this day, this very day, presented to our enraptured eyes as a living fact. Slavonic brethren have come together from countries sundered far and wide—have come to us in Prague, the city of old renown, to declare that they belong to one great family, to give the hand to an eternal bond of love and brotherhood." . . . "The freedom that we now desire," he said, "is no stranger among us—no exotic imported from foreign lands; it is a tree that has grown on our own soil; it is our inheritance from glorious ancestors. Perhaps it was necessary that we should be taught its value by the bitter experience of its loss for ages. That we have now regained it, that we are now once more what we will be, free, we owe in the first instance to our own awakening, to our own perception of what alone can save us, and next to our gracious King and Emperor Ferdinand. I, who knew the old misfortunes and sufferings of our nation, I, who see with a clear eye the glorious future that is opening on a country that is the beloved of my soul, I may exclaim like him recorded in the gospel, 'Lord, now lettest thou thy servant depart in peace, for mine eyes have seen thy salvation.'" But a few days were sufficient to show that Palacky, however admirable as a historian, was not endowed with the gift of prophecy. After a few meetings, in which it was proposed among other things to found a great library of books in the Slavonic languages, after the issue of a few documents, one of which, signed by Palacky, was an 'Address of the Slavonic Congress to the nations of Europe,' came the misunderstandings, not originating however, it is said, in the congress, which led so early as the 12th of June to fighting in the streets, and before a week was over to the bombardment of Prague by Windischgrätz. The Slavonic Congress was broken up to re-assemble in happier times, but the time for re-assembling has not yet arrived. Palacky was afterwards the head of the Slavonic party at the diet of Kremaier, but the diet of Kremaier has proved equally abortive. He is now peacefully engaged in continuing his 'History of Bohemia.'

The 'History of Bohemia' is one which ought to have many attractions for an English student. It was under a Bohemian queen of England, the consort of our Richard II., that the doctrines of Wycliffe which were effectually smothered in England were carried by some of her followers from Oxford to Prague, where they burst into a flame, which throws a light on Bohemia in the history of Europe. It was under an English queen of Bohemia, from whom Queen Victoria's claim to the throne of England is derived, that the country emerged again into notice, to be consigned by the fatal 'Battle of the White Mountain' to two centuries of obscurity and neglect. Palacky's will no doubt, when completed, be the standard history of the country. It is written not only with a complete knowledge of the subject, to which he has devoted his life, but with a thorough mastery of his materials and a general tone of vigour and spirit. In religion Palacky is a Protestant; in politics, a lover of freedom; but his historical impartiality and candour have scarcely been questioned, even by opponents who question the conclusions to which he arrives. He was assailed by Kopitar for asserting the Byzantine origin of the Slavonic liturgy, a view which is not regarded with approbation by Catholics, but the general voice of competent judges has been on Palacky's side. The 'Archiv Cesky,' a collection of documents in the Bohemian language hitherto unpublished, and collected by Palacky from various sources, is a companion to the history. It extends to three quarto volumes (1840-44), and was published at the expense of the Bohemian States. The smaller works of Palacky are very numerous, but all of them relating to subjects of Bohemian history, literature and biography, except his 'Theory of the Beautiful,' 1821, and his 'General History of Aesthetics,' 1823, both in German, a language which he writes with perfect mastery unusual in a Bohemian. His 'Elements of Bohemian Prose,' in Bohemian, published in conjunction with Safarik in 1818, his 'Estimate of the old Bohemian Historians,' 1830; his 'Synchro-nistic View of Bohemian Dignitaries,' 1832; his 'Life and Literary Labours of Dobrowsky,' 1833 [DOBROWSKY]; his 'Literary Tour to Italy in 1837;' his 'Oldest Memorials of the Bohemian Language' [DOBROWSKY and HANKA], 1840,—all in German—are some of the most important. In 1829 he edited a third volume of the 'Scriptores rerum Bohemicarum,' of which the first two had been published many years before by Eder.

PALACKY-PHATUS. Four Greek writers of this name are mentioned by Suidas, the oldest of whom, an epic poet, a native of Athens, is said to have lived before the Homeric times. Suidas quotes the titles of several of his works—the 'Cosmopoes,' 'The Birth of Apollo and Diana,' &c. The second was a native of Paros or Priene, who lived in

the time of Artaxerxes Mnemon, and to him Suidas ascribes a work in five books entitled 'Of Things Incredible.' The third Palsphatus was an historian of Abydos, and a great friend of Aristotle. The fourth is called a grammarian of Alexandria by Suidas, and a peripatetic philosopher by Tzetzes and others; the period in which he lived is not stated. Suidas mentions a work by him, entitled 'Explanation of Things related in Mythology.' This seems to be the work which has come down to us in one book, divided into fifty short chapters, under the name of Palsphatus, and which is commonly entitled 'On Things Incredible.' The author explains, according to his fashion, the origin of the mythical fables, such as the Centaurs, Paimphus, Actæon, &c., to which he attributes an historical foundation disguised or corrupted by ignorance or love of the marvellous. The best editions of the text is that of Fischer, Leipzig, 1789, in which he has given all the passages of ancient authors concerning the various writers of the name of Palsphatus; and that of Westermann in the 'Scriptores Poetice Historie Græci,' Brunswick, 1842. A Latin translation of the work was published at Cambridge in 1671, and a French translation was published at Lausanne in 1771. There are some other fragments under the name of Palsphatus which have been published with the work above mentioned—one on the invention of the purple colour, and the other on the first discovery of iron.

PALENCIA, ALONSO DE, a celebrated Spanish historian of the 15th century, was born, as appears from his work 'De Synonymia,' cited by Pellicer ('Biblioteca de Traductores,' p. 7), in 1422. At the age of seventeen he became page to Alfonso de Carthagena, bishop of Burgos, and author of the 'Doctrinal de Caballeros,' printed at Burgos in 1482, in whose family he acquired an early taste for letters. He afterwards visited Italy, where he became acquainted with the learned George of Trebizond, whose lectures on philosophy and rhetoric he attended. On his return to his native country he was raised to the dignity of royal historiographer by Alfonso, younger brother of Henry IV. of Castile. After Alfonso's death he attached himself to the fortune of Isabella, and was employed in many delicate negotiations, particularly in arranging the marriage of that princess with Ferdinand of Aragon. [FERDINAND.] On the accession of Isabella to the throne of Castile he was confirmed in his office of national chronicler, and passed the remainder of his life in the composition of philological and historical works, and translations from the classics. The time of his death is uncertain; but he must have lived to a good old age, since it appears from his own statement (Mendes, 'Typographia Espannola,' Mad., 1796, p. 190) that his version of Josephus was not completed till the year 1492.

The most popular of Palencia's writings are his 'Chronicle of Henry IV.' and his Latin 'Decades,' containing the reign of Isabella down to the taking of Baza from the Moors in 1489: an edition of the former work has been published by the Spanish Academy of History. Palencia's style, far from the scholastic pedantry so common among the writers of his age, exhibits the business-like manner of a man of the world. His sentiments are expressed with boldness; but the scenes he describes, and in which he himself was an actor, are sometimes delineated with party feeling. He passes however for one of the best Spanish historians, and his works are very much commended by Zurita, Clemensin, and other critics. Besides the two above-mentioned historical works, Palencia wrote, 'El Universal Vocabulario en Latin y Romance,' Sev., 1495; 'Los libros de Flavio Josepho,' ib., 1491; 'Las Vidas de Plutarco,' ib., 1508; 'El Espejo de la Cruz,' ib., 1485; and several other works still in manuscript. Two copies of his manuscript 'Chronicle of Henry IV.' are in the library of the British Museum, Bib. Eg., Nos. 297 and 298.

(Prescott, *History of Ferdinand and Isabella*, vol. i. p. 136; Nicolas Antonio, *Bib. Hisp. Vetus*, vol. ii. p. 397; Clemensin, *Elogio de la Reyna Catalica*, in the sixth volume of the *Mem. de la Acad. de la Hist.*)

PALESTRINA, GIOVANNI PIERLUIGI DA, a composer of the greatest renown in the annals of music, was born at Palestrina, near Rome (the ancient Praeneste), according to his biographer the Abbé Baini, in 1524. Of his family nothing is known, except that his parents were men in rank and in circumstances corresponding to their station. The name of the master who is entitled to the credit of having instructed him in an art in which he became so famous seems to have been Claude Goudimel, a native of Besançon, a disciple of the Franco-Belgio school, a Huguenot, and one of the victims of the Bartholomew massacre of 1572.

Palestrina was appointed Master of the Chapel to Pope Julius III. in 1551, to whom in 1554 he dedicated his first work, consisting of four masses for four voices. Julius, to reward the composer, placed him among the singers of the Pontifical Chapel, who were well paid for their services. The college of chaplain-singers remonstrated, and pleaded the law that no new member could be associated with them unless elected by a majority of themselves; but in vain: the mandate of the inflexible tiara was obeyed, though not without a kind of protest. In 1555 however Cardinal Orsini succeeded to the papal throne, under the title of Paul IV., and finding that Palestrina had quitted a state of obliquity, which all the higher appointments in the apostolic chapel enjoined, abruptly dismissed him. For some time he felt severely his straitened circumstances; then gladly accepted the place of Maestro di Capella of St. John in the Lateran, which he

exchanged in 1561 for a more lucrative situation at Santa Maria Maggiore, and in 1571 was restored to his post in the Vatican. Up to the year 1560 he composed many works for the Church, among which Baini especially mentions those 'Improperij,' "so remarkable for depth of science and perfect adaptation of music to the sense of the words." "To hear them as executed on Good Friday in the Sistine Chapel," says the abbé, "the mind is subdued by emotions of tenderness and awe;" but, judging from the 'Improperia' published by Dr. Burney in his collection of music performed in the Capella Pontificia, it seems to us that these much-extolled compositions, consisting of the simplest counterpoint, must owe their effect to place and high-wrought feelings.

During the above period however the Council of Trent, among other matters, took the state of ecclesiastical music into serious consideration, and appointed two cardinals whom they charged with its reform, who called to assist them a committee of eight selected from the college of chaplain-singers. Much discussion arose out of the case. The cardinals reasonably demanded the abolition of all the secular tunes which had been recklessly foisted into the sacred service, many of them vulgar, some obscene, and required more simplicity in the music. The singers defended the melodies, and contended for the florid and elaborate. At length it was agreed that Palestrina should write a mass on the principle laid down by their eminences, and on his success depended the fate at that time of music in the Roman Catholic Church. In consequence of this determination he produced three masses for six voices. The two first were rather coldly approved, but the third was considered as the perfection of art, and the singers even could not restrain their expressions of admiration during its performance. This is known under the title of the 'Mass of Pope Marcellus.' He applied all his powers on the work, and wrought himself up to the most enthusiastic pitch. On his manuscript were found the words "Domine, illumina oculos meos." The pope, "before whom this mass was performed, was enraptured, and compared it to the heavenly melodies which the apostle John heard in his ecstatic trance." "By this one great example the question was now for ever set at rest," says Ranke (in his 'History of the Popes,' acknowledging Baini as his authority); "a path was opened, in following which the most beautiful, the most touching works, even to those who are not of the Church, were produced. . . . This art, which had been perhaps more completely alienated from the spirit and service of the Church than any other, now became the most closely connected with it. Nothing could be more important to Catholicism. . . . Spiritual sentimentality and rapture were the favourite themes of poetry and painting. Music, which speaks a language more direct, more impressive, more adapted to ideal expression than any other art, became the interpreter of these emotions, and thus subjugated all minds to her empire." (Mrs. Austin's translation of Ranke, vol. i.) We here again find the warm expressions of an enthusiast, no doubt; but it must be borne in mind that the writer heard these compositions performed under peculiar circumstances of a very influencing nature—under the roof of the grandest temple in the world, with every advantage that the finest execution, a solemnity unequalled for imposing effect, and the most exciting religious associations could bestow.

On the restoration of Palestrina to his office, his fame spread widely. Cardinal Pacecco announced to him that Philip III. of Spain would receive with satisfaction any work from the composer that he might dedicate to him. To his other appointments was now added that of 'Maestro' to the congregation of the Oratory. He also undertook the direction of the school established by Gio. Maria Zannini. Soon after this he was charged by Pope Gregory XIII. with the task of reviving the Roman Gradual and Antiphoner, which however he did not live to complete—a duty performed by his son, an only surviving child. Rather late in life his pecuniary circumstances must have been much improved, for on his death-bed, after blessing his son, he added, "I leave many unpublished works, and thanks to the Abbé de Baume, the Cardinal Aldobrandini, and the Grand Duke of Tuscany, I leave you also the means of publishing them." In January 1594 it became evident that his life was rapidly drawing to a close; and on the 2nd of the following month, after receiving the last rites of the church from the hands of his friend (the future Saint) Filippo di Neri, he expired. Of his funeral, Torrigio ('Grotte Vaticane,' ii. 168) says, "In St. Peter's church, near the altar of St. Simon and St. Jude, was interred, in consequence of his extraordinary abilities, Pierluigi da Palestrina, the great musical composer, and Maestro di Capella of this church. His funeral was attended by all the musicians of Rome, and 'Libera me, Domine,' as composed by himself, was sung by five choirs. On his coffin was this inscription:—'Johannes Petrus Aloysius Praenestinus; Musicae Princeps.'"

Palestrina's music is learned and grave, and that written for the church—as well, indeed, as much that proceeded from the same school—when heard in the kind of place for which it is adapted, and attended by pomp and pageantry, is strongly felt by all, and acts with irresistible force on sensitive minds. But in the concert-room or chamber, his compositions, whether sacred or secular, have, with few exceptions, no charms for hearers who have not cultivated a taste for simple, solid, airless harmony, or for the intricacies of fugal points well woven with a skill that owed more to study than genius. His works are

exceedingly numerous, chiefly ecclesiastical; but including also many madrigals, now rarely performed, except in societies devoted to this species of music. Clever as these are, their dryness is undeniable, and they are perhaps more praised than admired. Three of his motets are in use in our cathedrals, adapted by Dean Aldrich to the English version of the 44th, 63rd, and 115th Psalms. Of these the first, 'We have heard with our ears,' and third, 'Not unto us,' are printed in Dr. Arnold's 'Collection of Cathedral Music'; the second appears in its original state in Hawkins's 'History,' iii. 175. Of his madrigals but one is found in Yonge's 'Musica Transalpina' (1588), a work containing twenty madrigals by Italian masters; and this is the only composition of Palestrina noticed in 'La Musa Madrigalesca' (1837); an elegant, interesting volume, comprising the words of 395 compositions, chiefly madrigals, "of the Elizabethan age," together with many translations from the Italian, and much curious matter. The Padre Martini, in his 'Saggio di Contrappunto,' has given two madrigals, and several extracts, from the works of this celebrated master, all of them evincing his deep knowledge of the art, as understood and practised in his time, but all exclusively confined to that style now distinguished by his cognomen—by the term 'alla Palestrina.'

PALEY, WILLIAM, was born at Peterborough in the year 1748. He was descended from an old and respectable family in Craven, in the West Riding of Yorkshire. During his infancy his father removed to Giggleswick in Yorkshire, near the family property, having been appointed head-master of King Edward's School in that place. He was educated under his paternal roof, and speedily distinguished himself by great abilities, a studious disposition, and a ripeness and discrimination of intellect. In his seventeenth year he was entered a sizar of Christ's College, Cambridge; on which occasion his father declared that he would turn out a "very great man," for he had by far the clearest head he had ever met with in his life. He graduated in January 1768, and was senior wrangler. Having taken orders, he was elected fellow of his college in 1766, and soon after became one of the tutors. In 1775 his friend Dr. Law, bishop of Carlisle, presented him to the rectory of Musgrove in Westmorland. Shortly afterwards he married, left the university, and retired to his living. He passed through a succession of preferments, of trifling value, in the diocese of Carlisle; and in the year 1794 Dr. Porteus, bishop of London, made him a prebendary of St. Paul's, and Dr. Prettyman promoted him to the subdeanery of Lincoln cathedral. The year following the Bishop of Durham, Dr. Barrington, gave him the valuable rectory of Bishopwearmouth. His time was now spent between his subdeanery and his living, with occasional visits to Craven and Cumberland; and his life, unchequered by any events of importance, was occupied in the quiet performance of his duties, the society of his friends, and in completing that series of works which will perpetuate his name. The latter part of his existence was painfully subject to attacks of disease, which terminated in his death, May 25, 1805.

In matters of opinion, Paley was liberal-minded and charitable; he was a friend to free inquiry, and an able supporter of the principles of civil and religious liberty; and when Wilberforce and Clarkson commenced their labours for the abolition of the slave-trade, he strenuously exerted himself to suppress that disgraceful traffic.

As a writer, he is distinguished not so much for originality as for that power of intellect by which he grasps a subject in all its bearings, and handles it in a manner entirely his own; for the consummate skill with which he disposes and follows out his argument, and for a style peculiarly suited to philosophical investigations—strong, exact, and clear, and abounding in words and phrases which, though sometimes homely, express and illustrate his meaning most forcibly and most distinctly.

The greatest and most important of his works, 'The Principles of Moral and Political Philosophy,' was published in the year 1785. The general outlines of it had been delivered as lectures to his pupils when he was a tutor in the university. Though in many respects faulty, the work is a valuable addition to the literature of our country. His desire of introducing into the foundation of his system too much of the exactness of demonstrative science, has occasionally led him to define things which in their nature are indeterminate—which cannot be brought within the limits of a precise and formal definition. His account of the *law of honour* and of *virtue* is of this character. He is also too fond of putting forward disjunctive propositions, and reasoning upon them as though they were exhaustive, as in the instance of the *methods of administering justice*. Hence his applications are sometimes lettered and his conclusions defective. Both in his metaphysical and ethical views, Paley was a follower of Locke. Locke, in excluding innate ideas, overlooks innate capacities; and Paley denies the existence of a moral sense—of any faculty by which the mind is enabled to discriminate right and wrong.

This work is divided into two parts,—Moral Philosophy, and Political Philosophy. In the first part, after giving some account of the law of honour, the law of the land, and the Scriptures, as rules of action; rejecting the notion of a moral sense, or an innate capacity of moral judgment; and defining what he means by human happiness and virtue,—Paley proceeds to explain the principles and lay down the foundation of his system. This he does in book ii., 'On Moral Obligation.' A man is said to be obliged when he is urged by a violent motive resulting from the command of another. In moral matters,

the motive is the expectation of future reward or punishment, and the command is from God. Hence private happiness is the motive, and the will of God the rule. But how is the will of God known? From two sources—the declarations of Scripture, and the light of nature; and the method of coming at the divine will concerning any action, by the light of nature, is to inquire into the tendency of the action to promote or diminish the general happiness. Here then Paley arrives at his principle, that "whatever is expedient is right. It is the utility of any moral rule alone which constitutes the obligation of it." Its utility is to be determined by a consideration of general consequences; it must be expedient upon the whole, in the long run, in all its effects collateral and remote, as well as in those which are immediate and direct. Having settled his principle, he proceeds to apply it to the determination of moral duties. He takes a three-fold division of duties: namely, those which a man owes to his neighbour, or relative duties; those which he owes to himself; and those which he owes to God. The first set are determinate or indeterminate: determinate, such as promises, contracts, oaths. The obligation to keep a promise, according to the principle of expediency, arises from the circumstance that "confidence in promises is essential to the intercourse of human life;" and the sense in which a promise is to be interpreted is that which the promiser knowingly and willingly conveys to the mind of the person to whom it is made. Contracts are mutual promises, and therefore governed by the same principles; consequently, whatever is expected by one side, and known to be so expected by the other, is to be deemed a part or condition of the contract. Oaths are to be interpreted according to the 'animus imponentis,' that is, in the sense which the imposer intends by them. Indeterminate duties are charity, gratitude, and the like. They are called indeterminate because no precise and formal limits can be assigned to their exercise. Another class belonging to this first set of duties originate from the constitution of the sexes. The second set of duties are those which a man owes to himself. As there are few duties or crimes whose effects are confined to the individual, little is said about them. A man's duty to himself consists in the care of his faculties and the preservation of his person, and the guarding against those practices which tend to injure the one or the other. The third division of duties are those which are due to God. In one sense, every duty is a duty to God; but there are some of which God is the object as well as the author: these are worship and reverence.

The second part of this work is devoted to the elements of political knowledge. In determining the grounds of civil government and the reasons of obedience to it, Paley is guided by the same principle as that which constitutes the foundation of his moral system—'Utility.' The controversies on the origin of government have been many and bitter. Sir Robert Filmer and his followers, among whom the Oxford Tractators are the most prominent of the present day, hold the notion of a divine and inalienable right in kings to govern, and the corresponding obligation of passive obedience in their subjects. They contend that God vested in Adam, the father of mankind, an absolute power over his posterity, and that this power descends without diminution to kings, the representatives of Adam. Locke, on the other hand, supposes a Social Compact, a compact between the citizen and the state, as the ground of the relation in which they stand to each other; a mutual agreement as to the terms of their connection, and the condition on which one undertakes to govern and the other to obey. Paley rejects both theories. He puts the divine right of kings on the same footing as the divine right of constables,—the law of the land. Against the Social Compact he urges that it is false in fact and pregnant with dangerous conclusions. The principles he assigns as the only reason of the subject's obligation to civil obedience, is the "Will of God, as collected from expediency." Public utility is the foundation of all government. Hence, whatever irregularity, or violations of equity, or fraud and violence may have been perpetrated in the acquisition of supreme power, when the state is once peaceably settled, and the good of its subjects promoted, obedience to it becomes a duty. On the other hand, whatever may have been the original legitimacy of the ruling authority, if it become corrupt, negligent of the public welfare, and cease to satisfy the expectations of the governed, it is right to put it down and establish another in its place. After defining and giving some account of civil liberty, in which, as in every other part of his work, he adheres strictly to his principle—'utility,' which he follows out to its consequences,—he proceeds to speak of the different forms of government, especially the British constitution, their advantages, and disadvantages, the nature of crimes and punishments, and the administration of justice.

With respect to religious establishments also, 'expediency' governs all his views and conclusions. As no form of church-government is laid down in the New Testament, a religious establishment is no part of Christianity; it is only the means of inculcating it. But the means must be judged of according to their efficiency; this is the only standard; consequently the authority of a church establishment is founded in its utility. For the same reason tests and subscriptions ought to be made as simple and easy as possible; but when no present necessity requires unusual strictness, confessions of faith ought to be converted into articles of peace. In establishing a religion, where unanimity cannot be maintained, the will of the majority should be consulted, because less evil and inconvenience must attend this than any

other plan. On the same principle persecution is condemned and toleration justified; because the former never produced any real change of opinion, whilst the latter encourages inquiry and advances the progress of truth.

The book ends with the subjects of population and provision, agriculture and commerce, and military establishments. "The final view," observes Paley, "of all national politics is to produce the greatest quantity of happiness." In legislation, in government, in levying war, this is the ruling principle; and in relation to these questions, as in every other part of his work, he applies it with great skill and with a most masterly judgment.

In 1790 he published his 'Horse Paulina,' certainly the most original of his works, and executed with singular ability. He here opens a new department of evidence in favour of Christianity. By a comparison of St. Paul's Epistles with the history of that apostle, as delivered in the 'Acts,' and by marking what he designates the "undesigned coincidences" of the one with the other, he establishes the genuineness of both, and thus furnishes a novel and ingenious and at the same time a very conclusive species of testimony in behalf of revealed religion.

His 'View of the Evidences of Christianity' appeared in 1794. In the composition of this work he availed himself largely of the labours of the learned Lardner and of Bishop Douglas, but the materials are wrought up with so much address and disposed with so much skill, and the argument laid before the reader in so clear and convincing a form, that it is one of the most valuable and important books of the kind. The argument, which is opened and illustrated with singular ability, is briefly this:—A revelation can be made only by means of miraculous interference. To work a miracle is the sole prerogative of the Supreme Being. If therefore miracles have been wrought in confirmation of a religion, they are the visible testimony of God to the divine authority of that religion. Consequently, if the miracles alleged in behalf of Christianity were actually performed, the Christian religion must be the true one. Whether the miracles were actually performed or not, depends upon the credibility of those who professed to be witnesses of them, that is, the Apostles and first disciples of Jesus Christ; and their credibility is demonstrated from this consideration—"that they passed their lives in labours, dangers, and sufferings voluntarily undergone in attestation of the accounts which they delivered, and solely in consequence of their belief in those accounts; and that they also submitted, from the same motives, to new rules of conduct." They could not have been deceived; they must have known whether Christ was an impostor or not; they must have known whether the miracles he did were real or pretended. Neither could they have been deceivers; they had no intelligible purpose to accomplish by deception; they had everything to lose by it. On the other hand, by being still—by letting the subject rest—they might have escaped the sufferings they endured. It is perfectly inconceivable, and entirely out of all the principles of human action, that men should set about propagating what they know to be a lie, and yet not only gain nothing by it, but expose themselves to the manifest consequences—enmity and hatred, danger and death.

His last great work, 'Natural Theology,' was published in 1802. As noticed elsewhere [NEUWENTYT, BERNARD, vol. iv., col. 511], it has been shown that, for the general idea, and most of the materials of this work, Paley was indebted to the 'Religious Philosopher' of Nieuwentyt, the English version of which was published about eighty years earlier. The only explanation of this apparent plagiarism is that furnished by Paley's known method of composition. This, like his other works, there can be little doubt, was written from the materials collected in his notes for his lectures as a college tutor; and probably against neither the arguments nor the illustrations which he copied did he enter the name of the author from whom he borrowed them. It might easily happen that it would be difficult in the course of so many years (the 'Natural Theology' was written more than five-and-twenty years after removing from Cambridge, and, as he expressly says, while prevented by ill-health from discharging his regular duties) to recover the original authorities, however anxious he might be to do so. Had Paley himself been called upon to answer the charge, we fancy he would have done it by pointing to a passage in the preface to his 'Moral Philosophy,' which seems to us fully to meet the case and corroborate what we have here suggested. It may be thought necessary to explain, he says, why "I have scarcely ever referred to any other book, or mentioned the name of the author whose thoughts, and sometimes, possibly, whose very expressions I have adopted. My method of writing has constantly been this, to extract what I could from my own stores and my own reflections in the first place; to put down that, and afterwards to consult upon each subject such readings as fell in my way. . . . The effect of such a plan upon the production itself will be, that, whilst some parts in matter or in manner may be new, others may be little else than a repetition of the old. I make no pretensions to perfect originality: I claim to be something more than a mere compiler. Much no doubt is borrowed: but the fact is that the notes for this work having been prepared for some years, and such things having been from time to time inserted in them as appeared to me worth preserving, and such insertions made commonly without the name of the author from whom they were taken, I should, at this time, have found a difficulty in recovering those names with sufficient exactness to be able to render to every man his own. Nor,

BIOC. DIV. VOL. IV.

to speak the truth, did it appear to me worth while to repeat the search merely for this purpose. When authorities are relied upon, names must be produced: when a discovery has been made in science, it may be unjust to borrow the invention without acknowledging the author. But in an argumentative treatise, and upon a subject which allows no place for discovery or invention properly so called; . . . I should have thought it superfluous, had it been easier to me than it was, to have interrupted my text or crowded my margin with references to every author whose sentiment I have made use of." We do not adopt this statement as satisfactory, but quote it as the apology which Paley did put forth in one work, and would probably have offered in this had he anticipated the objection. But it is only fair to add that Paley has wonderfully improved where he has borrowed, and made that clear, impressive, and convincing, which in the original was confused, illogical, and tiresome. He has added too more than he has borrowed; and, as in all the rest of his productions, the matter is arranged and the argument followed out with consummate judgment. His object is to establish the fact of benevolent design in the works of the visible creation. Hence the existence of a Supreme Designing Intelligence is inferred; and his personality, unity, and goodness demonstrated. It is not only one of the most convincing, but one of the most delightful books in the English language.

A valuable edition of this work, with notes and scientific illustrations, was published a few years since by Lord Brougham and Sir C. Bell, the former furnishing a preliminary discourse of natural theology. The discourse is divided into two parts: the first contains an exposition of the nature and character of the evidence on which natural theology rests, with the intention of proving that it is as much a science of induction as either physical or mental philosophy; and the second is devoted to a consideration of the advantages and pleasures which the study is calculated to afford. Subjoined to the volume are some notes on various metaphysical points connected with the subject.

Besides the above works, Paley was the author of various sermons and tracts. Numerous editions of his 'Natural Theology' and 'Evidences' have been published, as well as several complete editions of his works. A complete edition, in 4 vols., containing posthumous sermons, published by his son, the Rev. Edmund Paley, in 1838, may be regarded as the standard edition.

PALGRAVE, SIR FRANCIS, KNIGHT, was born in London. He assumed the name of Palgrave in lieu of that of Cohen. In 1827 he was called to the bar at the Inner Temple. He became known to those of the literary public who take an interest in the historical antiquities of Great Britain by some learned articles which were ascribed to him, in periodical publications, and by the 'Parliamentary Writs,' 2 vols. folio, 1827-34, which he edited under the Commissioners of Public Records. In the early part of the year 1831 he published a pamphlet entitled 'Conciliatory Reform: a Letter addressed to the Right Hon. Thomas Spring Rice, M.P., on the Means of reconciling Parliamentary Reform to the Interests and Opinions of the different Orders of the Community; together with the Draft of a Bill founded on the Ministerial Bill, but adapted more closely to the Principles and Precedents of the Constitution.' About this time he was elected F.R.S. and F.S.A. In the year 1831 he published 'The History of England; Anglo-Saxon Period,' 12mo, in 'The Family Library.' This little work is written in a popular manner, with much liveliness of style, and displays an intimate knowledge of the details of this period of English history. In 1832 he received the honour of knighthood for his services generally, and especially for his attention to constitutional and parliamentary literature. He is also a K.H. In the same year he published his 'Rise and Progress of the English Commonwealth: Anglo-Saxon Period, containing the Anglo-Saxon Policy, and the Institutions arising out of the Laws and Usages which prevailed before the Conquest,' 2 vols. 4to. In the first volume of this valuable work Sir Francis Palgrave examines into the ranks and conditions of society during the Anglo-Saxon period, connecting them with the usages and legal institutions. He afterwards discusses the political and municipal government, and the ecclesiastical polity, and treats of the warfare, protracted for some centuries, between the invaders and the Britons, introducing much new and curious matter. He afterwards connects the political and legal institutions of the Anglo-Saxons with those of the continent under Charlemagne and his successors. The second volume of the work is entitled 'Proofs and Illustrations,' and is supplementary to the first volume. The work is especially valuable to the inquirers into the origin of English jurisprudence, affording at the same time abundance of curious information on the other early institutions of the country.

About a year after the passing of the 'Act to amend the Representation of the People in England and Wales,' the king issued, in July 1833, a Commission under the Great Seal to twenty gentlemen, "to inquire into the existing state of the Municipal Corporations of England and Wales." Of these twenty gentlemen Sir Francis Palgrave was one, and he published in the same year 'Observations on the Principles to be adopted in the Establishment of New Municipalities, the Reform of Ancient Corporations, and the Cheap Administration of Justice,' 8vo. The reports of the commissioners on individual corporations occupied five folio volumes, the greater part of a sixth volume contained important information on matters connected with the corporations, and the results of the whole inquiry were presented in a General Report, published in 1835, and signed by sixteen of the commissioners.

2 T

Sir Francis Palgrave was one of the four who did not sign the General Report, and in the same year he published the 'Protest of Sir Francis Palgrave against the First Report of the Commissioners appointed to inquire into the Municipal Corporations of England and Wales,' in which he controverted many of the statements contained in the General Report, and expressed his dissent from the reasonings and views founded upon those statements. The Municipal Reform Act however, founded on the views of the General Report, was passed, and received the royal assent Sept. 9, 1835.

Sir Francis Palgrave was not long afterwards appointed Deputy Keeper of her Majesty's Public Records, an office which he still holds, and the duties of which he performs with general approbation. He presents a 'Report' annually to parliament: his last 'Report,' printed by order of the House of Commons in 1856, was the seventeenth. In 1836 he published 'Rotuli Curie Regis,' 2 vols. roy. 8vo. His edition of the 'Calendars and Inventories of the Treasury of the Exchequer,' 3 vols. roy. 8vo, 1836, some of which were compiled as early as the 14th century, is very interesting, as exhibiting the ancient modes in which records were preserved. Sir Francis has given illustrative figures of the pouches or bags, chests, coffers, and such like, in which they were kept, and of the 'signs,' or small drawings, by which they were marked, and which in most cases have some analogy to the subjects of the documents. In 1837 he published 'Documents illustrating the History of Scotland,' vol. i., and 'Truths and Fictions of the Middle Ages—the Merchant and the Friar,' 12mo; and in 1844 an 'Essay upon the Authority of the King's Council,' 8vo.

In 1851 Sir Francis Palgrave published the first volume of 'The History of Normandy and of England.' Vol. i. General Relations of Medieval Europe; the Carolingian Empire; the Danish Expeditions in the Gauls; and the Establishment of Rollo, 8vo, 1851. This First Volume comprises the First Book of the entire work, according to the general scheme of the author. The Second Volume is now (February 1857), we believe, nearly ready for publication. Book II. is to give the History of Capetian Normandy; Richard I., or Richard-sans-Peur; Richard II., or Le Bon; Richard III.; Robert I., or Robert le Diabie; and William the Bastard, or the Conqueror. In Book III. is to be given the History of Duke William as king of England. Book IV. is to comprise the History of the sons of William the Conqueror—Courthose, Rufus, and Beauclerc; and the History of the First Crusade. Book V. will be occupied with the History of Robert Courthose and Henry I. Book VI., completing the work, will include the reigns of Stephen of Blois and Henry Plantagenet.

Sir Francis Palgrave married Elizabeth, one of the daughters of Dawson Turner, Esq., F.R.S. and S.A., of Yarmouth. She died in August 1852, at his residence, Hampstead. [See SUPPLEMENT.]

PALLADIO, ANDREA, an Italian architect whose name has become almost proverbial through Europe, and whom many critics still consider as one of the greatest masters of his art, more especially in all that appertains to taste. He was born on the 30th of November 1518, at Vicenza in the Venetian territory, a city which is distinguished by the numerous structures with which he adorned it. Of his family, his early youth, and his first studies, scarcely anything certain is now known. It appears however that he studied with great diligence the writings of Vitruvius and Alberti, and that he found an encouraging patron in his countryman Gian-Giorgio Trissino, whose name still holds a conspicuous place in the annals of Italian literature. By him Andrea was taken to Rome three several times, and he turned these opportunities to such excellent account that scarcely an ancient edifice or any note escaped his examination, while of many of them he made drawings and studies, and carefully noticed their construction.

He appears to have returned from the last of these journeys in 1547, when he was in his twenty-ninth year, and to have settled at Vicenza. His first work, or rather one in which he had a share, was the Palazzo Publico at Udine, begun by Giov. Fontana, a Vicentine architect and sculptor, and by some supposed to have been Palladio's instructor; but the first work of any importance entirely designed by himself was the Basilica or Palazzo della Ragione at Vicenza, a large ancient Gothic structure, the exterior of which he entirely remodelled. He surrounded it on three sides by open loggie or porticos, forming two orders, Doric and Corinthian, in half columns, each including a smaller order of insulated columns whose entablature forms the impost to the arches which occupy the upper part of the larger intercolumns. So great was the reputation he at once acquired by this edifice that he was shortly after summoned to Rome by Paul III., who wished to consult him respecting the works then in progress at St. Peter's. He accordingly visited that city for the fourth time, but Paul died before he arrived.

On his return he seems to have been overwhelmed with commissions, almost every one in Vicenza and its neighbourhood, who could afford to build, employing him to design a mansion or villa, of which class of subjects the majority of his works consist. Though he executed comparatively few structures of great magnitude and importance, he had numerous opportunities for displaying his invention upon a moderate scale, and creating a style of domestic architecture till then almost unknown—which no doubt is one reason why he has so generally been taken as a model by architects of other countries. Among the numerous private mansions erected or designed by him at Vicenza are the palazzi Tiene, Valmarana, Chiericati, Forti, Capitaneale,

Barbarino, &c., and the celebrated Villa Capra or Rotonda at a short distance from the city, besides a great many villas and country-seats along the Brenta. But some of the mansions at Vicenza have never been completed, and others too evidently attest either the poverty or the excessive negligence of their present possessors.

The reputation acquired by these and similar works led to Palladio's being invited to Venice, as Sansovino, the chief architect there, was growing infirm. He was at first employed with some alterations at the convent Della Carità, consisting of a Corinthian atrium, and a cloister beyond it. This atrium is merely an open court about 42 feet wide by 56 in depth, with a colonnade of four Corinthian columns on each side, and on each hand within these colonnades is the entrance to what were affectively called Tablini, which were merely two tolerably spacious rooms, one intended for the sciorist, the other for a chapter-house. The atrium just mentioned communicates immediately, through a door facing the entrance, with the larger inner court or cloister, about 80 by 66 feet, whose elevations present three orders, viz. a Doric and Ionic with open arches between the columns (six on each of the longer, five on each of the shorter sides), forming open galleries quite around, while the Corinthian order above them has windows of rather small proportions. Two churches afterwards erected by him in the same city afforded him an opportunity of displaying his talents in buildings of that class. The first of them, San Giorgio Maggiore, was begun in 1566, though the façade was not erected till 1610. The plan consists of a nave with two aisles, but so short in proportion to the rest, there being only three arches on each side, that the whole approaches to the form of a Greek cross. Of decoration too there is very little besides columns and entablatures, and the small columns and pediments forming the altar tabernacles; even the vaulting and dome being quite plain, with merely arcs-doubleaux formed by the upper semicircular windows. The front has a large composite order of four three-quarter columns supporting a pediment, and placed on very lofty pedestals, with a small order in Corinthian pilasters on each side, surmounted by a half pediment, the horizontal cornice and rest of their entablature being continued as a fascia between the larger columns. Yet although there is no lack of decoration, the intercolumns, except the centre one (occupied by a lofty door, square-headed but with an arch over it), being filled by niches and panels, and there being, besides, festoons between the composite capitals, the architecture itself is by no means rich; none of the mouldings are carved, and the modillions of the cornices are mere blocks. The same may be said of the still more celebrated church called Il Redentore, begun in 1578, about two years before the architect's death. In description the façade of this edifice agrees very nearly with that of the preceding, being similarly disposed, with a large composite order and a lesser Corinthian one, with half pediments. At the same time there are considerable differences, for instead of being raised upon pedestals, the larger order stands upon the platform of a flight of steps occupying the centre division of the front, and, instead of four three-quarter columns, consists of two half-columns and two pilasters. The proportions again are quite dissimilar, owing to the omission of pedestals, the greater width of the intercolumns, and the relative sizes of the two orders, the Corinthian one being here much larger than in the other instance, so that the cornice of its entablature is nearly level with the top of the shafts of the larger columns, whereas at San Giorgio the smaller cornice is not higher than two-thirds of the larger columns. Neither is the lesser entablature here continued throughout, but its architrave alone, except in the centre intercolumn, where there are two Corinthian half-columns to the door, surmounted by an entablature and pediment, besides which there are smaller columns and segmental pediments to the niches in the lateral divisions of this centre compartment. All these different columns, pediments, and half-pediments tend to produce quite as much monotony as variety. In its plan this church greatly surpasses the other, having a good deal of play and elegance in its arrangement, and being more imposing in its proportions. Still here, again, the order itself constitutes the whole of the architecture—all the rest being bare and cold, and plain almost to nakedness.

The façade of San Francesco della Vigna was also designed by Palladio in 1562, although the church itself is said to be by Sansovino. This front is very much like that of San Giorgio, except that instead of a large panel there is a semicircular window (in three compartments, or of the kind called a Palladian window) over the doorway, also a circular sculptured ornament within the pediment, and an inscription on the frieze.

One of his last, if not his very latest work, was the Teatro Olimpico at Vicenza, which he did not live to complete, for he died on the 8th of August 1580, at the age of sixty-two, and that structure was not entirely finished till 1583. It has been extravagantly extolled by many, and severely condemned by others as a piece of puerile architectural pedantry. It may indeed be asserted of Palladio's works generally that they have been greatly and indiscriminately overpraised by successive writers, who seem to have merely repeated one another. Among the many who have extolled Palladio's extraordinary merits, but without attempting to show wherein they consist, are the names of Göthe, Quatremère de Quincy, Forayth, Hope, and Beekford.

Judging Palladio dispassionately, it is impossible to deny that his works abound with defects and solecisms that would hardly be tol-

rated in any one else. As regards Palladius himself, there may be much excuse for his errors, but certainly none for the prejudices of those who would now insist upon our admiring his works without qualification, more particularly as nothing is easier than for a modern architect to avoid his faults, and even to improve upon his beauties.

PALLA'DIUS, generally surnamed 'Sophista,' or 'Iatro-sophista,' the author of three Greek medical works still extant. Nothing is known of the events of his life, but he is supposed to have gained his title of *ιατροσοφιστής* by having been a professor of medicine at Alexandria. His age is also very uncertain: but as he quotes Galen ('De Febril,' pp. 6, 8, 12, 56, ed. Bernard), and he is himself several times mentioned by Rases, we may safely place him somewhere between the beginning of the 3rd and the end of the 9th century A.D. Freind, in his 'Hist. of Physic,' argues that he must have lived after Aëtius, because the chapter 'De Epiala,' in his treatise 'De Febrilibus,' is taken word for word from that author: but this argument is by no means conclusive, because (as Bernard remarks in his preface) almost the very same words are to be found in Galen ('De Different. Febril,' lib. ii. cap. 6) from whom therefore it is probable that both authors borrowed the passages in question. The first of his extant works is entitled *Περὶ πυρετῶν σύντομος σύνοψις*, 'De Febrilibus concisa Synopsis.' It consists of thirty chapters, and contains an account of the different kinds of fever (cap. 4, &c.), its causes (cap. 9), and its symptoms (cap. 10): it then treats separately of the different kinds of fever (cap. 14-18), and especially of the intermitting (cap. 19-23); and finally, in one short chapter, of the treatment (cap. 29). The treatise is too short to be of much value, and almost the whole of it is to be found in Galen, Aëtius, and Alexander Trallianus. It was first edited by Chartier, 4to, Gr. and Lat., Paris, 1646; the best editions are those by J. St. Bernard, 8vo, Gr. and Lat., Lugd. Bat., 1745; by Ideler in the first volume of his 'Physici et Medici Græci Minores,' Berol. 8vo, 1841. It deserves to be noticed, that though there are several manuscripts of this treatise in different public libraries, not one of them bears the name of Palladius; but in some it is ascribed to Stephanus, in some to Theophilus, and in others to both. It is however, in the opinion of Freind ('Hist. of Physic') and Bernard ('Præfat. '), clearly ascertained to be the work of Palladius, as he refers to it in another of his works entitled *Ἐπι σκροτῶν ἐπιδημιῶν πρόμνημα*, 'In Sextum (Hippocor.) Epidemiorum Librum Commentarius' (sect. vi. 6). This work is imperfect, and goes no farther than the seventh section, with a few fragments of the eighth. In it (says Freind) he, with great perspicuity and exactness, illustrates not only Hippocrates, but also several passages of Galen; and observes particularly that the stone increased much in his time, and was less curable; and this he imputes to the luxury of the age, to much eating, and want of exercise (sect. i. 5, p. 19, ed. Dietz.). It was first translated into Latin by J. P. Crassus, and published after his death, Basil. 4to, 1581, in the collection called 'Medici Antiqui Græci,' &c. The Greek text was published for the first time by F. R. Dietz, in his 'Scholia in Hippocratem et Galenum,' &c., 2 vols. 8vo, Regim. Pruss., 1834. The third work by Palladius is entitled *Σχόλια ἐπὶ τὸ περὶ ἀγμῶν Ἰατροκράτους*, 'Scholia in Librum Hippocratis de Fracturis.' This also is imperfect; but, in Freind's opinion, what remains is enough to let us see that we have no great loss by it, the text being as full and as instructive as the annotations. They were translated into Latin by Jac. Santalbinus, and are inserted, Gr. and Lat., in the edition of Hippocrates by A. Foesius, Francof., 1695, fol., sect. vi., pp. 196-212; and in that of Hippocrates and Galen by Chartier, tom. xii., pp. 270-286. Dietz, in his preface, mentions another work by Palladius which he found in manuscript in the library at Florence, consisting of scholia on Galen's work 'De Scota,' which he intended to publish, but found the manuscript so corrupt, that he was obliged to give it up. Palladius appears to have been well known to the Arabians, as, besides being quoted by Rases, he is mentioned among other commentators on Hippocrates by the unknown author of 'Philosoph. Biblioth.,' quoted in Casiri, 'Biblioth. Arabico-Hisp. Escurial,' t. i. p. 237.

PALLA'DIUS, a Roman writer on agriculture, whose complete name is PALLADIUS RUTILIUS TAURUS EMILIANUS. The place of his birth and his period are uncertain, but it is probable that he lived about the time of Valentinian and Theodosius. He is the author of an extant work entitled 'De Re Rustica,' in 14 books. The first book contains general rules about agriculture; the twelve following books are respectively devoted to the agricultural labours of each month; the fourteenth book is in elegiac verse, and treats of grafting trees. The work of Palladius appears to be mainly a compilation from previous writers, such as Columella and Martialis Gargilius, whose work on agriculture and garden cultivation is lost. The style is inferior to that of Columella, and indicates a late period. The work of Palladius, probably owing in some degree to the convenience of the division, was much used in the middle ages, and the 'Speculum' of Vincent of Beauvais has borrowed much from it.

Palladius and the other Roman writers on agriculture are contained in the edition of the 'Scriptores Rei Rusticæ,' by J. M. Gesner, Leipzig, 1735, and in the improved edition of the same work by Ernesti, 1778. The best edition is by J. G. Schneider, 4 vols. 8vo, Leipzig, 1794-97. The 'De Re Rustica' has been translated into English by Owen, 1808; into French by Darce, 1658; into Italian by Sansovino, 1560, and by Zanotti, 1810; and into German by Meier, 1612.

PALLA'DIUS, one of the early Christian fathers, was bishop of

Helenopolis in Bithynia, and author of a Greek work containing the lives of certain persons in Palestine and Egypt who made themselves remarkable at the time when he wrote by their religious austerities. This work was called the 'Lausiac History,' from Lausus, an officer in the imperial court at Constantinople, to whom it was dedicated. It is published in the 'Bib. Pat. Morell,' Par., 1644. According to Cave, Palladius wrote his history about 421, in the fifty-third year of his age. We know nothing more of him, except that he was an Origenist and an admirer of Rufinus. He speaks very strongly against Jerome. There was another writer of the same name, who composed a 'Dialogue of the Life of St. Chrysostom,' at Rome, in the year 408. It is not known whether he is the same or a different person from the former. Du Pin thinks him the same; Tillemont and Fabricius take him to be another person. His 'Dialogue' is published in the best editions of Chrysostom's works.

PALLAS, PETER SIMON, was the son of a surgeon at Berlin, where he was born on the 22nd of September 1741. He was brought up to the medical profession, and instructed in the natural and medical sciences, in which he made rapid progress. He had also a great talent for learning languages, which he found of advantage to him in after-life. While very young he imbibed a taste for zoology, and to this science (which became the sole occupation of his future years), he devoted all his leisure while a boy. In 1758 he went to the University of Halle, and he afterwards visited those of Göttingen and Leyden. At Leyden he took his Doctor's degree, on which occasion he wrote an inaugural dissertation on intestinal worms. Zoology had now become his ruling passion, and he employed almost all his time in visiting the different museums of natural history, for which Leyden was at that time particularly celebrated. In July 1761 he came to London for the avowed object of studying medicine, but in reality for the purpose of examining the different collections of animals in this country, and making himself acquainted with the natural productions. He remained in London nearly a twelvemonth. In 1763 he obtained his father's permission to settle at the Hague, where in 1766 he published his 'Elenchus Zoophytorum,' a work evincing great talent, and which acquired him considerable reputation. The 'Miscellanea Zoologica,' which appeared the same year, further increased the fame of Pallas, and he had appointments offered him by several foreign governments. Among others he attracted the notice of the Empress Catherine, who invited him to St. Petersburg, and offered him the professorship of natural history in the Imperial Academy of Sciences, which he accepted in 1767.

At the time of his arrival in Russia an expedition, composed of a number of astronomers and other scientific men, was on the eve of setting out, by command of the empress, for the purpose of observing the transit of Venus, and of investigating the natural history and geography of Siberia and the other northern parts of the Russian empire. Pallas gladly accepted an invitation to accompany the expedition, and employed the winter previous to his departure in making the necessary preparations. During this interval he found time however to continue his literary labours, and prepared several numbers of the 'Spicilegium Zoologica' for publication, a work which he had commenced previous to going to St. Petersburg. He also presented his first celebrated memoir to the academy on the fossil bones of great quadrupeds, which have been so abundantly met with in Siberia. He showed that these bones must be referred to different species of elephant and rhinoceros, and other animals now inhabiting tropical countries.

The expedition set off in June 1768. The first summer was spent in traversing the plains of European Russia, and the winter was passed at Simbirsk, on the Volga. The next year the expedition visited the borders of Calmuck Tartary, when Pallas carefully examined the shores of the Caspian Sea. They afterwards proceeded through Orenburg, and passed the next winter at Ufa. In 1770 Pallas crossed the Uralian Mountains to Catharienburg, and after examining the mines in that neighbourhood he proceeded to Tobolsk, the capital of Siberia. The year following the expedition reached the Altai Mountains, which run from east to west, forming the southern boundary of Siberia, and, by forming a barrier which obstructs the course of the southerly winds, renders Siberia much colder than many countries in the same degrees of latitude. Thence they proceeded to Krasnoyarsk, on the Yenesei, where they passed the winter, and here they observed the freezing of mercury, in 56 $\frac{1}{2}$ ° N. lat. The next spring Pallas penetrated across the mountains to the frontiers of China, whence he retraced his steps, and slowly proceeded homewards, visiting Astrakhan and the neighbourhood of Mount Caucasus on the way back. He reached St. Petersburg in July 1774, having been absent six years.

Pallas, who was a young and vigorous man when he set out, returned broken down in health, and with his hair whitened from fatigue and disease. Almost all his companions had died; and instead of enjoying the rest which he so much needed, he was obliged to redouble his activity, in order to arrange their notes and observations as well as his own. The journal which he had kept of his travels, and which he occupied his time in arranging while the expedition was detained in winter quarters, had been regularly transmitted each year to St. Petersburg, and published on its arrival.

On his return to St. Petersburg he received many marks of favour

from the Empress Catherine. She decorated him with titles, and gave him several lucrative appointments. The office of instructing the grand-duke Alexander (afterwards emperor) and Constantine in the natural and physical sciences was also entrusted to him. After remaining many years at St. Petersburg, quietly engaged in the pursuits of literature and science, in 1793 and 1794 he took advantage of the conquest of the Crimea to travel through the southern provinces of Russia. He was so much delighted with the climate and productions of the Crimea that he asked permission of the empress to settle there, hoping to recruit his health. The empress acceded to his request in the most generous manner, giving him a handsome establishment and a liberal salary to support it. He went to live in the Crimea in 1795, but found that the climate, instead of being as he supposed temperate and equable, was in fact very variable and sickly. The inhabitants too were barbarous, and he was deprived of all society. His existence was thus rendered very uncomfortable. He lived there however fifteen years, occupied in his researches in natural history. At last he sold his property and quitted Russia. Pallas arrived at Berlin in 1810, after forty-two years of absence: he survived his return a short period only, dying on the 7th of September 1811, at the age of seventy.

Any analysis of the works of Pallas is impossible, for he spent his whole life in the accumulation of facts, which he always related in the simplest manner, leaving the easy task of drawing deductions from them to others. All his writings, of which he left a prodigious number, though written in a dry and uninteresting style, are full of novelties and truths. "They have placed," says Cuvier, "the name of their author in the first rank of naturalists, who are constantly referring to and quoting from every page of them. They are also read and consulted with equal interest by the historian, the geographer, and the student of languages or of nations." The following is a brief notice of his principal works:—

'Elenchus Zoophytorum,' 8vo, the Hague; 'Miscellanea Zoologica,' 4to. Both these works appeared in 1766, and were interesting from containing a great deal of information on those little-known classes of animals which had been confounded under the name of worms. Pallas showed that the presence or absence of a shell should not form the primary basis of their distribution, but that the analogies of their internal structure ought to be consulted. The 'Elenchus,' which is principally confined to sponges, corallines, &c., is remarkable for the clearness of the descriptions and the care bestowed on the synonyma. The 'Miscellanea' was partly reprinted, with many additions (but with the omission of some of the most valuable parts relating to the invertebrate animals), in the 'Spicilegia Zoologica,' the first four numbers of which were published at Berlin in 1767.

'Travels through different Provinces of the Russian Empire,' published in German, 3 vols. 4to, St. Petersburg, 1771-76. This work contains a great deal of valuable information, but is imperfect, from having been hastily compiled, without access to books of reference, during the author's travels. After Pallas returned to St. Petersburg from his first expedition, he published several interesting papers descriptive of the new and rare quadrupeds which he had met with in Siberia. His account of the musk, the glutton, the ghibeline, and the Polar bear may be particularly mentioned, which form the four last parts of the 'Spicilegia Zoologica,' and are exceedingly well written. He published a separate volume on the different species of *Rodentia* that he discovered; it is entitled 'Novæ Species Quadrupedum ex Glirium Ordine,' 4to, Erlang, 1778. The anatomy and history of these animals are excellently described in this work, which is altogether one of his best. Pallas became a botanist during his travels, and undertook, by desire of the empress, a 'Flora Rossica,' illustrated with magnificent plates, two volumes of which were published at St. Petersburg, in fol., 1784-86; no more appeared.

The last great work which he wrote was a Fauna of the Russian empire, which he intended to embrace all the animals found both in European and Asiatic Russia. He worked at it till his death, and completed the manuscript of the vertebrate animals, which was printed in 3 vols. 4to, at St. Petersburg, in 1811, under the name of 'Zoographia Rosso-Asiatica;' but it was not published until 1831, in consequence of the plates having been mislaid. Some naturalists however managed to obtain copies of the text.

Pallas may be said to have laid the foundation of modern geology in a memoir containing 'Observations on the formation of Mountains,' which was read to the Academy of St. Petersburg in 1777 before Gustavus III. of Sweden. "An attentive consideration of the great mountainous chains of Siberia led Pallas to the discovery of the general law, which has since been completely verified, of the succession of the three primitive orders of rocks, the *granitic* in the centre, the *schistose* on their sides, and the *calcareous* externally." (Cuvier.) Pallas rendered further service to geology by his second memoir upon the fossil bones of Siberia, published in the 'Novi Commentarii Acad. Petr.' He here related (what was at that time considered as an incredible circumstance) the fact of having found the body of a rhinoceros entire, with the skin and flesh on, imbedded in the frozen ground. The probability and truth of this observation are placed beyond all doubt by the well-known subsequent discovery of the body of an elephant in a mass of ice on the coast of Siberia.

Pallas wrote a 'History of the Mongolian Nations,' 2 vols. 4to, in

German, Petersburg, 1776-1801, which is perhaps the most classical account that was ever written of any race of people. He not only treats of the origin and physical character of these people (all usually denominated Tartars), of their manners and government, but also of their religion and languages.

Pallas undertook, by command of the empress, a 'Comparative Vocabulary' of all the languages of the world, two volumes of which were published at St. Petersburg in 1787-89 in 4to. They contain 286 words in 200 languages of Asia and Europe. A third volume, which never appeared, was intended to embrace the languages of Africa and America. The plan of this work (suggested by the empress) was bad, for a simple vocabulary can never give any idea of the mechanism and spirit of a language: it is however of considerable value.

Besides the works already mentioned, Pallas published, among many others, 'Travels through the Southern Provinces of the Russian Empire, in the years 1793 and 1794,' 2 vols. 4to, Leipzig, 1801, in German. There is an English translation of this work, and also of a memoir by Pallas on the different kinds of sheep found in the Russian dominions and among the Tartar hordes of Russia. The latter was translated by James Anderson, the agriculturist.

Pallas was a member of the Royal Society of London, of the Institute of France, and of several other foreign academies, besides that of St. Petersburg; and he wrote many memoirs, which will be found in their different 'Transactions.'

PALLAVICINO, FERRANTE, was born at Parma in 1615. He entered at an early age the Order of the Canons of St. Augustine, and made his vows; but after a few years he found that he had acted rashly, and that he was totally unsuited for the life which he had embraced. Having obtained his superior's permission to travel, he repaired to Venice, where he led a life of licentiousness, and wrote obscene books, which found a ready sale. He afterwards went to Germany as chaplain to a nobleman, and returned to Venice just at the time when war broke out between Edoardo Farnese, duke of Parma, and Pope Urban VIII., on the subject of the duchy of Castro. Pallavicino wrote in favour of his sovereign the duke, using violent expressions against the pope and his nephews the Barberini. One of his pamphlets was entitled 'Il Divorzio Celeste,' by which he intimated that a divorce had taken place between the Church and its Divine founder. Pallavicino now thinking he was no longer safe in Italy, resolved to go to France; but unfortunately for him, he was accompanied by a young Frenchman of insinuating address, who proved to be a spy of the Barberini, and who led him unawares into the papal territory of Avignon, where he was immediately seized and led to prison. He was tried for apostasy and high treason, and was condemned and beheaded on the 5th of March 1644, at the early age of twenty-nine years. (Poggiali, *Memorie per la Storia Letteraria di Piacenza*.)

PALLAVICINO, SFORZA, son of the Marquis Alessandro Pallavicino of Parma, was born at Rome, November 20, 1607; studied in the Roman College, and afterwards entered the order of the Jesuits. He wrote a philosophical treatise, 'Del Bene' ('On Happiness'), and another treatise, 'Dello Stilo' ('On Style in Written Composition'), both of which are esteemed. But the work for which he is best known is the 'History of the Council of Trent' ('Istoria del Concilio di Trento,' 3 vols. 4to, Rome, 1664), written in defence of the see of Rome against the charges and insinuations brought against it by the celebrated Father Sarpi in his history of the same council. Both works ought to be consulted and compared, in order to form a just opinion of the important transactions to which they refer. Pope Alexander VII. made Pallavicino a cardinal, and employed him in important affairs. His last work was on Christian perfection, 'Arte della Perfezione Cristiana.' Cardinal Pallavicino died June 5, 1667.

PALMA, GIACOPO, called the Old, to distinguish him from his great-nephew of the same name, was born at Serinalta, in the territory of Bergamo (though Vasari says at Venice), and is said to have been a disciple of Titian. The dates both of his birth and death are not precisely fixed. Vasari says he died at the age of forty-eight, some years before the publication of his 'Lives of the Painters' in 1568. He appears to have been born about 1480; and he was still living in 1521. Palma's manner has much resemblance to that of Titian, whom he chiefly imitated in the softness, as he did Giorgione in the brightness of his colouring, the warm golden tone of which is extremely pleasing. It appears that he had a peculiar manner of laying on his colours, by which he gave the appearance of high finishing without labour. The paintings of Palma are highly esteemed (though some writers deny him originality) for the noble taste of his composition, for natural and pleasing expression, and the harmony of his colours.

Vasari speaks with high commendation of a picture by Palma representing the ship in which the body of St. Mark was brought from Alexandria to Venice, exposed to the fury of a frightful storm. Other celebrated paintings of his are—'Santa Barbara' at Venice, and a 'St. Jerome' in the Zampieri palace at Bologna. The galleries of Vienna, Munich, and Berlin possess several of his works, and there are some in England.

PALMA, GIACOPO, called the Young, was born at Venice in 1544. He was the son of Antonio Palma, a painter of some note in his day; but young Palma soon left the style of his father to study the works

of Titian, and more especially those of Tintoretto. At the age of fifteen he was taken under the protection of the Duke of Urbino, and maintained for eight years at Rome, where, by copying the antique, Michel Angelo, Raffaele, and Polidoro, he acquired correctness, style, and effect, which he endeavoured to embody in the first works which he produced after his return to Venice. Some writers of little acuteness conceive that those works combine the best principles of the Roman and Venetian schools. They are executed with considerable degree of facility, which was the great talent of this master, but are wanting in the higher excellences of art. Young Palma did not till late succeed in obtaining adequate employment; honour and emolument were engrossed by Tintoretto and Paul Veronese. He owed the advantage of being considered the third in rank to the patronage of Vittoria, a fashionable architect and sculptor, through whose recommendation he was overwhelmed with commissions, which had the unhappy effect of relaxing his diligence. On the death of his former competitors, when he found himself without a rival, his carelessness increased, and his pictures were little more than sketches; yet, when time and price were left to his discretion, he produced works rich in composition, full of beauty, variety, and expression. His tints, fresh, sweet, and transparent, less gay than those of Veronese, but livelier than those of Tintoretto, though slightly laid on, still preserve their bloom. In variety of expression he is not much inferior to either of those masters, and his 'Plague of the Serpents' at St. Bartolomeo may vie with the same subject by Tintoretto in the school of St. Rocco. From young Palma the deprivation of style at Venice may be dated, yet his works have much to attract and interest. He died in 1628, aged eighty-four years.

**PALMAROLI, PIETRO**, a painter and celebrated picture-restorer, who was the first to transfer frescoes from the wall to canvas. The first work so transferred was the 'Descent from the Cross' by Daniele da Volterra, in the church of Trinità de' Monti, in 1811: it is still in this church, but not in the chapel in which it was originally painted. The successful transfer of this picture caused a great sensation at Rome and in other parts of Italy, where such transfers were and still are repeatedly practised with success. Palmaroli transferred and restored many celebrated works in Rome and in Dresden, and among those in the latter city the celebrated 'Madonna di San Sisto' by Raffaele was restored by him. Palmaroli has done great service as a restorer: he freed in 1816 the celebrated fresco of the 'Sibyls,' painted by Raffaele for Agostino Chigi in the church of Santa Maria della Pace, from the destructive restorations in oil which were made by order of Alexander VII. Although some restorations were necessary and are evident in this work, the lovers of art are highly indebted to Palmaroli; for, before his undertaking, this celebrated fresco was a subject of general disappointment to the admirers of Raffaele, and was indeed so dark that the objects were scarcely distinguishable. He died at Rome in 1828. (Platner, *Beschreibung der Stadt Rom*, vol. iii., pt. 3, p. 385; *Kunstblatt*, 1837; Nagler, *Neues Allgemeines Künstler Lexicon*.)

**PALMBLAD, VILHELM FREDRIK**, a Swedish writer of considerable note, was born on the 16th of December 1788, at Liljestad, near Söderköping, the 11th child of a military commissary, who had procured the situation of Kronofogde, or collector of taxes. The property of the family must have been considerable, as young Palmblad, when a student at Upsal and before attaining his majority, bought, in conjunction with another student, the university printing-office, and forthwith commenced a series of publications, which had for their object to effect a revolution in Swedish literature. The first number of 'Phosphoros,' a new periodical by Atterbom and Palmblad, appeared in July 1810, within a month of his taking possession of the printing-office; at Christmas of the next year appeared the first number of the 'Poetisk Kalender,' the earliest Swedish annual, and in the beginning of 1813 the first of the 'Svensk Litteratur Tidning,' or 'Swedish Literary Gazette.'

The 'Tidning,' which lasted for eleven years—up to 1824—was the most long-lived Swedish literary periodical on record; while the Danes could, in 1824, boast of one that had outlived a century. [MÜLLER, P. E.] Its circulation, we are told by Palmblad, was never upwards of 200, and averaged about 150; yet it had a great influence on the cultivation of Swedish literature. It excited the astonishment of the public by the audacity of its attacks upon the old school in literature, which at that time was entirely French in its models and its opinions; and on one occasion the Rector of the University of Upsal summoned Palmblad, as the university printer, before him to inform him that, if his periodical contained any more unfavourable criticisms upon the Swedish Academy, his privilege would be withdrawn. The Swedish Academy had been founded in imitation of the French Academy by Gustavus III., who was accustomed to declare that there were two things he held in utter abomination—the German language and tobacco. One of the chief objects of the new school—which from the title of its first periodical, the 'Phosphoros,' became known by the name of the 'Phosphorists'—was to introduce the Swedish public to some knowledge of the masterpieces of Göthe and Schiller; and in spite of the efforts of the Academy, which in the first instance looked upon the Phosphorists as a body of contumacious rebels, the result was general though not total success. Atterbom, the chief leader of the party, was indeed too fantastic in the character of his own writings to become unconditionally popular; but before the close of his career he was

electd a member of the Academy of which he had been the assailant. Tegnér and Geijer, who had censured some of the proceedings of the new party as violent and intolerant, were themselves much more averse to the principles of the old; and, finally, an almost complete revolution took place in the aspect of Swedish literature.

Palmblad, who was active both with the pen and the press, continued to contribute to the periodicals that successively arose on the ruins of each other, the 'Journal of the Swedish Literary Union,' 'Svea,' 'Skandia,' 'Mimer Frey,' &c., and also pursued an academical career. In 1822 he became 'Docent' or tutor of Swedish history at the university, in 1827 assistant professor of geography and history, and in 1835 professor of Greek. Many of his numerous works are on the subjects which occupied him as professor: his 'Handbook of Physical and Political Geography' (6 vols., Upsal, 1826-37) is of high reputation, and has been translated from Swedish into German. His poetical translations of Sophocles (1841) and of Æschylus (1845) are of some note. When professor of Greek however he often felt an inclination to return to an early amusement of writing novels, and his 'Falkensvärd Family' (2 vols., Örebro, 1844-45), and 'Aurora Königsmark' (6 vols., Örebro, 1846-51), met with much success, and were translated into German. The work however which is certain to perpetuate his name is the great 'Biographical Dictionary of Celebrated Swedes,' which he left incomplete at his death, on the 2nd of September 1852.

This dictionary, 'Biographiskt Lexicon öfver namnkunnige Svenska Män,' commenced in 1835, was interrupted at Professor Palmblad's death, but is now again in progress. The last volume we have seen is the twenty-second, which brings it as far in the alphabet as the end of the letter W. It embraces the names of the living as well as the dead, and a considerable portion of the information it contains is derived from private communications or from personal observation, and embodied for the first time in its pages. It aspires to give an account of every Swedish name of note, and a list of the works of every Swedish author. The only other biographical dictionary of the same kind that the Swedes possess, is that of Geselius in three volumes, and a supplement commenced in 1778. But the new work is on a much larger scale in every way than the somewhat meagre compilation of Geselius. Many of the lives are given at considerable length, several are autobiographies, as the account of Palmblad himself. On the other hand, some of the lives of living persons are little more than a string of dates, with a record of promotions; but such inequalities are of course unavoidable in a work of the kind. The book is generally known as 'Palmblad's Biographical Dictionary,' but does not bear his name in the title, and in his life he speaks of himself as only one of the editors, and the author of a considerable number of the lives. It is one of the most indispensable books in a Swedish library, and will, as it comes to be more generally known, do much to spread abroad the knowledge of the illustrious names of Sweden. [See SUPPLEMENT.]

**PALMERSTON, HENRY JOHN TEMPLE, VISCOUNT**, was born at Broadlands, near Romsey, in Hampshire, on the 20th of October 1784. His family, the Temples, trace their descent from one of the Saxon earls anterior to the Norman Conquest. With this family the dual house of Buckingham and Chandos is connected by ancient marriage. The Temples themselves were of some distinction in English political history as early as the time of Elizabeth, or even earlier; but perhaps the most celebrated of them was the famous Sir William Temple, the friend of William III. and the patron of Dean Swift. They were first ennobled in 1722, when Henry Temple, Esq., was created Baron Temple of Mount Temple, county Sligo, and Viscount Palmerston of Palmerston, county Dublin—both dignities being in the Irish peerage. He died in 1769, and was succeeded by his grandson Henry Temple, the second peer, who lived till 1802. Of this second peer the subject of our memoir was the eldest son; but there were three other children—a son, the late Sir William Temple, K.C.B., long British minister-plenipotentiary at Naples, and two daughters, one of whom was the wife of Admiral Bowles. The present Lord Palmerston was educated first at Harrow School, then at the University of Edinburgh (where Dugald Stewart and other distinguished professors were at that time in the height of their reputation), and lastly at St. John's College, Cambridge. Before the conclusion of his university education he succeeded his father in the title at the age of eighteen (1802). In 1806 he took the degree of M.A. at Cambridge. Early in the same year, being then only twenty-one, he contested the representation of the University of Cambridge in the House of Commons with Lord Henry Petty (now the Marquis of Lansdowne), who had just accepted the chancellorship of the Exchequer under the Whig government of Lord Grenville, and was consequently obliged to appeal to his constituency. The young candidate for political honours failed in this attempt, but was immediately returned to parliament for the borough of Bletchingley. He subsequently sat for Newport in the Isle of Wight, but at length obtained the object of his ambition in being returned for the University of Cambridge. From his first entrance into parliament Lord Palmerston's conduct and manner were such as to impress his seniors with his tact and ability, and to mark him out for promotion and employment. He spoke seldom, but always interestingly and to the purpose; and his talents for business were from the first conspicuous. In 1807, on the formation of the Tory administration of the Duke of Portland and

Mr. Perceval, he was appointed (though then only in his twenty-fifth year) a junior lord of the Admiralty. In this capacity he made perhaps his first important parliamentary appearance as a speaker in opposing a motion of Mr. Ponsoby (February 1808) for the production of papers relative to Lord Cathcart's expedition to Copenhagen and the destruction of the Danish fleet—measures which had been ordered by the government for fear of an active co-operation of Denmark with Napoleon I. On this occasion Lord Palmerston broached those notions as to the necessity of secrecy in diplomatic affairs on which he has ever since acted. In 1809, when Lord Castlereagh resigned the office of secretary of war under the Perceval ministry, Lord Palmerston succeeded him; and in February 1810 he for the first time moved the Army estimates in the House. It seemed as if the secretaryship at war was the post in which Lord Palmerston was to live and die. He held it uninterruptedly through the Perceval administration; he continued to hold it through the long Liverpool-Castlereagh administration which followed (1812-27), the first three years of whose tenure of power were occupied with the final great wars against Napoleon; he held it still during Canning's brief premiership (April to August 1827); he continued to hold it under the ministry of Lord Goderich (August 1827 to January 1828); and he held it for a while under the succeeding administration of the Duke of Wellington. Under this last ministry however he found himself unable to act. Never appearing to interest himself much in general politics, but confining himself as much as possible to the business of his own department, he had yet, towards the close of the Liverpool administration—especially after Canning's accession to the Foreign Secretaryship on the death of Castlereagh in 1822—shown a more liberal spirit than was general among his colleagues. He seemed to attach himself to Canning and to share his opinions: like him, he was a friend to Roman Catholic emancipation, and to the cause of constitutional as distinct from despotic government on the Continent; though, like him also, he opposed for the time all projects of Parliamentary Reform at home. These tendencies, growing more decided after Canning's death, unfitted him for co-operation with the Duke of Wellington's government, and in May 1828 he seceded from it along with Huskisson and others of 'Canning's party.' Meantime he had spoken much on foreign affairs, and with such ability that, after Canning's death, he was felt to be the greatest parliamentary master of that order of subjects. Before leaving the Wellington ministry he had opposed the Test and Corporation Bills; but he had done so on the principle that he could not relieve Protestant Dissenters till the emancipation of the Roman Catholics had taken place.

As an independent member, Lord Palmerston devoted himself especially to foreign questions. He kept up the character of being Mr. Canning's successor, the inheritor of his mantle. His speech on the 10th of March 1830, in which, in moving for papers respecting the relations of England with Portugal, he developed Canning's idea of the necessity of increased sympathy on the part of England with the cause of struggling nationality abroad, was accounted a great parliamentary success. The motion was lost by a majority of 150 to 78; but it marked out Lord Palmerston as the future foreign secretary, as soon as a ministry should be formed of which he could become a member. Such a ministry was formed in November 1830, when the Duke of Wellington resigned, and the Whigs came into office. Twenty years secretary at war as a Tory, Lord Palmerston now became foreign secretary as a Whig; but his known attachment to the liberalised Toryism which Canning had professed and introduced, was felt to constitute a sufficient transition. Roman Catholic Emancipation, of which he had always been a supporter, had already been carried; and the only question where a modification of his previous opinions was requisite was that of Parliamentary Reform—the very question which the Whig ministry had been formed to settle. Lord Palmerston's assent to the Reform Bill policy of his colleagues led to a disagreement with the Cambridge University electors; and, losing his seat for Cambridge, he fell back (1831) on his old borough of Bletchingley. Representing first this borough, and then (after the Reform Bill in 1832), the county of South Hants, Lord Palmerston remained foreign minister till December 1834, when the Whigs went out of office, and were succeeded by the Conservative ministry of Sir Robert Peel. This ministry lasted only till April 1835, when the new Whig administration of Lord Melbourne was formed, and Lord Palmerston (who had lost his seat for South Hants at the general election, and been returned for the borough of Tiverton) resumed his functions as foreign minister. He continued to exercise them till September 1841; and these six years were perhaps the period during which he attained that reputation for brilliancy, alertness, and omniscience as a foreign minister, which has made his name a word of exultation to his admirers, and of execration and fear to some foreign governments. It was during this time that over the Continent from Spain to Turkey, the name 'Palmerston' began to be used as synonymous with English diplomatic activity; and it was during the same time that a party of erratic politicians sprang up in England, who sought to prove that he was a voluntary tool of Russia, and argued for his impeachment. Records of this state of feeling with respect to Lord Palmerston may be found in the pamphlets of Mr. Urquhart and his friends, as regards home, and in Count Ficquelmont's 'Lord Palmerston, l'Angleterre, et la Continent' (1852), as regards Europe at large. The opposition of the Conservatives in parliament was a more

normal matter. It was during this period of his foreign secretaryship under the Melbourne administration that Lord Palmerston married. His wife, the present Lady Palmerston, was the daughter of the first Lord Melbourne and the widow of the fifth Earl Cowper. On the re-accession of Sir Robert Peel to office in 1841, Lord Palmerston retired from the foreign secretaryship; and he continued in opposition till 1846, when on the retirement of Sir Robert Peel after the abolition of the Corn Laws (July 1846) he again became foreign secretary, as a member of the new Whig ministry of Lord John Russell. He continued to direct the diplomacy of the country in this capacity—steering the policy of Britain in his characteristic fashion through the many difficult and intricate foreign questions which arose, and, amongst them, through the many questions connected with the European revolutionary movement of 1848-49, including the Italian and Hungarian wars—till the year 1851, when differences with Lord John Russell and with his other colleagues induced him to resign. The year 1851, in fact, closed that part of Lord Palmerston's history which is connected with his tenure of the foreign secretaryship in particular.

But such a man could not remain long out of office. Broken up mainly by Lord Palmerston's secession from it, the ministry of Lord John Russell gave place (December 1852) to the coalition ministry of Lord Aberdeen. As Lord Aberdeen had been the foreign minister under previous Conservative governments, and was therefore regarded as the rival and in some respects the antagonist of Lord Palmerston in this particular department, Lord Palmerston in joining the coalition ministry took the office of home secretary, while the foreign secretaryship was taken by Lord John Russell. The business of his new office was discharged by Lord Palmerston with his customary activity (allowing for a short period of threatened rupture with his colleagues in 1853) till the dissolution of the Aberdeen ministry in 1855, when his lordship ascended to the apex of power as the First Lord of the Treasury and Prime Minister of Britain. In that capacity it has fallen to him to conduct the greatest war in which the country has been engaged since 1815—the war with Russia; and in the conduct of that war to establish that system of alliances with continental powers, more especially with France, which still holds. From the time of the coup d'état in France, Lord Palmerston had always expressed his respect for Louis Napoleon; and consequently in the conduct of the war, and of the negotiations which concluded it, Napoleon III. and Lord Palmerston are supposed to have deferred to each other, and to have acted systematically in concert. As regards other powers, consequently, there has not been on the part of Lord Palmerston, while premier, any strong direction of the policy of England one way or the other. Thus, while always keeping up the language of Canning as to the propriety of encouraging freedom and constitutional government abroad, and while using this language more especially of late with respect to Italy, he has never ceased to assert the maintenance of the integrity and power of the Austrian empire to be a necessity in the European system. This principle appears to have regulated his conduct also as foreign minister in the matter of the Hungarian wars of 1848-49. He gave no approbation to the popular movements; but he supported Turkey in refusing to give up the refugees, and advised the governments to leniency when the movements were suppressed, and to more moderate rule afterwards.

The history of Lord Palmerston—of his acts, opinions, and views—are to be gathered in detail from the parliamentary reports of the last fifty years; but more especially from the Blue Books of our foreign diplomatic correspondence since he went into the foreign secretaryship thirty-six years ago. Among summary works where the spirit and results of his political career are discussed, may be mentioned (in addition to those of Ficquelmont and Mr. Urquhart already spoken of as hostile) the two following:—'Opinions and Policy of the Right Hon. Viscount Palmerston as Minister, Diplomatist, and Statesman; with a Memoir, by G. H. Francis' (1852); and 'Thirty Years of Foreign Policy: a History of the Secretaryships of the Earl of Aberdeen and Lord Palmerston' (1855). The former is chiefly a collection of extracts from his lordship's speeches, exhibiting his opinions; the other is a general review of his policy. On special questions there have been scores of pamphlets for and against him. No collected edition of his speeches has been published; nor perhaps would the light, off-hand, and conversational yet energetic orations with which he charms the House, and often baffles and provokes an opponent, bear this test; but some of his more important speeches have been published separately at the time of their delivery in the form of pamphlets. The others remain more or less vividly in the memories of those who heard them, or lie buried in 'Hansard' and the newspapers. His speeches are generally shorter than those of other parliamentary leaders; and his occasional letters show the same light and easy energy as his speeches. Since 1835 he has sat uniformly for the borough of Tiverton, and has never sought to represent a larger constituency; and some of his most important manifestoes have been in the form of addresses to the Tiverton electors. [See SUPPLEMENT.]

PALOMINO Y VELASCO, DON ACISLO ANTONIO, an eminent Spanish painter, was born in 1658 (some say 1658), at Bujalance, near Cordova, in the university of which city he became a student, but his predilection for the arts induced him to take instruction in painting from Don Juan de Valdes Leal, in whose company he went in 1678 to Madrid to make himself acquainted with the styles of different schools:

He was introduced to King Charles II. by the celebrated Coello, and obtained through the friendship of Carenno a commission to paint the gallery Del Ciervo. He painted the history of Psyche so entirely to the king's satisfaction that he gave him the title of his principal painter and a considerable pension. He obtained such numerous commissions that notwithstanding his extraordinary industry he was often unable to do more than furnish the design, leaving it to be finished by his pupil, Dionisio Vidal. His reputation continued to increase, and all his works, which he executed at Valencia, Salamanca, Granada, and Cordova, to which cities he was successively invited, were highly approved. It has been a reproach to him that among some of his grandest works, such as the 'Confession of St. Peter' in the cathedral of Valencia, and those in the cathedral of Cordova, his figures are too faithful transcripts of ordinary life. What he executed himself, whether in oil or in fresco, is distinguished by invention and drawing, and his perspective and colouring are admirable. He died at Madrid April 18, 1726.

Palomino is the author of a work in three parts, theoretical, practical, and biographical. The first two bear the title of 'El Museo pictorico y Escala Optica'; the third part, 'El Parnaso Español pictorico, tomo tercero,' Madrid, 1724, though perhaps only intended as an appendix to the two others, is by far the most important and interesting, but the work is disfigured by carelessness in dates, credulity, prolixity, and want of judgment.

PAMPHILUS was a native of Amphipolis (Suidas, 'Apelles'), but he studied his art under Eupompus of Sicyon, and succeeded in establishing the school which his master founded. Eupompus was a native of Sicyon and the founder of the Sicyonian school of painting. He introduced a new style of art, and added a third, the Sicyonic, to the till then only acknowledged two distinct styles of painting, known previously as the Hælladic and the Asiatic, but subsequently to Eupompus as the Attic and the Ionic. These two styles, with the Sicyonic, henceforth formed the three characteristic styles of Grecian painting. ('Pliny,' xxxv. 10, 36.) Through his pupil Pamphilus, Eupompus established those principles of art which Euphranor, Apelles, Protogenes, and Aristides successfully developed.

The characteristics of the Sicyonic school were, a stricter attention to dramatic truth of composition, and a finer and a more systematic style of design. The leading principles of Eupompus were, that man should be represented as he actually appears, not as he really is, and that nature herself was to be imitated, not an artist. ('Pliny,' xxxiv. 8, 19.) Such was the answer which Eupompus gave to Lysippus, upon being asked by him which of his predecessors he should imitate.

Pamphilus succeeded Eupompus in the school of Sicyon, and taught his principles to Apelles. He was, says Pliny (xxxv. 10, 36), the first painter who was skilled in all the sciences, "omnibus literis eruditus," particularly arithmetic and geometry, without which he denied that art could be perfected. By arithmetic and geometry we must understand those principles of the art which can be reduced to rule: by arithmetic, the system of the construction and the proportions of the parts of the human body; by geometry, perspective and optics, at least so much of them as is necessary to give a correct representation of and a proper balance to the figure. Flaxman properly explains the terms by the rules of proportion and motion; and he remarks farther, that "it is impossible to see the numerous figures springing, jumping, dancing, and falling in the Herculean paintings on the painted vases, and the antique basso-relievos, without being assured that the painters and sculptors must have employed geometrical figures to determine the degrees of curvature in the body, and angular or rectilinear extent of the limbs, and to fix the centre of gravity."

Such was the authority of Pamphilus, says Pliny (xxxv. 10, 36), that chiefly through his influence, first in Sicyon and then throughout all Greece, noble youth were taught the art of drawing before all others; it was considered among the first of liberal arts, and was practised exclusively by the free-born, for there was a law prohibiting all slaves the use of the oestrum or graphis. In this school of Pamphilus, the most famous of all the schools of ancient painting, the progressive courses of study occupied the long period of ten years, comprehending instruction in drawing, 'arithmetic, geometry, anatomy, and painting in its different branches. The fee of admission was no less than a talent ('Pliny,' xxxv. 10, 36); a large fee, for the Attic talent, which is most probably here alluded to, was about 216*l.* sterling. Pliny mentions that Apelles and Melanthius both paid this fee. Apelles studied under Ephorus of Ephesus before he entered the school of Pamphilus at Sicyon. Pausanias of Sicyon also studied encaustic under Pamphilus, but Pliny does not inform us whether he belonged to his school and paid the above-mentioned fee.

Pamphilus, like his master Eupompus, seems to have been occupied principally with the theory of art and with teaching, for we have very scanty notices of his works. Yet he and his pupil Melanthius, according to Quintilian (xii. 10), were the most renowned among the Greeks for composition. We have accounts of only four of his paintings, the 'Heracidas,' mentioned by Aristophanes (Plutus, 885), and three others mentioned by Pliny—the Battle of Philus and Victory of the Athenians, Ulysses on the Raft, and a relationship, 'cognatio,' probably a family portrait; these pictures were all conspicuous for the scientific arrangement of their parts, and their subjects certainly afford good materials for fine composition.

The period of Pamphilus is sufficiently fixed by the circumstance of his having taught Apelles, and he consequently flourished somewhat before and about the time of Philip II. of Macedon, from B.C. 388 to about B.C. 348. He left writings upon the arts, but they have unfortunately suffered the common fate of the writings of every other ancient artist. He wrote on painting and famous painters.

PAMPHILUS was bishop of Cæsarea in Palestine, and the intimate friend of Eusebius, who was called Pamphili after him. [EUSEBIUS.] He is said to have been born at Berytus, and to have been educated by Pierius. He spent the greater part of his life in Cæsarea, where he suffered martyrdom in the year 309.

He was a man of profound learning, and devoted himself chiefly to the study of the Scriptures and the works of Christian writers. Jerome states that he wrote out with his own hand the greater part of Origen's works. He founded a library at Cæsarea, chiefly consisting of ecclesiastical works, which became celebrated throughout the Christian world. It was destroyed before the middle of the 7th century. He constantly lent and gave away copies of the Scriptures. Both Eusebius and Jerome speak in the highest terms of his piety and benevolence. Jerome states that Pamphilus composed an apology for Origen before Eusebius; but at a later period having discovered that the work which he had taken for Pamphilus's was only the first book of Eusebius's apology for Origen, he denied that Pamphilus wrote anything except short letters to his friends. The truth seems to be that the first five books of the 'Apology for Origen' were composed by Eusebius and Pamphilus jointly, and the sixth book by Eusebius alone, after the death of Pamphilus. Another work which Pamphilus effected in conjunction with Eusebius was an edition of the Septuagint, from the text in Origen's 'Hexapla.' This edition was generally used in the Eastern church. Montfaucon and Fabricius have published 'Contents of the Acts of the Apostles' as a work of Pamphilus; but this is in all probability the production of a later writer.

Eusebius wrote a 'Life of Pamphilus,' in three books, which is now entirely lost, with the exception of a few fragments, and even of these the genuineness is extremely doubtful. We have however notices of him in the 'Ecclesiastical History' of Eusebius (vii. 32), and in the 'De Viris Illustribus' and other works of Jerome. (Lardner's 'Credibility,' part ii. c. 69, and the authorities there quoted.)

PANÆNUS of Athens, the brother or the nephew of Phidias, the former according to Pliny and Pausanias, the latter according to Strabo, was one of the first of the Greeks who attained to any great excellence in painting; but he has been very improperly termed by some the Cimabue of the Greeks, for although the contemporary, he was many years the junior of Polygnotus, Micon, and Dionysius of Colophon, who had all deservedly attained the greatest fame in Athens considerably before his time.

Panænus assisted Phidias in decorating the Olympian Jupiter, but his most famous work was the 'Battle of Marathon' in the Pœcile at Athens; it contained the Ionic or portrait figures of Miltiades, Callimachus, Cynægirus, generals of the Athenians, and of Datis and Artaphernes, generals of the barbarians (Pliny, xxxv. 8, 34); their respective names were not attached to the figures in this instance (*Æchines* 'Against Ctesiphon'), that having already become an antiquated custom. These Ionics have been considered to signify portraits in the fullest sense of the term, but the picture of Panænus cannot have been painted much less than 40 years after the battle of Marathon took place, and nearly as many after the deaths of most of the above-named generals; for the Pœcile was built by Cimon in the third year of the 77th Olympiad, 20 years after the battle of Marathon; the Olympian Jupiter was painted in the 86th, 35 years later, and Pliny mentions the 83rd as the period of Panænus. The portraiture therefore, unless taken from earlier pictures, which is very improbable, must in this instance have been confined to the costume and decorations of generals as known to have been worn by them upon the occasion; and the 'Ionics' consequently, whether paintings or statues, although sometimes portraits in countenance as well as in figure were apparently not necessarily so.

The painting of the Battle of Marathon was in four great divisions; the first represented the positions of the two armies before the battle, the second and third the principal incidents during the battle, and the fourth the total rout and flight of the Persians; each in itself an extensive composition and forming an independent picture. (Pausanias, i. 15.) It appears that Micon assisted Panænus in painting these pictures, and was fined 80 minæ (108*l.*), for having painted the barbarians larger than the Greeks.

The paintings and decorations of the Olympian Jupiter by Panænus were on the throne and on the wall around the throne of the statue. (Strabo, viii. p. 354.) The subjects of the paintings were, Atlas supporting Heaven and Earth, with Hercules near him about to relieve him from his burden; Theseus and Peirithous; figures representing Greece and Salamis, the latter bearing the rostra of a ship in her hands; the Combat of Hercules with the Nemean Lion; Ajax and Cassandra; Hippodamia, the daughter of Cnemæus, with her mother; Prometheus chained, and Hercules preparing to destroy the Vulture which preyed upon him; and Penthesilea dying supported by Achilles, with Hesperian nymphs bearing fruit. (Pausanias, v. 11.)

Pliny tells us that Pansenus painted the interior of the temple of Minerva at Elis with milk and saffron; he painted also the inside of Minerva's shield, but in what manner we are not informed.

Already in the time of Pansenus prize contests were established at Corinth and Delphi, in one of which he was defeated by Timagoras of Chalcis at the Pythian games. (Pliny, xxxv. 9, 35.) Although this is the only notice we have of Timagoras, he must have been a painter of considerable merit, from this single circumstance. He himself celebrated his own victory in verse.

PANÆTIUS, a Greek philosopher, was a native of Rhodes. He studied at Athens, under Diogenes the Stoic, and afterwards went to Rome, about B.C. 140, where he gave lessons of philosophy and was intimate with Scipio Æmilianus, the younger Lælius, and Polybius. After a time Panætius returned to Athens, where he became the leader of the Stoic school, and where he died at a very advanced age. Posidonius, Seylax of Halicarnassus, Hecaton, and Mnesarchus are mentioned among his disciples. Panætius was not apparently a strict Stoic, but was rather an Eclectic philosopher who tempered the austerity of his sect by adopting something of the more refined style and milder principles of Plato and the other earlier Academicians. (Cicero, 'De Finibus,' iv. 28.) Cicero, who speaks repeatedly of the works of Panætius in terms of the highest veneration, and acknowledges that he borrowed much from them, says that Panætius styled Plato 'the divine' and 'the Homer of philosophy,' and only dissented from him on the subject of the immortality of the soul, which he seems not to have admitted. ('Tuscul. Quæst.,' i. 32.)

Aulus Gellius (xii. 5) says that Panætius rejected the principle of apathy adopted by the later Stoics, and returned to Zeno's original meaning, namely, that the wise man ought to know how to master the impressions which he receives through the senses. In a letter of consolation which Panætius wrote to Q. Tubero, mentioned by Cicero ('De Finibus,' iv. 9), he instructed him how to endure pain, but never laid it down as a principle that pain was not an evil. He was very temperate in his opinions, and he often replied to difficult questions with modest hesitation, saying *ἐπιτρέψω*, "I will consider."

None of the works of Panætius have come down to us, but their titles and a few sentences from them are quoted by Cicero, Diogenes Laertius, and others. He wrote a treatise 'On Duties,' the substance of which Cicero merged in his own work 'De Officiis.' Cicero says that Panætius had divided his subject into three parts: the first treated of those cases in which men deliberate between what is honest and what is dishonest; the second, concerning what is useful and what is disadvantageous; and the third, of those cases in which the useful is opposed to the honest: that he treated the two first in a masterly manner, but did not go on with the third part, although he had promised to do so, and though he lived for thirty years after he had composed the others. His disciple Posidonius supplied in some degree the deficiency. ('De Officiis,' iii. 2, and 'Epist. ad Att.,' xvi. 11.)

Panætius wrote a treatise 'On Divination,' of which Cicero probably made use in his own work on the same subject. In book ii. 42, Cicero quotes Panætius as "one among the Stoics who rejected the predictions of the soothsayers; and his disciple, Seylax of Halicarnassus, an astrologer himself, and also a distinguished statesman in his native town, as one who despised all the Chaldean arts of fortune-telling." Panætius wrote a treatise 'On Tranquillity of Mind,' which some suppose may have been made use of by Plutarch in his work bearing the same title. He wrote also a book 'On Providence,' mentioned by Cicero ('Ad Atticum,' xiii. 8), another 'On Magistrates,' and one 'On Heresies,' or sects of philosophers. His book 'On Socrates,' quoted by Diogenes Laertius, and by Plutarch in his 'Life of Aristides,' made probably a part of the last-mentioned work. Laertius and Seneca quote several opinions of Panætius concerning ethics and metaphysics, and also physics. He argued that the torrid zone was inhabited, contrary to the common opinion of his time. Seneca ('Epist.,' 116) relates his prudent and dignified reply to a young man who had asked his advice on the passion of love. For further information concerning this distinguished philosopher of antiquity, see 'Disputatio Historico-Critica de Panætio Rhodio,' by F. G. van Lynden, Leyden, 1802; and Chardon de la Rochette, 'Mélanges de Critique et de Philologie,' vol. i., Paris, 1812.

PĀNINI, the most celebrated of the Sanscrit grammarians, is said to have been the grandson of the inspired legislator Dēvala, and lived at so remote an age that he is reckoned among the fabulous sages mentioned in the 'Purānas.' (See Colebrooke, 'Asiat. Res.,' vii., p. 202.) With regard to his death we have the following tradition in the 'Hitopadēsa':—"It is related that the valuable life of Pānini was destroyed by a lion." The Indians consider him as their most ancient grammarian, but his great work is confessedly derived from earlier treatises on the same subject: he often quotes his predecessors Sākyā, Gārgya, and others; and it appears from a passage in the 'Bhagavad-Gītā' (unless the following line is an interpolation of a later age), that the nomenclature of grammar existed when the great epic poem, the 'Mahā-Bhārata,' was composed. Pānini's grammar consists of 3996 short aphorisms, or 'sūtras,' divided into eight books, in which the rules of grammar are delivered with such oracular brevity and obscurity that they need a commentary to render them intelligible even to the learned Indians. Besides the 'Cāricā' of Bhartrihari, a brother of

King Vicramāditya [AMARA], there were the following treatises, written expressly to illustrate it: 1, the 'Bhattikāvya,' which was nominally a poem describing the adventures of Rāma, but really a collection of all the defective and anomalous forms of words in the language, published at Calcutta, 1826; 2, the 'Mahā-Bhāṣya,' or 'great commentary,' by Patanjali. A new edition of Pānini has been published with the following title: 'Pānini's acht Bücher grammatischer Regeln; Sanscrit mit Commentar, herausgegeben und erläutert von Dr. Otto Böhtlingk,' 2 vols. 8vo, Bonn, 1839. The first volume contains the Sanscrit text of Pānini's 'Sūtras' with the native scholia; the second volume contains an introduction, a German commentary, and indexes.

PANINI (or PANNINI), GIOVANNI PAOLO, an eminent painter of architecture, was born at Piacenza (Placentia), in the year 1695. When prosecuting his studies at Rome, he took peculiar pleasure in designing every vestige of ancient magnificence, the ruins of the finest Roman edifices, and some of those buildings which are still the ornaments of modern Rome. He formed his style of composition and his entire manner after the works of Ghidolfi, in which he was so successful that he soon excelled all his contemporaries in that department of the art. His paintings are generally esteemed for the grandeur of the architecture, the correctness of the perspective, and the clearness of the colouring. His figures also are designed with taste, and cleverly grouped. Frequently however his figures are rather too large for the buildings, which detracts from the grandeur of the composition. In his latter time his works were distinguished by freedom and breadth of touch, but in colouring and effect they are more feeble than his earlier works. He died October 21, 1768. There are several pictures by Panini at Rivoli, a country-house belonging to the king of Sardinia, representing views of that seat and the environs.

PANVINIO, ONUFRIO, was born at Verona in 1529. He took at an early age the habit of the order of St. Augustine, and pursued his studies at Rome, whence he was called to Florence in 1554 to fill the chair of theology in that city; but soon afterwards, at his own request, was superseded in the office, and obtained leave from his superiors to visit the chief cities of Italy in order to collect inscriptions. At Venice he became acquainted with Sigonio, who had been appointed professor of belles lettres in that city in 1552, and who was not less enthusiastically attached than Panvinio himself to the study of antiquities. The acquaintance soon ripened into a lasting friendship. At Rome he was patronised by Cardinal Cervini, who in 1555 became Pope Marcellus II., and by him Panvinio was appointed to a situation in the library of the Vatican, with a salary of six gold ducats a month. The pope however died a short time after his election; and Panvinio was then patronised by Cardinal Farnese, who gave him apartments in his palace, admitted him to his table, and treated him in other respects with the greatest liberality. Having accompanied the cardinal in a voyage to Sicily, he was taken ill at Palermo, and died there April 7, 1568, at the age of thirty-nine.

Panvinio was a man of great learning and indefatigable industry. Niecron, in his 'Mémoires,' mentions twenty-seven of his works which had been printed; and Maffei, in his 'Verona Illustrata,' gives a list of his manuscripts in different libraries of Italy and Germany. The most important of his works are the following, some of which were not printed till after his death:—'Epitome Pontificum Romanorum usque ad Paulum IV.,' Venice, fol., 1557; 'Viginti-septem Pontificum Romanorum Elogia et Imagines,' Rome, fol., 1568; 'Fasti et Triumphus Romanorum à Romulo usque ad Carolum V.,' Venice, 1557, of which Mader published another edition in 1662 at Helmstadt; 'In Fastos Consulares Appendix; 'De Ludis Secularibus et Antiquis Romanorum Nominibus,' Heidelberg, fol., 1588; 'De Baptismate, Pascali Origine, et Ritu consecrandi Agnos Dei,' Rome, 4to, 1560; 'De Sybillis et Carminibus Sybillinis,' Venice, 8vo, 1567; 'De Triumpho Commentarius,' Venice, fol. 1573, and Helmstadt, 1676, 4to, by Mader; 'De Ritu sepeliendi Mortuos apud Veteres Christianos et eorum Cosmeteriis,' Louvain, 8vo, 1572; 'De Republica Romana Libri III.,' Venice, 8vo, 1581; 'De Bibliotheca Pontificis Vaticana,' Tarragona, 4to, 1587; 'De Ludis Circensibus Libri II., et de Triumphis Liber I.,' Venice, fol., 1600; 'Amplissimi Ornatisimique Triumphi, ex Antiquissimis Lapidum Nummorum Monumentis, &c. Descriptio,' Rome, fol., 1618; 'De Antiquitate et Viris Illustribus Veronesi Libri VIII.,' Padua, fol., 1648. The following treatises are contained in the great collection of Grævius, 'Thesaurus Antiquitatum Romanarum':—'De Civitate Romana,' 'De Imperio Romano,' in vol. i.; 'De Antiquis Romanorum Nominibus,' in vol. ii.; 'Antiquæ Urbis Imago,' in vol. iii.; 'De Ludis Circensibus,' 'De Ludis Secularibus,' and 'De Triumpho Commentarius,' in vol. ix. His great treatise 'De Cæroniis Curis Romanæ,' in 11 vols. folio, is in manuscript in the royal library at Munich.

(Weiss, in *Biographie Universelle*; Tiraboschi, *Storia della Letteratura Italiana*, vol. vii.)

PAOLI, PASQUALE DE, was born in 1726 in the village of Rostino, in the jurisdiction of Bastia in the island of Corsica. In 1784 his father Giacinto de Paoli, together with Giaffieri, was proclaimed their leader against the Genoese by the revolted Corsicans, but after a struggle of several years, in which the adventurer Theodor figured [NEUHOF, THEODOR VON], Giacinto was obliged by the French auxiliaries of the Genoese to give up the contest, and obtained leave in 1740 to withdraw from the island with his younger son Pasquale. Clemente the elder son remained in Corsica. Giacinto and his son

went to Naples, where the father obtained a commission in a regiment formed chiefly of Corsican emigrants, and his son was placed in the military college of that capital, where he studied under able masters, amongst others the celebrated Genovesi.

On leaving college young De Paoli obtained a lieutenant's commission in the Neapolitan service. Meantime a fresh revolt broke out in Corsica, under two chiefs, Matra and Gaffori, who gave full occupation to the Genoese for several years. In October 1753 Gaffori was murdered by hired assassins, and the Genoese were suspected of having instigated the crime. The Corsicans now cast their eyes upon young Paoli, and invited him to come and put himself at their head. He did so, and was proclaimed, in a parliament of the representatives of the people, in July 1755, captain-general of the Corsicans. During twelve years he baffled all the efforts of the Genoese, who lost every part of the island, except the maritime towns of Bastia, Calvi, San Fiorenzo, and Ajaccio, in which the Genoese garrisons were blockaded by the natives, and at last the Corsicans obtained possession of Ajaccio also. But Paoli had to encounter a more dangerous enemy than the Genoese, in the traitors among his own countrymen, headed by Matra, who, through jealousy or bribes, or both, excited a civil war, in which he was defeated and killed, and his brother was obliged to take refuge at Genoa.

Meantime Paoli organised the island, and fixed its government and administration. He formed a legislative assembly, under the name of 'Consulta Generale,' of 500 deputies, elected by the body of the people, one for each commune: the members were renewed every year; only freeholders twenty-five years old at least were qualified to be returned as deputies. The executive consisted of nine members, elected by the deputies. Paoli was the president of the executive, with the title of 'General of the Kingdom and Chief of the Supreme Magistracy of Corsica.' He had a body-guard which escorted him when he went out, to protect him against any attempt at assassination; but he would have no guard at the door of his apartments, trusting to the fidelity of six large fierce mastiffs which watched and slept in his room. A law of the legislative assembly forbade under severe penalties any person from speaking or writing against the general or the executive council. In 1764 Paoli established a university in the town of Corte, the professors in which were paid by the nation, and the students taught gratuitously. The funds for the new university were supplied from a tax on the parochial clergy. The military force consisted of militia well trained to the use of arms; Paoli could collect 30,000 men in case of necessity. He also formed a flotilla, with which he annoyed the Genoese trade, and took possession of the island of Capraia. The whole public revenue of the island did not exceed one million of livres, or about 40,000 pounds sterling.

In 1760 Pope Clement XIII., at the request of Paoli, sent to Corsica a bishop with the title of Apostolic Visitor, in order to regulate the ecclesiastical affairs, which were in a state of confusion. This step, which had something of the appearance of a recognition of the independence of Corsica, greatly displeased the republic of Genoa, which offered a reward of 3000 crowns to any one who should arrest the bishop and deliver him over to the Genoese authorities, forbidding at the same time all subjects of the republic to obey his mandates. The pope published an edict against the resolutions of the Genoese senate, which he characterised as iniquitous and an insult to the apostolical authority. The quarrel lasted for some years, and employed the pens of jurists and controversialists on both sides.

Genoa, despairing of ever recovering the sovereignty of Corsica, resolved on giving up the island to France. This was effected by the treaty of Versailles in 1768—a contract dishonourable and disgraceful to both parties. Paoli loudly and eloquently appealed to all Europe against the cession, but no one interfered in favour of Corsica. The French landed a large force in Corsica, well provided with artillery and ammunition, under the command of Count Marboeuf. Paoli determined upon resistance, and was seconded by the whole population, including the women. The Corsicans fought desperately: though overwhelmed at first by superior forces, they defeated the French with great slaughter on the banks of the Golo; and again, on the 9th of October 1768 they routed the main body of the enemy, commanded by Marboeuf in person, with the loss of two thousand men. In the following year large reinforcements came to the French from Toulon under General de Vaux. In May 1769 a general battle took place, in which the Corsicans, after fighting bravely, were completely routed near Pontenuovo. The French entered Corte, and overran the whole island. Most of the communes submitted to the conquerors. Paoli, with many followers, retired to Portovechio, from whence he sailed in an English vessel for Leghorn, where he was kindly received by the grand-duke Leopold. Paoli afterwards repaired to England, where he remained till 1789, when Mirabeau moved in the National Assembly the recall of all the Corsican patriots who had bravely fought for the independence of their country.

Paoli repaired to Paris, where he was received with acclamations, and in the hall of the Assembly he promised fidelity to France under the new order of things. He was presented to Louis XVI., who made him lieutenant-general and military commandant in Corsica. He was received in his native island with the greatest enthusiasm, and was placed at the head of the national guard. Paoli acted faithfully towards the constitutional monarchy of France; but when the violent revolutionists overthrew that monarchy, he drew back, and separated

BIOG. DIV. VOL. IV.

himself from the French party. His nature, sincere and steady of purpose, recoiled from the injustice, the oppression, and the immorality of the Convention. He was soon accused before that Assembly, and his name was placed on the lists of proscription. Paoli now saw it was high time to declare himself. He assembled his countrymen, by whom he was appointed general-in-chief and president of the council of government. At the first declaration of war between England and France, he applied to the English commanders in the Mediterranean, and, with their assistance, drove the French garrisons out of the island. Soon after, a deputation of the consulta proceeded to London to offer the crown of Corsica to the King of Great Britain. The offer was accepted, and most Corsicans thought that Paoli would have been appointed viceroy, but Sir Gilbert Elliot was named to that office. This and some subsequent disagreements made it desirable for Paoli to leave the island, in order not to give a pretence for civil dissensions. Having recommended his countrymen to remain firm in their allegiance to the British crown, as their only means of salvation, he returned to England, where he lived in retirement for several years on a pension which the British government allowed him. He died near London in February 1807. A monument, with his bust and an inscription, was raised to his memory in Westminster Abbey.

The biography of Paoli has been written by Pommereul in an hostile and unfair spirit: Boswell, on the contrary, has written a kind of panegyric with his usual commonplace enthusiasm. Pompei, in his 'Etat de la Corse,' Paris, 1821, gives the best account of the particulars of Paoli's life. Botte, in his 'Storia d'Italia,' book 46, gives a copious narrative of Paoli's career in Corsica. A volume of Paoli's letters has been published, which, with his spirited manifestoes, are his only literary remains.

PAOLO SARPI. [PAUL, FATHER.]

PAOLO VERONESE. [CAOLIARI.]

PAPIAS, one of the early Christian writers in the Greek language, was bishop of Hierapolis in Asia at the beginning of the 2nd century. According to Cave, he flourished in the year 110, according to others in 115 or 116. He wrote five books, entitled 'An Explication of the Words (or Oracles) of the Lord,' which are now lost. In a passage of this work which is quoted by Eusebius, Papias professes to have taken great pains to gain information respecting Christianity from those who had known the apostles, and some remarkable statements of his respecting the apostles and evangelists are still preserved. According to Irenaeus, he was himself a hearer of John and a companion of Polycarp. He is said by Eusebius to have been a Millennarian, and a man of little mind, "as appears," says Eusebius, "from his own writings." (Eusebius, *Hist. Ecc.*, iii. 39; Cave, *Hist. Lit.*, under 'Papias;' Lardner.)

PAPINIANUS, ÆMILIUS, was a pupil of the jurist Q. Cervidius Scaevola at the same time with Septimius Severus, afterwards emperor. Under the emperor Marcus Aurelius he held the office of advocatus fisci, in which he succeeded S. Severus. After Severus became emperor, Papinian was his libellorum magister, and praefectus praetorio. Paulus informs us that he had given an opinion before Papinian in his auditorium. ('Dig.' 20, tit. 5, s. 12; 'Dig.' 12, tit. 1, s. 40.)

Severus was always on intimate terms with Papinian, and at his death recommended to him his two sons Caracalla and Geta. Caracalla murdered his brother, and shortly after put to death Papinian, together with Papinian's son, who was quaestor. The cause of this execution is only obscurely stated ('Spart., Sever.' c. 21; 'Anton. Carac.' c. 8.); but it appears that the rigid morality of Papinian was shocked by the brutal conduct of Caracalla, and that he showed his disapprobation of this unnatural act.

Few Roman jurists were held in higher estimation than Papinian, and he is often cited in the most honourable manner both by the historians ('Spart., Sever.' c. 21) and in various parts of the code ('Cod.' 5, tit. 71, s. 14, &c.). Justinian ('Const. ad Antecess.') in the course of study which he laid down after the completion of the 'Institutes,' 'Digest,' and 'Code,' in speaking of the third year's course of study, makes special mention of Papinian. The twentieth, twenty-first, and twenty-second books of the 'Digest' were enjoined to be read in place 'acutissimi Papiniani;' the name 'Papinianistae' was still to be retained by the students of the third year, and the festival formerly celebrated on the occasion of commencing his work, it was declared, should be solemnly kept as usual, in order that the memory of the great Papinian might be for ever preserved. The 'Digest' contains extracts from his thirty-seven books of 'Questiones,' his nineteen books of 'Responsae,' and fragments from his two books of 'Definitiones,' his two books on 'Adulteria,' and a single book on 'Adulteria;' also from a Greek fragment, entitled *de τῷ ἀπονομῶνι μὴοβήθου τοῦ Πάπινου*, that is, 'On the duty of the *Ædiles* in Rome and the Municipia.' Papinian is chiefly quoted by Paulus and Ulpian, and sometimes also by Marcian.

PAPIRII, the name of a patrician and plebeian gens in ancient Rome, who were formerly called Papii. ('Cic., Ad Fam.' ix. 21.) This gens was divided into several families, such as the Mugillani, Crassi, Cursores, and Massones; and the most celebrated of the different individuals of these families was Lucius PAPIRIUS CURSOR, the grandson of L. Papirius Cursor, who was censor in the year in which Rome was taken by the Gauls ('Liv.' ix. 34), and son of Spurius Papirius Cursor, who was military tribune in B.C. 379 ('Liv.' vi. 27.) We first read of L. Papirius Cursor as master

of the horse to L. Papirius Crassus, who was created dictator a.c. 339, by the consul Manlius, in order to carry on the war against the Antiates. ('Liv.,' viii. 12; Cic., 'Ad. Fam.,' ix. 21.) The time of his first consulship is doubtful. Livy mentions C. Postillius and L. Papirius Mugillanus as consuls in a.c. 325; but he adds that instead of Papirius Mugillanus, the name of Papirius Cursor was found in some annals. ('Liv.,' viii. 23.) During the year of their consulship the Lex Postillia Papiria was passed, which enacted that no one should be kept in fetters or bonds, except for a crime which deserved them, and only until he had suffered the punishment which the law provided; it also enacted that creditors should have a right to attach the goods and not the persons, of their debtors. ('Liv.,' viii. 23.)

In the following year Papirius Cursor, who is said by Livy (viii. 29) to have been considered at that time the most illustrious general of his age, was appointed dictator to carry on the war against the Samnites. He appointed Q. Fabius Maximus his master of the horse; and during his absence at Rome to renew the auspices, Fabius attacked the enemy contrary to his commands and gained a signal victory. On his return to the camp, he commanded Fabius to be put to death; but the soldiers espousing the cause of Fabius, the execution was delayed till the following day, before which time Fabius had an opportunity of escaping to Rome, where he placed himself under the protection of the senate. The proceedings which followed are interesting to the student of the constitutional history of Rome, as they show that an appeal (provocatio) could be made to the people from the decision of a dictator, which is in accordance with a remark of Livy in another part of his history (iii. 55), that after the decemvirs were expelled from Rome, a law was passed, enacting that in future no magistrate should be made from whom there should be no appeal. Papirius demanded Fabius of the senate; and as neither the entreaties of the senators nor those of the father of Fabius, who had been dictator and three times consul, could induce Papirius to pardon him, the father of Fabius appealed (provocavit) to the people, and at length, at the earnest entreaties of the people and of the tribunes of the plebs, the life of Fabius was spared. Papirius named a new master of the horse, and, on his return to the army, defeated the Samnites, and put an end to the war for the time. ('Liv.,' viii. 29-37.)

Papirius was elected consul a second time with Q. Publilius Philo, in a.c. 320, and again defeated the Samnites; and apparently a third time in the following year, though there appears to be some doubt upon the latter point. ('Liv.,' ix. 7-16.) He was consul for the fourth time in a.c. 315 ('Liv.,' ix. 22), and for the fifth time in a.c. 313 ('Liv.,' ix. 28). He was again named dictator in a.c. 309, to carry on the war against his old enemies the Samnites, whom he defeated with great slaughter, and obtained, on account of his victory, the honour of a triumph ('Liv.,' ix. 38, 40); after which time we find no further mention of him.

Papirius Cursor, says Livy (ix. 16), was considered the most illustrious man of his age; and it was thought he would have been equal to contend with Alexander the Great, if the latter, after the conquest of Asia, had turned his arms against Europe.

PAPIRIUS, JUSTUS, a Roman jurist, who compiled twenty books of Constitutions, according to the Florentine Index. There are sixteen excerpts from this work in the Digest. In one excerpt (Dig. 2, tit. 14, a. 59) Papirius mentions a rescript of the Emperor Antoninus, addressed to Avidius Cassius. The fact of the rescript being addressed to Cassius shows that Antoninus is the Emperor Marcus Antoninus. Accordingly Papirius was living under Marcus Antoninus; and he also survived him, as appears from his speaking of the Divi Fratres.

A jurist of the name of Papirius Fronto is cited by Callistratus (Dig. 14, tit. 3, a. 4.)

PAPIRIUS, SEXTUS or PUBLIUS, is the collector or supposed collector of the old *Leges Curiatæ*, or as they are sometimes called, *Leges Regiæ*, which were enacted at Rome during the kingly period. This Papirius is said to have been Pontifex Maximus and to have lived under the last Tarquin. The few and doubtful fragments of this supposed compilation are contained in Hoffmann, 'Hist. Juris,' vol. ii. p. 1. The collection is mentioned under the name of *Jus Papirianum*, not because he added anything of his own, but because he arranged the laws in due order (Pomponius, 'Dig.,' 1, tit. 2, a. 2, § 2); and sometimes it is called *Lex Papiria*. (Servius ad Virg. 'Æneid,' xii. 836.)

PAPPUS, ALEXANDRINUS, an eminent mathematician of Alexandria, who flourished about the end of the 4th century of our era. In the very brief accounts we have of him, he is mentioned as the author of several treatises, all of which, except his 'Mathematical Collections' (*Μαθηματικὴ Συλλογὴ*), probably the most valuable of his writings, appear to have perished. This work, as its name imports, is miscellaneous; and besides a variety of propositions, both problems and theorems, contains some curious notices, not found elsewhere, of the history of mathematics, and of mathematicians in his own and in preceding times. Of the eight books of the 'Mathematical Collections,' the first and about one half of the second are presumed to be lost; the rest have reached the present time, though with many imperfections, and in some passages so mutilated that the meaning cannot be certainly determined. The original Greek, except some short extracts, has never been printed; and the only translation of it, which

is by Commandine, was first published at Pesaro in 1588; and another edition, with little variation or improvement, was printed in 1660 at Bologna. This translation is accompanied with a commentary, often tedious, and in some places defective; but at the same time it is extremely valuable, from the explanation which it contains of some difficulties, and the correction of many errors in the manuscript used by Commandine, and which pervade all the manuscripts of Pappus that have hitherto been examined. From Commandine's manner of referring to the Greek, it appears that he had only one manuscript for his guide. He died before the work had received his last corrections, and no account is given of the history or character of the manuscript which he followed. From a family dispute between two sons-in-law, the publication was suspended for some time after his death; and at length, by the munificence of his patron, the Duke of Urbino, the translation was printed, but confessedly without any correction whatever of the errors or omissions in the unfinished work of Commandine. In this state however it was a very interesting communication to the mathematicians of that age, and almost immediately excited the greatest interest and attention towards the Greek geometry.

The two first books of Pappus are not in Commandine's translation, from their not being found in any of the manuscripts to which he had access; but a portion of the second book was afterwards found in a manuscript in the Savilian Library at Oxford, and published by Dr. Wallis in 1688, with a Latin translation, and valuable notes explanatory of the Greek arithmetic. From this remaining fragment, it is reasonably conjectured by Dr. Wallis that these two books related solely to that arithmetic; and thence he infers that the loss of them is not greatly to be lamented: the whole object of the second book appears to be equivalent to what is now considered as a very simple proposition, viz. that the multiplication of any numbers, all or any of which have ciphers annexed, may be performed by multiplying these numbers without the ciphers, and then adding all the ciphers to the product. The first book was probably employed about the simple operations of the addition and subtraction of numbers. The third book contains geometrical problems both linear and solid. The fourth contains theorems of plane, solid, and linear classes of propositions. The fifth treats principally of isoperimetrical figures. The sixth is employed chiefly in explaining and correcting some propositions of Theodorus and some other ancient writers, in treatises on spherics. The seventh book is entirely on the ancient analysis. The eighth and last book is entirely on mechanics; but though a curious document of the state of that branch of science in the time of Pappus, yet from the great improvement both in the theory and practice of mechanics in modern times, it is comparatively of little value.

(Dr. Trail, *Life of Simson*; Suidas, in voc. 'Voicius de Chronologia Mathematicorum'; and Montucla, tom. i.)

PARACELSUS, the name commonly given to a very extraordinary person, who called himself by the compound and high-sounding appellation PHILIPPUS AUREOLUS THEOPHRASTUS PARACELSUS BOMBAST, AB HOHENHEIM; to which is sometimes added the epithet 'Eremita.' Of all these names it is difficult to say which, if any, really belonged to him; for though he seems to have liked 'Theophrastus' better than any of the others, and sometimes (as in his will and his letter to Erasmus) called himself by that alone, and though he says, in his book called 'Paragranum,' "Et Naturæ et Baptismatis jure Theophrastus nominor," still he was wont to pay so little regard to truth, either in his words or actions, that he cannot safely be believed even in such a trifle as this. The place of his birth is equally uncertain, but he is generally supposed to have been born in 1493, at Einsiedeln in the canton of Schwyz, the Latin name of which, 'Helveticus Eremitus,' caused him to be sometimes called 'Eremita.' (See however Haller, 'Biblioth. Medic. Pract.,' tom. ii.) His father was a physician, and instructed him in alchemy, astrology, and medicine. He was never regularly educated, and he confesses himself that he was not fond of books and had a horror of languages, inasmuch that at one time he did not open a book for ten years together. This is quite confirmed by the internal testimony of his writings, which are as unintelligible from their style as their substance.

He early commenced a wandering life, and spent some years in travelling over almost all Europe and probably several parts of Asia and Africa. He had a most ardent desire for information of all sorts, and neglected no opportunity of acquiring it; but he seems to have exercised very little judgment in the choice of his informants, and to have consulted conjurers, old women, and quacks of every description, quite as much as physicians and philosophers. The most valuable acquisition that he made in his travels was an acquaintance with metallic chemistry, by means of which he was enabled to perform several wonderful cures, and thereby laid the foundation of his fame. In 1526 he was chosen to be professor of medicine and natural philosophy at Basel, and commenced his course of lectures by lighting some sulphur in a brazen chafing-dish, and then threw into the flame the works of Galen and Avicenna, exclaiming "Sic vos ardebitis in gehennâ." He lectured partly in Latin and partly in German, which, together with his singular manners and the novelty of his opinions, rendered him extremely popular. In consequence however of a dispute with the magistrates about the amount of a fee which he demanded of one of the canons, he left Basel in about a year, and recommenced his wandering life. He seldom stayed long in one place,

but lived chiefly in taverns, where he scarcely ever took off his clothes by day or night; and though he had hitherto lived a very temperate life, and taken nothing but water, he now spent whole nights in drinking with the lowest company. He still maintained his reputation by occasionally effecting some extraordinary cures by means of his powerful medicines, but his failures were equally conspicuous. At last, after passing through many vicissitudes, the boasted possessor of the philosopher's stone and the elixir of life died in great poverty in 1541, at Salzburg, in the Tyrol, at the early age of forty-eight.

As might be expected, Paracelsus has been as much extolled by his admirers as he was despised and abused by his enemies. With respect to his moral and religious character, there seems to have been nothing to admire: he was totally destitute of piety, and his theological opinions (if they deserve to be called such) were a confused mixture of infidelity, heresy, and absurdity; in gluttony and drunkenness, in lying and charlatanism, in vanity and arrogance, he has been seldom equalled, and never surpassed. If any one is inclined to think this judgment of him too harsh and severe he will find it abundantly confirmed by the passages quoted from his own writings and those of his personal acquaintances by Le Clerc, in the Appendix to his 'Hist. de la Méd.' His intellectual talents and acquirements are not much more deserving of respect; but in order to estimate these fully he must be considered—1, as a chemist; 2, as a physician; and 3, as a philosopher. 1. As a chemist (though probably the ablest of his time), he falls far short of his predecessor Basil Valentine. "His original discoveries," says Brande, in his 'Manual of Chemistry,' "are few and unimportant, and his great merit lies in the boldness and assiduity which he displayed in introducing chemical preparations into the 'Materia Medica,' and in subduing the prejudices of the Galenical physicians against the productions of the laboratory. But though we can fix upon no particular discovery on which to found his merits as a chemist, and though his writings are deficient in the acumen and knowledge displayed by several of his contemporaries and immediate successors, it is undeniable that he gave a most important turn to pharmaceutical chemistry; and calomel, with a variety of mercurial and antimonial preparations, as likewise opium, came into general use." He pretended (as was hinted above) to possess the secret of the philosopher's stone and the elixir of life, besides various other preparations called by strange and pompous names, such as the 'Quintessence,' the 'Arcanum of Vitriol,' 'Azoth,' &c.: the composition of his 'Laudanum' he is supposed never to have revealed, and in the short dictionary at the end of his works we are merely told that 'Laudanum Theophr. Paracelsi est medicina laude digna, ex duobus tantum rebus constans, quibus excellentiores in mundo reperiri nequeunt, quâ morbos omnes fere curabat." 2. As a physician he cannot lay claim to any scientific skill; and though his epitaph declares that "Lepram, Podagram, Hydropisiam, aliaque insanabilia corporis contagia mirificè arte sustulit," we are told on the other hand that "he killed many of his patients, or at least made them worse than they were before." (Libavius, 'Hist. Panac. Amwald,' quoted by Le Clerc.) His medical writings are full either of credulity or imposture. He says that it is possible for a man alone to create a living child resembling in every respect those born of women, only much smaller; and he gives directions for doing so, too absurd and indecent to be quoted. He explains minutely the analogy which he supposes to exist between the 'Macrocosmus,' or external world, and the 'Microcosmus,' or human body; and says that every physician ought to be able to point out in man the east and west, the signs of the zodiac, &c. ('Paragranum,' Tract 2.) He says that the human body consists of nothing but sulphur, mercury, and salt. ('Paramirum,' lib. i.) He professes his belief in magic (though in this he was not more credulous than his contemporaries), and boasts of having received letters from Galen, and of having disputed with Avicenna in the vestibule of the infernal regions. ('Paragranum,' Præf.) Some of his most remarkable cures were cases of syphilitic and other obstinate ulcers, and his 'Chirurgia Magna' and 'Chirurgia Minor' have been more esteemed than perhaps any of his other works. In extracting an arrow or other weapon from a wound, he recommends (when all other means fail) the use of certain *verba constellata*, which will infallibly succeed. 3. With respect to his philosophical (or 'theosophical') opinions, it is very difficult to discover what they were, not only from the great obscurity of the subject-matter of his works, but also from the new words that he invents, and still more from the peculiar and arbitrary senses that he puts upon those in common use. Iliadus, Iliaster, Idechtram, Domor, Cagastrum, Evester, Trarames, Dualech, &c., are some of those invented by himself, and of which no intelligible explanation is to be found. "He made great use," says Tennemann ('Manual of Philoa.') "of the cabalistic writers, whom he endeavoured to render popular, and expounded with a lively imagination. Among his principal mystic notions were those of an internal illumination, an emanation from the Divinity, the universal harmony of all things, the influence of the stars on the sublunary world, and the vitality of the elements, which he regarded as spirits encased in the visible bodies presented to our senses." "These are," says Hallam ('Liter. of Europe') "the silvains (sylphs), undines or nymphs, gnomes, and salamanders. It is thus observable that he first gave these names, which rendered afterwards the Rosicrucian fables so celebrated. These live with man, and sometimes (except the salamanders) bear children to him; they know future

events, and reveal them to us; they are also guardians of hidden treasures, which may be obtained by their means."

The works of Paracelsus, part of which are written in German and part in Latin, and of which a complete list is given by Haller in his 'Biblioth. Medic. Pract.,' were published in Latin at Frankfurt, in 10 vols. 4to, 1608; and in German, by Huser, at Basel, also in 10 vols. 4to, 1589-90.

PARADISI, COUNT AGOSTINO, was the great-nephew of Agostino Paradisi, author of the 'Ateneo dell' Uomo nobile.' He was born at Vignola, in the territory of Reggio, April 25th, 1736, and was educated at the Collegio Nazareno at Rome, on returning from which he prosecuted his studies diligently, and, among the rest, applied himself to that of English literature. His talent for poetry displayed itself at an early age, and when only sixteen he was admitted member of an 'accademia' at Reggio, where both his poetical compositions and his dissertations obtained for him great distinction. He afterwards visited Genoa, Venice, and Bologna, in which last place he became acquainted with the Marquis Albergati Capacelli, and shared with him in some of his dramatic compositions. On the death of the Abbate Salandri in 1771, Count Firmian, the Austrian minister, invited Paradisi to accept the office of perpetual secretary in the academy of Mantua; but the Duke of Modena appointed him professor of civil economy and lecturer on belles-lettres in the university of that city; and afterwards (1776) bestowed on him the title of count. During the eight years that he filled that chair, his lectures obtained for him the applause not only of his own countrymen but of many eminent foreigners. In 1780 he returned to Reggio, where he held a distinguished civil employment, devoting his leisure to literary pursuits; but his health now began to decline, and he was attacked with dropsy in the chest, which disorder carried him off, February 19th, 1788, in his forty-seventh year.

Besides his 'versi sciolti,' or poems in blank verse, which are esteemed both for their elegance of style and their moral value, he published three volumes of tragedies, translated from the French, including an original one entitled 'Le Eptidi.' Among his prose writings, his éloges on Montecuculi is considered a masterpiece of its kind. His 'Saggio sopra l'Entusiasmo nelle Belle Arti,' shows his ability as a philosophical critic; while his knowledge of jurisprudence and civil economy is displayed in his 'Parere Economico,' and other productions of that kind.

PARÉ, AMBROSE, the first and most eminent of the old French surgeons, was born in 1517 at Laval, in the province of Maine and the modern department of Mayenne. His parents were poor, and his education was neglected; but having one day witnessed the operation of lithotomy, he went immediately to Paris and commenced the study of surgery. He afterwards accompanied the French army during several campaigns in Italy, and gained so much reputation that in 1552 he was appointed surgeon in ordinary to King Henri II. He held the same office under Francis II., Charles IX., and Henri III., until his death, at Paris, December 22, 1590. He appears to have been a pious and excellent man, and having been educated in the reformed church, he steadily refused to leave it. During the horrible massacre of St. Bartholomew's he owed his life to his professional reputation and the personal friendship of the king, whom, as he tells us himself, he had especially obliged by having saved him from the consequences of a wound accidentally inflicted on the median nerve in venesection. ('Opera Chirurg.,' lib. ix., cap. 38.) Brantome says, in his 'Memoirs,' that on the evening of the massacre the king sent for him into his bed-room, and told him not to stir out, saying that it was not right to murder a man who was so useful to the world (tom. iv.).

The French writers justly consider Paré to be the father of modern surgery, and say that he holds the same rank in this branch of the profession as Hippocrates does in medicine. He was not satisfied with blindly following the precepts of his predecessors, but by diligent observation and reflection made several important changes in the mode of treatment, which have been followed to the present day. One of his greatest reforms was in the treatment of gun-shot wounds, into which it was the custom at that time to pour boiling oil; he was also the first person who left off the barbarous practice of cauterising a limb to stop the hæmorrhage after an amputation. He was the first who recommended the extraction of the fetus by the feet in cases of difficult parturition (lib. xxiii., cap. 26). He says that in cases of ascites the fluid should not be drawn off all at once after paracentesis (lib. vii., cap. 12). Although he was not the discoverer of the art of tying the blood-vessels, he at least restored the practice, pointed out its advantages, and gave some excellent rules for performing the operation. His works are chiefly valuable and remarkable for the great number of facts and cases contained in them, and for the care with which he avoids giving any directions resting merely upon theories and unsupported by observations. They were published in a collected form at Paris, 1585, fol., in French, and are divided into twenty-eight books, of which the first five are chiefly on anatomical and physiological subjects. There are several other editions of his whole works, which have also been translated into Latin (Paris, 1582, fol.), in twenty-six books, into English (London, 1578, fol.), into Dutch (Leid. 1604, fol.), and into German (Frankf., 1604, fol.).

PAREDES, DIEGO GARCIA DE, a celebrated Spanish general, commonly called 'the Spanish Bayard,' was born of noble parents, at Truxillo, a town of Estremadura in 1466. Having early embraced

the career of arms, he accompanied his father to the war of Granada (1485), and was present at the taking of Baza, Velez, and Malaga from the Moors. [FERDINAND.] It was there that he became acquainted with the celebrated Gonzalo de Cordova, under whom he afterwards served in Italy. Shortly after the taking of Granada (1492), which put an end to the Moorish war, Paredes, who had retired to his native town, determined to repair to Italy, then the theatre of war; but as he had neither horse nor armour, he stole those of a cousin of his, and secretly left his father's house. Scarcely however had he proceeded a few miles on his way, when he was overtaken and attacked by seven of his cousin's squires, of whom he killed two, wounded two more, and put the remainder to flight. On arriving at Rome, he was well received by the Pope (Alexander VI.), who gave him a high command in his army. He served that pontiff with great zeal until 1499, when he left his service and enlisted under the banners of the Great Captain, who with a powerful fleet sailed towards the Morea. He was present at the taking of Cephalonia from the Turks (June 1501), and was made prisoner in a sortie of the garrison, but he soon succeeded in extricating himself from the hands of the enemy. War having broken out (July 1502) between the French and the Spaniards, who contended for the possession of the kingdom of Naples [FERDINAND; LOUIS XII.], Paredes rendered most important services by his military skill and his undaunted courage. At the celebrated pass of arms of Trani, he was one of the eleven Spanish champions who entered the lists, and, though debilitated by the wounds he had received on a former occasion, he alone unhorsed three of the antagonists. At the storming of Ruvo (February 1503) he led the scaling party, and was the first on the ramparts. He also distinguished himself at Cerignola, where he commanded the centre of the Spanish army, and signalled himself by descending alone on the bridge against a body of French knights, all completely armed, and contending successfully with them, until he was rescued by a party of his own men. According to Mariana (book ii. lib. 29, cap. 4), Paredes, having been, shortly after the death of the Great Captain (December 1515), deprived of his estates by the restoration made to the Angevin lords, endeavoured to repair his broken fortunes by driving the trade of a corsair in the Levant. However this may be, Paredes continued to serve in Italy. He was present at the sieges of Verona and Vicenza, and also at the celebrated battle of Favia (1525), where Francis I. was taken prisoner. [CHARLES V.]

Paredes died in 1530, at the age of 64. He always lived in great intimacy with Gonzalo, whose brilliant qualities he appreciated, being one of his most zealous supporters when he fell into disgrace. Having one day, while in the presence of Ferdinand, overheard two noblemen speak slightly of his general, Paredes threw his gauntlet on a table, and said, "Whoever asserts that the Great Captain is not the king's best vassal, let him pick up this."

Paredes wrote a short but highly interesting account of his own military campaigns and exploits, which is printed at the end of the 'Cronica del Gran Capitan.' (Paulo Jovio, *Vita Illust. Virorum*, Bari, 1578; Guicciardini, *istoria d'Italia*, vol. 1, lib. 6; *Cronica del Gran Capitan*, Alcalá, 1584; Zurita, *Anales del Reyno de Aragon*, vol. iv.; Quintana, *Españoles Célebres*, vol. i.)

PAREJA, JUAN DE, born in 1610, is remarkable not only for an extraordinary love of the art of painting, but for having acquired a great degree of excellence while in a low and abject condition of life. He was a mestizo, that is, born in the West Indies, and the son of a Spanish father by an Indian woman: he became a slave of the celebrated Velasquez, who employed him to grind colours.

He spent whole nights in drawing, and almost denied himself rest and sleep, imitating, as may be supposed, the manner of Velasquez. He was however under perpetual fear of being discovered by his master; till at length he hit on an ingenious mode of disclosing his secret. Having observed that Philip, king of Spain, who frequently honoured Velasquez by visiting him, always ordered any paintings which were placed with their faces to the wall, to be turned, Pareja placed a picture of his own in that position; the king, as he expected, ordered it to be turned. He expressed his admiration of it to Velasquez, who however was taken by surprise, and declared that he knew nothing of it. On this Pareja fell on his knees and begged the king to obtain his pardon of his master for having presumed to practise the art without his permission. Philip, being much pleased at this address and admiring a work produced under such singular circumstances, told Velasquez that a man who showed so fine a genius and possessed such talents ought no longer to be a slave. Velasquez, of course, immediately emancipated him. But he never quitted his master, and after the death of Velasquez continued to serve his daughter with the most grateful fidelity.

He was especially successful in painting portraits, which in style, colouring, and handling so exactly resembled the works of his master, that we are assured they could not be distinguished from them. He died in 1670.

PARENT-DUCHATELET, ALEXANDRE-JEAN-BAPTISTE, was born at Paris on the 29th of September 1790. His father held an office under government which had been in the family for upwards of three centuries. At the birth of Alexandre he was possessed of considerable wealth, but the changes that occurred during the Revolution seriously affected his circumstances, and he retired to a house in

the country called Châtelet, about a league from Montargis. Here Alexandre, who was the eldest of five, was brought up with little further assistance in his education than could be given by his mother—who was an amiable and accomplished woman. He was however fond of study, and early exhibited a taste for natural history by collecting the insects and birds of the neighbourhood.

At the age of seventeen he was sent to Paris, where he commenced the study of medicine. In 1814 he took the degree of doctor of medicine, and commenced practice in Paris. He became early dissatisfied with the practice of medicine, and directed his attention to pathology. One of the earliest works which he published was a valuable monograph upon inflammation of the arachnoid membrane. In this work he was assisted by M. Martinet; the title is 'Recherches sur l'Inflammation de l'Arachnoïde cérébrale et spinale, ou Histoire théorique et pratique de l'Arachnitis,' Paris, 8vo, 1821. The mind of the author was however shortly after directed, through the influence of Hallé, to the subject of public health, and from the period that he first thought on this subject to the day of his death, he devoted all the energies of his mind to it. From 1821 to 1836 he published twenty-nine memoirs and papers on various questions relating to public health. One of his first efforts on this subject was a series of researches directed to discover the cause of a disease which had occurred on board a vessel which was conveying poudreite across the seas. Parent examined the manufacture of this substance, which consists of animal and vegetable matters which have been collected from the drains and sewers of Paris, and, being exposed to the sun and air, are allowed to dry. In this state it is used as a manure. It was the fermentation of this substance, in conjunction with moisture, that had produced the disease, and Parent recommended that in future plaster of Paris should be mixed with it, which prevented the recurrence of such catastrophes.

His next work was upon the common sewers of Paris, entitled 'Essai sur les Cloaques ou Egouts de la Ville de Paris, envisagés sous le Rapport de l'Hygiène Publique et de la Topographie Médicale de cette Ville,' Paris, 8vo, 1824. Parent-Duchâtelet here displayed the peculiar aptitude of his mind for the investigation of subjects which others regard with natural abhorrence. He not only made inquiries into the state of the health of the workmen employed in cleansing these places, and obtained from them much important information, but he entered with them the places of their noisome occupation, and, from diligent personal inspection and experience, reported on their condition and nature. Shortly after the publication of this work, Parent was appointed on a commission to superintend the emptying of one of these common sewers (égouts) which had been blocked up for years, and which threatened to generate fever of the worst kind. Under his direction this place was cleansed without the loss of life to a single workman, and without any evil results.

He subsequently contributed largely to the 'Annales d'Hygiène Publique et de Médecine Légale.' In this work will be found reports and papers by him on the influence on the health of workmen and the public, of tobacco manufactories, of pyroigneous-acid factories, of employments requiring immersion of the feet in cold water; of burying the dead in cities; of putrid emanations from dead animals and vegetables, of dissecting-rooms, &c. He also published a work on the progress of cholera, and a history of its ravages in Paris. His greatest work, and that which most displays the industry and character of the man, is that on prostitution in the city of Paris. It was published after his death, edited by F. Leuret, with the title 'De la Prostitution dans la Ville de Paris considérée sous le Rapport de l'Hygiène Publique, de la Morale, et de l'Administration,' Paris, 2 vols, 8vo, 1836.

Parent-Duchâtelet died of inflammation of the lungs, on the 7th of March 1836. Few men have led a life of greater usefulness, and his labours have assisted in laying the foundation of those systems of medical police which, when properly conducted, are undoubtedly the most important institutions of a civilized community. (Leuret, *Notice Historique, sur A. J. B. Parent-Duchâtelet.*)

PARINI, GIUSEPPE, one of the best and most popular Italian poets of the 18th century, was born in the district of Boasio near the lake of Pastano, in the Milanese territory, May 22, 1729. His father, though poor, was anxious to bestow upon him a good education, and for that purpose removed to Milan. He was however obliged to seek to support himself at an early age, by copying, and it was only in the intervals of his employment that he could study the best writers, both Latin and Italian. In compliance with the wishes of his friends, he published a volume of poetry, at the age of twenty-three; which procured for him admission into the Accademia dei Trasformati at Milan, and that of the Arcadians at Rome. He was successively engaged as tutor in the Borromei and Serbelloni families. In 1763 he published the 'Mattino,' the first part of his celebrated poem 'Il Giorno,' which he had been induced to do by Count Firmian, then Austrian minister of Lombardy, who after employing him some time in editing a gazette, appointed him professor of belles-lettres in the Palatine schools ('scuole palatine') at Milan, and, on the suppression of the Jesuits, promoted him to the professorship of eloquence at the college of the Brera. His lectures, which were printed, were as favourably received as were those which he afterwards gave on the fine arts; and both of them contributed materially to disseminate an improved taste. After the death of his patron Count Firmian, cabals were

excited against him, and he was at one time in imminent danger of losing his appointments, owing to his refusing, for some reason or other, to compose, as he had been commissioned to do, an eulogy on the Empress Maria Theresa. Notwithstanding this, Leopold II. promoted him to the prefecture of the Brera, with an increased salary. At the period of the French Revolution politics began to engage his attention; General Bonaparte and Saliceti caused him to be elected one of the magistrates of Milan; but being disappointed in his expectations of being able to serve his fellow-citizens, Parini requested permission to retire from office, and bestowed on the poor the emoluments he had derived from it. From this period he lived in retirement, poor but respected. In addition to his general ill state of health, he was obliged in his seventieth year to undergo an operation. He died August 15, 1799, and the astronomer Ordani caused a monument and bust of him to be erected in the college of the Brera.

His principal production, 'Il Giorno,' may be considered an ironical, didactic poem, wherein, pretending to instruct a youth in the various duties and economy of a fashionable day, he satirises the frivolities, the follies, and vices of the idlers and triflers who constitute what is called the gay world. Yet although it is relieved by many agreeable episodes, the continued strain of irony and mock solemnity becomes fatiguing; and though the style is elegant, it is somewhat too ornate and laboured for the subject. Besides this and his lyrical pieces, Parini also wrote some 'rime piacevoli,' and other compositions of that class.

PARIS, also called ALEXANDER, one of the most celebrated characters of the mythic age, is said to have been the son of Priam and Hecuba. In consequence of an alarming dream which his mother had previous to his birth, Priam gave him to a slave to be exposed upon Mount Ida. The order was obeyed, but upon returning at the end of five days to the spot where he had exposed the infant, he found that he had been nursed by a bear. The slave took the child to his own home and brought him up as one of his sons, among the shepherds of Mount Ida. When Paris grew up, he became distinguished by his beauty and strength, and in consequence of his success in repelling the attacks of wild beasts and robbers, he is said to have obtained the name of Alexander (from *ἀλέξω*). He was afterwards recognised by his parents, and received at the court of his father; but before he left his flock he is said to have given that celebrated decision in favour of the superior beauty of Aphrodite (Venus), in consequence of which he obtained Helena, but at the same time brought upon himself and the whole Trojan race the implacable enmity of Hera (Juno) and Athena (Minerva).

He is said to have carried off Helena from the court of Menelaus, while the latter was absent at Crete; and after touching at Sidon in his way home, to have brought her in safety to Troy. Herodotus however informs us (ii. 113-116), on the authority of the Egyptian priests, that Paris in his voyage home was driven to Egypt by unfavourable winds, and that Helen and all her property were detained by Proteus with the view of restoring them to Menelaus. Herodotus thinks that Homer was acquainted with this story, and quotes some passages in the 'Iliad' and 'Odyssey' in confirmation of his opinion.

We read very little in the 'Iliad' of the exploits of Paris. In the third book he engages in single combat with Menelaus, and is only saved from death by the intervention of Aphrodite. He wounds with his arrows Diomedes (xi. 369-383), and Machaon (xi. 505); and is mentioned in the twelfth book (l. 93) as a commander of one of the divisions of the Trojan army. According to later poets, he killed Achilles with one of his arrows. The manner of his death is variously told; but it is generally agreed that he was killed by Philoctetes with one of the arrows of Heracles. Later writers state that, while he fed his flocks upon Mount Ida, he was married to CEnone, daughter of the river Cebren, who endeavoured to dissuade him from attempting to carry off Helen, but, unable to succeed in his endeavours, she told him to return to her if he was ever wounded; as she alone could save him. After being wounded by Philoctetes, Paris accordingly desired to be carried to CEnone; but offended by his desertion, she refused to heal him, and left him to his fate.

PARIS, JOHN AYRTON, a distinguished physician. He was born at Cambridge on the 7th of August 1785. He received his early education at the Grammar school at Linton. At the age of fourteen he commenced the study of medicine, and for this purpose became a pupil of Dr. Bradley of London, who was physician to Westminster Hospital. Here he made great progress in his classical studies, and made acquaintance with the sciences of chemistry and botany. In 1808 he matriculated at Caius College, Cambridge, where he became distinguished for the extent and elegance of his classical knowledge, and pursued natural science in as far as the university studies permitted him. He subsequently graduated as M.D. at Cambridge, after having previously studied at Edinburgh. He obtained the Tancred studentship in physic at Cambridge in 1804, and made the Tancred speech in 1808. He first commenced the practice of his profession in London, where he made the acquaintance and gained the patronage of Dr. Maton, whom he succeeded when only in his twenty-third year as physician to the Westminster Hospital. He had not however been long in London when he was induced to settle at Penzance in Cornwall, as successor to Dr. Borlase. Here he met with great success in practice, and turned his attention to the study of natural history. He founded the Royal Geological Society of Cornwall, one of the earliest geo-

logical societies in the kingdom. He wrote a 'Guide to Mount's Bay and Land's End,' which contained an account of the geology and objects of natural interest in that part of Cornwall. He also studied agriculture in relation to chemistry, and wrote a paper 'On the Soils of Cornwall, with a View to form a Rational System of Improvement by the Judicious Application of Mineral Manure.' He anticipated here the discoveries of modern times, and suggested a practice which is but now beginning to bear its fruits. Whilst at Penzance he also wrote 'Memoirs of the Life and Scientific Labours of the late Rev. W. Gregor.' In the Preface to this work, which was published in 1817, he took leave of his friends in Cornwall, and once more returned to London.

He now commenced a course of lectures on the materia medica at the Windmill-street School of Medicina. He also gave a course of lectures on the philosophy of medicine, at the Royal College of Physicians. The matter of these lectures he afterwards worked into the Introduction to his celebrated 'Pharmacologia.' This work, which was originally published in 1819, went through many editions, and is at the present day regarded as one of the useful text-books on the subject of materia medica. He also published a 'Treatise on Diet,' which comprehended all that was known on the subject at the time he wrote. It was a work much needed in the profession, and brought Dr. Paris more than any of his other publications as a practical physician before the public.

As a Cambridge graduate all the positions at the London College of Physicians became opened to him. He was made a censor in 1817, an elect in 1839, and delivered the Harveian oration in 1843. On the death of Sir Henry Hallford in 1844, as one of the elects, of whom there are seven, he was eligible for the post of president of the College, and was selected by the fraternity of elects to that position. During his presidency he was opposed to all reform in the College, whose charter, granted in the time of Henry VIII., is ill adapted to the requirements of the profession in the present century. He retained his position as president till his death, on the 24th of December 1856, and was succeeded by Dr. Thomas Mayo.

Dr. Paris devoted much attention to the study of the physical sciences, especially chemistry. When in Cornwall he conferred a great benefit on the mining population by suggesting that the bar used for moving portions of rock, should be covered with copper, which prevented the iron of which it was composed from striking fire against the rock, and which by igniting the gunpowder used in blasting, often produced the most serious ill consequences. In London he became an early member of the Royal Institution, and was the friend and biographer of Sir Humphry Davy. His 'Life' of the great chemist is an unusually elegant piece of biography. He wrote anonymously a little work of great merit, and which has gone through many editions, entitled 'Philosophy in Sport made Science in Earnest.' He was a Fellow of the Royal Society, and a Doctor of Civil Law of the University of Oxford.

PARIS, MATTHEW, was born about the end of the 12th century, took the religious habit in the Benedictine monastery of St. Alban's in 1217, and died there in 1259. Almost the only incident of his life that has been recorded is a journey he made to Norway, by command of the pope, to introduce some reforms into the monastic establishments of that country, which mission he has the credit of having executed with great ability and success. He is said to have stood high in the favour of Henry III., and to have obtained various privileges for the University of Oxford through his influence with that king. His acquirements embraced all the learning and sciences of his age; besides theology and history, oratory, poetry, painting, architecture, and a practical knowledge of mechanics, are reckoned among his accomplishments by his biographers or panegyrists. His memory is now preserved by his history of England, entitled 'Historia Major,' which begins with the Norman Conquest, and comes down to the year of the author's death. Of this work the following are the printed editions:—1, fol., Lon., 1571, edited by Archbishop Parker; 2, fol., Tiguri (Zürich), 1606, a mere reprint of the preceding; 3, fol., Lon., 1640 (or in some copies 1641), edited by Dr. William Watts; 4, fol., Paris, 1644; and 5, fol., Lon., 1684. Watts's edition, which is sometimes divided into two volumes, besides various readings and copious indexes, contains two other works of the author, or attributed to him, namely, his 'Duorum Offarum Merciorum Regum (S. Albani Fundatorum) Vita,' and his 'Virginti Trium Abbatum S. Albani Vitae,' together with what he calls his 'Additamenta' to those treatises; and these minor productions are also given in the subsequent Paris and London editions. In the British Museum, and in the libraries of Corpus Christi and Bene't colleges, Cambridge, there are manuscripts of an epitome, by Matthew Paris himself, of his history, generally referred to by the names of the 'Historia Minor,' or the 'Chronica,' which has never been published, but which, Bishop Nicholson says, contains "several particulars of note omitted in the larger history;" and some other works, which are now lost, are attributed to him on the doubtful authority of Bale and Pits. Some old notices of his 'History' speak of it as beginning at the creation of the world; and on this account it has been conjectured, though with no probability, that the historical compilation ascribed to Matthew of Westminster may really have been the composition of Matthew Paris. But even of the 'History' which bears his name, the portion extending to the year 1285 is very little more than a transcript from the work of Roger de

Wendover, Windleshore, or Windsor, who is said to have also been a monk of the monastery of St. Alban's, and died Prior of Belvoir in 1237. Some recent antiquaries have regarded Matthew Paris as the real author of the 'Flores Historiarum,' usually attributed to Roger de Wendover; but others, among whom may be mentioned the Rev. H. O. Coxe, who edited the edition of Wendover published by the English Historical Society, 4 vols. 8vo, 1841-42, have strongly maintained the claim of Wendover. Matthew Paris writes with considerable spirit and rhetorical display, and uses remarkable freedom of speech; and his work, which is continued to the death of Henry III. (1272) by William Rishanger, another monk of the same abbey, has been the chief authority commonly relied upon for the history of that reign. Its spirit however is somewhat fiercely and narrowly English; and from the freedom with which he inveighs against what he regards as the usurpations of the papal see, Romanist writers have always expressed strong dissatisfaction especially with his accounts of ecclesiastical affairs. With Protestant critics, on the other hand, Matthew Paris has been a favourite, in proportion to the dislike he has incurred from their opponents. At one time it used to be affirmed by the Roman Catholics that the printed Matthew Paris was in many things a mere modern fabrication of the reformers; but Watts, by collating all the manuscript copies he could find, and noting the various readings, proved that there was no foundation for this charge. A translation of the 'History' of Matthew Paris by Dr. Giles forms a volume of Bohn's 'Antiquarian Library,' and the 'Flowers of History of Roger of Wendover' forms two volumes of the same series.

PARK, MUNGO, was born on the 10th of September 1771, at Fowlshiel, a farm on the banks of the Yarrow, not far from the town of Selkirk. His father, an intelligent and successful farmer, died in 1792, but not until Mungo had been fairly launched into professional employment; his mother, who was alive in 1816, was the daughter of a farmer in the vicinity of Fowlshiel. Mungo was the seventh child and third son of a family of thirteen, eight of whom attained the years of maturity.

At the usual age Mungo was sent to the parochial school at Selkirk. "He had," says the writer of the biography prefixed to the complete edition of his 'Travels,' "shown a great love of reading from childhood, and was indefatigable in his application at school, where he was much distinguished and always at the head of his class. Even at that early age he was remarked for being silent, studious, and thoughtful; but some sparks of latent ambition occasionally broke forth, and traces might be discovered of that ardent and adventurous turn of mind which distinguished him in after-life." At the age of fifteen Mungo Park was apprenticed to Mr. Thomas Anderson, a respectable surgeon in the town of Selkirk, with whom he resided three years, during which time he improved his acquaintance with the classics by occasional attendance at the grammar-school. In 1789 Park removed to the University of Edinburgh, where he attended, during three successive sessions, the course of lectures prescribed to all who wish to graduate as surgeons. There is nothing left on record of his academical life, except that he devoted considerable attention to botany. Any spontaneous inclination he might feel towards botanical pursuits must have been confirmed and encouraged by associating with his brother-in-law Mr. James Dickson, who, having settled in London as a nurseryman and seedsman, and having attracted the notice of Sir Joseph Banks, had acquired considerable reputation as a scientific botanist. A tour which Park made through the Highlands with this gentleman during one of the summers of his college life, contributed much to his progress in the science of botany.

On the completion of his studies at Edinburgh, Park repaired to London. Mr. Dickson introduced him to Sir Joseph Banks, through whose interest he obtained the appointment of assistant-surgeon to the Worcester, East Indiaman. He sailed in that vessel in the month of February 1792, on a voyage to Sumatra, and returned to England in the course of the following year. He availed himself of the opportunities afforded him by this voyage to extend his acquaintance with natural history. The third volume of the 'Linnæan Transactions' contains a paper read by Park on the 4th of November 1794, containing descriptions of eight fishes, not previously described, from the waters of Sumatra, which he represents as the fruits of his leisure hours during his stay on that coast.

At the time of Park's return, the exertions of the African Association had concentrated a strong interest upon that quarter of the globe. Under the guidance of Major Rennell the Association had collected and published, in a systematic form, a considerable amount of information relative to the interior of Africa. The problem which at that moment more especially engaged their attention was the existence and course of the river mentioned by some ancient geographers by the name of Niger. Intelligence had been recently received of the death of Major Houghton, who had been sent out by the Association for the purpose of exploring the course of the Niger, and much difficulty was experienced in finding a successor. Park's attention was naturally attracted to the subject through his connection with Sir Joseph Banks, one of the most active and influential members of the Association. A liberal reward had been offered to any person willing to proceed on the arduous mission who should be found qualified for it. Park had a general passion for travelling; he was in the full vigour of youth; he had some experience of a hot climate; he was not insensible to the

distinction to be acquired by a discoverer in African geography: he offered his services to the Association, and, after inquiry into his qualifications, the offer was accepted. Two years elapsed however between his return from India and his departure on his African expedition. With the exception of the time occupied by a short visit to Scotland in 1794, he seems to have resided during the whole of this period in London or the neighbourhood, chiefly occupied in acquiring the knowledge and making the preparations necessary for his undertaking.

He sailed from England on the 22nd of May 1795, and reached Pisanía, a British factory about 200 miles up the Gambia, on the 5th of July. Here he remained several months in the house of Dr. Laidley, learning the Mandingo language and collecting information concerning the countries he was to visit. For two of these months he was confined by a fever contracted by imprudent exposure during the rainy season. He left Pisanía on the 2nd of December 1795. After passing through the territories of a number of petty negro chiefs, he was induced, in order to avoid the suspicion of being a spy, which might have attached to him had he passed from the territories of the chief of Kaarta into those of the chief of Bambara, those sovereigns being then at war, to adopt a more northerly route across the territory of Ludamar, then governed by the chief of a predatory horde of nomad Moors. He reached Yarra, the frontier town of this state, on the 18th of February 1796. Ali, the Moorish chief, detained him a captive till the 1st of July. When Park made his escape he possessed nothing more than a horse with its accoutrements, a few articles of clothing, and a pocket-compass, which he had saved from the Moors by concealing it in the sand. Undismayed by his destitute and lonely condition, he pushed on to the Nil-el-Abid, or Johba, which he reached at Sego, after a journey of fifteen days; explored the stream downwards to Silla and upwards to Bammakoe, then crossed a mountainous country to Kamalia, a Mandingo town, which he reached on the 14th of September. Here, 500 miles from the nearest European settlement, his health gave way, undermined by the fever which had attacked him at Pisanía, and by the vexations and sufferings to which he had been exposed. For upwards of a month he was rendered helpless by a fever among a race which, though alive to human sympathy, could neither think nor feel as he thought and felt. He was detained in the same place five months after his recovery before he could obtain the means of journeying to the coast. At last, on the 10th of June 1797, he returned to Pisanía, and was received by Dr. Laidley "as one risen from the dead." His lonely and toilsome wanderings had occupied upwards of nineteen months.

His unexpected return, the rumours which went abroad regarding his adventures and the strange countries he had visited, excited eager curiosity in the public mind. An abstract of the expedition, prepared by Mr. Bryan Edwards, secretary to the African Association, from materials furnished by the traveller himself, was printed and distributed among the members. To this abstract a memoir by Major Rennell was annexed, consisting of geographical illustrations of Park's journey. It was at the same time announced that a complete narrative would be prepared and published by Park himself. The composition of this work occupied him till the spring of 1799, when it was published. His principal place of residence while engaged upon it was London; and while there he was in constant communication with Major Rennell and Mr. Bryan Edwards, especially the latter. The summer and autumn of 1798 he spent among his relations in Scotland, his head-quarters being Fowlshiel, at that time occupied by his mother and one of his brothers. The accounts subsequently collected from his family represent him as leading then the life of a hard student, employed on his papers during the whole of the morning, and allowing himself scarcely any recreation beyond a solitary walk on the banks of the Yarrow. He adopted the abstract of Bryan Edwards as the framework of his book; and Major Rennell's memoir was added as an appendix. The work was well received; two impressions were rapidly sold off. The profits of publication and the liberal remuneration he received from the Association placed him for the moment in easy circumstances.

In 1799 he retired to his native country, and in the August of that year married the daughter of Mr. Anderson, with whom he had served his apprenticeship. He continued to reside for upwards of two years subsequent to his marriage, in the house of his mother, unable or unwilling to settle to any steady employment. At last a favourable opportunity for commencing the practice of his profession occurring in Peebles, he settled with his family in that town in October 1801. Park soon obtained a good share of the business of the neighbourhood, but his profits were inconsiderable. In other respects his situation was agreeable. He was a man of retired habits, who sought and found his happiness in the family circle. There were however in the neighbourhood some minds who could appreciate the intellectual and moral worth that lay beneath his cold exterior. Among these were Dr. Adam Fergusson, at one time professor of moral philosophy in the University of Edinburgh, and author of the 'History of Rome,' and Mr. (afterwards Sir Walter) Scott. He also received marked personal attentions from Mr. Dugald Stewart. But the gratification of being appreciated by such men and enjoying their society was no sufficient counterpoise to the harassing reflection that his income was inadequate and his family increasing. His mind too

had never ceased to dwell upon foreign adventure. An overture made to him on the part of government in 1798, to take a part in a survey of Australia, then in contemplation, had been renewed in 1799, but without any other result than that of keeping Park's mind unsettled. In 1801, the prospect of an appointment on the surgical staff at Goree, which had been recently captured from the French, seems to have crossed his mind. In 1801 he learned, by a letter from Sir Joseph Banks, that the Association would probably, in the event of peace, renew their efforts in African discovery, and that Park would certainly be recommended as the most eligible person to be employed. In the autumn of 1803 he received a letter from the office of the colonial secretary of state, requesting his immediate attendance in London. The result of his interview with Lord Hobart was his acceptance of the proposal from government that he should command an expedition of discovery into the interior of Africa, and that the expedition should leave England in the end of February. Some changes in the cabinet caused a postponement. Doubts that began to be entertained of the practicability of the attempt occasioned a further delay. It was not till the 30th of January 1805 that Park actually sailed from Portsmouth. The interval he had employed, at the suggestion and expense of government, in obtaining a knowledge of the Arabic language, and improving himself in the practice of making astronomical observations.

Park had adopted Mr. Maxwell's opinion, that the Congo and the Niger were one stream; and his plan was, with a supply of merchandise sufficient to defray travelling expenses, and a body of soldiers sufficient to insure immunity from hostile attacks, to cross from the Gambia to the Niger, and then sail down the stream to the ocean. The expedition, as it started from Pissania, consisted of himself, his brother-in-law Mr. Anderson, surgeon, and Mr. George Scott, draughtsman to the expedition, five artificers from the royal dock-yards, Lieutenant Martyn and 35 privates of the Royal African corps stationed at Goree, and Isaac, a Mandingo, a priest and trader, the guide. Supplies of asses had been purchased at St. Jago and Goree to carry the merchandise. The expedition left Pissania on the 4th of May 1805.

Park's journal, completed up to the time of his departure from Sansanding, and some letters which he despatched along with it, bring the narrative of his adventures down to that period. To Mrs. Park he wrote, on the 19th of November—"We have already embarked all our things, and shall sail the moment I have finished this letter." In his letter to Lord Camden (Lord Hobart's successor in the Colonial Office), he said—"I am sorry to say that of forty-four Europeans who left the Gambia in perfect health, five only at present are alive, viz. three soldiers (one deranged in his mind), Lieutenant Martyn, and myself." He added—"We had no content whatever with the natives, nor was any one of us killed by wild animals or any other accidents;" and again—"Your lordship will recollect that I always spoke of the rainy season with horror, as being extremely fatal to Europeans, and our journey will furnish a melancholy proof of it." Isaac stated on his return to the Gambia that Mr. Park arrived at Foulah Dougon with thirty-three white men; and from Foulah Dougon to Sego (which was eight days' march, but which is generally performed in three days by a negro), they lost twenty-six men by the rains, damps, &c.

At Sansanding Park dismissed Isaac, and took, upon his recommendation, a man named Amadi Fatouma to guide him to Haoussa. From this man was procured the only direct contemporary evidence regarding the fate of Park and his companions that has been obtained. His accuracy however is established by a strong body of circumstantial evidence: the traditions of the fate of some white men, collected by Clapperton and Lander, on the spot where Fatouma stated that Park and his companions had perished; muskets with the Tower stamp, seen by Lander at Wowow, and said to have been the property of the white men who perished at Boussa; a book of tables seen by Lander at Boussa, among the leaves of which was found a card of invitation to dinner, addressed to Mr. Park by a Mr. Watson, and dated "Strand, 9th November 1804." The story of Amadi Fatouma, corroborated in its essentials by these circumstances, is briefly this:—That in sailing down the Niger they had repeated engagements with the natives; that on arriving at Yaouri, Fatouma's engagement having terminated, he quitted Mr. Park; that after Mr. Park's departure the chief of Yaouri informed the king (falsely) that the white men had departed without giving the customary present; that the king in rage imprisoned Fatouma, and sent an armed force to intercept the white men at the narrows of the river; that on his release from prison Fatouma learned from a slave (the only survivor of Park's party) that during a skirmish which ensued the boat was sucked into a rapid, and that the white men, in attempting to make their escape, were drowned.

Thus perished Mungo Park, towards the close of 1805, in the thirty-fifth year of his age. In person he is said to have been tall and athletic. His manner was cold and reserved, attributable in part to that awkwardness which men conscious of their own powers are apt to feel in society when the circumstances of their early life have kept them from mingling with it. His last letter to Mrs. Park (in which he affects a degree of confidence and hope he could not possibly have felt, to allay her apprehensions), and many little incidents in his brief history show the warmth and strength of his attachments. His

judicious conduct while detained by the Moorish chief would alone be sufficient to establish his reputation for the control of his passions; and what he achieved in his first journey, together with the simple striking language of his last letter to Lord Chatham, show the power of his determination and perseverance. His acquirements in natural history were necessarily limited; for in Scotland, where he laid their foundation, that branch of knowledge was only beginning to attract attention, and his residences in London were brief, and occupied with other matters. It was not till the eve of his departure on his second journey that he acquired the Arabic language, not only the best medium of communication with the Moors and Arabs, but the only key to the civilisation of Africa, such as it is. His converse with astronomy does not seem, even at the time of his second journey, to have gone beyond the power of making with accuracy the necessary observations for the ascertaining of latitudes and longitudes; and at the time of his first journey seems to have been limited to the power of observing for the latitude with the sextant. On his first journey he lost all his instruments, with the exception of a pocket-compass, when taken prisoner by the Moors. On his second journey he was better provided; but his only chronometer seems to have been very defective. These deficiencies however in acquirements and apparatus were to a great extent counterbalanced by a calm courageous self-possession, an unwearied power of observation, and a modest scrupulous veracity that enables us to rely upon his statements as in no instance exaggerated.

Almost the whole of the country which he traversed may be regarded as having been before him unvisited by Europeans. His ignorance of Arabic on his first journey exposed him to misapprehend the Arabs; but his detention in a Mandingo village enabled him to master the domestic life of the negroes and their civil and economical organisation. His meteorological and botanical observations are valuable; his geological are less so. Walcknaer and his echo Bowditch have impugned the trustworthiness of his observations for latitude on his second journey, on account of an entry in his journal, "31st April," that month having only 30 days. But Oltmanns has satisfactorily established, in an elaborate and able paper in the 'Transactions of the Berlin Royal Academy,' by comparison of the data stated in Park's journal with the Ephemerides of the 'Nautical Almanac' for 1805, that by whatever oversight he may have written "31st April," he was perfectly correct in his reckoning when he made his observations. On the other hand Oltmanns (in the 'Abhandlungen der König. Acad. der Wissenschaften zu Berlin aus dem Jahre 1831') has pointed out a circumstance which vitiates Park's calculations of his observations for longitude: the confusion arising out of the substitution, without sufficiently explicit warning, in 1805, in the Ephemerides of the 'Nautical Almanac,' of *mean time* for apparent time, in the tables for the eclipses of Jupiter's satellites. Unluckily, Park has stated only in one instance (Bee-creek) the whole of the data upon which his longitudes were calculated; and consequently in that one instance alone can his oversight be corrected. Only one opinion can be entertained of the sound judgment displayed by Park in his conduct during his first journey as a solitary traveller. His judgment in the estimation of obstacles and the calculation of forces by which they might be overcome in planning the expedition in which he persisted, is more open to challenge; but he did not seek to shun the consequences. A question regarding the degree of credit due to him in a literary point of view for the narrative of his first travels, seems really of little consequence. It is clear that, unaccustomed to literary composition, he formed his book upon the model of Bryan Edwards's abstract; but that it was his own composition there seems no good reason to doubt. Either owing to natural good taste, or a lucky want of facility in sentence-turning, his style is far less turgid than that of his model.

PARKER, MATTHEW, a very eminent name in the catalogue of illustrious Englishmen. That he attained to the highest dignity in the English church is not the sole proof of his claim to be so spoken of; but that he was an eminent scholar as well as a great churchman, a cultivator of historical literature as well as a great proficient in theological learning, and that he was archbishop of Canterbury in that critical period when the English Protestant or Reformed Church was in its infancy, and that he fulfilled the purposes of those who placed him in that high dignity by the skill with which he conducted the very difficult operations necessary at that time for its formation in a certain order and its perpetual existence. He was born in the city of Norwich, in 1504; and was educated in Corpus Christi College, Cambridge, being intended for the Church. He was so diligent in his studies, especially of the Scriptures and the fathers, that before he was thirty he was fixed upon by Wolsey to be one of his professors in the college which he meant to found at Oxford. This honour however Parker declined, probably in consequence of having attached himself to the reforming party in the Church, with some of the more eminent of whom he was by that time become intimate. At this early period of his life he had a licence to preach.

We must pass lightly over the succession of his preferments during the reigns of Henry VIII. and Edward VI. Besides having two or three benefices, he was made an archdeacon in 1526; dean of the college of Stoke Clare, his favourite piece of preferment, 1535; one of the king's chaplains, 1537; master of Corpus Christi College,

1544; dean of Lincoln, 1552. In 1545 he was vice-chancellor of his university.

He took a wife in 1547. One of the measures of the reign of Queen Mary, by which it was hoped to re-establish the Church in its former state and order, was to deprive the married clergy of all their benefices and preferments. This removed from the Church at one stroke no small number of the more zealous reforming divines. It is marvellous that Parker fared no worse in the reign of Mary. It does not appear that he even found it necessary to leave England, but rather that he continued to live quietly in the eastern counties, pursuing his theological studies. Very soon after the death of Mary, and when Elizabeth had ascended the throne, he was summoned from his retirement, and induced to accept at once the high dignity of archbishop of Canterbury. His consecration took place on December 17, 1559.

He was archbishop more than fifteen years, during which time he was assiduously employed in watching over the interests of the reformed Church, and in giving it that consistency and order which the Church of England has since maintained. We cannot enter into the detail of what he did, but we must not forbear to mention that the preparation of the great work called the Bishops' Bible was performed under his auspices, and that the work was completed in 1568. Whoever wishes for more information respecting the labours of this eminent father of the English Protestant Church, and the minute particulars of his history and character, may be abundantly satisfied by consulting the folio Life of him written by the indefatigable Strype. He died May 17, 1575.

Parker is not to be estimated solely by what he did as an ecclesiastic. He collected a large library of valuable manuscripts, which he gave to his college in Cambridge, where he founded also divers fellowships and scholarships. The manuscripts still remain, having been very carefully preserved. There is a minute and excellent catalogue of them in print by Nasmith, who made also a catalogue of the manuscripts in the Public Library at Cambridge, which has never been printed. Parker gave encouragement to Saxon literature by the publication of a Saxon homily. He caused to be printed also the 'Chronicles of Matthew of Westminster and Matthew Paris;' and there is an original treatise, 'De Antiquitate Britannicæ Ecclesiæ,' which is usually attributed to him, and in the preparation of which he had no doubt much concern.

PARKER, SAMUEL, a prelate of the English Church, was born at Northampton in September 1640. He was of Puritan extraction, and was remarked for certain Puritan extravagances, when, as a young man, he entered Wadham College, Oxford. But at Oxford he became acquainted with several persons of a very different turn of mind, and particularly with Dr. Ralph Bathurst, who is said by the writers of his 'Life' to have been chiefly instrumental in drawing him away from a party which was marked for persecution and extinction. He had an active pen, which he employed about the time of the Restoration, and for a few succeeding years, in repeated attacks on the Puritan, or, as it then was become, the Non-conforming party. The controversy is almost forgotten, and we think it needless to recount the titles of his tracts. One of his writings, a Discourse in Vindication of Bishop Bramhall, called forth the 'Rehearsal Transposed' of Andrew Marvell in which Parker was very severely handled, and to which he replied in 'A Reproof to the Rehearsal Transposed,' but Marvell's wit was too much for him, and in everything he subsequently wrote, he showed how keenly he felt the castigation.

He was favoured and promoted in the Church. In 1667 he was made chaplain to Archbishop Sheldon, in 1670 he became archdeacon, and in 1672 a prebendary of Canterbury, and had the livings of Ickham and Chartham.

When King James II. contemplated the re-union of England to the general Church, with its head in the Roman pontiff, he looked among the English divines for persons who might be willing to assist in his designs, and amongst other persons, he fixed upon Parker, who was made by him Bishop of Oxford, in July 1686: and when Hough was deprived of the presidency of Magdalen College, it was given to Parker. It is said that he was strongly inclined to popery: but how far he would have gone with the king in that direction, cannot well be fully determined, as his life was cut short soon after he had obtained this dignity. He died at Magdalen College, on March 20, 1688.

The only writing of Bishop Parker of any permanent reputation is a treatise entitled 'De Rebus sui Temporis Commentarius,' but it is disfigured by his party virulence, is in no respect trustworthy, and to us seems extremely dull. This treatise was not published till 1726, when it was given to the world by his son, a second Samuel Parker, an eminent non-juring divine.

PARKES, JOSIAH and JOSEPH, see vol. vi. col. 1016.

PARKHURST, JOHN, was the second son of John Parkhurst, Esq., of Catesby, in Northamptonshire. He was born in June 1723, and educated at Rugby Grammar School, and afterwards at Clare Hall, Cambridge, where he took the degree of B.A. in 1748, and that of M.A. in 1752. He was for some years a fellow of his college. He took orders in the Church of England, but never obtained any preferment, having succeeded to a considerable estate, which rendered him independent. He acted, without receiving any salary, as curate of the church at Catesby, the preferment of which was in his own gift. In 1754 he married Susanna Myster, daughter of John Myster, Esq., of

Epsom in Surrey. She died in 1759, leaving him a daughter and two sons. In 1761 he married Millicent Northey, by whom he had a daughter, Mrs. Thomas, who became eminent for her learning: she wrote her father's epitaph in Epsom church.

Parkhurst died at Epsom on the 21st of March 1797. He was a man of great integrity and firmness of character. He always lived in retirement, though he possessed qualities which fitted him to shine in society. In spite of a weak constitution he was a most laborious student, rising for many years at five o'clock in the morning.

His first work was 'A Serious and Friendly Address to the Rev. John Wesley,' 1753, remonstrating against the doctrine of the faith of assurance as held by that divine. In 1762 he published the first edition of his 'Hebrew and English Lexicon, without Points,' with a Hebrew grammar, which has passed through several editions. His 'Greek and English Lexicon to the New Testament,' with a Greek grammar, appeared in 1769. Of this work there are several editions, both in quarto and octavo: the first of the octavo editions was edited by his daughter, Mrs. Thomas. A new edition, by the Rev. Hugh James Rose, B.D., was published in 1829. The only other work published by Mr. Parkhurst was 'The Divinity and Pre-existence of our Lord and Saviour Jesus Christ demonstrated from Scripture, in answer to the First Section of Dr. Priestley's Introduction to the History of Early Opinions concerning Jesus Christ,' 8vo, London, 1787. Dr. Priestley replied to this work in 'A Letter to Dr. Horne.'

Parkhurst's lexicons, though now superseded, enjoyed a considerable reputation from the time of their first appearance. They are however disfigured by many fanciful and ridiculous etymologies, and they bear traces of the Hutebisonian opinions of their author.

PARME'NIDES (Παρμενίδης), the second in the series of the Eleatic philosophers, was a native of Elea. He was descended from a noble family, and is said to have been induced to study philosophy by Aménias. (Diog. Laert., ix. 21.) He is also stated to have received instruction from Diocletus the Pythagorean, to whom he erected an herom. Later writers inform us that he heard Xenophanes, the founder of the Eleatic school; but Aristotle ('Met., i. 5) speaks of it with some doubt. We read that Parmenides gave a code of laws to his native city, which was so highly esteemed that at first the citizens took an oath every year to observe it. (Diog. Laert., ix. 23; Plat., 'Adv. Colot., 32; Strabo, vi., p. 252, Casaub.)

The time when Parmenides lived has been much disputed. According to Plato ('Parmenid., p. 127), Parmenides, at the age of sixty-five, accompanied by Zeno, at the age of forty, visited Athens during the great Panathenæa, and stopped at the house of Pythodorus. As this visit to Athens probably occurred about a.c. 454 (Clinton, 'Fast. Hell., p. 364), Parmenides would have been born about a.c. 519. But to this date two objections are urged: first, that Diogenes Laertius (ix. 23) says that Parmenides flourished in the 69th Olympiad, that is, about a.c. 503; and consequently, if he was born a.c. 519, he would only have been about sixteen in the 69th Olympiad; and secondly, that Socrates is stated by Plato, in his dialogue entitled 'Parmenides,' to have conversed with Parmenides and Zeno on the doctrine of ideas, which we can hardly suppose to have been the case, as Socrates at that time was only thirteen or fourteen. Athenæus (xi., p. 505) accordingly has censured Plato for saying that such a dialogue ever took place. But in reply to these objections it may be remarked, first, that little reliance can be placed upon the vague statement of such a careless writer as Diogenes; and, secondly, that though the dialogue which Plato represents Socrates to have had with Parmenides and Zeno is doubtless fictitious, yet it was founded on a fact that Socrates when a boy had heard Parmenides at Athens. Plato mentions, both in the 'Theætetus' (p. 183) and the 'Sophistes' (p. 127), that Socrates was very young when he heard Parmenides.

We have no other particulars respecting the life of Parmenides. He taught Empedocles and Zeno, and with the latter he lived on the most intimate terms. (Plat., 'Parm.,' 127.) He is always spoken of by the ancient writers with the greatest respect. In the 'Theætetus' (p. 183), Plato compares him with Homer; and in the 'Sophistes' (p. 237), he calls him "the Great." (Compare Aristot., 'Met., i. 5.)

Parmenides wrote a poem, which is usually cited by the title 'Of Nature'—Περὶ φύσεως (Sext. Empir., 'Adv. Mathem.,' vii. 111; Theophrastus, 'Ap. Diog. Laert.,' viii. 55), but which also bore other titles. Suidas ('Parmenid.') calls it φύσις; and adds, on the authority of Plato, that he also wrote works in prose. The passage of Plato ('Soph.,' p. 237) however, to which Suidas refers, perhaps only means an oral exposition of his system, which interpretation is rendered more probable by the fact that Sextus Empiricus ('Adv. Mathem.,' vii. 111) and Diogenes Laertius (i. 16) expressly state that Parmenides only wrote one work. Several fragments of this work, 'On Nature,' have come down to us, principally in the writings of Sextus Empiricus and Simplicius. They were first published by Stephanus in his 'Poesis Philosophica' (Par., 1573), and next by Fülleborn, with a translation in verse, Züllichau, 1795. Brandis, in his 'Commentationes Eleaticæ,' Altona, 1815, also published the fragments of Parmenides, together with those of Xenophanes and Melissos; but the most recent and most complete edition is by Karsten, in the second volume of his 'Philosophorum Græcorum veterum, præsertim qui ante Platonem floruerunt, Operum Reliquiæ,' Brux., 1835.

The fragments of his work which have come down to us are sufficient

to enable us to judge of its general method and subject. It opened with an allegory, which was intended to exhibit the soul's longing after truth. The soul is represented as drawn by steeds along an untrodden road to the residence of Justice (Diké), who promises to reveal everything to it. After this introduction the work is divided into two parts: the first part treats of the knowledge of truth, and the second explains the physiological system of the Eleatic school.

PARMENIO, a Macedonian general, who distinguished himself in the service of Philip, father of Alexander the Great. He gained a decisive victory over the Illyrians, about the time of Alexander's birth, and the news of both events reached Philip, who was then absent from his capital on some expedition, together with that of his having won the prize at the Olympic games. Philip, while preparing to invade the Persian empire, sent a considerable force into Asia as an advanced guard, and he chose Parmenio and Attalus as the leaders of the expedition. These commanders began by expelling the Persian garrisons from several Greek towns of Asia Minor. Parmenio took Gryneum in Æolis, the inhabitants of which, having sided with the Persians, and fought against the Macedonians, were sold as slaves. When Alexander set out on his Asiatic expedition, Parmenio had one of the chief commands in the army. At the head of the Thessalian cavalry he contributed materially to the victory of the Granicus; and at Issus he had the command of the cavalry on the left wing, which was placed near the sea-coast, and had to sustain for a time the principal attack of the Persians. In the field of Gaugamela, he advised Alexander not to give battle until he had well reconnoitred the ground. Being in command of the left wing he was attacked in flank by the Persians, and was for a time in some danger, until Alexander, who had been successful in another part of the field, came to his assistance. Parmenio afterwards pursued the fugitives, and took possession of the Persian camp, with the elephants, camels, and all the baggage.

When Alexander marched beyond the Caspian gates in pursuit of Darius and Bessus, he left Parmenio, who was now advanced in years, in Media, at the head of a considerable force. Some time after, whilst Alexander was encamped at Artacoana, a conspiracy is said to have been discovered against his life. The informer was a boy of infamous character, and the persons accused were officers, though not of exalted rank. The informer said that he had first told his secret to Philotas, the son of Parmenio, who had daily access to Alexander, but who had taken no notice of it for two days, at the end of which time, through the means of another officer near Alexander's person, the information was conveyed to the king. This threw strong suspicion upon Philotas, who however was not implicated by either the informer or any of the accused in their confessions. But Craterus, who had an old jealousy against Philotas, on account of the favour the latter enjoyed with the king, encouraged the suspicions of Alexander, who recollected what Philotas had said at the time when he claimed Jupiter Ammon for his father—he pitied those who were doomed to serve a man who fancied himself a god. Craterus had also for some time previous bribed a courtesan kept by Philotas, who reported to him, and through him to the king, all the boastful vapourings and expressions of discontent uttered by Philotas in his unguarded moments. In short, Alexander, according to Curtius, was induced to order Philotas to be tortured, in consequence of the suggestions of Craterus, Hephæstion, and others of the king's companions. Cœnus, who had married the sister of Philotas, was one of the most violent against the accused, for fear, it was supposed, of being thought an abettor of his brother-in-law. The torture was administered by Craterus himself, and Philotas, after enduring dreadful agonies, confessed, though in vague terms, that he had conspired against the life of Alexander, and that his father Parmenio was cognisant of it. This being considered sufficient evidence, Philotas was stoned to death, and Alexander despatched a messenger to Media with secret orders to Cleander and other officers who were serving under Parmenio, to put their commander to death. The unsuspecting veteran, while conversing with his officers, was run through the body by Cleander. This is the substance of the account of Curtius (vi. and vii.), a compiler by no means unfavourably disposed towards Alexander.

Arrian, after stating that he derived his knowledge of these occurrences from the work of Ptolemæus, briefly says that Philotas was charged by Alexander, before the assembled Macedonians, with having conspired against him: that Philotas at first succeeded in justifying himself, but that afterwards fresh evidence was produced to criminate him, and among other arguments urged against him on his trial, one of the strongest was, that having received information of a plot against the king's life, he did not reveal it, although he had access to Alexander's person twice a day. The result of the trial was that Philotas and his accomplices were run through with spears by the Macedonians. Alexander despatched Polydamanthus to Media with letters for Cleander, Sitalces, and Menides, three officers who were serving under Parmenio. Parmenio was put to death, pursuant to the orders of Alexander: "Whether it was," Arrian observes, "that Alexander thought it unlikely that Parmenio should be ignorant of the treachery of his son Philotas, or that, even if he was ignorant of it, it appeared to Alexander a dangerous thing to leave him alive after the execution of his son, especially as Parmenio's authority was so great with the troops, both Macedonian and auxiliary." (Arrian, b. iii.)

BIOC. DIV. VOL. IV.

Whatever may be thought of the trial and execution of Philotas, and it appears to have been at least a summary and unsatisfactory proceeding, the murder of Parmenio and the manner of it form one of the darkest blots in Alexander's character. Parmenio was evidently sacrificed in cold blood to what have been styled in after-ages 'reasons of state.' He was seventy years of age; he had lost two sons in the campaigns of Alexander, and Philotas was the last remaining to him. Parmenio appears to have been a steady, brave, and prudent commander.

PARMIGIANO, FRANCESCO MAZZUOLI, sometimes called, in the diminutive form, PARMIGIANINO, was born at Parma, January 11, 1504, and was the son of Filippo Mazzuoli, called dell' Erbetta. He studied painting under his uncles Michele and Filippo and his countryman Marmitta. In his sixteenth year he finished a picture of the Baptism of Christ, now in the palace of Count Sanvitati. Correggio's visit to Parma 1521 made him acquainted with the style of that master. In 1522 he painted, among other works, a Madonna with the Child, and St. Jerome and St. Bernardin (in the convent Della Nunziata), but which has suffered from time and the hands of unskillful restorers. In hopes of giving Pope Clement VII. proofs of his skill, he went in 1523 to Rome, where the sight of the works of Raffaele made a deep impression on him. In his subsequent works he endeavoured to combine with the grace of Raffaele the contrasts of Michel Angelo and the grace and harmony of Correggio; whence he was called *Il Raffaellino*. On the taking of Rome, 1527, when he sustained considerable loss, he went to Bologna, where the engraver Fantuzzi, commonly called Antonio de Trento, stole several of his drawings, which were afterwards found in the collection of the Earl of Arundel, and brought back to Italy by Count Zanetti, who published them in 1749, admirably cut on wood and printed in colours.

Among the finest works executed by Parmigiano in Bologna were St. Rochus, painted for the church of St. Petronius, the Madonna della Rosa, now in the Dresden Gallery, which he had changed from a Venus to a Madonna, and the St. Margaret. He afterwards returned to his own country, where he painted the Cupid fashioning his bow, with two infants at his feet, one laughing, and the other crying, of which there are numerous repetitions; and began to adorn with several paintings the newly built church Della Steccata. But his health being greatly weakened, he was unable to work, and the directors of the building threw him into prison, as he had received a sum of money in advance. They indeed set him at liberty on his promise to complete the work; but indignant at this treatment, he fled to Casal Maggiore, where he died August 24, 1540, in his thirty-seventh year. His works, especially his easel pieces, are very scarce. The predominant features of his style are elegance of form, grace of countenance, contrast in the attitudes, perfect knowledge of the chiaroscuro, and the charm of colour. But his figures are often characterised by excessive slenderness rather than real elegance of form, and his grace sometimes degenerates into affectation and his contrasts into extravagance. Parmigiano was celebrated for the care and freedom with which he designed, and for those bold strokes of the pencil which Albano calls divine. There are few altar-pieces by him: the most valued is that of St. Margaret in Bologna, a composition rich in figures, which was studied by the Caracci, and which Guido even preferred to the St. Cecilia of Raffaele. In the National Gallery is a large painting (11½ feet by 5 feet) of the Vision of St. Jerome, painted in 1527 for the church of San Salvatore di Lauro at Città di Castello.

The etchings of Parmigiano are universally known as models of taste, delicacy, and freedom. He has been erroneously considered as the inventor of the art of etching, which was practised by Albert Dürer before him; but he was the first who introduced it into Italy.

PARNELL, THOMAS, was born in Dublin in 1679. He entered Trinity College, Dublin, at the age of 13, and became Master of Arts in 1700. In the same year, though under the canonical age, he was ordained a deacon, a dispensation having been granted by the Bishop of Derry. About three years afterwards he took priest's orders; and in 1705 received the archdeaconry of Clogher from Dr. Ashe, the bishop of the diocese. Nearly at the same time he married Mrs. Anne Minchin, by whom he had two sons and a daughter. Parnell was on a familiar footing with the leading wits of the time of Queen Anna. On the ejection of the Whigs, towards the close of her reign, he abandoned that party, to which he had been previously attached, and was cordially welcomed as an adherent by the Oxford administration. His hopes of preferment from this quarter however were disappointed by the dismissal of the Tories from office on the death of the queen. Thereafter he is represented to have fallen into intemperate habits, occasioned, it is said, chiefly by the untimely death of one of his sons, or the loss of his wife, who died in 1712. On the recommendation of Swift, he obtained a prebend from Archbishop King in 1713; and in May 1716, was presented to the vicarage of Finglans. He died at Chester, on his way to Ireland, in July 1717, in the thirty-eighth year of his age. A selected edition of his poems was published by Pope soon after his death, and dedicated to the Earl of Oxford. A volume, said to contain his posthumous works, the authenticity of which is doubtful, appeared in Dublin in 1758. As a poet, Parnell is principally remarkable for the smoothness and ease of his versification, and the elegance and purity of his sentiments. The pieces on which

his fame must rest are, the 'Rise of Woman,' the 'Fairy Tale,' the 'Hymn to Contentment,' 'Health,' the 'Vigil of Venus' ('Pervigilium Veneris'), the 'Night-Piece on Death,' the 'Allegory on Man,' and 'The Hermit.' Parny was the author of the 'Life of Homer' prefixed to Pope's translation, certain papers in the 'Spectator' and 'Guardian,' and various unacknowledged performances.

PARNY, EVARISTE-DÉSIRÉ-DESFORGES, Chevalier and afterwards Vicomte De Parny, was born in the Isle of Bourbon, on the 6th of February 1753. At the age of nine he was sent to France and placed at the College of Rennes; but he appears to have shown considerable indifference to the course of studies which was followed there. His imagination, which even at an early age had taken the almost entire guidance of his conduct, impressed him as he grew up with the belief that he was called upon to embrace the ecclesiastical profession, and it is said that he attempted to join the brotherhood of La Trappe. An effort of imprudent zeal however, on the part of the confessor whom he had chosen as his spiritual guide, produced a rapid change in the mind of the young convert, and he is related to have fallen into an opposite extreme of conduct, and soon after, entering into all the dissipations of youth, finally to have enrolled himself in the military profession. He returned to his native island at the age of twenty, where he became acquainted with a young creole lady, the Eleanor of his verse, which acquaintance his fervent imagination soon converted into the most ardent attachment. Their mutual love inspired his first poetical effusions, which paint with grace and freshness, though perhaps in too vivid colours, the all-absorbing passion of his soul. The affections however of the lady were of an evanescent nature; a marriage of interest, which she contracted at the desire of her parents, induced Parny to return to France. Distance and time were unable to efface his sad reminiscences, and he there continued to translate into the language of poetry the feelings which appear to have taken a lasting possession of his mind. In 1775 was published his first collection of elegiac poems, which have been so much admired by his countrymen that they have earned for him the title of the French Tibullus. On the breaking out of the French Revolution he became deprived of the property which he had inherited from his father, and he was compelled to obtain a livelihood by the cultivation of his talents. A painful and striking change now appears in his writings, which he had the weakness to adapt to the prevalent taste of a corrupt age. The rival of Tibullus became the feeble copyist of Voltaire, and his 'Paradis perdu,' 'Galanteries de la Bible,' and 'Guerre des Dieux,' by their disgusting profaneness and absence of genuine poetical feeling, will only be remembered by posterity as indications of the state of society at a period when "everything evil was rank and luxuriant." So strong indeed was the feeling excited against Parny even in France on account of the last mentioned of these three poems, that his name was repeatedly passed over among the candidates for the honours of the Institute. However he was admitted into it in 1803, in the place of Devaines. Most of his other poems are inferior to his early productions; his 'Goddam,' published in 1804, is a spiritless and insipid parody on the invasion of England by the Normans; his 'Isnel and Aelôga,' though possessed of more merit, is but a feeble imitation of the Scandinavian style of poetry; but among his later productions there are two small poems, one on the culture of flowers, and the other entitled 'Journée Champêtre,' which for simple beauty and delicacy of colouring are deserving of being ranked among the finest specimens of lyric poetry. His principal poem, in eighteen cantos, on the loves of the Queens of France, was destroyed by him from fear of its falling into the hands of the suspicious judges of the Revolutionary Tribunal. He died in Paris, after a painful and lingering illness, on the 5th of December 1814.

His works have been published in 5 vols. 8mo, by Didot, Paris, 1803, and at Brussels, in 2 vols, 8vo. The best edition however is that by M. Boissonnade in the 'Collection de Classiques Français,' Lefevre, Paris, 1827. A volume was published in 1826 entitled 'Les Poésies inédites de Parny,' with a notice on his life and writings by M. Tissot.

PARR, CATHERINE. [HENRY VIII.]

PARR, SAMUEL, was born in 1747, at Harrow-on-the-Hill, where his father was a surgeon and apothecary. He was early distinguished for his love of books and his aptitude at learning. He received his education at the grammar-school of Harrow, and gave the highest satisfaction to the masters under whom he was placed, and who predicted his future eminence. In his fifteenth year he was removed from school and put to the business of his father. But the progress he had made in classical literature, and the intellectual habits he had formed, enabled him to continue his studies with the greatest advantage and success. Being disgusted with the employment selected for him, and having early displayed a grave and serious disposition, a predilection for the clerical profession, and an attachment to ecclesiastical pomp and circumstance, it was at length determined to send him to the university. Accordingly, in 1765, in his nineteenth year, he was entered at Emmanuel College, Cambridge, where he applied himself with great diligence to classical and philological pursuits. But his father dying soon after, he was compelled, before he had taken a degree, to relinquish his academic career, where so bright a prospect was opening upon him, and in 1767 became one of the assistants in Harrow School. In this situation he remained five years, with the greatest credit to himself; and on the death of Dr. Sumner offered

himself as a candidate for the vacant mastership, but without success. His youth was the ostensible, while in all probability his politics were the real objection against him in the mind of the governors. With bitterness of spirit he now left the place of his birth and the scenes of his boyhood, and kept a school successively at Stanmore, at Colchester, and at Norwich. In 1786 he settled at Hatton in Warwickshire, to the small living of which place he had been presented; and here he spent the remainder of his life, in discharging the duties of his parish, in the instruction of youth, and in accumulating those stores of philological learning for which he became so eminently distinguished. The highest preferment he obtained in the Church was a prebendal stall in St. Paul's. The Whigs, to whom he had attached himself, had few opportunities of disposing of the patronage of the state; and when the occasion offered Lord Grenville, with cool ingratitude, urged against him, who had so long and so faithfully served his party, his unpopularity with the members of his profession. In fact while he served his party he did not attach or fix himself upon the individuals of his party.

Parr was a man of great talents, of very extensive learning, and of pre-eminence conversational powers; but he was vain, arrogant, and overbearing. His friends uniformly represent him as possessing much benevolence and kindness of feeling; but he required the utmost submission, and exacted the most devoted attention from all who approached him, or he never hesitated about insulting and making himself offensive to them. Neither can some of his acts be altogether reconciled with the character of generosity ascribed to him. He printed an edition of Bellendenus [BELLENDENUS], with a preface, in which he eulogised the eloquence and ability of the 'tria lumina Anglorum'—Lord North, Fox, and Burke; but he seems to have undertaken the task rather for the sake of boarding his political foes than passing an encomium upon his political friends. He republished 'Tracts by Warburton and a Warburtonian' to annoy Bishop Hurd, the editor of Warburton; and felt no compunction about injuring the fame of Warburton, whom he pretended to admire and respect, if he could only annoy Hurd, who had given him no offence save what a morbid self-conceit might imagine. In his literary and political disputes he argued and declaimed with the fierceness of party-feeling and the petulance of self-love, and forgot alike both the equities and the decencies of controversy. Though of unquestionable ability, he spoke and wrote with the fluency of ready knowledge, rather than with the profoundness of original thought or the compass of a philosophic spirit. He was a determined and violent Whig, rather than one having right views or just sentiments with respect to freedom, as his opinions on the Slave Trade and Test Act questions fully testify. It must be stated however that on these subjects his mind underwent a change in the latter part of his life. Still his notions about civil and religious liberty were never the clearest or the most comprehensive; for while he could recommend conciliation to the Roman Catholics and the Unitarians, he did not hesitate to suggest persecution against the Methodists.

Parr left a vast mass of papers behind him, consisting of his correspondence, and of historical, critical, and metaphysical disquisition. His published writings, by Dr. Johnstone, fill eight thick 8vo volumes. They are distinguished by a copious erudition, a ready conception, and a vigorous and ample style. But he has left no great work; nor will his name go down to posterity associated with any important principle or extensive literary undertaking. His fame rests upon a learning which, whatever may have been its accuracy and extent, has bequeathed to the world no memorable results, and upon a colloquial power which, in the opinion of his admirers, left him, with the exception of Dr. Johnson, without a rival. He died in 1826, in the seventy-ninth year of his age, and was buried at Hatton.

PARRHASIUS, son and pupil of Evenor, was a native of Ephesus, but became a citizen of Athens. He raised the art of painting to perfection in all that is exalted and essential. He compared his three great predecessors with one another, rejected that which was exceptional, and adopted that which was admirable in each. The classic invention of Polygnotus, the magic tone of Apollodorus, and the exquisite design of Zeuxis, were all united in the works of Parrhasius; what they had produced in practice he reduced to theory. He so circumscribed and defined, says Quintilian ('Inst. Or.' xii. 10), all the powers and objects of art, that he was termed the Legislator; and all contemporary and subsequent artists adopted his standard of divine and heroic proportions.

Parrhasius himself was aware of his ability: he assumed the epithet of the Elegant ('*Ἀσποδίατρος*'), and styled himself Prince of Painters; he wrote an epigram upon himself (Athenæus, xii. p. 543, Cassaub.), in which he proclaimed his birth-place, celebrated his father, and pretended that in himself the art of painting had attained perfection. He also declared himself to be descended from Apollo, and carried his arrogance so far as to dedicate his own portrait in a temple as Mercury, and thus receive the adoration of the multitude. (Themist., xiv.) He wore a purple robe and a golden garland; he carried a staff wound round with tendrils of gold, and his sandals were bound with golden straps. (Ælian, 'Var. Hist.' ix. 11.) It appears then that Pliny justly terms him the most insolent and most arrogant of artists. ('Hist. Nat.' xxxv. 10, 36.)

The branch of art in which Parrhasius eminently excelled was a

beautiful outline as well in form as execution, particularly in the extremities, for, says Pliny, when compared with himself, the intermediate parts were inferior.

One of the most celebrated works of Parrhasius was his allegorical figure of the Athenian people, or Demos. Pliny says that it represented and expressed equally, all the good and bad qualities of the Athenians, at the same time; one might trace the changeable, the irritable, the kind, the unjust, the forgiving, the vain-glorious, the proud, the humble, the fierce, and the timid. How all these contrasting and counteracting qualities could have been represented at the same time, it is difficult to conceive; if we are to suppose it to have been a single figure, it is very certain that it could not have been such as Pliny has described it (xxxv. 10-30), for, except by symbols, it is totally incompatible with the means of art.

Parrhasius painted a Theseus, which, after the general spoliation of Greece, was placed in the Capitol at Rome. It was probably for this picture that he was made a citizen of Athens. When Euphranor remarked that the Theseus of Parrhasius had fed upon roses, and his own upon beef, he seems to have alluded particularly to the style of design, and not, as one might suppose, to the colour; for, as Winckelmann has observed, the word used by Plutarch (*γλαφυρός*, 'elegantly,') relates expressly to form. ('De Glor. Ath.,' 2.) According to the taste of Euphranor, the figure of Parrhasius was too elegant, too delicate, too effeminate for heroic beauty.

Pliny enumerates many other works by Parrhasius; a naval commander in his armour; a Meleager, Hercules, and Perseus, upon the same tablet; Ulysses feigning insanity; Castor and Pollux; Bacchus and Virtue; a Cretan nurse with an infant in her arms; a priest officiating, with an attendant youth bearing incense; two youthful boys, in which were admirably depicted the innocent simplicity of the age, and its happy security from all care; a Philiclus; a Telephus; an Achilles; an Agamemnon; an Æneas; and two famous pictures of Hoplites, or heavy-armed warriors, one in action, the other in repose, admirably painted.

Parrhasius amused himself also with painting small libidinous pieces. The Archigallus mentioned by Pliny was most probably of this description, both from the particular favour of Tiberius with which it was honoured, and the peculiar nature of the rights of Cybele, whose chief priest was the Archigallus. To this class we may add the picture of Meleager and Atalanta, mentioned by Suetonius. ('Tib.,' c. 44.) This picture was bequeathed to Tiberius on the conditions that if he should be offended with the subject, he should receive in its stead 1,000,000 sesterces ('decies H.S.,' about 2500*l.*). The emperor not only preferred the picture to the money, but had it fixed up in his own chamber, where the Archigallus was also preserved, and which was valued at H.S.LX. or 60,000 sesterces (about 500*l.*). These productions entitle Parrhasius to the epithet of Pornograph, and prove that this style of painting was in fashion long before the decline of Grecian art.

Plutarch instances Parrhasius's picture of Ulysses feigning insanity as an improper subject for the pencil, yet reconciled to our taste through the spirit of the conception and the truth of the execution. ('De Aud. Poet.'). Parrhasius painted a Hercules, which he affirmed was a fac-simile of the god as he had frequently appeared to him in his dreams. (Athensus, xii. 544.) He painted also a Philoctetes. ('Anthol. Gr.,' iv. 8, 26.) Pliny mentions a contest between Parrhasius and Timanthes of Cythnos, in which the former was beaten: the subject of the picture was the contest of Ulysses and Ajax. The proud painter, indignant at the decision of the judges, is said to have remarked that the unfortunate son of Telamon was for a second time, in the same cause, defeated by an unworthy rival. (Athen. xii. 543.) Pliny records also a trial of skill between Parrhasius and Zeuxis, in which the latter allowed his grapes to have been surpassed by the drapery of the former. "This contest," says Fuseli, "if not a frolic, was an effort of puerile dexterity."

The story told by Seneca of Parrhasius having crucified an old Olynthian captive when about to paint a Prometheus chained, that he might seize from nature the true expression of bodily agony, cannot relate to this Parrhasius, and is probably a fiction; it is nowhere to be found but in the 'Controversies' (v. 10) of the preceptor of Nero. Olynthus was taken by Philip in the second year of the 108th Olympiad, or B.C. 347, which is nearly half a century later than the latest accounts we have of Parrhasius. Socrates died in the 95th Olympiad, and Parrhasius must therefore have been already celebrated before that time, from his dialogue with that philosopher upon the principles of art as preserved by Xenophon. ('Mem.,' iii. 10.) He is even mentioned by Pausanias (x. 28) in the 84th Olympiad, when he is said to have painted a battle of the Lapithæ and Centaurs on the shield of the Minerva of Phidias at Athens. Supposing such to be the case (for although improbable it is still not impossible), Parrhasius, if living, must have been at least 120 years of age when Philip took Olynthus.

PARRY, SIR WILLIAM EDWARD, KNT., Rear-Admiral of the White, was born December 19, 1790, at Bath, in Somersetshire. His father was Caleb Hillier Parry, M.D., a physician of some celebrity. His mother was the daughter of John Rigby, Esq., of Lancaster.

Edward Parry, as he was always called when a boy (and generally known afterwards as Sir Edward Parry), was educated in the grammar-school of the city of Bath, where he attained a knowledge by no means

contemptible of the Latin and Greek languages. His parents intended him for the medical profession, but in 1803 Miss Cornwallis, a near relative of Admiral the Hon. William Cornwallis, then in command of the Channel fleet off Brest, induced them to change their purpose. She thought he had the qualities suitable for a naval officer, and that her influence would suffice to float him off comfortably. As he had no objection to make trial of a sailor's life, in June 1803, through the kindness of Admiral Cornwallis, he was appointed a first-class volunteer on board the *Ville-de-Paris*, 110 guns, then about to go out as flag-ship to the Channel fleet. Young Parry took a liking to his profession, and studied French and mathematics under the chaplain of the *Ville-de-Paris*, which continued to cruise in the Channel, off Brest and Ushant. In the early part of 1806 he left the *Ville-de-Paris* to go on board the *Tribune* frigate, as a midshipman. The *Tribune* was employed about two years in cruising off the French coast; but in the spring of 1808 Captain Baker was promoted from the *Tribune* to the *Vanguard*, 74, which belonged to the Baltic fleet, and Parry went with him. The *Vanguard* returned to the Downs in December 1809, and Parry obtained his commission as lieutenant, January 6, 1810. Early in February the same year he proceeded to Sheerness to join the *Alexandria* frigate, which was about to sail on service in the Baltic, and was afterwards employed in the northern seas in protecting the Spitzbergen whale-fishery. During that period Lieutenant Parry was a good deal employed in making astronomical observations, and in improving the Admiralty charts of those seas. In January 1813 he left the *Alexandria*, and proceeded to Halifax in *Nova Scotia*, to join the *La Hogue*, 74. Great Britain was then at war with the United States, and Lieutenant Parry having joined the *La Hogue* in the summer of 1813, in the spring of 1814 was engaged in a successful boat-expedition, which ascended the river Connecticut as far as Pettipague Point, and destroyed several privateers and other vessels, in all 27, valued at 50,000*l.*, with the loss of only two men killed.

After the peace of 1814 the *La Hogue* returned to England, but Lieutenant Parry, in hopes of preferment, remained on the North American station in the *Maidstone* frigate, and afterwards in the *Arden*, 64, the *Carron*, 20, and the *Niger*, 86. He continued on the North American station without preferment till March 1817, when he was summoned home in consequence of his father having suffered a severe attack of paralysis. While on the North American station in the *La Hogue* he drew up a little work for the use of the junior officers of the fleet on that station, and distributed it in manuscript. It was afterwards printed, under the title of 'Nautical Astronomy by Night, comprehending Practical Directions for knowing and observing the Principal Fixed Stars of the Northern Hemisphere; to which is prefixed a Short Account of the most interesting Phenomena in the Science of Astronomy; the whole illustrated by several Engravings,' &c.

Lieutenant Parry was desirous of joining the expedition to the river Congo in Africa, but owing to his having been detained at the Bermudas, he did not reach England till the end of 1817, when it was too late. Meantime, in consequence of a report that the Arctic seas were then much less encumbered with ice than usual, the Admiralty had fitted out two expeditions for those seas, one under Captain Buchan and Lieutenant Franklin, to proceed by Spitzbergen to the North Pole; the other under Commander John Ross for the purpose of exploring Baffin's Bay, and ascertaining the probabilities of a North-West Passage from the Atlantic to the Pacific. Parry having heard of these expeditions, wrote to request employment, observing that he was "ready for hot or cold, Africa or the Arctic regions." When he arrived in London, he was introduced to Mr. Barrow, secretary to the Admiralty, who soon afterwards appointed him to the command of the *Alexander*, under the orders of Captain Ross in the *Isabella*. The *Isabella*, followed by the *Alexander*, left the Thames at the end of April 1818. On the 19th of August the two ships were off Smith's Sound at the northern extremity of Baffin's Bay. They then turned southwards, sailing along the western coast, passed the mouth of Jones's Sound, and on the 30th reached the wide opening of Lancaster Sound. The water was deep and free from ice, and on the following day both ships under a press of sail were steering westwards up Lancaster Sound. Parry was full of expectation, as were all the crew on board the *Alexander*, when suddenly the *Isabella* tacked, turned her head eastwards, and rejoined the *Alexander*. Both vessels then retraced their course, and Lancaster Sound was left behind. Commander Ross had imagined that he saw high land, which he named the Croker Mountains, barring the passage to the westward. The two vessels entered the Thames on their return in November of the same year.

Lieutenant Parry's opinion that there was an open passage up Lancaster Sound, and that the Croker Mountains were all a mistake, though privately expressed, was soon known at the Admiralty. He had interviews with Mr. Barrow, and was introduced to Lord Melville; and a second expedition for the discovery of a North-West Passage having been resolved upon, the *Hecla* and *Griper* were taken into dock at Deptford to be repaired and strengthened for service in the Arctic seas. Parry was appointed to the command of the *Hecla* and of the expedition, Lieutenant Liddon being placed under his orders in the *Griper*. The expedition left the Thames on the 11th of May 1819, and having sailed up the eastern side of Davis's Strait and Baffin's Bay, on the 21st of July they were in 73° N. lat., nearly opposite to the entrance of Lancaster Sound, but with extensive masses of ice to the

west interrupting their passage to it. Through these masses however, with excessive labour and frequently exposed to great danger of being crushed, the ships forced their way; and on the 29th of July reached open water on the western side of the ice, having passed through eighty miles of it. They entered Lancaster Sound, and sailing westward through the imaginary Croker Mountains, on the 4th of September crossed the meridian of 110° W. long. in 74° 44' 20" N. lat., by which they became entitled to a reward of 5000*l.*, offered by an order in council to such of his majesty's subjects as might succeed in penetrating thus far to the westward, within the Arctic Circle. Parry gave the name of Barrow's Strait to the continuation of Lancaster Sound; discovered Melville Island, on its northern side, and from its vicinity described the high coast on the southern side, which he named Banks' Land, but which Sir Robert MacClure has since ascertained to be the northern side of Baring Island. Parry also discovered Prince Regent's Inlet and the Wellington Channel, and penetrated as far as 118° 54' 43" W. long. On the 26th of September, after three days of arduous labour in cutting a channel, with the thermometer nearly at zero, both ships were got safely into their station at Winter Harbour, on the south shore of Melville Island. There the ships remained frozen up, with the sun entirely below the horizon from the 11th of November to the 7th of February, and were not released from the ice till the beginning of August 1820. After making several attempts to advance farther westward, they were compelled to return to England, and entered the Thames in November 1820. On the 4th of the same month Lieutenant Parry was promoted to the rank of commander; and several other rewards and honours, F.R.S., &c., were bestowed upon him. His 'Journal of a Voyage for the Discovery of a North-West Passage,' 4to, 1821, with maps and engravings, was published by authority of the Lords Commissioners of the Admiralty.

Arrangements were soon afterwards made for another expedition. Captain Parry received a commission, dated December 30, 1820, for the *Fury*, with Captain G. F. Lyon under his orders in command of the *Hecla*. This expedition was much less fortunate than the former. It sailed from the *Nore* on the 8th of May 1821, and having entered Hudson's Strait, on the 8th of October the ships were frozen in at Winter Island, where they remained till the 2nd of July 1822. They were then released, and sailed northward up Fox Channel. Having discovered the *Fury* and *Hecla* Strait, the ships were again frozen in on the 31st of October at the island of Igloolik, at the eastern end of *Fury* and *Hecla* Strait. There they remained till the middle of August 1823, when they commenced their voyage homewards, and entered the Thames in October. During his absence Captain Parry had been promoted to the rank of post-captain, November 8, 1821. His 'Journal of a Second Voyage for the Discovery of a North-West Passage from the Atlantic to the Pacific, performed in the years 1821-22-23,' 4to, 1824, was published by authority of the Lords of the Admiralty. On the 1st of December 1823, Captain Parry was appointed Acting Hydrographer to the Admiralty.

The *Hecla* and *Fury* were soon afterwards refitted for another Arctic voyage, the *Hecla* commanded by Captain Parry and the *Fury* by Captain H. P. Hoppner. They sailed from the Thames on the 8th of May 1824, passed the following winter at Port Bowen in Prince Regent's Inlet, and remained there frozen up from the 28th of September till the 20th of July 1825. The *Fury* was shortly afterwards wrecked, and the *Hecla* reached England, with a double ship's company, in the following October. Parry's 'Journal of a Third Voyage for the Discovery of a North-West Passage' was similarly published, in 4to, in 1826.

After his return Captain Parry was appointed Hydrographer to the Admiralty, and continued to perform the duties of the office till the 10th of November 1826. Having then proposed a plan for reaching the North Pole, and obtained sanction for it, he was again appointed to the command of the *Hecla* for that purpose, and sailed from the Thames on the 3rd of April 1827. The *Hecla* was secured in Treurenberg Bay, on the north coast of Spitzbergen, on the 21st of June; and on the 22nd two flat-bottomed boats, which had been prepared for the enterprise, left the ship, and proceeded northward. One boat, with twelve men, was commanded by Captain Parry; the other, with the same number of men, by Lieutenant James C. Ross. The remainder of the crew, under Lieutenant Foster, remained in charge of the *Hecla*. With excessive labour the boats were paddled through the water and dragged over the ice till they attained the latitude of 82° 45', which is the nearest point to the North Pole ever yet reached. Finding then that a current was taking them southward as fast or faster than they could advance northward, they commenced their return, and reached the *Hecla* on the 21st of August, after an absence of sixty-one days. The *Hecla* began her return voyage on the 28th of August, and Captain Parry reached London at the end of September. This expedition terminated Parry's arduous labours in the Arctic regions. His 'Narrative of an Attempt to reach the North Pole in Boats fitted for the Purpose, and attached to His Majesty's Ship *Hecla*, in the Year 1827,' 4to, was published by authority of the Duke of Clarence, then Lord High Admiral.

Captain Parry resumed his situation as hydrographer, but, as his health suffered considerably from close attention to the duties of his sedentary occupation, he accepted the office of Commissioner of the Australian Agricultural Company in New South Wales. Previously however to his departure from England, he received the honour of

knighthood from George IV., together with Sir John Franklin, April 29, 1829; and he and Franklin had, also together, the degree of D.C.L. conferred on them by the University of Oxford. Sir Edward Parry sailed from the Thames for Australia on the 20th of July, and reached Sydney on the 13th of December. His residence as commissioner was at Port Stephens, about 90 miles north from Sydney. He entered the Thames on his return, with his wife and family, in November 1834.

In March 1835 Sir Edward Parry was appointed an Assistant Poor-Law Commissioner in the county of Norfolk; but his health giving way under the pressure of work, he resigned the office within a year. In 1837 he was appointed to organise the packet-service between Liverpool and Ireland. From the 19th of April 1837 to the 2nd of December 1846 he was Comptroller of Steam Machinery for the Royal Navy. He then retired from active service, receiving the appointment of Captain-Superintendent of the Royal Clarence Yard and of the Naval Hospital at Haslar, near Portsmouth. On the 4th of June 1852 he attained the rank of Rear-Admiral of the White. At the end of 1853 he received the appointment of Lieutenant-Governor of Greenwich Hospital, a situation which he retained till his death, which took place on the 7th of July 1855, at Ems in Germany, where he had been residing for the benefit of his health. His body was brought to England, and interred in the cemetery at Greenwich.

Sir Edward Parry married, October 23, 1826, Isabella Louisa, fourth daughter of the first Lord Stanley of Alderley. She died May 13, 1839. On the 29th of June 1841 he married the daughter of the Rev. Robert Hankinson, of Walpole in Norfolk, and widow of Samuel Hoare, jun., Esq. By his first wife he had two sons and two daughters, and by his second wife, who survived him, two daughters.

A life of Sir Edward Parry has been published recently, 'Memoirs of Rear-Admiral Sir W. Edward Parry, Knt., F.R.S., &c., late Lieutenant-Governor of Greenwich Hospital, by his Son, the Rev. Edward Parry, M.A., of Balliol College, Oxford, and late Tutor in the University of Durham,' cr. 8vo, London, 1857.

PARUTA, PA'OLO, was born at Venice, in 1540, of a patrician family; studied in the university of Padua, and afterwards entered on the career of diplomacy. In 1562 he accompanied the Venetian ambassador, who was sent to Vienna to congratulate Maximilian II. on his accession to the throne. On his return he stopped at Trento, where the council was then assembled, and where he conceived the plan of his dialogues on political life, 'Della Perfezione della Vita Politica Libri III,' in which he introduces two prelates of the council as the interlocutors. On his return to Venice he filled several official stations in the service of his country, and in the year 1592 was sent ambassador to Pope Clement VIII. at Rome. He was there instrumental in persuading the pontiff to grant absolution to Henry IV. of France, and thus reconciling the latter with the church of Rome. (Andrea Morosini, 'Storia Veneta,' b. xv.) While at Rome, he says, a change took place in his ideas, which had till then been turned towards ambition and worldly pursuits. He asked himself, "What am I doing in this world? what am I thinking of? and what do I expect in the end?" The process and result of his self-examination, in which he recapitulated the whole of his past conduct, he has given us in his 'Soliloquy,' published at the end of his 'Discorsi Politici,' which forms a useful moral treatise.

Before he went to Rome he was appointed historiographer to the republic, in which capacity he continued the history of his country from 1513, where his predecessor Luigi Contarini had left it. The 'istoria Veneziana dal 1513 al 1531,' of Paruta is divided into twelve books. A distinguished Italian critic, Apostolo Zeno, says of this work, that "the author has fulfilled the duties of a grave and able historian, both in respect to the veracity of his narrative and the dignity of his style." Paruta also wrote a separate history of the eventful war of the Venetians against the Turks in the Island of Cyprus in 1570-72, in three books. The histories of Paruta are not mere dry narratives of political or military events; they are intermixed with information and reflections concerning the civil history of the people, and the customs, manners, and opinions of the age. That branch of political knowledge now known by the name of statistics, was attended to at Venice much sooner than in any other modern state, and Paruta had early applied himself to it. Paruta's 'Political Discourses,' in two books, are a series of disquisitions upon the history of Greece and Rome, as well as upon various passages of modern history, and deserve, for their impartiality and statesmanlike penetration, to be put by the side of Machiavelli's 'Discourses on Livy.' Montesquieu is said to have availed himself of Paruta's 'Discourses' in the composition of his works. (Corniani, 'Secoli della Letteratura Italiana,' art. 'Paruta.')

Paruta, after returning from his embassy at Rome, was made a knight and procuratore of St. Mark, and shortly after died at Venice, December 6, 1598.

PASCAL, BLAISE, a distinguished French philosopher, justly characterised by Bayle as "one of the sublimest spirits in the world," was born at Clermont in Auvergne, June 9, 1623. He was the only son of Etienne Pascal, president of the Court of Aids in that province, himself a learned and respectable man and able mathematician, who, when his boy had reached his eighth year, resigned his office and removed to Paris, for the purpose of watching over his education.

From his childhood, Blaise displayed abilities far above the common order, and evinced so inquiring a spirit that, as his sister has recorded, he would not rest without knowing the reason of everything. The bent of his infantine genius was decidedly mathematical; but his father, who was his only preceptor, and who was anxious that his attention should not be distracted from the study of the dead languages, resolved to exclude every notion of geometry from his mind, removed all books which treated of that science, and even abstained in the child's presence from any conversation on mathematical subjects with his friends. Notwithstanding these precautions however, young Blaise, when only in his twelfth year, without the aid of books or oral instruction, began to draw figures with charcoal on the floor of his room, and had, without any assistance, made some progress in geometry before his father surprised him in these researches.

After this discovery, he was thwarted no more in the pursuit of mathematical investigations; and at sixteen years of age he produced a treatise on the conic sections, of such excellence as to provoke the incredulity and wonder; of Descartes, who would not believe that so extraordinary a performance was the work of a mere youth. In his nineteenth year he invented an ingenious machine for making arithmetical calculations, which excited the admiration of his times; and, afterwards, at the age of twenty-four years, the conjecture of Torricelli that the atmosphere had weight, and that this quality might account for effects before ascribed to the horror of a vacuum, led him to institute many able and successful experiments on this subject, which confirmed the truth of Torricelli's idea, and established his own scientific reputation. The results of these labours were collected into two essays, which appeared after his death, 'On the Equilibrium of Liquids,' and 'On the Weight of the Atmosphere.'

From these researches, made before he had completed his twenty-fifth year, the great mind of Pascal was diverted entirely to objects of religious contemplation; and thenceforward he abandoned almost entirely the pursuits of science. He had been all his life as remarkable for piety as for genius; and it is the testimony of a learned biographer, whose opinions were far from resembling his own, that he knew exactly how to distinguish between the rights of faith and of reason. The conviction of Pascal may therefore with propriety be cited among the most striking and satisfactory examples of the deep submission of the most powerful intellects to the truths of revelation; while it also may be numbered with other illustrious exceptions to the reproach that the high cultivation of mathematical science is little favourable to piety. It is no fair objection to the value of his example, that Pascal, under the nervous excitation of bodily disease, fell into many absurd excesses of fanaticism; that he practised the most rigid abstinence from all worldly enjoyments, and wore next his skin a cinchure of iron studded with points, which he struck with his elbow into his flesh, as a punishment to himself whenever any sinful thought obtruded itself into his mind. Such things may be ascribed to the inherent weakness of our corporeal nature, to some of the ordinary caprices of human disposition, or to the imaginative delusions attendant upon a particular state of bodily health; but they detract nothing from the soundness of the anterior investigation which had led a pure and unclouded reason like that of Pascal to embrace the doctrines of revelation, by a process analogous to that which had conducted him to the discovery of abstract truth.

It is a curious exemplification of the anomalous conditions of the human mind, that, while Pascal was immersed in these superstitious observances, he published his famous 'Provincial Letters,' in which, under the name of Louis de Montalto, he assailed the morality of the Jesuits with equal wit and argumentative acumen. He was induced to write this work by his adoption of the opinions of the Jansenists, which he warmly espoused, and which involved him in the religious disputes of his age and country. Among the fruits of his devotional exercises may also be named his 'Pensées,' which were collected and published after his death; and in which he has beautifully availed himself of an idea of one of the ancient fathers, that he who believes in the existence of a God gains eternally if he be right, and loses nothing if wrong; while the atheist gains nothing if right, and renders himself miserable eternally if he be wrong. The weakly frame of Pascal was reduced to premature old age by infirmities, which were aggravated by his ascetic habits, but which he bore with exemplary patience; and he died in Paris, August 19, 1662, aged thirty-nine years. His life was written elaborately by his sister Madame Perier; and afforded the materials for an able and interesting article in the Dictionary of Bayle. The first complete edition of his writings is that of Fougere, Paris, 1844.

PASCHAL I. was elected bishop of Rome after the death of Stephen V., A.D. 817. To him the pretended donation by the emperor Louis the Pious is said to have been made. He crowned as emperor Lotharius, son of Louis the Pious, in the year 823, and died February 10, 824. He was succeeded by Eugenius II.

PASCHAL II., RANIERI OF BLEDA in Tuscan, was a monk of the order of Cluni. Having been sent to Rome about the affairs of his monastery, he was noticed by Pope Gregory VII., who made him a cardinal. After Gregory's death and the short pontificate of Urban II., Paschal was elected pope. He refused the dignity, and even concealed himself, but was at last prevailed upon to accept the papal chair in 1099. He prosecuted the great contest about the investitures,

begun by Gregory VII. with the Emperor Henry IV., against whom he launched a fresh bull of excommunication. Henry's son and namesake, availing himself of this, revolted against his father, and having deposed him, was acknowledged as king of the Germans by the title of Henry V. He then proceeded to Italy with an army, in order to get himself crowned emperor. On the question of the investitures he was as stubborn as his father. After some conferences between him and the pope's ambassadors, Paschal proposed what appeared to be a reasonable compromise of the matter in dispute. "If the emperor," said he, "contends for his regal rights, let him resume the donations on which those rights are founded, the duchies, margraviates, countships, towns, and manors, which his predecessors have bestowed on the Church. Let the Church retain only its tithes and the donations which it has received from private bounty. If Henry renounces the right of investiture, the Church shall restore all it has received from secular princes since the time of Charlemaigne." (Fagi, 'Vita Paschalis II. ;' Fleury, 'Hist. Eccles.,' 66.) This proposal went to the root of the evil, and Paschal was probably sincere in making it; but the bishops, and especially the German bishops, who were possessed of large fiefs, strongly protested against it.

In the meantime Henry arrived at Rome to be crowned in 1110. He kissed the pope's feet according to custom, and entered hand in hand with him into the church of the Vatican; but here an explanation took place concerning the compromise, the result of which was that the treaty was broken off, and Paschal refused to consecrate the emperor. The particulars have been differently related by the various writers. Some say that Paschal could not fulfil his proposed renunciation of the temporalities of the Church, owing to the opposition of the bishops; others say that Henry would not give up the right of investiture, because his councillors, and among the rest several German bishops who were about his person, unwilling to risk their domains and revenues, persuaded him not to renounce what they represented as an essential part of the imperial prerogatives and of the splendour of the imperial dignity. After repeated messages between the pope and the emperor, the latter, who wished to be crowned at all events, determined to frighten the pope into compliance. At the suggestion, it is said, of two German prelates, one of whom was the Archbishop of Metz, he ordered his German soldiers to lay hands on the pope. A scuffle ensued; and the people of Rome, irritated at seeing their pontiff prisoner, fell on the German soldiers, and drove them back with considerable slaughter to their camp outside of the town. Henry however kept possession of the person of the pope, whom he dragged after him, stripped of his pontifical ornaments and bound with cords. Paschal remained for nearly two months in a state of confinement, during which he was assailed by the remonstrances of his clergy, many of whom were prisoners with him in the German camp, until at last he yielded to their entreaties, and consented to consecrate Henry unconditionally, giving up by a bull the right of investiture to the emperor. After the ceremony, Henry returned to Germany, and Paschal thought it necessary to assemble a council in the Lateran to submit his conduct to the judgment of the Church. He declared to them at the same time that he would rather abdicate than break his word to the emperor, either by excommunicating or molesting him. After much deliberation, Paschal's cession of the right of investiture was solemnly condemned; and it was declared that the investiture of churchmen by lay hands was a heresy. The prelates of France and Italy, and even some of those of Germany, approved of the proceedings of the Lateran Council, and several of the turbulent German feudatories revolted against Henry. The emperor however kept the field, and, having defeated his revolted subjects, marched again to Italy to terminate the question with the see of Rome. Paschal, blamed and even personally insulted by the Romans because of his indulgence towards Henry, and threatened at the same time by the latter, escaped to Benevento; and Henry, having come to Rome, caused himself to be crowned again by the Bishop of Benevento. After his departure Paschal returned to Rome, but soon fell ill of fatigue and anxiety, and died in January 1118, after a most stormy pontificate of eighteen years. He was succeeded by Gelasius II. The question of the investiture was settled by a compromise in 1122, under Calixtus II., the successor of Gelasius. It was agreed that the bishops, being elected according to the canonical forms, should receive their regalia at the hand of the emperor, and do homage for them; but that in this ceremony the emperor should no longer use the ring and crozier, the insignia of spiritual authority, but the sceptre only. Thus terminated a quarrel which had occasioned so much violence and bloodshed for half a century.

PASCHAL III., Antipope, was elected by the influence of the Emperor Frederic I., in opposition to Alexander III., in 1165. He took possession of Rome for a short time, Alexander being obliged to escape to Benevento, but he died shortly after, in 1168. [ALEXANDER III.]

PASKEVICH, IVAN FEDOROVICH, a Russian field-marshal, Prince of Warsaw, and Viceroy of Poland, was descended from a family of the Greek religion, bearing the name of Paskiewicz, which was driven from Poland in the 17th century by the persecution of the Jesuits. He was born on the 19th of May (new style) 1782, at Pultawa or Pultava, famous for the battle which decided the ascendancy of Russia over Sweden. After receiving his education at St. Petersburg,

he held the appointment first of page and afterwards of aide-de-camp to the Emperor Paul, and subsequently to the Emperor Alexander. He first saw service at the great battle of Austerlitz in 1805. In 1806 he was sent with the Russian ultimatum to the Porte, and in those days of Turkish barbarism owed to his own determination and activity his escape from Constantinople with his life. Not long afterwards he was taken up for dead from the ditch of Brailov, where he had mounted to the assault; he was promoted as a reward to the rank of colonel, and from that time his advancement was rapid. In the great campaign against the French in 1812 he fought at Borodino, and afterwards being put in command of a division, which at first amounted to only 4000 men, but subsequently rose to 30,000, took an active share in the triumphant campaign in Germany, and was one of the captors of Paris. After the peace he accompanied the Grand Duke Michael in a three years' tour through Europe. On the accession of the Emperor Nicolas in 1825 he was named successor to Yermolov, in command on the Persian frontier, at the time of the outbreak of the war with Persia. So high had the name of Yermolov risen, that it was doubted by the Russians, probably for the first time in Russian history, if a subject would yield obedience to the emperor's orders, and it even occasioned some surprise that 'the King of the Caucasus' allowed himself to be dethroned so easily. Paskevich, on the 26th of September 1826, defeated the Persians under Abbas-Mirza at Elisavethpol; later in the same year he crossed the Araxes; early in the next he conquered all Persian Armenia, and on the 13th of October he took by assault Erivan, and thenceforth by the emperor's order bore the name of Paskevich-Erivansky to commemorate the exploit. The peace with Persia, established by the treaty of Turkmanchai (22nd of February 1828), was almost immediately followed by war with Turkey. In 1828 Paskevich took Kara, and in the following year Erzerum, receiving in reward the title of field-marshal. A year of desultory warfare against the Circassians in 1830 was followed in 1831 by the campaign against the Poles, to whom the name of Paskevich sounded as that of a countryman. He took the command of the Russian army after the death of Diebitsch, and, more fortunate than his predecessor, was soon able to announce the fall of Warsaw. Raised to the rank of Prince of Warsaw, and made Governor-general of Poland, he promulgated the organic statute of the 26th of February 1832, which unites Poland to Russia, and for the next sixteen years carried out his plan of subjecting the country, one of the main points of which was the conversion of Warsaw into a strong fortress against its own inhabitants not less than against an invading army. He succeeded so well, that 1848 passed over Russian Poland without a revolt, and in 1849 the Emperor Nicolas could spare him to crush the Hungarians. As on former occasions, his plans did not meet the approbation of military critics, but with his usual good fortune he was enabled to commence a despatch to the emperor in August with the words, "Hungary is at your feet." In 1850 the jubilee of his fiftieth anniversary in the service was celebrated with great rejoicings at Warsaw, and on this occasion the Emperor of Austria and the King of Prussia nominated him a field-marshal in their respective armies. This was the culminating point of Paskevich's long career. When the recent war broke out between Russia and Turkey, the veteran was again summoned to the field, much, it is said, against his will. He planned the campaign against the Turks, which terminated disastrously for the Russians in the repulse of their attack on Silistria, and in that repulse Paskevich himself, then past his seventieth year, received a severe contusion. From this time he seems never to have thoroughly rallied, and after a long and tedious illness he expired at Warsaw on the 29th of January 1856.

Marshal Paskevich was married to a lady who was a relative of the poet Griboyedov (GRIBOYEDOV), his companion in some of his Persian campaigns, and had by her four children, one of whom, a son, Fedor, is a colonel of the Russian guards, and has also made his appearance as an author. A separate life of the marshal in French was published by Tolstoy at Paris in 1835.

PASLEY, SIR CHARLES WILLIAM, K.C.B. and Lieutenant-General in the Royal Engineers, entered the army December 1, 1797, as second lieutenant in the Artillery, but removed to the Engineers in 1798. He became first lieutenant August 28, 1799, and captain March 1, 1805. He served in 1806 at the defence of Gaëta, in the kingdom of Naples; he was at the battle of Maida, and at the siege of Copenhagen in 1807; he served as aide-de-camp under Sir John Moore in Spain in 1808-9, and was engaged in several skirmishes and in the battle of Coruña, January 16, 1809. He was employed in the Walcheren expedition, where he was chief engineer of the Marquis of Huntley's division; he reconnoitred the enemy's coast under the fire of batteries, was at the siege of Flushing, and on the 14th of August 1809, while leading a storming party to attack an advanced work occupied by the French in front of Flushing, received a bayonet-wound through the thigh, and a musket-wound which injured the spine. He was afterwards employed in the Peninsular war. In 1810 he published an 'Essay on the Military Policy and Institutions of the British Empire—Part I.,' 8vo. The work had been commenced and the two first chapters written in 1805, but had been interrupted by his military duties in Spain and at Walcheren. Nothing further has been published, but Part I. was so written as to be complete in itself, in case Captain Pasley did not think fit to publish a second part. He became brevet-

major February 5, 1812; brevet-lieut.-colonel May 27, 1813; and lieutenant-colonel December 20, 1814.

In 1817 Colonel Pasley published a 'Course of Military Instruction originally composed for the Use of the Royal Engineer Department, by C. W. Pasley, Lieutenant-Colonel, Royal Engineers, F.R.S., and Director of an Establishment for instructing the Corps of Royal Sappers and Miners in Military Field-Works, 2 vols. 8vo. In 1823 appeared a 'Description of the Universal Telegraph for Day and Night Signals,' 8vo; and 'Exercise of the New Decked pontoons, or Double Canoes, invented by Lieut.-Col. C. W. Pasley, R.E.,' 8vo. These two works were lithographed for the use of the Establishment for Field Instructions, Royal Engineer Department, Chatham. On the 22nd of July 1830 he became brevet-colonel, and on the 12th of November 1831 regimental-colonel.

In 1837 Colonel Pasley published in the 'Papers on Subjects connected with the Duties of the Corps of Royal Engineers,' vol. i. p. 117, &c., 'Extracts from a Report on the Copper-Pontoons used in the Neapolitan Service in 1805, with Remarks on the Inefficiency of all open pontoons of the common Rectangular Form for the Passage of Rapid Rivers.' His next publication contains much useful information for many classes of the general public, as well as valuable instruction for engineers, architects, and other scientific men. This work was the result of experiments which occupied a long time, and in which no expense was spared. It is somewhat irregular in the arrangement of the matter, but that defect is in a great measure remedied by a very ample table of contents, forming in fact a sort of abridgment of the work itself. The full title of this treatise is 'Observations on Limes, Calcareous Cements, Mortars, Stuccos and Concretes, and on Puzzolanas Natural and Artificial; Rules reduced from numerous Experiments for making an Artificial Water-Cement equal in efficiency to the best Natural Cements of England, improperly termed Roman Cement; and an Abstract of the Opinions of former Authors on the Subject,' 8vo, 1838. The first chapters were sent to press, as he states, in May 1836, so that the printing occupied nearly two years.

On the 23rd of November 1841 Colonel Pasley attained the rank of major-general. In 1843 he published 'Rules for Conducting the Practical Operations of a Siege—Parts I. and II.,' 8vo. The University of Oxford in 1844 conferred on him the degree of D.C.L., and in 1845 he was created a Knight Commander of the Bath. Sir Charles Pasley became Lieutenant-general November 11, 1851, and Colonel-commandant of the Royal Engineers November 28, 1853. He is now Inspector-General of Railways. He has received the silver war-medal with two clasps for the battles of Maida and Coruña, and the Peninsular medal. [See SUPPLEMENT.]

PASQUIER, ETIENNE, was born at Paris in 1529, and studied the law under Hotoman, Balduin, Cujas, and other celebrated jurists of that age. After the completion of his studies it was several years before he could get into practice. In 1564, when the great suit between the Jesuits and the university was brought before the parliament of Paris, Pasquier was entrusted with the management of the cause on behalf of the university. He made a brilliant speech, which was printed and translated into various languages, and established his reputation. ('Histoire du Parlement de Paris,' c. 26.) In 1585 Henri III. made Pasquier advocate-general to the Chambre des Comptes. In 1588 he was named deputy to the states-general of Blois, and there he witnessed the murder of the Duke of Guise, which he relates impartially in his letters. When Henri III. was obliged to leave Paris in possession of the League, Pasquier followed him to Tours. His sons were at that time fighting in the king's army, and one of them was killed. After the surrender of Paris to Henri IV. in 1594, Pasquier continued in his office of advocate-general till 1603, when he resigned, and passed the rest of his life in studious retirement. He died at Paris in 1615. His works were published in 2 vols. fol., 'Œuvres d'Etienne Pasquier,' Amsterdam, 1723. They consist of his 'Recherches sur la France,' which is an interesting work, and of his 'Lettres.' The first book of the 'Recherches' treats of the Gauls and their subjugation by the Romans; the invasions of the Franks, the Goths, and the Normans; the origin of the Bretons and the Gascons; and the formation of the Frankish monarchy. The second book treats of the old institutions of the French, of the feudal nobility, the peers, the maires of the palace, the parliaments, &c. The third book relates to the Roman Catholic Church; to the Bishop of Rome, and his gradual assumption of supremacy and of the title of 'pope;' the various conflicts between the see of Rome and the Gallican Church; the abuses introduced into the Church; the tithes, the benefices; and lastly the 'sect of the Jesuits,' as Pasquier calls it, and here he inserts his 'plaidoyer' against that order. The fourth book treats of the laws and judicial customs of the monarchy. The fifth book consists of remarks on the history of Clovis and his descendants of the first dynasty. The author undertakes the defence of Brunehaut against the imputations of the chroniclers. [BRUNEHAUT.] The sixth book relates to the establishment of the third or Capetian dynasty and the history of its kings, their wars both at home and abroad, with some marvellous anecdotes, in relating which the writer shows considerable credulity and want of critical discrimination, which however are not surprising in his age. The seventh book treats of French poetry; and the eighth book of the origin of the French

language, with explanations of many peculiar words and idioms. The ninth book is on the universities and other scientific institutions of France, the introduction of the Roman law, and its prevalence over the 'droit coutumier,' or old prescriptive usages of the country, of which Pasquier shows himself a warm defender, alleging that they were more favourable to the liberties of the nation than the Roman law, which, having emanated from the absolute power of the emperors, was not in accordance with the spirit of the limited monarchy of France; and he presses his views upon several of his brother councillors in some of his letters, and especially in one to Brisson. Pasquier's letters are arranged in 22 books, and relate to multifarious subjects of law, literature, contemporary history, and private life.

Pasquier is an authority of considerable weight in matters relative to the civil history of the old French monarchy before it was converted into a despotism, and the information which he collected has been very useful to subsequent writers. He wrote also poetry, both French and Latin, which has long since been forgotten.

PASSERI, GIOVANNI BATTISTA, a distinguished painter, and author of one of the best collections of biographies of Italian artists, was born at Rome about 1610. Passeri received a good education, and, according to his own account, did not take up painting until comparatively late; he was first engaged in the capacity of a painter in 1635 by Canini in the Villa Aldobrandini at Frascati, where he contracted an intimate friendship with Domenichino, then returned from Naples. When Domenichino died in Naples in 1641, Passeri was president of the Academy of St. Luke, and he read a funeral oration on him, and painted a portrait of him, which was placed in the academy with other portraits of painters, which are at present in the gallery Degli Uffizi at Florence; the portraits now in the academy at Rome are copies. (Platner, 'Beschreibung der Stadt Rom.'). At the close of his life Passeri entered into holy orders; and obtained in 1675 a benefice in the college of Santa Maria in Via Lata. He died April 22, 1679.

Passeri is one of the best of the Italian historians of art; his theoretical knowledge was good and his facts are believed to be very correct. The circumstance of his book lying for nearly a century unnoticed, or rather unpublished, was owing to its unfinished state and the severity of many of his remarks, especially on Bernini. It was first published in Rome by an anonymous editor (supposed to be Bottari, editor of the 'Lettere Pittoriche') in 1772, with some omissions, under the title 'Vite de' Pittori, Scultori, ed Architetti che anno lavorato in Roma, morti dal 1641 fino al 1673, di Giambattista Passeri, Pittore e Poeta,' 4to. pp. 492 (Lives of the Painters, Sculptors, and Architects who had practised in Rome, and died between the years 1641 and 1673 inclusive); thus constituting a continuation to the work of Baglione. It contains thirty-six lives, from Domenichino to Salvator Rosa inclusive.

There is only one public picture by Passeri in Rome, a crucifixion between two saints, in the church of San Giovanni della Malva. They are not so rare in galleries. He painted sometimes still-life. His nephew GIUSEPPE PASSERI was likewise a painter of some eminence. He died in 1714, aged sixty.

PASSERONI, GIAN CARLO, was born in 1713 at Condamine, in the county of Nizza; studied at Milan in the Jesuits' College; and afterwards took orders as a priest. He went to Rome with the papal nuncio, and afterwards returned to Milan, where he spent the rest of his life in a state of poverty often bordering upon destitution; but he was so used to be content with little that he felt no inconvenience from his condition, and constantly refused the offers of his numerous Milanese friends to relieve his wants. Passeroni was fond of study, and especially of poetry, and he had a great share in reforming the taste of the Italian writers of his age. Parini, who in his youth was intimate with Passeroni, afterwards admitted that to his precepts and example he owed the formation of his own style. The principal work of Passeroni is a half burlesque, half moral poem, styled 'Il Cicerone,' in 101 cantos. It is full of digressions, something similar in manner to Sterne's 'Tristram Shandy;' but Passeroni's digressions are clearly intelligible, and have all a moral scope. A kind of parody of Cicero's life is used by the author as a thread whereon to hang his disquisitions. Passeroni ridicules or reproves the numerous follies and vices of society in a good-humoured and often highly-amusing strain, and his verses, like those of Ovid, seem to flow naturally and without effort from his pen. This facility, and the unaffected simplicity of the style, constitute the principal charm of the poem. Passeroni wrote also seven volumes of fables in verse, chiefly imitations of those of Æsop, Phædrus, and Avianus. He died at Milan, December 26, 1803.

PASSIGNANO, DOMENICO DA, or DOMENICO CRESTI, Cavaliere, was born at Florence about the middle of the 16th century. Some accounts give 1560, but this is probably too late; Baglione says he was eighty years old when he died in 1638, which would place his birth in 1557 or 1558. He was the pupil of Federigo Zuccheri, and lived some time in Venice, where he acquired a decided preference for the Venetian school of painting, and especially the works of Paolo Veronese. He acquired a great reputation at Rome, where he was employed by the popes Paul V. and Urban VIII.: he painted the 'Crucifixion of St. Peter' for the Capella Clementina in the great church of St. Peter on the Vatican, for which he was created Cavaliere dell' Abito di Cristo. He spent the latter part of his life at Florence,

and he was one of the most influential of those painters who contributed towards the reform of the Florentine school by improving the taste for colour and rendering the mannered anatomical school less popular. Passignano was the friend and associate of Cigoli, and is said to have been the master of Lodovico Caracci while in Florence. He had many scholars, of whom Pietro Sorri of Siena was the most distinguished. He died at Florence, May 17, 1638.

PASSIONEI, DOMENICO, was born in 1682, at Fossombrone in the duchy of Urbino. He studied at Rome, after which he received holy orders, and was employed in several offices under the papal court. He also distinguished himself in classical learning and the study of antiquities, and collected a valuable library of scarce works and manuscripts. He was a correspondent of Montfaucon and other learned men of his age. In 1706 he was sent by the pope to France, and thence he proceeded to Holland, where he resided some time. He was appointed papal nuncio to the Congress of Utrecht in 1712, and afterwards to the Congress of Baden in 1714. On his return to Rome from these missions, he resumed his favourite studies, but in 1721 was sent by Innocent XIII. as nuncio to the Helvetic Confederation: he resided in that capacity at Luzern till 1729, when he proceeded as nuncio to Vienna. Passionei wrote a journal of his Swiss mission, entitled 'Acta Apostolicæ Legationis in Helvetia,' 4to, Zürich, 1729. He returned from Vienna in 1733, and was made 'secretary for the briefs' and a cardinal, with the title of Archbishop of Ephesus. He was also appointed a member of the Congregation de Propaganda Fidei. Notwithstanding all these duties, he found time to pursue his favourite studies and to keep up an extensive correspondence with Maupertuis, Eckardt, Ruinart, Gronovius, Bianchini, and other learned contemporaries. He had a country-house at Frascati, where he formed a museum. His nephew, Benedetto Passionei, published the inscriptions in this collection, 'Iscrizioni Antiche con Annotazioni,' folio, Lucca, 1765. In 1755 Cardinal Passionei was made librarian of the Vatican. He died at Frascati in 1761. Passionei was a member of most Italian academies and also of that of 'the Inscriptions' at Paris. He was a great favourite with Pope Benedict XIV., with whom however he had frequent altercations, being very tenacious of his opinions and not at all courtly disposed. He was particularly hostile to the Jesuits, and was very careful not to admit any of their works into his library. His books were purchased after his death by the Augustine monastery, and added to their fine library, which is styled the 'Angelica,' and is one of the principal public libraries at Rome. Passionei revised, together with Fontanini, the 'Liber Diurnus Pontificum,' edited several other works, and wrote in Italian a funeral panegyric on Prince Eugene. He was a great promoter of learning, and one of the most distinguished prelates of the church of Rome in the last century. (Galletti, *Memorie per servire alla Storia della Vita del Cardinal Passionei*, Rome, 1762.)

PATEL, PIERRE, was born in 1654, but though a native of France neither the place of his birth nor the master under whom he studied is known, which is not a little surprising, considering the high and deserved admiration in which his works are held. He appears to have taken Claude Lorraine for his model, and in his own country he is called the French Claude. It cannot indeed be said that he equalled that great artist, yet it is no mean honour to have imitated him successfully. His works show that he diligently studied nature. His subjects were always well chosen; his foregrounds are judiciously broken, his distances admirable; the scenery, rocks, and the forms of his trees remarkably elegant and airy. The antique buildings, ruins of aqueducts, vases, and other ornaments give great variety and richness to his pictures. His touch is light and firm; his colouring clear and natural; and his figures are generally elegant and correctly drawn. He was killed in a duel in 1703. He had a son, also named Pierre Patel, who likewise practised as a landscape-painter, but was much inferior to his father.

PATERCULUS, VELLEIUS, was born about B.C. 19. He served in the army under Augustus, was made military tribune, and accompanied Tiberius in his German and Illyrian campaigns. On his return to Rome he was appointed successively quaestor, tribune of the people, and lastly praetor, which office he filled in the year of the death of Augustus. He wrote his abridgment of Roman history, which he addresses to the consul Vinicius or Vinutius Quartinus, in A.D. 30, the year before the proscription of Sejanus. Paterculus is supposed to have lost his life at the time when Sejanus suffered, as he was a friend of that favourite, whom he praises in a rather fulsome strain near the end of his work. The 'Historia Romana' of Paterculus consists of two books. The first begins with a brief notice of the early history of Greece after the Trojan war, and of the Greek colonies in Italy; it then mentions the foundation of Rome and the establishment of a senate by Romulus, after which there is an hiatus of 600 years, occasioned by the loss of that part of the manuscript. The work, as we have it, is resumed at the time of the war against Persæus, and briefly relates its result, as well as the destruction of both Corinth and Carthage. The second book is complete, and written more at length. It treats of the disturbances of the times of the Gracchi, of the civil wars of Marius and Sulla, of those between Cæsar and Pompey, of the second triumvirate, and lastly of the reign of Augustus, concluding with a panegyric on Tiberius and Sejanus. It serves in some measure as a substitute for the lost books of Livy. The writer expresses him-

self with tolerable fairness concerning the civil wars, until he comes to his own times, when he adopts a laudatory style towards the existing powers. His diction is elegant and fluent. The work of Patereulus has been often printed. The Bipont edition, 1780, with Dodwell's 'Annales Velleiani,' is a useful edition; but a still better, perhaps, is that of Ruhnken, Lugd. 1789; reprinted by Frotcher, Lips. 1830-39.

**PATERSON, WILLIAM.** Of the early history of this man, who originated several celebrated projects, little is known. By some accounts he is said to have been brought up to the clerical profession, to have been sent as a missionary to the West Indies, and to have subsequently become a buccaner. In the account however of the parish of Tinwald, Dumfriesshire, in the first volume of the old Statistical Account of Scotland, it is asserted that he was born at Skiplyre in that parish about the year 1660, that he was respectably connected, and that he more than once sat for Dumfriesshire in the parliament of Scotland. Whatever may be his early history, he must have had ample opportunities of making himself acquainted with the commerce and institutions of foreign countries, and he was probably an extensive traveller. His schemes regarding banking and trading projects are said to have been first offered to the mercantile communities in the Low Countries, and to have been coldly received. He subsequently laid his plans before the merchants of London, and it seems to be nowhere doubted that they were the foundation of the project of the Bank of England, incorporated in 1694. From the rapidity with which the scheme was brought into a working shape, it may be conjectured that very little alteration was made on the original suggestions of Paterson. It does not appear that the inventor was for any length of time practically connected with the working of the institution. It is usually said that the rich capitalists, once possessed of his ideas, quarrelled with him, set him adrift, and managed his project for their own peculiar advantage. It is probable however that Paterson, though so able a schemer, was a bad practical man of business; that his invention was perpetually on the wing, and that he could not settle down to the routine of business with much advantage either to himself or to others.

His next project, if it was not conceived at the same time as that of the Bank, was the renowned Darien expedition. Scotland was at that time filled with active and enterprising spirits, who, by the two kingdoms being under one crown, had lost much of that department of foreign service which their ancestors had held in states at war with England. There was an earnest desire to rival England in commerce and manufactures, and in colonies, of which Scotland was not previously possessed. An act of the Scottish parliament was passed on the 26th of June 1695, incorporating certain persons by name, of whom Paterson was one, with powers to add to their number, to be called 'The Company of Scotland trading to Africa and the Indies.' Very important privileges, both in connection with foreign trade and with the institutions of the country, were conferred on the members. The company raised a large subscription in England. Its progress roused the English jealousy of trade, and after some representations by the East India Company and other bodies, both houses of parliament presented an address to King William, in which they stated, "that by reason of the superior advantages granted to the Scottish East India Company, and the duties imposed upon the Indian trade in England, a great part of the stock and shipping of this nation would be carried thither, by which means Scotland would be rendered a free port, and Europe from thence supplied with the products of the East much cheaper than through them, and thus a great article in the balance of foreign commerce would be lost to England, to the prejudice of the national navigation and the royal revenue." In fact, under the guise of a company having a monopoly, Paterson's plan would have developed itself, had it come into full operation, as a nucleus of free trade; and its opponents rather felt how unable they would be to compete with this untrammelled community, than saw in its constitution any general principle of superiority to the restrictive commercial system with which they were connected. "We do hereby publish and declare," says the first proclamation of the company, "that all manner of persons, of what nation or people soever, are and shall from henceforward be equally free, and alike capable of the said properties, privileges, protections, and immunities, and rights of government granted unto us; and the merchants and merchant-ships of all nations may freely come to and trade with us without being liable in their persons and goods to any manner of capture, confiscation, seizure, forfeiture, attachment, arrest, restraint, or prohibition, for or by reason of any embargo, breach of the peace, letter of marque, or reprisals, declaration of war with any foreign prince, potentate, or state, or upon any other account or pretence whatsoever. And we hereby not only grant, concede, and declare a general and equal freedom of government and trade to those of all nations who shall hereafter be of or concerned with us, but also a full and free liberty of conscience in matters of religion."

In contemplation of a company conducted on such principles, the two houses of the English parliament represented that "the privileges granted their company would render their country the general storehouse for tobacco, sugar, cotton, hides, and timber; the low rates at which they would be enabled to carry on their manufactures would render it impossible for the English to compete with them." King

William was induced to discountenance the undertaking, and the projectors were deprived of all aid, not only from England but from foreign speculators. This only made the scheme a more truly national object, and all the disposable wealth of Scotland was speedily embarked in it. The main scheme of the company was to establish a colony at Darien, when Paterson believed that it would be in the middle of the highway of the world, and form the emporium where the commerce of the East would meet that of the west. With all due respect for the principles on which the commerce was to be conducted, it may be questioned if the place possessed all the peculiar advantages which he attributed to it, especially at a time when regular commercial enterprise had made so comparatively little progress over the globe. The expedition set out on the 26th of July 1698; its disastrous results may be found recorded in the ordinary histories of the period, and particularly in Sir John Dalrymple's Memoirs. Paterson was ambitious, but not mercenary, and in the palmy days of the company he had resigned the profits which those confident of its success had assigned to him. The failure of the expedition preyed deeply on his spirits, and grief and disappointment brought him, during his return home, to the borders of lunacy. He lived subsequently a life of obscurity, and the period of his death is not recorded.

\***PATON, SIR JOSEPH NOEL,** born at Dunfermline, Fifeshire, in 1823; and received his education as an artist at the Royal Scottish Academy, and we believe the Royal Academy, London. He first became known to the public by his cartoon of 'The Spirit of Religion,' which obtained one of the three premiums of 200*l.*, awarded at the cartoon competition in Westminster Hall, 1845. In 1847 the Fine Arts Commissioners awarded him a second class prize of 300*l.* at the Westminster Hall competition for his oil-paintings of 'Christ bearing the Cross,' and 'Reconciliation of Oberon and Titania;' but he was not in consequence of these successes called upon to execute any work for the New Houses of Parliament. Mr. Paton resides at Edinburgh, and is regarded by his countrymen as one of the most promising of their rising painters. The following are among his principal pictures: 'Quarrel of Oberon and Titania,' purchased for the Scottish National Gallery; 'Dante meditating the episode of Francesca,' 1852; 'The Dead Lady,' 1854; 'The Pursuit of Pleasure,' 1855; and 'Home,' which was exhibited at the Royal Academy in 1856, and was generally regarded as the best of the sentimental class of paintings called forth by the recent war. He was knighted in 1867.

**PATRICK, ST.**, the apostle of Ireland, was born, according to Usher and Tillemont, in the year 372. The former places his death in 493, but Tillemont about 454. Nennius says he died fifty-seven years before the birth of St. Columba, consequently in 464.

The two principal ancient Lives of St. Patrick are, that compiled by Jocelin, a Cistercian monk, in the 12th century, who quotes four Lives written by disciples of the saint; and that by Probus, who, according to the Bollandists, lived in the 7th century. In both, legendary tales are intermixed. The chief authentic information we possess concerning this saint is obtained from his own writings, his 'Confession,' and a letter which he addressed to Corotic, a prince in some part of Wales, after the Britons had been abandoned by the Romans, who made a descent upon Ireland during St. Patrick's mission to that country. From the 'Confession,' we learn that he was born in a village called Bonaven Tabernis, supposed to be the town of Kilpatrick at the mouth of the Clyde in Scotland, between Dumbarton and Glasgow. He calls himself both a Briton and a Roman, meaning of mixed extraction; and says his father was of a good family, named Calphurnius. His mother was Concha, or Conchessa, who, according to some writers, was niece to St. Martin of Tours. According to Nennius, St. Patrick's original name was Maur; that of Patricius was given to him by Pope Celestine when he consecrated him a bishop, and sent him as a missionary into Ireland in 433.

Jones, in his 'Historical Account of the Welsh Bards,' folio, Lond., 1794, p. 13, says St. Patrick was born in the vale of Rhos in Pembrokeshire. His festival is marked on the 17th of March in the 'Martyrology' of Bede.

(*Acta Sanctorum* of the Bollandists, 'Month of March,' vol. ii., pp. 517-592; Butler, *Lives of the Saints*, 8vo, Dublin, vol. iii., pp. 176-186, 1779.)

**PATRICK, SIMON,** a prelate of the English Church, distinguished as the author of many excellent works in practical divinity and expository theology, was born in 1626. He was a native of the town of Gainsborough, educated in Queen's College, Cambridge, and the chief scene of his public labours as a clergyman was the parish of St. Paul's, Covent Garden, of which he was rector till higher preferment was bestowed upon him: he became Dean of Peterborough in 1679, Bishop of Chichester in 1689, and Bishop of Ely in 1691. He died in 1707.

The titles of his writings will show at once their nature and tendency to have been to promote Christian piety and to foster the spirit of devotion. In their day they were much esteemed, and they are still valued as among the best helps to devotion:—'Heart's Ease,' 'Parable of the Pilgrim,' 'Exposition of the Ten Commandments,' 'The Friendly Debate,' 'The Christian Sacrifice,' 'The Devout Christian,' 'Advice to a Friend,' 'Jesus and the Resurrection justified,' 'The Glorious Epiphany.' Besides these there are his 'Paraphraes' and 'Comments' on the books of the Old Testament, which have been several times reprinted. These writings are the foundation of Bishop Patrick's

reputation. He also completed and published Gunton's 'History of the Church of Peterborough.'

PAUL, SAINT, the great Apostle of the Gentiles, originally called Saul, was born at Tarsus in Cilicia. Though a Jew of the tribe of Benjamin, and a Pharisee of the most rigid sect, he was by birth a Roman citizen—a privilege inherited from his ancestors, upon some of whom it had probably been conferred for services rendered to the state. The year of his nativity is not known. He was present at the martyrdom of Stephen, A.D. 34, on which occasion he is first introduced to our notice, and is called a young man. He learned the art of tent-making, not with the intention of making it the occupation of his life, but because it was a custom among the Jews, even of the highest respectability, to instruct their youth in some mechanical art. Having been educated in the learning of the times, for which Tarsus was then highly celebrated (Strabo, p. 873, Casaub.), and in which he undoubtedly made great proficiency, he went to Jerusalem to study the laws and traditions of his people under Gamaliel, a distinguished Rabbi. Being a man of great talent, ardent mind, and inflexible resolution, and being devotedly attached to the institutions of his country, whose origin and antiquity alike impressed and fascinated his imagination, he contemplated with alarm and anxiety the progress of the new religion. Accordingly he took an active and prominent part against the Christians, and pursued them with such zeal and fury, that his conduct towards them is described as "breathing out threatenings and slaughter." He obtained letters from the Sanhedrim to the synagogues of the Jews at Damascus, and also to the governor, authorising him to apprehend and bring to Jerusalem whomsoever of the disciples he might find there. While on his journey for this purpose his miraculous conversion took place, the particulars of which are recorded in the ninth chapter of the Acts of the Apostles. This event, so important in its results upon the subsequent fortunes of Christianity, occurred in 35, two years after the crucifixion of our Lord.

After his baptism at Damascus he went into Arabia. In 38 we find him again at Damascus; and from this place, as likewise from Jerusalem shortly after, he was compelled to escape secretly and by night, in consequence of the perseverance with which the Jews sought his life, for preaching with so much boldness and success the religion which he once laboured to destroy. From Jerusalem he retired to Tarsus, his native city, and was employed for some years in propagating the faith through the neighbouring regions of Syria and Cilicia. Up to this time the preaching of St. Paul and of the other apostles had been confined to the Jews; but the conversion of Cornelius, a Gentile, was a very significant indication that Christianity was intended not for one country or one people, but for all mankind, without distinction of race or nation. This was the conclusion inferred both by the apostles and the Jewish converts at Jerusalem. Immediately therefore the object of their mission was extended; and instead of being restricted to the children of Abraham, now comprehended all mankind. Into this great idea, that of founding a religion for the entire human race, St. Paul entered with all the ardour and devotion which characterised his mind. He departed from Tarsus in 42; and in conjunction with Barnabas, who had been sent from Jerusalem for the purpose, preached to the Gentiles at Antioch with the greatest success. But the views he had formed of Christianity as a universal religion suggested to him the propriety of enlarging the sphere of his labours, and of carrying the gospel to more remote provinces. To this work he and Barnabas were divinely appointed (Acts xiii.); and he commenced his first apostolic journey in 45, ten years after his conversion. In company with Barnabas and Mark the evangelist, he sailed from Seleucia, and successively visited Salamis and Paphos in the Isle of Cyprus; Perga in Pamphylia, and Antioch in Pisidia; Iconium, Lystra, and Derbe, in Lycania; and made converts and founded churches in these places. At the end of two years he returned to Antioch in Syria. While at Antioch he was engaged in a most important controversy with some Jewish Christians, who asserted that circumcision was necessary to be observed by converts to the new faith. St. Paul, on the other hand, contended that Christianity entirely superseded the Mosaic Law, and required conformity to none of its rites. The question was referred to a council of apostles and elders at Jerusalem, who, after much deliberation, decided in favour of the view which St. Paul had taken. The decision was declared to have received the sanction of the Holy Ghost, and it was communicated to the Gentile converts at Antioch and other places.

In the year 50 St. Paul commenced his second apostolic journey. Leaving Antioch, and passing through Syria and Cilicia, he traversed the whole extent of Asia Minor and came to Troas. From Troas, in obedience to the direction of a vision, he sailed over into Europe; and after preaching the gospel at Philippi, Thessalonica, Berea, and Athens, arrived at Corinth, where he abode a year and a half, and was eminently successful in establishing an important Christian community in that learned, wealthy, and voluptuous city. From Corinth he sailed to Ephesus, and thence to Cæsarea; and, taking Jerusalem in his way, returned to Antioch in 53. During this journey he wrote his two Epistles to the Thessalonians, and his Epistle to the Galatians; the two former, and probably the latter, from Corinth.

Having remained a short time at Antioch, he in 54 set out upon his third and last apostolic journey. He visited the churches in Galatia and Phrygia, and thence came to Ephesus, where he lived about two

HOE. DIV. VOL. IV.

years. Here, and in the neighbouring district of Asia Minor, he preached the gospel with so much success that not only were great numbers converted to Christianity, but those who practised incantations and magical arts and other gross superstitions, for which Ephesus was notorious, renounced their practices, burnt their books and divining instruments, and professed their faith in the new religion. After the disturbance raised by Demetrius the silversmith, of which an account is given in the 19th chapter of the Acts, the apostle deemed it prudent to leave Ephesus. He went to Troas, and thence passed over into Europe, visiting the churches which he had planted in Macedonia and Greece. From Corinth, where he remained about three months, he returned by Macedonia to Asia; and taking an affectionate farewell of the elders of the Ephesian church at Miletus, embarked for Cæsarea, and in 58 terminated his journey at Jerusalem. On this journey he wrote his first Epistle to the Corinthians, from Ephesus; his first Epistle to Timothy, the one to Titus, and the second to the Corinthians, from Macedonia; and his Epistle to the Romans, from Corinth. These journeys occupied him about thirteen years.

When St. Paul was at Jerusalem some Asiatic Jews, seeing him in the Temple, endeavoured to excite the populace against him by denouncing him as a dangerous and destructive agitator, who was aiming to abolish all distinction between Jew and Gentile, teaching things contrary to the law of Moses, and polluting the holy Temple by introducing the uncircumcised heathen within its precincts. The mob, roused by this appeal to their passions and their prejudices, would have murdered the apostle had he not been rescued by the officer of the Temple guard. The subsequent events—his examination before the Sanhedrim, his defence before Felix and Agrippa, his long confinement at Cæsarea, his appealing to the emperor, and his arrival at Rome in 61, after a most tempestuous passage—are circumstantially related in the latter chapters of the Acts. He remained in Rome, in his own hired house, under the custody of a soldier, for two years, and wrote his epistles to the Ephesians, Philippians, Colossians, Hebrews, and to Philemon. The Scripture history here leaves him; but it is probable that after his first imprisonment at Rome, which terminated in 63, he visited Judæa, Asia Minor, and Greece, and returned to Rome in 65, where he was imprisoned a second time. "Knowing his departure to be at hand," he wrote his second Epistle to Timothy; and it is supposed he suffered martyrdom in the year 66.

St. Paul was an extraordinary man, and peculiarly fitted for the times in which he lived and the mission to which he was called. He was accomplished in all the learning of the age; was brought up at the feet of one of the most skilful jurists of the East; possessed a powerful intellect, which was cultivated with the greatest care; was strong in feeling, firm in resolution, quick in perception, and sound in the decisions of his judgment. He had too much penetration to be himself easily deceived, and too much honesty to attempt to deceive others. His devoted attachment to the old and time-honoured institutions of his nation, and the zeal and ability he displayed in their defence—his ambition, mental power, and restless activity—and the well-grounded apprehensions with which the preaching of Jesus and his disciples had filled the imaginations of many, and which he alone seemed competent to dissipate, combined to make him an object of general attention to his countrymen, and prepare for him a career of distinction and emolument. His conversion therefore, which involved the loss of all his brilliant prospects, has, next to the miracles and resurrection of our Lord, been justly contemplated as one of the most striking and memorable events connected with the early history of Christianity.

From being a furious zealot, a fierce and unrelenting persecutor of the disciples of Jesus Christ, St. Paul became a disciple himself, and a most energetic advocate of the faith which he had once attempted to destroy. After his conversion St. Paul was indefatigable in preaching the gospel. His perseverance never tired—his courage was never daunted. He was the main instrument of carrying the Christian religion among the Gentiles; and in this mission his labours were continued through a period of many years, and spread over a territory of vast extent. Judæa, Syria, and especially Asia Minor were filled with monuments of his zeal. He also passed over into Europe, where he made converts and planted churches. In this righteous cause he was deterred by no difficulties and no persecutions. He groups together in one passage the dangers which he had encountered: he speaks of toils, stripes, prisons, deaths—of being stoned and shipwrecked—of perils in the city and in the wilderness, on dry land and on the ocean, from false friends and open foes—of watchings and weariness, of hunger and thirst, of cold and nakedness. "We see him," says Paley, "in the prosecution of his purpose, travelling from country to country, enduring every species of hardship, assailed by the populace, punished by the magistrates, scourged, beat, stoned, left for dead; expecting wherever he came the same treatment; yet, when driven from one city, preaching in the next; unshaken by anxiety, want, labour, persecution, and the prospect of death."

The exertions of this great apostle in the cause of Christianity were not confined to bodily toil and personal instruction. He was the author of fourteen epistles to individuals, and to churches, on various points of Christian doctrine, practice, and discipline. These epistles

constitute a very considerable and most important part of the New Testament. They show him to be a man of great genius and great abilities; of clear conception, fervid imagination, lofty intellect, and a large and liberal heart. His style is strong and animated; unlaboured and without artifice in its construction; often broken and abrupt; it abounds in transitions; and brief and rapid allusion to existing errors, practices, and habits of thought, from which he draws the most apt illustrations. He addresses, by turns, the intellect, the imagination, the passions, the heart. He unites a severe logic with the noblest eloquence. The loftiest truths are made subservient to the most sober, pure, and rational morality; a morality essentially practical, and admirably adapted to human character and human circumstances. If he exhorts, it is with intense earnestness; if he reproves, it is in the spirit of sympathy and kindness; and whether he reasons, or advises, or admonishes, or consoles, a manly gravity and seriousness pervade his thoughts. Full of the dignity and grandeur of his subject, his ideas flow from him with irresistible rapidity; and borne along by the sublimity of his theme, and the vastness of his conceptions, he stays not to arrange his words and adorn his periods. His arguments carry conviction to the mind of his reader; sometimes disclosing in a few words the profoundest views of Christian truth. His appeals to the passions are equally effective. Hope and fear are important springs of human action; to these he addresses himself, as well as to the reason; not by cold speculation on abstract fitnesses, but by the solemn infallibilities of a resurrection from the dead to an eternity of happiness or misery. With a like mastery and success he interests the affections and the higher moral faculties. Though disclaiming the "enticing words of man's wisdom," he could, when the occasion required it, use the arts and display the accomplishments of the rhetorician. His speeches in the Acts of the Apostles are worthy of the Roman senate; and his answers, when at the bar, to the questions proposed to him by the court, are distinguished for their address and their dignity. At the same time, wherever he happened to be, whether among the Jews in Pisidia, or the Gentiles at Lystra, or the polished Greeks at Athens, or pleading before Felix and Agrippa, his discourses are adapted with admirable judgment and ability to the character and capacities of his several audiences. On the subject of St. Paul's writings, see Dr. Harwood, Michaelis, and Bishop Newton; and especially the very valuable 'Life and Epistles of St. Paul' by Conybeare and Howson.

There is a tradition in the Church that Paul was beheaded near Rome, and buried about two miles from the city, in the Via Ostiensis; and a magnificent cathedral, dedicated to his memory, was built over his supposed grave by Constantine.

PAUL OF SAMOSATA was chosen Bishop of Antioch in A.D. 260. In consequence of being supposed to hold heterodox opinions concerning the person of Christ, a synod was assembled at Antioch about 264 to inquire into his sentiments. After holding several meetings, this synod was unable to extract from Paul an avowal of his suspected heresies. In the year 269 another synod was convened on this business, consisting of a large number of bishops, at which Malchion, a rhetorician and presbyter of the church at Antioch, succeeded in convicting Paul of the erroneous opinions imputed to him. He was excommunicated by this synod, which wrote an epistle to Dionysius, bishop of Rome, and to the churches of the empire, giving the reasons for their decision. Fragments of this epistle have been preserved by Eusebius. Though deprived of his bishopric, Paul refused (probably under the protection of Zenobia, who is known to have favoured him) to give up "the house of the church" till the year 272 or 273, when the bishops who had excommunicated him applied to the Emperor Aurelian, who compelled Paul to yield. It is probable that he continued after this to propagate his doctrines. His followers formed a sect under the name of Paulians or Paulianists, which seems to have lasted to the 5th century. They were condemned by the Council of Nice, who ordered those baptised among them to be re-baptised.

The accounts we have of his doctrines are not very clear. The synodical epistle of the council which deposed him speaks less of them than of his personal character, which is represented as marked by pride and arrogance, haughtiness in the exercise of his authority, and great love of pomp and display. He held some secular office together with his bishopric. The following statement of his opinions by Moseheim appears, as far as we have the means of judging, to be tolerably correct:—"That the Son and the Holy Ghost exist in God, in the same manner as the faculties of reason and activity do in man; that Christ was born a mere man; but that the reason or wisdom of the Father descended into him, and by him wrought miracles upon earth, and instructed the nations; and, finally, that on account of this union of the divine Word with the man Jesus, Christ might, though improperly, be called God."

PAUL THE DEACON, or PAULUS DIACONUS, called also WARNEFRIDUS from his father's name, was born about 740 at the town of Friuli (Forum Julii). He became attached to the court of Ratchis, king of the Lombards, and afterwards (about 763) he left the court, and was ordained deacon of the church at Aquileia. He returned to the court on the invitation of Desiderius, successor of Ratchis, by whom he was made chancellor. About the part of his life which followed the overthrow of the kingdom of Desiderius by Charlemagne in 774, we know nothing for certain; but the most probable account is, that

he retired to a monastery, and afterwards entered the celebrated monastery of Monte Casino, whence he addressed to Charlemagne in the year 781 an elegy, in which he implores the release of a brother who had been taken prisoner in the Lombard war. About this time Charlemagne appears to have attached him to his court. He was employed to instruct in Greek the clergymen who were to accompany the emperor's daughter Rotrude in her journey to Constantinople to be married to the son of the Empress Irene. Paul visited France, and stayed some time at Metz, of the early bishops of which city he wrote a history. He afterwards returned to Monte Casino, where he died about the year 799.

As a poet, Paul is spoken of in the most extravagant terms of praise by his contemporary Peter of Pisa. His poems, which are really good, consist chiefly of hymns and other short pieces in Latin. His fame rests however chiefly on his merits as an historian. His works were:—1. 'Historia Miscella,' a Roman history consisting of twenty-four books, of which the first eleven contain the history of Eutropius; the next five, by Paul himself, contain the period from the reign of Valentinian to that of Justinian; the remaining books are attributed to Landulphus Sagax. The best edition of this work is in Muratori's 'Rerum Italicarum Scriptores.' 2. 'De Gestis Longobardarum Libri Sex,' a history of the Lombards: his most valuable work. This is also contained in Muratori's collection. 3. 'Gesta Episcoporum Metensium.' 4. 'Life of St. Gregory the Great.' 5. 'Excerpta' from Festus, 'De Verborum Significatione.' [FESTUS.] There are also extant a collection of homilies and two sermons which are attributed to him.

PAUL THE SILENTIARY, the son of Cyrus and grandson of Florus, was of a noble family and possessed of great wealth. He held in the palace of Justinian the office of chief of the Silentarii, a class of persons who had the care of the emperor's palace. When the church of St. Sophia at Constantinople was rebuilt by Justinian in 562, Paul wrote a description (or *εἰσφοράς*) of the edifice, in 1026 Greek hexameters, with a preface consisting of 184 iambic verses. It is evident from this poem that he was a Christian. The work was edited, with notes and a Latin translation, by Ducange, Paris, 1670; the text edited by Bekker is contained in the Bonn edition of the 'Byzantine Historians,' 1837, with a second part, consisting of 275 hexameters and a preface of 29 iambs, not included in the edition of Ducange. Paul was also the author of a poem entitled *Εἰς τὴν ἐκκλησίαν Θεοῦ*, and of several epigrams, which are included in the Greek Anthology. (Fabricii, *Bibliotheca Græca*, ed. Harles, iv. 487, vii. 581.)

PAUL I. succeeded Stephen III. in the see of Rome A.D. 757. He was involved in disputes with the Longobard king Desiderius, and sought the protection of Pepin, king of the Franks. He died in the year 767.

PAUL II., a Venetian by birth, succeeded Pius II. in 1464. He began by correcting abuses, and checking the exactions of the officers and secretaries of the Papal court, who levied contributions at pleasure from those who had occasion to apply to Rome for licences, rescripts, and other official papers. He endeavoured also to form a league of the Christian princes against the Turks, who threatened Italy; and for this purpose he proclaimed, in 1468, a general peace among the Italian governments, threatening with excommunication those who did not observe it. Paul, in 1471, gave to Borso of Este the investiture of Ferrara with the title of duke as a feudatory of the see of Rome. [ESTE, HOUSE OF.] An academy had been formed at Rome for the cultivation of Greek and Roman antiquities and philology, of which Pomponius Letus, Platina, and other learned men were members. Paul, who unlike his predecessor Pius II., had no taste for profane learning, became suspicious of the academicians and their meetings. Some one probably excited his suspicions, by accusing them of infidelity and of treasonable designs. The academy was proscribed, some of its members ran away, others were seized and tortured, and among them Platina, who after a year's imprisonment was released through the intercession of several cardinals. It may easily be supposed that Platina, in his 'Lives of the Popes,' which he wrote afterwards under Sixtus IV., did not spare the memory of Paul II. But besides Platina, other contemporary writers, such as Corio Ammirato, an anonymous chronicler of Bologna, and the monk Jacopo Filippo of Bergamo, all speak unfavourably of this pope. Paul II. died suddenly, in July 1471, and was succeeded by Sixtus IV. Cardinal Querini has undertaken the defence of Paul II., in his "Vindicie adversus Platina aliosque Obrectatores."

PAUL III., CARDINAL ALESSANDRO FARNESI, succeeded Clement VII. in October 1534. At that time the most urgent applications were made by the various states of Europe to Rome for the assembling of a general council, which was required by the state of the Western Church, distracted by the disavowal of the papal supremacy by Luther and Zwingli, as well as by measures of Henry VIII. of England. Paul however took a long time to consider before he finally acceded to the request, and it was only in 1542 that he issued the bull of convocation. In the meantime he excommunicated Henry VIII., and released his subjects from their oath of allegiance, by which measure he hastened the total separation of England from Rome. In 1540 he sanctioned the new order of the Jesuits. The war between Francis I. and Charles V. occasioned a further delay in the assembling of the council, which was finally opened at Trent in 1546. That assembly, which was prorogued several times, transferred

to Bologna, and afterwards removed again to Trent, did not terminate its sittings till 1563, long after Paul's death.

Paul was very anxious to aggrandise his own family. He had a natural son, Pier Luigi Farnese, whom he first made Duke of Castro, and afterwards Duke of Parma and Piacenza. For his grandson Ottavio Farnese he obtained the hand of Margaret, a natural daughter of Charles V., and made him Duke of Camerino. The pope subdued the people of Perugia, who had revolted against him, put to death several of the leaders, and built a citadel to keep the citizens in awe. He also attacked the Colonna, the most powerful baronial family in the neighbourhood of Rome, took all their strongholds, and obliged the members of that family to take refuge in the fiefs which they held in the kingdom of Naples. He sent a contingent of 12,000 foot and 1000 horse, under his grandson Duke Ottavio, to join the emperor's army in Germany against the Protestant princes, and he afterwards strongly opposed the religious pacification granted by Charles in 1547, under the name of the 'Interim.' In the same year Paul received the news of the tragical death of his son Pier Luigi, who was murdered at Piacenza, where he had made himself odious by his tyranny and his lust. Overcome by grief at the news, he told his two grandsons, Ottavio and Cardinal Farnese, who were with him at the time, to take warning from their father's death, and to live in the fear of God. Having secured the succession of Parma and Piacenza to Pier Luigi's son, Paul died, in November 1549, at a very advanced age, and was succeeded by Julius III.

PAUL IV., CARDINAL GIANPIETRO CARAFFA, who was of a noble Neapolitan family, succeeded Marcellus II. in 1555. He was old, haughty, intolerant, and intent upon aggrandising his nephews. He quarrelled with Philip II. of Spain, who sent the Duke of Alba with an army from Naples to invade the papal territory. The duke advanced to the gates of Rome, but after some demonstrations a peace was concluded in 1557. Having learned that his nephews, one of whom he had made a cardinal, were leading a most dissolute life, and were plundering both the people and the treasury of the Church, he banished them from Rome in 1559. Paul IV. died shortly after, eighty-four years of age. He had been a zealous advocate of the tribunal of the Inquisition. As soon as the news of his death became known, the people of Rome rose in insurrection, ran to the prison of the Inquisition, wounded a Dominican monk who acted as commissary, delivered all the prisoners, and burnt the papers. They then threw down the statue of the pope, crying out "Death to the Caraffas." The tumult lasted several days, after which the conclave elected a new pope by the name of Pius IV., who instituted a process against the nephews of the late pope, two of whom, Cardinal Caraffa and the Duke of Paliano, were found guilty of several crimes, and put to death in 1560.

PAUL V., CARDINAL CAMILLO BORGHESI OF SIENA, succeeded Leo XI. in 1605, when he was fifty-three years of age. His first act was a dispute with the senate of Venice concerning two ecclesiastics, subjects of that state, who, being accused of heinous crimes, were on their trial before the civil magistrata. The pope asserted that clerical men could only be tried by their bishops, and as the Venetian senate maintained their rights, Paul laid Venice under interdict. The senate forbade the publication of the bull, and as the members of several monastic orders professed that they could not continue to perform religious worship in a country placed under interdict, they were allowed to quit Venice, and the senate appointed secular priests to perform service in their stead. The people remained perfectly quiet, and the bishops and vicars continued their functions as usual. Paolo Sarpi, better known as Father Paul [PAUL, FATHER], the senator Antonio Quirino, and others, wrote in defence of the senate, and Cardinal Baronius and Bellarmino wrote in defence of Rome. There were three points at issue between the pope and the senate: 1, the senate had made a decree that no new convent or religious congregation should be founded without their permission; 2, that no property or perpetual revenue of any kind should be bequeathed to the church without their approbation; 3, that clerical men accused of crimes should be judged by the secular power like other citizens. The king of France and the emperor took the part of Venice, the court of Spain that of the pope, and Italy was threatened with a war like that of the Investitures. Henri IV. of France however proposed his mediation, and sent to Venice Cardinal de Joyeuse, who after consulting with the senate, proceeded to Rome, where he succeeded in effecting a compromise. The decrees of the senate were maintained, but the two clerical culprits, in compliance with the wish of the French king, were given up to the pope, "saving the right of the republic to punish all offenders, clerical or lay, within its dominions." Upon this arrangement being made, the interdict was removed.

In 1614 Pope Paul had a dispute with Louis XIII., on account of a book of the Jesuit Suarez, entitled 'Defensio Fidei,' in which the author maintained that in certain cases it was lawful to murder kings. This book was publicly burned by sentence of the parliament of Paris. The pope maintained that he was the proper authority to decide upon the contents of works concerning religious and moral doctrines, and that the book ought to have been referred to him. This affair was likewise settled by a compromise.

The pope was in the meantime usefully employed in reforming many abuses in the tribunals and other offices of the Roman court, and in

embellishing the city of Rome. In this respect he ranks among the most distinguished pontiffs for his encouragement of the fine arts. He enlarged the Vatican and Quirinal palaces, restored the church of Santa Maria Maggiore, constructed or repaired aqueducts, made additions to the Vatican library, collected statues and other antiquities, and built the handsome villa Mondragone at Frascati. He established the fortune of the Borghese family, which is one of the wealthiest of the Roman families. Paul V. died in 1621, and was succeeded by Gregory XV.

PAUL I., emperor of Russia, son of Peter III. and Catherine II., was born in 1754. He lost his father at an early age, and the death of his brother Ivan, in 1763, made him heir apparent to the crown. He had good instructors, but was treated with great strictness by his mother as long as she lived, and was studiously kept in ignorance of all public affairs. She often expressed an unfavourable opinion of his judgment and disposition, and it is believed that she would have disinherited him had she been able to do it. In 1776 Paul married Mary of Würtemberg, an amiable princess, by whom he had four sons, Alexander, Constantine, Nicolas, and Michael, and several daughters. In 1780 he travelled with his wife through Germany, France, and Italy, under the title of 'Comte du Nord.' On his return to Russia he continued to live in retirement, at the country residence of Gatchina, thirty miles from St. Petersburg, and his sons and daughters were educated at court, under the eye of the empress. In 1796, on the death of Catherine, Paul, then 42 years of age, emerged from his restraint, and was proclaimed emperor. He began by causing solemn funeral honours to be paid to his father, together with the late empress, and for this purpose he had the coffin containing his body removed from the place where it had been deposited, and placed in the church by the side of the corpse of Catherine. Paul also went in person to release the Polish patriot Kosciuszko, who was confined as a state prisoner, not however in a dungeon, as some have said, but in a private house, under a military guard, and he gave him money to enable him to go and live in the United States. He likewise liberated Potocky, Niemcewicz and the other unfortunate Poles who were confined at Schlüsselburg and other fortresses. These acts of the new emperor gave hopes of a good reign, but Paul's character soon showed itself in all its capriciousness and violence. He liked to interfere in the most minute details of police and of military discipline; he forbade the wearing of round hats in the streets of St. Petersburg; he likewise proscribed trowsers and frock coats, and several foreigners were ill-used in consequence of these absurd regulations. Any one who met him in the street was obliged to take off his hat, even in the severest weather, and ladies were required to alight from their carriages. For the former convenient dress of the Russian infantry, consisting of a jacket and pantaloons, he substituted the German uniform, with tailed coats, spatterdashies, and queues bedaubed with grease and flour as being cheaper than powder and pomatum. This caused much discontent among the soldiers and numerous desertions, a thing almost unknown till then in the Russian army. In the same spirit, Paul, whose only desire seemed to be to alter, remodelled all the departments of administration, and all the courts of the empire, in consequence of which thousands of civil officers were thrown out of employment.

In his foreign politics Paul at first seemed disposed to adopt a system of neutrality in the great quarrel between France and the allied powers. But he soon became alarmed at the progress of the French arms, and at the encroachments of the French directory; the invasion of Switzerland, of Rome, Naples, Malta, and Egypt, determined him for war. He had an army of from 40,000 to 50,000 men assembled in Galicia by Catherine, and he ordered it to join the Austrians and march upon Italy. The veteran Suwarrow, the most distinguished general of Russia, who had been dismissed by Paul soon after his accession, for having sneered at his martinet innovations in the army, was appointed to command the expedition. For an account of his successful campaign in Italy, in 1799, see SUWARROW. Another Russian army, 40,000 strong, under General Korsakov, was sent to join the Archduke Charles in Switzerland. This army was defeated by Massena, at Zürich, in September 1799. A third army was sent to join the English, under the Duke of York, in Holland, and that expedition also failed. A fourth Russian army was embarked on a fleet, which, joined to the Turkish fleet, conquered the Ionian Islands, and assisted in restoring the King of Naples to his continental dominions. In the end however Paul was sorely disappointed in his military expectations. His best general, Suwarrow, after the conquest of Italy, having marched into Switzerland to join his comrades there, arrived just after the defeat of Korsakov, and was obliged to retreat through the Alps of Glaris into the Grisons country. He and his army were recalled by the emperor, and Suwarrow arrived, desponding and in bad health, at St. Petersburg, where he soon after died. Paul, who had broken the heart of the veteran by attributing to him the disasters in Switzerland, in which he had had no part, relented towards him in his last moments, sent to inquire how he did, and allowed the grand-dukes, his sons, to go and visit him. Paul withdrew from the coalition without publishing his reason for it; he offended the allies, but at the same time made no proposal of peace to France. He thus displeased everybody, and showed himself fickle, passionate, and weak. His private conduct partook of the same character. He

became more stern and morose, showed suspicion of everybody, and was disliked by all. The soldiers detested him for his vexatious minuteness in discipline, the nobility for his rude and often cruel behaviour, and men of information for his proscription of books and journals. Paul chose to quarrel with England because she would not give up Malta. He had caused himself to be elected grand-master of the order of St. John, after the death of the grand-master Hompesch and he expected England to give up the island to him. After the battle of Marengo, Bonaparte bethought himself of profiting by this disposition of Paul, in order to gain his friendship. He accordingly collected all the Russian prisoners in France, clothed them, supplied them with muskets, and sent them back to Russia. This produced its effect, and Paul, who had proclaimed himself the champion of legitimacy, became suddenly a great admirer of Bonaparte.

His next step was to seize the English vessels and other property in his harbours, because England had sent a fleet to Copenhagen in August 1800, to oblige Denmark to acknowledge the navigation laws and the right of search of neutral vessels. In December of the same year, Paul concluded a convention with Sweden and Denmark, to which Prussia soon after acceded, by which the right of search of neutral vessels was declared an attempt against the sovereign rights of the nation to which they belonged, and a squadron of the four Baltic powers was to be assembled to protect their merchant vessels, and resist any attempt at searching them. In consequence of this step England put an embargo upon the vessels of the Baltic powers. Paul now sent an agent to Bonaparte, and friendly communications were re-established between France and Russia. Bonaparte even accepted Paul's mediation in favour of the court of Naples, which was still at war with France. Count Kalitcheff went to Paris as ambassador of Russia, and was received with great distinction. "France," said Bonaparte publicly, "can ally itself only with Russia, for Russia is mistress of the Baltic and Black seas, and she holds the keys of India in her hands, and the emperor of such a country is truly a great prince. Paul is eccentric, but he has at least a will of his own." (Thibaudeau, 'Le Consulat et l'Empire,' ch. xiv.)

After peace was concluded at Luneville between France and Austria, in February 1801, Bonaparte secretly concerted with the court of Russia the plan of an expedition to India. Thirty thousand chosen French troops were to march into Poland, and there join an equal number of Russian infantry, besides 40,000 Cossaks and other irregular cavalry, and thence the allied army was to proceed to the borders of the Caspian Sea, either to embark and cross that sea or march by the way of Persia, whose consent was solicited by the two powers. (Thibaudeau, ch. xv.) Meantime England had sent a fleet into the Baltic under admirals Parker and Nelson, to dissolve the maritime coalition. On the 2nd of April, Nelson attacked the Danish fleet, and on the 4th an armistice was signed between Denmark and England. While the armistice was being concluded, news arrived of the sudden death of Paul, which happened in the night of the 24th of March. The Baltic coalition was thereby dissolved. A conspiracy had been formed among the officers near the person of the emperor, who went in a body at night to his apartments, and presented him an act of abdication to sign, on the score of mental weakness. Paul refused, saying "he was emperor, and would remain emperor." A scuffle ensued, in which the unfortunate monarch was overpowered and strangled. His son Alexander was proclaimed emperor.

When the news arrived in Paris, Bonaparte was greatly vexed and mortified. Talleyrand, to calm him observed that "this was the customary mode of abdication in Russia." According to the practice of those times, the French papers intimated that England was privy to the conspiracy; but the fact is that the Russians had become weary of Paul's caprices, which bordered upon insanity, and the plan of forcing him to abdicate, though not of murdering him, appears for some time previous to have been discussed among the members of the court, and even of the Imperial family, as a measure of absolute necessity. At the news of his death, the whole city of St. Petersburg, the army, nobles, and people rejoiced.

PAUL, FATHER, the celebrated historian of the Council of Trent, whose original name, before he embraced the monastic profession, was PIETRO SARPI, was born at Venice, in the year 1552, of a respectable commercial family. His father however was unsuccessful in trade; and his mother, a woman of sense and virtue, was early left a widow in indigent circumstances. Fortunately her brother was the master of an excellent school, and under his care she placed her son, who from infancy displayed an extraordinary aptitude for study. Before the completion of his fourteenth year, he had made great progress in mathematics and logic, as well as in general literature; and at that boyish age, having become a pupil of the logician Capella of Cremona, who was of the Servite order, this connection led him, contrary to the urgent advice of his uncle and mother, to adopt the same monastic habit and rule with his preceptor. In his twentieth year he solemnly took the vows of the order.

At the same period, the ability which he displayed in a public disputation, held at Mantua, during a chapter of his order, attracted the favourable notice of the reigning prince of the house of Gonzaga, and he was appointed to the professorship of divinity in the cathedral of that city. But though he was honoured with many marks of regard by the Mantuan duke, a public life was little to his taste; and he

shortly resigned his office and returned to the learned seclusion which he loved. In that retirement he continued to cultivate learning and science; and in his twenty-second year, he had not only already mastered the Latin, Greek, Hebrew, and Chaldee languages, but was also a proficient in the civil and the canon law, in various departments of philosophy, in mathematics and astronomy, in chemistry, medicine, and anatomy. In these last sciences he became deeply versed for his times, and it has been alleged that he was acquainted with the circulation of the blood.

The claim of Sarpi to be considered the discoverer of the circulation rests on the authority of Veslingius, who states, in his 'Epist. Anat. et Medicæ,' ep. xxvi, that he had read a manuscript by Sarpi, belonging to his pupil and successor Fulgentius, in which the circulation was described. George Ent (Harvey's commentator and friend) admitted the testimony, but said that whatever Sarpi knew of the circulation, he learned from Harvey himself. Ridanus, Harvey's chief adversary, gives no credit for the discovery to Sarpi; and Fulgentius himself does not claim it for him. Several writers attribute to Sarpi the discovery of the valves of the veins, which gave Harvey the first idea of a circulation; but Fabricius was acquainted with them in 1574, when Sarpi was but twenty-two years old, and it is certain that he (Fabricius) taught Harvey their existence. The above is on the authority of Haller ('Bibliotheca Anatomica'), who does not attribute any part of the discovery to Sarpi.

The pursuit of such studies, and the renown which they procured for him, no less than the freedom of his expressed opinions in correspondence with the kindred minds of his age, drew upon him the envy and suspicion of the mean and bigoted; and he was twice arraigned before the Inquisition on a false and absurd accusation of heresy, and on a better-founded charge of having declared in a letter his detestation of the papal court and its corruptions. His high reputation protected him in both cases; but the court of Rome never forgave him, and, at a subsequent period, revenged and justified his bad opinion of its administration by refusing to reward his unquestionable merits with preferment to a bishopric. The famous dispute which arose between the Roman see and the republic of Venice, during the pontificate of Paul V., in the year 1606, drew the speculative recluse from the quietude which had only been thus partially interrupted, into open and dangerous collision with the papal power. When Paul V. endeavoured to revise the doctrines of the supremacy of the pope over all temporal princes and governments, and reduced these pretensions to practice by laying the Venetian state under an interdict and excommunication for having subjected priests to the secular jurisdiction, the senate of Venice, not contented with setting these papal weapons at defiance, determined to support by argument the justice of their cause. The most eloquent and successful advocate whom they employed for this purpose was Father Paul; and animated both by zeal in the service of his native state and by indignant opposition to the Romish usurpations, he fulfilled his task with equal courage and ability, and signally exposed the papal pretensions. Paul was finally compelled to consent to an accommodation very honourable to the Venetian state.

The papal party, however, though reduced to yield to the power of that republic and the strength of her cause, was resolved not to forego its vengeance against her defenders, and among them Father Paul was signally marked for a victim. Several attempts were made to assassinate him; and even in the apparent security of his retreat at Venice, he was attacked one night as he was returning home to his monastery by a band of ruffians, who inflicted on him no fewer than twenty-three wounds. The assassins escaped in a ten-oared boat; and the papal nuncio and the Jesuits were naturally suspected of being the authors of a plot prepared with such a command of means and expensive precautions. None of the wounds of Father Paul were mortal; and, preserving one of the stilettes which the assassins had left in his body, he surmounted it with the inscription, 'Stilo della chiesa Romana' ('The pen (or dagger) of the Romish Church').

These attempts upon his life compelled Father Paul to confine himself to his monastery, and induced him to employ his constrained leisure by engaging in the great literary composition by which he is chiefly remembered—'The History of the Council of Trent': a work which has been not more deservedly commended for its style as a model of historical composition, than for the extent of its learning, the generous candour of its spirit, the unbiassed integrity of its principles, and the unostentatious piety of its sentiments. While occupied in this and other labours of minor import, Father Paul was overtaken by death, in his seventieth year. A neglected cold produced a fever, the immediate cause of his dissolution; and after lying for nearly twelve months on a bed of sickness, which was supported with the most edifying cheerfulness and piety, he expired on the 14th of January, 1623, and his memory was honoured by the gratitude of the Venetian republic with a public funeral.

The discussion of Father Paul's theological opinions and conduct is beyond our province. His opposition to the papal see has drawn upon his character the severe animadversions of Roman Catholic divines, and procured for it in a consequent degree the favour of Protestant writers. It may here suffice to observe that the uprightness of his motives and the sincerity of his religious faith have never fairly been impugned; while his leaning to the doctrines of the Protestant churches has been

variously inferred as a matter either of commendation or reproach. Editions of Father Paul's 'History of the Council of Trent' were published in London, in Italian, English, and French, in 1619, 1676, and 1736; and of his whole works, in the original language, at Verona and Naples, in 1761, 1768, and 1790.

PAUL VERONESE. [CAGLIARI.]

PAULDING, JAMES KIRKE, was born August 22, 1779, at Pawlings, Dutchess county, in the state of New York. He is of Dutch descent, and the place of his birth derives its name from an ancestor by whom it was founded. Having completed his education, Mr. Paulding settled in New York, where he has since for the most part resided. His first literary effort was made in 1807, when, in conjunction with his brother-in-law, Mr. Washington Irving, he wrote the series of satirical papers entitled 'Salmagundi.' [IRVING, WASHINGTON.] This work was eminently successful, but Mr. Paulding does not appear to have followed up his first success till 1813, when he produced a satirical poem entitled 'The Lay of a Scotch Fiddle,' and soon after a somewhat elaborate reply to an article on America in the 'Quarterly Review.' This was followed in 1816 by a more pretentious work, 'The Diverting History of John Bull and Brother Jonathan,' a successful imitation of Swift and Arbuthnot. From this time Mr. Paulding led almost as busy a literary life as his colleague in the 'Salmagundi' venture: but being in easy circumstances, and looking rather to the circles of New York than to the entire world of English readers for appreciation, he has had neither the spur of necessity nor the feeling that the keener judgment of European criticism must be satisfied, to incite him to that close study and careful finish which have done so much to secure the wide and lasting reputation of Washington Irving. In 1817 Mr. Paulding published, in 'Letters from the South' in 2 vols., an amusing account of a visit to Virginia. In 1818 he wrote a second series of 'Salmagundi,' and 'The Backwoodsman,' a poem. Following these appeared in 1823 'Koningsmarke, or Old Times in the New World,' a novel; 'John Bull in America,' 1824; 'The Merry Tales of the Three Wise Men of Gotham,' 1826; 'The Book of St. Nicholas, a Series of Stories of the Old Dutch Settlers,' 1827; 'The New Pilgrim's Progress,' a satire, 1828; and 'Tales of the Good Woman, by a Doubtful Gentleman,' 1829. In 1831 Mr. Paulding published 'The Dutchman's Fireside,' the most successful of his novels, a story of the colony of New York in the time of the old French war, which has been placed by some critics alongside Knickerbocker's famous history. His next work was a story of the backwoods, 'Westward-ho,' 1832. The title has been seized by a popular English novelist, but only in the title is there any resemblance between the two works. A dissertation on 'Slavery in the United States,' and a 'Life of Washington, for Youth,' followed. Having accepted in 1837 the office of secretary of the navy under President Van Buren, Mr. Paulding confined his pen to his official duties till the death of Van Buren in 1841, when he resigned his post, and again made his appearance as a writer. He has however since confined himself mostly to the magazines, the only separate works published by him being a novel called 'The Old Continental, or the Price of Liberty,' and a short tale called 'The Puritan and his Daughter.' Mr. Paulding's works are marked by strong native humour and a genial, hearty manner; and they are all thoroughly American in scenery, characters, and spirit. [See SUPPLEMENT.]

PAULINUS, SAINT PONTIUS MEROPIUS, Bishop of Nola, was born about A.D. 353, at Bordeaux, of a noble family. He was a pupil of Ausonius, and was recommended by him to the emperor Gratian, who appointed him consul in 378, and afterwards advanced him to several offices of great importance. Through the influence and exhortations of St. Ambrose, he was induced to relinquish the world and give his property to the Church. He was ordained presbyter in 393, was made bishop of Nola in 409, and died in 431. Paulinus wrote several works, of which only a few have come down to us; the principal of which are a discourse on alms-giving, some letters, and a few poems on religious subjects. Paulinus was intimate with the most distinguished theologians of his time, and is frequently mentioned in the Epistles of St. Augustine and St. Jerome. His works were published for the first time by Badius, Paris, 1516; but the best editions are by Muratori, Verona, 1736, fol.; and by J. B. Le Brun, Paris, 2 vols. 4to, 1685.

PAULINUS, SAINT, patriarch of Aquileia, is chiefly known in ecclesiastical history for the exertions he made in defence of the Trinity. He was born near Friuli, about 730, and was made patriarch of Aquileia by Charlemagne in 776. He died in 804. His works have been published by Madrial, Venice, 1737.

PAULINUS, better known under the name of JOHN PHILIP WERDIN, was born near Mannerdorf in Austria, on the 25th of April 1748. He studied philosophy and theology at Prague, and afterwards learned some of the oriental languages in the college of the Carmelites at Rome, which order he had joined in 1769. He was sent to the coast of Malabar in 1774, where he remained for 14 years, and was successively appointed vicar-general and apostolic visitor. In 1790 he returned to Rome in order to superintend the religious works which were printed by the Propaganda for the use of the missionaries in Hindustan. He died at Rome, on the 7th of January 1806.

Paulinus was one of the earliest Europeans who acquired a knowledge of the Sanskrit language. In consequence of his being settled in the south of Hindustan, he was not placed in such favourable cir-

umstances as our countrymen in Bengal for obtaining an accurate knowledge of Sanskrit, since the Brahmans of the north are much more skilled in that language than those of the south. Paulinus however was very unwilling to admit his inferiority to the English scholars, and he frequently attacked them in his works. The Sanskrit Grammar of Paulinus is published in the Tamil character instead of the Devanagari, which is the character in which all Sanskrit works are written in the north of Hindustan, and which is employed in the Sanskrit grammars and works which have been published at Calcutta and in Europe.

The Sanskrit Grammar of Paulinus was published at Rome, in 1790, under the title of 'Sidharubam, seu Grammatica Samscrdamica, cum Dissertatione historico-critica in Linguam Samscrdamicam,' and also in a fuller and different form in 1804, under the title of 'Vyacarana, seu locupletissima Samscrdamica Lingue Institutio;' but both these works are entirely superseded by later, more accurate, and complete grammars. Paulinus also wrote and edited many other works, of which the most important are:—'Systema Brahmanicum liturgicum, mythologicum, civile, ex monumentis Indicis, &c., dissertationibus historicis illustravit,' Rom., 1791; 'India Orientalis Christiana, continens Fundationes Ecclesiarum, Seriem Episcoporum, Missiones, Schismata, Persecutiones, Viros illustres,' Rom., 1794; 'Viaggio alle Indie Orientali,' Rom., 1796; 'Amarashinba, seu Dictionarii Samscrdamicæ sectio prima, de Cælo; ex tribus ineditis Codicibus Indicis Manuscriptis, cum Versione Latina,' Rom. 1798 (the whole of this dictionary, of which Paulinus has edited the first part, was printed at Serampore, in 1808, under the care of Colebrooke); 'De Antiquitate et Affinitate Lingue Zendicæ et Samscrdamicæ germanicæ Dissertatio,' Rom., 1798, Padua, 1799; and 'De Latini Sermonis Origine et cum Orientalibus Linguis Connexione,' Rom. 1802.

PAULUS ÆGINE' TA, so called from his birthplace, in the island of Ægina, in the Sinus Saronicus, is one of the latest and at the same time one of the most valuable of the ancient Greek medical writers whose works are still extant. Abulfaraj ('Hist. Dynast.,' p. 114, ed. Pococke) states that he lived in the 7th century A.D.; which is probably somewhere near the truth, as he quotes Alexander Trallianus (lib. iii. cap. 28; vii. 5, 11, 19), who is supposed to have lived about the middle of the 6th. Nothing is known of the events of his life, except that he travelled a great deal, as we learn from two barbarous Greek iambs prefixed to his work. It is on this account (as some think) that he is sometimes called *περιδουτης*, a word which appears to indicate a kind of travelling physician. He appears to have visited Alexandria (lib. vii., cap. 17; and iv. 49); and it is probable that he there obtained the title *ιατροσοφοτης* (a practitioner in both medicine and surgery), which is sometimes given him. Suidas says he wrote various medical works; and Abulfaraj, that he composed a treatise on medicine, in nine books, and one on female diseases. The latter work (if some parts of the first, third, and sixth books, which treat of that subject, are not meant) is lost; the former still remains, with the title *ἐπιτομῆς ἰατρικῆς βιβλία ἑννα*, 'Compendii Medici Libri Septem.' As there is no reason for supposing this work to be imperfect, it is probable that each of the third and seventh books, which are much longer than the rest, was divided by the Arabic translator into two. He appears to have been much esteemed by the Arabians, who, on account of his skill in midwifery and female diseases, called him Al-Kawabali, 'the accoucheur.' His remaining work is chiefly a compilation from Galen, Oribasius, Aëtius, and others; and indeed he tells us himself in the preface, that he meant it to supersede the short abridgment, by Oribasius, of his own larger work, the 'Hebdomocontabillon;' however it contains also a good deal of original matter, though the author speaks very modestly of his own additions. The following account of the contents of each book is given by himself in his preface, and the English translation by Mr. Adams has been adopted. "In the first book you will find everything that relates to Hygiene, and to the preservation from and correction of distempers peculiar to the various ages, seasons, temperaments, and so forth; also the powers and uses of the different articles of food, as we have explained in a summary manner. In the second is explained the whole doctrine of fevers, an account of certain matters relating to them being premised, such as excrementitious discharges, critical days, and other appearances, and concluding with certain symptoms, which are sometimes the consequences of fever. The third book relates to topical affections, beginning from the crown of the head, and descending down to the nails of the feet. The fourth book treats of those complaints which are external and exposed to view, and are not limited to one part of the body; also of intestinal worms and dracunculi. The fifth treats of the wounds and bites of venomous animals; also of the distemper called hydrophobia, and of persons bitten by dogs which are mad, and by those which are not mad; and also of persons bitten by men: among other things it treats of deleterious substances and the preservatives from them. In the sixth is contained everything relating to surgery, both what relates to the fleshy parts, such as the extraction of weapons; and to the bones, which comprehends fractures and dislocations. In the seventh is contained a description of the properties of all medicines, first of the simple, then of the compound; particularly of those which I have mentioned in the preceding six books, and more especially the greater and, as it were, celebrated preparations. Towards the end are certain things connected with the composition of medicines, and of those

articles which may be substituted for one another; the whole concluding with an account of weights and measures."

The most valuable and original part of his work is the sixth book, which contains several descriptions of operations, either first mentioned there, or else with more accurate and precise directions than in any former author. There is a minute and excellent account of bronchotomy, taken from Antyllus (vi. 88). He recommends the jugular veins to be opened (vi. 40), and also in some cases the division of an artery (ibid.). He describes minutely and accurately the different kinds of hernia, and the operation necessary for replacing the intestine (vi. 65). He notices that few persons, if any, recover if hydrophobia comes on after the bite of a mad dog; but that if the wounded part be immediately cut out, there is but little danger (v. 8). He gives directions for opening an imperforate hymen (vi. 72) and anus (vi. 81). The work is also valuable as containing fragments of many authors whose writings are lost, such as Antyllus, Archigenes, and Diocles Carystius.

The Greek text was first published, Venet., 1528, folio, in sedit. Aldi et Andr. Asulan; the second and last edition, which is much superior to the former, was published, Basil, 1538, folio, ap. Andr. Cratandrum, under the care of Hier. Gemmusus. There are three Latin translations of the whole work, besides several others of detached parts:—1, that by Albanus Torinus, Basil, 1592, folio, several times reprinted, together with the sixth book, which was omitted in the first edition; 2, that by Jo. Guinterius Andermaeus, Paris, 1682, folio, much superior to the former, and several times reprinted; and 3, that by Ja. Cornarius, Basil, 1556, folio, accompanied by a valuable commentary, or (as he expresses it) "*dolabellarus, sive ostigationum libris septem delectata ac levigata.*" This translation and commentary are inserted in the '*Medica Artis Principes*,' Paris, 1607, folio, ap. Henr. Steph. An Arabic translation was made by the celebrated Hensin Ibn Ishak, better known perhaps by his Latinized name 'Joannitus' ('*Biblioth. Philosoph.*,' apud Casiri, '*Biblioth. Arabico-Hisp. Escur.*,' tom. i. p. 288), which, according to Haller ('*Biblioth. Chirurg.*'), still exists somewhere in manuscript. There is an English translation with a copious and learned commentary, by Francis Adams, of which only a first volume was published in 1834; but a second and improved edition appeared in three vols. 8vo, London, 1844, &c.

PAULUS AEMILIUS. [ÆMILI.]
