#### EDITORIAL NOTE.

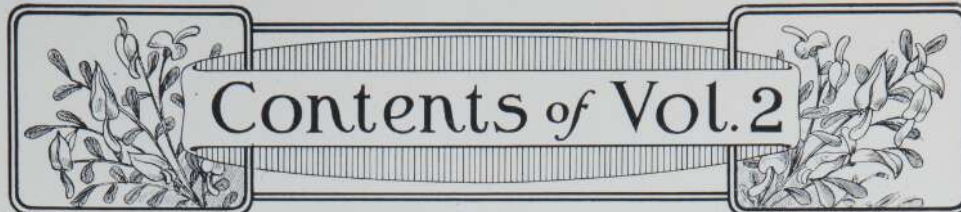

*The History of Exploration appearing in this volume was prepared by Mr. C. Battye; the articles on Mining by Mr. A. Montgomery, M.A., and Mr. J. J. East, F.G.S.; and that on Agriculture by Mr. W. Cotton Grosby, F.L.S. As regards the remainder of the volume the Editor is greatly indebted to various public officials, town clerks, secretaries of associations, and other helpers for assistance rendered. Their ready co-operation has made the work of editing comparatively light.*

#### ERRATA.

- Vol. I.—Page 193—In title to illustration read "King Karri."
- Vol. I.—Page 209, col. 1, line 29—For "1833" read "1883."
- Vol. I.—Page 343, col. 2, line 44—For "Beverley" read "Pingelly."
- Vol. I.—Page 365, col. 2, line 6—For "first" read "second."
- Vol. I.—Page 375, line 2 of the biography—For "Commissioner" read "Inspector."
- Vol. I.—Page 557, col. 1—After line 35 read "unique record. Owing to the finan."
- Vol. I.—Page 772, col. 2, line 46—For "Fraser" read "Fraser."
- Vol. II.—Page 123—In title to illustration read "Newmarracarra."
- Vol. II.—Page 739—In title to illustration read "Dam."

## EXPLORERS AND EXPLORATION.

### CHAPTER I.

#### MINOR EXPLORATIONS, 1829-1836.

**S**INCE the foundation of Western Australia the subject of exploration has ever been prominently before the minds of its people. Unlike the other States, exploration in Western Australia has been to a certain degree continuous; not the subject of periodical outbursts of popular interest resulting in desultory expeditions, but the marked policy of the country has been to discover by means of well-equipped parties all that *terra incognita* which, even up to the present time, embraces many of the interior places of the Island Continent.

Hardly, indeed, could the infant colony be called settled and complete in 1829, before several expeditions were launched to discover more of the land than lay within the immediate vicinity of Perth and Fremantle.

In September, 1829, Lieutenant Preston, an officer of H.M.S. "Sulphur," essayed to cross the Darling Range and to discover, if possible, what lay beyond. At the outset the expedition met with difficulty, for the sea is exceptionally rough at that period of the year, and the bar at the entrance to the River Swan proved an impassable barrier for the then heavily-laden boats. Deciding to unload on the mainland, Lieutenant Preston sailed for Woodman's Point, and with extreme difficulty succeeded in landing his stores. Returning to Fremantle, he next day crossed the bar and entered the river, sending the men to bring the stores to the boats by a system of portage.

Proceeding up the Swan River, the Canning River was reached by evening, and at a low point beyond what is now Point Heathcote they pitched their camp for the night. Early next morning the expedition was joined by Ensign R. Dale, of the 63rd Regiment, and Mr. Knight, who were accompanied by some soldiers from the infant settlement. Deciding to explore the Canning River, the expedition sailed the next morning, but found that the current of the stream made progress very slow. Very few natives were met with, and these displayed quite a friendly spirit. The difficulties of navigation increased, and on September 12 a small party of twelve left the river and set out in a direct course for the ranges. By

B

midday it had reached the summit, about 1,000 ft. high, and descending slowly camped for the night well down the reverse slope. Next morning it moved on over exceedingly rough country, interspersed with marshes and ridges. In the dales the soil was a mixture of sand and clay, and on the ridges large fragments of granite rock and ironstone lay strewn about, whilst immense trees soared heavenward.

The expedition was unsuccessful in discovering good agricultural land, and as it was not equipped for a long journey a return was decided upon, and Fremantle was reached on September 19, after a weary and trying time.

However, the determination to thoroughly explore the country between the ranges and the infant settlements led Ensign Dale to again essay the task, and a few weeks after his return from the previous expedition he left the camp at Perth with the intention of tracing the Helena River. Crossing the Swan River at what are now known as Heirison Islands, he proceeded in a course east-by-south in order to examine the outside country. After penetrating for some distance into the bush, he turned in a north-easterly direction. Some two days were spent in attempting to discover the source of the Helena River, but in this Mr. Dale was unsuccessful. In many other respects the results of the expedition were of value, as the fertility of the soil adjacent to the various watercourses had been amply demonstrated.

On November 17, 1829, Lieutenant Preston, accompanied by Dr. Collie—a naval surgeon from H.M.S. "Sulphur," after whom the town of Collie takes its name—prepared to make the most extensive expedition hitherto attempted in Western Australia, along the coast and into the southern portion of the colony. The labours of this party were responsible for the foundation in the future of Bunbury and Busselton, and incidentally most of the coastal districts in the south-west.

Leaving H.M.S. "Sulphur" early on November 17, 1829, in two whaleboats the expedition passed through the channel between Garden Island and Cape Peron, making careful soundings and charting the waters for

future marine survey. By these means the coast immediately south of the original landing-place at Fremantle became thoroughly known, and in this manner alone the expedition did valuable work. The entrance to the harbour had already proved sufficiently dangerous, and it was imperative that more should be known of the southern passages. During the first day the explorers sailed into the Murray River, and ascertained that though the country adjacent to the coast was of a barren nature, inland the vista opened on to an extensive and rich country. Here perfect amity prevailed between the explorers and the aborigines they met. The natives were consumed with curiosity at the boats, personal clothing, and appointments of the members of the expedition, and manifested every desire for peaceful intercourse.

Leaving the Murray on the 20th, contrary winds and rough sea compelled them to run the boats ashore, and for two days but little progress was made southward. On the 23rd, Port Leschenault was reached, and here the party landed and formed camp with the intention of thoroughly examining the inlets and the country adjacent. Soon the camp was visited by the natives, who manifested the "most friendly interest" in the expedition. Within three miles of the site of the camp a river was discovered, to quote from the journal of the explorers, "flowing over a shallow to the estuary. There are two mouths of the river, with a low sandy island between them, and the one we entered, the westernmost, was afterwards found the most shallow." Proceeding up the river, the expedition came upon another island, beyond which they found fresh water, so filling their barricoes they turned back. On the return a large number of natives had, it was found, assembled on the banks of the river, and the intruders were received with every mark of goodwill and pleasure. The land surveyed during the day appeared with few exceptions to consist of a productive soil, and the explorers returned to camp weary but well satisfied with their labours.

On return it was found that a member of the crew was missing, and a search for him was unavailing, nor did he appear during the night. It had been intended to proceed southward early in the morning, but rather than they should be accused of voluntarily abandoning the man, though it was generally thought that he had deserted, they decided to remain. Ordering a diligent search to be made along the coast, Lieutenant Preston and Dr. Collie proceeded up the river for fresh water, and on returning the man was found on the banks. On being asked for an explanation of his actions, he informed the leaders that wandering in the bush he had come upon a nearly naked aboriginal woman, who had screamed at his approach. The screams attracted the attention of two male aborigines, who pursued him with spears, until for safety he rushed to the river and swam out of danger.

Whether or not the man had offered any insult or injury to the native woman it was hard to say. However, the incident did not appear to have caused any friction, for the natives on the banks of the stream, with amicable gestures, accompanied the boat to the camping-place, and the subsequent interview was of a very friendly nature.

During the afternoon of the same day another river was discovered, and its course examined for a short distance. The soil here was distinctly good. The rivers became known as the Collie and the Preston. Proceeding on the journey the expedition reached Port Vasse on the 25th, but as the country seen did not impress them favourably and as more was known of this portion of the coast than of Leschenault Inlet, they returned to the latter port for more extended exploration.

The two rivers were now thoroughly examined, and the Lieutenant-Governor (Captain Stirling) was made acquainted with the results of the trip. Two things had been established—first, that there was abundance of good soil in the south-western coastal district; and secondly, the natives were generally friendly and not of a bellicose nature; two main essentials for the commercial success of pioneering efforts.

In the month of December, 1829, Ensign Dale made another attempt to trace the Helena River, for upon his former report settlement had proceeded apace on the lower reaches. He determined to take a more direct course in this instance, and after crossing the Swan steered in an easterly route. His journey towards the hills disclosed the nature of the country as being somewhat patchy, but in general suitable for certain agricultural purposes. After crossing the Helena with no difficulty, the expedition climbed the hills to about 1,400 ft. through rugged gorges and splendid mountain scenery. The report furnished by Mr. Dale on his return, though increasing vastly the knowledge of the eastern district, was not too promising in regard to its suitability for agricultural enterprise.

During the month further exploration was carried out in the extreme south in the vicinity of King George Sound by Dr. J. R. Wilson, R.N., who with a party of five left that place to examine the country northward towards the Swan River. The party included an intelligent aboriginal native named Mokare, and much of its success is attributable to the excellent service he rendered.

Some previous local explorations had taken place in this district under the leadership of Major Lockyer, Captain Wakefield, and others who had been connected with the original settlement at King George Sound, but no records remain to us as to the results obtained thereby.

Steering a course north-north-west the party crossed a considerable stream after seven miles' journey, and the soil, which had hitherto been of poor quality, began to improve in value. It compared very favourably with

that thrown open on the banks of the Swan, and its value as pastoral country, especially for sheep, became more and more manifest. Here and there, as was expected, patches of barren land appeared, but in general the outlook was distinctly good. To read the old records in the light of present-day agricultural science, it would appear as if the explorers had discovered country pre-eminently fitted for a future dairying population.

During the journey an intelligent native known to Mokare, attempted to prevail upon Dr. Wilson to take up an easterly course, stating that all the best land was in that direction, but the leader adhered to his original intention.

Of the country discovered Dr. Wilson writes:—"So much has been said of the scenery in New South Wales resembling noble English domains that the comparison is rather trite. Imagine a rich valley of considerable width, extending east and west as far as the eye can survey, bounded on the north and south by a succession of undulating and moderately elevated hills, thinly but sufficiently ornamented by trees of gigantic form, and you have some conception of the beauty of the spot." So far the results of the trip had been successful from an agricultural point of view; but after the discovery and naming of Loch Katrine—a circular basin about half a mile in diameter—the explorers, continuing their course westward, passed into barren scrub land. This did not extend for any considerable extent, and next day they encountered a watercourse, which was named after Kent, one of the members of the party.

The alternations of good and indifferent country now became very rapid, until they reached a high mount, which was named Mount Lindesay, in compliment to the officers of the 39th Regiment. Dr. Wilson writes of this elevation:—"The highest peak is about 30 yards square, perfectly level, paved with minute particles of quartz, and at each angle is an immense block of granite." Ascending the mount a magnificent panorama was

B2

unveiled, and several elevated peaks discovered, which were respectively named by Dr. Wilson as Mount Roe, Mount Mitchell, and Mount Frankland.

Next morning the party determined to explore the base of Mount Lindesay, and discovered some streams issuing therefrom, the greatest of which they named the Denmark River, out of compliment to a surgeon of the fleet. The banks of this river displayed very rich soil. The leader now decided to return and, striking a south-easterly course, he soon reached the coast. Returning along the coast towards the settlement at King George Sound, another river was encountered, which was named the Hay River, after Mr. Hay, the Under-Secretary of State. Another river was crossed named the Heeman, and a high conical hill, observed some distance away,

received its name, Mount Hallowell, after an admiral of that time. Mount Shadforth was named after the Lieutenant-Colonel commanding the 57th Regiment, and the party returned to King George Sound.

The results of the trip were of paramount importance, and even so early as the year 1830 it was thus

amply demonstrated that land of high quality was to be found adjacent to what is now the town of Albany. Notwithstanding these discoveries, however, the country remained for many years in its primal state, the bulk of the agricultural settlement being to the north-east and east of the infant town of Perth. Any settlement that took place southward was more toward Port Leschenault and the country between the Collie and Preston Rivers and Perth; but, nevertheless, the work of Dr. Wilson proved that excellent arable land was to be obtained within easy distance of one of the ports.

Gradually the boundaries of the Swan River settlement were being extended, and it became of pressing importance that further information should be gleaned about the country previously discovered but not sufficiently proved. With this intent Captain Stirling (the Lieutenant-Governor), the Surveyor-General (Lieutenant

From Grey's "Journals of Two Explorations."  
ATTACK OF NATIVES, NEAR KOLAINA PLAINS.

Roe, R.N.), with a few experienced and practical settlers, and a detachment of the 63rd Regiment, left Fremantle in a schooner for the scene of the explorations of Dr. Collie and Lieutenant Preston at Port Leschenault.

The Lieutenant-Governor was not wedded to the idea of founding the new settlement at Port Leschenault, and before determining upon the site he proceeded to Geographie Bay and spent two days exploring the country in the vicinity of Cape Naturaliste. A considerable extent of good country was opened up, but, unfortunately, somewhat patchy in nature. Somewhat dissatisfied with the prospects here, and also at the Vasse, Captain Stirling determined to found the new departure at Port Leschenault. After a cursory examination the Governor was as favourably impressed with the outlook as Messrs. Collie and Preston had professed to be, and immediately steps were taken to ensure a proper station for the expansion of the agricultural movement. Stores and provisions were now disembarked and temporary quarters at once erected. Several separate excursions into the interior were made, that led by Lieutenant Roe (the Surveyor-General) being the most important. After proceeding on a boat expedition for some miles, tracing the course of the Collie River, the explorers were at last compelled to disembark, owing to the obstructions caused by the snags in the watercourse, which threatened to destroy the boat. Continuing on foot in a south-easterly direction, they came upon some beautiful open forest land. Turning eastward they reached a range of hills, the southern end of which was named Roe Mountains after the leader, one particular elevation being named Mount Lennard after a member of the party. From the summit of these hills the broad valley of the Preston was observed, and after examining it and the Preston country the party returned to the camp at Port Leschenault.

The Lieutenant-Governor was particularly pleased at the quality of the land at Port Leschenault and very hopeful that the exploration work would lead to early and rapid settlement. Had it been taken up by settlers predetermined to live on the land and get their livelihood from it, then no doubt the favourable prognostications of Captain Stirling would have been realized. Instead, however, huge tracts were taken up by men who made no immediate use of it, and the movement did not prosper as it should have done.

Being thoroughly imbued with the value of the south-western coastal districts for agricultural settlement, Captain Stirling, accompanied by Captain Currie and a band of settlers, again set out to explore the southern country. The party sailed from Gage Roads on April 29, 1830, rounded Cape Leeuwin, and anchored near the mouth of an inlet east of the Cape. Several days were passed examining the country adjacent to the Blackwood River, and before the return of Captain Stirling to

Fremantle on May 16 the site of a town (Augusta) was chosen, and the disembarkation took place of those who intended to form a settlement there.

Much of the minor, but exceedingly valuable, exploration was due to the zeal and pertinacity of the naval and military officers attached to the Government, and the name of Ensign Dale will always be associated with some of the most successful expeditions in the earlier history of the State. Gifted with a keen insight and unerring judgment, the value of his work in the earlier stages of the State's existence can never be over-estimated. Indomitable and steady in purpose the initial difficulties to him were made only to be surmounted, and his discoveries in the year 1830 did much to increase the prosperity of the infant townships. This officer, to whom most of the previous exploration eastward of the settlements was due, had determined that he would lay bare the secrets of the land over the Darling Ranges, which he had so often viewed from their summits. On July 31, 1830, accompanied by a Mr. Brockman and two others, he left Perth in bitterly cold weather thoroughly equipped for an extensive journey. The time of year added to the difficulties attached to their rugged path, many of the mountain streams having become almost unfordable torrents. In some places checked by boggy swamps and in others by almost impenetrable bush and scrub, they toiled laboriously forward. Several times, indeed, were they compelled to build temporary bridges, so that their horses could be transported over the chasms that existed amidst the gorges. On August 8, 1830, at sunrise, the thermometer registered  $31\frac{1}{2}$  degrees, and the travellers experienced colder weather than ever before in Australia, and were glad to get into movement again. Proceeding along the banks of a river which proved very laborious for the horses, they were at last compelled to tether the animals and advance on foot. Taking only two days' provisions with the party, Dale recognized that it was necessary to push on with vigour. After walking six miles an abrupt and almost perpendicular range of hills was met, and this was named after the Colonel of the 63rd Regiment, General Dyott. In these hills they discovered abundant traces of aboriginal drawings, and, listening, they heard the natives hailing each other in the forest. The weather, which had been inclement and bitterly cold throughout the journey, now culminated in a prolonged rainstorm; and gaining what shelter they could under the shelving boulders of granite the explorers rested for the night. Continuing their onward march next morning, August 11, and steering a course north-by-west, they at last reached the summit of the Dyott Range, which was named Mount Bakewell, after Lord Bakewell. The expedition now returned to the place where the horses had been left, and the remainder of the time was spent in exploring the river afterwards called the Avon.

Greatly impressed with what he had seen, Ensign Dale returned to Perth with news of a fertile region to recount to the settlers of the infant State. This raised the hopes and expectations of the Lieutenant-Governor considerably, and it was generally conceded that up to this time the work of exploration carried out by this officer had been of the greatest value to the small settlement.

The discovery of the River Avon gave rise to the very highest conjectures as to the value of the land in the interior, and the colonists were unanimous in the expression of their sentiments that the possibilities of the colony had been greatly extended.

The Adjutant of the 63rd Regiment, Lieutenant Erskine, left Perth on September 6 with the intention of making a wider survey of the eastern country discovered by Ensign Dale. The country traversed was similar to that described by Dale, and the Avon was reached on September 13, where a party of natives was found encamped on the stream.

After exploring the country for several days, and proving that Dale's optimistic views were in the main correct, Lieutenant Erskine began his homeward journey on the 17th. The attitude of the natives, who had assembled in large numbers, was perfectly friendly; too much so, indeed, to suit the taste of the leader, who reached Perth on September 22.

During this period the necessity of exploring the southern lands was not forgotten, and in the month of September Captain J. Molloy conducted some valuable work in the vicinity of the Blackwood River.

With his usual desire to gain his information by actual personal inspection, the Lieutenant-Governor (Captain Stirling) decided to accompany an expedition to be led by Ensign Dale into the eastern country. Travelling a somewhat easier route than that used by Dale on his initial trip, and being possessed of the best horses obtainable in the settlement, this party did not suffer such hardship as on the previous journey. A general inspection was undertaken of the lands adjacent to the Avon River for purpose of agricultural settlement. At this time of the year (October) the country was to be seen in its best aspect, and the Lieutenant-Governor hurried back to Perth to publish his information of the rich lands only waiting to be occupied.

Ensign Dale and party of six volunteers, including Messrs. Clarkson, Hardy, Camfield, and W. Stirling, remained, and with five horses to carry ten days' provisions pushed on east with the determination to explore as far as possible before compelled to return. On October 28 they separated from the returning band, and passed along the northern base of Dyott Range for a mile and a half, and when nearing the Avon observed excellent loamy soil. Forging the Avon they proceeded south-by-east, and emerged into a magnificent country lightly

timbered with wattle, gum, and sandalwood. The soil was of a magnificent quality, and the explorers were delighted with the success of their efforts. Continuing along the banks of the Avon for nearly three miles, they came upon large open downs of a sandy soil, covered with light brushwood, until they halted about 11 miles east of Mount Bakewell. Most of the country passed over was rich and promising land, decked with flowers, and although somewhat patchy in places, still infinitely better for agricultural purposes than any other hitherto discovered. Next morning they traversed grassy, undulating plains, bounded on the right by an apparently fertile valley rising to low hills, upon which the trees were grouped like an old English park. Entering into an unusually large sandy patch, they came upon a stream flowing northward, which plunged into a thickly-wooded area. Leaving the woods they again came upon open undulating country, which they traversed for nearly 15 miles. Continuing their journey eastward on October 30, over sandy commons, interspersed with woodland scenery, they entered a dense forest of gum-trees, in which the undergrowth was unusually thick, proving very difficult to penetrate, especially as swampy ground was also encountered. At the eastern extremity of the forest they sighted two remarkable isolated hills, which they decided to examine. To the northern one Dale gave the name of Mount Caroline, and to the southern Mount Stirling, after a member of the party, Mr. W. Stirling. Near these hills, which were simply huge masses of granite, they camped for the night. At sunrise next morning they ascended Mount Stirling to get a bird's-eye view of the country. Low ranges of hills lay about 30 miles to the south-east, whilst abundance of marshes, containing water, the nature of which was yet to be proved, abounded in other directions. Though their provisions were now nearly exhausted, they decided to go on "short commons" and complete, as far as possible, their exploration of the surrounding country; so they set off in a south-easterly direction from Mount Stirling, eventually changing their course to a south-westerly one. On November 1 they found extensive downs and deep woods. On one of the downs were pools of water, with traces showing that the natives had lately been there; there was also a quantity of game. A kangaroo was killed which made a welcome addition to the now almost depleted larder. A superior description of country was sighted in a direction bearing south-south-west from Mount Stirling, and native fires were observed, showing that the aboriginal population was larger than had previously been noted in the country round Perth.

On November 2 the party began its return journey, the more timid members being somewhat afraid of the proximity of such a numerous aboriginal population. Early in the day they came upon two native couples,

whose terror on beholding the explorers was sufficient proof that they were the first of a white race that they had ever seen. The men advanced, making hostile demonstrations, apparently to cover the retreat of the women, but finding discretion the better part of valour, scurried away and disappeared with the females behind a hill.

On November 3, after traversing rich and extensive valleys, they resighted the Avon River at an estimated distance of 18 miles south-east of Mount Bakewell. At this point the stream was about 30 yards wide, but on tracing its course towards the mountains it was seen to get narrower, again broadening and deepening as they progressed, at which situation they decided to camp for the night. The next two days were spent in examining the banks of the Avon and selecting their grants in land, for the members of the party had decided to eventually settle in the locality. On November 5 they started their homeward journey to Perth, reaching that settlement on November 7.

More than usual credit is due to the intrepid young officer who acted as leader on this occasion. To him belongs the honour of having opened up this new district, and though only the fringe had as yet been explored, that exploration was due to the pluck and determination of Ensign Dale.

The explorations in the Avon valley greatly extended the area of arable land open to the settlers, and the country was rapidly applied for by intending occupiers, as the main body of the immigrants objected to settlement southward at Port Leschenault. Immense areas were at once alienated, and though this was not the fault of Dale, it shows the bad state of the earlier land regulations.

Before the year closed some minor exploratory work was carried out by Lieutenant Preston, R.N., and Ensign Dale. Preston explored the coast to latitude  $28^{\circ} 45'$  south, a little north of Geraldton, whilst Dale traced the course of the Helena River.

Late in the year the Lieutenant-Governor (Captain Stirling) decided to thoroughly explore the country between the Swan River and King George Sound, but though the exploring party left Fremantle on December 14, 1830, its labours scarcely began, so far as new territory was concerned, until January, 1831.

The party crossed the Darling Ranges at a more southerly point than essayed by former parties, and the route taken over the hills varied somewhat from that of previous explorers. The hills presented a very rugged appearance, with outcrops of ironstone and gravel, covered with sparse scrub; but the valleys and undulating plains contained good pasture land. The party pushed forward, but the advance was none too rapid owing to the difficulties of transport across the ranges. From the encampment could be seen a hilly though

lower country, and the party, which was under the leadership of Captain Bannister, who had associated with him Mr. Smythe (of the Survey Department), who was to act as special guide, decided to take a south-east course. The decision of the leader was mainly based on the hope of being able to discover a continuation of the open-plain pasture country, described by Dale as existing to the northward, but the explorers did not enter the fertile fields they had hoped for. They travelled in the direction noted until December 23, and found tracts of excellent land containing good food for stock, but not equal to that discovered on the Avon River in and about the present towns of York and Beverley. The jarrah timber was now interspersed with blue and red gums, which in their turn were superseded by white gums in the valleys and by banksias and ti-trees in the swamps and low lands. The course was changed to south-by-east on December 23 and continued till January 5, the explorers pursuing their way amidst delightful scenery. The difficulties of their advance increased, but the season was so pleasant that the labours they performed were a cheerful task.

Captain Bannister waxed enthusiastic in his report, and describing this portion of the journey wrote:—"Broad, flat lands and valleys, many miles in extent, moderately grassed and wooded, lay around us. A very great portion of the tract was land of the finest description, fit for the plough, sheep, or cattle, and the beauty of the scenery near to, and distant from, the rivers which we crossed, is equal to any I have seen in the most cultivated timbered country in those parts of Europe which I have happened to pass through."

Five rivers were passed in this march of 80 or 90 miles, and numerous small watercourses. Excursions were made in different directions from points where the party was compelled to bivouac on purpose to rest the horses. No difficulty was experienced throughout the journey in regard to the water supply, though the work was carried out at the midsummer period.

Captain Bannister's report does not mention the names of any places until he reached King George Sound, and it is therefore impossible to give an exact route of the journey. At the outset the party did not follow either what was afterwards the old Albany Road or the present Great Southern Railway, but must have approximated to these tracks in the later stages, when nearing King George Sound.

On January 5, 1831, it was decided that the course followed had become too easterly, and it was changed to a more westerly one; but the difficulties of the journey were thereby greatly increased. Seeing elevated lands to the south-west they proceeded thence, and upon ascending the highest peak they descried an interesting view. From this point they went south for

four days, making 40 miles. They had now entered upon extremely mountainous country, containing thick underwood, and though picturesque it was extremely difficult to traverse. At this stage the leader became very anxious, for his view was extremely limited and the difficulties of travelling increased every mile. During the next thirty-six hours they traversed 16 miles in a south-west direction, when they came upon large granite rocks. Captain Bannister and Mr. Smythe ascended these outcrops, if possible to obtain some conception of the country over which they yet had to journey.

To the southward they discovered some high mountains, three of which were conical and of considerable altitude. One of them possessed two "bare heads." Mr. Smythe reckoned that these peaks lay to the north

of King George Sound. They, therefore, directed their steps towards it, and encamped on the banks of a large river flowing south. The position was one to cause grave concern, and on reaching the twin-headed mountain Captain Bannister ascended it, but no satisfactory landmark was to be found. So far as the eye could see was one vast forest, and still further south were high lands. The provisions of the party were now nearly expended, and Captain Bannister decided to push on to the hills observed to the southward, in the hope that the outlook from their summits would disclose the Southern Ocean. Through the haze they imagined they could see sandhills towards the south-west, and in this direction they travelled. All day long they plodded laboriously forward, covering 17 miles over rugged country, to find with bitter regret that the sandhills were but the effect of a mirage. Tired, dispirited, and now thoroughly alarmed for the safety of the party, Captain Bannister struck directly southward in the hope of reaching the ocean, for a rapid survey had shown that the provisions would not hold out until the settlement at King George Sound was reached.

On January 16 they arrived at the coast, and the

leader breathed a heartfelt prayer of gratitude, for he now considered that actual starvation was at least warded off, for the shell fish on the rocks of the coast were a surer food proposition than the precarious livelihood to be derived from occasional kangaroos. Though somewhat mitigated, their difficulties were not yet removed, and as Mr. Smythe's observations had been proved to be utterly unreliable, due to the fact that he was not supplied with a chronometer, Captain Bannister found himself in a most dubious situation. Mr. Smythe now reckoned the distance from King George Sound to be forty-three miles, but it proved considerably more, for they were in reality near Cape Chatham, and the double-peaked mountain was the Mount Mitchell previously discovered by Dr. Wilson.

The provisions had practically been exhausted before

they reached the coast, and thence the party suffered great privations. The diet now consisted of shell fish, of which sometimes there was a sufficiency, at others very meagre commons indeed. The constant search for food to keep body and soul together delayed the advance, and exceedingly slow progress was made. Owing to the

From Grey's "Journals of Two Explorations."

ATTACK OF NATIVES, NEAR HANOVER BAY.

roughness of the track two horses died from exhaustion, and the men were in a terrible plight. Finally, by the aid of friendly natives, they were shown an easier path and supplied with food, eventually reaching the Sound on February 4, in a thoroughly exhausted and dilapidated condition.

One can imagine the pleasurable excitement displayed by the explorers when they sighted the settlement which had been the goal of their endeavours for so many wearisome days, and the feat they had accomplished was no mean one, considering the difficulties of the road and the poor transport facilities at their disposal. The trying journey had been carried through with courage and resolution, and they were now in a position to make light of their previous difficulties.

Within a few weeks Bannister and his party, now thoroughly restored, returned to Fremantle, where his

report was eagerly read. This showed that the good agricultural country was of a large extent, but the insuperable difficulties attending transport prevented its immediate allocation and settlement. In his report Captain Bannister pointed out that even the disasters and mistakes were productive of good, for through these means they were compelled to traverse country that might have remained unexplored for years, concluding his remarks with a glowing panegyric on the fruitfulness of the land and the magnificence of its mountain scenery.

Being imbued with the possible advantages of Port Leschenault as a settlement Mr. W. K. Shenton, on January 24, 1831, left the Swan River Settlement to further explore the country adjacent to the Collie River. The expedition, which was of a purely private venture, contained amongst its members such notable settlers as Messrs. Bryant, S. Henty, and Camfield, who had already undertaken valuable pioneering work. The expedition did not undertake the land journey between the two points, but proceeded by boat to Port Leschenault. The most notable feature of the voyage was an immense "bush fire" which was at the time raging on Garden Island, and which one of the members described as "grand and awful." The report of this expedition can scarcely be called favourable, for it was responsible for checking settlement for some time on the Collie River.

Some minor exploratory work was undertaken during the months of March and December, 1831, between Perth and Port Augusta, by Mr. J. G. Bussel. The effect of this was of a purely local nature.

However, an intense desire to know more about the country existing between Perth, Port Leschenault, and Port Augusta led to more than one expedition to discover its value or otherwise.

One of the most notable was that of John Dewar and Andrew Smith, who certainly possessed no mean knowledge of "bush craft," and the history of their exploits would not disgrace the pages of Fenimore Cooper. It is unfortunate that more than a little doubt has been placed on the reliability of their report. Armed with a gun each and sufficient ammunition, and without a compass, they did not overburden themselves with provisions, carrying only 10 lb. of bread, 4 lb. of beef, half a gallon of water, 4 lb. of sugar, and  $\frac{1}{2}$  lb. of tea. They left Port Augusta on March 15, 1831, and practically held to the sea throughout their course. On the first day they travelled 25 miles, and camped for the night on a fresh-water lake. The country traversed was not prepossessing and the land of an inferior quality. Being of a determined nature no time was wasted, and daylight next morning found them pursuing their journey through country which improved in quality as they advanced. They crossed several brooks containing fresh water, and

moving on to the coast travelled forward on the beach for two days until their course was blocked by immense rocks running out to sea. They now struck inland, and returned to the beach after the obstructions which barred their way had been left behind. On the following morning they came upon a deep indented bay, upon the rocky shores of which they discovered a jolly-boat and parts of a ship named the "Cumberland," which by appearances they judged to be a whaler that had suffered shipwreck. The country was of an inferior nature, and on the sixth day out they came upon and passed Cape Naturaliste. At this point a native attached himself to them whose attentions they did not cultivate, as he showed a truculent nature, with an intense desire to appropriate some of their belongings. From the Conical Hills to Cape Naturaliste parallel to the sea coast there existed a low range of hills, inside of which were magnificent forests of gum and jarrah timber. At Cape Naturaliste their provisions gave out, and for two days they existed on wild figs and fish. On reaching Leschenault Inlet they constructed a raft and crossed the rivers, eventually discovering some provisions that had been left there by Captain Stirling on his previous visit. Though never hard pushed to the same extent as Captain Bannister's party, still their sufferings were not light, and they reached Perth in a dilapidated condition.

During the early period of the existence of the settlement, it was deemed necessary to attach for purposes of protection and assistance H.M.S. "Sulphur," and by means of this vessel a wider knowledge was obtained of the immediate coast and coastal waters. The naval training of the Lieutenant-Governor had clearly taught him the value to be placed upon a proper survey of the coast. A wider knowledge of the bays and harbours was thereby secured and the presence demonstrated of hidden dangers to navigation.

Early in the year 1831, the "Sulphur" was engaged southward on this most valuable work, and it was decided when near Ramé Point to despatch a boat expedition to explore the adjacent coast. On April 18 the whaleboat left the "Sulphur" and stood in to the shore; owing to the heavy swell the voyage was not unattended with danger, and it was only after some time the explorers found a safe landing-place. The estuary they had entered proved safe anchorage, and on the shores they found a large body of hospitable natives who increased their larder by a quantity of broiled fish. The expedition was under the leadership of Lieutenant Preston, whose previous efforts had been of considerable value to the Government, and with him was associated another officer, Lieutenant Skottowe. In the morning they breakfasted before daylight, but the aboriginals were even earlier astir, and with demonstrations of affection desired the party to cross the estuary. The explorers now embarked, and by eight o'clock had rounded Point Nuyts, where

they discovered an island not previously marked on any existing chart. From here to Cape Chatham the shore presented such a forbidding appearance that no attempt was made to land, and eventually the leader steered for the island off Point D'Entrecasteaux, and the party landed on the mainland about four miles east of the island. It was at once seen by the smoke from various fires that natives were in the vicinity, but none were encountered. Here the travellers rested for the night, after precautions had been taken against surprise, determining to make an early start next morning. At 4 a.m. they breakfasted, and at daylight proceeded on their journey, finding a passage for small vessels between the island and the point, but the rough sea compelled them to pull inshore, and though only three miles from the shore it took three hours to accomplish the distance. On nearing the land they found that the heavy sea and broken water made landing an extremely difficult task, and that the breakers and surf extended half a mile from the shore. Once the boat was nearly overturned, and it was only by a miracle that it righted; as it was, all the open provisions were ruined, and everything was soaked owing to water shipped in the attempt to beach. Eventually the surf drove her up on to the shore, and thus ended an extremely dangerous situation.

The stormy weather continued for two days, and on the third, though the adverse conditions showed no signs of abatement, the leader decided to attempt to launch the boat, trusting that when the passage of the surf was accomplished they would be able to proceed on the journey. However, in attempting to launch the boat it was driven with such force against one of the crew as to nearly cost the man his life. The attempt was therefore abandoned, and Lieutenant Preston decided to make a land journey to Augusta. In the meantime an aboriginal native had accosted the party, and after a demonstration of amicable feeling, and being given a few luxuries, he was allowed to depart, being greatly impressed by the fact that the boat had achieved a safe landing through such a sea. As the party had never contemplated a land journey of any considerable distance away from the boat, the equipment for such had not received consideration, and difficulty was now experienced when the provisions had to be carried. Being handy men, however, they soon improvised a rough kit, and before daylight on the 23rd set out on their journey towards Augusta. The first day they covered a distance of 20 miles, and encamped at 5.30 p.m., immediately retiring to rest, desperately tired. Long before daylight next morning they recommenced their march, and the advance until sunrise was of a toilsome and exhausting nature, the beach in the earlier stages being so rough as to compel them to move inland. Mr. Skottowe and one of the petty officers became greatly fatigued, a constant life on shipboard not being quite the training necessary

for the accomplishment of such pedestrian feats. During the day they sighted Cape Leeuwin, their spirits rising accordingly, and they camped for the night at a spring of fresh water close to the Cape. The journey was continued at half-past two on the following morning, in the hope that they would reach Augusta by night. The beach was rocky and difficult to traverse and occasioned great hardship, and this, together with the fact that their provisions were almost exhausted, caused much anxiety. The two sick men were so weakened that their loads were removed and divided amongst the others, but Mr. Skottowe suffered keenly throughout the day. At seven o'clock in the evening they reached the Blackwood River, having walked 33 miles during the day. Their rough and unkempt appearance led the settlers to believe they were convicts who had escaped from King George Sound, but on the Resident (Captain Molloy) being informed he quickly altered this impression. The whole of the party was heartily welcomed, and the ministrations of the settlers soon restored the sick men to health.

The leaders being anxious to return to Perth as soon as possible and the party being fully recovered, they embarked in a boat from the Augusta Settlement on the 30th, intending to proceed to the head of the river by these means, and then continue the journey by land from this point. The party was augmented by two men who desired to proceed to the Swan River, and Lieutenant McLeod and Mr. Bussel, with a party of soldiers, arranged to escort them as far as Leschenault Inlet. On May 1 they reached the headwaters of the Blackwood and disembarked to essay their long journey on foot. No water was obtainable during the first few hours, and the explorers suffered horribly from thirst, and next morning were reduced to sucking the dew from the leaves of the plants to allay their thirst. Luckily one of the dogs discovered a native well with a small amount of water, and an hour later they came upon another, which contained ample supplies. Pursuing their way, somewhat refreshed, Cape Naturaliste was sighted to the north-west of their position. The vista that now opened up before them amply repaid them for the previous inconvenience, consisting as it did of a beautiful rolling plain well watered, upon which numbers of large kangaroos were roaming. Mr. Bussel, who had suffered severely from the first day's labours, now became so exhausted that it was deemed inadvisable for him to continue the journey; therefore, after a day's rest, and accompanied by Lieutenant McLeod and the soldiers, he returned to Augusta.

The party from the "Sulphur" now pushed forward and the estuary at the Vasse was reached, the intervening country being described as excellent pastoral land; that seen next day Lieutenant Preston described as "the finest he had seen in the colony," an opinion which seems

to have been borne out by all those qualified to judge. On the morning of May 4 the explorers, after an early meal, started their journey at 4 a.m. with the hope of reaching Port Leschenault that day. After walking two miles along the beach they were compelled to turn inland owing to extreme softness of the shore sand. The nights were extremely cold, but near the sea firewood was readily procurable; bitter disappointment was occasioned, however, when it was discovered that they would not reach Port Leschenault that day. They reached the Preston River early on the 5th, and having secured some fish and birds they camped and rested for the day. Making an early start on the 6th, they marched down the Preston towards the Collie River, and about noon arrived at its mouth. Thoroughly tired out, they retired to rest in hopes that a good night's sleep would restore them, but heavy rain began to fall, which materially added to their discomforts. At half-past four next morning they continued their weary way. Keeping to a native path they encountered some natives who immediately recognized Lieutenant Preston, and detailed by signs some of the incidents of his former visit to this part of the colony, at the same time mentioning by name some of the members of the previous party. Being accompanied by females the natives showed some degree of restraint, but allowed Lieutenant Preston to advance alone, and so far as he was able converse with them. Some of the women were extremely prepossessing, whilst others "were horrible to behold." On the other hand, Preston describes the children as "the finest he had ever seen."

A course was now set for the Murray River and, leaving the hospitable natives behind, the travellers pushed forward, being somewhat refreshed. However, their privations were by no means ended, and for the two days immediately preceding their arrival there they were practically without provisions. On reaching the Murray their troubles were ended, for the settlement was now firmly established, and procuring a boat from Lieutenant Erskine, who was in charge, they completed their journey to Fremantle without further incident. Taken all through the journey was one of difficulty, and the hardships suffered by the party were of more than ordinary severity, but well repaid by the appreciation accorded its efforts by the Lieutenant-Governor.

Whilst Lieutenant Preston was so employed, his old companion and ally in this useful pioneering work, Dr. Collie, was engaged on a task of the same nature in the country immediately to the northward of King George Sound. On April 26, 1831, Dr. Collie left that settlement by boat, accompanied by three attendants—an aboriginal named Mokare, previously mentioned in these pages for valuable assistance, and two soldiers of the 63rd Regiment. Some little time having been spent in taking soundings over the bar of Oyster

Harbour, Dr. Collie directed his course towards French River, noticing in passing the good quality of the soil on the banks of that stream. The explorer proceeded by boat until stopped by a series of waterfalls, or, as he states, "the bed of the river is elevated by rocks, over which the river flows as a rapid stream." Leaving the boat and also the river a course to the north-east was steered, when another stream, evidently a tributary of the French River, was discovered. After proceeding in this direction for some six miles, over rough and uneven country with outcrops of granite and with soil of a very poor nature, the explorers halted for the night. On the following morning, the 28th, a more northerly course was followed, but the journey so far was absolutely devoid of incident, and it was not until the 30th that they came upon anything in the nature of good soil. They now observed the footprints of horned cattle and a horse, and Mokare informed the leader that several months before the natives had reported the presence of these animals in the woods. Further up the river they came to a place called, by Mokare, Moor-illup, which was said to be the headquarters of the native tribes around King George Sound. Everywhere were to be found traces of natives, and game was extremely abundant. On May 1 the northerly course was changed to one south-east-by-south, and the explorers came upon several patches of good soil. The direction was now changed to west-south-west, and the country showed signs of improvement. Wattle was here the general growth of timber, which, as they ascended the hills, gave place to excellent redgums. Much of its success was due to the ability of the native guide, Mokare, who led the party by paths familiar to him from boyhood, and in his account of the proceedings Dr. Collie lays particular stress upon this point. On May 2 they were joined by a number of natives, and the party returned to where it had left the boat on the French River. It reached Oyster Harbour without mishap, and bivouacked at the mouth of the French River. On May 4 Dr. Collie proceeded to the mouth of the King River, and several subsequent days were spent in exploring the country immediately adjacent. From his headquarters Dr. Collie made several excursions by boat to points of vantage and thence explored the surrounding country, but found few places fit for closer settlement on agricultural lines, most of the land being more suitable for the pastoral industry.

Starting on September 5, 1831, Ensign Dale examined the country 50 miles north and south of Mount Bakewell. The party arrived at Mount Bakewell on the 16th, eleven days after leaving Guildford. The passage over the Darling Ranges was slower than had been anticipated, in consequence of the heavy rains, but despite the wet and toilsome journey the party arrived in good health and spirits at what was to be its headquarters. The country was carefully and thoroughly

examined with a view to agricultural settlement, and the previous accounts of the same explorer on a former journey in every respect verified. During the exploration many large bodies of natives were encountered, who were very friendly disposed.

During the year several other explorations of a minor, but still valuable, nature were carried out. Mr. R. Clint, of the Survey Department, commenced an examination of the ranges north and east of Porongorup, and Lieutenant Roe (Surveyor-General) and Sir James Stirling in H.M.S. "Sulphur" made an exhaustive survey of the south coast.

On January 29, 1832, Ensign Dale furnished a report on a short exploratory journey he had taken from King George Sound on the 21st of the month, to locate if possible two cereals spoken of by the aborigines as growing on the mountains to the northward. In this endeavour the party was unsuccessful, but the information gathered by Dale was of a valuable nature in regard to the agricultural possibilities of the soil.

This was followed in February and May of the same year by other explorations in the vicinity of the settlement of Albany, undertaken by Dr. Collie. Nothing of importance was discovered, the expeditions mainly verifying the reports of previous efforts by the same leader. The work of Dr. Collie cannot be too highly commended, for with indefatigable energy he carried out his exploration of the southern country as minutely as Ensign Dale had carried out that in the vicinity of the present town of York. These two names will take a high place in the history of early exploration in the great Western land.

Some very useful and valuable information was supplied by Mr. J. Bussel, who conducted two semi-private efforts during the year 1832 through the country adjacent to Augusta and the Vasse. On his expedition to the latter place he was fortunate enough to discover land of an excellent quality. Mr. Bussel was deeply impressed with the value of his discovery, and he thus describes the country that he traversed:—"Here was a spot that the creative fancy of a Greek would have peopled with dryad and naiad, and all the beautiful phantoms and wild imagery of his sylvan mythology: Wide waving lawns were sloping down to the water's edge; trees thick and entangled were sloping over the banks. One in the centre of the rapids had taken root in the very rocks over which the water tumbled; its bent trunk and tortuous roots seemed to indicate that it had struggled more than once to gain the perpendicular form from which it had been thrust by the rude torrents." This may have been of the nature of a rhapsody, but, nevertheless, his report shows that he possessed a scientific mind of no mean order, and his deductions were of considerable value, whilst we find therein mention of what must have been the first attempt to form a comparison between the etymology of the various tribes.

During the year 1833 but little work in the field of exploration was carried out, only two expeditions of any importance being noted. In March of that year Mr. F. Whitfield traced the Helena River to its source, and in July Mr. Alfred Hillman, of the Survey Department, explored the country between Albany and Nornalup Inlet.

Exploration work was now decidedly in abeyance, and only expeditions of a small nature were carried out, mainly over old routes or by excursions using old tracks and stations as the base of operations. Mr. G. F. Moore, who since his arrival in the State had taken a keen interest in the progress of the colony, traced the Swan to its junction with the Avon River, performing the journey in January, 1834. In September of the same year Mr. Turner traced the Blackwood River to its source, whilst in October Mr. H. G. Smith explored the country from Greenmount, just outside the present town of Midland Junction, to the townsite of Northam. These journeys, though valuable from an agricultural point of view and mainly undertaken to increase the general knowledge of lands suitable for the same, can hardly be called explorations, but in each case as part of the country traversed was virgin land they receive mention here.

In December, 1834, a party under the command of Mr. A. Hillman, of the Survey Department, left Perth to explore the land on the banks of a river which had been discovered on one of the earlier expeditions and named the Hotham. The party returned to Perth on January 26, 1835, and the report was of an exceedingly encouraging character. Both the Hotham and the Williams Rivers had been explored, and within 130 miles of Perth and 30 of Port Leschenault most excellent pasturage was observed, and abundance of native game was to be found browsing thereon.

In February of this year the Surveyor-General (Captain J. S. Roe, R.N.) examined the country between the headwaters of the Kalgan (French River) and Hay Rivers; and in April Mr. G. F. Moore, who was keenly interested in the vocabulary of the natives, made a journey through the country to the northward of the Swan River.

A report was made to the Lieutenant-Governor early in October of this year, with reference to a remarkable journey made by two lads in the country east of King George Sound. They were employed by a party of sealers on the southern coast, and becoming disgusted with the depravity and barbarity of their companions they deserted when 400 miles east of Albany. Deciding, if possible, to make the settlement, they walked along the coast, and principally with the aid of friendly natives accomplished their task. The boys suffered many privations, and it is extremely unfortunate that the details of their journey are so meagre.

A second expedition set out to explore the Hotham and Williams Rivers in October, 1835. Sir James Stirling accompanied it, and with him were associated the Surveyor-General (Captain Roe), Captain Ball, and Mr. A. Hillman (of the Survey Department), who was practically in command. After making its way to the district of the two rivers the party separated for the homeward journey, a portion returning *via* York and another taking the Kelmscott route: whilst the Governor and Captain Roe continued their travels towards the south-east. The opinions on the value of the land were somewhat diversified, mainly due to the different routes employed on the return; but all agreed that it was eminently suitable for pastoral purposes.

The story of exploration in 1835 is not so interesting nor so extensive as that of the previous year, with the exception of the one last mentioned. This was due, no doubt, to the removal from the colony of three of its most prominent characters in the realm of exploration. Ensign Dale returned to England in 1834, Captain Bannister was in the eastern colonies, and Dr. Collie had succumbed to a decline just when he was about to return to the Homeland. These three had contributed greatly to the pioneering work of the colony, and Dr. Collie, who was a naturalist of no mean order, had partially compiled a work on Western Australia. The State owes a debt of gratitude to these gentlemen for their self-denying efforts. They did much to open up new fields for settlement at a most critical period of its existence. Mr. G. F. Moore (the Advocate-General) made an excursion to the northward of the Swan River during the April vacation of the Courts. With Mr. Heffron and a black boy he left Perth with the intention of locating the position of a river said by the natives to exist to the northward. The party did not attempt to cross the ranges, but proceeded along their western base northwards, and was guided by the natives to the river mentioned. The country was described as resembling that of York, the soil being of an excellent loamy character.

The river was named the Moore, out of compliment to its discoverer. The report of the explorer contains reference to the view held at that time with regard to the interior of the continent of Australia being a large inland sea, for a salt lake of considerable dimensions discovered by Mr. Moore was thought by him to be a continuation of a chain of such extending from Spencer Gulf.

Later on in the year Mr. Moore, accompanied by Messrs. Peter Brown (the Colonial Secretary) and George Leake, examined the country to the northward and eastward of Northam, and opened up a new tract of grazing and agricultural land.

During the month of May Lieutenant Bunbury, 21st Fusiliers, explored the country between the mouths of the Dale and Williams Rivers, and again between October 20 and 23 he crossed from Pinjarra to the Williams, whilst between June and September Mr. A. Hillman surveyed a road from Albany towards Perth.

From October 2 to November 11 Surveyor-General Roe conducted an expedition to the north and east of Perth, proving the difficulty of forming an opinion on a tract of country without exhaustive survey. Captain Roe went south-east from York, and though he travelled nearly 50 miles he found few spots that deserved the high praise bestowed upon them by Ensign Dale, who had been over the adjacent country previously. It will be remembered that Ensign Dale had spoken of this country in a most promising manner, and considering that Mr. J. W. Hardey, a prominent agriculturist, was a member of the party, they must have pursued an entirely different course to that followed by the Surveyor-General. This fact was further proved by a tour subsequently made by Messrs. P. Foley, P. Meares, and L. Parker. These gentlemen made a slight detour from the courses followed by Ensign Dale and Captain Roe, and reported that much of the land was equal to the best in any part of the country.

## CHAPTER II.

### SIR GEORGE GREY, 1837-1839.

The year 1837 saw the inception of exploration, so far as Western Australia was concerned, on a far more extensive scale than had hitherto been contemplated or attempted. In the latter part of the year 1836 Lieutenant George Grey, who was afterwards to become so famous in the history of Australian colonization, together with Lieutenant Lushington, addressed a letter to Lord Glenelg, then Secretary of State for the Colonies, offering their services for exploration purposes from the

Swan River to the northward, having particular regard to the direction of the coast, so as to intersect any considerable body of water, and in the event of the same being discovered to make a particular examination thereof, as far as circumstances might admit. Several secondary objects were enumerated in the letter, which were afterwards embodied in the instructions to the explorers. This offer and the suggestions therein put forth were very favourably entertained by the Secretary of

State, and the whole statement having been placed before the Royal Geographical Society, which accorded the proposal its hearty support, it was finally decided by the Government of the day to accept the services of these two officers for the purpose set out in their original letter.

After mature consideration it was decided to materially alter the original proposal, and that the expedition should start from Prince Regent River, on the north-west coast, and be directed to the Swan River; but the principal object was still clearly defined, *viz.*, to search for some large river, which many explorers thought existed flowing towards the coast from the centre of Australia. After several minor details were observed, and everything suggested by the explorers as necessary for the success of the work liberally accorded by the Government, a letter of instructions was forwarded to Lieutenants Grey and Lushington embracing the following directions:—

1. They were to embark in H.M. sloop of war the "Beagle," then fitting out for a survey of the coasts and seas of Australia, under the command of Captain Wickham, R.N.; and to proceed in that vessel either to the Cape of Good Hope or to the Swan River, as might ultimately appear best suited to forward the objects of the expedition.

2. Upon their arrival they were directed to procure a small vessel to convey the party and stores to the most convenient point in the vicinity of Prince Regent River.

3. An examination was ordered of the country in the vicinity of Prince Regent River, after which they were instructed to take such a course as would lead them to the great opening behind Dampier Land. From this point a certain discretionary power was allowed the explorers, but the following was inserted in the instructions:—"You will use the utmost endeavours to penetrate from thence to the Swan River; as by adopting this course you will proceed in a direction parallel to the unknown coast and must necessarily cross

every large river that flows from the interior towards that side of the continent."

4. To allow for the safety as far as possible of the party—and in the event of difficulties occurring which could not be surmounted, and to provide an opportunity of falling back upon the vessel under these circumstances—the vessel was not to quit the place where the expedition disembarked until such time as was agreed upon. To secure the observance of this duty the explorers were ordered to draw up an agreement on the lines suggested by the local authorities where the vessel was chartered.

SIR GEORGE GREY.

5. The main objects of the expedition were stated to be:—"To gain information as to the real state of North-Western Australia, its resources, and the course and direction of its rivers and mountain ranges; to familiarize the natives with the British name and character; to search for and record all information regarding the natural productions of the country, and all details that might bear on its capabilities for colonization or the reverse; and to collect specimens of its natural history."

6. Finally, instructions were issued as to the strict discipline to be observed, and regulations were formulated as to the demeanour of the party when in contact with the natives; the whole of the instructions concluding with the following paragraphs:—"No further detail has been given you in these instructions, for, as you have been made aware of the motives which have induced His Majesty's Government to send out the expedition, it is supposed that each individual will do his utmost in his situation to carry out these objects, either by obtaining all possible information or by such other means as may be within his power. Although the instructions are addressed to you conjointly, as conductors of it, it is necessary that the principal authority and direction should be invested in one individual on whom the chief responsibility would rest. It is to be understood that Lieutenant Grey, being the senior military officer, is

considered as commanding the party, and the person by whose orders and instructions all individuals composing the party will be guided and conform."

At this time a large portion of the western coast and interior of the great Australian continent had remained unvisited and unknown, whilst the opinions of the celebrated navigators, Captains Dampier and King, connected with other circumstances, led to the inference, or at least the hope, that a great river, or water inlet, might be found to open out at some point on its western or north-western side, which had then been only partially surveyed from seaward. The opinions then existing, and which were not totally dissipated until many years later, in regard to this feature of Australian geography, led to many further expeditions in the future, but none were more pregnant with possibilities than this. To Lieutenants Grey and Lushington, therefore, can be accorded the honour of the first serious attempt to clear up all that mystery.

On July 5, 1837, the party, which consisted of the officers already mentioned together with Mr. Walker (a surgeon and naturalist) and Corporals Coles and Auger (Royal Sappers and Miners who had volunteered their services), embarked on the "Beagle" and sailed from Plymouth on the same day. The usual incidents of the voyage entertained the party until their arrival at False Bay at the entrance to Simonstown Harbour, now a naval station, on September 21, where they received information that a boat for the purpose mentioned in their instructions from the Secretary of State could be much more economically hired and provisioned at Cape Town than at the Swan River. Eventually, the schooner "Lynher," of 140 tons, with Henry Browse as master, was secured, and proved a most valuable adjunct. The party was now increased by a few additional hands, amongst whom was a seaman named Thomas Ruston, who had served on the Australian coast under Captain King. Having made all arrangements, the party embarked in the "Lynher" on October 13. It now consisted of:—

Lieutenant Grey	Private Mustard
Lieutenant Lushington	J. C. Cox, storekeeper
Mr. Walker, surgeon	Thomas Ruston
Mr. Powell, surgeon	Evan Edwards
Corporal R. Auger	Henry Williams
Corporal J. Coles	R. Inglesby

Add to these the crew of the vessel, which consisted of a captain, mate, and seven men, also a cabin boy, and we have the full total of the adventurous souls who essayed to cross the turbulent Indian Ocean in a small schooner of 140 tons burden. Before leaving, Lieutenant Grey had collected an amount of provisions and livestock, consisting altogether of thirty-one sheep and nineteen goats. There were also six dogs, of nondescript breeds, to be used for hunting purposes.

Grey decided at the outset to land at Hanover Bay and there form a temporary encampment, and, having landed the stock, to despatch the boat, with Lieutenant Lushington in charge, to Timor for ponies. In the absence of the party he intended to make short excursions inland for the purpose of inculcating some of the elementary principles of bushcraft. Upon the return of the vessel it was the intention of the leader to move the whole party to some convenient spot, to be chosen during their absence, and then to advance attended by one of the party and fix on the spot to be selected for the next encampment. This was the plan to be adopted for the whole expedition, and never to move the party from one halting-place until the next had been chosen. Considering the fact that it was so well equipped as to be able to establish and maintain itself in any position, the method suggested, though slow and perhaps over-cautious, had much to commend it. Then, again, it was the explorer's intention to introduce useful animals and plants into this part of Australia, for the benefit of future generations of colonists. For this purpose valuable collections had been made at Teneriffe and in South America, including the seeds of the cotton plant. From the Cape and also from England collections had been gathered, and the party returning from Timor with the ponies was to receive instructions to fill the vessel with the plants of tropical and sub-tropical fruits.

It was not until the morning of November 29 that they practically reached the shores of Australia, and through the negligence of the lookout found themselves in dangerous shoal water. They escaped these dangers and soon sighted Red Island, anchoring off Entrance Island, Port King George the Fourth, on the evening of November 29, 1837. About 10 a.m. next morning Grey determined to land and walk to Hanover Bay, in the hope of finding water and forage, so that without delay the schooner could be despatched to Timor for the ponies. The party to land consisted of Lieutenants Grey and Lushington, the surgeon (Mr. Walker), and three men. Their experiences in the tropical sun were of a most distressing character, and the party was very hard pushed before it returned to the ship in the evening, Lieutenant Grey having to undertake a most sensational swimming feat. After sunrise next morning it was found almost impossible to sleep, for the flies became an intolerable nuisance, and Grey comments on the prevalence of the insect in the northern portion of the continent. Directly after breakfast a boat was despatched in search of fresh water, and in another boat Grey went up Prince Regent River.

The stock and stores were landed on December 5, and after the leader's return on the 17th inst. he hoisted the British flag and took formal possession of the north-west. During the day the explorers first came into contact with the natives, who retreated on being accosted,

and fearing to increase their alarm Lieutenant Grey would not allow them to be followed. In the evening Lieutenant Grey, accompanied by Corporal Coles and Private Mustard, started on a short exploring excursion from the camp. Provided with ten day's provisions they intended to make as thorough an examination as possible of the country in the vicinity of their temporary encampment. Early next morning, at the bottom of a deep ravine, they discovered a rushing stream, which the explorer named Lushington in honour of his colleague. During the day Mustard, one of the members of the party, became ill, and so delayed their advance. Travelling until December 21, and their provisions having become almost exhausted, the leader determined to halt in a valley they had discovered where game abounded. Rain fell almost continuously during the expedition, and on following the valley down towards Prince Regent River they came upon numerous traces of native occupation, but these were not of recent date, and it was not until the following day that they came into closer contact. Being driven to take refuge from a very heavy rainstorm amongst some rocks, they were attacked by a party of natives and were forced to fire over their heads, when the aborigines departed in haste. They now made a hurried and forced march for the temporary encampment, and were relieved to find all the members of the party in good health and spirits. The watering of the vessel had been considerably delayed, owing to the difficulties experienced in bringing the water to the schooner, due to the abnormally low tides, and though only partially completed it was decided to finish the watering at Timor, so the boat set sail on December 21 for that destination. The portion of the expedition left behind was employed in building a shed for their stores, and on December 24, 1837, this labour was completed. They decided to have a Christmas jollification, and all dined together the following day. After dinner they drank the health of the Queen, no doubt the first time such a ceremony had been performed in the vast waste of the north-west.

Another excursion was begun on January 6 to examine the land between Port George the Fourth and Hanover Bay. The proportion of good country to the bad was small, but they came upon some exceedingly fertile spots, where there were rich meadow plains. During this expedition Grey came upon several trees which were peculiarly marked, and also some native drawings which were of an extremely rude nature and showed an utter lack of talent amongst the aborigines. On their return to the encampment they found that the schooner had not arrived, which occasioned some alarm for the safety of those on board. The shore party was extremely well found and could have constructed a boat large enough to have carried them all to Fremantle. The party was now engaged in forming a garden and in

discovering a passage over the cliffs so that horses with loads could get to Hanover Bay.

On January 17 the "Lynher" came safely to anchor in Hanover Bay. The party on the schooner had been able to procure the requisite number of horses, and had also secured a large number of tropical and sub-tropical plants. The ponies proved to be smaller than had been anticipated, and as they were unbroken, intractable brutes many difficulties had to be overcome before the party could move. This occasioned some anxiety to the leader, for if they had been caught in their present position by torrential rain the effect would have proved disastrous. As it happened, the crossing was bad, as the explorer's own words most clearly show:—"Having thus gained the elevated plains I laid down to sleep, satisfied that the worst of our labours were over; yet I could not but recollect that it had taken us ten days to reach a spot which by the proper route was only a short day's journey from the valley we were first encamped in, and that in our march through the country we had been compelled to traverse we had lost seven ponies and injured many of those remaining; all these difficulties arose from our departure having been delayed so long, till the rains had set in, and so flooded the country that we could not proceed by the proper route."

On the morning of February 11 Grey, accompanied by Corporal Coles and one of the men recruited in Cape Town, left the encampment to choose the track for the next day's route, as he had previously outlined would be his method of procedure. He desired, if possible, to approximate as nearly as he could to the previous route he had followed, mainly because it would rapidly get the livestock on to good grass country; but he had also in view the completion of a map of the country which he had commenced on his previous journey. Very soon after their departure those left at camp heard natives talking in the woods. The camp got immediately under arms. Judging it to be imprudent to parley with the natives, who were now in considerable force, they took up a position for the defence of the camp and its stores. The costume of the visitors formed a subject of laughing comment for the many women and children who accompanied the native party, whilst the ponies were objects of universal respect and awe. The party at the tents overlooked all their movements and heard every word that was uttered. The language spoken was described as clear, distinct, and agreeable to the ear. The men were a fine, tall, and athletic race, whilst two remarkable physical examples seemed to control the movements of the rest. After a short period distant shouts were heard in the direction which had been taken by Lieutenant Grey and his party, and a large body of male aborigines moved off towards the sounds, headed by their chiefs. After about two hours cries of distress were heard, and the natives departed hurriedly from about the camp.

The explanation of these occurrences was to be found in the arrival of Grey's party. After travelling for a short time what was taken to be a native call was heard from the woods, and Grey halted to ascertain whence it emanated. Nothing having been observed, it was decided that the call was that of some native bird, and the party proceeded. Sending back the Cape man to conspicuously mark a tree that had been overlooked Grey was astonished to find the man returning in a state of absolute terror, whilst following him was a native in the act of preparing to throw a spear. A moment before the woods had been absolutely silent, but they now rang with fierce and ferocious yells, and the party was found to be surrounded by armed men bent upon its destruction. It was taken completely by surprise, and the cowardice displayed by the first man had changed the awe of the natives into something like contempt. Escape being impossible Grey fired a gun over the heads of the leaders, but this availed nothing, and he was compelled to fire at one of the leaders, striking the native in the arm, which fell powerless to his side. But still the large body of natives pressed on. Giving Corporal Coles his gun to reload Grey tore his rifle from its cloth case, and advanced to the rock which covered the second leader, but in the advance was knocked down by a discharge of spears, one of which penetrated his hip. Tearing out the spear he pushed steadily forward, when the native rushed from his cover in retreat, being immediately shot dead by Grey. At once the tumult ceased, and the natives silently slunk away, till within a few moments the whole might have appeared but a bad dream. Gradually the natives returned and picked up the badly wounded leader who was first shot, but the party did not fire, considering that such would be an act of barbarity. It was now high time to consider their own state. The cowardice displayed by the Cape man at the inception of the trouble continued right through, and he was absolutely useless. Both Coles and this man were uninjured, but Grey was severely wounded in the hip, and after binding up the wound they returned homewards. During the return march Grey's wound became extremely painful, and excessive weakness supervened owing to the loss of blood he had sustained. Eventually, almost in sight of camp, he was compelled to call a halt and send Coles forward for help and assistance. On the news arriving at camp, the surgeon (Mr. Walker) pushed on alone to Grey's assistance, and after the dressing of his wound was completed he was removed in a litter to the camp, but he suffered severely from its effects. The man to whose cowardice the whole episode could be clearly traced was at his own request allowed to return to the ship with a party sent to the vessel under the charge of Mr. Walker. The captain of the "Lynher" was instructed to delay his departure until May 2, during which the exploration of the vicinity would be completed

and Grey have recovered from his injuries. During the enforced retirement of Lieutenant Grey, Lieutenant Lushington explored the country to the westward and reported very favourably upon it. On the morning of February 27 the leader was so far recovered as to be able to sit on his pony, and the party moved off in the direction previously taken by Lieutenant Lushington.

The incidents of the next few days were not of much moment, with the exception that the party came upon a high conical hill of volcanic origin, composed of vitrified lava resembling common glass, from which the natives fashioned their spear heads. The country was mainly basaltic, but luxuriantly grassed and of excellent character for pastoral pursuits. On the morning of March 2 it came upon a river estimated to be four miles wide and decked with many verdant isles. Grey named this stream the Glenelg River, after the Secretary of State, Lord Glenelg. The wound sustained by him was very slow in healing and caused much suffering. This, added to the fact that such a clear and ardent mind could ill admit its incapacity through physical exhaustion, only retarded his recovery and added to his mental disquiet. The difficulty of finding a route when they reached the Glenelg was extreme, and, as Grey points out, though the country was so adapted for commerce and enterprise it brought forth many difficulties for the explorer. The north-easterly course taken by the Glenelg and its extreme width led the leader to fear that after all what he deemed to be a river might be only an estuary of the sea, and all his time hitherto spent on a large island, which existed with a comparatively narrow channel between it and the mainland. An expedition started from the camp to explore the bank of the river, and found it extremely marshy, but it succeeded in reaching one of the channels which Lieutenant Lushington, who was in command, estimated to be 400 yards wide, with a tidal rise and fall of fully 20 ft.

On March 7 the whole party followed the course of the river in a north-easterly direction through magnificent country and luxuriant vegetation, but the mosquitoes were extremely troublesome and caused a large amount of annoyance. Owing to a rapid flood on March 11 they were compelled to camp on a position that showed signs of recent native occupation. Close to the camp was a large mass of basaltic rock, and scratched upon these were some native drawings, very roughly and crudely executed, representing various parts of the human frame. However, the natives seemed to have been but lately engaged in an extensive manufacture of spearheads, and as this looked very like preparation for a warm reception to be given to the explorers, extraordinary precautions were taken to guard the camp.

Having crossed a stream which ran between the Glenelg and the encampment, the party turned almost due north, the direction of the advance being soon after

changed to the south-east, when, after negotiating the passage of several streams, it came upon high ground, the highest point of which Lieutenant Grey named Mount Lyell, after Sir Charles Lyell. This peak was estimated to be about 1,800 ft. high, though the height could not be properly ascertained owing to the barometer having been broken, but the explorers were well repaid for the labour necessary to attain its summit. From the peak they had a remarkable view, and the magnificence of the prospect repaid them for the arduousness of their labours up to that time. Native fires were detected here and there throughout the region which lay between the Glenelg and Prince Rupert Rivers, showing that game abounded, whilst the value of soil and climate could, from a pastoral point of view, hardly be surpassed.

Next morning, to get clear of the marshes, they steered a south-easterly course, and were thus forced up into a range of high basaltic hills. Along the foot of these the course continued through an uninterrupted succession of rich flats, thinly wooded but luxuriantly grassed, until upon rounding a small hill they again found the Glenelg, which at this point made a sudden turn. The water was now quite fresh, and the main river was here joined by a tributary. Grey was greatly imbued with the value of the river for agricultural and pastoral purposes, and it would not be out of place at this stage to quote his own words, which, unfortunately, later explorers were unable to altogether verify:—

"I stood for some time watching this dark, turbid stream, sweeping rapidly along, and could not but wonder where so great a body of water could have its source. I had then seen no other Australian rivers, but judging from description this differed widely from them all. I have since visited many of the most noted Australian streams, and found this distinguished by many peculiar characteristics; nor would I hesitate to say that, with the exception of the Murray, it will be found the most important on that continent; and taking into consideration its geographical position, the fertility of the country on its banks, as far as it is yet known, and the

c

rise and fall of the tide, it may perhaps not yield in consideration even to the Murray."

The swollen nature of the Glenelg, owing to the torrential rain, rendered it impassable to the explorers, and continuing their course they soon found that the marshy nature of the country made further progress in that direction utterly impossible. Grey was much chagrined at his inability either to cross the river or proceed on a south-easterly course, and reluctantly he again headed to the north-west. At this point they were introduced for the first time to the large boa, for one was shot by Mr. Lushington in the act of crushing a kangaroo to death. The rain fell in torrents, and rendered progress extremely difficult, until Grey was forced to the conclusion that if this were not an extraordinarily wet season then any attempts to explore the country at this time of the year would necessarily be foredoomed

to failure. On March 23 they reached a watershed, and were again unable to turn on an eastward course, and thus travel round the swampy ground. The watershed consisted of a range of elevated hills, from which streams were thrown off to the Glenelg and Prince Rupert Rivers, and again the ex-

plorer refers to the magnificent scenery and the extreme luxuriance of the tropical vegetation.

The route was now changed to a southerly direction, when the explorers came upon a range of sandstone hills of such a rough and precipitous nature as to make any further advance impracticable, and no endeavours succeeded in locating any pass over or through its grim barriers. In searching for a pass Grey came upon some extraordinary examples of native art in the sketches which adorned the roof and walls of a cave. These paintings, for some of them were coloured, were the most pretentious artistic efforts hitherto discovered during the expedition, and the leader went to some pains to make copies as correct as possible for reproduction. On leaving the cave they came upon a sandstone rock upon which a specimen of native sculpture was described, being a face, about 2 ft. in diameter, chiselled into the hard rock. Grey determined, as he could not cross the sandstone

DEPARTURE OF EYRE'S EXPEDITION.

From "Eyre's Journals."

ridge, to try and find a way round it, and the explorers moved westward, through a magnificently grassed valley where they camped, and out of which they found it difficult to get their ponies to move next morning, after a night spent amongst the rich herbage.

After breakfast on March 29 they forded several of the tributary streams of the Glenelg, flowing through fertile valleys, until they came to a wide sandy tract somewhat heavily timbered, and during the course of the afternoon they came upon what appeared to be the Glenelg, or a very large branch of that stream. At this place the river formed a series of rapids, and just above these they found a good ford. Crossing at this point a few miles further advance brought them to another precipitous sandstone ridge, and whilst journeying through it they came upon another cave, which contained native paintings of a curious character. The recent presence of natives was clearly noticesable, but none were observed. The difficulties of the road now became of pressing moment, and though Grey's wound was still open and painful, he toiled for hours to try and find a practicable pass over the mountains. After almost superhuman exertions he was compelled to camp for the night with success still far away, but with the determination to renew the search in the early morning. The search next morning proved unavailing, and as Lieutenant Grey's wound was steadily getting worse, the surgeon (Mr. Walker) on examination informed him that any further movement forward would probably imperil his life. For three days he rested at the camp, a small flying party having gone forward under the command of Lieutenant Lushington; but so rough was the track that on the return of this party it was found that it had only penetrated 12 miles into the unknown.

On April 4 the return journey to Hanover Bay was begun, and on the 7th Grey discovered what he considered to be native tombs, placing an age of two to three hundred years upon them. On April 13 it was ascertained that a store of provisions which had been buried on the outward track was intact, and early in the evening the Lushington was crossed. Before daybreak Grey was astir and on the way to Hanover Bay, in great anxiety of mind as to the fate of the "Lynher," and crossing to the highest point of the beach, saw the little schooner riding at anchor in the bay. On a gun being fired a boat was at once despatched, and they were taken off to the vessel, where they found that the "Beagle" was on the coast, and at that moment in Port George the Fourth. Grey at once started by boat for the "Beagle," and being recognized when nearing the ship was welcomed with every demonstration of affection. The whole party now returned, being almost worn to skeletons by their great hardships. The schooner sailed for the Isle of France on May 17, and Grey did not return to Western Australia until some months later.

On arrival at the Mauritius it was found that a protracted stay would need to be made owing to the state of Grey's wound, which through want of rest and the hardships of the expedition had been prevented from healing. The "Lynher" was, therefore, discharged, and the intrepid soldier started to consider a plan for future operations. The rivers Glenelg and Fitzroy, large though they were, were recognized as being capable of draining but a small section of the vast area of that portion of the continent, so that Grey became extremely anxious to return as soon as possible to the north-west. After consultation with the Governor of Mauritius, Grey decided to first call at the Swan River for the purpose of meeting and conferring with Sir James Stirling, who had been instructed to afford the explorers every assistance. He therefore re-embarked at Port Louis on August 21, 1838, and on September 18 arrived at Fremantle. Losing no time, he at once communicated his views to Sir James Stirling, who concurred with Grey's decision to return to the north-west, and it was decided that as soon as the colonial schooner "Champion" returned, then absent on a voyage to King George Sound, it would be prepared to convey the party to Camden Sound, and there it could be reinforced by any persons who desired to accompany the expedition at their own cost for speculative purposes.

However, after further consideration, it was deemed advisable for various reasons, mainly that of the unseaworthiness of the vessel and the difficulty of repairing it in Western Australia, to abandon the project for the present. Grey was deeply chagrined at what he considered to be vexatious delays, but endeavoured to turn his spare time to some profitable use. This he did by constructing a vocabulary of the different dialects spoken by the various aboriginal tribes with whom he had come in contact, a work which has since proved of a valuable nature. Several short excursions were made from Perth, in one of which he was accompanied by a Mr. Frederick Smith, who was afterwards to fall a sacrifice to the expedition to Shark Bay. These opened up new country to the northward. It was now suggested that Lieutenant Grey might explore the country northward of Perth towards Shark Bay, but this project had to be abandoned owing to utter impossibility of procuring in the colony sufficient horses for such an expedition. A proposal to attempt a boat voyage to the portion of the coast mentioned was also abandoned.

Sir James Stirling had now relinquished the reins of office and Governor John Hutt had assumed control, but still there appeared no immediate prospect of accomplishing the original design; and Lieutenant Grey was in the interval prevailed upon to undertake an expedition to the southward of Perth, to discover if possible the whereabouts of Mr. George Eliot, who left the Williams for Leschenault on December 17, and who had not

arrived at the latter place. Grave fears were entertained as to his safety, and the Governor requested Grey to form a party from his establishment to clear up the mystery. Within an hour of the receipt of the message Lieutenant Grey, Surgeon Walker, and the two invaluable non-commissioned officers of the Sappers and Miners were ready to proceed. However, horses could not be immediately procured, and it was not until the next day that Grey and his party made a start. Three intelligent native guides were promised to assist the party, but on the morning of the 9th these were not forthcoming, a fit of cowardice having caused them to decamp, but this loss was supplied by the engagement of an intelligent native named Kaiter. Swimming the horses across the stream, the expedition started to accomplish its mission. It arrived at Pinjarra on the morning of January 11, and during the afternoon proceeded on its quest along the banks of the Murray River. Starting before dawn on the 12th, it travelled in a south-east direction, and by breakfast-time had discovered a passage through the Darling Ranges, finding numerous traces of wild cattle amongst their magnificent gorges. At this stage Grey, who had lost a valuable watch about half an hour previously, saw a sample of the marvellous tracking capabilities of the natives, for the aboriginal Kaiter returned along the track through the heavy scrub and soon found the watch. On December 13 the explorers pursued their way through the hilly country, and now turned in a due easterly direction, early next day reaching the Bannister River, and soon after that the Hotham. The leader comments on the magnificent land between these rivers, stating it was equal to any he had yet seen in Western Australia. Rapidly proceeding they reached the Williams on January 15, and here the explorer tells of the extremely hard lot of the settler, affirming that considering the limited population of the colony settlement had been pushed altogether too far afield. They now attempted, with the assistance of the native, to locate the tracks of Mr. Eliot, finding them on the bed of the river, and as it was the intention of that settler to proceed for 18 miles along that course they moved off at once on their task. They soon lost the tracks, which were at the best faint and indistinct, and decided to strike direct across the mountains to Leschenault, diverging from a true west route here and there to search the intervening country. If on arrival at Leschenault they should find Mr. Eliot still absent, they would obtain some additional natives at that point and return again to the Williams, taking a more southerly course. They reached the Harvey on the 20th, still unable to pick up Mr. Eliot's tracks or gain any tidings of him and his party. The party had now difficulty in procuring water, but digging near a native well found a muddy and stinking fluid that under the circumstances was even a pleasant draught. On January

c2

23 Leschenault was reached, only to find that Mr. Eliot had arrived before them. After staying the night with Mr. Bussel, whose establishment he praises highly, Grey prepared to return to Perth. Mr. Eliot returned with them, and early on January 31 they reached the settlement. Much of the country travelled over by Grey on this expedition had been explored previously, but his report was of value to the authorities.

Early in February, 1839, Grey saw a remote chance of being able to proceed with his exploration of the north-west, the reason for his presence in Western Australia. After a delay of nearly five months, which had proved both vexatious and mortifying, he procured three whaleboats, and bargained with the skipper of an American whaler to convey them, together with the party and the provisions, to some point to the northward of Shark Bay. It was the intention of the leader to form a provision depot on some island adjacent to the mainland, and from that point to commence operations by the examination of the undiscovered portions of the bay; and if circumstances rendered it desirable, he proposed to explore parts of the country as they coasted along, and to make such excursions inland as the nature of the country would permit. After this work had been completed, he intended to return to his depot, recruit his stock, and then make his way along the coast in the direction of the North-West Cape. The same procedure was proposed to be followed on this expedition as in that of the exploration of the bay, and when the provisions were again exhausted to return to the depot and examine the coast as far southward as Gantheaume Bay.

The party taken was altogether a thoroughly experienced one, and Grey arranged with Governor Hutt that if the party did not return to the Swan River within a certain time the colonial schooner would be sent in search of them. An American whaling skipper also engaged to fish in the adjacent water six months hence, and Grey therefore considered that he had made complete arrangements against the disaster of being entirely overlooked if things went wrong. However, the "best laid schemes of mice and men," etc., and an unfortunate occurrence to be narrated in its place partially frustrated this excellent plan. The three whaleboats were taken, though really only two were required for the needs of the party, because the leader thought it a wise policy to have a spare one in case of accident, a precaution amply justified as events proved. The party, which sailed from Fremantle on February 17, 1839, consisted of the following:—

Lieutenant George Grey (leader of the expedition),  
Mr. Walker (surgeon),  
Mr. Frederick Smith (a young Englishman in search of adventure),  
Corporal Auger, Corporal Coles,  
Thomas Ruston, H. Wood, and C. Wood,

and Messrs. Clotworthy, Stiles, and Hackney, volunteers from the Swan River Settlement. Also attached to the party was Kaiter, the aboriginal who had proved such a valuable addition to the party in the search after Mr. Eliot.

On the evening of Sunday, February 24, Dorre Island was sighted, and the vessel stood in to within two miles from the shore, but the coast presented such a forbidding appearance that it stood off for the night. Soon after daybreak next morning it made the north-western part of Bernier Island, and doubling the point stood in to Shark Bay. By noon the same day the party was all disembarked on Bernier Island. Here a rather grave misfortune was discovered, for it was found that the keg of tobacco for use of the expedition had not been taken from the ship, and this luxury, so necessary to men deprived of every other, was lost to the expedition.

After stopping on Bernier Island for two days, during which time they buried their stores, they found that the supply of fresh water was gradually diminishing, notwithstanding the ingenious efforts of Mr. Walker, who constructed a still for the distillation of the salt water. Finding their search for fresh water in the immediate vicinity unavailing Grey determined, despite the heavy sea, to skirt the land to the southward. The leader's boat was safely launched, but owing to misadventure the other, which was in charge of Mr. Walker, was thrown broadside on to the heavy surf, and the boat and all the stores, of which it contained about half a ton, were lost. Thus was clearly proved at the initiation of the expedition the wisdom of providing an extra boat.

Somewhat depressed by the accident the party did not venture to launch the spare boat until the next day, when the heavy sea had moderated. Still the position, when under weigh, was not over desirable, though anything was preferable to suffering the agonies of thirst on Bernier Island. At 3 o'clock on the afternoon of the 29th Dorre Island was reached, where a most convenient boat harbour was found. An immediate search was made for water, and a little discovered in small holes in the rocks. A terrific storm which sprang up during the evening again placed the boats in extreme jeopardy, and despite almost superhuman efforts one of them was driven ashore.

Next morning, when the explorers reviewed the extent of their damages, a woeful state of affairs was disclosed. The day before they had started in two good boats with plenty of provisions; they now found themselves in a most distressing plight. All the stores they had with them were spoilt, the ammunition was damaged, and their chronometers injured, while both boats had received such a buffeting that it was impossible with their limited means to properly repair them. To return to Bernier Island and replenish was, for the present, out of the question, the need of fresh water making a journey

to the mainland increasingly imperative, for a search of Dorre Island had proved that it was equally as barren as Bernier. They therefore got to work at once on the damaged boats to render them seaworthy without loss of time, and on March 3 they were ready for the voyage to the mainland.

Early on March 4 they entered the mouth of a river and came on a lagoon containing fresh water. The river was named Gascoyne, in compliment to Captain Gascoyne, a friend of Grey's. The district proved extremely fertile, especially the delta at the mouth of the river, and Grey's ardent imperialistic mind began at once to form visions of future prosperous settlement under the British flag. Mr. Smith developed an attack of fever, and the leader decided to halt for a few days and give him time to recover, in the interval making short excursions in the immediate vicinity. An island between the two main mouths of the river was called Babbage Island after C. Babbage. An incident here with two natives proved to Grey that a similarity existed between the language of the different tribes throughout Australia, as Kaiter was enabled to hold a sort of converse with the visitors.

Leaving the Gascoyne on March 7 Grey steered a course west-by-north, and landed near a range of hills containing a peculiar geological formation, which he named after Lyell, the distinguished geologist, and as he had been unable to find water on the plains, which gave every indication of its presence, he called them the Plains of Kolaina (deceit). The damage experienced by the stores on Dorre Island only became more pronounced as time passed, and the food became almost nauseating, which, together with the fact that native game was scarce, made the position exceedingly unpleasant. Still compelled to remain on shore, by reason of the heavy sea, the explorers were placed in a further difficult and even dangerous position by an attack from the natives, who succeeded in wounding Ruston and decamping with some bags of flour. It was not until March 18, the wind and sea having moderated somewhat, that they were enabled to move, and they made the northern mouth of the Gascoyne. Here they found an abundance of fresh water, but their provisions being so reduced they determined to make for Bernier Island at once.

Evidences of a still greater disaster met them on their return to Bernier Island, for the state of the coast and the class of driftwood thereon, together with presence of broken hogsheads of provisions, left no doubt in Grey's mind, that the fierce gales had destroyed their provisions, which to the best of his belief he had buried above high-water mark. The prognostication proved only too true, and Grey was now faced with a most serious responsibility. Leaving his companions, he sat down and read a few chapters of the Bible, and under Divine influence became perfectly contented and

resigned. His own words, partly in apology for making reference to this fact, are well worthy of being quoted:—"I should be ungrateful to my Maker not to acknowledge the consolation I derived from religion, and should ill perform my duty to my fellow-men, did I not bear testimony to the fact, that under all the weightier sorrows and sufferings that our frail nature is liable to, a perfect reliance upon the goodness of God and the merits of our Redeemer will be found a sure refuge and a certain source of consolation."

Eventually it was decided to attempt to make the Swan River in the whaleboats, and on March 22, all preparations having been completed, the explorers made sail to the southward on their long journey, which was to be in the case of at least one member the longest of all. Passing a low point on the shores of Shark Bay, Grey named it after George Bellas Greenough, the president of the Royal Geographical Society. On rounding Peron Peninsula

they were struck with a sudden tropical squall that threatened to destroy the now greatly damaged boats, but fortunately made land safely. Leaving Peron Peninsula they made for Dirk Hartog Island, but just managed to make the shore of a small island in the teeth of a furious gale.

The discipline of the party now became somewhat lax, and thus another anxiety was added to the list already carried by the leader. The two men recruited at Fremantle, named Wood, under the stress existing proved of a cowardly nature and insubordinate, and one of them refusing to work Grey ordered his rations for the day to be divided amongst the others, with the remark that "if he would not work, he would not eat." At 10 a.m. on March 31 they reached the northern extremity of Gantheaume Bay and decided to land. The landing proved disastrous. The sea was so fierce that both boats were broken and wrecked, and despite all efforts to refit they could not be used. The seriousness of the situation began to dawn on the minds of all, for they were now confronted with the prodigious land journey to the Swan River with provisions sufficient only to last for a few days.

Recognizing that their only course was to attempt to make the settled districts by a land journey Grey gave orders for the necessary preparations to be made. The food was equally distributed amongst the members of the party, and with strong hearts and a mighty determination to succeed the expedition moved off on its difficult and toilsome task. Three hundred miles of heavy, rough, and unknown bush had to be negotiated, and it needed courage of no ordinary character to view undismayed the hardships of such a journey. The course was set due south. The Murchison River was discovered flowing into Gantheaume Bay, and soon afterwards two high elevations, which were respectively named Mount Victoria and Albert were picked up. Despite his anxieties, Grey found time to examine the geological formations, which now possessed many remarkable traits, and the commingling of the flora of the south and north was clearly noticeable. Another river was discovered

some miles south of the Murchison and named the Hutt, after the distinguished brother of the then Governor. At this point were discovered very valuable traces of native occupation, and it appeared from the general surroundings as if some attempts had been made at primitive agriculture. The party now came into touch with

From "Eyre's Journals."

KANGAROO DANCE OF KING GEORGE SOUND NATIVES.

the natives, who evinced a hostile disposition, which added yet another to their many difficulties.

The leader deemed that it would be necessary to make forced marches to Perth, and sought to impress the perils of delay upon his companions. The provisions could not hold out, and their only hope was to make all haste. However, many of the others took the task very lightly, feeling sure that sufficient game would be encountered *en route* to supply their needs. Consequently they continually stopped and rested, greatly to the annoyance and dismay of the leader, and it was only with the greatest difficulty he enforced discipline. Many of the things the members of the party were carrying were of absolutely no value, and despite Grey's appeals they doggedly refused to lighten their loads. Another river was now discovered, which was named the

Bowes, and again they came upon traces of native occupation showing a certain advance on a primitive state.

On April 9 they came in view of a range of mountains, which Grey named the Victoria Range in honour of Her Majesty Queen Victoria, and struck with the extreme fertility of the soil he named the whole country the Province of Victoria. With Mr. Smith, who had now become his constant companion, the leader surveyed the prospect, and together they indulged in one of those imperialistic day-dreams so dear to Grey's heart. But time was growing very short for his companion, and a few weeks was to see the end of a most promising life under distressing circumstances. Another river was crossed which was named the Buller, and a watercourse near Mount Fairfax received the designation of the Chapman River. The men continued to straggle, due in no small measure to the useless loads with which they had encumbered themselves, and a search for the most recalcitrant member, who had been missed, led to the discovery of the Groenough River and the fertile flat country adjacent.

On April 9 the dried-up bed of a river was crossed, which was called the Irwin, after the Commandant of the troops at Swan River. Though Grey still persisted in his endeavours to force the marches, he was opposed by Dr. Walker, who on medical grounds differed from the leader. He addressed the whole of the party many times pressing upon them the immediate necessity for haste, but the majority decided in favour of slower marches and longer rests, taking the chances of the presence of sufficient native game to supply them with food. The distance covered each day was very slight, and Grey chafed under the delay. He did not wish to appear too severe, nor to abandon any member of the party, but he believed that their only hope lay in someone reaching Perth as soon as possible. The safety of the whole party was involved, and the conditions caused the leader many days of grave anxiety. Eventually he decided to divide the party in two, making the following division:—

No. 1.	No. 2.
Lieutenant Grey	Dr. Walker
Corporal Auger	Mr. Smith
Corporal Coles	Thomas Ruston
H. Wood	C. Wood
W. Hackney	T. Stiles
Kaiber.	A. Clotworthy.

On April 11 Grey started his forced march to Perth to secure relief, starting off on his long journey from a point a little to the northward of the Arrowsmith River, which he discovered on his tracks and named after Mr. John Arrowsmith, the distinguished geographer. When the first sight was gained of this watercourse the party had been without water for some hours, and it pushed on in the hope of gaining an ample supply, only to find

the bed of the stream dried up, and was thereby compelled to dig for the indispensable fluid. Moving on rapidly it came on a range of hills, the highest peak of which Grey named Mount Horner, after a friend, Leonard Horner.

On April 13 a well-defined range of hills was sighted, which was named after Gordon Gardiner, of the Colonial Office. The value of the aboriginal native increased, and it is hard to say whether or not the party would have succeeded in the difficult and toilsome journey without his assistance. In all things that made for success he was Grey's righthand man, and to his leading and knowledge of bushcraft it owed the satisfaction of its ultimate arrival in Perth. With keenness of vision, the outcome of a lifetime spent in the bush, he knew what shrubs were edible, and in the most unlikely places he found sufficient food for the party to maintain life; this, together with his invariable cheerfulness, was its main asset.

On the morning of the 14th he discovered a native storehouse, and the expedition was again saved from the pangs of dire hunger. A hawk shot by Grey proved a welcome addition to the larder, and on the 15th the party came to the dried-up bed of a river which the leader named the Smith, after a member of the expedition. The position was now one of extreme gravity. Huge waterless tracks were crossed under a broiling sun, and it was only the thought that the lives of all depended upon their exertions that buoyed them up on their toilsome journey and disposed them to make superhuman endeavours to reach their goal.

Just when it seemed as if human nature must succumb and human spirit could never surmount the difficulties still to be traversed, they met a party of friendly natives and learned the welcome tidings that they were within seven miles of the nearest settler. The settler was not at home, but they prepared a meal of frogs, and then slept more soundly than had been their lot for some time past. Leaving his companions early next morning Grey, accompanied by one of the friendly natives, pushed rapidly on to Perth, and five miles away came upon the hut of another settler just as the family was preparing for breakfast. The sight of the gaunt and haggard man so alarmed them that it was only with difficulty he could convince them of his identity. Grey sat down to the first good meal he had eaten for months, and whilst so engaged his famished and travel-worn companions appeared, and were hospitably entertained.

Proceeding at once to Perth, as he found he was now on the outskirts of the settlement, Grey called at the Governor's residence, who could scarcely recognize in the dilapidated and haggard wreck of humanity the explorer who had left Perth only a few months previously. After telling his story and recounting the difficulties they had experienced, no time was lost in

proceeding to relieve Dr. Walker's party, and many private expeditions started to scour the bush in hopes of picking up this remnant of the original expedition.

On April 23 Lieutenant Mortimer, of the 21st Regiment, with Mr. Spofforth and four soldiers, searched the country as far as the Moore River, but without finding traces of the explorers. Searching the bush to the northward Mr. Spofforth came upon Charles Wood, one of the party. This man had left the other members some days before, and as the search for the remaining five proved unavailing, they returned to Perth. The relieving expedition reached Perth on May 6, and on the 9th Surveyor-General Roe left the settlement, accompanied by Mr. Spofforth (who had volunteered his services), four men, and two native trackers, to discover if possible the whereabouts of those still remaining.

Two days after the party under Lieutenant Roe had left a gaunt, unkempt individual, horribly marked with sores and bruises, limped into Perth. It proved to be Dr. Walker, who, fearing that Grey had been lost and wildly anxious for the members of his own party, for whom he held himself more than personally liable, especially after the dispute on the method of procedure, had in the direst of plights pushed on alone. His sufferings were intense, and for some time both his life and reason hung in the balance.

To the wise provision that put the leadership of the relieving expedition under the experienced control of the Surveyor-General, the discovery and relief of the other party was mainly responsible. A consummate bushman, a noted tracker, and one firm and indomitable in courage and resolve, Roe was better equipped to undertake the duty than any man in the settlement. Noble-hearted and true, though stern and a strict disciplinarian, he was an example of the best type of naval officer. At once he moved rapidly northward on horseback, accompanied by native trackers of proved ability and tried endurance. Meanwhile the party left by Dr. Walker had toilsomely continued its southward journey, reduced by want of water and food to a terribly emaciated condition, so much so that it was miraculous how anyone survived the awful ordeal. At last, almost overcome by weakness, they committed the grave error of straggling, but they were now practically under no leadership, for Mr. Smith, who was nominally in charge, was more overcome by weakness than any. The history of their sufferings is gruesome reading, and they resorted to the most offensive actions, being now partially insane by reason of their awful agonies. Verily, they had suffered bitterly for their want of discipline and cohesion in the past.

The Surveyor-General scoured the country lying adjacent to the sea, feeling sure that they would not desert the only guiding-line they possessed, for none of them were experienced pilots for such a journey. At last

he was overjoyed to find the main body under a headland that jutted on the sea and round which in their weakened state they were unable to travel. Mr. Smith had been left behind, and it was utterly impossible to get any detailed account from the rescued men of the course they had taken. However, the determined Roe intended that not one should remain unrescued, and he pushed on northward. Not many miles further on he came upon Smith's body, wrapped in a blanket, quite dead, there being ample proof that he died from starvation. Amidst the deepest expressions of grief, the body was committed to its last resting-place, and out in the lonely Australian bush one of the first men to "blaze the track" in Western Australia sleeps, like many who were to follow him, in a forgotten grave. "It was a lonely place," says Roe, "and the red full orb of the setting sun seemed to linger on the horizon, as if to look for the last time on the remains of the explorer, and shed a stream of fire over the sea, which rolled with mournful, dirge-like sound on the strand close by." As the body was lowered into the grave amidst the tears of the relieving party, the solemn stillness of the bush was broken only by the painful howl of a wild dog. Bowed down with grief that he had not arrived a little sooner, Roe returned to the rescued men, and commenced his journey to Perth. At least he had the consolation of knowing that by his resource and coolness the bulk had been saved, and one can only say that he merited greater thanks than he received.

Grey expressed keen regret at the death of Mr. Smith, who was only eighteen years of age, and was thus far less inured to fatigue than the other members of the party. Though so young, he was animated by an intense sense of duty, and in the hour of actual danger cool and courageous. It was desired by many that the remains should be removed to Perth, but after mature consideration Grey decided to decline the proposal, preferring to allow the remains of his friend to rest close where he had died.

The results of the expedition were of immediate value to the Swan River Settlement, for it had demonstrated the value of the northern plains for pastoral and agricultural purposes. So out of evil had sprung good, for had the expedition hugged the coast, if all had gone well, and which was the original intention, much valuable information would have remained unrecorded.

At this time the death of Sir Richard Spencer (the Government Resident at King George Sound) having caused a vacancy in the colonial establishment, Governor Hutt offered the temporary appointment to Grey, who had been promoted Captain. The explorer accepted the position, filling in his spare time by extending his knowledge of the language and general characteristics of the natives, which work proved

of great benefit to the settlers. During the latter part of the year 1839 he received a letter of appreciation from the Secretary of State, speaking in terms of flattering

approbation of his efforts, and late in the year he relinquished his appointment and visited Adelaide, sailing for Home on April 11, 1840.

### CHAPTER III.

#### H.M.S. "BEAGLE," 1838-1841—MINOR EXPLORATIONS, 1837-1840.

Mention has already been made of the fact that H.M.S. "Beagle" had been commissioned in 1837 for the purpose of exploring and charting the coast of Australia, and her arrival off Port George the Fourth simultaneously almost with the return of Lieutenant Grey's first exploring party to the "Lynher."

The "Beagle" had arrived at Fremantle during the latter portion of the year 1837, and the officers were entertained by Sir James Stirling, who regretted that the explorer Lieutenant Grey had not come to Fremantle with the ship. After a short while spent in port the commander intended to sail on his mission of survey to the north-west, but was prevented by illness from accomplishing his design. However, the delay caused was made use of by Lieutenant (afterwards Admiral) Stokes, in making surveys and checking the soundings of Cockburn Sound and its approaches, a work of extreme value even to the present day.

The ship sailed from Fremantle on the morning of January 4, 1838, and anchored on the 16th in Roebuck Bay, about ten miles north-north-east of Cape Villaret. A party was at once landed to search for water, which proved unavailing, and the explorers returned to the ship, stating that they had interviewed several natives, all of whom were of larger stature than those previously seen. The general opinion had been expressed by Lieutenant Grey that perhaps the northern tribes of Western Australia had a strong intermingling of Malay strain, hence they possessed a more courageous nature than those met with south of Perth, or even immediately north of that place. The remarks of this party seemed to bear out this opinion, for one or two of lighter colour had been noticed who appeared to exercise a dominating influence over their fellows.

Having proved to their satisfaction that there was no inland water communication with Roebuck Bay the explorers coasted slowly northward, being totally unaware of the wealth of pearl shell under their keel. Very careful soundings were taken and the inland country was kept under observation, it being described as composed of immense plains dimly merging into the horizon. The navigators anchored in Beagle Bay, so named in honour of the ship.

At various points on the coast landings were made, and Lieutenant Stokes, upon whom the exploring work devolved, carried out his duties in a thorough and

extremely painstaking manner. The flora, fauna, and geographical features, and especially the appearance, customs, and habits of the natives, were especially set forth; together with this he corrected many navigating errors, so that his work on the north-west coast is not the least valuable of the memorials of an industrious life. At nearly every part of the coast touched upon natives were seen and many small encounters took place, as they were far more treacherous than those in the south, and far more bellicose. The native tracker and interpreter Miago, who accompanied the expedition, was very reluctant to hold converse with them, and preferred to give them a very wide berth. The flies were a veritable pest, and as in the case of Grey's expedition proved not only an inconvenience but an absolute physical annoyance, affecting the eyes of some of the members. Then, again, clouds of mosquitoes at evening rendered the work of exploration extremely tiring, as it was only with difficulty that rest was obtained.

Among other things discovered were a native raft, native sepulchres, and curious native huts and coverings, some of which Grey also drew attention to; in fact, the natives altogether appear to have advanced to a somewhat higher state of civilization than those in the south. The pastoral country discovered was of an excellent quality, and in many cases covered with a species of wild oats, which appeared to be indigenous to north-western Australia.

Much valuable information was gathered by the indefatigable efforts of Lieutenant Stokes, who with extreme methodical care collated it all for information of future parties. Many bays, inlets, and rivers were discovered and named. During March, 1838, the Fitzroy River was discovered and named, almost simultaneously with Grey's discovery of the Glenelg. In two boats the explorers ascended the stream, amidst magnificent scenery. An unbroken level was discovered, covered with high, strong, wiry grass, interspersed with numerous streams, depicting to them an ideal pastoral country. Native game was abundant, but the ubiquitous mosquito rendered life miserable, despite the glowing prospect. Proceeding up the river, they came upon a richly-wooded country, and the course, which had now become extremely tortuous, followed along a series of large lagoons. Lieutenant Stokes waxed almost poetical, and the scenery and circumstances of his visit—for, without

doubt, he was the first white man to view the land—had a great effect upon his mind. "Varied and undefined," he says, "were the thoughts called for at such a moment; the past, the present, and the future at once occupied and almost confounded the imagination; new feelings accompanied new perceptions; and gazing for the first time on a vast and unknown land, the mind, restless and active as the roving life by which it was informed, expanded for the reception of the crowded fancies called into life as by the magician's wand."

The "Beagle" sailed northward as far as Port George the Fourth, and on the morning of April 8 the quiet echoes of Hanover Bay were suddenly awakened by the report of four cannonades announcing the arrival of the ship at that port. It was soon in communication with the "Lynher," the schooner left by Lieutenant Grey at that point. The "Beagle" came to anchor in Port George the Fourth, and whilst engaged in taking in wood and water Lieut. Stokes set out to explore the coast between that port and Collier's Bay. On April 15 Grey returned, and a few days afterwards, on Lieut. Stokes rejoining the "Beagle," a collaboration of the information gained by both parties was made, and the proof of much valuable work, in the interests of the infant settlement, clearly demonstrated.

The "Beagle" returned to the Swan River early in January, 1840, and since leaving the settlement in 1838 the ship had performed many duties in the interest of Australian navigation generally. Much new information was collated, and many of the old charts corrected and verified. For some time during the year 1839 the ship had been engaged making a survey of the northern coast. In the progress of this expedition the Adelaide and Victoria Rivers were discovered, and after their careful exploration it was decided to sail round the north-west coast to the Swan River.

However, while engaged in exploration at Point Pearce, in the vicinity of the Victoria River, Stokes had the misfortune to be speared by a native. He was so seriously injured that the surgeon declined to allow the ship to proceed on her voyage, being very anxious as to

the effect of the motion of the vessel upon the sufferer. The incident almost closed the career of the heroic explorer. With others he had gone on shore to take observations, under the shelter of a high cliff, the summit of which was lightly wooded, when he was suddenly speared in the shoulder from the top of the precipice. The spear entered the cavity of the chest, and on being withdrawn by Stokes the wound bled most profusely. Seeing the effect of their action the blacks rapidly descended with ferocious yells to complete the work, and it appeared as if one more would be added to the number of that great "legion" who have made England's greatness. Fully expecting another spear, Stokes made for the boat as rapidly as his severe wound would allow, carrying the spear which he had withdrawn from his chest, but finding his strength failing fast. The other members of the party, not realizing that he was wounded

and seeing him hotly pursued, made to get the boat ready for instant launching. Recognizing that all hope seemed lost Stokes prepared to sell his life dearly, but fortunately the incident had been witnessed from the ship, and a boat was at once manned with an armed party under one of the officers. It ar-

rived just in the nick of time, and rescued the wounded officer and the men who were with him. On his removal to the ship the wound of Captain Stokes (since his first visit to Western Australia he had been gazetted to that rank) was found to be severe, but not necessarily fatal, for the muscles of the chest had prevented the weapon from penetrating the lungs, and he slowly recovered.

On arriving at Fremantle the officers of the "Beagle" first heard of the sufferings of Captain Grey in his terrible march from the north-west. Deep regret was expressed by all. The indomitable courage and clear-cut decision of that officer, combined with his unflinching cheerfulness under adverse circumstances, had made him beloved by those on board to whom he was so well known.

The "Beagle" arrived at Fremantle on January 31, 1840, and by the end of March the officers had completed a chart of Rottnest Island, and selected a point for the site of a lighthouse. Supplies being procurable at

EYRE'S ARRIVAL AT KING GEORGE SOUND. From "Eyre's Journals."

Fremantle and Perth, the vessel was re-vicealued for another cruise, and on April 4 set sail for the north-west, Captain Stokes being particularly desirous of undertaking a complete examination of the Abrolhos Islands. Two days later a line of breakers heralded the approach to the islands. With some little difficulty the party made a landing, and set out to explore the group. Stokes soon detected the presence of guano, but a number of years were yet to elapse before the fields were systematically worked, though its use as a fertilizer at this time would have been of great value. In fact, it was the report of this officer that suggested the testing of the deposits so many years later.

On a closer examination of the island, and on its south-west point, the beams of a large vessel were discovered, and as the crew of the "Zeewyk," lost in 1728, reported having seen the wreck of a ship on this part, Captain Stokes concluded that the remains were those of the "Batavia," Commodore Pelsart, lost in 1627. The explorer therefore named the temporary anchorage of the ship Batavia Road, and the whole group Pelsart Group. It was the wreck of the Dutch ship mentioned here that led to the discovery of this part of Australia, Pelsart himself having crossed from the islands to the mainland in search of water.

The ship now sailed to ascertain if a good harbour existed on the mainland adjacent to Moresby Range, as the report of the country in the vicinity made the presence of such and its proper survey of extreme importance. Eventually it came to anchor in what is now known as Champion Bay, naming it such in honour of the colonial schooner "Champion." This bay had previously been named Port Grey by the explorer of that name. The south-west point of its entrance was named Point Moore, in honour of the Advocate-General of that time, himself an explorer of no mean order. A plan of the bay was made, and Stokes drew a landscape sketch of the contour of the hills adjacent, regretting that time would not permit of his visiting the country praised so highly by Grey.

The explorers now returned to continue their examination of the Abrolhos Islands, and named Easter Group and Good Friday Harbour from the time of the year of this visit, and also Rat Island from the number of the vermin infesting it. On April 24, with Captain Wickham, Stokes landed on the largest island of the Pelsart Group, which they named Gun Island, from finding on it a small brass four-pounder of peculiar construction, containing a moveable chamber, which is now deposited in the United Service Museum. A number of glass bottles and pipes, and two Dutch doits, bearing dates of 1707 and 1720 respectively, were also discovered. Many other places were named by the party, including Zeewyk Passage, Middle Passage, East Wallaby Island, Pigeon Islands, Recruit Harbour (from finding on it

supplies of small kangaroos), West Wallaby Island, Flag Hill, North Island, Record Hill, and Slaughter Point.

The examination of the Abrolhos was extremely comprehensive, eliciting the fact that what had hitherto been considered one group was now proved to be three; whilst the soundings conclusively showed that the bottom was very similar to that of the Great Barrier Reef, the other side of the continent.

The Abrolhos were left on May 23, and the ship sailed slowly northward, until Depuch Island was reached on June 9. The greatest distance it was away from the coast of the mainland was 40 miles, and in the proximity of Shark Bay it was only 20 miles off. The stock of fresh water was now greatly depleted, and the river was sought after which was said to have been discovered on this island during Freycinet's voyage, but without result. By pure good fortune, however, a natural reservoir of good water was found, from which with extreme labour six tons were procured. On Depuch Island were found numerous drawings, most of far greater merit than those hitherto discovered. In regard to these drawings, Captain Stokes says:—"These savages of Australia, as we call them, who have adorned the rocks of Depuch Island with their drawings, have in one thing proved themselves superior to the Egyptian and the Etruscan, whose marks have elicited so much admiration and afforded food for so many speculations—namely, there is not in any one of them to be observed the slightest trace of indecency."

The neighbouring islands and waters were surveyed, Breaker and Oyster Inlets were named, and in July the "Beagle" went up to Timor. At Oyster Inlet a large pearl oyster shell was found near a native fire, but the explorer makes no comment on the discovery, which, considering the large pearling industry at present operating some distance further northward, is significant of the fact that its probable potential value did not strike him.

After supplies were obtained at Timor, the "Beagle" returned to the north-west coast at Dampier Archipelago, but the country was of such a dreary and sterile nature that it repelled the explorers. The work carried out, which consisted mainly of charting the waters on the coast, though very valuable, was deadly uninteresting. Several new species of fauna were discovered, as the ship in her slow progress down the coast allowed small exploring parties to visit the neighbouring islands and the mainland.

On September 27 the ship came to anchor in Gage Roads. Swan River was left on October 25, and after calling at King George Sound the "Beagle" sailed for Sydney.

A cursory inspection was again made of the north-west coast in 1841, and the ship, under the command of Captain Stokes, Captain Wickham having been

invalided home, anchored at Fremantle during November of that year. At this time there was much comment in Perth on the value of a map of Grey's exploration, published by Mr. Arrowsmith, the hydrographer, and also on the reports of the fertility of the country published by the Australind Company. Captain Stokes was requested to make another examination of Champion Bay or Port Grey, with which request he complied. Upon his return the "Beagle" again sailed for Sydney.

In April, 1843, the ship paid her final visit to Fremantle, and on this occasion the officers were presented with a letter of thanks from Governor Hutt and the Legislative Council testifying to the services they had rendered to the cause of exploration in Western Australia.

During the years 1837-1839 several minor journeys were made which, whilst not explorations in the truest sense of the term, served to open up new country for settlement. In 1837, from April 4 to 29, Sir James Stirling examined the country between Perth and Kojonup, proving the presence of a good quality of agricultural land. Between November 30 and December 15 of the same year Messrs. W. K. Shenton and Richard Dale made an excursion to the Collie and Brunswick Rivers. Sir James Stirling, who despite the cares and responsibilities of almost a patriarchal form of Government, again found time early in the year to examine the Vasse district.

Within a few weeks of the return of Captain Grey from his expedition in 1839, and after his report to the Governor had been made public, applications were made to the Government for permission to occupy the fertile district adjacent to the Hutt River, spoken of so highly by that explorer. These applications were not granted, as Governor Stirling felt that that part of the country had been insufficiently reported upon,

but he decided to send Captain Stokes on an expedition to Port Grey (afterwards renamed Champion Bay), to ascertain if there was a navigable entrance to the Hutt River. The voyage was made in the colonial schooner "Champion," and whilst the main object was unsuccessful, Mr. George Fletcher Moore, who accompanied it, found much that was desirable in the country in the vicinity of Champion Bay. The vessel left for the scene of the exploration during January, 1840, and before its return the Abrolhos Islands, so interesting to earlier settlers, were again examined. On the chart constructed by Captain Grey the Hutt was shown as a large river, but at the exact position as marked on his chart no trace of a large river could be found. The shore party which left the schooner for the purpose of this exploration had a rather embarrassing time with the natives, and it was only by Mr. Moore's sound judgment and cool common sense that it reached the boat without a conflict. However, despite the fact that no satisfactory evidence of the existence of the Hutt River could be demonstrated, Mr. Moore agreed with Captain Grey as to the value of the land, especially for pastoral purposes.

Again in 1840, from January 9 to 26, Mr. D. Dring in the "Champion" made a voyage from the Swan River to discover the mouth of the Hutt River, or an anchorage near it, but the river was not located.

From January 10 to 15 Mr. H. M. Ommaney, of the Survey Department, examined the Capel and Preston Rivers, and the Kojonup district was again visited in the same year by Mr. Hillman and Mr. William Nairn Clarke.

Another small expedition was undertaken in 1840 by a private party, under the leadership of Mr. John Scully, to further examine the country adjacent to the Moore River, when the Victoria Plains were discovered and named.

#### CHAPTER IV.

##### EDWARD JOHN EYRE, 1841.

Early in 1840 Captain Grey, on the completion of his labours in exploration in Western Australia, had called at Adelaide whilst *en route* for England, and with his optimistic view of all that prevailed in regard to Australia had pointed out to the Government of South Australia the necessity, in his opinion, of establishing an overland stock route from that State to Western Australia. The notes of Captain Grey were published in the South Australian Register of March 28, 1840. On the 30th of the same month a number of gentlemen, many of whom were owners of large pastoral properties, met together for the purpose of taking the matter into

consideration, and the result of the conference was the appointment of a committee to report on the best means of accomplishing the purpose. The circumstances of the case pointed out clearly that the man best adapted for the leadership of an exploring expedition—the stupendous task that was involved was yet hardly recognized—was Edward John Eyre, who had already clearly demonstrated his capacity for the work.

Edward John Eyre was the son of the Rev. Anthony Eyre, vicar of Homsea and Long Riston, Yorkshire. He was born on August 15, 1815, and therefore at the time he undertook his great task was barely twenty-six years

of age. He was educated at Louth and Sedleigh Grammar Schools, and in the year 1833, when only eighteen, emigrated to Sydney. He afterwards settled in South Australia, and in 1839 conducted an exploring expedition to the neighbourhood of Lake Torrens. A new race of explorers had now arisen, and foremost amongst them stands the name of Eyre. No history ever written contains a record of greater endurance and courage than will be found in the following pages, and yet that heroism commands a fame known but to few outside the confines of Australia.

Eyre had just returned from a visit to Western Australia, during which he had penetrated from Perth to King George Sound. On arrival at Adelaide he found the discussion relative to the overland expedition at its height. His previous expedition to the westward of the located and settled portions of South Australia had clearly proved to Eyre the futility of attempting to discover an available stock route to the Swan River, which proposal he considered to be impracticable, and all his influence was used to turn the endeavours of the committee to examining the country in the interior to the northward of the settlement at Adelaide. In this respect Eyre was successful, and considering that he had been in a measure responsible for the change of route he volunteered to undertake the leadership of such an expedition, at the same time stating that he was prepared to find one-third of the number of horses required and one-third of the expense attached thereto. The Governor, Lieutenant-Colonel George Gawler, took a keen interest in the proceedings, and was greatly concerned that the party, if sent out, should be as far as possible completely equipped to carry out the arduous duties it would be called upon to perform. With this in view he offered a subscription of £100 from the Government, together with a contribution of any two horses the explorer cared to select from those of the mounted police establishment of the colony. The colonial cutter, the "Waterwitch," was also offered to convey the heavy stores and equipment to the head of Spencer Gulf, and the labours of the land journey to that point being thereby considerably lessened, the offer was accepted. Meanwhile the balance of the money required to complete the equipment of the expedition was speedily raised by private subscription.

On June 18, 1840, the party was entertained at Government House by the Governor, the interest of the occasion being heightened by the presentation to Mr. Eyre of a Union Jack, which he was instructed to plant in the centre of Australia. After the entertainment the whole of the guests accompanied the exploring party on the first stage of the journey, only leaving them on the open bush being reached, which was but a few miles from Adelaide.

In outlining his plan to the committee, and in the various papers he had written on the subject, the

explorer stated his intention of following the Flinders Range northward to the centre of the continent. He, therefore, kept to his former track (traversed in 1839) for eight days, and after discovering and naming a pretty little watercourse, Crystal Brook, he reached Mount Brown and formed an encampment to await the arrival of the "Waterwitch," which was sighted within two days. The complement of the party was now full, and after sending one man back to Adelaide with the news to date it consisted of the following:—

Mr. Eyre,  
Mr. Scott (chief assistant),  
John Baxter (overseer),  
Corporal Coles, Royal Sappers and Miners (previously with Captain Grey),  
John Houston,  
R. McRobert,  
Neramberein }  
Cootachab } aboriginal boys.

It had thirteen horses and forty sheep, one two-horse and one three-horse dray, and the stores were calculated to last for about a three months' journey; in addition, a further supply was to be forwarded to the head of Spencer Gulf in the "Waterwitch," to await the arrival of the party in that neighbourhood.

On July 6 Eyre, accompanied by one of the native boys, on horseback, proceeded to reconnoitre Lake Torrens and the country north of the depot, leaving the bulk of the party in camp to rest the horses and enable the overseer to get up the supplies sent in the "Waterwitch" to Spencer Gulf. He arrived at Lake Torrens on the 9th, and ascertained that it was a basin of considerable magnitude, with a width varying from 15 to 20 miles and with a supposed length of from 40 to 50 miles. It was surrounded with an outer ridge of sand, covered with saline vegetation, and with encrustations of salt showing above the ground at intervals. Though of such magnitude it appeared to be shallow, and the explorer found it impossible to approach the water owing to the soft nature of the morass on its shores. However, there could be no doubt as to its saline character, as that portion of the dried bed exposed to view was covered with a layer of salt in a state of fine subdivision. No forage or sustenance of any kind could be discovered for the horses, and all water in the vicinity was proved to be extremely brackish. The country so far examined was of a very inhospitable nature, and Eyre was compelled to hurry away to the northward or else lose sight of the fact that his present journey was only of a reconnoitring nature, and undertaken mainly for the purpose of establishing an encampment for the rest of the party. After leaving the lake, many days were spent in examining the country still further northward. Its character seemed of a dull monotony, barren sandy plains formed the lower level, and the continuation of Flinders Range was composed

of flinty quartz and ironstone. However, this range, which he had previously deemed to extend well into the heart of the continent, was becoming more and more of a detached nature, whilst between its detachments long stony valleys now became visible, and the previous barrenness was only accentuated. The springs of fresh water that had existed amongst the hills were now becoming fewer in nature and smaller in extent. Pushing on rapidly he came upon a spot 90 miles to the northward of Mount Arden, where he decided to form his depot.

Returning to the main party, after an absence of sixteen days, he found its members safely encamped under Mount Arden, having carefully transported the supplies from the "Waterwitch" to that place. Sending notice to the Governor of occurrences up to date he ordered the cutter to return, and on July 24 he moved out to fulfil, if possible, the purposes of the expedition. After leaving Mount Arden the low, arid, sandy nature of the country between the hills and Lake Torrens compelled Eyre to follow a course close under the continuation of Flinders Range. The progress was slow, owing to the rough and rugged nature of the country and the difficulty of procuring water both for the travellers and the livestock with which they were encumbered, owing to the danger of starvation in the most barren and unproductive land. Gradually, as the party advanced, the hills, which had taken a pronounced easterly trend,

became less elevated, until they gradually ceased altogether, giving place to large stony outcrops interspersed with sand, which showed signs of recent inundation on a large scale. The plains were almost destitute of vegetation, the only herbage growing thereon being plants of a saline nature, and those but sparingly distributed. The plains were destitute of water, and the whole of the region presented an extremely dreary appearance. At the head of Flinders Range Eyre found that his previous conception of the extent of Torrens Lake was completely below the truth; and he now estimated it to extend for about 400 miles, almost from the head of Spencer Gulf, in the form of a horseshoe round Flinders Range, as it

were, encircling the base of the mountains. So far as could be ascertained the water of the lake was as salt as that of the sea, and the mud by which it was encircled rendered every attempt to cross it futile, and the whole region surrounding it, from the highest point of Flinders Range, presented a dreary and forbidding appearance. The explorer now found that he was hemmed in by a barrier impossible to pass with the limited means at his command. To proceed northward would necessitate a divergence either in an easterly or westerly direction, and considering he had now been three months away from Adelaide he decided to retrace his steps to Mount Arden and there consider the position.

Leaving Mount Arden, after deciding to try a westward course on the replenishment of his supplies, he travelled direct to Port Lincoln to procure the provisions he needed for the attempt. On reaching that port Eyre suffered great disappointment. Provisions were not to be obtained, and he took the only but extremely hazardous course of sending Mr. Scott to Adelaide for them in an open boat over a practically unknown sea. This journey alone can be recorded amongst and should find no unworthy place in the annals of daring deeds. On September 22 Mr. Scott returned in the "Waterwitch" with an abundant supply of stores and provisions, and the cutter was placed at the disposal of the explorer to co-operate with him along the coast westward. It was

EDWARD JOHN EYRE.

sent to Streaky Bay, and the party proceeded to that inlet by the land route previously discovered. Eyre well understood the extreme difficulty of his task at its very inception, the dense scrub adjacent to Streaky Bay being almost impassable at places. A passage had to be literally cut through the obstacle, and it was only by superhuman exertions that the party reached Fowler Bay. It had been previously decided to land the stores from the "Waterwitch" at this point, and as soon as this labour was completed the cutter was ordered to return to Denial Bay, and report again at Fowler Bay on December 11. The reason Eyre decided to keep the cutter so to speak "within hailing distance" was that in the

interval that should elapse before her return he would be able to discover something tangible about the intervening country, and thus report to the Governor his ultimate intention of attempting to cross overland to King George Sound.

During his attempt to round the head of the Great Australian Bight, the explorer lost three horses, and altogether the attempt occupied twenty-two days. After deep consideration the view was forced upon Eyre that it was utterly impossible to attempt his formidable task with a party of the numerical strength that he possessed, and he now determined to reduce it. He therefore requested the cutter to return to Adelaide with his report and a request for further assistance, at the same time returning all the party with the exception of Mr. Scott, the overseer, and the two native boys. In this report he outlined his intentions:—"When we have rounded the Bight, the country may perhaps alter its character so far as to enable me to prosecute the main objects of the expedition, that of examining the northern interior. Should such unfortunately not be the case, I shall endeavour to examine the line of coast as far as practicable towards King George Sound, occasionally radiating inland whenever circumstances may admit it."

After the cutter had left Eyre made another attempt to round the head of the Great Australian Bight, and the attempt was successful. Proceeding onwards for 50 miles, he reached the line of remarkable cliffs described by Flinders. The difficulties of this journey can hardly be portrayed, and the hardship endured by the horses was excessive, and wheeled transport was entirely out of the question. This decided the explorer to further reduce his party, and the only baggage to be taken to be such as could be conveniently carried on pack horses. To his great regret he had reluctantly to request Mr. Scott to return, greatly to that gentleman's dismay, and on the return of the cutter he sailed for Adelaide. The party was now augmented by the inclusion of a Western Australian native brought by the "Waterwitch," whose name was Wylie. This man had been brought from King George Sound by Eyre on his previous visit.

Deciding to rest his horses, and recruit their strength as far as possible for the terrible journey, Eyre remained at Fowler Bay for some weeks. On February 23, 1841, the small party prepared to start, but just as they were leaving the cutter was again sighted, and from it Mr. Scott disembarked in haste, gladdened that Eyre had not yet left the camp. He was the bearer of letters from the Governor, imploring the explorer to reconsider his decision, for to attempt to penetrate further westward in the light of his discoveries would be absolute madness. In the letters the Governor stated that the superhuman labours of the party up to that time were generally conceded, and he promised to assist him in trying again to

penetrate to the north by a more easterly route. To these pressing entreaties the explorer turned a deaf ear, and notwithstanding all that was written, determined to pursue his course, and on February 23 the devoted little band, to Mr. Scott's great dissatisfaction and regret, moved off on their terrible journey.

It can hardly be denied that the attempt was a rash one, and its value was not of great moment commercially, as events afterwards proved, but as an example of the sublime courage of the race it will stand for all time. The feat no doubt was of great value to geographical science. It forever placed beyond a doubt the fact that no great waterway existed bisecting Australia from north to south, and by Eyre's journey Australia, so far as the southern coast was concerned, had been traversed, practically, from east to west.

Burying a large quantity of stores at the depot at Fowler Bay, Eyre started on the first stage of the journey determined to succeed or perish in the attempt. The equipment consisted of ten horses, nine weeks' provisions, which included a few sheep. Hunger, thirst, and desolation reigned supreme, and when the journey to be traversed was for no less than 800 miles through an inhospitable bush, we can only raise our voices in the highest of praise to the sublime courage and endurance that could so calmly contemplate such a stupendous task unmoved.

On March 3 the explorers arrived at the head of the Bight, the sand having proved their greatest difficulty so far; but having taken the precaution to bring several barrels of water on their previous journey, they did not suffer from thirst. On March 7 they reached the last water with which they were acquainted, and Eyre set off, attended by one of the native boys, and driving the sheep slowly so that they could better withstand the long dry stages before them. For 110 miles they came upon no water for the sheep, and as the natives had previously informed them that for ten days' journey they would be waterless, it appeared as if their report had only been too true. Eyre left the sheep corralled in a hastily constructed yard, and hurried on to try and find some water. Again and again he was led to follow what appeared to be native tracks, only to find his efforts in vain, and overcome with fatigue he had to desist. The horses with him had now been several days without water, and their anguish was pitiable in the extreme. Early on the 11th he moved on as rapidly as circumstances would permit, and at last, seven miles ahead, saw a break in the formidable line of cliffs that skirted the seashore, and at this point they came on a well-defined native pathway. The road now led to low sandy country, and, rapidly digging, they came upon an abundance of water. Meanwhile Eyre was in great anguish of mind as to the fate of the remainder of the party, who were following on his track, and this was increased by the fact that at the present he

could do nothing to relieve their probable sufferings. The first streak of daylight next morning found them on the way to meet the other party, carrying three gallons of water. Upon passing a sandy valley they descried them filing along the cliffs above the valley. Both horses and men were found to be greatly fatigued, but on the whole they had got through better than had been anticipated, though they had been compelled to remove the loads from the pack horses 17 miles back. The sheep had broken out of the yard where they had been confined, but taking a backward course had been recovered by the overseer, and were left in charge of one of the native boys, who was slowly bringing them onward. By the evening the whole party was together again, and its pressing needs satisfied. In accomplishing the distance so far the horses had been without water for five days and the sheep for six days, and both had been almost wholly without food for the same time.

For six days they recruited at the wells they had dug, in the meantime sending back for the stores left by the overseer. The season of the year, practically the most trying of the South Australian summer, added to their many discomforts, and the heat during the time spent at the wells was so extreme that if they had had to encounter it on their journey through the waterless tract it is certain they would never have survived.

Before leaving Fowler Bay Eyre had been informed by the natives that two places existed where water was to be found, and as several native tracks were discovered leading westward, he naturally inferred that this was one of those mentioned, the other being further onward. This determined him to follow the course, and on March 18 the explorers moved on. At first they tried the beach, but it was too sandy, and so they again had recourse to the high ridges above the shore line. Several times they dug for water, but only to find that that which percolated through the sand was quite salt. Next day they made a long stage, and found abundance of dry grass, but no water. The horses were now too weak to proceed further on a questionable search for the life-giving fluid, and portion of the party hurried back to the sandy valley. Eyre remained with the baggage and livestock, and six pints of water. Their store of flour was reduced to 150 lb., and this was to supply five persons for the rest of the journey; but still, with indomitable fortitude, Eyre determined to proceed. The members of the party were beginning to feel the extreme privations to which they were subjected. Their sufferings were now intense, for they had been for seven days without water, having travelled 160 miles since that last discovered. On the seventh day it was found by digging in a likely valley. They now killed two of the remaining sheep, and Eyre decided to reduce the rations, being still determined to proceed, though the overseer begged him to reconsider his decision and return to Fowler Bay.

The travellers now began to suffer severely from the cold at night, no wood being obtainable to make a large fire, and to add to their many difficulties their supply of shot had almost run out. The long waterless stage through which they had passed was responsible for the death of several horses, and affairs were in a parlous state, as they were still 650 miles from King George Sound. The provisions with them would only last, even on short rations, for about three weeks, and the overseer again begged Eyre to return to Fowler Bay. The native boys deserted on the reduction of the rations, and the outlook could not have been worse. The last sheep was now killed in preparation for another journey, and the overseer went forward to examine the country for the advance. The news he brought back was extremely depressing, but the natives had returned to camp, finding that they could not exist on their own resources. No treachery on the part of the natives seems to have been apprehended, but nevertheless they were meditating an act of dastardly atrocity. On April 27 the party started again, and was unsuccessful in the search for water. On the evening of the 29th Eyre set out to bring in the horses, which showed a tendency to stray, and on his way returning to camp was startled by a gunshot. Thinking the overseer had fired it to attract his attention, Eyre hurried back to camp, being met by the native "Wylie" in a state of great distress of mind. Finding him too incoherent to explain what had happened, he was horrified on reaching the encampment to discover the overseer weltering in his blood, with a great hole in his chest. A glance explained the whole scene—the two natives were gone, and with them the bulk of the stores and most of the ammunition. Eyre's own description best fits the tragic occurrence. He says:—"The horrors of my situation glanced upon me. I was alone in the desert. The frightful, appalling truth glared upon me in such startling reality as almost to paralyze my mind. At the dead hour of night, with the fierce wind raging around me, in one of the most inhospitable wastes of Australia, I was left alone with one native boy. I could not rely upon his fidelity, for he was perhaps in league with the other two, who might be waiting to kill me. Three days had passed since we had found water, and it was very doubtful when we should find more. Six hundred miles of country had to be traversed before I could hope to find the slightest help or assistance, whilst I knew not a drop of water or an ounce of flour had been left by the murderers." The natives had decamped with the guns, and only a rifle, rendered useless by the lodgment of a ball in the barrel, and a pistol remained; and they had no cartridges to fit the latter. Obtaining possession of all the remaining arms, useless as they were, Eyre hurriedly returned, accompanied by the remaining native boy, to the horses, recognizing that if they got away no chance would remain of saving their lives. After

considerable search they were found, and Eyre stayed awake all night in watch over them. During this silent watch, insufficiently clad, Eyre reviewed the situation, and his own words are sufficient record of the intensity of his feeling:—"Suffering and distress had well-nigh overwhelmed me, and life seemed hardly worth the effort necessary to prolong it. Ages can never efface the horrors of this single night, nor the wealth of the world ever tempt me to go through similar ones again."

An examination of the state of the stores next morning showed that though bad, the robbery had not been quite so complete as was anticipated. Among the principal things carried off by the natives were the whole of the baked bread, amounting to 20 lb. weight, some mutton, tea, and sugar, the overseer's tobacco and pipes, a one-gallon keg full of water, some clothes, the two double-barrelled guns, some ammunition, and a few other articles. There were still left 40 lb. of flour, a little tea and sugar, and four gallons of water, besides the arms and ammunition Eyre had secured the evening before. A review of the situation convinced the explorer that owing to the weakened state of the horses only the barest necessities could now be carried, and he therefore had to discard the instruments and various specimens he had been able to collect on the journey. The ball obstructing the barrel of the rifle resisted all mechanical attempts to dislodge it, and as their lives depended upon this arm being placed in a serviceable condition, Eyre determined to melt the ball in the barrel. The effect of the heat dried the powder that had remained and ignited it, and the rifle went off, and the explorer narrowly escaped the bullet, which whizzed past his head. The rifle, however, was again serviceable, and Eyre reloaded it, feeling that unless surprised he was capable of accounting for the murderous natives should they attack him. The nature of the ground was so stony that it was found impossible to bury the murdered overseer, so wrapping a blanket round the still and silent form he left the melancholy scene. The native from King George Sound denied all complicity in the crime, but it was evident that he had been in a measure mixed up in the attempted robbery, in preventing the completion of which the overseer had lost his life. However, the other natives belonging to different tribes were now even a greater menace to him than even to Eyre. Proceeding onwards, in the afternoon of the next day they encountered the murderers, but all efforts of Eyre to parley with them were in vain. They attempted to get the native "Wylie" to follow with them, but without avail. Eyre up to this had been hopeful that they had made for Fowler Bay in the hope of rifling the stored provisions, and viewed with alarm their presence. Recognizing that their presence was a constant menace, he determined if they persisted in following to shoot the eldest of them. The natives, however, kept well without

range, and Eyre pushed rapidly on in the hope of distancing them, for being laden with their plunder they could not keep up with the horses, even in their weakened state. Slowly and laboriously they toiled on, the horses suffering severely, for they had now been seven days without water. The explorer was gladdened by coming across some banksia trees, being certain that they were now coming to a country more likely to contain permanent water. On the evening of the seventh day they came upon some native wells, containing the life-sustaining fluid, having crossed a waterless, stony tract of 150 miles. The fear of still being followed by the natives, and the constant dread of being surprised, continued to rob Eyre of proper rest, and he took extraordinary precautions for the safety of the party and its horses. Having come upon hilly country and passed the great cliffs of the Bight, Eyre considered that the ever-pressing fear of being unable to find water would soon be a thing of the past, and they decided to make a long rest. One of the jaded and weary horses was killed and its meat jerked for future transport. Every day they looked anxiously for the native boys, but no signs of them were seen. It was evident that they had either returned to Fowler Bay or perished. Proceeding on their journey on the 16th and 17th, and though both Eyre and the native boy were very sick, probably due to the diseased nature of the jerked horse-flesh, they still plodded wearily on. On the 18th they reached a nice, green, grassy spot, and were fortunate enough to kill a small kangaroo, the native making an enormous meal. He commenced by eating 1½ lb. of the horse-flesh and a little bread; he then ate the entrails, paunch, liver, lights, tail, and two hind legs of the kangaroo, finishing up with a dead penguin he had found on the beach. Thus for once, says Eyre, he admitted to the soft impeachment of being quite full.

The next morning was cold and showery, and they were compelled to turn in the direction of Point Malcolm, where they found excellent water, halting for the day after doing a stage of only five miles, so terribly were they weakened by illness and hardship. On the beach near Point Malcolm they found traces of Europeans, in initials and dates cut upon the ti-trees. These were "Ship 'Julian,' 1840," " 'Haws,' 1840," C.W., and some other letters which were not copied. For a few days they remained at Point Malcolm to recruit their strength, and were fortunate to find kangaroos fairly numerous, and the fishing yielded several meals. On the 26th they again took up the burden of their journey, making direct for Cape Arid, and thus cutting off Cape Pasley. On the first day out they covered about 20 miles, and camped in sight of some high stony rises, which Eyre named after Lord John Russell. Continuing their journey through fairly well-grassed country, most

of the running streams of which were distinctly brackish, they at last came on a fine fresh-water lake. The provisions were now getting low, and their luck with the native game not being so good as formerly, they were forced to eat some roots of an edible nature to keep away the ravages of actual starvation in all its hideousness. In fact, they began to live like savages, and in many ways Eyre despaired of being able to complete the stupendous task, but fortunately for them a totally unexpected relief was at hand. Moving off early on the morning of June 2, and crossing a small sandy ridge that obscured the sea from view, Eyre was surprised to see what he thought was a boat some distance out. Imagining the occupants to be either sealers or whalers, he hastily ignited a fire in the hope of attracting the attention of the crew, but was disappointed in his object. However, anxiously scanning the horizon in the hope of finding the vessel from which the boats had come, they descried the masts of a barque some six miles away. Hurriedly moving to the coast adjacent to where the

vessel was anchored they hailed from the shore, and in a few minutes Eyre had the unspeakable happiness of meeting civilized Europeans again. The ship proved to be the French whaler, the "Mississippi," and they were received with the greatest kindness and hospitality by Captain Rossiter, who commanded her.

To this wise dispensation of Providence in supplying aid at this critical moment, Eyre undoubtedly owes the fact that he completed his trip. On board the ship he was thoroughly restored to health and vigour, and the excellent rest afforded the horses made success almost assured, for though the country they had still to cross was rough in the extreme, it contained no waterless tracts such as had hitherto been passed. The hospitality of the whalers was accepted until June 14, and on that date Eyre continued his journey, with animals thoroughly restored and ample provisions and equipment. On the evening of June 30 they saw the hills behind King George Sound, but it took four days to get through the thick scrub and the watercourses that existed between.

On the evening of July 6 they reached King River, but encamped with the river between them and Albany. On the day following they entered the settlement, thus having completed their marvellous task.

At Albany the residents vied with each other in doing honour to the man whose courage and fortitude

From Forrest's "Explorations in Australia."

ATTACKED BY NATIVES AT WELD SPRINGS.

had carried him through an almost impossible journey. Indeed, for many months it had been generally accepted that the explorer had paid for his rashness with his life. After communicating with the Governor (Mr. Hutt) he embarked on the ship "Truelove" for Adelaide, and on July 26 arrived there, being received with boundless enthusiasm and welcomed as one risen from the grave.

## CHAPTER V.

### MINOR EXPLORATIONS, 1841-43—GREGORY, ROE, FITZGERALD, 1846-48.

The tide of exploration suffered no ebb as the years rolled on, and we find that several minor journeys were proposed and carried out in February, 1841, even when the fate of Eyre was still unknown and though many feared that the explorer had failed in his gigantic task.

Early in the year Mr. William Nairne Clark made a journey in a whaleboat from Albany to Deep River,

Nornalup Inlet, and Point d'Entrecasteaux, discovering immense jarrah and karri forests. The value of the discovery was clearly discernible by the explorer, and he comments at some length in his journal on the value to the settlement of these forests. During the journey Clark had exceptional opportunities of studying the state of the whaling industry, and pointed out clearly

in his report the danger of depleting to an inexcusable extent the schools that visited the south coast. He also forcibly commented on the fact that the whole of the whale fisheries were in the hands of the American whalers, stating that "upwards of 150 sail of 300 tons burden each were off the coast in the whaling season."

Several minor journeys were made in 1842, including a visit by the Governor, accompanied by the Surveyor-General (Mr. J. S. Roe) and Captain Stokes, to the settlement of Australind; and Mr. R. H. Bland traversed the country between the Vasse and Albany. In the same year Mr. E. W. Landor made an excursion to the south-east of Beverley and discovered some rich grazing country.

Persistent reports had been received from the natives that a large inland sea existed south-east of Beverley, and in 1843 Messrs. Landor and Lefroy made an attempt to locate it. Passing the headwaters of the Hotham and Williams Rivers they discovered some lakes, for the most part salt, but reported that they had failed to find favourable country of any large extent.

Notwithstanding the none too favourable report made by Captain Stokes, in reference to the patchy nature of the country on the coast adjacent to what is now the port of Geraldton, the colonists could not soon forget the glowing panegyrics of Captain Grey, and another expedition was fitted out to further examine and report on the country. Lieutenant Helpman in the colonial schooner "Champion" was despatched by the Governor (Mr. Hutt), accompanied by Mr. J. Harrison, a civil engineer, to take observations in the neighbourhood of Gantheaume Bay, some distance to the northward of Champion Bay, or Port Grey, with instructions to pay particular attention to the mouth of the Murchison River. The report of Captain Stokes was confirmed, but it was a pity that the possibilities of mineral wealth were not more definitely looked for.

In 1845 an assistant-surveyor (A. C. Gregory) made several journeys towards the south-west and southern districts, making an excursion down the Blackwood River, and a similar one to the east of Kojonup. In April of the following year the same officer traced the Gordon River. Later on in the same year, accompanied by his two brothers (Messrs. F. T. and C. Gregory), he made a somewhat more ambitious effort, visiting the salt lake region of what was then known as the interior. Starting from Bolgart Springs a large extent of swampy country was traversed and a range of granite hills discovered, which were supposed to be the watershed of the coast streams. Before returning he examined the head of the rivers mentioned by Grey, and at the head of one of them, the Irwin, he found a seam of coal. The seam was reported to be 6 ft. thick, and it was found at the base of a cliff 210 miles north of Fremantle and 40 miles inland, near the headwaters of the Irwin River. A party was sent to report on the discovery, under the charge of

Lieutenant Helpman, and the "would-be experts" pronounced the specimens submitted by this party as of exceeding high value.

On July 10, 1847, the Surveyor-General (Mr. Roe) examined the country in the vicinity of Champion Bay, and reported somewhat more favourably than those who had followed directly after Grey. The interest in exploration never flagged, and very soon after the return of the Surveyor-General, Mr. A. C. Gregory led a party, consisting of Messrs. L. Burges, Walcott, Bidart, and a soldier, on a voyage of discovery in the country contiguous to the Gascoyne River. About 1,500 miles were traversed, the party reaching a point 350 miles northward from Perth. The territory in the neighbourhood of the Murchison and adjacent small streams was closely examined, and found to consist of good pastoral country. The news proved very encouraging to the settlers of Perth, and many applications were received for pastoral leases. The discovery of what appeared to be a payable vein of galena also did much to augment popular interest in that portion of the State.

Another exploring expedition on a larger scale was now projected, and the temper of the settlers was such that failure in the past only encouraged them to greater efforts in the future. No State in the Australian Commonwealth has done more than Western Australia in this department of geographical and geological research. Though much had been done in a northerly and easterly direction, the great country in the south-east and towards the South Australian border was practically, with the exception of the slight light Eyre had thrown on the subject, an unknown land.

On September 14, 1848, the Surveyor-General (Lieutenant J. S. Roe), undertook a far more important expedition than he had hitherto attempted in the fields of exploration. Leaving Perth on September 14, 1848, he finally started from York in October for an examination of the country south of the most easterly settled districts. Roe's work in the past had been of such value to the settlement that it was the wisest of all measures that gave him the command of this expedition. Quiet, unassuming, cool, and at all times level-headed, he was not likely to be carried away by any momentary opinion of any nature, and the colonists felt that the value of any report would be increased tenfold if made by him. The course steered was south-by-east, and it was intended to proceed to Cape Riche through settled and semi-settled districts, and then make the final departure from that point. Besides the leader the party consisted of Messrs. Gregory and Ridley, Privates Lee and Buck of the 96th, and a native named "Bob." The instructions contained specific orders to search the country between Cape Riche and Russell Range, named by Eyre, and report on its mineral resources and geology generally, especially in regard to any coal-bearing strata that might

exist. No premonition in regard to the future mineral wealth that a succeeding generation was to find some hundred odd miles northward and eastward of their course seems to have entered the minds of those concerned. Yet Roe reached a point not many miles south of Norseman, and about equidistant between the Golden Mile at the Boulder and the southern coast. Cape Riche was reached without mishap, the party having during the journey examined new country and proved that at no inconsiderable distance south of York the pastoral country ceased and to the eastward the country appeared like a desert. The course followed by the expedition to Cape Riche passed in some parts through that portion of the State in which agricultural land of definite value is situated, though that to the eastward is still unproved. On the other hand, the sweeping assertions contained in several works of exploration as to the sterility of the land for agricultural purposes are hardly borne out by the proved facts of the present time.

On October 18 the expedition commenced the ascent of the Pallinup River. The stream was a fine one, and its nature had been previously reported upon by Eyre, as he had crossed it before entering Albany at the close of his famous journey. It flowed between red and white sandstone cliffs, and presented an awesome appearance. No traces of coal were found, though assiduous search was made in all directions. During the journey several good streams were crossed. Adjacent to the streams the land appeared extremely fertile, but away from them it rapidly gave place to sandy wastes, interspersed with tracts of good country for pastoral purposes. Following a branch of the main river in a north-easterly direction the aspect changed greatly, and the country presented a barren and sterile appearance. The water in the lakes met with on the north-easterly track became more and more brackish the further they proceeded, whilst the natural forage for the horses decreased to an alarming extent. By October 27 the explorers' anxiety had greatly increased, and though several very heavy rainstorms had been encountered it appeared as if they would be driven back through want of water for the animals. However, they now came upon a small sheet of fresh water, surrounded by a small area of well-grassed land, and next day were fortunate to come upon another, though of smaller extent, 14 miles further on. During the journey several well-marked geographical features were passed, and Roe named Mount Madden (after the Colonial Secretary), Mount Short (Bishop Short), Bremer Range (after a naval officer of that name), Mount Gordon, and Fitzgerald Peaks (after the Governor). On November 4 the party reached the last-named place in a state of exhaustion, having found extreme difficulty in locating water. It was almost with despair it embarked on a search at these mounts, but to the great joy of all both feed and water for the animals were found on their

n2

northern slopes. Here the party encamped for some days; the highest of the peaks had an altitude of over 1,000 ft., and from its summit was obtained an extensive view over the surrounding country. In every direction the almost impenetrable scrub and thicket were interspersed with salt lakes, and the prospect had but few pleasing features.

After leaving Fitzgerald Peaks on November 9 extreme difficulty was experienced in forcing a passage through the scrub, and even with forced marches the advance was very slow. At the end of the third day only 50 miles had been travelled. The condition had now become one of extreme danger, the country approximating very closely to that described by Eyre at the head of the Great Australian Bight. To proceed further eastward from that point appeared too rash for consideration, and the state of the horses made movement in any direction extremely slow. Fortunately the travellers came on a patch of good but rough grass, though water for the animals was unobtainable. Pushing onwards towards the southward in the direction of some high ground, which was afterwards named Mount Ridley, they found themselves involved in a terrible scrub, and their passage became increasingly difficult. During the night dew was collected on every article on which it was likely to be precipitated, and in the morning the wearied and thirsty animals on this scanty supply resumed their terrible journey. Great difficulty was experienced in restraining them in the neighbourhood of the salt lakes, and after being practically four days without water they again reached an oasis in this desert. Mount Ridley, on closer inspection, proved to be a huge mass of granite rising a sheer 800 ft., and at its foot they rested to recruit the horses, though the feed was poor and scanty. Some impression can be gained of the difficulties of the journey by the fact that again and again it was necessary to rest the horses after but short distances had been covered. The journey was resumed on November 18, and the Russell Range loomed on the horizon at a distance of about 50 miles. The country to be covered before these mountains could be reached vied with the worst yet traversed, and it was with very questionable feelings the explorers plunged into the scrub. However, though on the first day they were compelled to resort to digging for a supply of fresh water, for the next two days the country improved as they proceeded, and at several points they came upon small and shallow catchments of fresh water. The worst features of their journey had now been again encountered, and Roe almost despaired of being able to make Russell Range unless food and water were found for the horses, though they were within 20 miles, and it was only after extreme difficulty they reached their destination. Here food and water were abundant, and for several days the explorers recruited after their difficult and arduous journey. The capabilities of the range, however, proved anything but satisfactory, and pushing

on to the south they came to more pleasing country. From the eminence of Mount Rugged they saw but little hope of better country further eastward, and Lieutenant Roe determined to return to Cape Riche on a more southerly course than the outward journey, some miles to the northward of that of Eyre, who hugged the coast on his journey in 1841-42. The return journey proved far more satisfactory, and good tracts of country fit for settlement were discovered to the north of Esperance Bay. Several distinctive landmarks were discovered and named by the explorer, amongst them being Howick Hill, Mount Merivale, Mount Hawes, Gage River, Stokes Inlet, Young River, Mount Desmond, Eyre Range, Phillips River, Calham Inlet, Mount Bland, Fitzgerald River and Inlet, Gairdner River, and Gordon Inlet. The country adjacent was examined carefully for traces of coal. It will be remembered that at the outset one of the principal objects of the expedition was to discover payable coal seams, where the difficulties of the transport would not prove an insuperable bar to their utilization.

So far the expedition had passed through country that in the opinion of the leader was at its best totally unsuited for agricultural purposes. The dawn of science had just commenced, and no one could foretell the marvellous effect that it would have upon the first and greatest primary industry. Agriculture of that date was that which had been in vogue for centuries, and though Roe was one of the most enlightened men of his period he did not foresee the possibilities of the future. It is true that much of the country traversed will ever remain a barren and sterile waste, over which desolation will reign supreme, but, nevertheless, even after the short lapse of a little over half a century much that was then condemned is bringing forth fruitful and abundant harvests.

The search for coal continued, and on the Phillips River many traces of its existence were found, and on the Fitzgerald River extensive beds of the mineral were discovered. From the report of the leader, however, it would appear that he was a little dubious as to the value of the discovery, considering it to be a species of lignite or brown coal.

The travellers' steps were now definitely turned towards Cape Riche, and the journey compared very favourably with the outward, for up to the present they had found abundance of water. On an excursion to the coast, with a native boy as companion, Lieutenant Roe came upon the skeleton of a white man clothed in a few mouldering rags, proving to be that of one of three seamen who had deserted from an American whaler and essayed to make Albany along the coast. All that remained was a fitting commentary on the inexorable nature of the inhospitable Australian bush. Roe collected the remains and consigned them to the grave,

erecting a headstone of limestone to mark the last resting-place of the unfortunate sailor.

On February 2 the party returned to Perth. The result of the exploration was certainly of value to the State, and one can hardly agree with the conclusions drawn by a noted chronicler that "the more the land in Western Australia became known the worse its reputation became." In this expedition nearly 1,800 miles had been covered, and though much of the country will always be barren this does not apply to the whole. The timber country will ultimately prove an acquisition, and the time may come when the coal seams can be profitably worked, whilst a considerable tract is now under agriculture.

Mention has already been made of the discoveries on the Irwin River by the brothers Gregory and the mineral discoveries on the Murchison River. The latter discovery directed the attention of the public of the settlement to the great value attached to the presence of any mineral wealth which the then limited means would allow of easy transport to a safe sea harbour, and it was thought of paramount necessity that this discovery should be further investigated. With this end in view Governor Fitzgerald, who possessed a burning enthusiasm for the land over which he exercised the chief executive power, determined to personally investigate this latest discovery, and in December, 1848, accompanied by Mr. A. C. Gregory, Mr. Bland, and three soldiers of the 96th Regiment, he sailed for Champion Bay, with the intention of proceeding overland from that port. On December 7 they reached the point where Gregory had discovered the lead vein, which was traced for some considerable distance along the river bed. The outlook so far as could be ascertained was extremely good, and, immensely elated, the party set out on December 9 to return to Champion Bay. On reaching the Bowes River it was joined by a few natives, the numbers of which rapidly grew as the journey was continued, but as they appeared very friendly no danger was apprehended. Eventually, however, their disposition underwent a change from amity and goodwill to truculent animosity. Early next morning the explorers found themselves surrounded by armed and treacherous natives, who showed every desire to molest them. Finally, after indulging in stone throwing, one threatened Mr. Bland with a club, whilst another threw a spear at Mr. Gregory. Governor Fitzgerald immediately fired, killing the leader of the assailants. A shower of spears was the result, one of which penetrated the Governor's leg just above the knee. The natives showed fight, and it was only by keeping to the open ground and checking them with an occasional shot that the party escaped without further injury. Pushing on rapidly Champion Bay was reached the same day, and by sunset all were on board the vessel. The natives followed to the beach, and used every means to cajole the party on shore again. Two days later the

expedition reached Perth, where it was found that the Governor's wound was not very serious. Three natives were killed, but even though they were in this

exasperated state a mining party was soon on the spot, quite content to accept all the responsibility in regard to any troubles that might arise.

## CHAPTER VI.

### AUSTIN.

A break of something like a period of six years elapsed, after the return of Lieutenant Roe from his exploration of the south-eastern portion of Western Australia, before another expedition was projected. The gold discoveries in Victoria, culminating in the extremely rich deposits of that metal unearthed at Ballarat and Bendigo, and the principle of "the bird in the hand," led many adventurous spirits in Western Australia to try their luck at what had been demonstrated as a proved proposition, rather than waste health and substance in the hardships inseparable from exploration in the dry interior of their own State. In the light of the wonderful wealth to be discovered barely half a century later at Boulder, Kalgoorlie, and Coolgardie, the proverb, however, takes on a new meaning. In the opinion of those best able to judge, even at this time, it was thought not improbable that gold in payable quantities would yet be discovered in the Western Australian interior, where many quartz reefs were known to exist. The presence of mineral wealth, though of the baser metals, being now profitably worked on the site of the previous discovery of lead by Gregory, led the minds of the inhabitants to the need of exploring the quartz reefs for gold, especially as their geological features appeared to approximate to those from which the precious metal was being mined in Victoria.

The interest in the subject was not allowed to lapse, and eventually a party was equipped by the aid of Government subsidy and private subscription to ostensibly explore the country in the vicinity of

Cowcowing, which was reported to be fertile, but also in reality to see if any auriferous deposits could be located. Besides the leader, Mr. R. Austin (an assistant surveyor), this party consisted of nine men, one of whom was an aboriginal native. They were provided with twenty-seven horses and a four months' supply of provisions. The party left Perth on June 21, 1854, and proceeded to Bucklands, near Northam, whence on July 7 the journey

was continued into the unknown interior country. Steering a north-east course, the track led through a belt of elevated sandstone conglomerate on to extensive plains covered with casuarina. So far the stage had been an extremely dry one, the great disadvantage of Western Australian exploration, being again pro-

minent in this as in many other former efforts. Finding the country to the northward extremely unfavourable, Mr. Austin directed his course more eastward, and travelled over undulating country until he came to a salt lake of considerable extent, near which was found a spring of fresh water. At this stage the party was joined by a number of natives, who exhibited a perfectly friendly disposition towards its members. The journey was continued, and on July 16 the large salt lake of Cowcowing was reached. It was dry and covered with saline deposits and immense numbers of small shells. Moving due eastward from the lake, as the road to the northward was still blocked by unfavourable country, the progress of the party was considerably delayed by the want of water, necessitating in many cases the digging of wells for the daily supply. It was now clearly

From Forrest's "Explorations in Australia."  
PUBLIC WELCOME TO JOHN FORREST AT ADELAIDE.

demonstrated that the favourable view of the fertility of the country, which had mainly been gathered from the reports of the natives, was not altogether borne out by facts. However, the extremely unfavourable opinion come to by the leader does not hold good at the present day, as a somewhat considerable agricultural centre is at present in the vicinity of this spot. After consideration Mr. Austin was of the opinion that further exploration eastward was not desirable, and he decided to steer a north-east course. As it had been originally planned that two of the party should return from the lake to Perth with reports up to date, they were now detached, and, as can easily be imagined, those reports were not too favourable in their character. On August 6 a march forward was made on an almost direct northerly course, trending, if anything, a little to the eastward, and some formidable scrub country was speedily encountered which caused the progress to be slow and extremely difficult. In the opinion of the leader the country was absolutely valueless, and it was only with great difficulty that food and water were procured for the horses.

On August 20 the party camped in latitude  $28^{\circ} 43' 23''$  south and longitude  $118^{\circ} 38'$  east, thoroughly tired out, and somewhat dispirited by the toilsome and apparently valueless journey. A species of grass, hitherto unencountered, was here present, and the horses ate heartily. The feed, however, proved to be a species of *gastrolobium*, and extremely poisonous, so much so, indeed, that the horses became seriously affected and unable to proceed. Dividing the party, Mr. Austin proceeded to push on in the hope of discovering better country. Fortunately, 50 miles to the northward, he came upon fairly good country, free from the poison weed, which he named Recruit Flats, situated some 13 miles from an elevated range. The animals with the party were recruited, and in the interval Austin pushed on to the range, the highest point of which he named Mount Magnet. Determining to return to the depot where the sick horses had been left in charge of half the party, under Mr. Whitfield, he found on his arrival that seven horses were dead, and the rest in such a serious condition that he decided to abandon all but the most necessary stores and push on at once to Recruit Flats. Even with greatly reduced loads the progress was extremely slow, and three more horses were lost on the journey to the new camp. The position of the party was now very critical, entangled as it was in the scrub. After leaving Recruit Flats large patches of "poison weed" were occasionally encountered. The constant care of the horses had such a weakening effect upon the men that they begged the leader to abandon them and push on on foot. This course Austin wisely declined to pursue. Any other decision would have only brought about another of those tragedies of which the Australian bush has been only too prolific.

Before leaving on his attempt to reach Shark Bay, which now appeared to be the only possible course, Mr. Austin examined the country in the vicinity of Mount Magnet, and in his opinion desolation reigned supreme. In the light of future discoveries, it appears a great pity, considering the design of the expedition, that it did not include amongst its members a thoroughly qualified prospector. Owing to the large mortality amongst the horses, severe economy had to be observed in the matter of rations, but as the country abounded in a species of small kangaroo the outlook became a little more promising. On August 21 the explorers reached latitude  $27^{\circ} 43'$  and longitude  $118^{\circ}$ . Two more horses were lost by thirst and exhaustion just before they found a spring containing fresh water near a cave ornamented with native drawings. The prospect was now most dreary, and the chances of reaching Shark Bay most enigmatical. A fearful accident now marred the trip. The members of the party had fought steadily against the depression due to their toilsome journey, but their spirits could hardly recover from the shock of the misadventure. A member of the party, a comparative youth named Charles Farmer, whilst out shooting, shattered his arm by an accidental shot from his own gun. The circumstances were such that proper care could not be given, though every effort was made to relieve his fearful agony; unfortunately, however, tetanus supervened, and he died in agony a few days later. His body was consigned to the grave by his heartbroken companions, and out in the desolation of the Western Australian bush "he sleeps his last long sleep."

Misfortune now seemed to beset them on every side, for next day they lost one of their few remaining horses. Still their prospects of making Shark Bay became more hopeful, as the country did not present the same difficulties as they had encountered before. They now came to an elevated range, the highest point of which was named Mount Murchison, soon after coming upon the Murchison River. They were now many miles above any previous exploration of this river, but it was still a noble stream. Steadily pushing forward, they reached a point 110 miles from Shark Bay, but owing to want of water they were compelled to retrace their steps to a native well, a day's march in the rear. Again moving forward, but in a more westerly direction, they speedily were in trouble again, when they came providentially on a well, in country that gave no sign of its presence, which was surrounded by well-grassed land. At this point Mr. Austin decided to form a depot, and go on in advance of the party to choose a course for their further movement. On October 18 he again struck the Murchison River, only to find that the water it contained was extremely salt. Almost overwhelmed by fears as to the ultimate safety of the party, the leader pushed steadily forward, and eventually reached high ground containing

food and water in great abundance, which in heartfelt gratitude he named Mount Welcome. He at once returned to the party, which was moved forward as rapidly as possible to this desirable haven. Austin pushed forward to again determine the course of the expedition, and having found water to the westward he decided on that direction being maintained, and on October 29 the whole party reached a point 50 miles from Shark Bay, where a relief vessel awaited them. All baggage, except the barest necessities and the arms and the ammunition,

was now abandoned, and the party mounted the horses, reaching the Geraldine Mine in an exhausted state on November 20.

Though gold had not been actually discovered on the journey, the auriferous nature of the country had been closely observed by Mr. Austin, despite his many anxieties, and in his report he states that "the Murchison country had every appearance of being one of the finest goldfields in the world," a statement that time has in a measure proved.

## CHAPTER VII.

A. C. GREGORY, 1854-56—F. T. GREGORY AND S. TRIGG, 1857—F. T. GREGORY, 1858, 1861.

Early in 1854 a flattering proof of the value of his services to the cause of exploration was paid to Mr. A. C. Gregory, an assistant-surveyor in Western Australia. It had been decided by the Imperial Government to undertake a thorough exploration of Northern Australia, and in a despatch to Governor Fitzgerald in 1854 the Duke of Newcastle set out the complete design of the expedition. The Crimean War had in a measure prevented any definite action previously, and though the money (£5,000) for the purpose had already been voted, nothing had been undertaken. In his despatch the Secretary of State reviewed the possibilities of leadership of the expedition, and eventually the Imperial Government decided to offer the onerous position to Mr. A. C. Gregory, whose fitness for the task was universally admitted. After some hesitation, on the score of ill-health, Mr. Gregory decided to accept a position of such a distinctly flattering nature. Mr. Drummond, whose name ranks deservedly high amongst the earlier botanists of Australia, was offered that position, but reluctantly declined owing to his advanced age. The party was to start out from the eastern coast, and late in 1854 Mr. A. C. Gregory, with his brother, left for Sydney.

Eventually the party consisted of the following eighteen persons:—Commander, A. C. Gregory; second-in-command, H. C. Gregory; geologist, J. S. Wilson; artist and storekeeper, J. Baines; surgeon and naturalist, J. R. Elsey; botanist, F. von Mueller; collector and preserver, J. Flood; overseer, J. Phiffs; stockmen, etc., C.

Humphries, R. Bowman, C. Dean, J. Melville, W. Dawson, W. Shewell, W. Selby, S. Macdonald, H. Richards, J. Fahey. The livestock comprised fifty horses and 200 sheep. The provisions also were estimated on the basis

of an eighteen months' supply. On August 12, 1855, they weighed anchor and left Moreton Bay. Sailing through Torres Strait they encountered several difficulties, and decided to land the horses at Treachery Bay. Having transferred the stores to one of the vessels, the other departed for Singapore, and Mr. A. C. Gregory, accompanied by H. Gregory, Dr. Mueller, and seven men, landed with the horses. The other portion of the party was placed under the leadership of Mr. Wilson, who received instructions to sail up the Victoria River and establish a camp on the highest convenient position on that river. Gregory explored to the river without difficulty, and on his arrival found the vessel ashore in a dangerous position. However, she was got off in safety, and the expedition settled down to the serious work outlined in the instructions.

Gregory traced the Victoria River to its source, but was prevented from following his southerly course by an almost impassable desert, and fringing the northern edge of this eventually entered Western Australian territory. On February 21 he found, when fixing his position, that they were in that State, and Sturt's Creek was named after the distinguished explorer of that name, an elevated peak being named Mount Wittenoorn. Game on Sturt's Creek was found to be abundant, and for a time the party halted, being greatly refreshed after the experience of the desert.

AUGUSTUS CHARLES GREGORY.

Continuing the journey on March 5, 1856, a range of low hills was reached, the principal elevation of which was named Mount Wilson, in honour of the geologist attached to the party. The view from this low range was so dispiriting that he reluctantly decided not to continue his further exploration into Western Australia, but to direct his course to the northward.

At first sight it appears regrettable that Gregory did not continue his march into Western Australia, but the water had failed, and from the appearance of the country no rain seemed to have fallen for at least twelve months. Under these circumstances his decision that further advance was impracticable cannot be cavilled at. However, the explorations carried out in what is now known as the Northern Territory were of immense value to geographical science, and the great explorer returned to the eastern coast without serious mishap, having amply justified his position of leadership.

The next exploring expedition of any magnitude in Western Australia was undertaken by one of the brothers Gregory (Mr. F. T. Gregory), in conjunction with Mr. S. Trigg. It was always a moot point, since the expedition of Mr. Austin, whether or not the disastrous conditions under which that leader had laboured were not responsible for his somewhat severe strictures on the agricultural and pastoral possibilities of the country, and the journey of Messrs. Gregory and Trigg was undertaken mainly to gain further information on this debatable point.

The area covered by this journey comprised about 180 miles of the Murchison country, and the need of further exploration was amply demonstrated. Much of the country examined was traversed by Austin on his expedition in 1854, and the dissimilar conclusions of the two reports contain interesting features. Country described by the last-named explorer as desolate and barren and unfit for anything, if not proved in mineral wealth, was found to be exceedingly well grassed and highly valuable from a pastoral standpoint. Though many indifferent and scantily covered patches were crossed, nevertheless a route sufficiently well grassed to form a passage for travelling stock from the better portions of the interior was clearly proved. The great difficulty of passing any reliable opinion on any portion of the colony, and especially the tropical or sub-tropical areas, was only too conclusively shown, for much depended upon the time and season of the year. Thus areas which appeared barren and desolate to Austin, contained at the season when crossed by this expedition, many potential factors for the making of wealth. At an earlier stage of the history of exploration in the colony this peculiarity had received ample demonstration, for the verdant plains of Grey had gained but faint praise from Moore and Stokes.

The party returned by the north side of the

Murchison River, and the favourable opinion already conceived of the country was further enhanced. A large extent of good grassy land was found, extending for six and a half miles from the river bank and stretching westward for a considerable distance to within about 40 miles of the Geraldine Mine. The good land in all cases was flat, the soil a red loam, which when dry was very open. However, every tree, either living or dead, appeared to be infested with white ants. The country around Mount Murchison was described as being of an auriferous character, and altogether the expedition was of a very successful nature.

The following comparison between the two reports makes interesting reading, and is quoted as an example of the wide divergence of opinion that has many times existed between the views of travellers in exactly similar country in Western Australia:—"The striking difference there is between this account of the country on the Murchison and that given by Mr. Austin may be accounted for in several ways; first, Mr. Austin does not appear to have crossed, but skirted, the country intervening between Mount Welcome and Mount Murchison; but he describes the land about the latter as improving, and found water, while it was the feed and water at Mount Welcome which, in all probability, saved his party from perishing. The land on the north side, spoken of so favourably by Mr. Trigg, was not seen by Mr. Austin, and also his party was so exhausted that it was out of his power to diverge from a direct line in order to examine the nature of the country on either side; whereas Messrs. Gregory and Trigg made such an examination whenever any favourable appearance presented itself, and thus determined the quantity of valuable land for a distance of six or seven miles on each side of the river, and have thus been the means of conferring on the colony one of the greatest benefits it has received since the northern district was first opened by Mr. A. Gregory."

In consequence of the satisfactory results of the previous expedition to the Upper Murchison River, and the fact that the country had been thought eminently suitable for pastoral purposes, another was at once projected to collect more complete data and to locate clearly the exact position and area of each favourable run of country. For this purpose a number of settlers in the northern districts of Western Australia subscribed horses and equipment for a party to proceed still further to the east and north; and with the sanction of the Government the leadership was entrusted to Mr. F. T. Gregory.

The preliminary arrangements for this expedition were completed during March, 1856, and the heavy portion of the stores forwarded by sea to Champion Bay. The bulk of the cost of the expedition was borne by Messrs. W. and L. Burgess, Padbury, Willard, and D. McPherson, who also supplied many of the horses. The Government lent the services of Mr. F. T. Gregory and

an experienced chainman named Fairburn, besides the necessary tents, pack saddles, and general equipment, together with the scientific instruments and three horses.

Associated with Mr. Gregory were Mr. James B. Roe (second-in-command), and Messrs. W. Moore, C. Nairn, and Dugel (an aboriginal policeman).

Leaving Perth on March 26, Mr. Gregory picked up the various members of his party and reached Koobijawanna, the point of general rendezvous, on April 10. On April 14 he moved on to Yanganooka, passing the Geraldine Mine on the 16th, picking up some further equipment at this point. The party was exceedingly well found, having with it a sixty days' ration on a liberal scale, and every member was extremely well armed and furnished with a good supply of ammunition. The next eight days, from April 17 to 25, were occupied by the ascension of the Murchison River until its junction with the Impey, which was the highest point reached on the previous expedition. At this junction the bed of the Murchison River is over 1,000 ft. above the level of the sea, and though so high an altitude the plains were extremely well grassed, yet not so much so as on the previous visit, the want of rain being clearly demonstrated. Many careful bearings were taken of prominent landmarks, and the geographical work carried out by the leader led to the construction of a most reliable map. The game was very abundant, and the explorers found that much of the rations could be saved for any further contingency that might arise. Only one party of blacks had been observed, and it proved somewhat hostile in attitude, chasing the aboriginal Dugel into camp. Though no danger was anticipated, it was thought advisable to mount a sentry over the camp, an action which proved only too necessary, as after events clearly showed.

From this camp on April 26 the exploration of the unknown country really began, and the expedition followed the bank of the river in a north-easterly direction for 14 miles, until Mount Narriger, an elevated peak 1,688 ft. above the level of the sea, was reached. A few miles north of this spot they came upon a large tributary of the Murchison River. The bed of the main stream had now become more rocky, quartz dykes passing through it at many points, yielding a large supply of salt, sufficient to render the water undrinkable. To the eastward an elevated range was observed, the two main hills of which were named respectively Mount Matthew and Mount Hall. The main bed of the river was gradually rising, and at this stage of the journey was 1,240 ft. above sea level.

As the main object of the exploration was to explore the Gascoyne River, the party quitted the Murchison on a north-north-east course, which led for eight miles over a tolerably grassy plain, in some places open, but

in others thickly studded with acacia scrub. The plain appeared to extend to the horizon, only broken by one bold hill, which was named Mount Gould. The main Murchison flowed round its southern base, whilst a considerable tributary passed on its north-west side. The course was now changed to the north-west, and for two days the party marched across well-grassed plains, water being in abundance, and the crossing of several tributaries of the Murchison was safely negotiated. The limit of the plain was a stony ridge of no considerable elevation, but which proved to be the watershed between the Murchison and the Gascoyne. The country through which it had been travelling was so evenly and closely paved with small stones that it was given the characteristic name of the Macadam Plains. Crossing the watershed, the travellers descended the reverse slope, coming upon a river in a broad sandy channel, on which they camped. In general the features of the new country were tame, but a hill 20 miles to the northward was named Mount Gascoyne, and the summit of another range further westward Mount Puckford. Next morning the explorers steered a westward course, touching frequently upon the river upon which they had formed their camp, until it joined a large channel which eventually proved to be the main Gascoyne. A large sandstone range at this point was named the Lockyer Range, after Mr. Lockyer Burgess, who was one of the party. The course of the Gascoyne was now followed north-west, and the further the explorers went the wider the stream became. On the south bank was abundance of gum-trees and grass, which, however, did not seem to run far back. Rich flats, well grassed, were occasionally discovered, but the nearer they came to the coast the more the quality of the land deteriorated. During their course several prominent peaks covered with short herbage were discovered and named after members of the expedition or their friends. Thus Mount James was called after Mr. James Roe, and Mounts Samuel and Phillips received their names from those of a well-known Western Australian family.

On May 8 they came upon a native encampment; only a few of the men appeared to have returned from their day's hunting, but upwards of thirty women and children were present. These ran to the bed of the river to hide, immersing some of the children the more effectually to conceal them. The explorers had now an opportunity to discover the domestic economy of the aborigines. Around the fires, of which there were a considerable number, were ranged a number of wooden scoops capable of holding about 4 quarts. These scoops contained a variety of seeds and roots, the most plentiful being a species of grain gathered from a kind of wild wheat, which was very abundant on the alluvial flats. A few spears and kangaroo skins formed the rest of the equipment, which was left entirely as it was found.

However, they were to be paid a visit in return, for at about nine o'clock in the evening they were alarmed by the shouts of a large body of natives who were rapidly approaching, and it was found necessary to fire a charge of small shot at them, slightly wounding several before they would retire.

Resuming their journey next morning they followed the river bank, which now trended towards the south-west. The plains were getting larger in extent, and the timber more pronounced and of larger growth, the river receiving two large tributaries. The hills now began to disappear, the last one being named Mount Dalgety. Moving almost due west they came upon a large body of natives, with whom they established friendly relations; notwithstanding this, however, they did not relax their vigilance. During their course a large tributary to the main stream was discovered flowing from the northward, which was named the Lyons, and a range of hills over 1,200 ft. high was named the Kennedy Range in honour of the Governor of the colony.

On May 17, from an elevated position, they got their first sight of Shark Bay. Some time was spent in examining the country in the vicinity of the mouth of the Gascoyne, but on May 19 the party left on its northward journey, following the course of the Lyons River. On May 26 the expedition reached a well-defined ridge, the summit of which was named Mount Sandiman, and two days after came upon another elevation, which was called Mount Thomson. From this point, which caused a bifurcation in the river, they had an extensive view over well-grassed plains. The portion of the river taking a north-easterly course was called the Alma. A large mount seen in the distance, and estimated at over 3,000 ft. above sea level, was named Mount Augustus, in honour of a brother of the leader (Mr. A. C. Gregory), who was then conducting an exploration in what is now known as the Northern Territory. The expedition was continually on guard, owing to the truculence of the natives, and the members were by no means pleased to come upon strong evidences of native cannibalism, in finding the body of an aborigine that had been cooked, and upon which the teeth marks of the cannibals were only too evident. From Mount Augustus the explorers retraced their steps, reaching the Gascoyne River on June 7, having traversed magnificent grazing country. Continuing the journey they reached the residence of Mr. Burgess, on the Irwin River, on June 23. Here the financial part of the undertaking was adjusted, and the explorers rested until the end of the month. Mr. Gregory arrived in Perth on July 10, having been absent 107 days, during which period he had travelled over 2,000 miles.

In his report Mr. Gregory advised that the country should again be examined at another period of the year, when the conditions might not be so favourable. He

also pointed out that further exploration was necessary in the country adjacent to the coast, as on his route the difficulties and consequent cost of transport would be enormous, especially as the only port so far discovered was that of Champion Bay, at least 360 miles away. The thanks of the Legislative Council were passed to Mr. Gregory and the members of the expedition.

The great distress prevailing in the cotton manufacturing districts of England during the American Civil War directed the minds of the authorities in the Homeland to the value of the great colonial dependencies—especially those lying within the tropics—as probable producers of the raw material. The north-west coast of Australia had been favourably reported upon by Captain Grey in this respect, and subsequent explorers had also incidentally mentioned the matter. It was therefore proposed to establish a new colony in the north-west of Australia to carry out this object, and the presence of Mr. F. Gregory in England was utilized to further the project. The idea first formulated was that an expedition on a large scale should be fitted out to proceed direct to the north-west coast of Australia, accompanied by a large body of Asiatic labourers, and all the necessary machinery for the establishment of a colony. However, wiser counsels prevailed, mainly owing to the proposals and reports of Captain Roe, Surveyor-General of Western Australia, who advised thorough exploration as a preliminary to the suggestion for the foundation of a colony. For this purpose a grant of £2,000 was obtained from the English Government, to be augmented by an equal amount from the Western Australian treasury.

The leadership of this expedition was placed in the capable hands of Mr. F. Gregory, who collected a suitable outfit for the party in London, and early in 1861 proceeded to Western Australia to confer with the Governor and discuss the details of the expedition. Some delay was occasioned in passing the colonial vote for supplies, and the expedition did not leave Fremantle until April 23, 1861.

The exploring party, which embarked on board the "Dolphin," consisted of F. T. Gregory, commander; J. Turner, assistant and storekeeper; E. Brockman, W. S. Hall, and J. McCourt, assistants; and A. James, farrier. Supplies of flour, salt pork, dried beef, preserved meat, and groceries, sufficient for eight months, were provided for a party of nine. On arrival at Champion Bay the party was augmented by three volunteers—Messrs. J. Harding, M. Brown, and P. Walcott—the last named joining the party as a volunteer naturalist and botanist. On May 11 the "Dolphin" arrived at Nickol Bay, which was to form the base of the operations. Mr. Gregory proposed to proceed to the site of his former journey on the Lyons and Alma Rivers, and then move eastwards till longitude 120° was reached, if not further, and from

that point strive to connect with the Fitzroy River to the northward. It was not until May 25 that the party started on its journey, having been delayed by many vexatious accidents incidental to landing livestock and stores in an open roadstead.

The course was over an extensive grassy plain, containing a large number of small watercourses, one of the largest of which was named the Maitland, in honour of Mr. Maitland Brown, a member of the party. Moving westward the explorers continued their journey over

country of varying value, a good portion of which was desert land covered with spinifex, till in longitude 116° they came upon a river bed of considerable magnitude, which was named the Fortescue, after the Under-Secretary of State for the Colonies. On June 5, being in longitude 117°, they came upon a series of precipitous cliffs, through which the river flowed, and owing to their impassable nature were compelled to retrace their steps for a considerable distance. Some ten miles to the southward they descried a range of hills, and the leader decided to make for these in the hope that by crossing them the party

could move without the constant variation of the direction due to the tortuous course of the river. On reaching these hills the party camped for the night. They were named the Hamersley Range, in honour of Mr. Hamersley, a liberal supporter of the expedition.

So far the country traversed by the party presented very few favourable features. Sixty miles of poor pastoral country had been passed before the Fortescue was reached, and this stream had been traced for 70 miles through a hilly and stony country, and the plains just

before coming to the Hamersley Range were the only redeeming features. It was found impossible to cross the Hamersley Range, though the valleys were well grassed and luxuriant in vegetation, notwithstanding that the altitude was 2,000 ft. above the sea level. Despairing of finding a passage across the range, the leader took a north-west course, eventually striking the Fortescue River many miles above the point where he had parted from it previously. Four or five miles further on the river suddenly broke up into numerous channels

extending through fertile grassy country and forest land, becoming lost in an open plain, which extended to the base of the Hamersley Range. Another attempt to cross the range ended in failure, and it was only when the main channel of the Fortescue was again reached that it was found possible to negotiate the passage. The alluvial mud which coated the plains added greatly to their fertility, and a party of natives was found digging for edible roots which abounded. Some idea of the steepness and precipitous descent of the Hamersley Range can be gathered from the fact that a rock of a few tons' weight

YOUNG RIVER, NORTHERN KIMBERLEY.

which was accidentally started by Mr. Gregory bounded down the hill with a noise like thunder, nearly stampeding the horses in the valley below.

The course of the Fortescue through the hills was followed as far as circumstances would admit, but considerable detours had to be made, and several times there was difficulty in procuring water for the stock. On June 21 the horses had become so distressed and suffered so severely from sore feet that further advance without prolonged rest was impossible, and Mr. Gregory formed a depot

camp, while he proceeded to further explore the country between the range and the Lyons River. He therefore departed from the depot, accompanied by Messrs. Brown, Harding, and Brockman, with three pack-horses carrying eight days' provisions and 14 gallons of water. A river previously discovered near the depot camp had been named the Hardey, after a member of a well-known family of that name in Western Australia. The first four miles of the journey were on the grassy plains near to this river, when they came upon the channel of a large stream, too large for either the Lyons or the Alma, and which was named the Ashburton, after the President of the Royal Geographical Society. From the Ashburton the country to the southward became more rugged and mountainous, and being now almost upon the tropical line he named the hills Capricorn. From the summit of these hills there was a fine view, and away in the distance to the south they could see Mount Augustus, whilst portions of his former track were plainly visible. Having practically connected the present journey with his course in 1858 the leader returned to the depot camp, taking a more easterly direction for this journey, arriving at the camp during the afternoon of June 29. The next day, being Sunday, was observed as a "day of rest" by the party, and it is significant of this expedition that where possible every Sabbath Day was rigidly observed.

On July 1 Gregory ascertained that the horses had greatly benefited by their nine days' rest, and if stores had been available he would have returned to the Ashburton and traced that river to the south-east, but it was absolutely necessary to return to the base and refit the whole of the horses. On the return journey he named a peak near the Hamersley Range, Mount Samson. Mount Bruce, which Mr. Gregory estimated to be 4,000 ft. high, was named after the officer commanding the troops in Western Australia. Travelling at a rapid pace on an average north-east course, the explorer estimated that the country passed over could not have contained less than 200,000 acres of excellent pastoral land. In regard to its further capabilities, he says:—"This tract of country I imagine is well suited for the growth of either cotton or sugar, as it is apparently well irrigated in the summer months, and the soil is remarkably rich and strong."

When the party reached the sea the members found themselves 40 miles from Nickol Bay, and as it was very doubtful whether water could be procured in that distance Gregory determined on following up a leading valley of the Maitland. In the event of not finding water he intended to pass in the rear of Cape Lambert, and so return to the outward track. However, water was found within 18 miles of the camp, and after a desperate push through stony country he reached the depot, with the horses in a distressing and almost hoofless state, on July 19.

Ten days were now employed in treating the injuries to the horses and refitting them with shoes, during which time Gregory made a survey of the adjacent coast. Eventually, the refitment having been completed on July 29, the explorers left camp for the second part of the journey, with provisions for eighty-seven days. Turning from their old track, on the third day they came upon a stream of permanent water, which they named the Harding, after a member of the party. The Sherlock River was soon picked up, and the explorer comments on the fine stretch of arable land in the vicinity. In the east-south-east they discovered and named the Yule River, which they ascended for two days. The country was grassy and well watered, but extremely rocky, and they came upon several large pools teeming with waterfowl and the centre of most valuable land. The way now lay through hilly country. During the journey they came upon and named the Shelley River, a small tributary of this river contained a fish very similar to the herring, and a romantic glen on its banks was called Glen Herring. Six miles further on, in a north-east direction, they came upon the channel of a fine stream which despite the season still contained water. This stream was named the Shaw, and some plains to the southward were named Norton Plains, after the Secretary of the Royal Geographical Society. After following a tributary of the Shaw River they came upon and named the DeGrey River, after the earl of that name, who had evinced a lively interest in the inception of the expedition. Leaving the grassy plains they went further east and named the Oakover River, a tributary of the DeGrey.

The arduous nature of the journey began to tell very severely upon the horses, and the party advanced down the channel of the river, coming upon good country and abundant game. It was now decided to give the horses a short rest before pursuing their journey to the eastward. After leaving the Oakover on their easterly course they came upon desert lands, over which utter desolation remained supreme. The desert at first essay proved well-nigh impassable, and the expedition was compelled to fall back to its previous camp, owing to the absence of water. At this point Gregory determined to form a depot, leaving five members of the party, with instructions to fall back on to the main stream of the Oakover after three days, whilst with two companions and six horses he would try to discover a practicable route across the desert. The advance party suffered severely from exposure without water to an almost tropical sun, and that was reflected in a ten-fold degree upon the horses, two of which succumbed in the second day's march. Nothing now remained but to make a desperate attempt to reach the depot camp before that party had carried out its instructions and returned to the Oakover River. In direst need Mr.

Maitland Brown was detached to push on with all speed to the depot, whilst Gregory, now almost exhausted, followed on with the other companion. Brown, who was exceptionally enduring, soon got far ahead, and rapidly got rid of his equipment to allow of his attaining his object, for if those at the depot had left for the Oakover before his arrival the party would have perished of thirst. Fortunately Brown was successful, and the party reached the depot in a thoroughly broken-down condition. Gregory reluctantly abandoned the attempt to cross the desert, being assured that a land of plenty lay beyond it, but with the means at his disposal it would have been utter madness to again essay the task. The furthest point reached to the eastward was Mount Macpherson.

The return journey was now undertaken, and the party reached Nickol Bay in safety on October 17, finding the "Dolphin" at anchor there. The crew of the vessel had not been idle during the absence of the explorers, and a fine bed of pearl-oysters had been discovered and cursorily worked, several tons of pearl-shell and some small pearls of varying sizes and values being

brought to the surface. On October 23, having shipped the stores, horses, and general impedimenta of the party, the "Dolphin" weighed anchor and sailed for Fremantle, arriving at that port on November 9.

During the tour the party had covered over 2,000 miles of country, and the explorer estimated that 3,000,000 acres were fit for grazing land and 200,000 acres for closer agriculture, the greater portion of the latter being on the banks of the various rivers. The fitness of the district for the growth of cereals the leader considered to be somewhat doubtful, but considered that it would, at any rate, produce enough to supply a numerous population. However, he considered its capabilities in regard to the growth of cotton excellent, and considered that it would be in nowise inferior to that grown in Egypt. No traces of minerals, except iron, were discovered—a significant fact when we consider that part of the country traversed is now known as the Pilbara goldfield, the present township of Pilbara being in the proximity of the Gale River, whilst the mineral district of Marble Bar lies between the Shaw and DeGrey Rivers.

## CHAPTER VIII.

### MINOR EXPLORATIONS, 1861-1866—SIR JOHN FORREST, 1869-1870.

For the next few years explorations were carried out on a small scale, but, nevertheless, in many instances these were of exceeding value in confirming previous expressions in regard to various portions of the State.

From July 3 to August 23 Messrs. B. D. Clarkson, C. E. and A. Dempster, and C. Harper were engaged in exploring the country east of Northam, and successfully penetrated the dense scrub and salt-lake country previously supposed to be impassable. They reached Mount Kennedy and traversed a great portion of the district which now forms the Yilgarn Goldfield. Georgina Range was the furthest point reached, and here the country had considerably improved, the soil being rich and the grass excellent.

In July of this year, and in June, 1865, Captain E. A. Delisser, a squatter, made excursions from Fowler Bay, in South Australia, into the south-east corner of this colony. He went in a north-west direction from the head of the Bight, and after suffering somewhat from want of water reached a district covered with grass and saltbush, which he described as excellent for grazing purposes. His opinion of this district has since been confirmed by Mr. A. Mason and other travellers.

In 1863 Messrs. C. C. Hunt and Ridley landed at the DeGrey River and explored the country touched on by Mr. F. T. Gregory.

In the same year, from May 7 to July 31, Mr. Henry Maxwell Lefroy was in charge of an expedition organized for the purpose of exploring the district east of York and discovering country suitable for sheep-farming. It was partially successful in its object, as it enabled the leader to report the existence of good land for agricultural purposes. Lefroy said, however, that no settlement could take place till wells had been sunk, owing to the absence of surface water. He traversed a large portion of the present Coolgardie goldfields, and reached 122° 3' east longitude.

In 1864, on July 5, Messrs. B. D. Clarkson, Chas. Harper, and L. Lukin left Doodlakine, about 110 miles east by south of Toodyay, for the purpose of discovering pastoral lands to the north and east. They encountered country somewhat similar to that met with in 1861, and having reached latitude 30° 13' south, longitude 120° 20' east, without finding it at all suitable, they returned, reaching their starting point on August 18.

In the same year Mr. C. C. Hunt left York on July 10 for the purpose of exploring the country to the eastward. His trip is of importance, as he passed over the present site of Coolgardie, and reached longitude 121° 55' east (in the vicinity of the Hampton Plains). Owing to want of water he was compelled to return to the neighbourhood of Lake Lefroy, but reported that the land

further out was much better than that nearer York. This journey of 400 miles was made between the thirty-first and thirty-second parallels of latitude, and its result was disappointing. Mr. Hunt, two years afterwards, made an almost similar trip to the Hampton Plains.

From September 12 to 27 Mr. A. Dempster made a trip from the Gage River, near Esperance, to the Dundas Hills *via* Fitzgerald Peaks, and reported that a stock route to the north could be opened without much difficulty. In November of the same year Mr. E. T. Hooley failed to find one between Champion Bay and the Gascoyne. During this year, also, Mr. Robert Austin visited the Glenelg River, and reported favourably on the country in its vicinity.

About the year 1865 Mr. Trevarton C. Sholl made an exploration to the south of Camden Harbour. In this journey he visited the Glenelg Basin, ascended and named Mount Page, discovered the Berkelman River, crossed the Harding Range in the face of almost insuperable difficulties, and reported a large tract of good pastoral country.

In 1866, from January 10 to February 28, Assistant-Surveyor James Cowle explored the country between Roebuck Bay and Port Walcott, and reported 3,000,000 acres of country known to be fit for grazing purposes, and improving considerably inland from the coast.

In this year also (April 16 to November 10) Mr. E. T. Hooley made a more successful attempt to open up a stock route to the north-west, journeying as he did in safety from Champion Bay to Port Walcott and back. During the year (1866) Mr. R. J. Sholl and his son, Mr. Trevarton C. Sholl, were responsible for the conduct of several expeditions from Roebourne to examine the country lying around the headwaters of the Harding, Ashburton, Sherlock, and Fortescue Rivers. They were successful in demonstrating the suitability of the land for pastoral purposes, and opening up this practically unknown district for settlement.

On May 6, 1866, Mr. J. Logue sent out a party from Camden Harbour, under the leadership of Mr. A. McRae, for the purpose of exploring the country southward. On the 10th, after crossing well-grassed level plains (in places the grass being so strong that the horses had as much as they could do to wade through it) they reached a river. They found it a fine stream, 150 yards wide, running north by west. The banks were about 20 ft. high, and the current ran about two miles per hour. The next day they saw fifteen or twenty natives burning the grass for pigeons' eggs. The aborigines were unarmed; they were very much alarmed, and tried to hide themselves in the long grass. The party started on the return trip that afternoon, and reached Camden Harbour on the 16th. Mr. McRae reported that "the country possessed all the advantages of a good sheep country, except that it was low, and perhaps too far north. The

principal timber was the white and flooded gum and two kinds of wattle; the baobab also grew in great luxuriance."

Early in 1860 Dr. von Mueller, a botanist whose name will ever be inseparably associated with the highest and best in plant lore throughout Australia, communicated with the Western Australian Government with regard to Dr. Leichhardt, whose fate was still a mystery. From time to time endeavours had been made to clear up the circumstances of the last journey of the explorer, but without any tangible result. Information had been received from native sources that twenty years before, a date synchronizing with the last appearance of the lost explorer, a party of white men had been murdered at a point eastward in Western Australia. However, little credence had been placed on the stories, as the aboriginal in Australia is not renowned for his truthful attributes. Therefore, it was not until Mr. J. H. Monger had been informed by his native guide, when on a journey some miles eastward of any previous route, that he was at the position of the murder, that any great notice was taken of the native communications. The native guide mentioned gave such a circumstantial account of the whole occurrence, that far greater credence was placed in the story than had been the fate of those hitherto narrated.

With such confirmation it was decided to accept the offer of Dr. von Mueller to lead an expedition, and Mr. John Forrest, an officer of the Survey Department (afterwards Sir John Forrest, a name now redolent of all that stands for patriotism and honesty of purpose throughout the length and breadth of Australia), was offered the position of second in command of the expedition; but on the inability of Dr. von Mueller to carry out the work the sole command was delegated to him. The letter of instructions received by Mr. Forrest was drawn up by the Surveyor-General (the Hon. Captain Roe, R.N., an explorer of more than usual courage and resource), and contained explicit information and orders for the guidance of the expedition. The party, which consisted of six persons, was extremely well found and strongly armed. It was composed of Mr. George Monger (second in command), Mr. Malcolm Hamersley (third member), a farrier and a blacksmith, and two reliable natives, Tommy Windich and Jemmy, who had already acquired considerable experience with former explorers. Saddle horses were provided for all the members, and pack horses for transport, whilst a three-horse cart was to accompany the expedition as far as the nature of the country would permit.

The route laid down was to commence at Newcastle, where several members of the party were to be picked up and some of the horses obtained. The expedition from that point was ordered to proceed in a north-easterly direction to Goomalling, and thence 100 miles further in the same direction, passing eastward

of Mounts Chunbaren and Kenneth, discovered by Mr. Austin, in fact until the north-easterly limit of the journey of that explorer had been reached. The further course was to be dictated by circumstances and governed by the information of the native guides with regard to the locality where they had reported the bones of the missing white men. Further instructions contained the method of procedure to be adopted by the party on the discovery of the bones, and the conditions which were to govern its members in their attitude towards the natives in the vicinity. After attempting to trace the previous course of Leichhardt the party was to attempt to explore the surrounding country as far as the circumstances and provisions would permit. In the interests of science Forrest was required to make and preserve such specimens in natural history (especially in the departments of botany, geology, and zoology) as might be of economic use to the settlement. The long letter of instructions was expressly stated to be considered in no way a reflection on the capacity and initiative of the youthful explorer, but only to be taken as for general guidance of the expedition. On April 15, 1869, the journey was commenced, and

the leader was well supplied with scientific instruments, so that the daily position could be accurately ascertained. The provisions, which were considered ample, consisted of 800 lb. of flour, 270 lb. of pork, 135 lb. of sugar, and 17 lb. of tea; whilst each member carried two spare suits of clothes. On the 17th Newcastle was reached, at which point the services of a teamster and a three-horse cart were obtained, bringing the total number of horses up to sixteen. On the afternoon of the 20th Goomalling was reached, and preparations were at once begun to make ready for the real purpose of the expedition. On the 21st the journey was resumed, and on the 23rd the teamster and cart returned to Goomalling. By the 26th the party had reached Yarraging, the furthest station to the eastward, belonging to Messrs. Ward & Adams, where they bivouaced for the night. Some natives were

procured from the station, and with ten pack- and six riding-horses the party left next morning on a bearing N., 320° E. mag., which course was kept for eight miles. Still maintaining a north-easterly direction the party suffered from want of water for the next two days, but on reaching Danjinning, discovered by Austin in 1854, it came upon a native well which yielded an abundant supply. The next day being Sunday Divine service was held, and the party rested, resuming the journey on Monday, May 3, reaching Mount Churchman on the 5th. On the evening of that day it was joined by a party of nine natives (friends of the native Jemmy), who stated to Mr. Forrest that a long time before a party of white men and horses had died at a place called Bonincabbajibimar, also that a gun and number of other articles were there, and they volunteered to accompany

the leader to the spot. Forrest, however, was inclined to the belief that the horses mentioned by the natives were the remains of those which succumbed to the poison plant during the journey of Mr. Austin, and when from the story was eliminated the presence of human remains he became practically certain of his conjecture being true. This was

BOTTLE TREE ON FORREST RIVER.

found to be correct on the 12th. Another party of natives was encountered, who told him that only the bones of horses were to be found at the place mentioned. On the other hand Jemmy, the aboriginal native, persisted that the remains of white men were to be found at Noondie, and Mr. Forrest, on the 13th inst., pushed on to the locality. On the morning of the 18th a branch of a large, dry salt lake which stretched eastward was crossed, but continuing the journey he came upon the main lake, and experienced much difficulty in crossing, eventually bringing up at an island. The nature of the bed of the lake proving so bad for travelling, and no water being obtainable, the loads were left on the island, and the explorers were compelled to retrace their steps to where they first entered, and were very fortunate to discover feed and water about 3 miles away.

found to be correct on the 12th. Another party of natives was encountered, who told him that only the bones of horses were to be found at the place mentioned. On the other hand Jemmy, the aboriginal native, persisted that the remains of white men were to be found at Noondie, and Mr. Forrest, on the 13th inst., pushed on to the locality. On the morning of the 18th a branch of a large, dry salt lake which stretched eastward was crossed, but continuing the journey he came upon the main lake, and experienced much difficulty in crossing, eventually bringing up at an island. The nature of the bed of the lake proving so bad for travelling, and no water being obtainable, the loads were left on the island, and the explorers were compelled to retrace their steps to where they first entered, and were very fortunate to discover feed and water about 3 miles away.

The bed of the lake was covered with a deep layer of saline mud to the extent of about 4 ft., and it was only by almost superhuman exertions that the loads were recovered and brought to shore.

On May 22 Mr. Forrest attempted to get into communication with some natives known to be in the vicinity, but without success, and on the 23rd, attended by the two aboriginals attached to the party, he decided to track them to their camping-place. However, the natives were twelve hours in advance of the party and travelling at a rapid rate, and it was found impossible to overtake them. On the evening of the 24th the party camped at a place which bore the native name of Wooling, and from it saw a mountain in a north-north-east direction, distant about 20 miles, which the leader named Mount Elain. From Yeadie, on the 25th inst., Mr. Forrest had a splendid view of the lake they had been following for over 40 miles, which was named Lake Barlee, after the Colonial Secretary of Western Australia. On May 29 he reached the summit of a high hill, supposed by the aboriginals of the party to be Noondie, which Mr. Forrest named Mount Alexander. The story told by the natives in regard to the remains of white men proved so contradictory that no further credence was placed upon it, and after an exhaustive search in the neighbourhood where the aboriginals had led them to believe that they would find the remains of the white men, the leader determined to abandon that portion of his work and carry out the latter part of his instructions. After considering the whole proposition Mr. Forrest determined to penetrate as far eastward as possible, and on June 18 he set forth to carry out this part of his programme, being successful in finding water so far on the route. The 20th being Sunday, the party rested in camp. A high hill, 25 miles distant, was named Mount Leonora, and another about the same distance in another direction Mount George. Continuing the course and passing Mount Leonora, another hill was discovered, which was named Mount Malcolm, and a remarkable peak Mount Flora. From this point a high range was discovered, apparently about 16 miles distant, towards which the party travelled in the hope of finding feed and water, but without success. Next morning, soon after daybreak, the range was reached, the highest peak of which was named Mount Margaret. The farthest hill seen to the eastward was named Mount Weld, and on July 2 a return was commenced along the outward track. At Mount Malcolm the rest of the party were picked up, where Mr. Forrest had formed a depot camp previously, and preparations were made for the homeward journey. The rations, with strict economy, were found to be sufficient for a thirty days' supply, and Mr. Forrest decided to make for the homestead of Mr. Clarke, Victoria Plains.

On July 7 the return journey was commenced, and on the 10th a high range was reached, the highest point

of which was named Mount Alfred. On the 13th the party was left in charge of Mr. Monger, with instructions to proceed to Retreat Rock, the site of a bivouac on the outward journey, whilst, accompanied by Mr. Hammersley and Jemmy, the aboriginal, Mr. Forrest determined to make an attempt to cross Lake Barlee. The attempt was successful, and the party returned to Retreat Rock on July 15. Next morning the whole party moved off on the journey to the settlement, reaching the hospitable roof of Mr. Clarke on August 2. On this portion of the route the expedition had passed several places of interest, namely, Lake Monger, which was so named after a member of the party. Newcastle was reached on the 4th and Perth on the 6th, after an absence of 113 days, during which an approximate distance of 2,000 miles had been covered.

So far as the mystery in which the fate of Leichhardt was involved, the expedition was barren of results, but the additional knowledge gained was of some value. Mr. Forrest expressed the view that the country was worthless from an agricultural and pastoral point of view, but deploring his lack of a knowledge of mineralogy he suggested that it should be geologically examined. Over a quarter of a century afterwards the value of this suggestion was proved correct, for much of the country traversed is now contained in the Mount Margaret goldfield.

Immediately on the return of Mr. Forrest to Perth, Dr. von Mueller suggested the formation of a new expedition to carry out if possible the main features of the one which had recently returned.

In this case the eminent botanist proposed that it should be under the leadership of Mr. John Forrest and commence its labours on the Murchison River, and from that point attempt to reach the Gulf of Carpentaria. It was pointed out by the scientist that even if the party were unable to clear up the mystery surrounding the fate of Leichhardt, much valuable information would be gained, and as an example of the latter feature he drew attention to the previous attempt. Despite the earnest entreaties of the learned doctor, coupled with the desire of Mr. Forrest, the Government of the day could not agree to such a proposal, the benefits of which accruing to Western Australia would be at best extremely problematical.

The Governor (Mr. Weld) was extremely desirous of promoting exploration, especially in regard to finding a feasible and practical land route to South Australia, and Mr. Forrest was offered the command of a party to attempt to reach Adelaide by the south coast. The offer was eagerly accepted, and Mr. Forrest soon became engaged in getting together his party for the work. It was with some degree of care that the leader prepared for this undertaking. Its formidable nature could only be gauged by the experiences of Mr. Eyre in 1840 and 1841. Recognizing the difficulties with which he would have to

contend Mr. Forrest took every precaution that would make for a successful issue to the venture, and particular care was given to the question of route, chiefly as it affected the water supply, the main difficulty of Mr. Eyre. Fully recognizing the trials of his dangerous task, but totally undismayed, Mr. Forrest and his party on March 30, 1870, left Perth on their perilous adventure. The result was eminently satisfactory, and the journey, instead of presenting insuperable difficulties, was not as terrible as had been anticipated, and exactly five months after their departure from Perth the expedition arrived at Adelaide, completing a journey that Mr. Eyre had taken over twelve months to accomplish.

The party consisted of four white men and two natives, namely:—

- Mr. John Forrest (commander),
- Mr. Alexander Forrest (second in command),
- Mr. H. McLarty (a police constable),
- Mr. W. Osborne (farrier and smith),
- Tommy Windich and Billy Noongale (aboriginal natives).

Ample stores and provisions had been prepared for the use of the expedition, and the schooner "Adur" had been engaged to carry them to such points as the leader might detail. The party was ordered to take the most convenient route to Esperance Bay, where the men and horses were to be recruited and further supplies secured from the schooner. From that point the journey was to be continued to Eucla after the winter rains had set in, so that every prospect of success should attend the venture. At Eucla the party was to be again provisioned and recruited. Thence it was to make an exploration northward, and after its return to that point make a final start for Adelaide, the route to be left to the discretion of the leader. Such is a brief digest of the instructions issued by the Western Australian Government to Mr. Forrest, which ended with the following paragraph:—"Such, briefly, are the general instructions by which it is intended you should be governed in conducting the expedition entrusted to your care and guidance; and I may add that the fullest confidence is placed in your energy, zeal, and discretion for bringing it to a successful issue. The main objects of the undertaking are alluded to, and though a method of accomplishing them is briefly referred to, it is by no means intended to fetter your judgment in adopting such measures of minor detail as may appear to you necessary for effectually carrying them out." Of the value of the "energy, zeal, and discretion" of Mr. (now Sir) John Forrest future historians of Australia will speak with no uncertain voice.

The first stage of the journey to Esperance Bay covered a distance of over 450 miles, and with an enthusiastic send-off the expedition started on its dangerous and difficult task on March 30, 1870. By April 5 it had

reached Kojonup, where it rested for four days. Continuing on April 9, it reached the Fitzgerald River on the 15th of the same month, not yet having touched the track followed by Mr. Eyre on his memorable journey in 1841. On April 16 it reached the Phillips River, but as both these streams had been previously closely explored by Captain Roe, no time was wasted on any further detailed examination. On April 17 Eyre Range was reached and Annie Peak ascended, from the summit of which a distant view was obtained of the sea to the southward. Rain now set in, and continued almost without intermission until the party arrived at Mr. Campbell Taylor's station on the Oldfield River. On April 25 the expedition arrived at Esperance Bay, but it was not until April 29 that the schooner arrived there. At Esperance the explorers were the guests of the Messrs. Dempster, who had a settlement at that point. The party had a pretty rough time for the last 160 miles, getting a foretaste of the difficulties yet to be encountered, but the four days spent in rest and leisure, awaiting the arrival of the schooner, had done much to recruit their energies. The stores were landed, and from May 3 to 8 preparations made for the continuance of the journey. The leader prepared a report of proceedings to date, which was sent to Perth by Mr. William Dempster, who was leaving for that centre.

On May 9 the expedition started for Israelite Bay, where the master of the "Adur" had been instructed to again meet them. They travelled in an easterly direction over plains generally poorly grassed to Israelite Bay, which was reached on the 18th of the same month. Here the horses were recruited and shod, and many other details looked over and made secure. The master of the "Adur" was given instructions to proceed to Eucla Harbour, and remain there until August 2 awaiting the arrival of the expedition. If it did not appear by that time the master was further instructed to bury the provisions and return with all speed to Fremantle.

On May 30 the journey was resumed to Eucla Harbour, three months' provisions being carried by the party. Keeping near the coast for 60 miles, during which period the leader had made a flying trip inland, the expedition reached the sand patches a little to the west of Point Culver on June 2. On the 3rd Mr. Forrest made a flying trip to the north-east, returning on the 4th along the cliffs to Point Culver. He found the country entirely destitute of permanent water, but a few miles inland beautifully grassed, yet near the coast there was neither feed nor water. The question of permanent water being a most important one, Mr. Forrest determined, after mature consideration, to attempt at all hazards to reach the water shown on Mr. Eyre's chart in longitude 126° 24' E., or about 140 miles from where they were then located.

On July 7 they again started on their journey,

carrying over 30 gallons of water on three of the riding horses, and taking it in turns walking. Travelling for four days in a north-easterly direction, they were fortunate enough to find in rocky basins sufficient water to give each horse 2 gallons. On the fifth and sixth days out their difficulties were entirely ended, for they found sufficient for 7 gallons for each horse, and water on Eyre's track was now only 32 miles distant, which they reached on June 14. The country traversed during this portion of the journey was in many cases beautifully grassed, level, without the slightest undulation, and though about 300 ft. above sea level, not thickly wooded. The course of the journey was about 25 miles from the sea, and northward the prospect from a pastoral point of view appeared distinctly better. Whilst the main body was recruiting at the permanent water, a short journey was undertaken by Mr. Forrest, accompanied by McLarty and one of the aboriginals, and proved the value of the country to the northward for pastoral purposes if only permanent water could be obtained. They returned to camp on June 22, and at once started the preparations for a continuance of the journey to Eucla. Wandering around the site of the camp one of the aboriginals found the shoulder-blade of a horse and two small pieces of leather belonging to a pack-saddle. The shoulder-blade was, no doubt, part of the animal killed by Mr. Eyre for food thirty years previously. Part of the shoulder-blade was removed, and on the return of the party handed to Governor Weld as a memento. During his trip northward Mr. Forrest came upon some of the natives of the region, who were not prepossessing specimens, and entirely naked.

On June 24 the journey towards Eucla was resumed, carrying as before over 30 gallons of water, necessitating part of the journey to be undertaken on foot by the members of the party in rotation. Again they were fortunate in finding several rockholes that supplied the horses for the first two days with a sufficiency of the life-sustaining fluid. For the next four days, however, they were not so fortunate, and it was not until the evening of the 30th that they came upon sufficient permanent water to supply the needs of the animals, who were now greatly distressed. The finding of this water rendered this part of their journey secure, for they were within 30 miles of Eucla. On the morning of July 1 the expedition reached the cliffs, but Mr. Forrest did not follow them, preferring to take a more inland course, and shortly afterwards they sighted Wilson Bluff and Eucla Sandhills. The expedition camped for the night within five miles of the harbour, and next morning had the greatest pleasure in seeing the "Adur" riding securely at anchor in the roadstead.

Mr. Forrest describes the country passed over during this portion of the journey "as far surpassing anything he has ever seen as a grazing country. There is

nothing in the settled portions of Western Australia equal to it either in extent or quality; but the absence of permanent water is the great drawback. The country is very level, with scarcely any undulation, and becomes clearer as you proceed northward." For a distance of over 400 miles no permanent watercourse had been encountered, though the route was only 30 miles from the sea. Several parties of natives had been met with who appeared harmless and friendly, and were entirely destitute of clothing. Very little native game appeared, and altogether the report of the expedition thus far only served to emphasize the previous judgment of Mr. Eyre in many respects.

Rather more than half the distance from Perth to Adelaide had now been accomplished, but there still remained a formidable distance of 140 miles to be crossed where Mr. Eyre encountered many terrible difficulties. On July 8 the "Adur" was despatched to Fremantle, and the expedition prepared for the final stages of the journey. On Wilson Bluff was erected a flagstaff, and the Union Jack hoisted thereon. On the staff was nailed a copper plate bearing the following inscription:—

"Western Australia. Erected by John Forrest, July 12, 1870."

On the 13th a cask, containing 100 lb. of flour, 130 lb. of barley, 16 new sets of horseshoes, shoeing nails, etc., was buried 8 ft. west of the flagstaff, and a plate on the staff contained the information "Dig 8 ft. west." On July 14 the explorers resumed their travels, and following the usual procedure in regard to the conveyance of water, they essayed the formidable task of rounding the head of the Australian Bight. Great privations were now met with, not a drop of water being found for over 135 miles, but by travelling day and night they reached the head of the Bight on the 17th, and found abundance of water on digging in the sandhills. The horses had been without water for 90 miles, and the party was entirely worn out through want of sleep. Many of the horses could hardly walk, and some were delirious, but they all managed to carry their loads. Very little feed was encountered at the head of the Bight, and after a short halt to recruit the journey was resumed. On July 23 the expedition reached Colona, the head station of Degraives & Co., where Police-Trooper Richards was met, who was on his way to the head of the Bight to meet the party, in accordance with instructions received from Sir James Fergusson, Governor of South Australia. Leaving Colona on the 25th, the travellers reached Fowler Bay on July 27, all being well. The health of the party had been excellent, and so far not a single horse had been lost. From longitude 124° 25' E. to Port Eucla permanent water was only secured at one point, that noted by Mr. Eyre on his chart.

They were now 600 miles from Adelaide, and Mr. Forrest determined to pass through the Gawler Ranges,

skirting the south end of Lake Gairdner, and thence to Port Augusta and Adelaide, which he anticipated they would reach in from five to six weeks. After sending to the Governor of South Australia notice of his arrival at Fowler Bay, Mr. Forrest left that place on August 1 for his final destination. On the 18th he reached Port Augusta, arriving at Adelaide on the 27th, being enthusiastically received and welcomed.

The horses and equipment were sold by public auction, and on September 12 the party sailed by the s.s. "Alexandria" for King George Sound, arriving on September 17, and reaching Perth on the 27th, after an absence of 182 days.

Thus in less than five months the expedition had accomplished the journey which had taken Eyre twelve months. This was possible owing to the greater facilities which the later expedition commanded, and the leader was enabled to give a more impartial verdict as to the nature of the country passed through. In so far as this affected Western Australia it was distinctly cheering, for though Eyre's opinion of the waterless nature of the country traversed was confirmed, yet the district inland from the coast, hitherto supposed to be a sandy desert, was found by Mr. Forrest to be beautifully grassed between  $126^{\circ}$  and  $129^{\circ}$  east longitude, with water procurable in some places at moderate depth. To use the explorer's own words, "If water could be procured on the tableland, it would be the finest pastoral district of Western Australia."

During the year 1871 Mr. A. Forrest took charge of an expedition to the eastward in search of new pastoral country. Owing to a late start, he and his party were compelled to make for the coast when they had reached latitude  $131^{\circ}$  south, longitude  $123^{\circ} 37'$  east. This course led them to Mount Ragged, and thence proceeding westerly they returned to Perth *via* Esperance, having gone out 600 miles and discovered a considerable tract

of good country, much of which has since been taken up and stocked.

The next journey into the interior of Western Australia was conducted during April, 1873, by Mr. William Christie Gosse, Deputy Surveyor-General of South Australia, who, setting out from Alice Springs Telegraph Station, attempted to make the overland journey to Perth. He returned to his starting-point in December, having failed to get through owing to the arid nature of the country. He, however, entered Western Australia near the Tomkinson Mountains, and examined the country in the vicinity, also that near the Cavenagh and Barrow Ranges, thus acquiring a geographical knowledge of some hundreds of miles of new country. His furthest westerly position was in longitude  $126^{\circ} 59'$  east, to the south of the Barrow Range.

A more successful attempt was made in the same year, between April 15 and December 29, by Major Peter Egerton Warburton in his journey from the McDermot Ranges in South Australia to the headwaters of the Oakover River. Although he reached the west coast and penetrated a district never before examined by white men, little was learned from his experiences. The expedition was provided with camels, but owing to constant delays provisions fell short and sickness came. Warburton thereupon determined to push through as rapidly

as possible, travelling by night; and thus, fleeing "as it were for their lives westward over the Sahara," the members of the expedition were too much occupied to notice carefully the character of the districts traversed. What opinion they did form was unfavourable, as the country was reported to be a sterile one, in which horses could not possibly exist, and in which nothing was visible in the way of permanent watercourses. On this journey were found the Joanna Springs, since invested with melancholy interest in connection with the Calvert

JOHN FORREST.

expedition, as the appointed rendezvous which the ill-fated explorers, Wells and Jones, failed to reach.

Warburton's route throughout lay between the twentieth and twenty-second parallels of latitude south.

## CHAPTER IX

### SIR JOHN FORREST, 1874.

The much vexed question of the unknown character of the interior of Australia had exercised the minds not only of the explorers in that land, but of the scientific and learned societies throughout the world, and so far the mystery surrounding the position had never been satisfactorily cleared up, though many attempts had been made with that object in view. The journey of Major Warburton could not be said to have thrown much light on this subject, but the problem was near solution, and the next attempt to solve the question was to set the seal of greatness on a name which will ever stand for courage and resource throughout Western Australia. The overland journey to Adelaide by the south coast, which, after the disasters encountered by Mr. Eyre, had for fully thirty years been counted almost impossible of repetition, had been successfully accomplished by a youthful and comparatively untried explorer, who has yet to take a still higher place in the history of exploration in Australia. The previous task, faced as it appeared to be with almost insurmountable obstacles, was to shrink into a small compass when compared with the future labours of the same explorer. The secrets of the almost unknown interior were to be laid bare and geographical science to receive a wealth of detailed information hitherto regarded as unattainable. With the conditions existing forty years ago the carrying out of this work was a task of no ordinary magnitude, and the principle that "peace hath its victories no less renowned than war" does not appear to get that consideration which it deserves in Australia. With this regard it is well, therefore, to take a retrospective glance at the mighty achievements of the past, and view the works of many who have passed from this life's labours, and reward to a proper and fitting degree those of the few who still remain with us. National sentiment alone demands this, for it is only too often forgotten that this island continent has witnessed deeds of heroism that cannot be outvied by the race in any other land or clime.

Amongst the great names in the history of Australian exploration not one shines with brighter lustre than that of Sir John Forrest, whose courage and tenacity of purpose to accomplish for the good of future generations in Australia all that makes for national superiority and the benefit of the common weal will ever obtain our

affectionate regard. In the realm of exploration alone, disregarding his many other qualifications, Sir John Forrest has conferred an inestimable benefit on Western Australia that the succeeding years will only serve to deepen, and it is but fitting and meet that his name should hold the foremost place in his native land. In such measure is the fame of this explorer to be found, and the successful carrying out of the proposals, for the examination of the interior submitted by him to the Governor of Western Australia in 1874, places him in the forefront of those intrepid explorers to whom the Australian nation will ever owe a debt of gratitude it can never hope adequately to repay.

Ever since his return from Adelaide Sir (then Mr.) John Forrest had been very desirous of continuing his explorations, mainly in an attempt to prove whether or not a direct route was practicable to the more advanced settlements of South Australia. At the same time he hoped to contribute something valuable towards the solution of the problem in regard to the nature of the interior. It will be remembered that on his first essay in exploration Mr. Forrest had penetrated for a distance of 600 miles into the central desert, and despite the hardships of the previous journey he was again anxious to settle the question of a probable northern or direct easterly route. The whole matter took definite shape in a letter addressed by the explorer to the Surveyor-General of Western Australia for the consideration of His Excellency Governor Weld, in which he expressed a wish to undertake a further expedition. The route suggested was to start from Champion Bay and follow the Murchison River to its source, and thence continue in an east and north-east direction to the telegraph line which has been constructed from Adelaide to Port Darwin; afterwards proceeding to Port Darwin or Adelaide as might be deemed advisable under the circumstances then existing. The cost of the expedition was estimated at about £600, of which portion Mr. Forrest offered to contribute £200, or one-third of the total, feeling sure that he would be able to raise that amount by private subscription. The party was to be well found and armed, and to consist of four white men and two aboriginals, with twenty horses.

In his letter to the Governor the explorer pointed out the great benefit to geographical science that would

ensue on its successful termination. It would be the crowning feat of Australian exploration, and would for ever close the oft-recurring discussion as to the presence of a large river running inland from the watershed of the Murchison. To the letter the Governor appended the following minute for the information of the Legislative Council, and it is quoted here at length not only to show his appreciation of the virtues of the explorer, but as proof positive of his own desire for the advancement of Western Australia:—

“Mr. J. Forrest, in a most public-spirited manner, proposes to embark on an undertaking, the dangers of which, though not by any means inconsiderable, would be outweighed by the advantages which might accrue to this colony, and which would certainly result in a great extension of our geographical knowledge. Should he succeed in this journey his name will fitly go down to posterity as that of the man who solved the last remaining problem in the Australian continent; and whatever may come after him, he will have been the last (and certainly, when the means at his disposal and the difficulties of the undertaking are considered, by no means the least) of the great Australian explorers. The honour to be gained by him, and most of the advantages, will ultimately fall to this colony, which is his birthplace, and for my own part I shall be very proud that such a design was carried out during my term of office. I wish that the means of the colony were sufficient to warrant the Government in proposing to defray the entire cost of the expedition, and I think it would be a disgrace to the colony if it did not at least afford some aid from public funds.”

The proposition met with a most cordial reception in the Legislative Council, which voted £400 towards the funds, and Mr. Forrest set out to procure the remaining amount by private subscription.

However, at this time, 1872, great efforts were being put forth in South Australia in the realm of exploration, and it was thought advisable to postpone the expedition, otherwise it might appear as if Western Australia were entering into competition with that State. Only one of the South Australian explorations was successful in getting across to the western coast, and that, which was led by Colonel Warburton, was barren of results, and the course taken by that officer too northerly for practical purposes.

Eventually it was decided that the expedition should leave during March, 1874, and on the 17th of that month the Surveyor-General issued his final instructions to Mr. Forrest. These are too lengthy to quote fully, but many pertinent sentences in the light of after events are to be found therein. For instance, he writes of the Murchison district: “Every opinion of value that has been given on the subject tells one that the head of the Murchison

lies in a district which may prove another land of Ophir.” The leader was also ordered to do as much reconnoissance work as possible, and to add as much as he could to the geographical knowledge of the country.

Besides the leader, the party consisted of Mr. Alexander Forrest, second in command; James Sweeney, farrier; James Kennedy, police constable; and Tommy Windich (a true and tried companion) and Tommy Pierre, aboriginal natives. They were well armed and provisioned for a journey of eight months, but they were instructed by every means in their power to avoid conflict with the natives, and as far as possible cultivate friendly relations with any of such they might meet.

On March 18, 1874, the party left Perth, being wished godspeed by Colonel Harvest, the Acting-Governor, and accompanied for some miles by the Surveyor-General and others. On March 31 the explorers were entertained at dinner in Geraldton, and on the following day the serious work of the expedition commenced. The route at first lay through somewhat settled districts by way of Kolonaday, North Spring, and Tindlerlong to Yuin, the principal station of Mr. Burgess. This locality was reached on April 9.

At the outset it was impossible to overestimate the difficulties of the expedition. Colonel Warburton at the conclusion of his journey had stated that with horses it was impossible to do the work entailed, so he had been supplied with camels and yet he fared badly. Giles, Gosse, and others who employed horses were beaten back, but Forrest determined to essay the task, and over a longer route than that traversed by Warburton. That Mr. Forrest recognized the difficulties with which he had to contend was painfully true, and early in his journal we find the following sentence:—“Warburton and other explorers who endeavoured to cross the great inland desert from the east had the advantage of being provided with camels—a very great advantage indeed in a country where the water supply is so scanty and uncertain as in Central Australia.” This constant need to obtain water for the horses caused throughout the journey many wearying and otherwise unnecessary deviations from the main route and frequent disappointments, besides great privation and inconvenience to man and beast.

On April 20 they reached Warrorang, north-east of Geraldton, and rested to recruit both men and horses, and here they received letters which had been brought from Geraldton by Police-Constable Haydon, who was the last white man they were destined to see for six months.

Three routes in the letter of instructions had been left to the discretion of the leader. Firstly, to choose whether a westward course should be taken, with the alternative of falling back on Nicol Bay on DeGrey River; secondly, to push up Sturt Creek, keeping to the

westward of Gregory's track; and thirdly, to go eastward to the South Australian telegraph line. The third course was chosen, the reasons for which will appear as the narrative proceeds.

On April 22 they obtained a view of Mount Murchison to the northward of their track, which passed through splendid pastoral country, but the progress was necessarily slow, for the possession of only three riding-horses constrained half the party to walk in turns. On the 24th the expedition reached the Murchison River, and the weather became gradually warmer as it proceeded, and on the 27th registered  $90^{\circ}$  in the shade, giving the high temperature of  $83^{\circ}$  at 6 p.m. Continuing up the course of the river well-grassed flats of good loamy soil were passed, adorned with white gum, but the country required rain. Game abounded, and for several days the expedition was amply supplied with ducks, cockatoos, and emus. On April 30 the travellers came upon native tracks, and for the first time a guard was set at night. May 1 saw them encamped on a large grassy flat, adjacent to the banks of the Murchison, which contained a pool of excellent fresh water, and though the thermometer was still high the party enjoyed excellent health. Still going eastward, on May 3 they came upon several natives, who proved very uncommunicative, but appeared to be friendly. The journey was now through totally unknown country, hitherto previously unexplored, the party being accompanied by natives, who imparted valuable information in regard to the next water. This was reached about 20 miles ahead, a high hill close to the track being named Mount Maitland, in honour of Mr. Maitland Brown, who had previously performed some excellent work in exploration. Later on in the day a large range of hills was encountered, where Mr. Forrest found his compass to be useless, owing to their being largely composed of hematite. Eastward of this elevation, a high range was observed, which was named the Robinson Range, after Governor Robinson. One of the highest points was named Mount Fraser, after the Honourable Malcolm Fraser, and another elevation Mount Padbury, after Mr. W. Padbury, a contributor to the expedition funds. A fine river had been discovered a day previously, which gradually diminished in size the further the party proceeded. The country on every side was very dry, and the leader became very apprehensive, fearing that, without rain, he would not be able to continue the course. On the 11th, still following the course of the river, the explorers came upon a few native women, who though shy at first eventually were prevailed upon to converse, when they learnt that ahead they would find a sufficiency of water. White gums continued to live on the more fertile banks of the watercourses, and showed from a distance whence they trailed. Though the country gave every indication of being of an excellent pastoral nature, the leader was continually compelled to search for fresh

water. On May 13 a range of hills was reached, which was named Glengarry Range, but the country adjacent was amongst the most miserable hitherto crossed, being composed of thickets and spinifex. However, a few days later the travellers were gladdened by rain commencing to fall, and on May 15 they rested to take every advantage to recruit during the welcome change. Continuing the journey eastward next morning they came upon a fine brook, which was named Negri Creek, after Commander Negri, founder of the Geographical Society of Italy. The following day they discovered two remarkable flat-topped hills, which were named Mount Bartle and Mount Russell, after the President and Foreign Secretary of the Royal Geographical Society. On the 19th the expedition camped at some water in a small gully with excellent fodder for the animals, but generally throughout the previous 80 miles they had discovered no permanent water. A low range encountered on the 20th was named Kimberley Range, after Lord Kimberley, a famous Secretary of State for the Colonies. The anxiety of the explorers was, however, not abated, for the difficulty of finding water in any quantity still continued, and when on May 22 they discovered a fairly ample supply the leader decided to halt and recruit his wearied party. The journey was resumed on the 23rd, and a high range crossed named the Frere Ranges, after Sir Bartle Frere, the then President of the Royal Geographical Society. Still continuing a north-easterly course on the 27th and 28th, the explorers discovered and named Kennedy Creek (after the police constable with the party), Windich Springs, Carnarvon Range (after Lord Carnarvon, afterwards a Secretary of State for the Colonies), Mount Salvado (after Bishop Salvado), Davis Hill (after Mr. J. S. Davis), and Pierre Spring.

The expedition was now in a most miserable spinifex country, and on June 1 Forrest came upon the charred skull of a native, evidently the remains of a cannibal feast. The small supply of water found during the past few days had been only too limited to satisfy the needs of the travellers, and anxiety and hardship were beginning to tell severely upon them, and on June 2, with feelings of heartfelt gratitude, they came upon a most desirable camping-place. Swarms of birds led them to a gully containing an unlimited supply of clear fresh water and excellent feed for the animals. Game was in abundance; in fact, it appeared the common watering-place in that portion of the gloomy and sullen desert by which it was surrounded. Fresh food was therefore to be had in abundance, and here they rested for several days to renew their energies for the trials and tribulations still to come. The leader named this welcome oasis Weld Springs, in honour of Governor Weld, who had done so much to render possible the expedition and its work. From this point excursions were made into the surrounding country, but still the eternal spinifex was

predominant. During this period natives were seen, but they soon disappeared, and it was found impossible to trace them. After several journeys ahead to find a practicable route, the leader decided on June 10 to still continue at Weld Springs, the locality having proved such an excellent depot. On June 12 Alex. Forrest, accompanied by the native Windich, started in search of water for the journey eastward. Near midday next day, about sixty natives were discovered advancing on the camp in a warlike manner. Decorated in war paint and armed with spears and shields they ran towards the camp. Kennedy and the native Pierre, who had gone after game, were recalled to the camp, and, with Sweeney, Forrest prepared to receive the unwelcome visitors. When the two huntsman arrived the natives were within 50 yards of the leader of the expedition, where they halted. First one aboriginal advanced as if on a friendly errand, then a second came rushing forward, performed several manoeuvres, made many feints to throw spears, and finally signalled to his companions. The whole band then rushed forward on the explorers, shouting and yelling, with their spears shipped. When within 30 yards Forrest gave the order to fire, and a volley was the result. The natives at once decamped, and some appeared to be injured. The party reloaded and got ready for a second attack. When they were a hundred yards distant Forrest fired at one of them with a rifle, when the man was seen to fall, but he arose and was assisted away by his companions. A further attack was not made, and on the return of A. Forrest and Windich next day a strong stone hut was constructed to resist any future attack, especially at night. Despite the threatening attitude of the blacks, the leader did not consider it of sufficient moment to deter him, even for one day, from carrying out the programme he had decided upon. Therefore, early on the morning of the second day, accompanied by the faithful aboriginal, Windich, he left Weld Springs, steering a fairly easterly course, diverging slightly to the north or south as the nature of the country rendered progress

possible. Early in the evening the explorers thought that they heard the voices of natives in the spinifex, and immediately putting out the fire they watched for two hours, but the noise was ascertained to come from native dogs. On the 19th they returned towards Weld Springs and found the party advancing on their tracks, but as the horses of the advanced party had been without water for sometime they returned to the Springs. Next morning the journey was resumed, and they covered a distance of 28 miles before water was obtained. The supplies were extremely scanty, and nearly 80 miles were traversed before another was discovered, which proved to contain enough for one week. The main party halted at this place, and in the morning Mr. Forrest, accompanied by Tommy Pierre, left the camp, steering towards a high range about 30 miles distant. The spinifex now gave place to fine grassy country, game being abundant.

KING EDWARD RIVER, NEAR MOUNT LEEMING.

A large brook containing only a few pools, not large enough to be of material use, flowed through the flats. The highest point of the range the explorer named Mount Moore, after Mr. W. D. Moore, who was a contributor to the funds. A further range was named the Timperley Range, after Mr. W. H. Timperley, an In-

pector of Police, and a remarkable peak Mount Hosken, after Mr. M. Hosken, a resident of Geraldton. To the south, about nine miles away, the explorers caught sight of a lake, and on the journey came to a gully containing an abundance of fresh water and feed. This discovery was almost providential, for the only other alternative was to retreat towards Weld Springs, from which a fresh start could have been made on a slightly different course. The leader was now about 35 miles distant from camp, and about eight from the lake, to which early next morning he proceeded. The sheet of water was named Lake Augusta, and proved to be salt, and about five miles in circumference. It swarmed with wild fowl, and a very welcome addition to the larder was soon obtained. Continuing they came upon a body of natives, but though friendly overtures were made to them they proved too

shy to allow of closer approach. On June 24 they came upon a brook flowing into another salt lake, but fortunately a large pool of fresh water was discovered, and Forrest retraced his steps to the camp, which was reached on the 25th, being eminently satisfied with the results of his flying trip. The whole party now advanced, and the water found on the 24th was reached on the 29th, where a remarkable hill was named Mount Bates, in honour of the Secretary of the Royal Geographical Society. The leader and Windich again preceded the main party next morning, and soon became entangled in the spinifex wastes, and to add to their many anxieties the horses gave out. For days they struggled on, for the intrepid explorer realized that he had now come to the crucial point of his journey, for they were only 200 miles from the furthestmost point reached by Gosse in his journey from South Australia. The sullen wastes gave no hope, and they were compelled to drag their horses along, until the leader himself became so exhausted that it was only with the greatest difficulty he advanced. With stern determination they crawled forward, and on reaching a small supply of water decided to encamp and await the advance of the main body. The outlook was most unpromising. Only the ugly, sullen waste of spinifex was to be observed for miles ahead. Yet Mr. Forrest was not disheartened. On every hand was dull, level monotony; in fact, he had entered upon a most wretched desert country. On July 5 the main body crawled into camp, having experienced a most strenuous time, being compelled to abandon two of the horses. The supply of water at the halting-place was very limited, and a retreat became necessary to the last camping-place of the main body, 14 miles in the rear. Giving the horses what supply was available, a rapid survey of the surrounding country was made by two parties—the leader accompanied by Tommy Pierre, and his brother by Windich. The first party returned to camp unsuccessful, and to the leader the only course-possible appeared a retreat over terrible country for 70 miles. However, his overwhelming joy can be better imagined than described when the other party returned with the news that within five miles they had found a three weeks' supply of water, thus saving the expedition at its most critical period. The feed at this oasis was extremely poor, and a long stoppage to recruit could hardly be contemplated, and next morning A. Forrest and Tommy Pierre left on a flying trip to discover, if possible, a further supply of good water, leaving the main body under the leader to follow on. The outlook still remained gloomy and dispiriting, but fortunately for the fate of the expedition A. Forrest discovered a fine spring of fresh water in a beautiful patch of grazing country, the first they had encountered for a distance of 130 miles.

By July 13 the whole of the expedition were encamped at this place, which was named Alexander

Spring, after its discoverer. A flat-topped hill was named Mount Allott, after the Mayor of Adelaide, and a neighbouring elevation, Mount Worsnop, after the Town Clerk of the same place. Early on July 16 the leader, accompanied by his invaluable henchman, the native Windich, left Alexander Spring on their easterly track in a search for the life-sustaining fluid, for the success or failure of the expedition now hinged upon this important item. The eternal spinifex and sand met the eye on every side, but these wastes were interspersed with salt marshes, and they were gladdened towards the evening of the 17th by coming upon a series of sandstone gorges, where they found sufficient water to sustain life. Recognizing that the supply, about 250 gallons, was totally inadequate, in great anxiety of mind the leader pursued his search over the "most miserable country he had ever seen." The main party was following close behind, and on the 18th a fine pool was found (sufficient for one month's supply) on a small creek, which was named Blyth Creek, after the Honourable Arthur Blyth, Chief Secretary of South Australia. The whole of the party encamped at this spot on the 20th. It was now within a hundred miles of the position reached by Gosse, and the leader was determined, whatever the difficulties entailed, that he would cross the "intervening space, having reasonable hope that the worst of the journey would then have been accomplished." For several days the country was searched ahead for sufficient water to continue the journey, but without avail. Between the two points it was the worst yet experienced; in fact, it was owing to its terrible nature that Gosse had been compelled to retrace his steps. The leader now became very troubled, and communicated his fears to his brother. After discussion they came to the conclusion that even if faced with the worst they could with safety retrace their steps over the 1,000 miles of Western Australia they had so far traversed. The water in Blyth Creek was fast becoming exhausted, and the last sufficient supply was 60 miles in the rear. Forrest prayed that the water would last, and determined to continue the search. His own words at this stage of the journey are significant of his anxiety of mind:—"Just when the goal of my ambition and my hopes for years past was almost within reach, it appeared that I might not even now be able to grasp it. The thoughts of having to return, however, brought every feeling of energy and determination to my rescue, and I felt that, with God's help, I would even now succeed. I gave instruction to allowance the party, so that the stores should last at least four months, and made every preparation for a last desperate struggle." For two days the indomitable leader rested in camp, awaiting the return of his brother from a flying trip. The report was gloomy and unpromising, and the leader left camp with Windich on August 5 with every determination to succeed, instructing his brother to follow two days later

with the rest of the party. Small supplies were found on the track, and Forrest plodded steadily forward, but on August 7 the explorers were without water for the whole day, camping at night tired and thirsty. Next day they continued their search, at last coming on a brackish supply refused by the horses, but so great was their own need that they each absorbed about a pint. Slowly they crawled forward, until in a small granite hole they found 5 gallons of fresh water. The horses had now been without feed for forty-eight hours, and Forrest was gladdened by finding a day's supply of water. A little further on the flying party had come upon old tracks of horses, and it had ample proof that it was in the country previously traversed by Gosse. On August 8 a native well or spring was discovered, and the party camped to await the arrival of the main body.

During this journey several marked geographical features were encountered and named—a range of hills being called Baker Range, and its two highest peaks named Mount Samuel, after Sir Samuel Baker, the great African explorer, and Mount Harvest, after the Acting-Governor of Western Australia. On the 10th it was joined by the other portion of the expedition, and after supplying the horses with water the journey was continued. August 12 saw Mr. John Forrest and Windich again in the lead, and now entering country of a more promising nature, a granite peak near the camping-place being named Mount Elvire. At this point Forrest came upon the tracks of a number of horses, but as they appeared some distance from the route plotted by Gosse he put them down as belonging in all probability to the expedition of Mr. Giles. At length, on the 13th, they found a fine spring of good water, and camped to await the arrival of the second party.

The troubles were now to a certain extent over. The terrible desert had been safely negotiated after weeks of arduous toil, and the determination of man had conquered over the forces of Nature in her most awful and desperate mood. The leader now felt sanguine that he could reach the settled districts of South Australia, though he recognized that some further privations would be met. To the whole party he now voiced the opinion that they were in safety, and in all human probability in five or six weeks' time would reach the overland telegraph line, for at last they had bridged the awful, desolate spinifex desert.

The spring where they rested was named Barlee Spring, after the Honourable F. P. Barlee, Colonial Secretary of Western Australia, and a prominent elevation adjacent named Mount Palgrave.

The country now to be traversed was to a certain extent explored, yet the trials and tribulations of the party were not ended. Reference has already been made to the tracks previously discovered, and again they came upon the traces of previous exploration, but it was not

until August 16 that Forrest could definitely decide to which earlier expedition they belonged. On this date Windich discovered a tree marked <sup>E. GILES</sup> | and a little further on the marks of wheeled transport. As this must have belonged to Gosse's party, the leader decided that he had come upon the old tracks of both these explorers. The presence of an old track, deep and well-beaten, towards a gully led them to expect a spring, and their expectations were more than realized when they came upon a fine flow of water, surrounded by a stockyard and strongly-constructed bush hut. This appeared to be a camp of the party under Mr. Giles, and after events proved that Giles and Gosse were within a few miles of each other, but, strange to say, did not meet. The spring was the "Port Mueller" of Mr. Giles, where he rested for some two or three months. A pole was erected on the site of the camp, and the following inscription cut in it:—

"J. Forrest, August 17th, '74."

On August 19 the journey was continued, and the next few days were remarkable for the privations endured by the travellers. The outlook was anything but promising until by good fortune they discovered a spring missed by Mr. Gosse, and general relief was expressed, for it looked at one time as if a return to Fort Mueller would be absolutely necessary. The leader in his journal comments on the fact, and decided in future to rely on his own resources, and not follow blindly any of the old tracks, recognizing that the state of the season alters materially any patch of country in the interior. The spring was named Elder Springs, after Sir Thomas Elder, a well-known patron of exploration. Springs now became fairly numerous for a few days, but the water needed to be searched for, yet the party was never reduced to the same condition as before, though the state of the horses, owing to the continuous hardships of the journey, was pitiable in the extreme. During this portion of the course several geographical features were named, amongst them being Wilkie Spring, after Dr. Wilkie (treasurer of Burke & Wills exploration fund), and Crowther Springs, after Mr. Charles Crowther, of Geraldton. Moving on ahead of the main party, John Forrest and Windich on September 3 came upon a party of natives feasting, who resented the invasion of their domain by the explorers. For a time it looked as if serious consequences would ensue, as the blacks attacked at once and a shower of spears was hurled at the intruders. Fortunately, however, the firing of the revolvers kept the attackers off, and Forrest in turn became the aggressive party. The travellers were unsuccessful in their search for water during the remaining portion of the day, and it was not until they were close to a high elevation, which Forrest named Mount Mary, that their search proved successful on the morning of the next day, having been forced to camp in a thirsty and wearied condition during

the previous night. September 7 saw the party at a camping-place used previously by Gosse, and Forrest named the adjacent spring after that explorer. The 11th of the month saw the expedition at Whitell Creek, and a remarkable hill towards the south was named Mount Elizabeth. Sweeney, a member of the party, now exhibited signs of illness, the excessive privations having told severely upon his constitution. The meat ration carried by the party had been consumed, likewise the tea and sugar, and failing the presence of native game damper and water was the daily diet of the explorers. Departing from the usual procedure, the party continued its journey on Sunday, September 27, and a burst of prolonged cheering announced the first sight of the overland telegraph line. In his journal Mr. Forrest says:—"I felt rejoiced and relieved from anxiety; and on reflecting upon the long line of travel we had performed through an unknown country, almost a wilderness, felt very thankful to that good Providence that had guarded and guided us so safely through it."

The explorers travelled down the telegraph line, and three days later reached the settled district of Peake. The party was received with great hospitality, and the journey now became a royal progress. A general holiday was observed on the arrival in Adelaide, and the explorers were met by a band of equally famous pathfinders, *viz.*, Messrs. Warburton, Gosse, and Giles, who escorted them to Adelaide. Mounted on the horses that had served them so well, and clothed in their rough and travel-stained clothing, the explorers reached the Adelaide Town Hall, amidst the enthusiastic plaudits of the crowd.

Perth was reached early in December, and the welcome accorded in Adelaide was repeated.

Thus it will be seen by a perusal of the foregoing narrative that necessity shaped their course. First in Western Australia, owing to want of water, they were prevented from penetrating as far to the north as had been desired; afterwards when they had crossed the border a combination of causes, including a hot dry season, bad country, short provisions, and fagged animals changed Forrest's intention of exploring to the south. However, despite all the trials and disadvantages the mere geographical survey work was carried out at all costs. Whilst the report on the chances of settlement in the spinifex region was distinctly unfavourable, with perhaps an exception in favour of patches similar to those in the neighbourhood of Mount Moore and Lake Augusta, still the leader gave a most cheering account of the land on the Murchison beyond the then settled districts of the colony.

The disadvantages this explorer laboured under when compared with Warburton and Gosse were immense, but even thus handicapped he only the more exhibited his ability as an explorer. Warburton, it will be remembered, was equipped with camels, and yet he hurried across the continent, losing fifteen out of seventeen beasts. On the other hand Forrest not only saved twelve out of his eighteen horses, but travelling slowly and making careful notes, was able to give a full and valuable report on the country through which he had passed, and, in the words of a well-known historian, "concluded one of the most remarkable journeys on record."

## CHAPTER X.

ERNEST GILES, 1872-1875—ALEXANDER FORREST, 1879.

Contemporaneously with the expeditions of Forrest, Warburton, and Gosse, a series of journeys was being made by a man who must always rank high amongst the most famous of Australian explorers. Ernest Giles had a long and intimate knowledge of South Australian country and conditions, both as a digger and prospector and as a Government official of definite standing. Using positions on the overland telegraph line as bases to project expeditions westward in the hope of conquering desert wastes in that direction, several trips were undertaken by him to exploit this region.

In Baron von Mueller, the noted botanist, whose name is now a household word throughout the length and breadth of the island continent, the cause of exploration in Western Australia had a firm and lasting friend and advocate. The noted scientist's researches in the botanical world have conferred a lasting benefit on Australia; and hardly less comprehensive have been his services

to geographical science. Determined that still another attempt should be made to solve the problem of the interior of Australia, Giles and Baron von Mueller joined forces, and financed an expedition, to be led by the former, for the purpose of conquering the sullen wastes that had so long defied all attempts to explore and examine.

In August, 1872, Giles left the telegraph line on his first trip westward. The party consisted of, besides the leader, Messrs. Carmichael and A. Robinson. Fifteen horses formed part of the equipment, and on August 4, 1872, the party left Port Augusta, and on August 23, after a short period spent in recruiting, started for the serious portion of their trip from Chambers Pillar. The route followed by the expedition was through Glen Edith to Giles Range, where some excellent pastoral country was discovered. However, the expedition was soon to be involved in grave difficulties, and Lake Amadeus (named

after the King of Spain) prevented any further progress westward. Surrounded by barren sandhills (covered with spinifex and dense mulga scrub), Giles pushed determinedly forward, and reached a point 130° east longitude, but, daunted by his terrible environment, decided to return.

On October 1 he started on his homeward journey, reaching the telegraph line on November 21 at a point near to Hugh Junction.

The following passage, significant of the country, is extracted from Giles' journal:—"I was only too thankful to get out of this horrible region and this frightful encampment, into which the fates had drawn me, alive. I might condemn this region as a useless desert. I can truly say it is dry, stony, scrubby, and barren."

Undeterred by his previous non-success Giles set about finding the wherewithal to again attempt the serious proposition, and mainly by private subscriptions from Victoria he was enabled to set about the task. At the same time, however, two other South Australian efforts were practically under weigh, both of which have been previously mentioned, and one proved to be in a certain measure successful, but without much practical value.

On August 4 the expedition left the telegraph line at the junction of the Stevenson and Alberga Creeks for the attempted conquest of that terrible stretch of country between the starting-point and the more settled portions of the sister colony. The party consisted of Ernest Giles (commander), W. H. Tietkins, A. Gibson, and J. Andrews, with twenty-four horses. As was proved by Forrest's expedition, which came upon the tracks of both, Giles kept a course very close to that followed by Gosse, and at one period they could not have been very far apart, though both explorers were unaware of the fact. The sufferings were severe, and again to his deep chagrin Giles was compelled to turn back. But for one of the party there was to be no return, for Gibson succumbed to the hardships endured in that desert which now bears his name. The story of the privations is gruesome reading, and when on one occasion the leader was reduced to the extremity of eating a dying wallaby (to use his own words), "fur, skin, and all," some estimate can be formed of what was suffered. Only in the story of Eyre's terrible journey across the Great Australian Bight do we get any comparison of the trials and difficulties the expedition encountered. However, though

unsuccessful, it can be recounted to the credit of Giles that notwithstanding the terrible trials, and though nearly twelve months in the field, yet he successfully retreated to his base. He discovered several features in ascending the Alfred and Marie Ranges, Fort Mueller, a notable camping-place which proved so welcome an oasis to the wearied party under John Forrest, being one.

Twice unsuccessful though he had been in the attempts to conquer the lonely and inhospitable desert, nevertheless Giles had achieved sufficient fame to stamp him as one of the most indomitable exponents of Australian exploration. After the successful journey of John Forrest, by which the efforts of all previous explorers had been eclipsed, Giles decided to make another attempt to carry out his great desire to proceed by the overland route to Perth. This time the funds were supplied by Sir Thomas Elder, to whose exceeding generosity the cause of exploration in Australia is greatly indebted. The expedition was supplied with camels, and carried an eighteen months' supply of provisions. Besides the leader, the party consisted of W. H. Tietkins, J. Young, A. Ross, P. Nicholls, an Afghan named Saleh, and an aboriginal named Tommy. In this attempt Giles was determined to succeed or leave his bones as a monument in the fastnesses of the sullen wastes of the Western Australian bush. The course selected differed materially from those adopted by previous explorers, being more southerly than that taken by Forrest in 1874.

The expedition started from Ouldabinna on August 24, 1875, and speedily became entangled in a most inhospitable region. Almost from the outset one of the most terrible of deaths stared the travellers continually in the face, and without camels they could never have accomplished the earlier portions of the journey, and only the inflexible spirit of the leader, which was transmitted to the rest of the party, carried them through the terrible obstacles which were encountered. Rarely, indeed, has such sublime courage been displayed by any expedition, and Giles deserved all the praise bestowed at the conclusion of his magnificent feat. To the dweller in other lands the hardships of the Australian desert defy portrayal, and the indomitable perseverance of Giles, and the nature of the difficulties it helped him to overcome, is an example of the courage of the race.

The course of the journey was through a desert of a most appalling and forbidding nature. Miles of

ERNEST GILES.

spinifex-covered sandhill country were negotiated. Passing salt lakes, and through their attendant marshes, the travellers wearily plodded, and still hoped on, in surroundings that could only beget despair, until on September 3 they reached the boundary of Western Australia, and camped at what is known as Boundary Dam. Here Giles rested for a week, taking advantage of a fair supply of good water. From this point Giles steered a course west-by-south, and launched the party on an attempt to cross an almost limitless desert. For 323 miles the explorers proceeded without the slightest change, being buoyed by the determination to succeed, which seemed to imbue every member with a bulldog courage. It is impossible to comprehend the reason for this action, and the only solution that can be given is, that only one passion dominated the leader—to reach Perth. Just when their position was becoming extremely perilous they came upon a lake of pure water, which Giles named Queen Victoria Springs. Here in latitude  $30^{\circ} 25' 30''$ , longitude  $123^{\circ} 21' 13''$ , they rested for twelve days, and for the first time in seventeen days the explorers enjoyed a good wash. This fortunate discovery probably saved the expedition, and Giles was extremely thankful to the mercies of the Creator for the relief. Continuing the journey a west-by-north course was steered, passing Lake Roe, Broad Arrow, and Siberia. A further waterless track of 180 miles was crossed to granite hills, where difficulty was experienced with the natives. On November 6 Giles reached Mr. Clarke's station, near the Wongan Hills, Victoria Plains, and on the subsequent journey to Perth the explorer was received with that enthusiasm his great feat deserved.

In his further determination to return to South Australia by the overland route, Giles essayed a task never before contemplated in the history of Western Australian exploration. After a few weeks' rest in Perth, the return journey was begun on January 13, 1876, its first stage being to Northampton, *via* Geraldton. The party, in addition to the leader, consisted of W. H. Tietkins, Jess Young, Alexander Ross, Peter Nicholls, Saleh (the Afghan camel driver), and two natives—Jimmy Nanthona and Johnny Oldham. Giles' object in this expedition was not only to reach the Alfred and Marie Ranges which he had seen on his 1874 journey, and to connect with his route of that year, but also to ascertain how far the terrible Gibson Desert extended to the west. Having passed the headwaters of the Murchison and Gascoyne, he reached Mount Labouchere, and on May 10 encamped on the upper portion of the Ashburton. A subordinate excursion was then made from Grand Junction Depot northward to Ophthalmia Range and Mount Robinson, on the border of the tropics. The head of the Ashburton was reached, 350 miles from its mouth, and it was thus proved to be one of the most important rivers in the colony. Gibson Desert was entered on June 1,

having resumed the journey eastwards, and from the 12th to 18th of that month the explorers suffered intensely from want of water, a stretch of 230 miles being traversed without it. Soon afterwards the Alfred and Marie Ranges, and later on the familiar Rawlinson Mountains, came in sight, whence, passing through South Australian territory, the Peake Station was reached on August 23, a most formidable and hazardous journey having been completed with great expedition. Giles was now able to thoroughly substantiate the views of those explorers and geographers who had described the greater part of the interior of Australia as a sandy desert unfit for settlement. In performing these journeys he added greatly to the knowledge of the country traversed, and exhibited great skill as an explorer.

After the comprehensive journeys undertaken in the years 1872-75, which have been mentioned in detail, it would appear that but little fresh information could be gathered in reference to the Western Australian interior. However, a new (or, rather, the revival of the old) hypothesis was now beginning to agitate the public mind, *viz.*, the discovery of payable auriferous country. In the past the theory had many times been advanced that gold in payable quantities abounded in the interior, and the many quartz reefs intersecting the country previously explored certainly gave colour to opinions so freely expressed. Many of the earlier explorations had had for their *raison d'être* the discovery of the precious metal, and with indefatigable energy the hardy pioneers sought to unearth the longed-for ore.

With this object in view a journey was projected in 1876 by Messrs. Philip Saunders and Adam Johns, residents of the Northern Territory, South Australia, to prospect for the precious mineral throughout what is now generally known as the Kimberley district. The expedition crossed from Roebourne to the overland telegraph line prospecting the country on its track, but with a negative result. However, good pastoral country was encountered, and in this respect the expedition cannot be considered totally barren of results. Considering the gold discoveries in this region a little over a decade later, the opinion is forced upon the mind that despite the phenomenal yield of the precious metal from the Eastern Goldfields district, yet many possibilities still exist for the hardy prospector in Western Australia.

However, from the outcome of the next exploration paramount advancement to the colony was to result, and, second only to John Forrest, Western Australia owes a deep debt of gratitude to Alexander Forrest. From the exploring trip made under his leadership in 1879, the subsequent progress of Western Australia may be said to date.

Early in that year he was instructed to examine, map out, and report on the country between the De Grey River, in Western Australia, and the Victoria River, in

the Northern Territory. The party consisted of Messrs. Fenton Hill (second-in-command), Matthew Forrest, John Campbell, James Carey, and Arthur Hicks, together with two aboriginal natives (Tommy Pierre, whose help so largely contributed to the success of John Forrest's overland journey, and Dower). Mr. Hill was specially instructed to gather mineral, botanical, and zoological specimens. The party was provisioned for a six months' journey, and started from the "DeGrey River" Station on February 27, 1879. It hugged the coast for several days, until the inability to discover fresh water forced them some miles inland. The nature of the country crossed proved very patchy, in many places desolate and barren, whilst in others (notably near Roebuck Bay) very fertile, "where the grass stood over the horses' backs." Throughout a miserable lack of water existed, and several horses had to be abandoned. It was when Forrest reached Beagle Bay that the serious work of the expedition commenced, though more hardship than had been anticipated had already been encountered. A previous exploration by James Crowle, already mentioned, had explored a little to the north-east of Beagle Bay, and hence the country traversed so far by the expedition was pretty well known. One of the greatest inconveniences suffered in these regions by earlier explorers had been those caused by the prolific insect life, and Forrest and his party were not to be immune from the plagues of mosquitoes that rendered life almost unbearable to Grey and Stokes. All sorts of expedients were used to free themselves from these pests, but without avail, and the painful effects had to be stoically endured.

After a trip to the Lacepede Islands in a pearlyer the serious preparations for the inland journey commenced, and on April 22 the expedition started on its track northward. The Fitzroy River was reached on May 9. During this journey Lakes Louisa and Flora, the Rivers Mackay and Fraser, and Mounts Clarkson and Anderson were discovered and named. Game was abundant, and the country, being very well watered, contained many magnificent grazing areas. Forrest desired to cross the Fitzroy, and though to swim the watercourse was not an impossible feat, yet the danger of injury to the instruments he desired to take with him deterred him for a while. At length an ingenious raft was constructed of four water cans, on which were placed the instruments, firearms, and clothes of Forrest, Hill, and Campbell, and the passage was safely negotiated. Some little distance was traversed on the right bank of the river, during which Mount Abbott was named. On their return the explorers named three hills Mounts James, Tuckfield, and Campbell, and two ranges the St. George and Oscar, and a river the Margaret. The expedition followed the Fitzroy River for 240 miles, through country vastly different in nature to that previously traversed by the

leader, and the following extract from his journal clearly proves how much enjoyment and pleasure he obtained:—"The longest and largest river in Western Australia, it flows through magnificent flats, which contain about 4,000,000 acres of pastoral lands, and are capable of depasturing at least a million sheep, a larger number than the whole of the settled portions of the colony now carry." The boundless possibilities of this river (discovered by Stokes during his survey of the coast in H.M.S. "Beagle") impressed not only its discoverer but subsequent explorers. The scenery, as the river issued from the rugged gorges, could hardly be surpassed in its awesome grandeur, and it was with reluctance that the explorers left the romantic locality and set a course towards the north-west. The intention of the travellers was to reach the watershed of the Glenelg River, but soon after leaving the flats of the Fitzroy they became involved in very hilly and rocky country. Slowly moving forward over a series of rough and almost inaccessible hills, the route proved so difficult that they were forced to retire and seek a more practicable course, especially as the journey was beginning to tell with increasing severity on the horses. The hills had given place to mountainous ranges, and the explorer in attempting to ascend one of the steep summits was met by a precipitous wall of rock over 200 ft. high. The scenery was magnificent; the hills and valleys covered with luxuriant tropical vegetation lent to the view an almost poetic beauty, and the party delayed its advance, imperceptibly overcome by the grandeur of the ever-changing scene.

On June 8 the Lennard River was crossed and named, but the difficulties of the journey steadily increased, and the task of surmounting the precipitous ranges appeared well nigh hopeless. Moving in a north-easterly lateral course along the foothills Forrest was enabled to get a view of Secure and Collier Bays, and he hoped to be able to cross the rocky gorges, and so get to the Glenelg. Some sensational feats of mountain climbing now eventuated, and after an arduous climb and still more perilous descent, the party camped in a mountain pass, surrounded by romantic glens, beautiful gullies, and rugged gorges; yet beauty of scene could hardly compensate for their desperate situation. Several of the horses had been lost, Carey was extremely ill with a kind of fever (probably dengue), Forrest and another member of the expedition were afflicted with inflamed eyes, and to crown their misery the provisions gave unmistakable signs of depletion. For days they had wandered through rough mountains, scaled precipitous hills, and ploughed their way through the quagmires that surrounded many of the numerous springs. Nevertheless, the scene of their camp was delightful. Surrounded by waterfalls the cool shades of evening enhanced the wonderful beauty of the scene, and the memory of their troubles was partially obliterated by the ever-changing splendour of the locality.

Early next morning the journey was continued, and though parched and desolate desert plains and the ever-recurring anxiety in regard to water were absent, still the difficulties were well nigh insurmountable. Two horses fell in an attempt to climb the side of a precipitous gorge and had to be abandoned, and the further they proceeded the more difficult became the route. Steadily they plodded on, now climbing an almost impassable barrier of rock, with the certainty of a still more precipitous descent on the other slope, now passing through the boggy ground of an ever-flowing spring. Almost despairing of ever getting through the ranges they camped for the night on the shores of an inland stream. A horse was lost during the night, and after abandoning several saddles and some luggage next morning another attempt was made to surmount the difficulties. After a steep and arduous climb of 600 ft. the party emerged on a rocky tableland, and early in the afternoon camped to rest both wearied men and distressed horses. To add to the many difficulties some natives, who had been following them for some distance, approached the camp through the tall grass, but kindness and firmness combined ended satisfactorily a meeting that had at first presented many unpleasant features. Next day a mountain stream was passed and named Devil Creek, in itself a fitting commentary on the predicament of the explorers. Stubbornly they pushed on, but the position had now become so serious that the leader began to contemplate a return to Beagle Bay. Imbued with dogged courage and perseverance, and a consummate bushman, the difficulties must have been enormous when Alex. Forrest reached the stage of taking into consideration the question of retreat. After a tedious and dangerous climb of 800 ft. the expedition camped three miles further on. For two days it rested. Carey was still ill, and Matthew Forrest was suffering from sunstroke. Perceiving that it was useless to try and proceed in the general direction without first reconnoitring the ground to be traversed, Forrest left the camp next morning accompanied by one companion, in an attempt to plot out a route for their further advance. Moving in the direction of the Glenelg River he ascended a hill which he named Mount Hopeless, and got a view of the Stephen Range towards the Glenelg. As far as the eye could reach the endless zig-zags of the cliffs continued, interspersed here and there with deep, frowning, and rugged gorges, whilst the towering peaks with their bristling summits formed a panoramic scene of grandeur never to be forgotten—the embattlements of Nature in her sternest garb. Immensely impressed with the solemn and awe-inspiring view Forrest returned to camp, relinquishing all hope of passing the frowning barriers which lay between him and the Glenelg.

On June 25 the expedition moved to retrace its steps to the branching-off position on June 16. The difficulties

experienced on the advance again fell to its lot, and another horse was lost on this short journey. The outward track was followed to the former camping-place near the Fitzroy, and there the leader considered the paramount question of his future movements. After some deep thought Forrest decided on undertaking the gigantic task of an eastward journey to the telegraph line. This he considered infinitely preferable to attempting to return to Beagle Bay, where he considered supplies would be unobtainable. The Lennard River was reached on July 4, and the Fitzroy on the 8th, which formed a new starting-point for the eastward journey. With stern determination the travellers set their faces eastward, and with perfect confidence in the foresight and wisdom of the leader were assured that whatever fate had in store they would reach the journey's end in safety if human skill and endurance could accomplish the task.

Moving rapidly forward they came upon a portion of the Margaret River; during the journey naming Mounts Pierre, Krauss, George, and Barrett and Mueller Range. To their great delight the country became more open, and on July 20 they came upon a low range which was magnificently grassed. For a few days the journey was continued over splendid grassy uplands, whose pastoral capacities appeared almost unlimited, but on July 24 a rough and rocky range was encountered, being crossed only with difficulty. The meat rations had been slowly but surely diminishing, and they were compelled to kill one of the poor, tired horses for food. Both aboriginals were feeling severely the continued hardships of the journey, and were unfit for any exertion; so the leader decided to halt for two days to recruit the wearied party. Previous to this the Negri and Ord Rivers had been crossed and named, and on August 7 the toilsome journey was again renewed. The explorers were now in South Australian territory, and encountering another river it was named the Belin, and a range of hills the Connaught Range. The hardships of the journey were telling on every member of the party, but on the faithful aboriginal, Tommy Pierre, they fell very heavily indeed, and he had to be strapped to his horse.

The explorers reached Stirling Creek (so named by Gregory in 1856) on August 9, after passing through extremely rough country and suffering many privations. The 14th of the same month saw the dilapidated and wearied travellers in sight of the Wickham and Victoria Rivers. As game was very scarce and the rations were fast diminishing another horse was killed, and its flesh jerked for food; even reptiles were thought fit for the larder, as a snake 10 ft. long was killed and eaten by the half-famished explorers. The difficulties of the journey increased every day, and they were now to suffer from that curse inseparable from exploration in the interior of Australia—thirst. The country lying between the position they had attained and the telegraph line was

waterless, and they suffered untold agonies both of body and mind. In their present weakened state it appeared almost impossible to cover the distance, and not even on the previous expedition had Alex. Forrest met such a contingency as was now to arise. The heat was intense, being almost unbearable under the best conditions, and the horses were reduced to the last stage of exhaustion. After several unsuccessful attempts to negotiate this tract, the leader left the main body under Mr. Hill, and with one companion (Hicks) essayed to surmount the obstacle, and the evening of August 31 saw them in a most distressful condition. Forrest wrote in his diary on that night:—"We must hope for the best; we are in God's hands Who has guided us safely so far. To go back would be impossible; but, unless on our onward journey we reach water by this time to-morrow, we shall probably go to swell the list of those who have perished from thirst in the Australian bush." When it was dark they saddled their horses, and two miles away reached a dry creek, when Forrest's horse from sheer exhaustion lay down in the creek. The saddles were taken off and the exhausted men and horses attempted to secure repose. But as the wretched hours sluggishly moved on, they found that their anxiety of mind was too great to rest, and they determined to try and reach the telegraph line before morning. "At half-past ten," writes Forrest, "we set off, Hicks leading my horse and I following on foot. We had scarcely travelled a mile, when Hicks suddenly shouted that the telegraph line was ahead," and forgetting their thirst they cheered lustily. Offering a prayer of thanksgiving to the Divine Creator, they followed the line northward for three miles, coming on an iron tank full of water. On September 4 they met a party 50 miles

ALEXANDER FORREST.

from Katherine Station, and two days later, with good horses and plenty of water, they started back to relieve their companions, meeting them on September 11.

The party arrived at Katherine Station on September 19, and their trials and tribulations were now ended. Supplied with good horses by the South Australian Government, they reached Southport on October 6, and proceeded by boat to Palmerston. They returned to Western Australia *via* Sydney and the south coast, being enthusiastically received on their arrival. It was, however, to be the last trip of one member of the expedition, who though only of the rank and file was nevertheless one of the most indefatigable explorers in the Western land.

The illness of Tommy Pierre, the aboriginal, increased day by day, and he only lived long enough to reach King George Sound and to be buried in his own land. Both Sir John and Mr. Alex. Forrest have paid the highest tributes of respect to the memory of the aboriginals Windich and Tommy Pierre, and to them can be raised the noblest of all monuments that mortal man can have—"They did their duty."

No previous expedition undertaken in Western Australia had more far-reaching and important results than this of Alex. Forrest, who deserved far more than he received even at the hands of his grateful State. About 25,000,000 acres of pastoral land were discovered, and the colony recognized that some of the north-west areas were a valuable asset. The exploration of the Kimberley district, for so the whole came to be called, is an everlasting monument to the name of the man by whose indomitable courage, illimitable patience, and unerring bushcraft its potentialities were first made known.

## CHAPTER XI.

### RECENT EXPLORATION.

During the next few years exploration in Western Australia mainly consisted of a closer examination of country the general tenour of which was practically known, and to allow of more accurate survey for pastoral purposes.

In this regard the expedition led by Mr. John Forrest during the year 1883, in the immediate vicinity of

the Fitzroy and Ord Rivers, was mainly undertaken. He was accompanied by Surveyors J. S. Brooking, H. F. Johnston, G. R. Turner, and G. J. Walsh, and on landing at Roebuck Bay they examined a considerable portion of the Kimberley district. The intermediate country from La Grange Bay to St. George Range was most carefully examined, and found to consist in a very great

measure of rich elevated plains with abundance of water.

Round the lowest part of the Ord River the country was ascertained to be a fertile alluvium clothed with rich, luxuriant grass. The geological formation was also examined by Mr. E. T. Hardman, who was enabled to form a valuable geological map from the data he collected.

During the years 1883-1884 Messrs. W. J. O'Donnell and W. Carr-Boyd, exploring the country from the overland telegraph line in the direction of Roebourne, were fortunate in finding good country in the Kimberley district.

In the year 1883 and those immediately following, Mr. Harry Johnston, the present Surveyor-General, carried out some important surveys in the Kimberley district which were almost in the nature of explorations and well deserve mention. The more difficult portion of the work was undertaken during 1884.

In this year the party landed at Derby and extended the work from the Leopold Ranges to the South Australian boundary, near the junction of the Negri and Ord Rivers. To perform these surveys sufficient provisions had to be carried on packhorses for six months. This party was accompanied by Mr. E. T. Hardman, the Government Geologist, who performed some very valuable work.

Mr. Johnston returned to the Kimberley district in 1885. On this occasion he landed in Cambridge Gulf under View Hill, and went southwards to connect with his survey of the Ord River district in the previous year. The country was rough and picturesque, and Mr. Johnston voiced the opinion that it was more suitable for the pasturing of cattle than of sheep. A new species of kangaroo was discovered on this journey, and from every point of view the expedition was successful.

However, by far the most valuable portion of the work was accomplished by Mr. Hardman, and his geological survey, though of necessity hurried, can be said to have led to the first discovery of gold in payable quantities in Western Australia. In his first detailed description Mr. Hardman deals with the country from Roebuck Bay to the Fitzroy and Yeeda Rivers, thus covering an examination of the country north of the Meda River. In his report he recommended that a thorough search be made in the country between Napier Range and Mount Broome. As settlers, who had already penetrated as far as the Ord River, had reported the "colour of gold," Mr. Hardman examined this country and gave a very hopeful report. He found alluvial gold of a very encouraging character over many miles of country, and in conclusion expressed great hopes of finding payable gold in this country.

The nature of these reports stimulated interest in prospecting to a very considerable extent, and on August 5, 1885, a prospecting party—mainly composed of

residents of the Eastern colonies, in the persons of Messrs. Slattery, Hall, McCaque, Campbell, Nicholson, and Poult—left the "Yeeda" Station for the locality. The party held to the Panton River until it joined the Elvira. After following a dry creek for ten miles a waterhole was reached, near which was found payable gold, and in five or six days 10 oz. had been collected from the bed of the creek under a layer of drift sand.

It is not clear who actually was the discoverer of the Kimberley Goldfield, as, apart from the prospectors named, Mr. Carr-Boyd, a Victorian, now a well-known identity, laid claim to the honour. Prior to the discoveries of this prospecting party he had detached a parcel of stone from a reef and sent it to Melbourne to be treated.

Previous to the journey of this party, an ill-fated and unfortunate expedition was undertaken from Cambridge Gulf in 1884 by Mr. H. Stockdale, an experienced bushman, in order to explore the country in its vicinity. From the Gulf southwards he traversed well-watered and diversified country till Buchanan Creek was reached. Having formed his depot there, he hoped to make further explorations, but owing to certain irregularities which had occurred in his absence on a flying trip, he was compelled to start immediately for his destination, the overland telegraph line. Later, at their own request, he was compelled to abandon two of his companions, whom he left provided with all necessaries, and to whom a relief party was despatched immediately upon his arrival at the telegraph station. This and subsequent search parties failed, however, to discover any traces of the ill-fated men.

The general exploration was now carried out by prospecting parties, which in their search for the precious metal undertook expeditions where hardships of the severest character were encountered.

In 1887 the discovery of colours of gold at Moujakine led to the organization of the "Settlers' Association," which, with Government aid, fitted out a party, under the leadership of Mr. Bernard Colreavy, to explore the country to the eastward of Newcastle and Northam. They penetrated the country as far as the Yilgarn Hills, a distance of fully 200 miles.

About the same time a party under the leadership of Mr. H. Anstey, while prospecting in the same section, found rich specimens of gold-bearing quartz at Eenuin, which led to the more careful examination of the Golden Valley and Southern Cross districts.

Mr. Geo. T. Simpson, M.E., during the month of June, 1888, made a journey to the Hampton Plains on behalf of a private syndicate. He met with and reported on good country in that district, plenty of water and fair timber being found there.

The headwaters of the Gascoyne and Ashburton were explored in 1888-9 by Mr. Ernest Favenc, a well-known

Queensland explorer and historian. Setting out from Geraldton for the Upper Gascoyne, he crossed over to the headwaters of the Ashburton in the north and discovered three important tributaries of that river—the Cunningham, Jackson, and James—all running through magnificent pastoral country.

On March 14, 1889, Mr. W. H. Tietkins set out from Alice Springs to examine the hitherto unknown country to the north and west of Lake Amadeus. Entering Western Australia near the tropic of Capricorn late in May, he discovered and named the Kintore Range, 1,500 ft. high, to the north-east of Lake Macdonald, and ascended Mount Leisler. On the 31st of the same month he left for the lake, and its circuit having been practically completed, the Bonython Ranges were discovered to the south-east. On his return journey Tietkins passed through 60 miles of country supposed to be contained in the area of Lake Amadeus, but no vestige of this great natural feature could be seen, although the lake was subsequently found in another direction.

Mr. F. Newman, a Swede, in 1890 travelled from Fraser Range north-east to Queen Victoria Springs, calculated to be 135 miles distant. He described the latter part of the intermediate country as poor and covered with spinifex and stunted mallee.

The same year Mr. W. P. Goddard was sent by a private syndicate to report on the country to the north-east and east of Lake Lefroy, and in doing so he explored several districts previously unexamined. His most easterly position (in longitude  $124\frac{1}{2}^{\circ}$  east) was reached on September 12; the creek called by his name, and which is probably connected with the Ponton River in wet seasons, being discovered *en route*. About the same time the districts around Lake Lefroy and between that and Southern Cross were surveyed by Mr. Goddard.

Mr. Lindsay, the leader of the expedition fitted out by Sir Thomas Elder to complete the exploration of Australia—more especially the Western colony—left War-rina on May 2, 1891. Shortly after crossing the border Mr. Leech was despatched on a fruitless trip northwards to search for traces of the ill-fated Gibson, who had perished some seventeen years previously. The expedition then proceeded *via* Fort Mueller to Mount Squires, where water was obtained. Thence a south-west course was taken across the unknown Block A to Queen Victoria Springs. In latitude  $29^{\circ} 20'$  south, 270 miles from Mount Squires, the eastern edge of good pastoral country was touched. Upon reaching the springs they were found to be dry, and the intended further exploration from them as a base had to be abandoned, the party having to push on to Fraser Range; and this hasty trip through the desert from Mount Squires represented the only useful work done so far. Lindsay reported that when about half-way to the range, the travellers passed a good country of rich red soil producing good stock

bushes, but all extremely dry. A belt of country "worthy the attention of prospectors" was also met with. Having rested for some time at the range, they set out to examine, if possible, the western side of the desert they had just traversed, but want of water compelled them to take an extreme westerly course, *via* Mount Monger, to the Murchison, along which they passed through country mostly covered with miserable thicket on a sandy soil with granite outcrops. On January 1, 1892, they reached their destination, where the majority of the members left the expedition, and their leader was recalled to Adelaide. In his absence a flying trip was taken by Mr. L. A. Wells into the district known as Block A, lying between Giles' 1876 and Forrest's 1874 tracks. Starting practically from the depot at Welbun-dinum, he completed his examination of practically the whole block in about six weeks, between February 23 and April 4. In this expedition he travelled 834 miles, discovered some fine ranges and hills, a large extent of pastoral, and some auriferous country, but no permanent surface water. The total area explored in the two expeditions was 80,000 square miles, and the total mileage covered 2,745 miles.

During 1895 Mr. J. H. Rowe traversed the heads of the Gascoyne and Ashburton Rivers and the country south of the Ophthalmia Range, and mapped a fair extent of pastoral country, besides discovering some good waters.

Mr. C. A. Burrows in 1896 explored the country in latitude  $15^{\circ} 30'$  west of Cambridge Gulf to Mount Bradshaw and named the Drysdale and Carson Rivers.

In the same year, on July 16, Mr. L. A. Wells, chief of the Calvert Exploration Expedition, started from Lake Way to examine the country between the East Murchison and Fitzroy Rivers. Adopting a north-easterly course, a depot was formed in latitude  $25^{\circ} 54'$  south, longitude  $122^{\circ} 20'$  east, excellent waterholes and fair country existing in the neighbourhood. The period between August 10 and September 8 was occupied in a flying trip north-east through Mount Bates on a dry stage of 200 miles, till a good well was found in latitude  $23^{\circ} 23'$  south and longitude  $124^{\circ}$  east, whence a return was made *via* Giles' 1876 route. Leaving the depot finally on September 14, the party at length reached Separation Well. Thence travelling along the meridian of Joanna Springs, and upon subsequently reaching that point north-north-east, it struck the Fitzroy River on November 6, a little north-west of Mount Tuckfield, a distance altogether from Mount Bates of 500 miles. Most of this was the usual spinifex and sand-ridge country, and the last 300 miles were almost destitute of camel feed or water—in fact, the party was compelled to abandon five beasts, and had the greatest difficulty in saving the others. At Separation Well Messrs. C. F. Wells and G. Lindsay Jones were, on October 11, sent on to examine

the country bearing west-north-west for 80 or 100 miles, and thence north-east to cut their leader's track about 30 or 40 miles south of Joanna Springs. On his arrival at the rendezvous six days later than had been expected, Mr. L. A. Wells not finding the two men naturally concluded that they had arrived previously and had been compelled to push on to the Fitzroy. The fate of the unfortunate men has since been ascertained, their bodies being found by Wells some months afterwards 14 miles west-south-west from the springs. Their journal disclosed the fact that, being unable to proceed owing to the heavy nature of the country, they retraced their steps, and striking the expedition's track followed it northwards, only to perish from want of water about November 15. As soon as the news that two of the party were missing reached Perth, energetic efforts were put forth by the Western Australian Government; and on December 19 Mr. W. F. Rudall left "Braeside" Station on the Oakover River in charge of an expedition to follow up the river and its branch, the Davis, thence striking eastward to cut the tracks of the missing men. After leaving Christmas Pool some distance south-east of Mount Macpherson, Rudall, guided by blacks, came upon a camp into which footsteps, supposed to be those of the persons sought, were traceable. Here, unfortunately, all tracks were lost, and he was obliged, through his camels failing him, to return, though reluctantly, to his starting-point. He immediately organized a second trip, but after strenuous though fruitless efforts, the party engaged on this expedition was also driven back owing to the insuperable difficulties encountered. Rumours, supplied by natives, of straying camels, etc., having reached Rudall, it was considered wise to make a further search to the south of the Oakover River, and accordingly, on February 7, 1897, he again set out. The course of the river being followed for some distance the latitude of the tropic of Capricorn was reached, and in longitude  $120^{\circ} 10'$  east the bodies of two men, supposed to have been murdered by natives, were discovered. Returning *via* "Roy Hill" Station to Nullagine a report of the find was sent to Perth; but, after due consideration and medical examination, it was decided that the remains were not those of the missing explorers, and a final attempt was made to solve the mystery surrounding the fate of the two men. Rudall, leaving "Braeside" Station on April 9, visited Separation Well, and attained a point 60 miles south of Joanna Springs before returning to Braeside, which was finally reached on June 23. Although these journeys proved unsuccessful in their object, it cannot be said that the work was fruitless, since Rudall had travelled over an area of 23,000 square miles, and had obtained a large amount of information not previously possessed concerning the physical features of the country examined.

From June 17 to September 13, 1896, Mr. A. Mason,

a Government officer, was engaged in examining the south-eastern district of the colony, lying between Kurnalpi and Eucla, into portions of which rabbits were supposed to have penetrated. He claimed to have discovered several millions of acres of some of the finest pastoral and agricultural country in the world, but reported a very poor supply of surface water. This important belt of land lies between  $125^{\circ}$  east longitude and the South Australian border, and south of about  $30^{\circ}$  south latitude. These plains were partly examined by Sir John Forrest during his 1870 overland trip to Adelaide, and both he and Captain Delisser in 1865 spoke of them in terms somewhat similar to those used by the later explorer.

In the same year an expedition was sent, under the auspices of the South Australian Government, from Oodnadatta to Coolgardie to open up, if possible, a stock route between the two places. The leader, Hübbe, entered the colony near Mount Hinckley, below  $26^{\circ}$  south latitude, and keeping to the south of that parallel, followed Forrest's 1874 route through Barlee Springs as far as Mount Allott, and thence south-west by Ernest Giles Range travelled to Lake Wells. The remainder of the journey to Menzies and Coolgardie, by De La Poer Range and Mackenzie's Well, where a good supply of water was obtained, was through comparatively well-known country. Hübbe arrived at the latter place in August, and left sometime afterwards, returning *via* Eucla to South Australia. The report on the country traversed only confirmed those of previous explorers.

On July 20 an expedition, equipped and led by the Hon. David Carnegie, left civilization at Doyle's Well, some 50 miles south of Lake Darlöt, to strike across the continent in a north-north-easterly direction, in the hopes of finding gold-bearing or pastoral country in the great desert lying between latitudes  $19^{\circ}$  and  $28^{\circ}$  south and longitudes  $122^{\circ}$  and  $129^{\circ}$  east, which hitherto had only been crossed from east to west or *vice versa*. Travelling over a long stretch of dry country, during which journey the camels were without water for thirteen and a half days, they reached a soakage 45 miles south-south-west of Alexander Spring, which afforded water. Proceeding on past the spring, which was dry, a few low sandstone ranges and hills were found, and occasionally in the valleys belts of bloodwood and a few shrubs edible to camels; but most of the country was a continuous waste of sand ridges. From latitude  $20^{\circ} 40'$  to latitude  $19^{\circ} 20'$  south, these were again broken by occasional high tablelands and sandstone cliffs, from which small creeks ran into the sand, fine rock-pools, such as Godfrey's Tank, being found at their heads. On the outgoing trip, the only permanent water—Helena Spring—was found in latitude  $21^{\circ} 20'$  south in limestone formation. Within 50 miles of Hall's Creek one of the party, Mr. Charles Stansmore, lost his life through a gun

accident. On reaching that township on December 6, Mr. Carnegie heard of the disaster to the Calvert Expedition, and at once offered his assistance, but relief parties had already been despatched. After a badly-needed rest the expedition left Mr. Stretche's cattle station in the beginning of April, 1897, and travelled down the Sturt Creek to its junction with Gregory's Salt Sea, in which were found numbers of wild fowl and fish. Following thence a generally southerly direction parallel to the border, sand ridges commenced about latitude  $25^{\circ} 30'$  south, and continued in almost unending monotony as far south as the Rawlinson Range. A range of considerable size, the Stansmore, was found in about latitude  $21\frac{1}{2}^{\circ}$  south, but neither auriferous nor pastoral country appeared to exist in its vicinity. Thence a southerly course was taken to the eastern end of Lake Macdonald. The sand ridges in this district were so frequent that in eight hours' travelling eighty-six of them were passed over. From here a southerly and south - westerly course was taken past the Rawlinson Range, till the outward (1896) track was struck near Alexander Spring. Much-needed water was found in the bed of Blyth Creek, and a

welcome fall of rain filled the spring itself. Crossing Lake Wells, and cutting the Erlistoun Creek near its head, the first auriferous country seen since leaving Hall's Creek was met with. From this a course was shaped through Lake Darlôt to Coolgardie, which was reached in August, the expedition having travelled 3,000 miles in eight months. No permanent water was found after leaving Sturt Creek, and the impracticability of a direct stock route being opened between Kimberley and the North Coolgardie fields was proved beyond question. It was, moreover, clearly shown that the desert traversed, with the possible exception of small and isolated patches, contained no auriferous country.

During a period from May to October, 1897, Mr. Hugh Russel was engaged on a gold-prospecting tour. From Crawford's camp, 60 miles north-north-east of Mount Margaret, a course was steered *via* Mount Shenton to Mount Squires, the journey being mostly

over desert country. The whole district in this neighbourhood, including the Barrow, Warburton, and Cavenagh Ranges, was carefully examined, but little good country discovered. Returning on his outward track, no water was found from Melango Creek to Kirkpatrick's Well, which stage occupied thirteen and a half days.

On April 1, 1896, Mr. Frank H. Hann, a Queensland squatter, started from Lawn Hill, on the Gulf of Carpentaria, to prospect the north-west interior of Western Australia for pastoral country. His party consisted of one white man, six Queensland blacks, and sixty-seven horses, nine of which belonged to his white companion, who accompanied him as far as Roebourne. The Ord River was struck in about latitude  $16^{\circ} 37'$  south, and followed up to Hall's Creek. An attempt was made from here to find a track through the desert to the head of the Oakover River, but had to be abandoned, and a course

made for Derby along the Fitzroy River.

From Derby Mr. Hann went on with his party to Broome, Condon, and Roebourne. After replenishing his stores at this latter place he followed the Fortescue River to its head, and thence north-east to Nullagine. From here Mr. Hann made a trip eastward

into the desert, where he met Mr. Rudall, who was searching for the lost members of Wells' expedition. So far Mr. Hann's trip had been barren of results, and the loss of horses was so great, that on his arrival at Derby he was about to return to Queensland, when he met Police Inspector Ord, who advised him to try the Leopold Ranges for gold. This he decided to do, and a start was made for Mount Broome with six Queensland blacks, thirty-one horses, and two dogs. Great trouble was experienced in crossing the Leopold Ranges on the west side of Mount Broome, but an examination of the country to the north and east for about 30 miles so satisfied Mr. Hann that he decided to return at once to Derby and take up land in the district just visited.

On his leaving Derby, Inspector Ord joined the party, and the River Adcock, which had been explored and named on the first trip was followed down to its junction with the Fitzroy River. A high and impassable

BLUFF OF COCKBURN RANGE (FAR NORTH).

range, running north-east and south-west of the river on its south-east side, was named Sir John Range, and a lofty table-top was called Mount Brennan. Blacks here were very numerous. The Fitzroy River was then followed up to an impassable gorge, 200 ft. deep, with precipitous sides, which was named Sir John Gorge. To get round the range the course was altered to north-west, where splendid cattle country was noticed, and then to the south-east. A fine river from the north-north-west was struck here, which forms a junction with the Fitzroy River about half a mile above Sir John Gorge. This river was named the Phillips by Mr. Hann, but the name was afterwards altered to the Hann River. On this river, four miles above its junction with the Fitzroy, a tree marked by Mr. Robert Buttons,  $\frac{n}{4}$ , was discovered. Ten miles above the junction the river is a quarter of a mile wide, and splendidly adapted for watering stock; it has clear, running water, low banks, no bogs, the margin solid sand, and the stream opens up every now and then into large waterholes, all of which were found to be full of crocodiles, a harmless species, about 6 ft. to 8 ft. long, living principally on fish. About 20 miles up this stream a small lake was found on the right bank of the river. The lake was three miles in circumference and very deep, and was named Gladstone Lake. On the lake and river geese, ducks, waterhen, and many other kinds of game were in abundance. The whole country was found to be intersected with rivers, creeks, and lagoons, the timber on the river consisting mainly of coolibah, box, plum, gum, magnificent bloodwood, bauhinia, kurrajong, and baobabs. One of the latter trees was measured, and found to be 45 ft. in diameter, and rose perpendicularly to a height of 100 ft. In  $16^{\circ} 45'$  south latitude, the Hann River takes a northerly course, and runs through gorges into a rough range of hills, which were named the Caroline Ranges. About 25 miles west from here a large creek was met with, and called the Charnley. The travelling was exceedingly rough, and the horses in a bad state for want of shoes. In the Charnley some bream were caught, and the river was then followed down through very rough country to an impassable gorge cut through a range of high basalt hills. This range was named Edkins. It was covered with immense stones as slippery as glass. A new kind of palm was discovered here, with a succulent head, which formed a splendid vegetable something akin to cabbage. The Leopold Ranges were again crossed by means of a pass at the head of the Barker River, near Mount Hart. Mr. Hann was of opinion that a good dray road could be made over the ranges at this point. Natives were very numerous throughout this country, but very wild and unapproachable. They were without covering of any kind whatever, but iron implements were discovered in their camps.

The last described exploration was carried out in

June, July, and August, 1898. To quote Mr. Hann's own words, he "never saw better watered country in his life."

The next expedition was to be manned and equipped locally, and was to be the means by which much valuable information was acquired and tabulated.

During the month of April, 1901, the Government despatched a well-equipped party, under the leadership of Mr. F. S. Brockman, with Mr. Charles Crossland as second in command, to explore the extreme northern end of the State, lying between the 17th and 14th parallels of latitude, and west from the 128th meridian. That the investigation of the resources of the country might be complete, the party was accompanied by Mr. Gibb Maitland, the Government Geologist, and an assistant geologist, and Dr. F. M. House as naturalist. To use Mr. Brockman's own description of his trip:—"Leaving the port of Wyndham on May 9, the party proceeded in a southerly direction, following the course of a previously unexplored river (named the Chamberlain) to the 17th parallel, and proceeded thence westerly, principally over high sandstone tablelands, to the Charnley River, which had been explored and named by Mr. F. Hann, in 1899. Mr. Hann's position of this river and the neighbouring features were found to be geographically accurate. The party then traced the Charnley and Isdell Rivers westerly from Hann's exploration to their respective points of exit in tidal waters. They also traced the course of the Sale River and tributaries (discovered by Mr. T. C. Sholl in 1865, but placed too far south by him), and the course of the Glenelg River (discovered by Sir George Grey in 1837, and also previously shown in error of latitude). They discovered and traced the course of the Calder River, and the head waters of the Prince Regent River; located the positions of the tidal waters extending inland from Collier and Doubtful Bays, and generally investigated the country lying to the south-west and south-east of the main watershed, which is situate about the 16th parallel of latitude, and to the westward of the 126th meridian. From the northern fall of this watershed the Roe River was traced from its source to its exit into the tidal waters of Prince Frederick Harbour. The Moran River was discovered, and its course between the same points traced. The head waters of the King Edward River were discovered at the watershed, and this river was again picked up in about latitude  $15^{\circ} 15'$ , and its course traced northerly to its exit into Napier Broome Bay. Portions of the shores of Admiralty Gulf, Vansittart and Napier Broome Bays, were closely examined with a view to selecting a suitable port for the district. The Drysdale was traversed from its mouth (on the 14th parallel of latitude) to the main watershed previously referred to on the 16th parallel. At the same time a sufficient number of points on the Carson River were located to enable it to be mapped with approximate

accuracy. The Durack River was traced from the 17th parallel of latitude to its entrance into the tidal waters of Cambridge Gulf. The whole of the country drained by the rivers already enumerated was investigated as closely as practicable in an exploration of this description, all high points met with being ascended, and short excursions being made at right angles to the main line of travel wherever practicable. The exploration was completed on November 20 by the arrival of the leader and his party at the Pentecost River, at a point previously fixed by him on May 18. The practical results of the expedition consist of the discovery of a large area (6,000,000 acres) of basaltic pastoral country covered with blue grass, Mitchell and kangaroo grasses, and many varieties of top feed, lying principally in the neighbourhood of the Charnley, Calder, Sale, Roe, Moran, and Carson Rivers, with some extensive areas in addition situate on the Drysdale, and in smaller patches in the neighbourhood of the Durack and its tributaries. In addition, the existence of suitable ports and routes of access to enable this country to be utilized for stock raising was ascertained. Many objects of scientific interest amongst the flora and fauna of the district were discovered and brought back by the party. A few aboriginal weapons and implements and a large number of photographs of curious cave paintings were obtained. A considerable amount of information was also obtained with regard to the numbers, habits, and distribution of the aborigines of the country."

In the same year, 1901, a preliminary examination of the country between Kalgoorlie and Eucla was made by Mr. John Muir, the Inspector of Engineering Surveys, in connection with the proposed transcontinental railway. The object of the expedition was to obtain further information regarding that tract of country lying between the Coolgardie Goldfields and the South Australian border, south of the 31st parallel of latitude, with a view, in the first place, of determining the probable cost of constructing a railway through that country, and, secondly, of ascertaining the nature and resources of the country proposed to be crossed. Muir took with him three months' supply of provisions, eleven carrying-camels, and five riding-camels. The latter were required to explore the outlying country for as great a distance as possible on both sides of the line followed by the main caravan, and to search the surrounding country for water. Two were utilized on one side of the line of march, and two on the other side; the fifth was kept as a reserve. The expedition left Kanowna on May 16, followed the north-west side of the lake country as far as Kurnalpi, and from there turned south-east to Cardinia, a granite rock lying about 50 miles east of Bulong, which was reached on the 23rd. Here the camels were given a four days' spell, while Muir examined the country westwards towards Bulong, and two members of the

party were sent ahead to see what the Jumana water supply was like. A move was made to the latter place on the 28th, and thence the expedition proceeded to Goddard's Creek, about 60 miles further on, two men again being sent ahead to examine the prospects of finding water. While the caravan followed slowly the camel pad made by the advance party, Muir examined the country for about ten miles on either side of the line of march. On the 31st the two men were met, who brought news that they had discovered a soak. On June 2 the creek was reached, the camels having been five days without water. Later on a dozen or more similar soaks were discovered, but the supply in every instance was very limited. Mr. C. H. Babington, who was Mr. Muir's chief assistant, found a good soak some 12 miles down the creek, and the main caravan was moved on to it on June 4. Muir meanwhile, with two men, three camels, and a week's provisions, went north to examine the country, having been informed that frequent rumours were heard from the natives of the existence of a "big water" never yet seen by white men, but supposed to be situated 20 or 30 miles east or south-east of Victoria Springs. Having, however, continued his excursion for over 50 miles without finding any water, he returned to camp on June 8. On June 10 the country in the neighbourhood of the camp was explored, and as a result of this examination the camp was shifted on June 11 to a soak nine miles eastward, in the bed of the creek. Babington, who had been exploring ahead of the expedition, here rejoined the party, and reported that water was obtainable 30 miles down the creek. Another exploration northward for water, commenced on the 16th, proved as fruitless as the former one, and on the 21st Muir returned to the main camp on Goddard's Creek. Babington unfortunately had been equally unsuccessful to the eastward. The leader of the expedition therefore decided to make for Eyre, about 150 miles to the south-east. On the morning of June 25 the main caravan started for Yayouldle Rock; Babington, who was in charge, being instructed that, failing to find water there, he was to proceed to Eyre. On the same date Muir himself, with one man and two camels, started to examine the country along the probable course of the railway. Being unable to find any water, he also proceeded to Yayouldle Rock, which he reached on July 1, and where a small supply of water was found. On the following day he climbed the hills in the neighbourhood to look for the main caravan; on returning to camp he found Babington waiting for him there, who informed him that the caravan was some 20 or 30 miles on the road to Eyre. With all despatch Muir then pushed on to the latter place, reaching there on July 3, to find that the main party had arrived on the previous evening. From Eyre he sent the main caravan to "Mundrabilla" Station, on the coast, about 100 miles further eastward, where

water could be relied upon, while he himself, with two men, started out to work the inland country. He left Eyre on July 6, and after travelling 70 miles north went eastward 100 miles, and then 30 miles southward to Mundrabilla. Nothing of any moment occurred on this trip worth particularizing, and on reaching Mundrabilla on the 14th, he found that the camel train had arrived the previous day, and that Babington, with one man, had gone on a previously arranged special trip, 60 miles out, in a northerly direction. On the 17th Muir left, with one man and two camels, to examine the remaining portion of the line to Eucla, from a point about 30 miles north of Mundrabilla, the main caravan travelling to the latter place along the coast. Muir arrived at his destination on the 19th, the caravan arriving on the 20th. On the 29th the return journey was begun. About 50 miles north from the coast the westward course commenced, in latitude 31° south. At Wadalynia Rock, on August 12, a splendid water supply was found, and on the 16th another still more plentiful. Goddard's Creek was reached on the 20th, and Bulong on the 29th. The total distance travelled was about 1,100 miles. The country traversed was mostly waterless, though well grassed and timbered; game—kangaroos, emus, and turkeys—were fairly plentiful in the vicinity of the rock holes.

In April, 1903, Mr. F. H. Hann left Laverton to explore the country to the eastward of that place. After an absence of thirteen weeks, he returned to the starting-point, and reported the discovery of a practicable stock route to the Warburton Ranges. On leaving Laverton, an easterly course was kept as far as the 126th meridian, thence northerly to the Townsend Range, which was reached on June 30. A fortnight was spent in the examination of the country to the northward and west to Elder Creek. Mr. Hann reported it to be well watered and splendid pastoral country, containing upwards of 1,000,000 acres. Mineral indications were noticed, whilst natives were also observed to be numerous amongst the ranges. On the homeward journey only slight deviations were made from the outward route, Laverton being reached on August 8.

During 1911 a trip for the further exploration of the Kimberley district was mooted by Mr. C. Price Conigrave, F.R.G.S., who had been for some considerable period the senior assistant in the Western Australian Museum, but who had at that time severed his connection with the institution. The proposal of Mr. Conigrave received the support of the Government, and he at once undertook to get the necessary equipment, being ably assisted by the valuable counsel and support of Mr. F. S. Brockman, of the Survey Department. Associated with Mr. Conigrave on the trip were Messrs. L. McK. Burns and R. N. Collison. At Wyndham, the starting-point, the party was augmented by the inclusion of two local residents and two aboriginals; and before

actually commencing the more serious portion of the trip, two months were spent in exploring the country from that point towards the South Australian border. During this journey were found large belts of pine forests, the commercial value of which was deemed very high. In June a start was made on what was called "the big trip." In order to cross the head waters of the gulf it was necessary to make a detour round the south of Cockburn Range, and then to circle to the north through the ranges which flank the western side of Cambridge Gulf. Forrest River was reached at a spot some 20 miles from the mouth, where it had been arranged that a supply boat should put in about the middle of August. The boat duly arrived, and restocked with provisions the party set out from the river at the end of August. It was with great difficulty that a crossing was effected owing to the precipitous banks, and the party could only proceed very slowly. On the way to the head of the gulf a fine river was met with and named the Berkeley, after an elder brother of the leader. This was followed for a distance of nearly 70 miles, and as it was flowing at the time many magnificent reaches and pools were encountered.

After a fortnight spent in the neighbourhood of Mount Casuarina, a course was laid for the Drysdale River. On the way another stream was met with and named the King George River; this was found to empty into the sea near Cape Rulhieres. After some extremely rough country had been negotiated, the travellers reached the Napier Broome Mission on October 22. Whilst waiting at this point for supplies the party explored the country 100 miles to the west of Admiralty Gulf, and followed more or less the course of the King River, which Mr. Brockman had discovered in 1901. On the return a more southerly course was followed, and being unable to get the whole of the provisions required the party was faced with a journey to Wyndham of 350 miles with about a week's provisions. After passing through much rich country it reached Wyndham about the end of the year, having gained much valuable information regarding the country traversed.

In viewing the history of exploration in Western Australia from its very inception to the present day, perhaps the most remarkable feature throughout the whole story has been the presence of indomitable courage and perseverance.

To lay bare its boundless possibilities and also its many disadvantages could only have been essayed by a race animated by the truest courage and sternest determination. The fact that the large proportion were native-born Australians is an indisputable proof that even under sub-tropical skies there has been no deterioration in the inherent courage of the people. The journeys of the brothers Forrest, and the single-heartedness of purpose and aim that ever characterized their efforts are

alone a sufficient proof of this, without quoting other and equally famous examples.

One of the greatest characteristics of the British race is its devotion to duty; and surely no sublimer example is to be found in the annals of the British people than that which evidences how men have calmly and unmovedly performed the common duties of the daily task when faced with the most terrible of all deaths—that of thirst. It is true, nevertheless, that Australians do not adequately conceive the nobleness of their "Island story," especially when the difficulties of pioneering in Australia are under consideration. No thrilling tales of danger by flood and field go to embellish its stern reality; no hairbreadth escapes from the wiles of ferocious savages, or but few, can be recounted to stir the blood—but only the steady conquest of Nature in her most inhospitable mood. Verily, to those who may delight in sensational

incident and miraculous deliverance from dangers which stir the pulses, the story of the hardy explorers of Australia during the nineteenth century will appeal but little. Yet the courage displayed in the journeys described in the foregoing pages was of an infinitely higher order. Absent, indeed, is all that romantic setting which makes for public acclamation and popular enthusiasm; but looking deeper, we can trace the clear acceptance of responsibilities of so stern a nature that they should lead to a truer and higher appreciation of these efforts than they have had, even in their own land. However, for the mistakes and misunderstandings of the

past the present is in no wise to blame; but in perpetuating those errors the previous culpability and neglect is only increased, and the hope might be expressed that the story of exploration in Australia will in the future meet with that respect and appreciation it so richly merits.

**BIG POOL ON GRANT CREEK (FAR NORTH).**

## Educational.

### THE UNIVERSITY OF WESTERN AUSTRALIA.

The movement in favour of establishing a University in Western Australia may be said to have been in the air for many years past, but until very recently the actual steps towards a consummation have been few. The earliest definite step was taken in February, 1898, when the Adelaide University Extension Committee was formed. From that time until the present, Adelaide University in co-operation with this Committee has held examinations regularly for the Junior, Senior, and Higher Public certificates, and for a portion of the degree work in various branches of learning. Adelaide University in this way has done much to bridge the gap that existed in our educational system, so far as the examining side is concerned, through the absence of a local university. But, whilst every credit must be given to Adelaide, to the authorities of which the warmest thanks of Western Australia are due for the assistance thus rendered, it is felt that Western Australia has now reached the stage where more is required than examinations—the stage where, if education is to be effective, there must be that higher teaching in literature, science, and art that a university alone can supply. By the affiliation of our Technical School, Adelaide has in some measure endeavoured to help us in this direction also, but that help necessarily falls very far short of the full measure of our requirements.

In addition to the work of carrying out examinations, the Extension Committee has taken in hand the delivery of public extension lectures, and has succeeded in arranging annually for some years past a series of lectures by professors and lecturers of proved ability and standing in Great Britain and the Eastern States. Lectures of a similar character have also been arranged by the Swan River Mechanics' Institute (now the Perth Literary Institute) and other bodies.

The question seems not to have been mooted in Parliament until 1901, when a motion advocating the establishment of a University was brought forward in the Legislative Council by the Honourable R. S. Haynes. The motion was discussed at length, amended on the motion of the Honourable J. W. Hackett, and ultimately adopted in the following terms:—"That this House is of opinion that the advisability of at once establishing a University or University Institute demands, in the best interests of the State, the immediate consideration of the Government."

No further steps were taken until 1904, when Parliament passed an Act creating a University Endowment Trust, and granted to the Trustees under that Act about 4,000 acres of suburban lands, and some other blocks in various parts of the country, as the nucleus of an endowment for a University.

In 1906 the University Graduates' Union was founded with the object of banding together the University men who were resident in Western Australia, and thus in some measure endeavouring to educate public opinion in favour of a University.

In the same year Dr. Hill, Master of Downing College, Cambridge, came out under engagement to the University Extension Committee, and advantage was taken of his presence to hold a public meeting in Queen's Hall for the purpose of discussing the question of a University. At this meeting, held in September, 1906, at which Dr. Hackett presided, the following resolution was passed on the motion of the Bishop of Perth, seconded by Dr. Hill:—"That this meeting records its opinion that the time has come when a University should be established in Western Australia." The meeting further pledged itself to support the movement, and requested the Endowment Trustees and the Extension Committee to act in conjunction in the matter.

In June, 1907, a deputation from the University Graduates' Union waited upon the Minister for Education, and urged that a charter be granted for an examining University. The Minister expressed himself as favourable to the idea, but suggested that the Union should consult with the Endowment Trustees. The result of such consultation was that the idea of a merely examining University was abandoned, as it was felt that a teaching institution should be the goal towards which all efforts should be primarily directed.

In the following month, a sub-committee of the University Extension Committee, which, under the Chairmanship of the Right Rev. Bishop Riley, had been considering the question, brought in a report advocating as a fundamental principle that the University should be a teaching as well as an examining body.

Further action was taken in the beginning of 1909, when, on February 5, the Government appointed a Royal Commission charged to report to His Excellency the Governor "upon the question whether the time is opportune for the establishment of a University in this State,"

and, if so, to advise upon various matters in connection therewith.

The Commission consisted of the Honourable Sir Winthrop Hackett, M.A., LL.D. (Chairman), the Right Rev. the Bishop of Perth, Sir Walter James, the Honourable H. Briggs, M.L.C., Dr. A. J. Saw, Dr. J. W. Smith, the Rev. Bro. Nunan, and Messrs. T. H. Bath, C. R. P. Andrews, M.A., W. E. Cocke, M.A., and F. B. Allen, M.A., B.Sc., with Mr. J. S. Battye, B.A., LL.B., as Honorary Secretary. After exhaustive consideration the Commission, in September, 1910, recommended unanimously that a University should be established, and in order to facilitate matters, framed a draft Bill for the approval of the Government. The report, with a Bill on the lines suggested, was placed before Parliament during the session, and was passed on February 15, 1911, the date of its operation being left to proclamation. Various matters caused some little delay, but on February 13, 1912, the Act came into force and the first Senate was appointed. This body, which is to continue in office until the establishment of convocation, consists of the Honourable Sir Winthrop Hackett, M.A., LL.D., the Honourable T. Walker, M.L.A. (Minister of Education), Sir Walter James, K.C., the Honourable N. Keenan, K.C., Mr. J. W. Smith, LL.D., the Honourable Frank Wilson, M.L.A., the Honourable T. H. Bath, M.L.A., Dr. A. J. H. Saw, Dr. Gertrude Mead, Mrs. M. L. Moss, B.A., and Messrs. C. R. P. Andrews, M.A., J. S. Battye, B.A., LL.B., F. W. Burrows, W. C. Grasby, J. W. Kirwan, M.L.C., G. M. Roberts, A. Sandover, and W. Somerville. At the first meeting of the Senate, convened by His Excellency the Governor, Sir Winthrop Hackett was unanimously elected Chancellor.

Since its appointment the Senate has been busily engaged in organizing the University, in the hope that actual teaching work may be started early in 1913. Mr. Hugh Gunn, M.A., was appointed Organizer, and applications were called for Professors for the following Chairs:—English Literature, History and Economics, Mathematics and Physics, Mining and Engineering, Chemistry, Geology, and Biology, as well as for a Chair of Agriculture, the endowment for which was generously provided by the Chancellor. It was also decided to appoint Lecturers in Philosophy, Classics, Veterinary

HUGH GUNN, M.A. (Edin.), M.A. (Cape), the organizer of the University of Western Australia, was born in Sutherlandshire, Scotland, on May 20, 1870, and is a son of Mr. Alexander Gunn, of Sutherland. He received his education at the Aberdeen Grammar School, where he was awarded the Arthur Johnson medal in Latin, by the votes of his class fellows, and obtained first place in almost every sub-

ject of the curriculum with a record percentage of marks. He was also dux of the school, from which in due course he passed to the Aberdeen University. Here he was 1st Prizeman in English Language and Rhetoric, 2nd Prizeman in Latin and 3rd in Greek, and was 5th in Natural History; at the time of leaving holding the leading position for the Gold Medal offered by the Town Council for the best student of his

year. Mr. Gunn was the winner of numerous bursaries or scholarships by open competition in the various schools and colleges, and after his second year in Aberdeen University he proceeded to the University of Edinburgh, where his career was a very distinguished one. He was 2nd Bursar at the Entrance Competition for the 3rd year, Prizeman in Moral Philosophy and in Logic, and Psychology, and also 1st for an essay on

Science, and Modern Languages. Up to the present the following appointments have been made:—

*Professorships:—*

English Literature—W. Murdoch, M.A.  
History and Economics—E. O. G. Shann, M.A.  
Mathematics and Physics—A. D. Ross, M.A. D.Sc., F.R.S.E.  
Mining and Engineering—H. E. Whitfield, B.A., B.E.  
Chemistry—N. J. M. Willmore, D.Sc.  
Biology—W. J. Dakyn, M.A., D.Sc.  
Geology—W. G. Woolnough, D.Sc.

*Lectureships:—*

Classics—G. Wood, M.A.  
Philosophy—P. Le Couteur, M.A.  
Modern Languages—E. C. Suddard, L.esL.

In the matter of a permanent site for the University buildings there has been considerable discussion. After exhaustively reviewing the merits of the various sites suggested, the Senate decided upon Crawley, a large estate on the banks of the Swan. As to the wisdom of the choice there are pronounced differences of opinion, and both Parliament and the Press have expressed their views at length. In any case, the matter is largely one for the future, as it is generally recognized that for the next few years it will be most convenient to carry on the work in temporary premises close to the city and easily accessible to students.

In one respect the Senate has departed from Australian University traditions. Following the newer State University systems of the United States, it has decided that tuition shall be free, so that no student in the community may be debarred through lack of means from securing the highest education that the State can afford. The idea is democratic in the extreme, and its working will be watched with interest by all educationalists in the Commonwealth. Those who favour it are, however, thoroughly convinced that the experiment will succeed.

Many things remain to be done before the University can be considered *un fait accompli*, but if desire and earnest endeavour can make it so, Western Australia will soon possess an academic seat worthy to be compared with the older institutions of the Eastern States.

"The Ethics of Aristotle" in the Honours Greek Class. Subsequently, at Gray's Inn, London, he won the Bacon Scholarship of £90 for constitutional and general and legal history, which is the premier prize of the Inn, and was also awarded a special prize by the Inn for an essay on a subject of "Historical Research." He took the teacher's diploma of the Scotch Education Department, and founded and organized the Secondary Departments of Golspie and Brora Higher Grade Schools, of which latter he was principal. In connection with the Department of Education he assisted three out of the four present Chief Inspectors of Schools for Scotland in their districts for three years, during which period he visited nearly one thousand schools, including the secondary schools and training colleges. In 1902 Mr. Gunn was chosen as chief inspector of schools and organizer of education in the Orange River Colony Concentration Camps, towards the conclusion of the Boer War, and filled the appointment of Director of Education in the Orange River Colony from 1903 to 1910. In this capacity he reorganized the educational system of the colony, had most of the schools rebuilt, and proposed and carried through the scheme for the establishment of a State University College, taking the personal management of this and other scholastic institutions until the appointment of Governing Councils in 1910. In 1904 he was elected a member of the Legislative Council, with charge of education in the Orange River Colony, and was responsible for the passing of two education ordinances through the House. He was Chairman of a Government Commission to inquire into Technical Education in that year, and some years later was a member of the Inter-State Government Commission that inquired into the question of University Education in all the

States of South Africa. He was a member of the Governing Council of the University of the Cape of Good Hope, for the degrees of which all the University Colleges present their students. He was a representative in the Conference between the Government and representatives of the Dutch people that came to a settlement on the language question in 1905. In the same year he was commended in a despatch to the Secretary of State by the High Commissioner of South Africa for presiding at a conference of the heads of eight different churches and negotiating a

education to be all unsound, anti-British in intention, and calculated to drive British teachers out of the country. Mr. Gunn's resignation and the attempts made to make Dutch compulsory as a language and a medium of instruction for every child, English as well as Dutch, led to the establishment of a system of private schools and created great bitterness of feeling throughout South Africa. In 1912 the Union Government intervened and had the legislation altered, and laid down conditions regarding the language question which, in the main, followed Mr. Gunn's original proposals. He was one of the preliminary committee which arranged for a Conference of the Universities of the Empire, which was held in July, 1912. In 1911 he accepted an appointment for two years to organize the University of Western Australia. In connection with this appointment letters were received by the local committee from Sir Charles Lucas, of the Colonial Office, Mr. H. F. Wilson, late Colonial Secretary and Acting Governor of Orange River Colony, Mr. E. B. Sargent, late Director of Education in South Africa, Lord Milner, and Lord Selborne, ex-High Commissioners, speaking in glowing terms of Mr. Gunn's exceptional qualifications, his organizing and administrative powers, industry, and business methods, and describing him as a clear and forcible speaker and writer and a leader in education in the highest sense of the word. Mr. Gunn is the author of several publications, including "Reports on Education in the Orange River Colony," "The Language Question in the Orange River Colony," and "Education in South Africa," and contributions to the British Association and the South African Association for the Advancement of Science, etc. He was married in 1900 to a daughter of Mr. William Macdonald, of Sutherland.

Bartolotto. Mr. HUGH GUNN. Perth.

unanimous agreement regarding religious instruction in schools. Mr. Gunn also received the thanks of the Secretary of State for the Colonies for the services which he had rendered in South Africa. In 1910 he resigned his post as Director of Education, as he declined to carry out the bi-lingual legislation which had just been passed before the Free State entered the Union. He considered the legislation dealing with

### COLLEGIATE SCHOOLS.

Much has been done for secondary education in the State by the leading religious bodies as well as by the Government. So far back as 1857 the Right Rev. Matthew Hale, first Church of England Bishop of Western Australia, instituted the "Bishop's School," which continued for some years with great advantage to the community. Many of the boys who passed through it

became men of influence in their native State, and some of them have taken very prominent parts in the government of its affairs. Though after a time the school ceased to exist, it had established the need for higher education in the colony, and some few years later was succeeded by an undenominational school endowed by the Government.

### HIGH SCHOOL.

The High School, which may be considered the lineal descendant of Bishop's School, was established by Act of the Legislature in 1876 as an undenominational institution. For the first few years it was assisted by an annual grant of £500 from the Government, but under the circumstances then existing this amount was found to be too small, and it was increased to £1,000, at which figure it has remained ever since. The progress of denominational schools, however, and the determination of the Government to enter the field of secondary education has recently led to a reconsideration of the position, and during the session of 1912 an Act was passed abolishing the subsidy as from June 30, 1915, the opinion being that by that date the school should be in a position to continue without State aid.

The institution is controlled by a Board of Governors appointed by the Governor-in-Council. This Board is a corporate body, empowered to hold lands, goods, and benefactions in trust for the school, as well as to make by-laws and regulations for its management. The Board at present consists of Mr. J. S. Battye, B.A., LL.B. (Chairman), Sir Winthrop Hackett, M.A., LL.D., Sir Walter James, K.C., the Honourable Mr. Justice McMillan, Mr. T. P. Draper, K.C., and Dr. A. J. H. Saw.

The school was opened in March, 1878, being first carried on in a house belonging to Mr. George Randell,

but after a while the buildings erected for a military hospital, close by the Barracks in St. George's Terrace, were handed over to it by the Government. Here it has remained ever since, though the accommodation is far from satisfactory, being old, cramped, and dilapidated. In face of these obstacles, much good work has been done, and many of the boys who have passed through it have left a permanent mark upon the history of the State. The question of more up-to-date premises, to be erected upon an excellent site adjacent to the Observatory, is now under consideration, and it is hoped that by the time the grant ceases, new premises, thoroughly equipped on the most modern lines, will be ready for occupation.

The first Headmaster was Mr. R. Davies, B.A., of Corpus Christi College, Cambridge, who held office until the end of 1880, when he was succeeded by Mr. T. B. Beuttler, B.A., of Queen's College in the same University. Mr. Beuttler was in turn succeeded in 1887 by Mr. Raymond Gee, M.A., who gave place in 1890 to the present occupant of the position, Mr. F. C. Faulkner, M.A., of Trinity College, Cambridge. Mr. Faulkner is assisted by an excellent staff of masters, and under his guidance the school has made very considerable progress, winning its way to the highest places both in scholastic and in athletic work. Since the Rhodes Scholarships were inaugurated, no less than four have been secured by boys who have received their education at the High School.

### CHURCH OF ENGLAND GRAMMAR SCHOOL.

The Church of England Grammar School is situated at Guildford, opposite the East Guildford Railway Station, and eight miles from Perth. The school has no claim to be one of the older institutions of this State, but its short history is interesting as illustrating how a public body often takes over work started by private enterprise. The school started in February, 1895, on the initiative of Mr. Charles Harper, of "Woodbridge," East Guildford, who engaged Mr. Frank Bennett as master and placed at his disposal a spare room at "Woodbridge." There Mr. Bennett began teaching with seven pupils. That a need was being supplied was soon evident, for the number of pupils increased, till in 1898, when Mr. Bennett died, there were twenty-five day boys and eight boarders.

In 1899, under the headmastership of Mr. Gillespie, the school moved to new buildings on its present site, and soon obtained recognition as one of the secondary schools of Western Australia. When Mr. Gillespie died in 1903 Mr. Harper gave the control of the school to a council appointed for that purpose, who took in hand the completion of the school buildings so that they would have accommodation for fifty boarders and seventy day

boys. Mr. W. Stewart-Corr, M.A., till then senior master at King's School, Paramatta, was then appointed headmaster, with a staff of three others to meet the present requirements of the school. From 1904 till 1909 the school remained under the guidance of Mr. Corr, who made every effort to instil public school principles into the boys and to emphasize the place of sport in the development of character, without neglecting, however, the scholastic side of education. In the competitions with the other schools the athletic record of the school from 1904 onwards reflected great credit on such a young school.

At the beginning of 1909 the Church of England, after having through lack of funds and other difficulties had no school of its own in this State, took control of the management, and with a view to purchase at the end of a two years' option appointed a new council and made arrangements for a new headmaster to come to the school. At the beginning of 1910 the Rev. P. U. Henn succeeded Mr. Corr, who had returned to his old school at Paramatta. The new headmaster was entrusted with the task of reorganizing the school on Church of England lines. At the end of the two years' option the Diocesan Trustees

of the Church of England bought the school and nearly 30 acres of land surrounding it from Mr. Harper, and as the increase of members attending the school seemed to justify it embarked on a vigorous building policy. A new wing of classrooms and dormitories was erected in 1911, and during the same year the headmaster was provided with a separate residence. During this year (1912) a beautiful college chapel, given by a generous English donor, has been commenced, and when completed will form one of the finest ecclesiastical edifices in the State.

There are at present over a hundred boys at the school, of whom more than seventy are boarders from

different parts of the State. This is the limit of the old accommodation, but with the new buildings in use there is room for nearly a hundred boarders and teaching accommodation for 200, and the Church of England Grammar School should be able to more than hold its own with the other secondary schools of the State. The staff at present consists of the headmaster and five assistants:—The Rev. P. U. Henn, M.A. (Oxford), Mr. H. A. Brown, M.A. (Melbourne), the Rev. L. W. Parry, M.A. (Oxford), Mr. C. L. Riley, B.A., LL.B. (Cambridge), Mr. E. F. Cameron, and Mr. A. B. Montgomery.

#### CHRISTIAN BROTHERS' COLLEGE.

It has always been the principle of the Roman Catholic Church to provide satisfactory and efficient teaching for children belonging to that faith. The aim of the Christian Brothers, however, is even wider, as no restriction of creed is placed upon pupils who desire to benefit by the very excellent tuition provided.

In Western Australia this is particularly evident, as a large number of the boys attending the college belong to religions other than Roman Catholic. The Brotherhood has for a very long time past conducted scholastic institutions in various parts of Australia, but it was not until 1894 that it turned its attention to Western Australia. In that year two Brothers, acting under instructions from the Head of the Order, commenced teaching in an old building situated in St. George's Terrace, on ground adjacent to Government House. So great was their success that before long additions were made to the staff and steps taken to increase the accommodation. Premises costing £12,000 were planned and quickly erected, but these in turn became too small for the growing institution, the record of whose progress was briefly but clearly put by the Principal in his annual report for 1912:—"This year, 1912, completes the nineteenth year since the foundation of the college, during which time steady and continual progress has been made, and though there is never any finality in education I am pleased to be able to state that the college has now reached a high level, is permanently established, and fully equipped in every department for imparting that education that may be expected from a large public school. To meet the ever-increasing needs, new buildings have been erected and other expenses incurred, the staff has been increased, and everything possible done to render the college efficient. Up to the present over £35,000 have been spent on buildings and improvements, and the college, the plan of which is now nearly completed, forms an imposing edifice and is an ornament to the city of Perth. The new wing erected last year is fully occupied even now, and nine new classrooms and the dormitories are filled, and if the number of students increase we will be

compelled to erect new buildings. The number of pupils attending during 1912 was much larger than last year's, the number of boarders on the roll being 141, and there were 190 day boys, thus making the college the largest public school in the State. The upper classes have suffered owing to a number of the bigger boys having left, but we have great hopes from the younger ones, who should give a good account of themselves in a few years."

The buildings at present erected naturally attract a visitor, and the position of the College is unrivalled, having a frontage to the Swan River, and from the balconies and tower an extensive view may be obtained of Perth, Mount Eliza, the Swan and Canning Rivers, whilst in addition it gets the full advantage of the invigorating breezes that blow up the river from Fremantle.

The College is now firmly established, is well known all over Western Australia, and its reputation has spread to the Eastern States, on account of its successes both in the scholastic and athletic worlds. Its record is, indeed, a most honourable one in both departments, and it can justly claim to rank as one of the great public schools of Australia. Everything has been arranged on the most modern lines, both in the schools and in the boarding part of the establishment. Separate classrooms (well ventilated and equipped with single or dual desks), libraries, and suitable furniture, are special features. Physical and chemical laboratories are also included, and while due attention is given to the classical side of education, as may be seen from the results obtained at the examinations, yet the more practical side (especially the sciences) is not neglected.

The boarding part of the establishment includes four large dormitories capable of accommodating 200 boarders, and adjoining these are tiled lavatories with marble basins, perfectly hygienic, while the students can enjoy the luxury of either hot or cold shower-baths. In addition to the ordinary school hours the boarders have extra study in the morning and evening under supervision, when any extra help necessary is given. To vary

the monotony of school life there is, in addition to the games, a well-stocked library in the reading-room, a gymnasium, a billiard-room, and a variety of indoor games for the evenings.

The college has the honour of having introduced the Adelaide University Examinations into Western Australia, and of having given an impetus to secondary education in the State which has since caused such keen rivalry among the various colleges. Already it has four Rhodes Scholarships to its credit, the candidate for 1913 being selected from the college. Amongst its ex-students it can already reckon several who are practising law and medicine, and several others are at present pursuing

to attend to the moral training of their pupils, as they are convinced that instruction without such moral training is unworthy of the name of education.

In the athletic world the students have more than held their own against the competing colleges. Inter-collegiate contests take place year by year in football, cricket, rowing, and general sports, and these contests evoke much interest even amongst the outside public. For five consecutive years up to 1912 the college has secured the title of Champion School in Athletics; the football team was premier team from 1907 to 1912, and in rowing the college has been at the head of the river for four consecutive years. These competitions take

Photo by C. E. Farr.

CHRISTIAN BROTHERS' COLLEGE, ST. GEORGE'S TERRACE, PERTH

their various courses at the different universities. It has also won several of the Government Exhibitions (£450 each) and many other scholarships. In 1912 the college scored heavily on the pass lists at the various examinations, getting first and second place in the Junior among Western Australian candidates, and securing the only three credits in Greek awarded in both States. In money prizes over £1,500 fell to the lot of the college in 1912, while the total amount of prize-money won in scholastics up to the end of the same year is over £7,900.

Besides the ordinary education imparted to youth, the brothers make it a special feature of their teaching

place between the Christian Brothers' College, the Perth High School, the Scotch College, and the Church of England Grammar School, and are productive of much healthy rivalry among the students. The ideal situation of the college, its ample facilities, its extensive recreation reserves with football grounds, cricket pitches (both turf and granolithic), and its whole surroundings make it a most suitable place for an educational centre.

The Principal of the college is the Rev. M. P. Nunan, who for many years, with one short interregnum, has held the position. Under him and a competent staff of Brothers and other teachers the college has attained

an efficiency second to none in the State. Cadet drill, gymnastics, singing, elocution, music, and dancing are also included in the curriculum.

The college each year issues a beautifully illustrated and comprehensive review of the year's work, which may be had on application to the Principal.

In addition to carrying on educational work in

Perth, the Christian Brothers have also established colleges at Fremantle and Kalgoorlie, at both of which places they are carrying on work of a satisfactory nature. Though on a smaller scale than the college in Perth, the same desire for efficiency is apparent, and the results fully bear out the reputation of the Brotherhood as a teaching Order.

#### SCOTCH COLLEGE.

This college, which is under the direct control of the Presbyterian Church, owes its existence primarily to the generosity of Mr. and Mrs. W. Alexander, of Perth and Kalgoorlie. When the project of establishing a college was first raised, Mr. Alexander offered a large donation towards it, provided the Church authorities were convinced that such an institution was necessary. That point having been decided it was resolved to take immediate action. Mr. John Sharpe, M.A., was appointed headmaster, and temporary premises were secured in the old Shearer Hall in Beaufort Street. Work formally commenced in February, 1897, the college being under a provisional committee. In 1903 it was decided to bring it more closely under the General Assembly of the Church, but not to alter in any way its character or aims. In 1904 Mr. Sharpe resigned, and was succeeded

by the present headmaster, Mr. P. C. Anderson, M.A., and in the same year it became necessary to secure new premises. For this purpose Mr. J. M. Ferguson purchased a suitable property at Claremont and offered it to the Church authorities. The offer was gratefully accepted, and the school moved to its new home. Since then the progress of the school has required further extensions, and some thousands of pounds worth of buildings have been added, so that the whole now forms a modern school building fitted with all the requirements necessary for advanced secondary education. Though the youngest of the secondary schools, the Scotch College has held its own as well in the athletic as in the scholastic field, and its yearly increasing number of pupils bears ample testimony to its efficiency as well as to its popularity.

#### CHRIST CHURCH PREPARATORY SCHOOL.

This was established some three years ago by the Rev. Canon W. J. McClemons as a preparatory establishment for boys not sufficiently advanced or too young for the higher secondary schools. After three years'

experience the success of the school has fully justified the hopes of the principal. At the recent Naval Cadetship Examinations, one of the Christ Church boys had the distinction of being close to the top of the list.

#### LADIES' COLLEGES.

In the matter of girls' schools and ladies' colleges the State is quite as fully provided for as in the matter of boys' schools. Apart from the many small institutions which provide instruction of a more or less elementary nature, there are several colleges where secondary education of a high standard is being carried on.

The Roman Catholic Church, always to the fore in its care for the development of the young mind, maintains admirable convent schools in nearly every centre of population throughout the State, and if the public examination results afford any criterion, the Sisters of

that Church are doing their full share towards meeting the educational needs of the community.

Amongst those institutions controlled by private persons may be mentioned the Girls' High School at Claremont (under the direction of Miss Parnell), Geraldton High School (Miss Laver), and several others, whilst the Anglican Church is admirably served by the schools conducted by the Sisters of the Church, and the Methodist Conference attends to the wants of the Non-conformist denominations at the Methodist Ladies' College, Claremont.

#### SCHOOLS OF THE SISTERS OF THE CHURCH.

February 4, 1901, was the birthday of Perth College, the first Western Australian school of the Sisters. It stepped into existence modestly enough, at St. Mary's Hall, Colin Street. There were thirty-two scholars on

the opening day, and a few months later, when a boarding-school was opened, there was one boarder. In spite of these very humble beginnings, the Sisters felt justified in making their venture of faith, and looked forward

with persistent hopefulness to a time when Church of England parents would rally round them strongly, realizing the importance of religious education for their children. Then the school would grow and prosper. It did grow, for by the end of the first twelve months there were eighty-five pupils, but none the less years of stress and struggle lay before Perth College, and it would be hard to give any adequate idea of the way in which it had to battle for its life. The principals were constantly beset with money difficulties. Perhaps the college attempted too much, certainly it damaged its own prospects seriously for a time by endeavouring to accomplish a well-nigh impossible task. Brighter days dawned, however, and the teaching Sisters are now able to devote themselves wholeheartedly to educational progress. Year by year strenuous efforts are made to improve the teaching staff, the methods, the arrangements, and so by degrees to reach up to the Sisters' ideal of what "higher education" really means for their girls. Many pupils study for the University Examinations, and successes in the Higher Public, Senior, and Junior Examinations are recorded annually. Among the first applicants at the new Perth University will be an undergraduate from Perth College. The great hope of the Sisters now is that before many years have passed the college may be able to build or buy a school instead of renting houses as at the present time. Mr. Thring, of Uppingham, used to say, "If we would have learning honoured we should build it a fitting habitation."

In 1902 the second school of the Sisters of the Church (Girls' High School, Kalgoorlie) was undertaken at the earnest request of the Rev. Gordon Saville, who felt strongly the need of religious education for goldfields children. Here the commencement was rough in the extreme; the schoolroom was of corrugated iron, the old desks appeared to have come down from pre-historic times. The Sisters' own dwelling-place was so astonishing that a French lady upon seeing it remarked, "Mais c'est une souricière!" A few years later it became possible to build a nice house at Kalgoorlie, and the "souricière" was no longer recognizable.

In 1907 St. Alban's Preparatory School began its career in a good Church Hall in Beaufort Street, Perth. It stands almost shoulder to shoulder with a State school on one side and a Convent school on the other, but yet some fifty little Church of England children gather under its roof.

In 1908 the Sisters bought the goodwill of Miss

Best's Central High School, one of the pioneer schools of Western Australia, and continued it under the name of St. George's High School. The Bishop wrote on this occasion: "I am grateful to you for having undertaken to carry on this important work. I feel sure that under your management the school will continue to flourish. I am convinced that parents who entrust their daughters to your care may feel certain that their moral and religious education will be the best possible. This is, of course, of the utmost importance. I wish you every success, and I shall have great pleasure in helping you in any way in which I can be of use."

In 1909 the Misses Scott not only amalgamated their own large school with Perth College, but also offered their services to the Sisters. One of these ladies, "Sister Bessie," has now joined the community as a professed Sister, and is in charge of Cowandilla. Perth College and Cowandilla practically form one school. At the former all the older girls are educated, and at the latter the juniors from kindergarten to class iv. are taught.

The Sisters undertook work at the Lady Margaret School, Guildford, after repeated requests from various residents. Girls wishing to be prepared for University Examinations usually move on to Perth College when old enough. The school is named after Lady Margaret Beaufort, mother of Henry VII., whose saintly character, love of learning, and zeal for education made her an example worthy of the imitation of all women and girls, and whose honoured name is borne by so many colleges and schools in England.

This group of six schools is so organized that when parents find it convenient or necessary to move their child from one to another it is conscious of but little difference. So far as is possible the same methods and the same books are used throughout the Sisters' schools, and this unity of system is found to give strength and solidity to the work. None the less a healthy spirit of emulation among the scholars is encouraged, as it brings animation and interest. It is in their boarding-schools that the Sisters feel they can do most for the children entrusted to their care. Boarding-school work involves much anxiety and great responsibility, but also gives unique opportunities of influencing the children. The Sisters are enthusiasts for their schools, because they feel that Christian education is the grandest work in which anyone can engage, a work pregnant with glorious possibilities and results, a work that even angels might envy.

#### METHODIST LADIES' COLLEGE.

In the early days of the State the Government, in order to induce the various religious denominations to take up educational work, made grants of land to them by way of educational endowment. Amongst other grants

was a large area in Newcastle Street given to the Wesleyan Methodist Church. For years the Church was not able to do anything, but with the extraordinary development of the State during the nineties opportunities

for entering the field of education were opened up. After some discussion as to the relative advantages to be gained, it was decided to confine the efforts of the Church to the education of girls, and at the Conference of 1907 a committee was appointed to take steps to establish a Methodist Ladies' College. The block of land in Perth being considered unsuitable, it was decided to dispose of it and apply the proceeds towards securing a more suitable location. After careful consideration the site was secured on which the present portion of the College Building is erected. The block of land, which is situated at Claremont, contains six acres with a frontage to the Perth Fremantle Road on the north and to Freshwater Bay on the south. From the brow of the hill, on which the college stands, a full view of Freshwater Bay and the Darling Ranges can be obtained. The position and surroundings are very healthy, and the sea breezes which blow from the ocean, which is only half-an-hour's walk distant, make the building very cool in the hottest weather. Swimming-baths have been erected on the fore-shore of Freshwater Bay for the use of the scholars. During the summer months the boarders bathe every day and lessons in swimming are given by the sports' mistress.

The college building has been designed with the utmost care and foresight. The architect's plans provide for every modern convenience and comfort. Special attention has been paid to the house and boarding arrangements. Acting upon the advice of similar institutions in other places, the committee decided to do away with dormitories and in their place substitute bedrooms for the boarders. These rooms are light and airy, each providing sleeping accommodation for three or four girls. Two balconies have also been built to provide accommodation for sleeping out of doors. It is proposed to spend the sum of £12,000 on the completed building. For the present only a portion of the building has been erected, providing accommodation for fifty boarders and eighty day scholars.

The present Headmistress of the College is Miss Maud Connell, M.A. (Melb.), who is assisted by a large staff of resident and visiting mistresses.

The foregoing institutions, in conjunction with the primary and secondary system of State education, show that in the training of her children Western Australia is fully alive to her great responsibility.

METHODIST LADIES' COLLEGE, CLAREMONT.

## Ecclesiastical.

According to the latest Commonwealth census—that of April, 1911—the total population of Western Australia was 282,114, divided, so far as religious beliefs are concerned, into the following groups:—

I. CHRISTIAN—	
Church of England ... ..	109,435
Presbyterian ... ..	26,678
Methodist ... ..	34,348
Baptist ... ..	4,801
Congregational ... ..	6,203
Lutheran ... ..	2,491
Church of Christ ... ..	2,808
Salvation Army ... ..	1,890
Seventh Day Adventist ... ..	885
Unitarian ... ..	144
Protestant (undefined) ... ..	9,971
Roman Catholic ... ..	56,616
Greek Catholic ... ..	408
Catholic (undefined) ... ..	5,346
Other ... ..	1,736
II. NON-CHRISTIAN—	
Hebrew ... ..	1,790
Confucian ... ..	345
Mohammedan ... ..	1,517
Buddhist ... ..	1,795

ii. Non-Christian (continued)—	
Pagan ... ..	143
Others ... ..	260
III. INDEFINITE—	
Freethinker ... ..	447
No denomination ... ..	267
Agnostic ... ..	380
Others ... ..	461
IV. NO RELIGION—	
No religion ... ..	1,174
Atheist ... ..	71
Others ... ..	15
V. OBJECT TO STATE ... ..	
VI. UNSPECIFIED ... ..	3,544

Since the date of the census the population has increased to well over 300,000, and the numbers in each division will necessarily be greater. The percentage basis, however, probably remains about the same, and from this we find that the great bulk of the people—93½ per cent.—profess some form of Christianity. Of those who call themselves Christian 41·5 per cent. are Church of England, 21·5 per cent. Roman Catholic, 13 per cent. Methodist, 10 per cent. Presbyterian, 6 per cent. undefined, and the remaining 8 per cent. Baptist, Lutheran, Church of Christ, and minor sects.

### THE CHURCH OF ENGLAND.

There were settlers in Western Australia before the State entered upon its existence as a separate British possession under the name of the Swan River Colony (or Settlement) in June, 1829. It would, therefore, not be safe to say that the Church of England had no one to carry on her warfare amongst the pioneers and the aborigines before the advent of the first clergyman; for evidence is not lacking to show that from very early days godly laymen were most zealous in procuring the ministry of the Church for their families and neighbours, and that even the untutored savages were not excluded from their ministrations.

The Church was fortunate in having as its first clerical representative the Rev. J. B. Wittenoom, who was amongst those who, on September 5, 1829, were the successful applicants for the first allotments of land granted in the city of Perth, the first stone of which city had been laid but twenty-four days earlier. This clergyman worked amongst the settlers for many years, and an interesting item in an old diary is the record of

his marriage to Miss Helms on January 3, 1839, after a sojourn of ten years in the settlement. He is said to have continued in office as Colonial Chaplain until his death in 1854. He was kept well on the move in those days when sand tracks were the only highways, for G. F. Moore in his diary records that "the clergyman goes on alternate Sundays to Guildford and Fremantle and attends a Sunday-school." This entry appears in July, 1831, *i.e.*, two years after Mr. Wittenoom's arrival, by which time he had secured valued lay helpers and a "church," for Mr. Moore says in June, 1831, "Captain Irwin read the morning service of the Church in the hospital, and in the evening I went to the Rev. Mr. Wittenoom's church." This was a structure made chiefly of rushes, used on Sundays for worship and on week days for other purposes.

The mention of the name of Irwin recalls the suggestion just made that laymen possibly evangelized the community even before the advent of an ordained ministry in most of the newly-settled parts, certainly at

Albany and on the Swan. There is no doubt of the value of the labours of both F. C. Irwin and G. F. Moore in these earlier days. Not content with helping forward the work at Perth, they carried the Gospel by their own unaided efforts amongst the settlers as far as the Upper Swan. On July 2, 1831, Captain Irwin spent the night at Mr. Moore's camp at Millenden, Upper Swan, making "preparatory arrangements for the public celebration of the Church service which we mean to have regularly at a neighbouring barrack." He reports that "twenty-eight persons, many of them of the higher class, attended and warmly entered into Captain Irwin's object. He is a truly amiable and religious man, and interests himself most usefully for the colony." That Mr. Moore himself was an able seconder of these efforts is clear from his own confessions as follows:—"On Sunday, 10th [July, 1831], I filled, as I have so often done before, the office of chaplain to about twenty persons"; and a few months later an entry runs: "Read a sermon of Burder's this day and dined on four crows and a quail." Surely Wordsworth was too hasty in writing "plain living and high thinking are no more." Abundant evidence could be thus quoted to prove that wherever the early settlements were established the laity of the Church, with the aid of the clergy and often, as in this case, without their aid, worked faithfully to maintain Divine worship and to preserve the spirit of religion amongst the settlers. That the natives were not altogether uninfluenced we gather from a note early in 1833:—"Many of the natives came into the barrack during Divine service, of whom some remained all the time and conducted themselves with great decorum."

The modern movement known as the Church of England Men's Society owes its being to an undoubted capacity in the Church to find scope for all her members' activities, and this power is often more clearly revealed under new and unwonted conditions such as early settlements provide.

One of the earliest clerical colleagues to come to the help of Mr. Wittencoom was the Rev. Dr. Gustiniani, who came as a missionary to the natives in 1836; but apparently owing to bad health he did not remain more than two years, during which time he laboured on the Swan above Guildford.

He was succeeded by the Rev. Wm. Mitchell, who came from India on August 4, 1838, and at once began work upon the good foundation laid by Messrs. Irwin and Moore, relieving Mr. Wittencoom of the care of Guildford, and ministering from that point upwards to what was called the head of the river at the Upper Swan. He established himself at Middle Swan, midway between his outposts. Here a primitive abode had been erected, and within a year he had made arrangements for the erection of two churches—one at Middle Swan and another at Upper Swan. The former was begun on August

5, 1839, and the latter on October 31 in the same year. The latter was first used for Divine service, but even before it was begun there was a church building at Guildford, or more correctly at Woodbridge, on the spot where now only "some frail memorial still erected nigh" proclaims, or, at least, suggests, that a church once stood there. Right alongside it there is now being reared the stately walls of the Grammar School Chapel. To have preserved even a vestige of the structure, which must have been one of the earliest in the State, as a contrast to the finished work of the lovely chapel now in building would have provided an object lesson of great moral and practical value; but nothing remains.

That these three churches, *viz.*, the church at Woodbridge, an octagon church at Middle Swan, and a church at Upper Swan, were actually built and in use before there was a building set apart for Divine worship in either Perth or Fremantle seems to be proved by the statement, "we have *three* additional churches built on the banks of the Swan," which was made by the Governor in 1841, in which year "the foundation of a good-sized church at Perth" was laid. And that the structure at Woodbridge was the earliest of the three is apparent from the fact that the private diary of Mrs. Mitchell, the wife of the Rev. Wm. Mitchell, makes frequent reference to such a church before the other two were built, *e.g.*, "Sunday, November 25, 1838.—Sacrament at Henley Park (Major Irwin's property at Upper Swan) in the morning, with ten communicants. Service at half past four at Guildford Church." Mrs. Mitchell on one occasion writes the first half of the word "Woodbridge," and crossing it out substitutes "Guildford." In 1838 there were no churches further up the Swan, and the statement recorded in the Western Australian Year Book for 1899, that in November, 1840, a church was opened at Guildford, refers really to the opening of the Octagon Church at Middle Swan, which was considered to be adjacent to Guildford in those days, as is clear from the reference to its beginning made by G. F. Moore in his diary as follows:—"August 5, 1839.—The foundation of a small voluntary church for the Missionary Society erected on their grant *near Guildford*. The Governor was there and a good many people." The "grant" referred to clearly establishes this as the church at Middle Swan, for the Colonial and Continental Church Society's grant is there, though a casual reading would take it to mean a Guildford Church.

In 1835, or thereabouts, a church building, octagon in shape, was built at Albany by Mr. T. B. Sherratt, a layman, who himself conducted morning and evening prayer in it each Sunday, and in September, 1842, a church, still in existence, was built at Picton, near Bunbury.

It was not until April 6, 1842, that the foundation of a Church of England was laid at Fremantle, evidently

the result of the energy of the Rev. G. King, who came out in 1841 and devoted much time and zeal to evangelizing the natives as well as ministering to white settlers. Inspired by his zeal the settlers at Pinjarra and Mandurah erected churches in 1842. At about the same time there arrived the Rev. J. Wollaston, whose sphere of work first lay at Bunbury, and then at King George Sound and round the coast to Bunbury, Pinjarra, and other places. He it was who replaced the Octagon Church at Albany by a "neat church of granite," which was amongst the number duly consecrated by the Bishop of Adelaide on his first visit. In the same year, 1841, a third clergyman, the Rev. W. R. Postlethwaite, came and took up the work at Upper Swan, thus apparently enabling Mr. Mitchell to confine his energies to the growing work in and around Guildford. But before long

the whole area was again under his sole care. The visit in 1848 of Bishop Short to this distant and isolated portion of his diocese marked an important epoch in the history of the Church in Western Australia. He was accompanied by Archdeacon Hale, who had

ORIGINAL OCTAGON CHURCH AT MIDDLE SWAN, 1839.

left England with the Bishop in order to be his first Archdeacon of Adelaide. Bishop Short, who had only come out to his See (the City of Adelaide) about a year before he came to Perth, found six clergymen at work in the various centres here, York being by that time added to the places already mentioned. Mr. C. Harper appears to have journeyed to Adelaide on the Bishop's return to that city, and was ordained deacon there on September 21 (St. Matthew's Day), 1849, and was priested only a week later, evidently in order to permit his immediate return to Western Australia to continue the work begun by the Rev. Wm. Meares in the newly-opened district of York. This appears to have been the first instance of a Western Australian being ordained, and the ordination was not within the borders of the State. It was not till July 4, 1852, that an ordination was held in Perth,

62

when the Rev. Dacres Williams was advanced to the priesthood, he having also, like Mr. Harper, journeyed to Adelaide to be made deacon. Mr. Williams was located at Guildford. Bishop Short's most important work, however, consisted not so much in organizing and conferring with his clergy and consecrating church buildings, as in administering the Apostolic rite of the laying on of hands; and for this important function he found that a goodly number had been duly prepared throughout the settlement. The most substantial church building consecrated by him was naturally that at Perth, the foundation-stone of which had been laid with great ceremony by Governor John Hutt on January 1, 1841, and after many vicissitudes duly completed and opened for worship four years later, *viz.*, on January 22, 1845, the cost having been £5,000 and the estimated Angli-

can population of the colony under 3,000. It was enlarged in 1864, and replaced in 1888 by the present structure, which had cost about £17,000 originally, but upon which several thousands have since been spent at various times in enlargement

and adornment, notably the addition of the Queen Victoria Memorial Tower, the reredos that adorns the sanctuary, and the chancel screen, as well as several stained-glass windows.

Bishop Short again visited the colony in 1852, when he found practically no increase in the number of the clergy, but a great advance in the commercial life of the community. He was expecting three clergymen, who were much needed for Toodyay, Bunbury, and other parts. The town of Fremantle impressed him with its evident advance, chiefly noticeable in the erection of handsome Government buildings and the increased population, which caused the streets to "wear an air of life different from the listlessness observable in 1848," which had been a time of depression. The advantages of convict labour were much counterbalanced by the great

rise in the price of provisions, caused apparently by the greatly increased population more than keeping pace with the increase in the products of the colony. Money was clearly very scarce, and the Bishop reported that the Fremantle Church, begun on April 6, 1842, was, in 1852, still in debt £280; and—a hopeful sign—it required enlargement. In 1845 Fremantle appears to have been dependent upon the Anglican Church alone for religious ministrations, for the Rev. G. King, writing to the S.P.G. (of which venerable society he was a missionary), declared that except in the town of Perth, where the Wesleyans and the Roman Catholics had begun work, there was no other religious body in the territory. The Wesleyans had begun work at Fremantle, but when Mr. King wrote in 1845 "the door of their edifice" had not been turned on its "hinges for four months." It must be recorded, however, that the Wesleyans co-operated with the Church of England in these early days (perhaps not designedly) by establishing a mission amongst the aborigines at Wanneroo, from which place four men were, in 1848, married by Bishop Short to four native girls, evidently from Mr. King's native school at Fremantle.

During the first visit of Bishop Short he consecrated churches at the following centres:—Albany, Busselton, Pieton (probably), Perth, Fremantle, Upper Swan, Middle Swan, Guildford, and York. As there were churches at Pinjarra and Mandurah, and he visited and confirmed at these places, it is possible that the churches there were consecrated. There is said to have been a church at Toodyay also, and that in all there were thirteen Church buildings; but only twelve are mentioned above, and where the thirteenth was it is hard to say—only it seems certain that it was not at Bunbury, for the Bishop held service there in a room lent for the purpose and no mention is made of any church. The most striking feature of his visit, however, was the extraordinary number of persons confirmed. Out of less than 3,000 Anglicans in the colony, nearly 400 were presented for confirmation. In Perth alone 151 were presented, a total that both gratified and surprised the good Bishop, putting Adelaide completely in the shade. Remembering that a good number of the adults must have been confirmed before coming out to Australia, and that the rite is not administered to children under the age of fourteen as a rule, it is a most remarkable testimony to the influence for good exerted by the few clergymen who had been patiently labouring in this colony that from among the remainder they should gather 400 persons to receive this solemn rite. To judge from the records of this episcopal visitation (most of the land journeying being done on horseback), it is clear that both Bishop and clergy had learned to "scorn delights and live laborious days." The Bishop concluded his visitation tour by riding from Pinjarra to Perth in one day, a distance of

53 miles, "in the course of which," he says, "I violently sprained my knee through a fallen branch while riding through the forest."

After Bishop Short's second visit in 1852, it is quite clear that he realized the necessity of establishing a separate See at Perth, and at once secured a sum of £3,000 from the S.P.G. towards its endowment. The people themselves subscribed liberally both land and money, and in 1857 the See of Perth was constituted, the Archdeacon of Adelaide (Ven. Matthew Blagden Hale) being appointed the first Bishop. After a visit of some months to Western Australia, Dr. Hale proceeded to England for consecration. The ceremony was performed in the Chapel of Lambeth Palace in July, 1857. For nearly twenty years Bishop Hale laboured with conspicuous success, solidifying the work and extending the influence of the Church throughout the community. During his occupation of the See he contributed largely from his private purse to advance the interests of the Anglican denomination. Pecuniary assistance was rendered to the clergy of the diocese, secondary education was fostered by the establishment of Bishop's School, and various philanthropic movements for the care of the aborigines were undertaken.

In 1875 Bishop Hale was transferred to the See of Brisbane, and the Rev. Henry Hutton Parry was consecrated second Bishop of Perth. Bishop Parry had been since 1858 Bishop-Coadjutor of Barbados, and consequently brought to Western Australia a ripe experience in the episcopal office. Until his death in 1893 he laboured in the diocese, and by his administrative ability consolidated and extended the work so well begun by his predecessor in office. It was during Bishop Parry's term that the present St. George's Cathedral was built, on the site of the older structure, of which the foundation had been laid in 1841. It was consecrated by Bishop Parry in 1888, in the presence of the Primate, Bishop Barry.

After the death of Bishop Parry the See was administered by the Dean of Perth, the Very Rev. F. Goldsmith, until February, 1895, when the present Bishop, the Right Rev. Dr. Riley, arrived in Perth. Coming just at the time when the gold discoveries were attracting population in thousands, and were causing new towns to spring up almost miraculously in all parts of the State, the new Bishop entered upon a strenuous task in endeavouring to meet the spiritual needs of the new communities. In common with every other religious denomination the Church of England expanded by leaps and bounds, until by the growth of settlement it became almost impossible for the Bishop, notwithstanding the boundless energy, tact, and foresight which he possessed, to give that personal oversight to all parts of the diocese which the peculiar conditions of a new country demanded. Consideration had to be given to the question

of dividing the diocese by the creation of new Sees, and it was finally decided, in 1903, to create three new bishoprics as soon as funds would allow—the South-Western Bishopric, the Goldfields Bishopric, and the Missionary Bishopric in the north. The first of these—the South-Western Bishopric—was created in 1904 with headquarters at Bunbury, and in the same year the Very Rev. Dean Goldsmith was consecrated as the first Bishop of Bunbury. In order to secure efficiency and at the same time relieve to some extent the Bishop of Perth, the area comprised in the proposed Northern Bishopric was placed under the control of Bishop Goldsmith. This arrangement continued until 1909, when the Right Rev. Gerard Trower was appointed to the bishopric of the North-West. Endeavours were also made to secure the

of its work, and as the expansion of the State required it has undertaken with marked success those educational and philanthropic movements which have always been part of the policy of the great mother Church of England.

In 1872 a great change in the constitution of the Church in Western Australia was made. Hitherto it had been regarded as the official Church and treated differently from the Roman and other religious bodies, all of whom were granted assistance by the State in proportion to their numbers. The provision for the Church of England was regarded as a part of the Government expense for administration, and the clergy were considered as officials on the Civil List, being Imperial chaplains. When all this was altered and the Anglican Church placed in the same category as other religious

ST. GEORGE'S CATHEDRAL IN 1845.

funds necessary for the Goldfields Bishopric, but up to the present, owing in great measure to the decline of mining in the State, the efforts have not met with success. As soon as that movement becomes an accomplished fact, the constitution of the State as an ecclesiastical province will follow, with the Bishop of Perth as Metropolitan and Archbishop—a consummation which will be gladly welcomed by those who have been privileged to witness the whole-hearted devotion and service that Bishop Riley has rendered to the Church in Western Australia.

As an ecclesiastical organization the Church of England has adapted itself to all the conditions of Western Australia, and has established its agencies over all the settled portions. Ever since the colony began the Church has made the care of the aborigines a prominent feature

bodies, it was a case of disestablishment, an event which proved an inestimable blessing, as the Bishop at once organized a Synod, and the Church became a democratic body, independent and untrammelled. Synod from the first consisted of all the clergy, together with two laymen for each clergyman holding the Bishop's licence, and during the forty years of its existence it has been a most important factor in the development of the Church on sound lines, in ordering the temporal affairs of the Church, and in legislating for its welfare. Owing partly to the fact that not all the clergy could attend the sittings of Synod on account of distance, and that for the like reason still more of the lay synodmen would be absent, it often happened in the early days that great difficulty was experienced in procuring the quorum of

four clergy and eight laymen, without which no business could be done. But now, despite the detachment of Bunbury and the North-West, the Synod of the current year will probably see some fifty clergy and more than a hundred laity in regular attendance at its sittings, as the number of clergy at present is about sixty-five.

In addition to the Synod there is another important organization of the Church, whereby the whole diocese is subdivided into rural deaneries, of which there are at present four, *viz.*, Perth, Geraldton, Beverley, and Kalgoorlie. At rural-decanal conferences (the constitution of which is even more democratic than that of Synod, in that five laymen sit for every clergyman), although no legislative power is exercised, yet the deliberations have always proved most useful for the free discussion and ventilation of many questions which come up for decision in the larger gathering of Synod.

There are at present two archdeaonries, *viz.*, Perth and the Goldfields, the last-named being quite a modern creation. The Perth Archdeaconry dates from the appointment of the Rev. J. R. Wollaston in 1849, and his successors in office have been the Venerable James Brown (1858), the Venerable D. Glyn Watkins (1888), the Venerable C. E. C. Lefroy (1907), and the Venerable C. Huddlestone (1910). In 1865 there was an Archdeacon of Geraldton, the Venerable H. B. Thornhill; but the office was discontinued in 1866, and no one else has held it. Although the Goldfields Archdeaconry only began in 1897, there have been four archdeacons already, *viz.*, the Venerable F. J. Barton-Parkes (1897), the Venerable D. H. Griffith (1899), the Venerable T. McClemons (1905), and the Venerable E. M. Collick (1912). In 1905, when the Venerable F. J. Barton-Parkes removed from Coolgardie to York, the Archdeaconry of York was established, which included most of the Bunbury Diocese; and upon the establishment of that See in 1904 there was so little left of the York Archdeaconry that when Archdeacon Barton-Parkes removed in the following year to Fremantle the archdeaconry ceased to exist.

The important office of Dean of Perth has been held by the following:—The Very Revs. G. P. Pownall (1858), James Brown (1864), Joseph Gegg (1875), F. Goldsmith (1888), H. G. D. Latham (1906), the Bishop (1911), and H. F. Mercer (1912).

From the earliest days of the Church's work in this State, devout members, both clerical and lay, have ever been found ready to make efforts for the uplifting and Christianizing of the aborigines. In addition to Dr. Gustiniani and the Rev. G. King (whose work at Fremantle appears to have been particularly successful and earned the warm commendation of the Governor of that time), the Rev. W. Mitchell and his wife did something for the natives, and it was doubtless under their influence that the sympathies of Mrs. Camfield were first

aroused towards the aborigines. This lady, when Miss Breeze, lived on the Swan with the Mitchells, and there met Mr. Camfield, whom she subsequently married; and when he was Government Resident at Albany his good wife took charge of a mission established there by Archdeacon Wollaston for instructing native children. It is said that in some cases she paid the natives to hand over their children by exchanging rations for them. In 1859 Bishop Hale deemed it wise to transfer the work to Perth, and later on, in 1876, it was once more removed to its present abode on the Swan. Thus since 1836 there has been a continuous effort made, at least in respect of the children, to discharge the debt which the white Christian owes to the black brother he is supplanting. Other efforts to establish a mission in the north-west have, so far, not been successful, but at the time of writing a determined effort is in progress to establish at Forrest River a mission station under the Rev. W. H. Robins, who is now on his way there.

Probably the most effectual of the philanthropic work of the Church in Western Australia has been in connection with the care and training of neglected children and orphans. The late Archdeacon Brown was one of the most active in furthering this work in its early days, and he had valued assistance from many of the prominent laity of the time. It is about forty years ago that a home for boys was established at the Swan and another for girls at Perth, and upon the original sites of both institutions there are now to be seen massive buildings which have cost in the aggregate at least £20,000, of which during the present century no less than £13,000 has been spent in improvements and additions. Since this work was begun thousands of children have been trained and sent out to become useful citizens, and the work thus carried on has been of incalculable benefit to the State. Some twelve years ago an industrial school for older boys was established at Redhill, near the Swan, and although on a smaller scale and working under greater difficulties, already the results have abundantly justified the labour and money expended in this work.

The educational work of the Church has not been an unbroken success, but its failure at the outset was due perhaps to its effort being too ambitious. The Bishop's College opened in June, 1858, by Bishop Hale, aided by the S.P.C.K., in the premises which now form St. John's Theological College and which Bishop Hale built for the purpose of a school, proved to be somewhat in advance of the requirements of so small a community. Under Bishop Parry an effort was made to utilize the building as a school for girls, and continued thus for five years; but it was not until the Sisters of the Church came from England about twelve years ago that the education of girls was really taken in hand by the Church. Their work has grown with the growth of the population, and already very promising schools exist, not merely in and

around Perth, but at Guildford and Kalgoorlie also; and the indefinite extension of this important work is only delayed by the difficulty in procuring additions to the ranks of the Sisters' teaching staff. The education of boys was resumed even later than that of the girls, and the same satisfactory result has so far attended the fresh effort. The Guildford Grammar School, which had been started as a public school by Mr. C. Harper, has now been for about four years under the direction of the Bishop with a committee or council, which at present consists of the Diocesan Trustees. The school has greatly increased since it became a Church school, and now contains over 120 boys. The buildings have been enlarged at great expense, new playing-grounds have been bought, and a magnificent chapel is being erected at the sole charges of a gentleman in England, whose name has not yet been made public. There is also a preparatory school

for boys at Claremont, which is rapidly extending its operations and enlarging its buildings. It seems clear that the increased activity of the State in providing more advanced education in State schools will continue to rouse an increased desire for that

special type of education and training which can only be gained in an atmosphere where religion has its due recognition and its definite place.

However brief any survey might be, it would not be proper to omit special reference to the part played by the various missionary societies of the mother Church in planting and establishing her branches in the various dependencies of the British Empire as well as elsewhere. Confining our attention solely to our own State, but remembering that the case of many another struggling settlement was exactly the same, it may be said that the very existence, in the first place, of the Church of England in Western Australia is largely due to the fostering care of the Society for the Propagation of the Gospel, the Colonial and Continental Church Society, and the Colonial Bishops' Fund, and in the further carrying

on of the work the Society for the Promotion of Christian Knowledge joined in their benevolent labours by sending continuously grants in aid of building churches, rectories, and schools all over the State. To such invaluable help through so many years of our days of struggle and poverty must be attributed the fact that outposts such as Bridgetown in the south and the Williams further east and Roebourne in the north were long ago held when all around was wilderness with the merest sprinkling of settlement. Only by such substantial encouragement could simple, unadorned places of worship be erected, which stood for many years as the silent monitors of God's presence in the bush, now in many cases replaced by more ornate and commodious churches, which still owe something to the beneficence of the S.P.C.K., which society will always render aid for building purposes. To tell in detail the volume of such

ANGLICAN CATHEDRAL, PERTH, PRESENT DAY.

aid would be tedious. To regret that it is rapidly being withdrawn in the case of the S.P.G. and C. C. C. S. would be ungrateful. The Church is realizing that her own resources are becoming ample enough to furnish her with the sinews of war, and from hence-

forward she must brace herself for the time of independence from external support, which is almost at hand.

To that anticipated independence many are realizing that an essential corollary is a freedom in the ordering of the affairs of the Church akin to that which comes to all adults when launched upon their career, henceforth to pursue their paths in life without parental help and guidance. The problems of the Church in such wide regions as ours, and in such expanding times as these, demand that nothing in the way of shackles shall impede the free movement of the Church in Western Australia, in common with her sister branches in the other States of the Commonwealth, to a national unity which may enable her to adequately express her mind, and rightly wield her influence.

The Right Reverend CHARLES OWEN LEAVER RILEY, M.A., D.D., V.D., Lord Bishop of Perth, is the son of the Rev. Lawrence William Riley, M.A., vicar of St. Cross, Knutsford, and was born at Birmingham on May 26, 1854. He

Bartletto. Perth.  
RIGHT REV. THE BISHOP OF PERTH.

was educated at Owens' College, Manchester, and at Gonville and Caius College, Cambridge. He graduated as B.A. (sixth senior optime) in 1878 and as M.A. in 1881. He was ordained deacon in 1878 and priest in the following year by the Bishop of Ripon. From 1878-80 he was curate of Brierley, Yorkshire; from 1880-2 of Holy Trinity, Bradford; and from 1882-5 of Lancaster. From 1885-94 he was vicar of Preston in Lancashire and chaplain to the Preston and Royal Infirmary. In 1894 he was elected Bishop of Perth by a delegation from the Synod of Western Australia consisting of the Bishops of Manchester, Durham, and Southwell, and was consecrated in Westminster Abbey on St. Luke's Day by the Archbishop of Canterbury, assisted by several English and colonial Bishops. In the same year the degree of D.D. was conferred upon him by Cambridge University. He was enthroned in St. George's Cathedral, Perth, on February 5, 1895, by Dean Goldsmith, now Bishop of Bunbury. During his residence in this State His Lordship has been a most indefatigable worker in every good cause, and has taken a particular interest in the development of educational facilities in Western Australia.

He was a member of the Royal Commission on the establishment of a University (1909-10) and assisted very materially in the deliberations of that body. He was elected on March 4, 1913, as the first Warden of the University of Western Australia. Having been a military chaplain before his arrival in Perth he has continued his interest in military affairs, and is at present the senior chaplain of the Military Forces. Since 1904 he has been Grand Master of the Grand Lodge of Freemasons of Western Australia and takes a personal interest in the welfare of the craft. As a citizen of the State the Bishop has shown a deep interest in its affairs, and during his residence in Perth has gained the unbounded respect and affection of all classes of the community. In 1886 he married Elizabeth, daughter of Mr. C. A. Merriman, M.R.C.S., of Heath House, Knutsford, and has three sons and three daughters.

The Right Reverend FREDERICK GOLDSMITH, first Lord Bishop of Bunbury, is a son of Mr. Frederick William Goldsmith, of London and Eastbourne, and was born in the world's metropolis on August 3, 1853. He received his early education at the Merchant Tailors' School, and subsequently proceeded to St. John's College, Oxford. In 1876 he took the degree of B.A., three years later that of M.A., and having been ordained deacon in the former year, entered upon the duties of curate of Old Charlton, Kent, being ordained priest in 1877. From 1881 to 1885 he was in charge of a mission district in the parish of Cheam, and during the succeeding three years was vicar of Halling, a place famous for its manufacture of Portland cement. In 1888 he received his appointment as Dean of Perth and occupied this office until 1904, acting also as administrator of the diocese during the vacancy of the See in 1894-5, and during the absence of the Bishop of Perth in 1897. On July 17, 1904, he was consecrated and on the following day enthroned as Bishop of Bunbury, then a newly-formed diocese comprising 42,000 square miles, which formerly was the south-western portion of the Diocese of Perth. In addition to the many obligations attaching to this charge Dr. Goldsmith also had the episcopal oversight of 420,000 square miles of country in the North-West until the appointment of the Right Rev. Dr.

Trower as Bishop of the North-West in 1910. Since 1893 he has held the office of chaplain to the Commonwealth Military Forces in Western Australia. For eighteen years he was manager of the Girls' Orphanage at Perth. As showing the development of Western Australia during the past few years it is worthy of note that Dr. Goldsmith's original parish of Perth was divided during his incumbency into thirteen parishes. The oldest three Anglican churches in the State are all situated in the Bunbury Diocese, the first built and opened for service on September 18, 1842, being the picturesque little edifice at Picton, which is still standing. The next in order of antiquity is the church at Busselton, which was erected in 1845, while that at Albany was built three years later. The first church in Bunbury dates back to 1844, the original structure being replaced in 1866 by the present quaint Anglican pro-Cathedral. Efforts are now being made to raise funds for the erection of a Cathedral worthy of its object and consistent with the importance of the diocese. During the seven years that have elapsed since the creation of the diocese the work of church-building has gone rapidly forward, no less than thirty-two

Ford. Bunbury.  
RIGHT REV. THE BISHOP OF BUNBURY.

churches and rectories having been erected. Dr. Goldsmith was married in 1880 to Edith Emma, daughter of the Rev. George Frewer, Master of Eton College and late Rector of Hitcham, Buckinghamshire, England.

*One time (Perth)  
Dean Goldsmith*

The Right Reverend GERARD TROWER, D.D., Bishop of the North-West, is the seventh son of the Rev. Arthur Trower, M.A., rector of St. Mary-at-Hill, London, and was born at Hook Hill, Yorkshire, on December 3, 1860. He received

RIGHT REV. THE BISHOP OF THE NORTH-WEST.

his primary education at St. Mary's College, Harlow, proceeding from there to the Merchant Tailors' School, London, and was successful in being elected Hebrew Exhibitioner at Queen's College, Cambridge, in 1878. He was also awarded the Marriott Exhibition, Keble College, Oxford, in 1880, and continued his scholastic career at the latter University, where he took his B.A. degree in 1885, M.A. in 1888, and the honorary degree of D.D. in 1902. During his Oxford course he was captain of the college boats in 1884-5, and rowed in the Oxford University Boat Club Trials in 1884. He subsequently entered Ely Theological College, and after filling the post of travelling tutor for a couple of years was ordained deacon at Worcester in 1888, being made priest in the following year. He occupied the curacy of St. Alban's, Birmingham, from 1888 to 1893, removing from there to St. Mary's, Redcliffe, Bristol, where he remained until 1895. In the latter year he became rector of Christ Church, Sydney, New South Wales, and continued there until 1901, on January 25, 1902, being consecrated Bishop of Likoma (Nyasaland). He was transferred from Nyasaland to the new diocese of North-West Australia

upon the nomination of His Lordship the Bishop of Perth in January, 1910, and arrived in this State in May of the same year. Bishop Trower's diocese extends from the Murchison district to Wyndham, in the far north, and he has the assistance of six clergy. He is a member of New Oxford and Cambridge, Pall Mall and London (S.W.) Clubs.

The Very Reverend H. F. MERCER, Dean of Perth, was born at Barrow-in-Furness, Lancashire, in 1872. The name of Mercer is a very ancient one in both Scotland and England, his ancestors being the founders of the City of Perth in Scotland. Among them was Sir Henry Searle Mercer, Lord Mayor of London in 1209, through whose instrumentality the first stone bridge was built over the Thames; and in Ireland there was a William Mercer who was Bishop of Connor from 1353-75. The family has always been closely associated with the City of Perth, Scotland, and an inscription in the family vault in the Church of St. John, Perth, records that one of them, John Mercer, died in 1280. According to local and family traditions this vault was a royal grant to the family in consideration of their having given to one of the Scottish kings the mills of Perth, which were in their possession. Referring to the antiquity of the house of Mercer, a local rhyme says:—

So sicker 'tis as anything on earth  
The Mercers' aye are older than old  
Perth.

His father was the late Mr. Thomas Atherton Mercer, well known in municipal and business circles in the North of England. Educated at Giggleswick School in Yorkshire, one of Edward VI.'s grammar schools, Dean Mercer became a student in Christ's College, Cambridge, and at a later date graduated at the Western University, London, Ontario. In 1895 he was ordained by the Bishop of London, and after several years of work in London, chiefly among the poor, and in the Whitechapel district, in 1899 was appointed metropolitan secretary of the Church Army in London. Seven years later he accepted the incumbency of St. Columb at Hawthorn, Melbourne, arriving in Victoria in February, 1907, and subsequently received the appointment of chaplain to the Archbishop of Melbourne in 1909.

In 1912 Mr. Mercer was appointed to his present office of Dean of Perth, and entered upon his new duties in April of that year. His work among men in Victoria was regarded as particularly successful, and in that State he is looked upon as the leading authority in this important department. For five years he held Sunday afternoon services, which were attended regularly by several hundreds of men, and he was the founder of St. Columb's Brotherhood, in which were enrolled over 400 members. During the time spent by him at Hawthorn the church was enlarged and improved by the addition of a chancel, transept, and organ chamber, the Brotherhood presenting an oak pulpit, a brass communion rail, and a carved oak holy table, and other gifts to mark their appreciation of the vicar's services. He is a cordial advocate of healthy outdoor sport, having been a member of the leading English Rugby football teams, and also played for his college at Cambridge. He was well known in lacrosse circles at the University, and was responsible for the formation of several clubs in Lancashire, holding office as Captain of the Barrow Club. Mr. Mercer has been twice married. His second wife, to whom he was united

Bartolto. Perth.  
VERY REV. H. F. MERCER.

in 1909, is a daughter of Mrs. Tannock, of Geelong, the latter lady being first cousin to the late Earl of Cairns, a former Lord Chancellor of England, whose brother was Governor of Queensland, and gave his name to the town of Cairns in that State.

### THE ROMAN CATHOLIC CHURCH.

The first evidences of Catholicity in Western Australia were, like the mustard seed, very small indeed; but the subsequent history of the Church, like that of the colony itself, is one of steady development and continual progress.

The Swan Settlement was without a Catholic priest until the year 1843. By a letter, dated September 1, Archbishop Polding appointed the Rev. John Brady to be Vicar-General of Perth, with full powers for ministering to the faithful throughout the whole of the western colony. Father Brady, who was a native of Co. Cavan, Ireland, had already given proofs of his zeal and virtue on the mission in the Island of Mauritius, and afterwards in the district of Windsor, New South Wales. He came to the West accompanied by Father Joostens, an aged Dutch priest, and Mr. Patrick O'Reilly, a catechist. They arrived at Albany on November 4. Great and enthusiastic was the welcome accorded to these, the first priests arriving in Western Australia. The Catholics were full of joy as they assisted at the first mass celebrated in Western Australia, not in a church built by men, but in a chapel formed by Nature between large boulders of granite enclosing a cruciform area. Having attended to the spiritual wants of the few Catholics in Albany, the two priests set out for Perth, which they reached on December 13. The Catholics, who were few and far between, were delighted to meet the priests and to be given the long-wished-for opportunity of assisting at mass, and of receiving the Sacraments in their adopted country, the Swan Colony.

Governor Hutt, who gave the priests a very cordial welcome, granted the Catholic community three allotments of land for church, school, and presbytery. He also gave a liberal subscription to the first Catholic building committee formed in Perth.

A temporary school was opened almost immediately, and Father Brady himself acted as teacher for the first three months.

For the time being mass was celebrated in a newly-erected stone building, 60 by 24 ft. This building was filled to overflowing on Sundays, some of the worshippers coming a distance of nearly 20 miles.

Before many months had passed a primitive church, capable of accommodating 150 persons, was erected. Father Joostens was then left alone to attend to the spiritual interests of the Western Australian Catholics, as Father Brady set sail for Europe in order to enlist the sympathy of the Society for the Propagation of the Faith on behalf of his poor flock, and also to endeavour to secure some zealous missionaries who would devote themselves to the instruction and christianizing of the aboriginals, for whose salvation the good priest yearned.

In a letter to Propaganda, dated Vigil of All Saints,

1844, Father Brady stated that large numbers of Europeans had settled in Western Australia since 1829. "In Perth and its district," he stated in his report, "there are about 5,000 of white population and 2,000 blacks. In the other districts the European population is very small and very scattered, but the blacks are numerous, being estimated at 2,000,000. These aboriginals are far superior to those of New South Wales; they are of a dark-olive colour. The Government and the white population are most anxious to civilize them and to show some kindness to them." Father Brady suggested to Rome that Dr. Ullathorne should be appointed Bishop of Perth, and that two distinct missions should be established for the aboriginals—one at King George Sound and the other at Port Essington, towards the north of Australia.

Recognizing Father Brady's great zeal and heroic virtue, the Holy See appointed him Bishop of Perth, at the same time assigning to him the administration of the two vicariates apostolic at King George Sound and Port Essington. Father Brady was consecrated Bishop of Perth in the Collegiate Church of Propaganda on May 18, 1845. He then visited France and Ireland in search of missionaries, and succeeded in securing seven priests, one subdeacon, two benedictine novices, two lay brothers of the congregation of the Sacred Heart of Mary, eight Irish catechists, and six Sisters of Mercy, with one novice from the Convent of St. Leo, in Carlow, Ireland. This was the largest religious company that had yet set out for Australia. It sailed from London in the barque "Elizabeth" on September 16, 1845, and arrived in Fremantle on January 7, 1846. The whole population of the Swan Settlement assembled to greet the newcomers, who chanted the Litany as they rowed from the ship to the shore, and who, as soon as they touched Australian soil, sang the "Te Deum Laudamus" in thanksgiving to God for their safe voyage. None received a heartier welcome than the Sisters of Mercy, who were the first members of their Order to arrive in Australia. These quickly won the esteem and sympathy of all the colonists, and their schools were attended by pupils of all denominations.

The most noteworthy of those who arrived in the "Elizabeth" with Bishop Brady were Dom Salvado and Dom Serra, two Spanish benedictines of indomitable courage and heroic zeal, who laid the foundation of the now famous New Norcia Monastery in 1847.

The same zeal and courage was manifested by Father Confalonieri, a noble Italian priest, who unselfishly offered himself for the work of labouring among the aboriginals in the Port Essington district. Having received full powers of Vicar-General from the Bishop, Father Confalonieri, accompanied by two Irish catechists, James Fagan and Nicholas Hogan, set out for Port

Essington a few days after arriving in Perth. Proceeding to Sydney, the three sailed from there towards the northern tribes; but meeting with very rough weather they suffered shipwreck in Torres Strait, where all perished except the captain of the ship and the dauntless Italian missionary. The latter succeeded in reaching the natives, the salvation of whom he had so much at heart. For two years he laboured amongst them, and brought 400 of them to the fold of Christ. Worn out by his strenuous labours and weakened by disease and famine—a true martyr of missionary charity—Father Confalonieri died on June 9, 1848, at his post on Melville Island, not far from the spot now known as Cambridge Gulf.

The Commandant at Port Essington wrote to the Secretary of the Archbishop of Sydney on June 16, 1848:—"Your friend, the Rev. Angelo Confalonieri, was seized with a treacherous attack of fever on May 31, and calmly expired on the 9th inst. He received honourable burial on the morning of the 11th, his own instructions being carefully carried out. His remains were accompanied to the tomb by the officers and military with all the respect that was due to a man who was so highly esteemed."

Of the other priests who arrived in the "Elizabeth," Father Powell, from Ireland—being the only English-speaking priest amongst them—was given charge of the Cathedral Parish, while the three disciples of the Venerable Father Liebermann were appointed to take charge of the mission amongst the aboriginals of Albany and the southern coast. But this small community was thinned by the death of Father Bouchet a few days after their arrival in Perth. The remaining two, Father Thevana and Father Thierse, with two lay brothers, set out immediately for their mission. But it was literally a calvary of crosses; little impression could be made on the natives owing to their migratory habits, and some of the tribes were anything but friendly. The food supplies

brought from Perth consisted merely of a few bags of flour given them by the Bishop. These were soon exhausted, and the missionaries, being unable to speak English, received very little welcome from the few European settlers whom they met. They settled down on the bank of a fresh-water lake—Lake Matilda—and while their ammunition lasted they provided themselves with kangaroo and other game from the neighbouring forests; they also cultivated a few small patches of land, which yielded but a very poor return. Their house and their church consisted of wretched huts constructed with branches of trees. Their condition became desperate as food and ammunition began to fail them, and Father Liebermann, who shed tears when he heard of their privations and sufferings, had them transferred, by permission from Propaganda, from King George

Sound to the Mauritius.

The first Catholic Diocesan Synod of Western Australia was held at New Norcia on March 13, 1847. His Lordship, Bishop Brady, presided, and the clergy were represented by Father Joo-stens, Father Serra, and Father Salvado. It was resolved to

ROMAN CATHOLIC CATHEDRAL, PERTH, PRESENT DAY.

send Dom Serra to Europe to collect funds in aid of the mission. It was also considered necessary in the interests of the natives to secure a tract of land of 2,500 acres around the Monastery as a permanent reserve settlement, and for the purchase of this reserve the Bishop guaranteed, by promissory note, the payment of £1,280. The collecting tour undertaken by Dom Serra in Europe was very successful; large sums were contributed by several benedictine communities in Italy, as well as by many wealthy Spaniards.

While Dom Serra was collecting in Europe, the Home Government had marked out Port Essington (then called Port Victoria) as the foundation of a new colony. It was then considered a good move to appoint a bishop in order to prepare the foundations of a new diocese

there. Before he returned to Australia, Dom Serra was chosen for this new missionary field on July 7, 1847, and was consecrated Bishop of Port Victoria on August 15 in the same year.

In 1849 the diocesan debt was almost £10,000, and as it was rumoured that the sums collected by Dom Serra would be applied to the new diocese of Port Victoria, Bishop Brady commissioned Dom Salvado to proceed to Europe to collect money in order to lessen the liabilities of the diocese. In the meantime Father Joostens had left the diocese for Batavia, and as, on the departure of Dom Salvado, there would be no priest remaining in Western Australia, the Bishop ordained a young Irish catechist named Donovan. Dom Salvado then sailed from Fremantle for Europe on January 8, 1849. In order to meet the financial crisis, Bishop Brady sold some valuable private property which he held in Mauritius and paid the proceeds to his creditors. He was now feeling the pressure of monetary difficulties and the weight of pastoral anxieties; as a consequence his health began to fail. Anxious to shoulder all the requirements of his poverty-stricken diocese, he applied to the Holy See for a coadjutor. To that position the Propaganda appointed Dr. Serra, who was still in Europe. Accordingly, by brief dated July 25, 1849, Dr. Serra was transferred from the diocese of Port Victoria to that of Daulia *in partibus*, and appointed Coadjutor of Perth and Administrator of the Temporalities of the See. At the same time Dom Salvado was appointed Bishop of Port Victoria, and received his episcopal consecration in Naples on August 15, 1849.

Dr. Serra, accompanied by seven priests and thirty-two benedictine aspirants, arrived in Fremantle on December 29, 1849. Bishop Brady, in welcoming him at the episcopal high mass on the following Sunday, recalled the landing of St. Augustine on the shores of Kent, and expressed the hope that the arrival of the present missionary staff would bring similar blessings from the same Holy See. But the good Bishop's bright hopes were far from realization. The appointment of Dr. Serra to administer the temporalities of the diocese, without shouldering the burden of the many diocesan debts already incurred, only led to greater confusion. Hence Dr. Brady himself set out for Rome in the beginning of February, and arrived there in the month of May, 1850. He had more than one audience with the Pope, during the last of which the Holy Father used the words, "You must return to your people." The Bishop set off without delay for his diocese in Australia, forgetful of the rule that missionary bishops, when paying their visit *ad limina*, are not allowed under censure to return to their Sees until they receive the sanction of the Congregation of Propaganda. He arrived in Fremantle at Christmas, 1851. His arrival was not at all welcome to the Spanish clergy, and for some time the Catholic community was

torn by dissensions, which more than once led to litigation in the Law Courts. Dr. Brady withdrew from Western Australia in August, 1852. He spent some time in Rome, and subsequently resided in the diocese of Kilmore, in Ireland. Not having resigned his See, he continued Bishop of Perth until his death at Amelules Bains, in France, on December 2, 1871.

On the departure of Dr. Brady the entire administration of the diocese devolved on Bishop Serra, the Coadjutor of Perth, to whom special faculties were communicated by the Holy See.

A letter from the Superior of the Sisters of Mercy in Perth to the Archbishop of Dublin on September 25, 1852, gives some interesting details regarding the mission at that period:—"The Archbishop of Sydney," she writes, "has been in Perth (commissioned by Propaganda to inquire into the condition of things). His Grace had intended giving a series of missions in the various towns, but he has been obliged to leave before he could carry out his intention. He expressed his great regret at the want of such means of rousing up the religious feelings of the people, and also at the want of catechetical instructions for the men who belong to the humblest class of our poor countrymen; and we have but one Irish priest, who can with difficulty attend to one town. There are three Spanish priests, but they do not speak the English language well. The Bishop, Dr. Serra, speaks English very well for a foreigner. The convict system being mild, very many of the ticket-of-leave holders are becoming respectable members of society, and remarkably attentive to their religious duties. . . . We have endeavoured to lighten the burden on the mission by opening a school for the children of the gentry distinct from the poor school. It is doing very well. . . . We asked and obtained the Bishop's permission and full approval to commence a collection for the building of a schoolhouse for the children attending the poor school, whose number is ever on the increase, and whom we are obliged to crowd into a room not large enough to contain the half of them conveniently. The Catholics are all poor people; the greater number of the Protestants are also poor, and but few are wealthy. Yet we have collected nearly £300, principally from the Protestants, who value our schools so much that they freely gave what they could afford. It has been calculated that in this colony the building will cost £800."

In 1853 Bishop Serra again visited Europe, and on his return brought with him some students, lay brothers, and missionaries. He also brought four Sisters of the French Community of St. Joseph of the Apparition, to whom he gave charge of the Catholic School in Fremantle.

The most distinguished of the students who came to this colony with Dr. Serra in 1855 were Mr. Reynolds, afterwards Archbishop of Adelaide; Mr. Byrne, afterwards Vicar-General of Adelaide; and Mr. Bourke, now

the Right Rev. Monsignor Bourke, whose life work is bound up with the history of Western Australia, where he laboured under great difficulties, first as schoolmaster in Perth, and after his ordination as missionary priest in various parts of the colony, as Vicar-General of the diocese for several years, and as school and church builder in the parish of St. Brigid's, West Perth—the first canonically erected parish outside of the cathedral.

During his administration Bishop Serra erected the Bishop's Palace at Victoria Square, Perth, the Presbytery at Fremantle, and the old portion of what is now the Orphanage at Subiaco.

In 1859 Bishop Serra left Western Australia, having appointed the Rev. Martin Griver administrator of the diocese during his absence. He resigned the Coadjutorship of Perth in 1862, and withdrew to his native Spain, where he worked zealously until his death on September 8, 1886.

By a rescript from Rome in 1862 the Rev. Martin Griver, who was deputed to act as administrator of the diocese by Bishop Serra, was authorized to continue in that office. On October 10, 1869, he was appointed Bishop of

Toxa and Administrative-Apostolic of Perth. On August 5, 1873, Dr. Griver was, by special brief, translated from Toxa *in partibus* to the Episcopal See of Perth.

Dr. Griver gave the first real impetus to church building in the diocese of Perth. In 1860 churches were commenced in Fremantle, Guildford, and York. During Dr. Griver's administration in 1863 the foundation-stone of the present Cathedral, on the splendid site in Victoria Square, was laid by Bishop Salvado. The sacred edifice was opened on January 29, 1865, having cost £4,000, exclusive of the high altar, church furniture, and decorations. The beautiful marble altar was presented to the Perth Cathedral by Francis II., King of Naples and Sicily.

Early in the history of the colony the few Catholic schools in Western Australia had been in receipt of a

small subsidy from the Government, but owing to some disagreement between Governor Kennedy and Bishop Serra this help was withdrawn. The Catholics were both few and poor, but Dr. Griver was not disheartened. He himself was most frugal in all personal expenses, and whatever he could spare by almost heroic self-denial was devoted to works of religion and education. The people, recognizing his great zeal and utter unselfishness, co-operated with him as far as their means would allow; as a result great progress was made in a comparatively short time. As priest, as administrator, and as bishop, Dr. Griver was unwearied in every work that tended to save souls, and to his flock he was, in every sense of the word, a model of humility, of penance, of holiness, and of every virtue. Whenever the spiritual needs of his flock called for his care or his time every other consideration was brushed aside. He was all things to all men.

In 1869, when Dr. Griver went to Rome for his consecration, Father Matthew Gibney, V.G., supported by the clergy and Catholic laity, induced the Government of Western Australia to restore the grant formerly allowed to the Catholic

Photo by C. H. Park.

ROMAN CATHOLIC BISHOP'S PALACE, PERTH.

schools. But even then the Catholic schools received only half the amount allowed to the public schools, while the average attendance required to entitle them to a grant was double that required at a public school.

In 1882 Bishop Griver paid his *ad limina* visit to Rome. In the diocesan report drawn up at that time His Lordship recorded the facts that the number of Catholics in the Perth Diocese was about 8,500, and that there were 1,300 children in the Catholic schools. His report also contained the following interesting information:—"The Sisters of Mercy have three convents with twenty-five nuns. They have also two orphanages, one for girls, with forty-five children, and one for boys, with fifty-five children. For some time the Government refused to recognize the nuns' schools or orphanage, but the unquestionable merit of the Sisters and their success in teaching overcame every obstacle."

Referring to New Norcia, he stated that there were about a hundred aborigines settled down there, having their own homes and holdings. "They cultivate the land, take part with the lay brothers in all the various details of farm work, and conform to all the usages of civilized life. One day each week they get a run in the woods, hunting the kangaroo or opossum, or collecting wild fruits. They display considerable agility, and have been particularly successful in all matters of handicraft. Their cricket club is the best in the colony; they have borne away the palm in shearing; some of the native girls displayed wonderful skill in telegraphy; some of the grown boys trained at the Monastery have proved themselves excellent masons. The native children eagerly learn the Catechism, and are particularly fond of music. Several of them have become excellent musicians."

Dr. Griver was present at the Plenary Council of Sydney in 1885, but as he was then in very feeble health a petition for the appointment of a coadjutor was, at his own request, forwarded from the Council to the Holy See. The choice of Rome fell upon the Vicar-General, Rev. Matthew Gibney, but before the briefs of Dr. Gibney's appointment were received, Bishop Griver was called to his reward. He died on November 1, 1886.

"We have referred," says the late Cardinal Moran in his "History of Catholicity in Australia," "to the austerities for which this holy Bishop (Griver) was remarkable. When his remains were being prepared for burial, great was the surprise of those engaged in this work of mercy when they found fixed to his back, between the shoulders and partly embedded in the flesh, a thick wooden cross about a foot in length, from which fine iron spikes penetrated into the flesh. This instrument of torture must have been his companion for many years, for the flesh was healed round the wounds and the skin beneath the cross had become hard and dry. The cross was kept in position not only by the spikes, but also by a knotted cord, which, starting from the summit of the cross, was drawn over the shoulders and then tied tightly round the waist. Thus the saintly man, like another St. Paul, mortified himself and chastened his body and kept it in subjection, lest, while he preached to others, he himself might become a castaway."

The Rev. Matthew Gibney, who arrived in Western Australia in 1863, and who, as Vicar-General, was Bishop Griver's right hand, philosopher, and trusted friend, was consecrated Bishop of Perth on January 23, 1887, by the late Cardinal Moran, in the Cathedral of the Immaculate Conception. Never did any bishop in Australia face his work with greater determination, more undaunted courage, or more burning zeal than that manifested by Bishop Gibney. During his episcopate no effort was spared by him in his laudable endeavour to bring the blessings of the Church over which he ruled into every corner of his vast diocese. Church buildings

and school buildings were erected on the best sites available. Teaching orders, both of men and women, were introduced, not only to train the young and to bring the Catholic schools up to the most exacting standard, but also to care for the homeless and the orphan, to raise and reclaim the fallen, and to lovingly tend the sick and the afflicted in the St. John of God hospitals. Bishop Gibney also fearlessly championed the cause of the Western Australian aborigines, travelling unarmed amongst them for months, and making provision for their civilization on truly Christian lines.

Bishop Gibney retired in 1910, and Archbishop O'Reilly, of Adelaide, at the request of the senior priests of the diocese, sent the name of the Rev. Patrick Clune, C.S.S.R., as the most worthy to succeed Bishop Gibney in the See of Perth. In the following January the glad welcome news arrived that the chosen one of the Holy See was "Father Clune." No appointment could have been more popular with priests and people. Father Clune had, as a Redemptorist, given missions, not only all over the Commonwealth of Australia and in the neighbouring Dominion of New Zealand, but also in the British Isles. Hence the day of his consecration, in the Cathedral of the Immaculate Conception, March 17, 1911, was a new and inspiring day in the history of Western Australian Catholicity. His Eminence Cardinal Moran was the consecrating prelate; he was assisted by Archbishop Redwood, of Wellington, New Zealand, and Archbishop Delaney, of Hobart. Bishop Gallagher, of Goulbourn, preached a most eloquent sermon on the occasion. Bishop Gibney, Bishop Kelly of Geraldton, and Bishop Norton of Port Augusta, were also present. Immediately after his consecration, Bishop Clune commenced to work, travelling continually over his vast diocese, administering confirmation, and holding conferences with the leading Catholic business men in order to put the diocesan finances on something like a firm footing. During the first year of his episcopate Bishop Clune succeeded in reducing the immense diocesan debt by £60,398 12s. 8d.; this money was raised by collections and by sales of diocesan property. No more successful effort has been recorded in the ecclesiastical history of Australia.

The following general summary will give an idea of the extent and development of work in the Perth Diocese:—At the close of 1912 there were 56 Catholic churches, 45 secular priests, 11 religious priests, 20 Christian Brothers, 7 religious brothers, 429 nuns, 60 lay teachers, 2 colleges, 23 superior schools for girls, 47 primary schools, 2 orphanages, 2 hospitals, 1 Magdalene asylum, and 2 industrial schools; the total number of children in Catholic schools, including orphanages and reformatories, is 8,500.

In 1898 the diocese of Geraldton was established, and the Right Rev. William Bernard Kelly, a native of Subiaco, Western Australia, was consecrated its first

Bishop on August 14. At the end of 1912 Dr. Kelly had in his diocese 28 churches, 14 priests, 73 religious, 5 boarding schools, and 13 elementary schools. The total number of children in the Geraldton Diocesan Schools numbered 872.

The Catholic Mission at New Norcia (to which, as well as to Beagle Bay, reference has been made under the article on the aboriginals in Vol. I. of the present work) was founded by Dom Salvado, O.S.B. (afterwards Bishop of Port Victoria), for the purpose of civilizing and Christianizing the Western Australian aboriginals. It was established as an "Abbey Nullius" and Prefecture

Apostolic by Pius IX. in 1867, with 16 square miles of territory subject to the jurisdiction of the Abbot. The boundaries are now extended from 30° south to a line coinciding with the 31° 20' parallel of latitude (Moore River), and from the sea to 120° east longitude. The present Bishop is the Right Rev. Abbot Torres, O.S.B., who was consecrated on May 22, 1910. The Abbot has 10 churches, 10 religious priests, 3 secular priests, 9 monastic students, 32 religious, 21 nuns, 3 boarding schools, 2 superior day-schools, 5 primary schools, 2 charitable institutions, and 400 children attending the Catholic schools of his diocese.

The Right Reverend PATRICK JOSEPH CLUNE, the present Catholic Bishop of Perth, springs from what may be called a truly Levitical family. The fifth of eleven children, he was born in County Clare, Ireland, in the year 1864. His younger brother, Father Francis Clune, is at present Superior of the Passionist Fathers at Marrickville, Sydney. Besides the two brothers, two sisters also gave themselves to the service of God—Sister Mary Xavier, who joined the Sisters of Mercy in Goulburn, and Mother Emily, who joined the Faithful Companions of Jesus at Kew, Melbourne. The present Bishop read his classical course in the College at Ennis, County Clare. His apostolic spirit manifested itself early; he felt a strong desire to go on the Foreign Mission field, and in order to realize his wishes he went to All Hallows' Foreign Missionary College, Dublin. Here he was fortunate in having among his Professors the Most Rev. Dr. Delaney, the present Archbishop of Hobart, and the Right Rev. Monsignor O'Brien, now Rector of St. John's College within the Sydney University. Having finished his theological course before he attained the canonical age Dr. Clune was ordained, by special dispensation from the Holy See, at the early age of twenty-two and a half years. After his ordination Dr. Clune went to Goulburn Diocese, New South Wales, where his first appointment was to the College as Professor of English Literature and History. There he had as associate Professors the Right Rev. Dr. Gallagher, present Bishop of Goulburn, and the Rev. Michael Phelan, S.J.,

who is now one of the most distinguished Jesuits in Ireland. Those who are now familiar with Dr.

RIGHT REV. PATRICK JOSEPH CLUNE.

Clune's robust frame and manly appearance will be surprised to know that his health broke down after two years' Professorship at Goulburn College, and he was compelled to spend some time in the country before he was fully restored. He was then appointed one of the assistant priests at Goulburn Cathedral. From 1888 to 1893 he laboured with great success in Goulburn Cathedral Parish, where he is still affectionately remembered for his genial disposition, his eloquent sermons, and his noble priestly characteristics. But, feeling himself called to a still higher

life, full of zeal and actuated by genuine apostolic motives, he left Goulburn Diocese to join the congregation of the Most Holy Redeemer, founded by St. Alphonsus Liguori. Before actually joining the Redemptorist Order Dr. Clune travelled over the world in order to widen his experience and to perfect himself in modern languages. This was his first holiday, and the manner in which he united the pleasant with the useful shows the practical spirit of the man. On July 13, 1893, he entered the Redemptorist Novitiate at Bishop-Eaton, Liverpool, the principal house of the Anglo-Irish Province. He was professed on September 3, 1894, and soon after commenced his good work as a Redemptorist. He is well known in many parts of England and Ireland, where he was engaged in giving missions and retreats until 1899. It was in the year 1899 that the Redemptorists came to the Diocese of Perth on the invitation of the Right Rev. Bishop Gibney, who made the Order a present of that magnificent site on which the Monastery now stands in North Perth. Dr. Clune, who was among the first community sent out, soon became one of the best known of the pioneer Redemptorists in Western Australia. The remembrances of those pioneering days are full of interest; and many sturdy Irish exiles who were bearing "the burden of the day and the heats," blazing the track and carrying their swags outback, now attribute their spiritual resurrection to the visit of Father Clune, who brought them the consolations of their religion, gathering them for the Mass and

the sacraments in places where Mass was seldom or never celebrated before. Toward the end of 1904 Dr. Clune was transferred to New Zealand, where he was appointed Superior of the first Redemptorist Foundation in the Dominion. In New Zealand, as elsewhere, Dr. Clune conducted many successful missions and retreats; he also built the beautiful Redemptorist Church at Oriental Bay, Wellington. In December, 1909, he came West again, this time as Rector of the Monastery at North Perth. The return of Dr. Clune to Western Australia gave joy to both priests and people, and the joy was further increased in June, 1910, when by the almost unanimous vote of the priests he was selected "dignissimus" to succeed Bishop Gibney, who had resigned the See of Perth. The papal brief of Dr. Clune's appointment to the See of Perth arrived on February 8, 1911, and his consecration was fixed for March 17. On St. Patrick's Day, 1911, Dr. Clune was consecrated in the Cathedral of the Immaculate Conception, Perth, by His late Eminence Cardinal Moran, assisted by the Most Rev. Archbishop Redwood of Wellington, New Zealand, and the Most Reverend Archbishop Delaney of

Hobart, Tasmania. The other Bishops present were Bishop Gibney, Bishop Kelly of Geraldton, and Bishop Norton of Port Augusta, South Australia. Dr. Clune found the Diocese of Perth very heavily burdened with debt. Immediately after his consecration he took the priests and people entirely into his confidence, telling them in detail the exact state of affairs. He appointed two diocesan consultors, whose written consent would be required in all important matters relating to diocesan temporalities. He then called a meeting of the laity, men of business and talent, and formed a lay committee. On the advice and with the co-operation of this committee he commenced the work of reducing the gigantic debt. Within a few months after his consecration we find that he had been to the Eastern States and back on diocesan business; and we see him travelling up and down through his extensive diocese, sometimes speaking publicly three times each Sunday, his only regret being that his first visitation should be in the "guise of a beggar." Dr. Clune has been ever a warm favourite with the priests and people of Western Australia. He is also well known in the Eastern States,

where he has given many missions and retreats, and where he is regarded as one of the most successful missionaries and one of the most practical and zealous priests that ever came to Australasia. Whether his missions were held in the great cathedrals and suburban churches of the large cities, or "out on the fringe of the never-never" country, they were always a great success, and are always remembered with love and reverence as certain definite landmarks in the progress of Catholicity. "The style is the man," says Newman. This is very true of Dr. Clune. He has a style of his own, and the most striking characteristic of that style is the genuine ring of sincerity in all his utterances, whether in the simple instructions to children or in the highest flights of sacred eloquence. He is undoubtedly a man among men. On the missions long ago he was always known as the men's "man." His frankness, his zeal, his manly piety, his untiring energy, and his thorough determination have won the esteem, the admiration, and the affection not only of his own priests and people, but of all creeds and classes with whom he has been brought into contact.

### THE METHODIST CHURCH.

After the Church of England, the Methodist—or as it then was, the Wesleyan Methodist—Church can claim to be the oldest religious denomination in the State. One of the earliest vessels to arrive at the then new Swan River Settlement was the "Tranby," which reached Fremantle in February, 1830, bringing as settlers Messrs. J. and J. W. Hardey, G. Johnson, and B. Clarkson, with their families and servants. These were all active Methodists, and the leader, Joseph Hardey, had for many years been a local preacher in Yorkshire. As soon as possible after the arrival of the vessel he established services, first at Fremantle and then at Perth, for the benefit of those colonists who were members of his own communion. The Hardeys settled at the Peninsula, situated on the river between Perth and Guildford, and soon established meetings at the latter place also. At first, for want of a building, worship was conducted in the open air, the Perth services being held under a large jarrah tree which grew on the site now occupied by Charles Moore & Co. in Hay Street. Amongst those who welcomed the services were Mr. and Mrs. J. Inkpen and Mr. Henry Trigg. Mr. Inkpen was the first class-leader, and when the need for a church building became apparent, he it was who gave as a site a block of land at

the corner of William and Murray Streets, now part of the Queen's Buildings site. Here a building was erected which for nearly half a century formed the headquarters of Methodism in Western Australia.

The need for a spiritual head now became pressing, and application for a missionary was made to the Foreign Mission Committee of the British Conference. In 1837 the Rev. W. Longbottom was appointed to the post, but never arrived. After many vicissitudes passed in endeavouring to reach his charge, he was finally shipwrecked near Encounter Bay in South Australia, and was persuaded to become the pioneer Methodist minister of South Australia.

In 1839 another clergyman, the Rev. J. Smithies, was appointed. He arrived in June, 1840, and for some sixteen years, being stationed at Perth and York in turn, had the pastoral oversight of the little church. Under his superintendence a native mission was conducted by Mr. F. F. Armstrong, first at Perth, then at Wanneroo, and finally at York. Though for a time it succeeded fairly well, it apparently had not the elements of permanency, and after a few years was disbanded.

During the first quarter of a century after the inauguration of the services but little progress was made.

The reason for this may partly be found in the fact that there was divided control. The Western Australian Church was under the London Board of Missions, but was at the same time, in a vague way, part of the Australasian system of Methodism, and to some extent governed by it. Some expansion, however, was evident.

In 1852 the Rev. William Lowe joined Mr. Smithies, and after the departure of that minister took full control, being assisted by the Rev. Samuel Hardey. Apart from the Hardey families, the most prominent layman of the period was Mr. George Shenton. For many years he was one of the financial stays of the Church, and his work was long and ably continued by his son, the late Sir George Shenton.

In 1855 there were only two churches, four preaching-places, 67 Church members, and 480 attendants at worship. The history of the Church during the next forty years has been admirably condensed by the Rev. Dr. Burgess, to whom we are indebted for most of the following information.

Growth in the second quarter century was still extremely gradual, but preparation had been made for future expansion in the circuits that had already been formed. There were nine churches and four preaching-places, the membership had risen to 146, and the attendance to 1,820. At the commencement of the period the Rev. Mr. Smithies was removed to New Norfolk (in Tasmania); the Rev. Samuel Hardey left for South Africa in 1862, and the Rev. William Lowe, who had been removed to Tasmania in 1859, returned to Western Australia in 1866. Among the ministers who laboured for varying periods, the names of Messrs. Clay, Bond, Traylen, and Laurance deserve honourable mention; some of them were abundant in zeal and indefatigable in labour, often under circumstances of great discouragement. It was during this period that the stately

edifice, Wesley Church, was erected as the central point of Methodism in Western Australia.

A new condition of things began with the year 1873, when the Australasian Church came under a new constitution. What had previously been subject to the management of the same Conference, meeting in one or other of the principal cities, was divided into four separate Conferences, with a General Conference meeting every three or four years. Western Australia was attached to the South Australia Conference as a district, but except in name, and so far as legal and technical observances required, was really self-governing. All statistics and information regarding it were kept separate, and the acts of its District Synods were, as a rule, only submitted to the South Australia Conference for formal approval.

A better appreciation of the needs of the Methodist Church in this State followed the alteration of the constitution. Some of the foremost men in South Australia were detailed for work here. When, in 1884, Mr. Lowe relinquished the Chairmanship of the District, he was followed by the Rev. R. W. Campbell, one of Adelaide's ablest ministers. He in turn gave place to the Rev. P. C. Thomas, who was succeeded by the Rev. J. Y. Simpson.

By this time the gold discoveries had been made, and, in common with all other Churches, Methodists made a great advance. Much of its success was due to the able administration of the Rev. G. E. Rowe, who was chairman in 1893. Appreciating to the full the peculiar circumstances that came with the gold rush, Mr. Rowe spared no effort to make his Church a prominent factor in the life of the community. To his foresight may be ascribed the institution of the Sisters of the People, who carried healing and consolation to those overcome by the hardships and rough conditions of the mining

Photo by C. H. Park.

WESLEY CHURCH, PERTH.

camps. To his administration was also due the fact that in 1897—years before it happened in the Eastern States—a basis of union between the various sections of the Methodist Church was arrived at, and the Church saved from perpetuating unnecessary divisions. At his instigation, too, the movement commenced which ended in the grant of full autonomy to the Church in Western Australia.

The Western Australia Conference was established in 1900, and Mr. Rowe had the honour of being elected

the first President, the Rev. T. Bird, another honoured minister of the denomination, being elected Secretary. Since that time steady progress has been made. The zeal that was shown in carrying the Gospel to the mining camps has been equally evident in the help given to the new agricultural settlement, and the great principle of Methodism—Church extension—has been admirably maintained. The President of the Conference for the year 1912-13 is the Rev. John G. Jenkin, who is at the same time superintendent of the Kalgoorlie Circuit.

### THE PRESBYTERIAN CHURCH.

In November, 1837, the ship "Portland," on her voyage out from England to New South Wales, touched at King George Sound (Albany) "to procure refreshments for the sick on board." Among her passengers were the Rev. J. Dunmore Lang, D.D., senior minister of the Presbyterian Church in New South Wales, and nine other Presbyterian ministers. Availing themselves of the opportunity afforded by the brief stay in the Sound, they addressed a pastoral letter "To the Scotch and other Presbyterian inhabitants of the colony of Swan River." A copy of the pastoral was, by direction of the Governor, published in the *Government Gazette* "for general information," and appeared in the issue of Saturday, January 27, 1838. The writers say:—"We need not inform you how earnestly we desire and long for it on your behalf, that, in this remote land of your earthly habitation, you may be speedily blessed with the regular dispensation of the ordinances of religion, agreeably to the hallowed institutions of our true scriptural and apostolic Church, and that your interesting offspring may ere long enjoy the benefit and the blessing of a sound scriptural education, that most distinguishing privilege and glory of our beloved fatherland." The letter proceeds:—"In the meantime we request that a few of your number will do us the favour to form themselves into a Provisional Committee—first, to ascertain the number of the Presbyterian inhabitants of the colony and their general sentiments in regard to the desirableness of the regular dispensation of the ordinances of religion agreeably to the hallowed institutions of the Presbyterian Church in this colony; and, second, to correspond with us on the subject by the earliest opportunity." The letter does not seem to have been followed up by action on either side. Nor is this to be ascribed to apathy. In a total population for this colony of probably not more than 2,000, the Presbyterians must have been an insignificant handful.

It was not till forty years later that the desire expressed in the letter was realized. Through the agency of the Rev. J. Innes, the spiritual requirements of a few Presbyterians in the Toodyay district received attention for a brief term, under sanction from the Church of

Scotland, but it was not until 1879 that the responsibility of establishing a Presbyterian Church in Western Australia was formally undertaken. The man and the means came from Scotland. The Rev. David Shearer, M.A., arrived by the barque "Charlotte Padbury" in October, 1879, the bearer of a joint commission from the Established and Free Churches of Scotland to establish a Church in Perth and to visit scattered members of the fold. Services were at once commenced in St. George's Hall, a Sunday-school was started, and a week-night service was begun at Guildford. Three years after Mr. Shearer's arrival the first Presbyterian Church in the colony, St. Andrew's, Perth, was opened for Divine service. The congregation applied to the General Assembly of the Presbyterian Church of Victoria for admission into that Church, and was subsequently received into the Presbytery of Melbourne.

Pioneer work was now entered on in the eastern districts at Northam and Newcastle. After an experiment of several months it was considered preferable to adopt Fremantle as a base of operations. The Free Church of Scotland assumed the full financial responsibility, and in 1886 sent out the Rev. Robert Hanlin to begin work at the Port.

Meanwhile the Home Mission Committee of the Victorian Church was induced to give attention to Albany as a suitable place for occupation, and a charge was formed there in 1889. The three charges—Perth, Fremantle, and Albany—which had been placed for presbyterial oversight under the Presbytery of Melbourne, so continued till 1892, when they were formed into the Perth Presbytery under the General Assembly of Victoria.

The new Presbytery turned its attention to Geraldton, where a congregation was formed and a minister settled in 1894.

The claims of the eastern goldfields now became urgent, and it was resolved to follow up the crowds that were streaming in from the Eastern States. Early in 1896 a minister was placed at Coolgardie, and in the following year Kalgoorlie became a settled charge. In rapid succession Boulder, Kanowna, Bulong, Menzies,

Kookynie, and Leonora were supplied with ordinances.

The year 1898 witnessed the formation of full charges at Northam, Cottesloe, West Perth, Leederville, East Fremantle, and, at no distant date, in Subiaco and Midland Junction. And in somewhat more recent years Claremont, Katanning, North Perth, and Maylands have been added to the number of settled charges.

The year 1901 marked a change in the government of the Church. Hitherto the Church, as has already been pointed out, was under the General Assembly of Victoria. It now sought and obtained autonomy, and the first General Assembly met in Perth in the month of April. This step enabled the Presbyterian Church in Western Australia to participate in the Union of the Presbyterian Churches of Australia, which was consummated in Sydney in September, 1901, the Rev. Robert Hanlin, the first Moderator of the State Assembly, being one of the signatories of the Deed of Union.

There are in all 19 full charges—nine in the Perth Presbytery, six in the Fremantle Presbytery, and four in the Goldfields Presbytery.

In addition to the work carried on in full ministerial charges, the Church's energies have found a channel in various missions.

*The North-West Mission.*—Since 1909 regular services by fully-ordained ministers have been maintained at

Broome and in the Pilbarra, at Port Hedland, Whim Creek, Marble Bar, and Nullagine.

*Home Missions.*—Home Mission enterprise has characterized the Church from the first. Most of the present full ministerial charges began as Home Mission stations. Home Mission agents work over wide areas from the following centres:—Leonora, Menzies, Kanowna, Kellerberrin, Beverley, Narrogin, Yalering Lake, Kulnine, Denmark, Katanning, Mundaring, and Darlington.

*Aboriginal Mission.*—A mission to the aboriginals has recently been undertaken. The mission site is an area of 58,000 acres on Hanover Bay reserved for mission purposes by the Government.

*Education.*—True to its traditions, the Presbyterian Church has sought to promote education. In 1897 the Scotch College was founded, and was at first housed in the Shearer Memorial Hall, Perth. In 1905 the College removed to more suitable locality and buildings at Osborne, near Claremont. The scholars number 210, of whom eighty are boarders; there is a staff of nine masters.

*Publication.*—*The Presbyterian*, which is published monthly, is the

official organ of the Church in Western Australia.

*Statistics.*—The Presbyterian populations, according to census returns, were 529 (1870), 1,004 (1881), 1,996 (1891), 14,707 (1901), 26,678 (1911).

ST. ANDREW'S CHURCH, PERTH.

### THE CONGREGATIONAL CHURCH.

The Congregational Church may be said to have started in Western Australia in 1846, when Divine worship was held in a small building in William Street, Perth. In the previous years a few members of the denomination had assembled for prayer in a private residence.

The first ordained minister to officiate in the colony was the Rev. Jas. Leonard, B.A., who came out at the request of the Colonial Missionary Society in 1851. He

remained for three years, and then went to Gawler, South Australia, whence he had received a call. For some years the Church was without a minister, and the services were conducted by laymen. In 1862 the Rev. I. M. Innes was sent out by the Colonial Missionary Society, and he remained in office for six years, during which period a handsome new church was built. The congregation likewise increased. Mr. Innes then left the denomination to join the Presbyterians, and he was

succeeded by the Rev. D. Meadowcroft, who remained for seven years, and during the term of his ministry a commodious manse was erected. Successively, the Revs. T. G. Rose, J. Odgers, P. H. Crawley, Thomas Kyte, and E. Tremayne Dunstan were pastors, but in July, 1895, the Rev. W. T. Kench, the present minister, was appointed. In the meantime—during the Rev. E. T. Dunstan's ministry—the magnificent church in St. George's Terrace was built, and was opened in December, 1893, the Rev. Llewellyn D. Bevan, D.D., of the Independent Church, Collins Street, Melbourne, officiating on the occasion.

At Australind, as far back as 1848, Mr. John Allnutt, who was living there, inaugurated services in his house, and the attendance so rapidly increased that the adjacent cottage was secured and converted into a church. Acceeing to a request from Bunbury, Mr. Allnutt subsequently held service there every Sunday evening, which resulted in a church being built, and until his death in 1864, Mr. Allnutt conducted services at both Australind and Bunbury. In 1866 the Rev. Andrew Buchanan was pastor, and later, after two or three changes, the Rev. John Chapman was appointed. Mr. Chapman was succeeded by the Rev. T. D. Whalley, the present pastor.

In 1851 a small congregation had assembled at Fremantle, and received occasional visits from a lay reader. Eventually the congregation made application to the Colonial Missionary Society for a minister to be appointed, and in 1853 the Rev. Joseph

Johnston arrived. In the interim the Victorian gold-fields had drawn from Fremantle every person who had signed the petition, and Mr. Johnston, upon arrival, found himself without church or congregation. Nothing daunted, however, he hired a cottage, wherein he conducted service. The attendance at first numbered only about a dozen persons, but gradually the total increased,

until in 1854 it warranted the erection of a small building, which was subsequently enlarged. A manse was next built, and in 1877 the present fine brick church was constructed, the old building having been converted into a Sunday-school. The Rev. J. Johnston laboured for thirty-three years, and was succeeded by the Revs. A. G. Foy, C. Matthews, S. Bryant, W. F. Turton, and C. Taylor successively, the present minister being the Rev. Joseph Parker.

Until 1895 the Perth, Fremantle, and Bunbury churches were the only three of the denomination in the State; but in that year a Congregational Union was organized for mutual encouragement and forward work, the Hon. George Randell being elected the first Chairman. Since that time considerable extension has been carried out, and there are now some

forty churches, with twenty regularly ordained ministers and thirty-six lay preachers, their labours extending well into the far north and amongst the outlying stations. The present Chairman of the Congregational Union is the Rev. G. Potts, of Cottesloe; Rev. B. C. Wieland is Secretary, and Mr. Herbert Hocking Treasurer.

TRINITY CHURCH, PERTH.

### THE BAPTIST CHURCH.

It was not until the close of the year 1892 that any attempt was made to constitute the Baptist Church in Western Australia. In that year Mr. A. Lambert, a recent arrival from the Eastern States, made an effort

by holding services at his private residence, but the response was not sufficiently strong to warrant the services of an ordained pastor. Some two and a half years later, in June, 1895, the number of Baptists having

considerably increased, a Church was formed in Perth under the leadership of Mr. J. H. Cole, a layman from Victoria. The first services were held in the Town Hall, when some forty members signed the roll. The Rev. W. C. Hewson, of Pastor's College, London, was elected minister, but owing to ill-health was soon compelled to resign, and the services were continued by laymen. The Rev. A. S. Wilson, of Adelaide, was then appointed pastor, and services were continued in the Oddfellows' Hall, William Street, Perth. In the meantime Mr. Cole had turned his attention to Fremantle, and a small but healthy church was soon established in that town. Chiefly through the instrumentality of the same gentleman congregations were formed at Bayswater and Katanning, the first-named centre being the proud possessor of the first Baptist Church to be built in Western Australia.

With these four churches a Baptist Union was established in 1897, the Rev. A. S. Wilson and Mr. G. H. Cargeeg being the first President and Vice-President

respectively. The year 1899 saw the erection of the Perth Baptist Church in Museum Street, and since that time extension work has been carried on by pastors and home missionaries throughout the State. The Rev. Silas Mead, B.A., LL.B., was appointed assistant to Mr. Wilson, and from time to time other ministers arrived to take control of various churches. Like other denominations the Baptists became active on the goldfields, and have followed the development of agricultural centres wherever a sufficient number of adherents was settled.

In foreign mission work the Church in Western Australia has directed its attention to India, and has not only supported missionaries in that field, but has also sent out from its members workers to labour there.

At the present time there are twenty-one church buildings, the cost of which has been £16,500; there are nine ministers and eleven home missionaries, 1,134 members, and 1,300 Sunday-school scholars. Mr. H. D. McCallum is President of the Baptist Union, and Mr. W. L. Stokes Secretary.

### THE CHURCH OF CHRIST.

The Church of Christ was first established in Western Australia by an evangelist from Victoria, Mr. T. H. Bates, who came to Perth for the purpose in 1890. In the beginning the services were held in the old Temperance Hall in Barrack Street, and afterwards in the Working Men's Institute in Wellington Street. When this latter place became too small, the Temperance Hall in Museum Street was secured for Church meetings, but after a time the attendances outgrew this also. A block of land in Lake Street was then purchased, and a church, costing about £1,200, erected. This was opened in January, 1897, Mr. A. B. Maston, from Victoria, being the first preacher. In the following year the

denomination opened a chapel at Fremantle, and in 1900 a third at Subiaco.

The existing churches were formed into an incorporated association in 1898, the Hon. Frederick Illingworth being the first President. Since that time congregations have been formed in various suburban localities, in goldfields centres, and at various towns in the agricultural areas. There are now eighteen churches, these having sitting accommodation for over 2,000 persons. According to the census of 1911 the number of adherents of the Church was 2,808. Mr. H. J. Banks is the General Secretary of the associated churches, and Mr. H. Wright the Treasurer.

### THE SALVATION ARMY.

During his first visit to Australia in 1891, the late General William Booth commissioned Staff-Captain Knight, at the Exhibition Building, Melbourne, to lead a party of ten officers, and unfurl the blood and fire flag of the Salvation Army in the land of the sunny West. After meeting with a little opposition, which was speedily overcome by practical work, the Staff-Captain fully accomplished his mission, and army operations were firmly established.

Three years afterwards the late Major Hunter was commissioned to the command. The goldfields' rush having fairly set in, he at once decided to follow the men, so as to render every assistance possible to those who were risking their all in the rush for gold. To aid this work five sisters who had had practical experience in nursing were sent to work amongst the fever-stricken

miners. The men were not slow to show their appreciation of the Army's efforts to help them, and many are the tales told of suffering relieved by these devoted women during those stirring times.

In 1898 the Social Branch, which had already been doing good work, opened its first home with accommodation for twenty-two. The all too free and easy life of those days had told its own tale upon the virtues of many who had failed to count the cost of error. The home proved then, as now, a haven, and is still performing a good work. In 1901 many further advances were made in the social work. At North Fremantle the Hoptown Home for Maternity Cases was opened, where a total of thirty-six can be accommodated. It was also at this period that homes were opened on the Collie Estate for boys and girls, the Government of the day

having consented to send children there under the control of the Army. That these institutions have fully justified their existence in this State is borne out by the fact that whilst there is a total accommodation for 160 children there is not an empty bed in either home. The year 1904 saw another advance to meet a pressing need, *vis.*, the opening of a Home for Discharged Prisoners. Temporary premises were secured, and through the kindness of the Daglish Government a site was granted at Karrakatta,

upon which a well-equipped home was erected and opened, capable of sheltering twenty-five inmates. Much of the work done here is of a preventive character, though few men leave the prison gates without being met by an officer and in a kindly manner offered the many benefits of the home. In furtherance of the work amongst children another home was opened at Lamington Heights, Kalgoorlie, to accommodate twenty-four little children. This institution, which has been called "The Fold," is kindly spoken of on the fields, and is always full. In 1911 the People's Palace, Perth, designed to meet the wants of Salvationists as well as the travelling public, was opened; whilst February 1 of this year saw the inauguration of work amongst the aged pensioners. At Guildford, situated on the banks of

the beautiful Swan River, there exists the Aged Men's Retreat, the opening ceremony of which was performed by the Mayor and Mayoress of Guildford (Mr. and Mrs. Lefroy). The Samaritan Branches of both the men and women's side are presided over by the social secretaries of Western Australia, and in an unostentatious manner much suffering and distress is alleviated, whilst many are tided over to better days. There are fifty fully commissioned officers engaged in this work, and several projects for extension are now under consideration.

Regarding the spiritual side of the work, of which Brigadier Winter is the leader, it can be said that on the whole it is in a satisfactory condition, although, through its ranks being composed mainly of the working classes and given to moving from place to place, some of the corps are much reduced in numbers, whilst others, again, were never better. At the present time there are twenty-eight centres having some forty out-branches, which are visited at regular periods. There are sixty-three full-commissioned officers directing and conducting operations from these centres, and these in turn are assisted by a thousand active workers and a hundred handsmen. The adherents number 2,500, the Sunday-schools have a roll-call of 1,500, and the publications have reached a weekly circulation of 6,000. A large number of the buildings in which services are conducted are Army property, including the Pier Street building (known as "The Fortress"), the foundation-stone of which was laid by Sir John Forrest, K.C.M.G., in 1899. Reference should here be made also to the open-air work which is carried on. This is in itself unique. The popularity of these meetings has not waned. The man in the street has styled this as his church. The climate of the West being of such a genial nature, this is not to be wondered at, and their

constant attendance proves the truth of their own statement. Whilst the operations of the Army are now carried on in a less obtrusive manner, yet their efforts are none the less successful, and the ready response from a recent annual appeal to the goldfields, farming communities, timber mills, and the larger cities, shows the interest and faith the public take in the work, the total reaching £3,600; whilst the devotion and self-sacrifice continually manifested by the officers prove that the spirit which first moved them to leave their all to carry on this great work has not lessened.

SALVATION ARMY BARRACKS.

### THE JEWISH SYNAGOGUE.

Although it is said that there were several members of the Chosen Race among the early pioneers of Western Australia, there was no attempt made to form them into a congregation until 1887. In that year those who were residing in and around Fremantle took the first steps towards establishing Judaism as one of the recognized religious sections of the community. A meeting was called in August of that year by one Benjamin Solomon. At this meeting, which was held over the shop of the convener, Mr. L. Alexander was elected first President of the Jewish congregation in Western Australia; Mr. Henry Seeligson was appointed lay reader; and arrangements were made for holding weekly services.

In 1891 it was felt that a visit from a properly-ordained minister was necessary for the performance of certain indispensable rites; the Rev. A. T. Boas, of Adelaide, was invited, and he came to Fremantle for that express purpose. The services were held in the guard-room at the old Fremantle Barracks. Towards the end of 1892 a second congregation of some sixty persons was formed in Perth. This number, owing to the rush caused by the gold discoveries, increased rapidly during the succeeding years, and it was decided to erect a synagogue. A site in Brisbane Street was secured, and the foundation-stone was laid in October, 1896. The congregation

having grown sufficiently affluent to support a regular pastor, the Rev. David I. Freedman was appointed as Rabbi, and he arrived in the State early in 1897. In April of that year he opened the new synagogue. Though the Jews in Western Australia only numbered about 600 at that time, they have since, by immigration from various European countries and from Palestine, increased to something like 1,800.

Most of them are to be found either in the metropolitan area or on the eastern goldfields. For the use of the congregation resident in the latter area a second synagogue was erected at Kalgoorlie.

In Western Australia, as in other parts of the world, the members of this small community of Jews are particularly prominent in the various charitable and philanthropic movements. Led by the Rabbi, who is a specially valuable worker in the cause of charity, they render services out of all proportion to their numbers, and are never appealed to in vain for help.

As evidence of the progress made during the past fifteen years, it may be mentioned that extensive alterations and additions are at present being made to the synagogue at Perth, which, when completed, will have transformed it into practically a new building nearly three times the size of the original structure.

Photo by C. H. Park.

JEWISH SYNAGOGUE, PERTH.

The Reverend DAVID ISAAC FREEDMAN, Rabbi of Perth and Administrator for Western Australia, is a son of the late Mr. Moses Freedman, merchant, of London. He was born at Budapest, in Austria-Hungary, on April 17, 1874, and received his primary education

in Bell Lane School, London, subsequently attending the Jewish Theological College and the University College of that city. Whilst at the Theological College he gained two very valuable scholarships, and obtained further distinction at University College, where he was

awarded a first-class mathematical certificate, being the only student from the Jewish College who has ever received this honour, although the latter institution has been in existence over sixty years. He took his B.A. degree at the University of London in 1894, and having

completed his theological training at the age of 22 was sent to Western Australia to undertake the spiritual charge of the Jewish community in that State. Since 1897, from his headquarters at Perth, Mr. Freedman has laboured unceasingly among his people, and being the first Rabbi appointed in Western Australia has had an immense amount of organization work, to the details of which he has brought close attention, single-hearted zeal, and marked ability. All charitable institutions and movements have found in him a warm sympathizer and practical helper, and the charge of sectarian benevolence has lost its point where he is concerned. Within and without the pale of his own religious community poverty and helplessness never appeal to him in vain. He is Vice-President of the Children's Hospital, and was one of the founders of that much-needed refuge for the suffering little ones. He assisted also to establish the Home of Peace, and acts as Hon. Secretary to its Committee. He is Chairman of the Executive of the Children's Protection Society and is a member of the Council of the School for the Blind. The study

of literature has great attraction for Mr. Freedman, and he is continually enlarging his knowledge of this great subject. He is well known as a lecturer on historical and

Bartleto,

Perth.

REV. DAVID ISAAC FREEDMAN.

literary subjects, and is President of the Western Australian Literary Societies' Union and a member of

the Council of the Victoria League, besides holding other offices of almost equal importance. He is examiner in Western Australia for the University of London, was for six years Chairman of the Perth Education Board in connection with the State schools, has edited *The Craftsman*, and was a member of the deputation from the University Graduates' Union which prevailed on the Government to appoint a Royal Commission on the establishment of a University in Perth, the result of which is that the project has materialized. In the Masonic fraternity he has held many offices, and is the first Grand Principal of the Supreme Grand Royal Arch Chapter of Western Australia, and Past Senior Grand Warden of the Grand Lodge of Western Australia. As a patron of all sport which tends to develop the physical powers of man without degrading his finer instincts he is well known, and is the present Patron of the East Perth Cricket Club, which won the premiership of the Senior Association for the season 1912. In 1897 Mr. Freedman married Annie Florence, daughter of Mr. Nathaniel Cohen, of London, and has two sons.

### OTHER DENOMINATIONS.

Among the smaller sects which can claim adherents in Western Australia may be mentioned the Seventh Day Adventists and the Greek Catholics, the one numbering about 900 and the other over 400. The Unitarians in the State number 144.

Though presided over by a regular priest of the

Oriental Church, the Greek Catholics do not yet possess a consecrated church building.

The Seventh Day Adventists, on the other hand, have made such progress that they were enabled, in 1911, to erect a fine church in Hay Street West upon a site granted to them by the Government.

### ASIATICS.

According to the census of 1911, the total number of Mohammedans, Confucians, Buddhists, etc., in the State was 4,060. These are scattered over most of the settled towns, being particularly in evidence in the metropolis, the goldfields' centres, and the north-west. The Mohammedans hail principally from India and Afghanistan, and are engaged in small business

enterprises or as camel drivers; while the Confucians and Buddhists are almost exclusively Chinese and Japanese. There is a Mohammedan Mosque situated in Perth, wherein those of that faith may worship, but the other classes have not yet resolved themselves into definite congregations, and therefore have neither temples nor joss-houses at the present time.

## Undenominational Institutions.

### WOMAN'S CHRISTIAN TEMPERANCE UNION.

The Woman's Christian Temperance Union is well known to the world, and the following brief summary

will serve to show how much women can accomplish in the interest of the needy, as far as finances will allow, and

assist, as far as lies in their power, according to the Union motto: "FOR GOD, HOME, AND HUMANITY."

The Western Australian Woman's Christian Temperance Union was started in the year 1892, with Mrs. Justice Hensman as President. Among the first efforts was the formation of the Sailors' Rest at Fremantle, a room being hired at the Freemasons' Hall for the purpose. Mrs. Captain Smith threw her whole heart into this work, and it soon became evident that something more was required as the harbour extensions grew rapidly. At the W.C.T.U. Convention in 1895, Mrs. Captain Smith begged that an urgent effort be made to secure a block of land from the Government upon which to erect a Sailors' Rest. A committee, consisting of Mrs. J. M. Ferguson, Mrs. Hanlin, and Mrs. Smith, waited upon the Minister for Crown Lands, who decided to give the W.C.T.U. a block of land situated in Marine Terrace. The need for this was emphasized by the impossibility to accommodate two shipwrecked crews from the "Sepia" and the "City of New York." In 1900 the foundation-stone of the new building was laid by Sir John Forrest, K.C.M.G. It was opened by the Mayor of Fremantle. Mrs. Smith, through illness, was compelled to retire from active work, and was succeeded by Mrs. Farrelly. Mrs. Knight followed, and held the position for six years.

A portion of the McKellar bequest was obtained, which enabled the mortgage on the building to be paid off and some necessary repairs made. Mrs. Knight resigned, and Nurse Ryrie, who had formerly been a worker with the Seamen's Mission, was appointed. After a few months' service she was called to other work, and Miss Forsyth is now in charge, and, well supported by her staff, is doing a good work. A yearly grant of £100 is made by the Government.

The Sailors' Rest is now in good condition. It is a place of refuge for shipwrecked men; a home where, as far as possible, all comforts are administered. The hospitals are visited, and the sick are allowed to come to the Rest for a few days during convalescence. Beds are provided for seafaring men at a nominal cost, and reading matter and writing materials are obtainable. A billiard-table is in use, and socials and entertainments are frequently given. To quote the words of the foundress, Mrs. Smith:—"This home was built by the energy of our members, and it will be a lasting monument to the

Woman's Christian Temperance Union of Western Australia."

In 1897 it was decided to open a headquarters in Perth; this was opened in Barrack Street, and much good has been done. One of the chief objects was the endeavour to lift headquarters from the level of a mere boarding-house to a real centre of home-life, with the greatest freedom for social and Christian intercourse and fellowship, and also, wherever possible, to comfort and assist any who might be in trouble or perplexity. This in a great measure has been accomplished. It is gratifying to report that the accommodation for boarders is fully taxed; all liabilities have been paid off, and the usual current expenses are paid monthly, so the prospect is very hopeful and encouraging.

In the year 1901 a Sailors' Rest was formed in Albany with the Government assistance of £50 per annum. This is largely availed of by visiting seamen, who greatly appreciate the kindness shown to them.

In 1902 a grant of land was obtained at Boulder to build a home for friendless girls; this is known as "Willard House." The useful work of this Institution is well maintained. The building has been enlarged, and it is a quiet home for young women whose duties compel them to leave the comforts of their own homes. Several who have been incapacitated by illness have been glad to avail themselves of it during convalescence. Girls out of situations find a shelter there, and young women travelling have been received and helped on their way. Free meals have been supplied, and two beds are set apart for deserving cases. A grant of £100 is received from the Government.

Apart from the institutional work, the Lock-up and Fremantle Prison are regularly visited by the members. Regular monthly meetings are held in twelve towns in Western Australia, and progress is reported and recorded in evangelistic, temperance, and anti-gambling work. The efforts of the Union are directed towards the moral and social enlightenment of the community, more particularly in those directions which tend to lessen the evils of drunkenness and social vices. That it has met with considerable success cannot be denied, and there is no doubt that, even during its short term of activity in Western Australia, it has become a potent factor in the cause of national righteousness.

#### YOUNG MEN'S CHRISTIAN ASSOCIATION.

In 1908, after one or two ineffectual attempts to found a Y.M.C.A. in Perth, the task was accomplished mainly through the visit of the two Australian National Secretaries, Messrs. Alexander Jameson, M.A., and William Gillanders, B.A., with Mr. Herbert Stafford, B.A., as organizing secretary of the campaign. After five months' work the Association was formed in October.

A strong attempt had been made previously to raise £10,000, but at one time this effort seemed doomed to failure. This was averted by a timely donation of a building site in Murray Street worth £5,000, which filled the organizers with fresh hope and inspiration. This gift was made by Mrs. Oliver, a member of the Perth Baptist Church, and following upon the free use of rooms for two

years granted by Messrs. Cargeeg and Pitchford practically made the work possible. For some time a provisional committee, of which Mr. Martin E. Jull, Public Service Commissioner, was chairman, did the work. In 1909 the Board of Management was duly constituted, and Dr. Samuel Macaulay unanimously appointed President—a position which he has held continuously for five years, during which time he has served the Association with great acceptance and success.

Mr. Alexander Jameson, impressed with the necessity of work among young men in Perth, remained, after the initial campaign, as Secretary to the new Association, leaving in 1910 to take the National Secretaryship for Australia. He was followed by Mr. W. J. Clark who, in response to a call in 1912 from New Zealand, left for Y.M.C.A. work in the Dominion.

The members of the present Board are:—Dr. Samuel Macaulay (President), Messrs. G. H. Cargeeg and William Padbury (Vice-Presidents), G. F. Pitchford, Duncan Paterson, S. H. Lamb, D. L. Moffat, H. G. Jefferson, A. T. Wreford, W. A. Hutchinson, E. T. Owen, J. Henderson, J. Hassen, Carl Leschen, M. E. Jull, H. D. Holmes, John Nicholson, John Sinclair, Albany Bell, D. S. Walton, J. H. Harvey, J. T. Peet, F. Whysall, A. S. Wilson (General Secretary), W. E. Pickering (Assistant Secretary), and L. J. Judd (Physical Director), and the Rev. Daniel Ross.

The Association provides for a long-felt need in the city, and is an excellent club at very moderate fees for young men. It is cosmopolitan in its membership and is unsectarian, while founded upon a religious basis. Its

property, when its building scheme is completed, will be worth £24,000, of which £11,000 is already in use. The membership is 600. The various athletic clubs are very successful, and its educational classes are freely availed of. Thus the Harriers Club in 1912 held five out of six amateur championships for the State, while the Swimming Club last year obtained thirty-four awards from the Royal Life-saving Society. In a recent examination for accountancy only three men passed in the highest grade for Western Australia, and two of them were Y.M.C.A. men.

Commencing its history in a London softgoods warehouse, the Y.M.C.A. stands in close connection with the commercial community, from which, as in other cities, it receives much encouragement.

Of late years the Y.M.C.A. has devoted a great deal of attention to the physical requirements of men. The gymnasiums are, in most cases, finely equipped and up to date; while the physical departments are constantly producing experts in the science of physical culture.

Though only part of the Perth Association building has been erected, it has a fine gymnasium, with a large swimming pool attached. Its social, reading, and billiard rooms are cool and inviting, and the various concomitants of a first-class club are clean and well kept. The educational classrooms, for such subjects as accountancy, salesmanship, and elocution, have been recently erected. The various clubs are entered with great enthusiasm, and a fine spirit of comradeship and loyalty pervades the Institution.

## Philanthropic Institutions.

### THE CHILDREN'S HOSPITAL.

During the month of May, 1897, a little girl, accompanied by her mother, entered the establishment of Messrs. Chas. Moore & Co. The child's attention was directed to a "negro" money-box. She became interested in it, and soon discovered that if a coin were placed in the negro's hand and a spring touched the coin would be thrown into the box. Having three pennies, she experimented with them, and finally found that, having got

view to bringing the suggested movement before the public generally, and to that end a small meeting of sympathizers was called in October, 1897, when the originator of the scheme set forth the object he had in view. The meeting was favourable to the idea, and appointed a committee consisting of the Revs. Dean Goldsmith, Father Bourke, D. Ross, D. I. Freedman, and A. W. Bray, Colonel Phillips, and Messrs. Moore, Bick-

*Photo by C. E. Farr.*

THE CHILDREN'S HOSPITAL, PERTH.

into the box, they were irrecoverable. Mr. Moore happened to come along, and jocularly informed the child that she had lost her pennies, and he asked what she would like in lieu of them? "Oh, nothing," replied the girl; "give them to the Children's Hospital." "But we have no Children's Hospital," said Mr. Moore. "Then why not have one?" was the answer. "Yes," said Mr. Moore, "we will have one, and we will start it with your pennies."

In order to further gauge the attitude of the children towards such a proposal, Mr. Moore issued a number of collecting-cards, and agreed to subsidize the amount raised by each child by an equal sum. These cards in a very little while brought in nearly £100.

It was then deemed advisable to take steps with a

ford, and Hocking, to arrange for a public meeting at an early date, at which the advisability of founding such an institution in commemoration of the Diamond Jubilee of Queen Victoria might be discussed. Mr. W. Watson, the present Honorary Secretary of the Hospital, was appointed secretary to this provisional committee.

The public meeting, which was presided over by His Excellency the Governor (Sir Gerard Smith), was held on November 8, 1897, and in opening the proceedings His Excellency pointed out that the proposed hospital would form one of the three efforts, selected by public approval, to commemorate Her Majesty's Diamond Jubilee, the others being the Victoria Institute for the Blind and the Home of the Good Shepherd (now the Home of Peace).

The Dean of Perth moved, and Mr. Chas. Moore

seconded, the following proposition, which met with the enthusiastic support of the meeting:—"That in the opinion of this meeting the time has arrived for the establishment of a Children's Hospital."

Other resolutions were also passed, providing the necessary machinery for carrying the proposal into effect, and subscriptions amounting to nearly £900 were promised before the meeting closed.

At the first meeting of the General Committee held on November 15, 1897, a sub-committee, consisting of Sir Geo. Shenton, Messrs. Matheson, Battye, and Gobbett, and Mesdames Pretty, Hassell, and Strickland, was appointed to inspect certain sites said to be available and report thereon. This committee recommended the site situated at the corner of Mueller Road and Thomas Street (upon which the hospital is now erected). The General Committee approved the choice, and applied to the Government for a Crown grant. After some hesitation, a 999 years' lease of the site was granted, for which the committee was greatly indebted to the earnest support of the Hon. G. Throssell, Minister for Lands.

Three trustees were then appointed—Hon. Sir George Shenton and Messrs. Bickford and Hocking—but the first-named, finding it impossible to act, Mr. Battye was elected in his stead.

The movement having been thus definitely launched, various entertainments were promoted for the purpose of raising funds. The principal of these took the form of an "Olde Englyshe Fayre," held in Perth during April, 1898, in which all the members of the committee, together with a large number of sympathizers, were actively engaged, and which returned the handsome profit of £1,200 towards the furtherance of the scheme.

Amongst other schemes for raising money, a Hospital Saturday and Sunday was instituted in December, 1897, and a sum of £130 raised. From time to time desultory attempts to make this an annual event have been made, but so far with little success. It is hoped that a "Children's Hospital Saturday and Sunday" may be held every year.

On August 15, 1898, it was decided to call for competitive designs for a hospital of about eighty beds, the first portion providing accommodation for about thirty children to be erected forthwith.

With the consent of the then Minister for Works, Mr. Birtwistle (architect) was appointed assessor, and Drs. Lovegrove, Kenny, and Astles assisted materially from a professional standpoint. After mature consideration, it was agreed to award first prize to the design of Messrs. G. J. & E. J. Clark for a plan of a hospital on the cottage principle. These gentlemen were then appointed architects to the Hospital, and instructed to call for tenders for the first portion. This was done, and it was found that the lowest tenderer was Mr. W. Abbott, and the amount £2,042. As this was considerably in

advance of the estimate, it was decided to defer acceptance till a later date.

In the meantime there were indications that to proceed at once with the building might not be in the best interests of the scheme. It became evident that maintenance for the various charities of the district would be too great a burden upon the community, and the committee was strengthened in that view by the failure of a second carnival which was held in aid of the funds at the end of 1898.

The committee, therefore, resolved that the erection of buildings should be deferred, and that the amount then in hand, about £2,000, should be placed on fixed deposit for twelve months in the Western Australian Bank, to be redeposited, if deemed advisable, until such time as the committee considered it wise to proceed with the building.

Nothing further was done until August, 1907, when a meeting was held for the purpose of filling the offices of trustee and treasurer, which had become vacant through the departure of Mr. Bickford from the State. The Rev. D. I. Freedman was elected to the vacancy on the Board of Trustees, and Mr. H. Hocking to the position of Hon. Treasurer.

At this meeting Mr. Chas. Moore pointed out that the amount in hand was approximately £2,800, and asked whether the committee was of opinion that an endeavour should be made to carry the scheme into effect. On being assured that the time was opportune, Mr. Moore made the following proposal:—

"That if the Government would give £2,000 towards the building, provided a further sum of £2,000 was raised by the public, he would give £1,000 of that £2,000, and guarantee £500 of the remainder, and, further, that he would guarantee the sum of £1,250 yearly for three years towards maintenance, provided the Government would give the same sum yearly towards the upkeep of the Hospital."

The offer was warmly accepted, and it was agreed that a deputation, consisting of those present, should wait upon the Hon. the Premier (Mr. N. J. Moore) and endeavour to secure his adherence to the proposal.

The matter having been placed before the Premier by the deputation, Mr. Moore assured the committee of his warm personal interest in the proposed Hospital, and the desire of the Government to assist it so far as possible. He promised that the Government would contribute £ for £ for maintenance up to £1,250 yearly, and that it would give £1,000 towards the Building Fund, leaving the additional £1,000 asked for an open question.

Mr. Chas. Moore agreed that his offer of £1,000 should stand, and it was then decided that steps be at once taken towards the erection of the first portion of the Hospital, such portion to comprise medical and surgical wards, each capable of accommodating twenty

patients, together with operating theatre, quarters for nurses, and administrative buildings.

The foundation-stone was laid by His Excellency the Governor, Admiral Sir Frederick Bedford, G.C.B., in the presence of a very large gathering of sympathizers, on June 27, 1908; and a month later, on July 25, memorial-stones of the two wards and operating theatre were laid by Lady Hackett, Mrs. I. S. Emanuel, and Miss Shenton.

The Hospital was opened on June 30, 1909, by the Premier of the State, the Hon. Sir N. J. Moore, K.C.M.G., and if the progress made since then may be taken to be any criterion of the need for it, then the need was great indeed. Within less than two years from the date of opening it became necessary to increase the accommodation. An infants' pavilion, containing twenty beds, an isolation ward of twelve beds, and an X-ray plant (the cost of which was defrayed by Messrs. A. Lovekin and C. E. Smith) were erected. These proved sufficient for but a little time, and at present there is a comprehensive building scheme under consideration which, when completed, will give a fully-equipped hospital of some 150 beds.

As an evidence of the work done by the Hospital, it may be stated that during the year ending September 30, 1912, 928 in-patients and 15,519 out-patients were treated, the total number of operations performed being 220. The daily average of beds occupied was 57.4 per cent., and the death rate 15.4 per cent. This last seems perhaps a little high, though it is below the world's average, and when the fact that the Hospital takes sick children from birth is taken into consideration, is very satisfactory indeed.

With the object of bringing the hospital thoroughly up to date and in order to make it as efficient as possible, the Committee has recently secured the services of a

London specialist, Dr. J. S. Pearson, M.A., M.D., B.Sc., L.R.C.S., to whom the full professional control of the hospital has been committed. Through the services of this gentleman, combined with the help of an excellent staff of honorary physicians and surgeons, the Committee hopes to make the Institution a model of its kind throughout Australasia.

The governing power is in the hands of a Committee of thirty-six ladies and gentlemen, from whom a Board of Management clothed with executive power is appointed each year. The officers at present consist of the following:—Mr. J. S. Battye, President; the Rev. Dr. Freedman and Mr. W. H. Vincent, Vice-Presidents; Mr. B. Rosenstamm, Treasurer; Mr. John Tucker, Chairman of the Board; and Mr. C. G. Killick, General Secretary. Miss Homan is the Matron, and is assisted by a staff of about forty nurses and probationers.

The Hospital is supported by voluntary contributions, together with a yearly grant of £2,500 from the State. Though it is costing nearly £7,000 a year to maintain the work, the response to appeals has been such that there has never been a moment's doubt as to its financial success.

The General Secretary, Charles George Killick, is a native of New South Wales, having been born at Bathurst, in the Blue Mountains, in 1872. He received his educational training at the public schools of the Mother State, and at the close of his scholastic career became engaged in clerical work, continuing in this line of life until 1897. In that year Mr. Killick came to Western Australia, where he accepted a position on the administrative staff of the Government Railways Department. This he held until 1909, and in November of that year received appointment to the secretarial duties in connection with the Perth Children's Hospital, which post he still holds.

*Bartlett.* *Perth.*  
MR. CHARLES GEORGE KILLICK.

### THE HOME OF PEACE.

The Home of Peace is an institution that cares for the dying and incurable. It was founded in November, 1898, by Lady Onslow and Dr. Athelstan Saw. Previously the task of caring for the dying and incurable was undertaken by the Home of the Good Shepherd, which was conducted by the members of the Anglican Church. The Government refused to subsidize the Institution on the ground that it was managed by one

denomination, and in consequence the supporters found it impossible to carry on. At a public meeting, convened by Lady Onslow and Dr. Saw and held in the Town Hall, Perth, resolutions were carried affirming the need of founding a home for the dying and incurable, to be conducted on entirely undenominational lines. A large and representative committee was elected, consisting of members of all denominations, the first office-bearers being:—

President, the Right Rev. Dr. Riley (Bishop of Perth); Hon. Treasurer, Mr. F. C. Faulkner, M.A.; Hon. Secretary, the Rev. D. I. Freedman, B.A.; and Trustees, Dr. A. Saw and Mr. Faulkner.

The task of collecting funds for the building proved a somewhat difficult one. The Government promised £1,000 towards the building fund and £1 for £1 up to £1,000 per annum subscribed towards the maintenance. Special ladies' committees were formed in various towns throughout the State, and these greatly helped in adding to the funds. An appeal was made to all the Churches in Western Australia, and many responded satisfactorily. A similar appeal to the pastoralists and farmers was not successful. It was not until June, 1901, that sufficient money was collected to justify the committee in proceeding with the erection of the home. Thanks to the efforts of Lady Onslow, the funds and the property of the Lady Smith Lodge, which had then just closed, were handed over to the Home of Peace, whereby the committee of the latter Institution received some £700, a quantity of furniture, and a block of land in East Perth. It was made a condition of the transfer that the male ward of the "Home of Peace" should be named "The Lady Smith Ward." In appreciation of the valuable services rendered by Lady Onslow the committee decided to name the women's ward "The Lady Onslow Ward."

The Government originally presented the Home with a block of land, one and a half acres in extent, in Coghlan Road, Subiaco, as the site for the building, but strong opposition was raised by the local residents, the Perth City Council, and the Subiaco Town Council to the erection of the Home on that site. After some negotiation the committee agreed to relinquish that block for the present one in Hamersley Road, Subiaco, which measures six acres and which in many respects is more suitable. It is triangular in shape and fronts streets on its three sides.

On August 22, 1901, Mr. Richardson's tender for the erection of the Home of Peace was accepted for

£3,138 15s., the firm of Messrs. Hobbs, Smith, & Forbes acting as hon. architects. The foundation-stone was laid on December 18, 1901, by the Hon. Sir Arthur Lawley, K.C.M.G., the then Governor of Western Australia, and the Home was formally opened by Sir Edward A. Stone in December, 1902. Since then a number of additions have been made to the building. A cancer wing, containing two wards of six beds each, was erected in 1906 and opened by the late Admiral Sir Frederick G. B. Bedford, K.C.B. Later a men's smoke-room and women's dining-room were added, and in 1911 the administration block was extended to allow for increased accommodation for the nurses and staff.

Since the opening of the Home in 1903 till the end of June, 1912, the committee dealt with 395 applications for admission; of these 253 were admitted. There are now forty-two beds in the institution, and in 1912 the cost of maintenance amounted to £1,800, which is the cost of an average year.

The Home of Peace has been fortunate in enlisting the sympathy of many friends, the occupants of Government House making it a point to take a great interest in the wellbeing of the patients. Some valuable legacies have been left to the Home. These have not been put to the maintenance account, but have been set aside to form an endowment fund and to be used for the purposes of extension.

The following have occupied the position of President of the Home:—Bishop Riley, Sir E. A. Stone, Sir Edward Wittenoom, K.C.M.G., and Mr. W. T. Loton; the latter has held the office continuously since 1905 and is still the President. There have been three matrons—Miss Anderson (who held the position for nine and a half years), Miss Beeby, and Miss Phillips. The affairs of the institution are administered by the usual officers and a general committee consisting of thirty ladies and gentlemen. It is maintained by voluntary contributions from the general public and by an annual subsidy from the Government.

## VICTORIA INSTITUTE AND INDUSTRIAL SCHOOL FOR THE BLIND

It is generally conceded that the neighbouring State of South Australia is one of the most progressive in matters relating to the education and manual training of the blind. When, therefore, it was felt in 1896 that the time had arrived when Western Australia should take this necessary work in hand, those interested naturally turned to the Institution at Adelaide for assistance. In response to the request two officers trained in the North Adelaide Institution were sent to Perth—Messrs. S. C. Kent and Ide. The former of these two became manager of the infant Institution, and remained in that position until the middle of 1912, when he resigned and returned to

Adelaide; the latter took up the work of reading to the blind in their own homes, and is still engaged in that duty, being the means of bringing encouragement and help to the aged and infirm blind who are unable to receive instruction in any of the trades.

When the matter of erecting a permanent memorial in honour of the Diamond Jubilee of Queen Victoria was under consideration, it was decided that one form of celebration should be the erection of a building where blind people might find a comfortable home and be trained in the direction of becoming self-supporting. Through the kindness of the Government a block of land,

some two and a half acres in extent, was secured at Maylands, about two and a half miles from the city, and in June, 1897, the first stone of the now extensive series of buildings was laid by the then Governor, Sir Gerard Smith.

The aim of the Institution from the commencement has been to provide an efficient primary education for blind children, and to train them along those lines which seem to offer avenues of employment in later years. For those of adult age workshops have been constructed, and under competent instructors they are taught the trades of brushmaking, matmaking, and haircurling. The success which has followed the efforts of the governing council in this direction may be gauged from the fact that at the present time most of those engaged in workshops are able to earn sufficient to keep themselves

in moderate comfort. Those who have not reached that stage are provided with a home at the Institution, and receive in pocket-money a percentage upon their earnings. The organization has at present from thirty to forty blind persons under its wing, and the support that it receives from all sections of the community is sufficient evidence that the work it set out to do is being done efficiently and well and in the best interests of the people of the State.

The governing body consists of a council of sixteen, Sir E. A. Stone being president, His Lordship the Bishop of Perth and Mr. T. Quinlan are the vice-presidents, Mr. H. D. Holmes is the treasurer, and Mr. H. Hocking is the hon. secretary. Upon the last-named gentleman the management of the Institution at present devolves.

### DEAF AND DUMB INSTITUTION.

The Deaf and Dumb Institution was initiated in 1896 as a result of inquiries made by the late Mr. W. R. Thompson, himself a deaf mute, who was anxious to see something done to improve the condition of those deaf children he had discovered. The work was taken up by Mr. Thompson's sister and by the present superintendent, both teachers of the deaf. The first school was opened with three pupils in a small house in Moore Street, Perth, and shortly afterwards a committee was formed, consisting of the Very Rev. Dean Goldsmith, the Revs. D. Ross, W. T. Kench, and G. E. Rowe, Dr. McWilliams, and Messrs. F. A. Moseley, F. Illingworth, and C. H. Wilkinson. Many difficulties beset the foundation of the school. Chief among these was the fact that few people believed that there were any deaf children in the community, and hence any need for a school. Others otherwise advanced in ideas suggested the inadvisability of proceeding with the work as it was doubtful if the parents of the deaf children desired them to be educated. A curious view to take in these days of compulsory education. Government assistance to the school to the extent of £200 a year was obtained by the committee, and a collector appointed to gather donations in aid of the work. In a very little time, the number of pupils having increased, a larger house with plenty of ground adjoining was rented in East Perth, where the school was carried on for a period of three years, during which good progress was made by the scholars. The Institution was then

incorporated, and after some trouble in securing suitable land on which to erect a permanent building, the committee received a grant from the Government of about five acres of land at Cottesloe Beach overlooking the ocean. Plans for a building with accommodation for eighteen pupils were prepared by Messrs. Wilkinson and

DEAF AND DUMB INSTITUTION.

Smith, and the foundation-stone was laid in November, 1899, by His Excellency the Governor (Sir Gerard Smith). The opening ceremony was performed early in the following year by the Premier (Sir John Forrest). The cost of building and furnishing was £1,800, towards which the Government contributed a sum of £600, Miss E. Jecks £50, and Miss May Jecks £21. Since that time various extensions of the

building have been rendered necessary in order to more adequately carry on the work. The total expenditure on the fabric now amounts to £5,468, towards which the State contribution has been merely the sum of £600 already mentioned.

The work of the schoolroom, in which there are now nineteen pupils, is mainly devoted to the mental development of the children, the teaching of connected language, with, of course, the usual school subjects when the pupil is sufficiently advanced. Of all the subjects, however, the work of language teaching is immeasurably the most important, and to it every other consideration is subordinated. Some of the pupils—those best adapted thereto—are taught speech and lip-reading with very good results, as evidenced by the fact that by this means

all communication is carried on with them, both in the school and when they visit their homes. It may be well to point out here that the Institution is in no sense an asylum; all of the pupils have homes, and are only resident at the school for the purposes of education, returning to their parents for the holidays and when their school years are over. In addition to the school work outlined above, manual training as applied to woodwork is given to the boys, while the girls are taught dress-making and cookery, and receive also a training in household duties. It may be observed that no system of signs is employed in the Institution, this method of communication having been long ago abandoned in all deaf schools. This does not mean that the manual alphabet is not in use, for it should be remembered that the two systems are by no means synonymous. Signs are often arbitrary and incapable of being accurately translated into common speech, while anything conveyed by the manual alphabet is as exact and literal as speech itself. In this school and in American schools the form of manual alphabet used is that of the single hand, which has the great advantage that no matter how one hand may be engaged, say, with some school utensil, communication is readily effected by the disengaged hand, a performance impossible by the double-hand system. Its

use, moreover, is less obtrusive in public places than that of the double hand.

The ex-pupils of the Institution are employed in various callings, such as farming, millinery, bootmaking, etc., and all appear to be doing well. It is worthy of remark that the educated deaf as regards their personality are a desirable class in a community. They are steady, rarely out of employment, happy and cordial in temperament, and exceedingly temperate in their habits. Where the numbers warranted it the old scholars of the Australian schools have formed themselves into associations with the object of religious, intellectual, and social improvement. They are good citizens, and, it is gratifying to state, manage their affairs excellently.

In this State there are several instances known where eligible deaf children are not receiving instruction, and the committee hopes that parents will in all cases use the opportunities for education presented by the school provided for them.

The Institution is governed by a Committee of Management, of which Mr. F. A. Moseley is President and Major E. A. Drake-Brockman Treasurer. The duties of secretary are carried out by the Superintendent (Mr. H. H. Wichell), to whose ability, enthusiasm, and sympathy much of the success of the work is due.

#### WAIFS' HOME, PARKERVILLE.

This Institution established by the Sisters of the Church, forms another instance of the work these estimable women are doing for the sake of the children. Very soon after the Sisterhood came to Western Australia its members realized the need that existed for the care of infant life. They were constantly entreated to take charge of babies who were either neglected or cruelly ill-treated. To accede to the requests meant starting a Home for Destitute Children, and the first step was taken in 1902 by the purchase of 48 acres of land at Parkerville. The first year was a time of strain and anxiety for all concerned. At Perth the Sisters toiled hard to obtain the money required for the children's maintenance; at Parkerville itself there was ceaseless labour day and night, for the sickly infants had to be nursed and tended under hard and difficult conditions that might have daunted even the bravest spirit. Money was scarce, accommodation inadequate, comforts and even necessaries lacking. Yet still the work went on. The Sisters had the consolation of knowing that little lives were being saved, and even at this difficult stage of the undertaking the babies thrived, and whoever else suffered they were kept happy. The first nursery built was of weatherboard, bare in the extreme, draughty, and ill-furnished. All the cooking was done out of doors. The burden of many and everyday inconveniences was often very hard to bear.

In the course of two or three years, however, the work began to be recognized for its own worth, and since then no charity in the State has received more enthusiastic support. By the end of 1905 there were forty-five children—nearly all babies—in the Home, and many of them were received in an almost dying condition. Applications for admission were very frequent; it was becoming more and more evident that a large number of tiny atoms of humanity must be saved at all costs from surroundings of unspeakable wretchedness, and there was then no home or agency of any sort in Western Australia for the rescue of little infants excepting the Parkerville Home.

In 1907 a Government grant of £150 (the first given to the Home) was received in May, and a subsidy of £500 on the £1 for £1 basis earned since July 1, 1906, was paid to the Maintenance Fund. This generous recognition of their services by Government greatly cheered the Sisters, and gave a wonderful impetus to the work.

The crowning happiness was the opening of two new brick houses at Parkerville, one of them built at the cost of Mr. Padbury, that faithful benefactor to whom already the Sisters owed so much, and the other paid for by the father of one of the Sisters. On the occasion of the opening of these buildings 600 visitors found their way to the Waifs' Home, the Bishop and

His Excellency Sir Frederick Bedford were there, and fresh interest was aroused in many kindly hearts. The year was memorable also, because the whole State had been roused into interest and anxiety with regard to the question of "unwanted children." People no longer shut their eyes to the dreadful fact that through indifference, neglect, or cold-blooded cruelty many innocent little lives were being sacrificed every year in this civilized country. The State Children's Bill was introduced into Parliament; and the whole question of child-life was carefully deliberated. One of the Sisters was asked to give evidence before the Select Committee, and afterwards received most kind and courteous letters from the Colonial Secretary and the Treasurer, both of whom thanked her for the information she had given. These letters concluded with most kind words of appreciation for the good work done at Parkerville.

Since that time the record of the Home has been one of continuous progress. The following account taken from a Western Australian newspaper shows clearly the work as it existed at the end of last year:—

"For some few years past, the Waifs' Home at Parkerville has been more than a name to a very large circle of friends and well-wishers, who have watched with the deepest interest and the keenest solicitude the wonderful work done by the Sisters of the Church among the babies and children of the State. To those who remember the beginning of the work in a little log cabin in 1902, after the Sisters had felt as it were the pulse of the children's need in Perth by the opening of the first day nursery in William Street, the growth and progress of the Home seems nothing short of miraculous. The writer has had the privilege of staying with the Sisters this summer, and of entering into the daily life of those little ones to whom has come such a grand opportunity of happiness and development. The fact has been emphasized from the beginning, that the Home is not an institution in the ordinary acceptation of the word, but a home in the truest sense. From the verandah of a little cottage on the grounds, can be seen

the buildings which have gradually accumulated as the need for them arose, and which form the children's settlement. There is 'Babyland,' with its group of little ones from five to seven years old, who live in large, airy nurseries with wide verandahs and possess a happy playground. Near by is 'Padbury,' with bright, cheerful rooms containing families of younger children and babies who spend their lives in the creeper-trailed verandahs and grounds, under the watchful care of loving eyes. A short distance away there is the simple wooden cottage where the bigger boys live, with all the arrangements necessary for health and cleanliness. Further up on the hillside is another beautiful home, 'St. Nicholas,' where a set of little girls are cared for; while still further towards the top of the hill is a charming cottage where live yet another happy family party. Each family of children in each separate home is in charge of a guardian, who takes the place of the mother in a household and does in every way all that is needful for their health and comfort. The whole management of the establishment from beginning to end is splendid, the affairs of the little village settlement moving on oiled wheels, and through each and every labour there runs the steady endeavour to give to the children all that will make for their best health and happiness and welfare. They have food in generous quantities, but it is of the simplest and most wholesome description; there is no stint, and there is no waste. However, when all is said and done, the appearance of the children themselves is the very finest evidence of the work that is being done by the Waifs' Home. It is a work of which any State may be justly proud. That the work at Parkerville is blessed indeed must be very obvious to those who watch its progress and rejoice to see the number of its friends who year by year add their help to strengthen the brave hands of the Sisters who voluntarily labour in this vineyard of young life. What that work is and the delicacy and skill with which it is carried on no one can possibly imagine who has not watched and loved its inner workings."

#### CHILDREN'S PROTECTION SOCIETY.

Several small meetings held by those interested in the general welfare of child-life in Western Australia ultimately led up to a public meeting which was held in the Perth Town Hall in July, 1906. At this meeting it was decided to form a Children's Protection Society of Western Australia, the first executive committee being also formed. The Children's Protection Society was founded at a time when cases of the grossest cruelty and neglect to helpless infants were of very common occurrence. The law of the land in relation to children was then practically a dead letter, as was shown by revelations in the Supreme Court, which gave ample proof, if

any were needed, of the necessity for a society of this kind.

Briefly, the aims and objects are:—To protect children from ill-treatment at the hands of parents or guardians and, what is more difficult and wider, to aim at making baby-farming impossible; to place children, when compelled to be separated from parents, in a family with a foster-mother, thereby giving the child the next best thing to the natural home; to directly assist and encourage parents to provide for and maintain their own children, as inquiry into the working of the society will amply prove; to visit and report upon, frequently and thoroughly, every child the society is in touch with. One

of the chief aims is to prevent the necessity of making State children and to try to keep the natural bond between parent and child unbroken. The society can proudly point to the "State Children's Act" and claim that it came into force mainly through its untiring efforts.

Since its inception the society has boarded out 442 children. Of these 224 have returned at different times to their parents or relatives. Perhaps this is the most gratifying feature of the society's work. These little ones have been boarded out with foster-mothers during their natural parent's temporary difficulties and distress. In this one aspect of the work there lives in many a mother's heart joy and gratitude for practical help and sympathy in her time of need and sorrow. The society has received and investigated 247 reports of cruelty and neglect to children. It is generally found that the inspector's visit is regarded in the best spirit, and the regular supervision subsequently exercised proves of great service to the mothers and tends to the better condition of the children in nearly every case. In addition, there have been 750 "cases of general assistance." This takes in appeals for advice, assistance, and temporary help. No deserving case is allowed to go without something being done or the applicant put in the right direction of obtaining what is needed. Situations have been found, daily work secured, clothing given, and temporary monetary assistance provided. The inspector has made 6,660 visits to boarded-out and supervised children. The society has opened and maintained for some time past a "Day Nursery," which enables working mothers to leave their children in safety all day whilst they are absent at work, thus safeguarding the little ones from serious evils. It is impossible to describe in detail the use that is made of the society by people from the country, as well as townspeople, or the many daily happenings which go to show that it has inspired absolute confidence in those who refer to it for help and guidance. Many of the little ones have been legally adopted by people suitable in every particular to carry out this grave responsibility.

For the first three years of its existence the society was entirely dependent on the generosity of the public for support in the admirable work it carried on, but the Government was at last prevailed upon to acknowledge the work thus done was not performed by any other organization, and granted £50. This year (1913) it is promised £150, and is indebted to the present Government for the use of the premises in Pier Street.

The question is often asked, "What is the difference between the work of the Children's Protection Society and that done by the State Children's Department?" It is well to point out here that the class of children the State takes under its control is quite outside the province of the society, and the class of children the society looks after is quite outside the province of the Government. Children who come under the care of the Government

and are called "State Children" may be classified as follows:—(a) A child is an orphan and destitute: it belongs to the State; (b) a child has parents, but they are either morally, mentally, or physically unfit for their parental duty: this child belongs to the State; (c) boys and girls who are uncontrollable by their own parents and are in danger of entering upon a criminal career: these belong to the State. These children to all intents and purposes have no parents. Their natural guardians are either dead, or as bad as dead. The State comes in to be the father and mother. The society has nothing at all to do with this class of children. But there are others needing outside watchfulness, yet differing from the above in a most essential respect. There are children who have their parent or parents who are attached to them with all fondness and devotion, but for one good reason or another they are unable for the time being to give them the needful attention. The mother and father do not wish to be freed from their responsibility. The child is theirs, and they want it to be theirs. For a while, however, they happen to be placed in such circumstances that they cannot bring it up themselves. They want some good home where they can be assured it will be properly mothered and fathered. They are willing to work for their child and to contribute towards its support as much as their means will allow. At any time they may be in a position to have a home of their own, and then they will want their child back. It is this class of children, and this class alone, that the society takes under its ægis. To put the difference in a sentence—Where the tie of parenthood is severed the child is taken by the State, but where the tie still exists the child is taken by the society; and the reason it is taken by the society is because the State has no power to take it, nor does it wish to take it, nor has the State any cognisance of it beyond this—that if it happened to be an infant under the age of three years the State has to see that it receives the proper care at the hands of the foster-mother the society has found for it. Through the system of foster-homes the parents are held to the children. There is in modern life so much loosening of the parental tie that any agency which seeks to keep the tie firm and vibrant with affection, as does this society, deserves every encouragement from both public and Government.

The present officers are:—Patron, Lady Edeline Strickland; President, Sir Edward Stone; Vice-Presidents, Sir Winthrop Hackett, M.L.C., and the Hon. W. Kingsmill, M.L.C.; Executive Committee, the Revs. D. I. Freedman (Chairman), E. Makeham, and A. McCarlie, Dr. G. Mead, Mr. J. H. Prowse, Lady Hackett, Mesdames J. Cowan, G. H. Johnston, A. E. Joyner, W. Kingsmill, Leake, and Rischbieth, and Miss F. Davis; Hon. Treasurer, Mr. O. L. Haines; Hon. Solicitor, Mr. N. Cowan; Hon. Physicians, Dr. Gertrude Mead and Dr. Jull; Secretary, Mrs. J. A. Gover.

### M. C. L. CONVALESCENT HOME.

In June, 1891, there was inaugurated by Mrs. H. D. Holmes, at the Western Australian Bank, Perth, the Ministering Children's League. This world-wide society was founded by the Countess of Meath, who adopted as its motto "No day without a deed to crown it." In December of the same year a sale of work was held at Government House under the auspices of Lady Robinson, its first President, and Bishop Parry announced that the League had decided to work for a Convalescent Home, and, while wishing them every success, he thought that it was rather a big undertaking for a children's society.

In 1894 a petition was presented to the Government, signed by the doctors and leading citizens of Perth, praying that a portion of the reserve at Cottesloe Beach might be granted to the League on which to erect a Convalescent Home. This was refused by the Commissioner of Lands (the Hon. W. E. Marmion), but on November 15 a deputation waited on the Hon. A. R. Richardson, who had recently succeeded Mr. Marmion, and who subsequently granted the request conditionally on the land being built on within three years.

In October, 1895, tenders were called for the fencing-in of the land and sinking the well, and subsequently plans of the building were prepared by Mr. P. W. Harrison, and it was decided to name the Home when erected the M. C. L. Convalescent Home, as it was for this object that the League had decided to work, and also as Lady Meath, on hearing of the efforts made by the members to erect a home for convalescents, had most kindly sent two very generous contributions to the fund.

12

Lady Onslow, having accepted the position of President, placed the memorial tablet in the new building on November 21, 1896, and on May 1, 1897, Lady Smith, the wife of the Governor, Sir Gerard Smith, opened the Home for the admission of patients.

Up to the end of December, 1898, men were the only patients admitted, but in December of that year it was decided to utilize the sitting-room by turning it into a small ward for women, who have been increasing in number every year since. In 1900, at a meeting called by Lady Onslow at Government House, it was decided to make further additions, as the space at the

M. C. L. CONVALESCENT HOME, COTTESLOE BEACH.

disposal of the Committee for women was becoming far too limited, and later on a tender for £1,100 was accepted. On August 17 of the following year the Hon. Lady Lawley, wife of Sir Arthur Lawley, then Governor of Western Australia, laid the foundation-

stone of the new wing for women, and on December 14 Her Ladyship performed the opening ceremony of the completed building.

These additions sufficed for a little more than seven years, when it was imperative, if the Institution was to continue on its beneficent career, to further enlarge the building, and in March, 1909, a tender for £2,629 was accepted. This wing, which included two large wards, named the "Waylen" and "Padbury" Wards, was christened the "Meath Wing," and was opened by Lady Edeline Strickland, wife of Sir Gerald Strickland, the then Governor. This latest addition completes the building, which has been erected at a cost of £6,000.

The Home is situated at Cottesloe Beach, the most healthy of the suburbs, and the inmates enjoy the

refreshing cool breezes direct from the Indian Ocean. The number of the patients increases every year, especially the women, from all parts of the State, to whom the Home is a great boon. During the fifteen years of its existence, up to the end of 1912, 2,682 patients have been admitted; of these 1,300 were men and 1,382 women.

The Institution has benefited very greatly by the Padbury bequest, and a large number of patients are enabled to enjoy the benefits of the Home through the generosity of the late Walter Padbury.

Mr. P. W. Harrison, F.R.V.I.A., has been the

hon. architect from the inception, and has untiringly devoted a large portion of his time for the erection and preservation of the buildings. The Institution has been under a deep obligation to its several honorary medical chairmen, among whom of late years may be numbered Drs. Macaulay, Darbyshire, and Blackall, the last-named being its present chairman, who is ever anxious to attend the patients and give advice to the Matron in all cases needing medical attention. Mr. and Mrs. H. D. Holmes have been associated with the Home from its inception, the former as Hon. Treasurer, while the latter is its Vice-President.

### LADY LAWLEY COTTAGE BY THE SEA.

After Sir Arthur Lawley had concluded his term as Governor of Western Australia some ten years ago a movement was set on foot by the ladies of the community having for its object the recognition of the services rendered by Lady Lawley in helping the various charitable movements of the State. At Her Ladyship's suggestion it was decided to establish a convalescent home to which children under the age of twelve years might be sent to recuperate at very little cost to the parents. A block of land was secured close to the beach at Cottesloe, and a building erected capable of accommodating about sixteen children. The Home is supported partly by public subscription and partly by payment from the parents, the whole being subsidized by

the Government to the extent of £1 for £1 up to £250. Children sent by subscribers are charged 7s. 6d. per week, the full charge for a non-subscriber being 15s. By an arrangement recently made children who have reached the convalescent stage at the Children's Hospital are sent to the Home for a fortnight at the expense of the Hospital, thus obviating the necessity for a separate convalescent home for that Institution. The Home is managed by ladies, assisted by a board of advice composed of prominent gentlemen in the community.

Mrs. Fairbairn occupies the position of president, Mrs. McMillan that of vice-president, and Mrs. Eliot that of secretary.

### THE KINDERGARTEN UNION.

In October, 1911, at the invitation of the Committee of the Children's Protection Society, there came to Perth Miss De Lissa, from the Adelaide Training College, to lecture upon the need for a Kindergarten Union being formed in this city. In a series of charming and instructive lectures and demonstrations Miss De Lissa outlined the wonderful system of child-gardening, which saves to the nations hundreds of valuable human plants that would otherwise be eaten by the canker that besets human nature when left to itself unhelped by the Divine influences of pity and of love. In other words, the Kindergarten system of training saves many children from becoming criminals and being a burden to the State by counteracting the evil influences of heredity and environment found in the dark places of the earth. The State by aiding such work puts out at interest money which would inevitably have to be spent in the upkeep of prisons, asylums, and reformatories. "Train up a child in the way he should go, and when he is old he will not depart from it," has been amply proved by a review of the grand work performed since Froebel, who may be called the fairy godfather of childhood, began his loving

service for little children; for he transmuted dull and monotonous tasks into magic play, and made of it a power to build character and to form the virtues without which society could not exist.

Early last year a centre was formed at 160, Pier Street, where Miss Donnell is in charge as director. Assisted by the Misses Macaulay and Miss Ashe, a year of good work has been accomplished. Forty-six children were brought under the influence of the Kindergarten, and by visiting the parents in their homes Miss Donnell has been able to form the Mothers' Home-training Branch, which is an important adjunct to the work; whilst this year the Committee has established a training centre where young women will be able to take a complete course of Kindergarten training, which will enable them to become teachers. Five candidates have been enrolled and will at once enter upon the course. The enlargement of the premises at Pier Street to accommodate the growing classes, and the bright intelligence and order of the children so happily employed there, go to prove that the work so hopefully begun has not been in vain.

### HOUSE OF MERCY.

This Home, which is situated in Lincoln Street, Perth, is one of the oldest philanthropic movements in the State. Its object is primarily the reclamation of young girls, and it has for many years carried on its work quietly and without ostentation; at the same time fulfilling a very real want in the community. It

is scarcely a charitable institution in the strict sense of the word, as by means of a large laundry and other opportunities for work it is made to a large extent self-supporting. The president is Mrs. A. O'Grady Lefroy, who, since the time of its inception, has taken an active personal interest in the well-being of the Institution.

---

In addition to the foregoing there are the various Government and denominational charitable organizations. These, however, have already been noted either under the Charities' Department or under the various ecclesiastical denominations. Their work is confined chiefly to the care of the destitute and the orphan and

the reformation of the fallen. When we combine these various agencies noted above, we are fain to admit that Western Australia, though but a small community in point of numbers, can hold its own in point of charitable endeavour with the larger and more populous States of the Commonwealth.

## Agriculture.

### DIGEST OF THE LAND LAWS AND REGULATIONS.

#### LAND LAWS AND REGULATIONS PRIOR TO 1898.

On December 5, 1828, Lieutenant (afterwards Captain) J. S. Roe, R.N., was appointed "to take the charge and direction of the Surveying Department of the (then) proposed new settlement in Western Australia." In June of the following year he arrived in the colony with Sir James Stirling (the first Lieutenant-Governor) and the first batch of intending settlers, to take up his duties; and with Mr. H. C. Sutherland, Assistant Surveyor, who came out at the same time, formed the nucleus of what is now the Department of Lands and Surveys in this State.

On the same date as Lieutenant Roe was appointed, a circular was issued from the Colonial Office (afterwards known as "Circular A") to the effect that though it was the intention of His Majesty's Government to form a settlement on the western coast of Australia, the Government did not intend to incur any expense in conveying settlers to the new settlement, or in supplying them with necessaries after their arrival, but that any persons proceeding to the new settlement at their own cost, before the end of the year 1829, in parties comprehending a proportion of not less than five females to six males, would receive grants of land in fee simple proportioned to the capital which they might invest upon public or private objects in the colony—at the rate of 40 acres for every sum of £3 so invested; such land, if not brought into cultivation or otherwise improved or reclaimed from its wild state to the satisfaction of the Governor of the colony within twenty-one years, to revert to the Crown absolutely. The passages of labouring persons, whether paid by themselves or others, and whether they were male or female, provided the proportion of the sexes before-mentioned be preserved, was deemed to be an investment of capital entitling the person to land at the rate of £15 (that is, 200 acres) for the passage of each such labouring person, over and above any investment of capital.

In February, 1829, a further circular was issued from the Colonial Office (afterwards known as "Circular B") extending the operations of the previous circular with slight modifications up to the end of 1830.

This was followed by a memorandum of instructions for progressively dividing the colony into counties, hundreds, townships, and sections, and prescribing the size

of each. Although it would appear from some of the old maps of the colony that a commencement was made with this scheme (at least on paper), for some reason it was unfortunately never proceeded with, and though certain localities in the south-west portion of the colony were recognized as districts under different names, the boundaries of these districts were not clearly defined till within the last few years. In the meantime other sets of districts for magisterial, roads, electoral, and other purposes had come into existence. The consequence is that at the present time there are nine or ten sets of districts in this State, the boundaries of each being fixed almost without reference to the other—a most troublesome and confusing state of affairs which it now seems almost impossible to rectify, but which might have been avoided had the Colonial Office instructions been carried out. The memorandum also defined the conditions under which grants of land would be made, prescribing, among other things, the expenditure of 1s. 6d. per acre on improvements on the land within ten years and before the selector could obtain a grant in fee simple or effect a transfer, and imposing a fine of 6d. per acre per annum if at least one-fourth of the required improvements were not made within three years. It also provided for the leasing of town allotments, grants of land to pensioners, and the appointment of a Board of Commissioners to deal with Crown property.

This is apparently the first document in which the title of "Surveyor-General" appears.

The very liberal terms contained in the foregoing regulations, which enabled those who chose to take advantage of them to acquire huge tracts of land without any actual payment to the State (in one case a block of 316,000 acres was granted to one person), were presumably offered merely as an inducement to bring settlers to this, then very much "out-of-the-way" place, and it was not to be expected that they could hold good for any length of time. Consequently, we find that in July of 1830 a further circular was issued from the Colonial Office (afterwards known as "Circular C"), considerably modifying the terms of the previous regulations by reducing the quantity of land to be given to half that previously offered, *viz.*, 20 acres for every £3 of capital, and

100 acres for each labouring emigrant. The land so allotted, if not cultivated or improved to the satisfaction of the Government within two years, to be liable to a charge of 1s. per acre per annum as quit rent, and if not improved at the end of a further period of two years, to revert to the Crown or be liable to such additional quit rent as the Government may think fit to impose.

In March, 1831, a further circular was issued from the Colonial Office stating that His Majesty's Government had decided that in future the land in Western Australia should be disposed of upon the same principles as in New South Wales and Van Diemen's Land (Tasmania), but that the encouragement given to persons incurring the expense of taking out labourers would not be entirely withdrawn.

The circular then proceeds to define the rules or conditions, which are briefly as follow:—

The land to be put up to auction at varying prices, according to its quality, the minimum price being fixed at 5s. per acre;

Persons desirous of obtaining land to apply for same on forms provided, for which a fee of 2s. 6d. was charged;

Land to be advertised for three months before sale, and then sold to the highest bidder, providing that such bidding was not less than the upset price fixed;

Ten per cent. of purchase money to be paid at time of sale, and balance within one month;

Fee of 45s. to be paid for Crown grant and registration;

Land to be sold in blocks of 640 acres, but in special cases the Governor may authorize the sale of a smaller quantity;

Settlers incurring the expense of bringing out labourers to be entitled to an abatement of purchase money at the rate of £20 for each married labourer and his family.

About the same date as that of the issue of these regulations, a memorandum was issued from the Horse Guards, granting to officers of the Army the privilege of selecting land under the regulations referred to, and allowing a remission of the purchase money according to the following scale, *viz.*:—

Officers who had served twenty years and upwards to have a remission of £300;

Officers who had served fifteen years and upwards to have a remission of £250;

Officers who had served ten years and upwards to have a remission of £200;

Officers who had served seven years and less than ten to have a remission of £150.

Then follows a long extract from instructions to the Governor. This more fully sets out the course of procedure with regard to the subdivision of the colony into counties, hundreds, and parishes, and for making all necessary reserves for public purposes, and for grants of land under the regulations in force for the time being.

The next document in the shape of land regulations is a memorandum of instructions from the Governor to

the Surveyor-General, with reference to the reservation and laying out of lands for town sites in each county, which was to be as follows:—

COUNTY TOWNSHIPS.		Acres.
Building and gardening ground	...	1,920
Common grazing ground, including all meadows in the vicinity	...	640
Common forest land	...	640
Roads, streets, squares, quays	...	400
Public cemeteries	...	80
Church sites	...	20
School sites	...	20
Market sites	...	20
Barrack sites	...	20
Gaol sites	...	20
Public baths	...	20
Public gardens	...	20
Public slaughter houses and yards	...	20

(= 6 square miles) 3,840

TOWNS OF HUNDREDS.		Acres.
Building and gardening ground	...	600
Common grazing land	...	300
Common forest land	...	300
Sites of churches, schools, etc.	...	80

(= 2 square miles) 1,280

TOWNS OF PARISHES.		Acres.
Building, gardening, and farming land	...	300
Common grazing and forest land	...	300
Church sites, schools, and other purposes	...	40

(= 1 square mile) 640

Apparently these instructions were more honoured in the breach than the observance.

Then follow regulations defining the improvements which were required to be performed on town lots in the (then existing) towns of the colony.

It does not appear from these regulations that any price was yet charged for town lots. They were given on condition that the selector took possession and erected a building thereon of a certain value within a given time—both value and time allowed varying considerably in the different towns, and ranging from £30 to £200 and three months to five years respectively.

In March, 1832, a memorandum was issued from the Admiralty Office setting forth that the King had been graciously pleased to declare that officers of the Royal Navy purchasing land under the regulations in the colonies of North America and Australia would, in proportion to their rank and length of service, be entitled

to a remission of purchase money according to the following scale, *viz.* :—

Commanders and officers of the Royal Navy above that rank and field officers of the Royal Marines of twenty-five years' standing and upwards, in the whole £300;

Commanders and officers of the Royal Navy above that rank and field officers of Royal Marines of twenty years' standing and upwards, in the whole £250;

Commanders and officers of the Royal Navy above that rank and field officers of Royal Marines of fifteen years' standing, or less, in the whole £200;

Lieutenants of the Royal Navy, and warrant officers ranking as such, and captains of Royal Marines, of twenty years' standing and upwards, in the whole £200;

Lieutenants of the Royal Navy, and warrant officers ranking as such, and captains of the Royal Marines, of fifteen years' standing, or less, in the whole £150;

Subalterns of Royal Marines and assistant surgeons of the Royal Navy of twenty years' standing and upwards, in the whole £150;

Subalterns of Royal Marines and assistant surgeons of the Royal Navy of seven years' standing, or less, in the whole £100.

The earliest printed land regulation recorded in the Lands Department is dated January 28, 1841, and is interesting as showing the great difficulty the pioneers of this State experienced in obtaining labour to work their lands. It reads as follows:—

Colonial Secretary's Office,  
Perth, January 28, 1841.

His Excellency the Governor, with a view of affording facilities to persons who may desire to obtain the fee-simple of lands, held under the primary regulations, but upon which the necessary location duties have not been effected, owing to the all but impracticable difficulties thrown in their way by the extreme scarcity of labour, has determined, with the advice of the Executive Council, to leave it optional with parties interested to commute their location duties by the payment of the sum of 9d. per acre on their unimproved lands held under the Colonial Office "Circular B," and the sum of 1s. 6d. the acre on those held under the "Circular C."

By His Excellency's command,

PETER BROWN, Colonial Secretary.

Then follows a notice, dated May 11, 1841, to the effect that occupants desiring to obtain the full title to their lands without the performance of location duties could receive the same on payment of 9d. per acre on lands held under the terms of "Circular B," or 1s. 6d. per acre on lands held under the terms of "Circular C," or could receive the title to one-third of the same on the surrender of the remaining two-thirds.

On June 17, 1841, the price of Crown lands in the colony was raised to the uniform figure of 20s. an acre, and the minimum area to be sold in one block was fixed at 160 acres. A few days later a notice was issued from the Colonial Secretary's Office offering a bounty in the shape of remission of purchase money for land to anyone satisfactorily instructing an aboriginal native in the usual operations of farming, or teaching him a trade, to the extent of £18 in the first case and £36 in the second; but there is no record of such bounty ever being claimed.

In the *Government Gazette* of June 30, 1843, we find the first complete set of land regulations, issued under the Imperial Statute, 6 Vict., No. 36, superseding all those hitherto in force. These regulations provided for the sale of all lands by auction, the upset price of country lands being fixed at 20s. per acre, and town and suburban lands at such prices as the Governor thought fit in each case. The maximum and minimum area of blocks of country lands being 640 and 180 acres respectively, and 10 per cent. of price to be paid at time of sale and balance within one month; but provision was made for selling large blocks, 20,000 acres and over, by private contract at not less than 20s. per acre. These regulations prescribed no improvement conditions.

The next regulations were in the form of an Order-in-Council, dated March 22, 1850, and were proclaimed on September 9, 1851. These regulations, which were supplemented by a further set in November of the same year, apparently did not supersede those of 1843, but were supplementary to them. They were the first that made provision for pastoral leases. For the purposes of these regulations the lands of the colony were divided into two classes, denominated respectively A and B; class A comprising the lands within two miles of the sea coast and principal rivers and inlets, and lands within the vicinity of occupied town sites or fee simple lands; class B comprising the remaining lands of the colony. Class A lands were available for pastoral leases for terms not exceeding one year, class B lands for leases for a term of eight years with right of renewal for a further similar term, rental £5 per run or 10s. per 1,000 acres per annum. Tillage leases were granted in blocks not exceeding 320 acres at a rental of 2s. per acre per annum for a term of eight years, renewable on certain conditions for a further similar term. Among the miscellaneous clauses two or three occur which find a place, almost unaltered, in the present-day land legislation. Lands held under class B leases could be sold to the holder of the lease under right of pre-emption without going to auction, but in the event of any other person applying for such land it was submitted to auction; the lessee, however, was first allowed the prior right of purchasing at a fixed price.

The foregoing regulations were followed by a despatch from the Secretary of State for the Colonies, dated July, 1853, enclosing some further regulations respecting the terms on which officers of the Army and Navy could select land, modifying the previous regulations of February 24, 1831, and March 3, 1832.

Then we come to the land regulations of February 14, 1860—quite a voluminous document compared with earlier ones, and the first in which schedules giving the various forms of leases and licences appear.

These were made under the Imperial Statute intitled "An Act to repeal the Acts of Parliament now in force respecting the disposal of the Waste Lands of the Crown

in the Australian colonies, and to make other provision in lieu thereof," and all subsequent regulations up to the date of the introduction of responsible government were made under the same Act, the title of which is recited in all leases and licences granted up to 1891.

These show a marked change in land policy—the minimum price of country lands being reduced to 10s. an acre and the minimum area to 40 acres. Under them town and suburban lands were sold at auction as previously, and country lands at a fixed price of 10s. an acre. Mineral lands (now first mentioned) could be purchased at auction at an upset price of 20s. an acre, payable 10 per cent. on application and balance in about two years' time.

These regulations were the first to provide for licences for felling and removing timber and sandalwood, for which the following fees were charged:—

For any quantity not exceeding 640 acres of land, £20 per annum; for any quantity exceeding 640 acres and not exceeding 1,280 acres, £40 per annum, or 10s. per month for each pair of sawyers; to cut sandalwood, £2 10s. per month for each pair of sawyers, and £1 5s. for each additional man employed.

The rent of tillage leases was reduced to 1s. per acre per annum. Pastoral leases and licences were issued on practically the same terms as under

the regulations of 1851, except that the boundaries of the class A lands were extended considerably inland and included the larger portion of what is now the south-west division. No compensation was allowed for improvements made on a class A licence; and the purchaser of land within the limits of any such licence, or within a class B lease, had the right to depasture stock in proportion to the extent of his purchase. Pastoral lessees in class B were entitled to compensation from purchasers of land within their leases for improvements on lands so purchased, and the pastoral lessee had the right to select a homestead block within his lease with pre-emptive right of purchase at 10s. an acre. They also contained numerous minor provisions respecting transfers, payment of rent, and other matters, which it is unnecessary to further notice.

The next set of land regulations was proclaimed in August, 1864, but the difference between them and those of February, 1860, is so slight that they may be taken as a reissue. In January, 1865, regulations were proclaimed providing for "the disposal of the Waste Lands of the Crown in the Northern Districts." The price of the land was fixed at 7s. 6d. per acre. The provisions of these were, however, but very slightly availed of. They also raised the price of mineral lands to £3 per acre, and made provision for granting mining licences and leases (for working the lead and copper deposits in the vicinity of Northampton); the rent for a mining licence was 2s. per acre per annum, and for a mining lease 8s. per acre per annum for ten years.

In the year 1870 Captain Roe, R.N., who, as Surveyor-General, had guided the affairs of the Department from its

inception up to this time (a period of over forty years), retired on a well-earned pension (equal to his full pay), and made room for Mr. (afterwards Sir) Malcolm Fraser, who had been previously in the employ of the New Zealand Government, he being appointed Surveyor-General of Western Australia on December 19, 1870.

On March 20, 1872, new land

regulations were proclaimed repealing all former ones, but owing to some informality in the first proclamation they were again proclaimed on May 22, 1873. They provided for the appointment of a Commissioner of Crown Lands, and the head of the Department bore that title from this time forward till the Land Act of 1898 came into force; prior to the introduction of responsible government the Commissioner of Crown Lands was also the Surveyor-General. These differed in many ways from those that had preceded them, but the principal feature was the provision for conditional purchase by deferred payment of land in blocks of 100 to 500 acres in areas set apart for the purpose. These holdings were termed "special occupation licences," a licence being issued for ten years at a rental of 1s. per acre per annum, and at the end of the term,

NEW SELECTOR AT BRUNSWICK (SOUTH-WEST).

provided the required improvements, consisting of fencing in the whole and clearing and cropping one-fourth of the area, had been carried out, a Crown grant was issued. Provision was also made for holders of tillage leases under previous regulations to obtain the Crown grants of their lands upon payment of a sum, which, together with what had previously been paid as rent, amounted to 12s. 6d. per acre. Lands in the north and east districts, which at that time embraced the greater portion of the colony outside of what is now the south-west division, were offered for sale at 7s. 6d. per acre for one year after the coming into force of these regulations, and at 10s. per acre after that period. The pastoral lands were divided into three classes, distinguished as first, second, and third—the first being all the land within the present south-west division, the third all the land within the north and east districts, and the second the remainder of the colony. Pastoral leases of first- and second-class lands were granted for a term of fourteen years at a rental of 20s. per thousand acres per annum for the former and 10s. for the latter, while third-class lands for pastoral purposes were granted rent free for three years, after which a lease for eight years was granted at an annual rental of 5s. per thousand acres for the first half of the term and 10s. per thousand acres for the remaining term of the lease. In these regulations "poison leases" occur for the first time, provision being made for the leasing of lands infested with poison plants for twenty-one years at an annual rental of 20s. per thousand acres, and at the end of the term, provided the land was properly fenced and the poison plants entirely eradicated, the lessee would receive a Crown grant. Under the head of "Mineral Lands" a licence was obtainable to search for minerals on payment of a fee of 2s. 6d., which held good for two years; for mining licences for one year, not exceeding 200 acres in area, on payment of a fee of £1, renewable for another year on payment of a similar fee; and for mining leases for seven years at a rental of 5s. per acre per annum; and on certain conditions the holder of a mining licence or lease was allowed to purchase the land comprised therein at the price of £3 per acre. The regulations relating to timber were practically the same as those previously in force, except that the fee for cutting sandalwood was reduced from £2 10s. to 2s. 6d. Free grants were also provided for small blocks of land of 50 and 20 acres to volunteers and military pensioners respectively. In April, 1874, the regulations were slightly amended and added to, and again in February, 1875, and April, 1878—the first provided for a slight amendment of the form of Crown grant; the second made provision for free grants of land to immigrants, not exceeding 150 acres to one family, and for the granting of special licences to cut timber over a specified area for a term of fourteen years, on such terms as the Governor-in-Council might

think fit; and the third amended the regulations respecting grants to immigrants, and extended their operations to immigrants from the Australian colonies.

We then come to the land regulations of September 14, 1878, which again repealed all those of former years. They did not differ very materially from those which they superseded, but were fuller and more complete. The special occupation system remained the same, and lands could also still be purchased by direct payment at 10s. per acre in blocks of not less than 40 acres; but a new feature was the provision for the sale of small blocks (not less than 10 acres) at 10s. per acre for the encouragement of planting vineyards, orchards, and gardens. For the purposes of these regulations the colony was divided into four districts—the central (corresponding nearly with our present south-west division), the northern, the central eastern, and the south-eastern; land within any but the central district was sold at 5s. per acre in blocks of not less than 400 acres. The pastoral lands were divided into two classes, first and second; the first comprised all lands in what is now the south-west division, and the second all the other lands of the colony. Pastoral leases of the first-class lands were granted for fourteen years at a rental of £1 per thousand acres per annum, and of second-class lands for a similar term at a rental of 5s. per thousand acres per annum for the first half of the term and 10s. for the remaining half. The clauses relating to mineral lands, timber licences, and grants to volunteers, pensioners, and immigrants remained practically the same.

The next regulations were proclaimed on October 11, 1882, and, like their two predecessors, repealed all those then in force, but they differed so little in material points from those of 1878 that it is almost needless to summarize them. The principal new feature was contained in the clauses relating to the then new district in the far north, which was first explored by the late Mr. Alex. Forrest, and which was named Kimberley after the Secretary of State for the Colonies of that period.

On January 22, 1883, Mr. John Forrest, formerly Deputy Surveyor-General, succeeded Mr. Fraser as Surveyor-General and Commissioner of Crown Lands.

The last-mentioned regulations were followed in April, 1884, with others dealing with auriferous lands. Nothing was ever done under them, but a little incident occurred in connection with them which is worth recording. A draft of these, or somewhat similar, had previously been prepared in a great haste, owing to the reported discovery of a rich gold-bearing reef on the Blackwood; this reported discovery, however, turned out to be a mistake, or a hoax, and the Governor (Sir Wm. Robinson), to whom the draft had been sent, returned it with a short minute somewhat in the following words:—"These papers may now be filed; but they will

be wanted again some day." The total output of gold last year was over a million ounces.

On March 2, 1887, the last regulations made under the Imperial Statute before referred to were proclaimed. These were in a special sense Sir John Forrest's, as those of 1873, 1878, and 1882 were Sir Malcolm Fraser's. The leading features were the reduction of annual rents (or instalments) on conditional purchase blocks of 6d. per acre, with an extension of the term for twenty years; the distinction between conditional purchase with residence and without; limitations as to age of selector and area held by one person; and provision for survey before selection in agricultural areas; direct sale of land without improvement conditions being done away with; and the minimum area, except in special cases, or for vineyards, orchards, or garden blocks, being fixed at 100 acres. All these conditions are, with very slight modifications, embodied in existing land legislation, so that there is no need to further refer to them here. Under these regulations the colony was divided into six divisions, practically the same as the present divisions. The conditional purchase regulations above referred to (except in surveyed areas) were applicable only to the south-west division, others being treated as pastoral divisions. Pastoral leases were granted for a longer term and made to terminate at one time, *viz.*, December 31,

SCRUB ROLLING AT "NEWMARROCARRA," NEAR GERALDTON.

1907, and except in the south-west division were divided into three terms at the following annual rentals per 1,000 acres:—Gascoyne and Eucla—10s., 12s. 6d., and 15s.; north-west and Kimberley—10s., 15s., and 20s.; eastern—2s. 6d., 5s., and 7s. 6d. But in the Kimberley and Eucla divisions these rentals were reduced to half if the land were stocked. In the event of the land not being stocked within seven years, double rent was charged. The holders of all pastoral leases in existence at the time these regulations came into force had the right to come under them, and almost every one took advantage of it. Those relating to poison and mineral leases and timber licences were practically the same as previously. Those relating to improvements on pastoral leases and the manner in which their value was to be ascertained and paid for when included or affected by selectors were more full and complete, and provision was

made for special leases of small blocks for special purposes.

In December, 1890, the first Ministry under responsible government took office, and in 1892 a local Act was passed, which came into force in January, 1893, amending the 1887 regulations by reducing the rent for the second and third terms; and in October, 1893, the

Homesteads Act was passed, providing for the granting of free homestead farms and leases (now called grazing leases), and further amending the 1887 land regulations.

#### EXISTING LAND LAWS: THE LAND ACT, 1898.

Owing to the amendments that had been made to the Land Regulations of 1887 by the Act of 1892 and the Homesteads Act of 1893, under which some further regulations had been issued, the land laws and regulations were becoming somewhat difficult to follow. For this reason, and for the purpose of making further slight amendments, a consolidation of the land laws was undertaken, which in 1898 became law under the title of "The Land Act, 1898," and came into operation on January 1, 1899.

This Act, together with some amendments which have since been made to it, comprises the land legisla-

tion of the present day. For the purposes of the Act the State is divided into six divisions (closely corresponding with the divisions under the regulations of 1887) distinguished as South-West, Kimberley, North-West, Western, Eucla, and Eastern Divisions.

#### Purchase by Auction— Town and Suburban Lands.

Town and suburban village lands throughout the State, after being surveyed into lots, are sold by public auction at upset prices to be determined by the

Governor; 10 per cent. of the purchase money being paid upon the fall of the hammer (unless the purchaser has already paid a deposit of 10 per cent. on his application) and the balance by four equal quarterly instalments, the Crown grant and registration fees being payable with last instalment. All suburban land is sold subject to the condition that each lot shall within two years from date of sale be fenced on the surveyed boundaries with a fence of the prescribed description (but the Minister may accept other improvements in lieu of the fencing), and in default thereof the land shall be forfeited, together with all purchase money and fees which may have been paid.

In the case of suburban lands for cultivation, the balance of purchase money (after 10 per cent. deposit) is paid by ten equal half-yearly instalments, but subject to the further condition that the purchaser shall within three years plant at least one-tenth of the area with vines or fruit trees, or cultivate it *bona fide* as a vegetable garden, or otherwise cultivate and clear one-quarter of the area.

On payment by the purchaser of town or suburban lands of the first prescribed instalment of the purchase money a licence may be issue entitling the holder to occupy the land, and such licence may be mortgaged or transferred as prescribed by the Act.

Town and suburban lots may also be set apart and let as residential leases under the regulations referred to, or may be let as special leases under Section 152.

#### Conditional Purchases—Agricultural Lands.

Any portion of Crown lands (not less than 2,000 acres) within any of these divisions may be set apart and declared as an agricultural area, and after survey into lots opened for free homestead farms or conditional purchases under the various sections of this part of the Act, and in the South-West, Eastern, and Eucla Divisions land may be thrown open for free selection (*i.e.*, selection before survey) under the same conditions without previous declaration and survey of an agricultural area.

Any person over eighteen years of age may select land under the several forms of conditional purchase prescribed by Part V. of the Act. First there is

##### CONDITIONAL PURCHASE BY DEFERRED PAYMENT, WITH RESIDENCE.

This section is applicable to land within an agricultural area, and also to any other land in the South-West, Eastern, and Eucla Divisions which may from time to time be declared open for such selection.

The ordinary price of land under this section is 10s. per acre, but this price may be increased, and in special cases where the land is of inferior quality may be reduced to not less than 6s. 3d. for second-class land and

3s. 9d. for third-class, payable half-yearly at the rate of one-twentieth of the total purchase money per annum.

The maximum area allowed to be held by one person is 1,000 acres and the minimum 100 acres; any land held by the selector under similar clauses of the land regulations of 1887 or of "The Homesteads Act, 1893," is, in calculating the total area held by the selector, deemed to be held under this section.

Applications must be accompanied by a deposit of a half- or a quarter-year's rent, as the case may be; that is to say, if the application is made during the first quarter of the half-year a half-year's rent is required; if in the second quarter a quarter-year's rent; in the event of the application not being approved the deposit is refunded. On approval of the application by the Minister a lease is issued for twenty years, dating from the first day of the quarter next preceding the date of approval.

The lessee must, within six months from the date of his lease, take personal possession of the land, and reside upon it and make it his usual home, without any other habitual residence, during at least six months in each year for the first five years from the date of the commencement of the lease. If possession be not taken the land must be forfeited; but if the lessee is already the owner of rural land within 20 miles of the land applied for, residence on such land is deemed sufficient residence under this section.

The lessee must, within six months from the date of the commencement of his lease fence at least one-tenth of the land contained therein, and within five years from said date fence in the whole of the land; and within ten years expend upon it in prescribed improvements, in addition to the exterior fencing, an amount equal to the full purchase money. The Minister may allow half the cost of the exterior fencing to count as part of the improvements.

At the expiration of the lease or at any time after five years from the date of the commencement of the lease, provided all the conditions of fencing, residence, and improvements have been complied with and maintained and the full purchase money and fees have been paid, a Crown grant of the land is issued.

Any person having obtained land of less extent than 1,000 acres, may make other applications for land within 20 miles of the block first applied for up to the maximum area of 1,000 acres. Residence on the additional leases is not required, but all the other conditions shall apply, provided that if two or more leases held by one person adjoin they may be considered as one block with respect to fencing and improvements; if not surveyed the conditions date from the date of the survey instead of from the commencement of the lease.

For those who do not wish to personally reside on the land there is

CONDITIONAL PURCHASE BY DEFERRED PAYMENT WITHOUT RESIDENCE.

The lands referred to under the previous head may also be selected at the same price without the residential condition, but subject to all the other conditions mentioned, double the expenditure on improvements is, however, required in lieu of residence.

Land may also be obtained under  
CONDITIONAL PURCHASE BY DIRECT PAYMENT.

The price of land under this section is not less than 10s. per acre, payable within twelve months, the maximum and minimum areas allowed to one person being the same as under the two previous sections.

The application must be accompanied by 10 per cent. of the purchase money, and on approval a licence is issued for seven years, dating from the first day of the quarter next preceding the date of approval of application. The balance of the purchase money must be paid within twelve months from the date of the commencement of the licence by four equal quarterly instalments—on the first days of January, April, July, and October respectively—the first of such instalments being due on the first day of the quarter next following the commencement of the licence. The licensee must within three years from the date of the commencement of the licence fence in the whole of the land, and within seven years from such date expend upon the land in prescribed improvements, in addition to the exterior fencing, an amount equal to 5s. per acre; and the Crown grant is not issued until the Minister is satisfied that the prescribed conditions have been fulfilled. At the expiration of the licence or at any time during continuance of the licence, provided that the conditions of fencing and improvements have been complied with and maintained and the full purchase money and fees have been paid, a Crown grant of land may be issued.

Any person desiring to obtain a small block of land for a garden, vineyard, or orchard, may do so under the following section:—

CONDITIONAL PURCHASE OF SMALL BLOCKS FOR GARDENS, VINEYARDS, AND ORCHARDS.

The land may be obtained in small blocks for gardens, vineyards, orchards, etc., on the following terms:—The price of the land shall not be less than £1 per acre; the maximum area allowed is 50 acres and the minimum five acres, and two or more applications may be made to obtain the maximum. A deposit of 10 per cent. of the purchase money is required upon application, and the balance shall be paid within three years from the date of the approval of the application by equal half-yearly payments on the 1st of March and September. The improvements required are that the

land shall be fenced within three years and that one-tenth of the same shall, within the same period, be planted with vines or fruit trees or cultivated *bona fide* as a vegetable garden; whereupon the grant is issued.

Conditional Purchases—Grazing Lands.

Part VI. of the Act deals with the conditional purchase of second- and third-class lands, termed "grazing lands"; any such lands in the South-Western Division or within 40 miles of a railway in the Eastern and Eucla Divisions may be thrown open for such selection at a minimum price of 6s. 3d. for second-class and 3s. 9d. for third-class lands—payable half-yearly at the rate of one-thirtieth of the total purchase money per annum.

The maximum area allowed is 3,000 acres of second-class and 5,000 acres of third-class land, and the minimum in both cases is 1,000 acres, except when adjoining the holding of the applicant, in which case the minimum is 300 acres. If one person select two leases in different classes the total quantity must not exceed 4,000 acres, the minimum being the same as before, except in special cases.

Applications must be accompanied by a deposit of rent for the first quarter- or half-year, as the case may be, which, as in other cases, is refunded if the application is not approved, and on approval of the application a lease is issued for thirty years, dating from the first day of the quarter preceding the date of approval.

The conditions are as follow:—The lessee shall pay one-half the cost of survey in ten half-yearly instalments, the first of such instalments being paid with the application and subsequent instalments with the annual instalments of purchase money on the 1st of March and September in each year. Within six months from the date of commencement of his lease the lessee must take possession of the land and reside upon it during at least six months of the first year and nine months in each year for the next four years. Residence may, however, be complied with by the lessee's agent or servant. Within two years from date of the commencement of his lease the lessee shall fence at least one-tenth of the area contained therein, within five years from the same date shall fence in the whole of the land, and within fifteen years of the same date shall expend upon the land in prescribed improvements, in addition to the exterior fencing, an amount equal to the full purchase money.

The following shall be deemed improvements:—Subdivision fences, clearing, grubbing, draining, ring-barking, tanks, dams, wells, or any other work upon the land which increases or improves its agricultural or pastoral capabilities: Provided that where the lessee has erected a sheep- and cattle-proof exterior fence, half its value may be allowed towards the improvements.

At the date of the expiration of the lease, or at any time after five years from the date of the commencement of the lease, providing all the conditions of

fencing, residence, and improvements have been complied with and maintained and the full purchase money and fees have been paid, a Crown grant of the land shall be issued.

Grazing leases are now allowed within agricultural areas.

#### Conditional Purchases—Poison Lands.

Part VII. of the Act deals with the conditional purchase of lands infested with poisonous indigenous plants termed "poison lands." Any Crown lands being poison lands within the South-West Division may be declared open for selection under this part of the Act.

Land is considered as "poison land" when in the opinion of the Minister it is so infested with poisonous indigenous plants that sheep or cattle cannot be depastured thereon. The price is not less than 1s. per acre, payable half-yearly at the rate of one-thirteenth of the total purchase money per annum. The maximum area allowed is 10,000 acres and the minimum 400 acres. The application must be accompanied by the usual deposit and, on approval, a lease is issued for thirty years, dating from the first day of the quarter next preceding the date of application. Any person obtaining less than 10,000 acres may make other applications up to 10,000 acres, and if any two adjoin they may be fenced as one lease. The lessee has to pay the prescribed cost of survey in ten half-yearly instalments, the first instalment being paid with his application.

The conditions are that the lessee shall pay the prescribed cost of survey of the lease in ten half-yearly instalments (same as grazing leases): within two years from the date of the commencement of his lease, fence at least one-tenth of the land comprised therein, within five years from the same date shall enclose the whole area with a fence of the prescribed description, and during the term of his lease shall eradicate the whole of the poisonous indigenous plants as prescribed.

A Crown grant of the land is issued at the expiration of the lease, or at any time during the currency of the same, if all the foregoing conditions have been complied with, the fencing properly maintained, the full purchase money and fees paid, and the land has been rendered safe for depasturing cattle and sheep at all seasons, and has continued so for a term of two years.

#### Free Homestead Farms.

Part VIII. of the Act deals with free homestead farms, which is one of the principal features of present land legislation in this State and was first introduced by Sir John Forrest in the Homesteads Act of 1893.

Any land within the South-West Division, or within 40 miles of a railway in the Eastern and Eucla Divisions

and not being within a goldfield, may be declared open for selection under this part of the Act.

Any land within the South-West Division, or within 40 miles of a railway in the Eastern and Eucla Divisions special occupation or conditional purchase, being the head of a family or a male who has attained the age of eighteen years (reduced to sixteen years by the Amendment Acts of 1902 and 1906), may select a homestead farm of not more than 160 acres from lands declared open for such selection.

Every applicant must, with his application, make a statutory declaration as to his being eligible to hold a free homestead farm, and forward same to the Minister or his agent, accompanied by a fee of £1. Upon approval of the application the applicant receives an occupation certificate authorizing him to enter upon and take possession of his land for a term of seven years, to be computed from the first day of the quarter preceding the date of approval of his application.

Within six months from the date of such occupation certificate the selector must take personal possession of the land and reside upon it for at least six months in each year for the first five years of the term of his certificate. If possession be not so taken the occupation certificate is cancelled and the land forfeited, together with all improvements.

In certain cases of illness, or for other valid reasons, the Minister may waive forfeiture for non-residence upon the land or authorize absence and, with the Governor's approval, may accept double improvements in lieu of residence. Within two years from the date of his occupation certificate a habitable house must be erected of not less than £30 in value, or the selector shall expend £30 in clearing or clearing and cropping, or prepare and plant two acres of orchard or vineyard. Within five years from the said date the selector must fence in at least one-fourth and clear and crop at least one-eighth. Within seven years the whole must be fenced and at least one-fourth cleared and cropped. At the expiration of seven years from the date of his occupation certificate the selector, provided all the conditions have been duly performed, obtains a Crown grant on payment of the usual fees; but if the conditions have not been effected the land is forfeited. In certain cases where the clearing is very heavy these conditions may be varied (*vide* Section 7 of the Land Act Amendment Act, 1900).

The Crown grant may be obtained after twelve months' residence upon the selector proving to the Minister that the necessary conditions have been fulfilled and on payment of 5s. per acre, together with the fees referred to in the preceding paragraph. Homestead farms cannot be mortgaged, except to the Agricultural Bank, and can only be transferred to persons who are qualified to hold. The holder of a homestead farm may select other conditional purchase land where

residence is a condition—residence on the homestead farm, if within 20 miles, will be sufficient.

In connection with homestead farms the Governor may declare village sites, to be subdivided into lots not exceeding one acre; the selector of a homestead farm within five miles of such site may select one of such lots without payment, and the conditions of the homestead farm with respect to residence and erection of house may then be applied to such allotment instead of to the homestead farm. When the selector becomes entitled to the Crown grant of his homestead farm he may, upon payment of the sum of £1 and the prescribed fee, obtain the Crown grant of such village allotment.

#### Working Men's Blocks.

Any person who does not own land within the State in freehold or under special occupation or conditional purchase or a homestead farm under the "Land Act, 1898," or the "Homesteads Act, 1893," who is the head of a family or a male who has attained the age of eighteen years, may obtain a lease of lands set apart for working men's blocks. The maximum area that may be selected by one person is, if within a gold-field, half an acre, or five acres elsewhere, and only one block may be selected by one person.

The price of the land is not less than £1 per acre, payable half-yearly at the rate of one-tenth of the total purchase money per annum or sooner. Application shall be accompanied by a deposit of a half- or quarter-year's rent at the above rate. Upon approval a lease is issued for ten years, dating from the first day of the quarter next preceding the date of approval. The lessee must, within three months from the date of lease, take personal possession of the land and reside upon it during at least nine months in each of the first five years of the lease: Provided that possession may be taken and residence performed by the lessee's wife or a member of his family. Within three years from the date of commencement of the lease the whole of the land must be

fenced on the surveyed boundaries, and within five years from the same date an amount equal to double the full purchase money, in addition to his house and exterior fencing, must be expended on the land in prescribed improvements.

At the expiration of the lease or at any time after five years from the commencement of the lease, provided that all the conditions of residence, fencing, and improvements have been complied with and maintained and the full purchase money and fees have been paid, a Crown grant of the land may be issued.

In certain cases of illness, or for other valid reasons, absence may be allowed and forfeiture waived.

#### Pastoral Lands.

Leases of Crown lands for pastoral purposes within the several divisions of the State are granted on the following terms and conditions:

—In the South-West Division in blocks of not less than 3,000 acres at an annual rental of £1 per 1,000 acres; but in that part of this division situated eastwards of a north-westerly line from the mouth of the Fitzgerald River the rental is 10s. per 1,000 acres. In the Western and North-West Divisions in

blocks of not less than 20,000 acres at an annual rental of 10s. per annum per 1,000 acres. In the Eucla Division in blocks of not less than 20,000 acres at an annual rental of 5s. per 1,000 acres. In the Eastern division in blocks of not less than 20,000 acres at an annual rental of 2s. 6d. per 1,000 acres for the first seven years of the lease and 5s. per 1,000 acres for the remainder of the term. In the Kimberley division in blocks of not less than 50,000 acres when on a frontage, nor less than 20,000 acres when no part of the boundary is on a frontage, at an annual rental of 10s. per 1,000 acres. In any case where land applied for is shut in by other holdings and does not contain the minimum area a lease for a lesser quantity may be granted.

A pastoral lease gives no right to the soil or to the timber, except for fencing or other improvements on

GETTING READY FOR A BURN. MOUNT BARKER DISTRICT.

the lands leased; and the lands may be reserved, sold, or otherwise disposed of by the Crown during the term of the lease. Any pastoral lessee upon being deprived by the Minister of the use of any land held under pastoral lease is entitled to receive fair value for all improvements on the land of which he has been deprived. In the event of the land being selected from his lease under conditional purchase he is entitled to claim from the conditional purchaser fair value of any lawful improvements on or appertaining to the land applied for, the value of the improvements to be ascertained by arbitration, as prescribed by Section 148 of the Act.

Before any land within a pastoral lease can be taken by the Minister and thrown open as an agricultural area, three months' notice must be given to the lessee if within the South-West Division or twelve months' notice if within any other division; but free selection is allowed in leases in the South-West Division subject to the lessee's claim for improvements. In cases of leases granted under the Act within goldfields or mining districts the notice above referred to is not required.

Any lessee in the Kimberley Division, or on that part of the South-West Division situated to the eastward of a north-westerly line from the mouth of the Fitzgerald River, who during the term of his lease shall have in his possession within the division ten head of sheep or one head of large stock for each 1,000 acres leased is allowed, after satisfying the Minister to this effect, a reduction of rent for the remaining years of his lease of one-half of the rentals before mentioned. A penalty of double rental for the remaining portion of the term of the lease is imposed, except in the South-West Division, if the lessee has not within five years complied with the conditions as to stocking.

Permission may be granted to ringbark trees on a pastoral lease, in the discretion of the Minister, on application.

All pastoral leases expire on December 31, 1928.

#### CONDITIONAL PURCHASES BY PASTORAL LESSEES.

Any pastoral lessee in the South-West Division may select land within his lease (not being within an agricultural area or within a goldfield or mining district) in not more than three separate selections adjoining his homestead and not exceeding 20 per cent. of the aggregate quantity held on lease by him within such division, and on approval of the application a lease may be granted subject to all the conditions appertaining to conditional purchases under Section 55 of the Act, except residence; the maximum area is 3,000 acres, and the minimum, except in special cases approved by the Minister, shall be 200 acres. If the land selected is within a properly fenced enclosure the fencing of the land upon the boundaries is not obligatory.

Any pastoral lessee in the Kimberley, North-West,

Western, Eastern, and Eucla Divisions (the land not being within agricultural area or a goldfield or mining district) who has complied with the conditions as to stocking may select Crown land within his lease in not more than three blocks and not exceeding in the aggregate 1 per cent. of the total area held by such lessee under pastoral lease in such division on the same terms and conditions as are prescribed for purchase under Section 55, except the condition of residence. The minimum fixed for each block is 500 acres and the maximum 5,000 acres.

#### Timber Lands.

Part XI. of the Act deals with the timber lands of the State, and makes provision for granting licences and leases in connection therewith as follows:—

(1) *A timber licence*, authorizing the licensee to fell, cut, split, and remove any timber growing or standing on any Crown lands for all ordinary purposes (but not to cut or hew balks, piles, telegraph, or other poles). The fee for such licence is 10s. per month for each man employed. A similar licence must be obtained by every person engaged in removing the timber dealt with under a timber licence.

(2) *A woodcutter's or charcoal burner's licence*, authorizing the licensee to cut or split firewood from Crown lands and to remove the wood or charcoal cut, split, or burnt. The fee for such licence is 1s. per month for each man employed. A similar licence must be obtained by every person engaged only in removing firewood; but no licence is necessary for cutting, obtaining, and removing dead wood lying on Crown lands for domestic purposes, so long as it is not for sale.

(3) *A sandalwood licence*, authorizing the licensee to fell, cut, and remove any sandalwood growing upon Crown lands.

(4) *A wattle-bark licence*, authorizing the licensee during the months from August to December inclusive, or during any of such months, to strip and remove wattle-bark upon the Crown lands.

(5) *A bark licence*, authorizing the licensee to strip and remove the bark, or to remove the gum from other trees than wattle the bark or gum of which contains tannic acid, upon such terms as the Minister may think fit.

The fee for each of the three last-mentioned licences is 5s. per month for each man employed.

(6) *A licence to fell and hew timber* to be used or exported as piles, poles, or balks, the fee for which is £3 per month for each man employed.

#### TIMBER LEASES.

Timber leases may be obtained under the following conditions:—The maximum area allowed is 75,000 acres at a rental of £20 per annum for each square mile or

fraction thereof, payable half-yearly. The application must be accompanied by a deposit of a quarter- or half-year's rent as the case may be. A timber lease is granted for a term of not less than one year and no more than twenty-five years, and gives the lessee the exclusive right (subject to the Act and regulations) to cut, remove, and sell any of the timbers specified in his lease growing or standing on the land; also the right to construct railways and tramways on and through the area comprised in his lease and, with the approval of the Governor, to continue such railways or tramways over Crown lands outside the lease and to connect the same with any Government railway line.

A lessee of a timber lease must, within two years from date of his lease, or within such longer period as the Minister may decide, erect within the area a substantial and fully-equipped sawmill plant of sufficient power to cut up at least five loads of sawn timber per

perpetual leasehold takes the place of the method heretofore in operation—that of disposing of the freehold.

Since 1898 there have been amendments of the Land Act—in 1902, 1906, and 1909. These aim mainly at making the conditions easier for the man who is anxious to cultivate the land for a living, while at the same time making more stringent the provisions which are likely to affect land jobbing adversely.

The divisions of the State are slightly altered in that a Central Division takes the place of the Western under the previous Act.

The conditional purchase with residence clauses are amended so as to provide that the lessee must reside on his selection in person and make it his habitual residence during six months in each of the first five years from the date of the commencement of his lease, or on rural land within 20 miles. He must also expend in prescribed improvements an amount equal to one-

Photo by C. E. Farr.

CROP ON MR. R. CAMERER'S FARM, TOODYAY DISTRICT.

month for each square mile comprised in the lease, and must keep the said sawmill plant in good working order during the whole term of the lease.

Regulations made under the Act define the standard (or minimum) sizes for the various timbers of the State, and any person felling a tree below the standard size is liable to a penalty.

#### General Provisions of the Act.

The concluding part of the Act (Part XII.) gives the provisions regarding mortgages, rent, transfers, improvements, and so on, and also gives the Governor-in-Council power to make regulations for the various purposes named in the Act. The most recent of them are those made by the present Government, with the object of carrying into effect one of the planks in the platform of the Labour Party—that of the non-alienation of Crown lands. Under these regulations the system of

fifth of the purchase money in every two years of the first ten years of his lease, fence-in half the land during the first five years, and the whole within ten years. The total improvements, however, need not exceed £1 per acre. Where land is selected under conditional purchase without residence double the improvements are required, but not exceeding 30s. per acre. Where the conditional purchase is by direct payment the maximum area allowed is 1,000 acres, the purchase money being paid as follows:—Ten per cent. on taking up the land, and the balance within twelve months.

The term "grazing lands" is amended to mean such lands as the Governor may declare suitable for grazing but unfitted for agriculture. These may be acquired in areas of not more than 5,000 acres at not less than 3s. 9d. per acre, payable in instalments spread over twenty years. The value of the improvements on grazing lands must be an amount equal to the purchase

money expended at the rate of one-fifth of that amount in every two years of the first ten years of the lease and fencing-in the whole of the land during the said period of ten years. Where a sheep- and cattle-proof fence is erected half the value of such fence shall be deemed to be part of the improvements required between the fourth and tenth years of the lease. Where a rabbit- or dog-proof exterior fence, capable of resisting great and small stock, two-thirds of the value may be allowed as part of the improvements. In all other respects the conditions shall be the same as for leases under Section 55.

[NOTE. — Two hundred acres of first-quality land under conditional purchase or 5,000 acres under grazing lease may be selected, or proportionately, such as 1,000 acres first-quality and 2,500 acres of grazing land. The selector of a portion of any location that may be classified as first quality, and therefore under Sections 55 and 56, must take the balance of same location under grazing-lease conditions.]

The sections of the Act of 1898 dealing with "poison" leases were repealed in 1906, and a new section in the amending Act of that year provides that the

Minister may grant his certificate for the issue of the grant of the fee-simple under a "poison" lease granted under the principal Act or any land regulations if the Minister is satisfied that the conditions of the lease have been substantially fulfilled, notwithstanding that it may not be proved that the poison plants were entirely eradicated, for any prescribed period to the expiration of the lease.

In the same amending Act new provisions have been introduced relating to what are termed "special settlement lands." The Governor may by notice in the *Government Gazette* define and set apart any Crown lands as special settlement lands, declare the same open for selection, or withdraw any land from being so open for selection. Lands within these special areas may be cleared, drained, or otherwise improved before being thrown open for selection. In such case the value of improvements is added to the original cost of the land and paid by the selector in instalments.

The provisions of the Land Act, 1898, regarding pastoral leases have also been amended by the Act of 1906, and the present areas and rentals in the various divisions may be seen from the following table:—

*Pastoral Lands—Sections 93, 94, 95, 97 (as amended by the Land Act Amendment Act, 1906).*

PASTORAL LEASE CONDITIONS, 1912.

NAMES OF DIVISIONS.	AREA OF LEASES.	ANNUAL RENT PER 1,000 ACRES, OR PART OF 1,000 ACRES.	LESSEE QUANTITY MAY BE GRANTED, BUT NO LEASE WILL ISSUE FOR LESS THAN
South-West Division, Sec. 93	3,000 acres	£1 per 1,000 acres.	£1 per annum.
Central Division, Sec. 94 ...	20,000 acres	10/- per 1,000 acres.	£3 per annum.
Eucla Division, Sec. 95 ...	20,000 acres	3/- per 1,000 acres.	£3 per annum.
North-West Division, Sec. 96	20,000 acres	10/- per 1,000 acres.	£3 per annum.
Eastern Division, Sec. 97 ...	20,000 acres	5/- per 1,000 acres.	£1 per annum.
Kimberley Division, Sec. 98, on a frontage*	50,000 acres	10/- per 1,000 acres.	£3 per annum
Not on a frontage ...	20,000 acres	10/- per 1,000 acres.	£3 per annum

\* A frontage block is such as has its lesser boundary on a lake, river, main stream, other water channel, estuary, or sea-shore; its mean depth shall not be less than three times its mean breadth.

AGRICULTURAL LAND PURCHASE AND BANK ACTS.

Any digest of the present Land Acts would be incomplete without a reference to the Agricultural Land Purchase Act, 1896, and the Agricultural Bank Act, two measures which, while being an integral part of the land policy of the State, have played no unimportant part in the agricultural development of Western Australia.

The Agricultural Land Purchase Act makes provision for the repurchase by the State of lands situated within 20 miles of a railway. The amount which may be expended for the purpose (£200,000) may be taken from revenue or borrowed at 4 per cent. from Savings Bank funds.

A Board appointed under the Act must first report upon the land submitted, paying particular attention to

those points upon which resale for closer settlement is likely to depend. If the report of the Board is favourable the Minister may, with the approval of the Governor, purchase the land at the price recommended by the Board or at any lesser price.

Lands thus acquired are deemed to be Crown lands, and after survey into lots, and the setting apart of such portions as may be necessary for roads, reserves, town sites, and other purposes, are disposed of under the following conditions:—The selling price must be not less than the price paid for the land with one-tenth added. The maximum area allowed is 1,000 acres, and except in special cases no person can select land under this Act who is already the owner of more than 1,000

acres of land. The first half-year's instalment must accompany an application and on approval a lease is granted for a term of twenty years, the annual rent or instalment of purchase money being at the rate of £7 12s. for each £100 of the selling price and is payable half-yearly as under the Land Act. Within two years from the commencement of the lease the lessee is required to fence in at least one-tenth of the land contained in his lease, within five years to fence in the whole and clear and crop one-tenth, and within ten years he must expend upon the land in improvements an amount equal to the full purchase money; but if the land at the time of selection had improvements on it, the value of which was added to the selling price, the amount required to be expended is proportionately reduced.

At the expiration of the lease or at any time during its currency, provided that all the conditions of fencing

other moneys as may be provided by Parliament from time to time.

Subject to the provisions of this Act the Bank may make advances to persons engaged in the business of farming or grazing, or in agricultural, horticultural, or pastoral pursuits, to an amount not exceeding £2,000, or in any industry that the Governor may by proclamation declare to be a rural industry, for any purpose incidental to or in aid of any such business, pursuit, or industry, including the erection of a dwelling-house for the borrower on any land occupied or used by him in connection with such business, pursuit, or industry: Provided that no advance shall be made to any borrower for the purpose of any proclaimed rural industry to an amount exceeding a sum to be limited by such proclamation. Every application for an advance shall be made in the prescribed form and shall contain such particulars as may be prescribed. Where an advance is made

HAY CROP IN THE KELLERBERRIN DISTRICT.

and improvements have been complied with and maintained and the full purchase money has been paid, a Crown grant of the land is issued.

Lands within a purchased estate set apart as town or suburban lots are sold in the same manner as similar lands under the Land Act.

Under the Agricultural Bank Act the Governor is authorized to maintain a Bank for the purpose of promoting the occupation, cultivation, and improvement of the agricultural lands in the State.

The funds necessary for the carrying on of the Bank are raised by the sale of mortgage bonds and by such

for effecting improvements on the borrower's land, such advance may be made by progress payments as the improvements are being effected. If at any time, in the opinion of the Managing Trustee, any money advanced has not been applied for the purpose for which it was advanced, or has not been carefully and economically expended, he may refuse to pay any further instalment of the advance and may at once call in the whole amount already advanced, whereupon the borrower shall forthwith repay it, and in default the Bank shall have the same remedies for its recovery as are provided by this Act for recovery of sums payable by borrower.

#### THE POLICY OF PURCHASING ESTATES FOR CLOSER SETTLEMENT.

The policy of purchasing estates and subdividing same for closer settlement, which has proved a great

success, was commenced in 1898, and since that date twenty-three estates have been purchased, embracing

an area of 297,391 acres. Prior to 1912 282,515 acres were made available for selection on twenty years' terms. Of this area 261,942 acres were selected on June 30, 1911, leaving 20,391 acres unselected on that date. Out of the various estates 11,420 acres have been converted into freehold.

The financial position of these estates, as a whole, is sound, and when the estates thrown open to date are wound up there will be a substantial balance to go to consolidated revenue, which should amply repay the cost of administration, etc.

The condition of the repurchased estates fund to June 30, 1911, is stated to be as follows:—

Receipts (including sinking fund	
earnings) ... ..	£129,385 14 0
Expenditure (including interest) ... ..	58,377 11 9
<hr/>	
Balance ... ..	£71,008 2 3
Amount invested in sinking fund ... ..	£72,300 11 0

Estates are purchased, valued, inspected, etc., under the Management Board appointed according to the Agricultural Lands Purchase Act.

**THE METHODS TO BE PURSUED BY THE INTENDING SELECTOR IN THE ACQUISITION OF LAND.**

The agricultural portion of Western Australia is divided into six districts. In each district a Land Agency is established, presided over by a District Resident Surveyor and a Resident Government Land Agent, the former conducting the professional business and the latter the clerical and general business.

Applications for land, accompanied by the necessary deposit, must in all cases be lodged with the Government Land Agent in whose district the land applied for is situated.

When there is more than one application received for the same block, lodged personally or received by post on the same day, the matter is referred to the Land Board for decision as to whom the block shall be allotted.

When a subdivision is thrown open for selection the fact is intimated by a notice to that effect appearing in the *Government Gazette*, generally three weeks prior to the appointed date. Applications may be lodged on or before the appointed date, but all applications for land in that particular subdivision are treated as if received simultaneously on the appointed date.

The list of land open for selection, published in the *Government Gazette* about every fortnight, gives the names of the subdivisions open and about to be thrown open for selection, the name of the Land Agency in which the subdivisions are situated, the number of blocks available, the total acreage of same, the approximate distance from nearest railway, the approximate annual rainfall, and the purpose for which the land is suitable.

Lithographic plans may be obtained free of charge at the country Government Land Agencies and at the Head Office, Perth, showing area of blocks, classification of the various kinds of land, small locality plan, rainfall, price per acre, and the amount (if any) the Agricultural Bank is prepared to advance to an approved applicant. The working plans at the Head Office, showing the blocks selected, are corrected every day from records posted in from the country agencies. It is

obvious, therefore, that correct information to the very moment can only be obtained by a personal visit to the country offices.

An intending selector can lodge or post his application without the necessity of previous personal inspection of the land, the price of the land and the amount of loan obtainable thereon being a sure guide as to the value of the block and nature of the soil.

The necessary deposit to accompany application can be easily calculated, as the purchase money required for the first three years is only at the rate of 6d. per acre per annum, payable half-yearly, no matter what the prescribed price of the land may be. Subsequent instalments after the three years are increased when the land is priced at over 10s. per acre. In every case a lease fee of 5s. is charged for conditional purchase land. In the case of a homestead farm of 160 acres the application fee is £1, with 1s. for stamp and the prescribed survey fees when it is necessary to have a separate survey made of the 160 acres; but when the homestead farm is included in a surveyed block within a subdivision, the balance of which is selected by the same applicant, then no charge is made for survey.

An intending selector may act as agent for members of his family or any friends who may desire to secure land, or he may appoint an agent to act on behalf of himself. Where no declaration is required, and provided the necessary deposits are paid, approval notices will issue; but where a declaration is required, as in the case of a homestead farm, approval notice will not issue until the applicant has signed the documents connected therewith.

No railway concessions are granted to an intending selector when desiring to inspect the land previous to selection; after the land has been secured a selector on first taking possession of the land may obtain reductions in fares and freights for himself and his family, goods, and chattels from the Railway Department on production of a certificate from the Lands Department to the effect that he is a *bona-fide* selector.

## HISTORY OF AGRICULTURAL DEVELOPMENT.

[Contributed by W. CATTON GRASBY, F.L.S.]

To convey a clear idea of the development of agriculture in Western Australia, its present position and its future prospects, in the space available would require the powers of the mythical Æolus who confined the winds of heaven in the hide of an ox. If one attempt to give a brief summary he must of necessity omit many facts and opinions which are essential for a clear understanding of the subject. If, on the other hand, he allow himself to go into details he requires volumes, not columns. If he merely generalizes without examples, he is sure to be accused of hyperbole. If he furnish examples, he is in danger of being told that they are not typical. Not only is this so, but it must be remembered that the human mind may only grasp what experience has enabled it to comprehend. This applies equally to the philosopher, the king, the mathematician, and the man in the street. The mathematician may be bewildered over the construction of a wheelbarrow, and the ordinary, level-headed business man, who deals without hesitation in cargoes of wheat, may not understand the composition of superphosphate.

Agriculture in Western Australia at the present time may be compared to a young bird, which, after passing through all the uncertainties and vicissitudes common to the early stages of bird life, has left the nest, and in its early flights is experiencing the combined sensations of liberty and its possibilities, but not unassociated with some amount of timorous fear. Most people in dealing with the agricultural possibilities of the State forget all about the past, shut their eyes to the present difficulties, allow their imaginations full play as they talk of the wonderful future, and permit their tongues to play with millions, as though they had been all their lives accustomed to them.

I desire to avoid these faults in my present attempt to briefly review the history of agriculture in the Western State, try to summarize its present position, and endeavour to outline the future without exaggeration. It is not easy to do this, because it is hard to determine what is truth and what mere opinion. It is recorded of old that the Psalmist said in his haste "All men are liars," and it is stated of a modern Scotchman that in commenting on the Biblical statement he said "that he dinna see that David need apologize." The fact of the matter is that there are so many ways of looking at the past, the present, and the future that, never mind how much care is taken in verification, individual statements are sure to be criticized.

For the present purpose I am not concerned with the history of Western Australia except in so far as it

relates to the development of agriculture, but in order to understand the question it is necessary to remember that on June 2, 1829, Lieutenant-Governor Stirling arrived at Fremantle to establish the Swan River settlement. He brought with him regulations which, while they afforded inducements for settlement in the new colony, also laid the foundation for much of the trouble with regard to undeveloped land.

It must not be forgotten that some two years previously Captain Stirling had visited the Swan River with a view to the establishment of a settlement, and he, with Mr. Charles Fraser, the Colonial Botanist of New South Wales, formed a high opinion of the country. For example, Captain Stirling said, "In delivering my opinion on the whole of the lands seen on the banks of the Swan, I hesitate not in pronouncing it superior to any I have seen in New South Wales eastward of the Blue Mountains, not only in its local situation, but in the many existing advantages which it holds out to settlers, *viz.*—1. The evident superiority of the soil. 2. The facility with which the settlers can bring their farms into a state of culture from the open state of the country, the trees not averaging more than ten to the acre. 3. The great advantage of fresh-water springs of the best quality, and consequent permanent humidity of the soil—two advantages not existing eastward of the Blue Mountains. 4. The advantages of water carriage to their own doors, and the non-existence of impediments to land-carriage."

The above quotation is specially worthy of note in view of the present problem of clearing and the fact that agriculture languished in Western Australia up to within the last fifteen or twenty years. It will be noticed that special reference was made to the superiority of the soil, as well as the "open state of the country," and it was this and similar reports, together with the wonderfully liberal terms offered to intending settlers, that induced the admittedly fine class of men and women to come out to the Swan River in the early days. Many of these came with every intention of being genuine settlers, and not a few remained, but many others had for their sole object the securing of large areas of the highly praised lands of the new colony for speculative purposes. The fact of the matter appears to be that the report referred to the alluvial flats along the Swan River and the good, open country around what is now Guildford and the Middle Swan. The nature of the sandy forest and scrub farther back appears to have escaped notice.

The Home Government, in order to induce settlers

with means to come to Western Australia, promised that all persons arriving before the end of the year 1830 should receive grants of land free of quit rent in proportion to the capital introduced by them to be invested in the improvement of the land. Colonists were given an acre of land for each 1s. 6d. in money, stock of every description, implements of husbandry, and other articles necessary for the establishment of the settler on the land, and also up to the amount of any half-pay or pension received from the Government. They were also to receive 200 acres for each servant brought out, including their wives and children over ten years of age. One-fourth of the land granted was to be cultivated or otherwise improved or reclaimed from its wild state within three years, or it was to be liable to a tax of 6d. per acre, and should the land at the end of seven years still remain unimproved it was to revert absolutely to the Crown. These provisions look both liberal and wise on paper. The valuation of the assets of the early colonists appears to have been made in an equally liberal spirit, but the improvement conditions were never enforced.

This offer and the favourable report induced many people to come to the colony and secure extensive tracts of land for purely speculative purposes. The result was that all the best land was very quickly taken up, so that five months after the first settlement the only land available was at that time practically inaccessible. The owners in many cases left the colony without making any attempt at improvement, and some of these early grants still remain almost in their original condition. It was soon found that the early expectations with regard to the fertility of the land could not be realized, and it is recorded that "sheep and cattle went blind or dropped dead in a mysterious way from eating poisoned plants, the nature of which was entirely unknown." It is not a matter for congratulation that after eighty years our ignorance on this matter is still nearly as profound.

It is stated by the Government Statistician that up to December 31, 1830, 1,767 persons arrived in the colony with the following stock:—Horses, 101; cattle, 583; sheep, 7,981; pigs, 66; goats, 36; besides various poultry; but it was only in select spots of limited area that the settlers could make any headway in bringing the land under cultivation and increasing their flocks and herds. Thus it was that the settlers became very widely distributed, each little settlement on a fertile spot being separated from its neighbours by weary miles of forest, scrub, and sand. There was no stretch of virgin, fertile land near the coast and near the centre of government on which pioneer agriculture could progress as it did in South Australia. The wide extent of salmon-gum country which is now becoming the finest wheat and sheep-farming belt of Australia remained

unknown, or at least unappreciated, for nearly seventy years.

South of Perth, in the coastal region, there were limited areas of open fertile land on the banks of the rivers, comparatively free from timber and richly grassed, fully answering the description of Captain Stirling. These were all secured by the early settlers, Governor Stirling himself obtaining large blocks of the best. These were necessarily devoted almost entirely to the raising of cattle, sheep being found in those days unsuitable for the pioneering conditions. The area brought under cultivation was comparatively small, and confined to the growth of wheat and other cereals for food for the settlers and their stock. The difficulties of transit were so great that it was impossible to transport produce. The fact that the Swan River was navigable by boats for a considerable distance, added to the fact that there was a considerable area of good agricultural land adjacent to its banks in the neighbourhood of Guildford, led to that being practically the first agricultural area of the colony.

Governor Stirling himself appears to have thoroughly appreciated the soil of Guildford, and showed his opinion in a practical way by securing a large area of land there, on which in 1831 he built a vice-regal residence on the bank of the Swan, a little above the present Woodbridge House. Here are to be seen almond-, olive-, and fig-trees planted in the very early days of the settlement. As the settlers travelled over the range they quickly picked out the fertile valley of the Avon at York, Northam, Beverley, and Toodyay, and these thus very soon became important, though small, settlements. In the same way the fertile lands of Gingin and Yatheroo were selected for stock purposes by enterprising pioneers like the late Mr. Walter Padbury; while the alluvial flats of the Greenough formed one of the first important grain-growing centres of the State.

There were a number of well-educated, enterprising men and equally sterling women accustomed to the comforts of cultured English society among the early settlers of this State, and it is not hard for us to realize the enormous difficulties with which they had to contend. Even to-day Western Australia is a State of magnificent distances and scattered settlement, but our railway system, our roads, and bridges have wonderfully altered conditions of travel. The isolation of the early days must have been terrible. It must be understood, and is more or less definitely stated in the early records, that the report of Captain Stirling and Mr. Fraser was based upon an examination, during the favourable time of the year, of the extensive alluvial flats on the banks of the Swan River. We know now how very disappointing these flats have been, and the early settlers were not long in finding that they were subject to flood in the winter

months, and not as well suited for agricultural purposes as had been imagined.

The first settlers very quickly started cultivation operations, for it is recorded as a matter worthy of note in the official Year-Book that in 1831 an agricultural society was organized in Perth, and that in the September of the same year a party of settlers explored the country in the vicinity of the present town of York. In this year 160 acres of wheat were reaped, there being altogether 200 acres of land under cultivation in the colony, the labour being mostly done by hand. Although the date is uncertain, it must have been somewhere about this time that Mr. G. F. Moore records that wheat was 40s. a bushel, flour 10d. a lb., butter (when it could be procured) 1s. 10d. a lb., and eggs 5s. a doz.

In the next year, 1832, the first vineyard was established at Hamilton Hill by Mr. McFaul, who obtained his vines from the Cape, where most of the fruit-trees planted during the early days were also obtained. As the town site of Northam was surveyed in 1832 we may consider that agriculture was established in that centre at about this time. Considering the difficulties agriculture must have made fairly rapid progress, because it

is recorded that on November 6, 1834, the first cattle show and fair was held at Guildford under the auspices of the agricultural society established three and a half years previously. During the same year the first shipment of wool, consisting of 7,585 lb. (equivalent to eighteen or nineteen bales) was forwarded to England. The town of York was established in 1835, and during this year the assessment was made of the value of land and of the improvements of the colony with a number of livestock, the total value representing nearly a quarter of a million sterling. About 1,800 acres were under crop, and fifty bales of wool were sent to London. By 1840 the production had so increased that a ship laden wholly with colonial produce left Fremantle for London, and four years later the first shipment of horses, bred in the colony, was forwarded to India.

No account of the agricultural development of

Western Australia would be complete without reference to the export of sandalwood, which for many years played an important part in providing occupation and income for the early settlers. This industry may be said to have started in 1845, when the first shipment was sent away, and two years later the export trade of guano from the Abrolhos Islands was initiated.

Reference has already been made to the trouble caused by floods on the low-lying lands of the Swan in the very early days of the colony, and in July and August of 1847 it is recorded that exceptionally heavy rains caused floods which did a great deal of damage to gardens and growing grain on the Swan, the Avon, and other rivers in the south-western districts. In June and July of 1862 another noteworthy flood occurred, the Swan rising to such an extent that Mount Bay Road was 2 ft. under water, and all the gardens and low lands along the

Swan were submerged. The loss this year by means of floods was estimated at over £30,000. The record flood of the Swan is, however, believed to be that of 1872. The year 1862 is noteworthy from an agricultural point of view owing to the fact that a small consignment of cotton, grown in the locality of Geraldton, was

CHAFFCUTTING AT PINJARRA.

sent to England and the first export of flour from Western Australia took place. It was about this time that the pearling industry began, for it is recorded that in 1862 shells valued at £250 were exported.

Up to this time settlement had been entirely confined to the south-western portions of the State, extending from Albany to somewhat north of Geraldton, but the year 1863 is specially noteworthy because in this year for the first time settlement in the north-western district was undertaken by the late Mr. Walter Padbury, together with Messrs. Wellard, Withnell, and others, and in 1864 the first shipment of wool from the north-west, consisting of seven bales, arrived at Fremantle. These dates are taken from the statistician's Year-Book.

Mention has been made of the early settlement for agricultural purposes of the fertile lands of the Greenough and other parts of the Victoria district. In

1868 it is recorded that an area of 13,895 acres was under crop in this portion of the State, but owing to rust it proved an almost total failure. This is practically the only record of any severe loss from rust in Western Australia, but it is a coincidence that this should have happened a few years after the great rusty year of South Australia, when the crops of that State were almost entirely ruined by the disease. Notwithstanding this loss of the crops in the Victoria district, 13,000 bushels of wheat and 1,163 tons of flour were exported from the State in the year under notice.

As the Victoria district, or rather that part of it known as the Greenough and Dongarra Flats, was at one time known as the granary of the State, and was also the largest source of the beef supply, special reference should be made to the story of its development. The information here given has been largely obtained from Mr. Hugh Hamersley (of the "Wells" Station, Walkaway), Mrs. Maley, sen. (formerly of Greenough and now of Three Springs), Mr. Wm. Clarkson (of Dongarra), Messrs. S. F. Moore, M.L.A., and Josiah Waldeck, and Miss Mary Duncan.

Away back in the early history of the State several old colonists formed what was known as "The Company," for carrying on pastoral operations on the fertile Greenough and Irwin flats. The members of the firm of Edward Hamersley & Co. were the late Messrs. Edward Hamersley, Samuel Pole Phillips, and Lockyer Clare Burges. These men commenced operations in the early forties, devoting their attention to the raising of cattle. The more one sees of the land first selected the more convinced he becomes that the judgment of the early settlers with regard to the best land of the State was seldom at fault. The Victoria district on the whole still maintains the reputation it earned seventy years ago for providing fattening pasture. Two factors are responsible for this. The first is the climate and the second is the soil. When it is remembered that tomatoes will fruit the whole year round in this district, the difference in climate between there and the neighbourhood of, say, Northam, is clearly seen without making reflections upon the latter locality. It is recognized all over Australia, and indeed in every part of the world, that climate alone exercises a very considerable influence upon the nutritive value of pasture, and it is only in accordance with this law that the grass in the Victoria district should possess very high feeding value and great fattening qualities.

Apart from this we have the fact that the soil conditions of the lower valleys of the Irwin and Greenough are exceptionally good. These watercourses drain large areas of the Yalgoo and Victoria districts, and during countless ages and when the climate was probably considerably different from what it is now, they washed accumulated fertility from the surface of thousands of square miles of country and deposited the spoils on what

are now known as the Dongarra and Greenough flats. These alluvial soils vary in character from a stiff silt to a light loam, and like all soils of similar origin and character they are marvellously fertile. This is not only shown by the luxuriant growth of grass and other herbage, but by the fact that for over forty years crops of grain were continually grown under very primitive systems of farming without the use of any manure or fertilizer. There is no district of the State wherein there is a greater area of equally fertile soil, and Messrs. Hamersley, Phillips, and the brothers Burges recognized the fact and profited by it. They reared thousands of cattle, and when, in the fifties, the Home Government, after years of agitation, acceded to the request of the settlers and used Western Australia as a place to send select good-conduct prisoners, together with a number of soldiers, "The Company" secured the contract for the supply of beef to the Imperial Government. The headquarters of the Company were at "Irwin House," now owned by Mr. Irwin Burges, and here that old identity and pioneer of the district, Mr. Lockyer Burges, of many traditions and stories, held his court and combined a wonderful shrewdness, common sense, and religious conviction with a marvellous conscious and unconscious Irish humour. It is of him it is recorded that on one of his exploring trips he entered in his diary, "Crossed a magnificent river with a dry bed."

The land was held as pastoral country, but was available for selection as freehold under the then land laws. Mr. Wm. Cousins, about the year 1850 or 1851, settled at what is now known as Old Walkaway, on the bank of the Greenough and quite near to the Greenough Show Ground. Mr. Cousins sowed a small field of wheat, but as Mrs. Maley says, the seed was sown very late, and as little rain fell afterwards it was a failure, only growing from six to nine inches high. At all events, it was not good enough to attempt to harvest, and Mr. Cousins left the district. In the following year Mr. Lockyer Burges happened to pass that way in the course of his work on the station, and to his surprise found a "magnificent crop" of self-sown wheat and took samples with him, and published the news far and wide. The result was that public attention was drawn to the suitability of the Greenough flats for wheat-growing, and settlement began to take place.

In those days it was the custom of the Home Government to grant what were called remission tickets to soldiers and others which entitled the holders to Crown grants to the number of acres of land mentioned on the ticket. Hamersley & Co. purchased as many as possible of these resumption tickets and applied them to the acquisition of large areas of the Greenough and Irwin flats. They also purchased additional land for cash. It is stated they had to supply 10,000 persons and soldiers with beef at 5d. a pound, and that in one year

they received £13,000 for beef from the British Government. The cattle were raised on the Irwin and Greenough and driven down the old coast road to Perth and Fremantle. In this way they secured the magnificent holdings now owned by descendants of the original members of "The Company," but round Greenough and Dongarra hundreds of men settled on small holdings, and in a comparatively short time the Greenough and Irwin became the granary of the colony. The ruined stone cottages bear witness to the fact that in the old days the district supported a large population, and all harvest operations were done by hand labour. Mrs. Maley states that her father, the late Mr. Frederick Waldeck, settled in Greenough in 1858, but he had held land there, and the male members of the family had gone backwards and forwards from Fremantle, for some years before. Mr. Josiah Waldeck, the youngest son, now lives in the old home.

Mr. S. F. Moore went to live at Dongarra in 1868, at which time a large portion of the flats was under wheat, which was shipped from the old jetty at Dongarra to Fremantle. One day, when on a hill overlooking the magnificent crops on the flats, he noticed a peculiar reddish appearance in a field to the south-east. He drew the attention of a companion to the occurrence, but it was not for several days that the reason was discovered. Day by day the reddish appearance of the crops spread, and in less than ten days almost the whole of the wheat in the district was ruined with red rust, which spread in the direction of the prevailing winds. He cannot remember the exact date, but is sure that it was in the early part of October, 1868. The disease seemed to start in the south-eastern portion of the flats, and it swept right through, causing ruin wherever it went. August and September had been wet and warm, but it was a magnificent growing season. This red rust outbreak caused the ruin of many farmers. The Government of the day had to come to the assistance of the settlers and provide work for them in order that they might live. It was during this time that scores of farmers were employed in carting broom-bush to Geraldton and spreading it over the sand-hills, which had commenced to drift, and but for this it is probable that the whole town would have been buried. It is a curious fact that no serious harm has been done by red rust since this one severe outbreak.

One point further should be mentioned, and that is, this first crop of wheat grown on the Greenough most clearly teaches a lesson, which seventy years of experience has fully confirmed and accentuated. In order to ensure success in wheat-growing in the northern and eastern districts of Western Australia the seed must be sown early. Mr. Cousins sowed late and his crop failed, but it produced enough seed, which Nature sowed during the summer ready for the first rains the following season,

and without any kind of cultivation or attention produced a crop which led to the settlement of the district. This same fact was realized in the very early days by the farmers in the York district who placed this as well as other important agricultural facts on record in the minutes of the local agricultural society, the second oldest in the State.

The early settlers of Western Australia have often been reproached by the people of the Eastern States on account of the slow progress made by the development of the colony during the first fifty years of its existence. The fact is not disputed, but the reflection is not just and can only be made in the absence of a proper conception of the real condition. As a matter of actual fact the early settlers in no State of the Commonwealth were of higher type, as judged by their up-bringing, their enterprize, and their moral fibre, than were the early colonists of Western Australia, and no State produced a finer lot of enterprizing, self-denying, and successful explorers. This statement is correct whether we judge by the difficulties which they had to encounter or the results achieved by the more notable among them. It is quite easy to understand why the colony did not progress faster, and a consideration of the facts does not reflect discredit upon the colonists, although this statement necessitates the candid admission that the natural disadvantages for the successful settlement of agricultural people were greater than they were in any of the other States.

The natural disadvantages which retarded progress and thus conserved the country until the end of the nineteenth century may be summarized as:—

1. The extent of sand covered with forest between the Darling Range and the sea.
2. The low-lying character and water-logged condition in winter of other large areas, together with the denseness of the timber and the prevalence of scrub and harsh, worthless vegetation.
3. The relatively small areas of rich soil which could be readily brought under the plough.
4. The poverty of the soil, of the dryer lands, in organic matter and phosphoric acid, and the difficulty and cost of draining the peaty swamps.
5. The enormous difficulties of transit from the coast across the twenty miles of sandy country to the range, the equally great difficulties of transit over this escarpment of tableland, and the expense of road-making on account of the absence of road-making materials.
6. The general absence of natural nutritious fodders, together with the presence of a remarkable series of plants directly poisonous or injurious to stock. The importance of this can hardly be over-estimated, and it would appear that an altogether unwise policy has been adopted in failing to recognize this factor. The absence of a determined attempt to investigate the

nature of the poisonous plants and the means by which either the effect of the poison could be overcome or the plants themselves eradicated, must also be noted with regret. While we still know comparatively little about the real nature of these poisonous plants, our settlers have learned a great deal about them in a practical way and they no longer serve as a bar to the use of the land which they formerly did. We have tens of thousands of acres which for over half a century remained absolutely useless, now carrying sheep, horses, and cattle with safety.

7. Another cause of the slow development in the eastern districts was the absence of surface water. It is a curious fact that although the country in its natural condition is so heavily timbered and has a remarkably regular rainfall, surface water even in the rainy season is scarce. We are now finding that conservation is comparatively simple, and that ringbarking and clearing the timber changes the country, in this respect, in a most remarkable way. The early pioneer who drove his sheep out to the eastern forest country, which is now becoming a vast cornfield interlaced with railways and studded with bustling towns, found three difficulties which prevented him making the progress which quickly raised the pioneer sheep men in the eastern colonies to positions of wealth. These difficulties were the absence of grass in the timbered country, the presence of poisoned weeds which caused his sheep to die, and the absence of water in those places where the other two draw-backs were more or less absent. That Western Australian settlers were not lacking in enterprise is shown by the persistent attempts at settlement and by the development of the north-west. Surely of no portion of the Eastern States could a more thrilling story be told than of the energy, the enterprise, the hardship, and the successful hard work of the pioneers of this, the great pastoral part of Western Australia.

The first Ministry under responsible government, with John Forrest (now Sir John) as Premier, assumed office on December 29, 1890, and from about this time the progressive development of Western Australia may be said to date, although it really began a few years before. With the change of the form of government was initiated a bold policy of development by means of borrowed money. This in itself caused an increase of population from the eastern portions of Australia and other parts of the world. The close relationship of the mineral to the agricultural industry, however, must be clearly acknowledged. It was in 1887 that gold quartz was found in the Yilgarn, Golden Valley, and Southern Cross districts. In the previous year, 1886, the railway was formally opened as far as Beverley, and in 1889 the land grant railway from Albany to Beverley was opened. This reference to history is necessary in order to show that the adoption of responsible government was only

one phase of a period of general activity in the development of the colony; the events mentioned having a direct relation to agriculture in two ways. In the first place the development of the mines, the making of railways, and the construction of the public works, such as the Perth water-works, which date from this time, led to the employment of labour, which required to be fed, and at the same time the railways themselves opened up the agricultural lands and provided facilities for the marketing of produce. Following the discoveries of gold at Southern Cross we have in rapid succession similar discoveries on the Murchison, at Coolgardie, Kalgoorlie, and numerous other places, the names of which have become world-famed.

Among the men who flocked to Western Australia from all parts of the world in the "roaring nineties" was a considerable proportion of agriculturists from the Eastern States. Many, either disappointed in their attempts to obtain gold or in some cases without ever attempting to reach the goldfields, quickly realized that farming, gardening, and fruit-growing were likely to prove more reliable sources of money-making than prospecting. These men had experience, they knew the work, and they were quick to realize the suitability of much of the land for agricultural purposes when produce was at famine prices. The gold discoveries were at the bottom of the development, but it was the experience which these men had had which enabled them to realize the value of the York gum, jam, salmon-gum, and other eastern lands. In the first place, however, they almost invariably picked upon either the red diorite soils covered with York gum and jam, or the soils as nearly related to them as possible.

The salmon-gum lands remained unappreciated for some years. Indeed, it may be said that it was the introduction of superphosphate which rendered available for agricultural purposes the millions of acres of salmon-gum forest in Western Australia. At first the cost of clearing was high, but hay, oats, and wheat realized proportionate prices. The old hands, of course, condemned, or at least shook their heads when these eastern men took to farming on land which seemed to them from their experience altogether unfit, and it is interesting and not a little amusing to recall the bitter controversy over the value of Western Australian agricultural lands. As men became disappointed with mining they turned their attention to farming, and progress, at first slow, became more and more rapid. Still the controversy continued, and when settlers went out as far as Meckering they were told that they were going out to a desert to starve, and each step further eastward, northward, and southward has been condemned in the same way.

We are not yet in a position to finally decide what is the eastern limit for safe farming. Controversy on

this question is perfectly futile, and the most that can be said is that the Government should not seek to tempt settlers to go beyond what are known to be safe limits.

One of the points upon which there has been a most violent controversy is the relative value of the different types of land. It is now recognized that the first settlers, although absolutely right in their high estimation with regard to rich diorite soils, were equally wrong in their under-valuing of the now recognized valuable salmon-gum and gimlet forests. Even yet we do not properly appreciate the scrub and heath lands, often very erroneously known as sand plains. This is not surprising, because there is only one standard by which the value of land may be judged, and that is what it will produce for a considerable number of years. The new settler, as a rule, does not farm. Virgin land has the

This has been the case in every State in the Commonwealth, in the United States, and in Canada, and it is going on in Western Australia to-day; but the comparative poverty of Western Australian land in phosphoric acid is, curiously enough, the factor which is making the Western Australian settler the most progressive pioneer farmer to be found in any part of the world. This very deficiency of phosphoric acid has, from the beginning, taught him to recognize something of the rudiments of scientific agriculture, and he is showing a desire and an aptitude which promises well for the future.

The area under wheat, barley, and oats during 1912 is estimated by the Government Statistician to have been 1,147,206 acres, made up as follows:—Wheat for grain and hay, 960,349 acres; oats, 180,287 acres; barley, 6,570 acres. The returns show an average of over

Photo by C. E. Farr.

HARVESTING ON MR. R. CAMERER'S FARM, TOODYAY DISTRICT.

accumulated fertility of hundreds, if not thousands, of years. The farmer settler proceeds to crop his farm, and in the most wasteful manner withdraw from it accumulated fertility in the form of wheat and hay.

11·6 bushels of wheat to the acre and a total yield of over 9,125,245 bushels and 243,171 tons of hay. Of oats the estimated production is 2,102,465 bushels, or an average of 16½ bushels per acre, together with 56,606 tons of hay.

#### THE WHEAT AREAS.

Neither the extent nor the limitations of the wheat lands of Western Australia are at present known with any degree of definiteness. It is only a few years since Grass Valley, a few miles east of Northam, was considered the eastern limit of the wheat-growing country, and the settlers from South Australia who selected land at Meckering were told that they were tempting Providence and were going out in the salmon-gum forest to starve. They have proved the fallacy of the old ideas about Western Australian soil, and Providence has showered bountiful harvests on all who have complied with her demands for good farming. The warnings of

failure were repeated as men went further east and settled at Cunderdin, Tammin, Kellerberrin, Nangeenin, and Merredin; and although that district seems at present to be the limit of safety time alone will tell whether wheat-growing can be carried on with reasonable assurance of profit further inland. All that can be said with confidence is that it appears to be a wise policy to wait until we know more of the rainfall before settling the lands eastward of Merredin. There is no question as to the richness of the soil, neither is there any doubt about there being ample rain during many of the years since records have been kept. The one uncertain point

is the proportions of good and unreliable seasons.

Allowing Merredin as the eastern known safe limit we have a stretch of proved wheat country over a hundred miles in width, which broadens as we go south for nearly 200 miles and decreases in width for nearly 300 miles northward. It is perfectly safe to say that the proved wheat belt comprises over 30,000,000 acres without considering the Esperance and similar country which are yet unproved, although considered by many to be far more reliable than much of the land being opened up by railways in South Australia, Victoria, and New South Wales.

Much of the thirty-odd million acres being yet unsurveyed, and much more not actually proved, it is impossible to do more than estimate the acreage suited for profitable wheat-growing. We do know that vast areas, which only five or six years since were looked upon as "third class" and useless for wheat, are now proved to be as valuable for this purpose as what was then considered "first class." We have also to remember that the water-supply problem is not yet solved in some localities, although it is not more difficult than in other States, and the experience of the past two years has shown that it is very unwise to be too pessimistic even under the apparently most unfavourable conditions.

Allowing for everything, it does not appear to be unreasonably optimistic to estimate that we may expect to have at least 15,000,000 acres of land cultivated as wheat farms within a comparatively few years. If we further allow that the farmers will by that time have adopted the three years rotation of wheat, sheep, and fallow, it will give us an area of 5,000,000 acres under wheat each year. Considering our climatic conditions, we should have an average of 15 bushels, but if we again make liberal allowances and put it down at 10 bushels, which is less than our past general average, we have to look forward to an annual production in the near future of 50,000,000 bushels of wheat. This is equal to twice the average production of South Australia or Victoria. It may seem a bold thing to say, but there appears to be no reasonable doubt that Western Australia, which only a few years ago did not produce enough for her own consumption and was considered to be incapable of doing so, will in the near future export more wheat than has been shipped in any past year by South Australia and Victoria combined.

In this connection it may be worth recalling that in 1904 the writer of these notes, in the course of a report to the then Government on the agricultural possibilities of the State, expressed the opinion that although the production then was not equal to the consumption it would reach 10,000,000 bushels within ten years. The idea was ridiculed, not only in the Press of the Eastern States but in this State as well. The forecast was spoken

of as "optimism run mad," but the final returns for 1912, as stated on page 139, show that, in spite of the unfavourable season in some districts, the predicted total has been nearly reached with two seasons to the good. The following figures show the development of wheat-growing in the State:—

Year.	Area under wheat.	Yield.	Average.
1890 ...	33,820	467,389	13·8
1893 ...	42,673	520,198	12·2
1898 ...	75,032	870,909	11·6
1900 ...	74,308	774,653	10·4
1902 ...	92,398	985,559	10·7
1904 ...	183,080	2,013,237	11·1
1906 ...	250,283	2,758,567	11·0
1908 ...	258,011	2,460,823	8·6
1910 ...	581,862	5,897,540	10·1
1912 ...	786,183	9,125,245	11·6

The geological origin of the soils over the greater portion of the wheat belt would not lead one to expect them to be rich, and actual examination and analysis proves the correctness of the conclusion. They are, as a rule, derived from the decomposition of granite, broken fairly frequently by dioritic dykes. The granite soils are light and gritty, the dioritic strong, rich clays and loams. Mere richness in plant food, or put in another way, the chemical composition of a soil is only one factor in fertility. It is an unfortunate fact that millions of acres of the richest soils of Australia and the rest of the world are barren because other factors in the complex problem of fertility are absent. The average soils of the wheat belt are not rich, and when we consider that the value of the land for wheat growing remained undiscovered for between two and three generations we need feel no surprise when the newcomer misjudges it.

Judged by chemical analysis much of the land is poor; valued by the returns it gives it is good. To harmonize these two undoubted contradictory facts we must consider other factors in soil fertility. These are:—

(1.) The physical properties, *i.e.*, the ease with which the soil can be worked, its capacity to receive, hold, and part with moisture to the crop, and the opportunity it offers the plant for root development. The chemically poor soils of the State are rich in this connection.

(2.) The climatic conditions. Judged from this point of view the south-west of this State is peculiar, but from the wheat-grower's point of view very fortunate. The outstanding feature is the wonderful regularity in the seasons. The rainy season, which usually starts in April, is associated with the movements of the Antarctic "lows" which pass along the southern coast of Australia and continue until October. During these

seven months an average of about 90 per cent. of the total fall is recorded. The remaining five months, from November to March, may be considered from an agricultural point of view to be rainless. The rains which do occasionally occur in summer are irregular and uncertain, and are only of value to the farmer in providing a supply of rain water. It is owing to this fact that country with an average rainfall of 10 in. can be relied upon to receive sufficient rain during the growing

period to produce payable crops on fallow land, except in occasional years when the distribution is not normal. This distribution of the rainfall renders it quite impracticable to grow summer crops without irrigation, except on very limited patches. Even in those districts where the rainfall is 35 in. and over maize and lucerne cannot be grown as staple crops, and green grass in summer is confined to limited moist patches.

### FRUIT GROWING.

In considering the fruit-growing industry of Western Australia, it is important to remember that, although it is over eighty years since the first settlement took place, for over half a century the homesteads were far apart and the population limited so that markets did not exist to enable fruit-growing to be carried on on an extensive scale. Round all the old homesteads, however, fruit trees were planted, so that when the new era began about twenty years ago plenty of evidence was to be found proving the suitability of the different districts for various classes of fruit. There are at the present time abundant examples of apple, pear, fig, olive, orange, and even apricot and plum trees which are known to be from forty to seventy years old. The varieties are not as a rule good, and the trees have in most cases been allowed to take care of themselves; but in spite of lack of cultivation, absence of manuring, and no attention to pruning the trees are healthy, vigorous, and productive. In considering the suitability of Western Australia for fruit-growing the evidence of these trees is of the utmost value. Unfortunately, when the great influx of population following the discovery of gold took place and men from other parts of the world started to plant orchards, they did not pay sufficient attention to the lessons which they might have learned from these old home gardens. The result has been an enormous waste of money, much misdirected effort, and in many cases false impressions. In one sense the fruit industry of Western Australia did not develop—it sprang into life as part of the hurly-burly of the "roaring nineties," and to this fact is due most of its peculiarities. As an industry it has not yet passed through many of the ordeals which those familiar with the Eastern States remember so well. According to statistics, the State ranks next to Tasmania in acreage under fruit trees per 1,000 of the population, there being nearly 60 acres of fruit trees for every 1,000 people as against over 100 acres in Tasmania. Before the discovery of gold, Messrs. Charles Harper and F. H. Piesse, as well as other progressive men, were planting and urging others to plant commercial orchards, while Mr. Allnutt, of Bridgetown, had a large orchard

in bearing, and at once reaped the profits of his enterprise. As has been mentioned, every home had its fruit garden, but the varieties were mostly obsolete, the original trees having been brought from the Cape or elsewhere in the early days of settlement. The total area under trees was given at about 1,800 acres, but it is probable that a good many of these acres had only a few scattered old trees.

With the influx of population fruit quickly reached famine prices, and the fortunate possessors of even poor-quality old trees found that these were almost as good as gold mines. Fruit which had been unsaleable readily brought from 6d. to 1s. per lb. in the orchard. Apple trees known to exist around old deserted homesteads were sought out and given a certain amount of care. A few miles from Albany, on the King River, for example, two old neglected apple trees produced 16 cwt. of apples which were sold at 9d. per lb. on the trees. Cherries were sold in the shops of Perth at a penny each, and anything in the shape of fruit found a profitable market. With the high prices ruling men rushed into fruit-growing here, there, and everywhere. There was not much experience to guide them, and they entirely neglected what there was. In justification of their now apparently absurd procedure it must be mentioned that the development of agriculture in this State has always been a series of surprises. This applies to every branch of the industry and not least to fruit-growing. The knowing ones, or those who thought they knew, were often no more right than the novice who did not know pears from apples. Anything in the name of a fruit tree was good enough to plant, and it is no matter for wonder that speculating men bought up all the rubbish from the Eastern nurseries, shipped them to Western Australia, and sold them at high prices—seedlings, suckers, stunted, and diseased stuff all came along and were labelled to suit the customers. If all the trees which have been planted since 1890 had grown and thriven, it is safe to say that the industry in Western Australia at the present time would hardly be exceeded by any State in the Commonwealth.

Another fact must be mentioned here. In the

regulations under the Land Act certain conditions of improvement were insisted upon, and among these was a provision to encourage the planting of vineyards and orchards. It did not take people long to discover that the planting of an acre or two of vines or fruit trees was the cheapest and quickest method of complying with the improved conditions, but the trees having been planted and inspected there was no further obligation to attend to them, and it is a matter of regret that in some cases the same trees and vines did duty on several different properties. These facts are mentioned in order to account for the apparently contradictory fact that although the area under orchards is now approaching 20,000 acres the production is not anything like what might be expected from such an area. It may be worth while to summarize some of the causes of failure:—

1. Many have gone into the fruit-growing without understanding the business or having any aptitude for it.

2. Orchards have been planted in unsuitable localities or in unsuitable, badly-prepared land.

3. Tens of thousands of trees have been planted which should have been burned, being in many cases unworked or worked suckers, worthless varieties, untrue to name, badly grown, or injured beyond recovery in transit.

4. Hundreds of orchards have been planted as a cheap way of complying with the improvement conditions of the Lands Department, in some cases with no intention of attempting to make them profit-bearing. In other instances they still remain and are given in the returns, but are not and can never be profitable.

5. Orchards have been planted by city men who have, or at least had, extravagant ideas of the profits to be made and insufficient knowledge of the cost, trouble, risks, and time necessary to make a profit-producing orchard.

6. Many orchards have proved unprofitable on account of neglect and because owners try to grow hay in them, though as a rule the orchards of this State are as well kept as in any other.

7. Some of the best-cared-for orchards have proved unprofitable because of the absurd but prevalent ideas on pruning. The owners cut off the fruit-bearing wood and generally butcher the trees and wonder why they do not bear.

8. Growers persist, in spite of advice to the contrary, in planting the trees they fancy instead of those that are suited to their conditions. They plant oranges in pear country, apples on orange land, fruit trees where they should grow fodder, apricots on land which would pay better under pine trees for cases, and apples where jarrah is the only known suitable and profitable crop.

9. Some orchards are unprofitable for lack of capital, and others because the owners have fertilized their land

with sovereigns at the rate of hundreds to the acre and the crop of interest has exceeded that of fruit.

In spite of all drawbacks, however, the fruit-growing industry has steadily progressed, and the export of apples this year will probably be somewhere about 75,000 bushels, while the quality is recognized to be on the whole superior to that of any of the other States. This superiority is due not only to the actual suitability of Western Australia for growing first-class fruit, but largely to the great care exercised in grading, packing, and transport. It may be safely said without any qualification that where the right type of men have gone into fruit-growing in the right localities, and have planted the varieties suited for their conditions, nowhere in the world has a higher average of success been obtained and a greater individual profit reaped.

#### Fruit Zones.

Each class of fruit has its own special requirements. It is not our present purpose to consider fruit-growing as a recreation or for home purposes, but as an industry wherein it is essential that fruit may be grown on a large scale of first-class quality and at such cost as will enable it to compete with other fruit-growing countries. Fruit may be classed in various ways, but perhaps the best method is to consider it in relation to climatic conditions, and while doing this we may also discuss the fruit zones or sections of the State suitable for each class as follow:—

1. The tropical fruit zone in which the most prominent are the pineapple, banana, mango, coconut, etc. These may all be grown in the tropical portions of Western Australia; but the time is not yet ripe for the development of a tropical fruit industry.

2. The sub-tropical and mild temperate fruits, including the various members of the citrus family, the olive, guava, loquat, fig, vine, mulberry, almond, apricot, peach, Japanese plum, persimmon, passion fruit, Cape gooseberry, etc. Of these it will be remembered that some are evergreens, and these as a rule require a milder and warmer climate than those of the other section which are deciduous and lose their leaves during the cold weather. There is a very large area of Western Australia suitable for these fruits. Oranges, for example, may be grown with complete success in suitable soils from the Murchison River along the coastal district as far south as Bunbury, and the zone also includes the sheltered valleys in the hills and various suitable localities considerably inland. It is, of course, clearly understood that the particular varieties of fruit should only be planted in soils specially suited for their various requirements. These will be referred to in the various headings later.

3. The cool temperate fruits include the apple, pear, European plum, quince, cherry, walnut, chestnut,

raspberry, blackberry, red and black currants, gooseberries, strawberries, filberts, and so forth. Some of these can only be grown in special positions in the extreme south-west and in the Albany district, but apples and pears have a very wide range, suitable country being found in the hills east of Perth and from there southward to the Southern Ocean.

#### Oranges and Lemons.

It is well known that there are special adaptations of fruit to soils or of soils to different kinds of fruit, and the secret of commercial fruit-growing to a very large extent depends upon paying attention to this, the first consideration. In Western Australia as elsewhere there is no large consecutive area of many thousands of acres on which the settler can be recommended to grow oranges as a commercial proposition. They can be

vigorous, healthy trees. Sometimes, however, at the end of the dry period, some trees will be found to exhibit signs of lack of moisture, and when a heavy crop of fruit is to be matured a limited amount of water applied in January, February, and March is found to promote the growth of the tree and result in much finer growth. Too much water, however, is worse than none at all.

The most suitable land for orange growing is found on the well-drained alluvial river flats, and on some of these at Gingin, Pinjarra, Armadale, the Serpentine, the Harvey, etc., orange trees may be seen which are thoroughly healthy, vigorous, and profitable although from forty to fifty years old. Anyone seeking land for the establishment of an orangery should not consider the price per acre so much as the thorough suitability of the soil.

MR. G. H. PALMATEER'S ORCHARD AT HEIDELBERG.

grown, but for complete success the intending grower should seek for an area of well-drained, deep loamy soil, not subject to alternate conditions of excessive wet and lack of moisture. Considering our long, dry summer he should also endeavour to select a situation where he will be able to give the trees a little artificial watering during the dry summer months. Let it be here clearly stated that in the southern portion of the State below Perth the rainfall is such that irrigation in the sense understood at Mildura and Renmark, for example, is not only unnecessary but would be positively injurious. Up to the present time no large orangery has received regular watering, and yet at the end of March each year, when practically no rain has fallen for five months, the trees will be found to present that dark-green colour accompanied with young growth which indicates

The total area under oranges in Western Australia now runs into several thousand acres, there being some 1,200 acres within two or three miles' radius of the Harvey Station on the Bunbury railway.

#### Apple Country.

It may be laid down as a fairly definite working rule that if the climatic conditions are thoroughly suited for orange-growing they will not be equally adapted for apples, and similarly where the climatic conditions are suitable for apples, although the orange may be grown, it will not possess the quality of first-class fruit. The apple is much more accommodating as to soil than the orange or the lemon, and it is also more tolerant with regard to climate. In selecting a site for an apple orchard where it is intended to grow first-class export

fruit it is essential that the teaching of experience should be carefully followed. As a rule the coastal plain is unsuited for the production of really first-class apples. This statement will be questioned by many people, because without doubt the many apple orchards which have been established between the Darling Range and the sea have proved productive and the fruit is good. It is not, however, as good as that produced on the more elevated and colder lands farther inland, such as Bridgetown and Mount Barker, and, indeed, on the suitable situations on the whole of the vast area extending between these two places as well as in the hills farther north and south. The soil conditions are important, but provided the subsoil is good the actual surface soil does not matter very much, and some of the most profitable apple orchards in this, as well as in the Eastern States, are on poor, hungry-looking country overlying a strong retentive, but well-drained clay subsoil. It may also be laid down as a general rule that where artificial drainage is required the settler should avoid planting an apple or, indeed, any other orchard. It will very often be found, however, that in any block of considerable size small sections may be too wet, and it will pay to drain these in order to allow of continuous planting and regular working. Experience proves conclusively that in the best apple country of Western Australia, where good cultivation is adopted, neither under-drains nor irrigation is necessary, although, of course, it cannot be doubted that in many cases a little water given when the fruit is maturing will result in apples of a larger size and better appearance.

The area under apples is increasing rapidly, and probably in no State in the Commonwealth are the commercial orchards more generally deserving of praise. In the first place the growers have confined their planting almost exclusively to three or four varieties proved to be most suitable for export. The trees as a rule are well cared for, comparatively free from disease, and the soil is kept in a beautiful state of cultivation through the summer. There is, however, a general lack of system in the training of the trees, and although this in itself does not prevent their being thoroughly profitable, it does in many cases mean that they require considerably more attention.

The special advantages which Western Australia possesses as a producer of export apples are:—

1. The trees when properly cared for come into bearing at an early age.
2. They are remarkable for their regular heavy cropping.
3. The varieties proved most suitable for the climatic conditions are also those which are found by experience to realize the best average prices in the European market.

4. The fruit ripens somewhat earlier than in the best apple districts of Victoria and Tasmania, and at the same time we are so much nearer to Europe that the fruit can remain on the trees from one to two weeks longer than in the Eastern States. Owing to these two causes there is an average of about a fortnight in favour of this State. This is very important with the early shipments, which generally bring the highest prices.

5. The apple-grower does not have to contend against some of the worst pests and diseases which cause so much loss in the Eastern States. The codlin moth has not yet gained a footing, and fusicladium or apple scab, although present, causes practically no trouble and requires no treatment.

6. The fruit-growers have the best organization of any in the Commonwealth.

All that has been said about the apple applies equally to the growth of the pear. Western Australia was the first State to demonstrate that the Williams Bon Chretien or Bartlett can be cold-stored for over three months with complete success, and may be carried to England and back without loss, provided the temperature is kept even and sufficiently low.

#### Miscellaneous Fruits.

So far the growers of stone fruits have not achieved the same success which has followed the efforts of those who have devoted attention to apples, pears, citrus, vines, and some other fruits. On the coastal district apricot trees thrive splendidly, but the varieties which have been tried have not proved to be uniform regular croppers. So far a district thoroughly suited for apricot-growing has not yet been found, but as the trees grow so well it seems only a question of time to find varieties which are suited to the special climatic conditions. Some evidence that this will be so is already available.

Peaches do much better than apricots, and some varieties can hardly be surpassed in any part of Australia for vigour of growth and regularity of fruiting. Unfortunately this fruit is subject to the attacks of the fruit-fly, and in the districts for some miles round Perth this pest causes considerable loss.

English plums, like apricots, have not proved to be reliable croppers, but Japanese varieties "grow like weeds" and produce regular heavy crops of magnificent fruit.

Cherries only thrive in select gullies in the southwest, and Sir Winthrop Hackett, who has a fine cherry-orchard at Cherrydale, Donnybrook, is the only grower on a large scale of this popular fruit.

The fig appears to thrive better in Western Australia than in any other State of the Commonwealth.

There are magnificent old trees in perfect health and vigour, though probably seventy years old and up to 3 ft. in diameter. The mild climate and the absence of hot, drying winds are favourable to the production of a large, luscious fig with a soft skin suitable for drying and preserving. The Lop Injir or Smyrna drying-fig has been introduced, and, like other varieties, thrives splendidly over a wide area near the coast. As is well known, this variety requires the agency of the fig wasp (*Blastophaga grossorum*) in order to mature its fruits, and the result is a fig equal in size and quality to the best product of the Meander Valley in Asia Minor.

#### The Olive.

Olive trees were introduced in the early days of settlement, and adjacent to the old homes are now to be found trees probably superior in size to any others in Australia. Some of these are growing in sand, but the largest are on the stronger soils of the coastal area. The following measurements of an old tree on Mr. Clifton's property at Brunswick may be taken as an example, although there are other trees similar in size to be found elsewhere, which remind one of the old patriarchs to be seen in Greece, Southern Italy, and other portions of the Mediterranean. The tree has three trunks springing from a huge bole many feet in diameter. At 18 in. above this they are between 14 ft. and 15 ft. in circumference. The spread of the present branches is about 25 yards.

In the early days no care seems to have been taken with regard to the selection of special varieties, but the olives produced have been tested for oil and the product, when well made, is equal to that produced in any other part of the world. Here and there are to be found trees producing very large fruit suitable for pickling, and this product also compares favourably with that of France, Spain, and California. While present labour conditions prevail it is not much use talking about an olive industry, but the fact that the climatic conditions have proved to be so suitable to the olive that trees grown from seed distributed by the birds are found growing amongst the indigenous vegetation adjacent to old settlements indicates great possibilities in years to come.

Such fruits as the persimmon and guava thrive splendidly over large areas, while in select spots in the neighbourhood of Perth the plantain and mango are grown sufficiently to form articles of trade.

The Cape gooseberry grows like a weed in the sand, and as its value for preserves becomes better known it will fully take the place of the English gooseberry in colder climates. It cannot be said that strawberries thrive as well in this State as in Southern Victoria or Tasmania, but when suitable situations and soil are chosen the growth of this fruit is very profitable.

κ

English gooseberries and raspberries are grown on a small scale in the colder districts of the south-west, but it is hardly likely that this will form an article of trade in competition with the product of countries with more suitable climate. It is a recognized law that various agricultural products are only produced in complete perfection under special conditions, and it is wise when considering the growth of fruits to rely on those for which the climate is proved to be best adapted.

What has been said of the apricot applies so far to the almond, but there is evidence to show that certain local seedlings are likely in the near future to entirely alter the present opinion with regard to this fruit. Nowhere does the almond tree grow better, and now that heavy cropping varieties of high quality have been produced by cross pollination, it is quite probable that the almond-growing industry will become of considerable importance to this State.

So far walnuts are only grown to a limited extent, but there is not wanting evidence that in certain portions of the extreme south-west the conditions will in the near future be proved to be thoroughly adapted for the production of walnuts.

#### The Vine.

It may be safely said that no part of the world is capable of producing heavier crops of high-class grapes under natural conditions than is Western Australia. The suitability of the country for the growth of the vine is as well proved as for the apple, the orange, and the fig. Old vines of very large size are to be found in various parts of the State, and the young vineyards which have been planted during the last twenty years simply confirm the recognized fact that we do not even yet know the extent of the capabilities of the State for the production of the grape. These remarks apply both to the growth of table grapes, raisin grapes, currant grapes, and the best varieties suitable for wine-making. Many mistakes have, of course, been made, but there is now sufficient experience to prove that no further serious loss in this way will occur. The wine industry, which made considerable headway prior to Federation, has received a severe setback owing to the introduction of wines from the established vineyards of South Australia; but there is not wanting evidence to show that a reaction is setting in, and if wine-making is undertaken on the same systematic lines as is done by South Australia there is no reason why this State should not rank as one of the most important contributors to the production of wine and brandy. The great evil so far has been the lack of concentration. The character of the wines produced in the most carefully managed cellars shows that all the conditions are favourable for the production of wine of a very high class. One feature in connection with the wine industry

of great importance is the development during the last few years of the export trade in grapes. This is largely due to the enterprize of Mr. Barrett-Lennard, of the Middle Swan, who has succeeded in proving that grapes can be sent safely to India, Ceylon, Singapore, and other Eastern ports as well as to London, and the trade has assumed proportions second only to the export of apples.

In summarizing the conditions of the fruit industry in Western Australia, it may be said that probably in no part of the Commonwealth or elsewhere can a larger variety of high-class fruits be produced, while such fruits as oranges, apples, pears, figs, and olives can be grown in competition with any part of the world.

#### DAIRYING AND MIXED FARMING.

A favourite expression of Mr. James Mitchell, M.L.A., when Minister for Agriculture, was to state: "We are sending away a thousand golden sovereigns every day of the year to the Eastern States to pay for butter which should be produced in Western Australia." When the value of preserved milk, cheese, and other dairy products is added, the annual value of imports which should be produced in the State reaches over £450,000. Prominent attention has been drawn to this unsatisfactory condition of things for many years, and the lack of enterprize of the people who allow it to continue has been the favourite theme for ridicule and denunciation. The export of money, however, and the corresponding import of Victorian butter, cheese, and so forth still continues. When the volume of talk indulged in by politicians and departmental lecturers, not to mention the enormous amount of space which has been occupied by agricultural and other writers on the subject, is considered, there is no difficulty in deciding that there must be some sound economic reason why dairying and, indeed, mixed farming generally has not assumed greater proportions in Western Australia. The fact has been stated so often that the soil and climatic conditions of the south-western portion of the State are suitable for a dairy industry that people have become so familiar with it as to take no notice whatever of its repetition. Before considering the practical side of the subject it is desirable that an effort should be made to find a reason for the present condition of things.

Recently a member of the Legislative Council, in speaking at a luncheon in connection with one of the agricultural shows, stated in effect that "the history of the development of the dairying industry in any of the States of Australia seemed to indicate that before real progress could be made it was necessary for the farming people to pass through bad times, during which it was difficult to obtain a living in any other way, and that the backwardness of dairying was therefore an evidence of prosperity." There is some truth in the remark, because there is no getting away from the fact that while dairying is not hard work it is an occupation which presents more difficult labour problems than any

other rural occupation. It is an industry which requires attention for seven days in the week, it necessitates early rising and long hours, although not necessarily of hard work; and, while a good living can be obtained without these drawbacks, it is hardly to be expected that farmers will seriously take on the work of dairying.

Speaking to a farmer who happens to work one of the largest farms in the south-west where the conditions are undoubtedly thoroughly suited for dairying, I asked him the question, "Why don't you start dairying? The conditions seem in every way favourable, and there is no doubt about the profitableness of the industry." His reply corresponded with that of the politician. He stated: "While I can raise lambs, fatten mutton, and grow wool and sell them at present prices it suits me better to devote my attention to sheep. I know the land would produce more money if devoted to dairying, but it would need a great deal more labour, the work would be a much greater tie, while it would be more irksome, and it is doubtful whether my net profits would compensate for the extra trouble and worry." During the last two seasons the fat-sheep market has been less satisfactory, and there is a prospect of the same condition of things prevailing as the sheep industry progresses, so that he is seriously considering whether the time is not near at hand when it would be advisable to devote attention to dairying.

What has been said will probably explain, better than could be done in several pages of abstract talk, the main reason why the dairying business in Western Australia has not made the progress which it should, but in addition we have also to consider several other points. For example, the labour problem in Western Australia is much more difficult than in any other State in the Commonwealth. This is not, as so many people appear to imagine, a question of wages only. It is true that wages are higher in Western Australia than in any other State of the Commonwealth, but, on the other hand, the price of produce is also higher, and it would seem to be quite unsound to argue that the extra wages are sufficient to make dairying unprofitable. The real trouble is not the wages, but the character of the labour

available. In this State any man with enterprize, initiative, and industry has been able with very little trouble to obtain land and start farming, taking contract work to provide enough money for his living and other expenses. Able-bodied men are able to go to the timber mills or work at sleeper hewing or contracting and make such good money that they consider it ridiculous to work for what are considered standard farm wages, however high they may be when compared with similar labour in the Eastern States. Owing to these facts, what labour is available is, in a measure, either unreliable or inefficient. Farmers would not need to grumble at paying the wages demanded by farm hands in Western Australia if that labour were efficient.

Another fact which has to be faced is the provision of suitable fodder for a dairy herd. Whatever

clovers and couch are established it will probably produce during the course of the twelve months an equal amount of pasturage as average land elsewhere. Whatever may be the drawbacks during the dry summer they are largely compensated for by the mild winter and early spring. Then, again, on most farms suited for dairying a sufficient amount of water is either available or may be secured to provide for a little irrigation, or there is moist land which, by proper cultivation, will produce summer crops. The wealth of growth on cultivated, well-fertilized lands in the springtime is quite sufficient to provide an ample supply of oats and peas, oats and crimson clover, or rye grass and clover to provide fodder and make ensilage for feeding dairy cattle, but it requires labour, and under the present conditions a man can make a living without the irksomeness which is

Photo by Bartletto,

DAIRYING PASTURES AT THE VASSE (SOUTH-WEST).

may be the advantages of the south-west of Western Australia, it must be candidly admitted that it does not possess large areas of natural pasture land such as are to be found in Victoria. Before pasturage can be obtained the land has not only to be more or less cleared, but it must be broken up and cultivated. Of course, something of the same kind has to be done in Gippsland, but whereas that district has a summer rainfall the south-west of Western Australia has for practical purposes very little, so that owing to the long, dry summer red clover and permanent pasture grasses, such as cocksfoot, perennial rye, and so forth, do not prove a success, and therefore cannot be depended upon to keep up the milk supply of the herd. The winter season is not cold, but it is very wet, and altogether the conditions are different. Where the ground has been cleared, broken up, and fertilized, and where the wild

κ2

necessarily supposed to be associated with dairying. This is the real reason why the industry has not made any progress. There seems little doubt that it will not be long now before conditions will change, and the low price of mutton will force Western Australia to be self-supporting so far as dairying products are concerned.

#### Irrigation and Drainage.

In connection with the development of dairying there will be an enormous increase in the extent of irrigated country. The streams which rise on the tableland and pass down through gorges to the coastal plains are suited for providing irrigation schemes, and although these will not be as large as some of the great engineering works of Victoria and New South Wales they will, on the other hand, be less expensive, and the water conserved will have a higher effective value.

With irrigation there is no State in the Commonwealth which can grow lucerne better than the south-west of Western Australia, because with proper attention there is no difficulty in obtaining eight cuttings in the twelve months. In addition to the big schemes referred to there is an enormous amount of water running to waste in small streams, and in a comparatively few years this will be lifted on to the adjacent flats and made to produce great wealth in the form of summer fodder. Owing to the distribution of its rainfall Western Australia is not naturally a maize-producing country, but with irrigation there is no difficulty in producing this crop for fodder purposes. In the winter time field cereals, peas, and tick beans can be grown, and in the summer time maize, cow peas, soy beans, and similar crops under irrigation.

No one can properly grasp the condition governing the development of dairying and mixed farming in the south-west of Western Australia without understanding the peculiar soil and climatic conditions, which have no parallel in the Eastern States. Fringing the coast are ranges of sandhills with a basis of impure limestone, in which between Busselton and the Leeuwin are the celebrated caves. Behind the sandhills are chains of swamps of varying character. Some are masses of reeds, bullrushes, and sedges, others are covered with dense growths of paper-barks or tea-trees, a species of *Melaleuca*. Between the coastal swamps and the Darling Range or escarpment of the tableland which constitutes the greater part of the State, there is a stretch of generally level country up to 20 miles wide, known as the coastal plain. This plain is entirely of a sedimentary origin, but varies very much in character. Considerable portions are of a poor, sandy nature, while others are of a strong, red loam. Between these extremes practically every grade of soil is to be found.

At frequent intervals meandering watercourses traverse this coastal plain, conveying the drainage of the hills to the sea. With the exception of a few instances where the larger rivers such as the Murray open into estuaries, these streams empty into the coastal swamps, and only at the time of heavy winter floods does the water break through the sandhills. Owing to this fact the drainage of the swamps is a somewhat difficult matter, but when it is carried out thoroughly they will constitute one of the most fertile portions of Australia, and dairying and mixed farming will provide the chief source of revenue of a closely-settled, thriving people. All along the borders of the watercourses are strips of rich alluvial soil costly to clear, but when cleared and brought under cultivation and irrigation are as valuable for lucerne-growing and similar work as are the famous lands of similar character in the best portions of Victoria, New South Wales, and South Australia. These

lands were referred to earlier in connection with orange-growing.

Perhaps the largest area of this coastal plain is made up of somewhat hungry, uninviting flat country, the soil of which is a strong clay loam overlying a clay subsoil, in its natural condition fairly thickly timbered with redgum and a more or less useless undergrowth. In the early days when the colony was first settled there was a fair quantity of nutritious herbage and such grasses as kangaroo grass, but these have been largely eaten out, and now the whole country is covered with tussocks of sedge-like plants and woody low scrub of little or no use for pasturage, but so vigorous that it absolutely prevents the growth of useful grasses and fodder plants. In the winter time much of this country is exceedingly wet, and during the rainy periods may be almost covered with water. In the summer time, during the rainless five months, it bakes almost as hard as a brick, and is comparatively useless. Sufficient experimental work has been done by enterprising settlers to show that when this uninviting country is surface drained, the undergrowth and small timber cleared off, and the soil broken and treated with lime and phosphates, splendid growths of couch grass, winter clovers, and winter grasses can be grown as well as profitable crops of oats, peas, rape, and so forth. This land in its natural state is more or less useless, but in its improved form it will compare with country in Victoria and the Eastern States which sells at high values. The development of such country takes time, but we may look forward to the period when these now comparatively worthless lands between Perth and Bunbury will be highly productive, and the industry most natural to the conditions will undoubtedly be dairying.

To summarize the method of improving this country we have—(1) The clearing of the useless scrub; (2) drainage; (3) the breaking-up and cultivation of the soil to destroy the tussocky herbage; (4) the application of lime and phosphates; (5) the growth of winter clovers, oats, rape, and other fodder crops; (6) the development of irrigation by means of which summer crops of lucerne, maize, cow peas, and so forth can be grown on a large scale.

#### Potato Growing.

The development in potato-growing during the last three years affords evidence of how a branch of the farming industry will make rapid strides under special circumstances. It cannot be said that the conditions in Western Australia are more favourable for potato-growing now than they were a few years ago, but as long as the growers had to compete with the cheap potatoes grown in Northern Tasmania and Southern Victoria there was not sufficient inducement to bring

large areas under this crop which involves much labour and is costly to produce. During the scarce time of the year the production was sufficient for local demands, but growers would not plant potatoes to compete with the imported article at the prices at which potatoes could be imported. There was a small outbreak of Irish blight in 1909, but apparently the dry, hot climatic conditions during the following summer were such that it was completely stamped out, whereas in the Eastern States it made rapid headway and ruined the potato crops. In order to protect the local industry the importation of potatoes was for a time prohibited. Under the influence of this restriction prices ran up to £40 a ton, those who had potato crops reaped an unexpected harvest, and attention was prominently drawn to the profitability of the industry. Since that time, although imported potatoes are now admitted under very stringent conditions into quarantined areas, which include the metropolitan region and the goldfields, the resulting high prices have stimulated production. The State is able to claim absolute freedom from the Irish blight, and under the peculiar circumstances of restricted production in the Eastern States, Western Australia actually exported some 600 tons of potatoes during the past season. There never has been any doubt in the minds of those most competent to form an opinion that potatoes of very high quality can be grown the whole year round in the south-western portion of the State. For many years individual growers have been producing three crops during the twelve months, so that a large amount of local experience is available, and under the stimulus of high prices the area under crop has increased enormously and is continuing to increase. The Government has taken a considerable amount of trouble in importing pure seed of the best varieties and having it planted in quarantine, so that at the present time

there is probably a better class of seed potatoes to be obtained in Western Australia than in any other State.

The swamp lands are particularly adapted for growing summer crops of potatoes, the river alluvials are equally fitted for growing the staple spring crop, and the hill slopes in many places are frost free and will carry a crop through the winter. By means of these three crops prime seed is always available in the best possible condition for planting. The average yield per acre of potatoes in Western Australia is somewhat uncertain, but probably corresponds very closely with the yield in the Eastern States. Speaking generally, potatoes grown under favourable conditions may be expected to return from 4 to 8 tons per acre, but yields of 10 tons are reported each year. The area, however, in such cases is usually limited.

#### Market-Garden Crops.

For many years now the State has produced all its own requirements in regard to market-garden crops, with the exception of onions, and the only reason why the production of this crop has not been equal to local demands is the fact that during the time of the year when the staple crop is being harvested in the Eastern States growers do not consider it profitable to grow onions on account of the high cost of labour which has prevailed. As a partial compensation for the shortage in onions we have a very large production of tomatoes, for which the climate and soil conditions of the State are so exceedingly favourable that each year an increasingly large area is devoted to this crop, the produce being readily taken by the factories for conversion into pulp, which forms an article of export to the Eastern States. Ordinary market-garden produce is cheaply produced on the drained swamp lands, the supply being regular and the quality good.

### ROYAL AGRICULTURAL SOCIETY.

Since the revival of interest in agriculture, which had its commencement less than two decades ago, agricultural societies have sprung up in almost every centre where cultivation of the soil forms the staple industry of the district. These are all offshoots from the parent stem—the Royal Agricultural Society of Western Australia, which in humble circumstances came into existence soon after the State was established. For our account we are almost wholly indebted to the short sketch attached to the society's "Annual."

"The history of the Agricultural Society, with its fluctuating fortunes, may be regarded as a barometer indicating the varying degrees of progress made by the colony of Western Australia. It should be remembered

that the history of the Agricultural Society of Western Australia differs from that of every other agricultural society in Australasia in this particular: the other societies were organized some time after the settlement of the various colonies to which they belong and confined themselves to the ordinary work of an agricultural society as it is understood to-day, but in Western Australia the Agricultural Society is the oldest organization in the State; for some years there was no other organization in existence, outside the Government, for dealing with public affairs. At an agricultural society dinner in 1833 one of the toasts honoured was 'Success to those interests which are watched over and encouraged by the Agricultural Society.' The interests thus

watched over and encouraged were 'the general interests of the settlement.' Being the only organization through which public opinion could express itself, it will be readily understood that a variety of questions affecting the public weal were introduced and discussed with keen interest at the meetings of the society, and that several times during those early days the infant society was nearly wrecked on the rock of 'party politics.' The history of the society is marked by certain well-defined stages which may be described as follows:—The first period from 1829 to 1863 was what may be called the pre-historic period, concerning which all the official records have been lost. Usually, when authentic documents are missing, legend and tradition abound; the present instance is no exception. The particulars herein set forth relating to that period have been gleaned from various sources and selected from public documents. The second period dates from 1864 and extends to 1882, during which time the society had a dual existence and was a kind of organized 'Dr. Jekyll and Mr. Hyde.' Discord and divided counsel mark several of these years, consequently the movement was slow and the progress small. The third period, from 1883-1904, comprised years of arduous toil, great activity, and uninterrupted progress, during which time the society developed its usefulness in many directions. The fourth period, from 1904 onwards, may be designated the new era, when the Royal Agricultural Society of Western Australia took a foremost place among the great societies of Australasia. There are certain names which stand out prominently in each of the above periods—names which should not be forgotten, for the society owes a debt of gratitude to the long line of devoted and patriotic pioneers who, by their liberality, sagacity, and foresight, made possible the work of to-day. The first agricultural society in Australia was formed in Tasmania in January, 1822. The second was organized in Sydney in July of the same year. Seven years later the third came into existence, when the Western Australian Agricultural Society was formed in 1829. The Western Australian Year Book sets out in chronological order the historical events of 1829 (the year in which the colony was founded), and at the end of the list there is this entry:—'An agricultural society formed this year. Members admitted by ballot.' The same authority records that on May 28, 1831, 'An agricultural society organized in Perth.' Whilst for November 6, 1834, we find this entry:—'Cattle show held in Perth under the auspices of the agricultural society.'

"The society holds the original draft of a memorial which was presented to His Excellency the Lieutenant-Governor on May 28, 1831. This document, which is in the handwriting of Thomas Peel (one of the founders of Western Australia), is most interesting in view of later developments. In it the lofty ideals of the sturdy pioneers

who first peopled this land may be seen and bear evidence to the fact that the 1831 'grain of mustard-seed' contains potentially all the splendid development of 1912."

The society held its first annual show on November 7, 1834. This partook more of the nature of a market or fair; and the annual meeting, which was held about the same time, afforded the means by which all those engaged in agricultural pursuits might meet together and discuss general matters pertaining to the well-being of the settlement. At the time of this show cultivation was represented by 564 acres under wheat, 100 under barley, 116 under oats, 29 under maize, 109 under potatoes and other crops, half an acre under vines, and 118 acres lying fallow. The livestock consisted of 162 horses, 502 head of cattle, 3,545 sheep, 492 goats, and 374 pigs.

For many years the show was continued under the name of a fair, and the society applied itself to obtaining accurate information as to rainfall conditions, conditions of soil, and suitability of crops. After a few years many of the more prominent settlers, including the most active members of the society, had developed holdings in the York district, and for some years onwards from 1843 we find a second society, the York Agricultural Society, taking a very active interest in the affairs of the colony and especially in the discussions which led up to the introduction of convict labour.

During the first quarter-century of the society's existence the names of many of those instrumental in founding the young colony appear on the minutes of the society as taking a deep interest in its welfare. Among these may be mentioned Thomas Peel (to whose efforts the foundation of the society was due), Peter Broun, George Fletcher Moore, William Tanner, Joseph and John Hardey, Thomas Drummond, W. L. Brockman, and others. In many cases their descendants are still actively pushing on the development of agriculture in the State.

The second quarter-century of the society's operations was marked by a period of storm and stress, when the meetings became the fighting ground for diverse opinions, political and otherwise. During this period we find that many of the older pioneers were passing out of active work, and their places were being taken by a later generation, amongst whom stand out prominently S. W. Viveash, Dr. Waylen, Walter Padbury, E. R. Brockman, and Henry Brockman. From that time the history of the society has been one of uninterrupted success, in which W. T. Loton, Sir Edward Wittenoom, T. W. Hardwick, A. W. Edgar, Edward Roberts, George Paterson, H. J. Higham, and Theo. R. Lowe have taken no small part. In fact to the last-named, who was secretary of the society until his death in 1911, most of the credit for the society's recent progress is due. Through his untiring efforts and ability

the new show-ground at Claremont, which took the place of the old ground at Guildford used for so many years, was laid out for the show of 1904, and has since been improved so as to form the most up-to-date enclosure of the kind in the Commonwealth.

No better idea of the progress of the society can be gained than by pointing out that at the show of 1912 the attendances of the public for the week numbered 76,000, the total number of entries 4,572, and

prize money £1,773. In fact, the Royal Agricultural Society's show has become one of the principal annual events in the community, and its ever-increasing importance affords ample evidence of the enormous development that is taking place in agricultural affairs in Western Australia.

The present office-bearers of the society are:—H. J. Higham, President; W. J. Ashton, Secretary; and A. Gorrie, Hon. Treasurer.

ROYAL AGRICULTURAL SOCIETY'S SHOWGROUNDS, CLAREMONT.

## THE FARMERS AND SETTLERS' ASSOCIATION OF WESTERN AUSTRALIA.

The Farmers and Settlers' Association, formed some years ago for the purpose of watching the interests of those engaged in rural industries, has since then grown to be an important factor in the life of the agricultural section of the State, and out of it there has recently been formed a "Country Party," whose avowed object is to influence legislation, wherever possible, in the interests of the farmers. The mainspring of the association, as has been disclosed by the authorized pamphlets from which our information is taken, is co-operation.

There are nearly 60,000 persons in this State who are directly concerned in the grazing or cultivation of the soil. Of these there are over 50,000 who are either paying rent on leaseholds or instalments of purchase money to the Lands Department, and there are certainly thousands more, especially in the older settled portions of the State, who hold their land in fee simple, and who therefore do not come under the operations of that department. Each one of this numerous body is at present working under more or less serious disadvantages, and all are paying considerably more than

they should pay, not only to produce their crops, but to get these crops to their natural markets. Individually the farmer is absolutely helpless; he is hampered and oppressed with a number of circumstances which his isolated efforts, no matter how determined, are powerless to remove.

Recognizing the inherent truth of the old adage, "In union is strength," this association has been formed for the purpose of banding all rural producers into a solid and united body for the purpose of achieving by mutual effort that which the individual is powerless to accomplish. The objects of the association are stated very succinctly in the constitution. They are:—

1. To secure the co-operation of the producers in the advancement and protection of the rural industries.
2. To take such other action as may from time to time be considered advisable by the committee to promote the advancement of such industries.
3. To act in conjunction with other associations of a similar kind in any other part of Australia.

ALBERT CHARLES RUSSELL LOARING, orchardist, owner of the "Lawnbrook" property at Heidelberg, is a son of the late William Loaring, of Somersetshire, England, and was born in that county on February 22, 1870. He spent the early years of his life in Devonshire, and at the close of his education obtained his first commercial experience in the Prudential Insurance Society. In 1888 he left the Old Country for Western Australia, and after spending a year in this State continued his travels to South Australia. There he accepted employment in the Northern Territory on behalf of the firm of Elder, Smith, & Co., Limited, for whom he was engaged in tank-sinking for some time, and latterly was among the first to undertake the snaring of rabbits in large numbers for exportation by the Government. In 1896 Mr. Loaring returned to Western Australia, and upon arrival proceeded to Coolgardie, where he entered upon the duties of accountant to the United Mines Ore Reduction Company, holding this post for four years. At the end of that period, in 1900, he commenced contracting on his own account, and for some time supplied wood fuel to the mines in that district. In the following year he purchased a battery for Burtville, north-east of Coolgardie, in the

Mount Margaret district—the farthest point at which a battery had been erected—with the object in

Burtville,

Perth.

MR. ALBERT CHARLES RUSSELL LOARING.

view of working it as a public crushing plant, but owing to the difficulty of obtaining an adequate water supply he sold out shortly after taking possession. Mr. Loaring had interests in several of the mining leases in the district, but these proved only moderately successful, and in 1902, leaving the goldfields,

he took up his present south-western property in conjunction with Mr. Neil McLeod. This estate originally was held by the late John Bussel, and is situated 35 miles south of Busselton, on the Margaret River. It consisted at that time of 29,000 acres agricultural leasehold from the Government with 6,000 acres of the Caves Reserve area; but since then a portion has been resumed by the State, and the leasehold has been reduced to 9,000 acres, with 1,500 acres of C.P. and freehold. One thousand acres of the freehold and C.P. is owned by Mr. Loaring; the remainder, with the leasehold, being jointly held by him and his partner abovementioned. At the present time the property is used chiefly as a horse- and cattle-breeding station, about 200 head of cattle being pastured in the paddocks and forty head of horses. In 1910 he sold the old homestead back to the Bussel family. During Mr. Loaring's residence of three years in this district he interested himself in local affairs, and his name was well to the front in all matters of reform or advancement in the neighbourhood. For about two years he served as a member of the Roads Board, and he was the founder of the Progress Association, of which he has since been made a life member. He was prominent in the movement

to secure educational facilities for the young, and chiefly owing to his endeavours a school was established at Margaret River. In 1902 Mr. Loaring purchased the orchard property at Heidelberg, where he now resides, and after spending six months here returned to the south-west, ultimately settling down at "Lawnbrook," where he has continued ever since. The holding lies 24 miles from Perth, in the Upper Darling Ranges, about 1,000 ft. above sea-level, the district being one of great natural beauty. The orchard nestles in a valley, with hills encircling it on every side, and to the traveller arriving it presents a very charming aspect. Originally embracing 220 acres, Mr. Loaring has reduced the area to 170 acres freehold, and he has 16 acres under cultivation of fruit-trees, of which

Photo by C. E. Farr

MR. A. C. R. LOARING'S RESIDENCE, HEIDELBERG.

eight acres are in full bearing. Five acres of citrus trees display a flourishing appearance, the chief varieties represented being the Washington Navel and St. Michael in oranges, the Beauty of Glen Retreat mandarin, and a special variety of variegated lemons. He has always found a ready and lucrative market locally for the disposal of this fruit, but is now devoting considerable attention to the producing of apples suitable for export purposes. He has four acres under apple culture, and in 1911 sent his trial shipments

plums, peaches, and nectarines also find places in this orchard, which has proved wonderfully adapted to the production of a wide range of fruits. Owing to the care and attention concentrated on this valuable property scale and fruit-fly are almost unknown, and it is Mr. Loaring's opinion that if every orchardist would apply the same preventives and remedies these pests would quickly disappear from the vineyards and orchards of the State. The soil throughout is a rich chocolate loam of great depth with a rich clay subsoil, and a beautiful brook runs

with foliage and flowers, the cultivation of which claims a large portion of Mr. Loaring's spare time. Over 100 varieties of roses grace this ideal spot, and chrysanthemums, daffodils, primroses, and violets shed their beauty and fragrance over different parts of the garden, the well-kept lawn and tropical palms giving the finishing touches to what must be acknowledged as one of the picture orchards of the district. Mr. Loaring is a large and successful exhibitor of fruit at the annual shows of the Royal Agricultural Society, having been awarded numerous first

GENERAL VIEW OF THE ORCHARD AT "LAWNBROOK"

to London and Germany, in the following year despatching over 500 cases of Jonathans, Cleopatras, and Dunn's Seedlings to these markets. In the former year the general fruit harvest was excellent, 3,281 cases of fruit being gathered and sent away, all of a high-grade quality. To show the prolific bearing capacity of the trees it is only necessary to state that in the same season 672 cases of lemons were taken from forty-three trees, and five St. Michael orange-trees yielded £37 worth of fruit. Pears,

through the property. Irrigation is made easy by the utilization of a natural reservoir situated 40 ft. above the orchard, where by the aid of 1,500 ft. of 4-in. piping all the trees may be watered copiously during the long, dry summer months. The homestead, of ten apartments, with underground cellar, and wide verandah running all round the house, stands in the midst of the orchard, and is fitted up with all modern conveniences. It is surrounded by a lovely garden, which in the spring and summer is rich

prizes for lemons, oranges, apples, and pears. He is a member of the local Roads Board, a director of the Fruit-growers' Trading and Shipping Association of Western Australia, Limited, and member and delegate of the Fruitgrowers' Association, and is also connected with the Liberal Club. In 1892 he married Maria, daughter of the late Alfred Westhorpe Akam, of London, and has two sons and three daughters, both the former assisting their father in the work of the orchard.

THOMAS PRICE, managing partner in the "Illawarra" Orchard, Pickering Brook, is a son of Mr. James Price, of Shropshire, England, and was born in Herefordshire on October 3, 1864, in which county he also received his education. Upon leaving school he studied horticulture in his native place, afterwards becoming connected with the firm of Messrs. Langs, Veitches, & Williams, the well-known nurserymen of

admitted him as partner in the nursery branch of his business. After remaining at Guildford until 1900 he entered into an arrangement with

MR. THOMAS PRICE.

London. In 1891 he left for Western Australia and first entered the employ of the late Mr. Charles Harper, of Woodbridge, who ultimately

Photo by C. E. Farr. MR. T. PRICE'S RESIDENCE, PICKERING BROOK.

Mr. Edward Wharton White and Mr. Dean Smith, in conjunction with whom he took over the "Illawarra" Estate, and immediately entered upon the duties of manager. This property originally was held by the late Mr. Edward Keane, from whom it passed into the hands of Messrs. Smith and White, who are at present interested in the business. It is situated 27 miles from Perth, in the Darling Ranges, and is one of the most elevated orchards in the State, being about 1,000 ft. above sea-level, and is surrounded by the tall jarrah and gum-trees with which

suited to the soil and climate. All the ordinary kinds of apple are represented in the well-tended rows, but "Illawarra" has achieved a name for five special varieties, *viz.*, Doherty's or Improved Yates, Jonathans, Cleopatras, Dunn's Seedlings, and Rokewoods; while in pears the Bartlett is easily first, with Gansel's Bergamot making a good second. While a ready and lucrative trade always has been done with the several Western Australian markets, the steady increase in the fruit industry led Mr. Price to look farther afield, and in 1907 a trial shipment was sent to London, since which date regular consignments have been dispatched to the English and German ports. The total output each year averages 10,000 cases of apples and pears. A fine store and packing-shed of wood and iron has been erected, sawdust being used to insulate the walls and maintain an even temperature suitable to the better storage of fruit. Mr. Price avails himself of the facilities provided at the Perth Government store, and frequently has as many as 2,500 cases of fruit in cold storage. The Cleopatra apple has proved one of the best keeping varieties, and invariably commands the best prices at the overseas markets, where they always arrive in tiptop condition. The "Illawarra" Orchard being situated in hilly country has the advantage of a mixture of soils, these varying from a rich chocolate loam with clay subsoil to the gravelly soil which suits the

FRUIT-PICKING AT "ILLAWARRA."

cultivation of certain classes of trees. Lying in a natural gully, irrigation is easily carried on from a fresh-water spring some 30 ft. above the orchard level, the upper rows of trees and the flower garden being served by a 2-in. main, while a creek running right through the centre acts as a drain in the winter and preserves moisture for the dry summer weather. The orchard and grounds are also drained by a system of underground slabs and pipes, which also serve the dual purpose of carrying off surplus waters and retaining moisture for the time of need. Great vigilance is exerted to keep the orchard free from pests, no fruit being allowed to remain on the ground, and constant watch is kept for unwelcome intruders, with the result that the fruit-fly, scale, and fungoid diseases are almost unknown. The homestead on rising ground overlooks the orchard, and is approached by a long avenue of pines, which give dignity and beauty to the scene. A trellis surrounds the house, almost completely covered by a wealth of climbing roses and other creeping plants, and, beyond, the well-kept flower-beds testify to the good use Mr. Price makes of his leisure time. About 100 varieties of roses are to be found, and thirty-six choice exhibition carnations, besides many other blooms of rare beauty and fragrance. Mr. Price is a member of the Executive Council of the Western Australian Fruit-growers' Association, and takes an active part in all the deliberations of that body. He married in 1899 Emily Claudia, daughter of Mr. J. Rogers, of Guildford, and has three sons and a daughter.

**HUBERT EDWARD BARKER GULL, J.P.**, of "Bebo Mora," Guildford, is a son of the late Mr. T. Courthope Gull, a cousin of Sir William Gull, the famous Royal Physician. The late gentleman was a member of the first Western Australian Parliament and represented one of the oldest families of the State, the fifth generation of which is now resident at Guildford, this being the birthplace of the gentleman under review. Upon the completion of his education at the High School, Perth, he entered the mercantile office of Messrs. Barker & Gull, the business at that time being under the control of trustees. Upon attaining his majority he took into

partnership Mr. Sydney Chester and continued operations in conjunction with this gentleman for about five years, when the business was brought to a close and the firm dissolved. At this time, in 1891, he became identified with mining pursuits, which, however, proved unprofitable. After continuing for a time in the Niagara district, where with his three brothers he owned the Perseverance Mine, he returned to Guildford, and has since employed himself in developing the property on which the homestead stands. This consists of about 24 acres, about half of which is under cultivation of vines and fruit-trees. Mr. Gull has his own plant on the premises and carries on winemaking on a small

*Bortetto, Perth.*  
MR. HUBERT EDWARD BARKER GULL.

scale. He has large landed interests in the Mullewa and Serpentine districts, which ultimately he hopes to turn to good account as farming properties. In 1902 he received his commission of Justice of the Peace for the magisterial district of Guildford, and six years later was a candidate for Parliamentary honours in the Liberal interest in the same district, but suffered defeat at the hands of Mr. Johnston. He married Eliza Annie, daughter of Mr. James Palmer, C.E., of Victoria, who built the first railway in the Western Australian State—from Geraldton to Northampton—and has two sons and two daughters. Mrs. Gull is an artist of no mean merit, and the home at Guildford is adorned with many productions of her skilful brush.

**GEORGE HENRY PALMATEER**, orchardist, "Heidelberg," via Kalamunda, is a son of the late Mr. Francis Palmateer, of the United States of America, an early pioneer of Bendigo, Victoria, where he arrived about the year 1840. The subject of this review was born at the latter goldfield on August 7, 1866, and received his education at Spring Creek, a mining centre in the vicinity of Alexandria, Victoria. Upon leaving school he entered upon active life in the Survey Department of the Government Railways, where he spent about four years. At the end of that period, in 1891, after the declaration of responsible government in Western Australia, he approached the Government of that State with a view to securing a position in the Public Service, and receiving sufficient inducement to make the removal, left Victoria in September of that year, and landed at Albany, which was then the chief port. With Perth as an objective he started on the long journey from the seaport to the metropolis, breaking his trip at most of the towns on the route in order to gain some idea of the character of the country in which he was to make his home. Upon arrival at Perth he joined the Survey Department of the Western Australian Government Railways, and immediately was dispatched to Geraldton, where the section of the railway line from that town to Mullewa was being surveyed. Here he spent about nine months, during which time he suffered many hardships on account of the sand and the shortage of water, in company with Mr. Pidgeon, the present Superintendent of Traffic in Western Australia, who was in charge of the work. Subsequently Mr. Palmateer was associated with the survey of the railway from Northam to Southern Cross, where he was engaged for about three months, and upon the gold rush consequent upon the discoveries at Coolgardie he resigned from the service and made his way to the new field. The owner of several horses, after three months, owing to the scarcity of water, he found himself in the awkward predicament of having to lose them or leave the field. Deciding on the latter course he arrived at Perth at Christmas, 1892, and in January, 1893, selected his present property, "Heidelberg"—at that time virgin forest—situated 17 miles from Perth and four miles from Kalamunda. The property comprised about 300

acres of mixed land, the gully soil being a very good chocolate loam, and the higher portions gravel and ironstone, covered chiefly with jarrah

classes of fruits. A handsome new homestead has just been erected on the property, its elevated site overlooking the orchard in the valley

FRUIT-PACKING SHED AND PORTION OF ORCHARD.

timber. Since then Mr. Palmateer has subdivided the holding into several smaller blocks, which he has sold to settlers in the district, retaining about 250 acres for his own use. Of this he has cleared 40 acres, and has a 23-acre orchard, the area of which he is extending every year. His chief asset lies in 12 acres of citrus trees, which are now in full bearing, and where the St. Michael, Washington Navel, Valencia, and Mandarin oranges come to perfection, the Beauty of Glen Retreat being the favourite in the latter class. The remainder of the orchard is under cultivation of apples and stone fruits, the former including Clios, Jonathans, Stone Pippins, and Spitzenbergs, and the early variety Alexandria, and the latter early peaches (Royal George and Early Silver) and Japanese Plums (Blood and Burbank). The whole of the property is irrigated from a natural spring situated on high ground, and capable of supplying about 40,000 gallons per day, the water being conveyed in the simplest manner over the entire area. Mr. Palmateer has long been an exhibitor in connection with the local shows, and has been a successful prizewinner at these functions for various

beneath. It is solidly built of brick and concrete, and consists of ten rooms, with a wide verandah running all round the house, which is fitted up with all modern conveniences, water laid on throughout, etc. Always interested in local public affairs, Mr. Palmateer takes an

active part in the work of the district, and for many years was a member of the local Roads Board. He is

late Mr. John Wallis, of "Orangedale," Kalamunda, and has two sons and three daughters.

ALBERT SCHUNKE, orchardist, proprietor of the "Kattamondo" Estate, Kalamunda, is a South Australian by birth and a son of the late Mr. Henry Schunke, who was one of the earliest arrivals from Germany in that State, where he took out his naturalization papers. Born at

on his father's property, where he continued until eighteen years of age. He then left his native soil for Victoria, where he turned his attention

City Council and latterly at Mr. T. Statham's quarries. After seven years spent in this way Mr. Schunke came to reside upon his property, and

Ruskin Studios, Perth.

MR. ALBERT SCHUNKE.

Hahndorf, a German settlement about 18 miles from Adelaide, on May 21, 1866, Mr. Albert Schunke pursued his studies at a local school, and upon the conclusion of his education began his career as an orchardist

to contracting on his own account and spent about ten years in this calling in the Wimmera district. In 1894 he came to Western Australia, and shortly after arrival inspected and purchased his present holding, upon which he placed a man to start the work of development, while he himself engaged in engineering work, first in connection with the Perth

took over control of operations. The holding, which at the time of purchase was virgin country, consists of 100 acres, and is situated about two miles distant from the township of Kalamunda, and within 13½ miles of Perth by the Welshpool Road. Eighteen acres have been cleared, and the orchard monopolizes almost the whole of this area, being 15 acres

PORTION OF ORCHARD AT "KATTAMONDO" ESTATE.

in extent. Adequately supplied with water, the value of copious irrigation is thoroughly appreciated by Mr. Schunke, and it is his intention to lay down a surface irrigation plant for the flooding of the orchard at necessary intervals of time. The many rows of fruit-trees manifest by their flourishing appearance and richly-laden boughs in the bearing season the skilled care and attention which have been brought to bear upon their cultivation. In especial, the hundreds of apricot trees draw attention to the fact that the soil and climate must be particularly favourable to the production of this popular fruit, of which Mr. Schunke is the largest grower in the district. The citrus fruits are also given pride of place, with many varieties of apples, including Clios, Rome Beauties, Jonathans, and Dunn's Seedlings, the lastnamed being, in Mr. Schunke's opinion, the most suitable for export purposes, while among the citrus trees navel oranges come to perfection, and are most largely cultivated. The first shipment of fruit was made to the Indian market in 1908, and in the following year Mr. Schunke opened his trade with London and Germany, and since that period has dispatched regular annual consignments to those markets. He is a very successful exhibitor of various classes of fruit at the annual shows held in the neighbourhood, and has carried off a large percentage of prizes both for single exhibits and the best collection of orchard products. A few vines are cultivated, table varieties of grapes only being grown. During the period of his residence in this district Mr. Schunke has rendered valuable service in various public and semi-public ways. He first became connected with local administration in 1902, and was elected a member of the Roads Board, which seat he has continued to hold ever since, with a break of one year only. For five years he was a member of the committee of the local Agricultural Show and has been chairman of the Kalamunda Fruit-growers' Association since the inception of that body in 1910, being

a delegate on various occasions to general conferences of similar organizations held in Perth. In earlier life he was very fond of shooting, and had the reputation of being a good marksman. Mr. Schunke married in 1899 Kate, daughter of the late Mr. Edward Finine, of Ireland, and widow of the late Mr. Alfred Black, of Melbourne. The late Mr. Finine was one of the first to arrive from the Old Country at the Bendigo Gold Mines, Victoria, in the early days. Mr. Schunke has a daughter.

ARTHUR HENRY ANDERSON, "Rainsworth," in the Swan district, is a son of the late Rev. W. D. Anderson, rector of Milton, of "Damerel," near Bideford, England, where he was born in 1862. At the close of his education he spent eleven years in commercial life in London, and in 1890 left the Old Country for Australia. Upon arrival at Adelaide he accepted an appointment as assistant master in St. Peter's College, which he continued to hold for three years. At the end of this period Mr. Anderson took up about 150 acres of land at Saddleworth, and planted a vineyard, which he carried on until 1900, when disposing of this property he returned to his native land. Two years later he was again compelled to seek

a less rigorous climate, and once more sailed for Australia. Eventually he decided to retire from active

Bartletto,

Perth.

MR. ARTHUR HENRY ANDERSON.

life, and coming to the Swan district in Western Australia erected his present substantial homestead on a nice little property of ten acres, which originally formed part of the oldest estate on the Swan. In 1901 Mr. Anderson married Emily, widow of the late Mr. William Strelley-Harris, a son of Dr. Harris, of Western Australian fame. His family consists of three sons and a daughter.

Photo by C. E. Farr. MR. A. H. ANDERSON'S RESIDENCE, SWAN.

WALTER EDWARD NEWMAN, vigneron, "Strelley Brook," Middle Swan, is a son of the late Mr. C. F. Newman, of South Australia. He was born at Houghton, near Adelaide, on November 5, 1873, and at the close of his education at the local public school entered the agricultural industry under the guidance of one of his brothers, and subsequently spent three years in his father's nursery at Houghton. This period was succeeded by three years

market-gardening on his own account. After renting four acres of land for four years and working there successfully he took possession of his present

on the premises for the purpose. The Zante currant bears prolifically and produces a grape which when dried makes a currant of fair size and

*Bartletto, Perth.*  
MR. WALTER EDWARD NEWMAN.

in orchard work under the experienced supervision of his parent, and in 1896 he left for Western Australia. Upon arrival Mr. Newman became associated with a brother at Coogee, with whom he continued for twelve months, and at the end of that period turned his attention to

holding, comprising 60 acres of good rich soil, and situated five miles from Midland Junction, on the Gingin Road. The whole of this block is now cleared, and fruit-growing and gardening operations are in full swing, about 45 acres being under cultivation of vines, which are the chief asset in his industry. The vineyard is principally intended for the production of grapes for drying and table uses, and all the best varieties of table grapes are represented in the well-set rows of vines, which are being brought to perfection on the trellis system. The Gordo Blanco and Sultana have been chosen for the raisin-drying, and this process is greatly simplified by means of a special plant which Mr. Newman has

acceptable flavour. Until recently Mr. Newman has contented himself with producing for the local markets, but in 1912 he extended the scope of his operations by making a trial shipment to London with very good results. One of the great advantages which "Strelley Brook" possesses is a splendid well of fresh water, from which irrigation on an extensive scale is carried on over the vineyard and orchard. Two acres of ground are devoted to the orchard, where apples, oranges, quinces, pears, apricots, and peaches are grown in their season. The large vegetable garden covers several acres, where kitchen products are continually being cut or pulled to be sent off to market where good returns are realized. Mr. Newman is a large and successful exhibitor at the different agricultural shows of the district, including the Royal Show at Perth and similar functions at Coogee, Jandakot, Guildford, and other centres. He has been particularly fortunate in this respect with his exhibits of vegetables and kitchen stuff, on two occasions gaining the special prize for the largest number of awards in this class. His raisins also have found favour in the eyes of the judges, and have taken prizes at the shows. Mr. Newman finds recreation on the cricket field, this being the only sport in which he finds time to indulge. He married Charlotte, daughter of Mr. W. J. Bryant, of South Australia, and has a son and two daughters.

*Photo by C. E. Farr.* "STRELLEY BROOK" VINEYARD, MIDDLE SWAN.

CHARLES WILLIAM FERGUSON, vigneron, owner of the "Houghton" property in the Swan district, is a son of the late Dr. John Ferguson, of Perthshire, Scotland, who filled the position of Colonial Surgeon to the Western Australian Government from 1846 to 1873. The gentleman under review was born at Perth on September 11, 1847, and received his education at the scholastic institution known as Bishop Hales' School, now the High School, Perth.

Bartletto, Perth.  
MR. CHARLES WILLIAM FERGUSON.

At the conclusion of his studies he immediately took up his residence on the property where he now resides, which was purchased by his late father from Messrs. Houghton and Yule, the original owners of the estate, which took its name from Colonel Houghton. At the period when it was taken in hand by Mr.

Ferguson the country was practically in its virgin state, about five acres only being cleared and a small dwelling-house erected. With

late Mr. Joseph Harris, and to-day the "Houghton" Estate covers an area of 560 acres in all, ten acres having been taken by the Midland Railway

Photo by C. E. Farr. RESIDENCE ON THE "HOUGHTON" ESTATE

energy and determination he set to work to make the necessary preparation for cultivating the soil, and to-day it is only necessary to drive through the acres of smiling vineyard to realize how thoroughly the task to which he applied himself has been performed, and with what success his efforts have been crowned. In the first instance it was to a much smaller acreage that the name of "Houghton" was applied, the whole property consisting of only 320 acres. The late Dr. Ferguson, desirous of enlarging his borders in this favoured locality, purchased an adjoining block comprising 250 acres, from the

Company for railway extension. At the present period, the greater portion of the property not under cultivation of vines is given over to the growth of natural grasses, which form good grazing pastures, but in the early days, after Mr. Ferguson's advent in 1863, large crops of hay were grown on the rich flats of the Swan, which were the chief feature of the industry carried on. As, however, the vintage operations have increased in importance, so less attention has been given to cropping with wheat and hay, and only sufficient acres are sown annually for the use of the stock on the estate. Mr. Ferguson

Photo by C. E. Farr.

PORTION OF THE "HOUGHTON" VINEYARDS

encountered the ordinary difficulties and drawbacks of the pioneer struggling to make way without the conveniences and labour-saving appliances of modern civilized regions, but he persevered, planting acre after acre with vines as he realized more clearly that that way prosperity lay. Practically the whole of the property,

which for a lengthy period has held its own among vigneron. This is now giving place to standard vines, the sturdy growth of which and their prolific crops have obtained for them favourable recognition among the scientific and practical growers of the present day. The different varieties of grapes for the best classes of wines

vines are grown in large numbers. The large cool cellars, capable of holding over 100,000 gallons of wine, consist of five cellars in addition to

Photo by C. E. Farr

INTERIOR VIEW OF WINE CELLARS

with the exception of about 50 acres, is now cleared, and the extensive vineyard, which stretches over 130 acres, is being added to each year. A change of method in cultivation has taken place in recent years, the older portion of the vineyard being marked by evidences of the trellis system,

are well represented, those used for clarets being the Carbinet, Malbec, and Red Shiraz, and for light white wines such as hock and chablis the Riesling and White Shiraz, while for ports and sherries the Grenache, Red Shiraz, Dolcetto, Pedro Ximines, and Doradilla

Bartletto,

Perth.

MR. JOHN VIVEASH FERGUSON.

the fermenting room and distillery, and all the wine that leaves the vineyard is at least three years old when it is sent to Perth for bottling and distribution. As recently as thirty years ago the vineyard extended over only ten acres, the demand for both fruit and wines at that time being extremely limited, but with the growth of the State and its influx of population from other countries the demand for local products increased rapidly. The "Houghton" vintage achieved popularity which warranted its rapid extension, and this being carried out on a generous scale led to

Photo by C. E. Farr.

"HOUGHTON" DISTILLERY AND WINE CELLARS.

L.

yet wider sales and more pronounced success, which demanded and warranted the establishment of cellars and bottling works in Perth. Accordingly Mr. Ferguson in 1903 established a business in the city of Perth for bottling and distribution purposes of wines of strictly local manufacture, and it was at this period of the firm's history that the name of "Houghton" was adopted and used on the registered label—a name which has become famous with connoisseurs throughout the State. The quantities of wine manufactured at the present time average about 25,000 gallons, while the vineyard in its pride and maturity ranks among the finest in the Western Australian State. The original dwelling-house has long since been converted into a part of the cellars, the present homestead having been built by Mr. Ferguson in 1863. A public-spirited man, he has not been neglectful of his responsibilities in regard to the community of which he forms a part, but has always taken an active part in the affairs of the district. On many occasions he has represented the interests of the ratepayers on the local Roads Board, and in 1898 he received a commission of Justice of the Peace for Swan magisterial district at the hands of the Forrest Administration. He has occupied a seat on the Committee of the Royal Agricultural Society for some years, and takes a great interest in the promotion of shows in connection with the local organizations of this nature. He has been an active and earnest worker in Church matters for almost forty years, nearly all the time as churchwarden of the Swan Parish Church, the foundation-stone of which edifice was laid by his mother. Upon his retirement from active work in connection with the management of the vineyard, which marked the closing of a long era in his life, Mr. Ferguson was the honoured recipient of an address and testimonial from his fellow-members in this communion, setting forth their appreciation of his long and honourable association with the local church. His retirement took place in 1911 after forty-eight years' residence in the Swan district, with only one break, which occurred in 1872, when he left

the vineyard and turned his attention to the pearling industry in the north-west, where he spent about two years at Shark Bay, meeting, however, with but indifferent success. Mr. Ferguson now resides in his town house at North Perth, a fine residence with spacious grounds, which he purchased upon leaving the Swan district. His marriage took place in 1876 with Dora, daughter of the late Dr. Viveash, of Ashby, Swan, and he has a family of five sons and four daughters. JOHN VIVEASH FERGUSON, the present manager of the "Houghton" Estate, is a son of the foregoing gentleman, and was born in the Swan district on May 25, 1877. He pursued his educational studies at the Perth High School, and upon the close of his scholastic career became associated with the wine-making industry under his father, and obtained a valuable training for the calling to which he has since devoted himself. In 1904 he started on a year's travelling tour through the principal wine-producing countries of the world in order to make a study of the latest methods and ideas of manufacture. With this object in view he visited California (U.S.A.) and France, and gained much valuable information in regard to the industry, which has proved of considerable benefit both in the culture of the vines and converting the juice of the grape into fermented liquor at the "Houghton" cellars. In 1911 Mr. J. V. Ferguson married Mildred, daughter of the late Mr. William Barnes, of Guildford.

WILLIAM MINCHIN, who owns the "Spring Park" property in the West Swan district, is the eldest son of the late Mr. Alfred Minchin, of Hampshire, England, who came to Western Australia with his parents in the ship "Caroline" on October 12, 1829, at the age of four years. The family, which was among the first free settlers to arrive in this State, took up land on the Swan River, near Guildford, and the gentleman under review was born in this neighbourhood on July 30, 1851. He received his education locally, and upon leaving school followed in

his father's footsteps in the farming industry on the home property, in the development of which he continued to assist until the failing health of his father compelled his retirement from active work, when the son took over the management of the farm on his own account, and has remained there ever since. The area of the holding covers about 160

Bartletto, Perth.  
Mr. WILLIAM MINCHIN.

acres, the soil being partly of a sandy nature and partly a good loam. This has been cultivated with good results, about 60 acres being cropped with hay, while in a six-acre orchard vines, apples, and stone fruits flourish. Mr. Minchin has been a successful exhibitor of field and garden products at the Guildford annual shows, having secured first prize for chaff on several occasions and various honours in the vegetable section. He runs a flock of crossbred Shropshire and Lincoln sheep, the carrying capacity of his paddocks being about one hundred, which is the limit of his present flock. The homestead, a solid building of sun-dried bricks, was erected about fifteen years ago. Mr. Minchin has taken an active part in local administration work, and since 1908 has served as a member of the Swan Roads Board. He married in May, 1880, Mary Louisa, daughter of Mr. David Hitchcock, of Swan, and has a son and four daughters.

HENRY HARDWICK, who owns the "Baskerville" property in the Swan district, is a native of Birmingham, England, being a son of the late Joseph Hardwick, of that city, where he was born on January 28, 1858. For scholastic instruction he attended the Sutton Coldfield Grammar School in Warwickshire, and upon leaving that institution served his indentures to the engineering trade. Subsequently, after four years' practical work, two of which were spent in his uncle's foundry, he was articled to the survey profession, and during this time was resident at Wolverhampton, completing three years at this centre before he left for London. In the world's metropolis he took up auctioneering for two years, at the end of which period, in 1882, he left his native land for Australian shores. Landing at Melbourne he became connected with the Railway Department as surveyor, and filled this position for two years. Resigning from the Government service he purchased a farm in the Wimmera district and worked this property for about a year, when, deciding on a new project, he disposed of his interests and opened in business as a stone merchant, carrying on on his own account until 1885. In that year he made his

advent to Western Australia, and almost immediately after arrival continued his journey to the goldfields, where he spent a few months in mining pursuits. Turning attention

MR. HENRY GUY VERNON HARDWICK.

once more to farming life Mr. Hardwick next came to the Swan district, where he entered into possession of his present property, which originally was owned by the late Walter

Padbury, with whom he was connected by marriage. The estate consists of 1,500 acres of good arable soil, and is situated about seven miles from Midland Junction, on the Gingin Road, with the Swan River forming its western boundary. It is completely fenced and subdivided with pig-proof fencing, and the cleared portion of 400 acres is cut up into paddocks of from 20 to 30 acres in extent, all of which have been brought under cultivation. The crops are sown chiefly for the production of manger hay, which is greatly in demand by the racehorse owners and trainers in the district, and has proved a very payable proposition, being at the present time the biggest branch of industry carried on at the farm, a ton of hay to the acre being the average yield. Another department of work is the fruit orchard, covering about ten acres of ground, where luscious fruits of different varieties testify to skilled care and attention, and a large crop of apples is garnered annually. Mr. Hardwick recently has relinquished cattle and dairy produce operations, and is directing his energies more seriously to horse-breeding. He has met with considerable success in producing good representatives of the medium-sized

*Photo by C. E. Farr.*

"BASKERVILLE," RESIDENCE OF MR. H. HARDWICK, SWAN.

draught type from a superior stamp of mare of Victorian pedigree, and at the present time has about thirty horses and foals on the estate. Sheep-raising is also carried on, 500 sheep of the merino and Shropshire cross finding excellent grazing pastures on the uncultivated portion of the property, and among the flock some especially superior rams and ewes may be noted. The Swan River flows for a considerable distance through the property and provides watering-places for the stock, the sea salt, which during several months of the year proves such a drawback to its utilization farther down, never being found so far up its course as where it enters the "Baskerville" area. The homestead is built of brick, and was erected about the year 1896. It is a substantial and comfortable structure, in which all modern and up-to-date conveniences may be found, an excellent water supply being laid on throughout the whole house from a fresh-water well near by, which is about 30 ft. deep, and provides beautiful sparkling water. About a quarter of a mile distant from the homestead are the outbuildings, consisting of a stable with eight stalls, and cowshed 120 ft. by 22 ft., a barn built of brick 60 ft. by 22 ft., a hayshed 90 ft. by 44 ft., and other structures. Present on the place is an 8-h.p. engine, which recently has been superseded by

the steam chaffcutter owned jointly by Mr. Hardwick's three sons, by whom he is greatly assisted in the work of the farm. The Messrs. Hardwick are all engaged in agricultural enterprise, and possess large

*Bartleto,* *Perth.*  
MR. GERALD PADBURY HARDWICK.

interests in the wheat-growing areas of the State, the gentleman under review holding in trust for his youngest son, who has not yet entered upon active business

pursuits, 2,000 acres of land adjacent to the properties owned and worked by the Hardwick Brothers. Mr. Hardwick married in 1885 Caroline Ruth, daughter of Mr. Thomas Payne, of Victoria, brother-in-law to the late Walter Padbury, of Western Australia, and his family consists of the four sons above-mentioned and one daughter. HENRY GUY VERNON HARDWICK, the eldest son of Mr. Henry Hardwick, was born at Footscray, Victoria, in the year 1886, and received his education at the Geelong College. At the close of his scholastic career he entered mercantile life in the office of the Western Australian Bank at Perth, and after a year in this institution transferred his services to the National Bank in the same city. Subsequently he was sent to the country branches, and was stationed at Wagin and York, being promoted to manager of the Wyalcatchem branch. In 1901 he resigned from the bank's service in order to devote himself to agriculture, and with this end in view acquired 2,000 acres of land near Mount Marshall, to which he gave the name of "Giggirmilla," and which, though lying 20 miles distant from the nearest railway station, is close to the newly surveyed track. The whole of this fine property lies on good gimlet and salmon-gum country, which is very specially adapted to

*Photo by C. E. Farr.*

VIEW OF THE ORCHARD.

wheat-growing, and already Mr. Hardwick has completed the clearing of 200 acres and has 30 acres under crop, the remainder lying fallow. He is directing his energies to the rapid improvement of the estate, and at the present time a 1,000-yard dam is in course of construction, his only immediate supply depending on the Government well about five miles distant. Mr. H. G. V. Hardwick—who still assists his father in the management of the home farm and spends a portion of his time on each property—is fond of outdoor sport, and takes part in cricket and golf as opportunity offers. GERALD PADBURY HARDWICK is the second son of Mr. Henry Hardwick, and was born at Footscray, Victoria, in 1887. While still a child he was brought by his parents to Western Australia, and acquired his scholastic education at the Guildford Grammar School. Subsequently he received his initial experience in agricultural pursuits under the guidance of his father on the home farm, and having obtained valuable experience in this way in 1909 launched out on his own account in partnership with his younger brother, with whom he conjointly owns 4,000 acres of good, wheat-growing territory in the Mount Marshall district, which is known as the "Raydowns" Estate. The ringman's axe has been busily plied on the timber, and 300

acres have been cleared and brought under cultivation, the present crop covering 200 acres, while the residue is fallow land. Good results have been attained, the average yield of

Bartlett,

Perth.

MR. ROY STANLEY HARDWICK.

wheat being reckoned at 20 bushels to the acre, and there is still much virgin country covered with gimlet and salmon-gum which, in course of time, will be transformed into

waving fields of wheat. The soil is a good red loam, and under the skilled methods employed by these experienced agriculturists is likely to prove a mine of wealth in the not too distant future. The partners have their scheme of improvement in view, which is already being carried out, and includes the building of a tank or dam for the conservation of water, the extent of which when completed will be 1,000 cubic yards. A large shed also has been erected, measuring 100 ft. by 50 ft., and the stable is 60 ft. by 20 ft., eight horses being employed in the work of the farm. The steam chaffcutter already referred to is requisitioned in the season for turning out quantities of chaff on the Mount Marshall properties, being transported to "Baskerville" in time to meet the necessities of the later harvest there. ROY STANLEY HARDWICK, like his brother, is a Victorian by birth, and attained his majority in the year 1912. He was educated at the Guildford Grammar School, and following in the footsteps of the other representatives of the family has chosen the free life of the soil. At the early age of eighteen he became concerned in independent enterprise in conjunction with his brother, Mr. G. P. Hardwick, as above stated, and has every reason to look forward to a highly prosperous career.

HAYSTACK ON THE "BASKERVILLE" ESTATE.

"SANDALFORD." This well-known estate is situated about three miles from the town of Guildford, its boundaries being the West Swan Road, the Middle Swan Road, and the Swan River. It is part of the original property held by the late Capt. J. S. Roe, R.N., grandfather of the present owner and the first Surveyor-General of Western Australia (1829-71), who accompanied Governor Stirling when he landed

accompanied the navigator, Lieut. Philip P. King, R.N., F.R.S., F.L.S., in an expedition sent out by the British Admiralty in 1817, with

in 1836, he penetrated as far as Lake Brown, near the western boundary of the present Yilgarn goldfield, and discovered many of the salt lakes,

CAPTAIN J. S. ROE, R.N.

at Fremantle in 1829. This veteran of worthy memory, who was a man of great energy and of a scientific turn of mind, had previously

Photo by C. E. Farr. MR. J. FRED. ROE'S RESIDENCE, "CAVERSHAM"

the object of completing the survey of the north and north-west coasts of Australia. After receiving the appointment of Surveyor-General to the infant colony—which he held for forty-two years—he was foremost in the early endeavours to explore the country, and in 1830 led an expedition in the vicinity of Cape Naturaliste, Point Leschenault, and over the territory between the Collie and Preston Rivers. Subsequently,

which form a feature of the table-land of the interior. It is interesting to note that the late Captain Roe was the first Chairman of the Western Australian Bank, of which his son, the late Mr. James Broun Roe, who filled the position of principal sheriff of the colony, afterwards was a director. Mr. J. B. Roe, father of the present proprietor of "Sandalford," was born in Perth on May 11, 1833, and received his

Photo by C. E. Farr.

VIEW OF THE ORANGE GROVE AT "SANDALFORD."

scholastic training from the Rev. J. Bardett Wittenoom, the first chaplain in the service of the colony, and at the best schools then established.

MR. JAMES BROUN ROE.

In 1851 he entered the Survey Department, and subsequently became second officer in command in a Government exploration party to the Murchison district under the leadership of Mr. T. F. Gregory. Starting in the spring of 1858 the expedition, during its three months' trip, followed up the Murchison River for several hundreds of miles, and striking across to the Gascoyne traced it to the present site of Carnarvon, discovering large tracts of

good country *en route*. In 1865 Mr. Roe was gazetted Registrar of Births, Marriages, and Deaths, and in 1877 was appointed Sheriff, to which offices in 1886 the duties of Inspector of Prisons were added. He died in February, 1907, after a busy and useful career. JOHN FREDERICK ROE was born in Perth on June 2, 1870, his mother being Alice, daughter of the late Mr. G. F. Stone, at one time Attorney-General of Western Australia. At the conclusion of his education at the High School, Perth, he joined the staff of the Western Australian Bank at Perth, and continued in the service of that institution for seven years. In 1893 he resigned and proceeded to the eastern goldfields, but met with only indifferent success as a result of his prospecting and mining endeavours. Returning to the capital he became connected with the Mines Department of the State, where he remained until 1900, when he decided to turn his attention to horticulture on the "Sandalford" property, which he had inherited from his father. The original estate consisted of 3,000 acres, and was taken up by the late Captain Roe in the early forties. About 1,500 acres of this afterwards was sold by the late Mr. J. B. Roe, and the remainder was continued on lease to various tenants, the estate being divided into four sections, each with its homestead and area of land for farming purposes. The portion of the estate appropriated by the gentleman under review for development

as an orchard and vineyard consists of 70 acres, and is situated on a strip of land which practically forms a peninsula, with the river flowing round two sides of it. The "Sandalford" property possesses in all a mile and a quarter of river frontage, and the whole of the southern portion of this peninsula-like strip is taken up by Mr. Roe's orchard operations, covering, with the vineyard, an area of 50 acres.

Bartletto.

Perth.

MR. JOHN FREDERICK ROE.

Its position makes it highly favourable for convenient irrigation, and it is Mr. Roe's intention to inaugurate an extensive scheme for utilizing the river waters for this purpose, except in the first few months of the year, when the presence of salt in the stream which makes its way up from the sea, renders the water unfit for the uses of irrigation. In the vineyard Mr. Roe found the trellis system of vine culture highly successful, and now consistently follows this method, producing grapes of excellent size and flavour. Many varieties are grown, the chief crop being obtained from the popular Muscatel, to which a large area of the vineyard is devoted, and in addition the Red Prince, Whortley Hall, Lady's Finger, Red Malaga, and Sultana come to perfection, together with the Zante currant, to which

Photo by C. E. Farr.

"ZANTE" CURRANTS GROWN BY MR. J. FRED. ROE.

Mr. Roe is giving a good deal of attention. He finds there is a constant demand for the last-mentioned grape and the Sultana, both of which bring high prices in the local markets. Until 1911 he contented himself with supplying the Western Australian trade, but in that year saw his way clear to export profitably to the London, Singapore, and Colombo markets, the best varieties for this purpose proving to be the Red Malaga and Red Prince, both preserving their condition well during transit and commanding good returns at the foreign ports. Mr. Roe is a large cultivator of citrus fruits, certain varieties of which ripen early in this district, and in size and quality compare favourably with those grown in the more southerly localities. Among these are the Navel and Mandarin orange and the Lisbon lemon, which find a ready sale at the Perth and Kalgoorlie markets. Experiments have been made on a small scale with the growing of lucerne, but this branch of the industry has not so far been developed to any large extent. The homestead, a recent erection, is built of brick with cement facings, and stands on an elevation commanding a splendid view of the vineyard and orchard, with the river beyond and in the background the Darling Ranges. It consists of seven rooms, and has water laid on throughout from a large fresh-water well on the property. The commodious outbuildings are situated a little distance from the dwelling-house, and include, besides stables and chaffhouse, convenient packing-sheds for the handling and storage of the fruit. Mr. Roe is a member of the Royal Agricultural Society. In earlier days he was a keen follower of aquatic sports, and still retains his membership in the Royal Perth Yacht Club. He married Maeva, eldest daughter of the late Mr. A. W. Hassell, of Western Australia, and has a son and a daughter.

**SAMUEL HENRY VIVEASH,** who owns and resides on the "Wexcombe" property in the Swan district, is a son of the late Mr. S. W. Viveash, M.R.C.S. and L.R.C.P.

(Lond.), who with his wife and child and a party consisting of his brother, Mr. R. Viveash, brother-in-law, Mr. Y. Smith, and servants, including a married couple, nurse-maid, shepherd, carpenter, and two

DR. S. W. VIVEASH.

other men, left England by the ship "Britomarte" in June, 1838. After a trip lasting nearly six months, and during which they stayed three weeks at the Cape, the vessel arrived at Fremantle in December of the same year, upon the eve of the departure of Governor Stirling, and

the Viveash family was able to attend the farewell ball given by him. Proceeding to the Avon district, the three brothers took up a tract of country in which are now comprised "Yangedine" and "Hais-thorpe," Mr. S. W. Viveash and his family residing for a year at "Woodlands" until the erection of a stone structure, intended ultimately to be used as a barn, was completed on the property, and this building for a few months formed the family abode. A stone homestead was soon built, and so substantially was it constructed that even at the present time, after a lapse of seventy-two years, it serves as a dwelling-house. Dr. Viveash was the only medical man in a very wide neighbourhood, and his practice even extended as far as the Swan district, so that after his departure from the place in 1842, when he took up his residence at Swan, he still travelled to York and Toodyay to attend special cases. A year was spent at Houghton, at the end of which time "Wexcombe" was given up by his cousin, Mr. Tanner, and the Viveash family took over the estate and continued there for ten years. Mr. Viveash then purchased "Ashby," now a part of "Wexcombe," from Mr. Marshall McDermott, and resided there until the time of his death, in June, 1880, interesting himself especially in

Photo by C. E. Farr. MR. S. H. VIVEASH'S RESIDENCE SWAN.

gardening and planting a vineyard on the property. He occupied various public offices, being the first chairman of the Royal Agricultural Society, and as far back as 1844 was appointed resident magistrate of the district. Upon the establishment of a convict depôt at Guildford he received the appointment of Government medical officer, following which he altogether relinquished private practice. For thirty-six years he faithfully discharged his magisterial duties, resigning the office in 1870, the last ten years of his life being spent in retirement at "Ashby." Mr. S. H. Viveash was born in the homestead where he now resides on March 6, 1849, and received his education at a private school kept by a Mr. Logue, about three miles from "Ashby." Upon leaving this institution he occupied the position of Clerk of the Court at Guildford for three years under his father, and upon resigning this office was associated with farming pursuits on the "Katrine" Farm, owned by Mr. Viveash, sen., at Newcastle and Northam, now the property of a nephew of the subject of this article. He had passed a couple of years on this station when a conversation with a Mr. Wilkinson turned his thoughts to the north-west, and he gained his father's permission to seek his fortune in the newly-opened country. In conjunction with Messrs. Wilkinson and Middleton he purchased 600 sheep and three horses, and these were placed on board a chartered vessel

and a start made from Fremantle under most auspicious conditions, which unfortunately were not lasting. Soon after leaving Fremantle, in March, 1865, their troubles began, the vessel being becalmed for a day and a night, and after losing 180

MR. SAMUEL HENRY VIVEASH.

sheep they sent 100 more ashore, and continued their voyage to Cossack with about 300. The trip took nine days, and upon arrival at their destination the sheep were landed by means of boats, while the horses swam ashore. A few hardy pioneers had preceded the party to this region, namely, Messrs. Hall (manager for

Mr. Wellard), Padbury (of "De Grey" Station, and Withnell (of Roebourne), besides Mr. A. R. Richardson's party, consisting of Messrs. A. E. Anderson, McK. Grant, J. Edgar, and the two Richardson brothers, who had arrived just a week previously. The only waterhole known was at Roebourne, a distance of nine miles, and thither the stock was taken in the first instance. Acting upon the advice of Mr. Withnell, they then proceeded 24 miles inland, and established the "Andover" Station (now owned by Mr. John Meares) at the waterhole Intharoonca, near which they erected the homestead which remains standing to the present day. For twenty-four years Mr. Viveash made his home in the north-west, continuing the development of the station in conjunction with Messrs. Wilkinson and Middleton, and finally taking it over on his own account. His initial experiences were discouraging, the first season being an exceptionally trying one, with practically no rainfall, the result being extreme hardship for both man and beast and much of the stock dying. Matters improved steadily, however, and the 300 sheep proved the nucleus of a fine flock, which as time went on increased to the number of 10,000. In pleasant contrast to the experience of many of the early settlers, Mr. Viveash had little or no trouble with the natives, who always displayed a very friendly spirit, and he frankly declares his indebtedness to them for their assistance in the station work, ascribing a large share of the success of his operations to the efficient aid rendered by them. One of his reminiscences of those early days is that the idea of killing a sheep for food was never so much as entertained by him, the party subsisting entirely on tinned provisions, with such variety as they could secure by means of their rifles on the surrounding plains and pools. Being forced to depend upon the arrival of ships with supplies they resigned themselves to much uncertainty as to the date of replenishing, and often suffered considerable shortage before the welcome consignments came to hand, on one occasion

being without flour for three weeks. About this time matters looked so serious that Mr. Charles Harper—with whom Mr. Viveash was then associated—and Mr. Farquhar McCrae made the journey overland to Perth, the trip taking a month to accomplish. It was in conjunction with Mr. Harper that the gentleman under review subsequently built a boat and engaged in the pearling industry for three seasons, this firm being the first in the north-west to employ native divers for obtaining the pearl shell. The vessel was called the "Amateur," and prior to launching out on this enterprise Mr. Viveash rode on horseback from Ashburton to Port Hedland, a distance of about 400 miles. Success attended the venture, which proved sufficiently profitable to cover all the expenses of the expedition and provide a balance toward the carrying on of the station. The seventeen natives employed in the summer on the pearling-grounds were, in the winter, equally invaluable on the station shearing-shed and in handling the sheep, which were rapidly increasing in numbers. Two years after his arrival in the district Mr. Viveash made his first visit to Perth, travelling by the "Mystery," a sailing ship which visited Cossack at irregular intervals, and securing a passage only by finding three weeks' provisions for the boat. As events transpired, these ran short, the voyage extending over thirty-five days, and had they not fortunately encountered the ship "Monarchy," which supplied them with meat and biscuits and a cask of water, results might have been serious. Many vicissitudes were experienced during the long period of Mr. Viveash's residence in the north-west, but steady progress was made, and in 1889 he decided to dispose of his interests and return to the Swan district. Taking up his abode in the old "Wexcombe" homestead—situated about two miles from Midland Junction, and originally built by Mr. Tanner in 1840, the material used being rammed earth—he turned his attention to mixed farming pursuits. With the adjoining property of "Ashby" the estate comprises 1,400 acres, the cleared portion of 250 acres being devoted to the tillage of wheat and oats and to fruit culture. The 15-acre vineyard is carefully kept and produces fine crops of grapes, and an orchard of five acres is planted with stone and citrus fruits, and a

large number of apples. It is worthy of note that two of the orange-trees were grown in a tin at Northam for fourteen years, and when planted out at "Wexcombe" the root was split in two, and has produced a couple of splendid trees, which bear a heavy crop of oranges. About 70 tons of hay are grown every year, with oats for horsefeed and wheat for the pigs and fowls. A portion of the land is applied to grazing purposes, about 300 sheep of the merino type forming a nice little flock, and the breeding of draught horses is carried on, a Suffolk Punch stallion, bred from imported stock, being used as sire. The estate has about two miles of river frontage, and is plentifully supplied with fresh water from a number of wells on the property. Stables, sheds, and barns have been erected at a convenient distance from the homestead, which stands on elevated ground and commands a pleasant outlook over the river. Mr. Viveash has always taken a deep and active interest in the public life of the district, and for nineteen years has occupied a seat on the local Roads Board, filling the chair for three years. He is a successful exhibitor and a committeeman of the agricultural society, and shortly after his return to the Swan district was gazetted a Justice of the Peace. In 1880 he married Ellen, daughter of Mr. Symon Meares, of York, whose father was Captain Richard John Goldsmith Meares, of the Second Life Guards, a veteran of Vittoria, Toulouse, and Waterloo, and who was present at the siege of Paris. Subsequently this gentleman came to Western Australia, and was appointed resident magistrate at York, where he died in 1861. The result of this union was a daughter (still living) and a son (Frank), who died in 1895 in his fourteenth year. Mrs. Viveash died in 1909.

JOSEPH LIONEL LOCKYER, orchardist, Glen Hampton, Armadale, was born at Northam, Western Australia, in 1869 and is a son of Mr. Joseph Lockyer, of Kent, England. He received his education at the State school, Perth, and at the conclusion of his studies entered the employ of the Bon Marché establishment as cashier, which position he retained for about twelve months. At the end of this period he became identified with farming pursuits on his father's property at Northam, and continued

there until 1884, when he purchased a property belonging to Mr. Churchman at Kelmscott. This consisted of 3,500 acres, and for some time he carried on business as a grazier, running cattle, sheep, and horses on his pastures and devoting a portion to purposes of cultivation. In 1909 Mr. Lockyer acquired his present property, embracing 86 acres, about half of which area he had under crops and fruit-trees, the remainder being used for grazing. He may be regarded as one of the pioneers of the district, the settlement at Armadale at the time of his arrival consisting of two dwellings. It was at that time under the control of the Cannington Roads Board, and Mr. Lockyer was one of those appointed with the increase of population to canvass the district with the object of obtaining signatures to bring before the Government the wish of the community for a separate administration. This was granted and Mr. Lockyer was third chairman of the newly-formed body, holding the position for five years. He was instrumental in the formation of the local agricultural society and filled the secretarial office in connection with this organization for two years, also acting as president at intervals, covering in all about eleven years. He occupied a seat on the Kelmscott Hall Committee for ten years and assisted in bringing about many improvements in the town and district. He was the organizer of the present football club at Kelmscott, of which he was president for two years, and captained the local cricket team for a similar period. Mr. Lockyer married Christina, daughter of Mr. James Ferguson, of Melbourne, and has a son and a daughter.

THOMAS BRODIE POW, vigneron and retired mercantile captain, "Walland," West Swan, is a son of Mr. William Pow, of Dundee, Scotland, and was born at Prestonpans. He received his education at Dundee, and upon leaving school was apprenticed to marine life in the sailing vessel "Uxine," which subsequently was sold to the well-known London house of G. Duncan & Co. After four years' service, during which he voyaged to India and the colonies, he took his certificate as second mate, and for nine months was identified with the "Karrachie," which he joined at Greenock. He sailed in the brig "Lady Alicia" from Greenock to

Fremantle in 1865, and having visited Melbourne returned from that port to Scotland by the "Moravian." In the year 1868 he secured his first mate's ticket at Dundee, and sailed in that berth from Glasgow, in the "Abbey," bound for Brazil. Subsequently he became chief officer on board the "Abyssinian," trading to the Black Sea, and after remaining about two years with this vessel served as quartermaster on the ves-

Bartletto, Perth.

seis "Nevada" and "Caspian," trading from Liverpool to New York and Baltimore, and in 1871 took his master's certificate at Dundee.

Photo by C. E. Farr. MR. T. B. POW'S RESIDENCE, WEST SWAN

Captain Pow had several berths as first mate before obtaining his first command, serving in that capacity on the "Natal Star" trading

to Port Natal, the "Lady Macdonald" at Port Elizabeth, owned by Messrs. G. Duncan & Co., and the "Umgeni," trading between London and Natal. He came out to the

commanded the barque "Rose," owned by the same firm and trading to North America and China. Captain Pow continued with this ship for about four years, and after

colonies again in 1875, and in 1882 was appointed master of the "Lily," a vessel trading round the South Australian coast, and two years later was appointed to command the "Iris," sailing from Newcastle, New South Wales, to Fremantle, Western Australia. After four years with this boat he had command of the barque "St. Lawrence," 1,000 tons register, and on his way to Fremantle was totally dismantled off the Leeuwin, and was forced to put into

relinquishing the connection directed his attention to trawling round the coast on behalf of the Western Australian Government, subsequently carrying on operations for a private company. He held several commands until 1905, when he retired from marine pursuits after forty-five years' service with the rank of master mariner, and in that year became engaged in his present industry at "Walland," in the West Swan district. As the initial step he purchased the freehold of a portion of the "Priory Park" Estate, situated on the West Swan Road, about three miles from Guildford, and embracing an area of ten acres. The soil is a rich, sandy loam, with clay subsoil, and has proved itself specially adapted to the culture of vines and other classes of fruit. The vineyard stretches over almost the whole of the ten acres, and is devoted chiefly to the cultivation of grapes for drying purposes, the principal varieties including Zante currants, black, red, and white muscatels, the Wortley Hall, and Waltham Cross, besides the Flame de Cay and Lady Fingers, and other table grapes. Captain Pow has adopted the trellis system of culture for his vines, and at the present time is preparing an irrigation scheme to water the vineyard from a fresh-water well on the property. He personally superintends the drying of the fruit, and his

brand of currants, "T. B. Pow, Walland," is becoming very favourably known in the local markets, to which so far he has confined the sale of his dried products. His table grapes also find a ready sale at Perth and Kalgoorlie, and he has always been successful in obtaining the highest prices for his consignments. He is an exhibitor at the annual shows held by the Royal Agricultural Society. The homestead at "Walland" erected recently is a beautiful residence of six rooms, with water laid on from the wells, and about a mile distant Captain Pow owns a paddock of 15 acres, which he uses for grazing horses. In 1886 he married Jane (now deceased), daughter of the late Mr. Robert Elliott, of Devonshire, England, and has three sons and a daughter surviving.

"DERRYNASURA." Sir Arthur Stepney's winemaking enterprise. This fine vineyard property is situated to the north-east of the township of Armadale, on the western aspect of the gently rising country which betokens the approach of the foothills of the Darling Ranges. It comprises 280 acres of land, the soil—a rich, sandy loam mixed with ironstone gravel—being admirably adapted to the cultivation of wine grapes of different varieties. The Narrogin brook flows through the property, forming a valuable means

of irrigation all the year round, and in its vicinity is the orchard and orangery comprising 12 acres. The vineyard covers almost a third of the estate, having been considerably enlarged by Sir Arthur Stepney, an English baronet, who, since buying it in 1897, has judiciously developed its resources. Only the choicest vines are planted, and as the industry is confined to wine production no table varieties are grown, the grapes used in the manufacturing being shiraz, carbonet, and malbec, and the chief wines produced are port, claret, and sherry. The hillside has been excavated for the construction of cellars specially designed for coolness and ventilation. They are very substantial structures and present the appearance of a terraced erection of four storeys, one lying behind the other and following the slope of the hill. They are all well ventilated from the roofs and side on the up-to-date principle of double doors, by which means a cool, even temperature is maintained even in the hottest days of summer, the dark-claret cellar never registering higher than 68 degrees. Into the top storey of the series is received the new season's yield of grapes, which are passed through a Mabile Brothers' crusher and stemmer, the winepress working on a tram which serves the fermenting-vats wherein the must is left for the requisite period. As a preventive of deleterious microbes all the vats, presses, and machinery are treated with a coat of parafin. The racking of the wine is carried on through pipes

wines are kept. These are not less than four years old, and as storage after racking the matured wines into bottles improves the quality of certain kinds, a quantity is bottled and then stored for at least another twelve months. The vintage figures of recent years have reached 15,000 gallons per annum, representing port, sherry, claret, and hock. The "Derrynasura" wines are of beautiful colour and exquisite bouquet, and emphasize the fact that the vineyards of this State can produce wine that need fear no comparison with any other country. Mr. H. C. Sewell, who has charge of the property, has great faith in the ultimate popularity both here and in other lands of the locally manufactured wines, and Mr. H. Ullmann, the working manager, has kept in view the purpose of the proprietor in applying a large amount of capital to the development of the "Derrynasura" Estate, that it should be made a centre for wine production of the highest grade, and the whole equipment of the cellars and vineyard are indicative of this policy. The "Derrynasura" wines have been on the market for a sufficiently long period to test their quality and value as compared with the products of other cellars in the State, and there is little doubt that they will more than repay the efforts that have brought the vineyard into line with the best wine-producing industries of the eastern States.

"DERRYNASURA" VINEYARD, ARMADALE.

of irrigation all the year round, and in its vicinity is the orchard and orangery comprising 12 acres. The vineyard covers almost a third of

from cellar to cellar until the last of the terraces is reached and the product is received into the maturing cellar, where the bulk of matured

JOSEPH MARIAN, of the firm of J. & A. Marian, proprietors of the "Slavonian" Vineyard, Armadale, is a son of Mr. Steffan Marian, of Austria, where he was born in 1836. His early life was spent at sea, and when he arrived at Melbourne in 1865 he became connected with the fishing industry, continuing in this line until 1897. In that year he left the sister State for Western Australia, and after spending about four years in similar employment here took up some 60 acres of virgin country at Armadale in 1901. He immediately set to work to plant a vineyard, and in 1905 manufactured his first supply of wine, consisting of about 1,000 gallons. Since that time Mr. Marian has steadily continued the development of the industry, and has met with such success that the output of wine during the present season amounted to 8,000 gallons. Mr. Marian is assisted in the vineyard by his nephew and partner, Mr. Anton Marian.

## Pastoral.

It is a somewhat difficult matter to obtain information respecting the pastoral industry in the early days of settlement in Western Australia, which was, of course, confined to the south-western portion of the State. The development of the Murchison, Gascoyne, and other north-west sections and of the West and East Kimberley is of much later date. Casual references in old-time records, as well as the recollections of some of the older settlers, go to show that attempts were made in the very early days to establish merino sheep in the districts south of Perth. It is stated, among other things, that the Henty Bros., who afterwards settled in the Western District of Victoria, brought over a considerable number of sheep and attempted to establish themselves in the early days of the colony. After losing a great many, they shipped the balance away; and their failure did not encourage others. It is also on record that Lindsay Gordon, poet and rough rider, spent some time also in the south-west with similar results. The fact had to be faced that the country in its natural state was not suited for sheep excepting in very limited spots. The early settlers, therefore, devoted themselves to cattle, and to a certain extent to the breeding of horses, some of which became wild. The conditions were not favourable for a dairying industry, and, except for this purpose, in the absence of a market for beef, cattle are not stock which produce an annual return such as may be obtained from sheep in the form of wool. In spite of drawbacks, in these early days a considerable amount of butter and cheese was made during the spring season, the butter being salted in kegs and laboriously carted to the Perth market, where the cheese was also disposed of.

The early history of the State indicates that many efforts were made by explorers to find suitable pastoral country with open grass lands and permanent water. Nearly everywhere the result was the same, the timber was too heavy and the grass scanty, water was too scarce, or poison plants were too plentiful. Nevertheless a considerable number of settlers in the eastern districts kept sheep in comparatively small flocks under the care of shepherds, who drove their charges from place to place and camped wherever they could find food and water. It was in these days that men like the late Mr. Walter Padbury established stations in the picked spots, such as Brooklands and Ferndale on the Balingup Brook in the south-west and at Yatheroo, which has

always remained famous for its rich pastures. The rich lands of Gingin were early settled, and considerable herds of cattle were kept on the choicest spots near the coast and in various parts of the timber country in the south-west.

Later on the much richer grass country in the Victoria district was opened up by Messrs. Hamersley, Burges, and others, and the stock-feeding value of this country has maintained its reputation to the present day. Various horse-breeding stations were established particularly in the neighbourhood of Geraldton, and horses in considerable quantities were exported to India. It was not, however, until the north-west was explored and stocked that the pastoral industry assumed any considerable importance. It appears from the records published by Malcolm A. Fraser that the first settlement of the north-west district by Messrs. Padbury, Withnell, and others took place in 1863, and a little later, in August of 1864, the first shipment of wool from the north-west, comprising seven bales, arrived at Fremantle.

There are a number of well-known names connected with the early establishment of the pastoral industry in the north-west, among the most prominent being Messrs. W. Padbury, A. E. Anderson, A. R. Richardson, MacKenzie Grant, J. E. Richardson, and John Edgar. In 1865 these appear to have taken a flock of 1,600 ewes from Victoria, with horses, plant, and equipment, and landed at Cossack Roads and Port Walcott. Among the other early pioneers of this part of the State were Messrs. A. Nairn, John Wellard, Maitland Brown, John Withnell, Norman McCloud, Charles Harper, Sholl, and R. L. McKenzie. The town of Roebourne was proclaimed in 1866, at the end of which year there were forty-nine runs, with no less than a total area of nearly 4,750,000 acres. In these days what were known as free stock runs, generally consisting of 100,000 acres, were granted to settlers subject to stocking conditions. The blacks were in parts numerous and troublesome, water was scarce except along the rivers, and as there were no fences the sheep had to be shepherded. Under these conditions the fleeces were dirty and dusty, and as the sheep were generally of poor class the fleeces were light. In addition to this, wool was as low as 4½d. per lb., so that progress was slow and the profits uncertain. All honour must be given to the old pioneers, who stuck

to the country in the face of these great drawbacks.

It was not until 1878 that the paddocking system in the north-west was first initiated on the "DeGrey" Station. When we think of the wealth which has been returned from these north-west stations in more recent years, we should not overlook the enormous difficulties under which they were established. The only means of travelling was by bush track or small trading schooners of from 25 to 60 tons, which were as irregular in their trips as they were uncomfortable. It was no small task to drive a flock of 4,000 sheep from the York District up to the Gascoyne, as Mr. Aubery Brown did in 1876 when he established the "Brick-house" Station. What is now the port of Carnarvon was then practically uninhabited country. The north-west is probably the best pastoral country in the State, but like similar country in the Eastern States it is subject to occasional periods of drought, and although these are not so severe in their effects as are those which occasionally inflict losses in the south-west of Queensland and the north-west of New South Wales, they have acted as a bar to the development of the industry. During the good years, of course, the country may be heavily stocked, but in the bad years the stock die for want of feed and water. Year by year the pastoralists are continuing the work of subdivision and are providing water by means of tanks, wells, and artesian bores, and gradually minimizing the danger of loss in dry seasons in so far as the lack of water for stock is concerned.

About the same time as the north-west lands were being settled pioneers were opening up the West Kimberley country. The Roebuck Bay Pastoral and Agricultural Association, Limited, with a capital of £160,000, was formed about 1864, but the occupation of its area was associated with the tragic murder by the natives of three members of the advance party, Messrs. Harding, Panter, and Goldwyer. The company was not successful with sheep, and although it was found better suited for cattle the station was abandoned after some years. Very little was known of the Kimberley country until 1879, but gradually, after various exploring expeditions by John and Alex. Forrest and others had made it better known, settlement was begun, and in April, 1881, or seventeen years after the first settlers landed in that part of the country, the first lot of sheep was driven across the Fitzroy River. Among the names associated with the early settlement of the district were Messrs. Julius Brockman, Arthur Hicks, A. R. Richardson, William and George Paterson, S. R. Elliott, and Hamlet Cornish. The reports of these men, added to that of Mr. John Forrest, induced such men as Messrs. McClarty, W. E. Marmion, S. G. Pearse, Robert Sholl, N. C. Davies, Alex. Forrest, Emanuel Bros., William Lukin, F.

Monger, Rose Bros., and others to take up land and commence to stock it. We may, therefore, say that the establishment of the pastoral industry in the Kimberleys dates from 1880, since which time the flocks of sheep and cattle have continued to increase. Soon afterwards settlement was pushed on into East Kimberley, and thus the great cattle country of Western Australia was opened up. In some cases stock was taken by boat from the southern districts of the State, in others they were driven from the north-west overland. Yet more settlers brought stock by ship round the north coast from Queensland, while some, like the Duracks, drove mobs of breeding cattle from West Queensland across the Northern Territory into the Kimberley district.

During the past six years a great and very important development of the sheep industry has taken place in the south-west of the State, but it is safe to say that the average man does not yet realize its rapid growth or its influence on the production of wool, the supply of the metropolitan and goldfields meat markets, and later on the export trade in sheep and lambs. The movement is yet in its infancy, but sufficient progress has been made to render it necessary to give it more than passing notice.

Very definite mention has been made of the difficulties experienced by the settlers in the Crown-colony days in trying to establish a sheep industry in the forest country south of Geraldton and from the coast eastward towards the goldfields. Three of the chief difficulties may be summarized:—

- (1.) The absence of open grass lands, where water was abundant, in the redgum and jarrah country;
- (2.) The combined scarcity of feed and water in the whitegum, York-gum, and salmon-gum country of the tableland east of the Darling Range; and
- (3.) The presence of a number of peculiar plants, the herbage of which was poisonous and caused great mortality amongst the stock.

Coincident with the new era in agriculture, following the great gold discoveries of the "roaring nineties," these difficulties began to be overcome. It must not be concluded that the new movement actually commenced then, because a few advanced men, like the late Charles Harper and F. H. Piesse, with full knowledge of the difficulties combined with a faith in the future, preached the gospel of ringbarking, cultivation, and water conservation while as yet the Cinderella State was experiencing troubles and receiving the reproaches of her more fortunate sister colonies. They were laughed at and called visionaries as a matter of course, but when the time was ripe for the new era they were able to demonstrate their theories and were among the most vigorous of the workers who brought it about.

In the great wheat belt the country is now carrying more sheep than it did when sheep and wool were its agricultural products; but for every animal now kept there will in a very few years be ten, and in yet a few more the tens will become hundreds. The lesson is now learned, that by ringbarking, clearing, cultivation, and water conservation our eastern forest lands will not only produce golden grain equal in quantity and quality to any Australian State, but will grow magnificent wool and mutton.

Hundreds of thousands of acres of "poison" lands have been conquered and proved to be capable of producing some of the best merino wool in the Commonwealth. It has been proved that the initial work of ringbarking, "poison" grubbing, and water conservation can be carried out at a cost which still leaves the land

part of the country has been touched, and even the farms that now carry a sheep to the acre are equally capable, with further development and improved methods, of carrying five.

Another important phase of the new era has been the establishment of stud flocks. In the York, Northam, and great southern districts there are now many excellent studs of the best merino sheep procurable in the Eastern States, and the progeny is showing, first, that the country is suitable for the industry, and second, that the owners know their business and are determined that Western Australia shall not be dependent on South Australia, Victoria, and New South Wales for stud rams and high-class breeding ewes. It is only a few years since nearly all the leading winners at the Royal Show were imported animals; now they are nearly all

*Photo by C. W. Walker.*

TYPICAL VIEW OF COUNTRY IN THE KIMBERLEY DISTRICT ("KIMBERLEY DOWNS" STATION).

among the cheapest in Australia if valued on its productiveness and the annual return it will eventually give.

In the still more heavily timbered redgum and jarrah lands a similar movement has been going on, and there are now many properties which twenty years ago were considered quite unsuitable for sheep and on which only a short time since a few hundred could be carried through the winter, which now carry a sheep to the acre, and are able to fatten and market as many more prime fat crossbred mutton and lambs through the scarcest season of the year. The land is the same; the difference is due to development and cultivation. But while it is gratifying to be able to speak of what has already been accomplished, it is equally pleasant to think of the future, because all who are familiar with the country are aware that the most that can be said is that a beginning has been made. Only a fractional

locally bred. Fine studs of Lincolns, Border Leicesters, Leicesters, Romney Marsh, Shropshires, and the various Downs breeds have also been established, and visitors to our shows freely admit that our breeders are going in for the best that can be produced and more than capable of holding their own with the pick of the flocks of the older States.

Summed up, then, it may be stated with pride and confidence that while our north-west is, and is likely to remain, the centre of our great pastoral industry, the agricultural areas, with their fine climate and reliable rainfall, will in a year or two produce all the mutton and lambs required for local consumption, and will in a short time support a large export meat trade. They will also provide the stud animals for the north-west and prove no small factor in our great wool industry.

The late G. J. BROCKMAN. The name of George Julius Brockman is one that will be forever linked with the history of the Western Australian State in the earlier stages of its development. His chief heritage, a spirit of enterprise and indomitable pluck, which carried him through vicissitudes under which a weaker nature would have given way, he found in the country of his birth, a sphere which offered sufficient scope for the exercise of every quality of grit and endurance with which he had been endowed. Born at Guildford, on the Swan River, on January 2, 1850, he was the seventh son of the late Mr. Robert Brockman, a one-time settler of the Lake Bambon district, near Gingin. Mr. Brockman's boyhood was spent in this neighbourhood, the country consisting of a sandy plain, but well watered and abounding in kangaroos, which formed the chief meat supply, and here occurred the first of his many hairbreadth escapes from destruction when he was almost burnt to death playing with fire. From Lake Bambon the family moved to Minigara, north of the Moore River, a locality situated about 100 miles from Perth and 130 miles south of the then farthest settlement to the northward. This was the present Geraldton, then called Champion Bay, after the British ship "Champion," sent out by the British Government to search for the sailor marooned there twenty years before, and about 1859 Robert Shaw was employed by the Western Australian authorities to blaze a track from Minigara to the coast settlements, which were pioneered by Messrs. Burges, Hamersley, Phillips, and others. The new bush home of the Brockman's was situated on a swamp on a stretch of unbroken sandy plain reaching from Gingin to the Irwin River. A mud house was built, to which was added a dairy and a small flour-mill, where the home-grown wheat was ground for family use, the surplus being sold in Gingin. Rye was also cultivated and all kinds of vegetables grown, while a flock of sheep thrived well, but was prevented from increasing in payable numbers by the dingoes, which were very numerous. At "Gnumbung," a station situated 30 miles distant in a northerly direction, cattle and pigs were kept, the latter proving a profitable investment. Of plain food there was plenty, and good sport was provided by wild duck, pigeons,

cockatoos, emus, and kangaroos, which abounded in great numbers. In 1863 Mr. Brockman, sen., took his family farther north to a tract of land which he rented on the Greenough River, and here young Brockman had another narrow escape from death, a mud gable crashing through the roof on to his bed during a violent storm. At the age of sixteen he left home and rode 400 miles to Busselton, with all his worldly goods on the saddle, and after working three years for a Mr. Gale, who paid him 30s. a month, he took a contract to hunt wild cattle on the Donnelly River, 80 miles south of the port. The country was very densely timbered and the cattle fat, wild, and cunning, so that eventually he relinquished the unequal odds and took a position as

Bartletto, Perth.  
MR. GEORGE JULIUS BROCKMAN.

foreman of Mr. H. C. Prinsep's stations "Henty" and "Prinsep Park," near Bunbury. Hard work and little compensation awaited him in this service, and he was glad to accept an offer to exterminate wild cattle on Mr. A. P. Bussel's run on terms of equal shares. Twelve months passed in this rough life, but he persevered, hoping to earn sufficient to buy a few horses and cattle and return to the north. About this time, however, the pearl fisheries at Shark Bay were discovered, and a general rush was made for that region, which Mr. Brockman also determined to reach. The story of his journey thither strikingly illustrates the courage and resourcefulness which marked the whole of

his career. In 1872 his half-caste discovered a teak log washed ashore, and having shaped out of this a 14-ft. boat made a sail of chaffbags and launched her for a trial trip upon the river. Mr. Brockman tested the capacity of the craft and purchased her, put out to sea, and after sailing all day among rocks finally landed on the sandy beach at Hamelin Harbour. In company with his brother he continued his voyage to Busselton, calling at Margaret River on the way, and from Busselton sailed alone to Bunbury. He knew nothing of sailing and was without ballast, being entirely at the mercy of his bag sail. Keeping close in, he got into breakers and was thrown on shore, where, using oars for rollers, he pulled the boat high and dry, and on the following day launched her again and reached the port safely. Here he had a new set of ribs added to his craft, which he named "White Witch," and having ridden 60 miles to Bridgetown engaged there as captain a sailor named Thomas, who walked into Bunbury, doing the whole distance in twenty-four hours. They set sail for Fremantle in the middle of December, 1874, having a great crowd of people to see them off, and landed at Fremantle at noon next day, later proceeding up the river to Perth. The 5-ton cutter which had been built for his brother, Mr. John Brockman, was here delivered into his charge, and the party, composed of Messrs. Brockman, Thomas, Withers, and Kerr, received an additional member, Mr. Saw contributing £50 and a barrel of salt meat to allow his son to join the expedition. A start was made, but some delay occurred when the vessel was stranded for three days on the bar at Fremantle, and on January 25, 1875, having laid in provisions and water, they put out to sea. While at anchor on the night of the 24th the rope slipped the big stone which served as an anchor and the boat commenced to drift ashore some two chains away. The way to safety lay over a boiling, seething reef, which was with difficulty negotiated, and drenched with spray from the breakers the gallant crew shaped for Wedge Island, where another anchor was rigged. Dongarra was gained on the 28th, and it was then discovered that the boat was leaking through being badly finished, and she had to be unloaded and recaulked, work which took two days. Arriving at Geraldton they remained

some days, and on February 20 set out for the pearling grounds, being accompanied by James Hough in a small cutter called the "Ada." The rough coast and cliffs of Dirk Hartog Island were sighted on the last day of the month, and shortly after the pearling grounds were reached, but during the height of a gale which was raging the boat stuck on a shoal, the hold filled with water, with the result that the whole of the flour, sugar, and rice was saturated and had to be carried ashore and placed in the sun to dry. A licence to pearl was taken out, and fair results rewarded the strenuous endeavour which had brought Mr. Brockman to the scene of the fascinating

planned to visit Dirk Hartog, Dorre, and Bernier Islands, and during this expedition the mainland was crossed near the mouth of the Gascoyne River. Three weeks were spent in cruising, and when the return to the camp was accomplished all had given up the wanderers for lost. Being now thoroughly tired of the life, which was not yielding sufficient compensation for its hardships, Mr. Brockman accepted a passage in the Government revenue cutter "Southern Cross," under command of Captain Walcott, who had called at the camp on his way north to take control of the pearl fisheries. At Barrow Island Mr. Brockman had the novel experience of riding a

under great hardship and difficulties, and subsequently he undertook the management of "De Grey" Station for three months, afterwards managing for Mr. Mackay during the absence of the latter on a trip to Melbourne. Before Mr. Mackay's departure two men, Messrs. Shea and Cooper, had been killed by blacks, and Mr. Brockman rode 75 miles to Roebourne to tell the news. His horse, an Arab strain, had already covered 42 miles that day, yet he arrived at Roebourne at a trot, the rider being the more tired of the two. A police party and trackers set out, and Mr. Brockman, being advised by Mr. Mackay, accompanied them. On the first day

"EURILLA," RESIDENCE OF THE LATE MR. G. J. BROCKMAN

industry. From time to time the party essayed to explore Hartog Island, and one night, having moored the boat and landed at Turtle Bay, a gale sprang up and their boat was smashed to pieces. The dinghy, however, was saved, and Mr. Brockman, with several others, rowed 40 miles round the coast to a sheep station on the Island owned by Mr. von Bibra, where the women on seeing them took fright and bolted the door, thinking them to be pirates. They were able to make themselves known, however, and after rest and refreshment pulled 30 miles across the channel and reached the pearling camp in safety. After a week's rest another trip was

M

turtle both on shore and in the water, where he had to keep its head up to prevent it from diving. In due time the vessel made Cossack, and from this date Mr. Brockman began his career as a pastoralist, with which industry his name will be for ever linked, and it was here that he considered his real life began. After visiting the town of Roebourne he accompanied Mr. Anderson, of Messrs. Grant, Harper, & Anderson, to Mr. A. R. Richardson's station "Pyramid," and continued his journey with a 50-mile ride to Mr. S. P. Mackay's station, finally arriving at "De Grey" Station at the end of 1875. A return to Roebourne was accomplished

Turner River was reached, and during the day following the bodies of the murdered men were discovered in a little hollow where they had been set upon while drinking. Shea was a powerful man, and it was evident that he had not succumbed without a fearful struggle. After interring the bodies the party tracked the natives to a spot where they had held a dance in celebration of the murder, and continued on the trail for seven days to the head of Turner River. They then crossed the ranges to Shaw River, a large tributary of the De Grey, and on the succeeding day came up with some women and children. The native wanted was in hiding, and three

days were spent in waiting for him to come in. He was finally captured before sunrise on the fourth day, and after securing a second the party proceeded to the Gillyeling River for two others. Rations now began to give out, and they had to fall back on wild figs and locusts, and sustained by this simple diet finally reached the native camp, only to find that the "wanted" were away fishing. They were at length taken while sleeping, a great struggle ensuing, and the party with their prisoners returned 150 miles to Roebourne. Mr. Brockman next accepted the management of Mr. A. R. Richardson's station for three years, and during this period he purchased, and afterwards sold to Mr. Richardson, a block of 40,000 acres which he had taken up on the Yule River. In 1879 he determined to see the Kimberley country, explored by Mr. Alex. Forrest in the previous year, and arranged with Messrs. Farquhar, McRae, Fiveash, and Pearse to take 300 sheep and other stock and start a station in that district. The schooner "Ariel" was chartered, and they arrived at Beagle Bay on November 19, 1879, landed all the stock before night, and pitched camp about a mile and a half inland. A log cabin was built and afterwards an iron house of two rooms, and about Christmas time a party of three started for their proposed destination 100 miles east. About this time the Government decided to declare a new district and form new regulations, under which the lease for a tract of country comprising 400,000 acres on the south side of the Fitzroy River, taken up by Mr. Brockman, was refused, and an offer of 50,000 acres of inferior land made, which in turn was declined by the settlers. After further exploration they discovered the Meda River and applied for 250,000 acres of this country, finally accepting the Government offer of 100,000 acres rent free for twelve years. Upon the arrival of the Murray Squatting Company with sheep some twelve months later Mr. Brockman moved his camp to Lake Louise, 16 miles on the way to the Fitzroy, where they lived for three months chiefly on game, and during this time they cut a track through the thicket to the Logue River, a distance of 50 miles. Trouble occurred through the hostility of the natives, and at length, after transporting their goods to the mouth of the Yeeda River, where they were

landed within six miles of the camp, Mr. Brockman arranged with Mr. Paterson to look after his sheep for a year and returned to Roebourne, where he bought 1,100 ewes and started up the Yule River to form a station. He was a sufferer by the drought of 1882, and lost a great number of sheep in the succeeding floods, so he sold the remainder to Messrs. Richardson and Welland for £900, the largest sum of money he had ever possessed, and purchasing 400 sheep returned by the schooner "Azelia" to the Fitzroy camp. Here he found the sheep badly diseased with scab introduced by some new settlers from the Williams River, and leaving them with Mr. Forrester returned to try to bring some horses and cattle overland from Roebourne. Reaching "De Grey" Station with 170 cattle and twenty-seven horses, a week later he started for Pardoo, and proceeded from there to La Grange Bay, over 200 miles distant. Water becoming scarce, retreat was made to De Grey River and finally to Roebourne, the cattle being left at the 90-mile beach. When the trip was again attempted toward the end of the journey they passed Derby, where the Government had made a settlement and built an iron house for the Resident Magistrate, Mr. Fairbairn, and other bush dwellings, and a week later reached the home station, just eight months after leaving Roebourne. A stockyard was built in eight days, and the run, which covered 250,000 acres, was explored, this work taking a month. The next move was to get his sheep from Yeeda and 400 maiden ewes from Mr. Forrester on the Meda, and these, mixing in the common herd, all got badly scabbed. He procured sulphur from Derby, and after shearing dipped the sheep, and then went south to arrange for stores and fencing wire, on which occasion he rode alone 600 miles. Here he encountered hostile natives and scarcity of food and water, but surmounted every difficulty and returned to his station to carry it on for five years, when it was sold to Messrs. M. C. Davies and McLean Brothers & Rigg. Later Mr. Brockman visited the Gascoyne country and purchased "Minilya" from his brother Charles for £15,000, this station comprising 800,000 acres of very dry region, but first-class sheep country when watered and fenced. A month after taking delivery scab broke out on the sheep, but with the

aid of some tobacco, which he had to cart 80 miles at heavy cost, he dipped 24,000 sheep, and repeating the operation was successful in coping with the trouble, which, however, recurred and interfered with the sale of the stock. Three bad seasons succeeded, and though many wells were sunk the water proved salt. Wool was at famine prices, and for ten years little else than hard toil and disappointment confronted him. He fenced a paddock of 20,000 acres during the second year, brought 400 head of cattle from Roebourne, and took up the Point Cloates country, a strip of 60 miles along the coast, hoping to find water which would relieve "Minilya." To reach Point Cloates he procured a boat at Carnarvon, which he called the "Ada May," and on March 2, 1888, sailed out of the Gascoyne, in due course reaching Tuckey's passage leading through the reefs to Yalobia. It is a coincidence that Mr. Brockman was wrecked three times within thirteen years along this coast, the name of each boat beginning with the letter A, *i.e.*, the "Ada"; the "Albert," a cutter sailed by a man named O'Grady, who purposely ran her on to a reef to escape the consequences of having breached her cargo, the property of another man; and the "Ada May." While negotiating the passage breakers were sighted ahead, but as the tide was out and there was very little water on the reef the native guide asserted that it was quite safe. At this juncture the boat parted her painter, and this was not noticed until it had dropped 100 yards behind. As they were running before the wind all would have been well, but the steersman, endeavouring to recover the dinghy, luffed the boat among the breakers, bringing her broadside on, when a great wave struck her, carrying away the mainsail. Two men were washed overboard and the hold half filled with water. The crew scrambled on board again, to be met by a mountain of surf which carried them all away, except Mr. Brockman, who had dived and came up again after the wave had passed over the boat. A third wave filled the vessel, and she went down stern first, the jibboom only showing out of the water. They were three miles from the shore with masses of reefs and rough water showing in between, but all began to swim for land as their only chance of safety. The place was teeming with sharks, and

suddenly a piercing shriek was heard from Miller, one of the crew, who disappeared and was never seen again. Mr. Brockman was carried into terrible breakers, which nearly ended his career, but though he got very badly knocked about he managed to strike out for shore. Night had fallen and the outline of the coast was growing faint, but he finally reached shallow water and dragged himself up on the beach in a most exhausted condition. After spending the night with the sand for a couch he started barefoot on a walk of 20 miles to the spot where the cargo had been shipped and overtook two of the crew who had

through the frightful state of his skin, rest being obtained only by hanging his arms over a padded batten nailed between two verandah posts, in which way he secured a little sleep. A native oiled him twice daily with emu oil, and when partially recovered he returned to the station. Much illness followed, and a trip to Perth for medical advice left him still in a very unsatisfactory condition. In 1889 his most efficient assistant, Mr. Matheson, of whom he spoke in terms of the highest praise, left him. Drought in 1890 preceded the poor season of 1891, but 1893 saw a fair winter with plenty of grass and

sent 30 miles away to keep them alive. He had 1,000 fat sheep on the coast, which were shipped to Fremantle and brought a good price, as meat was scarce. Mr. Brockman now went in for breeding from his own stock, and although 1897 and 1898 saw a long spell of dry weather he was better prepared for the drought, as several windmills had been put up, and as the lambing was good the flock increased to 20,000. After purchasing Messrs. Knight and Bateman's station, which he stocked with 2,800 sheep and a few cattle and horses, he continued his personal supervision of the properties for a year or two, but finding

PORTION OF THE ORANGE GROVE AT "EURILLA."

escaped, whom he sent for assistance to the out-station on the Lyndon River. With no water he crawled on through the terrible heat all day, and finding his clothes unendurable threw them away. The naked skin cracked all over, causing extreme pain, the ground burnt his feet, and round him hovered myriads of green-headed March flies, which stung like hot wire. At 4 p.m. he reached Lyndon River, into which he plunged to wet his parched skin, and was within two miles of the camp when a native boy appeared with a kettle of water, which he drank at a draught. He was assisted to the camp, and for three weeks could not lie down

m2

water. He disposed of a good many cattle at this time, but the following season being dry the purchaser could not take delivery, and he had about 3,000 head of cattle, 22,500 sheep, and 300 horses on the run when the terrible drought of 1895 and 1896 set in and almost the whole country was burnt out. By the end of 1896 there was neither feed nor water, the whole country was one mass of drifting sand, and sheep and cattle were dying by thousands. When at length the rain came 11,000 sheep were mustered, with 100 horses and five head of cattle, and an imported bull with two cows and calves which had been

that his health was seriously affected after twenty-nine years of hard pioneering life in Roebourne, Kimberley, and Gascoyne he sold all his property with the exception of a 60-acre block at Carnarvon, on which was a house and a fine fruit garden. This he let, and coming south bought a farm of 4,000 acres on the Chapman River, and for the next three years engaged in sheep- and cattle-dealing. Tiring of this he turned his thoughts to travel and took a trip to England, Japan, and America, returning to Guildford, Western Australia in 1906, where he lived in semi-retirement until the time of his death on August 29, 1912.

The late JOHN WITHNELL, whose name is indelibly inscribed in the annals concerning the early settlement of the great north-west of this State, was a descendant of the ancient family of Withnell, possessors of the lands of Withnellfold and Withnellcroft, now the village of Withnell, in Lancashire, where the name is still retained. He was born at Bolton, in that county, on March 24, 1825, and came to Western Australia with his parents in the ship "Nancy" in 1829. His brother Robert, whose birth occurred in August of that year, was the first male European to be born on the mainland of Western Australia. The late John Withnell took up land at York, where he carried on farming and grazing pursuits. In course of time the young colonist married Emma Mary, a daughter of the late George Hancock, of Beverley, formerly of Devonshire, England, whose family was a branch of the Gregorays, Lords of the Manors of Fresseley and Ashfordby Farms, and descended from the McGregor clan. Mr. Withnell and his wife, who was one of the very early native-born Western Australians, settled at Beverley, where for a time they engaged in farming occupations. As an outcome of discoveries resulting from the explorations in North-Western Australia, carried out under the leadership of Francis T. Gregory, in 1861 a hardy little band of settlers ventured upon the extremely hazardous undertaking of pioneering the pastoral lands reported to exist in those remote regions. Among those whose enterprising spirits prompted this bid for fortune were John Withnell and his young wife, who, disposing of their "Hillside" Estate at Beverley, and "Boraning" Station, on the Williams River, chartered the "Sea Ripple," a three-masted schooner of 187 tons register, and set sail from Fremantle for Cossack, then known as Port Walcott. Mr. Withnell provided all the fittings on this vessel for the accommodation of one thousand picked ewes, fifty choice rams, ten cows, ten draught mares, one two-year-old Clydesdale stallion valued at £250, and a big supply of station requisites—stores, clothing, tools, firearms, medicine, and all the etceteras necessary for outfitting a station in a new land which was without any of the conveniences of commerce and everyday necessities, and had only occasional communication with civilization. The party,

consisting of Mr. and Mrs. Withnell, their two sons, George and John, Mr. and Miss Hancock, Mr. Robert Withnell, and two servants, pitched camp on the sandy beach, where wells were sunk from which to water the stock. The water, however, proved brackish, and Mr. Withnell made a trip up the Harding River to find a more favourable locality. This he discovered at Mount Welcome, a small hill in the vicinity of a large fresh-water pool in the river bed, so called to express the joy of the pioneers in coming to an end of their search, and within a week the camp was removed to the spot where the town of Roebourne now stands, on the slopes of the hill referred to. Mr. Withnell and his brother-in-law, Mr. Hancock—also an intending settler—spent some time in

MR. JOHN WITHNELL.

looking round the country, at length deciding to make application for the Millstream and Pyramid country, on the George River to the south and east of Roebourne. In June a son was born, to whom the name of Harding de Witt was given, after the Harding River and De Witt's land, this being the first white child born in the north-west. Shortly after this event huts were built of stone and rough mortar, bush timber being used in the construction of these dwellings, which were thatched with grass. All the materials had to be carried, as the teams had been lost. In September the first clip took place, and the wool, hand-washed and packed in ten bales, was shipped in the following month in a vessel that called at the port. By this boat,

from which a little clothing was purchased for the settlers, Mr. and Miss Hancock returned to Fremantle, the former being deputed to secure from the Government the grants of country which were required. In November a letter from him was delivered at the settlement by one of Bateman's boats from the whaling station that had just been founded on Rosemary Island, stating that the Millstream country had been granted to a Mr. Taylor, who was declared to have the necessary number of stock (200) on the "De Grey" Station, in care of Mr. Padbury's manager and partner, Mr. Nairn. Mr. Hancock had therefore taken up 30,000 acres in the vicinity of Roebourne, and paid the rent then ruling, and the eight-years' lease was to follow. Upon receipt of this information Mr. and Mrs. Withnell set out to explore the country east of their camp, and being favourably impressed with the district surrounding the Sherlock River, decided to take up the land which afterwards became known as the "Sherlock" Station. Their flocks increasing rapidly, by the time an opportunity occurred of notifying the Lands Office of their selection they had a sufficient number of sheep to entitle them to the free runs. Upon returning from this trip they were told by the natives that "ships, men, and animals had arrived about four moons back," that the ships had left and the men gone east with the stock, also that the natives had killed three white men. This was the first intimation the settlers had received of a party sent by the Government to Le Grange Bay to start a station at Roebuck. The party was in charge of James Harding, who had been a member of Gregory's exploration party in 1861, the Harding River at Roebourne being named after him. From the same source they heard a rumour that a "big disease" had been introduced by the Malay prows fishing for beche-de-mer along the coast; that it was coming nearer and nearer, and killing off all the natives in its path. This proved to be smallpox in its most virulent form. It reached Roebourne about ten months later, when the aboriginal population succumbed by the hundred, an average of six per day for weeks being buried in the vicinity of the settlement, while for months afterwards bodies of natives were to be seen along the river banks. Mrs. Withnell, with the aid of her medicine chest, saved a few of these

unfortunates, and also nursed two of her own children safely through the disease. Meanwhile several ships had arrived with settlers and their stock and plant. The first vessel bringing white women to the settlement was the "Warrior," chartered in Melbourne by the Denison Plains Company, in charge of Mr. C. Broadhurst; on board were his wife and two children, also the surveyor to the party, Mr. Charles Wedge, with his wife and five children. Mrs. Wedge was the first lady to land and be entertained by Mrs. Withnell, whose welcome to the first representative of her sex and class to join her in the heroic facing of the many difficulties and hardships endured by the brave wives of the early pioneers of this great district was very touching. Somewhat earlier another Victorian Company, known as the Camden Harbour Association, had been formed to settle a portion of the Kimberley district, but owing to the country in the neighbourhood of the harbour proving quite unsuitable for sheep most of the settlers decided to abandon the undertaking just at the juncture when the "Tien Tsin" had conveyed a resident magistrate (Mr. R. J. Sholl) and staff to the spot. Upon the breaking-up of the Association, the Government party was removed to Roebourne, where the laying-out of the town began; a post office, land office, residency, hotel, and store were erected, with other public and private dwellings, the population of the district now having increased to about 200. The majority of these inhabitants were station owners and their employes, the pastoral industry having gone ahead by leaps and bounds and the stock having increased in large numbers. About this time, however, the price of wool in London went down to 4d. per lb., and as the facilities for shipping the wool were of the most primitive description—there being no jetties nor lighters, but only small dinghies to row out three miles in a tidal creek at Cossack, where there was also a marsh to cross—the cost of transport and selling charges swallowed up all the profits. As there was no market for the wethers beyond the few required for consumption by the townspeople, matters at this juncture looked very black, and some of the settlers lost heart and sold out. The Withnells, however, on their station at Mount Welcome, solved the problem by scouring the wool and despatching thirty bales to London, where it

realized 1s. per lb. Many, who had not thought it worth while to forward their wool, afterwards followed this example, and for many years it was the rule to scour the wool in this district. As time passed various misadventures befell the settlers, among which were some severe droughts, during one of them not a drop of rain falling in the Roebourne district for over two years. Upon another occasion they were visited by heavy floods, when many miles of country were inundated, and thousands of cattle, horses, and sheep were carried out to sea, while a great cyclone wrecked houses and buildings and rendered the family homeless. Only 1,200 sheep were saved out of 6,000, while twenty head of cattle remained as sole representatives of the splendid

meanwhile, built a lighter, with which he conveyed the settlers' stores up the river from Cossack to Roebourne, and, with his team, undertook carting contracts, also building a large storehouse in which goods could be kept in safety. Thus, by various means, the family was able to subsist until a measure of prosperity was restored to them. The north-west is noted for the terrible storms which sweep round its coast, and in which many vessels have been wrecked and many lives lost. Through these, too, the Withnells were sufferers, losing in the "Emma," which left Cossack with forty-two souls on board, never to be heard of again, their wool clip and a sum of 148 sovereigns taken from the Government party for meat supplies, besides other commodities. On another occasion the "Brothers" left Fremantle for the north-west with a big invoice of goods, including fully £200 worth for "Mount Welcome" Station; there being, of course, no insurance in those days, and this boat foundering off Dirk Hartog Island, everything was lost, and ten months elapsed before supplies finally reached the north-west. During this time the late Mr. Charles Harper, of Guildford, and three other friends ventured overland, mostly on foot, to Geraldton—roughly speaking, a journey of 1,000 miles—whence they reported the state of affairs. In due time a sailing boat arrived with provisions, only to find many of the settlers reduced to gaunt skeletons with scurvy and starvation, some too ill to rise from their beds. Much heroism was shown during this trying period, when Mr. Withnell had often to witness his wife fainting with starvation, as she was unable to eat the fresh fish which, together with what game could be secured with the gun, and cow's milk, of which, fortunately, there was a good supply, formed the mainstay of their diet. Nevertheless, a general disposition was shown to make the best of the situation, and cheerfulness was the predominating note. The development of the Roebourne district proceeded steadily, and, in course of time, a visiting clergyman—the Rev. Edward Tanner, who accompanied the Camden Harbour Association in 1864—was appointed to minister to the north-west settlement. At a later date a church was built, in which the Withnell family took great interest and to which they subscribed generously, while Mr. J. Hancock presented an American

Bartletto,

MRS. WITHNELL.

Perth.

herd built up from three cows purchased by Mr. Withnell from some of the earliest settlers. With these and only ten horses a fresh beginning had to be made. The home and stores had gone; there was a young family of five children. Yet, even with the incubus of a debt of over £2,000, the brave pioneers kept up heart, and, having youth and health, set themselves to retrieve their fortunes in whatever way might open. Mrs. Withnell, who in everything was her husband's most able helpmeet, procured wethers and steers from the inland stations, which had missed the fury of the cyclone and the floods, and opened a butchering business, which was carried on for three years with signal success. Mr. Withnell,

organ at a cost of £55. A school, subsidized by the Government, was opened about 1873, the first teacher being Mr. Andrew Young, and some five years afterwards a Government school was built, and Miss McCort (now Mrs. Clarkson) appointed schoolmistress. After an absence of twenty-eight years, Mr. and Mrs. Withnell sailed for Fremantle in the "Mary Ann," under Captain Miles, to visit Mrs. Hancock at Beverley, leaving their son, Harding, and a daughter (now Mrs. J. G. Meares) in charge of the station. During their absence the whole of the homestead, together with a large outfit of supplies and an English importation of clothing and domestic goods, was burned to ashes, £2,000 worth of

building up. Here they continued for eleven years, selling out in March, 1890, with 20,000 sheep, 130 horses, 150 cattle, and all plant, etc., to four of their sons and to their son-in-law, Mr. Meares, who in time bought the sole interest in the station. Ill-health compelled the retirement of the brave pioneering couple, with their younger children, to Guildford, where Mr. Withnell died on May 15, 1898, at the age of seventy-two, honoured and respected by the whole community. A man of high character, unflagging industry, and great liberality, he was also distinguished for the initiative he displayed in pioneer work. He was the first to make and use the canvas waterbag, which has proved such a

living. Mrs. Withnell resides at North Perth, in the enjoyment of excellent health, and, although in her seventy-fourth year, makes frequent visits to the north-west on pleasure and business combined. It is an interesting fact that mineral discoveries have been made in the district by three of the Withnell family. In 1888 Mr. James Withnell when a small boy picked up a stone to throw at a crow, and noticed yellow spots on it, which proved to be gold. A rush of diggers followed, the locality being "Mallina" Station, 70 miles from Roebourne. Mr. J. G. Withnell discovered tin in 1887; and another member of the family was the first to distinguish the copper outcrop which the

FLOCK OF MERINO EWES ON "KARRATHA" STATION.

property being lost. Cutting short their visit, the parents set sail on their return voyage with a complete new outfit, including a two-roomed wooden house, but great hindrance was encountered through a tremendous gale, which lasted two days and two nights, throwing the vessel out of its course. Cossack was finally made in safety, and they reached home to find their daughters lodged in a one-room wooden building put up by their brother, and completely bare of every comfort. The place, however, soon resumed its appearance of prosperity, and in 1879 the "Mount Welcome" Run was purchased by Mr. R. J. Sholl, the Withnell family removing, with their stock, to "Sherlock" Station, which they had been gradually

boon to settlers and others; and he set the example in inducing his natives to dive for pearlshell in deep water along the coast. With his own hands he built the first house at Roebourne before the town site was selected, on a block of land which is now the centre of the town; cut the first stack of grass hay; and made the original piece of road across the marsh at Snake Creek for landing goods, which were brought from the ship's side in a flat-bottomed boat constructed by him. A man of few words, his opinion carried great weight, and his hospitality was unequalled. Mr. and Mrs. Withnell had a family of eight sons and three daughters—nine of whom were born in the north-west—who are all still

Whim Creek Copper Company is now working. "KARRATHA" STATION, owned by Messrs. Withnell Brothers (business manager, J. G. Withnell), is situated in the Roebourne district, about 38 miles west of the town of Roebourne, and was purchased by the present proprietors from Messrs. J. & R. Clarkson in 1899. It has since been added to by the purchase of the "Chirritta" Run from Mr. A. C. Gillam, and now comprises about 500,000 acres of wide, open plain and undulating country intersected with timber belts and low-lying hills, some of which are of granite formation. The soil throughout is of red clay, and in addition to various grasses and herbage, there is abundance of

spinifex; while the timber, which is light in character and found chiefly on the river banks, consists principally of blackheart (a species of white gum), and cadjeput. The property is watered by three rivers—the Maitland, the Nicol, and the Yannary, which contain several fine pools,

Bartolotto, Perth.  
MR. J. G. WITHNELL.

while various creeks run in the rainy season. In addition to the natural facilities for watering the stock, from thirty to thirty-five wells have been sunk and fitted with windmills and troughs, which in these dry areas greatly assist the holders of runs to stock fully the capabilities of the land. The whole property is fenced with six wires run along wooden posts and iron standards, and is subdivided into thirty paddocks of about 20,000 acres each. A homestead, erected in 1872, was destroyed by a gale and rebuilt in the following year, and in 1909 the present modern residence replaced the former dwelling-house. This is built of stone, with iron uprights and cement floors to combat the white ant pest, the roof being of iron and the ceiling of stamped metal. It contains eight rooms fitted with all up-to-date appointments, and is surrounded by a spacious verandah; while, in the vicinity of the house, a kitchen garden has been cultivated, which provides a welcome supply of vegetables all the year round. In a suitable locality stands the shearing-shed, with accommodation of ten stands, woolpresses, and other necessary plant. Up to the present the work of shearing has been done by

hand, but the firm is considering the advisableness of installing a modern machinery plant in the near future. "Karratha" is essentially sheep country, and the 50,000 merinos grazing on the estate form a valuable flock, which was originally founded by stud and flock rams imported from the Eastern States, as big a figure as 200 guineas having been paid for high-class rams. South Australia has contributed the most largely from her "Hill River" and "Koonoona" Stations, and these strains are preferred, as they have been proved to thrive well and bring about distinct improvement in the flock; but a few good types procured from the Springfield Pastoral Company, New South Wales, are also present. Predominating features of the sheep are robust constitutions and strong frames; while the wool, clean, soft, and fine, of good density and long staple, is caused by local conditions to become "red-tipped," which slightly depreciates its selling value. The 1912 wool clip comprised 700 bales for the London sales, and averaged all round 10d. per lb., while the secondary qualities sold at Fremantle at satisfactory prices. Various important awards have been gained by wools from "Karratha" which have been exhibited in important competitions. Included in these awards are the gold medal of the

National Show, awarded by the Department of Agriculture of Western Australia; diploma from the Glasgow Exhibition; and gold medal and diploma from the Franco-British Exhibition for the combined fleeces of twelve ewes, which are among the group reproduced in our illustration. The other stock on the station comprises 250 horses and a milking herd of 150 shorthorns for station uses. Great attention has been paid to the quality of the horses bred, the stallions in use at the present time being "Merriween," by "Neckersgat"—a high-class thoroughbred of fine appearance—and "Belmont Warrior," the Suffolk Punch stallion, unbeaten as a champion in the show ring, and winner of first prizes at the Sydney and Melbourne Royal Shows, also champion of the Royal Agricultural Show in Western Australia, 1910-11. The three brothers, Messrs. John, William, and Ernest Withnell, all of whom take an active part in the management of the run, are firm believers in a policy of improvement, and have brought the stock up to a high standard, which ensures ready markets and good prices. Mr. James Withnell, who was also closely associated in the building up of "Karratha" Station, in 1912 acquired the whole of "Dirk Hartog" Station, in Shark Bay.

"MERRIWEEN," BY "NECKERSGAT"

"LIVERINGA," the property of the Kimberley Pastoral Company, Limited. The Kimberley district was first opened up in 1879 by the late Mr. Alexander Forrest, who led an exploring expedition from the De Grey River to Beagle Bay, and thence along the coast to the Fitzroy River, which he followed up for 240 miles. The journey proved one of the eras in the history of Western Australia, as it gave an impetus to subsequent general progress, settlement on the land being more eagerly pursued and pastoral pursuits followed up with greater vigour and determination. The liberalization of the land laws proved a popular measure, and the

A. Cornish subsequently were admitted into partnership, and an expedition arranged. The sailing vessel "Amur" was chartered by the company and loaded with a cargo consisting of the necessary plant for starting operations, and live stock comprising horses, cattle, and 900 sheep, besides a generous supply of provisions. Officered by the Messrs. McLarty Brothers and A. Cornish, the expedition set sail from Fremantle on November 12, 1881, and after a prolonged trip arrived at King Sound, the rendezvous chosen for unloading. A satisfactory landing-place had been reported here, but upon the attempt being made there was proved to be an insufficient

difficulty had to drive the stock to a spot 20 miles distant, where supplies were struck at the Yeeda Creek, not, however, before the loss of several horses had been sustained. Fortunately the loss with the sheep was inconsiderable, and arrangements were set in train not long afterwards for bringing over further shipments from Cossack. Nearly 3,000 sheep were purchased from "Millstream" Station, and by the aid of the staunch little "Amur" the first cargo of over 1,500 was started on the voyage. Heavy losses, however, occurred with this shipment, the vessel at the very outset of the journey going aground in Cossack Creek while heading for the open sea. All the

GENERAL VIEW OVER STATION, SHOWING HOMESTEAD, OUTBUILDINGS, AND DRAFTING-YARDS.

attention of stock-raising circles was drawn especially to the vast unexploited district in the far north of the State, to which the name of "Kimberley," after the Secretary of State for the Colonies, had been given. The staunch old pioneer, Mr. G. Julius Brockman, was first on the field at the end of 1879, to be followed shortly afterwards by the Murray Squatting Company, and in 1881 the Kimberley Pastoral Company was formed. The land now forming its station was drawn by lottery, the syndicate concerned in the transaction comprising Messrs. W. Marmion, Pearce Brothers, M. C. Davies, and Sholl, by whom Messrs. J. P. McLarty, W. G. McLarty, and

depth of water and the boat went aground, only, however, to float off the bar at high tide, having sustained but little damage. The next endeavour to get in brought the vessel within half a mile of the shore, and as the tide receded the "Amur" was left high and dry on the sandy bottom. In the intervals between the tides the stock was landed and driven ashore after a considerable amount of trouble, and the rest of the cargo was unloaded and conveyed to a place of safety. At an early stage of subsequent proceedings they were met by the drawback already encountered by their predecessors in this locality, namely, scarcity of water, and in order to overcome this

sheep had to be landed, and when the tide was sufficiently high to lift the vessel she stood out three miles from shore and all the stock had to be taken out in lighters. This occupied three days, and during that period 300 sheep were lost, principally through drinking salt water. Upon arrival at King Sound the captain condemned the landing-place as too shallow, and sailed 200 miles down the coast to Beagle Bay, where the sheep were got ashore. The second shipment of 1,400 were also landed here with little loss, but while waiting for the latter draft many of the first consignment died as a result of the rough handling they had received during the sea trip. The overland

trip to the station over a very poor and uncertain track was conducted safely, and after a good journey their destination—a tract of land at the mouth of the Fitzroy River, near the coast—was reached. A year or two later the sheep were removed some 60 miles inland and the camp pitched on the locality afterwards developed as "Liveringa" Station, the coastal region known as Lulingui being turned into a cattle station, and as such is still carried on by the firm. The resident managers of the company found themselves in a very isolated position at the outset, and after their first landing nine months

hostility of the natives, who were always on the look out to make away with the sheep. In spite of the sharp watch kept for the preservation of their own lives as well as those of the stock, the little company suffered the loss of one of its number, in 1882 Mr. A. Cornish being speared by the natives while engaged in droving sheep. A reduction also occurred in the staff of seven employes, two of the three aboriginals on the station succumbing through sickness, and additional help could not be procured from any locality nearer than Fremantle. The sheep country of "Liveringa" has 60 miles of frontage

intersects the property. The timber generally is light and stunted, the heavier growths being found in the back country. The trees along the river area do not attain to any considerable size. Among the species natural to the district are coolibah (which has proved suitable for fencing purposes), cadjeput (which is somewhat scarce), and salmon bark. There is a fair supply of top feed, and other growths include peach-bush and a kind of wattle, while the chief varieties of herbage consist of spinifex and saltbush. Natural grasses abound, including crowsfoot, and the especially valuable Flinders,

HOMESTEAD AT "LIVERINGA" (BILLABONG IN FOREGROUND).

passed before they received any communication from Cossack, the nearest port. Before the arrival of a party of pioneers and prospectors their provision supply had become exhausted, all the flour they had left having gone bad. Fortunately game was plentiful, and they were able to sustain life until fresh supplies came to hand. Conditions improved in 1884 after the arrival of the Government Resident and various survey parties, when the district began to go ahead. In addition to the strenuous work of the first five or six years the life was full of adventure and excitement, chiefly on account of the

to one side of the Fitzroy River, which, although it does not flow all the year round, has several large permanent pools, and various soaks and springs are found on different parts of the property, besides billabongs several miles in length. The stretches of dark-chocolate, loamy soil reaching back ten miles from the watercourses at about that limit give way to Pindan country, consisting of a reddish and very rich sandy soil, which produces splendid sheep pasturage. On the whole the territory is flat, but welcome undulations occur at intervals, and a small range of hills called the Great Ranges

Mitchell, and barley-grass varieties, which grow rapidly and to a good height after sufficient rain has fallen. In the season a quantity of these grasses is cut and stacked every year, to be fed to the stock during the dry summer months, Flinders grass having proved the most suitable for this purpose. The rainy season occurs between December and March, the annual fall averaging 35 in., having in special seasons risen to 40 in. and dropped to 14 in. respectively. Among the first work undertaken was the sinking of a well for domestic purposes. Since that early period several bores have been

put down, which provide a splendid flow of good water all the year round. An iron shed was put up as a temporary dwelling-place, and round this erection the first fence was made in 1888, with posts cut from timber on the run and wire procured from Fremantle. A 4,000-acre paddock was fenced in, and in the same year a stone house took the

etc., having been added. A small vegetable garden has been laid out, where kitchen stuffs are grown for consumption on the run. Fencing has been continued from year to year, and the property is subdivided into paddocks ranging in size from 4,000 to 16,000 acres. A fence with six wires and netting was put up to define the boundary on the western

this side being Messrs. Emanuel Brothers' "Noonkambah" Run. In the year 1883 Mr. W. G. McLarty paid a visit to Adelaide with the object in view of securing some reliable stock to improve the strain of sheep on the Kimberley property. For this purpose he purchased 2,000 ewes from the well-known "Canowie" Station in South Australia, and 250

GROUP OF FLOCK RAMS AT "LIVERINGA."

place of the iron shed, with two rooms and wide verandah, the site being a granite-crowned hill overlooking a large pool which forms part of a billabong four miles from the river. In recent years the homestead has been improved, and the station now presents a cluster of buildings, men's quarters and overseer's cottage, store and stables,

side of the station, separating it from the adjoining "Mount Anderson" Estate. The subdivisional fences are constructed mostly with posts planted about three to the chain, with iron droppers between, and threaded with five wires, the cost averaging £30 per mile. The eastern boundary is also almost completely fenced with six wires, the adjoining property on

rams from the late Mr. A. B. Murray. Chartering a vessel he reached Beagle Bay in thirty-two days, with a loss of only fifty sheep on the voyage. At frequent intervals since fresh infusions of blood have been made from prominent flocks in the Central State, and upon one occasion Wagga rams were introduced from New South Wales. Breeding from

Photo by C. W. Walker.

CATTLE WATERING AT URYELLA CREEK.

these types has been steadily carried on, and the flock now numbers from 90,000 to 100,000, this being about equal to the carrying capacity of the run. As a result of this steady development in the strain, and by means of careful culling a really good type of medium-sized merino has been obtained, which represents the bulk of the "Liveringa" flock. The

after the establishment of the flock the wool was sent down the Fitzroy River to Derby, but this method of transit was superseded by bullock and donkey teams at a very early stage of the history of the run. Lambing occurs in May, and there are a few new arrivals in January, the annual drop averaging 75 per cent., although during the regime of

Kimberley" Run. Bulls bred from Victorian stock were purchased from Messrs. J. & R. Clarkson, and others were introduced from South Australia and from Mr. A. W. Eggar's Strathalbyn "Derrimut" strain, so favourably known in this State. The cattle raised for the beef market hitherto have been sent to Fremantle, but during the present year 1,500 head will probably find their way to Java markets. Mr. W. G. McLARTY, who with his brother, the late Mr. J. P. McLarty (who died in 1909), started the Kimberley Pastoral Company's Station in 1881, was born at Pinjarra, Western Australia, on February 28, 1853. He is a son of the late Mr. John McLarty, of Campbelltown, Scotland, a farmer, who came to this State by the sailing vessel "Hindoo"—afterwards burnt at sea—and was one of the early settlers on the land, being first identified with Pinjarra as manager of a property now owned by the Messrs. Patterson Brothers. In 1854 he took up a holding and commenced farming operations on his own account in the same district, where he continued until his death in 1885. The gentleman under review was educated at Pinjarra, and subsequently was associated with his father on the home farm until his departure for "West Kimberley." In 1890 he succeeded his brother as manager of the station, and in 1901, on account of failing eyesight, relinquished the reins of control and returned to the place of his birth. After Mr. McLarty's departure he was succeeded by Mr. Percy Rose, the

Photo by C. W. Walker. "LULINGUI" CATTLE GOING TO WATER

fleeces cut from these animals are well up to the average, being of good quality, length, and staple, with a little yolk in evidence. The wool when it comes from the sheep is fairly clean, and only a small quantity of second-grade wool is scoured before shipment. It is sent to London from the port of Derby and commands good prices, in its greasy state fetching up to 10d. and scoured to 15d. The shearing-shed

Mr. W. G. McLarty the percentage occasionally exceeded 80. In former days great loss was experienced through the depredations of dingoes, but by means of poisoning this trouble has been reduced, since which period an appreciable increase in the number of lambs has been evident. No lambs are sold, as they are not profitable handling, but heavy drafts of sheep are sent to Fremantle, and this year (1912) it is anticipated

MOB OF HORSES AT WATERING TROUGHS

provides accommodation for forty stands, and shearing is done by blades, both whites and natives being employed in the work of clipping. For the first year or two

that Java will take a number of fats. The station carries about 15,000 shorthorn cattle, the nucleus of the herd being derived from Messrs. Sholl Brothers' "West

present manager, who resides on the station. The Secretary of the Company is Mr. D. J. Goyder, of Messrs. Smith & Goyder, Elder's Building, Perth.

"KIMBERLEY DOWNS," the property of M. C. Davies & Sons. The traveller, pursuing his journey to the "Kimberley Downs" head station, rides or drives in a direction due east of the seaport of Derby for about 60 miles. As he nears his objective he finds himself in a wide, silent country, composed of vast plains broken only by the gentle undulating hills and abrupt hillocks of ironstone and granite formation. One of the latter rises in full view from the station homestead and forms a striking feature in the landscape, its flat top spread out like a miniature tableland, on which a fringe of sparse timber matches the scanty belt of trees around its base. Farther afield, in the Napier Ranges, there are rugged outcrops of

being smooth and clean. It grows only in the Pindan country, and has proved very useful, being hard and capable of resisting the encroachments of the white ant pest. The next in value is the bloodwood, while box has been found a most useful fencing timber. A species of chestnut has proved highly suitable for bullock yokes, which are also constructed of the wood of the pear-tree, the latter bearing a fruit resembling a pear, which is very good eating. The confluence of two streams on the western side of the Napier Range, which lies east of "Balmaningarra" and north of "Lennard" Stations, forms the continuation of the Lennard River, which flows within the vicinity of the homestead, where it divides, forming the

water and greedily slaking their thirst before retreating to rest in the scant shade provided by the light timber indigenous to the locality. About seven miles from the head station a bore has been sunk by means of a hand boring plant, natives being employed in the performance of this work. For domestic uses when need arises recourse is had to a billabong, whence water is carted to the homestead by means of a tank drawn by mules. Considerable attention has been given to the water-supply question, which is one of the most momentous in the successful carrying on of these gigantic northern sheep and cattle runs. At "Kimberley Downs" it has been met to a large extent by the utilization of the

Photo by C. W. Walker.

GENERAL VIEW OF HOMESTEAD AND OUTBUILDINGS.

limestone showing indications of copper ore, and portions of the run are rather densely wooded, the trees attaining considerable girth and height. One giant Boab tree—the largest in the district—has a circumference of 67 ft., and with its curious growth of ponderous trunk and slender branches terminating in fine twigs and delicate leaves forms a picturesque feature in the landscape. The varieties of timber which meet the gaze during a progress through the run consist chiefly of red gum, white gum, York gum, box (or coolibah), ironbark, beefwood, bloodwood, woolly butt, etc.,. The latter derives its name from the peculiar woolly bark which clothes its trunk to a height of about 5 ft., the upper portion of the tree bole

Meda and May Rivers. Ninety miles of river frontage are thus provided, and, in addition, there are creeks, which, however, though flooded in the wet season, often present a perfectly dry bed during the summer months, though there are a few permanent soaks from which water is raised for the necessities of the stock. Large billabongs are formed in times of flood, and at "Napier"—the cattle station—there is a splendid spring which has watered 600 head of stock during a dry season, and which is known as Barnett Spring. This part of the run is also fortunate in possessing an excellent supply of artesian water, which forms wide streams in which the cattle wade, immersing the greater part of their heated bodies in the

natural artesian supply, and much capital has been expended in the prosecution of the scheme by the Kimberley Pastoral Company. A "Cyclone" boring plant has been in use for some time past, and various sites have been tried for water. These efforts have been supported by the Government, and from Bore 67 a stream of good water flows through Ant Hill Plain, where numbers of sheep graze among the curious monuments, some of which are 8 ft. or 10 ft. high, raised by the tiny workers whose engineering ability is so often commented upon. The soil on the wide plains is dark and of rather greasy nature, and, were the climatic conditions more suitable, wheat should do well in these localities. There is plenty of Pindan

country, and natural grasses are found in abundance all over the run, including bundle-bundle, the valuable Flinders grass, wheatgrass, buck spinifex (a coarse, prickly growth), and soft spinifex, which is a great stand-by for the stock in dry seasons. Artificial grasses have been introduced without success. Wattle and peachbush form good top-feed with other species of low timber, and in the sheep country, "Balmaningarra," there is abundance of natural shelter for the flocks. The history of the "Kimberley Downs" Station is full of interest, forming, as it does, a record of the opening up and development of a very important portion of the Western Australian State, and giving some idea of the drawbacks experienced by the early pioneer in the remote districts of the far north-west in materializing his dream of prosperity through the medium of fat cattle and woolly sheep. That part of the run known as "Balmaningarra," on which the head station is situated, originally was started by the late George Julius Brockman in the year 1884, a free lease of 100,000 acres for twenty-eight years being granted by the Government of the day to this

well-known pastoralist in recognition of his pioneering labours in the Kimberley district. Only a few months after Mr. Brockman entered

Mr. M. C. DAVIES.

into possession the property was purchased by Mr. M. C. Davies, who placed it in the hands of a manager, and during the next half-dozen years

the post was occupied by one after another until, in May, 1890, Mr. Alfred Barnett accepted the appointment and commenced his seventeen years of service on behalf of the proprietor. Mr. Brockman stocked the run with cattle, horses, and sheep brought overland from Roebourne, and at the time the property changed hands it was carrying 1,619 sheep (including 600 lambs), 312 head of mixed cattle, 31 horses, and a motherless foal, afterwards named "Hard Times," in remembrance of the troubles which beset its early career. The work of improvement proceeded but slowly, and when Mr. Barnett took charge there was but one small paddock for corralling horses and a two-roomed dwelling, the walls of which were mud batts and the roof iron. The new manager set to work with energy and determination to make the most of his resources, and before long the first shearing was done on the station under his supervision. There were plenty of natives roaming the country and often making a rendezvous of the station, where "tucker" was generally obtainable. This raw material was commandeered, and proved very creditable and efficient

Photo by C. W. Walker.

SHEEP AT SOAK IN BED OF LENNARD RIVER.

for shearers, teamsters, and stockmen. After the first rains had fallen the sheep would be secured and all hands marshalled to work at fencing in paddocks and building huts for the musterers and boundary riders, while on the track to Derby yards were erected at intervals for convenience on the long droving trips to seaport, and well-sinking was entered upon, good water eventually being struck in the midst of a stretch of 11 miles of heavy sand. At a later date the first bore was put down on the station at a locality 15 miles south of the homestead, where at a depth of 42 ft. a good supply of stock water was struck; a well was also sunk to a depth of 16 ft. on the spot where Bore 67 is now located, which yielded an excellent supply of first-class drinking water. The result of the first shearing was twenty-three bales of wool, which was carted by Mr. Barnett to Derby, and subsequently Mr. Davies was induced to make large additions to the stock on the station. Three thousand 2-tooth and 4-tooth ewes and fifty flock rams were secured from "De Grey" Station in the north-west and overlanded to Kimberley, 2,852 surviving the stress of the journey and duly making their destination. The season following the advent of the new arrivals was a poor one, and the natural increase of the flock fell far short of previous expectations, while the second shearing resulted in a clip of not more than sixty-four bales. During the next ten years seasons good, bad,

and indifferent were experienced, but the work of developing the property was continued strenuously. There were times of disheartening disappointment and depression, but hope

nine paddocks representing seventy odd miles of fencing, a four-roomed homestead with mud batt walls and iron roof having been erected and the usual outbuildings, including a

IRONSTONE AND GRANITE BLUFF SEEN FROM HOMESTEAD.

was never entirely lost, and the indomitable pluck of the Australian pioneer prevailed until at length conditions improved and the road became easier to travel. In the year 1900 the adjoining territory, then known as "Lennard" Station, was purchased from Messrs. Dalgety and Co., Limited, and with it 16,500 sheep, 50 horses, and a team of working bullocks. This property comprises 450,000 acres, and is divided into

woolshed and shearing-shed with accommodation for twelve stands. The two outstations, "Napier" and "Lennard," are embraced in this part of the run, and are used almost exclusively for cattle, the sheep being grazed on the extensive pastures surrounding the "Balmaningarra" homestead. This homestead is built on elevated ground, which forms a kind of island in times of flood, when an area of seven miles in length and

Photo by C. W. Walker.

ARTESIAN WATER AT "NAPIER" STATION.

three in width is completely encircled with surging waters. Besides the galvanized dwelling-house, where the manager resides, and which is built on piles, there are men's quarters

sheep being mustered from all parts of the run for the annual clip, which is done by blades. Twenty-three paddocks have been enclosed for the sheep which by the end of

purchase from "Mount Crawford" Station in that State, the sheep being robust, well-balanced animals, carrying wool of medium length and quality (heavy tropical rains and the hot sun accounting for light condition), which provokes good competition and prices in the London markets. During Mr. Barnett's reign the average cut was estimated at 3½ lb. per fleece, but in individual instances this figure has been brilliantly excelled, the fleece of a single ram having been known to weigh 18 lb. In earlier days the shearing season generally began in June and proceeded, as circumstances permitted; but at the present time it takes place in April, both white men and aboriginals being employed in this work. Three bullock teams, each comprising twenty-two animals, are employed in carting the wool to Derby and in bringing stores, fencing-wire, etc., to the station, the round trip taking twenty-one days. The herd of cattle consists of 21,800 head, principally shorthorns, bred from pedigree bulls purchased in South Australia, at the Royal Agricultural Society's Shows in Perth, and from Mr. A. W. Edgar's "Strathalbyn" Estate at Gingin, Western Australia. There are also 157 horses and thirty-four donkeys on the station. The property is managed jointly by Mr. E. H. Myring, who has charge of the sheep, and Mr. D. J. Ronan, the latter controlling the cattle station.

Photo by C. W. Walker.

LARGEST BOAB TREE (67 FEET CIRCUMFERENCE) IN WEST KIMBERLEY DISTRICT.

and various outhouses, mostly constructed of the same material. Adjacent are the sheeyards and shearing-shed, measuring 70 ft. by 44 ft., which were erected in 1908, and contain eighteen stands, the

1900 had increased to 19,000, and at the present time (1913) number 30,000. The type has been vastly improved by the importation each year of high-class flock rams from South Australia, including a

WATERING HORSES AT "NAPIER" STATION.

"BROOKING" AND "MILLY-WINDY." "Brooking" Station lies 220 miles by road from the Port of Derby. Situated in the West Kimberley district, it embraces 164,000 acres of first-class pastoral country, excellent for the raising of both cattle and sheep. It is lightly timbered, with an ample growth of natural grasses. The run originally was settled in 1889 by a Mr. James Taylor, who transferred it to Mr. C. C. Blythe, the present owner, in the same year. The area, at first consisting of 64,000 acres, in 1890 was extended by 50,000 acres, and in the following year another 50,000 was added. In 1889 Mr. Blythe had purchased 94 cattle and leased them to a neighbouring run. In the following year these had increased by 30 per cent., and the mob was then removed to Noonkambah, where it remained until 1893, when the number had swelled to 336. To these Mr. Blythe senior added by purchase a further 300 head, and the lot were turned on to "Brooking" and formed the foundation of the present herd, which totals 5,000 cattle. It is interesting to record that at "Mount House" Station, settled by Mr. Joseph Blythe, father of Mr. C. C. Blythe, and now owned by three of his sons, there is a herd of 15,000, the nucleus of which was secured from the 600 beasts above referred to. Being on the main track to the interior Mr. Blythe, with considerable foresight and enterprise, in 1897 opened the "Crossing" Inn and obtained a publican's licence, also

establishing a store to supply those commodities required by the settlers in northern latitudes. He retained the ownership of these concerns until 1902, when he sold out. The "Crossing" Inn, which proved a great convenience to the early travellers in that region, is still being carried on. The present homestead, which was erected in 1903, is situated at the foot

domestic purposes, and from an adjacent well, 20 ft. deep and surmounted by a windmill and 2,000-gallon tank, water is also drawn for use in the house and on the station. Lambing takes place twice each year, the principal drop being in May, and the second in the following January. In 1911 from 3,400 sheep (including 700 lambs) 7½ tons of wool were shorn, giving an average of about 4½ lb. each animal. The average in 1910, when 3,000 sheep and 500 lambs were put to shears, was much the same. Shearing is done by hand and, hitherto, has taken place in July, but in the future it is Mr. Blythe's intention to shear in September, as he considers it better for the sheep to lose their wool just as the warm weather sets in rather than at a time when its lack renders them less able to withstand the rigours of the winter climate. The average of 4½ lb. in wool, above given, although considerably below some of the returns from other stations in the district, is a very satisfactory one to Mr. Blythe, as each year has shown an increase in weight of wool due to the introduction of several well-bred rams from South Australia, and to the attention given to the flock by the owner. In addition to ten merino rams purchased from Mr. W. D. Crozier, the well-known South Australian breeder, in 1906 sires were chosen from "Booboorowie" and "Kanoona" stud flocks in the same State. The flock at "Brooking" shows its pure merino strain, and in general appearance the sheep have well set up sturdy

Bartletto,

Perth.

of the Oscar Range, in close proximity to the Fitzroy River. "Brooking" has been subdivided into seven large paddocks, five being utilized for sheep pastures and one each for the horses and bullocks. Four tanks provide rain water for

GENERAL VIEW OF "BROOKING" HOMESTEAD.

frames, while the wool contains plenty of yolk and is of good density and length. The wool is sent to London, and has brought as much as 1s. 6d. for the scoured product, while in its greasy state the average of 91d. has been maintained. In the past Mr. Blythe has given the larger share of his attention to the raising of cattle—principally shorthorns of the Durham breed, particularly esteemed for their beef-producing qualities—but it is his intention henceforward to use "Brooking" as a sheep-breeding station and to transfer the whole of the cattle to "Millywindy," 900 of the herd having already been removed to the second property. The flock now numbers 3,400, and the pick of the rams and ewes are kept. More stud rams will be added yearly and close attention given to the improvement of the sheep. Considerable trouble has been experienced in retaining a sufficient number of horses for use on the station, as the Kimberley disease early attacks them and leads to their premature decay. The half-hundred horses at "Brooking" are chiefly hacks and stock horses, and a certain number are bred each year to meet requirements. For transport purposes, such as the carriage of stores, wool, etc., and for station work, forty mules are kept, and these hardy animals have long since proved their worth. For many years Mr. Blythe kept a team of twenty-one mules on the road, and made a profitable undertaking of the carriage of supplies between the Derby township and inland centres. At the present time there are two mules at "Brooking" which worked continuously for

five years and show little sign of wear, approaching old age being their principal enemy. "MILLYWINDY," Mr. Blythe's other property, is situated in the Leopold Ranges, some forty miles due north of "Brooking." The run was taken up by Mr. J. G. Calder in 1906, and comprises 132,000 acres of basalt and sandstone country well watered by springs and

Bartletto, Mr. C. C. BLYTHE. Perth.

creeks. The natural grasses grow in abundance. It was not until the latter part of 1911 that Mr. Blythe was able to devote time to the improving of "Millywindy," but in that year work was begun and has since proceeded steadily. The property lies in a valley formed by the Leopold and Lady Forrest Ranges, both of

which form a natural boundary, and less than a dozen miles of fencing will be required to make the run stock-proof. In April, 1912, Mr. Blythe purchased from Mr. A. W. Edgar the "Oscar Range" Station, which adjoins "Brooking" on the western boundary. The property comprises 522,000 acres, and 7,000 head of shorthorn cattle are grazed on its wide expanses at the present time, but it is the intention of Mr. Blythe to reduce this number in the future and restock with sheep. There are also 170 horses on the station, including twelve thoroughbreds, and a jack donkey, imported from America by Mr. Edgar at a cost of 200 guineas, is used for breeding mules—of which there are twenty—for station use. The pedigreed mares include "Maiden Erleigh" ("Sunrise"—"Queen Eliza"), "Monazite" ("Malua"—"Galena," by "Richmond"), "Girton Girl" ("Mentor"—"Sylvina," by "Glorious"), and others equally well bred. The Oscar Range runs through the property for about 50 miles, and fine grazing pastures for both cattle and sheep are provided by the extensive tablelands on the summit of these hills. Forty-four miles of fencing have been put up, and half a dozen wells, fitted with windmills and tanks, are augmented by natural springs, so that there is no scarcity of water. The homestead, constructed of stone and iron, contains four rooms, while adjacent are men's quarters, drafting yards, and other outbuildings. These improvements will be steadily added to by Mr. Blythe, and the property will be controlled from the head station.

TEAM OF 21 MULES AND 2 HORSES TRANSPORTING WOOL TO DERBY.

N

GISKE GORGE, FITZROY RIVER, KIMBERLEY.

JOSEPH BLYTHE, father of Mr. C. C. Blythe, was born at Bunbury on May 22, 1850. He is a son of the late James Blythe, of Edinburgh, Scotland, who was attached to the 21st Regiment Imperial Forces and took part in the historic battle of Pinjarra, subsequently becoming a member of the Homney Survey Party. Within recent times a tree was discovered at Stone's Brook, near Collie, on the trunk of which had been engraved the words "21st Regiment, Jas. Blythe, Sept. 4, 1838." The portion of the trunk bearing the inscription (about 3 ft. in length) is now in the possession of the Forests Department and is in a splendid state of preservation. Mr. Joseph Blythe was early associated with agriculture and stock life, and at nineteen rented from Mr. Mark

FAT CATTLE FROM MR. C. C. BLYTHE'S STATIONS LANDED AT FREMANTLE, MARCH, 1913.

Padbury a farm of 40 acres situated in the Lower Blackwood district, holding the same for about five years. After spending a short time in the Warren district he bought "Jelbargarup," a holding situated in Lower Blackwood district, where he remained nine years, when he sold out owing to a disease attacking his dairy herd. In 1884 he proceeded to Derby, in the Kimberley district, where, among other ventures, he opened an hotel and continued in the jovial rôle of boniface for five years. He then commenced operations at "Noonkambah" Station for Emmanuel Brothers, and continued until 1894, when he took over the management of "Lennard" Station, where he remained

for the next two or three years. In 1897 he explored the north side of the Leopold Ranges, being the first to open these hills for pastoral purposes. He afterwards drove his cattle throughout the range in 1903 and opened up the original track, over which he drove the first vehicle. Returning to Bunbury in

eight children, of whom six sons and one daughter now survive. One son perished of thirst while endeavouring to overtake straying cattle, his horse dying under him. When on "Lennard" Station Mr. Blythe rendered signal service, and himself narrowly escaped death, by joining forces with the police in

gained a splendid insight into practical farming under his father, and on arrival of the family at Derby turned his attention to team driving and stock handling, continuing in these occupations for six years. During this time he added to his experience of farming considerable knowledge in all departments of the pastoral industry, and feeling confident of his ability to form a successful station he started "Brooking," and has since brought the station up to its present state of efficiency. Mr. Blythe is one of the finest judges of stock in Western Australia, no further proof of this being needed than the splendid shorthorn cattle and sheep which to-day are to be found on "Brooking" Station. Mr. Blythe has not permitted the whole of his time to be taken up in the management of his own affairs, but has given a portion of his attention to social demands. He was one of the founders of the Fitzroy Racing Club in 1901, and since its inception has filled the offices of president, judge, and steward. On the occasion of the first race meeting held under the auspices of this club Mrs. Blythe was the only white woman present. He is patron of the Derby Race Club, and was gazetted a Justice of the Peace for West Kimberley in 1908, during the regime of the Moore Government. Mr. Blythe married at Richmond, Victoria, in 1900, Pauline, third daughter of the late John Tyson, of Wales, England, latterly of Victoria. Mrs. Blythe is related to the famous Tyson family, and is able to trace her family tree as far back as 800 years.

FAT BULLOCK FROM MR. C. C. BLYTHE'S "MILLYWINDY" STATION.

1898 Mr. Blythe began business as a butcher, only to sell out and return to Kimberley in 1903 for the purpose of opening up "Cowandine" Station in conjunction with one of his sons. This partnership was afterwards dissolved, and Mr. Blythe, sen., taking two-thirds of the cattle, settled at "Mount House" Station, in the Leopold Ranges, where he continued until 1910, when he sold his interests to his three sons—Messrs. Joseph William Blythe, Arthur Blythe, and Mervyn Frederick Blythe. He afterwards proceeded south to Moora and commenced wheat-growing and sheep-raising on a moderate scale. Shortly after settling at Moora Mr. Blythe's health began to give way, and in 1911 he made over the farm to his son, Roland George, himself retiring to Bunbury to enjoy a well-earned rest after the many strenuous years of labour in different parts of the State. He married a daughter of the late James Copping, of Busselton, and had a family of

the search for and ultimate shooting of the dangerous aboriginal "Pigeon," who had shot five white men and for three years had evaded all the efforts of the countryside to secure him. CHARLES CHRISTOPHER BLYTHE was born at Bunbury on February 13, 1871. He

ANOTHER VIEW OF FAT CATTLE AT FREMANTLE.

"ETTRICK"—The pastoral property of "Ettrick," owned by Messrs. George Learmonth Hardie, George Harold Corney, and John Lyall Stewart, is situated in the north-western areas of Western Australia. It comprises some 200,000 acres of country, watered by the De Grey River, which runs right through the property, and originally formed part of "Mulyie" Station, now held in the name of Anderson Brothers and Co. The first to take up the territory for pastoral operations were Mr. Grant and Mr. J. W. Anderson, by

producing many different species of native grasses, among which are included several varieties of spinifex, which flourishes on the open grassy plains, and in its early stages is an excellent fattener for stock. By the belts of light timber defining its boundaries the course of the De Grey River may be traced, winding its way throughout the property. This watercourse is looked upon as the mainstay of the estate, large pools sunk deep in the bed of the river and stretching over long reaches providing a permanent supply of water

are nearly always full, and serve by an automatic contrivance the iron troughs, which are always kept brimming with a continually-renewed supply of pure water. The boundaries of "Ettrick" are defined and protected by fences, in the construction of which wooden posts and iron standards were used, threaded with six strands of wire, the same system obtaining throughout the subdivision fences which separate the thirteen paddocks, varying in size from 10,000 acres to double that area. The homestead is a neat building

Photo by W. E. Elston.

"WALLINAR," RESIDENCE OF MR. G. L. HARDIE, BROOME HILL.

whom it was sold to Messrs. Ross and Tom Anderson. Eventually the run was split up and Mr. George L. Hardie purchased an interest in the "Ettrick" portion, together with Messrs. James Duff and the Anderson Brothers, all of whom he subsequently bought out, continuing for about twelve years as sole proprietor. Toward the end of the year 1910 Mr. Corney and Mr. Stewart were admitted into partnership on terms of quarter shares, the station being held under the existing terms of pastoral leasehold. The soil is fertile,

during the hottest of the summer months. Water may be obtained almost anywhere by sinking in these localities, and twelve wells, ranging in depth from 15 to 60 ft., are found on different parts of the property, fitted with windmills and surface tanks of 6,000 gallons capacity, which latter are raised a couple of feet from the ground. These tanks are constructed of sheets of plain iron, riveted together in a circular shape, the cost averaging from £25 to £30 each tank. Through the abundance of the water supply they

constructed of iron walls and wood flooring, the roof being of galvanized iron. It comprises six rooms in addition to the three-roomed bachelors' quarters, and storeroom of commodious size, which stand about 20 yards distant. The dairy also is semi-detached, and clustered together on another part of the homestead area are the stockyards for cattle and horses, built of river gum of local growth, substantial slab stables securely roofed with iron, the buggyshed, harness-room, feed-room, and other outbuildings. The woolshed,

designed for the accommodation of ten shearing stands, has its engine-room, a 4 horse-power engine providing driving power for the Faulkner and Bolls' machines, which were installed in 1910, and have been found in every respect satisfactory. The yards surrounding the shearing-shed cover an area sufficiently large for the working of 5,000 sheep. The flock on "Ettrick" consists of about 18,000 sheep, which display the best traits of the merino type, the famous "Boonoke" strain having produced its unvarying excellent results when

the value of the wool in districts where they are prevalent. A contemporary writer has stated his opinion that the best merino flocks in Western Australia in the future will probably be found in the northern areas, including the north-west, where many flocks of high-class wool-producing qualities are already found. It is inspiring to remember that Australia stands at the head of the wool-producing countries of the world with 92,000,000 sheep, which produce fleeces the average weight of which (7 lb. 10 oz.) is only surpassed

of good imported blood and suitability of environment is already made manifest by the fact that the average weight of fleece has increased during the past fifteen years by about 1½ lb. per sheep. The breeders of the north-west are making strenuous efforts to reach the high-water mark of quality, and are rapidly coming on in this direction. The flock at "Ettrick," together with many others in the district, produces fleeces the average weight of which attains to 7 lb., and the wool in its greasy state usually commands from 9d. to 10d.

Photo by W. E. Kinton.

STUD EWES ON RAPE PATCH AT "WALLINAR"

transplanted to the north-west of the Western Australian State. Infusions of fresh blood have been made from time to time, but the wonderful combination of fine qualities evidenced in the merinos bred in the Riverina by Messrs. Falkiner & Sons is difficult to surpass, and about forty rams are purchased each season from Mr. Ross Anderson, of Katanning, who breeds from the same "Boonoke" strain. The sheep are entirely free from all those diseases which cause so much mortality in the flocks and depreciate

by the flocks of New Zealand. Western Australia contributes about five and a half millions toward this grand total, and it may confidently be expected that this number will be increased in the near future by another million, and thus bring her into line with South Australia, which has stood normal for several years at about six and a half millions. With increase in numbers improvement in quality must go hand in hand, if the reputation of the State as a sheep-breeding and wool-producing country is to be enhanced, and the result

per lb. at the London markets. The principal lambing season occurs in May and June, but there is a secondary drop in October and November, and the average for the year runs out at about 65 per cent. A few cattle of the shorthorn type are bred, chiefly for use on the station, which has its milch herd and its mob of "killers," in addition to the working bullocks of the teams. A bull, bred by Mr. Grant at Newmarcararra, was purchased in 1909, and is used for breeding purposes, but it is not the intention of the owners of

"Ettrick" to engage in cattle-raising on any extensive scale. The horses bred are mostly hacks for station requirements, the sire in use being "Stonebreaker," by "Stone Design," originally imported from Victoria. The rainfall of this district for the past ten years has been lighter than formerly, only 10 in. being averaged, against 15 in previous seasons. The dews, which throughout the north-west are heavy and frequent, are a valuable auxiliary to the rainfall, and have a very refreshing effect on young grasses and herbage. After a

reticulation scheme. Especially beautiful are the oleanders, which have taken very kindly to the soil and climate, and bloom all the year round, and very many other favourites, perennial and annual, brighten by their vivid colours the monotony of the neutral shades which prevail in these localities. GEORGE LEARMONTH HARDIE is a son of the late Mr. George Hardie, who came to Victoria from Scotland in the early forties, and during the whole of his subsequent career was closely identified with the pastoral

beginning to come into prominence. Mr. Hardie took a position as general station hand on "Mulgie" Station, owned by Messrs. Anderson Brothers, and here he applied himself to master the details of station management and gained valuable experience in the conditions of soil and climate to be met with in the northern localities. In 1893 he joined his brother in storekeeping pursuits at Marble Bar, and for a couple of years was engaged in commercial life. At the end of this period the business was sold and the

PAIR OF BUGGY PONIES, THE PROPERTY OF MR. G. L. HARDIE.

few heavy dews, even though there may have been no rain, tender grass and spinifex will often shoot and grow rapidly for 3 or 4 in. Cultivation has not been attempted on the station, excepting round the homestead, where all kinds of vegetables are grown, providing a plentiful supply for domestic requirements during seven months in the year. The shrubs and blossoms of the flower garden also generously reward the careful tendance which they receive, and all the plots are copiously irrigated by means of an efficient

industry in that State. The gentleman under review was born at "St. Heller's" Station, in the western district of Victoria, on July 16, 1869. His education was conducted by means of private tuition, and all his interests from infancy being directed toward stock and agriculture, the natural bent of his inclination also tended in that direction. He was engaged in the sheep-raising industry and mixed farming pursuits generally for some years before his arrival in Western Australia in 1889, about which time the far north-west was

brothers purchased some pastoral country lying about 50 miles from the scene of their recent business operations. In this way the station now known as "Warralong" was formed, and until 1902 Mr. G. L. Hardie retained his interest in this property, which is held at the present time by Messrs. T. A. Hardie, A. E. Hardie, and J. L. Stewart, the last-named gentleman being one of the partners in "Ettrick." In the above year, having disposed of his share in "Warralong" to his brothers, Mr. Hardie directed his whole attention

to the development of "Ettrick," into possession of which he had come, as already related, some five years previously. Before the expiration of 1902 he purchased Messrs. Anderson

*Bartletto, Perth.*  
MR. GEORGE LEARMONTH HARDIE.

Brothers' share of the property, and two years later Mr. Duff also went out of the partnership, and Mr. Hardie was left sole proprietor. In the latter end of 1910 Mr. Hardie purchased a half-share in the "Noreena Downs" Station, which has since been floated into the Noreena Pastoral Company, a fine property of 760,000 acres, which at its formation had been stocked with horses and cattle. Under the supervision of Mr. Hardie sheep-raising operations were inaugurated, and this department shows promise of becoming, before the lapse of many years, the most profitable branch of the industry. The 200 horses on "Noreena Downs" comprise chiefly draughts and hacks, and of the three stallions one is of Arab blood, bred on Mr. J. McKay's station at Roy Hill, and another upstanding trotting stallion was imported from Victoria. The cattle are of the usual shorthorn type, and it is the intention of the company to breed for the southern markets, where a ready sale is obtained for high-class stock from the north-west runs. About five miles west of Broome Hill, in the South-West Division of Western Australia,

lies "Wallinar," an estate comprising 3,400 acres, which was purchased by Mr. Hardie in 1905 from Messrs. Genoni Brothers, who had selected the holding some eight years previously. The soil is of mixed character, the light sandy loam being varied by tracts of the red soil prevalent in the district, and there are expanses of timber, the valuable jam and white-gum being most largely represented. Mixed farming operations are carried on, but it is Mr. Hardie's intention to use the property chiefly as a stud farm, where sheep will be bred to replenish his north-west properties. At the present time there are about 800 sheep on "Wallinar," and 250 acres are already cropped with

MR. GEORGE HAROLD CORNEY.

wheat and oats, while a further 800 acres have been cleared and will shortly be placed under cultivation. The rainfall is good, and excellent results may confidently be expected to follow the working of the energetic and up-to-date policy which Mr. Hardie has put in motion on the estate in connection with the agricultural department. A fine homestead has been erected for a family residence, comprising twenty rooms, and adjacent is the orchard, ten acres in extent, where splendid crops of apples and stone fruits are produced, while a plentiful supply of grapes is obtained from the two-acre vineyard in the vicinity of the homestead. Mr. Hardie was married in 1903 to

Hilda Gertrude, daughter of the late Mr. A. N. Corney, a well-known early settler of Tasmania. GEORGE HAROLD CORNEY, one of the shareholders in "Ettrick" Station, is a native of Tasmania, his father being the late Mr. A. N. Corney, an early pioneer of the Lake House district of that island. He came to Western Australia in 1905 and was identified with operations on "Ettrick" for some five years previous to his entering into partnership with Mr. Hardie. He resides at the station and is actively employed in the management of the property. JOHN LYALL STEWART, the other partner, was born in the western district of Victoria, and came to Western Australia in the early nineties. For several years he was employed on "De Grey" Station, discharging the duties of bookkeeper and assisting in various ways in the station routine, until in conjunction with Messrs. Mervyn Corney and H. R. L. Hardey he became one of the founders of "Strelly" Station. In 1908 he joined Messrs. Hardie Brothers in partnership in "Warra-long" Station, and undertook the management of that property, which

*Bartletto, Perth.*  
MR. JOHN LYALL STEWART.

he still conducts. In 1910 he disposed of his interests in "Strelly" Station, and purchased a fourth interest in "Ettrick."

"WARRALONG" and "BOODARRIE," the property of Messrs. T. A. and A. E. Hardie. Situated some sixty miles from Port Hedland, on the railway connecting Marble Bar, lies the pastoral run of "Warralong," founded in 1894 by Mr. T. A. Hardie with sheep secured from "Mulyie," an adjoining property on the De Grey River. It embraces 300,000 acres of undulating country, where chocolate loam is varied by a light sandy soil, very favourable for growing spinifex, which forms the principal fodder. Besides the Shaw River, "Warralong" depends for its water supply on Pier Creek, and the pools and soaks in the river bed are augmented by thirty wells in different localities sunk to an average depth of 50 ft. from the surface. The water is raised by means of twenty-five windmills and stored for convenient service to the stock in tanks of 5,000 gallons capacity. Originally containing 145,000 acres, the property subsequently was enlarged by the purchase of 180,000 acres of the "De Grey" Station, and is subdivided into twenty paddocks. The original homestead was erected in 1895, and further accommodation provided from time to time. Sheep-raising is the principal industry; the flock, numbering 22,000, is composed entirely of merinos. Rams purchased

from Mr. W. D. Crozier, the well-known South Australian pastoralist, introduced a good strain, which predominates, though from time to time

Bartleto,

Perth.

MR. THOMAS ANDERSON HARDIE.

the standard has been considerably raised by the infusion of fresh blood. The sheep are well framed, and the fleece, yielding wool of extra long staple, is in weight well up to the

general average obtained on north-west properties. Shearing takes place in July, and in due course the wool is shipped to London, where it fetches sound prices. There are 400 purebred shorthorn cattle, 70 horses, 10 camels, 2 mules, and 20 donkeys, which, in addition to the bullocks, compose the teams for transport of wool, supplies, etc. The manager of "Warralong" is Mr. Jack Stewart. "BOODARRIE" has for its boundary on the western side the tossing billows of the Indian Ocean. It lies north of Port Hedland, from which its nearest point is eight miles distant, and is an ideal locality for sheep-raising. The flock was founded by Messrs. Wedge, Richardson, & Co., and was purchased from them by the present owners with the property in 1901. It now numbers 18,000 merinos. The "Boodarie" property originally embraced 600,000 acres, but afterwards was divided, Mr. J. E. Richardson taking half and the other portion falling into the possession of the Messrs. Hardie. Later on the latter gentlemen sold over 100,000 acres, which reduced the run to its present acreage of 191,000, subdivided into 20 paddocks, comprising each about 5,000 acres. Besides sheep the "Boodarie" property carries 200 head of shorthorns,

Photo by W. E. Elston.

"ROSEDALE," RESIDENCE OF MR. T. A. HARDIE.

about fifty horses, and thirty-five donkeys, by means of which the wool is carted for shipment. The station operations are under the control of Mr. G. T. O. Macpherson, the general manager. "ROSEDALE," the property of Mr. T. A. Hardie, is situated on the Clayton Road, some

Mr. A. E. Hardie's "Denabling" Estate. It now comprises 4,000 acres, this area being subdivided into ten paddocks for grazing pastures.

Samuel Way's "Kadlunga" Estate (S.A.), which met with such approval that a further selection was made by Mr. Hardie at the Adelaide

Bartolletto, Perth.  
MR. ALEXANDER EDWARD HARDIE.

nine miles from Narrogin, in the south-western district of the State. It was taken up by the present owner in 1907 by purchase from Messrs. Clayton and Rentoul, about 1,000 acres having been cleared prior to its changing hands. Originally embracing between 9,000 and 10,000 acres, it underwent diminution in 1911, when 5,000 acres were cut off to form

Sheep-breeding is the primary industry, and great improvement has taken place in the flock during the past five years, results yielding twenty bales of wool per 1,000 sheep in 1911, against twelve bales in earlier seasons. This has been largely due to the importation of rams from Mr. W. D. Crozier's estate in South Australia, and locally-bred "Boonoke" blood rams from Mr. Ross Anderson's flock have also given good results. Even more marked has been the improvement since the introduction in 1910 of several rams from Sir

Royal Show of 1911. Carefully-chosen ewes have been mated with these sires, and sound foundation laid for the future stud flock. The proprietor intends to continue breeding almost exclusively from the pure merino stock for which "Kadlunga" has made itself famous, and a large surplus of stud rams, available for intending purchasers, is being produced annually on the "Rosedale" estate. The sheep show good breadth and robust constitution and are well covered on top, while the wool has grown long and strong, with

Photo by W. E. Eiston. ENTRANCE DRIVE TO "ROSEDALE."

Photo by W. E. Eiston. HOMESTEAD ON "DENABLING" ESTATE.

plenty of yolk in evidence. Horse-breeding is carried on to provide for station requirements, the Clydesdale stallion "Glenluss Harold" being used as sire. This stallion is by "Young Champion," and his dam, by "The Beau" (imp.), gained first at Maryborough, Victoria, in 1903, this being the only occasion upon which she has been shown. About 200 acres of new country is developed each year for grazing pastures, and a similar area is cleared and cropped with hay, the average yield being a ton and a half to the acre. Mr. Hardie is well up-to-date in the important particular of chaff-feeding the sheep during the later months of summer. A quantity of wheat and oats is grown, the former giving 15 bushels and the

where all the comforts and many of the luxuries of modern civilization have found place. Acetylene gas has been installed throughout, there are a hot and cold water service, electric bells, and flyproof doors and windows, while wide verandahs help to reduce the temperature in summer. Kitchen, dairy, laundry, and servants' quarters are alike properly appointed. An iron shearing-shed with five stands, fitted with Wolsley shearing-machines, steam-driven, has been built, where, by arrangement, the flocks of neighbouring estates are also shorn. The shed is used in the summer for the storage of hay. The stables are up to date, and there are the usual chaffcutters, harvesters, and other machinery found on the

into partnership, and later Mr. George Hardie was bought out. In 1907 the subject of our notice purchased his "Narrogin" property, and entered personally upon its development, four years later dividing the estate with Mr. A. E. Hardie as above stated. Mr. Hardie interests himself in the affairs of the district, and is president of the Narrogin Agricultural Society and of the local Liberal League. He was also president of the race club for three years, upon his resignation Mr. A. E. Hardie being elected to the post. In 1896 he married Alma, daughter of the late J. F. Hancock, latterly of "Ashburton Downs" Station, and one of the first to penetrate the north-west. In company with Mr. John

SHEARING SHED AT "WARRALONG."

latter 35 bushels to the acre. Lucerne is also cultivated with excellent results, and the area devoted to this fodder will be increased as soon as arrangements are made for obtaining a regular and sufficient water supply. For this purpose a dam is being constructed on Miningin Brook, from which the water will be raised by means of a windmill and stored in a second reservoir excavated in an adjacent hill, whence it will gravitate through a series of pipes to the lucerne paddocks. Superphosphates are used on the cultivation fields, the result being very noticeable improvement, which is lacking where patches have been missed. A fine homestead of brick and stone, comprising fourteen rooms, was erected in 1911 on the "Rosedale" Estate at a cost of £2,500,

most advanced properties. THOMAS ANDERSON HARDIE was born in Victoria in 1863, and is a son of Mr. George Learmonth Hardie, formerly of Glasgow, Scotland, who came to Australia in the early days, and was farming in the western district of the above-mentioned State. At the close of his education at Port Fairy Mr. Hardie assisted his father on the home farm for a period, and at the age of twenty came to Western Australia. He was identified with station life in the north-west until 1892, with the exception of some time spent in storekeeping pursuits at Marble Bar goldfield. In that year, in conjunction with his brother, Mr. G. L. Hardie, he founded "Warralong" Station, and carried it on for two years, when Mr. A. E. Hardie was admitted

Withnell this pioneer landed the first sheep at Port Hedland, but lack of water caused him to proceed to Point Walcott (Cossack), where "Sherlock" Station was settled. Mr. Hardie has a family of two sons and four daughters. "DENABLING," on its western side adjoins the "Rosedale" property, of which it once formed a part, being purchased by Mr. A. E. Hardie in 1911. It comprises 5,041 acres of land, of which the greater portion is still heavily timbered with jam and gum, 800 acres only having been cleared at the time of writing, but a further 200 to 300 acres will be brought under the axe annually. With an average rainfall of 17 inches and plenty of natural grasses, among which trefoil prevails, the place is well suited to the purposes of mixed

farming to which it is applied by the owner, sheep-raising and cereal-growing being the primary industries carried on. The estate is watered by the Miningin Brook, from which an adequate supply is raised by windmill, pumped across the roadway and troughed for the requirements of the stock. One 500-yards dam has also been put down. Although the property has not been long in the hands of the present owner a number of improvements have already been made, and a manager's cottage, stables, chaffhouse, etc., erected. Substantial fences surround and subdivide the estate, the boundary-fence being of six wires and netted, the cost of fence construction averaging £35 per mile. The sheep, taken originally from the Rosedale flock, number 1,700 merinos, which have been built up from Mr. W. D. Crozier's South Australian strain. At a later date rams were obtained from the estate of the late Thomas Millear, of Deniliquin, New South Wales, with the object of breeding a good wool-producing sheep and suitable rams for north-west purposes. The sheep look very promising, being bright, robust, and well-framed, with wool of long staple and very clean. A few draught horses are bred, "Glenluss Harold" being used as sire. The farm work is done principally by contract, and Mr. Arthur Hiscock manages the property on behalf of Mr. Hardie, who intends further development on entirely model lines.

ALEXANDER EDWARD HARDIE was born at Port Fairy, in the western district of Victoria, in

the year 1875, being a son of Mr. George Hardie. He pursued his scholastic studies at Portland, and subsequently was engaged in farming avocations on his brother's property at Port Fairy. In 1895 he came to Western Australia and joined Mr. T. A. Hardie at "Warralong" Station, where he assisted in the station operations until 1901. He then took charge

nine months, has given his personal attention to the management of the property. He has purchased a settler's block two miles from Narrogin, where he intends to build and take up his permanent residence. Mr. A. E. Hardie is deeply interested in sporting matters, particularly in connection with the Narrogin Race Club, of which he is chairman of

"BOODARRIE" HOMESTEAD.

of "Boodarrie" until 1909, in which year he came south to "Rosedale," and managed that estate for the next twelve months, when the property was divided, Mr. T. A. Hardie retaining the original holding, whilst Mr. A. E. Hardie formed "Denabling." In 1911 the latter went to England on a pleasure trip, and since his return, after an absence of eight or

committees. He owns a few thoroughbreds, and his colours (red, green sleeves and red cap) are often to be seen at the local meetings, to which he lends hearty support. He has won several events with his horses, which are bred principally in the north-west of the State. An enthusiastic polo player, he acts as secretary to the Narrogin Polo Club

HOMESTEAD AT "WARRALONG."

"MUCCAN" and "TELYARUP." Situated about 125 miles from Port Hedland lies the pastoral property of "Muccan," owned by Mr. M. Corbett. It comprises 387,000 acres with a frontage of 25 miles to the De Grey River. The station is

Bartletto, Perth.  
MR. MICHAEL CORBETT.

surrounded by mountains on the northern boundary, which make a defining line, otherwise the country consists mostly of plains well suited to sheep-raising and wool-growing. The native grasses grow luxuriantly in good seasons and there are fields of soft spinifex country. The "Muccan" flock, which is purely a merino one, owes its foundation to the importation of several rams from Mr. Alex. Murray's "Mount Crawford" Station and the purchase of a number of ewes from Mr. Duncan McRae, of "Croydon" Station, Western Australia. At a later date fresh blood was introduced by the

purchase of rams from Mr. W. D. Crozier, of South Australia, and in 1905 100 of the famous "Boonoke" rams were obtained from Messrs. Falkiner & Sons, New South Wales. Since then fresh importations of ewes have been made from Mr. W. D. Crozier's "Moorna" and "Rockbrook" Stations in South Australia. This liberal infusion of new blood has had a marked effect on the flock, the sheep being well up to the

100 head of shorthorn cattle and 90 horses. Six camels and eighty-five donkeys are kept for transport purposes. In 1907 Mr. Corbett directed his attention to the southern portion of the State and purchased an estate situated 17 miles distant from Broome Hill, on which he bestowed the name "Telyarup." The property covers an area of 3,400 acres, and is well watered and grassed with trefoil and clover, and has proved

"TELYARUP," RESIDENCE OF MR. M. CORBETT, BROOME HILL.

standard, their strong frames carrying a heavy fleece of excellent length and staple. The 1910 clip averaged 7 lb., including a fair percentage of lambs. Lambing occurs in March and September, and the general average totals about 75 per cent., though in record years 100 per cent. has been exceeded. The wool is sent to the London markets, always commanding the best ruling price. Besides the flock, which consists of about 21,000 sheep, the run carries

admirably adapted for the purposes Mr. Corbett had in view, *viz.*, that of breeding stud sheep. Sparing neither energy nor outlay, he has already cleared 2,000 acres at a cost of £1 per acre. The country is gently undulating, with forests of York gum, morrel, and salmon. The soil consists of a rich loam of good depth, and it is Mr. Corbett's intention to engage in wheat- and hay-growing on an extended scale. Easy access to the port of Albany

HOMESTEAD AT "MUCCAN" STATION.

has been provided by the newly-constructed Tambellup-Ongerup railway, the Gnowangerup Siding on this line being only seven miles distant from "Telyarup." At the present time the flock consists of about 1,000 sheep, a fine type of merino having been produced by means of rams imported from the "Koonoona" Estate in South Australia, while the stud flock now numbers about 250. Hitherto Mr. Corbett has disposed of his surplus rams, which have

fine stallion "Deep Dugdale" ("Sir William"—"Violet") is responsible for some valuable specimens of rising stock in the district. A number of Ayrshire cattle was purchased from R. Dugdale, of Bacchus Marsh, Victoria, and another important department of Mr. Corbett's operations is the raising of Berkshire pigs from three purebred sows and a boar ("Manor Arthur") which Mr. Corbett bought in England from Mr. Arthur Hiscock, a noted breeder, of

improvements have been effected, including the excavation of nine 1,000-yard dams for water conservation purposes. The "Telyarup" Station is under control of Mr. P. Corbett, while Mr. C. Holthouse manages the property in the north-west. MICHAEL CORBETT was born at Perth, Western Australia, in 1860, and is a son of the late Mr. James Corbett, of Tipperary, Ireland, a carpenter and contractor, who came to Western Australia in the fifties and was a prominent tradesman in this State. At the close of his education Mr. Michael Corbett was associated with his father in business for three years, but desiring larger scope for his energies he entered upon station pursuits with the firm of Grant, Anderson, & Edgar. Seven years later he took up the "Warrawagine" property, which subsequently was exchanged with Messrs. Darlot Brothers for "Muccan," and in 1907 acquired "Telyarup," as above recorded. Mr. Corbett is chairman of the Progress Committee in the latter district, and was a prominent advocate of the Tambellup-Ongerup railway line. He is a Justice of the Peace, a member of the Roads Board, and for three years was chairman of the Broome Hill Race Club. In 1911 he visited England, Ireland, Scotland, and the Continent, Canada, and America, the tour occupying in all about nine months.

HARVESTING AT "TELYARUP"

commanded very good prices, but in future all the rams and ewes will be kept for breeding purposes. An enterprise which is attracting considerable attention from the horsebreeders of the State is Mr. Corbett's importation of the purebred Percheron sire "Invincible." While travelling in France in 1911 he was struck by the possibilities of the Percheron type, and he finally secured the present sire, which was landed in splendid condition, at a cost of £700, being the first of its kind to reach Western Australian shores. "Invincible" was foaled in 1908, and is a handsome stamp of animal, showing in every point the purity and excellence of his pedigree. The Arab strain is well in evidence, and the fine combination of strength and activity displayed by every movement of the magnificent limbs is a convincing argument for the popularity which the Percheron breed has attained in Canada and America, as well as on the Continent. Mr. Corbett intends to use "Invincible" with a limited number of Clydesdale draughts and blood mares in the surrounding districts. There are some twenty Clydesdales at "Telyarup," and the

"Manor" Farm, Morcambe, Dorset. In 1910 a fine brick homestead was erected at "Telyarup," embracing nine rooms, and surrounded by a spacious verandah. Many other

CHARLES MITCHINSON STRAKER, J.P., of "Hamersley" and "Coolawhyniah" Stations, situated on the tableland of the Roebourne district, was born at Withernsea, near Hull, Yorkshire, England, on June 28, 1857. He is a son of the late Mr. John Straker, of that place, and received his education at Hull

Bartletto, Perth.  
MR. CHARLES MITCHINSON STRAKER.

Grammar School, at the close of his scholastic career turning his attention to farming pursuits in his native county. In January, 1882, he arrived in Western Australia, and immediately proceeded to the north-west, where he was entertained for a time at the "Chirritta" Station as the guest of the proprietor, Mr. McLeod. Being desirous of getting into harness as soon as possible he accepted a position as jackeroo on the "Millstream" Station, and having gained sufficient experience at a later period undertook the duties of sheep overseer on "Croydon" Station. Having held various other positions, in 1887 he took over the lease of "Tambrey" Station in partnership with Mr. Harry Mears, and carried it on until 1891, when a serious drought compelled the abandonment of the enterprise. After managing a property at Roebourne for a short time Mr. Straker received the appointment of travelling Inspector of Aborigines under the auspices of the Government, which he filled for two years, at the close of that period taking charge of a party to open up a stock route for the Government from Mullewa to Roebourne. After this trip, during which fifty-two Government

wells were sunk by the party, Mr. Straker resigned his position in 1899 in order to join Mr. Duncan McRae in the purchase of the "Croydon," "Hamersley," and "Coolawhyniah" Stations. This partnership existed until 1911, when "Croydon" was sold, and Mr. Straker purchased Mr. McRae's interests in "Hamersley" and "Coolawhyniah," and has since carried them on as sole proprietor. He received his Commission of Justice of the Peace under Governor Broome in 1888 before the introduction of responsible government in Western Australia. For thirteen years he occupied a seat on the Tableland Roads Board. He has made two trips to the Old Country, visiting England in 1900 and again in 1909, when he extended his travels to the Continent of Europe, returning to his adopted country after an absence of nine months.

LEONARD HAWTHORN DARLOT, of Darlot Brothers, of "Warrawegine," "Polelle," and "Urella" Stations, is a son of the late Mr. H. Darlot, of "Bundyulumblah," Deniliquin, New South Wales. He was born at Melbourne, Victoria, on September 18, 1862, and received his education at Wesley College, in that city. Having concluded his scholastic career he began life on the "Bundyulumblah" Station, in Riverina, and after a short sojourn in that district proceeded to Queensland and spent about two years in travelling in the interior of that State, during which period he enlarged his experience in pastoral operations. In March, 1882, he arrived in Western Australia and settled on the Murchison River, where his brother, Mr. E. F. Darlot, had preceded him by some twelve months. The late Mr. H. Darlot had purchased "Berringarra" Station, on the Murchison, from Messrs. Robert Campbell and Smith, and the brothers took control of this property with the adjoining "Mount Fraser" Station, which had been the property of a Mr. Keily. The latter run afterwards was sold to Messrs. Steele Brothers, at a later date being again purchased by Messrs. Darlot Brothers and resold to Mr. E. Lee Steere, the present owner, while "Berringarra" in 1910 passed into the hands of the Australian and New Zealand Land Company. Various other properties were acquired by the firm from time to time, among

which was "Annean" Station, on the Murchison, a portion of which they sold, retaining "Polelle," which originally was part of this property. The brothers also purchased and afterwards sold "Narra Tarra," near Geraldton, and "Yangedine," near York, and at the present time are owners of "Warrawegine" and "Bay-side," in the north-west, and "Urella," near Mingenew. Mr. Darlot is a keen lover of horses, and on the turf his name stands for everything which has tended to keep the sport clean. With his brother, he has owned and raced many well-known performers, among which may be mentioned "St. Ives," "Wairiri," and "Keston" (all Derby winners), "Lucky Dog," "Limber," "Ropa," and a host of others. For some time he has occupied the position of president of the Western Australian Hunt Club and is one of the oldest members of the Western Australian Turf Club. He is a member of the Northern Club at Auckland, the Weld Club, Perth, and acted as Director of the Wellington Park Stud Company, where

Bartletto, Perth.  
MR. LEONARD HAWTHORN DARLOT.

the famous "Carbine" was bred, and for a considerable time it was his custom to pay an annual visit to New Zealand. He is fond of golf and is president of the Perth Golf Club. He is a member of the Committee of the Royal Perth Yacht Club; and also a life member of the Western Australian Cricket Association. In 1907 Mr. Darlot married Jenny, daughter of Mr. T. W. Brown, of London.

JAMES BROCKMAN, J.P., is a son of the late Mr. Robert James Brockman, of Beechborough House, Kent, England, who came to this State in 1831, and was one of the pioneer farmers of the eastern districts. He died in 1897, after living in retirement for thirty years at Bunbury. The gentleman under review was born at his father's residence near Guildford, Western Australia, on July 19, 1843, and was brought up to farming and station pursuits. At sixteen years of age he left home and obtained a position as foreman on a large horse and cattle station near Gingin, where numbers of fine horses were bred for shipment to the Indian market, and gained considerable experience as a roughrider. Four years later, in conjunction with a friend, he took over the lease of a large dairy farm and cattle and horse station combined, and after its expiration continued in the pastoral industry for some years. About this time he obtained his first knowledge of seafaring matters, becoming owner and afterwards master of a schooner engaged in the coastal trade, and was the first to load a shipment of guano from Houtman's Abrolhos, a group of small islands off Geraldton, which he sold to Mr. W. Spencer, a merchant at Bunbury, thus proving its commercial value. Mr. Brockman had long wished to visit the "great north-west," and at length an opportunity occurred. A party formed by two young men, Messrs. Henry and William Clarkson, had been engaged by Messrs. Grant, Harper, & Anderson, squatters, of the "De Grey" Station, in the Roebourne district, to purchase and drive overland a large herd of cattle. Both brothers lost their lives in January, 1874, Henry Clarkson being murdered by the natives while endeavouring to carry water to the relief of his brother William, who subsequently perished from thirst. The party being left without a leader, Mr. Brockman applied for and obtained the post, and succeeded after a journey occupying six months in getting the party to Roebourne. He next took a position as mate on the Government vessel "Adela" under Captain P. Walcott, Inspector of Pearl Shell Fisheries, resigning at the end of the pearling season. In July, 1880, he fitted up a small vessel, the property of his brother, Mr. C. S. Brockman, for the purpose of engaging in the pearling industry. He procured native divers from the

Gascoyne, now known as Carnarvon, and after touching at Cossack proceeded to the then new pearling grounds of King Sound. Here he lost one of his divers, who was seized and torn to pieces by a large alligator while diving off the mouth of the Fraser River. This induced him to leave and to try his fortune in the latter part of December on the old western grounds near Roebourne, where he did remarkably well. On January 7, 1881, in company with fourteen other vessels, he was met by one of the terrible hurricanes common to those latitudes. Every vessel was either swamped or driven ashore, and many lives were lost. His boat, with two heavy anchors down, dragged for a long distance and finally capsized and sank. After keeping himself afloat for five hours

vessels were at a discount. He then joined his brother, Mr. C. S. Brockman, in squatting interests in the Gascoyne district, and ultimately, after many years, sold out his share in the enterprise. Unable to lead an idle life, he accepted an appointment as Inspector of Pearl Shell Fisheries at Shark Bay, where he remained in command of the Government cutter "Genista" for six and a half years. He then received promotion to the post of Government Resident at Roebourne, the capital of the north-west, and after three and a half years resigned in April, 1900, when he came to Perth and has lived in retirement ever since. He has been a Justice of the Peace for the whole State for forty years.

ALFRED BARNETT was born on December 16, 1857, and early in life commenced work on a mill at Northam, later gaining considerable experience in the pastoral industry on a farm in the Beverley district. On October 16, 1882, he left for the Kimberley district, where, with other members of a syndicate called the Meda River Pastoral Company, he had taken up 250,000 acres of land on the Meda River. This run was stocked with sheep conveyed from Fremantle by means of the barque "Amur," but out of 1,400 ewes 500 were lost in landing. Mr. Barnett continued his connection with this enterprise for eight years, during the greater part of which time he had full control of operations on behalf of the syndicate and met with a fair measure of success. He then accepted the management of "Balmaningarra," and was identified with the development of this property until 1905, when he relinquished his post and came to Serpentine, where he owns a small holding and devotes his time to mixed farming. During the early years of his residence at Kimberley he experienced great hardships and had many adventures with the blacks, in all of which, however, he came out successfully. He was one of the party sent out to secure the murderer of Antony Cornish, a member of the Squatting Company, who had been speared by the native "Gorilla," and was present at his capture by the police party. During the great flood of 1895, the biggest on record for the district, Mr. Barnett was responsible for the rescue of two white men and a number of natives, on one occasion swimming a mile with a native on his back.

Bartletto, Perth.  
MR. JAMES BROCKMAN.

in the height of the storm and in utter darkness he was carried by the tide and landed upon a sandy shore in a most exhausted condition. Here he found members of his own and other crews, all with a sad tale to tell of similar disaster. During five subsequent months he occupied his time by digging a canal, 300 yards in length, from the spot where his vessel had been thrown on the marsh, to an adjacent creek, and at the high spring tides floated her down into deep water, where he jury-rigged her and proceeded to Fremantle. There he refitted his boat, and loading her with general cargo went into the north-west coastal trade, which proved very profitable until the era of the steamer arrived, when sailing

WILLIAM GERALD LEFROY, the owner of "Yaneyaerddy" and "Towera" Stations, in the Ashburton district, is the second son of the late Gerald de Courcey Lefroy, of Santrey, Tipperary, Ireland, who left his native heath for the Antipodes in the early forties. The late Mr. Lefroy came to Western Australia and taking up land at Walebing, near Moora, engaged in sheep-farming during the years that followed, his efforts being crowned with considerable success. After an absence of some fifteen years Mr. Lefroy, sen., returned to Ireland and commenced farming at Ballyloghey, where he continued for a few years with unfortunate results. Accordingly, he once more set out for southern shores, and upon this occasion chartered a vessel for the purpose of bringing with him a large number of emigrants, whom he intended to land at New Zealand in return for a grant of land.

Upon arrival he found that the offer had been withdrawn, and he was compelled to reship his living cargo at considerable loss to himself. Continuing his voyage, first to Sydney and then to Western Australia, in the year 1860 he landed at Busselton. Proceeding to the Warren district he again applied his energies to agricultural and pastoral pursuits, and made a payable proposition of mixed farming operations. Mr. Lefroy's next move was to enter the Civil Service

as Sheep Inspector, and upon his resignation, after a lengthy occupation of this post, was gazetted Resident Magistrate at Bunbury, which office

At the age of sixteen he purchased a small boat capable of carrying 2 tons, and in company with a man and a boy set sail for Shark Bay to engage

he filled for a brief period. He then secured a lease of the property known as "Jayes," owned by Sir James Lee Steere, and here he followed his original calling of farming until the time of his death. Mr. William G. Lefroy was born at Ballyloghey, Ireland, on October 6, 1856, and at the age of four years was brought to Australia by his parents. He was educated at Bunbury, and early in life gave evidence of an enterprising and resourceful nature.

in the search for pearls. At the end of six months Mr. Lefroy sold his interest in the craft, and proceeding to Cheriton he obtained some useful experience in farming life, a little later joining his father at "Jayes," in the Blackwood district, where he assisted to work the estate. Severing this connection he went to the Swan district and rented a farm on the Swan River, where he continued for two years. Discontented with the progress he was making towards the

Photo by C. E. Farr. GARDEN AND DRIVE AT "MILEURA," PEPPERMINT GROVE.

goal to which most aspire he decided to move farther afield, and in 1880 set out for Carnarvon. Almost immediately he found employment in shearing on Mr. C. S. Brockman's property, and turned his hand to various tasks incidental to the development of pastoral areas. Before long, however, his adventurous spirit impelled him to face the perils of the explorer, and within two years he covered an immense amount of ground, proceeding inland in an easterly direction for close on 300 miles and crossing the Barlee Ranges. Mr. Lefroy was one of the first white men to penetrate this country, and had many trying experiences with the natives, but always managed to come through unscathed. In 1880, with a black boy, two riding horses and a packhorse, he set out in a north-easterly direction, and about 200 miles from Carnarvon came upon a tract of country with the appearance of which he was so favourably impressed that he applied for and obtained a lease of 300,000 acres, which area now forms part of "Yanyearreddy" Station. Leaving Mr. Brockman he spent twelve months with Mr. Mervyn Bunbury, and in the following year, with his brother, Mr. H. G. Lefroy, secured a three years' lease of "Boolathana" Station from his former employer. When this lease expired the Lefroy Brothers took the surplus stock, consisting of 2,200 sheep and a few cattle and horses, purchased a team of ten bullocks, a waggon, and other supplies, and in 1886 proceeded overland to "Yanyearreddy," where they arrived with their flocks and herds unbroken and entered into active possession of the property. Improvements immediately were set in train, the initial enterprise being the sinking of a well to a depth of 30 ft., which yielded an excellent flow, and from this well, in addition to a few soaks in the bed of the Lyndon River and a natural spring on the property, the first supplies of water were obtained. The water was raised by hand and poured into troughs made from the hollowed-out trunks of trees, and as time went on other wells were sunk and further provision made for the watering of the stock. The erection of a bush fence to enclose an area of about 15,000 acres of land for the use of the sheep was one of the next steps in the formation of the station. The preparation of this fence was no light task, as the whole of the material used had to be cut, and the trees

stacked one on top of the other to the required height. Wire was next imported from England, and with posts of mulga cut on the property,

Bartletto,

Perth.

MR. WILLIAM GERALD LEFROY.

threaded with six strands of wire, substantial fences defined the boundaries and subdivisions of the run. Meanwhile progress was being made in the erection of a homestead, for which sun-dried clay bricks were used, and soon a comfortable dwelling, including three large and two smaller rooms, was ready to welcome the settlers within its walls. This was completed in 1887, and two years later the shearing-shed and woolshed were built, the natives, having been taught the use of a saw, assisting in the general work of improvements. In 1890 such excellent progress had

been made that Mr. W. G. Lefroy decided to leave his brother in charge of the property and take up his residence at Herne Hill, in the Swan district, where he engaged in farming pursuits for the next fourteen years. In 1905 he erected a fine residence at Peppermint Grove, Cottesloe, where he now resides during the greater part of the year. This beautiful home, "Mileura," standing in two and a half acres of ground and surrounded by its lawns, flower-beds, and vegetable garden, is one of those which have given to the picturesque suburb a large share of its popularity. The credit of planning and laying out these fine grounds has to be given to Mr. S. Boulden, and under his care the garden has become a fine example of floricultural art. In 1907 Mr. Lefroy bought out his brother's interests in "Yanyearreddy," and three years later purchased "Towera," which property adjoins the former station on the north and western boundaries. From its original area of 300,000 acres "Yanyearreddy" during the ensuing years has doubled its acreage, adjoining land being purchased from time to time, the final acquisition from Mr. C. F. Wainwright, owner of "Caroline," an estate of 150,000 acres, situated almost in the heart of the run, bringing the latter up to its present dimensions. The general contour of the estate is undulating, the soil principally being loam and limestone with a plentiful sprinkling of quartz and granite. Indications of gold have been found on several parts of the run, but never in sufficient quantities to make development a paying proposition. Numerous species of natural grasses, the chief being wind

"YANYEARREDDY" HOMESTEAD.

and star grasses and bundle bundle, grow in profusion over the estate, and Mr. Lefroy forwarded as many as thirty-seven varieties to the

with a holding capacity of from 10,000 to 20,000 gallons, and troughs for watering the stock. "Yanyearddy" has been subdivided

Australia) were obtained, a notable improvement being evident. Several years later the "Bungaree" strain from the same State was introduced and used in the flock for five years, and in 1908 two representatives of the famous "Wanganella" flock were imported from New South Wales, to be followed by an additional fine ram from the same stud in 1911. The flock has thus always been on the up-grade, and to-day holds its own among contemporary flocks in good average quality. The sheep show a stronger frame, while the wool has grown finer and longer in staple, displaying a fair yolk and giving good results when scoured. The wool is carted to the port of Onslow by means of camel, donkey, and bullock teams, whence it is shipped direct to London, where the "Yan-yearddy" clip has more than once brought top prices for wool from the Ashburton district. Shearing takes place in July, the work being done at "Towera," where Moffat-Virtue machinery, driven by an 8-h.p. steam-engine, has

VIEW OF THE YANREY RIVER "TOWERA" STATION.

Indian and Colonial Exhibition held in London. With saltbush, blue-bush, and cottonbush there is always plenty of fodder, and during the dry season of 1911-12 the sheep were in prime condition. Generally speaking the estate is lightly timbered, the heaviest growth being on the river flats. The Lyndon River wends its way through the estate, providing a water frontage of about sixty miles, and besides the numerous creeks there are at the present time twenty-four wells averaging in depth from 20 to 40 ft. Most of these have been fitted with windmills and tanks,

into seventeen paddocks of varying sizes, the dividing fences having five strands of wire, while on the boundaries six strands have been used, and altogether some 300 miles have been erected at a cost of £30 per mile. The old homestead gave way in 1910 to the present building, which is of granite, and contains four large rooms, and a hall 36 ft. in length. The flock, which is an exclusively merino one, numbers 40,000. In the first instance "Canowie" rams from South Australia were used, but results not being wholly satisfactory, types from "Hill River" (South

been installed. The lambing season is from March to June, and a second drop takes place during December and January, the general average over a number of years being about 80 per cent. The run carries 150 horses, and a number of Clydesdale mares are kept for breeding purposes. The sire in use, "Patch," a fine stamp of Suffolk Punch, was originally imported to the State from Bangor by Mr. S. Mackay, and purchased for "Yan-yearddy" in 1910. Mr. Lefroy is breeding from Clydesdale mares with the object of obtaining a medium-sized staunch horse suitable to cope

"YANYEARDDY" MERINOS AT THE MINGENEW SALE YARDS.

with the heavy work of the station, and in turn through this stock to produce a heavy stamp of hack for lighter work. For the latter purpose a sire descended from a highly-bred Victorian family was purchased from Mr. Mervyn Bunbury, by whom it was introduced to the north-west. At one time Mr. Lefroy was a large breeder of cattle, but relinquished operations in this line in favour of the more profitable industry of sheep-raising. For station uses about 200 head of Durham shorthorns are run on the property. "TOWERA," Mr. Lefroy's second property, was settled by Messrs. Simpson and Cameron in 1880, and, after being sold to Messrs. Britnall and Forrest, was purchased by Mr. Henry Twitchen, who in turn sold it to the present owner in 1910. It consists of 550,000 acres of spinifex country, varied by tracts well supplied with natural grasses and top feed. The property is subdivided into seventeen paddocks, and about 250 miles of fencing have been completed, the boundary fence being not quite finished. The boundary contains six and the subdivision fences five strands of wire. Other improvements have been carried out on up-to-date lines, the shearing-shed, erected at a cost of £3,000 and providing for sixteen stands, being considered the finest in the north-west. The homestead and outbuildings are of the same substantial character, and in every respect "Towers" may be classed as a first-class property. Sheep-raising is the principal industry, and the flock of 40,000 merinos was founded from ewes brought from the western district of Victoria by Mr. Mardie Simpson. These were mated with the best rams procurable, and in 1908 fresh blood was brought

from "Widgawa" Station. The type differs slightly from the "Yan-yearreddy" flock, being a little lighter in frame, while the fleece is heavier

chief magistrate for the district. He was also a member of the Swan Roads Board for very many years, and occupied the chair for three terms. He

YANREY RIVER IN THE DRY SEASON.

and the wool of better quality. At present every effort is made to keep the flocks apart, but a gradual intermingling is certain to take place and lead to a levelling up of the qualities of the sheep. Mr. Lefroy has not been unmindful of his responsibilities towards the general community, and during his residence in the Upper Swan district was always to the fore in any movement for the advancement of the neighbourhood. When Midland Junction was gazetted a municipality he was asked by an influential deputation to contest the mayoralty, and consenting, at the ensuing election was returned as first

aided the cause of the Anglican Church in that district by accepting the office of people's warden. He fills the office of vice-president of the Pastoralists' Association, and holds membership in the Western Australian Turf Club and the Weld Club. His chief recreation is found in tennis, and his home at Cottesloe is graced by two fine courts, where he may frequently be seen wielding the racquet. He is also a keen motorist. Mr. Lefroy was married in 1888 to Flora May, daughter of Mr. E. G. Barrett-Lennard, of "St. Leonards," Middle Swan, and has a surviving family of six sons and six daughters.

OLD HOMESTEAD AT "YANREYREDDY" STATION (PARTLY DEMOLISHED).

"YANREY," the property of Thomas Frederick de Pledge, is situate in the Onslow district of the north-west of the State. It comprises some 950,000 acres of undulating country, composed of rich clay flats intersected with sandhills and large patches of volcanic soil. On the western boundary of the run, which faces the broad reaches of the Indian Ocean, there is a salty marsh quite valueless for the purposes of stock-raising. The timber on the property is of negligible quantity, except on the river frontages, where there is substantial growth, although this is being gradually denuded by the ravages of bush fires which occasionally sweep through the estate during the dry summer months. In good seasons there is an abundant growth of natural grasses, spinifex, blue-grass, and weeping-grass, all of which are regarded as excellent fodder for stock. On the eastern side of the property the Ashburton River slowly wends its way to the sea, while the western side is watered by the Yanrey River, from which stream the estate derives its name. The supply of water derived from the two streams mentioned is supplemented by a complete system of irrigation, the fluid for the purpose being raised from a series of wells, some twenty-seven in number, each of which is fitted with a windmill and galvanized surface tanks of a storage capacity varying from 16,000 to 18,000 gallons. By means of gravitation the water is conducted through pipes to most parts of the run, with the exception of the paddocks on the northern side, where the well water is too salty to be brought into use. To overcome this drawback to the proper stocking of this portion of the property, Mr. de Pledge is putting in additional bores, and is hopeful of locating a good supply of fresh water in the near future. "Yanrey" was purchased by the present owner from the executors of the late John Stuart in the year 1898, and originally consisted of about 270,000 acres. Three years

later the acreage was considerably augmented by the acquisition of the adjoining properties "Yannangal" and "Yananey," the former from Messrs. Knight & Cummings, the latter from Messrs. G. & R. Woodhouse, who were among the pioneer settlers of the district. In 1908 the estate was further enlarged by the purchase of "Globe Hill" Station, and with this latest addition the area enclosed in the "Yanrey" estate leapt to within easy reach of 1,000,000 acres of land. The property is almost completely surrounded by a five-wire fence with iron and timber uprights, and is in turn subdivided into a number of paddocks, all of which are similarly

Bartolotto, Perth.  
MR. THOMAS FREDERICK DE PLEDGE.

fenced in. It is estimated that there are 500 miles of fencing on the estate erected at a cost of £10,000, and no inconsiderable item in the yearly account is that showing the outlay incurred in keeping the fence in proper repair. Located some 70 miles from Onslow township the homestead makes no claim to pretentiousness. It is a comfortable structure of wood and iron, built after the bungalow style, and contains nine large, airy rooms. The present building was erected in 1904, and is surrounded by outbuildings such as are usually found on properties of a similar kind dotted about

all the Australian States. The homestead boasts of a fine vegetable garden, and in the winter months vegetables of all descriptions are cultivated with great success. In the north-west the breed of sheep which appears to thrive best under the exacting conditions of the locality is the world-famed merino. The flock at "Yanrey" consists of 70,000 sheep, all of which, without exception, are pure merino stock. In the early days some stud rams were obtained from the "Murray" Estate in South Australia, but these were discarded after a number of years in favour of the "Boonoke" blood, which previously had been requisitioned and after an exhaustive trial found to be better suited to the requirements of the district. Accordingly in 1904 200 carefully-selected "Boonoke" stud rams were purchased from Messrs. Falkiner Bros., of New South Wales, and the results that have followed this extensive introduction of new blood have been most gratifying to Mr. de Pledge. A noticeable improvement in the robustness of the flock has followed this importation, and the weight of fleece has shown a steady increase during the past few years. The sheep are characterized by strong frames and bulky fleeces of strong combing wool showing plenty of quality and averaging about 8 lb. The full clip is shipped direct to the London markets, where it is in good demand, and at the 1910 sales the price topped 11½d., which is the record price obtained to date for wool bearing the "Yanrey" brand. Shearing is usually started towards the middle of June, and by the end of the month the twenty Moffat-Virtue machines are generally proceeding at high pressure. The lambing season commences in April of each year, the percentages varying in accordance with the seasons. As high as 100 per cent. has been reached in a favourable year. Mr. de Pledge does not devote particular attention to the breeding of pedigree cattle, but confines his attention to

the raising of a goodly number of fat cattle, which ultimately find their way to the stock markets for local consumption. The horses form an interesting feature of "Yanrey." About 300 to 400 of light draughts are kept, the majority being in use on the station. In addition to breeding all the horses he requires for his own purposes Mr. de Pledge raises a large number of this type of animal for the local market. Until recently "The Strutter" performed the duties of station sire,

blood horse formerly in use on the estate was "Onslow," bred by Mr. de Pledge, and known to Western Australians as the winner of several races round about Perth. A large number of brood mares are kept for stud purposes, and as they are mostly out of imported mares, the result is the production of sound blood stock showing good bone, stamina, and endurance. THOMAS FREDERICK DE PLEDGE, proprietor of "Yanrey," is a son of Mr. Joseph Price de Pledge, and was

He then visited the Ashburton district, and for seven years found employment with Messrs. Forrest and Burt, of "Minderoo," going thence to "Globe Hill" Station, the property of Messrs. McCrae and Harper, the original settlers of the run, which covered some half a million acres, with whom he continued for two years. He then purchased the original "Yanrey" Estate, which he has since developed into the splendid pastoral property that it is to-day. Mr. de Pledge married

and his progeny was deservedly popular for stamina and evenness of temper. This horse has now given place to the stallion "Woorooma," by "Wallace" — "Bon-Mot," purchased by Mr. de Pledge when in Melbourne early in 1911. "Woorooma" was a well-known performer in Victoria, and his stock should be eagerly sought after by buyers desirous of introducing the highly-prized "Wallace" strain into their stud. Another

born at Durham, England, on March 17, 1867. He received his education at Aldenham, in his native country, and came to Western Australia in the year 1886. He was a passenger by the "Australind," the first steamer to come down the coast from Singapore, and landing at Fremantle he immediately made his way to Bunbury, where for the ensuing nine months he gained experience on a farm in the district.

a daughter of Mr. Single, of New South Wales, and has two daughters. When at Perth he resides at "Craigmere," on the King's Park Road, one of the most beautiful homes in or around Perth, delightfully situated in the midst of charmingly designed flower-beds and extensive lawns, the harmonious effects of which lend an added charm to the sense of comfort which appears to pervade the home.

"MINILYA," the property of Mr. Donald Norman MacLeod, J.P. Somewhat less than forty years ago—to be exact, in July, 1876—the first settler arrived in the Gascoyne district. The traveller in this remote region was Mr. Aubrey Brown, who had overlanded from York district, bringing with him 4,000 sheep. Previous to his arrival on the land which he had selected at the mouth of the river Mr. C. S. Brockman had started from Irwin, in the Murchison district, with the object of exploring the country lying to the north in the direction of the Gascoyne, and in due course reached Mount Clere. After a fortnight's rest he struck for the coast, 300 miles away, which he reached on July 15, 1876. In the vicinity of the Kennedy Range Mr. Brockman met Mr. Brown and remained with him two weeks, aiding him in the initial work of preparing his station. Proceeding on his way Mr. Brockman discovered two rivers, one of which he named the Minilya and the other the Lyndon. By the end of September he had returned by the coast route to Irwin, and shortly afterwards he once more set out for the Gascoyne, this time with 3,600 head of cattle. He reached Rocky Pool, 50 miles from the mouth of the Gascoyne, on April 5, 1877, and in the same year established "Boolathana" Station, and a few years later "Minilya" Station. Mr. Brockman disposed of his interests and left the district in 1885, "Minilya" becoming the property of his brother, Mr. G. Julius Brockman, by whom it was carried on until December, 1899, at which time the property was purchased by the present owner, Mr. D. N. MacLeod. "Minilya" is situated about 80 miles north of the town of Carnarvon, and comprises a little over half a million acres of splendid sheep country, Mr. C. S. Brockman making no mistake in his selection when having first pick of the country. The rich alluvial flats on the river frontages ultimately merge into extensive salt and cottonbush plains,

while on the back portions of the run heavy splashes of red sand thickly covered with many varieties of edible bush and mulga appear at frequent intervals. The estate is but lightly timbered, and in the pioneer days of the station great trouble was experienced in obtaining anything like an adequate supply of fresh or stock water, but now there is an abundance of the precious fluid drawn from wells, tanks, and surface dams and from four artesian bores sunk to a depth averaging 1,600 ft, the daily flow from these ranging from 600,000 to a million gallons. Open drains and channels have been excavated, and by means of these the water from the bores is distributed for many

*Barletto,*

*Perth.*

MR. DONALD NORMAN MACLEOD.

miles over the run. The estate is completely surrounded by a post and six-wire fence, and is subdivided into thirty paddocks, the acreage of which varies considerably. The original homestead erected by Mr. Brockman was destroyed by fire, and in 1908 the present comfortable bungalow residence of brick, wood, and iron, containing twenty-three rooms under the one roof, was erected by Mr. MacLeod. The house, which is a comfortable and well-appointed residence, is lighted throughout by means of acetylene gas and has a complete and effective water service. Close by is a spacious and well-kept

lawn, with a tennis court laid down in couch-grass, which is kept in perfect condition the whole year round by means of a series of water-sprinklers. Adjoining is a very fine vegetable garden, the surface of which has been graded to allow of the easy transit of water distributed from a large overhead reservoir by means of a network of piping. Oranges, lemons, and figs flourish particularly well under irrigation, and it would be difficult to find a better variety or quality of vegetables than those grown in the gardens of "Minilya." In ordinary seasons there is an abundant growth of natural grasses, varieties of which were forwarded to the Government Department of Agriculture for classification, the report on these proving eminently satisfactory. Drought-resisting salt-bush, bluebush, mulga, and cottonbush, the last-named plant being considered splendid fodder for stock, grow sturdily, and on parts of the run perennial grasses are to be found. The merino is a firm favourite with breeders in the north-west of the State, and it is this type of sheep which holds sway at "Minilya." The flock has been built up by rams selected from the famous "Bungaree" stud in South Australia. Much attention has been given to improving the breed, and the merinos now running on the estate are conspicuous for their robustness and large frames, in illustration of which fact a draft of 2-toothed wethers averaging 57 lb. each was on one occasion shipped to the metropolitan butchers. The fleece has shown a corresponding improvement both in weight and density. In 1910 32,195 grown sheep were put to shears yielding 854 bales, equalling 26·68 bales per thousand; 10,489 lambs cut 92 bales, equalling 8·76 bales per thousand, the aggregate clip for the year being 946 bales. The average weight of fleece for grown sheep was 10·47 lb., and for lambs 3·25 lb. The flock has shown a steady increase in numbers each succeeding year, and Mr. MacLeod is hopeful of

topping the 50,000 mark during the shearing time of 1913. The shearing-shed is a commodious structure of wood and iron, fitted with all the latest appliances, including sixteen Moffat - Virtue shearing - machines, propelled by means of a 6-horse-power British Robey steam-engine. Hitherto shearing has taken place in the month of September, but for the future it is intended to start the work toward the middle of August. The lambing period extends over May, June, and part of July of each year, and an annual percentage of from 80 to 85 is maintained. The paddocks are all extensive in area, and in consequence the large percentage obtained by breeders using small paddocks cannot be reasonably looked for. Mr. MacLeod makes a hobby of the breeding of shorthorn cattle, and has a high-class herd of about 400 on the station. The nucleus of this herd came from the Angas Estate in South Australia and from Sir Rupert Clarke's "Bolinda Duke of Derrimut" breed. A few years ago a shipment of thirty-two four-year-old bullocks from the "Minilya" herd averaged 1,065 lb., several of the beasts weighing up to 1,300 lb. Hackneys and coaches are also bred with great success, and two high-class blood stallions are kept for the purpose of raising horses to work the property, the surplus animals being sold. Altogether some 270 to 300 animals are grazed on the run. There are few people in Australia better known than Mr. DONALD NORMAN MACLEOD, the proprietor of "Minilya" Station. Born at "Borhoneyghurk" Station, in the western district of Victoria, in the year 1848, he is the second son of the late Mr. John Norman MacLeod, one of the earliest pioneer settlers of Port Phillip (now Victoria). His grandfather, Major Donald MacLeod, was a distinguished officer in the 71st Highland Regiment, East India Service, who emigrated to Tasmania, where he settled as early as 1821. Mr. MacLeod, sen., figured in the early Parliamentary history of Victoria, having represented the district of Portland in the House of Assembly, which constituency was also

represented by his son, Mr. Donald Norman, thirty years later. Mr. D. N. MacLeod was educated at the Scotch College at Melbourne, and upon leaving that institution determined to follow stock and station pursuits. He first settled on "Benyeo" Station, near Apsley, in Victoria, on the South Australian boundary line, where he remained for some considerable time, after which he transferred his energies to the northern part of Western Australia, straightway commencing pioneering operations at Nicol Bay, where he was responsible for the opening up of a large tract of country. Mr. MacLeod in company with the late Mr. John Hancock, of "Ashburton Downs" Station, Onslow, overlanded one of the first drafts of cattle and horses from the southern part of the State to the Nicol Bay district (Roebourne), which in those days was the only settlement in Western Australia north of Geraldton. The trip took five months, and the course followed was guided by compass, not an acre of land being occupied from the mouth of the Murchison to the Fortescue River, where now a succession of flourishing and prosperous sheep stations cover the country from point to point. In 1882 he returned to Victoria after a successful sojourn in Western Australia and purchased the "Yannarie" Estate, near Portland, where he resided for some ten years. Here he commenced the dairying industry according to modern methods, and was the first to introduce into that district a cream separator and modern plant. He took some interest in public matters, and was elected councillor for both the shire and borough of Portland, holding the seats for many years, and also devoting considerable time to magisterial duties as an honorary Justice of the Peace. For a time he held a commission in the Victorian Mounted Rifles under the late Colonel Tom Price. In 1892 Mr. MacLeod was elected to represent the constituency in the House of Assembly, succeeding Sir Henry Wrixon, the then member, who had left the State to attend the Ottawa Conference in the Dominion of

Canada. Mr. MacLeod retained the seat for seven years, during which he survived two strenuously-fought elections, being on one occasion opposed by Mr. Samuel Mauger, who in later years became Postmaster-General in the Commonwealth Parliament. He was for some years chairman of the Board for the Protection of Aborigines, was a member of the Zoological Acclimatization Board, and a member of the Old-Age Pensions and the Railway Lighting Committees. He was a member of the Perishable Products Commission appointed to inquire into the questions of storage, freight, etc., the report and recommendation of which brought about a marked improvement in the export trade of the sister State. Upon the occasion of the first Bushmen's Contingent leaving Victoria for South Africa Mr. MacLeod was appointed by the Government of Victoria to select and examine the candidates as to their qualifications as bushmen and roughriders, his extensive colonial experience rendering him an expert in such matters. He retired from public life in 1899, in which year he came to Western Australia to take up his residence at "Minilya," the charms of station life and the recollections of his early days in Western Australia after a lapse of eighteen years having proved irresistible. He is a Justice of the Peace for both the States of Victoria and Western Australia. In 1879 he married a daughter of the late Mr. Alfred Pickford Bussel, who was a nominee member of the Legislative Council during the administration of Governor Weld, and one of Western Australia's earliest pioneers, the issue being six sons and six daughters. Mr. MacLeod's eldest son, Hugh Vernon, is managing "Talisker," a large pastoral property in the State of Victoria; the second, Donald Guy, is managing the property under review, "Minilya"; and Alex., the third son, is in charge of "Richmond," an estate purchased by Mr. D. N. MacLeod near Narrogin, in the southern district of the State. This is the fourth generation of the clan to adopt the pastoral industry for their lifework.

"BOOLTHANA" STATION, the property of Messrs. C. & J. Butcher, is situated in the Gascoyne district, and lies some 20 odd miles from the town of Carnarvon in a northerly direction. The run was first settled on by Mr. Charles S. Brockman in the year 1879, and from that time he bent his attention to the improving of the area for the purpose he had in view—that of raising a strong-framed, robust type of sheep. In 1890 the Messrs. Butcher purchased an interest in the property, and thenceforward, until 1901, the entire management rested in the hands of Mr. J. Butcher. Since the latter date Mr. C. Butcher has been at the head of affairs, and under his experienced and energetic control the flock has made excellent progress. The

boundary and subdivided into a number of paddocks. The outer fence contains six strands of wire, but for the subdivisions five have been found ample, the total length of fencing aggregating about 250 miles. The homestead, erected as far back as 1891, is designed after the bungalow style, and is a very cosy residence. Lighting is supplied by means of an acetylene gas plant, and near by a fine vegetable garden is cultivated, the necessary water for its upkeep being drawn from a spacious dam in the vicinity. This dam also provides the requisite water for household purposes and for the men's quarters, besides which it is laid on to the shearing-shed. When laying the foundation of the "Boolthana" flock Mr. C. S. Brockman

from the heavy, over-night dews has rendered this plant invaluable as a fodder at all times, but more particularly in tiding over the lengthy dry spells, which frequently occur in this portion of the Western State. During the last eighteen years rams obtained from "Rhine Park" and "Mount Crawford" in South Australia have been used, and the strain is now well up to standard. With the advent of September shearing is begun. The shed is a roomy structure of wood and iron, fitted up with fourteen stands of the Moffat-Virtue machinery, a ten-horse-power oil engine providing the necessary driving power. The clip averages from 9 to 10 lb. of wool per sheep, while the lambs return about 3 lb. The lambing period usually extends

"GARDEN HILL," RESIDENCE OF MR. W. J. BUTCHER, GUILDFORD.

boundaries of the estate enclose some 400,000 acres of open saltbush country, intersected with sand ridges, lightly timbered, and mulga scrub. In other parts the scrub is somewhat dense, but the property is generally considered to be well adapted to the purposes of sheep-raising. The average rainfall is very light, being about 8 in., but this is supplemented by a copious supply of artesian water, besides which there are numerous wells and catchment areas dotted about the station. The several artesian bores have been sunk to depths varying from 1,600 to 3,000 ft., and the water obtained from these sources is conducted by means of open drains over the greater part of the run. The estate is completely fenced on the

selected the hardy merino as his mainstay, and brought a number of these robust sheep overland from the Champion district in the north-west. Subsequent experience has proved the wisdom of the first selection, and to-day the flock numbers in the vicinity of 50,000. The merino is eminently suited to the severe climatic conditions of the locality, being large framed and robust and producing a fleece of good weight and staple. The carrying capacity of the estate is equal to one sheep to ten acres, and each year, so as to prevent overstocking, the flock is reduced in numbers directly following the termination of the clip. The peculiar properties of the saltbush in retaining a large percentage of moisture

over the months of June and July, the annual percentage varying from 85 to 90 per cent., a splendid average considering the conditions of the locality. The horses on the estate are not numerous, but what few are in use are animals of a very fine stamp. The breed is half Arab, and horses are bred solely for use on the station. About fifty milking cows of the shorthorn type are also grazed on the property.

CHARLES SAMUEL BROCKMAN was born at Guildford in 1845, his father, the late Mr. Robert James Brockman, who came to Western Australia in 1830, being

one of the earliest pioneers of the State. Education in those days was hard to obtain, but young Brockman had the advantage of a private tutor for a few months, and at fourteen years of age went on to his father's station, in the Geraldton district, which he managed for five years. Subsequently he assisted in opening up the pastoral country at the Warren, and upon attaining his majority began farming on his own account at Greenough Flats. For the first three years he met with absolute failure through the prevalence of red rust which ruined most of the farmers of the district, their only resort being to apply to the Government of the day for assistance to tide them over this season of distress. Mr. Brockman having lost heavily sold his stock and implements and entered into the sandalwood industry at Dongarra, and was the first to cross the salt marsh for sandalwood. While thus engaged he explored the Mount Margaret district in the Murchison Ranges, which afterwards was taken up as excellent pastoral country. Nine years later, having cleared himself of most of his liabilities, he formed a small party and spent five months in exploring the Gascoyne district in the north-west, during which trip he discovered and named Minilya and Lyndon Rivers, the former being the first water struck after an 80-mile journey. Here he took up a tract of country and arranged to rent 3,000 sheep from a friend in the Geraldton district, continuing in the face of many difficulties until he had acquired 1,600,000 acres of some of the finest country, this being the largest area then held by any one man in the State. During the course of ten years his flock had increased to 20,000, besides horses and cattle; but the natives were very troublesome, and other anxieties incident to his calling so undermined his health that he decided to divide his property into three stations, two of which he sold, and having retained the third for a time eventually parted with that also. After recruiting at the metropolis for a time, in 1866 he purchased a property in the Blackwood district, on the Ballingup River, formerly known as Padbury's Brook. This comprised 30,000 acres of leasehold and 900 acres of freehold practically unimproved, with the exception of fencing. Naming it "Brookland," Mr. Brockman started operations and continued with such success that at the present time it will compare

favourably with any of the fine improved properties in the south-west. As time went on he gradually reduced the area of the estate to 3,000 acres, finally selling out in May, 1911. Mr. Brockman, who has held a Commission of the Peace for fifteen years, has always taken an active interest in matters affecting the welfare of the district, and was a member of the Roads Board for most of that time. In 1886 he married Mary,

MR. CHARLES SAMUEL BROCKMAN.

eldest daughter of the late Mr. G. C. Dowden, a well-known Murchison pastoralist, and has three sons and two daughters.

**JOSEPH FREDERICK WALDECK**, part-owner of "Wooramel" Station, in the Gascoyne district, is a native of this State, having been born at Greenough Flats in 1871. He is a son of the late Mr. William Waldeck, of the same place, and was sent to Fremantle for the acquirement of scholastic knowledge under the tutorship of Mr. (now the Honourable) Henry Briggs, of Fremantle. In 1886 he proceeded to the town of Carnarvon, and obtained his first experience of pastoral pursuits on "Wandagee" Station, the property of Mr. G. J. Gooch. The following year he returned to Fremantle, where he spent a further twelve months at the Fremantle Grammar School, and at the expiration of this period once more became engaged in his former occupations at Wandagee. His experiences during the next few years included the handling of sheep and cattle, team-driving, etc., and

he gained a full knowledge of station work in all its aspects. In 1892 he was chosen to bring a draft of sheep overland to Perth—the railway not then being available—and this work he performed with singular merit, not losing a single animal, and landing the sheep in the saleyards in splendid condition. Mr. Waldeck returned overland to the station, where he continued until 1894, in which year he was seized with the prevailing gold fever, and set out to prospect for gold, following up the Ashburton River and finally striking out for Roebourne. He reached this township without obtaining a glimpse of colour, and next prosecuted a copper proposition in the Roebourne country with similar lack of success. By this time, having exhausted his capital, he found his way back to "Wandagee" and took up his former duties until 1899, his work mainly consisting of driving stock overland to Mingnew for railing to Perth. In the latter year Mr. Waldeck decided to make a move for himself, and in conjunction with Mr. William Snook purchased "Wooramel" Station from Messrs. J. & C. Butcher. With characteristic energy, aided by his partner, he fell to the work of development with such excellent results that within a few years the value of the place was considerably enhanced, and in 1907 Messrs. T. Statham and J. McCarty joined the firm. In 1912 Mr. Snook disposed of his share of the property to Mr. Statham, and the partnership now consists of Messrs. Statham, Waldeck, & McCarty. "Wooramel" Station originally was owned by Sir Winthrop Hackett, from whom it passed to Mr. A. von Bibra, who sold to Messrs. J. and C. Butcher. It comprises 355,000 acres of good pastoral country, in which saltbush plains predominate, the soil being chocolate loam with a few low-lying sandhills. The first water was obtained by sinking two wells to a depth of 50 ft., in both of which a plentiful supply was struck, and from these wells the stock was watered for some considerable time. At a later date three additional wells were sunk, which, with two clay-pans lasting from the rainy season into January, and three artesian bores 1,000 ft. in depth, and each yielding 1,000,000 gallons daily, provide an ample supply of water. Windmills have been erected over all the wells, and tanks 10,000 gallons in capacity added for storage purposes. One of

the bores serves to water the shearing-shed and drafting-yards. The station was started with 600 head of cattle of mixed shorthorn breed, and a number of bulls have been introduced each year, mostly from the "Angas" Estate in the neighbouring State. The raising of cattle for the local market was carried on, and operations were extended until they were conducted on a fairly large scale. Within the last two or three years, however, the proprietors, like many other pastoralists in the north-west, decided to pay more attention to sheep-raising and gradually reduce the herd, and this policy has been followed until at the present time only a few hundred head of cattle remain. In the first instance 5,000 merino ewes were purchased from "Brickhouse," "Boothana," and "Minilya" Stations, and in 1911 3,000 ewes from "Petermulla" Station, on the Asburton River, were added to the original flock. Rams were obtained from the "Hill River" Estate in South Australia, and a steady improvement has taken place in the flock, which now numbers 20,000, in addition to 4,000 lambs. It is intended to bring the numbers up to 40,000, which would be about as many as the carrying capacity of "Wooramel" would safely allow. The wool displays good quality, being long and dense, with good yolk and staple, and in its greasy state commands about 9d. in the London markets, whither it is sent. The lambing season in May is followed by the busy shearing time in September, when the whir of

machinery in the long-silent shed indicates the steady progress of the clipping process. The shed is built of iron, the timber used being jarrah, and it is the best-fitted

Bartleto, Perth.  
MR. JOSEPH FREDERICK WALDECK.

structure of its kind in the north-west, containing twelve stands of Wolseley machinery, driven by a steam-engine. Adjacent are the men's quarters, where all arrangements have been made with an eye to the comfort of the occupants, and in a convenient position close by the stables and stockyards for general musters have been erected. The homestead is situated on the Wooramel River, two miles distant from the telegraph station bearing

the same name, and 70 miles from Carnarvon, in a southerly direction. A fine vegetable garden has been laid out, which is irrigated by a good supply of water from a neighbouring well, and another attractive feature is the orchard, where oranges, lemons, grapes, apples, and other fruits come to perfection in their season. The timber belts are sparse, but there is a good supply of natural grasses, which are supplemented by a variety of herbage, including saltbush, bluebush, and cottonbush, which provide a welcome additional fodder for the stock. The breeding of thoroughbreds, though not so extensively carried on as formerly, receives attention. Blood stock of more than average merit has been produced on the station, the principal sire used being "Breakaway" ("Broken Hill" — "Princess of Wales"), purchased in 1895 from Mr. David James, the well-known racehorse breeder and pastoralist of South Australia. This horse put up some splendid performances on the turf, and as a three-year-old won the Carnarvon Cup and other events, including races on the metropolitan courses. One of his colts, "Yardoo," proved very smart as a sprinter, and was to the fore in several short-distance events. Another daughter of the station, "Shot Silk," by "Light Artillery," was successful in winning races at various country meetings, and at the present time the firm has a limited number of first-class stock to dispose of. Other classes of stock are represented by sixteen camels, which are used for transport purposes, and a small dairy herd for the requirements of the station. The hard pioneering work and anxieties of development over, Mr. Waldeck has been able to turn his attention to lighter tasks, and his time is now mostly taken up with the overlanding of sheep to Mingenew. He estimates that, in the many trips made, he has brought down over 30,000 sheep, and has been fortunate in the very small percentage of loss sustained. The management of station affairs has not left him much time to devote to outside matters of public moment, but he is connected with the Masonic craft, his mother lodge being the Gascoyne, No. 62, W.A.C. In 1891 he married Florence, daughter of Mr. Albert Hyden, of Perth, and has three sons. He resides at Emerald Hill Terrace, West Perth.

SHEARING SHED AND DRAFTING YARDS AT "WOORAMEL."

"GRASS VALLEY" HOUSE, situated about two miles distant from the Grass Valley Railway Station, and some 70 miles from Perth, on the Eastern Railway line, was originally taken up together with surrounding properties as a pastoral lease by the late C. Taylor. Subsequently the lease passed through various hands, eventually to be purchased in 1904 by Mrs. M. Dempster, widow of the late William Simon Dempster, formerly of "Buckland," Northam. The estate comprises some 4,500 acres in a choice pastoral locality, including a huge slice of the pick of the Avon Valley grain lands, so much in demand among agriculturists, and its value is further enhanced by the railway which passes through the property. For grazing purposes the wide pastures are hardly

MR. WILLIAM SIMON DEMPSTER.

to be surpassed, and to add to the suitability of the place for stock-raising there is an excellent water supply, the goldfields water scheme having been carried through the paddocks, in addition to which there are several dams and a few soaks in the watercourses. The homestead is of compact design, and contains ten rooms, forming a most comfortable dwelling-house, where refinement and taste have combined to provide an inviting interior. It is situated just off the main road from Northam to Meckering, and, with its supplementary offices and outbuildings, from a distance presents quite the appearance of a village settlement, the little township of Grass Valley, which lies in the near vicinity, hardly

outrivalling it in the size and number of its buildings. The stables are substantial and fitted with roomy stalls and boxes. The estate is fully fenced and subdivided into thirty or forty paddocks, the boundary fences being constructed of jam timber posts with seven wires. About 2,500 acres of land have been applied to purposes of cultivation, 1,100 acres being cropped annually, and the waving fields of wheat and oats, as the reaping season approaches, are sufficient criterion of the abundant harvests that are gathered in. The flocks of crossbred and merino sheep give the rich touch of pastoral life to the rural scene. To keep up the standard of quality among the merinos a special stud flock is kept, and many handsome and valuable trophies and prize ribbons have fallen to Mrs. Dempster for exhibits in this class of stock, both at the Northam and Royal Agricultural Societies' shows. At the same functions she has also achieved success with Ayrshire cattle, carrying off awards against all comers. A large number of horses are bred on the property, some of which are sold locally, the remainder being used to work the estate. Mrs. Maud Dempster, the eldest daughter of Canon Sweeting, a clergyman of the Anglican Church who came to the State in the early fifties, married the late William Simon Dempster, youngest son of the late Captain Dempster, a colonist of Scottish descent, who was practically the founder of the "Bucklands" Estate, near Northam, which may be described as the premier homestead of the Avon district, and which was recently purchased by Mr. S. P. Mackay, after having remained in the Dempster family for over seventy years. Of this union were born four sons and two daughters, the eldest son being the owner of "Marron" Station, while the youngest, Mr. John Cedric Dempster, resides with his mother on the "Grass Valley" House Estate. The second and third sons respectively, Messrs. William Edward and Norman McLean Dempster, are engaged in pastoral pursuits near Esperance, and in connection with this enterprise it is an interesting piece of history to recall the first opening up of this district by their late father and three of his brothers who, in the early sixties, set out in the direction of Esperance Bay, where they discovered and leased a wide tract of pastoral country comprising 300,000 acres. They also selected 200,000 acres in the

vicinity of Fraser Range, about 180 miles from their starting point, Mr. Andrew Dempster assuming the management of these areas, which were gradually stocked with a full complement of sheep. At the present time the brothers Dempsters hold about 103,000 acres, a portion of which is freehold, and many miles of rabbit- and dog-proof fencing have been erected, the development of the run being steadily proceeded with. Near the coast the land is adequately watered by permanent swamps and springs, and about 7,000 sheep of the merino type are pastured on the property, besides some seventy head of horses of mixed classes.

FREDERICK GEORGE DEMPSTER, owner of "Marron" Station, Carnarvon, is by birth a Western Australian, his native place being "Buckland," Northam, where he was born on June 5, 1882. His father was the late William Simon Dempster, youngest son of the original founder of the last-mentioned property. The subject of this notice was sent to England for his education, and attended the Durham

C. M. Nixon, Northam.  
MR. FREDERICK GEORGE DEMPSTER.

Grammar School until seventeen years of age, when he returned to Western Australia and became engaged in pastoral pursuits at "Buckland." Mr. Dempster sold the "Buckland" estate to Mr. S. P. Mackay in 1913, having previously purchased "Marron" Station from the Messrs. Sholl Bros.

GEORGE ERNEST SEWELL, J.P., pastoralist, was born on the site of the present town of Midland Junction, before the settlement was formed there, the date of his birth being December 16, 1866. He is a son of the late George Sewell, a pastoralist of this State, who established the station known as "Sand Springs," now in occupation of Mr. Vernon Sewell.

*Bartletto.*  
Perth.  
MR. GEORGE ERNEST SEWELL.

and at the termination of his studies, which were pursued at the Rev. George Sweeting's private school at Guildford, became identified with pastoral pursuits on the station owned by Mr. J. G. Mearns, on the Yule River. Here he remained for nearly two years, during which period he gained considerable insight into station life. He relinquished the connection in order to try his fortune in prospecting on the Nullagine goldfield, where, however, he met with indifferent success, and abandoned the venture after a short time. Returning to the south he went on to his father's farm in the Upper Swan district, but about the time that Kalgoorlie came into prominence was tempted once more to court Dame Fortune's smile on the newly discovered field, having for his partner on this occasion Mr. Henry Wilberforce Clarkson, of the Range, Newcastle. This time he carried on operations for two and a half years over various parts of the gold-bearing locality with a fair amount of success, but eventually returned to Midland Junction, and was for two years associated with Mr. S. A. Brown in a stock agency business.

Upon the death of his brother at "Sand Springs" he took over the management of that property during the minority of the present owner, and upon being relieved of his duties he in 1903 purchased "Mount Hill" Station, near Walkaway, an estate which he recently disposed of. At the present time Mr. Sewell lives in partial retirement at Geraldton, but still retains a small interest in the pastoral property of "Red Peak," near "Sand Springs," and directs the management of "Tibradden" Station for the owner (who resides in Melbourne), while he also leases a property at Georgina. Mr. Sewell was appointed to the Peace Commission by the Dalgligh Government within the past decade. He is one of the oldest members of the Geraldton Club. In November, 1906, he married Alice Mary, daughter of the late William MacDonald, of Nhill, Victoria, one of the pioneer squatters of the Wimmera district, and has two daughters.

EDWARD MAGNUS DIXON, manager of "White Peak" Station, near Geraldton, was born at Rosedale, Victoria, on January 12, 1868, and is a son of Mr. Thomas Dixon, a native of Tasmania, whose progenitors came originally from Scotland. At the close of his education, which he received at the Sale Grammar School, he entered upon the pastoral industry at "Nambrok" Station, Victoria, which was owned by Mr. King; and by his energy, industry, and force of character, rose within three years from the position of boundary rider to that of manager, "Merryman's Creek" Station being placed under his control. This property being sold three years later, Mr. Dixon took a droving contract for the same firm, which lasted for four years, and at the end of that period he joined the mounted police force of Victoria. After continuing in the force for eight years he resigned, and, in partnership with Mr. Donald Munro, turned his attention to the raising of pure-bred stock (comprising southdown and merino sheep, Ayrshire and shorthorn cattle, and Berkshire pigs), in which enterprise he met with considerable success, eventually selling the property and dissolving his connection with Mr. Munro five years later. In the early nineties Mr. Dixon came to Western Australia, which had been well advertised by the recent

gold finds, and upon arrival founded the Perth Omnibus Company, which he managed for nearly five years. Disposing of his interest in this concern, he took over the management of the general storekeeping business owned by Mr. Jules Gascard at Cue, and upon the demise of the principal two years later, carried on operations until the estate was wound up. He then established a butchering business on his own account, and continued in this line of trade for ten years at Nannine, Meekatharra, and The Star of the East. Selling out on the Murchison, he became for a short time overseer and manager for Messrs. Logue Brothers on "Tamala" Station, in the north-west, relinquishing that connection to take up his present position as manager for the Trustee, Executor, and Agency Company, Limited, of "White Peak" Station, and upon the property coming into the hands of the present proprietors, he secured an interest in it, and has since continued to supervise operations. For eight years Mr. Dixon exercised a Commission of the Peace in the Murchison district, which he resigned when

*Miller.*  
Geraldton.  
MR. EDWARD MAGNUS DIXON.

he left that neighbourhood. He has been a member of the Masonic fraternity for nearly a quarter of a century, is a member of the Geraldton Club, and a genuine supporter of all forms of clean, outdoor sport, taking a keen interest in the affairs of the Victoria District Turf Club, of which he is a member, and holding a reputation as a judge of horseflesh second to none in the district.

"DAIRY CREEK" STATION, the property of the Dairy Creek Pastoral Company. Prominent among the large pastoral runs of the Gascoyne district is "Dairy Creek" Station, situated 160 miles to the eastward of Carnarvon. The property originally was taken up by Messrs. Gooch & Wheelock, but before these gentlemen had entered upon the first stages of its development it was purchased by the late John Bernard Fitzpatrick in 1883, the country being practically in its virgin state. From him the run descended to its present owners, the sons and daughters of the late pastoralist, who formed the Dairy Creek Pastoral Company, and have carried on the personal conduct of its operations ever since. The run comprises 408,000 acres of country in which sandy soil predominates, and is lightly timbered, the principal feature being the prevailing mulga scrub. No permanent stream waters the estate, but over a score of wells have been sunk in different localities to depths of from 20 to 140 ft., and from these an excellent supply of

water suitable for domestic and stock purposes is obtained. On the surface are storage tanks, capable of holding up to 20,000 gallons, and

MR. JOHN BERNARD FITZPATRICK.

nearly all of the wells have been fitted with windmills, thus assuring an abundance of water, although at certain seasons of the year there are

long periods of calm weather, when from lack of wind the mills cease working, and there is a resulting shortage of supply. From the first it was Mr. Fitzpatrick's intention to devote the run to sheep-raising purposes, and with this end in view he purchased from 2,000 to 3,000 of the ever-popular merino, with which the foundation of the present flock was laid. Several years elapsed before the work of fencing could be commenced, and the wide, open country offered no obstacle to the wandering sheep, which had to be shepherded until in 1887 the first fences were put up and the subdivision of the property was begun. At the present time the estate is completely fenced on the boundary and sixteen paddocks have been formed, over 200 miles of fencing having been accomplished in all, the posts of wood being threaded with six strands of wire. After two years of rough pioneering work Mr. Fitzpatrick was followed by his family to the new home, but it was not until 1890 that the first homestead was erected and the original building

"STRATHMORE," RESIDENCE OF MR. JAMES FITZPATRICK, SUBIACO.

gave place to the present comfortable edifice in 1904. Built of stone with galvanized iron roof and containing five large rooms, the dwelling is fitted up with many of the conveniences of modern life, showing the rapid march of progress during the past few years, even in these remoter parts. During the winter season a vegetable garden is cultivated, and a welcome supply of green vegetables is obtained. The late Mr. Fitzpatrick in his lifetime paid special attention to the improvement of the flock, and from time to time many rams of good strain were imported from the Eastern States, one importation of fifty rams from the well-known "Widgawa" Stud, on the Riverina, New South Wales, being made in 1907. A steady advance towards perfection has been the result of this careful selection of types from which to build up the flock, and to-day the "Dairy Creek" Station sheep are distinguished for their well-set-up frames, robustness, and general stamina, whilst the wool has shown great improvement, both in density and length of staple. At the present

time the "Widgawa" strain predominates, and the breed has proved itself suitable to withstand the varied and frequently severe conditions that prevail in these latitudes throughout

Bartletto,

Perth.

MR. JAMES FITZPATRICK.

the course of the year's seasons. Lambing takes place in May and June, and a general average of 75

per cent. is maintained, but in favourable seasons the returns have exceeded 90 per cent. Shearing is begun in August of each year, and usually lasts from two to three weeks. The shearing-shed is a large, commodious structure, 120 ft. long by 40 ft. wide, and in addition to its twenty-four stands of the Moffat-Virtue machines, is fitted up with all the most modern appliances, including a wool-press, the driving power being provided by a 6 h.p. steam-engine. The wool is sent direct to the London markets, where its fine qualities obtain for it a ready demand and top prices. In 1898 ninety-four bales of scoured wool when placed on the London market realized the splendid figure of 23½d. per lb. The wool is carried to Carnarvon by means of camel teams, the distance (160 miles) being covered at the rate of about ten miles a day, and for this purpose about sixty head of camels are kept on the station. The late Mr. Fitzpatrick was a great lover of the thoroughbred, and at considerable expense established and kept up for many years a fine stud of valuable

GENERAL VIEW OF "DAIRY CREEK" HOMESTEAD.

racehorses. The first sire to be used was "Fishmonger" ("Cynic"—"Scandalmonger"), which gave way to "St. Ives," a son of "St. Alban" by "Dahlia," this fine stallion being followed by "Lord Carrington." Then came "Forest King," by "Froude" (a sire imported from England), his successor being "Siege Gun," by "Light Artillery"—"Belle Hampton" (imp.), The last sire in use was "Musketeer," by "Carbinier," a lineal descendant of the famous "Carbine." With such a fine string of sires it is only natural that Mr. Fitzpatrick should have bred some high-class stock, and at country meetings he carried off many events with horses of his own breeding. At Cannington he won the Mayor's Mile with "Newfish," which established a record for that distance in Western Australia. It is not the intention of the present proprietors to continue a racing stud, and when a suitable opportunity presents itself these valuable horses, some thirty in all, will be sold. A few buggy horses are bred for station use, any surplus animals of this class finding ready purchasers among those desirous of securing reliable steeds for single or double harness. There is also a herd of 2,000 cattle of the shorthorn and Hereford breeds, and drafts of these

animals are overlanded to Mingenew, a distance of 500 miles, whence they are conveyed by rail to the metropolitan cattle market. In good seasons the stock fattens quickly on the

Bartlette, Perth.  
MR. MERTON FITZPATRICK.

various nutritious grasses which grow luxuriantly over the run, but when these fail a good substitute is found in the different sorts of herbage and saltbush, which is an acceptable fodder. Extensive stockyards have been erected, covering about three

acres of ground, and additions and improvements are continually being made to the property. The Company recently acquired 379,000 acres of country some fifty miles distant from "Dairy Creek" Station, through which the Wooramel River flows, the double river frontages equalling forty-five miles. There are also several pools in evidence during the greater part of the year, and it is intended to sink wells and erect windmills, by which a regular supply of water will be obtained. The country is thickly covered with a light scrub of an edible nature, and into this the cattle are turned with the object of breaking it down, so that the area may be the more easily cleared for sheep pastures, it being the intention of the proprietors ultimately to relinquish cattle-raising in favour of sheep-breeding both on "Dairy Creek" Station and the new property. The late Mr. JOHN BERNARD FITZPATRICK was born at Edinburgh, Scotland, on November 14, 1842, and was brought to Western Australia when about nine years of age. At a later date he returned to Clifton, near Bristol, where he completed his education, and arriving once more in this State entered upon farming pursuits on the Moore River, at

"DALGETY DOWNS" HOMESTEAD.

Baramba, some 30 miles north of Gingin, which he relinquished to take over the "Dairy Creek" Station in 1883. He married in the year 1863 Rose, daughter of John McCormack, of Ireland, and of a family of six children three sons and two daughters survive. His death occurred on October 3, 1909, when "Dairy Creek" Station descended to his three sons and two daughters, and was carried on by them under a partnership arrangement until February, 1910, when one brother, Alfred, sold his interest to the others, since when it has been

Dalgety Creek, and in addition to this supply wells have been sunk and tanks constructed for storage purposes, which the erection of wind-mills has also facilitated. The property is divided into seven large paddocks, and there is about 120 miles of fencing on the estate, which bears the reputation of carrying the best fencing in the north-west, all the fences being made on the wooden post and six-wire system. The residence of stone and iron is surrounded by a broad verandah, and adjacent is a small garden where a few bright blooms make welcome

conveniences. Without these proposed additions, however, "Dalgety Downs" Station is already well improved, in this respect being second to none in the north-west, and as each year passes some new phase of development is entered upon. About 500 head of cattle are grazed on the run, but as time goes on these will be turned on to the newly acquired property of the Dairy Creek Pastoral Company with the herd from the parent station, finally to be disposed of and their place taken by the less picturesque and exciting but more profitable sheep. The flock

"DAIRY CREEK" HOMESTEAD.

carried on by the remaining four members of the family. "DALGETY DOWNS," the property of Messrs. James and Merton Fitzpatrick, adjoins the "Dairy Creek" Station, of which originally it formed a part, and was purchased from their father by the present owners in the year 1904. In area it covers 266,000 acres, and in general conformation resembles the parent property. In winter a fine flood of water is brought down by the

splashes of colour in their season. A roomy shed, 104 ft. by 35 ft., has been erected, and here the waggons are kept under shelter and harness and chaff are stored, while there is also a well-fitted-up blacksmith's shop, where the ring of hammer on anvil is frequently heard. The Messrs. Fitzpatrick have under consideration at the present time plans for a modern shearing shed and out-buildings which, when erected, will be replete with the most up-to-date

numbers 17,500 of the merino type, and was formed in the original instance from representatives of the "Dairy Creek" flock. In 1907, 300 stud ewes were brought from Mr. J. H. Horsfall's "Widgawa" property, on the Riverina, New South Wales, and the practice has been followed with very satisfactory results of using all the rams bred as sires. If anything, the "Dalgety Downs" flock is slightly in advance of that at "Dairy Creek," but there is little to choose

between them. The sheep thrive well and are sturdy, big-boned animals, carrying a heavy growth of wool of good length and density, and maintaining an enviable immunity from diseases so prevalent in less healthy climates. The lambing percentages rival those of "Dairy Creek," and the quality of the wool bears comparison with the best in the district. Fine draught horses of the Clydesdale strain are bred on the station, about sixty being required for the ordinary uses of the property, while a few are sold from time to time. The sire in use at the present time

With the remainder it is their intention to breed, and in the near future horse teams will be replaced by the "ships of the desert" in the transport of wool from the scene of its production to the sea-coast. The general management of both the "Dairy Creek" and "Dalgety Downs" Stations is in the hands of Mr. Merton Fitzpatrick, and in the busy season a large number of hands are employed, as many as eighty, in addition to a few aboriginals, at times being kept at work on the two stations. The other partner, Mr. James Fitzpatrick, makes periodical visits

considerable benefit. They continued to assist in the management of the "Dairy Creek" Station until 1904, in which year the two brothers launched out on their own account, purchasing their present property and forming the "Dalgety Downs" Station, the development of which has proceeded with great rapidity and success. Both of these gentlemen started at the bottom rung of the ladder, and by sheer hard work and indomitable courage have worked their way to the top, and they are an excellent illustration of what grit and courage can do in face of the arduous

SHEARING SHED, "DAIRY CREEK" STATION.

is the imported horse "Pride of Dean," and his progeny seldom fail to develop into magnificent specimens of the breed which is so popular among the breeders and station-owners of the Western Australian and other States of the Commonwealth. An especially interesting feature of the "Dalgety Downs" industry is the camel herd, which now numbers 130, forty of these valuable freight animals having been sold since March, 1911, when the Messrs. Fitzpatrick purchased 170 from Mr. James Nicholas, Leonora.

P

to the property, and during his stay renders valuable assistance in the conduct of affairs of both estates. The birthplace of both brothers was at "Baramba," on the Moore River, near Gingin, Mr. James Fitzpatrick being born on September 8, 1874, and Mr. Merton Fitzpatrick on June 24, 1876. Upon the completion of their educational studies they were brought up to pastoral pursuits on the home station under the able guidance of their father, by whose ripe experience as a successful pioneer in the district they reaped

conditions which beset the pioneers who bravely sallied into the wilderness to reclaim the vast areas of this great pastoral country, the possibilities of which are beyond reckoning. Mr. James Fitzpatrick was married in the year 1911 to Daisy, daughter of Mr. Timothy Flynn, of Cork, Ireland, an old and respected Civil Servant of forty-eight years' standing, whose retirement took place in 1903. He resides at "Strathmore," Chester Street, Subiaco, a charming home, a view of which is reproduced on page 222 of this work.

"LYONS RIVER" STATION, the property of Mr. William Hatch, lies almost due east of Carnarvon, being 140 miles distant by road from that port. The track is a decidedly bad one, and the traveller is glad to reach the hospitable homestead after a wearying drive lasting from three to four days, the journey having to be made in slow stages. For some time past property-holders in the district have mentally conjured up the vision of a railway from Carnarvon to The Junction, a distance of some 110 miles, the construction of which would be easy and economical, no bridges nor grading being necessary. This would do away with the necessity to cart goods over a rough, wearisome stretch of country at charges altogether out of proportion to the value of the goods consigned, and in addition be of great advantage to travellers. Chaff, which at the present time (March, 1912) is purchased at Carnarvon at £11 10s. per ton, has a ruinous effect on the pockets of the pastoralist, whose only alternative in these dry periods is to stand idly by and watch the stock perish for want of fodder. The suggested terminus—The Junction—is easily reached by most of the run-holders, as the approach from all sides is excellent, and figures have been compiled which serve to show that sufficient freight would be available to make the railway a paying concern from the commencement. "Lyons River" Estate embraces 275,000 acres of good pastoral country, mostly undulating in character, the intersections of low-lying hills being of granite formation. On the western side the boundary is formed by the Kennedy Ranges, the sides of which are exceedingly precipitous, the formation being sandstone and fossilized stone. The range forms a splendid barrier, as the sheep are unable to ascend any portion of it. The Lyons River runs for 26 miles through the estate, and the flats leading to the banks of the stream are of rich chocolate soil of good depth. Lightly timbered, the country shows its principal growth in the vicinity of the river, and various timbers, including river gum, black-heart, mulga, and several species of jam are here to be located. All over the run there is a plentiful supply of top feed and mulga scrub, snakewood, saltbush, and varieties of the prickly acacia flourish, to which species of fodder the stock are especially partial. The grasses include Mitchell, bluegrass, windgrass, bundle

bundle, and in the vicinity of the range a little spinifex is found. The Lyons River is not a permanent stream, but in the dry seasons water is procured from the river bed by soaks, and two permanent pools provide a very welcome supply. Many wells have been sunk, in nine of which good water is found, over which windmills and tanks of varying capacity, up to 14,000 gallons, have been erected. The shearing-shed is served by one of these wells, and from another the supply for domestic purposes is obtained, this being augmented by two rain-water tanks and by water taken from the river, which flows within a stone's throw of the homestead. A vegetable garden is cultivated, where all varieties of kitchen stuff are grown and tomatoes are to be obtained all the year round. On the river side is a spacious lawn, and in good seasons some attention is devoted to the cultivation of flowers to enliven the neutral character of the surroundings. The homestead, a roomy building, erected in 1907, stands on top of a small hill and contains four rooms and a large hall which is used as a dining-room. It is built of stone with an iron roof, the whole structure being encircled by a wide verandah, which gives it a very comfortable aspect, in no way belying the interior. There is a kitchen and men's dining-room and the usual outbuildings, the stables and cartshed being a commodious building measuring 40 by 14 ft. "Lyons River" Station was first taken up by Messrs. George Hamersley and Tom Simms, but a series of bad seasons set in and the property was transferred to Messrs. S. J. Phillips and P. Ryan, who held possession from 1887 until 1906, when the lease was purchased by the present owner. Mr. Hatch shortly afterwards sold 20,000 acres to Mr. R. Newman and 40,000 to "Onslow Creek" Station, and took up 58,000 acres of Government land on the west side of the river, bringing the run up to its present acreage. It is fenced on three boundaries—the range forming the fourth—at a cost of £28 to £30 a mile. The fences are constructed with mulga or black-heart posts, with five wires, excepting those subdividing the run into eight paddocks, varying in extent from one to seven square miles, for which four wires have been found sufficient. Prior to entering into possession of "Lyons River" Estate Mr. Hatch had owned "Onslow Creek" Station,

adjoining his present property on the north-east side, which, in conjunction with Mr. Philip Ryan, he had purchased from Mr. J. Munro in 1893. His connection with the north-west was already of long standing, for in 1886 he had been managing "Mungarra" Station for Messrs. Forrest & Burt, with whom he had continued until 1898. In those days this firm owned several areas of country, namely "Brickhouse" Station, "Nebo" Station, and "Junction" Station, the last two being joined to form "Mungarra" Station, the general manager residing at "Brickhouse." After twelve years Mr. Hatch left this employ and turned his attention to the development of "Onslow Creek," having bought out Mr. Ryan in 1895. The place was already stocked in a measure with the progeny of a few cattle and sheep purchased by Mr. Hatch before he acquired the property, and which were temporarily grazed on Crown lands and on rented country under the care of a stockman. After the removal of the stock to "Onslow Creek," and after the departure of Mr. Ryan, Mr. Daniel Hatch, brother of the proprietor, took over the management, and has continued in this capacity ever since, transferring his services to "Lyons River" when "Onslow" was sold some years later. At its inception, the herd consisted of 150 to 200 cattle, and from these and a small flock of sheep breeding was begun, resulting in a gradual increase every year. In 1900 Mr. Hatch decided to pay more attention to sheep-raising, and to this end purchased 1,200 ewes and some stock rams from Mr. D. Hearman, of "Middalya," on the Minilya River. He continued operations on "Onslow Creek" until 1907, when the property and improvements were sold to Mr. Gerald Lefroy, Mr. Hatch transferring all the livestock, plant, etc., to "Lyons River," which he had acquired the previous year. By this time his flocks had increased to 3,000 sheep, with 500 to 600 cattle and 100 horses. Considerable improvement had already taken place in the sheep, and in the ensuing years still further efforts have been made with success to bring the quality of the type into line with that of the average flock of the district. Rams were secured from the Eastern States, and some first-class representatives were procured from "Mount Sandyman" Station, on the western side of the "Lyons River" Run. "Booborowie" blood is also in evidence, and a

mixed strain runs through the flock, rams from Mr. Collins' estate in South Australia being used, with others from "Newmarracarra" and from Mr. G. J. Gooch, the latter being "Koonoona" blood out of "Boo-oorowie" ewes. The flock now numbers 13,000 sheep with even, strong frames, and wool of medium weight and good staple, the average fleece, including a fair percentage of lambs, weighing from 6 to 7 lb. The wool has little yolk, is fairly clean, and scours and packs well. It is carted by contract labour 140 miles to Carnarvon, where it is shipped to London, *via* Singapore, and brings excellent prices. Shearing takes place in July, and in 1911 about 13,000 sheep were put to shears, including a large number of stragglers, satisfactory mustering being difficult. Prior to 1911 the work was done by hand, but in that year a new shed was erected, of timber and iron, five miles distant from the homestead, with accommodation for eight stands of Wolseley machinery, which is driven by a  $6\frac{1}{2}$ -h.p. Tange oil engine. Drafting-yards capable of handling from 20,000 to 30,000 sheep are now in course of construction, and with various other improvements that are under way the value of the property is being considerably enhanced. Lambing occurs in March, the average drop being about 60 per cent. The cattle are being sold as opportunity offers, and in the near future the herd will be reduced to small numbers, sufficient being retained for the uses of the station. Mr. Hatch has confined the breed to shorthorns, and a few prime cows are kept. More attention has been paid to the breeding of horses, and some fine sires have been worked on the station. At the present time, however, only a light stamp of horse is being produced, some of which find their way into the saleyards. The first mares in use were bought from Messrs. Woolhouse Brothers, and were sired by "Knight Errant." "Telephone" by "The Englishman" was used as a sire, and a fair number of first-class fillies were got by him. These in turn were mated with "Redfern" by "Goldborough," a sire of great merit, but not long owned by Mr. Hatch when he broke his leg and had to be destroyed. He left his stamp, however, on a few fillies, which proved high-class, and several of his get also proved themselves on the turf. One of these—"Fern"—ran second in the Carnarvon Cup three years in succession, and won a

p2

number of other events. "Novelty" won races on the Goldfields course and various metropolitan events, and "Pilgrim," a fine stamp of gelding and a splendid jumper, had the misfortune to break his neck while being schooled for the big steeplechase at Boulder, for which event he was considered to have a very rosy chance. "Pilgrim" was full brother to "Fern," who is still on the station. "Redfern" was succeeded by "Tellus" by "Pell Mell," by "Panic," this sire in turn giving way to "Tribulation" by "Isenomy." "Tribulation" proved very promising, and sired a few winners, but was lost on account of his defective teeth during a dry season that occurred being unable to crop sufficient of the scant feed to sustain life. The next sire "Coree" by "Devon" is now

Bartlett,

MR. WILLIAM HATCH.

Perth.

being used, but his progeny is as yet too young to try. Besides this racing stock, a few draughts are bred for the requirements of the station. Mr. Hatch has been represented on the racecourse, "Lubra" and "New Woman" having carried his colours with very fair success. He was part owner of "Onslow" when that horse won the Railway Stakes and ran second to "Le Var" in the Perth Cup of 1898. A keen judge and lover of thoroughbreds he is likely to continue the breeding of some blood stock as long as his connection with pastoral life is kept up, but he has in recent years relinquished the active connection with racing events which distinguished him in former times. It is his intention, after improving the

flock at "Lyons River," to dispose of the property and to settle down on a small farm in the southern district of the State. WILLIAM HATCH was born at Wanneroo on June 22, 1858, being a son of William Hatch, of Wilts, England, who came to Western Australia in the early fifties. This gentleman, after working for a time as a gardener, bought a property on the Moore River, comprising 700 acres, in addition to which he leased 3,000 acres and carried on mixed-farming pursuits, growing cereals and producing cattle and pigs. His death occurred in 1908. The subject of this review assisted in the operations of the home farm until twenty-one years of age, during this period gaining an excellent grip of the various details of management. In 1881 he set out for the north-west, having been engaged by Messrs. Woolhouse Brothers to work on "Yarraloola" Station, where he continued for three years. Here he gained experience in team-driving and in the handling of sheep and other station pursuits, and proceeded thence to "Hardie Junction" Station, in the Ashburton district, which was just being started by Mr. Arthur Hicks. In 1886 he took a well-earned holiday to Perth, where he met the late Alex. Forrest, and accepted the management of Messrs. Forrest and Burt's "Mungarra" Station, on the Gascoyne River. For many years he lived the life appertaining to a kind of roving commission, moving the sheep from place to place, wherever rain had fallen, and making his home in whatever spot the camp was pitched, being assisted by twenty natives in the shepherding of the flock. Tiring of this life, in 1898 he turned his attention to the development of "Onslow Creek" Station, which he had acquired some years previously, and eventually disposed of in 1907, in order to take up the "Lyons River" property, which he has since greatly improved. Mr. Hatch has the interests of the district at heart, and has been a member of the Gascoyne Roads Board ever since the formation of that body. He is a true sportsman, and an unfailing supporter of country race meetings. For twenty-four years he has been a member of the Carnarvon Race Club, in connection with which he is a committeeman and fills the office of steward. Mr. Hatch was married in 1881, his wife dying a few months later. In 1909 he was united to Ethel, daughter of Mr. Egan, of Victoria, and has one daughter by this union.

"MILLY MILLY" STATION. A typical Western Australian pastoral property is Mr. Daniel Mulcahy's "Milly Milly" Station, situated on the Murchison River about 140 miles from the Cue and Day Dawn railway stations. The country originally was taken up by the late Mr. O'Grady, only to pass at a later date into the hands of Mr. James Aitkin, eventually passing into the hands of his brother-in-law, Mr. McKellar. Subsequent to the death of this gentleman it was purchased by the Messrs. Mulcahy Brothers, the present proprietor, Mr. Daniel Mulcahy, having been for many years in partnership with his brother, Mr. Michael Mulcahy. The Messrs. Mulcahy assumed possession of the property in 1906, at which time the area of the estate comprised some 772,000 acres. With the progressive spirit of the Australian pastoralist the partners soon desired to enlarge these already generous borders, and extensive additions have since been made both by purchase and by taking up adjoining country, which enterprise has added considerably to the value of the run, the acreage of which now runs into a million and a half. It possesses, among other advantages, a fine river frontage of about 110 miles—40 miles to the Murchison River and 70 miles to the Wooramel River—and in good seasons there is an abundant flow of water from both these sources, the natural supply proving amply sufficient during the greater part of the year for watering the stock. Extensive provision has also been made in this department by artificial means, wells having been sunk in different parts of the run. Good water for stock may be obtained almost anywhere at a depth of 40 ft., and the work of well-sinking is continually going on, there being at the present time about forty-two whip wells on the property, each one of which is furnished with a substantially-made trough. The value of the windmill has been abundantly proved, as many as thirty having been already erected at an average cost, inclusive

of properly-protected troughs and galvanized tanks, of £100. These galvanized-iron tanks with which the windmills are supplied are 7,000 gallons capacity, ensuring a surface supply of water of from 14,000 to 21,000 gallons, in addition to the ample troughing, where the supply is so arranged that each trough keeps filling automatically. The character of the country, taken as a whole, is flat, with occasional slightly-rising ground to break the monotony of otherwise seemingly endless plain. The red soil generally found in the district prevails over the major portion of the run and proves rich in the necessary chemical constituents which make the different grasses

Bartletto, Perth.  
MR. DANIEL MULCAHY.

and varieties of herbage so nutritious a fodder for stock. The country is lightly timbered, mulga being chiefly in evidence, and the flora and fauna correspond with that of other parts of the district. The comfortable station homestead was erected in 1909, stone excavated on the property being used for building purposes. It is a substantial structure of one storey, with galvanized-iron roof, and enjoys the advantage of a wide verandah, which encircles the whole of the main building. The store, office, and kitchen premises are semi-detached, the plan having been to form the whole block of

buildings into a hollow square with central courtyard. Adjacent is the flower garden, which has been tastefully laid out, and vegetable garden, where an abundance of fresh vegetables are grown for consumption on the station during the whole of the year. The water reticulation scheme at the homestead is exceptionally good, and gives every encouragement to the cultivation of all classes of plants suitable to the soil and climate. A large amount of capital has been expended from time to time on the development of the property, and the subdivision of its immense area into paddocks of convenient extent has proceeded as rapidly as circumstances would permit. At the present period it has been divided into thirty paddocks, and about 400 miles of fencing have been accomplished at an average cost of about £25 per mile. Further subdivisions are being made, and at time of writing (1912) a further fifty miles of fencing is in course of erection. The boundary fencing is of six wires with mulga posts, this timber having proved sufficiently durable and able to withstand the varied climatic influences which prevail. The divisional fences contain five strands, which have been found to provide sufficient security to the stock. Round the station homestead are found the usual outbuildings, including stables, trapsheds, harness-room, and other conveniences. The cattle station, "Innawindy," is situated about 40 miles distant from the "Milly Milly" Homestead, and here is found a cluster of stockyards and stone buildings, all of a substantial nature and well adapted to the various purposes for which they have been designed, while on another "outback" camp, which goes by the name of "Yederadda," is a wood-and-iron structure where the station shearing-shed was formerly located. There are over 2,000 head of cattle on the run of the shorthorn strain, and showing the best qualities of that famous breed. The foundation of the herd was laid with good stock by the original proprietor, and this has

been improved from time to time by the importation of bulls of excellent pedigree from Victoria and New South Wales. The bulk of the "Milly Milly" cattle find their way to the metropolitan markets, and the prime specimens of beef bullocks brought under the hammer never fail to excite the keenest competition among buyers. The station carries about 200 horses, the majority of which are draughts bred for sale and for use on the property, the

at a specially high figure. This horse is by "Grafton" (imp.), his dam being "Amitie," by "Melos" from "Fiancée" by "Marvelous." His grandsire, "Melos," recorded a splendid performance by carrying 8 st. 12 lb. into third place behind "Bravo" in the Melbourne Cup of 1889, the famous "Carbine" on that occasion notching second honours. Prior to his advent in Western Australia in 1908 "Cobber" was exhibited at the Royal

cattle and horses at last season's shearing was running 30,000 sheep of the merino type, square-framed and strong-bodied, and yielding wool of good staple and density. It was formed in the first instance by representatives of the famous "Boonoke" blood, bred by Messrs. Falkiner and Sons, "Boonoke," in the Riverina, New South Wales, and as recently as 1910 a couple of very valuable "Boonoke" stud rams, costing some hundreds, were purchased, so that

remainder being of lighter type for harness and saddle use. A magnificent Clydesdale stallion, imported from New South Wales, has proved himself a sire of excellent qualities, and has been getting stock of quite exceptional merit which finds a ready sale and commands the best prices in the markets. Another fine stallion used for stud purposes on the station is "Cobber," purchased in Sydney from Mr. M. J. Thompson

Show in Sydney, New South Wales, on which occasion he was the successful prize-winner among the stallions in the three-year-old and under-four-years sections. The wool-growing industry forms, perhaps, the most important branch of the "Milly Milly" pastoral operations, and has proved a very profitable department of the business. The country, which is much understocked, in addition to carrying

the steady improvement which each year has been so marked a characteristic of the "Milly Milly" flock might suffer no diminution. Both for mutton-producing and wool-yielding purposes the Murchison district has proved itself distinctly favourable, and in these respects has been found to yield results which will bear comparison with any of the other northern localities in the Western Australian State. It has

been the general aim of the breeders of the neighbourhood to produce a sheep of robust type, well proportioned and well developed, with a sound, hardy nature, fitted in every way to withstand the varied conditions of the climate, and "Milly

Shearing takes place in August, and long after the "cut-out" is called work on the station proceeds at high pressure. The woolshed and shearing-shed are located about 11 miles from the station homestead, and are built of wood and iron, the

Dawn, whence it is railed to Geraldton for shipment to market, where it invariably changes hands at top prices. For very many years horses and bullocks were depended upon for transport purposes, but the successful experiments of other pastoralists having demonstrated the superiority of camels as beasts of burden for the long, dry, northern Australian tracks a number of these animals were purchased, from which Mr. Daniel Mulcahy is now breeding, and he hopes at the close of the present season to have increased his herd to the number of fifty. DANIEL MULCAHY, the proprietor of "Milly Milly" Station, is a son of the late Mr. Daniel Mulcahy, of Fremantle, formerly of Kingswell, Tipperary, Ireland, where the gentleman under review was born on September 6, 1866. He received his scholastic training at the Christian Brothers' and the National Schools in his native town, with a finishing course at a private school. With a view of entering upon a commercial career, at the age of seventeen he joined the establishment of Mr. W. Coman, in Tipperary, and acquainted himself with the business

TYPE OF BOONKE RAM.

Milly" has done its part in the attainment of this ideal. Lambing takes place about April, and during recent seasons the drop has averaged 75 per cent., with a high standard of quality, showing that Western Australia is prepared to hold her own with the Eastern States in the important matter of sheep-breeding. The flock is provided with excellent pasturage in favourable seasons in the varieties of grasses which come up luxuriantly after the early summer rains, and during the winter find a good substitute in herbage, and in times of drought saltbush and other bushes which cover the plains. Originally the idea of saltbush as a life-sustaining agent was rejected by some of Australia's most eminent explorers, but this theory has long since been proved by practical experience to be erroneous, as to the succulent saline juices many a hungry flock has owed a longer lease of life when the green blades of grass, for which the sheep show a marked preference, fail to appear.

present structure having been erected in 1911. The available space has been fitted up in the most convenient manner, and the twenty Wolseley sheep-shearing machines

FLOCK OF MERINOES.

which have been installed are driven by a 10 horse-power Clayton and Shuttleworth steam-engine. The wool is carefully packed and transported by camel team to Day

of a general merchant in all its branches. After four years' connection with this concern Mr. Mulcahy left Ireland for Australia, arriving in Queensland in 1887. He

continued to follow the same calling, first in Brisbane, then at Townsville, and afterwards at Charters Towers, and in 1891 came to Western Australia, where his first position was with the firm of William Sandover & Co., hardware merchants, etc., of Fremantle. Upon the report of gold discoveries at the Murchison commercial ambition gave way to mining enterprise, and Mr. Mulcahy was among the first to arrive at Nannine, in which district

prospector, leaving no stone unturned in pursuit of the precious metal, and finally became possessed of sufficient capital to enable him to give up the rough life on the fields and devote himself to the more certain, if less exciting, calling of trade. In 1893 he purchased an interest in the Commercial Hotel, High Street, Fremantle, and two years later was joined by his brother, Mr. M. Mulcahy, now of the National Hotel, Fremantle. This enterprise proved

interests were taken over by Mr. Daniel Mulcahy, who is now sole owner of the property. About this time the health of the latter gentleman becoming affected by the continued pressure of his long connection with business affairs, he decided to retire from active commercial life, and has since lived in semi-retirement at "Knocknagow," East Fremantle. A true patriot, he is one of the most generous donors to the funds of the Irish Home Rule cause

TRANSPORTING WOOL FROM "MILLY MILLY" TO DAY DAWN.

he prospected for about a year with varied success. Subsequently he proceeded to Peak Hill, and thence with a party of prospectors went overland to Coolgardie, a task involving considerable pluck and endurance, as this was the first party which had done the trip, and great privations were suffered from the scarcity of water and other hard conditions. At Coolgardie he engaged in the usual life of the

a pronounced success, and subsequently the brothers acquired several hotels, notably the National Hotel, Fremantle; the Terminus Hotel, Fremantle; the Royal Hotel, East Fremantle; the Central, Perth; the Shamrock Hotel, the Metropole Hotel, and the Grand Hotel, Boulder. Until the year 1911 Messrs. D. & M. Mulcahy were joint proprietors of "Milly Milly" Station, but in that year Mr. Michael Mulcahy's

and is a notable supporter of the Celtic Club in Western Australia, having helped to steer it safely through its infancy and assuming the office of guarantor in times of financial stress. His favourite form of diversion is found in the game of bowls, and he is connected with the East Fremantle Club. Married in 1895 to Mary Agnes, daughter of Mr. Lawrence Fay, of Fremantle, he has three sons and five daughters.

"YALLALONG," the property of Messrs. L. D. Mitchell & Sons. It has been said that a certain air of romance surrounds the settlement of the great north-west; that to the southern Australian reader the

better by experience. Admitting this element of romance, which is an undoubted factor in the scheme of

face of heartbreaking disappointment, by the judgment which curbed ambition in the years of plenty, by the industry, courage, and hope which have ultimately spelt success for him, he has amply deserved the

accounts of tropical and semi-tropical flora and fauna, and of life under the conditions peculiar to such regions, are more interesting than stories of places which he knows

exploration in reducing things to the bedrock of fact, it will be found that the average pastoralist who has gained a fortune by living and investing in these remote regions has not passed his years in the lap of luxury, but by the grit which causes him to set his teeth and go forward in the

harvest of the years. An immense amount of patient drudgery often lays the foundation for the realization of those dreams of success which first inspire the enterprise that proves

PORTION OF THE "YALLALONG" FLOCK.

a matter of ups and downs, like the average commercial venture. With its recently acquired additions of territory, the property which forms the subject of this article covers the large area of over 1,000,000 acres—a vast expanse of country, into which hundreds of the farms of the Motherland could be packed without undue crowding. It is situated on the Murchison River, in the north-west district of Western Australia, the vicinity having been first traversed in 1854—a year of drought—by Assistant-surveyor R. Austin, who described much of the territory as desolate and devoid of pasturage. In the following year, however, when his

four or five miles from the river to the base of the hills. Along the river—the double frontage of which to the "Yallalong" property equals about

120 miles—the country is fairly open, rising gently on the northern side to the Mount Blair Range, composed mostly of rough hills of granite

formation, while other parts of the run are undulating, with rises of a more pronounced nature occurring here and there. In a "good" season—namely, when the summer rains have fallen in abundant downpour, satisfying the thirsty soil and filling up the watercourses—the indigenous grasses spring up like magic, the nourishing wandering grass and wind grass being well represented; while the saltbush, which

efforts were followed up by Messrs. Gregory and Trigg, who explored about 180 miles of the River Murchison country, the same areas were found by these pioneers to be grassed equal to the average in the Champion Bay district, in some places the pastures being most luxuriant. The soil, generally of light depth, was found to deepen on the river flats, where it assumes a red, chocolate, clayey character, when dry being very open—fine, grassy plains extending

"YALLALONG" HOMESTEAD.

survives through long months of drought, and proves, with various species of top feed, the mainstay of the flocks, takes on new vigour, and succulent herbage flourish in moist places. Along the river flats the flooded gum-tree is considerably in evidence, and over the areas of the run belts of mulga and pine may be found, while the white-gum is also a feature of the region, ample shelter being provided in various localities for the flocks by the foliage of this and other trees and bushes. When first taken up in the early eighties by the late James Mitchell, father of the present general manager, the "Yallalong" property comprised some 300,000 acres, a portion of which was secured on terms of purchase, the remainder being leased from the Government. Mr. Mitchell was a native of Redruth, Cornwall, England, and prior to his advent to Western Australia had been engaged in the mining industry in the Old Country, having been occupied in lead-mining at Northampton for four or five years. The possibilities of pastoral enterprise

in the north-western areas having impressed him as providing a likely avenue to prosperity, he rented the "Trevenson" property near the same centre, and became engaged in the breeding of merino sheep for the wool markets, and in horse-breeding,

but in the early eighties he once more turned his attention to the pastoral industry on the more remote districts of the Upper Murchison, "Yallalong" being situated about 170 miles north-east of Geraldton and 110 miles from Mullewa. Stocking

WATERING SHEEP AT "YALLALONG."

LOAD OF WOOL LEAVING STATION FOR MULLEWA.

gaining considerable experience during the seven or eight years that he retained his connection with "Trevenson." Relinquishing this enterprise, he entered upon hotelkeeping pursuits, becoming boniface of the Miners' Arms Hotel at Northampton;

the run with 2,000 merino sheep, purchased on the Greenough Flats, near Northampton, Mr. Mitchell, whilst developing the place chiefly as a wool proposition, also went in for cattle and horse-raising on a more limited scale, the latter stock being procured from his former property, "Trevenson." A primitive homestead was built, and a little fencing accomplished, but the drawbacks to rapid development were numerous, and even facilities for shearing were absent, the flock having to be driven to Northampton for the annual clip, which, at that time, was done by blade. On account of the lack of fenced paddocks, shepherding of the flocks continued for many years, and in general the work of improvement proceeded very slowly, while the increase in the numbers of the stock

was very small. Mr. James Mitchell died in 1892, after a life devoted almost entirely to business pursuits, his only connection with any social organization being membership in the Geraldton Lodge of Freemasons. He was twice married, his second wife

his mother, who holds the major interest in the estate, himself and a brother also being small shareholders. At the time of his taking over the supervision of affairs the station was stocked with 2,000 sheep, 60 horses, and 300 to 400

merino rams from the South Australian station, "Nalpa," owned by Messrs. Stirling Brothers, the well-known pastoralists of that State. This introduction of superior blood has been found eminently satisfactory, and the flock, which has now increased to 21,000 sheep, and has been subjected to careful culling every year, displays a robust type of animal, with a clean fleece of longer, denser wool, in which a fair amount of yolk is in evidence. A satisfactory feature is the absence of diseases, these being almost unknown in the district; and another advantage of the locality is the very little loss occasioned by the depredations of dingoes and hawks, which prove such a scourge in some parts of the country. Lambing takes place during May, June, and July, the average drop reaching about 80 per

"YALLALONG" SHEARING SHED.

cent., though in 1910, which was an especially favourable season, this percentage was increased to 89. September is the shearing season, and since Mr. J. C. Mitchell's regime commenced a shearing-shed has been erected at the station, containing being Leah, daughter of the late John Sainsbury, of Fremantle, by whom he had three sons and five daughters, a son by his first marriage also surviving. JOHN CLAYTON MITCHELL, the eldest son of the late James Mitchell by his second marriage, was born at Northampton on February 11, 1880. He pursued his primary studies at the local public school, subsequently completing his scholastic career in Sydney, New South Wales, where he remained for fifteen months, returning to Western Australia in 1897. Young Mitchell had already acquired considerable experience in the management of sheep and cattle on the parental property, and now took up his residence at "Yallalong," in the following year being invested with full powers of control on behalf of

cattle. In order to improve the type of the flock Mr. Mitchell, in 1900, introduced some Shropshire rams, from which good results were anticipated, but these proving of no avail, the experiment was discontinued, and at a later date he imported some well-bred

merino rams from the South Australian station, "Nalpa," owned by Messrs. Stirling Brothers, the well-known pastoralists of that State. This introduction of superior blood has been found eminently satisfactory, and the flock, which has now increased to 21,000 sheep, and has been subjected to careful culling every year, displays a robust type of animal, with a clean fleece of longer, denser wool, in which a fair amount of yolk is in evidence. A satisfactory feature is the absence of diseases, these being almost unknown in the district; and another advantage of the locality is the very little loss occasioned by the depredations of dingoes and hawks, which prove such a scourge in some parts of the country. Lambing takes place during May, June, and July, the average drop reaching about 80 per

WELL FITTED WITH WINDMILL, TANKS AND TROUGHING.

twelve stands, Wolseley machines having been installed in 1909. An up-to-date woolpress has also been erected, and the clip—which averages 7 or 8 lb. to the fleece—is pressed and packed in its greasy state and despatched per donkey and camel teams to Mullewa, thence by train to Geraldton, the port of shipment for London, where it commands an average price of 10½d. per lb. The herd has now reached the goodly number of 2,400 cattle, a favourable cross between the shorthorn and Hereford breeds having been brought about by the importation of bulls from South Australia and local purchases from Mr. A. W. Edgar's "Strathalbyn" Estate, Gingin, and Mr. W. McKenzie Grant, of "Newmarracarra," Geraldton. Mr. Mitchell breeds for the Western Australian markets chiefly, and about 500 head

annually find their way to the local saleyards. There are about 200 horses on the station, medium draughts and hacks being bred for station use and for sale. The fine draught stallion "Grand Review," by "Garthland" — "May," by

"McArthur," bought from Mr. Cockram at the figure of 200 guineas, has been used as sire for some time, excellent progeny being the result; and the trotting stallion "Rapid," by "King Frederick the Great"—"Rapid," by "The Swell," has also

entirely justified this decision. Other classes of stock on the run include forty donkeys and thirty-five camels, a couple of teams of each being always kept on hand for carting and other station purposes. Among the improvements which

PORTION OF CAMEL HERD.

placed some fine young colts and fillies to his credit. The sire "Darnley," imported from Queensland, was used in previous years, but it was felt that an improvement could be effected in this department, and the result of the changes made has

were begun in good earnest when Mr. Mitchell took over the reins of management was the steadily continued erection of fences, this work going on at the rate of from 20 to 50 miles per annum, until at the present time there are 500 miles of fencing completed, a division of the run

into forty paddocks having been made. The fences are constructed of pine and mulga posts cut from the local timber and threaded with five wires, costing about £18 per mile. The primitive dwelling built by the late Mr. Mitchell was replaced in 1904 by a stone house with iron roof containing seven rooms, and the usual outbuildings—stables, cartsheds, shearers' quarters and shearing-shed, blacksmith's shop, etc.—have been added, while in the winter a small vegetable garden is cultivated. The rainfall varies

MURCHISON RIVER IN FLOOD.

considerably from year to year, but over a period the average is about 10 in., the principal fall occurring from the months of May to August, and, in addition to the natural water supply provided by the Murchison River and various smaller creeks and sand soaks and pools, fifty to sixty wells have been sunk, at an average depth of 30 ft., which provide excellent water for the stock, to which it is served by the aid of fifty windmills, with tanks and troughing of up-to-date design. In 1910 the area of the estate was brought up to its present acreage by the purchase of "Wail" and "Balgooda," outstations of the "Mount View" Station, the property of Messrs. Drage Brothers. The former, being mostly unfenced, but watered by a few creeks and claypans, is used

ANOTHER VIEW OF RIVER.

CAMEL TEAM ON THE ROAD.

MURCHISON RIVER RUNNING A BANKER.

chiefly as a cattle run; while "Yallalong" and "Balgooda" are kept as sheep country, the pasturage being well suited for that purpose. Mr. Mitchell is an enthusiastic motorist, and has on the station an "Overland" car and a motorcycle, by means

of which he is able to keep in touch with all portions of the firm's extensive holdings. Being kept fully occupied in attending to the multitudinous duties always associated with pastoral enterprise, Mr. Mitchell has but little time to devote to outside affairs, but he is associated with the Masonic craft, being a member of the Geraldton Lodge, No. 3, W.A.C. He was married in the year 1907 to Ethel Blanche, daughter of Mr. Thos. Drage, of "Mount View," and has a family of one son and one daughter. Mrs. Leah Mitchell resides at Churchill Avenue, Subiaco.

"STRATHALBYN," the property of Mr. A. W. Edgar, is a fine pastoral property situated about two and a half miles from Gingin, on the Perth to Geraldton railway line, and is distant about 52 miles from the western metropolis. The estate embraces part of the original "Cheriton" Station, formed some fifty to sixty years ago by the late Mr. W. L. Brockman, a pioneer of the pastoral industry in Western Australia. "Strathalbyn" comprises some 2,500 acres of beautiful undulating country, particularly well adapted for the needs of cattle raising. The soil of the estate varies a good deal, and embraces about 500 acres of rich black soil, 1,500 acres of redgum country, and 500 acres of poorer country of the same class, intersected with patches of sandy plain. Originally covered with a heavy growth of redgum, the timber gradually has been thinned out until now very little of it remains. The natural grasses grow luxuriantly, and are supplemented by a cultivated area of from 60 to 70 acres. On the eastern boundary of the estate runs the Gingin Brook, a permanent watercourse, the daily flow of which has been estimated at 2,000,000 gallons. With the depletion of the timber on the property another running stream has come into being, and as the average annual rainfall is about 32 in. there is always a copious supply of water for all purposes. The property is subdivided into twenty paddocks, each of which has the advantage of a

natural spring, and is completely encircled by a wire fence of four strands and three barbs, which has proved ample for the security of the sheep

Greenham & Evans. Perth.  
MR. A. W. EDGAR.

and cattle. Assuming complete control of "Strathalbyn" in 1899, Mr. Edgar decided to establish a first-class stud of merino sheep, and in pursuit of this enterprise expended considerable sums of money. The pure merino strain first tried gave way a little later to the Shropshire, but principally owing to footrot and rickets the sheep failed to make headway, and operations in this direction were ultimately abandoned. Mr.

Edgar's enterprise, however, was not altogether barren of success, as his Shropshires and merinos were awarded numerous prizes, particulars of which will be found elsewhere. In the year 1898, some twelve months prior to the establishment of the sheep stud, the foundation of the present very fine herd of shorthorn cattle was laid by the purchase and importation of pedigreed stock from New South Wales, Victoria, South Australia, and New Zealand. Selections were made from the estates of Mr. T. E. Bowman, Campbell House, Lake Alexandrina, South Australia, Mr. R. Whitehead, "Goodwood," near Caramut, Victoria, and Mr. Tindale, New South Wales. "Miss Matilda 18th," which subsequently placed to its credit three championships and numerous other prizes, was purchased from Mr. L. Dugdale's "Springfield" property, and at the same time fifteen cows with good pedigrees were selected. Many others were purchased at prices ranging from 100 to 150 guineas, and for two fine cows from Mr. A. J. Webb's "Lindenow" Estate, near Bairnsdale, 150 and 115 guineas respectively were paid. The sum of £300 was outlaid in the purchase of three cows from "Bolinda Vale," along with many others from this noted stud at from 20 to 60 guineas; 200 guineas were paid for "Bolinda Duke of Derrimut 267th," a splendid specimen of a seven-month-old calf; and "Bolinda Duke of Alpine 3rd" became Mr. Edgar's property at a cost

Photo by Greenham & Evans. "LINDENOW DUKE OF DERRIMUT 2ND." BY "DUKE OF YORK 2ND."

of 175 guineas. New Zealand was next visited, and at an important sale a cow of the shorthorn strain was purchased for "Strathalbyn" at a cost of 225 guineas. No further purchases were made in the Dominion, but two cows imported from England by Mr. W. T. Loton were added to the stud at an outlay of 150 guineas, and a number was secured at the Melbourne sales at prices ranging from 30 to 90 guineas. The magnificent shorthorn bull "Royal Albert 11th," bought at auction in Melbourne for 260 guineas, was originally secured in England from the breeders, Messrs. C. Hobbs & Sons, of Maisey Hampton. Mr. Edgar was the breeder of that fine bull "Strathalbyn Monarch," which was purchased and sent to England by Mr. G. J. Brockman, but the cattle restrictions of the Old Country preventing the landing of the animal it was returned to Western Australia, and at the present time is at "Boo lathana" Station, owned by Messrs. C. & J. Butcher. The present home-  
stead, built in 1900, is a comfortable stone and brick structure, the architectural side of which is not altogether devoid of beauty.

"DE GREY" STATION, situated in the north-west of the State, comprises about 655,000 acres of open grassy plain, dotted here and there with belts of light timber. Fifteen different grasses flourish on the estate, including seven varieties of spinifex, five of which are considered good for stock, the soft spinifex being looked upon as one of the best stock-fatteners known. The subdivisions embrace about thirty paddocks, varying in size from about 10,000 to 70,000 acres, and are fenced with six wires with iron stanchions, the latter being imported from England at a

cost of 6d. each. The estate is watered by several permanent pools, by the De Grey River, and a number of clay-pans, which retain water for periods varying from three to ten months of the year; in fact, water is to be had almost anywhere by sinking 25 to 50 ft., no well on the station being deeper than 70 ft. The flock comprises about 60,000 sheep of the hardy South Australian merino type, which has proved itself to be admirably adapted to the rigours of the Kimberley expanses. As well as the sheep "De Grey" Station carries 1,000 well-bred shorthorn cattle,

Dangar. About fifty ponies are bred, the sire in use being a hackney stallion bred by Mr. Phillip Charley, of New South Wales. In the early days of the settlement of "De Grey" Station the owners devoted a considerable amount of attention to the pearl-shelling industry and kept three boats in commission. In addition to the native crew, thirty to forty native divers were carried on each boat, and for fifteen years the profits derived from this work annually reached £6,000. Pearlsell was then worth £130 a ton, but its present selling price is almost double

that sum. The highest figure ever obtained by the firm for a single pearl was £1,200. Nowadays the boats no longer ply their trade, but when the tide is out beach-combing prevails, the natives being employed to gather the shells. Between high and low tide there is a difference of 25 ft., and for wool-loading purposes sailing vessels stand close in to land, the receding tide leaving them high and dry on the sandy shore. The wool teams then pull alongside, and work is vigorously proceeded with until the incoming tide causes a temporary cessation.

Lambing usually commences in May and is finished by the end of June, but a late lambing occurs in October and November, the average for the past twenty years being about 50½ per cent., including dry seasons and drought years. Shearing takes place in July, and in 1910 1,098 bales were obtained from 54,500 sheep, including a number of lambs. ALEXANDER WILLIAMSON EDGAR was born at Mullagh, in the western district of Victoria, in the year 1856. He is the second son of the late Mr. Walter Edgar, who reached Victoria

HEAD OF "BOLINDA DUKE OF DERRIMUT 267TH"

and nothing but pure shorthorn bulls have been used for twenty years. The station also runs about 300 horses, and the sires used for the last thirty-five years are "Sir Isaac" by "Angler," "Nutwith" by "Kelpie," "Metal" by "Tredeagle," "Stone Design" by "Precious Stone," "Gunpowder" by "Guinea," and "Georgie Mentor" by "Mentor." The sires now in use are "Orel," own brother to "Nushka," "Brookong," and "Kilfer"; and "Stamp," a son of "Postmaster"; also a fine Suffolk Punch imported from England, and one bought at Sydney sales bred by Mr.

VIEWS OF "STRATHALSYN" ESTATE.

in the very early days of that State, and was one of the pioneer settlers to open up the land. Mr. A. W. Edgar came to Western Australia in his twenty-first year, and soon after arrival found employment as a station hand on the "De Grey" Station, then owned by Messrs. Grant, Harper, & Anderson. His brother, Mr. John Edgar, subsequently purchased Mr. Harper's share in the estate, and of this share Mr. A. W. Edgar ultimately bought a sixth portion. The reconstructed firm continued operations until the death of Mr. Anderson in 1886, and three years after the demise of Messrs. Grant and Edgar, who died within a fortnight of each other in 1897, a syndicate composed of brothers, sisters, and nephews, was formed to purchase the property of which Mr. A. W. Edgar is now the largest shareholder and general manager. Apart from this property the syndicate retains large interests in other pastoral areas in the north-west of the State. "Warrawagine," which adjoins the "De Grey" boundaries, was originally a part of that station, but was sold to the Darlot Brothers some twenty years ago. "Obagooma," in the Kimberley district, was opened up by the Edgar Brothers' firm, and a few years later sold by them to the present proprietors. Mr. Edgar holds a two-thirds share in the "Oscar Range" Station, comprising over half a million acres, over which 7,000 head of cattle are grazed. At this station there is also a jack donkey, imported from America by Mr. Edgar at a cost of 200 guineas, which is used for the purpose of breeding mules for use in the work of the station. Mr. A. W. Edgar, in conjunction with his late brother, started a small stud of pedigree mares in 1895, and imported "Maiden Erleigh" by "Sunrise" out of "Queen Eliza," "Monazite" by "Malua" out of "Galena" by "Richmond," "Girton Girl" by "Mentor" from "Sylvina" by "Glorious," "Sturt's Pea" by "Gang Forward" from "Rose of Australia" by "Melbourne," afterwards adding "Rosary" by "Light Artillery" from "Tuberosa" by "Grand Flaneur," "Rupee" (full sister to "Florin") by "St. Swithin" from "Dime" by "Dollar," "Fragrance" by "Russley" (imported) from "Spice" (sister to "Abercorn") by "Chester," and used as a sire, "Field Artillery" by "Light Artillery" from "Sunnydale" by "Gang Forward." The stud was successfully carried on, but subsequent

to the death of his brother Mr. Edgar gradually relinquished operations as a breeder of horses. He bred a few good horses, notably "Fireworks," well known on the unregistered tracks in Melbourne; and "Independent," a good performer in Western Australia; besides many winners at backblocks race meetings. Mr. Edgar takes a keen interest in working sheep-dogs, and has only twice been beaten in all the field trials he has contested in Western Australia. At "Strathalbyn" there is also a very fine flock of American bronze turkeys, for which there is a very strong demand from all parts of the State. About three miles from "Strathalbyn" a piece of land has been purchased from the Midland

total of 42, valued at £7 19s. Horses—11 first prizes, 12 second prizes, 1 third prize, a total of 24, valued at £40 19s. Total number of prizes, 428; value, £645 18s. Chief winning animals of the "Strathalbyn" herd of shorthorns:—Bulls—"Strathalbyn Ringleader," son of "The Gift"—1 first prize, 1 special prize, 1 second prize; "Lindenow Duke of Derrimut 2nd"—9 champions, 16 first prizes, 3 special prizes (this bull was never beaten and was in sixteen shows in five years); "Strathalbyn Monarch"—3 champions, 6 first prizes, 1 special prize; "Bolinda Duke of Derrimut 267th"—2 champions, 4 first prizes (this bull as a calf beat thirty-six in his class at Melbourne Royal Show; and

Railway Company, and for the purpose of exterminating the scrub and undergrowth a herd of pure Angora goats has been recently imported from South Australia. The following is a list of trophies and prizes won by Mr. Edgar from 1898 to 1910:—Shorthorn Cattle—46 champions, 126 first prizes, 64 second prizes, 8 third prizes, 2 recommended third prizes, 3 cups, 4 governor's cups, 5 special prizes, a total of 258, valued at £398 5s. Shropshires and Merinos—10 champions, 47 first prizes, 21 second prizes, 4 third prizes, 1 special prize, 1 certificate of merit, a total of 84, valued at £131 11s. Dogs (field trials)—9 first prizes, 10 second prizes, 1 third prize, a total of 20, valued at £67 4s. Poultry—1 champion, 24 first prizes, 12 second prizes, 5 third prizes, a

was exhibited for three years and remained unbeaten). Cows—"The Gift"—1 reserve champion, 4 first prizes, 1 recommended third prize; "Strathalbyn Gift," daughter of "The Gift"—5 first prizes (this cow has an unbeaten record); "Strathalbyn Gift 2nd," daughter of "The Gift"—4 first prizes; "Miss Matilda 18th"—3 champions, 1 reserve champion, 5 first prizes, 3 second prizes, 1 third prize; "Strathalbyn Josephine"—3 first prizes, 2 special prizes, 2 second prizes; "Strathalbyn White Wreath"—4 first prizes, 1 second prize; "Charmer of Inglewood's 5th Princess"—2 champions (milking strain), 1 reserve champion (milking strain), 3 first prizes (milking strain), 3 second prizes (milking strain), 1 third prize (milking strain).

"SPRINGHILL," the property of Mr. W. T. Loton, is in the valley of the Avon, seven miles to the south of Northam, and some 16 miles distant from York township. "Springhill" Estate is looked upon as a model

Bartletto, Perth.  
Mr. W. T. LOTON.

farm of Western Australia. The property comprises about 7,000 acres of land, ideal in every respect for agricultural and pastoral purposes, and since the first days of settlement

the face of the landscape has undergone considerable changes, most of the dense timber and undergrowth with which the property was encumbered having succumbed to the vigorous onslaught of the woodman's axe. Altogether some 5,000 acres have been cleared and rendered available for cultivation, while a further 1,000 acres have passed the first stage in the transformation from virgin forest to smiling cornfields. In 1911 the harvest of wheat and hay was well up to the yield previously maintained, namely, eighteen bushels of wheat per acre and one and a half tons of hay per acre. The property is completely surrounded by a substantial fence, and is subdivided into seventy-five paddocks, ranging in area from 5 to 800 acres. The locality is favoured with a regular and abundant rainfall, in addition to which there are several permanent sources from which water is drawn both for stock and domestic purposes. Grasses grow luxuriantly on the property, the many varieties including clover, cocksfoot, silvergrass, dandelion, and corkscrew. Besides these many artificial grasses have been introduced by Mr. Loton, who is continually experimenting in this direction. Fifteen acres are given over to paspalum, a splendid fodder for stock, and in a number of smaller

paddocks lucerne is cultivated. Since about 1895 the management of "Springhill" has been entirely in the hands of Mr. A. G. Loton, and under his energetic direction remarkable progress has been made in developing

Bartletto, Perth.  
MR. A. G. LOTON.

the resources of the property. In 1910 he was successful against seven other competitors in winning a silver cup presented by the proprietors of *The Northam Advertiser* for the best-managed farm in the district, scoring

RESIDENCE AT "SPRINGHILL"

85 points out of a possible 100, a result of which Mr. Loton may well be proud. The homestead at "Springhill," a fine roomy house, is situated on a slight elevation and commands a magnificent view of the surrounding hills and valleys. It contains some fourteen rooms and is surrounded by a beautiful garden, upon the cultivation of which much time and attention have been lavished. The residence is enclosed on three sides by a spacious verandah covered with creepers, which provides a welcome retreat during the hot summer months. The various outbuildings have been erected on the most modern lines, and the machinery in use on the estate is the most up-to-date obtainable. As with the majority of sheep-breeders in the Western State, the merino holds pride of place in the estimation of Mr. Loton. The noted characteristics of the breed, the robust frame, well-set-up body, long wool of good staple, are all present in the "Springhill" flock, which for evenness and excellence would be hard to beat. The foundation of the flock was laid some twenty-five years ago by the introduction of rams from the famous Murray flock of South Australia and some ewes from Canowie. Subsequently rams by "Royal Hero" and "President" were imported from Tasmania, these giving great density of fleece and wool of high quality. In more recent years rams of a very high class from the celebrated "Wanganella" and "Boonoke" studs have been obtained. The introduction of the latter strain has been attended with very satisfactory results, and the

standard of the flock has thus been raised to a high plane of excellence. The principle stud ram "Boono" was purchased from Messrs. Falkiner and Sons in 1907. Several of his young rams have since realized good prices,

"Wonga," bred by the Executors of the late Mr. Thomas Millear, of "Wanganella." This ram carried off championship honours at the Royal Show of 1907, since when he has not been exhibited in the show ring.

GROUP OF DRAUGHT MARES

q2

first and champion prize in the respective classes of strong and medium merinos, and "Sir Samuel," the strong wool ram, carried off the prize as grand champion merino ram at the show. The stud flock now totals 500 carefully selected animals, and each season Mr. Loton will have available for sale a considerable number of young rams. Shearing takes place in September, and this year over

good stamp of draught horses, and at the present time has twelve splendid station-bred Clydesdale draught mares for brood purposes. During 1908 a pure-bred Cleveland bay stallion, "Potto Laird," and three Cleveland brood mares, "Beadlam Star," "Lady Crawford," and "Mischievous," were imported from England. "Potto Laird" (1700) was bred by Mr. F. Wilson Horsfall, of

in adding considerably to the laurels gained by him in the English show rings. "Lady Salton" (1068) was also a famous prizetaker, having won over forty first and championship prizes, including three Royals and four Great Yorkshires in the period between 1897 and 1906, and was never beaten in the show ring. *The Northam Advertiser*, in reviewing the judges' decision in awarding

Photo by C. E. Farr.

TWO-TOOTH "BOONOK" RAMS, "SIR SAMUEL" AND "BOONS."

3,500 sheep will be put to the shears. The work is performed by hand in a commodious shed of wood and iron, fitted with six stands and all the necessary conveniences for the prompt dispatch of the work. Lambing takes place in May, and for many years the excellent average of 80 per cent. has been maintained. Mr. Loton has not confined his attention solely to the breeding of stud sheep, but has gone in for the raising of a

Potto Grange, Northallerton, and was foaled in 1906, his sire being "Potto Hutton" (1603) by "Broomgrove Pride" (1364) and his dam "Lady Salton" (1068) by "Tucksall" (189). He combines the best Cleveland blood in England, and with such breeding cannot fail in being an impressive sire. "Potto Hutton" won several valuable prizes, and was afterwards secured for the Orange River Colony, where he succeeded

the first prize to "Springhill" Farm, said:—"Springhill" may be fairly described as a model farm. The care given to the accommodation of the stock is certainly responsible for their splendid condition. The stalls for the horses, the cattle-sheds, the pigsties, and the shearing-pens are all on the most up-to-date principle, and everything is kept in complete repair and at the highest standard of cleanliness. The cement pigsties, with thorough drainage conveniences and all facilities for easy feeding, have been built entirely out of the profits from the pigs themselves, and thus demonstrate that it is true economy to treat well 'the gentleman that pays the rent.' For the horses the loose-boxes, stalls, yards, and crushpens for handling young stock have all been designed with a view of securing the healthiest conditions for the animals and the least labour for the men." The machinery on the estate includes an 18 horse-power oil-engine and Bunce chaffcutter capable of a daily output of 30 tons, saws and forges, ploughs, seed-drills and harvesters, all of which are maintained in the highest state of efficiency. Mr. W. T. LOTON is an Englishman by

TWO-TOOTH MERINO EWES.

birth, his native place being Dill-horne, in Staffordshire, where he was born in 1839. He descends from an old farming family, but his early life was spent in the atmosphere of a mercantile house in the above county, and afterwards in London. In 1862 he sailed for Western Australia, arriving at Fremantle in March, 1863, and engaged in commercial pursuits at Perth and Geraldton until 1867. In the latter year he entered into partnership with Mr. Walter Padbury, with whom he built up the great mercantile firm of Padbury, Loton, & Co. Both Mr. Loton and his partner were large investors in landed estate, as well as financiers on a considerable scale, and were among the most enterprising of the pastoralists of the north-west country. Their dual business of trade and finance grew enormously, and in 1889 they sold their business on St. George's Terrace, whereupon Mr. Loton began to devote himself more exclusively to his interests as a landed proprietor. As early as 1876 he had purchased the "Belvoir" and "Upper Colston" properties on the Upper Swan, comprising about 6,000 acres of forest, arable, and grazing land, now known as "Belvoir," and at a later period (1884) he secured the "Springhill" Estate near Northam, about 7,000 acres in extent, which even before the goldfields era had acquired considerable value. In 1884 Mr. Loton accepted a seat as a nominee member in the Legislative Council, from which he resigned in 1887, and was elected member for Greenough district, which he continued to represent until the adoption

of responsible government in the year 1890. In the first Parliament under responsible government he was elected member for Swan district in the Legislative Assembly, and held that position until 1897, when he temporarily retired from the arena of politics. In 1898 he was elected

for two terms, 1901-2-3. He has held many offices of honour, including that of President of the Royal Agricultural Society for several terms. He has been a trustee of the Anglican Church for a lengthy period, is chairman of directors of the Western Australian Bank, a

JERSEY BULL "EMPEROR."

member of the Legislative Council for the Central Province, and afterwards, from 1901 to 1908, represented the Eastern Province, at the end of this period retiring from active political life. He has taken his share in the municipal life of Perth and was elected to the dignity of Chief Magistrate, holding office

director of the Western Australian Trustee, Executor, & Agency Company, and of various other financial institutions. In 1868 Mr. Loton married Annie, only daughter of William and Priscilla Morris, of "Rugeley," Staffordshire, England, and has two sons and two daughters now living.

BERKSHIRE SOWS.

"MOKINE," the property of T. H. WILDING, M.L.C., is situated in the valley of the Avon, about 12 miles distant from Northam, and comprises 9,000 acres of hilly pastures and undulating agricultural country. Originally a grant to a man named Trimmer, it passed into the hands of the Wilding family about thirty-seven years ago—Mr. Thomas Wilding, sen., having purchased it at auction in 1876. It was heavily timbered with York gum, flooded gum, and jam, and 3,000 acres are now cleared. One-fifth

being fitted with modern comforts and conveniences. An excellent water supply is obtained from the hillside at the rear of the house, from whence it gravitates in pipes to the dwelling. The well-kept garden, protected by a *Macrocarpa* hedge, delights the eye with the profusion of blooms. Beyond is the orchard, a place of delight in early summer, when many of the choicest fruits come to perfection. Another attraction is the vineyard, where fine crops of grapes are annually gathered. Fruit-drying,

valuable pioneering work. His sheep, horses, cattle, and pigs have won for "Mokine" an excellent reputation as a stock-producing farm, and innumerable prizes have been taken at the district and Royal shows by representative exhibits from the different departments of his pastures and pens. In one season alone he has carried off 300 first prizes, and his record of premier awards totals altogether considerably over 1,000. The "Mokine" merinos command a ready sale, and are eagerly sought after by purchasers anxious to

Photo by C. E. Farr.

GENERAL VIEW OVER "MOKINE" ESTATE

of the cultivable area is cropped each season, and various grasses grow well on the cultivated portion, among which are found burrtrefoil, yellow trefoil, white clover, rye grass, and Cape weed species. The property is well watered with surface water and wells, and in a charming valley through which runs the brook from which the property receives its name, stands the substantial homestead, a handsome, two-storey structure consisting of eleven rooms, the whole interior

fruit-preserving, and jam-making for many years have been carried on, and many prizes for exhibits in these sections have been awarded to the "Mokine" products at the local shows, as also for the choice displays of flowers from the same source. Dairying also receives attention, and a quantity of butter is made. The breeding of good class stock takes pride of place among the many industries of "Mokine," and in this department the present owner, Mr. T. H. Wilding, has done

improve the strain on their own properties. The flock consists of about 5,000, mostly of this popular breed, which was originally founded by importations of both rams and ewes from the deservedly noted stud flock of "Koonoona," South Australia. These ewes are kept exclusively for stud purposes, and with their progeny are forming a very valuable small stud at "Mokine," while the flock for wool-growing and mutton-producing values has been raised chiefly by

means of the "Koonoona" rams with 100 ewes imported from "Canowie" Station and another 100 from "Boo-boorowie." Very excellent results have been obtained by these methods, and Mr. Wilding has effectually demonstrated that sheep equal in size and quality to those produced in South Australia can be bred under equally favourable conditions in the Western State. Of recent seasons he has turned his attention to cross-breeding for the lamb export trade, this being a development of his earlier enterprise in raising lambs for local consumption, in which department he was the pioneer for the district. The "Mokine" clip maintains from season to season

"Blue Prince" was confidently expected to place to his owner's credit in 1910 the Sires' Produce Stakes, a special prize offered by Messrs. H. Wills & Co. to the owner of the sire of the best colt, which Mr. Wilding had won each year since its inauguration with the progeny of "Royal Blue." By an oversight the colt missed competing, and thus a break was created. The magnificent draught mares of "Mokine" are renowned throughout the State as prize-winners and truly worthy representatives of their breed. The lengthy-pedigreed "Deborah," by "None Such" out of "Model," won first and championships in 1907 in every show, including the Royal, in

equally well in the following year; and "Cornflower," a half-sister of "Blue Rose," has emulated very closely the triumphs of the latter. The high prices brought for draught colts proclaim their popularity, yearlings having sold for from 90 to 150 guineas, and the latter sum has been refused by Mr. Wilding for one of his two-year-old fillies. The "Mokine" Jersey herd is purebred. About three years ago Mr. Wilding purchased a bull and ten cows from Mr. George Jay, late of Ballarat, Victoria, and this was the nucleus of the present herd. In 1910 he bought a Jersey bull by "Cherry's Pride," bred by Alexander Murray, of "Mount Crawford,"

Photo by C. E. Farr.

GROUP OF TWO-TOOTH MERINO RAMS.

a steady reputation, and continues to hold its high place on the price-lists. Frequenters of the Royal Show are invariably struck with admiration of the splendid Clydesdale stallion "Royal Blue," the champion for seven years at this important function, and the prize Clydesdale mares from "Mokine." In the breeding of draught horses Mr. Wilding has won a reputation not only for his own stables, but for the State. Bred from "Navy Blue," "Royal Blue" has transmitted many of the fine qualities of that famous sire to his own offspring, a very promising two-year-old being "Blue Prince," out of "Cloe," one of Mr. Wilding's Western Australian bred mares.

which she was exhibited, and won equal honours the following year at Northam, Toodyay, and the National Show, Busselton, with first prize at the Royal Show, Perth. "Cloe," by "None Such" from "Dora," in 1909 was first and champion at Northam. "Roma," by "Revenue" from the valuable imported mare "Beauty," as a three-year-old took premier place in all competitions, and added other laurels to her record in ensuing years, being first at Toodyay in 1910. A filly named "Blue Rose" from "Dinah," sired by "Royal Blue," was placed first in the two-year-old sections at Northam, York, Toodyay, Beverley, and the Royal Shows, and did

South Australia, and recently secured a young bull sired by "Campanile's Noble," a recent importation from Jersey Island by Mr. William Padbury, which he intends to use as the next sire of his stud. The valuable stud of Berkshires, founded many years ago, is now being superseded by the progeny of some pedigreed sows brought from Bacchus Marsh about nine years since, and which were mated with good English boars with the best results. During the past twelve months Mr. Wilding has been using the new importation from England of Mr. R. E. Weir, Chief Inspector of Stock for Western Australia.

The Honourable HENRY JOHN SAUNDERS, J.P., of "Henley Park," Guildford, was born at Thurloe Square, London, on February 16, 1855. He is the second son of the late T. Bush Saunders, chief magistrate of Bradford-on-Avon, England, and early in life was sent for his scholastic education to Clifton College, Bristol. At the conclusion of his studies at this institution he commenced a course of training in order to qualify for the profession of a civil engineer, and was successful in obtaining his diploma of A.M.I.C.E., London. In 1884 he established himself at Perth as a civil engineer and mining agent, and was entrusted with the execution of all plans and sections for the Midland Railway Company on behalf of Messrs. Morrison and Crossland, surveyors, of this State. Mr. Saunders then formed a partnership with Mr. James Barrett, which extended over two years, during which period the firm executed the designs for various important schemes, including the Perth Waterworks. Upon the discovery of gold at Southern Cross Mr. Saunders turned his attention to mining matters and became one of the leading promoters of the industry in the district just being opened up, to which all sections of the community were at that time directing their gaze. He distinguished himself by being one of the first to bring the mineral resources of Western Australia, then but little known, under the notice of London investors, and as a company promoter at the time stood almost alone in the extent of his operations

and the confidence which they inspired on both sides of the globe. He was very successful in obtaining the support of capitalists in the development of first-class leaseholds, and so complete was the confidence inspired by the judicious character of his speculations that in many instances the required capital was more than fully subscribed well in advance of the day appointed for the opening of the applications for scrip.

Bartleto, Perth.  
HON. HENRY JOHN SAUNDERS.

The co-operator in many of his mining ventures has been Mr. Allen H. B. Stoneham, and among the early enterprises profitably floated by these gentlemen was the "West Australian Goldfields Company, Limited," the object of which was to explore the gold-bearing regions of

the State and acquire payable properties. Well-equipped and justly-remunerated prospecting parties were sent out, and during the first year of its existence the company paid a dividend of 37½ per cent., which subsequently was increased to 40 per cent., while the net profits for the year ended March 31, 1896, were £232,000 upon a capital of £100,000. The Lady Shenton Company, another successful venture, was created under his auspices with a capital of £160,000, which yielded a fine harvest to shareholders, and the Florence, the second of the great mines opened up at Menzies, as a claim was purchased from the Menzies Syndicate for £120,000, and in the event amply rewarded those investors who reposed their faith in Mr. Saunders' judgment and integrity at its inception. Mr. Saunders' name was identified with many other leading enterprises, among which the Mount Margaret Company, the Town Properties of Western Australia, the White Feather Reward Company, the Gold Lands Corporation, and the Mount Jackson Gold Mines, Limited, may be enumerated as successful dividend payers, of which not only the members of mining circles but also the general public are thoroughly cognizant. During certain periods so wide was the scope of Mr. Saunders' operations that his clerical staff and the heads of the various departments of management on the mines, etc., embraced as many as twenty-six men, the head office being situated in St. George's Terrace, Perth, where the firm still carries on business under the style of H. J. Saunders & Co. On account of failing health Mr. Saunders now attends only to the business of a few special clients, and lives in partial retirement at his beautiful country residence, "Henley Park." This estate, which is situated near Guildford, comprises 5,400 acres of land, with a mile and three-quarters frontage to the Swan River. It was originally taken up by the late Colonel Irwin, from whom it passed into possession of the late Judge Mackay, and in 1895 it was purchased by Mr. Saunders from the late Mr. Brockman. A very picturesque piece of country, it presents an appearance resembling an English park. About 500 acres have been brought under cultivation, and an orchard and orangery, two acres in extent, the trees of which are in full maturity, add beauty to the scene, and a 12-acre vineyard gives

Photo by C. E. Farr.

STABLES AT "HENLEY PARK."

a good yield of grapes, being also a spot of beauty in its place. Upon this estate was erected some seventy-three years ago (1840) the Upper Swan Church of England, one of the oldest places of worship in the State. In contrast to this ancient structure are

trophies in the show ring. With the production of high-class Berkshire pigs he has also met with success. At one time he owned properties in the north-west, but within recent years these were placed on the market and disposed

very keen sportsman, he has until recently been closely identified with the turf, and had fine horse boxes erected at "Henley Park," and a track one mile in circumference laid down for training purposes. Latterly he has relinquished active connection

market is Mr. Loton's chief industry. In the first instance he made a careful selection of imported rams from Victoria, of the Shropshire type, which were mated with merino ewes, a second cross being made with Lincoln rams with highly satisfactory results. Mr. Loton owns a valuable milking shorthorn bull, bred by Mr. A. Miller on his "Broadlands" Estate.

a breeder of draught horses of good stamp, the sire being a massive dark-bay horse, foaled in 1904, and standing 16 $\frac{3}{4}$  hands, with plenty of bone and showing good action. "Merry Morning" has an excellent record, having carried off first prizes at Fort William and Castle Douglas, and subsequently was awarded premier honours at the Dunedin Show of

PASTURES AND CULTIVATED FIELDS.

1904, his colt, "Morning Times," being brought to Western Australia as a three-year-old. Flowing right through the property is the beautiful Swan River, which continues its winding course on "Belvoir" for about two and a half miles, thus providing an excellent water frontage to the grazing pastures on either side. The stock is watered from a fresh-water well on the estate, 80 ft. in depth, from which two miles of piping conduct the supply to troughs in every paddock. The homestead is a substantial brick building. There are eleven rooms and a basement, and round the whole of the dwelling runs a wide verandah, which imparts an air of coolness and spaciousness which is very inviting on a hot summer's day. Nearby are the stables, barn, and outhouses; and in addition there are on the estate three substantial-looking cottages for the use of the workmen employed by Mr. Loton. ERNEST WILLIAM LOTON, the owner of the property above described, is a son of Mr. W. T. Loton, the prominent Western Australian pastoralist elsewhere referred to in this work. He is a native of the State, having been born at Perth on January 8, 1872, and pursued his scholastic studies in the city of his birth, attending that excellent institution, the High School, Perth. At the close of his educational course he straightway directed his attention to pastoral pursuits, and was associated with Mr. McKenzie Grant, at "Newmarracarra," for about two years. Leaving this part of the

country he came to the Swan neighbourhood to assist his father in the management of the property where he now resides, and in 1897 took over

This seat he resigned upon the occasion of his departure on a trip to England, but in 1907 he resumed his seat in the chamber, and has

its development on his own account. Since taking up his residence in this district Mr. Loton has displayed an active interest in the various public organizations of the place, and in 1898 allowed himself to be nominated as a member of the local Roads Board, to which he was duly elected.

continued to represent the ratepayers on this body ever since. He is also a member of the Swan Agricultural Society. Mr. Loton was married in 1894 to Annie Campbell, daughter of Mr. J. H. Forrest, of "Seaview," Ludlow, and has three sons and a daughter.

VIEW OVER "BELVOIR," LOOKING EAST.

WILLIAM PADBURY, stock-breeder, Guildford. Of recent years Mr. Padbury has gained considerable prominence as the owner of what is undoubtedly the finest herd of Jerseys to-day existing in the six States of the Australian Commonwealth. It was about 1903 that he first turned his attention to Jersey stock, and in that year he purchased two cows from Mr. George Joy, who had previously brought his herd to this State from Victoria. Soon after the purchase of these cows, "Milk-maid" and "Pretty Queen" by name, two calves were born—a bull calf and a heifer, the former of which was named "Empire's Optician 2nd," after its sire, and was the winner of several first prizes during the three years he was exhibited, including one gained at the Royal Show. He was subsequently sold to Mr. M. T. Padbury for service at his estate at Koojan. "Pretty Queen," also a prizetaker, including a special prize for large percentage of butter-fat, produced a calf, "Pretty Maid," which grew up to be a beautiful specimen of her breed, and on the three occasions on which she was exhibited in competition gained three first prizes and three champions. She was a wonderful butter-fat producer, and in this section was also a prizetaker, with over 5 per cent. "Pretty Maid" is still at Guildford, and has since secured numerous championships in the Royal, Moora, and Swan showings. At the Moora Show Mr. Padbury carried off the special prize offered by the Government and valued at ten guineas for the best pen of five milch cows. In 1909 he

proceeded to England and included in his itinerary a visit to Jersey, one of the Channel Islands, for the purpose of inspecting the world-famed Jersey herds. There he was fortunate enough to meet Mr. Miller Hallett, of Goddington, Kent, vice-president of the English Jersey Society and president of the Royal Jersey

Bartletto,

Perth.

MR. WILLIAM PADBURY.

Society, and Mr. J. A. Perree, secretary of the Royal Jersey Society, and in company with these authorities made a complete tour, during which every herd on the Island came under inspection. This work is performed every year by the gentlemen mentioned, who are considered to be

the finest judges of the strain the world over. A strict standard is observed for the Jersey herds, and any of the animals falling the least short of the necessary requirements are sold outside and are eagerly sought for by neighbouring countries, notably Holland and Denmark, while the pick of the cattle are eagerly bought up by American buyers, who pay fabulous prices in their endeavour to secure them. Only the perfect stock is entered into the herd register, and it is by these sound methods that the strain maintains its superiority over all others. After a most careful selection Mr. Padbury, guided in his choice by the judgment of Mr. Perree, purchased a bull and six heifers at a total cost of close on £1,000. The bull, "Campanile's Noble," a magnificent beast of great quality, was specially bred to serve certain heifers, and but for the fact that he had fulfilled his allotted duty Mr. Padbury would not have had the opportunity of bringing him to Western Australia. His sire, "Noble of Oaklands," won first prize at the St. Saviour's Show of 1907 and first prize shown with his progeny at the R.J.A.S. Show, Jersey, 1910. He was afterwards exported to the United States of America, where he was sold in 1911 for £3,000. His dam, "Lady Viola," won three first prizes and two championship prizes in Jersey, and secured numerous prizes in England, including three times first at the R.A.S.E. Shows 1906 to 1908. She was afterwards exported to the United States of America, where, also, she was sold in 1911 for £1,400. All of Mr. Padbury's purchases are entered in the Jersey herd-books and their pedigrees certified to by the secretary of the Royal Jersey Society. These animals are perfect examples of the Island breed, and their importation will place Western Australia in the forefront as the home of pure-bred Jersey cattle. The stockbreeders of Australia will be able to benefit by the great enterprise shown by Mr. Padbury, who has rendered invaluable service to the State by the introduction of such highly-prized blood stock. The aim of the expert raisers of Jersey cattle has always been in the direction of obtaining a high percentage of butter-fat in the shortest possible time, and, as is well known, great success has attended their efforts. In advising Mr. Padbury that his purchases had been safely shipped, Mr. Perree wrote as follows:

Photo by C. E. Farr. "REGARD OF WILLOW VALE," BY "BAKEWELL."

—“I do hope the cattle will do well. One thing is certain: that you have the best blood the Island has produced, and as regards the bull I should advise you to use him just as long as he will work, and at five years old, when his daughters come ‘to milk,’ you will then see how valuable he is.” Weighty words from one who

also being secured in Victoria. Early in 1912 Mr. Padbury, while in South Australia, purchased from Mr. J. G. Burdett, the well-known breeder of pedigreed Holstein cattle, the bull “Annette’s Admiral,” six heifers, one yearling bull (calved February, 1911), by “Superior,” by “Koos II.” by “Koos” (imp.), and one bull calf,

“Ebbe” (imp.), the dam of “Transvaal,” yielded on her first calf 653 gallons of milk, average test 3.337 butter-fat, and his granddam, “Margaretha,” yielded 1,099 gallons of milk in 325 days, producing 407 lb. of commercial butter, besides which she has the record of 75 lb. of milk per diem. To these were added by purchase from Mr. Ben Collins, Cannington, “Whitetail,” by “Roselad,” “Granny,” by “Roselad,” and “May,” by “Milkklad,” all bred on Mr. J. G. Burdett’s “Bolivar” Estate, and two yearling heifers. “Whitetail” gained first prize and “Granny” the reserve champion prize at the Royal Show, 1911. “May” won the champion prize at the Royal Show, Adelaide, in 1911, and in a class of twenty-one dairy cows was awarded third prize, yielding 59 lb. of milk in twenty-four hours. This year Mr. Padbury also purchased a number of highly-bred Ayrshires, including the bull “Regard of Willow Vale,” imported from New South Wales by Mr. E. W. Loton. Calved in April, 1905, “Regard of Willow Vale” comes of very fine stock. His sire “Bakewell,” by “Jamie of Oakbank,” was placed every time he was shown in the ring, and has a lengthy list of first and champion prizes to his credit. In addition to the sire, Mr. Padbury secured a number of cows, including “Stately” and “Violet,” all claiming descent from stock imported direct from Scotland. “Stately,” by “Pride of Belvoir” out of “Stately of Mount Grand,” took

Photo by C. E. Farr.

“LOO OF OAKLANDS” (IMP.), BY “NOBLE OF OAKLANDS.”

has been closely associated with the breeding of stock practically from the time he vacated the cradle. “Campanile’s Noble” has not only distinguished himself in the show-ring, but is proving his potency and ancestry by such typical and beautiful Jersey heifers as to-day are to be seen at Mr. Padbury’s Guildford stud farm. Another recent addition to the stud is a yearling bull selected from Mr. G. T. Chirnside’s “Werrabee Park” (Victoria) herd named “Audrey’s Carnation’s Fox.” This bull is magnificently bred, being by “Carnation’s Fox” (imp.) out of “Twylish Audrey’s Lotus” (imp.), by “Lord Twylish” (imp.). “Flying Fox,” the sire of “Carnation’s Fox,” was imported from the Channel Islands by Mr. Chirnside at a cost of 1,500 guineas. He was first over Jersey in 1899. “Carnation’s Fox” was champion in both the Adelaide and Melbourne show-rings. “Lotus Lily” (imp.), dam of “Audrey Lotus,” was, in the opinion of Mr. Chirnside, the finest cow ever imported into Australia. She was the winner of the £100 butter-test prize at the Royal Show, Melbourne (1901), and in 312 days in milk yielded 458 lb. of butter. A further shipment of fourteen cows and heifers has also been landed, these animals

by “Annette’s Prince,” by “Edinglassie” (imp.). “Annette’s Admiral” (calved in June, 1907) was bred in New South Wales by Mr. A. C. Lamond, of Berellan, Shoalhaven, and is by “Transvaal,” by “President,” by “Garfield,” his dam being “Annette II.” “Maggie Ebbe,” by

“GRANNY” BY “ROSELAD.”

first prize as a yearling at the Royal Show in 1908, and first prize as a two-year-old at Swan in the following year; and "Violet," by "General," is noted as an exceptionally heavy milker, yielding from 5 to 6 gallons daily. From Sir Lancelot Stirling's estate in South Australia one two-year-old bull and five yearling heifers, highly pedigreed, were selected, and these were landed safely at Fremantle during September of the year 1912. The

purchased Mr. H. Morphett's small stud of choice English Leicesters, consisting of ten rams and twenty-eight ewes. The "Glengrove" stud was founded from stock bought from the executors of the estate of the late A. S. Fotheringham, "Hillyfields," Dashwood's Gully, and the strain is descended from the fine old Bakewell sheep which came from the Midlands of England. The stud ram "Peter Pan" and stud ewe "Lady Elgin" (champions at Melbourne,

rich pasturage. The area is subdivided into a number of small paddocks and is bordered on one side by the Swan River. The business premises cover about an acre of ground, while five acres are given over to an orchard, in which is grown a great variety of fruit, including peaches, apples, oranges, nectarines, grapes, etc. Lucerne is cultivated for the stock, and the property is well supplied with water from an artesian bore sunk to a depth of 755 ft., the

Photo by C. E. Farr.

"CAMPAÑILE'S NOBLE" (IMP.) BY "NOBLE OF OAKLANDS"

housing arrangements have received careful attention, and the cattle are comfortably located in roomy quarters built on an elevated spot. Milking is performed by hand, and in the adjoining creamery, spotlessly clean, the milk is put through a separator, the cream being made into butter and sold to customers. Mr. Padbury's itinerary in South Australia included a journey to "Glengrove" Estate, Kangarilla, where he

Adelaide, and Ballarat) were used in the "Hillyfields" flock, from which Mr. Morphett's Leicesters were afterwards selected. Besides the foregoing, two rams and one stud ewe were purchased from Messrs. Aitken and Co., Melbourne, Victoria, both of which, it is claimed, are fit to gain premier honours against all comers. The property at Guildford covers in all some 25 acres of rich alluvial flats, and the natural grasses afford a very

daily flow equalling a quarter of a million gallons. Apart from the cattle, an interesting feature is to be found in the flock of Toulouse geese. There are from twenty to thirty well-bred birds, all prizetakers, which may be purchased at prices ranging from a guinea upwards. The Silver-laced Wyandotte, too, is in evidence, and may also be purchased. The merit of these birds is too well known to need extended comment. Suffice

it to say that they are not to be excelled as table birds and are unrivalled egg-producers. In the vicinity a number of pure white pouter pigeons are housed, and add to the charm of this delightful model farm. At "Rosehill," a few minutes'

number, and large black pigs are kept. Mr. Padbury has been breeding pigs for a number of years, and in 1910 imported from England a pedigree boar and two sows, with the object of providing a much-needed change in the strain. The boar,

well adapted to local conditions, as they grow rapidly and put on flesh at a great rate. Large black pigs are also being raised, and for this purpose some fine stock were secured at the Royal Show of 1911, including "Oakford Sultan" ("Oakford King"

FLOCK OF 28 ENGLISH LEICESTER EWES.

drive from Guildford, Mr. Padbury has an estate of about 200 acres, half of which has been cleared of timber and brought into use. It is situated on the Helena River, which flows through the holding, and adjoins "Waterhall," the property of Mr. James Morrison. The soil on the flats is very rich, and there is always an abundant supply of water to be obtained from a 50-ft. well and various soaks. The herbage grows luxuriantly, and at times the cattle are grazed over the property. The

"Hammond's Zambuk," and the sows were landed in splendid condition in October, 1910, and took kindly to their new abode. Shortly after their arrival the sows farrowed, and of the newcomers all were kept with the exception of one boar, which was sold. These three animals are descended from the finest stock, and are included in the British Society's herd-book. The sire now in use, "Heroic 2nd," by "Heroic" out of "High Court," was bred at "Newmarra-carra," and is proving his worth in no

—"Hester"), first and champion, boar class, "Peggy" ("Oakford King" —"Martha"), first and reserve champion sow, and "Bridget" ("Oakford King"—"Martha"), second prize sow, all of which were bred by Mr. T. W. Hardwick, of "Oakford," Western Australia. Breeders desirous of securing young stock would do well to avail themselves of an opportunity to call on Mr. Padbury, who is at all times willing to exhibit his pigs and dispose of them at a reasonable figure. A flock of peacocks lend

GROUP OF BERKSHIRE SOWS.

principal feature, however, is the piggery, which was recently built on the most approved lines and covers a considerable area of ground. Here the famous Berkshires, some sixty in

unmistakable manner. This animal was awarded the first prize at the Royal Show in 1910. Mr. Padbury has great faith in the Berkshire strain, and considers they are particularly

additional attraction to the farm, and as they strut with mien majestic, their tails extended, they add considerably to the picturesqueness of the surroundings.

"BEHN ORD" ESTATE, the property of Connor, Doherty, & Durack, Limited, is one of the finest holdings in the fertile areas of the south-western portion of Western Australia. It is situated some 18 miles from that rapidly growing town of Wagin, one of the most progressive centres at present on the Great Southern Railway. The estate comprises altogether a trifle over 20,000 acres. The soil is naturally of mixed varieties, in keeping with the general formation of Western Australian lands, but by far the greater portion is of that rich red and light loamy nature so eminently suited to the culture of grain and hay crops, while the whole of it is capable of producing excellent natural or artificial foddere. In the early days the old sandalwooders camped in these parts, mainly on account of the magnificent fresh-water soaks or springs which are found in that locality. At present there is domiciled close to one of these (which was known to the old hands as Nicklin Spring) a typical sample of the good old battler, his present occupation being the attention to and supplying of vegetables for the homestead and the other quarters situated on various parts of the station. In the course of a chat with old Jack Davis, as he is familiarly known, this sturdy Britisher took us back some thirty odd years to a period when the mention of wheat-culture would have been liable to draw forth general sympathy and a suggestion of doubt as to one's mental condition. It was in these days that one Dan Craddock alienated a patch of something like 40 acres under the then existing land laws. As stated above, this was for the sake of the water. He afterwards increased his holding a trifle; but it was not until some seven or eight years back that things in these parts began to go with a bang, so to speak. It was then that Mr. P. B. Durack, on the recommendation of an old pioneer, made a trip through the district and was so impressed with its appearance and its future prospects that he at once applied for and secured a plot of 10,000 acres on behalf of his firm. The company has since added to the property by the alienation of further Crown lands, as well as by the purchase of adjoining holdings, till the area had reached its present proportions, which is considered to be sufficient for the carrying out of a model stud sheep station. The whole estate is enclosed by a sheep- and dog-proof

fence, the posts being of jam, easily the most impervious timber in Australia so far as rot or white ants are concerned, and a large stock is procurable on the estate. The top wire is plain, the second is barbed, and the third is again plain, to which the wire-netting is affixed, while there is again a barb at the bottom, flush with the earth, and to which, of course, the netting is also affixed. Such class of fencing, including material and labour, costs about £54 a mile. The dividing fences are mostly six and seven wires, and cost to erect something like £24 a mile. Of course, these prices include cost of clearing the fence lines in each case, which means the grubbing of all timber and undergrowth to a distance of about a chain on either side of

Bartletto,

Perth.

MR. P. B. DURACK.

the actual fence, a very necessary precaution against fire. Practically the whole of the work has been done by contract, and as the estate has already been subdivided into 28 paddocks there is more than 100 miles of fencing thereon. Owing to the absence of rivers or permanent streams in this portion of the West, dams have been excavated on each paddock. These range in capacity from 1,200 to 8,000 yards, and there are altogether twenty-one on the estate. The largest is at the intersection of cross fences, and thus waters no fewer than four paddocks. The dams were also put down by contract at an average cost of 1s. per yard. Mr. Durack showed genuine forethought in this regard, for it might be mentioned that, while

during the summer of 1912 the greater portion of the country has been and is still crying out for water and petitioning the Government from all quarters, every paddock on the estate has an adequate supply. Indeed, on some there is sufficient to tide over about three years. Nor is the water of that dirty, muddy nature so very frequently met with in tanks of this kind, but beautifully clear and fresh, the result of practical knowledge and careful choice of site and catchment. Almost as soon as possession was obtained contracts were let for ring-barking, and by the end of the second year there was not much of the whole area that had not been ringed and suckered. Simultaneously with this total clearing was put in hand on portions intended for agriculture in the first instance, while picking-up contracts were let on paddocks where the timber had become dry and the smaller limbs had fallen. Of course, suckering goes hand in hand with the picking-up, and it is quite a revelation to the novice to note the vast and appreciable difference shown in the growth of the natural grasses where these improvements have been made. The homestead is occupied by Mr. Edgar, the overseer, who formerly had some nine years' experience in the famous "Haddon Rig" Station, New South Wales, and here are to be found the necessary stabling, outhouses, and other conveniences. Besides this, the company has had erected a number of other residences, together with woolshed, drafting-yards, and other appurtenances. Each of these residences is occupied by a married man with his wife and family, who carry out the various duties appertaining to the proper care and working of the numerous industries of the estate. The enterprising firm was not long in having installed the most modern conveniences in the way of telephonic communication. The homestead, or overseer's quarters, is connected with the Wagin Exchange, the 18 miles costing about £10 a mile to construct, and the station plant and employes being requisitioned to assist in the work. From here the line has been carried privately to each of the other residences on the estate, while Mr. Durack's private home, in the suburban area of Wagin, is brought into the circuit. When the property was acquired the now famous Dumbleyung wheat district was only in its infancy, but the

energetic manager of "Behn Ord" decided to give grain a trial. It shaped exceedingly well, and the result has been that each year the area has been increased till at the present (1911) there are fully 2,000 acres under crop. Nearly the whole of this area has been cultivated on the share system, a small portion having been put in by the firm for hay. Mr. Durack offered to find the cleared land as well as the whole of the seed and manures, so that it is not to be wondered at that there were plenty of partners forthcoming. Nor should they have anything to complain of in the way of results, for we were taken over one field of about 250 acres of wheat where a couple of years ago 25 bushels were averaged, and this

results. The heads have filled well and yielded a full-bodied grain of splendid milling qualities. As proving the filling capabilities of the soil hereabouts, it may be mentioned that one of these share-farmers, at the last annual show, secured first honours for his wheat from a score or more exhibitors. A few fine specimens of shorthorn cattle are kept, and the young stock, the progeny of a magnificent imported English sire which has recently been transferred to the firm's Kimberley runs, is being allowed to develop on the rich pastures of "Behn Ord," partly because Mr. Durack cannot altogether cut himself loose from such long association with these splendid species of the beef tribe, and partly as an experiment of the country for

out the fact that before the timber was killed and the soil sweetened there were few soaks and very scant and coarse grasses, whereas a little judicious labour and expense has since quite altered the situation. Mr. Durack's method has been to spread broadcast a quantity of the seed of the noted Yatheroo oat, clover, and trefoil, and each year these have increased until now the paddocks are simply mottled with these great fatteners. On the estate are kept about seventy active draught horses, mostly mares, together with a fine young son of "Lollsworth's Pride," a hero of the show-ring, also a Suffolk-Punch sire. Some dozen hacks, including a few pure blood mares, with their progeny, are also noticeable, beside

Photo by C. E. Farr.

RESIDENCE OF MR. P. B. DURACK.

season, under not the most favourable weather conditions, the average should go fully 20 bushels to the acre. According to the official figures, the average rainfall for the district for the past twenty years (1891-1910) is 17.22 in. The lowest precipitation was in 1893, when 12.77 in. was recorded. The highest fall recorded was 23.38 in. in 1895, and the same number of points was registered in 1903. Fully 80 per cent. of the annual rainfall takes place during the months of April to October, and the climatic conditions are extremely favourable to the growth of cereals. In the past Mr. Durack has not classified his seed-wheat, but has sown a variety of the best-known sorts with excellent

cattle-fattening. He thinks, however, that the country is eminently adapted for the Ayrshire and Jersey, and he predicts that with the gradual deforestation and the resultant breaking out of permanent soaks, as well as the development of natural grasses, will come the dairying industry, which up to date has been practically unheeded in this vast estate. Many thousands of pounds sterling leave the country every year for the importation of butter, and this will, Mr. Durack believes, be remedied by the advent of the factory and the institution of the dairying industry in these more southerly portions of Western Australia within a very few years. In proof of this contention he points

which there are pony mares and a pure Hungarian stallion, about 10 hands high, by the celebrated "Bonnie Charlie," of Sydney. There is one word, that of "sheep," which acts as elixir to Mr. Durack. Horses, crops, and cattle are all very well, but it is when one mentions "sheep" that he comes right away from himself, and his enthusiasm is then equalled only by his remarkable energy. Some four years ago he settled on the "Haddon Rig" strain of merinos as the best and most profitable type to adopt. He thereupon made a special trip to that far-famed station of the north-west plains of New South Wales and purchased and imported 250 ewes and five rams. The following year he

R

returned and brought back a fine flock of 620 ewes and 30 rams. Last year he made his third purchase, having been so well satisfied with the results of his previous shipments. On this occasion he procured 500 very special ewes and 15 rams, the rams having been picked

excessive yolk. Some very heavy clips have been taken from these animals, one of the "big guns" recently purchased by Mr. Durack this season yielding 29½ lb.; while the ewes, after rearing their lambs, have gone as high as 10½ lb. The wool is practically free from all kinds

of the London market rates for the product in the grease. Very good percentage of lambs has resulted, the lambing season being early in July; while the shearing commences the first week in October. Like every thorough sheepman, the master of "Behn Ord" has not forgotten the

value of a good dog, and has recently imported a good kelpie slut as well as a pedigreed kelpie dog puppy. Mr. P. B. DURACK, who is the local managing director of "Behn Ord," was born some forty-one years ago at Cooper Creek, West Queensland, at which time his father was a pioneer squatter in that out-back country, and the nearest neighbours lived about 250 miles away, with the exception of a brother-in-law, who was tolerably close at hand, his homestead being only 25 miles off. Young Durack grew up

Photo by C. E. Farr.

VIEW OF CROP, "COLLAMELLING," "BEHN ORD."

by that noted connoisseur, Mr. J. C. Darke, of New South Wales, at the annual Sydney sheep sales. The demand for the "Haddon" strain kinds is very great. As showing the favour into which this strain has come, it may be mentioned that each year twenty specially selected stud rams are offered at the Sydney sales, and they bring exceptionally high figures. In 1910 they averaged 167 guineas apiece, one magnificent animal reaching the fabulous price of 1,550 guineas, the purchaser being Mr. Collins, of South Australia. At the 1911 sales these twenty classic gents came out with an even better average, *viz.*, 170 guineas each. Two of these, "Major Hunter" and "General Grant," fell to the lot of Mr. Durack, and it is fairly safe to say that up to date they are the finest pair of their kind imported into Western Australia. At the same sales five selected 2-tooth rams were also secured. This type of sheep was decided upon both for their mutton and wool attributes. They grow rapidly and are very weighty and compact, while the wool carried is full of quality, the staple being long with lots of character, very even throughout, yet free from

of burrs. This is only to be expected, of course, in a young country, where burry fodders and excessive seeds are less frequently encountered. It is perhaps due to this fact that the Wagin wools have almost every season been at the top

among the sheep and worked at every branch of station life. He naturally became a very keen judge, while the breeding instinct was a predominant feature in his composition. When but nineteen years of age he migrated

Photo by C. E. Farr. "HADDON RIG" RAM, "GENERAL GRANT."

to the East Kimberleys, in the tropics of Western Australia, along with others of the family, and they then entered extensively upon squatting. In the year 1897 an amalgamation was brought about with Messrs. Connor and Doherty, who were also much interested in the industry. Mr. and Mrs. Durack with their family reside in Wagin, but the master of "Behn Ord" spends the greater portion of the week on the estate. There are over 5,000 head of the "Haddon Rig" blood on the land, including some splendid lots of 2-tooth locally-bred rams for sale, while last season's lambs are wonderfully even and well grown. Mr. Durack anticipates that when the estate has been fully developed he will run about 12,000 head of sheep, besides doing a fair amount

of cropping. **KIMBERLEY.**—The large holdings of Connor, Doherty, and Durack, Limited, in the Kimberley district were taken up by the Duracks in the eighties, and constitute the pick of the whole country. Nowadays the firm has 6,000,000 acres of the northern country, comprising eight stations, and its leases extend from the port of Wyndham along both sides of the Ord River for scores of miles to the Victoria River in the Northern Territory, a distance of nearly 200 miles. In addition to the fine frontage to the Ord River the Denham River also courses

through the property for many miles, and there are innumerable creeks and springs, so that a plentiful supply of water is always at hand. The official rainfall figures for Argyle Station for the past twenty years show an average of 26 in., and in the locality drought is unknown. The country generally might be described as open and undulating, with basalt and limestone hills in between black-soil plains. Grasses, including the

latterly, from England at prices ranging from 500 to 600 guineas. Some 60,000 head of cattle are pastured over the various runs, and shipments of these are regularly sent to Fremantle and supply a large proportion of the meat trade. Latterly the firm has engaged to supply 600 per month to Manila, where a good trade has been opened up. There has also been under consideration of the Government a project to erect freezing works

Photo by C. E. Farr.

SPECIAL STUD EWES AND LAMBS.

Flinders, Mitchell, rye, ribbon, bluegrass, and one peculiar to the locality, grow luxuriantly, and throughout the whole year there is abundant fodder for stock. The head stations are "Argyle" and "Newry," situated about 100 miles from Wyndham, on both of which a considerable sum has been spent in improvements. At "Ivanhoe" Station, 50 miles distant from the port, the stud stock is kept, which comprises some of the finest shorthorn cattle to be found in the Commonwealth, the best procurable stud stock having been imported from all the States, New Zealand, and,

at Wyndham, and should this eventuate the firm considers there will be a reduction in the price of meat to the consumer, as it would then be shipped dead, and thus save the big losses that now occur in weight and by accident through shipping to Robb's Jetty alive. The breeding of horses for station work is also carried on on a large scale. A sound start was made with the pick of 600 mares, mostly "Panic" blood, purchased from "Thylungrah" Station, Cooper Creek, Queensland, and these and their progeny have since been mated with such magnificent blood horses as "Double Strain" by "Robinson Crusoe" out of "Maid Marian"; "Ogaphone," a full brother to "Megaphone" by "Nebolt" out of "India"; "Cranbrook" by "Fenman" (imp.); "Glenarra" by "Berlin" (imp.); "Inverary" by "Escutcheon" out of "Springtime"; "Madrid" by "Goldsborough"; and "Warrior" by "Enfilade" (a brother to "Nordenfeldt"), his dam being "Melodise," a full sister to "Melos." Many other fine blood horses of equal breeding are also doing service, the latest acquisition being the English hackney "Tiberius" by "Roman Warrior" (imp.), his dam being "Lady Shales" (imp.). The manager of the firm's enterprises in the northern areas is Mr. M. P. Durack.

"TILLELLAN," the hospitable home of the Honourable C. A. Piesse, M.L.C., situated in the midst of a property of 3,000 acres, of which 2,600 acres are cleared and cultivated, claims to be one of the

earliest residences erected on the Great Southern Railway line. Built on rising ground, as it stands in the midst of its broad acres, all in a high state of cultivation, a fine view is commanded of the prosperous and progressive town of Wagin, with its surrounding fertile land, the whole forming a picture pleasant for the eye to rest upon. As the home farm "Tillellan" for many years was the active centre of operations in connection with Mr. Piesse's extensive pastoral and agricultural pursuits, the successful development of which, under the trade name of C. A. Piesse and Sons, had much to do, through example, in encouraging the later remarkable settlement of the district of Wagin. Mr. Piesse's operations extended west of "Tillellan" to a point 32 miles distant, embracing a valuable property known as the "Arthur River"—now owned and successfully worked by Mr. Piesse's stalwart sons, Austin, Vernon, and Oxley, who, trading as Piesse Brothers, have so developed this outer portion of the old estate that they have this year shorn 12,000 sheep and harvested 1,500 acres of cereal crops. The wool from this station and "Tillellan" commands a leading price

in the English markets. "Tillellan" boasts of having had the first rural telephone line in the district installed between the homestead and Mr. Piesse's mercantile premises in Wagin, where was carried on the

agricultural operations, may justly claim to have stood in the same relation to Wagin as "Koo-beelya," the beautiful residence of the late Honourable F. H. Piesse, C.M.G., and its attendant enterprises, to the sister town of Katanning. Mr. C. A. Piesse was in partnership with the last-named gentleman for a quarter of a century, and shared with him the years of strenuous toil, the fruits of which were ripe for the plucking when the much-regretted decease of the latter occurred. No description of "Tillellan" would be complete without reference to Mr. Piesse's late wife, whose premature death took place in the year 1900. Many of the early settlers will recall with gratitude the never-failing hospitality extended to them by this lady, who, in spite of the many claims of a large family of six daughters and three sons, had always a ready welcome for newcomers who felt the need of social sympathy in their fresh sphere of life. Mr. Piesse married again in 1910 and took up his residence at "Cintramia," a new dwelling-house erected in a picturesque position in close proximity to "Tillellan," a view of which is shown herewith. Here, in thoroughly congenial surroundings, he has settled down to spend his later life on the fine property which by his own enterprise and with the assistance of his loyal group of sons and daughters he has built up with so great a measure of success. By his second marriage Mr. Piesse has a son and a daughter.

THE OLD HOMESTEAD AT "TILLELLAN."

JOHN ELLIOT RICHARDSON, pastoralist, now living in retirement at "The Reste," Broome Hill, is a native of Tasmania, where he was born on May 31, 1843. He is a son of the late Thomas Elliot Richardson, of Portland, Victoria, and was educated at the latter town, at the close of his scholastic career beginning his connection with active business life in an office in the same place. About this time considerable interest was aroused in the family circle and among their friends by the published journal of Mr. F. T. Gregory's exploring expedition to the north-west district of Western Australia in 1861. In 1834 Mr. Alexander Anderson, whose daughter Jane afterwards married the late T. E. Richardson in Tasmania, came from Fife, Scotland, and settled for a few years in the Western State, where he was associated with another future son-in-law, Mr. Thomas Anderson. The latter gentleman, after taking up his residence in Victoria, continued by correspondence to keep in touch with the nonoured old Western Australian pioneer, Mr. Walter Padbury, and the young men of both families had their pioneering enthusiasm continually quickened by letters and discussions relating to Mr. Gregory's explorations. A party accordingly

A barque was fitted up for carrying from 1,600 to 1,700 sheep, horses, plant, and equipment, with twelve months' stores, etc., which were shipped at Portland Bay for the port of Cossack, which was

*Biltoft.*

MR. JOHN ELLIOT RICHARDSON.

reached in twenty-seven days on April 2, 1865. Rafts for landing the sheep were improvised by lashing two boats together, and

management was in the hands of Mr. A. R. Richardson. This gentleman then resigned the control of affairs to Mr. G. J. Brockman, and finally was bought out by his brother and Mr. Edgar, upon whose decease Mr. J. E. Richardson took over the sole proprietorship. He continued to reside upon the property for another fifteen years, and finally disposed of it to Mr. Broadhurst, after a forty years' connection with this particular portion of the great north-west. He still retains an interest in the pastoral industry at Port Hedland, being part owner with his sons in "Pippingara" Station in that district. Whilst resident at the "Pyramid" (named after a very remarkable cone-shaped hill, forming a perfect pyramid, included within the area of the run) Mr. Richardson entered Parliamentary life, and represented the North-Western Province in the Legislature for ten years. His retirement took place by effluxion of time, and he did not seek re-election. In 1904, after leaving the north-west, he visited England and spent some time on the Continent and in America. Subsequently with his family he took up his residence at Claremont, at a later date forsaking this suburb in order to settle at Broome Hill, near two of his sons,

*Photo by H. C. Biltoft.*

MR. J. E. RICHARDSON'S RESIDENCE, BROOME HILL.

was formed by Mr. Anderson's son Edwin, consisting of himself, the late Mr. McKenzie Grant, afterwards of "Newmarracarra," near Geraldton, and part owner of the "De Grey" Station, the late John Edgar, and Messrs. A. R. and John Elliot Richardson, who formed the company, with two sleeping shareholders in Melbourne.

about eight weeks after arrival the party established itself on "Pyramid" Station, in the Roebourne district, where it had secured the lease of over 200,000 acres of good pastoral land. At the end of four years Messrs. A. E. Anderson and McKenzie Grant sold their interests to the remaining three partners, and for a period of seven years the

who have chosen the great southern district in preference to the north for their pastoral operations. His present home, "The Reste," has been built upon a holding of 300 acres, and on this area he carries on the cultivation of cereals and hay. Mr. Richardson is a member of the Royal Agricultural Society of Perth.

"FAIRFIELD," the property of Messrs. A. H. & L. E. McKenzie, is situated in the picturesque district which lies about 7½ miles west of Broome Hill and 12 miles from Katanning. It comprises an area of 7,800 acres of excellent agricultural and pastoral country, which originally was taken up by the late Mr.

C. E. Farr, Perth.  
MR. A. H. MCKENZIE.

W. H. Graham who came from England to try his fortune in Western Australia in the early sixties of the nineteenth century. In 1897 the attention of pastoralists and others was drawn to the district by the purchase by the Government of the Great Southern Railway, when a very large area of splendid land with a great diversity of soil capable of growing almost any variety of products was resumed along the railway

route. Three years later the "Fairfield" Estate was purchased from Mr. Graham by Mr. A. H. McKenzie, who proceeded with its development and worked it on his own account for a period extending over ten years. In 1910 he was joined in partnership by his brother, Mr. L. E. McKenzie, when the operations of the firm took on fresh stimulus and have continued to embrace a wide range of activities ever since. The country is undulating and until the advent of the present owner was very heavily

wheatgrowing form the most important departments of the industries of "Fairfield." The popular merino has maintained its good reputation on these pastures, which have proved most favourable for sheep-raising purposes, the flock consisting of about 3,000 of this excellent woolgrowing breed. The small number of store stock available in the district was recognized as a decided drawback by the settlers, and Mr. McKenzie has devoted a good deal of attention to the improvement of

Photo by C. E. Farr. MR. A. H. MCKENZIE'S RESIDENCE, BROOME HILL.

timbered. Extensive ringbarking, however, has altered the whole aspect of the property and about 650 acres have already been cleared, of which area nearly a fifth is devoted to agricultural purposes. A division of the estate has been made into fourteen paddocks of varying sizes for the convenience of grazing and mustering the sheep, which with

the strain. He obtained very satisfactory results in the first instance from the use of rams obtained from Mr. Murray's station at Rhine Park, South Australia, but, not content to stop at this point, at a later period experimented with representatives from the "Kanoona" stud in the same State, and in 1911 purchased ten rams from "Wanganella" Station, in

JOHN CAMPBELL WARREN, J.P., of "Dyliabing," at East Cobline, in the District of Katanning, is of South Australian birth, his father being the Honourable John Warren, who has represented the North-East District in the Legislative Council of South Australia for a period extending over nearly a quarter of a century. Born at "Springfield," near Mount Crawford, on May 18, 1866, the subject of this review was sent to Adelaide for a collegiate education, attending St. Peter's College and matriculating at the University of Adelaide in 1883. At the close of his scholastic career he proceeded to "Anna Creek" Station, the joint property of his father and uncles, situated in the Lake Eyre district, and here applied himself to the mastery of the principles of successful pastoral management. While making a careful study of sheep-raising in particular he made full use of the opportunities afforded to observe results of the methods of horse and cattle breeding on the station. These with kindred interests occupied his time until 1889, when to extend his experience he entered the firm of Elder, Smith, & Co., Limited, being identified with the stock and station department at the Adelaide office. Subsequently he was transferred to the Broken Hill office of that firm, where he was in charge for some time, and after a later period at the Burra, under Mr. William Fox, he took control of the Gawler branch of the firm's business. Resigning this appointment, Mr. Warren in 1892

undertook the management of "Tinga Tingana" Cattle Station in the Cooper Creek district, on behalf of Messrs. Hogarth & Warren. Four years later, owing to the depredations of rabbits, the station had to be abandoned, and the gentleman under review went to West Queensland to take

left "St. Ann's", and was in control at "Montacollina" until 1898, when he left the eastern States in order to launch out on his own behalf in pastoral pursuits in conjunction with his two brothers in Western Australia. A large territory, comprising the present "Dyliabing" and other estates, was taken up in the district of Katanning, the Warren family being the pioneers of this country, which is now the scene of many a successful settler's holding. For nearly ten years the development of the property was carried on jointly by the brothers, but in 1907 a separation was resolved upon, Mr. J. C. Warren becoming sole proprietor of "Dyliabing," while "Walyaming," which was part of the estate, fell to the share of Mr. Robert Warren, and Arnold, another brother, took up "Warnaminup" in partnership with Mr. Elliot Warren, a younger member of the family. These gentlemen have since continued to carry on the development of their respective properties, and their name is indissolubly united with the history of the district for the opening up of which they have been so largely responsible. "Dyliabing" contains nearly 4,000 acres of country, originally somewhat heavily timbered with York gum, salmon gum, and the valuable jam. When first taken up the owners had to combat the difficulties presented by complete lack of any natural supplies of water, but this drawback was overcome at an early period by the excavation of one of the largest dams in the district, a work which was followed by several others of a similar character. Unsuccessful attempts were made to find water by boring in the first instance, but one well has been sunk which is yielding a good supply, and there are several soakages from which water may be obtained in time of need. The work of improving the property was carried on with energy and judgment from the outset, a spirit of enterprise being shown in the erection of eight miles of rabbit-proof fencing to guard the boundary against a threatened invasion of this pest from the other States. This was the first attempt in Western Australia to put into practical force the maxim that "prevention is better than cure" with regard to dealing with a possibility which in the eastern portion of the Continent has become an actual menace to the prosperity of the pastoralist. Before the close of three or four years 2,500 acres of land were ringbarked and

charge of "St. Ann's" Sheep Station, of which Messrs. Conrick & Ware were proprietors. The position of manager of "Montacollina" Station, on the Strzelecki Creek, being offered him by Messrs. W. B. Sells & Co., he

Photo by H. C. Billoft. HOMESTEAD AT "DYLIABING," EAST COBLINE.

divided into paddocks of convenient size, and the homestead erected in the first year of residence by Mr. Warren and his brothers is still standing. It is built in the old station style, of slabs of timber placed

inaugurated in 1854 with ewes purchased from the late J. H. Angas and bred to Murray blood exclusively ever since. The Murray flock is acknowledged to be unique in Australia from the circumstance that no

of this breed. Rams from the "Springfield" flock have been used successfully in the Lake Eyre district in South Australia for over half a century, and Mr. Warren has found his faith in the strain justified in every respect since its transplantation by him to Western Australian soil. The only variation he makes for breeding purposes is by the occasional introduction of the well-tested Murray blood, the result of which is the foregone conclusion of all that could be desired. The sheep bred on "Dyliabing" display all the best characteristics of the strong-wool merino, carrying length of staple with as much density as possible without sacrificing frame and constitution. Mr. Warren is vice-president of the Great Southern Districts Pastoral and Agricultural Society, and has occupied the presidential chair of this body. He was a founder of the local branch of the Farmers and Producers' Political Union, of which he is the present chairman, and he is also hon. secretary of the Rockwell Agricultural Hall. A member and supporter of the Anglican Church, he holds the Bishop's licence as lay reader in that communion. The Bedouin Polo Club, under Mr. Arnold Warren as captain and Mr. Elliot Warren as secretary, has its headquarters at "Dyliabing," Mr. J. C. Warren being a playing member and a vice-president of the Great Southern Polo Association. In 1892 he married Lillie May, daughter of Captain Dale, of Woodville, South Australia, and has two sons and four daughters, his eldest son (Campbell) being now (1912) in residence at St. Peter's College, Adelaide.

Photo by H. C. Biloft. MERINO EWES (4 MONTHS' WOOL).

in a horizontal position between grooved uprights, the inside wall being neatly battened and plastered and the whole surmounted by an iron roof. On three sides of the house the orchard area flourishes, stone fruits, apples, and other varieties being found within the enclosure, and about 200 acres of land are cultivated, thirty at the homestead for hay and the balance on the share system for wheat. Dairying is carried on on a small scale to supply the necessities of the household, and the various departments of industry common to rural estates of this nature receive the requisite amount of attention. The chief business of "Dyliabing," however, consists in its sheep-raising operations, and it is Mr. Warren's intention still further to raise the standard of the flock with the object of supplying the stations in the north-west with new blood of suitable quality. It was founded originally by high-class merino rams and ewes imported from the Hon. John Warren's estate at "Springfield," Mount Crawford, South Australia, the "Springfield" flock having been

outside strain has been introduced since the stud was founded in 1842, and it is a familiar assertion that improvement has occurred in every flock where its representatives have found a place. As wool producers they have an enviable reputation, saltbush country with only a 5-in. rainfall registering a cut averaging up to 11 lb. for full-grown sheep

DAM (750,000 GALLONS CAPACITY) ON THE WARREN ROAD.

"KENDENUP," the property of Mr. J. F. T. Hassell, is situated on the upper branches of the Kalgan River, in the Plantagenet district, some 42 miles from Albany, and is probably one of the best-known pastoral properties in the Western State. The original area of the estate in 1838 was 20,000 acres, but it has since been added to by the purchase of adjoining lands until at present it embraces some 60,000 acres of fine sheep-raising country. Most of the run is clear and undulating in character, but included in its formation are low ranges of hills, somewhat thickly covered with a light scrub, which from time to time has been considerably reduced by means of ringbarking. Opossums and coomels abound in these scrubs, and the fur of these animals is particularly noted for its fine quality, and is not to be equalled in any other part of the world where they are to be found. The property is completely fenced in and subdivided into about forty paddocks, and it is estimated that the number of gates exceeds 1,200. Natural grasses abound in profusion, and of the eight or ten varieties to be found on the run the corkscrew, wild couch, blowaway, and lady's finger grasses are mostly in evidence. The property has a frontage of 25 miles to the Kalgan River, and there are also numerous creeks and water-courses, so that an adequate supply of water is always obtainable. An area of about 6,000 acres has been cleared of the undergrowth, and of this 2,000 to 3,000 acres are devoted

to the acre. Mr. Hassell is assisted in the management of the estate by Mr. J. C. Jordan, who was born over thirty years ago at "Woodyarrup," another station owned by Mr. Hassell, his father before him having been with Mr. Hassell some forty

MR. J. T. F. HASSELL.

years. The original "Kendenup" Homestead, erected by his father in the year 1839, still stands on the property. Mr. Hassell's present home is built of brick and stone, with a wood and iron roof, and is of two stories, containing fourteen large,

very snug corner in the general picture. The present flock of sheep consists of about 25,000 of a very fine strain, and noted for their strong frames and healthy growth of staple. Since the foundation of the flock by the late Mr. John Hassell in the thirties no effort has been spared in improving the breed, and within the last ten years the present proprietor secured two rams from Saxony at heavy expense. His enterprise in this direction has been attended by a wonderful improvement in the robustness of the sheep and an increase in the weight of fleece. In 1840 the first clip was sent to the London market, *via* Adelaide, to be disposed of, and it was not until two years had elapsed that the late Mr. Hassell received payment for his wool, which was sold at 4d. per lb., leaving a margin of loss equal to 2d. per lb., after the payment of expenses incidental to the carrying out of the transaction. This disappointing experience, coming so early in the uphill struggle, would have discouraged most men, but the sturdy pioneer was spurred on only to greater efforts to overcome the many difficulties which stood in the way of his path to success. After thirty-two years had flown the year's clip was again shipped to London, this time with signal success. Of the 318 bales thus marketed 62 bales of first combings averaged 2s. 4d. per lb., which price to the present day remains a record for the Commonwealth for greasy wool. Further honours fell to the proprietor of "Kendenup" in 1890,

"KENDENUP" HOMESTEAD.

to wheat-growing and grasses, and Mr. Hassell has secured the splendid average of 40 bushels of wheat to the acre. Potatoes and onions are also raised, the soil being well adapted to their growth, the tubers yielding as high as 20 tons and the onions 15 tons

airy rooms. It is surrounded by a flower and vegetable garden, and adjacent is an orchard of five acres, which contains a great variety of fruit trees. On the opposite side of the river the usual outbuildings are in evidence, and the whole forms a

when he was awarded the Grand Prix at the Paris Exhibition for twenty-five fleeces in open competition with the world, and again he gained the gold medal for the best display of wool at the Western Australian Exhibition of 1906-7. The "Kendenup"

fleeces are noted for their length and quality of staple, and the exceeding fineness of the wool is to some extent accounted for by the presence of the scrub already referred to, and which appears to have much to do with the fineness of staple and healthy condition of the flock. Shearing is usually started about the first week in November, and proceeds merrily to its conclusion in the following month. The clipping is done by hand, or by what is known as blade-shearing, in a commodious wood and iron shed which allows for twenty-four stands, but as a rule only fifteen hands are kept employed, besides some fifteen shedhands and woolpresses. Mr. Hassell presses

goats formerly had been kept, and from information obtained from other sources he learned that Louis XVI. had in times past engaged in the breeding of sheep. Stimulated to further research by this discovery he found it recorded in a book that the King of Spain had presented Louis XVI. with fifteen ewes and a ram, and that at his death the stud had been disposed of by auction to a family by the name of Gadegast, residing at Oschatz, in Saxony. Being greatly interested in this discovery Mr. Hassell made efforts to locate the Gadegast family, and with the assistance of Lord Brassey's agent—Mr. Potter—and Cook's Bureau his inquiries were brought to a

Wales, in the year 1838 he set sail from England for the Antipodes in his own vessel, the "Dawson," bringing with him his wife, who was to share his lot in the country of their adoption. After touching at the Cape a course was shaped for Sydney, but before sighting the south-west coast of Australia the supply of fresh water ran out and Captain Hassell was compelled to call at Albany, where he anchored his vessel in Frenchman Bay, King George Sound. Here he replenished his tanks with water obtained from Vancouver Well, work which occupied nearly two days, as the means of shipping the water were extremely primitive, it being first filled into casks

and dumps his own wool, and for the carrying on of this work the most up-to-date appliances have been introduced. The lambing season commences early in May, and the end of June usually sees this interesting period safely over. The high average of from 80 to 90 per cent. has been successfully maintained for many years, and is a speaking testimony to the excellence of this country for the purposes of sheep-raising. Some nine years ago Mr. Hassell visited London and the Continent, and while at Versailles inspected the old Palace and grounds. The outbuildings attracting his attention, he discovered traces where, in his opinion, sheep or

successful conclusion. Proceeding to Saxony he inspected the descendants of the Spanish monarch's gift, and having assured himself that they were genuinely sprung from the sheep presented to Louis XVI. he purchased two rams at 500 guineas each and shipped them to Fremantle, where they were safely landed at a total outlay of £1,500. The founder of this valuable property, the late Mr. John Hassell, had a most interesting and varied career. He was a master mariner by profession, his port of registration being London, and he had followed seafaring pursuits for some years. Having made up his mind to settle in New South

from the well and then rafted to the ship's side, whence it was hoisted to the deck. At that time Sir Richard Spencer represented the Imperial Government at Albany, and Lady Spencer having learned from the pilot that a lady was aboard the "Dawson" immediately requested that Mrs. Hassell should become her guest during the vessel's stay in port. Mrs. Hassell gladly availed herself of the opportunity, and for the next two days had an enjoyable time at their residence at Strawberry Hill. Sir Richard also prevailed on Captain Hassell to return to Western Australia at the conclusion of his voyage to Sydney, saying that

Western Australia would eventually become the leading State of Australasia. After this pleasant break in

known as "Kendenup." This block Mr. Cheyne had obtained from the Imperial authorities on a remission

certificate which entitled him to a concession on certain terms, and Captain Hassell undertook to carry out the required improvements, as a result of which he received a grant in fee simple. The family having settled in Albany, young Hassell was placed under the care of a governess, who imparted instruction until her fund of learning became exhausted. Subsequently he studied farming under Mr. A. Harsum, the manager of his father's estate, until at the age of seventeen the managerial mantle fell upon his shoulders. He now seriously turned his mind to the affairs of the property, and in the years that followed directed his efforts to improving the flock, with the success already recorded in this article. In 1885, death having removed his father from worldly scenes, he purchased his brothers' share in the property, thus becoming sole proprietor. In later days Mr. Hassell increased the area of his estate,

READY FOR SHEARS.

a tedious voyage the "Dawson" made her way to Launceston, where Captain Hassell owned a farm on the Tamar River which he had started while on a previous visit to the "Apple State." Leaving his wife in the care of Mrs. Suested, proprietress of an hotel at Launceston, he proceeded to Sydney, and having successfully disposed of the vessel and cargo returned to Tasmania to find that in his absence his wife had given birth to a son, the present proprietor of "Kendenup." With his wife and child he returned to Sydney, and after a good look round decided to return to Western Australia on the representations of Sir Richard Spencer. Thereupon Captain Hassell chartered a barque called the "China," purchased 450 ewes from the Blaxland and McArthur flocks and several head of cattle and horses, and sailed for Western Australia, also taking with him eight male servants and two maids. It was in 1839 that he reached Albany for the second time, and having selected a suitable anchorage he landed his stock by swimming them ashore. His next move was to purchase from Mr. George Cheyne a 20,000-acre block in the Plantagenet district and

PASTURES ON THE "KALGAN" RANGES.

unrivalled in the whole of the pastoral areas of Western Australia. JOHN FREDERICK TASMAN HASSELL was so named after his father, uncle, and the country in which he first saw the light of day on June 24, 1839. He married at Malvern, Victoria, in 1868, Isabel, the second

daughters and five grandsons. When at Perth Mr. Hassell resides at "Kendenu," Hay Street West, a charming two-storied home set in the midst of verdant lawns and beautiful flowers, the cultivation of which whiles away his leisure hours. At a banquet given in celebration of the turning

October 20, 1886, Mr. Hassell was an honoured guest, and to him fell the reply to the toast of "The Plantagenet District." During his remarks on that occasion he gave utterance to several remarkable prophecies, and of two of the most important of these one has been fulfilled, while it is only a matter of time before the other will have become an accomplished fact. His first prediction was that the Great Southern Railway would be the precursor of railway construction on a large scale in the State, leading to the settlement of the country; and the second that in a few years' time there would be a great Transcontinental Railway from the East to the West. Mr. Hassell did not then believe that he would live to see the latter great undertaking accomplished, but he is still hale and hearty in the seventy-fourth year of his life, and all things being equal should be witness of the happy consummation of this wonderful project. He has ever had at heart the welfare of Western Australia, and his confidence in the future success of the great pastoral and agricultural industries has never wavered. His perspicacity in this direction has brought its own reward, and no one will begrudge Mr. Hassell the success that has fallen to his share.

MR. J. F. T. HASSELL'S RESIDENCE, WEST PERTH.

ALBERT YOUNG HASSELL, J.P., owner of "Jarramongup" Station, in the south-western division of Western Australia, is a native of the State, having been born at Albany on November 15, 1841. He is the

CAPTAIN JOHN HASSELL.

second son of the late Mr. John Hassell, who came to Australia in the very early days, sailing from London in 1822 as chief officer in the ship "Belinda," and landing at Tasmania. Leaving the vessel shortly afterwards the late gentleman took a partnership in the cutter "Governor Arthur" and traded between Hobart, Launceston, and the mainland until 1837, when he returned to England, married, and came out again to make his home under the Southern Cross. After revisiting Tasmania he decided to settle in Western Australia, and accordingly purchased the original "Kendenup" Station, near Albany, from the late Mr. George Cheyne, and taking up his residence in the seaport town worked his estate from that centre. At a later date (1849) he took up the "Jarramongup" property, now comprising 13,000 acres freehold and over 16,000 leasehold (to which Mr. A. Y. Hassell eventually succeeded), and acquired large tracts of land in other parts of the State, which have been disposed of since his death. To the late Captain Hassell must be rendered the credit of having opened the first gold

mine in Western Australia. Upon one of his visits to Sydney he took with him samples of stone from the "Kendenup" property, which was submitted to the Rev. Mr. Clark, a prominent geologist of New South Wales, who pronounced them to be gold-bearing. Upon the advice of this gentleman Captain Hassell sent 5 tons of the stone to the New North Clunes Gold-mining Company's mills at Clunes, Victoria, the crushing of which gave a return of 4 oz. of gold. A company was formed to work the mine, but the proposition turned out unprofitable, and eventually was abandoned. A presentation of some of the first gold produced was made by the directors to Sir William Robinson, at that time Governor of Western Australia. Mr. Albert Young Hassell, at the close of his education in Albany, when eleven years of age, went to "Kendenup" in the capacity of boy jackeroo, and began his initiation into the handling of sheep and cattle. Before reaching the age of 19 he had acquired a good general knowledge of the various branches of the pastoral industry, and in the early part of 1861 was sent by his father to take the management at "Jarramongup," where he continued for about two years. During this time he took a trip from there to Esperance, over 200 miles of unexplored country, being the first white settler to take the overland journey from the West. In the latter part of 1863 he returned to

"Kendenup" to undertake control of operations there, and with the exception of a couple of years which he spent on another of his father's properties at the Blackwood River, was identified with the management of that estate for upwards of twenty-nine years. In 1894 the properties

Bartletto, Perth.  
MR. ALBERT YOUNG HASSELL.

were divided, and "Kendenup" fell to Mr. John F. T. Hassell, the subject of our review succeeding to "Jarramongup." Like his father, Mr. A. Y. Hassell resides at Albany, where he

"HILLSIDE," MR. A. Y. HASSELL'S RESIDENCE, ALBANY.

had built the "Hillside" home upon leaving "Kendenup," and manages his "Jarramongup" property by means of frequent and extended visits, in which he is often accompanied by his family. This practice he still continues, and about six years ago erected a new dwelling-house at the

established he sought election to the Plantagenet seat against the late Mr. Andrew Dempster, and, being returned, held the seat for fifteen years. When the Plantagenet constituency was divided on the redistribution of seats Mr. Hassell was a candidate for Albany, but was

He has always regarded seriously his responsibilities with regard to the community in which he resides, and has taken his share in local government, being a member and chairman of the Plantagenet and Albany Roads Boards in turn from 1872 to 1910, when he retired. He is the Vice-Consul for Norway at Albany, which office he has held for several years. In the early days Mr. Hassell was one of the best-known men on the turf, and has been prominently identified with Western Australian racing circles for over a quarter of a century. As far back as 1877 his horse was returned the winner of the Plantagenet Cup at Albany, a triumph repeated two years later by his mare "Corisande," which also won several races in Perth. The horse was trained by Mr. W. Strickland, the father of racing in this State. He also bred "Satyr," which won two Onkapinga Cups and other important races in the eastern States, and "Bas Blanc," which for some considerable time held his own against allcomers in Western Australia. A founder of the Plantagenet Lodge of Freemasons, E.C., at Albany, Mr. Hassell's connection with the craft has extended over forty years. For a couple of decades he has been a

FLOCK OF EWES AND LAMBS BRED BY MR. A. Y. HASSELL.

station, in which most of the comforts of the modern era have found a place. Mr. Hassell has played his part in the arena of politics, in 1871 being elected member for Albany in the first Legislative Council, which consisted of twelve elected and six Crown nominee members, the qualification for election to that office then being possession of landed freehold property to the value of £2,000,

defeated and retired from politics. During his parliamentary career, in 1897 he was elected by both Houses as one of the representatives for the colony of Western Australia to the Federal Convention charged with the duty of framing the Federal Constitution for the Commonwealth of Australia. It is interesting to note that Mr. Hassell has filled his various public offices only by election,

SHEARING SHED AT DOUBTFUL ISLAND BAY.

or £200 a year drawn from landed property free from all encumbrances. The constituency of Albany at that time extended from Eucla to the Williams district, embracing all the country between, and Mr. Hassell represented this electorate for three years, at the end of which period he resigned his office. When responsible government was

never having been a nominee, except in the case of his Commission of Justice of the Peace, which was granted him in 1872 by Mr. (afterwards Sir) Frederick Weld, the then Governor of Western Australia. This he has exercised ever since, and is now the oldest Justice of the Peace in office, his magisterial district extending over the whole of the State.

member of the Weld Club, Perth, and was a foundation-member of the Albany Club. He has derived both pleasure and profit from the practical study of botany, and materially assisted the late Baron von Mueller in the gathering of his Western Australian botanical collection, receiving in return the honour of having his name bestowed upon several of the

beautiful specimens and plants and flowers included in the Baron's catalogue. Mr. Hassell married in 1878 Ethel, daughter of the late Mr. William Carmalt Clifton, who for many years represented the P. & O. Steam Navigation Company at Albany, and has four sons surviving and three daughters. "JARRAMONGUP" STATION is 120 miles north-east of Albany, in the Kent district, its principal watercourse being the Gardiner River, which, unfortunately, is salt. It was originally discovered by the late Captain Roe, the first Surveyor-General of Western Australia, in the course of one of his expeditions. His report, however, was anticipated by a man, Maxwell by name, who was assisting in the collection of specimens by Mr. Drummond, a visiting Scotch botanist, and otherwise occupied himself by taking notes of the value of the land for pastoral purposes. Mr. Maxwell came to Albany, and having expressed his high opinion of the possibilities of the region through which he had travelled, for a consideration offered to escort the late Captain Hassell to the locality. This was in 1849, when the prestige of the pioneer demanded that he should penetrate far distances into the heart of the bush to open up new country and make a home on the "edge of the beyond." Mr. Hassell decided to risk the venture, and in the first instance took up about 20,000 acres, which afterwards was increased to

flowed rapidly after rain. Four natural fresh-water springs were in evidence, and at the present time the numerous dams which have been constructed preclude any anxiety with regard to the water supply. The soil is a light chocolate, sustaining a fair natural growth of silver-grass and corkscrew, not sufficiently luxuriant to allow of heavy stocking, and there is no top feed. It is timbered chiefly with yate, sheaoak, and manna gum.

constructed, with two wires above 3-ft. netting, and one interlaced below, the cost being approximately £32 per mile. The estate is subdivided into twelve paddocks, of which the smallest comprises over 200 acres and the largest 4,000, the division fences being on the same scheme as the boundary fence. The general character of the country is clear and open, but about 10,000 acres have been ringbarked to enlarge the

TYPICAL VIEW OF COUNTRY AT "JARRAMONGUP."

The rainfall has averaged 16 in. during the past twenty years, and only one drought has been recorded on the property, this, occurring in the early seventies, being the only season

pastoral area, and when the present owner, Mr. A. Y. Hassell, went to take charge of the property in 1861, he cleared 20 acres and sowed it with wheat and barley, soon after erecting a mill to grind the flour. To-day about 160 acres are under cultivation. The first homestead was built of stone and brick, with thatched roof, and contained six rooms. This is now used for men's quarters, while a wood and iron cottage has been erected for the use of the sub-manager, Mr. O. D. Hassell, the youngest son of the proprietor. Large stockyards constructed of yate posts and marluck rails, with the sheepyards and drafting yards, cover an area of over 4 acres, while stabling is provided for six horses, and there are two horse-boxes for the stallions. A kitchen garden supplies the station for the greater part of the year with fresh vegetables, and a few apple-trees bear well. The station was started with about 2,000 sheep of the merino breed, descendants of the McArthur merinos brought by Captain Hassell from New South Wales, for "Kendenuup," in 1840. In the earlier days from four to six shepherds took

DAM IN SCOTT'S CREEK. "JARRAMONGUP" STATION.

44,000 freehold and leasehold. He found the country undulating in character, with a plentiful outcrop of granite rock and frequent steep watercourses down which the streams

since the run was taken up when there has been any lack of feed. Much has been accomplished in the way of improvements, over 100 miles of dog-proof fencing having been

charge of flocks numbering from 1,000 to 1,200 sheep, and shearers were obtained in the season from "Kendenup." Trouble was experienced with the natives, who at that time were very hostile and refused all offers of friendship extended to them by the new settlers, and from this source many losses occurred among the sheep, and on one occasion a shepherd was speared near "Jarramongup." The "Wanganella"

being the great English horse "St. Simon." Some twenty to thirty draughts are bred yearly for the market, and a similar number of light horses, all of which are readily disposed of at good average prices. Of the other properties possessed by Mr. Hassell "Warriup" is situated on the east coast, near Cape Riche, 47 miles from Albany, and comprises some 8,000 acres freehold and 11,000

brother some fifteen years ago. The country resembles "Jarramongup" in many respects, being of granite formation, some of it very well grassed. It is used chiefly as a reserve for the parent station, and the management, under Mr. E. A. Hassell, the owner's second son, is carried on on the same lines as "Jarramongup." Another property, "Magedup," situated on the Salt River, 45 miles east of Proctor Hill, and embracing 3,000 acres freehold, was purchased from the Government twenty years ago, and has been leased by Mr. Hassell to his eldest son, Mr. John Hassell, who uses it mainly for sheep-raising purposes and some cropping. At the mouth of the Gardiner River, near Qualup (Doubtful Island Bay), lies another estate consisting of about 1,600 acres freehold and 17,000 leasehold, which is under the control of another son, Mr. H. W. Hassell. The shearing shed is located at Doubtful Island Bay, where all the sheep are shorn, the wool being shipped from there to London. Mr. A. Y. Hassell has had some notable successes with his wool products, being awarded a diploma and gold medal from the Franco-British Exhibition of 1908 and a gold medal from the Roubaix Exhibition, France, in the year 1911.

ORIGINAL HOMESTEAD BUILT IN 1861.

type has proved most successful and best suited to the climate, and the prevailing traits of the 12,000 sheep on the runs are the plain-bodied, strong frame, large for the breed, with good density of wool and satisfactory length of staple. The average weight in a clip of 12,000 fleeces, including 3,000 lambs, gave over 6 lbs., and the ordinary price obtained for greasy combings in London is 13½d. The lambing season occurs early in May and continues until July, the annual percentages averaging eighty-five. Mr. Hassell considers neither the country itself nor the geographical position suited to cattle-raising, and only about 130 head of mixed cattle—mostly short-horns—are run on the property. Some fine horses have been bred, and the sires now in use are "Darnley," by "Ian Hamilton," and "Clarus," by "Renown." "Darnley," a beautiful brown horse, was bred by Mr. John Thomas, of Blackheath, Victoria. His sire, "Ian Hamilton," was imported from New Zealand, in which country he carried off forty prizes in the various show rings. "Renown," the sire of "Clarus," is by "Treviton" out of "Elsie" (imp.). "Clarus" is out of "Surmise" by "Neckersgat." The mare "Elsie" was bred in England, her sire

leasehold. Sheep and horses are bred on this property, which was purchased by Mr. Hassell from his

TWO "WANGANELLA" RAMS USED IN FIRST STUD FLOCK AT "JARRAMONGUP."

ALBERT JESSE TALBOT, pastoralist, owner of "Mundra Billa," "Madura," and "Binyarinyinna" Stations, was born at Hackworthy, Devonshire, England, on March 9, 1870, being a son of the late Jesse Talbot, a farmer, of that place. He received his education at the local public school and was apprenticed to the butchering trade, emigrating to Australia when seventeen years of age. Landing at Queensland, he entered a butchering establishment as assistant, and remained for over a year. With the object of gaining more experience he proceeded to Victoria, and there carried on business for a short time with a friend. The "call of the West" led him to Fremantle, where he obtained work on the Midland Railway, which was then being constructed. His next move was eastward, and he became engaged in the Frazer's mine, Southern Cross.

J. J. Dwyer, Kalgoorlie.  
MR. ALBERT JESSE TALBOT.

Less than two years later, a strike having occurred on the Yilgarn gold-field, Mr. Talbot joined two mates and penetrated into the bush to prospect, and striking the tracks of Messrs. Bayley and Ford, the well-known mining prospectors, decided to follow that party, coming up with them at Coolgardie, where they were working on a small leader, west of the "Big Blow" Mine. After pitching their camp, the three partners, Messrs. Talbot, Baker, and Fosser, set to work on surrounding country, and upon the third day struck a rich patch of gold, from which, within an hour, they had collected £1,100 worth of specimens, besides a large parcel which they buried in the

adjoining creek. In returning to the camp at nightfall they lost their bearings, and when they again reached the spot where their treasure had been concealed it was only to

attracted their notice, and unearthing the parcel of gold they followed the tracks to what proved to be the nucleus of the great Bayley's Reward claim, and the discovery of the

"MUNDRA BILLA" HOMESTEAD.

find that Messrs. Bayley and Ford meanwhile had come on the scene and pegged out the claim on their own behalf. Whilst prospecting in the creek, the newly-disturbed earth had

world-famed Coolgardie field. Mr. Talbot and his party, having thus narrowly missed making a speedy fortune, pegged out the adjoining claim—Bayley's No. 1 South—which they

Photo by J. J. Dwyer. TYPE OF STALLION IN USE ON STATION.

afterwards sold privately, and which at a later date was floated into a big company. Hannan's Field was also prospected by Mr. Talbot, who, likewise, was among the first eight arrivals in the Kurnalpi district in the early nineties. At the latter place he combined with his mining interests commercial pursuits, establishing a bakery and butchering business and owning one of the first water-condensing plants in the place. For a lengthy period he engaged in the butchering trade, following the rushes to various new fields, notably to Edjudina, Yerilla, and Lake Darlot, and finally opening in a large way at Coolgardie. The latter business he sold ultimately to the firm of Messrs. Kidman & Uhr, and it has been well known as one of the most

post-and-wire fencing erected, and the natural water supply consisting of springs augmented by the construction of eight dams, while five wells are being fitted up with troughs and pumps. "Madura" lies 120 miles nearly due west of Eucla, and consists chiefly of limestone plains heavily covered with indigenous grasses and herbage, and owing to the limestone foundation the locality is considered by experts to be the pick place in Australia for the breeding of horses. The average rainfall is about 10½ in., besides which the property is watered by wells and dams, ten of the latter having been constructed, while an artesian bore has been put down, which yields 37,000 gallons of splendid stock water per diem. Over 80

the homestead has been erected—a comfortable dwelling-house containing six rooms. The fencing on this station was erected at a cost of £50 per mile, and consists of 60 miles of vermin-proof boundary fence, the posts being of miall and ti-tree, and another 60 miles of subdividing fences. Permanent, good stock water is provided by five wells, which have been sunk in various parts of the run, and several dams have been constructed from which a goodly supply is drawn. At the present time the "Mundra Billa" run is stocked with about 5,000 sheep, but its carrying capacity is much higher. An excellent lambing percentage is obtained, the annual drop never falling below 80 per cent., while in specially favourable seasons it has been known

Photo by J. J. Dwyer.

MOB OF CATTLE FROM "BINYARINYINNA" ON THE WAY TO MARKET.

important concerns of its kind in Western Australia. Upon retiring from this line of trade, Mr. Talbot became interested in the pastoral industry, taking up the leases in the Eucla district known as "Madura" Station, and afterwards purchasing "Mundra Billa" from the late firm of Messrs. Kennedy, of Magill, this being the first pastoral property taken up in the district. These, with a third property, "Binyarinyinna," situated about 70 miles south-east of Kalgoorlie, comprise over 600,000 acres of country, and are used as cattle, sheep, and horse stations, the last-named run being kept exclusively for fattening cattle. Considerable improvement work has been done on "Binyarinyinna," 50 miles of

miles of fencing have been erected. The class of horses on "Madura," chiefly medium draughts and a heavy type suitable for light lorries, are bred almost exclusively for the goldfields markets, where they command a ready sale at good prices. In addition, over 1,000 head of cattle are grazed on the run, these being of the shorthorn and Hereford strains, and like the horses they are overlanded to the goldfields, where the reputation of "Madura" stock is firmly established. The sheep station "Mundra Billa," which, in the aboriginal nomenclature, means "plenty of grass," is situated about half-way between "Madura" and the postal town of Eucla, its distance from the latter being 63 miles. Here

to rise as high as 95 per cent. Great credit is due to the progressive owner of "Mundra Billa," "Madura," and "Binyarinyinna" for his enterprise in opening up a tract of country which, before his advent, had lain almost untouched by the pastoralist or any other pioneer in the various lines of industry. These stations are on the line of route to be traversed by the Trans-Australian Railway, and as there are millions of acres of similar country which with the aid of artesian bores may readily be converted into magnificent grazing pastures, it may be confidently expected that the time is not very far distant when this land, which, hitherto, has been looked upon practically as a *terra incognita*, will become

one of the great pastoral areas of the Island Continent. Mr. Talbot married in 1904 Elizabeth Haldane, daughter of the late G. Coward, of Coward Springs, South Australia, and has two sons and two daughters.

THOMAS ELLIOTT RICHARDSON, pastoralist, joint-owner with his father and brothers in "Pippingarra" Station, in the Port Hedland district, was born at Fremantle on January 16, 1878. He is a son of Mr. J. E. Richardson, formerly sole proprietor of "Pyramid" Station, in the north-west, now living in retirement at "The Reste," Broome Hill. His elementary education was obtained at Fremantle under the tuition of Mr. Henry Briggs, now President of the Legislative Council, and was supplemented by a finishing course at Prince Alfred College, Adelaide. Returning to Western Australia he entered the office of Messrs. Dalgety and Co. at Fremantle, where he gained a valuable mercantile training, together with useful experience connected with the pastoral industry. After two years in this connection he went to the north-west as jackeroo on "Pyramid" Station, and augmented his theoretical knowledge by practical work. Three years later he became identified with "Ettrick" Station, the property of Mr. G. L. Hardie, where he gained an intimate acquaintance with the methods of handling sheep, which has proved of much value to him in his subsequent career. In 1901 Mr. Richardson took delivery of "Boodarrie" Station, now owned by Messrs. Hardie Brothers, but at that time newly purchased by a firm composed of the present owners, his father, Mr. J. E. Richardson, and himself. In addition to "Boodarrie" the property then comprised the additional area now called "Pippingarra," which, when the run was subsequently divided, was retained by the Messrs. Richardson as their share, and which comprises about 300,000 acres. For seven years Mr. Richardson remained as manager of this property, at the end of which period, in 1910, taking his two younger brothers into partnership, he came to the Broome Hill district and purchased "Langwell," an estate of over 4,000 acres, where he devotes his attention mainly to the breeding of pure merinos for the replenishing of the north-west runs. The famous "Boonoke" and other flocks have been drawn upon for

blood stock with which to enrich the quality of the breed produced at "Langwell," which is strengthened from time to time by fresh importations from the same quarters, and displays many of the excellent traits of the New South Wales sheep. A portion of the land is tilled and placed under crops, principally with the object of improving the nature of the soil. Mr. Richardson is a member of the Great Southern Pastoral and Agricultural Society, and is a well-known exhibitor in connection with various annual shows. He interests himself in the different movements for the advancement of the district, and for some considerable time was a member of the local Roads Board at Broome Hill. He is a keen sportsman, and is prominent in the Great Southern District as a member of most of the sporting clubs. Though an advocate of all forms of clean sport, personally he favours polo, and is an enthusiast in the game, in which he is very proficient. He is a member of the Katanning-Broome Hill Polo Club, of the Katanning Racing Club (acting on the committees of both these institutions), and of the Western Australian Club, Perth. In 1905 he married a daughter of the late Mr. John Campbell, well known in the pastoral circles of the north-west, and has a son and three daughters.

The late GEORGE GREY EGERTON-WARBURTON, J.P., of Yerrimup, Western Australia, on the west side of the Great Southern Railway, was born at Strawberry Hill, about a mile from Albany, on October 9, 1844. He was a son of the late Mr. George Edward Edgerton-Warburton, of the 51st Regiment, Imperial Army, who was one of the earliest settlers in Western Australia, originally coming to Albany with troops from Tasmania. He married a daughter of the late Sir Richard Spencer, Post Captain Royal Navy, then Resident Magistrate at the southern seaport and a pioneer of the State, and took up land about 30 miles from Albany. On this estate the subject of our memoir spent his early boyhood and gained his scholastic knowledge under the tuition of a private tutor. At thirteen years of age he became closely identified with the working of his father's property, and before he had reached his majority was entrusted by his parent with the

management of the sheep run where he ultimately made his home. While still on the sunny side of forty he purchased the estate, and industriously devoted all his energies to its development. He carried on mixed farming operations, being successful both in fruit-growing and other agriculture, and in the breeding of sheep and cattle. The merino sheep, imported from the Eastern States, maintained the worthy reputation won in years gone by on the sunny hills of Spain and sustained after transplantation to the warmer climes of Australia. Horses of medium-draught quality were bred on the estate, and a good type of cattle produced. Mr. Egerton-Warburton belonged to that fine class of early pioneers who,

Bartolletto,

Perth.

MR. G. G. EGERTON-WARBURTON.

among all the privations and vicissitudes of those primitive days, made a success of the pastoral industry and paved the way for their more favoured descendants and to whom the State owes a debt of gratitude not easily discharged. He was for a considerable time chairman and member of the Plantagenet Roads Board and received his Commission of Justice of the Peace during the earlier Premiership of Sir John Forrest. Mr. Egerton-Warburton, who was a member of the Western Australian Club, married in 1872 Amy, second daughter of the late Mr. E. G. Hester, J.P., and left a son and three daughters. He died at Peppermint Grove on May 24, 1913.

**JOSEPH THOMAS RUTTLE**, J.P., pastoralist, "Perkalilla" Cattle Station, Kanowna, was born at Rathkeal, County Limerick, Ireland, on December 21, 1852, and is a son of the late Joseph Ruttle, of that place. Being brought to Australia by his parents when only a year old he was educated at a State school near Castlemaine, Victoria, and in 1867 turned his attention to mining pursuits. At a later date he served his apprenticeship to the carpentry and bridge-building trade, and after spending a couple of years in this calling joined his father in farming occupations for some time. Subsequently he relinquished agriculture to enter upon the business of a general contractor, and was engaged

J. J. Dwyer, Kalgoorlie.

MR. JOSEPH THOMAS RUTTLE.

in this way in West Queensland and Victoria for a number of years. In 1897 he came to Western Australia and entered the Department of Public Works as supervisor of the construction of the causeway spanning the River Swan between the city and South Perth. Upon the completion of that work in the following year he resigned from the public service and started dairying pursuits on his own account on the eastern goldfields, with headquarters at Kanowna. His business, which was conducted on both wholesale and retail lines, prospered, and in 1911 Mr. Ruttle disposed of his connection and began his career as a pastoralist, taking up about 30,000 acres of pasturage country in the vicinity of the above-mentioned town. During his residence on the goldfields he has

been associated with most of the public bodies of the district, and besides serving as a member of the Kanowna Municipal Council has been identified with the North-East Coolgardie Council for many years, holding the office of chairman of the latter chamber for a considerable period. He received his Commission of the Peace from the Wilson Administration, and is a member of the Licensing Bench. He has been connected with all forms of sport, and is the present chairman of the Kanowna Rifle Club. In 1887 Mr. Ruttle married Mary Ann, daughter of the late George Ashenhurst, of Goulburn Valley, well known in the Government Service.

**ROBERT CECIL JONES**, J.P., Bulong, was born at Brighton, England, on June 21, in the year 1867, and is a son of the late Mr. John Robert Jones, a clergyman, of Wales. He was educated at Brighton, and continued his studies at Lee, in Kent, until his eighteenth year. At twenty years of age he crossed the seas to Queensland, and for a time was engaged in commercial pursuits, but becoming imbued with the spirit of the "bush" for a time he took part in a variety of occupations peculiar

J. J. Dwyer, Kalgoorlie.

MR. ROBERT CECIL JONES.

to colonial life. Mr. Jones spent several years in the employ of the Colonial Sugar Refinery Company, and for a period was in charge of health arrangements in connection with the labourers on the Johnston River plantations. In 1890 he came

to Western Australia and engaged in the pearling industry at Shark Bay, which he afterwards relinquished in favour of mining pursuits. For a number of years he was prospecting over the Murchison, Gascoyne, and Eastern goldfields, but eventually returned to mercantile enterprise, opening a general store at Kurnalpi. In 1900, when the Bulong district was in the full tide of prosperity, Mr. Jones, perceiving the excellent prospects offering, transferred his energies to this centre, and established the storekeeping business which he has carried on ever since. In addition he took up a pastoral lease in the neighbourhood, comprising 60,000 acres, which is known as "Hampton Hills" Station, and erected a homestead within a couple of miles from Bulong, on the Kalgoorlie side of the town. He is here inaugurating cattle-breeding operations, and anticipates considerable profit from this venture. Mr. Jones has taken a prominent part in the public life of the town, having filled the mayoral chair for several terms, and is the senior Justice of the Peace for the Coolgardie Goldfields. In 1896 he was married to Frances Emma, daughter of the late Mr. E. W. Butcher, pastoralist, of Gascoyne, and has two sons and three daughters.

The "MERRIDEN VALE" STUD FARM. This well-known stud farm was established by Captain R. T. McMaster in 1905, and has since come under the notice of the pastoral and sporting sections of the community as the cradle of some of the most promising young stock in the State. A splendid trio of sires have been imported from England and the Eastern States, among which the magnificent Suffolk Punch stallion "Rendlesham Militiaman" has met with the great favour of those desirous of obtaining sound, well-bred specimens of this popular type of draught. This stallion was bred by the late Mr. E. F. Quilter, of Bentley, Ipswich, in 1906, his sire being "Wilson's Worcester" (2273) and his dam "Minnie Palmer" (3756), by Smith's "Palmwood" (2196), and was purchased from Mr. Alfred J. Smith, of Rendlesham, Woodbridge, England. His pedigree is a distinguished one, and not less notable is that of the well-known racing stallion "Barbarossa" by "Medallion" (son of "Nordenfeldt" by "Musket") from "Algerine" (by "Hawthornden," imp.). Bred at

Tocal Stud, New South Wales, in 1897, this horse was bought as a yearling for 295 guineas, afterwards being purchased for 400 guineas and imported to Western Australia. "Barbarossa" defeated, at weight for age, such champions as "Wakeful," "San Fran," "Tarquin," "War God," "Fleet Admiral," "Limber," "The Idler," "Australian," "The Victory," "La Carabine," and "Haymaker," and his mile and a half record is 2 min. 36 sec. The winner of many races, he also finished in places in the V.R.C. Derby, won by "Malster," and the St. Leger Stakes, won by "Finland." Another sire is "Prince Albert," a handsome jet-black Clydesdale bred by Mr. D. Dowd, of Euroa, Victoria. He is a weighty, thick-set horse and stands about 17 hands high. His sire, "Earl of Albyn," as a yearling gained first prizes at Daylesford and Kyneton, and later at Murchison, Numurkah, and Shepparton. He is descended from the most fashionable strains of imported blood on both sides, and as a three-year-old gained firsts at Euroa and Shepparton. Besides these fine specimens of equine blood stock the farm is noted for its purebred Ayrshire bull, "Lord Palmerston," and the fine Holstein bull, "Hopeful," both of which have built up a reputation among cattle-producers second to none in the State. "Lord Palmerston" has a lengthy pedigree, his immediate progenitors being "Edward II." (vol. 4, A.H.B. of A.) and "Gertie" by "Blucher," while "Hopeful" was sired by "Wilhelm II.," his dam being "Flora Macdonald." All of these sires are available to breeders at moderate fees, particulars of which may be had on application to Captain McMaster.

The SWAN MEAT COMPANY, Limited, Midland Junction, Perth, and Kalgoorlie; Managing Director, Fritz Lange. In including the present article in the section of the "Cyclopaedia of Western Australia" devoted to the Pastoral Industry of the State, the publishers do not wish to imply that the Swan Meat Company is a pastoral proposition in the ordinary sense of the term, but the interests of the Company being so closely interwoven with those of the breeders of cattle and sheep in the north-west districts it was felt that no better place could be found in which to insert a review of the extensive ramifications of the firm now under notice. There are at the present time in Western Australia a number of well-known men who from small beginnings have accomplished big things. With their foot on the lowest rung of the ladder they commenced a resolute ascent, and long ere this have attained that tangible eminence in the busy world of commerce to which every ambitious and progressive business man must aspire. As in other departments of enterprise so in that

most important branch of industry, the cattle trade of the State, there have been conspicuous examples of this inherent ability to "get on in the world." As opportunities presented themselves and were availed of by the pastoralists of the great north-west and other pioneers of the stock-producing areas, so did those more directly in touch with the consumers as meat purveyors embrace their opportunities as they occurred, thus giving direct and special emphasis to this phase of the commercial life of our country. There is, perhaps, no head of a thriving business firm in Perth in relation to whom these remarks could be applied with truer significance than to the managing director of the Swan Meat Company, Mr. Fritz Lange, who, with the immense enterprise which he has brought to such successful issues, forms the subject of this brief review. Founded by him in 1902, the present business had its modest beginning in a small shop at Midland Junction, and proving himself equal in every respect to deal with the rapid expansion of trade which followed the inception of its

Photo by C. E. Farr. SWAN MEAT COMPANY'S PREMISES, BARRACK STREET, PERTH.

operations, he continued at the head of affairs during the extension of its interests to Perth and Kalgoorlie, and to-day is the brain and central governing force of what is justly regarded as the premier concern of its kind throughout the State of Western Australia. FRITZ LANGE was born at Magdeburg, Germany, on January 25, 1865, and having attended school in his native town concluded his scholastic studies there at the age of fourteen. His father,

countries. To this early but comprehensive grounding in sound business principles and the special expert knowledge required in his particular calling Mr. Lange attributes much of the success which followed his keen exercise of energy and brain-power when he found himself in a comparatively new country which furnished chances denied to the man who had to push his own way in the older-established centres of the world and assisted in placing him in the

progress and prosperity ever experienced by a young country, and Mr. Lange, perceiving that here was a land of promise waiting to bestow rich rewards on those who should assist in the development of her abounding possibilities, forthwith set sail for her shores. He sought his first opportunity on the Coolgardie goldfields, and like many others endured much hardship in the pioneering work of the district, displaying throughout indomitable

INTERIOR VIEW OF BARRACK STREET PREMISES.

the late Mr. Henry Lange, was desirous that he should enter upon a commercial career, and he became engaged in the butchering trade in Magdeburg and other cities of the Fatherland. During the few years that he spent in business in Germany he was enabled to acquire valuable experience in all branches of the trade, and before leaving the country of his birth was thoroughly familiar with all the details of stock-dealing and with the trading of stock between Germany, England, Bavaria, Holland, and other

position that he holds in his own line of life to-day. During his boyhood his health was indifferent, and ultimately, under medical advice, he was induced to seek benefit in this respect from the more genial climate of Australia. Leaving his native land in 1894 he sailed for Victoria, and landing at Melbourne remained in the sister State for nearly two years, during which period his health was completely restored. About this time Western Australia was enjoying what could only be reckoned as one of the most notable eras of

pluck and endurance. A business opening offering in the firm of Messrs. Kidman & Uhr, he accepted the post, and when at a later date this concern amalgamated with that of Messrs. Fox & Holmes he found himself an important factor in the leading butchering business on the goldfields, its trading operations being carried on under the title of Butcher & Uhr. For over six years Mr. Lange devoted the whole of his energy and ability to the conduct and expansion of this connection, and at the end of that period, in

1902, he determined to launch out on his own account. In choosing Midland Junction as the venue of his operations he displayed the instinctive foresight and sound judgment of the true business man who places his finger upon the pulse of a community and is made aware of the existence of a demand which it is in his power to supply. That such a demand existed in the neighbourhood of the small shop (which he opened in partnership with Mr. W. E. Tootell) was very rapidly made manifest by the ready patronage which was accorded the modest establishment, and that this was no mere initial flutter of popularity was proved beyond challenge by the steady and progressive nature of the trade. So speedy, albeit so sure, was the expansion of the business that in the incredibly short space of three years after its foundation it was floated into a limited liability company, the governing interests in which were retained by the former proprietors, Messrs. Lange & Tootell—a change which only served to accelerate the rapid march of its

advancement. The firm as constituted in 1905 continued for five years, when Mr. Lange acquired Mr. Tootell's interests, and holding a half

share in the company and retaining the governing interests he still occupied the position of managing director. In October, 1912, Messrs.

INTERIOR VIEW OF KALGOORLIE PREMISES.

Lange and Tootell bought out the other shareholders, and it is interesting to note that the big trading concern, after various changes which have taken place in its history, is again under the sole proprietorship of the two partners who twelve years earlier established it in such a comparatively humble way, Mr. Lange owning a 75 per cent. interest and Mr. Tootell, who does not take any active part in the business, holding the remainder. To emphasize the remarkable growth of the concern it is only necessary to state that whereas during the first week the firm succeeded in disposing of one carcass of beef and those of eight sheep, the present operations are such that through the various branches there are retailed over 120 bullocks and more than 1,200 sheep

each week, as well as from seventy to eighty pigs. In the building up and control of the Swan Meat Company Mr. Lange found his time very fully occupied, as in addition to the conduct of the Midland Junction business, only six months after its inception he opened a branch at Guildford, and by the close of the first year established another shop at Kalamunda. In 1907 an important forward movement was made in the extension of operations to Kalgoorlie, where a retail business was started in Hannan Street, which quickly developed into a cash-over-the-counter trade, large attention also being given to supplies for the wholesale

huge demand, and during other months of the year supplies are obtained chiefly from the Ashburton, Murchison, and Gascoyne provinces. The cattle which come from these districts are frequently overlanded a distance of from 200 to 650 miles to the nearest port, and this long period of time spent in travelling over the road, together with the ensuing voyage, entails a great loss in weight to the beasts in question, but apart from this the cost per head to land stock, including droving, is about £4. Sheep are obtained principally from the Carnarvon districts during the winter months, and in the remainder of the

disposal of from 5,000 to 6,000 bullocks, from 50,000 to 60,000 sheep, and over 4,000 pigs per annum demands big plants and very complete general facilities, and everything in connection with this part of the business has been most thoroughly gone in to by Mr. Lange, who favours the most up-to-date arrangements for the construction of slaughter-yards, pig-styes, etc., and the installation of cool storage plants, etc. Slaughtering is carried on at the company's private abattoirs on the Newcastle Road, about three miles from Midland Junction, under Government supervision, for the metropolitan trade, and at the

SWAN MEAT COMPANY'S RECEIVING DEPOT, ROBB'S JETTY, FREMANTLE.

traders. In connection with this branch, cattle and sheep are sent alive to the goldfields, where they are slaughtered at the Government abattoirs, the goods being kept in cool stores, the refrigerator and ice plant having a capacity of over six tons. It is a feature of the trade of the Swan Meat Company that from all of the branches there is dealt with by rail a large country connection, while supplies for the upkeep of the various depôts are drawn from many parts of the State. From the middle of April to the middle of October the districts of the north-west contribute most largely to the

year the firm relies upon the Murchison and more southerly districts for its supplies. Mr. Lange makes frequent trips to these centres in order to attend personally to the important matter of securing stock, and purchases are made well in advance and to the best possible advantage, both from the company's and consumers' standpoint. A close eye is kept to the ruling climatic conditions in the cattle-producing districts, and wherever the best stock is to be obtained buying is vigorously proceeded with, so that the best meat in the market is secured for the firm's many customers. The handling and

Government abattoirs at Kalgoorlie for the goldfields' demands. In connection with the Newcastle Road yards there is also a large piggery, built on a slope, where a dozen or more large pens are paved with concrete, while a copious supply of water laid on to each ensures absolute cleanliness. A few swine are bred, but the pork retailed at the various branches is mostly fattened elsewhere, the company being large buyers from outside breeders. There are a great many drafting-yards for the cattle and sheep, which, with the buildings, are situated on freehold property, 70 acres in extent,

and recently the company acquired a long lease of 600 acres adjoining this area for the purpose of paddocking cattle and horses. At the principal shops are fitted the most modern and complete refrigerating and cooling plants, among which that at the establishment at Barrack Street, Perth, takes pride of place. This consists of a Linde compressor working on to three large rooms and an ante-room for the cold storage of meat. The latter is fitted with a large plate-glass window fronting Barrack Street, and here meat is displayed to the view of the passer by. There is also a tank with a capacity of two tons of ice per every twenty-four hours. The rooms represent the best method known in the way of insulation, while the system employed for cooling is that known as the dry-air method. At Midland Junction a large Werner freezing-plant has been installed in close proximity to the abattoirs, which also serves to supply ice to the surrounding district and to centres as far as 200 miles distant. Each

room has a separate system of its own and can be worked independently of the other rooms. A large

staff is employed, and numerous horses and carts are kept for delivery of orders, the heavy cartage being performed by a powerful motor-lorry. Mr. Lange owns a fine private residence at Midland

Junction, known as "Harsburg," where one of the chief attractions is the large and beautiful garden, in the superintendence of which Mrs. Lange spends a considerable portion of her time. So keen an interest has this lady taken in her favourite hobby and so successful have been her efforts that in 1910 she was awarded the challenge trophy for the champion garden of the district awarded by the Goldfields Water Supply Department. In addition to his numerous business and private interests the gentleman under review finds time to devote to his duties as a Freemason, his Lodge being the Friendship Lodge, No. 17, W.A.C., and he is also a member of the West Australian Club and of the Commercial Travellers' Club. He is a keen motorist and uses his 30-h.p. Overland motor-car both for pleasure and for business purposes. In 1893 he married Martha Clara, third daughter of the late Carl Meereis, of Böhmen, Austria, and has two sons, Fritz Carl and Hermann August.

## Timber.

### FOREST RESOURCES.

Apart from their value and magnificence as scenery the forests of Western Australia form one of the principal commercial assets of the State. So far back as 1840 the possibilities of a flourishing industry in native hardwoods and fragrant timbers were recognized, and at the earnest solicitation of Governor John Hutt the foundations were laid of a trade that has since developed into one of the most important sources of the prosperity and wealth of the community. Timber differs from gold in that it is being continually replaced by natural growth, and if to this be added a wise system of reforestation it may readily be seen that the forest resources of the State are practically inexhaustible. Over the whole south-western division, where the rainfall is abundant and steady, jarrah, karri, and other eucalypts grow in profusion; further east there are forests of sandalwood, a timber so greatly valued in oriental countries; and of recent years the northern areas have been found to comprise large forests of the cypress pine, for which parts of Queensland have long been noted.

According to the calculations of the late Mr. J. Ednie Brown, formerly Conservator of Forests in Western Australia, the area of forests containing timber of a high commercial value is 20,400,000 acres, distributed as follows:—

	Acres.
Jarrah (with red and black gum) ...	8,000,000
Karri ... ..	1,200,000
Tuart ... ..	200,000
York, gum, yate, sandalwood, etc. ...	4,000,000
Wandoo ... ..	7,000,000
	<hr/>
	20,400,000

The matured timber growing on the Crown lands of the State was estimated by Mr. Brown in 1904 to be as under:—

	Lods.
Jarrah ... ..	40,000,000
Karri ... ..	15,000,000
Tuart ... ..	300,000
Wandoo, yate, etc. ... ..	7,000,000
	<hr/>
	62,300,000

The value of this timber, after making all allowance for waste in cutting, and reckoned at the market price of about 60s. per load, was set down by the same authority at the immense sum of about £124,000,000.

These figures do not take into consideration the northern areas occupied by cypress pine, of which accurate information has not been so far obtained. They are, however, sufficiently large to show that in its timber Western Australia possesses an asset comparable with gold, and much more permanent as a natural production. Owing partly to the slow growth of the State and partly to the somewhat tardy recognition of the value of the hardwoods no considerable trade was built up until recent years, but at the present, with increasing knowledge of their value and ever-expanding markets, Western Australia is rapidly advancing as one of the chief timber-exporting States of the Commonwealth.

In the matter of durability it is doubtful whether any hardwoods surpass those of this State. Whether in the ground, in water, or on the surface they are, owing to some inherent property, immune from the ravages of the white ant and teredo. Piles taken out of the water after years of immersion have been found to be sound and serviceable. In the Public Library at Perth there are bookcases made of jarrah cut from piles that had done duty in the Perth Causeway for nearly half a century, and railway sleepers exposed to sun, moisture, and the wear and tear of railway traffic for nineteen years have been found to be still sound. With durability there seems to go the quality of being non-inflammable. Experiments made a few years ago by the British Fire Prevention Committee indicated that buildings built of jarrah or karri possessed unusual resistance to fire, especially so far as the beams were concerned.

In order to secure a thorough knowledge of the physical characteristics of the various timbers of the State, an exhaustive series of tests was carried out by Mr. G. A. Julius in 1906 under the authority of the Government. The series embraced some 16,000 individual experiments, and showed generally that Western Australian hardwoods compared very favourably with those of any other portion of the world. The timber known as yate, which is common to the south-west portion of the State, was proved to be probably the strongest sawn timber in the world. In the matter of durability and quantity available it cannot, however, claim to rank with jarrah, which fulfills all requirements in the matter of strength, is known to possess high durability, and there is probably more of it available than of any other timber in Australia.

Baron von Mueller, in his "Report on the Forest Resources of West Australia," says that the jarrah for the durability of its timber is unsurpassed by any kind of tree in any portion of the globe, it proves impervious to the borings of the chelura, teredo, and termites or white ants.

It is not uncommon to find considerable areas covered with the jarrah (*eucalyptus marginata*) or, as the settlers often call it, the mahogany gum, where many of the matured trees attain heights of from 90 ft. to 120 ft., with good stems 3 ft. to 5 ft. in diameter and 50 ft. to 60 ft. to the first branch. Taking an average of these forests, a jarrah tree representing a fair specimen of its kind would run about 90 ft. to 100 ft. in height and from 2½ ft. to 3½ ft. in diameter at the base. Of course, in places individual trees are met with which run into figures far in excess of these measurements.

Mr. Ednie Brown has stated that it would take from forty to fifty years for a tree to attain a diameter of 2 ft., which he considered to be the stage when the tree was fit for the mill.

The jarrah forests cover a scope of country extending north and south nearly 350 miles, and from 50 to 100 miles east and west, embracing all that portion of the colony upon which the heaviest rains fall, averaging 38 in. annually in the last ten years. Although purely a semi-coastal tree, that is, not being found anywhere strictly beyond the influence of the sea, the jarrah is not at all partial to the direct effect of the sea breezes, the best species of the tree being found 20 to 30 miles inland from the coastal line. The principal *habitat* of the jarrah is therefore along the tablelands and slopes of the Darling Range, which runs nearly through the whole of the south-western district. Perhaps the best areas of jarrah lie along that portion of this range from the Blackwood River north to the Helena River, with the choicest portions midway between these two points.

The weight of jarrah wood when newly cut is a little over 70 lb. per cubic foot, which is reduced to 60 lb. when thoroughly seasoned. It is red in colour, polishes well, and comparatively easily worked. The principal uses to which it has as yet been applied are wood-blocking, piles, bridging, and jetty-building. A trial shipment sent to the Admiralty in the early forties was greatly praised, and jarrah was after trial entered by Lloyd's as a first-class timber for the frames and planking of ships. It makes the best charcoal of any timber in the colony, not burning so readily into ashes as other kinds of wood, while its adaptability for all kinds of outdoor work is well known, and hence it is considered the staple timber of Western Australia.

Second only to the jarrah comes the karri—the giant of the Western Australian forest—and from the point of view of beauty possibly the most magnificent tree in the Commonwealth.

The karri (*eucalyptus diversicolour*) when young is a highly ornamental tree, regular, straight, and umbrageous. When matured its appearance is handsome in the extreme, and in this respect at least puts the more homely jarrah far in the shade. The trees are almost invariably of straight growth, and tower skywards for great heights without even the semblance of a branch. The height of some of these trees is almost phenomenal; an average tree may be credited with a height of 200 ft., and a diameter of 4 ft. at 3 ft. to 4 ft. from the ground, and about 120 ft. to 150 ft. to the first branch. Trees of this size are usually sound in every respect, and may be expected to turn out timber free from the usual blemishes of dry rot, gum veins, etc., to which large trees are usually subject.

Specimens of the karri not unfrequently attain the most majestic proportions. On the Warren River it is not unusual to meet with trees which go 300 ft. in extreme height, over 180 ft. to the first limb, and from 20 ft. to 30 ft. in circumference at the base, comparing even favourably with the giant sequoias of the mariposa and calaveras groves of big trees in California. One of the finest trees in the State is one known as "King Karri," at Karridale, which measures 34 ft. in circumference at 3 ft. from the ground, 14 ft. in circumference at the first limb, 160 ft. to the first branch, and over 200 ft. in extreme height. From these figures it is seen that this tree, from the bottom to the first limb, contains nearly 6,000 cubic ft. of timber, which means a weight of 40 tons in all; that it would take one of our ordinary mills at least four days to convert it into sawn stuff; and that it would form about a quarter of the loading capacity of one of the ships which form the fleet of our present export trade.

The karri is a rapid grower, and soon attains great height and considerable dimensions of timber. A forest of marketable karri can be produced in the short term of from thirty to forty years. This tree is strictly confined in its range of locality to the more humid portions of Western Australia lying between Cape Hamelin on the west and the "Torbay" Estate (near Albany) on the east and between latitudes 34° and 35° south. It delights in plenty of moisture, and hugs the coastline. It is here we find immense forests of trees of great and wonderful size, springing out of a soil rich, deep, and spongy; yet the country is not difficult of approach either by road or train. The karri grows best at an elevation of from 300 ft. to 600 ft. above sea level. The wood is red in colour, and has very much the appearance of the jarrah. It is hard, heavy,

elastic, and tough, but is harder to work, nor does it dress so easily as the latter. It is known that posts and slabs of karri have been in the ground for 30 or 40 years, with only an ordinary amount of decay, though for underground or for waterworks the jarrah seems somewhat superior; however, from tests in regard to its tensile, crushing, and breaking strength, it stands as a timber of a very high order indeed, and must be looked upon as one of the best suited for superstructural works. For bridge planking, shafts, spokes, felloes, and large planking of any sort, flooring, general wagon work and beams, it stands unequalled in this colony. For street-blocking it is also valuable, and is superior to jarrah, in that it does not become slippery through wear and tear.

Owing, however, to the limited area of country over which it is found, some of which is still very difficult of access to the timber-getter, the output is considerably less than that of jarrah, and its use consequently greatly restricted. Quite recently the Commonwealth Government has decided to use karri sleepers for a portion of the Trans-Australian railway line. The decision has raised considerable controversy, the advocates of jarrah contending that karri does not possess such strong resistance to the attacks of white ants. This weakness, in the opinion of its friends, may be cured by "powelizing," a chemical process to which the timber is subjected, which it is claimed makes it superior to jarrah for railway purposes. The argument is one which probably time alone will settle. In any case, apart from the question of rivalry, it is practically admitted that in jarrah and karri Western Australia possesses timbers which, in the opinion of the engineering

profession, are better suited for certain purposes than any others at present known.

Another tree of commercial value native to the State is the tuart (*eucalyptus gomphocephala*), a handsome eucalypt which has a wonderfully bright and cheerful appearance in the forest. The bark is of a greyish-white colour and the trees are always clean and bright looking. In height this species sometimes attains to 150 ft., and in circumference more than

22 ft. at the base. In some cases the trees run up to 70 ft. or 80 ft. without a branch, but as a rule they have heavy tops with boles about 40 ft. to the first branch. The tree is confined in its natural growth to the limestone belts lying along the coast between Perth and Busselton. It seems to grow nowhere except upon this calcareous formation, which forms a strip of country, intermittent in places, but hardly, if ever, more than two or three miles in width, in all cases close to the sea, and in some instances running into the coastal sandhills.

The timber of this species of eucalypt stands classified as the strongest, heaviest, and toughest in Western Australia. It is so hard and interlaced in the grain that it is well-nigh impossible to split, and seasons with

little shrinkage. It has also the quality of resisting the changes of weather. Among the uses to which it is now applied are railway waggons, buffers, keelsons, and sternposts, wheelwright's work generally, shafts and work where great strength, solidity, and hardness are requisite. The wood, owing to its denseness, is difficult to work. There are doubts as to its resistance to white ants or the teredo.

Other commercial timbers of the colony include the

JARRAH FORESTS, WELLINGTON.

wandoo, or white gum, with a large range of *habitat*, being the principal forest tree on the eastern slopes of the Darling Range. Specimens 60 ft. to 80 ft. in height, with diameters of from 1 ft. to 2½ ft., may be taken as fairly representative of this species. The timber is hard and dense, and is suitable for all uses to which the tuart can be put to. The blackbutt, red-gum, and several other varieties of eucalyptus also flourish in various parts of the colony, and play no inconsiderable part in an estimate of the timber resources of Western Australia. They are distributed over a large area of territory, and are used by farmers and settlers for all sorts of farm work at present. The sphere of their utility is, however, capable of being very much enlarged. On the eastern sand plains, in the more arid country of the interior, considerable belts of native pine are found. This wood is suited for use where the white ants are troublesome.

The wattle, from the bark of which material for tanning is obtained, and its relation, the raspberry-jam tree, the wood of which needs to be smelt to be appreciated and from which an oil smelling of raspberry jam is distilled, are fairly plentiful everywhere.

Of late years it has been found that the bark of the mallet-tree forms an excellent substitute for wattle-bark in tanning processes, as from 38 to 42 per cent. of tannic acid may be secured therefrom. The Germans have been quick to realize the value of the mallet, and since 1903, when the export first began, about £750,000 worth has been exported, chiefly to that country. The bark of the mangrove-tree, growing in the north-west, is also said to possess excellent tanning properties.

The principal aromatic tree is the sandalwood, the commercial value of which was recognized early in the history of the State, and in which for many years a thriving trade was carried on with China and the East. It is used chiefly for ornamental purposes, and from it idols are generally carved. The essential oil which is yielded upon distillation has considerable medicinal value. In the early days sandalwood proved a good friend to the farmers and settlers, who supplied it to the merchants in exchange for goods. It was then shipped to China and Singapore, bringing a return of from £7 to £8 per ton. During the early eighties the trade languished, owing partly to a drop in the demand and partly to the fact that the tree had been cut out of the settled areas. New country having been opened up by the railways and the market having improved there has of recent years been a revival of export, and for the year ended June, 1912, the value of sandalwood sent away to the East was £43,354.

Of recent years an important addition has been made to the timber resources of the State by the discovery of large belts of cypress pine in the Kimberley districts. The tree (*callitris robusta*) attains a height

of from 70 ft. to 100 ft., with a diameter of from 18 in. to 24 in. The wood, which is hard and light coloured, is said to resist the attacks of insects. As it grows in country easily accessible, though remote, there is every possibility that it will ultimately be the means of adding to the timber industry of the State.

With timber such as that described at its command it was impossible that Western Australia should fail to turn it to profitable account. During the lean years in the early history of the State it formed one of the main sources of wealth, and since the time that representative government was established in 1870 has made such strides that an industry has grown up which affords constant employment for thousands of men. The development has been particularly marked since the beginning of the present century. Previous to that time there were several companies acting independently and in competition with one another, but since then, by arrangement, output has been regulated as well as prices, so that the industry has become one of the most important and lucrative in Western Australia. Its present condition may be gleaned from a study of the latest Annual Report (for 1912) of the Conservator of Forests. From this document we learn that the values of exports were:—

Timber exported beyond Commonwealth	...	£685,552
Timber exported to Eastern States	...	312,442
Sandalwood exported	...	43,354
Mallet bark exported	...	44,610
Total	...	£1,085,958

If to these figures we add the value of the timber used locally, we gain some idea of the position and importance of the industry. How long the forests will last at the present rate of export is a moot question, but the following remarks on forest management and reforestation taken from the official report would indicate that there is little need for uneasiness:—

"In countries where forestry has been studied with most care several different systems of management have been devised, in each of which certain advantages may be gained when properly applied. The preference that should be given to one or another must in all cases be determined by the local circumstances and conditions, and in this State the conditions have resulted in the employment of the selection method, called by the French 'fuertage,' that is, stealing or taking here and there from the forest. Under this method, the large trees are cut out, leaving others not yet matured to grow to full size. It is the same plan that is in common use in the reserves in America, where the timber is taken here and there as it is wanted for particular uses, all those above a certain girth being cut out, and those of a smaller size being retained, until the area can be again cut over in a similar manner. It results from this management that the forest always presents a great

diversity of growth of young trees, that it is never absolutely cut out, and that as the older and matured trees are removed, such clearances are made all over the area as to permit of Nature reproducing the species by natural regeneration by seed-shedding from the parent trees. In this way, although the forest may have been cut over, it is never cut out, and Nature goes on reproducing the species for all time. In fact, it is the same phenomenon which occurs in the primeval forest, trees dying or being blown down, fires burning

out spaces, and Nature all the time doing her utmost to repair the damage and perpetuate the species. The standard size at which the undermentioned trees may be removed from our forests, measured at 3 ft. from the ground with the bark on, are respectively as follows:—Jarrah, 90 in. in circumference; karri, 108; tuart, 90; blackbutt, 90; wandoo, 48; morrell, 48; yate gum, 36; sandalwood, 15. From the above it will be seen that a very large girth restriction is imposed on cutting in this State, and that consequently a large percentage of timber is left on the cut-out areas to come on and form a second crop. The European system of natural regeneration under standards or shelter-woods by seed-shedding from the parent trees is

the only practical system that can be carried out in this State at the present time, planting being quite impracticable owing to the enormous cost that would be entailed. Under this system regeneration goes on in all parts of the forest by the removal of the oldest, largest, diseased, or defective trees wherever they are found, and also by the removal of the tree weeds and young growth of such a crooked growth or faulty nature as would never

develop into useful lengths. This is the system which occurs in primeval forests. When a tree falls from old age, or some other cause, an opening is thus formed in the cover overhead, the seeds falling from the adjacent trees germinate and develop into seedlings, and these grow up under the shelter of the older trees until they in their turn become parent and shelter trees. In this manner a primeval forest, if undisturbed, goes on regenerating itself for ages. The process is, of course, a slow one, as the young crop will

develop only when sufficient light is admitted by the fall or death of the old trees. In silviculture it is accelerated by the artificial removal of a portion of the old trees when they have reached marketable dimensions. This system of natural regeneration is now being carried out in Western Australia; but owing to the vast areas to be treated and the enormous expenditure that would be necessary, it is impossible at this stage of the country's history to carry it out upon other than a small scale. The indigenous timbers of this State are endowed with wonderful recuperative and regenerative powers, examples of which may be seen where the forests have been heavily cut over or on any abandoned settler's holding,

NATURAL REPRODUCTION OF JARRAH (*Eucalyptus marginata*), UPON CUT-OVER AREAS IN DARLING RANGES.

mill-site, log-landing, or ring-barked area. In fact, there are few forests in the world which, if Nature is given a chance, will regenerate themselves naturally with greater rapidity than ours. I have indeed little fear, if the system above referred to could be extensively carried out, that the forests of this State would be maintained for all time, and supply a sounder and better class of timber than is being obtained from them

at the present time, as a very large percentage of the waste and faulty timber now cut is due to the fact that

the trees are over-matured, and should have been utilized years ago."

### TIMBER INDUSTRY.

The possibilities that lay in the hardwoods of the State, if developed along commercial lines, were known, as we have seen, as far back as 1840; but it was not until the late sixties that the task of creating an export trade was seriously undertaken. Under the land regulations conditions were set forth governing the granting of timber leases or concessions, and the first to take advantage of these was the Western Australian Timber Company, of which Mr. Yelverton was manager. The area controlled by the company was in the extreme south-west, and in order to get the timber to a port for shipment, a railway—the first in the State—was constructed from the forest to the Vasse in 1871. Some years after the establishment of responsible government the interests of this concession were acquired by the Premier (Sir John Forrest) on behalf of the State, and after certain privileges had been withdrawn the lease was put up for public tender and acquired by Messrs. Porritt & Wilson, who floated it in London through the late Zebina Lane as the Jarrahwood and Sawmills Co. Ltd.

Mr. Yelverton's action in securing timber rights over a large area of forest was quickly followed by others. Messrs. Mason & Bird were granted an extensive tract in the Canning district, and the Rockingham Railway and Jarrahdale Timber Co., Ltd., obtained a concession over valuable forest country in and around where the town of Jarrahdale now stands. Both these companies constructed railways, the one to bring the timber down through the ranges, and the other to carry it to the natural port at Rockingham. These lines were opened in 1872. Messrs. Mason & Bird's interests were afterwards transferred to Mr. Edward Keane, who had secured contracts for Eastern and Midland Railway construction and required large quantities of jarrah sleepers. At a later date this concern was floated in London as the Canning Jarrah Timber Company Ltd., and Mr. Frank Wilson was appointed managing director.

The value of Western Australian hardwoods was by this time becoming generally recognized, and other companies were quickly established. Messrs. M. C. Davies & Co., on behalf of a powerful syndicate, secured concessions and established mills in the karri country, where an extensive export trade was developed. Millar Bros., who were the successful tenderers for the Great Southern Railway, opened up mills at Denmark for supplying sleepers for the line, and after the line was

completed went on cutting timber for the market. About twenty-two years ago they decided to close down, and proceeded to realize upon the plant. Before, however, the realization was completed, a further tract of country was secured at Yarloop and a powerful company floated in London under the firm's name to work it.

The Gill, McDowall Company, under the direction of Mr. F. D. Good, then started operations at Waroona, finding their market principally along the Eastern Railway. The Imperial Jarrahwood Corporation Ltd. opened mills at Quindalup, and the Greenbushes Timber Corporation, under the direction of Mr. Ellerton Brown, secured interests at Greenbushes, and proceeded to supply paving blocks for the London market. Eventually the Canning Jarrah Timber Company, the Gill, McDowall Co., and M. C. Davies & Co. were sold in London and reformed. Then began a cut-throat policy among the various firms, all of whom were mainly interested in the supply of sleepers and paving blocks. Prices were cut until every company was operating at a loss. This state of things meant ruin to the industry, and so an amalgamation was brought about by Millar's, the most powerful company. This firm, directed by C. and J. Temperley in London, drew in the others by a process of absorption, those embraced in the amalgamation being the Canning Jarrah Co., the Jarrahdale Jarrah Forests and Railways Ltd. (formerly the Rockingham Railway and Jarrahdale Timber Co.), Gill, McDowall Co., Jarrahwood and Sawmills Co., Imperial Jarrahwood Corporation, and M. C. Davies & Co. This last, having powerful financial backing, naturally came in on the best terms. The new company, formed in 1899, became known as Millar's Karri and Jarrah Co., Ltd., and at once took the part of the controlling factor in the Western Australian timber trade. In 1902 a reconstruction took place, mainly for the purpose of modifying the share capital, and in 1913 the title of the company was changed to Millar's Timber and Trading Co., Ltd., in order to allow it to take up the business of general traders. The position that the company holds in the commercial world may be in a measure gleaned from a view of the massive pile of offices recently erected by it in St. George's Terrace, Perth. After the amalgamation the large mill at Jarrahdale, which had been erected by one of the constituent companies, was practically shut down, but a few months ago it was decided to make it again the head station, and a new mill—the largest in the State—

equipped with every labour-saving device for the handling of timber, is now in course of erection there, and when completed will give employment to some hundreds of men. The area of country over which the company holds timber rights is in the neighbourhood of a million acres, from which by far the largest proportion of the timber exported is drawn.

There are still several companies outside Millar's, but by common consent the dangers likely to follow from the adoption of a cutting policy are avoided. These companies are the Greenbushes Timber Corporation Ltd., the Kauri Timber Co. (formerly known as the Western Australian Jarrah Sawmills Ltd.), the Collie Co-operative Society of Timber Hewers, Messrs. Bunning Bros., and Whittaker Bros. The mills of the Kauri Timber Co. are at Barrabup, and deal almost wholly with jarrah timber. Such has been the expansion of the company that lines are being thrown out into the forest from Barrabup, and there is the intention of adding three new mills. The port of shipment for the export trade is Busselton. The Collie Co-operative Society of Timber Hewers started under the direction of Mr. Jackman on a concession granted at Collie by the Moore Government. Since then it has secured a further lease of portion of the fauna and flora

reserve, and is conducting operations on a large and successful scale. Messrs. Whittaker Bros. have also a portion of the fauna and flora reserve, while Messrs. Bunning Bros. have established mills at Lion Mill, Argyle, and Collie. These two firms are practically confined to the local trade, and do little in the way of export.

Recently the State itself has determined to enter the arena of timber trading, and is now establishing mills for the purpose of supplying sleepers for the Trans-Australian line, for which a contract has been secured.

The ports of shipment for Western Australian timbers are, in addition to Fremantle, principally Bunbury and Busselton. At both these places facilities for loading have been provided by the Government, which has wisely avoided the policy of attempting to centralize the whole trade at Fremantle.

The value of the export trade to the State has already been discussed, and the reputation of the timber is now so well established that there is every prospect of enormous increase. To meet this increase a careful policy of reforestation is necessary. Given that, the supply of excellent timber from Western Australia should be practically inexhaustible.

NEIL McNEIL, J.P., one of Western Australia's best known citizens and a large owner of real estate in the metropolitan and coastal areas, proprietor of the famous "Mount Barker" Estate in the Plantagenet district, and pioneer of the timber industry in Western Australia, formerly a large railway contractor in various parts of Australasia, was born at Dingwall, Invernesshire, Scotland, on December 30, 1857. He is the second son of Mr. Neil McNeil, sen., now living in retirement on a pastoral property at Ballarat, whose advent to Victoria took place in the early sixties, and who became well known in commercial circles as a contractor for railway construction and other important works and by his large investments in landed property in that State. The subject of our review, until seventeen years of age, pursued his studies at Ballarat College, and at the close of his scholastic career engaged in work in connection with his father's railway contracts. Whilst thus employed he mastered the details of engineering, and in a very short time qualified himself for the position of superintendent of the construction of lines. Upon emerging from his teens he launched out on his own account as a railway contractor, and accepted and carried out

some important contracts for the Governments of the Eastern States. The line from Hamley Bridge to Balaklava, in South Australia, was

Bartletto,

Perth.

MR. NEIL McNEIL.

built under his supervision, and upon the completion of this work he entered upon the construction of the Colac to Camperdown railway in Victoria. Thence proceeding to

Tasmania, he took in hand the line from Corners to Fingall and St. Mary's, which soon became an accomplished fact. A very heavy contract next offered in the shape of the railway from Lilydale to Healesville, in the carrying out of which much skill and judgment were required. Whilst engaged on this important work Mr. McNeil undertook the construction of the extensive waterworks in connection with the Metropolitan Water Supply Scheme, the principal catchment area lying in close proximity to the scene of his railway contract. Many other large contracts fell to his tender, including the construction of the lines from Branhholme to Casterton, from Warrnambool to Hamilton, the Dunkeld line, etc., all of which remain as monuments to the enterprise and skill of the gentleman under review. Were Mr. McNeil's only claim to recognition by his fellow colonists and all native-born Australians based on the work thus worthily fulfilled, which had an important bearing on the development of his adopted country, none would dispute that that claim would be a substantial one. When about twenty-five years of age he turned his attention to Western Australia, and in 1883 took passage by the first boat of 450 tons—then considered a vessel of large

tonnage—which opened up regular trading operations between East and West, and in conjunction with other ventures devoted some years to railway construction in this State. He placed to his credit the line from Jarrahdale to Bunbury, which gave considerable impetus to the timber trade, and also the railway from Geraldton to Mullewa, the first section of the Murchison line, completed on November 21, 1894. He was a promoter of the first Perth Waterworks Scheme inaugurated by the Perth Water Supply Company, active work in connection with which was begun in May, 1889, and undertook the construction of the Victoria Reservoir, situated on Mundy's Brook, Darling Range, with a capacity of 212,000,000 gallons, and the laying of pipes to Perth, including all the connecting service to public and private buildings. Mr. McNeil's partners were the late William McLean (of Messrs. McLean Brothers & Rigg) and the late John Whittingham, and the same two gentlemen, with the addition of the late Robert Reid, were also concerned with him in the taking over of the timber industry established in 1880

which have been such marked characteristics of his career, and taking sole control proceeded on his own initiative to open up the Western Australian timber trade in the London markets. This progressive movement proved to be the inception of the

unbounded confidence in the resources, possibilities, and prospects of the Western State, and has demonstrated this in the most practical manner by his fearless expenditure of capital in works such as the Perth Water Supply Scheme, which neither

great transactions which have since marked the trade between this State and the Old Country, the first of which was Mr. McNeil's contract to supply timber for the construction of 15 miles of streets in the world's metropolis. The success of this undertaking attracted the attention of a

the Government nor the City Council felt justified in undertaking at that stage of the young colony's history. He foresaw the days when Western Australia would be included among the great mineral producing countries of the world, and took a keen interest in the development of the mining industry, even before the marvellous discoveries of the eastern goldfields turned all eyes towards the new El Dorado of the Southern Hemisphere. He was a member of various prospecting syndicates, and was instrumental with others in sending out Mr. Robert Leslie Menzie, who, under these auspices, discovered the "Star of the East" Mine in the Murchison district, and at a later period, when prospecting on his own behalf near Coolgardie, became the pioneer of the important auriferous area to which he has given his name. The "Wealth of Nations," which, with the "Londonderry" Mine, first established the fame of the eastern fields, was also discovered by prospectors equipped by a syndicate of which Mr. McNeil was a promoter, and at the time of the opening up of the Kalgoorlie district the gentleman under review was among the first of the visitors to the

scene of the find. His experience was considerably augmented by his sojourn on this field, and he became very largely interested from a

under whose direction a vigorous policy of improvement was carried out. The orchard area was increased to 150 acres, and nearly 1,000 acres

of the estate up to 13,000, and there are now 4,000 acres ringbarked, which in heavily timbered land such as this alone represents no inconsiderable outlay of capital. The whole property is well fenced and watered, and is free from the poison-weed pest. About 350 acres have been brought under cultivation, in addition to the large orchard area which has been extended to over 200 acres, while the remainder of the property is applied to pastoral pursuits, each year further area being cleared and specially prepared for cultivation. After clearing the land is cropped for two or three years, very heavy dressings of manure being used, and by this system permanent pastures are produced, various clovers getting such a firm hold that the land thus treated can be heavily stocked. The orchards are spring-ploughed and continuously cultivated until the autumn rains set in, implements never being idle during the summer months. During the winter the manuring is done and crops of peas are sown, which are ploughed-in in the spring. Apples are the principal fruit produced, and with these a large export trade is carried on, while pears and quinces thrive, and various stone fruits such as apricots, plums, and cherries, etc., are largely grown, this property having been the first in Western Australia to produce stone fruits on a

Photo by C. E. Farr. VIEW OVERLOOKING RIVER SWAN.

financial point of view, though subsequently he deplored the fact that he lost many valuable opportunities of investing owing to his lack of scientific knowledge in regard to mining matters. Having once definitely determined to make Western Australia his adopted country he continued the policy of extending his interests in the various fields of industry, bringing to bear remarkable perspicacity and judgment in the selection of proper avenues for his investments. He became a very large owner of real estate, both in the metropolitan and rural districts, being proprietor of Surrey Chambers and McNeil's Building, Perth, and Phillimore Chambers, Fremantle, and many other of the principal buildings between the coast and the goldfields, to which in 1908 he added by purchase the famous "Mount Barker" Estate, upon which one of the two leading orchards in the State has since been developed. This well-known property was originally taken up by Messrs. Millar Brothers from the Great Southern Railway Co. as part payment for their share in the construction of the line. The cultivation of a large area as an orchard proposition was commenced, about 90 acres being planted with fruit trees, and some ten or twelve years later it was acquired by Mr. Teasdale Smith, another large railway contractor,

of land were cleared. Upon the departure of Mr. Smith from the State he sold the property to Mr. McNeil, a curious coincidence in the history of the place being that since its foundation it has been in turn in the hands

Photo by W. E. Elston. NO. 1 ORCHARD (APRICOT PORTION), "MOUNT BARKER" ESTATE.

of three of the largest railway contractors of the Commonwealth. The present owner also purchased adjoining country and brought the acreage

commercial scale. With the exception of a few hundred acres the estate consists of undulating country, and as it is naturally drained and has an

average rainfall of from 32 to 35 in. practically the whole area is suitable for fruit-growing purposes. The original timber comprises jarrah and redgum, with a fair sprinkling of yate, the latter being preserved, as there is a probability of its becoming of great value when its wonderful

and dams laid down in various parts of the estate. This property is designed ultimately to be applied to the orchard industry, as the demand for fruit develops, but at the present time it is utilized as a pastoral proposition, and is stocked with sheep of the merino type. When selecting a

where now cluster the picturesque mansions and villas composing the suburb. Mr. McNeil's residence—which is called "The Cliff"—is of bungalow design, and in its construction jarrah timber was used exclusively, in order to prove to the inhabitants of Western Australia the

filled with holiday-making passengers ply the moonlit waters, gleaming with many coloured lights, the strains of music floating sweetly on the ambient air, the scene, to the overseas visitor, is reminiscent of charming nights spent in Genoa, Milan, Venice, or other Continental resorts famous for picturesque scenery and bewitching atmospheres. Mr. McNeil still keeps himself closely in touch with the trend of mercantile interests in the State of his adoption, which so richly has repaid his early faith in her

Perth, towards the building of which he donated £1,000. When the Y.M.C.A. started their campaign for the erection of premises Mr. McNeil headed the subscription list with a donation which represented the actual cost of the magnificent baths and surrounding buildings which form part of the present headquarters, and a wall-plate recognizing him as the generous donor has been installed therein accordingly. Beyond the boundaries of the State many calls are nobly responded to by Mr.

Turf Club. The motor-car claims a good deal of Mr. McNeil's time, his original purchase, a Panhard, being one of the first large cars imported to Perth, and in this and other cars that he has owned he has travelled extensively, and visited most of the best-known resorts on the Continent of Europe, England, Scotland, the Eastern States, and Western Australia. In the year 1900 he was married to Jessie Alexandra Lawrie, daughter of the late Hugh Lawrie, of Ayr, Scotland.

## Mining.

### MINES AND MINING.

[Contributed by J. J. EAST.]

#### I.—MINING LAWS.

The fundamental principles of mining law in Western Australia are (*i.*) that minerals are an asset belonging to the whole community; (*ii.*) that the Crown may authorize any land to be worked for minerals contained in it; and (*iii.*) that the welfare and safety of the mineral workers are justly matters for regulating by law. These principles were not called into practice in a day, but only after long experience and proved fitness. To show this evolution, it is necessary to glance at the history of other gold-producing countries.

The facility of converting gold, silver, and precious stones into wealth, real or potential, has always made their possession a source of danger or of enterprise. Unprogressive, wealthy nations have always become the prey of nations more daring or progressive, and the concealment of the existence of mineral deposits, or of wealth liable to excite the cupidity of strong neighbours, has often proved a wise policy for a people exposed to invasion and conquest. To progressive nations the natural treasures are, so to speak, a bank from which to draw funds for the support of war, or for the further promotion of enterprise and industry.

From the earliest historic times the sovereign or rulers of a region have claimed the ownership of the soil and all that it contained. The use of the surface being fundamental to individual existence and social necessities, little trouble has arisen in devising laws suited to all classes. But the mineral wealth—the gold and silver which occurred naturally in the soil—was always reserved to the ruler—probably only as trustee at first, but later was claimed as the “personal property” of the royal family, and hence these metals were termed “royal metals.” The popular beliefs that such deposits owed their existence to creative action exercised by supernatural powers in the spiritual realms, readily accorded to that “divinity which doth hedge a king” the right (as the visible representative in this world of the powers in the spirit world) to appropriate the deposits prepared in the unseen realms.

The gold mines of Egypt and Nubia, and the copper mines of Sinai, were worked by forced—and therefore cheap—labour in the private interests of the semi-divine

sovereigns of Egypt upwards of 4,000 years ago. The ancient Assyrians regarded the mineral treasures as peculiarly the property of the lord Baal, and all search for mineral in the earth, unless properly authorized and propitiated, was a trespass in Baal-land. In countries visited by the Phœnicians traces of this Baal ownership still survive, and to this day the miners in Cornwall term a mine a “Bal” and their periodical statements of account with the mine proprietors as “Bal bill.” The imaginative nations of Northern Europe regarded the “Kobbolds,” or genii of the nether world, the guardians of all minerals beneath the surface; while in Central Asia, among the races speaking the Sanscrit language, the “Chuds,” or womb-deposits of Mother Earth, could not be broken into except by authority duly exercised. From this word “Chud” come the terms “chute” and “shoot” used by English-speaking miners of to-day as indicative of ore masses penetrating downwards into the earth for indefinite distances. In far-distant China also, the ruler, as the “Son of Heaven,” claimed proprietary rights over minerals and exacted a royalty when they were worked, while, even now, in isolated Tibet the gold alluvial fields and the borax deposits constitute a great part of the revenue of the Church or priest rulers of the community.

Thus, in every country having a civilization, the ownership of minerals is claimed by the Government or rulers, to the exclusion of the common people. Private ownership is definitely prohibited, unless a grant of the land conveys to the grantee in specific and precise language a right to ownership of the precious metals also. This is the Common-Law Right which, when exercised by the Crown in Australia and by the Government in the United States of America, has been productive of much friction and costly litigation. The development of the mining laws and their evolution from a primitive condition, is therefore a matter claiming much more study than is usually given to these subjects in self-governing States—particularly in those of to-day wherein the democratic element exercises much political power.

Western Australia is the latest of the important gold-producing countries of the world. Its mining laws may therefore be regarded as the outcome of experience,

applied and tested in many lands, and extending over many years. If the continuance of these laws makes for the advancement of its population, they will prevail and be adopted elsewhere. They are the most advanced laws of the world at present, and to correctly appreciate their incidence, the history of the other Australian States and of America must be compared.

Although the plunder of the accumulated gold and silver in Mexico and Peru enriched the Crown and nobility of Spain, the humbler classes of that country, and those by whose means the plunder was achieved, benefited but little individually thereby. So, also, the digging up of gold in the placers of the Ural mountains enriched the Russian imperial treasury and a few nobles, but not the toilers who won the metal from the soil.

It was the great placer deposits of California, discovered in a recently conquered territory not yet allotted to settlers, which first made possible the individual acquisition of gold as the result of personal labour by a free people. The opening of this region to unlimited immigration developed the opportunity, and was the cause of the maddest

rush for individual wealth that the world has ever witnessed. That rush was almost paralleled a few years later by similar discoveries in the, till then, unsettled portions of Australia. The inflowing population thus attracted comprised every element of society from every country which had a Government and fixed laws: but which laws varied from ultra-conservation of Crown rights or monopolies, to an almost equally open assertion of the people's right to the soil and all which that soil contained. In this latter respect the immigrant communities were not slow in claiming, and sometimes in putting into practice, the principle that no Home Government had any right to control distant colonies in their purely domestic matters when the colonial communities were so distant as California and Australia.

This modern epoch of gold discovery and inrush of populations became thus, naturally, one also of the evolution of new land-laws and social usages fitted to the new order of things thus suddenly created in the regions concerned.

Both in the United States and in the British colonies it is provided by statute that whenever a case occurs for which no special law or procedure has been laid down, the law and practice governing such cases in the English Courts shall be adopted. In Great Britain and Ireland, the right to gold and silver in the soil was inherent to the British Royal Family, and not to the Government of the Kingdom, until this right was specifically and formally relinquished to the State by the Royal Family of Britain in the year 1760. The War of Independence constituted the nineteen American States, each having sovereign rights to its own soil, into a

Federation as the United States of America. It is only in the younger States of that Union that the Federal Government, as the representative of the "nation," can make laws for reserving or disposing of the soil and all that is in or

beneath that soil. California was an acquisition by conquest by the Federal Government, and at the time of the gold discovery was held by military occupation. Previous to then the United States was not an important mineral country, though lead, copper, and coal were known and worked. The difficulties of administration, and the consequent expense, in connection with dealings with lands having one title to its surface and another title to minerals below the surface, did not commend itself to the business-minded Americans. So strongly was it felt that a change was needed, that President Polk, in the year 1845, recommended Congress to abolish the system of leasing mineral lands, and sell in future the lands outright, and without any reservation whatever. In pursuance of this recommendation

FACSIMILE OF AN ORIGINAL SHARE CERTIFICATE IN THE WESTERN AUSTRALIAN MINING COMPANY.

the lead lands of the Mississippi Valley were sold as freeholds, without reservation of minerals, from and after July 11, 1846. The mineral lands of Lakes Superior and Michigan were similarly dealt with from March 1, 1847, and two days later the law was applied to the Chippewa district of Wisconsin also. The war with Mexico was then in progress and gold had been discovered in California, but the treaty which added Texas, New Mexico, and California to the United States was not signed till May in the year following. The gold discoveries made it incumbent for the Federal Government to make local land laws for its new territory, until such time as the territory by growth of population should be entitled to claim entrance into the Union as a State. This point is of importance because many Australians went to California during the gold excitement, and when, subsequently, they, with others, rushed again back to the gold finds in Australia, they brought with them to the Australian fields notions of gold-digging laws and State Rights not compatible with the ideas of those in charge of the government of a British Crown Colony. This was the beginning of a friction between a roving population and imperiously asserted authority which led ultimately to the bloodshed at the Eureka Stockade on the Ballarat diggings.

In California the military commander, Colonel Mason, though armed with great powers (and after he had cleared all ground for discussion of titles to minerals by proclaiming the abrogation of all Spanish titles and reservations), did nothing to regulate the digging "industry." To quote his own words, he said that "it seemed to him better to let the miners fight out their differences between themselves." No general regulations which he could promulgate would, he felt, be applicable to each successive locality discovered. Each locality therefore evolved, by common consent as it were, the conditions for holding and working mineral lands: all disputes being summarily settled—by Lynch law when necessary. When, later on, the Federal Government enacted laws for the mineral lands, these enactments did little more than to legalize the local customs which had been found by experience most applicable to particular localities and conditions. Each locality had thus made its own regulations with regard to the rights of discoverers, the conditions of labour, mining expenditure necessary to the retention of a title to the ground taken up, and also the necessary preliminary steps for securing such title. These were fundamental though primitive conceptions, devised under conditions for which history furnished no parallel. All were permitted to work freely for alluvial gold if the ground was not already occupied and continuously worked, while quartz reefs could be held on a "lease," convertible later into a "freehold." President Polk's policy of sale rather than incur the cost and difficulty of collecting rents and royalty and the

irritation such collections caused was, in its real essence, thus preserved when dealing with the gold lands of California; and but little change has since taken place in the American mining laws. The influence of the western voters has materially contributed to prevention of change, and the great Civil War also precluded at a favourable time any general consideration by the National Legislature of this subject. It was not from America, therefore, that Australia received the principles existent in the laws dealing with mineral lands. Australian laws have evolved under conditions natural and requisite to the needs of a progressive and prosperous mining country.

It is a singular and significant coincidence that both in America and Australia the Governments had voluntarily given up all rights to gold and silver in the soil just prior to the great gold discoveries which have since made both regions world-famous. The British Royal Family, as previously mentioned, had long since given up their rights to the State for the benefit of the people. The State had established Crown colonies in Australia, but had equally explicitly given up the mineral reservations, avowedly as an inducement to that emigration from Britain which it was then desirous of promoting. At first, coal was reserved explicitly in all deeds of grants of land, because its exploitation at Newcastle in New South Wales had proved very beneficial to that colony. The hiring out of convicts as labourers for their keep, being also accompanied by grants of land proportional to the number of convicts so taken, soon began to make this form of land investment popular in Britain. In effect, it was land for nothing and bond labour for working it free of all costs except rations and clothing. The "Australian Agricultural Company" was formed in England to take advantage of this liberal provision. It was incorporated by the British Parliament on June 21, 1824, and received a grant of 1,000,000 acres the following year. Coal was then being exported from Newcastle, and the company in 1828 made a compact with the Colonial Office in London by which it received the Government coal mines in a 2,000-acre free grant of coal lands and the exclusive right to mine for coal in New South Wales for thirty-one years. The sole condition or consideration for this magnificent concession was that the company should supply all the coal required by the Government at the actual cost of production; convict labour to be supplied by Government as before.

The reservation of gold and silver to the Crown was first announced in the New South Wales regulations of 1828, and prevailed for a number of years. The British Government in 1831 made this reservation general throughout all the British colonies in America and Australasia. But in 1836 the colony of South Australia was founded on a new principle, known as the Wakefield system. This system was, in essence, that for all lands

sold half the proceeds should be spent in public works and improvements and half devoted to the importation of free immigrant labourers. The South Australian freehold sales reserved no mineral rights whatever. The freeholder became absolute owner of all above and beneath the surface of the soil. Immigrants were successfully attracted to South Australia, and in 1840 the British Government saw fit from this example to reverse the reservations to the Crown made in 1831. Lord John Russell, the Secretary of State for the Colonies, made this very plain in a despatch during 1840 to the Governors of New South Wales and Van Diemen's Land and their dependencies. His words are:—

"All deeds of grant throughout the whole of the colony should convey to the purchaser everything below and everything above the surface. Neither would I reserve lands merely because supposed, or even certainly known, to contain useful mineral substances. The small amount of profit derived from mines throughout the great extent of the British Empire would appear to us sufficient reason why such reservations would, as a general rule, be as unnecessary as they would be inconvenient to the progress of the settlement." (Vide English Parliamentary Papers, Sess. 1840, vol. 33, p. 396.)

This despatch of Lord John Russell, it will be noted, left it to the discretion of the Governors and their colonial legislatures to make such reservations as they thought expedient, provided the measures passed by them were best calculated to achieve the great object of attracting free settlers. Pursuant to the suggestion made, the New South Wales Government in 1843 (March 1) enacted that from that date "deeds of grant from the Crown will be issued . . . conveying . . . all that is above and all that is below the surface, except that, in certain areas, coal will be reserved until 1862," and that "precious minerals or metals may also be reserved if it be known that they greatly abound, but not otherwise."

The proviso that "precious minerals and metals may also be reserved if it be known that they greatly abound" shows that the Government of that day had more than a mere suspicion that some day rich mineral localities within the colony would come to light, and would require to be the special subject of legislation. It was an eminently prudential step on the part of the Government, but, on the other hand, it held out a strong incentive to discoverers, or those acquainted with a discovery, to conceal their knowledge until they had first secured the ground by indefeasible title as freehold, and at the upset price as for ordinary lands. Gold had been discovered in New South Wales as far back as 1839 by Count Strzelecki, but at the strongly-expressed desire of Governor Gipps the discovery was not made public: the Governor said he "dreaded the result of such discovery being made known in the then condition of society and labour in the colony." Officially, however, the

Government did not know of the existence of any locality wherein any "precious minerals or metals were known to greatly abound" except coal. This being the sole condition for reserving land from sale, "but not otherwise," the land sales in fee simple, conveying all that was above and all that was below the surface, went on at any point selected in the great colony of New South Wales, which then included what is now Tasmania, Victoria, and Queensland. When these latter colonies were severed from New South Wales the land laws of the mother colony continued to be adopted, until the progress of events called for amending laws by the local legislatures.

The subsequent litigation, which arose when valuable discoveries were made on some of the lands granted without reservation of the mineral rights to the Crown, proved lingering and costly. The most famous case was that relating to the celebrated Mount Morgan Mine in Queensland. The gold deposit there was found in 1882 on land which had been alienated as low-grade agricultural land as far back as 1864, and without any mineral reservations in the deed of grant; though gold was discovered in Queensland in 1858, and copper in 1861. The Government refused after 1852 to put up for sale any lands known to contain gold, but it allowed much copper land to be alienated at £1 per acre after £1 per acre had been expended on it in development work. Mount Morgan was therefore a piece of ground held under clean free title, and when the Morgan brothers discovered the gold they purchased the land from the original grantee for £1 per acre. When the richness of the find was proved by development, the company's title was attacked at the suit of private persons. The lawsuits failed because the suitors could show no better title than the holders, although the law, as then ruling, showed that the company was illegally taking gold to which the Crown alone had a claim. But the Crown did not prefer its claim, and the holders were for the time left undisturbed. But there was always a fear that political changes might later bring into power another Ministry which would not be so forbearing. In 1894, therefore, the Queensland Government enacted that "freeholds containing mineral" could be surrendered, and converted into "leasehold with royalty to the Crown" on the mineral produced. Mount Morgan Company was thus enabled to secure an indefeasible leasehold title over its 75 acres, at a royalty of 1s. per oz. of gold produced.

Though the Crown right to the precious metals in alienated lands was regularly established by procedure at law, the first assertion of this right was undoubtedly against the tenor of the instructions from the Home Government, and absolutely against the letter of the enactments passed by the colonial legislatures after the receipt of Lord John Russell's despatch of 1840. Had the gold discoveries been of less magnitude it is conceivable that an appeal to the Crown to waive its right

would have been unhesitatingly granted, because of the much-desired tide of immigrants which the discoveries would attract. But, with the experience of California before him, Governor Fitzroy, as soon as the magnitude of the New South Wales and Victorian discoveries became apparent, saw that a critical time was at hand. Immediate action by a strong hand, then and there on the spot, could alone ensure law and order, and secure to Government any semblance of authority. Desperate characters could not get to California at the first rush without money, but in New South Wales the time-expired convicts and their descendants, as well as free settlers and Government officials who threw up their billets in the eager rush common to all, brought about a case of equally extreme urgency from the very first. The Governor rose to the occasion. Law and order must be maintained at all hazards. The Home Government was too far away, and communication too slow, to seek authority for more power or for great expenditure. Colonel Mason, in California, had not sufficient military force nor police to enforce payment of fees by the gold diggers. Governor Fitzroy had his soldiers of the convicts' guard, and he could gather police from the law-abiding free population—if he could pay them. He resolved to make the diggings self-supporting by fees for digging for the gold. Disregarding the despatch of Lord John Russell and the laws passed in the colony he, by proclamation on May 22, 1851, asserted the "common-law right" of the Crown to "all mines of gold in its natural place of deposit . . . whether on the lands of Her Majesty or of Her Majesty's subjects," and further warned all persons that "anyone removing any gold, or digging for, or disturbing the soil in search of such gold, without being duly authorized, would be prosecuted both civilly and criminally"; and that "such regulations . . . as may be found expedient will be specially prepared and published, setting forth the terms on which licences will be issued for the purpose." The regulations were duly published on the following day, and "gold digging by licence" became the established legal form of gold winning in Australia, and has continued such to this day.

Two months later (July, 1851) Victoria was formally separated from New South Wales, and Governor Latrobe took office as first Governor of the new colony. On August 15 and 18 he repeated Governor Fitzroy's proclamation and regulations of the May previous. As time went on and experience was gathered, further regulations were issued by the Victorian Government, but the New South Wales lines were not always closely adhered to nor followed. The gold diggers generally preferred the New South Wales regulations. Fitzroy's wise policy bore early fruit, and when he in May visited the diggings he was thanked by diggers and miners alike for his maintenance of order and the establishing of

police escorts from the diggings to the coast, whereby the workers got their gold winnings cheaply and safely transported to the capital.

But evil times were ahead. The New South Wales regulations being more liberal to the licensees than the Victorian regulations caused resentment in Victoria. Fitzroy's fees were avowedly fixed as an emergency measure to meet costs during an emergency. As soon, therefore, as the gold output and increased population sufficiently increased the revenue of the colony to permit of lessening the impost, the licence fees were revised. In 1853 the New South Wales licence was reduced to 10s. per month, and did not affect those who were not engaged in actual gold digging. Latrobe's proclamation and the regulations under it of August 18 (which took effect on September 1) fixed the licence fee at 30s. per month for "all persons on the goldfield," even cooks in the eating-houses and teamsters on the road engaged only in carting to the fields. This was, in effect, a "poll tax," and it naturally evoked a storm. For a while protests carried at orderly meetings was the form of condemnation resorted to by the diggers. The Victorian Legislature in the following session passed an Act restraining, by arrest if necessary, any person unauthorizedly taking gold, but with a proviso that merely working in search of gold was not a punishable offence. For settling disputes between miners and generally dealing with goldfields cases, "Gold Commissioners" were appointed by virtue of this same Act.

Unfortunately, the police received half the fines when persons were convicted of unlawful digging. It was not sufficient—in their eyes—for the digger to maintain he was only a prospector not yet successful in finding gold to remove, he had, by their dictum, to produce a licence if caught actually at work in a claim hole, and the Commissioners' Courts upheld the police, and gave verdicts on police testimony—often perjured. A new industry thus sprung up, and "digger-hunting" became a lucrative police officer's business; though ostensibly it professed to protect the legitimate miner on his registered mine from interference by men professing to search for alluvial gold by digging. Victoria's revenue from the 30s. licences had by this time grown to no less than £700,000 per annum—an unparalleled impost on a community when applied as a poll tax; and recovered by summary proceedings in Court if evasion were attempted and detected—with half fines to the prosecuting police officers.

The "Gold Commissioners" were mostly young fellows of good families "at Home," and though some of them afterwards developed into good officers, the majority of them were quite incompetent and were alleged to be grossly corrupt. Public opinion came to a head in 1854, when a notorious character publicly boasted that the magistrate who tried and dismissed the case on

which he was charged dared not convict. At the same time three innocent miners were convicted on perjured police testimony. British freemen's blood was up at such outrages. A mass meeting was called, the police were condemned, and a further resolution demanded the immediate release of the falsely imprisoned miners. Governor Hotham, a strict naval officer accustomed to implicit and unreasoning obedience, resented this "demand," and sent up soldiers to uphold the majesty of the law and enforce order. The Eureka conflict followed, in which five soldiers and twenty-five miners lost their lives.

A Royal Commission of Inquiry followed on the Eureka episode, and from the date of its report, on March 25, 1855, the true appreciation of the correct principles on which goldfields and gold-mining legislation should be based may be said to begin. The Legislature in the June month following enacted a new Goldfields Act, embodying the principles by this time most generally favoured: legislation having for its object the

substitution in its place of a certificate or document, happily and justly called a "MINER'S RIGHT," at a charge of only £1 for a whole year.

The creation of the "Miner's Right" was the first real forward step of a practical and all-round nature as yet taken in Australian mining. It allows the prospector to go to any point legally open to his operations or search, and ensures to him the first right to dig for and remove the gold in the surface soil, as usually understood by the word "alluvial." Tradition and practice have since so confirmed this interpretation that for years past the alluvial gold has been considered the sole heritage of the worker, and cherished accordingly by all as the people's "birthright." Any interference with this now recognized birthright on the part of the Government, the proprietor of land, or the leaseholder of an area for mining or other purposes, is now in either of the Australian States instantly resented. As a natural law and legal consequence it has come to be generally recognized and promises to permanently remain.

advancement of mining; the improvement of the position of the miners and diggers; and the collection, by means the least irritating and burdensome, of reasonable fees for the privilege of winning gold from Crown lands.

By this new Act five Local Court districts were created to deal with local goldfield cases. The Courts each comprised a chairman appointed by the Governor, and nine members elected by the miners in the district. These Courts could make by-laws for working the claims and for securing such, and could settle all disputes among miners. The "Gold Commissioners" were abolished, and other officers styled "Wardens" appointed in their stead. Later, in 1865, the judicial side of the Local Courts was separated and placed under "Mining Boards," which dealt only with mining questions. The Wardens then became very important officers. But the greatest reform of all which this new Act introduced was the abolition of the licence fee impost of 30s. per month, and the

Every attempt to restrict this doctrine has ended in victory for the alluvial gold digger. The only real disturbance throughout the wide area of the goldfields of Western Australia occurred over this alluvial question, and special provision is now made in the mining laws and regulations to delay granting leasehold titles to mining investors or companies until there is reasonable ground to believe that no alluvial gold remains or exists in the soil sufficient to attract workers other than those proposing to mine deeply along the reefs or veins from which alluvial gold could have been shed.

The Victorian Act of 1865 is generally regarded as the real mother Act of gold mining in Australasia. It was evolved as the outcome of the experiences to that date of the great boom of 1851, while a mining, or would-be mining, population flowed into the colony with unprecedented rapidity. It avoided the anachronisms of the Californian laws, and is in many respects the very

antithesis of the Californian and later American statutes.

But statute law framed by legislators and understood to mean one thing when it comes into being, is often found to mean something altogether different when interpreted by judicial pronouncements from the Supreme Court. Victoria fortunately possessed at the time a strong man of great judicial worth, in the person of Mr. Justice Molesworth. His decisions practically made and gave force to the laws of mining as they now exist throughout Australia. Speaking as late as 1907, Sir Samuel Griffith, the present Chief Justice of the Commonwealth, said:—"It is a well-known fact that the mining law of Australia was practically made by the decisions of Mr. Justice Molesworth and the Supreme Court of Victoria."

It was in the Victorian law courts that the question of the ownership of the precious metals was bitterly fought. Both in that colony and in New South Wales the proclamation of Governor Fitzroy, which asserted the common-law right of the Crown to all gold in the soil, was bitterly resented as a breach of covenants and an invasion of the rights of vested interest. In the New South Wales Courts the verdicts were always against the Government on this question of ownership under common law, while in Victoria, under Judge Molesworth's decisions, the Government always won. Indeed, it was not until 1873 that the Victorian Government even considered it necessary, or worth while, to formally insert the reservation of the precious metals to the Crown in the deeds of grant. The ultimate decision of the Privy Council in 1877, in the appeal case of "Woolley v. Attorney-General of Victoria," finally set at rest the question of ownership of the gold in its natural state throughout British dominions:—"A Crown grant does not pass to the grantee ROYAL MINES (that is, gold and silver) that may be found under the land included in the grant, unless the intention that such minerals should pass is expressly stated in the grant in apt and precise words."

The South Australian Legislature decided once for all that precision of language should apply to the lands granted in that colony. Its Act 88, of 1877, therefore set forth:—"Whereas doubts have arisen whether or not minerals and metals, more particularly gold and silver, belong to the owner in fee simple of the land heretofore alienated from the Crown, and it is desirable to remove such doubts, and to declare as hereinafter declared: be it therefore enacted, etc., as follows:—1. The grant in fee simple of any land in South Australia, heretofore granted or hereafter to be granted, shall be construed to include and convey to the owner in fee simple for the time being of such land, the absolute property to all mines and minerals including gold and silver (commonly termed "royal metals"), nothing whatever above or below

the surface of the land being reserved to the Crown."

In 1888 this law was amended so that, in future, all gold would be reserved to the Crown; and in 1895 this reservation was extended to "all minerals." Mining access to private property was also provided for, with compensation and royalty to the owner.

Thus, in the course of fifty years, the rights of the Crown to all gold in the soil of Australia had become clearly established, and that the lands should cease to be sold with all its mineral contents has become also a recognized principle, to be applied wherever practicable in future. With the single exception of South Australia no private owner can prevent the minerals in land being made exploitable, but there is no confiscation in this, because the owner of the land is guaranteed a royalty on the values obtained; which is more than the consideration reserved to the Crown when, as owner, it allows Crown lands to be open for gold mining.

Mining on private property is not yet in a satisfactory legal condition throughout the Australasian colonies. Legal red-tape in one State, and influence with the Administration in another, have in the past greatly stultified all attempts to throw open to the miner lands which never should have been parted with in fee simple without reservation of its minerals. Thus, in South Australia, before an owner can be compelled to give access to his land for mining, it must first be certified by a responsible Government officer that a "payable" deposit of the mineral exists on such land. How the officer can certify the payability of unprospected ground without having power to himself make search beforehand, is one of those absurdities of legislation sometimes introduced expressly for making such legislation unworkable in practice. The South Australian Act was rightly termed in Parliament, "an Act for the Prevention of Mining on Private Property."

The forerunner of the "Mining on Private Property" statutes was the New South Wales Act of 1861; which provided powers for proclaiming "goldfields" and applying special laws to obtain only within such goldfields. The Act declared that nothing in the Lands Act of 1861 "shall be held to require the sale of any land that may contain auriferous deposits." It further departed from the Lands Act by providing for conditional purchases of goldfields lands, but with the gold rights reserved; and also for free prospecting and resumption rights over such lands. It required still another thirty years for the public to discern that, from the public and State interest, there was no "essential difference between mining for gold and mining for any other mineral: the mere digger for gold is not a "miner" in the sense that he requires land with an area sufficient for engineering and other manifold purposes, for which capital enterprise and not individual labour is necessary.

But, with regard to "minerals," such as the ores of the base metals and coal, the freeholder of a grant, in which such was not reserved, became and still remains the actual proprietor. If he will not mine the minerals himself he can still exact a royalty from those who are willing to do so. Hence "landlord's dues" must be confronted by all Australian investors mining on private property for the common minerals, though, in general, these dues are limited in amount by direct Act of Parliament, and do not exceed 5 per cent. royalty. To those who acquired the unencumbered titles to their lands before constitutional government was given the colony in which they hold their lands, the law of conserved rights is claimed to give exemption from State interference. The question has never been definitely settled, and in Western Australia, at least, the Government has hitherto shrunk from a test case. As a consequence, the lands which were sold in the early days as "mineral lands" are either worked for mineral or devoted to farming or grazing, at the will of the owner.

The principle of selling outright any "mineral lands" is inherently vicious, and it was especially so in the young days of the struggling colonies of Australasia. In addition to the evil of permanently alienating the land from the people's use, it deprived the purchasers of much-needed ready money in order to make the purchase: and this occurred at a time when currency was extremely scanty. In fact, it practically drained Adelaide of its ready cash when the £20,000, necessary to buy the Burra Burra Mine in South Australia under "special survey" conditions, was raised and paid over to the Colonial Treasurer. Similarly, in Western Australia, a large sum was expended by the first organization formed for mining purposes in this State; though some sixty years later the land was sold at a huge profit on first cost, and returned the subscribed capital to the heirs and successors of the investors.

Obviously the correct course would have been never to have sold land at all with the mineral rights unreserved. But it was the policy of that age in every country, and men's minds have become broadened with the advancing times. It was early seen that a mistake had been made in selling all land at one price, and the necessity of a geological survey of land before its mineral rights were disposed of was urgently advocated as a means of minimizing the evil in the future. It is necessary to emphasize this point, for the fact has been altogether lost sight of, that the Government Geologist's duty in the several States is not primarily the finding and survey of mines and minerals, but only to locate or assess areas applied for in fee simple, or which it might be intended otherwise to offer for sale as freeholds. This is really but another form of the principle that the land should be put to the use for which it is best suited. The colonies which had no important mineral discoveries,

nor ever expected to get such within their borders, refrained from creating geological departments; thus saving much expense at the moment, but losing far more later on in the sequel.

Turning now directly to Western Australian mining laws, it is noteworthy that no important mineral discoveries were made in the colony until years of experience in dealing with such matters had resulted in the formulating of statutes in the other colonies of Australasia. As a consequence, when at last the gold wealth of Western Australia became manifest, there were laws ready to hand, fitted for the occasion, and tried by experience. These were adopted verbatim from the codes in force in the East. The local conditions were not always identical with Eastern conditions, and some of the Acts adopted, such, for instance, as the South Australian Mining on Private Property Act, were abandoned almost immediately after adoption, and without an effort being made to apply them. An attempt to limit the dual title to ground and to restrict the depth to 10 ft.—at which depth the alluvial digger should give place to the miner holding the ground on mining lease—assumed a grave aspect, threatening bloodshed at Kalgoorlie in the early days of that centre. In adopting a line of least resistance by conceding the diggers' claim, and subsequently passing regulations deferring the issue of leases until satisfactory evidence was forthcoming that no alluvial difficulties were likely to arise, the Western Australian Government kept abreast of the spirit of the age. Ample powers of resumption of any area can be exercised for any purpose of "public utility," which broad and comprehensive term, if used by the earlier colonies, would have saved much friction and greatly benefited the people generally. From laws dealing with the land itself on the broad principles thus sketched, it has been a natural advance to the enactment of humanitarian laws devised directly for the benefit of those following the avocations incident to the mining industry. The mineral industry is distinctly a people's interest, and, regarded as such, every encouragement has been given to those willing to embark capital or labour in it.

Australia, since its great gold discoveries, has made sixty years of progress which has astonished the world. Its mining laws are the most liberal of any realm, and the mining laws of Western Australia are the most liberal of the Australian laws. The laws which governed American mining sixty years ago prevail there to-day, yet, with breezy assurance, Australians are often bidden to look to America for examples in sound mining legislation!

Mr. A. C. Veatch, a geologist of the United States Survey, who was sent in 1909 to Australia as a Special Commissioner to investigate the Australian mining laws, in his report to the Joint Committee of Congress, awards the pride of place to Western Australia, over all other

Australasian States, in the following words:—"The Western Australian mining law is, in short, a wonderfully symmetrical and carefully balanced enactment, and while it may not be, as a whole, applicable to American conditions, it contains many suggestive provisions which merit careful consideration, as they are not the idle visions of some theorists, but the mature enactment of a legislature whose members are chosen entirely by the voters of a great democratic mining State, a State which ranks among the greatest mining countries of the world, and which, as recently as 1904, has reorganized and revised its mining laws to meet the practical work-a-day conditions of a mining region . . . it is, moreover, a mining community in which the capital employed in development is almost wholly of foreign origin."

## II.—HISTORY OF MINERAL DISCOVERIES.

Bond labour of the convicts allotted out to the free settlers established the fortunes of the woolgrowers and farmers in eastern Australia. The working of copper deposits made fortunes for private enterprise in South Australia and established that colony. The discovery and working of lead ore at the Murchison River similarly gave the first impulse to the prosperity of Western Australia. The great gold discoveries of New South Wales and Victoria, coming still later, finally started the Australians on the direct march to nationhood by attracting population on a scale sufficient to settle all the best parts of Australian coasts south of the tropics. Such in brief outline has been Australia's industrial history. The development of its mineral wealth has been a most potent factor.

Seventeen years' experience and exploration showed the early settlers of Western Australia that woolgrowing and farming conditions, as then obtaining in the other colonies, were non-existent in their colony. The open grass lands were limited in area, and the herbage scanty as compared with the more favoured east side of the continent. Not only did the dense low scrub and bush undergrowth tear the wool from the sheep seeking to browse among it, but also noxious plants induced a mortality among the stock which science and local experience could only overcome after a prolonged period of study. The loss of wool amid the scrubby bush was estimated at upwards of 20 per cent. of the natural fleece by the woolgrowers of Tasmania, and this loss was the incentive which took the Hentys and others to the privately discovered pastures along the Victorian coast. Henty tried Western Australia also, but soon retired in dread of repeating his Tasmanian experience. The outlook for the farmer was little more inviting, for the soil of Western Australia adjacent to the coast was of most uninviting aspect, and singularly barren looking to those conversant only with the systems of agriculture then

practised in the older European countries. Surveyor-General Roe made an extensive journey inland in 1836, but though he found good soil, its distance from the coast and the general absence of surface waters precluded all hope of any early benefit from it. Dense scrub covered the good soil, and sandy wastes or salt claypans occupied the open spaces. In the Avon River Valley the farmers found, at York and Toodyay, locations suitable for their work, but the distance from the coast and rough roads made the farmer's life one of hard struggle even in these more favoured localities. What little ready money was brought into the early colony became gradually drained away in procuring the necessary things from outside, and—though the need was pressing—an export trade which should bring money into the country was in such circumstances a difficult thing to bring about.

A deep feeling of envy of South Australia's good luck in discovering copper mines gained in intensity as labour and settlers were attracted there from Western Australia. Mining for coal made an export trade for New South Wales; mining for copper and lead was doing the same for South Australia; surely the bounty of Nature had reserved some good thing beneath the soil for the Cinderella colony, whose surface was so unready for man's occupation? Such was the question often and seriously asked. The hope and the wish for a coal mine had induced the Western Australian Government as early as 1830 to offer a reward of 2,500 acres in fee simple to any person "who may discover and point out any considerable bed of coal" within the colony. Locally the desire for a coal mine near Perth was intensified by the abundant occurrence of iron ore forming the cappings of ridges and skirting the higher gullies throughout the Darling Range, where it was covered with jarrah forest. Experimenting crudely with crucible charges in a blacksmith's forge easily produced iron from this ore, and showed it fairly rich in the metal. In 1839 and 1840 the Government renewed its offer of a reward for a coal discovery, and the agricultural society, which the residents around York had formed, kept up a special interest among the public by inciting its members to observe and bring under notice all mineral occurrences noted. Dr. Harris, the Colonial Surgeon, who had established a pastoral station in the Williams district, was also a keen observer and strong advocate of search for minerals.

There was another special reason which incited individual effort to search for coal and the base metal minerals, such as iron ores. This was the indefiniteness of the reservation of all the "precious metals" in the deeds of grant of land. "The Crown reserves to itself all mines of precious metals," is the wording in the regulations issued March 1, 1831. Naturally, among a people uninformed in mineralogy, any ore of any metal

which might happen to have associated with it a "precious" metal would be liable to a Crown claim for possession, and only to be worked by the finder under some, as yet, undetermined form of licence to be issued. An early discovery of a patch of meteoric stones was made near the head of the Avon River, but the find was long kept a close secret lest the stones should prove to contain something precious, and be claimed on behalf of the Crown. The discovery is thus noted in *The Perth Inquirer* in its issue of November 4, 1840:—

"It has been related to us that a few miles to the back of a settler at the head of the river there is a remarkable parcel of stones to which the natives attach peculiar veneration; they have a tradition that these stones fell from the heavens three or four generations ago, and to this day great care is taken of them by the natives, who place 'blackboy' tops over and under them.

"Our informant has had the curiosity to visit the spot, and describes them as being of somewhat meteoric appearance, and totally distinct from any other stones in the neighbourhood. They are probably from twenty to thirty in number, most of them exactly oval and perfectly smooth, varying in weight from 3 to 18 or 20

lb. The gentleman in question has removed some of them to his own house."

A large meteorite from Youndegin, a locality east of York, has since been shown at several international exhibitions, and is now in the museum of the Geological Survey of this State.

The York Agricultural Society held its first annual meeting the week after this find of stones was announced, and took up in earnest the question of developing the colony's mineral resources.

A purer form of iron ore than the laterite cappings high up in the jarrah ridges occurs at several points in the Perth plain at the foot of the Darling Ranges. They are deposits of a clean ironstone or ironstone gravel, resting usually on a clay bed. One such deposit, discovered by Mr. Raikes one and a half miles west of

Rainsworth on the Middle Swan, attracted much attention in August, 1843, not only from its metallic percentage as determined by Mr. W. J. Gregory, but also on account of the deduction made that coal measures would be found in association with it. Dr. Harris, the acting Colonial Surgeon, pointed out that in England—with one exception only—coal beds and ironstone always occurred alternately, and there was no reason that a similar parallel occurrence should not exist in Western Australia. The doctor further pointed out in support of his theory, that near Canning there occurred a black shale and slate, and that near the Williams River on the Albany Road, iron ore in both the spherical and cubical forms occur. He considered the Rainsworth discovery full of promise, and regretted that no suitable boring machine was in the colony whereby the site could be tested. The report of the doctor, along with the report of Mr. Gregory, was published in the proceedings of the York Agricultural Society, and

developed a widespread belief that coal would be found underneath the flat, low coast plains between Perth and Bunbury. The Government offer of a reward for the discovery of a coalfield was again repeated in the follow-

ing year, so keen had now become the quest for coal.

Three full years later it seemed at last that the coal predictions of Dr. Harris were confirmed. A settler named Beecham, while trenching his plot on the south bank of the Murray River, and five miles from the sea coast, discovered what appeared to be coal. This was in July, 1846, and the Resident Magistrate, Mr. Singleton, was at once sent down to examine and report. He was accompanied by Messrs. Lefroy and S. Moore, along with Mr. George Nash, the editor of *The Perth Gazette*. A pit was sunk to a depth of 14 ft. and passed through nine beds or layers of strata, all dipping westward at a gentle slope of 1 ft. in 18. In the third layer, which was a clayey shale, there occurred coal which, when retorted in a pipe, gave off illuminating gas. This stratum lay right underneath the trench made by Beecham. But

"CALABASH" OR "SHIRE PLASTER," USED AS PAPER CURRENCY IN THE KIMBERLEY DISTRICT, 1887.

William Beecham was a man of purely parochial ideas, one of a class afterwards long considered to be representative of Western Australia by the "t'othersiders" in the eastern colonies. It was no concern of his that the colony needed a coalfield. He didn't. He objected to pits being sunk on his ground; for, said he, "What do I want with coal? I have firewood enough to last my time!" But the Resident Magistrate over-ruled William, and a pit was sunk till water stopped further progress. The different layers passed through were:—

- (1) Yellow clay, slightly sandy.
- (2) Yellow clay, with red spots, apparently iron-stone.
- (3) Clayey shale, with gas coal fragments.
- (4) Brown clay.
- (5) Light-blue clay, very tenacious, 6 in. thick, and showing veins of black with distinct marks of leaves.
- (6) Blue clay, 3 ft. thick, and rather lighter than layer No. 5.
- (7) Brown clay, 14 in. thick.
- (8) Fine drab-coloured sand, 2½ ft. thick.
- (9) Strong adhesive clay, through which sinking was prevented by the heavy influx of water from the drab-coloured sand layer.

The evidence thus obtained was sufficient to convince a resident named Birch, who had resided in the English coal districts, that the clay shale represented part of a true coal measure. The Government accepted the result equally without reserve. The local press considered it most opportune news to send to Singapore by the Government schooner then sailing for that port, and whence a mail to England would be despatched. The question of a steam route to Australia, *via* Fremantle and the South Coast, instead of through Torres Straits to Sydney, was now considered to be the assured policy of the future.

In addition to this coal discovery at the Murray, copper and lead mineral occurrences were reported on lands which had been alienated. The dread that "precious metals" reserved to the Crown would possibly interfere with the opening of these discoveries on private lands, caused the Governor to submit a despatch to the Colonial Office on July 25, soliciting explicit instructions on the point. Should discoveries occur before a reply was obtained, the Governor had resolved—although this fact was not publicly known—to follow the example of Governor Young in South Australia, and reserve a one-fifteenth royalty to the Crown in deeds of land grants. Governor Young's measure was extremely unpopular in South Australia, because it put a stop to a great and rapidly growing evil—the "special survey" system of acquiring lands in fee simple; 20,000 acres at a time. By that system the speculator there had two chances, one of which was sure to win him profit. He got the pick of the land (the

eyes of the country, in fact) for £1 per acre, and if it contained no mineral deposits of value the land itself could be sold at a substantial profit, or made to produce a regular income under rental. The Burra Burra Mine and Estate was one of the properties thus acquired; and at the time of the Perth excitement over Beecham's coal discovery, and the reported copper and lead finds near Kelmscott, a Perth solicitor, Mr. B. Aubrey Vigors, had just returned from a trip of observation to South Australia. On his representations a movement was got up in Perth for the formation of a joint-stock company on South Australian lines. It was proposed to negotiate with discoverers, and quietly buy the Government lands on which the discoveries were made, without exciting competition when the lands were put up to auction as the law required. Tin was at this time also reported to have been found in the Toodyay district, but the finder refused to disclose the locality unless substantially rewarded. This alleged tin find, and Beecham's discovery, fanned the excitement. At a meeting convened at the London Hotel on September 17, Mr. S. Moore being chairman, a company was formed with the twofold object of promoting discovery of minerals and buying the mineral land as cheap ordinary agricultural lands. Mr. Vigors addressed the meeting, and showed how such a policy combined all colonial interests in one object and the success of such a scheme in South Australia.

Thus "The Western Australian Mining Company," as it was named, was launched with a capital of £20,000, divided into 10,000 shares of £2 each, as had been the case with the South Australian companies. The terms of subscription decided upon were: 4s. per share on application, the balance payable in calls of 10 per cent. at intervals of not less than three months. At all meetings every five shares to carry one vote. When lands were put up to auction by the Government, at the instance of the company any shareholder bidding against the company would have his shares forfeited, and be further deemed to hold the land as a trustee for the company. Only fully qualified members could attend meetings of the company, and every member was to sign a bond of secrecy. Over 600 shares were subscribed for at the meeting, and a committee of control appointed, consisting of Messrs. Roe, S. Moore, Sutherland, Vigors, Knight, and R. Habgood, with power to add to their number, and five to form a quorum.

On the same date that this company was started the following announcement was issued by the Governor, and appeared in the *Gazette* two days later, along with the advertised prospectus of the company:—

Colonial Secretary's Office,  
Perth, September 17, 1846.

His Excellency the Governor, having learnt with great satisfaction of the discovery of the existence of metalliferous ores in this colony, is pleased to direct it to be notified for general information—with a view to prevent any

apprehension as to the royalties to be reserved to the Crown in all future grants of land, known or supposed to contain such ores—that the amount of such royalty will not for the present exceed one-fifteenth of the proceeds of the mine, and that with the exception of this reservation, and the conditions necessary for the securing of it, all lands will be put up to sale as heretofore.

Despatches on this subject are expected from Her Majesty's Government, and full regulations for the information and guidance of the public will shortly be promulgated.

It is evident that "precious metals" were supposed to be contained in, or associated with, the minerals found, such as copper, iron, or lead, because before the promised regulations were issued they were rendered unnecessary by the receipt of the following despatch from the Home Government:—

Colonial Office, Downing Street,  
London, December 23, 1846.

Sir—I have received your despatch No. 29 of July 25 last, in which you submit the question whether the terms of reservation hitherto used in deeds of grants in Western Australia (namely, "all mines of gold, silver, and other precious metals") can be legally held to include copper, iron, lead, or other metallic ores other than those of gold and silver. . . . I have to acquaint you that it was not the intention of Her Majesty's Government to claim on the part of the Crown, under the name of "precious metals," such minerals as copper, iron, or lead.

By omitting all reference to tin, antimony, zinc, and other well-known metallic minerals the limitations of the words "precious metals" could hardly be said to be clearly defined in this despatch.

With the formation of the Western Australian Mining Company, and the *Government Gazette* announcements following on after it, the mining history of Western Australia begins. The projected company hung fire, however, for the chief reason of its existence—the speculation in mineral lands to be purchased from the Crown as ordinary lands—received a severe check by the declaration of a royalty reservation and a three months' advertising before the lands could be put up to auction. Once more the attention of the settlers was directed to searching for lands for grazing purposes. The flocks and herds had by their natural increase already occupied all the open land available, and more grass land was urgently needed. Hope of better things in the interior to the eastward had long since been given up, but there still remained the country inland from the coast to the northward. The expedition of Captain (afterwards Sir George) Grey, though disastrous to the party, had indicated pastures of fair promise in the Victoria district adjacent to the coast, and some 200 miles north of Perth. To explore in this direction was urged upon the Government, and with the aid of private subscriptions a party was fitted out under the leadership of Mr. A. C. Gregory, who was accompanied by two of his brothers—Messrs. Frank and Charles Gregory. Starting from Bolgart, the expedition went over swampy country and up over a granite divide to the plateau of the salt lakes, among

which Lake Moore is the largest. Then it turned westward to examine the country at the head of the rivers crossed near the coast by Grey. The interminable scrubs covered all the uplands, but it was hoped that more open valleys would be found along the river channels as they ran towards the coast. Descending from the granite upland a thick formation of white sandstone was found at its base, and shortly afterwards a shale strata was met with suggestive of coal deposits. A few miles further, at a point some 17 miles north-east of the present town-site of Yandanooka on the Midland Railway line from Perth to Geraldton, search in a deep valley was rewarded by the discovery of two large seams of coal—one 5 ft. and the other 6 ft. in thickness. Here, "having pitched the tent and tethered the horses," remarks Gregory in his journal of the expedition, "we commenced to collect specimens of the various strata, and succeeded in cutting out 5 or 6 cwt. of the coal with the tomahawk; and in a short time had the satisfaction of seeing the first fire of Western Australian coal burning cheerfully in front of the camp, this being the first discovery of coal in the western part of the continent."

The excitement in Perth, when this discovery of Gregory's was made known in the Press of November 26, was intense. Its immediate effect was to cause a further 1,000 shares in the Western Australian Mining Company to be eagerly subscribed for, and enabled that organization to enter actively upon operations. Six weeks earlier the company, in the following advertisement in the Press, had publicly announced its desire to acquire a mining property:—

Western Australian Mining Company.  
Notice.

The Committee of the Western Australian Mining Company solicit information relative to the existence of minerals in this colony, and are prepared liberally to reward persons affording the same.

All communications on the subject to be addressed (post paid) to "The Committee of the Western Australian Mining Company, Perth."

CHARLES SHOLL,  
Hon. Secretary.

Perth, Sept. 21, 1846.

In response to this advertisement a lead find was brought to the company's office during October. It was south from Perth, and not far from Kelmscott. It was on freehold land, and thus the Government regulations of the moment did not prejudice negotiations with the proprietor of the land in fee simple. Negotiations were also opened with a German savant in South Australia named Menge, with the view of his visiting Western Australia and giving expert advice on mining and geological questions of concern to the company. The company as a joint-stock concern was never fully formed, and no deed of settlement was prepared and adopted as the law in such cases required. But the enthusiasm following on Gregory's coal discovery, and the number

of shares in the company taken up as the result of that excitement, caused the committee to issue scrip, which thus gave to Western Australia all the outward semblance of a community possessed of a real mining enterprise. The facsimile of the scrip on page 295 will be interesting, and is furnished by the liquidator of the company, Mr. H. R. Coombs, of Perth, who was appointed by the Supreme Court to wind up the company after it had been sixty years in unregistered existence.

Meanwhile the Government was taking steps to further prove the value to the colony of Gregory's coal discovery. The distance of the find from a place of shipment—90 miles—prohibited hope of early benefit owing to transport difficulties, which, in the then state of the colony and its finances, could not be surmounted. The carboniferous formation of rocks, however, extended an unknown distance towards the seaboard, and some hope was felt that further search would locate coal seams more advantageously situated for development. To this end a Government party, consisting of Messrs. Gregory, Meikleham, and Irby, and Lieutenant Helpman, with an escort of five soldiers, was sent up the coast in the Government schooner "Champion" during the last week in November. They visited the coal find, and brought some 3 cwt. of the coal away for a trial test. They failed to locate any other seams in the country traversed, while the coal brought down, when tested, proved of inferior quality—altogether of no value at such a distance inland.

It was now evident that other minerals than coal must be obtained if the community settled around Perth was to benefit in the near future. The secrecy attending the actions of the Western Australian Mining Company soon made residents very dissatisfied with the outlook. The company was roundly charged with having only land speculation for its object, and not mining. Some colour was given to this charge by secret expenditure in investigating reports of copper and other discoveries in the districts outside of Bunbury. Messrs. Vigors and J. W. Gregory both appear, in the balance-sheet, to have involved the company in expenditure in that direction. The sporadic attempts to develop the lead show at Kelmscott was insufficient to explain delay there, and when copper was reported on Crown lands near by, the new discovery was immediately discounted as a further excuse for dallying and speculating in land. The Government's refusal to accept "remission certificates" as part of the purchase money, and the auction sale after three months' notice by advertising, also contributed to delay on the company's part. Finally, however, the Kelmscott land was purchased, and also the land on which the copper was reported to occur. With this estate to begin on, a practical working miner named Thomas and a German scientist named Dr. von Sommer were imported from South Australia, and mining work was actually begun.

Messrs. Duffield and Gilman, the discoverers, were paid £20 reward for introducing the property to the company. Mr. J. W. Gregory superintended the mining work until Dr. Sommer's arrival, his salary being £5 per month as from December 4. Under Mr. Gregory's directions a shaft was started on the lead lode, the miners sent down from Perth being engaged at 6s. per day, with rations provided. The 50 acres of land on which the lead lode occurred was purchased for £70. As usual in such cases, the men were soon complaining of the quality of the rations provided, and work progressed at a distressingly slow rate. A month's work resulted in sinking the shaft to a depth of 9 ft. only. At that depth copper appeared to be replacing the lead. This was another incentive to secure practical mining advice from the copper-producing sister colony of South Australia.

To incite this company, and also the Australind Company in the south-west, to greater activity in demonstrating the value and extent of the mineral deposits, the captain of the "Despatch"—a vessel then trading to Fremantle—offered to take to England free of charge a shipment, as trial parcels, of one ton of lead ore and one ton of copper ore. When Dr. von Sommer arrived everything was apparently in readiness to fulfil promises made and expected.

Dr. von Sommer's engagement was for six months from February 15, 1847, at a salary of £6 per month, including travelling expenses. The doctor's first report on the property stated that there were six lodes in it, five carrying lead and traversing the property lengthwise, and the sixth a lode transverse to all these, and carrying copper ore. A contractor named Coles was sinking the main shaft at this time, and so hopeful was the committee that the members anticipated events of the future by at once purchasing some tramway material and talked largely about tramping the ore from the mine to Fremantle for shipment. Secretary Sholl, whose work had been honorary hitherto, was now made full secretary with salary at £20 per year and back dated to September 18 of the previous year. By the beginning of April the total number of shares taken up was 6,916 out of the total 10,000 projected for the formation of the company. The application call of 4s. per share had thus given the company a sum of £1,383 4s., a highly creditable contribution by the settlers when the population and scanty monetary supplies then within the colony are considered. Expenditure to that date (including land purchases) totalled £526 14s. 2d., leaving a credit balance of £826 after providing for some further outstanding liabilities.

A month later the shareholders learnt that, despite prospects, no actual pay-ore had been discovered. On the 50-acre block, at a point north from the first shaft sunk, a vein 3 ft. thick had been discovered which carried zinc ore, but no lead. Specimens assayed showed the ore to contain 66 per cent. zinc, 13 per cent. sulphur, 10

per cent. iron, and 10 per cent. earthy matter. This lode was not economically important, as zinc ore commanded a very low market price. The prospects for the future were then dealt with by Dr. von Sommer as follows:—"As soon as I have finished all my arrangements at the mine," he wrote, "I intend first to go and try the great meridian lode on Cardon's boundary, and perhaps some in other places, and then to follow up that line at least as far as the Serpentine. If I should not in this district meet with a real copper lode, we must give up our hopes on that line and try some other district." This report completely disconcerted shareholders, and when the examination towards the Serpentine River also failed of success, the company decided on a breathing time and husbanding its resources. Dr. von Sommer's services were loaned to the Government till the end of his six months' term. The engagement was not renewed, but foreman Thomas was directed to continue sinking the shaft.

The service for which Dr. von Sommer was loaned to the Government was another general effort that Governor Irwin had decided to make to find a coal mine south of Champion Bay and near the coast. The Governor at first even contemplated going up in person with

the expedition. Two distinct parties formed the expedition as finally constituted, one section going up overland from Toodyay, and the other, which included Dr. von Sommer, sailing up in the "Champion" to Port Grey. A geological examination from Port Grey, south to the Hutt River, showed rocks considered to be of the same age as that in which Gregory's coal seams occurred, but no coal was ascertained to be contained in them along this section.

Von Sommer returned to the Kelmscott Mine the second week in September, and found that during four months the shaft had been sunk to only 46 ft. altogether. The lode had dipped out of the shaft, which shaft, despite his written and verbal instructions, had not followed the lode in its underlay, and now 12 ft. of driving (or £60

v2

worth of dead work) would be necessary to see again the lode at a depth of 36 ft. below the surface. The committee declined to renew von Sommer's engagement, and appointed a man named Forbes to superintend operations, the balance funds in hand having now shrunk to £362 7s. 3d., with £222 outstanding liabilities. Forbes reported on September 27 that, so far, he had seen only zinc blende ore, but as assays showed both lead and copper present in association he judged the mine would make copper at depth. The unimproved outlook at Kelmscott then decided the committee to look for another property, and Mr. Forbes was despatched to Moore River and other places in search. By December the funds had sunk to £70, at which stage a call was considered desirable. However, the meeting called for this purpose took exception to the committee's powers; no

deed of settlement had yet been adopted, and, till one was drawn up and its adoption passed, the power to make further calls did not exist. To avoid a lawsuit and to gain time to look further into the question, the company closed up for the present, and thus ended, on December 2, 1848, the first and abortive attempt to start a mining industry in Western Australia.

1600-FT. LEVEL, GREAT BOULDER GOLD MINE.

After his engagement with the mining company had expired, the Government engaged Dr. von Sommer for a term as Government Geologist. In this capacity an examination was made of the Moore River in search of coal, and later, his journeyings were extended to the south coast and east of Albany to near Mount Barren. At the latter place the doctor saw a change of country, which made him augur the possible occurrence of coal in that region. Eyre, during his journey in 1841, had conceived the same idea.

In the month of November the expedition to the Murchison River country returned to Perth, with the news of the discovery of a lead lode (galena) right in the bed of the river where the stream had eroded its channel down through the sandstone formation and laid bare the

ancient rocks lying beneath them. For two and a half miles below this galena occurrence Gregory found fragments of the lead ore, but as no other vein was found he believed they were all shed from the one vein first located. The galena vein, as described by Gregory, "filled a cleft in the rocks a foot wide and 30 yards long, but being covered with water to the depth of 3 ft., except at the northern end, I could examine it but imperfectly: neither could I trace it beyond the bed of the stream. The bearing of the mine is N. 25° E. mag., and the adjacent rocks are of hard syenitic gneiss, dipping 80° to the west-north-west, and the strike north-north-east." Gregory was not at the time of opinion that he had found a "main lode" of silver-lead ore, but only an offshoot from one. "It is somewhat remarkable," he goes on to say in this connection, "that the vein coincides exactly with the stratification of the adjoining rocks; this appears to indicate an accidental mass or offshoot from a vein, as it is not usual for a true lode to be parallel to the strata." Gregory also referred to the country between the Bowes River, in what is now the Northampton district, and the Murchison, and adds in this report: "There is also a mineral resembling plumbago in many of its properties. It is found disseminated in small particles in the gneiss rock on several parts of the Bowes and Murchison Rivers."

The old question of the land laws at once cropped up when Gregory's discovery became known. Mr. L. Burges applied to purchase a location on the Murchison River. The area sought was just about sufficiently large for a station and homestead, and no more. Burges was at once accused of trying to obtain the mineral land at the price of ordinary agricultural land, thus subverting the regulations which enacted that "mineral" lands must first be advertised for three months, and then thrown open to competition at public auction. To settle definitely the correct policy to be followed in dealing with these lands on the Murchison, Governor Fitzgerald resolved to go up personally and investigate. He went, and his trip resulted in bloodshed, owing to an attack by the natives—the Governor being himself wounded by a spear thrown at close quarters. The result of the Governor's trip was a decision to sell the land as "mineral land," and it was advertised accordingly. A shipping port was selected at Lynton, some distance north of Champion Bay (now known as Geraldton), to which a bullock-dray road was made later.

Matters again looked hopeful for the struggling colony, and this hope was increased by the news brought in by Surveyor-General Roe from his five months' trip eastward of Narrogin and along the south coast to the Russell Range. He had found no good pastoral land, but while returning coastwise to Albany he had, at the Fitzgerald River and close to the coast, found a bed of coal; it was of inferior quality. But about the same

period Maxwell, a plant collector of Albany, had brought in some very superior "glance coal" from somewhere near Roe's find. This confirmatory intelligence decided the Governor to send Mr. Gregory down to investigate. His examination failed to locate good coal. The question of a payable coalfield at the Fitzgerald was not disposed of till Mr. C. G. Nicolay visited the spot a quarter of a century later. He proved the deposit one of carbonaceous mud allied to the deposits termed "turbo" in Brazil, and recommended the expunging of the "carboniferous" formation in this region from the geological map of Australia. Maxwell's specimens were unquestionably genuine coal of good quality, and in explanation of its occurrence on the south coast it has been suggested that it was either procured from one of the French or American whaling vessels then frequenting the coast, or had been left behind by them at one of their camps in the vicinity.

The copper-mining boom in South Australia had reached unprecedented dimensions by the time the three months' advertising of the mineral land at Murchison River had expired. Burra Burra Mine shares were selling at £130 each on March 3, 1849; flour in Adelaide was selling at £9 per ton, and wheat at from 3s. to 3s. 6d. per bushel. Wealth was rapidly accumulating in the sister colony, and a keen Perth speculator went across to Adelaide and organized a syndicate for purchasing and developing the lead finds in the Murchison. The specimens brought down by Gregory were pronounced very rich in silver and lead when assayed by the Adelaide experts—Menge and Pascoe; but Dr. Davey, whose verdict carried great weight in financial circles, pronounced them worthless from the economic standpoint. The syndicate planning to secure the Murchison land cheaply—and which, it would appear, was acting with full knowledge of Dr. Davey's opinion—reckoned, however, without its host. It had collected £3,000, and intended to secure another 1,000 acres. When the land was put up to auction it was secured at £1 per acre—the price of ordinary land—not by the Adelaide syndicate, but by a quietly-formed Perth company, which had organized in thirty-two shares of £20 apiece. Dr. Davey's opinion was then used, much to the prejudice of the local company and its mining prospects, and in the depressed state of local feeling in regard to mining and things generally it was decided that further samples should be procured before operations were commenced. In one sense it was unfortunate for the colony that the Adelaide plan was forestalled, for it would have led to considerable influx of capital into the colony from outside, instead of diverting the small amount locally possessed. A sailing vessel to bring over a quantity of machinery and plant had, in fact, already been chartered by the Adelaide syndicate, which was compelled to abandon the enterprise at the last moment.

The further examinations of Murchison specimens appear to have been satisfactory, for, during April and May, the local company called for tenders for the raising and carting down to the coast of a parcel of 100 tons of ore from the Geraldine Mine—as the new venture was named. The advertisement calling for the tenders proceeded to state:—

For the information of parties tendering, it is stated that the vein, containing pure ore and of an average width of 18 in., is open for the space of 320 yards, throughout the greater extent of which the ore protrudes above the surface as a wall; so the entire quantity required can easily be obtained without sinking or blasting. (See official report of Assistant-Surveyor, A. C. Gregory.)

A. O'G. LEFROY,  
G. SHENTON,  
R. M. HARGOOD, } Trustees.

Perth, April 24, 1849.

The uncertainties of any attempted traffic through the 60 miles of bush country which separated the mine from Champion Bay, the selected place of shipment, added to possible trouble with the native tribes, who had attacked Governor Fitzgerald's party, proved a deterrent to tenderers.

The progressive march of settlement northward and better assay reports on the quality of the ore, determined the Geraldine shareholders to attempt work, provided the Government would give military protection. The Messrs. Burges, of York, determined at the same time to found a pastoral station north of Champion Bay, and to this end advertised their willingness to take and keep, on shares, the stock of others, if lots of not less than 1,000 sheep or twenty-five head of cattle were sent them by approved persons. Combining forces with the Messrs. Burges, the Geraldine shareholders procured two teams of horses from Mr. T. Carter, of York, purchased three months' supplies for the party, and engaged workers. The party went up overland, Mr. L. Burges, who had agreed to superintend operations, being in charge. He had with him Messrs. A. Gregory and E. Hester, four workmen, and an escort of seven soldiers. The intention, when this party was organized in October, was to break out 100 tons of ore and transport it to England by the next outgoing woolships, in order to have a practical test made of the ore on a commercial scale. Burges' work, however, and the preliminary prospecting of the locality which eventuated from it, soon showed that the district contained much more mineral than was included in the 640 acres taken up as the Geraldine Mine. Smelting the ore on the spot was seen to be possible, as the timber for fuel and for mining purposes was handy and plentiful. Wells obtained water plentifully at 15 ft. deep, the road to the boat harbour at Lynton was found easily practicable, and the harbour itself was capable of taking ships up to 800 tons burthen. Lead at this period was selling at £18 per ton, and against each ton of pig-lead

to be produced at the mine the estimated charges were figured out thus:—

	£	s.	d.
Raising the ore ... ..	1	10	0
Smelting ... ..	4	0	0
Cartage to Champion Bay ...	3	0	0
Freight to Singapore ... ..	2	0	0
Contingent expenses ... ..	0	10	0
	<hr/>		
	£11	0	0

This showed an estimated net profit on sale at Singapore or China of £7 per ton, which amount was capable of further increase as the freights and cartage costs became naturally reduced.

The promising outlook and improved prospects decided the Geraldine proprietors to throw the property into an enlarged joint-stock company in order to provide capital sufficient for working the mine on a modern engineering scale. Subscriptions were invited from South Australia also, and a place was found for an Adelaide representative on the directorate. The prospectus of the proposed company appeared in the Perth newspapers on January 18, 1850, under a title-head, as follows:—

THE GERALDINE MINING COMPANY.  
Perth, Western Australia.  
Capital, £6,400, in 1,280 shares of £5 each.

Directors.  
R. HARGOOD    A. O'G. LEFROY    T. SMITH    D. SCOTT  
G. SHENTON    J. W. DAVEY    E. STIRLING    H. VINCENT  
J. FERGUSON    P. MARMION    J. DYER  
G. J. CARR    W. PEARCE    W. OWEN

With power to add to their number.  
Banker—The Western Australian Bank.  
Director for South Australia—W. OWEN, Esq.  
Secretary—ROBERT J. SHOLL, Esq.  
Repeated applications having been made for shares in the above mine, the Company has resolved to purchase the same from the proprietors and to throw it open to the public, in order that all parties may be enabled to avail themselves of a share in a speculation that offers every prospect of a prosperous issue. . . . Copper has been discovered upon the Company's grant in the immediate vicinity of the mine; indeed, there can be but little doubt that the whole of the grant, which amounts to 640 acres, is rich in mineral products.  
Coal and timber fuel is abundant in the neighbourhood, so that every facility exists for smelting the ores upon the spot. . . . For further information, parties are referred to the various reports that have from time to time been published in the journals of the province.  
Applications for shares to be made to Mr. R. J. Sholl, Perth, and to Mr. W. Owen, Adelaide.  
By order of the Directors,  
ROBERT J. SHOLL, Secretary.

Perth, January 10th, 1850.  
Gregory's discovery of the Geraldine lead lode inspired a section of the Western Australian Mining Company to keep that organization alive, in hopes that something might turn up to retrieve the past. Against the strongly expressed wishes of the controlling committee a

call of 1s. per share was made, whereupon the committee resigned and a new one was appointed. Work at the Kelmscott Mine (or rather, to give the locality its true name as now known, Mundijong) was again started, and by March 3 £271 had been paid on the call made. By the following August the balance of funds was reduced to £188, and on the motion of Messrs. Roe and Witteboom at a meeting of shareholders, the committee was directed to convene a general meeting in the first week of the November following, to consider the formal winding-up of the company. But by November the Geraldine Company had made a start, and Perth folk talked mining once more. At Mundijong itself, Mr. Habgood had been instrumental in finding a new copper-bearing lode, and in view of the changed outlook he and Mr. Shenton strongly deprecated winding-up. Mr. Samson, the chairman, further drew the meeting's attention to the Geraldine and other discovered indications in the far north country, suggesting that the company might do well to migrate there and secure land at a later date as developments occurred. The result was a resolve to carry on, and to make another shilling call and to persevere further with the Mundijong land. While this policy was in progress news came down from the Murchison River of new discoveries there. Burges had discovered a real silver-lead lode, and Gregory had discovered a large deposit of copper ore—blue and green carbonates in quartz—at a point three and a half miles from the Geraldine location and two and a half miles south from the river. The ore specimens brought down left no doubt of the importance of this last discovery, and a new company in shares of £100 each was immediately projected to acquire and work it. The mine was to be named the Wheal Gregory, after its discoverer. The opportunists in the Western Australian Mining Company now saw the success of their "Micawber" policy. Negotiations were at once entered into for securing the Wheal Gregory, but the shareholders' reluctance to pay the necessary calls caused the project to fail.

The doubts cast upon the payability of the Geraldine Mine did not deter the shareholders in that property from entering on a vigorous policy for its development. A smelting plant was purchased in England, and expert officers brought out to direct the mining and smelting. The 80 miles of cartage from Champion Bay to the mine proved a big handicap, and seriously delayed a proper start. The larger company, successfully formed, closed its share-list on December 1, 1851, and in the February following the Governor paid another visit to the district and witnessed the progress made in opening out on the lead and copper discoveries. As the result of this visit a road was authorized to the new harbour named Port Gregory, whereby cartage to the mine would be reduced to 40 miles. In April the director, Carter, and Habgood visited the mine, and though the smelting plant,

imported per the "Morning Star" months previously, still lay on the beach at Champion Bay awaiting carters, the smelter, Mr. Pearson, and Captain James had pushed matters with energy at the mine itself. Mr. Pearson and Captain James had made bricks, and erected a primitive type of smelter devised on the spot, and calculated to turn out 3½ tons of metal weekly. With this plant the first charges of lead ore were run and two bars of pig-lead, each weighing 140 lb., were produced in the directors' presence. The facility with which this was done encouraged shareholders to hope that, with the installation of the larger equipment, capable of turning out 1,500 tons of pig-lead annually, the venture would be a remunerative one. Thus mining and the production of exportable mineral dates in Western Australia from April, 1852. By what was probably a transcription error, the official records place this beginning of Western Australia's mining history in 1842, or ten years earlier. The error is of little importance locally, but, unfortunately, it has been copied into publications compiled elsewhere and widely circulated in Europe and America.

The copper lode discovered at Geraldine, though fairly rich at surface, did not, unfortunately, hold down below the water level of 16 ft. Some good specimens of ore from it were, however, extracted in time to be sent to the great exhibition at the Crystal Palace in England. Convict labour was by this time obtainable in Western Australia, and eighteen of the convicts were drafted up to Geraldine. Their conduct was not exemplary, and gave considerable trouble to the mine officials. The preliminary mining work had yielded such favourable results, however, that a Mr. Wills, claiming to be agent for the English and European Copper Company, opened negotiations with the directors of the Geraldine Company for a purchase on terms of partnership, which would place considerably more working capital to the company's credit. The Geraldine shareholders authorized the directors to act, but Mr. Wills' stay in the colony was not prolonged sufficiently to conclude the bargain. Further calls of £1 per share were made on Geraldine shareholders at intervals and readily responded to, but the glamour of gold discovery in the eastern colonies had by this time completely disorganized the free labour market in all the colonies, Western Australia included. The carting difficulties between Geraldine and the coast was increased, and for a time brought to a standstill by the depredations of the natives, who speared and killed the bullocks used for draught. The military and police protection given by Governor Fitzgerald was regarded as wholly inadequate, and bitter complaints were made on this score during the following winter months.

The subsequent history of the Geraldine mine was a chequered one for several years. Outside influences reacted prejudicially upon the colony to an extent unexampled in the eastern colonies. Mining was not

immediately sufficiently productive to dispel stagnation, and capital could not accumulate in the country from pastoral effort because of the absence of sufficient grass land. The Geraldine shareholders pluckily paid calls and sunk money in all sorts of projects to overcome natural difficulties, but it was not till June, 1854, that the smelting plant was in a position to do regular work on a commercial scale. The new manager, Captain Evans, was then producing one ton of pig-lead daily from ore assaying 50 per cent. of metal. Further extension of the plant was entered upon and funds readily provided for the purpose.

Meanwhile the pastoral settlements in the Victoria district, as the territory contiguous to Champion Bay was called, had become successfully established, and much land acquired from the Crown in fee simple at a cheap rate. A spurt was given to mining excitement once more by the display at the Survey Office of a collection of ores of copper and lead brought down from the northern country by Mr. Gregory, but information of locality was withheld at the moment. Messrs. Shenton and Leake, being among those refused information, created an agitation which led the Govern-

ment to call for a first, and then a second and fuller report from Mr. Gregory. From this fuller report it appeared that though the largest and best specimens came from the Geraldine neighbourhood, the remainder fully attested that a new mineral area had been discovered at Bowes River—now known as the Northampton mining district. Mr. Gregory, it appears, had found some of these specimens in the Chapman Valley, near King's Table Hill, as far back as 1846, but no explanation is given why the discovery was not made public at the time. The land laws, which prescribed the competitive auctioning of "mineral land" at that time, were probably the reason of this silence. Presumptive evidence on this point is furnished in Mr. Gregory's own words, for after describing the Geraldine district specimens, he says of the others: "The remainder of the metalliferous specimens (as shown

by the attached labels) are all from lands which are the property of private individuals."

These private lands in the Victoria district ultimately became the site of much mining activity for copper and lead. In fact, this was the real mining centre of Western Australia until the discovery of a payable goldfield in the Kimberley division twenty-five years later. The high price of copper following on the Crimean War came most opportunely for the mines in the Victoria district, and English capital flowed readily in and worked them. But at depths between 200 and 300 ft. the richer ore makes were depleted, and the smallness of the veins, enclosed in intensely hard rock, made following them to greater depth expensive—for these were the days of black powder and hammer and drill work for blasting, and the diamond-drill had not come into regular

use for mine exploration. Northampton had the usual experiences and vicissitudes of a town in a mining centre, but ultimately the rich agricultural soil induced permanent settlement by those who preferred farming to mining. As the mines closed down from one cause and another their history passed almost into oblivion, for the records of the English com-

Photo by J. J. Dwyer. GREAT BOULDER GOLD MINE, KALGOORLIE.

panies were all in England. Only since the great gold boom of the nineties has any attempt been made to reopen them, and then it was only to obtain the auxiliary help of the lead ore in the smelting of gold ore at Fremantle, which was sent down from the rich mines at Kalgoorlie. Being on private land the mining laws of the State, which compel mineral land to be worked either by the owner or by others willing to work it, do not apply. Only the land purchased since the passing of the Act which reserved all minerals to the Crown from and after January 1, 1899, can be dealt with by direct permission of the Crown. In other cases the private owner alone decides whether his land shall be broken up by the miner's pick, unless it is in search for the precious metals or for coal, in which case the Government may grant a licence.

It will form a fitting conclusion to this long chapter in the early history of Western Australian mining—a chapter which has never before been written—to append hereto the locations purchased as “mineral land” during the early mining days. The particulars are taken from a list recently compiled by Mr. S. Roberts, the Mining Registrar for the State, and kindly placed at the writer’s disposal by Mr. H. S. King, Under-Secretary for Mines.

### III.—DISCOVERY OF GOLD.

The slow development of the Geraldine Mine and doubts cast on the general prospects of mining in the colony produced a veritable depression in Western Australia in the beginning of 1854. This was accentuated by contrast with the gold-producing regions in the east, and consequent loss of the local population, which took every opportunity to go to the goldfields. It was felt that if Western Australia had a goldfield all would be well for the community as a whole. But for the flock-owners, whose stock had now filled all the available pasture grounds, the outlook was dismal indeed, unless grass lands could be discovered in the interior. Perth and Fremantle needed mining, but York and Northam needed grass lands. Such was the feeling when Governor Fitzgerald was induced to sanction a further expedition into the back country in search of grass, and decided to place the expedition in charge of Mr. Robert Austin. The Northam and York people subscribed a sum of £625, in horses and money, towards the cost of the expedition, and the party took the field from Northam at the end of June. Austin was the surveyor who came out with the Clifton contingent of settlers who took up land at Leschenault. He appears to have been a man with considerable knowledge of minerals and geology, as well as possessed of the faculty of closely observing every feature met with in his journeying. Starting out *via* Cow-cow-ing Lake he was the first to traverse part of the typical gold-bearing country which extends from the eastern goldfields to the Murchison. His observations were very precise, and had his advice been taken for a further examination of the region of which he just

skirted the edge, it is more than likely that Western Australia would have entered upon her gold-mining history close upon the heels of the great gold booms in Victoria and New South Wales, and nearly half a century of neglect and stagnation would have been saved the colony.

When approaching the country where now is the mining field of Black Range, Austin found the ridges composed of foliated greenstone rock, and in the plains between he noticed that the burrowing animals cast out from their excavations a peculiar white earth resembling limestone, which was perfectly white and soft. “Upon breaking open some of the lumps,” he writes in his journal, “I found the core invariably consisted of a piece of the foliated greenstone of the same kind as the adjacent hills, which appears to corrode or oxidize to this white earth. This peculiarity causes the hills to look like quartz-hills when viewed from a distance, as the exposed rock is very white, and it is only when fractured that the true brilliant green lustre of the stone is developed. The prevailing rocks on the plain were quartz and ironstone, but the soil beneath was rich and deep, and in a favourable climate would most probably be very fertile.” In the above words Austin has lucidly described the rock which contains the typical “lode formations” of Coolgardie and Kalgoorlie fields. Changing his course more westerly, he approached the ranges near Lake Austin and again came on rocks of different feature from those previously met with. Of one range, about 400 ft. above the plain, which he ascended, he states: “The base of the range was composed of compact variegated crystalline rocks, hard and heavy, and evidently of trap formation, and presenting red, white, and black seams, alternating in nearly parallel lines in flat specimens, and curved in the concentric specimens of the rock. Above this rock there rested other highly crystalline, apparently stratified, rocks of more sombre hue, all rent and piled up together. Upon a close inspection of this rock I found it presented a laminated structure, composed of thin seams of puce-coloured rock of a clayey character, separated by delicate layers of a crystalline substance resembling quartz, and that while the laminae were horizontal the fracture was vertical and at angles of 45 degrees.” Austin had lighted upon the great series of banded “haematite-bearing quartzites” which, containing “jasper” reefs (often phenomenally rich with gold), prevail all over the principal goldfields, and are characteristic of them. His compass was so distinctly affected by the puce-coloured stone, each fragment or splinter of which being a true lodestone (with north and south poles at the ends), that he called the hill Mount Magnet. He was at the moment looking northward and westward over one of our largest auriferous areas.

Sighting Lake Austin to the south and struggling

to make a north-westerly course, Austin during the next 70 miles passed over most likely country for gold. Despite the sufferings of his party, and his daily dying horses, he notes place after place where, if he had had the means, he would have "washed for gold." He recognized he was but on the fringe of a great gold-bearing region, and that a fertile soil and more open country characterized its surface. "We have in this hitherto unexplored and imprudently neglected portion of our territory," he wrote in his official report to the Government, "probably ONE OF THE FINEST GOLDFIELDS IN THE WORLD. I have noted many important facts in support of these opinions, which, if you wish to have laid before you, I shall have much pleasure in submitting for your consideration, as well as for a plan for future operations."

But Austin's expedition had been a disastrous one from the point of view of those pastoralists who had subscribed so liberally to its cost. He had not actually seen gold, nor had he found grass nor water. The animals and the bird-life noted by him seemed to the authorities indicative of the Central Australian Desert of Sturt, Eyre, and other explorers, extending right across to Western Australia. A land of stony hills and forest, backed by a high waste of sand and scrub, seemed the justifiable verdict on the Swan River colony. With gloomy forebodings as to the future of their flocks and herds, and with their farmers restricted to very limited areas suitable for grain-growing, the colonists, the British Government, and the outer world in general, regarded Western Australia as almost a useless territory—a veritable Cinderella among her sister colonies of Australia; and it took many years and the indubitable testimony of solid facts and progress to reverse this verdict and remove the reproach.

Meanwhile the search for gold in the known regions near to the settlements took vigorous turns as the facts relating to the occurrences of gold in the eastern colonies became better known and appreciated. Prospecting parties explored the Stirling Range, near Albany, and claimed to have discovered gold in the channel beds of watercourses there. This led to a mild rush, but the excitement was short lived. Next, a big rush took place at Cardup, near the Serpentine River, and the ground was soon honeycombed with diggers' pits, all producing the shining yellow particles the diggers took for gold, but which the scientists showed later to be only mica in fine scales. That gold did actually exist in the rocks of Western Australia was proved by the discovery of a speck or two in the quartz of the Victoria district, and a geological map of the known parts of the colony, prepared by the Gregorys, encouraged the belief that, inland from Champion Bay, towards the Talling Peak, the rock formation was favourable to gold occurrence. Austin, as already shown, had gone a step farther, and actually indicated the localities in which (with a

presence deserving of better recognition) the search would not have been in vain.

Successful diggers returning to their homes in the different colonies were not slow in applying the knowledge they had gained in Victoria. South Australia experienced a gold fever when the alluvial patches in the Echunga district were discovered. In consequence, the South Australian Government secured the services of the Government Geologist of Victoria, Dr. (afterwards Sir) Alfred Selwyn. Dr. Selwyn travelled the whole length of South Australia occupied by the Flinders Ranges, and on the whole his report was encouraging, but not sufficiently specific to direct private enterprise. Mr. Hargreaves, the original discoverer of the New South Wales diggings, was then engaged, and he travelled over nearly the same ground as Selwyn, but his conclusions were adverse as regards any extensive rich auriferous areas in that colony. In 1862 the Western Australian Government offered a reward of £5,000 for the discovery of a payable goldfield within 50 miles of Perth, and this brought Hargreaves into the western colony. His offer to search (for a fee of £500 and expenses) was eagerly accepted, and in the same year he came over and began prospecting. He soon condemned the prescribed reward radius around Perth, but he endorsed Austin's conclusions that the Murchison country afforded most promise. Seven years later the Government reward was again offered, but this time the area of prospecting was widened to 300 miles from any established port in the colony. The reward was to be payable when 5,000 oz. of gold had been won from the field and exported. The opinions of scientific men like Sir Roderick Murchison and other trained geological observers were by this time beginning to command confidence in the mining world. From being primarily the administrative auxiliary in the classification of mineral land before sale, the geological departments became referees as to where to look for gold mines and for alluvial diggings.

In 1871 the Government of Western Australia stepped into line with the eastern colonies by also creating a geological department. Mr. H. Y. L. Brown, one of the young officers of Dr. Selwyn's school, was appointed Government Geologist. During three years he made geological excursions which covered all the south-west corner of Australia, from Champion Bay, on the west coast, to Esperance Bay, on the south coast. Practically, Mr. Brown accepted the geological map prepared by the Gregorys, and extended the geological colouring over very little more of the map than they had done. His verdict, in brief, was that only in the Talling Peak corner of the ancient rock formations was there a reasonable chance for finding gold, and on his advice some expenditure was incurred in making trial at a locality called Peterwangy, a short distance northward of Mingenew, on the track towards Mullewa. Two men, named

Rownan and Brelsford, were engaged to sink for "any 'wash' or gravel beneath the sandstone and grits which overlie the bed rock in the vicinity of Peterwangy," says Mr. Brown in his report to the Governor. He adds that they "sunk 42 ft. through the overlying sandstone and ironstone without reaching bed rock . . . sinking a hole at a place where there were quartz leaders associated with decomposed granite and greenstone, and in a drive 12 ft. in from the bottom, striking a quartz reef about 18 in. thick, from the casing of which was obtained two or three fine 'colours' of gold. (Samples of gold enclosed.) This is a most important discovery, and indicates the existence of gold in the quartz associated with the greenstone, and also shows where the gold found in the gully below comes from." The find in the gully was made in the August month previous. The Governor forwarded Mr. Brown's letter and the sample of gold (consisting of a small nugget and some lesser rounded specks) to the Secretary of State for the Colonies, at that time Lord Kimberley. His Excellency was naturally elated with the promise of the future for the colony, and in his despatch (dated April 25, 1871) he asked Lord Kimberley for any special instructions necessitated by the discovery of a payable goldfield entailing expense in maintaining order and carrying on the machinery of Government in face of what would be, to this small community, a revolution commercially and socially. Lord Kimberley sent an extract of this despatch to the Royal Geographical Society, and replying to Governor Weld gave him a free hand to deal with matters as occasion might require.

This was the first real gold discovery made in Western Australia. Failure of success in following it up was locally ascribed to want of gold-mining experience on the part of skilled labour. All samples of supposed ore to be tested in bulk parcels had to be sent to Victoria for treatment, and many reported finds were therefore neglected because the prospects did not warrant the expense. The Government therefore, in 1873, imported sixteen miners from Ballarat, and erected a small stamp-battery at Fremantle to treat stone which they or others might win. The result was a great failure, and once more the colonists turned their energies to other things. The pastoral occupation of the north-west coast and the discoveries of pearling banks had by this time shown that prosperity was to come to the State from that direction, and when, later, the Kimberley district was explored the future became really bright. For the examination of Kimberley's mineral resources the position of Government Geologist was again revived, and Mr. Hardman, of the Irish Geological Survey, was appointed. Mr. Hardman's report was highly favourable, and a further report, made after he had paid a visit to Victoria and compared the rocks there, caused him to predict gold occurrences not only in Kimberley, but also probably in the south-west corner of the colony as well. Near Nannup Mr.

Hardman detected tin ore in the river sand, and this clue led ultimately to the discovery of the Greenbushes tinfield. Prospectors later discovered alluvial gold in Kimberley, and 1885 witnessed a real gold rush to Western Australia—gold-seekers flocking in from every colony, even from far-off New Zealand. But the gold-bearing rocks of Kimberley occupy only a limited area, and the alluvial gold in the thin soil was soon worked out. Quartz-reefing companies had meanwhile been energetically floated on the stock exchanges, and much plant sent forward to the field in order to sustain the market boom. The end came sooner than was expected; yet the field is one which may in future carry a fair population when systematic mining is pursued there with sufficient capital to support it.

The disappointed diggers of Kimberley had among them men of sterling grit and with a taste for prospecting explorations. They returned down south overland, and discovered the Pilbara and Murchison goldfields. These discoveries in turn led to other expeditions from Perth, one of which, promoted by Anstey, discovered the Southern Cross field in 1887. Next followed the great discovery of Coolgardie, only to be eclipsed shortly afterwards by the discovery of the still more prolific district of Kalgoorlie. Field after field was brought to knowledge as the prospectors visited in succession every range or swell of country which broke the horizon of interminable salt-pans or thick scrub. But for these salt-pans the fields could not have been opened up so rapidly as they were. A primitive condensing plant, erected alongside the salt-water wells sunk in the lake beds, furnished the only adequate water supplies for man and beast while traversing this primeval wilderness. However, the road or track once "blazed" was soon thronged with travellers and traffic. The machinery of Government closely followed on the heels of the prospector. The only water supplies obtainable being along the tracks supervised by authority, and easily controlled in the interests of law and order, made the gold-rush of Western Australia a vastly different one in moral phase from the rushes to California and the diggings in New South Wales and Victoria. The gold discoveries in Western Australia happened along in the fullness of time, when experience had been gained how best to regulate and develop them, and when science and commerce were well fitted to make good the deficiencies of Nature which the pioneers had to contend with. The stories of the discoveries of the different fields have been so often and fully described in the literature of to-day that it would be both tedious and superfluous to repeat them here. At all points the characteristic British pluck and endurance were manifested, and rich as the reward often proved to be, seldom did that reward fall to those who had not fought desperately to win it. The gold discoveries lifted the struggling Cinderella colony to the proud eminence of a princess,

and when, only a few years later, the other States of Australia united in a Commonwealth special terms were offered to Western Australia to enter the bond. Since that time the farmer has spread into the interior more than half-way to the Kalgoorlie goldfield, and the pastoralist has gone further onward than the farthest out mining field. Thus has the wilderness been subdued and made blossom to man's benefit. Nearly 600 miles inland from the coast has the railway followed the miner, and for over 400 miles of this distance does a huge iron pipe convey life-giving water from the reservoir near the coast. The mining industry is first in commercial importance to the State, and supports, directly, a population probably amounting to 70,000 souls.

#### IV.—MINING AND METALURGICAL DEVELOPMENT.

The mining and metallurgy of gold in Western Australia has reached a point of excellence which to-day has become a world-standard. The early experiences of California and the eastern colonies of Australia were all gained before the gold-miners in the West had serious occupation in gold mining, the extraction of gold from its matrices, or the purification of the metal in order to obtain its highest intrinsic value. The era of quartz "reefing" had developed. The art of the underground miner had been enormously increased by modern engineering facilities and the use of explosives that were possessed of high shattering power against rocks which almost defied the efforts of the miner in the days when only black gunpowder was available for blasting. Machine rock-drills, which bored the blast holes eight and ten times as fast as the former hammer-and-drill men could proceed, enabled the modern miner to open up his mine rapidly, and to blast down economically the ore in large masses, or gouge out rich veins of small thickness without removing more rock than was necessary to secure room for the worker. Electric firing of the blast

holes up to any number in one simultaneous blast was also at command of the miner, instead of being restricted to separate explosions each controlled by a time-fuse. Liberating, or freeing the gold from its enclosing rock by breaking that rock up to dust, was effected by machinery which either pounded, squeezed, or rubbed the broken stone down to the degree of fineness desired. Collecting the gold by means of mercury, or by converting it into a soluble compound with chlorine or cyanide, and leaching the soluble compound out from the mass by percolating water, had enabled the gold miner to extract such a large percentage of the gold contained originally in the ore that the residues after such treatment were practically valueless. All this could be done so long as the crushed material was so sharp and gritty that it did not pack in a mass impervious to the chemical solutions. The cyanide process just introduced into South Africa on an immense scale had provided a cheap chemical treatment by which even the low residue values in the fine sands, hitherto thrown away as finished with, could

be still further economically pursued. Only the actually palpable slimes and the fine-as-flour gold particles which these slimes entangled resisted treatment by the well-equipped and painstaking gold-miner and miller. It was seldom that such slimes contained high values, and when they did the only effectual treatment for extraction of their precious metal

contents was to send them to a smelter. Police escorts, furnished by Government, took charge of the gold and brought it down from the producing districts at a nominal charge per ounce, while branches of the Royal Mint received the gold and for a charge of 3d. per oz. converted the refined metal into coin of the realm, thus securing to the miner the fullest possible commercial return for his labour in winning the gold.

Such was the state of science and commercial mining development when the great gold boom broke in on Western Australia in the early nineties. So long as it was merely alluvial gold in the form of nuggets or dust, or

Photo by J. J. Dwyer. LAKE VIEW CONSOLS GOLD MINE, KALGOORLIE.

the coarse and fine gold recovered from the crushing of quartz rock or ironstone in which the gold was imbedded, the digging for or the mining of gold-bearing reefs in Western Australia presented no difficulties unconquered elsewhere. Where gold was discovered most plentifully, however, it generally occurred that water was most scarce, and frequently timber also, which was required for mining supports or for fuel. The high costs for labour and general maintenance prohibited any attempt at a close extraction by means of the usual auxiliary equipments, and so for a while the residues heaps (often containing values up to several pounds per ton) were allowed to accumulate till a more opportune time. A simple stamp-battery was therefore the usual and only equipment provided in the early boom days of the West for extraction of gold. The tailings heaps grew in size as time went on, but the slimes were not considered an asset. At the permanent water level some of the mines showed evidences of a sulphide mineral zone beneath, such as that which in some other mining countries produced a complex ore which required roasting to drive off the sulphur and leave the gold as naked metal ready for collection in mercury. The gold, however, in such mineral was not chemically in combination with the mineral. It was simply fine gold mechanically enclosed in it; its liberation being achieved when the sulphide became oxidized to a fine red rust by the process of roasting. At times the sulphide mineral would yield up its gold to mercury if continuously crushed up with it in a revolving cup or pan while amply supplied with water to keep the mass a mere puddle in consistency. For a while these "grinding pans" promised to meet all requirements wherever they could be effectively installed. Where very rich sulphides, but only in limited quantity, became apparent, the system of concentrating them out of the crushed ore and exporting the concentrate for sale to some smelting works, was manifestly the policy to adopt. Some form of concentrator as an adjunct to the milling or stamping plants was, therefore, the first extension to the western fields of the known systems of dealing with gold ores which are not "free-milling" ores.

The first Westralian mine at which some form of concentration was felt necessary was the Fraser's Mine at Southern Cross. Strange to say, however, this was not a sulphide problem, but one to deal with an oxidized ore from the shallow depths. The gold which escaped was a very fine powder having a matrix of scheelite or tungstate of lime; this scheelite crushed to very fine gritty powder in the stamper-box, and floated away as a white powder with the slimes; it did not settle in still water till after very long standing. A suggestion made by the writer of this article to Mr. Nesbit, one of the directors, was to try a concentration by taking advantage of the capillarity, or filtering capacity, of strips of coarse blanket resting on the surface of the running water in

the strakes as the pulp flowed away from the stamper-boxes, and also after it had passed the amalgamating plates. The experiment was signally successful. The blanket strips when saturated with the grit were washed in a tub of water, and the washings collected in this tub assayed nearly  $2\frac{1}{2}$  oz. per ton. The discovery came too late for adoption at Fraser's Mine, however, as the scheelite-bearing portion of the lode—its richest part—had by that time become nearly depleted.

It was the want of water which was most acutely felt in the early days of Coolgardie, and at Hannans, as Kalgoorlie was at first called. The earlier fields of Kimberley, Murchison, and Southern Cross were more favourably situated as regards both rainfall and storage facilities, while search for subterranean supplies were seldom unsuccessful. But these two last and greater fields were situated well inside a region long considered part of a veritable "desert," being part, in fact, of the region shown in maps of the day as the "Great Australian Desert." The early mining enterprises gave little warrant for thinking a sufficient supply could be obtained when making the ordinary mining explorations, and the little known geological structure of the country failed to indicate any locality near at hand where a copious supply might be struck by shafts put down solely to search for water. The richness of the oxidized deposits above the scanty waters beneath them would brook no delay to shareholders clamouring for returns from their mines. The Government had pluckily pushed out a railway towards Coolgardie, and long ere it was completed preparations were finished for transporting the stone down to a well-watered district for treatment, and the conveyance of water back by rail to the field for domestic uses. A magnificent battery plant was installed at Seabrook, near Northam, and the trucks provided were specially designed to carry either water or ore. A triangular or ridge-shaped tank was built along the whole length of these trucks to form its bottom, while the sides ran up at the outer edges as in the case of ordinary railway trucks. But before this experiment was given a place in actual practice, the Forrest Ministry had announced the policy of supplying the field with the present pipe-service from Mundaring. The Seabrook scheme was therefore strangled at its birth. Work was suspended and the plant dismantled and sold at a ruinous loss to Mr. Vanzetti, the promoter of it.

No sooner was the water difficulty in a fair way to be overcome than a new problem arose at Kalgoorlie field: one concerning which, this time, it was useless to look elsewhere for the benefit of experience. Gold in chemical combination with telluride minerals was discovered to be the chief form of gold occurrence in the Kalgoorlie sulphide zone, and no way for its extraction, other than by the expensive system of smelting, was then known. The lodes in which these telluride ores occurred

were also of a character quite foreign to mining experience in either America or Australia. They had few of the characteristics of ordinary lodes, or of reefing veins, but appeared mostly as decomposed rocks in a more or less defined channel amid rocks of nearly identical character; the difference being chiefly that one channel contained gold in great quantity while the adjacent rock contained it but sparingly. At many points it was only the assayers' work which guided the miner in following the course of the supposed main ore channel. Often very rich side ground was thus missed, and only discovered at a much later period in the mine explorations.

In the oxidized zone, or the decomposed rock channels above the water level, much of the gold occurred in secondary veins, composed either of a ferruginous grit or else a bluish-white, watery-looking deposit of colloid silica. Sometimes this silica was translucent and formed elongated runs of chalcodony. At other times the structure was in bands of opaque white chert. Then, again, it would appear as bands of grey hornstone, locally termed "jasper," which was the general aspect of most of the surface outcroppings. These outcroppings, known as jasper dykes or jasper bars, were usually associated with a lengthened channel of black amorphous graphite, mostly quite soft and earthy, but sometimes so compact and hard as to be termed "natural coke." When the graphite channel became strongly developed the gold usually disappeared and the rocks took on a green-slaty character, though still a truly plutonic rock as regards composition. Where transverse veins of true white quartz crossed these slate belts the gold often appeared at, or near, the contact edges in coarse lumps, affording magnificent and sensational cabinet specimens. Many mines were floated in the early days on such specimen occurrences, which ultimately proved to be all the gold in the mine worth extracting. In those portions of the channel which decomposed to a crisp and sometimes to an argillaceous rock, producing much dust when broken and much slime in battery stamping, the gold occurred thickly disseminated in extremely minute scales. These tiny scales curled up like saucers and floated on water when one surface of them got dry or was exposed to the sun. It forms an ideal type of "float-gold," and though plainly visible in the stone before crushing or when freshly broken from the ore channel, all attempts to save this gold by the usual mill methods proved futile. It escaped with the slimes from the battery, and often made the slimes a fair-grade payable ore by assay percentage could but some method be devised of treating profitably the slimes. To the "dryblower" digger this fine gold was a source of exasperation. Dish prospects of his dust showed splendid stuff to operate upon, but the dusty tailings from his "shaker" and from his "tipping dishes" always held the fine gold still uncaptured. One of the richest occurrences of this nature occurred at

the surface diggings now forming portion of the Kalgurli Mine. The discoverer of the deposit there, Tom McLeay, many times refused the pressing invitation of speculative buyers to "put a price" on his lease. One day, after his usual experience of finding apparently nearly as much gold in the residues as he had won from the primary treatment, he expressed his disgust to a young speculator named Lovely, and offered to sell at a price before discussed. Lovely had previously made a quiet assay of McLeay's residues, and found them worth £27 per ton! Needless to say the bargain was closed with very promptly, and the Kalgurli Company floated in London at a big figure.

This fine gold when seen in the wash-dish of the prospector has a peculiar and characteristic appearance. The writer, in a description of it published in the Adelaide Press, dubbed it, for want of a better term to distinguish it, "mustard" gold, and the lode channels in which the ore occurred he characterized as "lode-formations." Both terms supplied a public want at that time, and became so generally adopted that they are now stably fixed in the mining terminology of Australia and America. Though unknown at the time, the origin of the "mustard" gold is due to the decomposition or oxidation of telluride of gold. When, therefore, the problem of dealing with the mustard gold slimes had been solved, the road for a successful treatment—till then impracticable—of the telluride minerals from the sulphide zone at Kalgoorlie was equally plainly indicated. Prior to the successful slimes-treatment an attempt at collective treatment of the ore itself by a dry process had been made at the Brown Hill Mine. The process was, in brief, the passing of the ore (very finely crushed) along a series of continually broadening air passages, with box receptacles in the floor of each air passage. By this system the gold and heaviest minerals fell out of the current as it slowed down, but as a final exhaust current had to be maintained—however slow the passage of such current might be—there was always a passing out of fine impalpable dust. With this escaping dust went also much of the "mustard" gold, so much, in fact, that the collective treatment of the ore as crushed had to be abandoned as financially prohibitive. Smelting was next tried as a full collective process. The railway having reached Kalgoorlie by that time made the trial a feasible one. The ore could not, of course, be smelted by itself, owing to the small metallic content it held. It had to be smelted along with a rich metallic ore of one of the baser metals, such as lead or copper. The precious metals, when thus collected in alloy with the base metals, had to be separated again from them during another stage of refining: an extra cost which had to be borne by the precious metal recovered by the operations. The ore from Kalgoorlie was therefore exported to South Australia and to New South Wales for smelting with the copper

ore at Wallaroo or the lead smelters treating the lead ore from the Broken Hill mines. The railway freight was but  $\frac{1}{2}$ d. per ton per mile, and the freight per steamer to the eastern ports only a further 12s. 6d. per ton. The smelting charges came to but 35s. more, so that the costs due to distance from the place of treatment would at first sight appear to be in no wise prohibitive to the dealing with the rich ores then being mined at Kalgoorlie. But the smelters paid only £4 per ounce for the gold, and for only 95 per cent. of the gold contents in the ore as shown by assay. Only the very richest ore could bear such imposts, and smelting became a very restricted business in dealing with Kalgoorlie ore.

The successful treatment of the slimes was first achieved by Mr. John Sutherland, then metallurgist to the Lake View Consols Mine, and afterwards manager of the Golden Horseshoe Mine. Mr. Sutherland had been an assistant metallurgist at the Broken Hill Mine before coming to Western Australia. At Broken Hill the treatment by wet process of low-grade lead ores, containing considerable silver, necessitated a filter-press to collect the precipitate and fit it for smelting as ore. The value of the Broken Hill product so obtained was hardly greater than the gold contained in the richer slimes at Kalgoorlie. It thus occurred to Mr. Sutherland that if a solvent process could be successfully used with silver ores at Broken Hill with the adjunct of a filter-press, a similar application of the press might be applied to Kalgoorlie finely crushed or slimed ores after their treatment in cyanide solution. A Johnstone filter-press was procured and the trial made. It was a great success. The total sliming of all the telluride ores was at once advocated as the future system of Kalgoorlie ore treatment, while the filter-pressing of cyanided slimes could be applied to residues at every field in the State.

The first preliminary to treatment of the telluride—or, rather, sulpho-telluride ore—was to oxidize it by roasting. But this roasting was not such a simple affair as it was found to be when dealing with the ordinary sulphide ores pure and simple. The minutiae of telluride-ore roasting took a long time to perfect, and meanwhile the rich oxidized ores in the larger mines were approaching exhaustion from the large inroads made into them monthly. The Great Boulder Company arranged with an American expert, named Koneman, to make working trials of his system for comprehensive treatment on a cheap scale of complex sulphide ores combined with cyaniding and filter-pressing. Koneman's efforts failed, but his attempt revealed the true lines on which the comprehensive treatment should be done at Kalgoorlie. While the treatment plants were being erected and the systems to be operated were still in the experimental stage, some wonderfully rich bonanzas of telluride ore occurred in several of the mines. The impatience of speculators and market investors compelled a resumption

of smelting exports, and for six months the world was amazed to see mines at Kalgoorlie producing from half a ton to over a ton of gold per month from single mines. The consequence was a disastrous boom, which, after assuming colossal dimensions, burst with an aftermath which is still felt. It did irreparable harm to mining in this State, but fortunately the permanent character of the goldfields in Western Australia was by that time securely established.

The first furnaces erected at Kalgoorlie for roasting the tellurides were failures. The system, so simple in theory, met with unexpected difficulties in practice. Experience had to be gained by degrees; step by step, in fact. To ensure a good roast the ore had to be crushed to a very fine degree, a large proportion of dust as fine as flour being produced in the operation. This dust was not sharp or gritty as expected, but smooth and almost unctuous when rubbed between the fingers. Ball mills—*i.e.*, revolving horizontal cylinders containing a number of loose iron balls free to mix among the stones of ore, and by rubbing contact wear down the stones to continually smaller pieces till they become mere particles—was the type of crushing plant first installed. The Pearce-Richards type of vertical furnace, then so successfully in use at the Mount Morgan Mine in Queensland, was the type of roaster first to come into operation on the field. It was erected at the Great Boulder Main Reef Mine, and consisted of a high narrow tower with sloping shelves or ledges arranged in series all the way down from the top. But the fine dust lodged on these sloping shelves, and refused to run off lower by gravitation. The masses thus collected grew higher and higher, until at length the ascending hot draught was effectually checked. This was an unlooked-for development, and proof that whatever type of roaster-furnace was to be adopted must provide for pushing or "rabbling" the ore through the hot current of air. Free falling through the air current in a revolving cylinder of Bruckner's type was meanwhile being tried on a small scale at the Associated Mine, but the product was so slowly produced and so imperfectly done as a whole that this type was early recognized as unsuited to the local conditions. The wealthy Lake View Consols Mine, having controllers in London who were conversant with the latest American furnace improvements, erected two huge furnaces of the Ropp "straight-line" type, and shortly before they were completed the Associated Mine was also being equipped with four of these mammoth structures. The South Kalgurli Company also started to erect a Brown's straight-line furnace, which was a modification of the Ropp type. Ghastly failure in each case attended the attempt to operate with these furnaces. The chairman of the Associated Company told shareholders that £100,000 in bank notes taken from their cash and deliberately burnt to waste would have been a better financial gain to the

company than the installation they had put up at Kalgoorlie. A certain proportion of the gold in the telluride ore was extracted by the treatment adopted, but at an enormous cost and the prohibitive production of rich residues which must be again treated in future.

While the roasting problem was vexing the souls of the Kalgoorlie metallurgists, a new and unexpected trouble arose in the cyanide treatment of the roasted ore. While under treatment in the vats the fine ore set hard and compact, and in those cases where the treatment had been prolonged for two or three weeks the vats could only be emptied after blasting charges had been used to break up the cemented material. Investigation showed that sulphate of lime had formed in the vat; the ore as broken in the mine containing from 8 to 12 per cent. of calcite in its composition. In the roasting of the ore this calcite was burnt to quicklime, while a certain

classification of the ground product for subsequent treatment with cyanide became the policy of Kalgoorlie mine managers as soon as a satisfactory solution of the roasting process was achieved. A suitable furnace was at length devised by Edwards at Bendigo, in Victoria. It is a long iron-framed, horizontally-pivoted tube, which can be tilted to the angle indicated by working trials. The ore is stirred about during its passage through the furnace by water-jacketted iron rabbles. Manager Hamilton, of the Great Boulder Mine, utilizing Kone-man's old plant with modifications, and using an Edwards' furnace for roasting, first achieved commercial success with this now world-recognized Kalgoorlie method of treating sulpho-telluride ores. Still, though the success then achieved was great, the value of the residues, due to unavoidable incompleteness of the roast, prohibited throwing them away, and great heaps of tailings

GREAT BOULDER PERSEVERANCE GOLD MINE, KALGOORLIE.

percentage of the sulphide ore always escaped roasting to the full stage of oxidation. When covered with liquid in the cyaniding vats the quicklime and the iron sulphates reacted on each other, and aided also by dry sulphate of lime formed by the reaction of sulphur and lime in the furnaces, produced the compacting of the mass of charged ore. A further complication in the proposed method of direct cyanide treatment was the presence of much free gold in coarse particles occurring in the mine along with the sulpho-telluride minerals. A separation of this free gold by the ordinary amalgamation process is easily done, and, as the slimes had proved amenable to filter-press treatment, the way to deal with Kalgoorlie telluride ores was plainly a process which should combine both systems as first conceived by Kone-man. Stamping and grinding with mercury and

began to mount skywards on the principal mines to a significant extent.

It was at this point that the march of chemical science came to the aid of Kalgoorlie's mill-men. Cyanide of potassium is a very slow solvent of gold, and needs to be both fresh and vigorous in itself, to be well aerated, and kept continually supplied with oxygen, and to have a clean metallic surface to attack. When in contact with gold the gold displaces a part of the potassium, which displaced portion forms in the liquid a solution of caustic potash. This caustic-potash solution, when in contact with gold, prevents any further action of the cyanide; its removal or neutralization is therefore necessary for the attack on the gold particle or film to go on continuously. The depth into a rock-fragment to which the cyanide will effectually pursue a minutely thin gold vein

or speck is a matter easy of conception. The little cave formed by some gold being removed becomes finally saturated with the caustic solution, unless a very complete agitation or turning over of the fragment permits of a clean wash out from the little cave or cleft. The presence of bromine added to the cyanide solution caused bromide of potassium to be formed with the liberated caustic potash, and thus enabled the cyanide attack to go on wherever the gold film or pellicle could be followed by the solution. The bromide mixture also provided the oxygen required, and thus fulfilled the function for which bleaching powder had previously been added. This discovery, being a patent process, was not generally adopted at first, nor was there a convenient method of adding the bromine immediately devised to meet all conditions of working. The system of agitating, by which the pulp in the vats was continually turned over by means of revolving arms furnished with baffle-blades, was therefore long relied upon to complete the cyanide attack on the fine ore particles. Except in very special cases, some eight hours of this slow stirring brought about the desired result. The special cases arose, however, when the ore contained some telluride ore not completely "dead-roasted." This partially-oxidized mineral succumbed to the bromo-cyanide treatment, and the preparation of the bromine as bromo-cyanide before charging the cyanide solution with it furnished the metallurgists with a powerful agent too potent to be further neglected. On all the Kalgoorlie mines where telluride occurs in appreciable amount the bromo-cyanide system is now adopted. Briefly summarized, the Kalgoorlie practice of to-day combines the old amalgamating system used for free-milling ore, along with the comprehensive plan of reduction to slime or fine powder of all the body of ore treated. The separation of the solution from the slimy pulp is effected by filtration, either by the direct action of compressed air, or by the more recently-devised system of vacuum filtration. This latter system admits of conducting the whole operation with much smaller plant and area occupied, and the economy in working is very pronounced.

Outside of the Kalgoorlie field the metallurgical problems have been due rather to poverty of the ore in gold contents than in difficulties due to complexity of chemical composition. By a fortunate coincidence, the mining centres at which much ore is required to be roasted are the districts where Nature has been most lavish in providing forest timber for fuel. Hundreds of miles, in the aggregate, of light and cheaply constructed tramlines have been run through the forests to supply the insatiable demands of the roasting furnaces. The great water-supply scheme, by which water for domestic and metallurgical purposes—and to some extent for irrigation also—is pumped from Mundaring dam, near the coast, 370 miles away, has solved once for all the

water question, which so impeded progress of the great field in the early days. Railway facilities made smelting practicable so long as the ore was extremely rich, but only the highest grade ore would pay the working. For this cause a lead-smelting works was erected at Fremantle, and the lead lodes near Northampton were again exploited in view of the lead requirements for smelting with the gold ores. It was a costly failure, as supplies of both the rich gold ore and of lead ore fell off after a year or two. The works now stand idly overlooking the jetty at Owens anchorage, four miles south of Fremantle. The establishment of the Perth branch of the Royal Mint has been of untold advantage to the gold-mining industry of the colony, though some of the companies that pay their dividends in London still ship to England the amount of bullion necessary for disbursement at that end. The bullion is conveyed by ocean liners at a freight charge of  $\frac{1}{2}$ d. per oz. The gold produced in the State from the treatment of the base-metal ores is relatively unimportant. In the copper-ore smelting at Phillips River, the gold present in the ore was sufficient to command separate accounting in the purchases of the copper ore by the smelter, and some gold is invariably found with the copper, lead, and antimonial ores which occur here and there throughout the goldfields regions. At Wiluna, the furthest out mining centre of the Murchison region, the antimony occurs so plentifully in the gold ore that it is now seriously under consideration to smelt the ore so as to collect the gold in the antimony regulus, and thus avoid the roasting and cyaniding process altogether. Experiments on a moderate working scale show the method to be practicable. Volatilization of the gold and collecting it when condensed in a receptacle specially devised for the purpose is also proposed to be tried at Wiluna mines.

The actual mining practice in Western Australia has developed consistently and progressively along the modern lines combining the greatest efficiency with economy. Only one large mine (the Cosmopolitan Mine at Niagara, about 140 miles north of Kalgoorlie) has called for pumping power to an extent which justifies the appellation of a wet mine. As a general rule, indeed, the mines of the State would really be benefited by a more abundant supply of water in the strata. The deepest mine in the State is at present the Great Boulder, which is down to 2,800 ft. from the surface and nearly 1,600 ft. below the level of the sea. The extreme age of the rock strata has caused the rock to be much cooler than those usually met with in the deep mines of the world where the strata is of younger age, and as a consequence of this cooling the temperature in the bottom of the deep mines of this State has not yet called for cool artificial ventilation except under special circumstances at particular points. Natural ventilation is the general rule, and is found to meet all requirements. For exploring the ground ahead, or in the lateral areas outside of

the working areas, the diamond drill is largely used. This system has been of great advantage on the whole, but owing to the lode channels being sometimes obscurely indicated—even when close to big ore bonanzas—too much faith must not be given to the drill's evidence when such evidence is merely negative. It is under such circumstances that the quartz-reefing experiences of miners fail when applied to the "lode-formations" at Kalgoorlie. It is an illustration of the refinement to which systematic organized work has been developed at Kalgoorlie that the whole cost of opening up, winning, and treating ore, and realization of the bullion, does not average £1 per ton. Ore broken during exploring work must be hoisted out of the way, whatever its grade, and if the grade is equal to 3 dwt., or, say, not less than 12s. per ton, it is hoisted right to surface and tipped to the treatment plant, where it is crushed, roasted, and cyanided. This may be fairly regarded as record practice in treating complex gold ore, and marks most certainly the standard of excellence attained in gold mining in Western Australia.

On account of its bearing on the expansion of the gold-mining industry over wide areas, a word must now be added regarding State batteries and works operated by the State for treating ore won by private labour. Its inception dates back to 1898; a period which marked an interregnum between the excitement and eager mine purchasing following in the wake of the prospectors' rapid discoveries, and the wild boom of frenzied finance and inflated share values due to the tremendous outputs of gold for half a year previous to the outbreak of the Boer War in South Africa. The boom collapsed with the setback of markets synchronizing with the British military reverses, and prospectors who had good discoveries to sell waited in vain for a renewal of activity by agents of London buyers. Many of them had rich ore piles raised and rich stone exposed in their workings below, but this ore was of no value to them as money, while in many cases the ready cash of the discoverers had all been laid out in the pioneering work done. In this dilemma the State came to the aid of the prospector. Batteries were purchased and erected at selected places, with the double object of converting the prospectors' ore into money and demonstrating to the investing world outside that there were many undeveloped districts worthy of the investments of capital. The first object was attained, but the second aim proved futile and prejudicial to speculation. The capitalist not coming forward, the prospectors had to continue gold production in order to live. Their system, or rather want of system, in working, resulted in all the ore richest and easily obtainable being gouged out and the properties being abandoned when the water level or hard rock was reached. To stimulate further effort the Government then procured Parliamentary authority to grant loans of money to prospectors making further

v

exploration work, especially below water level. An expert officer, with the title of State Mining Engineer, was also appointed to advise the Minister for Mines in the granting of the loans. It thus came about that the State battery system, intended first as an aid to prospecting and discovery, developed instead into a system of a direct aid to mining and exploitation of known areas. An immense amount of gold has been added to the annual output of the State from this source, but though the indirect benefit through maintaining workers and their families has been very considerable, it is questionable whether the gain has compensated for the destruction of evidence regarding the original lode outcrop, and whether the proved depletion of what were rich but limited surface shows has not done more to scare capital away instead of attracting it. Some £40,000 a year is now spent in the upkeep of these batteries, and the work is done at charges which meet working expenses, but not plant redemption on capital cost. The system has now become definitely established as State policy, and the slimes are paid for at time of crushing. They are then stored until the accumulated heap justifies the erection of a special plant for treating by cyanide and filter-press. Plants for the treatment of tin ore have been similarly provided to enable the diggers of stream tin, or workers on tinstone from a lode, to realize money on their product.

The system of dredging for alluvial gold in dry ground, which has so successfully applied in California, seemed feasible also in this State when the great pipe service of water from the coast reached the eastern gold-fields. A dredger was operated for a while at Coolgardie, but the soil had yielded up so much of its contents to the "dry-blowing" of the alluvial diggers that the dredging was unprofitable there and abandoned. The plant has since been transferred to the Greenbushes tinfield, where it is doing payable work in getting alluvial tin ore. Dredging propositions have been mooted in several of the fields, but up to the present no sufficiently promising tract appears to have been located.

#### V.—PRESENT CONDITION OF MINING OTHER THAN GOLD.

Only one of the present copper mines in Western Australia owes its existence solely to copper ore. This is the Whim Well Copper Mine on the north-west coast. The lode there is a copper deposit of soft kaolinized rock, and no precious metal or ore of lead occurs in association with it. The property is freehold, having been acquired before the passing of the Act which compels mineral land to be worked or thrown open to those willing to work it. The other copper mines are parts of gold-bearing veins in which copper ore largely predominates, especially where cross-veins intersect the original gold lode. Such are the mines in the Phillips River district, on the south

coast, and the Eulamina (formerly the Anaconda) at Murrin Murrin, in the Mount Margaret goldfield. Although much copper has been won from every one of these centres, the present mining position of them calls for notice, chiefly for the metallurgical practice followed in the treatment of the mineral. Where sulphur occurs abundantly with the ore, as at Phillips River, the modern "matte-smelting" process, in which part of the sulphur in the charge acts as fuel of combustion, is adopted. This method, briefly defined, consists of fusing in an air-blast sulphur-iron ore along with copper ore of the oxidized class, either as naturally occurring or artificially prepared by roasting. The sulphur in the fused mass combines with the copper, and continuous addition of further copper ore results in an equivalent portion of the iron becoming oxidized. The resultant sulphide mass can thus be enriched with copper up to any degree required, becoming a "regulus" rich enough for separate treatment on the spot, or for export, as financial considerations may determine. The Government opened up the Phillips River field by installing a matte-smelting plant for treatment of the working leaseholders' mineral, advancing money against the ore until realization at Home or colonial markets admitted of final adjustment of the proceeds. When by this procedure the extent and nature of the field was fully demonstrated, an English company, which had bought the principal mines in the district, purchased also the Government smelter, and brought abundant capital into the district. The Government at the same time provided railway and shipping facilities, which were urgently needed. So far the operations of the company have not been financially successful, despite enormous expenditure in mine development and the erection of extensive new plant. One reason—and the chief one ascribed by local authorities—for this non-success is that operations were planned on too ambitious a scale. The ore bodies were not of great length, and before ore in sufficient quantity to keep the plant continuously going could be opened up, the necessities of the moment compelled ore-raising under circumstances which sacrificed economy by methods of selective mining, to the making of a large collective output whereby the average grade of the ore was brought very low—too low to be payable. The gold ore bought from the private miners working in the field was smelted with the copper ore and reported as auriferous matter.

At Murrin Murrin the ore mined and treated has been practically all of the oxidized class, and run out to "blister copper" in the one operation.

At Whim Well the ore is carefully sorted after being raised, and is exported to Europe for sale. The results have been highly payable, but, as only the richer grades are shipped, a very large amount of low-grade material has accumulated at the mine, and awaits treatment by some cheap process. This cheap process has, it is

believed, been found in the system of "magnetic" concentration, known as the Murex system, which system is in successful operation in Spain. The ore at Whim Well is not in itself magnetic, but is to be made so by mixing it, finely ground, with iron ore. To the mixture, when wetted to a thin pulp, oil is added. The pulp is then caused to flow in a thin stream under a field of magnets. The magnets, by their attractive power on the iron ore, cause the coalesced particles of oil, iron ore, and copper ore to rise buoyantly to the top of the stream, and a bar or scraper, set obliquely to the current, diverts the concentrated magnetic scum into another channel leading to a receiver. The success of this system will mean much for mines in other districts where smelting is inapplicable on account of the cost of fuel and transport.

The tin ore exported from Western Australia has, so far, been almost exclusively derived from the washing of stream-gravel. There are two chief localities where the pursuit of stream-tin has been successfully followed for a number of years past. One is at Greenbushes in the Cape Leeuwin corner of the State, the other is at Pilbara goldfield, on the north-west coast. A new field of some promise has lately been discovered in the Murchison goldfield, westward of Cue. At Greenbushes some "lode-tin" in small quantity is obtained, the Government battery being used for crushing it. At Wodgina, in the Pilbara field, the lodes are large and the alluvial tin scanty. A crushing plant has been installed, but no returns from it have yet been published. The tin ore at Wodgina is accompanied by tantalite in considerable quantities. A few years ago there was a keen demand for this tantalite mineral, and fabulously high prices ruled. It was soon shown that Western Australia was probably the richest country in the world in this mineral, and although the demand does not now admit of profitably working the Wodgina veins, hopes are entertained that the time is not far off when tantalite export will figure largely in the State's annual statistics.

The tinfields have brought to light several minerals new to science; and all of the tantalite family. A tantalite of antimony occurs at Greenbushes, and was long exported with the tin ore, for which it was mistaken owing to its colour and weight. A radio-active mineral from Wodgina has been named Pilbarite.

Northampton copper mines have not been reopened of late years, but one of the lead properties—the Baddera Mine—is being systematically developed, and small parcels of ore won during this development work are marketed from time to time.

Western Australia has to-day a flourishing coal-mining industry. Strange to say, the coalfield was not one known, or even suspected, during the early days of keen search for coal. It is at the Collie River, right in the heart of the region first settled, and was discovered by accident during the early days of the gold boom. The

coal is not of high class, but is a useful kind. Its development has made Western Australia independent of trusts or monopolies in the eastern States. In general practice it is used on the railways with an admixture of New South Wales coal, the Collie coal being from 50 to 80 per cent. of the mixture, according to the season of

the year when danger from engine-sparks is considerable or negligible. The mail steamers calling at Fremantle take large quantities every voyage, and steamers of other lines do likewise to an extent which is now no inconsiderable bunker trade. The Collie coalfield is not of great area, but the coal seams are very thick and practically inexhaustible.

## THE MINERAL INDUSTRY.

By A. MONTGOMERY, M.A., F.G.S., STATE MINING ENGINEER.

### INTRODUCTORY.

The State of Western Australia, like most of the other States of Australia, mainly owes to mining its rapid development from small beginnings to its present state of prosperity and importance. Prior to the discovery of gold the population was small and industrial progress very slow, but with the great stimulus to settlement given by the opening of its goldfields, the State commenced at once to come into prominence and to make rapid progress not only in mineral production but even more by way of permanent land settlement.

Even yet minerals constitute nearly one-half of the value of the total production of the State, and though the mineral production has been falling off for various reasons since 1903, while agricultural and pastoral production is rapidly increasing, there is such an immense area of mineral-bearing country in the State that the produce of its mines must long remain of vast importance to it and form a very large factor in its industrial welfare.

### AREA AND CLIMATE.

The State covers the vast area of 975,920 square miles, of which the proclaimed goldfields comprise over a third, *viz.*, 330,107 square miles. It extends over twenty-one degrees of latitude, from 14° to 35° south, thus having its northern portion well within the tropics

and its southern parts approaching the cooler regions of the temperate zone. There is, therefore, a considerable range of climate in the different parts of the State. There is a good rainfall along most of the west coast,

averaging 30 to 40 in. annually, but it decreases going inland, and on about 57 per cent. of the area of the State the rainfall is under 10 in. per annum, subarid conditions prevailing, and the provision of permanent supplies of fresh water being a first necessity of settlement. In the summer months the shade temperature often rises to over 100° F., and in the tropical

Photo by J. J. Dwyer. IVANHOE GOLD MINE, KALGOORLIE.

parts of the country there is naturally a high average annual temperature, but south of the tropics the climate for the greater part of the year though warm is not by any means excessively hot, and in winter it is often fairly cold, frosts at night being not uncommon. The atmosphere being generally dry higher temperatures are endurable without discomfort than in more humid regions. On the whole the climate of sub-tropical Western Australia must be regarded as an exceptionally pleasant one, and even within the tropics Europeans can live and work with much comfort and excellent health.

### TOPOGRAPHY OF GOLDFIELDS.

There are no high mountain ranges in Western Australia, the altitude of its highest portion being only

about 4,000 ft. Most of the goldfields country consists of extensive plains 1,000 to 1,500 ft. above the sea level and broken by frequent low ridges and island-like low hills. Over the main portion of the central and eastern goldfields there are very few outstanding ranges of hills of any large size, but from Peak Hill northwards the country becomes much more hilly, and distinct mountains of some magnitude are often visible. In the south of the State also there are some fairly high and steep mountain ridges, and along the southern part of the west coast the Darling Range is prominent from the low-lying country at its western foot, though of little importance when viewed from the inland plateau, to the east of which it forms the western edge rather than a distinct mountain range. There are no great mountain ranges in the State sufficient to form a source of permanent rivers, and except in the north-east and south-west regions, where there is a good rainfall, running streams are unknown except during rains.

The interior plateau is very plentifully studded with shallow salt lakes, some of great extent and others quite small, which collectively cover a great area of country. These lakes occupy the lowest parts of very extensive basins, which may be traced for miles outwards from their margins, gradually rising towards the hilly ridges, and which undoubtedly represent the basins of lakes once much more extensive, of which only the shrunken and dried-up remnants now exist. On the edges of the basins we very often find precipitous escarpments from 10 to 50 ft. or more in height, locally known as "break-a-ways," which present all the features characteristic of sea-worn cliffs found on the margin of a shallow sea. When adjacent lake basins are thought of as filled with water up to these "break-a-ways" it is readily seen that many of the lakes would have been united so as almost entirely to cover the greater part of the area of the eastern and central goldfields. At the top of the escarpments we frequently come on small plateaux, often very level, which are relics of an older marine plain, and on these there are frequently sand-dunes, fringing the old lake-basins. The principal topographical features of the goldfields remain therefore as they were left after being shaped by a process of marine erosion by a shallow sea which later rapidly contracted to a series of salt lakes. Since that time arid conditions have prevailed, and there has been little alteration of the features of the landscape as last shaped by the waters. In the ridges the bedrock is nearly always readily visible, and in the plains it is often very shallow or even quite bare, but frequently also it is covered by detrital material to depths up to 50 and 100 ft. or more, showing that older hollows and valleys in the bedrock have been levelled up by water-borne detritus and that there must have been a preceding surface which had been more or less carved and furrowed by erosion. "Deep leads," some containing

gold, others tin ore, are found in various parts of the country in such furrows in the bedrock underlying the plains, and are best explainable by their having been old watercourses of a period antecedent to the submergence of the land beneath the sea or lakes.

#### MINING TIMBER AND FUEL SUPPLIES.

In the south-west portion of the State where the rainfall is good there are large forests of heavy timber, but on the goldfields the forest is much lighter, and in the drier parts becomes rather scanty. In the southern portions of the goldfields, however, there are large belts of good eucalyptus timber, fit for mining purposes of support and fuel, and sufficient to meet the needs of the mining industry for a long time to come. In the Murchison and Mount Margaret districts the forest is mostly rather light "mulga," yielding good firewood and a fair amount of rather small and inferior mining timber. Still further north the country becomes very open, and is covered with grass and spinifex, forming good pastoral country, but is often very deficient in supplies of timber for mining, the trees being confined to small belts along the watercourses. The country is on the whole very easy to traverse, little difficulty being found in taking vehicles across it in any direction without any necessity for forming roads, and this ease of getting about explains the extraordinary way in which the goldfields were over-run by prospectors within the first ten years of the gold discoveries. The easy nature of the country also explains why it has been possible to lay down railways at a cost of from £1,500 to £1,800 per mile of track.

#### OCCURRENCE OF MINERALS.

Gold and other minerals are found more or less all over the explored portions of Western Australia, the principal metallic minerals being gold, tin ores, copper ores, lead ores, and iron ores, while coal is the most important non-metallic mineral. The metallic minerals occur in very old igneous and sedimentary rocks, the geological age of which is not yet determined beyond that it is pretty certain that most of them are older than the Cambrian period. There is a very complex system of exceedingly ancient metamorphic rocks mingled with igneous intrusives, many of which have become converted into schists, and which may be roughly grouped together as the auriferous greenstones. Breaking through these there are great granitic intrusions, which, in turn, have been pierced by later dykes, both acidic and basic, of different ages. In this great series of old rocks there are doubtless both sedimentary and igneous products of many different ages, the relations of which to one another have not yet been worked out. Lying unconformably on these oldest rocks we find here and there

throughout the country small patches of a younger but still extremely old formation of sedimentary slates and schists (known as the Mosquito Creek series), and apparently of later date than these are the fossiliferous Cambrian beds of the northern part of the State. In the north also we have a large development of Devonian rocks, and in the north and west considerable areas of permo-carboniferous strata. In the most southerly of these last the Collie collieries have been opened up. The occurrence of patches of cretaceous marine strata and tertiary to recent limestones in widely-separated parts of the State shows that much subsidence and elevation of the country must have gone on since the coal measures were laid down. Except for coal, phosphate rock, gypsum, salt, bauxite, and some few other minerals, and when considering the distribution of alluvial gold and tin ore, we may put to one side, from a mining point of view, all the country occupied by the strata of later date than the Devonian period. In the Devonian system we have a very interesting series of auriferous conglomerates (the Nullagine conglomerates), which are in many respects closely analogous to the "bankets" of South Africa, and it is interesting to note that in

Photo by J. J. Dwyer. 100-HEAD STAMP MILL, IVANHOE GOLD MINE.

these beds the gold is pretty certainly of alluvial origin, derived from the erosion of the underlying Mosquito Creek and auriferous greenstone series, both of which teem with auriferous veins. The Devonian and later strata are comparatively little crumpled by orogenic movements, and show little, if any, evidence of ever being penetrated by mineral veins, and it seems very clear that the period of formation of the mineral veins in the older rocks was long anterior to the Devonian, and probably also to the Cambrian, period. All the pre-Cambrian strata, whether igneous or sedimentary, are greatly plicated and contorted, the axes of folding running north-north-westerly in the southern part of the State and north-easterly in the northern, conformably with the general direction of the western coastline. The

complex of ancient intrusive and metamorphic rocks in which the mineral veins occur, and which we now find at surface, were doubtless once deep in the base of a rising region, probably forming a mountain chain like the Swiss Alps or the Cordilleras of South America. There is much reason to regard it as most probable that the quartz veins carrying the gold and minerals were of very deep-seated origin, much of the vein stuff being more or less sheared country rock transmuted into quartz by metasomatic change. Most probably they are the result of pneumatolytic processes operating—very likely more or less in connection with volcanic activity—during the period of mountain-forming movement, which was certainly mainly pre-Devonian and probably pre-Cambrian.

The principal gold discoveries may be arranged in

more or less interrupted parallel patches and zones, whose long axes correspond very much in direction with those of the oldest strata. It is noteworthy that the main granitic areas have so far been found to contain few mineral veins, and that the latter are usually in the greenstone schists and dioritic intrusives not far from the contacts with the granite. When

payable mineral veins have been found in the granite in almost all cases they have been quite close to the greenstone contacts. Many of these contacts have probably been lines of very severe faulting movement, the greenstones along the contact being much sheared and foliated, and the granite being also in some cases converted into schist, which a short distance away soon merges into gneiss and granite.

#### MINERAL PRODUCTION.

The official records of mineral exports from Western Australia commence in 1850, when a small quantity of lead ore was exported from the Northampton mineral field, and three years later a small amount of copper ore is found among the exports. Ores of these metals continued to be the principal mineral production for many

years, copper mining at Northampton reaching its zenith in 1864 and lead mining in 1877. Exports of gold are first recorded from Kimberley in 1886, followed by Pilbara and Yilgarn in 1889; Ashburton and Murchison in 1891; Dundas in 1893; Coolgardie in 1894; North Coolgardie, North-East Coolgardie, and East Coolgardie in 1896; Peak Hill, Yalgoo, East Murchison, Mount Margaret, and Broad Arrow in 1897; Gascoyne and Donnybrook in 1899; and Phillips River in 1902. Exports of tin ore from the Greenbushes mineral field first appear in 1889, and from Pilbara in 1893. Coal is shown for the first time in 1898; mica in 1892; while sundry other minerals, including asbestos, cobalt ore, plumbago, antimony ore, tantalite, scheelite, and wolfram appear in and after 1900.

Table No. 1, from the Annual Report of the Department of Mines, 1911, shows the position of the State of Western Australia as a mineral producer in comparison with the other States of Australasia since the beginning of the century.

Table No. 2, also from the Annual Report of the Department of Mines for 1911, shows the mineral production of the State to end of 1911, as obtained from Customs returns of exports, reports of the gold received at the Royal Mint in Perth, and producers' returns. Except for specie and manufactured gold retained in the State practically the whole of the metallic minerals produced are exported, and the export and mint figures are therefore preferred to the producers' returns, but where the production is largely or entirely consumed in the State, as in the case of coal, limestone, and ironstone, the producers' returns have been accepted. It may be seen from the table that out of a mineral production valued at £107,566,303 no less than £103,850,487 are due to gold; tin and copper are each approximately £1,000,000 in value, and the production of coal has been steadily increasing.

The relative position of the various States of the Commonwealth as producers of gold is shown in Table No. 3, taken from the Commonwealth Year Book, 1911, which shows also the dates at which each became known to export gold.

For comparison with these figures two more tables are reproduced from the Commonwealth Year Book of 1911 to show by Table No. 4 the world's gold production, 1897-1910, and the percentage of the total contributed by Australia, and by Table No. 5 the countries which have recently greatly increased their gold production. The rapid falling back in the relative importance of Australia's production is seen to be due less to the reduction of her own output than to great increases in other parts of the world.

The importance of the mineral production relatively to that of other industries throughout the Commonwealth is well shown by Table No. 6, made up from corresponding tables in the Commonwealth Year Book for 1909 and 1910.

The leading position of the mining industry in Western Australia is shown very prominently by Table No. 6, but its importance to the State is even better seen if the mineral exports are compared with the total exports of the State, which are the goods by the sale of which the community pays for most of its dealings with the external world if purchases from loan moneys are excluded. Table No. 7 shows that the mineral exports have averaged over three-fourths of the total since the beginning of 1900.

Table No. 8, adapted from the Mines Department Annual Report for 1911, gives the names of the various goldfields and mining districts, their areas, and the extent to which they are occupied for mining purposes.

† Weight not stated.

**VALUE OF PRODUCTION PER MAN EMPLOYED.**

The mineral industry has on the whole been a very profitable one in Western Australia, not only from the impetus given to settlement and general trade, but also from the very handsome returns which may be shown to have been earned per man engaged in mining. Dividing the value of all minerals produced, as shown in Table 2 (page 327), by the total number of men recorded as employed in mining both on surface and underground, inclusive of alluvial diggers, we get the following results for the last eleven years:—

**Table No. 9.**

**PRODUCTION OF MINERALS PER MAN EMPLOYED IN MINING.**

**DIVIDENDS.**

It is in the nature of mining that some mines make very large profits while others are losing concerns, or have great difficulty in making ends meet, and we can only judge if it is a generally profitable industry or not by taking average results over the whole. It is difficult to get accurate data on which to decide the question, as the essential issues from a purely industrial point of view are apt to be obscured by others which relate to quite another matter, the value and profits of mining stocks and shares. As a purely industrial problem the profitableness or otherwise of mining depends upon whether or not there is a surplus of revenue over expenditure sufficient to cover all expenses and to return the capital invested within a reasonable time with interest commensurate with the risks of an admittedly speculative sort of investment. The market value of mining shares, however, depends on popular favour for the time being, and need not necessarily afford any reliable measure of the true value of the mine. Many so-called "losses in mining" are due merely to speculations in the rise and fall of prices of mining shares, in

which luck has run against the person complaining of them, and are no fair charge against the industry at all. Many others are due to paying large sums to obtain stock in mining companies whose operations result unsuccessfully, in which case the portion of the subscriber's money which is actually spent on the mine is a fair charge against it as an industrial proposition, but very commonly much the largest part of his money goes to promoters and vendors who frequently obtain huge sums for the property. Their actual expenditure in prospecting and opening the mine and in obtaining further necessary working capital are a fair charge against the produce of the mine, but the balance of the money paid to them is neither a loss nor a gain to the community as a whole, being merely transferred from the pockets of one set of owners to those of another.

In Western Australia there is a very large number of the smaller mines privately owned by single owners or small parties of men working in partnership whose profits are not declared. It is well known that many such parties have great difficulty in earning a bare livelihood, and that some of them are kept going at the expense of supporters and storekeepers who eventually lose their money, but on the other hand it is equally well known that many such parties have made a good living from their mines and frequently have obtained large profits. The fact that a large number of mines are kept going year after year by the unaided efforts of the men who own them and without assistance of outside capital does much to show that the mining industry gives them as satisfactory results as they have any hope of obtaining in any other line of employment. The high rate of individual production of gold per man employed already shown goes very far to indicate that on the whole the mining industry is a profitable one.

The same conclusion also stands out very clearly when the ratio of dividends to production is taken. Dividends, in normal working of mines, and leaving out such as result from liquidations of concerns which have failed, represent mainly the surplus of profit over and above costs of winning and realizing the mineral, and a high proportion of dividends to production, taken over a term of years, must indicate that the industry is a profitable one unless the dividends are offset by calls, reconstructions, or other new payments from the investors' capital.

The table following shows the relation between gold-mining dividends declared by companies in Western Australia and the total production from all sources, and also for the last four years only, the relation between those declared by gold-mining companies and their own total production, not inclusive of gold produced by owners who are not registered companies and do not declare their profits as dividends.

	Total Dividends paid during 1911	—	—	—	—	826,376	—	
	Total Dividends paid to end of 1911	—	—	—	—	—	22,177,659	

The total capital contributed by companies toward exploiting the mines of Western Australia is not readily estimable, and it would be still more difficult to arrive at any true valuation of the amount actually spent by them on mining work, which is the basis upon which the return made in dividends should be calculated in order to show whether the industry is a payable one. The mines included in Table No. 11 are the largest and most important in the State, and it is quite improbable that the actual expenditure of capital in the other non-paying and extinct mines has exceeded the amount spent in the equipment and development of these large producers. The total amount of dividends paid, £22,177,659 to end of 1911, is almost certainly greatly in excess of the subscribed capital expended in actual mining operations. The Western Australian mining industry accordingly must be regarded as having proved itself on the whole

still exist all over the State very numerous lodes and reefs not yet discovered, and also plentiful shoots of payable ore in lodes which have been partially tried, and that there is more than ever need and scope for active prospecting both in the older fields and in the untried country. There is great need for better organized and more systematic search for minerals than has hitherto been customary, and still more need for sane judgment in opening up and developing any discoveries which are made in order to avoid the evils of undue market excitement and "booming" inflation of share values.

#### TENURE OF MINING LANDS.

The system of tenure of mineral lands in Western Australia is now mainly as leaseholds from the Crown, under the provisions of the Mining Act, 1904, the older

Photo by J. J. Dwyer.

ASSOCIATED GOLD MINES, KALGOORLIE.

a highly payable one, having returned to investors more money than the total they have sunk in mining equipment and development.

#### OPPORTUNITIES FOR NEW MINERAL DISCOVERIES.

Though mineral discoveries have been made over an immense area of country in Western Australia it needs very little acquaintance with the fields to learn that most of these are still very imperfectly prospected and many promising belts of country have hardly been touched at all. Even in the best-known districts it is only in very rare instances that any sustained attempt has been made to trace the lode-bearing country from the knolls in which the outcrops were found down under the adjacent lacustrine plains. There can be no doubt that there

system of "Miner's Rights" tenure being now rarely employed for any but temporary holdings. Only a very few mines are on land held as freehold, and no Crown lands are now alienated as mining freeholds. Even on privately-owned land, which is now always sold by the Crown without mineral rights, provision has been made for mining leases to be permitted to be taken up on terms prescribed in the Act, except in the case of some special grants which were alienated with mineral rights before the mineral wealth of the country was fully appreciated, and special provision made for retention of minerals by the State. The main features of the system of tenure are very similar in their working to those obtaining in the other Australasian States, and practically identical with these in essential principles. To persons accustomed to a freehold tenure there often seem to be restrictions and obligations in the Australian

system which they anticipate may operate onerously and unsatisfactorily, but in actual practical working there is probably not so much difference as might be expected in the net effect of either system of tenure. While a mine is in active operation it rarely happens that it is a matter of material consequence whether the land is held on the freehold or on the leasehold tenure, and when it comes to a standstill there is in practice little, if any, more difficulty in realizing upon the saleable assets in the one case than in the other. It is when an owner wishes to hold ground locked up for speculative purposes, or, as perhaps oftener happens, in order to preserve to himself a mine which has failed until he can dispose of it to advantage or devise means of again operating it, that the freehold tenure becomes most desirable from the owner's point of view, but there is a great deal also to be said against allowing mineral lands to be locked up for an indefinite length of time. A leasehold system which gives to the owner of a mine which has had to cease working all reasonable time and opportunity for recuperating his resources for another trial at working the mine, or for disposing of his property to any buyer who would be willing to pay a fair value for the work which has been done, leaves little ground for complaint, and, as the law is administered, is in effect the system obtaining throughout the States of Australasia more or less. A recent investigation of this matter in 1907 and 1908 by Special Commissioner A. C. Veatch, of the United States Geological Survey, resulted in the Commissioner reporting strongly in favour of the Australian system of leasehold tenure as against the freehold one of the United States. He was especially complimentary in his references to the Mining Law of Western Australia, which he says has "proved a decided success." In another reference he describes it as a "wonderfully symmetrical and carefully balanced enactment" which as recently as 1904 has been revised "to meet the practical workaday conditions of a mining region." On comparison of the terms offered by the various countries which are inviting the aid of capital to develop mining properties it may be claimed confidently that few, if any, give a tenure of mineral lands more favourable to the investor than Western Australia. This subject has been much misunderstood and not uncommonly greatly misrepresented by casual observers and by persons anxious to throw the blame on the mining laws and administration of the State for their own want of success in handling investors' interests entrusted to their care. An unsuccessful agent can readily find excuses for failure in alleged absurdities, injustices, and follies of the mining laws, but while no claim is made on behalf of these for perfection, and they doubtless are capable of much improvement, the cases are very rare in which such complaints have proved on inquiry to have any solid foundation.

#### GOVERNMENT ASSISTANCE TO MINING.

The Government of Western Australia has at all times recognized the importance to the State of the mining industry, and has done a great deal to foster it and encourage its development by means not only of improvement of general public facilities by the establishment of railways, water supplies, roads, stock routes, schools, post, telegraph, and other public offices, but also by more direct assistance by way of the establishment of State batteries and smelting works, schools of mines, and the geological survey, and by direct subsidies and loans in aid of prospecting and mining work under the Mining Development Act, 1902, and special Parliamentary votes granted in aid of mining development.

It is often contended that no active and virile industry should require more assistance from Government than freedom to work out its own destiny without unnecessary interference, and in the main the assistance given to mining by the Western Australian Government has been in the direction of improving the general conditions of working throughout the fields rather than by direct financial help to any individual concerns. The railways which have opened up all the most important goldfields, the roads throughout the country, the large sums spent in sinking wells and making water-supply tanks, and the great Goldfields Water-supply Scheme, are all public works of the greatest assistance to mining, benefiting everyone working mines within their sphere of influence by improving the conditions under which the work has to be carried on, and so lowering the working costs. The Geological Survey and the School of Mines improve the conditions of the industry by supplying scientific knowledge of the country and its mineral deposits and better training for the men who have to operate the mines. In the State Battery System, however, and in the assistance given under the Mining Development Act the Government has deemed it wise to go beyond mere general assistance, and to do something to supply the capital, without the aid of which miners with little or no money of their own are often quite unable to secure means of crushing their ore or furnishing the machinery necessary for opening their mines to any considerable depth.

In times of briskness in mining investment little of this sort of assistance is required from the Government, as mine-owners have small difficulty in getting financial aid from investors, but when for one reason or another mining investment is out of favour, and money is not available for it, the aid of the Government in assisting struggling mine-owners in getting their mines to the point of production becomes of very great value to the industry, and has done much to enable it to live through hard times in many districts, with the result that several important new mines have been developed.

## THE CHAMBER OF MINES OF WESTERN AUSTRALIA (INCORPORATED.)

It was not long after the discovery of gold at Coolgardie and the commencement of genuine work there that the leaseholders and representatives of the mining companies operating in the district decided to combine for the protection and advancement of their interests. This combination took the form of a Chamber of Mines and Commerce; it was established in 1895 with the title of "The Coolgardie Chamber of Mines and Commerce." The first president was Mr. A. E. Morgans, and the first secretary Mr. Eng. Hine. In the following year (1896) the splendid developments in the mines of what is now known as the "Golden Mile" showed beyond doubt that Kalgoorlie was destined rapidly to eclipse the importance of Coolgardie as a gold-mining centre, and in that year the Kalgoorlie Chamber of Mines was inaugurated. A meeting of mine managers and others concerned in the working of gold-mining leases in and about Kalgoorlie was convened by circular on August 15, 1896, and was presided over by Mr. Harold G. Parsons, the then Mayor of Kalgoorlie, and solicitor for a number of the mining companies interested in the district. At that meeting it was resolved:—

That a Chamber of Mines be formed consisting of managers and leaseholders in the North and East Coolgardie Goldfields to take into consideration all those things that are at present pressing heavily on the mining community, and to use its influence in obtaining the repeal of several clauses in the Goldfields Act of 1895.

The late Mr. William Oats, a well-known identity on the eastern goldfields for many years, was elected the first president of the Chamber and Mr. H. G. Parsons was elected vice-president. The first executive committee consisted of Messrs. F. Bissenberger, E. S. Rosman, Harry Wilson, Robert Gibson, Richard Hamilton, T. Pierce, T. McClure, Stephen Harris, and T. F. Whitford. Mr. L. Cullen acted as secretary, and was formally appointed to the position a month later.

At that stage in the early development of the mining lands there was necessarily an extensive business transacted in the registration of leases and claims, transfers, liens, and other dealings connected with mining tenements. The provisions of the Goldfields Act of 1895 with regard to these matters were considered unduly oppressive and restrictive, and this was the subject to which the newly-formed Chamber actively turned its attention almost at its inception. The membership of the Chamber was at that time purely personal, and the institution was supported by the modest subscription of £4 4s. per annum, contributed in quarterly instalments by the individual members. Even as far back as 1897 the subject of amalgamating the two Chambers was discussed, but

did not reach full fruition until several years later. A Perth Chamber of Mines, established in 1897 (with Mr. E. T. Scammell as secretary), and consisting principally of attorneys and legal managers of mining companies, did some useful work, particularly in the dissemination of statistics regarding the gold yield, but it was ultimately seen that the serious

Photo by J. J. Dwyer. GOLDEN HORSESHOE, GOLD MINE, KALGOORLIE.

and useful work of a Chamber of Mines must necessarily be performed on the mining field, and, consequently, the Perth Chamber very soon outlived its usefulness. Grants of land and liberal assistance from the Government enabled the Coolgardie and Kalgoorlie Chambers to erect suitable premises for carrying on their work.

In October, 1897, Mr. Richard Hamilton (General Manager of the Great Boulder Mine) was elected president of the Kalgoorlie Chamber, and the growth and increasing usefulness of that body was coeval with the wonderful development of those gold mines which have since become world-famed for their marvellous wealth of production.

In the year 1900 the first Industrial Conciliation and Arbitration Act was passed in Western Australia,

and the growing influence of the Trade Unions in industrial matters made it desirable, and indeed necessary, for the mining employers to come into closer unity; and, after a number of meetings to discuss plans for the fusion of the two Chambers for the purpose of consolidating the work, the amalgamation was effected in the same year and a Chamber of Mines of Western Australia, with a new constitution, was created. The first general meeting of the new Chamber was held in Kalgoorlie on March 11, 1901. The president of the Kalgoorlie Chamber (Mr. Richard Hamilton) was unanimously elected president, and he has continued to fill that office, with great credit to the Chamber, up to the present time. The then president of the Coolgardie Chamber (Mr. W. L. Daniell) was elected one of the vice-presidents—his colleagues being Messrs. W. R. Feldtmann, T. Hewitson, and R. S. Black. The executive council of the new Chamber comprised the following gentlemen:—Messrs. Richard Hamilton, T. Hewitson, W. L. Daniell, J. W. Archibald, W. R. Feldtmann, H. L. Read, Norbert Keenan, A. E. Thomas, R. S. Black, J. W. Sutherland, R. Nicholls, W. H. Rodda, E. D. Cleland, G. W. Hall, and R. B. Gleisberg. Mr. T. Maughan, secretary of the Kalgoorlie Chamber since November, 1899, was appointed general secretary of the Chamber of Mines of Western Australia, which office he retained until 1913.

The objects of the Chamber are briefly:—

1. To protect and promote the mining interests and industries of the Western Australian gold-fields.
2. To consider all questions connected with the mining industry and to promote all public discussion thereon.
3. To promote and oppose legislative and other measures affecting the mining industry.
4. To collect and circulate statistics and other information relating to the mining industry.
5. To communicate with and exchange information upon mining matters with Chambers of Mines or Government Departments of Mines in Western Australia or elsewhere.
6. To establish and maintain libraries and museums of models, specimens, designs, drawings, and other articles of interest in connection with the mining industry for the use of members.
7. To act as arbitrators in the settlement of any disputes arising out of mining.
8. To start, acquire, print, publish, and circulate, or otherwise deal with, any newspaper or newspapers or other publications, and generally to carry on the business of newspaper proprietors and general publishers.
9. Generally to do all such other things as may appear to be incidental or conducive to the attainment of above objects or any one of them.

The membership of the Chamber is limited to persons, firms, and companies interested in the objects of the Chamber, and being the owners of mineral or gold-mining leases or claims in Western Australia, or being mining engineers directly concerned with the mining industry of this State, and of associate and honorary members.

The subscriptions of the Chamber are raised by assessment every year on the members, one moiety of the sum being assessed in proportion to the average number of workmen employed by each member during the preceding six months, and the other moiety on the average of the declared value of the monthly production of gold or other metals or minerals from the mine or properties of the members during the preceding six months, with a minimum subscription of £5 5s. Each member may, subject to the approval of the council of the person or persons proposed, nominate, in writing, one representative for every subscription of £5 5s. paid up to £26 5s., and such representatives exercise all the rights of membership. There is a provision which allows any member paying an annual subscription at the rate of not less than £47 5s. to nominate, subject to the approval by the council of the persons proposed, not more than four "supplementary representatives," without voting power. Subject to election by the council any person may become an associate member of the Chamber, the subscription for such members being £2 2s. for those resident within the State and £1 1s. for those resident outside of Western Australia. The council's prerogative of electing honorary members is rarely exercised, and is invariably limited to distinguished visitors, or to persons who have rendered special service to the Chamber or the mining industry.

The carrying out of the objects and the control and management of the business of the Chamber is vested in an executive council of fifteen members elected annually by the members of the Chamber, and from the council so elected a president and four vice-presidents are annually selected. Immediately after the annual general meeting in each year, standing committees are appointed by the council, consisting of (a) finance and building committee to look after the finances and property of the Chamber; (b) publications committee to supervise the editing and publishing of the Chamber's organ (entitled *The Monthly Journal*, and which is registered as a newspaper) and of any technical publications issued by the Chamber; (c) organization committee to consider legislation affecting the mining industry, industrial matters, and, more particularly, industrial disputes referred to the Court of Arbitration. Not infrequently, however, the council itself determines the action to be taken in industrial matters, and the detail work of preparing evidence devolves on the organization committee and officers of the chamber. All these committees are ancillary to the council, though the publications committee

has considerable latitude, and, as a rule, only submits to the council articles of a contentious nature or that may in any way affect the policy of the Chamber.

In practice it has been found advisable, when any matter of particular importance crops up that requires special consideration and investigation, to appoint special committees to deal with such subjects as they arise. This relieves the council of much detail work and also makes for expedition. These committees report direct to the council, and the council's subsequent decisions become the collective views of the Chamber, which are communicated to the Government, the Labour Unions, or other bodies concerned.

The headquarters of the Chamber are situate in Kalgoorlie, where the executive council meets every Tuesday. The State of Western Australia covers a very wide area of auriferous country, and in any district where not less than five members of the Chamber reside, within reasonable distance of one another, it is the custom to appoint a local committee composed of the representatives of such members in the district. These committees appoint their secretary and meet as frequently as may be necessary to deal with matters of local interest and to keep the council advised thereon.

Apart from the specific functions of the publications committee, the Chamber finds it necessary from time to time to communicate to the daily Press its views on topics of mining interest, and such contributions are written by the secretary, under the supervision of what is known as the "editorial committee," consisting of the president, four vice-presidents, and two members of the executive council of the Chamber. These contributions are mostly in the nature of corrections or refutations of misleading statements made by officials of the Labour Unions, or articles designed to influence public opinion in the interests of the mine-owners. The columns of *The Monthly Journal* are also largely utilized for that purpose, as a reference to the leading articles will show.

The passing of the Industrial Conciliation and Arbitration Act, 1902, and the first mining arbitration case heard in Kalgoorlie that year gave a great stimulus to the organization of the mining employers and brought many accessions to the membership of the Chamber. The Chamber undertakes the conduct of all cases before the Arbitration Court on behalf of its members, and the funds for this purpose are contributed by the members on a *per capita* basis of men employed.

Through the medium of its *Monthly Journal* the Chamber publishes a good deal of interesting and valuable statistical matter concerning the operations of the mining companies and the gold production of the State, together with articles, contributed by its members, on topics of technical interest to the members of the mining profession. The Chamber takes a very keen and active interest in all legislation directly or indirectly affecting

w

the industry of mining, and is generally regarded by the Government and local governing bodies as the mouth-piece of the mining industry.

Independently of the ordinary functions it exercises in regard to the defence of the mine-owners' interests in the Arbitration Court, two matters of singular importance may be specially mentioned as showing how the Chamber is serving and protecting the interests of mining. Its vigorous opposition to the extension of the McArthur-Forrest cyanide patents saved the gold mines of this State from the payment of many thousands of pounds in royalty; and within the last year it successfully carried to the Privy Council an appeal against the claim of the Government for alleged short-paid dividend duty, and in this instance alone it saved the companies anything from £30,000 to £60,000. At the present time it is interesting itself in the formation of a strong combination to oppose the threatened action of the Moore Filter Company for alleged infringement of their slime-filter patents. Many of the mines in the State are now using the vacuum-filter process, and others will adopt it later on. The amount of money involved in this case will be very large should the Moore Company succeed in establishing its claims for exaction of royalty from all users of the vacuum-filter process.

The Chamber's membership extends over the whole of the mining districts of the State, from Ravensthorpe in the south to Whim Creek in the north-west and to the eastern and western boundaries of the auriferous areas. It now comprises seventy-nine companies, with 154 representatives, forty-four associate members, and two honorary members. It has an annual income of nearly £4,000.

The following are the officers and committeemen holding office for the year current:—

PRESIDENT—Mr. Richard Hamilton.

VICE-PRESIDENTS—Messrs. R. S. Black, W. A. Macleod, R. B. Nicolson, and J. W. Sutherland.

EXECUTIVE COUNCIL.—Messrs. R. S. Black, Lloyd Bloxsome, C. E. Crocker, R. Hamilton, A. L. Hay, W. A. Macleod, D. F. McAulay, John Morgan, R. B. Nicolson, E. T. Randall, G. M. Roberts, T. H. Sears, J. W. Sutherland, H. E. Vail, and R. A. Varden; *Ex-Officio*—Mr. C. H. Nicolson, Chairman, Murchison Local Committee; Mr. William Henderson, Chairman, Norseman Local Committee.

ACTING GENERAL SECRETARY—Mr. C. A. Bolton.

HEAD OFFICE—Chamber of Mines, Kalgoorlie.

The Chamber is perhaps the most highly organized and successfully administered institution of mining employers in Australia, and in that respect comes second only to the Transvaal Chamber of Mines. Unlike the case in such organizations as Chambers of Commerce and Chambers of Manufactures, the interests of its members

do not come into conflict or trade competition, this fact probably accounting to a very large extent for the high standard of unity and efficiency it has attained. Its value and importance to the mining industry is appreciated not only by its members, but also by the directors and

shareholders of the numerous Australian, English, and foreign corporations holding interests in Western Australia, and so long as there are mining interests to protect and promote the Chamber will continue to be a very important factor in the industrial life of the country.

RICHARD HAMILTON, J.P., General Manager of the Great Boulder Proprietary Gold Mines, Ltd., was born in Melbourne, Victoria, on April 29, 1855, and is a

J. J. Dwyer, Kalgoorlie.  
MR. RICHARD HAMILTON.

son of the late Henry West Hamilton. He received his education at the High School in Bendigo and at the School of Mines in that town, afterwards entering upon the mining industry in a crushing mill, where he became conversant with the various details of mining work. Subsequently he acted as assistant to his stepfather, Mr. F. Clark, of Eaglehawk, in the management of mining properties in the Bendigo district, and in this way obtained a comprehensive knowledge of practical mining. In the early eighties he proceeded to India to undertake the duties of manager of the Honnali Gold Mine, in the State of Mysore, and filled that post for about three years, at the end of which period Mr. Hamilton returned to Victoria, and shortly afterwards received the appointment of manager of the Peel River Proprietary Mine, in New South Wales, which eventually he resigned to devote his attention to the orchard industry in the Goulburn Valley. About a year after starting

this work he accepted the offer of the position of manager to the Canada del Oro Company in Arizona, which owned several groups of copper and silver mines in that State. The offer was conveyed through Mr. W. M. Murray, of Messrs. D. & W. Murray, who was the largest shareholder in the company, and a director in the Peel River Company. In 1895 he was recommended by Mr. Zebina Lane, with whom he had been closely associated as a boy, for the post of general manager of the Great Boulder Proprietary Gold Mines, Ltd., in Western Australia, and acceding to the invitation of the directors assumed his new responsibilities in the next year. The success of this great enterprise under Mr. Hamilton's supervision is now a matter of history, the mine having been fruitful of more dividends than any other of the great gold-producing propositions of the Western State. Mr. Hamilton is a member of the Institute of Mining and Metallurgy of London, a member of the American Institute of Mining Engineers, and a member of the Australasian Institute of Mining Engineers. He is President of the Chamber of Mines of Western Australia, having held this position from the foundation of that body, in which he took a leading part. Apart from his mining interests he holds a stake in the agricultural industry, and owns a property in the Moora district, approximately 5,000 acres, where mixed-farming pursuits are carried on successfully by his eldest son. Rifle shooting has been his chief recreation. He is a member of the local golf and rifle clubs, also of Hannan's Club, Kalgoorlie, and of the Weld Club, Perth. Mr. Hamilton married in 1886, Kate Muriel, daughter of the late John Hall Clark, railway contractor, late of Warwick, England, and has two sons and one daughter.

RICHARD ARTHUR VARDEN, General Manager of the Great Boulder Perseverance Gold-mining Company, was born at Worcester, England, and educated in his native

place. Subsequently he acquired a comprehensive knowledge of theoretical mining at the Clausthal School of Mines in Germany, where he took the degree of Mining Engineer. Having completed his course at this institution he spent several years in the mining industry in Mexico and the United States of America, and in 1894 came to Western Australia. Here Mr. Varden opened up the Hannan's Brown Hill and Oroya Links Mine, in the management of which he continued until 1897, when he returned to England. Since that period he has pursued his profession of mining engineer in North and South America, South and West Africa, Siberia, and almost every country in Europe, and in 1910 received the appointment of manager of the Great Boulder Perseverance

J. J. Dwyer, Kalgoorlie.  
MR. RICHARD ARTHUR VARDEN.

Gold-mining Company in Western Australia, with which he has been identified ever since. Mr. Varden is very keen on all matters pertaining to the mining industry, and is a member of the Council of the Western Australian Chamber of Mines, of the Institute of Mining and Metallurgy, and of the American Institute of Mining Engineers.

**WILLIAM ALEXANDER MACLEOD**, general manager in Western Australia for the firm of Messrs. Bewick, Moreing, & Co., mining and consulting engineers, St. George's Terrace, Perth, and at Kalgoorlie, was born near Dunedin, New Zealand, on November 2, 1874, and is a son of the late Donald Macleod, one of the first members of the teaching profession to come to the Dominion from Scotland. Upon completing his collegiate and mining course at the Otago University and School of Mines the subject of our memoir entered upon practical work in the mining industry, and for some considerable time was engaged in underground labour, milling, and cyaniding. Subsequently, he was appointed to fill the position of assistant director of the Thames School of Mines, where he took charge of the battery and the departments for assaying and the general experimental treatment of ores. His next appointment was that of director of the provisional mining course in connection with the University of Tasmania, which he held for over a year, from there proceeding to Queensland, where he

MR. WILLIAM ALEXANDER MACLEOD.

spent three years as director of the Government School of Mines at Charters Towers. Mr. Macleod afterwards filled the post of manager of the Brilliant Extended Gold Mine for two years, and for the seven years following on this period undertook the duties of general manager of the same company's mining operations in Queensland, which prospered in a

w2

marked degree under his control, the above-mentioned mine, which had hitherto proved a losing proposition, returning a profit of over £150,000. In 1912 the London firm of Bewick, Moreing, & Co., mining engineers, attorneys, consulting engineers, managers of mining companies, etc., offered Mr. Macleod the position of general manager of the Western Australian branch of their business, which he accepted and now holds. Mr. Macleod holds a certificate of service as mine manager issued by the Queensland Government; he is a member of the Australian Institute of Mining Engineers; member of the Institute of Mining and Metallurgy of London; and is also a corresponding member of the council of the same body. He was the first member in Australia and New Zealand to gain the distinction of winning the forty guinea premium offered by the Goldfields Consolidated of South Africa for the best paper of the year on mining engineering, the subject being "Surface Condenser applied to Winding Plant." Among the various positions he has filled may be mentioned that of president of the Charters Towers Technical College, and vice-president of the Hospital Committee of the same town; while in the world of sport he was the life and soul of amateur athletic circles during his stay in Queensland; also finding recreation in his hours of retirement in the perusal of general literature covering a wide range of subjects.

**HERBERT EUGENE VAIL**, mining engineer, manager of the Lake View and Star Gold Mine, on the "Golden Mile," was born at Forbestown, California, on January 16, 1870, and is a son of Mr. Henry Eugene Vail, a mineowner of that country, who has been personally connected with the gold-mining industry in California and other parts of America during the whole of his life. The subject of this sketch was educated at a High School in his native place, and upon the completion of his scholastic career served a term in underground mining with the object in view of becoming a mining engineer. He also took a practical engineering course and technical training at several centres in California, notably the Gold Bank at Forbestown and the Utica Mine at Angels' Camp, both well known in the history of gold-mining in West

America. He filled the post of underground manager of the Shakespeare Mine for a considerable time, afterwards holding the position of assistant metallurgist on the Utica Mine for nearly three years. Resigning from the latter post he accepted a similar position on the Carson Creek Gold Mine, and from here was appointed to the office of metallurgist and assistant manager of the Eagle-Shawmut Mine, where he remained for seven years. He next accepted

J. J. Dwyer,

Kalgoorlie.

MR. HERBERT EUGENE VAIL.

the appointment of superintendent of mines in Western Australia for the firm of Messrs. Bewick, Moreing, and Co., which he held for over five years, and upon the termination of this engagement took a trip to London, from which he returned to take over the management of the Hannan's Star and Boulder Deep Levels, which properties subsequently were amalgamated with the Lake View Consols, forming the present company, for which he has since acted as manager. Mr. Vail is a member of the American Institute of Mining Engineers and the Institute of Mining and Metallurgy of London, and is also a member of the governing council of the Chamber of Mines of Western Australia, in which body he has displayed the deepest interest since his arrival in this country. He is a member of the Masonic fraternity, being a Past Master of the Order, and for purposes of recreation indulges chiefly in golf and motoring. He is also a member of Hannan's Club, Kalgoorlie.

ASSOCIATED NORTHERN BLOCKS (W.A.) LIMITED. Head Office: 20, Copthall Avenue, London, E.C. General Manager in W.A., G. M. Roberts. This company is an offshoot from The Associated Gold Mines of Western Australia, Limited, and was registered on August 24, 1899, to take over from the parent company the four Kalgoorlie leases known as the Iron Duke, Iron Monarch, Medindie Hill, and Medindie Hill East, each lease comprising 24 acres. The authorized capital is £350,000, in shares of £1 each, all of which capital has been called up. Explorations in the Iron Duke lease early disclosed immense

employing some of its capital in other ventures, the Associated Northern Blocks Company acquired the El Refugio Mine at Zacatecas in Mexico during 1910, which property is being developed and equipped. In Western Australia, also, numerous properties offered to the company have been examined from time to time, and after a lengthened working option a property at Ora Banda, known as the Victorious Leases and situated some 30 miles north-westerly from Kalgoorlie, has lately been acquired. This latest venture has opened up well, and its equipment and working practice may be taken as typical of

lode runs nearly south-east (south, 42° east) and goes down apparently vertical. The average width of the Gimlet South lode is 45 ft., the average width of the Victorious lode is 5 ft. *Working the Gimlet South Lode.*—The lode formation is of a soft, clayey nature, and much impregnated with oxide of iron and silica. With depth there is a decided increase of the ironstone and silica, and the formation becomes much harder in consequence. At a depth of 240 ft. the water level is reached; the water being, however, strictly within the lode channel only, the enclosing country rock being practically dry. The lode has been

Photo by J. J. Dwyer.

SURFACE VIEW ASSOCIATED NORTHERN BLOCKS, KALGOORLIE.

bodies of very high-grade ore of the complex telluride class. A comprehensive scheme for its development and treatment was entered upon, and, in April, 1903, a subsidiary company (The Northern Blocks Syndicate, Limited) was formed with a nominal capital of £350,000 to take over the three other leases and prospect them. Half the shares in the syndicate were allotted to Associated Northern Blocks' shareholders at 1s. each, the company taking the remainder. The syndicate's work proved unsuccessful, and voluntary liquidation ensued in 1907. Pursuant to a policy of

the present advanced stage in Western Australian gold mining and milling as adapted to local environment and working conditions. The following brief descriptions of the equipment and working methods employed will be read with interest. **MINING and ORE TREATMENT, VICTORIOUS LEASES.**—*Lodes:*—There are two lodes in the Victorious Leases, known respectively as the Gimlet South lode and the Victorious lode. The Gimlet South lode is the main ore body of the mine. It runs on a course 66° east of north, and has a dip to north-north-west of 10°. The Victorious

explored at four levels, the depths being respectively at 110 ft., 182 ft., 252 ft., and 362 ft. Down to the No. 3 level (252 ft.) the ore values average from 16s. to 22s. per ton, but below this depth, *i.e.*, below water level, and at 362 ft. deep the values range higher. In the past development of the mine the usual mining practice has been followed. In the soft clayey material above the 252 level the blasting holes were bored with augurs only. Below this depth and down to the bottom level (362 ft.) the lode material, though still oxidized, is much harder owing to increase of silica and iron,

as previously stated. In this bottom zone rock-drills and hand-drills are used. The development work done on this lode, namely, the drives, crosscuts, rises, and winzes, make an aggregate total of 5,000 ft., the whole of which has been carried through at an average cost of 7s. 3d. per foot. In the harder bottom zone the cost per foot averages 27s., the telescope air-drill being used in the rises there with considerable success. *Stoping*:—Although the lode is fully 40 ft. in width, the stoping of this wide mass from the No. 1 level, right up to the overlying burden of laterite (ironstone) which covers it at surface, is being done

Fig. 1.  
END ELEVATION. SHOWING DRIVE AND LEADING STOPE SETS; ALSO PASS LOGGING.

without timber other than that required at the points where the ore shoots are placed. The main drive was first taken along the lode for the whole length of the pay ore (400 ft.), crosscuts made from wall to wall at 50-ft. intervals, and uprisers raised to the surface. For a height of 9 ft. the lode was then stoped, the stopes being highly arched, and pillars of ore 12 ft. square left standing in zig-zag rows 15 ft. apart as supports to the roof. The ore thus won cost 1s. 7d. per ton, including the shovelling of it into the trucks. From the leading stope thus made, a series of "incline rises" were raised to join the previously-made

vertical rises which lead to the surface. Ore shoots were fixed at the bottom of these inclines, and ladder-ways placed in the vertical rises. A second stope was then made across the lode, leaving a floor of 15 ft. between it and the previous stope, with special precautions that the new pillars of ore left standing as roof supports, were truly vertical over the pillars left in the lower stope. The cost of getting the ore by this second stope was 1s. 3d. per

Fig. 2.  
END ELEVATION. SHOWING DRIVE AND LEADING STOPE AND SECOND STOPE SETS.

ton. By this system of stoping the surface is approached economically from below, and as the stopes in the lower levels required material for filling them this filling was easily and advantageously procured by removal of the laterite overburden previously mentioned and throwing it down through the passes. By the time, therefore, that this first series of stopes reaches the top of the ore body, the whole of the barren, ironstone burden (varying from 10 ft.

to 35 ft. in thickness) will have been cheaply removed, and the ordinary system of open-cut be advantageously applied to recovery of the pillars and floors of ore left as supports while the stoping was in progress. *Stoping Heavy Ground*:—Above the Nos. 2 and 3 levels the lode formation is traversed by greasy joints. It is necessary to support this jointed ground with timber firmly footed and rising upward in continuous contact with the roof as the stoping mounts upward. At these levels two main drives were made along the lode channel, one drive being 6 ft. from the footwall and the other drive 6 ft. from the hanging-wall. The ore standing alongside these drives is left intact until such time as the stoping away of the ground above shall be completed. The drives are securely timbered with sets of 10-in. or 12-in. timbers set at 5-ft. intervals, each

Fig. 3.  
PLAN SHOWING TIMBER IN LEADING STOPE SET; INCLUDING PASS.

set having 7½-ft. legs and 3½-ft. caps. In addition to the gimlet-wood laths over the caps of these sets there were carried two stringers of 6-in. timber of 7-ft. lengths. These stringers render support to the stope timbers above the drive. Stoping is commenced at the passes. The three sketches, Figs. 1, 2, and 3, show clearly the method of supporting the ground. Fig. 1 shows the manner of carrying forward the leading stope starting from immediately above the roof of the drive. The two legs of 6-in. timber, 8 ft. in length, are fitted to the sill and cap with dowels of ½-in. iron, and are 10 clear ft. apart. The laths of gimlet wood above the cap are pitched forward to support the roof as the stope is extended a further 6 ft. along the top of the drive, and then at this distance another set is put in. When a distance of 20 ft. has thus been reached an ore "pass" is

formed with round timber reared to form a hollow pillar 5 ft. square, as shown in the figure. The two top-most logs are of 8-in. timber, each 9 ft. long, and are tightly wedged under the caps to which they reach, thus forming a further strong support to the roof. Fig. 3 shows this arrangement in plan. When the leading stopes are taken the required distance along the top of the drives, and of the full width of 11 ft. throughout, the central block of ore, 20 ft. thick, which stands between them, is stoped across with the usual stope sets, and the cavity filled in or mullocked up. The mullocking is packed right close up to the roof as the centre stopes advance, the mullock being let down through passes placed 50 ft. apart, to which are run connecting incline-rises about 20 ft. in length to permit of distribution of the mullock over the whole area to be filled. To take a second section, or slice, off the lode, a leading stope is again run exactly over the top of the previous one. It is therefore necessary that the sizes and fitting of the set timbers should be absolutely uniform. The only new timber required for this second stope, and succeeding ones above it, will be the legs of each set and the logs for the ore passes. The new legs are doweled to the top of the old legs and the cap and roof timbers simply lifted from their old sets and fixed over the new one, as seen in Fig. 2. Stoping across the centre block and mullocking then follows as before. The cost of breaking up the ore, timbering stopes, and delivering the ore into the passes amounts at No. 3 level to 2s. 9d. per ton for the leading stope and 2s. 2d. per ton for the succeeding stopes. At No. 2 level the respective costs are 2s. 6d. and 1s. 9d. per ton. *Working the Victorious Lode:*—This 5-ft. ore-channel lies between walls which are full of slickensides, and the ground is very soapy in consequence. The ordinary rill method of stoping is followed, but the rills are kept steep and the stopes short and shallow—40 ft. long and 8 ft. high. These stopes are quickly taken out and mullocked up to within 2 ft. of the back. The rills are sollared with sawn timber, and the ore passes kept empty, to prevent the broken ore blocking on the rill. Light props with head-boards are used to support the walls when necessary. The cost of breaking the ore in this lode averages 3s. 3d. per

ton, the total cost of ore extraction to date being 4s. 5d. per ton. *Main Shaft and Equipment:*—The shaft is 10 ft. by 4 ft. in the clear. It is divided into three compartments—two for haulage and the third for ladder-way, air-pipes, and water-pipes. The poppet-heads of timber are 60 ft. high. The hauling engine is of the geared type, cylinder 12 in. in diameter and 24-in. stroke. The two haulage ropes are  $\frac{3}{4}$ -in. steel, each 900 ft. in length. The cages are of the usual pattern, and the ore is brought to the surface in trucks holding 16 cwt. The chairs are suspended from the cage bottoms and travel with them. The mine water makes, at present, about 20,000 gallons daily, and an Austral Otis plunger pump of 50,000 gallons' daily capacity will deal with it. The water contains 4 per cent. of solids,

Kalgoorlie foundry. The breaker is 18 in. by 10 in. and driven by a 35-horsepower Tangye suction-gas engine, and runs 250 strokes per minute. The crushed ore then rejoins the fines from the grizzly, and is collected into a 10-ton bin. From this bin a Robin's belt-conveyer, set at an angle of 20°, conveys it 113 ft. at the rate of 350 ft. per minute to a large storage bin, 60 ft. long, 16 ft. wide, and 30 ft. high, with a sloping bottom. Its capacity is 600 tons, and the structure is of salmon-gum timber double lined with 9-in. by 1½-in. planking, cut on the mine from the local forest timber. The bin is fitted with four steel chutes, having rack-and-pinion doors. The ore distribution is made by a 44-in. Robin's hand-tripper with a double chute. *Milling Plant:*—There are four Fraser and Chalmers' 5-ft.

RIDGWAY VACUUM FILTER PRESS FOR SEPARATING GOLD SOLUTION FROM SLIMES, VICTORIOUS MINE, ORA BANDA.

but is quite suitable for ore-milling purposes. Compressed air is provided to work the pump, the compressor being a tandem compound steam and air machine of 10-drill capacity. The multitubular boiler of 160-lb. pressure and 150 horsepower, along with the necessary adjuncts of feed-water heaters, coolers, condensers, etc., complete the shaft plant. The engine-house is 48 ft. by 20 ft. and 22 ft. high. **MILLING and ORE TREATMENT.**—*Breakage and Storage:*—The ore trucks, on arriving at surface, have but 6 ft. to travel from the cage to a kick-up tip—one man can thus handle 500 tons per shift. After passing over grizzly screen the coarse ore passes to a rock breaker of the Blake type, made at the

Huntingdon mills of 100 tons capacity each per twenty-four hours. They are fed by four Nelson ore-feeders slightly modified for local use, and driven by a short belt from the mill shafting. The water for crushing purposes is the usual cyanide circulating solution, and is drawn from the circulating-solution tank by a 5-in. main. This tank is on a steel stand, 14 ft. high, and also the pulp thickeners. The product from the mills contains 1 ton of ore to 4 tons of water, and is conveyed by a cement launder in the floor to a pulp well, 7 ft. deep. From this well it is lifted by a duplex ram-pump 55 ft. to the top of a set of separators. *Separation, Amalgamation, and Pulp Thickening:*—Amalgamation within the

Huntingdon mills has not yet been definitely decided upon; but, if adopted, the mercury and amalgamating coming out along with the crushed ore will be caught in the

in the thickener vats are swept by spiral arms to a central cone, from which it is drawn off by a 3-in. pipe into launders which convey it to the agitators. The arms make one

6-in. plug-valve, fitted with a long stem to bring the operating wheel in line with the main floor. *Filtration:*—A 6-in. pipe delivers the pulp from the agitators to a duplex plunger pump, which elevates it to a distributing agitator situated between No. 2 and No. 3 filters. The slime-flow to the filters is regulated automatically while drawing a charge, and between charges is regulated by a thumb-screw regulator worked by hand. There are three filters of Ridgway's patent reciprocating type, whose capacity on roasted sulphide ore at Kalgoorlie is estimated at 300 tons daily, but with ore from the Victorious Mine, which contains so much clayey matter, the capacity is about 100 tons daily. The main features of these filters comprise two rectangular tanks 11 ft. by 6 ft. and 5 ft. deep, placed 7 ft. apart. An 8-ft. shaft is situated at the centre of these tanks, but considerably above them; it carries two strong arms and two worm wheels 8 ft. in diameter. From the arms on one side is suspended a cast-iron beam-pipe designed to accommodate twenty filter frames, each 5 ft. by 4 ft., and the necessary pipes and fittings of vacuum pump and air pipes. On the other side heavy weights are placed to balance the load. The worm-wheels connect with a driving-shaft by means of worms and bevel gear. This driving-shaft has two driving directions—one forward and the other backward—the speed being adjusted to suit requirements. Under the main 8-in. shaft which carries the frames is an iron chute, and to one side is placed a mixer 8 ft. in diameter and 7 ft. deep. The operations are as follows:—The pulp tank being full to mark the forward drive runs the frames into the pulp; the vacuum valve and float valve automatically opening at the moment of entry. The vacuum rises steadily to about 20 in., and with roasted sulphide ore a charge of 5 tons of slimes is taken up in four or five minutes. The operator in charge then works the belt striking-gear, and sets the machine going on the fast gear to the wash tank, which takes one minute only to do. It is this rapid means of transferring the cake into the wash-solution that gives the Ridgway filter its wide scope of usefulness, for it is practically impossible to retain the roasted sulphide slime cake in adhesion for longer

VIEW OF SURFACE PLANT, VICTORIOUS MINE, ORA BANDA.

separators along with the coarse sands. These separators are merely two sets of inverted cones; the full product passing into the smaller cone first, and thence into the larger one. There will be no upward flow of water through these cones, as a small proportion of slimes is not detrimental to further grinding and amalgamation in Wheeler pans, to which the separated sand and amalgam is conveyed by launder. The coarse gold will be collected in these pans, which will not push the grinding to a finer degree than is suitable to the cyaniding process to follow. *Pulp Thickeners:*—These are four steel vats, each 25 ft. in diameter and 9 ft. in depth; the bottoms of 5-16th in. plates, and the sides of 3-16th in., with a ring of channel-iron around the middle. These vats are in a single row on cast-iron columns, and are 12 ft. above the ground. The overflow from the Wheeler grinding pans and the main body of pulp from the separators are led to a collecting-box standing 4 ft. above the vats to which it is distributed. The vats are fitted with circular launders, which, receiving the clean water overflow, convey it to the vat containing the circulating cyanide solution. This inflow enters the solution vat at the top and leaves it at the bottom by a 5-in. pipe, which returns it to the Huntingdon mills to be again used in grinding the ore. The sands and slimes which settle

complete sweep every five minutes. *Agitation:*—The agitators are of the usual type and fitted with worm driving gear. Each vat is 20 ft. in

HUNTINGDON MILLS, ORE BINS, AND POPPET OVER MAIN SHAFT.

diameter and 6 ft. deep. The arms make seven revolutions per minute. The pulp is discharged through a

than sixty seconds without cracks developing in the cake, and cracks would prevent the thorough wash which follows. After five minutes' wash the machine is revolved to the pulp tank, which takes two minutes. At the end of the first minute the frames arrive directly over the centre of the shaft, and having drained off 70 per cent. of the moisture in this time the vacuum-valve is closed and the air-valve automatically opened. The 3-ton cake then falls off into the chute, and is washed away by a stream of water to the discharge mixer, and then pumped by a duplex 7-in. by 12-in. plunger to the tailings dump. Each

expansion chambers have been discarded owing to the heat of the exhaust gases from the engines being utilized for further power production. The four exhaust pipes are coupled at an angle of 45° into one large pipe securely lagged with asbestos, which leads to the fire-box of a locomotive-type boiler of 25 horse-power. In this boiler it is expected to develop approximately 10 horse-power from these waste gases, which power will be used to drive the electric-gas engine by night and the fitting shop by day. The following is a summary of expenditure for month ending March 31, 1913 (9,600 short tons):—

Cost per ton.

filter has its separate vacuum-pump, which is placed on the top floor and independent of the other machines. The gold-solution obtained from the filtered slime is delivered against a 6-ft. head into solution storage-tanks above the agitator vats. A steel vat placed immediately above the solution vat is fitted with twenty large filtration frames for clarifying the solutions previous to precipitating the gold. The solution is elevated to it by a centrifugal pump, and the mud caught in both these tanks will gravitate to the agitators. After clarification the solution is led to the extractor-room, where precipitation is effected with zinc shavings in the usual manner. Two Tangye suction-gas engines placed back to back, and each of 108 b.h.p., operate the mill per 14-in. rubber driving-belts. The gas generators, one for each engine, are each of 120 b.h.p., and, singly, can drive both engines for a short time when necessary. They are of the usual construction for operating with charcoal, and have large spark arresters. The gas passes through a coke scrubber and a wood-wool scrubber before entering the engines. The usual

GEORGE MOYSES ROBERTS, the owner of "Teddington" Estate, in the Mount Barker district, is perhaps best known by his association with the mining industry in Western Australia, he having been a prominent figure on the Kalgoorlie fields for very many years. He is the eldest son of Mr. Thomas Roberts, who came to South Australia from Cornwall, England, in the forties and is a colonist of long standing in the Central State. Mr. Thomas Roberts was brought to Australia by his parents in the early forties, the family settling on land near Gawler, and for some time he worked on his father's farm, but the gold discoveries in the sister State led him to undertake the hazardous overland journey and join in the search for the gleaming metal. He met with indifferent success, and ultimately returned to South Australia, where he secured a property near Clare, in the District of Stanley, and entered upon farming pursuits, in which he continued until 1899, when he relinquished active participation in the affairs of the estate and retired to Adelaide, where he still lives, hale and hearty, in his

eighty-first year (1912). He was elected a member of the Clare Town Council, from which he afterwards retired, and took an active part in promoting interests of the district. The politics of his adopted country have always gained his keen attention, and he is a warm supporter of the Liberal Party. The subject of our notice was educated at home and at the local school, afterwards spending six years on the parental farm. He early displayed a bent for metallurgy and its kindred subjects, and in 1887 he was sent to Ballarat to study at the School of Mines in that city, which he did with brilliant success. Within a year he had secured his certificate in metallurgy, chemistry, and assaying, and was the only one of his class to secure a first-class certificate in mining engineering. He also made rapid progress in the study of mining and railroad surveying, but before the examinations in this subject came to pass, in 1889, he was offered and accepted a position with the Broken Hill Proprietary Company as analytical chemist. Here his abilities found ready scope, and it was not long before he was

Hartleto, Perth.  
MR. GEORGE MOYSES ROBERTS.

appointed head of the department, with control over a staff of seventeen. Toward the middle of his seventh year with the company he accepted the post of Manager of the Mainland Consols Mine, on the Murchison, taking up his duties in 1895, in which year he came to this State. Three and a half years later his exceptional work attracted the attention of the

Directors of the Lake View Consols Mine, then at the apex of its career as a gold producer, and he was sent to New South Wales with a power of attorney to watch the company's interests in the Mother State, and to take charge of the gold extracted from the rich ore sent there for treatment. The onerous post lasted over three months, during which time he was responsible for the safe handling of over a quarter of a million pounds' worth of refined gold. We next find him filling the position of metallurgist and assistant manager of the Lake View Consols Mine for twelve months, after which he passed to the Great Boulder Proprietary Mine to hold a similar post for four years. He severed his connection with this important company to take over the general management of the Associated Northern Mines, in which position he has continued ever since, also acting as attorney in Western Australia for the company. From 1905 to 1911 his responsibilities were augmented by the management of the Associated Gold Mines, but the severe strain of controlling both properties told on his health, and he abandoned this second post. In addition to the Associated Northern, Mr. Roberts is developing the Victorious Mine at Ora Banda, the property of the same company, where an elaborate plant has been installed for the economical treatment on a large scale of low-grade ores. He was responsible for the plans and erection of many of the modern plants today working on the fields, and in the past his master mind and faculties of organization have been exercised unsparingly in his efforts to maintain the mining industry on a thoroughly sound footing. Mr. Roberts is looked up to as one of the State's foremost mining experts, and his long services have been recognized by his appointment by the Government to the first Senate of the University of Western Australia, representing the mining interests. He is a member of the American Institute of Mining Engineers and the Mining and Metallurgical Institute of England, and also a member of the Australian Institute of Mining Engineers. He was the author of an exhaustive article dealing with the sampling of silver-lead bullion, which was read before the former institute, and afterwards published in the journal issued by that society, and also contributed a valuable paper which was published in the monthly journal of

the Chamber of Mines at Kalgoorlie. For upwards of ten years he has been a member of the executive of the latter body, and as a unit of several sub-committees has rendered service of inestimable value to the mining industry. Mr. Roberts' time is too busily occupied to permit of his devoting much attention to outside matters, but what little leisure he has is given to the superintendence of his "Teddington" Estate in the Mount Barker district, a lengthy description of which appears elsewhere in this volume. His chief recreation comes from motoring, but he is fond of golf, and occasionally plays a few rounds on the Boulder links. Mr. Roberts is a member of Weld Club, Perth, and Hannan's Club, Kalgoorlie. He married in 1903 Frances C., daughter of the late Mr. Thomas Hewitson, mining engineer, of Victoria and Western Australia, and has a son and a daughter.

The OROYA LINKS MINE, now under the general management of Messrs. Bewick, Moreing, & Co., mining and consulting engineers, St. George's Terrace, Perth, and Kalgoorlie, consists of several amalgamated leases, chief among which are those of the Golden Links, the Kalgoorlie Amalgamated, and the Oroya Brown Hill leases. These combined claims comprise some 300 acres, situated on the eastern side of the "Golden Mile," and it was on the Brown Hill lease that the famous Oroya Pipe was first discovered, this shoot of gold traversing in turn the Hannan's Brown Hill, the Associated Northern, and the Oroya North Block Leases. The reduction plant is placed on the Hannan's Brown Hill lease, and consists of 50 head of stamps with tube mills, capable of treating some 12,000 tons monthly. The gold recovered from these leases up to the middle of 1912 amounted to 1,242,464 oz. from 1,366,036 tons of ore. PATRICK FITZGERALD, manager of the Oroya Links Gold-mining Company, Kalgoorlie, was born at Otago, New Zealand, on March 21, 1870, and is a son of Mr. W. S. FitzGerald, late Inspector of Public Schools at that place. He received his primary education at Dunedin, New Zealand, eventually passing from the Boys' High School to the Otago University School of Mines, where he made a special study of mining engineering. Upon

leaving this institution as a student he maintained his connection with the school as lecturer on metallurgy and assaying, which post he filled for some considerable time. He then entered upon the active practice of

J. J. Dwyer, Kalgoorlie.  
MR. PATRICK FITZGERALD.

his profession, and after spending several years in practical work, first in the Dominion and later in Tasmania, in 1897 he came to Western Australia. Mr. FitzGerald in the first instance accepted the position of metallurgist on the Hannan's Brown Hill Gold Mine—now the Oroya Links—and upon severing his association with this mine became manager for several propositions in the back country, notably the Vivian and Northern Mines at Lawlers, under the general management of Messrs. Bewick, Moreing, & Co. Discontinuing his service with this company he proceeded to West Africa, where he managed the Prestea Block A Mine, near Tarqua, and also acted as assistant superintending engineer of the group of mines controlled by the Consolidated Goldfields Co. of South Africa. After remaining on the Gold Coast and Northern Nigeria for about three years Mr. FitzGerald, upon arrival in London in the year 1910, was appointed to the charge of the Oroya Links Mine at Kalgoorlie, and taking up his duties shortly afterwards has since continued to fill the position. He is a member of the London Institute of Mines and Metallurgy and of the Chamber of Mines of Western Australia at Kalgoorlie.

The LONDON AND HAMBURG GOLD RECOVERY CO. (1905) LIMITED, the Head Office of which is in London, first opened up operations in Kalgoorlie in 1897. The idea was to test the various classes of ore found on Western Australian goldfields, with a view of determining the best method of treatment in each case, general economy and high rate of recovery of gold contents to be, of course, the main objects in view. To attain their object the company's directors established a testing station at Kalgoorlie, as the most important gold-mining centre of Australia. There was erected a large chemical laboratory, which, in addition to containing all the requirements for ordinary assaying, was fitted up so that all manner of chemical experiments could be carried out. Next, a testing plant was erected on a scale suitable for dealing with large samples of ore, which contained examples of the various kinds of machines used for gold recovery, so arranged that they could be used in any combination as required. In addition, extensive offices and officers' quarters were built. The chemical and metallurgical side of the business was conducted by Dr. L. Diehl, mechanical matters being placed in the hands of Mr. C. A. Gunther, both highly-qualified experts each in his particular line. Prior to opening the Western Australian branch, Dr. Diehl, whilst in Europe, had conducted experiments on the oxidized ore of the Hannan-Brown Hill Mine, and the erection of the plant decided upon for the treatment of that ore was the first work undertaken by the London and Hamburg Gold Recovery Company in Western Australia. During his researches, which he began in 1895, Dr. Diehl tried slimes treatment by means of the filter press, and his trial proving most successful he adopted the idea, the results obtained being the means of introducing the filter press into general use in gold recovery. The London and Hamburg Company acquired the Australian business of the Gold Ore Treatment Company, which controlled the patent rights of Messrs. Sulman and Teed for the bromo-cyanide process, and, after

extensive experiments in Kalgoorlie sulpho-telluride ore, the bromo-cyanide process was found to be eminently suitable for the extraction of gold from this complex mineralized material. The process, combined with mechanical appliances and improvements, is since known as the Diehl Process, and has been in operation with marked success. Hannan's Star was the first mine to be equipped with this method of treatment, and it was on this plant that tube mills were first introduced into mining. Other mines adopted it, and the London and Hamburg Company erected a plant on the Brown Hill Mine for the treatment of its sulpho-telluride ore, and, later on, the Lake View Consols plant was altered to suit the

GEORGE HENRY WALKEDEN, M.I.Mech.E., general manager, engineer, and attorney for The London and Hamburg Gold Recovery Company (1905) Limited, in Western Australia, was born at Wolverhampton, near Birmingham, England, on November 7, 1860. He is a son of the late T. W. Walkeden, well known in the business circles of that city, and at the close of his scholastic career was apprenticed to the trade of mechanical engineering, at the same time taking a special course in engineering and chemistry at Mason College, Birmingham. Upon the termination of that course and the agreement with his employers in 1890, he was admitted as a member of the Institute of Mechanical Engineers of England, so that for nearly

ACID PLANT, LONDON AND HAMBURG CO.'S WORKS, BROWN HILL, KALGOORLIE.

process. It was also in use on the Ivanhoe Gold Corporation, and subsequently the filter press came into general use for the purposes of gold recovery in various parts of the world. After the introduction of the bromo-cyanide or Diehl Process, in which sulphuric acid is extensively used, it was found that the imported supply of acid was unreliable and expensive, and to meet this difficulty the London and Hamburg Company decided to instal and put into operation an up-to-date plant for the manufacture of sulphuric acid, and thus provide a large stock from which the various mines could obtain supplies at any time.

fourteen years he was engaged in his calling in the Old Country, on work ranging from the mining of coal and iron, through every step to manufactured products of iron and steel. In 1890, desiring wider scope and chances of promotion, he came to Australia, landing in Melbourne early in that year. Upon arrival he joined the staff of the Railway Department Engineering Works at Newport, Victoria, for a few months, when he resigned in order to obtain some experience of Australian bush life, which was then considered necessary for every new colonist, and which embraced work ranging from surveying to saw sharpening for a timber mill. Returning to the metropolis, he established himself in

practice as consulting engineer for a considerable time, but early in 1896, being offered a position on the staff of the Broken Hill Proprietary Company, decided to accept it, and immediately entered upon a new sphere of action at the Barrier. After spending some twelve months there, during which time he was engaged

J. J. Dwyer,

Kalgoorlie.

MR. GEORGE HENRY WALKEDEN.

chiefly on the designs of the new mill and other works contemplated by the company, he was transferred to Port Pirie, where he had control of the construction of the extensive smelting and refining works for the same company. Concluding this work, Mr. Walkeden sailed for Western Australia, and early in 1899 accepted charge of the engineering works of the Great Boulder Proprietary Mine. After designing and erecting the treatment plant for this mine and starting it to work satisfactorily, he accepted a position as engineer to the London and Hamburg Gold Recovery Company on the construction of the treatment plants for the bromo-cyanide, or Diehl, process. Upon the completion of these works in 1902, Mr. Walkeden proceeded to London, subsequently going to Africa, where he spent some time in following his calling on the mines of the Gold Coast and Ashanti. Returning to London he was engaged for nearly two years on experimental work and designs for West Africa and Mexico. In 1907 he returned to Western Australia to fill the post of general manager, engineer, and attorney for his company at Kalgoorlie, and has since carried out the

manifold duties attached to this responsible position. Mr. Walkeden spends much of his time in the study of current works dealing with the technical side of his profession, and so keeps himself in touch with the latest ideas and methods in mining machinery. Whilst at Broken Hill, in conjunction with two other gentlemen, he was instrumental in founding evening technical classes, which formed the nucleus of the present Technical School in that city. In his leisure hours Mr. Walkeden takes great pleasure in floriculture, and in spite of difficulties, due to the vagaries of the climate, evidences of his knowledge and skill and love of Nature can be seen all round his home in Kalgoorlie. As a mechanic he effects all his own repairs, alterations, etc. Mr. Walkeden married in 1904 Frieda Olga, daughter of the late Julius Deglow, of the Transvaal, South Africa.

**ROBERT SILVERS BLACK.**

general manager of the Kalgurli Gold Mine, was born at Milton, South Island of New Zealand, on June 9, 1860, and is a son of the late William Black, a native of Yorkshire, who came to the Dominion in 1840, and took up land in the early days. The subject of our memoir attended various public and private schools during his boyhood, and at the age of seventeen entered the service of the National Bank. During 1880 and 1881 he gained some experience of mining, being employed by the bank during those years in its assaying and smelting office on the Reefton goldfield. Owing to indifferent health he relinquished this work, and continued with the bank in its ordinary business for seventeen years, during which time he held important managerial positions. Resigning from the bank's service Mr. Black left for Tasmania, and was associated with the early days of the Zeehan silver fields, where as general director he took an active part in the management of a number of mines. In 1895 he left for Western Australia to take up the management of the famous Londonderry Mine at Coolgardie. This position he occupied for about three years, and resigned to take the general management of the mines associated with the Octagon Explorers. Amongst these were the Crusoe, Friday, and Menzies Consolidated at Menzies, and Block 45 and Kalgurli United at Kalgoorlie.

In 1900 he was offered and accepted the general management of the Kalgurli Mine, and occupied that position until 1903, when he resigned on account of indifferent health and for private reasons. Residing in the Eastern States and on his pastoral property in New Zealand until 1907 he was then requisitioned by the Board of the Kalgurli Company to resume his former position as general manager, and returning to Kalgoorlie has continued in charge of the mine up to the present time. Mr. Black is a member of the American Institute of Mining Engineers and of the Australian Institute of Mining Engineers. For a number of years he has been a vice-president of the Chamber of Mines of Western Australia. He has done a considerable amount of travelling, and on the goldfields is known as a good supporter of all kinds of legitimate sport. He has been on the committee of the Kalgoorlie Racing Club for many years, and is vice-chairman of that body. Mr. Black has been twice married, his present wife being

MR. ROBERT SILVERS BLACK.

Emily, daughter of Mr. T. A. Browne (Rolf Boldrewood), of Melbourne, and has two sons and one daughter.

**GEORGE RIDGWAY**, mining engineer, assistant manager of the Great Boulder Mine, was born at Crawley, Buckinghamshire, England, on May 26, 1867, and is a son of the late Matthew Ridgway, farmer, of that place. Educated at the

Trinity Preparatory College, Old Stratford, upon the termination of his scholastic career he entered the Watling Engineering Works, Stoney Stratford, where he served articles of apprenticeship for five years. In 1888, having completed his engineering course, he came to Australia, landing at Melbourne, and subsequently filled the positions of manager and engineer for two different brick-manufacturing companies in Victoria before leaving the Eastern State for Western Australia in March, 1894, where, after a sojourn of short duration in Perth, he continued his journeyings to the newly discovered goldfields in the interior. In conjunction with Mr. Whitburn, a surveyor, now resident in Victoria, he established a condensing plant at the Black Flag, by which means he was able to supply the much-needed precious fluid to the early pioneers of the fields, but at a later date deserted these remoter regions, and in partnership with his brother engaged in the brick-making

*J. J. Dwyer,* *Kalgoorlie.*  
MR. GEORGE RIDGWAY.

industry at Midland Junction for two years. Returning to the goldfields at the end of that time he accepted employment on the engineering staff of the Lake View South Mine, and after spending a short period on the main reef he was engaged on the erection of the sulphide plant of the Great Boulder Proprietary Mine, and upon the completion of this work he was appointed to the position of engineer, which he filled from 1900 to 1903. He was next appointed to the

management of the Princess Royal Gold Mine at Norseman, which post he occupied until July, 1905, when he resigned to take over the duties of engineer and assistant manager of the Great Boulder Mine, and has continued to fill this appointment ever since. Mr. Ridgway is a member of the Chamber of Mines of Western Australia, and serves on the publication committee of the body. Engineering is his hobby as well as his profession, and he has patented many mechanical devices, one by which he is known far and wide and which has made his name familiar in the mining industries of the world, being the "Ridgway Vacuum Slime Filter," for the treatment of gold-bearing slimes. He holds three separate patents for this particular process, each representing a different method, one of which is now used with pronounced success on some of the leading mines of this State. During his period of training for his profession he attended the South Kensington School in London, and holds a first-class certificate in the Science and Arts Department, with honours in steam, machine construction, drawing, and applied mechanics. In his younger days he was prominent in football among the English schools, and served as captain to a couple of teams. Motoring is now his favourite recreation, albeit he is fond of horses, and takes some interest in sporting events, being a member of the local racing club. He is also a member of Hannan's Club. Mr. Ridgway married in 1898 Mildred, daughter of the late John Lukies.

JOHN WARRICK, mining engineer and underground manager, Great Boulder Mine, was born at Burra Burra, South Australia, on July 29, 1866, being a son of the late John Warrick, a colonist of the early sixties. He received his education primarily at the State and private schools, and subsequently proceeded to Broken Hill, afterwards entering upon farming pursuits. He also obtained considerable experience among horses and cattle on one of the large station properties, but relinquished pastoral occupations in favour of mining, and after working for two years at Moonta returned to Broken Hill, where he was identified with the Proprietary and Central Mines for about six years. During this period he specialized in assaying

and survey work, and obtained creditable passes in these subjects. In 1895 he came to Western Australia and engaged in prospecting

*Rembrandt Studios,* *Boulder.*  
MR. JOHN WARRICK.

around Coolgardie for about a year, at the end of which time he undertook the task of inspecting and sampling mining properties at Kalgoorlie on behalf of the New Zealand Mining Trust. From this position he passed to the control of the Lady Alice Mine at Coolgardie, and eventually accepted the post of underground foreman on the Great Boulder, at the end of twelve months being promoted to his present position, which he has now (1912) held for sixteen years. Mr. Warrick has been instrumental in introducing many economies in the underground working of the eastern goldfields mines and was an early advocate of the contract system, maintaining consistently the justice of payment by results. He is interested in the agricultural industry, owning a property of 4,000 acres at Wandering, devoted to the production of cereals and the grazing of sheep and horses. He is a member of the Western Australian Chamber of Mines, and acts on the publication committee of this body. He has held office as a Freemason, is associated with Hannan's Club, Kalgoorlie, and for mental recreation indulges in the perusal of works on agriculture and horticulture among other favourite subjects, being also a student on broad lines of political economy. In his younger days he was addicted to manly

sports, being fond of boxing and rifle shooting, besides being a meritorious performer on horseback over "the sticks." In 1892 Mr. Warrick married Mary Ellen, daughter of the late Christopher Martin, of Christchurch, New Zealand, and has four sons and three daughters.

**SIDNEY ARNOLD TEEDE**, accountant to the Great Boulder Mine, was born at Bunbury, Western Australia, on January 31, 1878, and is a son of the late George Teede,

*J. J. Dwyer, Kalgoorlie.*  
MR. SIDNEY ARNOLD TEEDE.

who was identified with the Civil Service of this State for over half a century, serving in the Education Department and as Clerk of Courts, etc. The subject of this notice received his education at the seaport town above mentioned, and at sixteen years of age left school to enter the legal office of Messrs. Stanley, Money, & Walker, solicitors, of the same place. After filling a clerical position in this firm for about four years, in 1899 he resigned in order to try his fortune on the eastern goldfields. Shortly after arrival on the fields he was appointed to fill the position on the Great Boulder Mine rendered vacant by Mr. Thomas Maughan upon the appointment of the latter gentleman as secretary to the Chamber of Mines. Subsequently, after passing through the various grades of clerk, book-keeper, and paymaster, Mr. Teede was promoted to his present post of accountant upon the retirement of

Mr. Rosman in 1911. He also filled the position of accountant to the Boulder No. 1 Company—a subsidiary corporation—for the past eight years, and represents that company in addition to the Great Boulder in the Chamber of Mines of Western Australia, in which he serves as a member of the finance and building committees. In his younger days Mr. Teede gained considerable prestige as a cyclist, being winner of the Western Australian Amateur 20-miles Championship event in the south-west and many other valuable trophies. He is a tennis player of no mean merit, and captained the Bunbury Football Club for a lengthy period. Mr. Teede is a member of the Tattersall's Club at Kalgoorlie. He married in 1900 Annie, daughter of the late John Monkhouse, of Adelaide, and has two sons and two daughters.

**JOHN MICHAEL FINNERTY**, J.P., F.R.G.S., who for twenty-six years filled the office of Warden on the Southern Cross, Kimberley, and Coolgardie goldfields districts, respectively, was born in the Limerick military barracks on January 31, 1853, and is a son of the late Lieutenant-Colonel Charles Finnerty, of the 47th Regiment, afterwards staff-officer of military pensioners in Western Australia till within a couple of years of his demise. Mr. Finnerty was sent as a student to the famous Rugby School, and upon the termination of his scholastic career returned to Western Australia, where he was appointed to the position of clerk to the then Chief Justice, Sir Archibald Burt. This life failing to satisfy the demands of his ambition, he resigned his post, and turned his attention to the north-west, where, after some successful experience in the pearling industry, he established, in conjunction with the late J. H. Monger, a large pastoral station on the Gascoyne and Murchison Rivers, for which he acted as managing partner. In 1886 Mr. Finnerty joined the Government service as Inspector of Police in the Kimberley district, being transferred to the Mines Department and appointed Warden and Chief Magistrate on the Kimberley Goldfields a few months later. After discharging the duties of this office for three years, he was sent at the end of 1889 to Southern Cross in the same capacity, and continued at this centre until the discoveries at

Coolgardie and Kalgoorlie led to his appointment to the newly-proclaimed field in April, 1894. For several years prior to his retirement—which was forced upon him through ill-health—Mr. Finnerty held the offices of Warden and Resident Magistrate of the whole of the eastern goldfields, and during his extended term of service no officer of the Crown throughout the entire mining community was better known and respected. His decisions in the civil, mining, or other courts over which he presided were universally upheld and respected, both by Crown and country; and he won the esteem of all classes for his strength of character and adherence to principle, no amount of labour or expenditure of time being considered too great in achieving the ends of the administration of justice without favour or prejudice. Mr. Finnerty, who now resides upon a rural property near Geraldton, holds one of the oldest Commissions of the Peace in the State,

*R. Vere Scott, Kalgoorlie.*  
MR. JOHN MICHAEL FINNERTY.

being gazetted for the whole of Western Australia. Among other honours which have been conferred upon him is the Fellowship of the Royal Geographical Society, with which he has been associated for a quarter of a century. He served in the Defence Forces of the Commonwealth for over a decade, attaining the rank of lieutenant-colonel of the Goldfields Regiment, and retiring upon his departure from the goldfields, after commanding this regiment for five years. He is a member

of the Weld Club, Perth, and upon his retirement from public life the honour of life membership was accorded him by the authorities of Hannan's Club, Kalgoorlie. Mr. Finnerty at the present time takes recreation quietly with his dogs and gun, but in his college days he was in the first fifteen in Rugby football—a much-coveted honour. In later life the weighty demands of his office left no room for sport. He married Bertha, daughter of the late Captain Oates, and has one son (who is engaged in pastoral pursuits) and two daughters.

or packhorse, on foot or in spring-dray, has scoured the country far and near, followed up the various rushes into the interior, suffered all the privations that fall to the lot of the prospector, pegged out claims by the score—obtaining good results in some and nothing in the great majority—selling for a comparatively small price properties that, if retained and worked, would have brought him fortune, managed mines and with the money thus made sent out men looking for gold for him, and through the medium of the father placed many properties on the

with the discovery and flotation of the Bullfinch Mines. The discovery of this field was made early in 1910, and the news was telegraphed to Mr. D. L. Doolette, then managing the St. George Mine at Mount Magnet for the Great Boulder No. 1 Company, that one of his prospectors, Mr. C. E. Jones, whom he had sent out to try and locate a new field in the Southern Cross (or Yilgarn) district, had obtained splendid pan returns from prospects he had taken at a spot some twenty-two miles from Southern Cross. In this prospecting venture Mr. Doolette

SURFACE PLANT ON THE BULLFINCH GOLD MINE EARLY IN 1911.

D. L. DOOLETTE. The name of Doolette has become indissolubly connected with mining in Western Australia, as from the very outbreak of the great gold rush either father or son, and oft-times both, has been associated with the discovery, opening up, and development of the various fields throughout the vast auriferous area in Western Australia. On the one hand the father has been at the head of the promotion, capitalization, financial, and general administrative work; while on the other the son, on camel

London market. Thus is the work performed. As in every branch of industry, the worker and the capitalist must go hand in hand—one is indispensable to the other; but it seldom happens that the position is so fortunate as in the case of the Doolette family, where the son acted in the capacity of worker and discoverer and the father obtained the finances necessary to prospect thoroughly and determine the value of those discoveries. The most recent and successful of these transactions between *père et fils* was in connection

had associated with him Mr. Vincent F. Shallcross, who has been widely connected with mining in Western Australia for many years, and these two gentlemen resolved to visit the spot at once and see whether the anticipations of their prospector were likely to prove accurate. To Southern Cross by train, and thence by buggy over the old Mount Jackson Road to a spot a few miles from Golden Valley, and along a turn-off for less than a mile in an easterly direction, and the "find" was reached. Further napping and

taking of samples and more panning was done by the party, and the results were satisfactory, but not, it was thought, sufficiently so to warrant the controlling of it by the small syndicate as a whole, and it was eventually decided that Mr. Shallcross should give an option over his seven-sixteenths share to Mr. Doolette for £1,000. Thus the latter gentleman became the owner of seven-eighths of the new find and Mr. C. E. Jones, the prospector, of one-eighth. The name of the mine had already been decided upon as Bullfinch, it being called that more by a reductive process than anything else, as all others were set aside until bird life was reached and the euphonious name of Bullfinch was adopted. Shortly after the transaction recorded above had been put on paper and work had been commenced on the likeliest part of the lease the values increased enormously, and it was realized that Mr. Shallcross had signed away a fortune for £1,000. Lucky was he, however, in his friend and quondam partner, for Mr. Doolette, ever ready to put himself in the other man's place and realizing what he would have felt had he disposed of his share for £1,000, sold him back one-sixteenth

an inkling of what was going on, and representatives of capital in the Eastern States visited the spot, witnessed the panning-off of the dirt that was being raised, heard of the wonderful assays that were being obtained, and the boom of 1910 set

MR. GEORGE PHILIP DOOLETTE.

in. Speculators, prospectors, and old mining identities from the nineties turned up by the hundred, and Southern Cross, which perforce

tables formed beds for men every night, and the road between the Cross and Bullfinch became a busy scene of traffic. It was this find that set the way for a new means of locomotion to the goldfields, and the motor-car became a very important—although expensive—adjunct to the opening up of a field. The roads were fearfully rough, but the cars were tough and the drivers expert, and it was nothing short of wonderful how the country for a hundred miles from Southern Cross was prospected and visited principally by means of the petrol-driven machine. All the country within miles of the Bullfinch Mine was taken up as gold-mining leases and named after some bird, and thus became established the "aviary." After working the mine for some time and obtaining wonderful values Mr. D. L. Doolette obtained offers from London, through his father, for floating the property. These were accepted and The Bullfinch Proprietary (W.A.) Ltd. became an established fact. GEORGE PHILIP DOOLETTE, notwithstanding the fact that he has already exceeded the allotted span of life, is the possessor of wonderful vitality, energy, and ability to meet the demands Time is making upon his constitution. It was a happy combination of circumstances that placed him in the last eighteen years or so in what was his real vocation—the financial and mining life of London. There he occupies one of the most prominent positions, and there he is known and highly appreciated for his business acumen, great administrative ability, and the kindness of manner which make friends wherever he goes. The possessor of considerable oratorical powers, he adds to them a tactfulness in dealing with men and meetings which have earned him fame in city circles as a company chairman. From his office in the city he controls mining propositions in many parts of the globe, but he has ever taken chief interest in matters relating to the land of his adoption—Australia. Mr. Doolette was born in Dublin in 1838, and although he went to Australia at a very early age it is said of him that his birthplace is easily guessed owing to the delightful manner he has of influencing others to his opinion. For many years he was engaged in commercial pursuits in Adelaide. He was ever fond of a mining speculation or investment, and got his first taste of

Photo by L. Shapcott.

GENERAL VIEW BULLFINCH GOLD MINE.

of the property for the £1,000, and thus they were together again. For some time work went on quietly. Then suddenly the outside world got

was made the headquarters of the rush, resembled exactly Coolgardie in the olden days. No accommodation was to be obtained, billiard

this in the South Australian Mines. Thence to Broken Hill interests was but following the natural sequence of events, and he was a large shareholder of the great silver properties across the border of his State. In the early nineties, when the news first came across of the discovery of the Coolgardie goldfield, and when numbers of his old Broken Hill mining friends were preparing for a flitting to the new field in the Golden West, Mr. George Brookman and he conceived the idea of forming a syndicate in Adelaide to obtain control of properties in the auriferous belt in Western Australia. In this way was the Coolgardie Prospecting Syndicate formed. This famous combination was started with a capital of but £250, in 25 shares of £10 each, and such was the success of its enterprise that had an original holder of but one of these shares held everything that would have come to him he would by now have received some hundreds of thousands of pounds in dividends and be worth several millions of pounds. In the furtherance of its policy, the Syndicate sent Mr. W. G. Brookman and Mr. S. Pearce to the goldfields, and they found their way to Kalgoorlie when the value of the discoveries made there began to be realized. A number of leases was acquired and Mr. Doolette, who was the Chairman of the Adelaide Board, was sent to London to finance matters. He had a very uphill fight, and properties subsequently worth millions were sneered at and ignored by the conservative English financiers. In the end, however, perseverance and the better knowledge diffused as to the worth of the properties prevailed and Mr. Doolette managed to interest Colonel North and Mr. John Waddington in the Great Boulder Company. Thereafter all was plain sailing, and Mr. Doolette had but little difficulty in disposing of all the properties as to which he had been negotiating at Home. All know what has come to Western Australia and the Commonwealth as the result of this successful work. So much was to be done from that end in connection with all the companies, and so fast was the progress made on them from the mining point of view, that Mr. Doolette decided to remain in London for some time, and eventually he found it necessary to take up residence there altogether and to make periodical visits to Australia.

He has been associated in the directorship of most of the successful gold mines of Western Australia and until recently was chairman of directors of the Great Boulder,

Bartletto. Perth.  
MR. DORHAM LONGFORD DOOLETTE.

Oroya-Brown Hill, and many others, as well as a director of the Sons of Gwalia. His recent health has, however, compelled him to resign from several of these Boards, but he

one son (Mr. D. L. Doolette) and one daughter living, and he resides at Caterham Valley, one of the most beautiful parts of Surrey. DORHAM LONGFORD DOOLETTE has made mining his hobby for a number of years, and, like all those who are seekers after the precious metal, has been forced to undergo all sorts of privations, disappointments, and trials in the following of it. He was born in South Australia in 1872, and educated at Whinham College, North Adelaide, afterwards attending the University of Adelaide, where he went through the Arts course and started his lectures for a bachelorship of medicine. The life, however, did not appeal to one whose instincts were all in the direction of an outdoor existence, and he abandoned the medical course in order to follow the gold lure which drew him to Western Australia. From but a few miles from the coast, right to Coolgardie he "humped his swag"; and that was the beginning of his mining career. From one rush to another he followed, and in many cases preceded, the prospector, and it was in the course of one of these that he found himself on the now famous "Golden Mile" of Kalgoorlie, and actually had the distinction of pegging out the Golden Horseshoe

Photo by L. Shapcott. MAIN SHAFT, BULLFINCH GOLD MINE.

naturally retains the position in the Great Boulder Mine, and that one to which he was of course appointed chairman—the Bullfinch. He has

Mine, which has since paid something like two and a half million pounds in dividends. In those days it was a case of getting hold of a property

and letting it go at a profit whenever one was seen, and it is no wonder, therefore, that he did not hold that or any others of the many mines he acquired and which have since become famous. Among the mines obtained by him in those days were the Golden Link, Central Boulder, and Chaffer's. At that time he was connected with an Adelaide Syndicate, but he then decided to start out for himself, and followed the rushes to the north of Kalgoorlie and went far afield of any of the prospectors. He prospected the Niagara country in 1895, and as a result of the success he there achieved paid a visit to the Old Country. After a good holiday he returned to the West and spent a number of years prospecting in the Eristoun, Laverton, and Burtville districts—in fact, over the whole of the North Coolgardie field. Later he paid a visit to the Aritunga (Northern Territory) field when the rush broke out there. On again returning to Western Australia Mr. Doolette became associated with the Great Boulder Company and was its field examiner for some years. Latterly he was placed in the management of the St. George Mine, Mount Magnet, and remained there until the discovery of the Bullfinch, when the attention demanded by that proposition brought about his resignation and caused him to spend all his time in the development of his own property. Mr. Doolette can best be described as an all-round man, his proclivities covering a wide range. He has ever been a lover of verse, and as a song-writer has earned much prominence and success through the medium of the columns of *The Bulletin* and other Australian papers. All his verse breathes of the bush, and this is only natural, as it was there he spent most of his time, and it was there, often in the silent watches of the night that most of his verses were penned. He is a keen follower of sports of all kinds, and has shown his interest in horse-racing by bringing from England to Australia a string of thoroughbred horses. Mr. Doolette was married in May, 1910.

**CHARLES EDWIN JONES**, discoverer of the Bullfinch Mine, was born at Sebastopol, the centre of a large mining area near Ballarat, Victoria, on May 25, 1878. His father was a native of Glamorganshire, in

Wales, and his mother an Irish-woman. Up to the age of fifteen he was educated at Ballarat, and then worked on his father's farm for a couple of years. While still in his teens he turned his attention to prospecting in Victoria and worked in Ballarat East gold mines for some time. Toward the termination of the Boer war he went to South Africa with the last Victorian contingent, but having contracted malaria while on service was obliged to return to Australia soon afterwards. He disembarked from the "Drayton Grange" at Albany, and when his health was somewhat improved proceeded to the Murchison gold-fields and entered upon prospecting and dryblowing in the Cue

Burtville.

Perth.

Mr. CHARLES EDWIN JONES.

district. He then worked for the Morning Star Company at Mount Magnet, chiefly at prospecting, subsequently taking up the Diggers' Dam lease, which he successfully worked with a partner for about two years, but had to abandon the claim at the end of that time owing to the difficulty in obtaining a sufficient water supply. While prospecting at Murchison he met Mr. D. L. Doolette, who offered him a position as sampler at the St. George Mine, Mount Magnet, of which Mr. Doolette was then manager. After three years' connection with this mine he became working partner with Mr Doolette and Mr. Shallcross, his duties being to prospect the different gold belts round

the Yilgarn district. Starting operations on the Corinthian Lease, about 10 miles north of Southern Cross, he worked down to the south of the town for about 40 miles as far as Parker Range, where he put in several weeks, but ultimately was forced to abandon operations on account of scarcity of water, none being obtainable within easy reach of the gold belt. On leaving Parker Range he made for Golden Valley, the first gold-producing district in the Yilgarn field, and after prospecting from there through Ennuin eastward for about 50 miles he was again confronted by the insurmountable water difficulty, and decided to return to Golden Valley. Following the ironstone belt of country south from there for about nine miles he struck the country soon to be called by that well-known name "Bullfinch," the story of which is now a matter of history. The outcrop was easily discernible, and on sample proved sufficiently good to warrant Mr. Jones advising his partners that he had at last been successful, having from the outset been without a doubt about the mine as a first-class mining proposition. In earlier days Mr. Jones was a marksman of some repute, and has competitive honours to his credit, and he was also a well-known footballer in Victoria in the late nineties. He was married in 1907 to Miss Scott, of Ballarat, and has a family of two children.

**EDWARD JAMES WELLSTED**, manager of Perth Branch of Bewick, Moreing, & Co., mining engineers, London, Kalgoorlie, and elsewhere, is a son of the late Captain Thomas Wellsted, of Sussex, England, where he was born in 1867. He received his education in the south of England, and subsequently was identified with various commercial enterprises. At one period journalistic work claimed his attention and he was representative of the Press Association in Newhaven. For several years he was connected with the Engineering and Stores Department of the Harbour Works of Newhaven, England, and at a later date was connected with the management of a quarry and whiting works at the same place. Eventually he joined the Stores Purchasing Department of the London office of Bewick, Moreing, & Co., and when in 1902

a stores and buying department was inaugurated in Perth, Western Australia, by the same firm Mr. Wellsted was engaged in the opening and carrying on of the same. Subsequently he held the position of business manager in the firm's head office at Kalgoorlie in this State, and has

*Bartletto.* *Perth.*  
MR. EDWARD JAMES WELLSTED.

since filled the appointment of office manager at the Perth branch. He is also a representative of the Chamber of Mines in Perth. Mr. Wellsted is a member of the Perth Club, of Hannan's Club, Kalgoorlie, and of the Masonic Club. Before leaving England he was secretary of the Newhaven regatta and the Newhaven Cricket Club, and was also a town councillor. Since coming to this State he has devoted his leisure chiefly to golf, and in 1909 won the Governor's Cup in connection with the Fremantle Golf Club.

MATTHEW McVICKER SMYTH, representative in Western Australia for Nobel's Explosives Company Limited, Glasgow, Elder Buildings, Perth, is a son of the late Mr. Matthew Smyth, of Paisley, Scotland, and was born on December 1, 1867. Educated in Dublin, he resided during the early years of his life in that city. He has actively followed commercial pursuits, both in the Old Country and Australia, since 1887, ultimately proceeding to Queensland in 1899 to take charge of the explosives department of

Messrs. Brabant & Co., of Brisbane, Queensland agents of his present company. Mr. Smyth returned to Glasgow in 1909 and left there early in 1910 for Western Australia to take up his present position. Elder, Shenton, & Co., Limited, of Perth and Fremantle, are the Western Australian agents for the Nobel-Glasgow Company, and sub-agencies are in active operation in every mining centre in the State. On the discovery of any fresh fields of mineral wealth, the Nobel-Glasgow Company makes immediate arrangements to meet the explosives requirements of the mining community, and in the agricultural districts supplies are obtainable at all the principal towns for purposes of land-clearing, well-sinking, etc. Magazines have been

*Bartletto.* *Perth.*  
MR. MATTHEW McVICKER SMYTH.

erected throughout the whole of the State for the storage of all classes of explosives, which are manufactured in various forms to meet every possible contingency. While in Queensland Mr. Smyth joined the Commonwealth Military Forces, and is at present on the Reserve Officers' List. He is a staunch Imperialist, and takes an active interest in the affairs of the Overseas Club. He has made a hobby of the collection of native curios and mining specimens, and his office at Perth contains a very fine array of aboriginal weapons and other interesting objects, of which he is justly proud, and which as a private collection would be very hard to beat.

FREDERIC SHIRLEY ANDREWS, legal manager and attorney, Princes Buildings, St. George's Terrace, Perth, is a son of the late Mr. Francis Andrews, of Croydon, Surrey, England, who for many years was associated with the Hong-Kong and Shanghai Banking Corporation, and on his retirement became a director of several London companies, including the Land Corporation of Western Australia, Limited, of which he was managing director. The gentleman under review was born at Wallington, Surrey, in 1876, and was educated at Beaumont House School, Croydon. Upon completion of his studies he joined his father's office in London for two years, and at the end of this period went to sea as an apprentice in the ships of Messrs. Bethell, Gwynn, & Co., London. In 1895 he left for Western Australia and upon arrival became connected with the staff of Messrs. Glanville and Forbes, who represented a large number of English mining firms in this State. Eight years later Mr. Andrews took over the business on his own account and since that time has continued to represent English

*Bartletto.* *Perth.*  
MR. FREDERIC SHIRLEY ANDREWS.

interests in Western Australia, and has held power of attorney for several important companies. He is an Associate Member of the Corporation of Public Accountants. A keen sportsman and interested in most outdoor diversions he has been connected with cricket and football clubs in Perth and is a member of

the Perth Club. In 1901 he married Grace Margaret, daughter of Mr. E. W. Snook, late Superintendent of Telegraphs for Western Australia.

**FREDERICK BIRD TRUDE**, mining engineer, was born in Devonshire in January, 1861, and received his education in England. At the age of nineteen he left his native land for New Zealand and at once became associated with mining enterprises on the west coast and later in the North Island. Migrating to Australia in 1884 he followed mining pursuits in turn at Charters Towers, New England, and Broken Hill. With the exodus of mining men from east to west, in 1902 Mr. Trude arrived in the "Cinderella" State, and has since made Western Australia his home. Actively engaged in the management of mines all over the State he is regarded as one of its most enterprising men. Mr. Trude was married in 1896 to

*Bortletto.* *Perth.*  
MR. FREDERICK BIRD TRUDE.

Miss Bowman, of Archerfield, Hunter River, New South Wales.

**THOMAS MAUGHAN**, formerly General Secretary of the Chamber of Mines of Western Australia (Incorporated), was born at Jarrow-on-Tyne, Durham, England, on October 13, 1871, being a son of the late Thos. Maughan, naval architect and

x2

marine surveyor, of the same place, and later of Sunderland, where the gentleman under review received his education. He was connected with shipping interests for a number of years in Sunderland, and in 1895 came to Western Australia. After being engaged in the Government service for a couple of years, he joined Mr. W. A. Kōneman upon the Boulder Milling Company's Ore Reduction Works at the Great Boulder Mine, and subsequently became connected with the staff of the latter mine. In conjunction with Mr. A. Gurner he established the firm of Maughan & Gurner, shipping and general agents, but several years after his appointment, in November, 1899, to the secretaryship of the

*J. J. Dwyer,* *Kalgoorlie.*  
MR. THOMAS MAUGHAN.

Chamber of Mines of Western Australia, when the duties of this position assumed an onerous nature, he withdrew from the firm in order to devote the whole of his time and energies to the work of the Chamber. In 1913 he relinquished this post to take up the duties of secretary to the newly-formed Employers' Federation of Western Australia.

**JAMES OWEN HUDSON**, Inspector of Mines, East Coolgardie goldfield, is a New Zealander by birth, his father being Mr. John Robert Hudson, who occupied a post in the Civil Service of the Dominion until his retirement in 1908. Born at Hokitika on November 1, 1868, the gentleman under review received

his education in his native place, and subsequently entered upon the study of mining at the Reefton School of Mines, where he continued for a considerable time. He was associated with the mining industry on various fields in the Dominion until 1893, in which year he came

*J. J. Dwyer,* *Kalgoorlie.*  
MR. JAMES OWEN HUDSON.

to Western Australia, and upon arrival took over the management of a mine on behalf of the Kinambala Wealth of Nations Gold-mining Company, under the general control of Messrs. Bewick, Moreing, & Co. He also engaged in the business of reporting and inspecting for different mining companies, and in 1897 was offered the position of Inspector of Mines, for which he duly qualified by passing the prescribed examination, and received appointment in this capacity to the North Coolgardie and Mount Margaret goldfields. In 1903 he was transferred to a similar post at the East Coolgardie field, and has filled this position ever since. Mr. Hudson is prominent in first-aid work in connection with the St. John Ambulance Association, and has done much to popularize this movement throughout the goldfields, at present occupying the office of president of the local branch. He is an enthusiast in the matter of roses, and spends his leisure time in cultivating with much success these and other garden favourites. In 1900 he married Isabel, daughter of Mr. James McAllister, of Geelong, Victoria, and has three sons.

**BURBANKS MAIN LODE** (1904), Limited. — The Burbanks Main Lode Gold Mine is situated five miles to the south of Coolgardie, and possesses 108 acres. The company is the second reconstruction of the original Burbanks Main Lode, and was registered in London on May 1, 1904, the original company having been registered on July 22, 1896. The authorized capital is £40,000, in 200,000 shares of 4s. each, of which 187,810 shares have been issued fully paid. The total value of the bullion recovered to date amounts to £296,501 from 133,299 tons (2,000 lb.) crushed, and dividends paid amount to £15,000, the last being at the rate of  $7\frac{1}{2}$  per cent., paid on December 5, 1912. The reef being worked is narrow, contorted, and disjointed, and some idea of the manner in which it is twisted and thrown about can be gained from the accompanying photograph, which was taken at the 700-ft. level south. The average width of the reef is

Photo by F. Martyn.

REEF IN NO. 1 SHAFT AT 700-FT. LEVEL (BACK OF SHOULDER).

15 in., and the country rock consists chiefly of hard diorite. The main shaft has reached a depth of 900 ft., and further sinking will be commenced almost immediately. A large inflow of water has been the great drawback, the mine being entirely

flooded out for about two years, and at present 100,000 gallons are being taken out daily. The plant consists of a 20-head battery, cyanide plant, three "Babcock" boilers fitted with superheaters, "Walker" cross compounds air-compressor (1,600 cu. ft. capacity, new), an Ingersoll

air-compressor (800 cu. ft. capacity), Bellis-Platt electric set (new), winding engine, economizer, surface condensing plant, water purifier, electric pumps, complete fitting-shop and smithy, etc. The company is completing the erection of new portions of the

plant, *viz.*, Walker compressor, Bellis-Platt set, the economizer, condensing plant, etc., and expects to have all working early in the present year. The following are the company's Directors:—Messrs. M. W. Colchester-Wemyss, D.L. (chairman), S. C. Hunt, G. C. Howard, and William Nicholas, F.G.S., Lond.; London Secretary, R. Lawrence Spicer, F.C.I.S. The mine officials are as follows:—Attorney and General Man-

ager, William Nicholas, jun.; Mine Manager, Richard Wearmouth; Metallurgist, W. G. Clarke; Engineer, A. R. Mill; Amalgamator, J. Waters; and Accountant, Wm. Thomas; most of whom have been associated with the mine since its inception.

PANORAMIC VIEW OF BURBANKS MAIN LODE GOLD MINE.

**WILLIAM THOMAS**, accountant to the Burbanks Main Lode Gold Mine, was born at Dublin, Ireland, on May 29, 1874, his father, Mr. Henry Thomas, being well known for over half a century in commercial circles in the Irish capital. Educated at the Kildare Street College, Dublin, upon the termination of his schooldays Mr. Thomas joined the land agency office of John Eyre Harris, a very old Irish firm, with which he continued for ten years, relinquishing the connection in order to seek his fortune in a land which offered more scope for his energy. Arriving in Western Australia in 1901 he came direct to Coolgardie, and for a time was engaged in clerical pursuits, being appointed secretary of the Coolgardie Brewing Company in the heyday of the town's prosperity. Within four years he resigned his position and took a trip round the world which occupied nearly two years, during which period he visited many places of picturesque and historical interest on the Continents of Europe and America, touching also at China, Japan, and other parts of Asia, besides spending some time in the land of his birth and in England. In 1906 he returned to Western Australia and joined the staff of the Burbanks Main Lode as accountant, and has been identified with this mine in the same capacity ever since. In 1908 he married Cora, daughter of Mr. Edward Townsend, of the Bank of Victoria, Kyneton, Victoria, and has one son and one daughter.

**PATRICK HANNAN** was born in the parish of Quin, County Clare, Ireland, in the year 1843, and came to Australia twenty years later. Soon after his arrival in Melbourne he went to work in one of the Ballarat mines, and continued there for nearly five years, in 1876 leaving for New Zealand, where he followed mining to the exclusion of all other interests. During the six years spent in the Dominion he visited most of the principal gold mines of the country, and in 1873 returned to Australia, where he was one of the first to be concerned in the Temora rush of 1880. Coming again to Victoria, he passed the next few years in making himself acquainted with the various auriferous localities in the States of Queensland, New South Wales, Tasmania, and South Australia, in the last-named State joining the rush to Teetulpa in

1886. After experiencing the roughest side of early Australian goldmining in the Eastern States, Mr. Hannan came to Western Australia in 1889, and, proceeding through Southern Cross, was among the pioneers in the Parker's Range district. Prior to this date, and for several years after his arrival in the West, he was the subject of the usual ups and downs of the prospector's career, at times enjoying Dame Fortune's smile, and, anon, her darkest frown; but his advent in Coolgardie

Webb & Webb. Perth.  
MR. PATRICK HANNAN.

in 1892 marked the commencement of an era of prosperity. Striking a fair alluvial proposition, a year later he trekked east, and in company with his old mate, the late Tom Flannagan, prospected the country surrounding Kalgoorlie, and within a week of arrival reported gold (June 17, 1893). The report caused great excitement, and was the signal for the biggest rush that had yet occurred on the Western Australian fields. Great hardships were suffered, both provisions and water being very scarce, and after remaining for about a year, during which period he received his reward claim from the Government, Mr. Hannan returned to the coast to recover his health, which was seriously impaired. The following year, however, saw him again on the field, and since that time he has been identified with the goldmining industry in all parts of the State. A genial kindly disposition has made him generally popular, and he makes friends wherever he goes.

**NATHANIEL ASHER FRIEDMAN**, J.P., partner in the firm of Friedman & Johnston, battery owners, Ora Banda, was born at Bendigo, Victoria, on May 19, 1877. He is a son of the late Mr. Frederick Joseph Friedman, a mining identity of Bendigo in the early days and proprietor of Friedman's Reef on that field. Educated at Bendigo, Mr. N. A. Friedman, at the termination of his studies in 1894, sailed for Western Australia and entered upon mining pursuits. He prospected the Siberia district in the pioneer days of that venture, and spent considerable time in testing the possibilities of the field. He next came to Kalgoorlie, and took an early opportunity to avail himself of the advantages offered to students by the local School of Mines, which he attended for two years. In 1895 he joined Mr. J. H. Johnson in partnership in various mining interests, and in conjunction with the same gentleman became engaged in the treatment of slimes and tailings at the time when

J. J. Dwyer. Kalgoorlie.  
MR. NATHANIEL ASHER FRIEDMAN.

the cyanide methods were first gaining ground on the goldfields. Mr. Friedman undertook sole charge of the treatment of ores at the battery and cyanide plant purchased by the partnership at Paddington, one of the first crushing mills for public convenience to be subsidized by the Government. With his partner he was also the pioneer of the Ora Banda district, where they erected a battery pumping-station, and in 1909 purchased the Gimlet Mine, discovered a year earlier by a Mr.

Abbott. This mine, which has proved a very profitable proposition, is still in course of development, and the installation of a sulphide plant capable of treating 3,000 tons of ore a month is now being contemplated. Mr. Friedman recognizes his public responsibilities, and in 1909 accepted a Commission of Justice of the Peace from the Wilson Administration. He was a member of the first Progress Association Committee on the fields, and has interested himself in various ways for the benefit of the district. He is keenly interested in the scientific side of gold-production, and gives a considerable amount of study to the different methods in use for the treatment of ores. Having charge of this department of the firm's business he occupies himself with making continual experiments, and has the reputation of obtaining the best results in the district from his manipulation of the plant. Mr. Friedman married in 1904 Maude, daughter of Mr. J. W. King, the well-known Australian metallurgist, and has one son and two daughters.

JOHN HENRY JOHNSON was born at Auckland, New Zealand, on August 20, 1864, and is a son of the late John Grant Johnson (a member of the historical Scotch family of Ogilvie-Grant), who came to Australia when quite a young man, and for a time occupied the post of private secretary to Governor Grey in New Zealand. The gentleman under review was educated in his native city. Leaving New Zealand, he spent some time in Melbourne, and was engaged for some four years in the building trade and contracting during the days of the land boom in the early nineties. When the silver-lead fields were discovered on the West Coast of Tasmania in 1891 he proceeded to Zeehan, and obtained his first active mining experience, engaging in work on the mines and in the erection of mining machinery. From there he returned to New Zealand, and while filling a position as engineer in charge of Bunker's Hill Gold Mine took up study at the School of Mines under the now famous Dr. McLaren, D.Sc., F.R.G.S., obtaining his mine manager's and mining surveyor's certificates by examination at that school in 1900. Mr. Johnson subsequently came to Western Australia and acquired an interest in the Jubilee Mine on the Kurnalpi goldfield. For some time he worked this proposition, but

finding it unpayable he formed a syndicate to put up a crushing mill at Bulong for public convenience, a scheme which was subsidized by the Government. After managing this concern for nearly two years he formed a partnership with Mr. Nat. A. Friedman, who for many years had been engaged as battery manager and metallurgist in the mining industry, and in conjunction with this gentleman prepared a scheme to treat the sand residues on the Great Boulder No. 1 Mine. Failing to come to agreement with the directors of that mine for the purchase of the sand, they proceeded with their plan to Broad Arrow and treated the residues on the famous Hill End and another mine, at the same time acquiring a crushing mill at Paddington, in that vicinity. For three

J. J. Dwyer,

Kalgoorlie.

MR. JOHN HENRY JOHNSON.

or four years the firm did practically all the crushing in the Broad Arrow district, and at the end of that period—in 1906—they secured an interest in the Ora Banda Mine, and erecting a 15-head battery pumping station with five miles of water line, started on the development of their claim. In 1908 the Gimlet Mine was discovered by a prospector named Abbott, and a year later Messrs. Johnson and Friedman purchased the property, interests also being held by Messrs. Fimister and Cutchish, of Kalgoorlie. The former mine was abandoned and the new claim rapidly responded to the measures set in train for its opening up. Eighteen months' active work produced over 13,000 ounces of gold

from 25,000 tons of stone, and recent developments show 60,000 tons of ore in sight, valued at 50s. a ton, and so favourable are the prospects that the property is about to be equipped with an up-to-date sulphide plant, capable of treating 3,000 tons of ore a month. Mr. Johnson is chairman of the Ora Banda Progress Committee, and since the inauguration of the Broad Arrow Roads Board has been a member of that body. He makes a hobby of his work, and derives pleasure from the study of scientific principles as set forth by the leading writers on the subjects relating to mining. He married in May, 1905, Nance, daughter of Mr. J. J. Macnamara, of Auckland, and has two sons and one daughter.

CAMPBELL SHAW, J.P., mining manager, Kalgoorlie, was born at Greenock, Scotland, on May 15, 1854, and is a son of the late John Ritchie Shaw, a well-known mining manager at Ballarat in the late fifties. He was educated at the latter town, attending principally Mr. Rosenbloom's Academy, where he remained until twenty-one years of age. For about five years he was engaged in the mining industry at Ballarat, during two of which he managed the Red, White, and Blue Mine at Little Bendigo in that district. From there he proceeded to New Zealand, where he became engaged in contracting work in partnership with two friends for a couple of years. At the end of this period he returned to Australia, and for sixteen years was engaged in the mining industry in New South Wales, being identified in managerial positions with a mine at Rose Valley, the Chance Tin-mining Company, the Basaltic Deep Lead Mine at Vegetable Creek, and later had control of operations at the Webb's Consols and Mount Galena Silver Lead Mining Company's properties, while immediately prior to his departure for Western Australia he managed the Newstead Tin mines at Inverell, New South Wales. In 1896 Mr. Shaw landed at Fremantle and continued his journey direct to the back country, where for nearly two years he prospected in the Mount Margaret district. He then accepted the appointment of manager of the Golden Rhine Gold Mines, Limited, at Laverton, three years later relinquishing this post to take charge of the Ida H. Mine in

the same locality, which he managed for upwards of eleven years, during the greater portion of which time the mine was a handsome dividend-payer. In 1911 Mr. Shaw visited his native shores and renewed acquaintance with the scenes of his childhood, also visiting London and many of the places of historical note

*J. J. Dwyer, Kalgoorlie.*  
MR. CAMPBELL SHAW.

in North Britain. He has always found time to take a live and practical interest in the welfare of the community by which he was surrounded, and for a lengthy period filled the position of chairman of the Mount Margaret Roads Board. He served also on the board of management of the hospital at that centre, being a founder and first chairman of the institution. He was appointed to a Commission of the Peace by the Forrest Administration in 1900, while for several years he was a member of the Licensing Bench in the Mount Margaret district. Hunting has been a favourite pastime of Mr. Shaw's, and in earlier days he was particularly successful in his pursuit of fur and feather, many wild turkeys, kangaroos, etc., falling victims to his steady aim. He married in 1884 Margaret, daughter of the late Patrick Fox, of County Clare, Ireland, and has one son and three daughters.

OSMUND ALBERT ARCHIBALD, Kalgoorlie, who has been associated with gold mining in Western Australia for over twenty years, was born at Ramornie, New South

Wales, on November 4, 1876, and is a son of the late William T. Powell Archibald, who was closely related to the late Sir George Adams Archibald, first Governor of Manitoba and subsequently Lieutenant-Governor of Canada, and to Sir William Archibald, of Rusland Hall, Ulverston, England. Educated at Grafton, New South Wales, the gentleman under review, at the close of his scholastic studies, became interested in the mining industry at Drake, joining the staff of the Rivertree Proprietary Gold Mine in the assaying department, with which he was connected for two years. At the close of this period he came to Western Australia and upon arrival in company with other prospectors, exploited the district in and around North-east Coolgardie, being one of

*J. J. Dwyer, Kalgoorlie.*  
MR. OSMUND ALBERT ARCHIBALD.

the first prospectors of the Ora Banda field. In 1900 he accepted the position of metallurgist to the Guest Gold Mine at Mount Morgans, under Mr. John Morgan, now manager of the South Kalgurli Mine, and occupied this post for two years before turning his hand to the treatment of tailings on his own account. In conjunction with Mr. J. D. Hayes he erected the first treatment plant at Burtville, and at a subsequent date successfully worked the Ramornie Gold Mine at Mount Morgans, which, eventually, he sold at a considerable profit and took a trip to Europe, where he visited many places of interest in Great Britain and the Continent. Upon his return to Western Australia he took control of a mine

on the Murchison fields, but finding that the property was not a profitable concern proceeded to England to advise the directors to invest in a more promising direction. Failing to gain their agreement to his proposals, Mr. Archibald resigned the management of the mine, and sailing for Western America became interested in the gold-mining industry at California and Nevada. In 1909 he returned to Western Australia and has since been concerned in the development of several mining ventures at Ora Banda and the eastern goldfields district, in 1912 prospecting the Palm Gold Mine, in which he holds a large interest. Mr. Archibald, in conjunction with the late Mr. Stephen Grace and Mr. Colreavy, founded the Eastern Goldfields Prospectors' Association. He is a member of the Kalgoorlie Tattersall's Club.

DAVID MOYES, Manager of the State Batteries at Coolgardie and Norseman, was born at Guildford, near Castlemaine, Victoria, on November 14, 1863, and is a son of the late James Moyes, a well-known contractor, who erected a number of mining plants in the earlier

*F. Martyn, Coolgardie.*  
MR. DAVID MOYES.

Victorian mining days. He pursued his scholastic studies in his native place and subsequently at Maldon, where his parents resided for a time, and at the close of his schooldays he took a position as junior hand in the Caledonian Crushing Mill. During the thirteen years that Mr. Moyes

spent in the Caledonian Mill he passed through the various grades of promotion, and was finally appointed manager, a post which he held for two years, at the end of that period proceeding to Melbourne, where he remained for nearly three years. He then accepted a position of charge at the South German Gold-mining Company's Mill at Maldon, and towards the end of five years was offered the appointment of manager of the ten-head crushing plant in connection with the Fortune of War Gold Mine, on the Murchison, Western Australia. This he held until the closing down of the mine, and having obtained his certificate as engine-driver spent two years in positions of this kind in the Great Fingall Mine at Daydown and in the Burra Mine at Lemonville. In 1898 Mr. Moyes was appointed manager of the Peak Hill Goldfields Battery, comprising forty head of stampers, from which he resigned after four years of service on account of indifferent health. After recuperating at Perth for a few months he accepted the management of the Mulline State Battery in 1903, and ever since that period has continued in the Government service, having managed the batteries at Mulline, Yarrri, Norseman, and Coolgardie, being now stationed at the latter. Mr. Moyes is a member of the Masonic fraternity and of the Coolgardie Club. A keen advocate of all forms of manly, outdoor sport, in earlier days he was a well-known athlete, being unsurpassed as wicket-keeper in cricket and a noted player of the famous Fitzroy Football Club. In 1901 he married Margaret, daughter of Mr. Robert Allen, late Inspector of Victorian Railways, and has three sons and two daughters.

**FREDERICK WILLIAM SPENCE**, Mining Registrar and Government Land Agent, Kalgoorlie, was born at Birkenhead, Cheshire, England, on May 12, 1867, and is a son of the late John B. Spence, shipowner and merchant, of Liverpool. He was educated at Fettes College, Edinburgh, one of the most famous Scottish public schools, and, at eighteen years of age, entered upon a commercial career, joining the Liverpool Stock Exchange, where he operated until 1891, in which year he left the Old Country

for Australia. After his arrival in New South Wales, he became Master of the Mudgee Grammar School, and continued in this post for two years, when he proceeded to Queensland and remained in the northern State for a brief period. In 1894 he came to Western Australia and followed mining and prospecting pursuits in the Cue district until the end of the year, when he became connected with the Mines Department at Cue, and

*J. J. Dwyer, Kalgoorlie.*  
MR. FREDERICK WILLIAM SPENCE.

later was transferred to Mount Margaret, where he occupied the post of Mining Registrar, and subsequently for over four years acted in that capacity at Laverton. In 1900 Mr. Spence was appointed Warden and Resident Magistrate at the Phillips goldfield, and after ten years' service at this centre in 1911 was transferred to Kalgoorlie, where he has filled his present appointment ever since, also discharging the duties of Acting-Warden during the prolonged absence of Mr. Walter from his post. Mr. Spence, besides distinguishing himself in classics at college, was known as an athlete of no mean merit, and figured as one of England's representatives, playing Rugby in the English International Fifteen. While resident in New South Wales he was awarded the medal of the Royal Humane Society for life-saving in Sydney Harbour in 1892.

**WILLIAM OWEN MANSBRIDGE**, J.P., Mining Registrar and Clerk of Courts at Kanowna, is a son of Major William Henry

Mansbridge, of the West Yorkshire Regiment, and was born in the ancient town of Chester, in the County of Cheshire. He was educated under private tuition in India, where his father's regiment was quartered, and spent in all some twelve years in the Indian Empire. In 1890 he came to Western Australia, and after a few months proceeded to Kimberley, in the north-west, where he joined the Telegraph Service, at a later date receiving transfer to the Mines Department in that town. Here he remained for five years, and during this time devoted his holidays to prospecting the district, gaining considerable acquaintance with its geology. In 1895 he was sent to the East Murchison goldfield in the capacity of Registrar at Lawlers, where he continued for a further five years, during part of that period acting as Warden and Resident Magistrate. He was next appointed to a similar post at Hall Creek, in the Kimberley Division, and subsequently was stationed at Mount Magnet, in 1905 receiving transfer to his present office at Kanowna, where he combines

*J. J. Dwyer, Kalgoorlie.*  
MR. WILLIAM OWEN MANSBRIDGE.

the duties of Mining Registrar, Clerk of Courts, Clerk of the Licensing Court, District Registrar, Government Land Agent, Treasury Paymaster, Returning Electoral Officer, Electoral Registrar, and Registrar of Old-age and Invalid Pensions. It is of interest to note that for many years Mr. Mansbridge was the youngest Justice of the Peace in the State, having received his

Commission from the Forrest Administration in 1896. Outside of his official duties Mr. Mansbridge devotes a portion of his time to military matters, and is Commanding Officer of B Company, 84th Infantry, Goldfields Battalion. His military experience dates back to his boyhood, his first commission being granted in 1896, when he was gazetted to a lieutenancy, receiving his commission of captain two years later. He has also passed for his majority, and has been recommended for this rank. He interests himself in the public welfare, and is chairman of the Caulfield Memorial Library of Kanowna, whilst in church matters he is a member of the Anglican Synod, representing his district. Tennis is his favourite recreation, and when opportunity permits he also indulges in fishing. He was married in 1897—his wedding being the first in the East Murchison district—to Annie, daughter of Mr. Henry Jones, of Bendigo, Victoria, and has one son and three daughters.

**SYDNEY CULLINGWORTH**, formerly Inspector of Mines, Mount Margaret goldfield, was born at Southport, England, on October 28, 1865, and is a son of the late Henry E. Cullingworth, merchant, of that place. He received his education in his native town and subsequently at the Ballarat School of Mines, Victoria, where he completed his mining course in his early twenties. Upon leaving this institution he was employed as assayer and sampler on the Kohnoor Mine, New South Wales, and afterwards held positions on various mining properties, spending three years in Tasmania, and for a considerable time occupying the post of metallurgist to the English and Australian Copper Company in Adelaide. In 1895 he came to Western Australia to erect and conduct a battery at Cue, where he joined the staff of Messrs. Bewick, Moreing, & Co. as their mining representative on the Murchison goldfield, a post he held for three years. Resigning his position at Cue he returned to the eastern States and became engaged in mining pursuits on his own account, at the same time practising as mining engineer for a considerable period. In 1904 he again sailed for Western Australia and joined the Mining Department, first as battery manager at a place called Duketon on the Mount Margaret goldfields, where he

continued for a year, and subsequently at the end of 1905 received the appointment of Inspector of Mines. Mr. Cullingworth was stationed at Mount Margaret in 1908, and continued there until 1913, when he received transfer to the State Mining Engineer's Department, Perth. In addition to his official position at Mount Margaret he occupied the post of Government representative on the Leonora Water Board. He finds recreation on the tennis court, and is particularly fond of shooting game. Mr. Cullingworth married in 1897 Mildred, daughter of the late Dr. Herbert, of Adelaide, South Australia, and has two sons and two daughters.

**GEORGE McCULLOCH**, Government Inspector of Machinery for the North Coolgardie and Mount Margaret districts, is a son of the late George McCulloch, of Kirkcaldy, Scotland, and was born in London on January 20, 1877. He received his primary education at the Cowper Street School, subsequently proceeding to the University of Edinburgh, where he studied mechanical engineering. He served his apprenticeship at the engineering works of Messrs. Douglas & Grant, of Kirkcaldy, and upon the completion of his indentures was employed for about four years as engineering draughtsman with the firm of Richard Moreland & Sons, and afterwards with Messrs. Simpson, the latter firm being known in Western Australia as the makers of the Coolgardie water scheme engines. In 1899 he came to this State under an engagement to the Kanowna Consolidated Gold-mining Co. as mechanical engineer, and for two years remained in control of the Company's plant at Kanowna. Subsequently he occupied the post of chief engineer on the Great Boulder Mine for five years. In 1906 he was offered his present appointment of Government Inspector of Machinery for the North Coolgardie and Mount Margaret districts, the duties connected with which he has since carried out. Mr. McCulloch is well known in engineering circles, being the author of a work entitled "Winding Engines and Appliances," in which he collaborated with Mr. Campbell Puters, of Newcastle, England, its publisher being Mr. Edward Arnold, of London, and which is the only textbook on the subject at

present in existence. He makes a hobby of entomology and microscopy, devoting a good deal of his leisure time to these fascinating pursuits; and for outdoor recreation indulges chiefly in motoring and shooting, being also an adept with the foils. A well-known figure in amateur theatrical circles since making his home in Leonora he has contributed in no small measure to the enjoyment of the residents in the exercise of his gifts in this direction as well as in assisting the sacred cause of charity. He is a member of the Masonic fraternity, being associated with the Doric Lodge at Menzies. Mr. McCulloch married Bertha, daughter of the late Thomas Brockman, of Guildford, one of Western Australia's early pioneers, and has three daughters.

The **GOLDEN ZONE MINE**, the property of Mr. George Hughes, situated a mile north of Kalgoorlie, was discovered in the year 1897. Ten years later it was purchased from a local company by the present owner, who, about the same period, acquired from English syndicates the Hannan's North and the Kalgoorlie Star Mines, and subsequently the three properties were amalgamated under the name of the Golden Zone Mine, by which they are now known. The area of the Golden Zone extends over 66 acres, and the character of the lode is marked by the presence of sulphides. Passing from the crushers the sands undergo the cyanide process for the extraction of metals, work which is carried on coincident with the development of the mine, which produces about 600 oz. of gold per month, the average output of gold at the present time being about an oz. and a half to the ton. The main shaft has been sunk to a depth of 600 ft., and over 300,000 oz. of gold have been recovered from the three mines since the early days of their development, the general average over the period under review being 2 oz. to the ton. Since the mines came into the hands of Mr. Hughes more than £20,000 has been spent on machinery alone, and the Golden Zone to-day is better equipped in this respect than any other individually-owned mine in Western Australia. A 15-head battery of the latest pattern (manufactured by Fraser & Chalmers), together with three separate winding plants, have been installed, and there

are five large boilers in use in connection with the compressed-air plant, which is also of modern design. Mr. George Hughes has devoted the greater part of his life to prospecting, and in the search after the yellow metal worked on many Victorian goldfields, including the Steglitz, Gordons, Ballarat, and Egerton. In 1894 he decided to try his fortune in Western Australia, and upon arrival in this State proceeded at once to the eastern fields, and worked in turn upon all the leading mines in the "Golden Mile," spending the greater part of his time on the Cressus, Hannan's, Brown Hill, and Perseverance Mines. In 1897 he began his career as mining investor, which he continued with success for a few years, and in 1903 went abroad, visiting America, India, and New Zealand in search of promising mining interests, but failed to strike payable propositions, which were the object of his trip. Upon his return to Western Australia, Mr. Hughes entered into negotiations for the purchase of his

his career in Western Australia he suffered many vicissitudes in common with other hardy pioneers, who, in

MR. GEORGE HUGHES.

but ordinary comfort, and often health itself. He was among the first arrivals on the respective scenes of the principal gold finds ever since about 1895. In addition to his mining interests, he is also largely concerned in the pastoral and agricultural industries of the country, owning one of the best properties in the Moora district, comprising between 3,000 and 4,000 acres, and situated about a couple of miles from the Elsternwick railway station. This property, improved at the time of purchase, is still undergoing development, and about a quarter of it is cleared and applied to cropping and the breeding of sheep and horses. Amid the varied scenes in which his lot has been cast Mr. Hughes has taken considerable interest in sporting matters, and besides being a well-known owner of racehorses for some fifteen years past has played a personal part in many popular athletic events. Swimming is also a form of recreation for which he has a decided penchant, and he can still hold his

present property, and has since continued the development of the Golden Zone Mine with considerable success. During the course of

pursuance of a common aim—the opening up of the mineral wealth of an untouched territory—sacrificed not only the luxuries of civilization

own in this sport, even outside the ranks of amateurs. Mr. Hughes is a member of the various Tattersall's Clubs throughout Australia.

LODOVICO GIANINI, one of the original shareholders in the Hidden Secret Mine, Kalgoorlie, was born at Montagna, in the Province of Sondrio, Italy, in the year 1867, his father being the late Petro Gianini, a farmer of that place. He came to Australia at the age of twenty, landing at Melbourne, and afterwards spent some little time at Broken Hill before coming to Western Australia in March, 1892. Ever since that date he has been identified with the mining industry

J. J. Dwyer, Kalgoorlie.  
MR. LODOVICO GIANINI.

and has worked in various mines, including Bailey's Reward at Coolgardie, Lake View, Boulder, and other properties on the "Golden Mile." He spent about a couple of years in prospecting, and in 1893 was among the first to arrive at Kurnalpi, where he passed a similar period. Mr. Gianini was one of the promoters of the Hidden Secret Mine from the time it was originally prospected, and until two years ago held the principal interest in the mine, still remaining a large shareholder. This mine, which is still owned by the small syndicate of men who founded it and were instrumental in its development, has paid over £40,000 in dividends, 10,000 tons of ore producing in the crushing about £90,000 worth of gold. Mr. Gianini has revisited his native land on three occasions, and has acquired financial interests there. In 1909 he travelled widely through the Continent and England, and subsequently spent the greater part of the year prospecting in East Africa, when he found gold-bearing

country on the Gash River, at the head of the Blue Nile. He was married in Italy in 1909 to a daughter of Signor Grassi, of the Italian Civil Service, and has one daughter.

GIULIO DAVINI (better known on the goldfields as John Davey), one of the proprietors of the Hidden Secret Mine, Kalgoorlie, was born near Lucca, Italy, on June 14, 1861, and received his education in his native town. After engaging in farm work for a time and while still quite a boy he worked on the Corsican Railway, and at intervals was employed in the vineyard industry. At twenty years of age he joined the Italian army, and after three years' service emigrated to Australia. Upon his arrival in New South Wales in 1885 he proceeded to the Cobar Copper Mines, and after a year in this district accepted employment in the construction of the railway line to Bourke. From here he went to the Richmond River district, where he was identified with the sugar industry for seven years, subsequently taking passage for New Zealand and working on the Napier Breakwater. After again landing at New South Wales he revisited his native country, remaining for about a year, and on his return to Australia settled in the Western State, where he again engaged in railway construction on the Southern Cross to Coolgardie section of the eastern goldfields line. Upon the termination of this work he turned his attention to mining, and was identified with various enterprises on the "Golden Mile." Whilst prospecting in company with Mr. William Dowling in 1899 he was successful in discovering the mine now known as the Hidden Secret, since when the whole of his time and energies have been devoted to the development of this mine, which has proved one of the paying propositions of the district.

ADRIAN SWANSON (familiarly known on the fields as "Alf" Swanson), Linden, North Coolgardie goldfields, Yurrilla, part-owner of the Democrat Mine, situated at Linden, was born at Oskar Shamm, in Sweden, on April 19, 1874, and is the youngest son of the late Mr. Alfred Swanson, of that place. He received his education in his native

town, and upon the termination of his scholastic training sailed for Melbourne, Victoria, in the s.s. "Neuernberg," arriving in 1889. Here he entered upon a commercial career with a firm of auctioneers, at the same time acting as interpreter for various legal firms. In 1894, at the time of the mining boom in Western Australia, he came to this State and spent three years at Fremantle in the stevedoring line of business. The attraction to try his fortune on the fields proved irresistible, and leaving the coast he passed through various experiences all over the mining belts of the State, his first venture being at the Donnybrook field. Thence he went to Burtville and the Mount Margaret district, subsequently visiting Marble Bar, Bamboo Creek, and other mining centres of the north-west. In 1908 he became one of a party of prospectors, five in number, who journeyed east of Kookynie, and striking Linden—then deserted save for one man—took

J. J. Dwyer, Kalgoorlie.  
MR. ADRIAN SWANSON.

up three leases, on all of which gold was found in payable quantities. In August of the same year the party struck good ore on a newly-acquired lease known as the Democrat, and subsequent developments have proved the mine to be one of fortune's prizes. The first crushing produced 7 oz. over the plates and 3 oz. in the tailings, and as far down as 200 ft. an average of 5 oz. to the ton was taken from over 900 tons of stone. The mine is owned by Mr. Swanson, his brother, and Mr. Loydon, all of whom are very sanguine as to the

ultimate success of their proposition, and to this party must be accorded the credit of repopularizing the Linden field, over 150 men now finding permanent employment there. The Messrs. Swanson continue to finance prospecting parties all over the gold-bearing area, and do all in their power towards the promotion of the industry in which they have so important a stake. The gentleman under review is a rifleman of no mean merit, and devotes what spare time he can command to this form of sport. He is also very fond of reading, and recreates his mental faculties by the perusal of historical and other works.

**FRANCIS DAVID GESSNER** was born at Prahran, Victoria, on May 19, 1868, and is a son of Mr. Frederick William Gessner, who came from Germany to Australia, being among the earliest arrivals in the above-named State. He was educated at the local public school, and subsequently began active business life as a collector of botanic specimens for the late Baron von Mueller, which work he continued for a considerable time. In 1900 he came to Western Australia, accompanying a brother with the object in view of prospecting for gold on the eastern fields. This project led him to the district surrounding Kanowna, Lake Lefroy, and other localities, where he pursued his search for the precious metal with unabated ardour for several years. In 1904 he formed a prospecting partnership with Mr. Thomas Huffa, and continued his labours in the mining industry without conspicuous success for five years, when the partners struck gold at a place called the Six-mile—signifying its distance from Kanowna. They worked this claim with good results for about twelve months, at the end of which period they changed the venue of their operations to the old Kurnalpi diggings, and began prospecting in that neighbourhood, working chiefly on abandoned claims. Their efforts were rewarded by the discovery of gold in payable quantities on different parts of the field, and at length a memorable day arrived—in June, 1912—when Mr. Gessner, while working alone—his partner having gone to Kanowna for supplies—struck a rich patch of the red metal, and within a couple of hours had unearthed over 300 oz.

of gold. Subsequently this was increased to 600 oz., and the culminating triumph was the finding of a nugget weighing 215 oz. and valued at £782, at which figure it was purchased by the Scaddan Administration for exhibition. Upon the report of this rich find the field was again rushed by an eager army of prospectors, among whom Mr. Gessner and his partner have continued the working of their various claims. Mr. Gessner is a typical prospector, being one of those who have given the best of their lives to the mining

*J. J. Dwyer,*

MR. FRANCIS DAVID GESSNER.

industry and have few interests beyond the absorbing business of the moment.

**ALEXANDER NORTON**, mill-owner, Kanowna, was born at Penshurst, in the Western District of Victoria, on March 14, 1862, and is a son of the late Richard Norton, a pioneer of the fifties—the earliest days of the gold diggings in that State. The subject of this memoir received his education in his native village, and at the close of his school-days learned and followed the trade of carpenter at Ballarat for nearly ten years. Subsequently he resided in different parts of Victoria, and in 1893 came to Western Australia, pursuing his calling in Perth for a time, and eventually finding his way to the eastern goldfields. After a brief sojourn in the Coolgardie district Mr. Norton came to Kanowna

in 1896, where he was first engaged in the erection of works on the property of the Easter Gift Proprietary Mine. Having completed this engagement he turned his attention to his present enterprise, erecting a six-head battery at the locality known as the Six-mile and working out all the payable alluvial ore procurable before transferring his plant to Kanowna, where he installed it on the present site. The plant has since been enlarged, and when not engaged in crushing for the several mining companies in which he is personally interested Mr. Norton throws the mill open as a public crushing concern. Since his arrival in the town he has been prominent on the directorate of various mining ventures, and at present acts in this capacity for the Sirdar and Golden Crown Mines. He is also largely interested in the sale of mining machinery, being the first to introduce the Hornsby gas-engine to Western Australia. His chief pastime consists in motoring, and he does much travelling in the back-blocks in his Darracq car. He has been twice married, his first wife being a daughter of Mr. William Luce, of Jersey, Channel Islands. In 1910 he was united to Eliza, daughter of the late W. Wade, of Brighton, Victoria.

**JOSEPH ANDREW WITTMAN**, mining investor, owner of the Ironsides North Gold Mine and Battery, is a son of the late Mr. Frank Wittmann, of West Maitland, New South Wales, and was born at Dummore, on the Hunter River in that State on August 22, 1863. When about ten years of age, in a boyish prank he left his home, and meeting with a firm of contractors some 130 miles distant apprenticed himself to them as a stonemason, receiving even then 6s. a day. Three years later he was in receipt of the highest wages, and while still in his teens began to take contracts on his own account, some of the biggest buildings in the country towns of New South Wales being of his erection. At a later period he accepted the management of the Pymont quarries, the largest stone quarries in Australia, and after seven years' connection with this enterprise obtained six months' leave of absence in order to pay a visit to the Western State. While

there a gold rush to Southern Cross occurred, and Mr. Wittman catching the fever spent about two years prospecting the districts of Siberia and Wealth of Nations round Menzies, and Mount Margaret at Lake Darlot, and coming to Kalgoorlie was fortunate in securing as his share of profits about 400 oz. of gold. In 1905 he went for a trip to his native State, and upon his return took the position of mine manager in the Easter Gift Mine at Kanowna. This post he resigned to re-enter the building trade, and taking over the Ashlar quarries at Mount Robinson erected many of the leading hotels at Kalgoorlie and Boulder and laid the foundations of many of the big mining plants on the fields. In 1904 he took the lease of the Brown Hill Consols, which had been already forfeited by an English Company, and being successful in striking good gold within 60 ft. of the surface took steps at once to erect a 20-head battery at the mine, by means of which £120,000 worth of gold was obtained, and the mine being worked out the plant and battery were disposed of for £8,000. The Ironsides North Mine being for sale Mr. Wittman purchased it for £250 for the sake of its water, which was necessary for the development of certain other of his ventures. The mine had been abandoned as useless, and the company owning it had gone into liquidation, but after its transfer some of the miners employed there offered to take and work it on tribute. This offer caused Mr. Wittman to make investigations, and finding payable gold he decided to work it and erected a plant, securing in three years £60,000 worth of the precious metal. The gentleman under review takes a keen interest in fishing, and some three years ago nearly lost his life in pursuit of this sport. With Messrs. Salmon, manager of the Kalgoorlie Amalgamated Gold Mines, and Fred Reynolds, of Fremantle, he was about 8 miles out on the Indian Ocean when a shark nearly 20 ft. long attacked the boat and stove a hole in the bottom, and had it not been for the timely presence of two kapok beds with which they were able to stop the leak until the shore was made the result would probably have been fatal. He is a keen motorist and recently, on a trip to the Old Country, purchased a S.C.A.T., on which he toured some

17,000 miles all over Italy, Austria, Hungary, France, Germany, Belgium, and Great Britain, besides nearly 30,000 miles by sea and rail, and during this trip displayed his patriotic spirit by the distribution of 3,000 post cards showing the map of Australia, and printed statistics of her exports, productions, and imports. He is a member of the Masonic craft and Club and a member of the Commercial Travellers' Club. In 1884 he was married to Kate, daughter of Mr. Henry George, who was the first to find gold at Bendigo in the now famous Garden Gully Gold Mine.

**FREDERICK CONNAUGHTON**, one of the directors of the Fenian Mine, Meekatharra, was born in County Galway, Ireland, in 1868. He came to Victoria and followed the calling of an agriculturist for some years, being attracted to Western Australia in 1895. Proceeding straight to the Murchison fields in that year he gained his initial experience in mining and prospecting, and taking over the proprietorship of the Meekatharra Hotel still continued his keen interest in the development of the mineral wealth of the district. The success of Messrs. Roberts Brothers when their prospecting venture was rewarded by the discovery of the Ingliston Consols gave encouragement for further enterprise, and Mr. Connaughton was one of those who gave the necessary support to the prospectors, thus becoming a joint-owner in the valuable property known as the Fenian Mine. Having arrived at Meekatharra when there were only twenty men on the field, and suffering the privations and hardships of the early pioneer, with others he never lost faith in the possibilities of the district, which has now proved itself to be one of the rich mineral centres of the State. He has been identified with all the ups-and-downs of the local mining industry and his prosperity may truly be said to have grown with that of the field.

**RICHARD WALLACE**, member of the syndicate of the Fenian Mine, Meekatharra, was born at Tipperary, Ireland, in 1862. He is a son of the late Mr. Patrick Wallace, of Grange Mocklar, near

Carrick-on-Suir, Ireland, and received his education at the National School in his native village. He was brought up to the agricultural industry on the farm owned by his mother in that district, and when twenty-four years of age took passage for Queensland. He was engaged in railway and mining work for nine years, and in 1895 left the

*Bartletto,* *Perth.*  
**MR. RICHARD WALLACE.**

Northern State for Western Australia. After some months in the mining industry at Kalgoorlie Mr. Wallace travelled over the different mining areas of the State, spending two years between Day Dawn and Chesterfield. The year 1903 marked his advent to Meekatharra, and for some time subsequent to his arrival he was employed by the Government in work on a water shaft, afterwards finding occupation in the Pioneer Mine. During this time he was one of those to promote and finance the band of prospectors, Messrs. Meldrum, Bray, and Ryan, who were continuing the work of developing the newly-discovered Fenian Mine, and who ultimately found it to be the payable proposition it has since proved itself. At a later period he became an active worker in the mine, and in 1908 retired from personal connection with its development, and now lives in retirement at Mary Street, Highgate. Mr. Wallace is a member of the Celtic Club. In 1908 he married Mary, daughter of the late Mr. James Meagher, of Grange Mocklar, Tipperary, Ireland.

The FENIAN GOLD MINE, Meekatharra. Meekatharra is widely recognized as being at the present time the soundest and, potentially, the largest gold-mining district in Western Australia outside of Kalgoorlie. The field itself is often spoken of as the "Golden Six-mile," just as Kalgoorlie is popularly termed in reference to its richer central portion "The Golden Mile." In the "Golden Six-mile" at Meekatharra there are three lines or belts of rich gold-bearing formations, the richest and most developed being the eastern belt. The wealthiest mine to date on this belt is the Fenian, nearly

splendid return from a 17-acre lease. It must not be inferred that the Fenian Mine proved a good mine right from the start. Far from it. It took much patient toil and the exercise of much faith and perseverance before payable gold was found on the property, and to one of the largest shareholders, Mr. Thomas Ryan, is due the lion's share of credit for the success ultimately won. An experienced prospector in the Murchison and East Murchison gold-fields, Mr. Ryan went to Meekatharra only a few weeks after Mr. Roberts and party had pegged the Fenian lease at the south end of the

property was then syndicated by taking in two more shareholders, Messrs. Wigmore and White, Mr. Ryan becoming entitled to a two-sixth interest instead of half. For a whole year the syndicate worked at a loss, the formation being gold-bearing, certainly; but when subject to the practical test of battery treatment some 20 tons of ore yielded only 9 oz. of gold. Mr. Ryan, however, notwithstanding hope thus deferred, still preserved his faith, and when three of the shareholders, Messrs. Osborne, Wigmore, and White, cried "enough" and retired, their places were taken by Messrs. Wallace,

Photo by J. Tovey.

FENIAN GOLD MINE, MEEKATHARRA.

one-half of the total gold yield of the field having been produced from it. This is an unchallengeable position, and a truly proud one when it is remembered that all its development and equipment have been done without the aid of outside capital. The pluck of the small party of owners, and their enterprise in putting back a goodly portion of the profits further to develop the property, has deservedly won good fortune. To the end of the year 1912 the results of nine years' work have been £350,600 worth of gold won and £161,185 17s. 6d. the amount of profits divided among the six owners. A truly

Ingliston lease, where good gold had been found. At that time Meekatharra was practically an unknown field, Paddy Donovan, a prospector delving for alluvial in what is now known as "Paddy's Flat," being the first to draw convincing attention to the possibilities of the district, whither other gold-seekers soon followed him. Mr. Ryan quickly seized up the potentialities of the locality, and purchased Mr. Roberts' interest in the Fenian lease. Later he also bought out Mr. Regan, and thus became owner of half the property, his two partners being Messrs. Osborne and Connaughton. The

Meldrum, and Bray. Mr. Ryan's confidence seems to have been shared by others, for while the syndicate still remained in six shares only, Mr. W. James secured by purchase one of the two shares held by Mr. Ryan. It will help to a better understanding of how success was achieved by the re-organized syndicate if a brief glance is first taken of the conditions under which gold occurs at Meekatharra. The district is a slightly elevated plateau, with its surface in great part covered by earth, which effectually hides the character of the rocks underneath except at a very few points and in the ridges in the

vicinity of the town site. The highly weathered and decomposed nature of the rock has prevailed to the greatest depth yet attained on the field, and has prevented the geological survey even to this date giving specific mineral names to the rocks met with in the mines. According to the State Mining Engineer there is more than one old surface of the country to be met with in places, particularly where the ground now lies flat and low. A quartz vein may help to preserve an old surface, and retain its original gold also, but in the absence of such support the ground rock decomposes to a clayey or talcose body, in which the original ore-channel is

very promising, no payable channel was struck. Mr. Ryan then resolved to get down deeper, and again try across country. Only 10 feet deeper an unmistakably true formation was met with, of large size, and for a full 30 feet in width gold was encountered in fairly defined veins. This was in 1903, and from that time the mine as a productive property has never looked back. The first crushing taken out was treated on April 24, 1904, and from 61 tons 151 oz. of gold were obtained, exclusive of values still retained in sands and slimes. In the December following another parcel of 53 tons was crushed and yielded 271 oz. To prove the

extent independently of the associated quartz veins. As showing the consistency of the veins met with and their extent, the following list of crushings made before a greater depth than 250 feet was attained is highly illuminative:—

Dates.	Tons.	Yield.	
		Ozs.	Dwts.

SLIMES PLANT ON THE FENIAN GOLD MINE.

now only traceable by the occurrence or absence of gold values. Mining among the lodes in the ridges was productive as early as 1898, but it was not until Paddy Donovan discovered the rich alluvial in the flat in 1902 that a clear conception of the necessity of deeper prospecting began to dawn upon those exploiting the Meekatharra country. Mr. Ryan's syndicate in the Fenian lease meanwhile had sunk to a depth of 50 feet in three different shafts and connected them by crosscutting. Gold was met with in this work, and though at times appearances were

ground along the lease in the gold-bearing zone a drive at a depth of 150 feet has been brought in over the boundary from the adjoining mine and run along the ore channel for a total length of 720 feet. Every vein and stringer of quartz was, of course, noted, as the richest gold occurred with them. At two different points the quartz occurred in size worthy to be dignified with the name of "reef," and lense after lense of such occurrences have made the Fenian a truly "quartz" mine, as well as one having a typical gold-bearing formation, which is payable over a considerable

The gold as per Mint returns realized £4 2s. per oz., and the tailings retained, according to Government assay certificates, from 8 to 20 dwt. per ton. With the capital thus at their disposal from such yields, and the large extent of ore-ground assured by development work, it was but natural that crushing at the State battery—where all the above crushings were made—should be discontinued at the earliest possible moment, a battery erected at the mine, and cartage saved. A ten-head stamp battery has since been installed, and a cyaniding and slimes

treatment plant further added to deal with the tailings and residues produced by the battery. To the end of last year (1912), as already mentioned, the gold won amounted to over a third of a million sterling value, but the development of the

properties at either end of it, and likewise produces rich quartz in those properties. The one immediately south is the Marmont, the total gold production of which has mounted nearly halfway to that produced by the Fenian. A large

channel has undergone has, in a great measure, shut out the passage of water along the channel. Thus the deepest mines, and richest also, so far, are those in which relatively little water is met with, a circumstance which has materially influenced the development of mining at Meekatharra. Had the rich mines been wet it would have been impracticable for their worker-owners to have got together the money necessary for proper development work. The richness of the stone would, of course, attract attention, and capital would have been readily forthcoming from many financial centres on the usual conditions, *viz.*, complete transfer of all the owners' interests to a public company, for cash or share considerations, and the mine afterwards worked as the will of distant directors would decide. Mr. Ryan and his fellow-partners needed not the speculator-expert or mining-company floater to tell them they had a good thing. They knew as well as anyone else could tell them. Other property-holders at Meekatharra knew the same with regard to their shows and acted accordingly. As a consequence the progress of Meekatharra has been unmarked by any period of wild excitement and company-promoting. In fact, throughout the whole district only two public companies have yet secured a footing. Some time ago a London group of financiers approached the partners owning the Marmont with a view to purchase and floating it into a company. A big price was asked,

Photo by J. Tovey.

SLIMES DAM AND SETTLING VATS.

mine has been in no wise stinted in the natural eagerness for gold-winning and the distribution of dividends among the owners. From end to end the property has been explored by drives, the formation has been crosscutted at frequent intervals, and the main shaft sunk to a depth of 570 feet from surface. The bottom drive is at 550 feet, where the ore-body averages 17 dwts. per ton. The main ore-body in the mine is the one near to the main shaft, where the quartz bodies have sometimes ranged up to 15 feet in thickness, though normally they are much thinner. Another body of ore is near to the northern boundary, two consort veins of quartz holding down along with the lode-channel or formation. Only the richer ore-veins would pay for exploitation prior to the advent of the railway to Meekatharra, as will be seen when it is stated that for the year 1909, *i.e.*, before railway advantages were provided, the Fenian company paid £1,205 for freight and cartage, £728 for firewood, and £642 for mining timber—a total of £2,575 for these three items alone. The great formation, in which the Fenian Mine works high-grade quartz veins, extends through

interest in this mine is held by Mr. Ryan, who also owns the next two properties beyond it. The water supply underground in the Meekatharra mines is most erratic. The Fenian is practically a dry mine, and it would appear that the faultings and contortions which the

STOPPING ABOVE NO. 4 LEVEL.

and for a time the negotiations looked like eventuating. But as all blandishments failed to induce the owners of the Fenian to name a price for their mine also, the proposed purchase of the Marmont fell through; the company-promoters wanted more than one kite to fly in the mining market of the great world capital.

The late CHARLES MACDONALD ROBERTS, of the firm of J. A. & C. M. Roberts, who with his brother, John Archibald Roberts, was

Bartletto, Perth.  
MR. CHARLES MACDONALD ROBERTS.

responsible for the mining development of Southern Meekatharra, was born at Bathurst, New South Wales, on May 21, 1862. He was a son of the late Mr. Christopher Roberts, of that town, where also he received his education. At an early age, when only fifteen, he entered upon mining pursuits, becoming a prospector in the mineral district surrounding his home. Three years later he went to Queensland and engaged in various mining operations on the Gympie goldfields, making a study of gold-bearing minerals during the ten years spent in that centre. He next visited different diggings of mushroom growth in the New England district of New South Wales and moved on from here, still prospecting, to the Omeo district of Victoria. Making but poor returns for his enterprise, in 1897 he returned to Queensland and until 1900 continued his connection with mining affairs in Gympie. In the early part of 1901,

y

lending a ready ear to the favourable reports of gold discovery in the Western State, he sailed for Fremantle, and proceeding straight to Abbots, in the Nannine district, got employment in the New Murchison King Gold Mine, where he worked for a few months. An industrial dispute arising, he left this employ and in order to make himself acquainted with the character of the country went prospecting, feeling his way with caution as far as Meekatharra. Here he undertook a systematic prospect of the surrounding district, forming one of a party consisting of Messrs. Uriah Wright, Martin, Bourgoin, Cleary, and his brother, who jointly acquired a mine discovered and owned by Mr. Wright, which is now known as the Ingliston Extended. Twelve months later Messrs. C. M. and J. A. Roberts purchased the interests held by the other partners and became sole proprietors of the mine. The settlement was in a financially low state at this time, but their venture turning out well the Messrs. Roberts sent out two prospectors, who were fortunate in finding payable gold south of the Ingliston Extended only a few months later. The brothers directed their energies chiefly to the development of the new find, which they named the Ingliston Consols, and which inaugurated a new era of prosperity on the field. This mine has paid in dividends almost 50 per cent. of the gold yielded up to date, and during the eight years of its existence has crushed over an ounce to the ton for nearly 30,000 tons crushed. It is now by far the deepest mine on the field, and the values proved at the greater depth are still highly satisfactory. The success of the Consols brought new capital to the Meekatharra group of mines, and Messrs. Roberts disposed of their first venture after two years' working. The neglected southern portion of the fields was prospected, with the result that the now famous Fenian and Marmont Mines were discovered, and at the present time a number of batteries, comprising over 50 head of stampers, are sounding the prosperity of the Murchison fields. Mr. Roberts was a member of the Western Australian Chamber of Mines. In 1907 he married Doris, daughter of the late Mr. Charles Huxley, of Sydney, New South Wales. Mr. Roberts died in April, 1913, two sons surviving him.

JOHN ARCHIBALD ROBERTS was born at Bathurst, New South Wales, on July 9, 1865, and received his education locally. At the conclusion of his scholastic career he served his apprenticeship to the wheelwright trade and spent five years in this calling. Prompted by love of travel and the desire for a wider experience and knowledge of his native country he took a trip to Queensland, where he followed various occupations for a few years, subsequently becoming identified with the different branches of mining and prospecting. Returning to Victoria Mr. Roberts spent a few years in the Southern States and followed his brother, Mr. C. M. Roberts, to Western Australia shortly after the departure of the latter for this State, eventually joining issue with him in the purchase of the Ingliston Extended and the development of the

Bartletto, Perth.  
MR. JOHN ARCHIBALD ROBERTS.

southern portion of the Murchison goldfield. He has travelled over most of the principal mining centres and, though comparatively a newcomer, is well known in Western Australian mining circles. He has interests outside the mining industry, and with his brother built the largest hotel on the Murchison fields, *viz.*, the Royal Mail, which is the first two-storied concrete building in the district. Mr. J. A. Roberts is a member of Tattersall's Club and of the various city clubs at Perth. He takes his recreation in driving and walking.

## Pearling.

When we remember that in the early days of the settlement of the State the "Beagle" passed over the placid waters northward of Shark Bay, and even collected at various places pearl shell, it seems almost impossible to imagine that the vast potential wealth was overlooked. However, not for long could the opportunities be neglected, and midway in the last century the glamour and romance of the search for this hidden treasure attracted many adventurous spirits to the mysterious shores of North-west Australia. The flavour of the Orient that attaches to the search for pearl shell, found always in the strange seas of tropical climes, was not absent. Natives of varied colour and country flocked to this the latest rendezvous, where the ever-changing deep held fortunes hitherto undreamt of. Then the search itself partook of the nature of a gamble, for who could tell what the unopened oyster might contain, and the eternal spirit of chance kept the votaries of that fickle goddess in a continual fever of expectation. The dangerous nature of the waters, subject to tempestuous squalls and predatory denizens of the deep, further increased the romance of the search. It is not hard, therefore, to understand the glamour that surrounds the industry, or to find excuses for the many vagaries of the polyglot population found at the various towns along that extensive stretch of north-west coastline.

There are two distinct species of oyster in Western Australian waters from which pearls and pearl shell are obtained. The smaller kind, the *Meleagrina imbricata*, known to the trade as the Shark Bay oyster, affords the shell used in the making of buttons and other small articles, while from the larger, *Meleagrina margaritifera*, is procured those magnificent shells that figure so largely in manufacture. Both kinds yield pearls of great lustre and beauty, some of them running up to the four-figure mark in value.

The earlier records of pearling as an industry are somewhat indefinite, but it appears to have made a beginning at Shark Bay during the early fifties. The methods adopted, and still used in places, were the crudest—hand-picking and dredging along the shore. These methods, however, with naked diving by aborigines, afforded good results, and carried many a settler through the early pioneering days in the north. Diving, according to the newspapers, seems to have been largely carried out by women, though early pioneers dispute the statement. At any rate, by ordinance of the Legislative Council female diving was prohibited after 1868.

Nowadays more up-to-date methods prevail, and every precaution is taken to ensure the work being carried on under the best possible conditions. Capital to the extent of about £200,000 is invested in the industry, and nearly 400 boats are employed. Operations extend northwards from Shark Bay to Broome, the headquarters of the industry, which is situated about 18° from the Equator. The management and control is in the hands of white men, but the divers are principally Asiatics, hailing from the Malay Peninsula, Manila, and Japan. The Japanese number about 1,500, and are rapidly displacing other coloured labour. White divers, it is contended by the pearl-ers, are not procurable, except at prohibitive prices, on account of the dangerous nature of the occupation, and consequently the "White Australia" policy of the Commonwealth Government was not at first rigorously enforced. In 1911, however, the pearl-ers were given two years' notice of the prohibition of coloured labour, and have consequently, though not gracefully, begun to make provision for the change which is due to arrive this year. Of late years the number of whites employed has materially increased, apart from any question of labour, but the reason of this may be found in the better returns secured under such conditions, as the shell is always opened in their presence.

As a factor in the export trade the industry is of considerable importance to the State. During the year 1911 25,482 cwt. of shell, valued at £239,969, and pearls to the estimated value of £60,000 were exported from the north-west stations, while from Shark Bay the returns for shell amounted to £1,166, and for pearls to £7,426, giving a total value of pearls and shell sent away of £308,561. This total is some £40,000 below that of the previous year—not a large sum in an industry which necessarily must fluctuate. To quote from a recent writer:—"The industry is essentially speculative. With good luck the investor may get rich more quickly than he could in any other enterprise; with bad luck disaster may overtake him with equal suddenness. The industry requires that capital be risked; it takes heavy toll of life, even in its ordinary working, and when a cyclone sweeps along the coast whole fleets, both boats and personnel, may be blown out of existence. A lugger and equipment cost, roughly, £700, and wages of the crew run to about £5 per month, and the diver gets from £3 to £5 per month and £25 to £30 per ton of shell raised, the bonus increasing if the haul for the season exceeds five tons. The working expenses of a boat aggregate

approximately £500 per annum, and shell has to be worth £140 a ton before there is a profit in the business. With a good season, and shell at a high price, without taking into consideration the possible finding of a pearl or pearls of great value, the investor may get his capital outlay returned in the first year; but if luck is against him he may make no profit at all, and may even lose everything. Thus the industry is of so risky and speculative a character that only the possibility of large profits and a sudden accession of riches makes it attractive to the investor or adventurer. As it is, it entirely supports at Broome a population of over 5,000, and partly supports smaller communities at other ports along the coast."

Many times have cyclones swept over the pearling grounds, destroying whole fleets of boats. Twice within recent years extraordinary storms have almost wiped the industry out of existence, yet such is the recuperative power

that the disasters of yesterday are almost forgotten in the promise of to-morrow. Happily, the fear that the beds might be worked out has been proved to be groundless, as there exist stock beds, below

the reach of present-day diving apparatus, which act as feeders for the beds inshore, and a continual regeneration by natural processes goes on from year to year.

The pearls and shell from the two pearling grounds possess distinctive lustres. Those found round Shark Bay are yellow, while the north-west produces material white in lustre. By experiment it has been found possible to transplant the oysters from one locality to the other, in which case the shell takes the lustre peculiar to the waters in which it is placed. Thus the continuance of the industry may be aided by farming, so that there is every indication that, scientifically managed, the pearl oyster will for an indefinite time provide a lucrative industry along the shores of North-west Australia.

PEARLING LUGGER AT BROOME.

## Freemasonry.

Freemasonry in Western Australia, which dates back to 1843, is probably, with the exception of the Royal Agricultural Society, the oldest institution in the State. In the year mentioned the Governor, Mr. John Hutt (who was an enthusiastic Mason), Mr. Peter Brown (the Colonial Secretary), and several other influential men in the settlement who were also members of the Craft, banded together and sought a charter from the Grand Lodge of England for a lodge to be named St. John's Lodge (now No. 1 on the roll of the Grand Lodge of Western Australia). For many years this remained the only Masonic body in the State, and to it is due the foundation of the large and progressive institution which is now spread over the populated areas of Western Australia. So favourably was it viewed by the Government that in 1861 a grant of land (for the purposes of the Craft) situated in Hay Street, adjoining the old Mechanics' Institute, was made, and in 1867 a hall was erected. This was used continuously until the late nineties, when it was sold to the Government, and is now occupied by the Mines Department. With the amount realized a block was secured in the same street, but further eastward, and the present handsome structure erected.

The year 1865 saw the opening of a second lodge—the Fremantle Lodge—at Fremantle, and then about twelve years elapsed before the third—the Geraldton Lodge—was established. The revival of trade and the expansion that took place after the Kimberley gold rush, as well, probably, as the hope of responsible government, seem then to have stimulated the members of the Craft living in various centres, as we find no less than six lodges consecrated in different localities between the years 1886 and 1889. Expansion proceeded at a more or less rapid pace from that time onwards, and when the question of establishing a sovereign Grand Lodge in the State was finally determined there were thirty-four lodges working under the control of the Grand Lodge of England. These lodges had for some years been endowed with a measure of self-government by the establishment in the State, by the Grand Lodge of England, of a District Grand Lodge, which controlled domestic concerns and became the medium of communication between the constituent lodges and the parent grand body. The enormous expansion of the State consequent upon the gold discoveries, however, and the evident advantages that would accrue from complete self-government, caused the local authorities of the Craft to turn their minds to the question of establishing a sovereign jurisdiction.

The movement for the establishment of a Grand Lodge for Western Australia had its beginning as early as 1894. At that date there were no other lodges in the colony but those owing allegiance to the Grand Lodge of England, a fact which was urged with a good deal of persistency by a worthy brother of Geraldton Lodge, No. 1683, E.C., as a good and sufficient reason for precipitating events. In the eastern colonies the step was taken when three constitutions were at work, and although the earlier movements in New South Wales and Victoria were not an unqualified success, still it is now apparent that the labours of those enthusiastic brethren of twelve and thirteen years ago were the means of laying the foundation-stones of those superb structures now admired and revered by Masons all over the world. The District Grand Lodge of Western Australia, E.C., however, did not entertain the Geraldton proposal, principally on account of the few lodges in the colony, and it accordingly lapsed. In the meantime several events transpired which had an important bearing on the question. As was anticipated by those who originally moved in the matter, the situation became complicated by the establishment of lodges under the Scottish and Irish constitutions, rendering Masonic unity less easy, although it was fully hoped and believed not impossible of attainment. However, as in a large measure counterbalancing this temporary difficulty, the way had been made smooth for the legal establishment of a local Grand Lodge by a radical alteration of the constitution of the Grand Lodge of England. Hitherto all such defections involved a technical art of rebellion, whereas provision had recently been made, so far as the lodges holding under the Grand Lodge of England were concerned, for the constitutional setting up in distant parts of the Empire of a government for the Craft at once local and supreme.

His Excellency, Bro. Sir Gerard Smith, who recognized the expediency of establishing a Grand Lodge, did not hesitate, as District Grand Master, E.C., to lend his countenance to the movement, and at once took steps to place the lodges in his jurisdiction in a position to legally discuss the question, nor did he delay in urging upon the District Grand Lodge the wisdom of initiating the autonomous movement. The declaratory step was taken in October, 1899, when the report of the District Board of General Purposes was presented to the District Grand Lodge. This showed that thirty-three out of the thirty-four lodges were in favour of the proposal, and a resolution was thereupon passed by the District Grand

Lodge to the following effect:—"That the lodges in favour of a Sovereign Grand Lodge for Western Australia (by virtue of resolutions already carried) hereby declare themselves as a Sovereign Grand Lodge for Western Australia, to be regularly constituted, consecrated, and dedicated in such manner and at such time and place as shall hereafter be prescribed." At the same meeting His Excellency the Governor, R.W. Bro. Sir Gerard Smith, K.C.M.G., was unanimously elected first Grand Master. The body thus formed entered upon its constitutional existence on February 27, 1900, when its first Grand Master was duly installed and its officers appointed and invested. It is a coincidence not unworthy of mention, as being in keeping with Masonic traditions of loyalty to the Throne, that while many of Her Majesty's vice-regal representatives in Western Australia have aided in raising the super-structure of Freemasonry in the colony, its foundations were laid at Government House as far back as 1843 by His Excellency the late Bro. John Hutt, and that this year of grace has witnessed, under vice-regal associations of the closest kind, the achievement of all that was implied by the solemn and social functions observed on February 27, 1900. It is also worthy of note that the Grand Lodge of England was represented at those functions by a Past Grand Chaplain of England in the person of the R.W. Bro. Bishop Riley, who officiated as Installing Grand Officer, and who was assisted in his duties by the late District Grand Master, R.W. Bro. the Hon. J. A. Wright, and the oldest surviving Past Master of the colony, V.Wor. Bro. the Hon. D. K. Congdon. Lastly must be mentioned the fact that among the vast concourse of brethren assembled to do honour to the new Grand Master were very many Scottish and Irish Freemasons, surely a happy augury of the future unity of Freemasonry in this part of the Empire.

Sir Gerard Smith only remained in office for one year, and left the State before the completion of it, as his term of office as Governor had expired. In 1901 the Hon. (now Sir) John Winthrop Hackett, LL.D., was elected Grand Master, and held the position until 1904, when he asked to be relieved from the office. The choice of the brethren then fell upon His Lordship the Bishop of Perth, who still occupies the post, being now Grand Master for the tenth year in succession.

As evidence of the growth of Masonry under local government, it may be mentioned that where the number of lodges at the establishment of the Grand Lodge was thirty-three, there are now ninety-four upon the register, of which ninety are in active work. The 2,000 members on the register in 1900 have increased to 4,000, and the funds have shown a corresponding growth. At the present time the General Fund shows a credit of £4,836, whilst the Benevolent Fund stands at £4,663.

In addition to these amounts there is a sum of £6,433 standing to the credit of the Widows, Orphans, and Aged Freemasons' Fund—a fund which aims at conferring annuities upon the distressed and orphaned, and thus enable deserving brethren to close their lives in peace and in the knowledge that there will be some assistance at hand for those they leave behind them. The Freemasons' Hall, with a credit of £13,000 assets over liabilities, is also the property of Grand Lodge. This building was originally the property of the Lodge of St. John, but on the establishment of Grand Lodge was generously transferred at a price little above the mortgage.

As has been previously mentioned, both the Scotch and the Irish Constitutions erected lodges in the territory before the formation of the Grand Lodge. With the latter body there was little difficulty, as there were only two existing lodges, and one of them decided at the time to throw in its lot with the new Constitution. The Scottish Constitution presented a graver difficulty as, although many of the brethren were favourable to the principles of self-government, yet the Grand Lodge of Scotland refused them even permission to discuss the question. The District Grand Master at the time, the Rev. G. E. Rowe, was consequently debarred from taking any part in the movement. Since that time, however, many of the Scottish lodges have changed their allegiance, and are now actively working under the Western Australian Constitution. For many years the Grand Lodge of Scotland steadfastly refused to recognize the supreme rights of the local Grand Lodge, and consequently more or less friction occurred; but since their change of attitude in 1908 perfect harmony has prevailed between the two Constitutions. In order to facilitate working, the Scottish lodges in Western Australia are now grouped into two districts, with Perth and Kalgoorlie as the respective headquarters. R.W. Bro. J. M. Lapsley is District Grand Master of the coastal district, and R.W. Bro. J. Thomson of the gold-fields district, the former being permitted to bear the title of Grand Master of Scottish Freemasonry in Western Australia. In the State there are twenty-six lodges remaining under Scotland, and these are evenly divided between the two districts. Some of them have been dormant for some time. One lodge, the Plantagenet at Albany, remains faithful to the Grand Lodge of England, and evinces no desire to change its allegiance.

The higher branches of Masonry are represented by the Supreme Grand Royal Arch-Chapter of Western Australia, of which M.E. Comp. J. S. Battye is first Grand Principal, having eleven constituent Chapters under his jurisdiction. There are, in addition, three Chapters working under the Grand Chapter of Scotland, and two Encampments working the Knight Templar Degrees and the Rose Croix.

## Friendly Societies.

So far as the aggregate accumulation of wealth is concerned, Western Australia is, of course, far below most of the other States of the Commonwealth. It can, however, claim a much higher place so far as the distribution of wealth is concerned. The "millionaire" type may be scarce, but at the same time the general standard is better than some of the larger States can show. These facts are proved by the growing total of deposits in the Savings Banks, by the rapid strides that provident institutions have made of recent years, and by general observation of the comparative absence of real pauperism.

Friendly Societies are in no sense charities. They exist for the mutual benefit of those belonging to them, and in a measure take the place of insurance in the case of those whose incomes are not sufficient to allow them to pay premiums on large policies. The funds represent practically the savings of wage-earners, and the number of members represent to a large degree that proportion of the workers which is willing to provide for the strain which accompanies sickness and death.

There are at present fifteen Friendly Societies registered in Western Australia. These are:—

- Ancient Order of Foresters—W.A. District.
- Ancient Order of Foresters—Goldfields District.
- Australian Natives' Association.
- Grand United Order of Free Gardeners.
- Grand United Order of Oddfellows.
- Hibernian Australasian Catholic Benefit Society.
- Independent Order of Oddfellows.
- Independent Order of Rechabites.
- Irish National Foresters Benefit Society.
- Manchester Unity Independent Order of Oddfellows:—
  - W.A. District.
  - Goldfields Grand Lodge.
  - Albany District.
- Order of Sons of Temperance.
- Protestant Alliance Friendly Society.
- United Ancient Order of Druids.

The whole of these societies have a common object, and their work is carried on along parallel lines, in that each cultivates fraternal intercourse amongst its members, and is distinguished by its own ceremonial, regalia, and signs. What may be termed lodge work, however, has but secondary importance for the sociologist. The outstanding features of value to the community are the

mutual and kindly interest evinced among members, and the provision made to meet sickness, calamity, and old age. As single societies they necessarily differ in strength and importance, as well as in financial resources, but they are equally valuable in the efforts they put forth to encourage thrift and, as a necessary corollary, reduce the dangers of pauperism. Considering that so large a proportion of the people are interested in their financial stability, it is not surprising that legislative action has been needed to regulate their administration and protect their investments. In Western Australia they are governed by the Friendly Societies Act, 1894, the Co-operative and Provident Societies Act, 1903, and other measures designed to protect the worker. All these are administered by the Registrar of Friendly Societies, to whose latest report we are indebted for all the figures and much of the information contained in this article.

The fifteen societies registered in the State comprise 269 branches, with a total membership of 17,637. The payments by members during the year 1911 were £49,591, and sick and funeral relief was distributed amounting to £31,240. Since the Act came into force in 1894 the payments by members have totalled £485,347, and the amount distributed in relief has been £286,470. The capital of the sick and funeral fund at the end of the year 1911 was £168,823, of the medical and management fund £5,691, and of other funds £7,437; giving a total capital for all the societies of £181,951. The capital per member in these funds is £10 6s. 3d., the largest society capital per member being the Manchester Unity Order of Oddfellows with £18 18s. 10d., and the smallest the Grand United Order of Oddfellows with £7 3s. 11d. These figures compare very satisfactorily with the Commonwealth average.

Another branch of work closely allied to Friendly Societies and under the control of the Registrar of Friendly Societies is that dealing with co-operative and provident societies. The Co-operative and Provident Societies' Act, 1903, provides for the registration of societies carrying on any lawful industries, businesses, or trades specified in or authorized by the rules, whether wholesale or retail, and including dealings of any description in land; but no member may have or claim interest in the shares of any society exceeding £200. There were eleven of these societies on the register

during some period of 1911, of which number two were in liquidation and two in course of being wound up by the Court. Only five out of the eleven furnished returns, which show that the total membership was 742, the liabilities of various kinds £57,276, and the assets

£91,125, the accumulated profit being thus £33,849. These figures are satisfactory so far as they go, but it is evident that the principle of co-operation in trading concerns has not so far greatly endeared itself to the workers of Western Australia.

THOMAS LEONARD BEAUCHAMP, J.P., Grand Secretary of the United Ancient Order of Druids, Royal Arcade, Perth, was born at Hampton Wick, in Middlesex, England, in 1866, and received his education at public schools in

Bartletto, Perth.

MR. THOMAS LEONARD BEAUCHAMP.

that town. He served a five years' apprenticeship to the plumbing trade, and on the expiration of his term, in 1884, came to Australia, where he carried on his calling in the Victorian State. In 1895 he left Victoria for Western Australia and after working at his trade for a period of eight years relinquished it to give his sole attention to the duties of his present office to which he received appointment in 1901. During Mr. Beauchamp's term of secretaryship the affairs of the organization have assumed a very

flourishing aspect, the membership roll having increased from 1,500 to 4,000 and the funds from £5,000 to £33,000, of which £30,000 approximately is invested on mortgage at 7 per cent. Since his first connection with the order the gentleman under review has passed through all the offices of his lodge, has fulfilled the duties of District President, and has been very active in the promotion of new branches, these having increased from twenty-five to fifty during the past ten years. His secretarial responsibilities absorb almost the whole of his time and attention, but he takes an interest in the affairs of the Children's Hospital, and in 1910 occupied a seat on the committee of that institution.

JAMES HALLS CRABB, General Secretary of the Western Australian Branch of the Australian Natives' Association, Weld Chambers, St. George's Terrace, Perth, is a Victorian, having been born at Creswick, in that State, in the year 1879. He received his education at the Armadale State School and at the conclusion of his schooldays entered the office of Messrs. George D. Meudell & Co., well-known stock and share-brokers of Melbourne, with whom he remained for eleven and a half years. At the end of this period he joined the Australian Traders and Producers' Company, Limited, of Melbourne, and filled the position of correspondence clerk in this company for two and a half years. He next became connected with the Mount Lyell Mining and Railway Company, Limited, at Queenstown, Tasmania, as assistant paymaster and bookkeeper, and five years later, in May, 1911, received

his present appointment of Secretary to the Western Australian Branch of the Australian Natives' Association. Mr. Crabb has had considerable experience in secretarial work, and while in Tasmania filled the office of Secretary to the Chamber of Commerce and Secretary to the Tourists' Association, beside which he is no novice in the work of the Association with which he has now connected himself, having been President of the Prahran (Victoria) Branch of the A.N.A. in 1903 and President of the Queenstown Branch in Tasmania in 1909. He was a member of the Queenstown Hospital

Bartletto, Perth.

MR. JAMES HALLS CRABB.

Board, besides acting as Treasurer to that institution. In sporting matters he was also to the fore, and occupied the post of Secretary to the West Coast Football and Band Associations.

## Scientific, Literary, and other Associations.

When we consider the long struggle which the mere handful of people in Western Australia had to subdue the forces of Nature and secure even a bare livelihood, it is little to be wondered at that institutions of a literary or scientific character were the exception rather than the rule in those early days. For very many years the agricultural society and the sheriff's meeting seem to have filled all requirements, and it was not until the late fifties that a literary institution was established. This was the Swan River Mechanics' Institute, founded by the then Surveyor-General, Captain J. S. Roe, which still continues an active existence as the Perth Literary Institute. This institution now possesses buildings to the value of £11,000, containing reading and recreation rooms as well as several shops. The number of subscribers is about 1,200, and the library contains about 12,000 volumes, mostly of a modern character. After some years the Fremantle Literary Institute, with practically the same objects, was founded, and has now a library of about 10,000 volumes. Since the expansion of the State during the nineties similar institutions have sprung up wherever a community has gathered together, thus providing a meeting-place for the population and a means of disseminating useful literature.

Like most other communities Western Australia possesses many literary and debating societies, all aiming to train the mind in one direction or another. Many of these have had their day and vanished, but the Catholic Young Men's Society and the Hebrew Literary Society continue to hold their own.

Scientific societies are of more recent growth, dating only from the time of the gold discoveries, which attracted many men of scientific attainments.

Other institutions that may be mentioned are the Society for the Prevention of Cruelty to Animals, the objects of which are sufficiently explained in the title; the Life-saving Society, which aims at giving instruction in methods of life saving, particularly in case of accidents in river or sea; and the St. John Ambulance Society, of which there are two branches in the State—the Perth and the Kalgoorlie centres, the objects of which branches are those of the parent society—to instruct members in methods of first aid and hold examinations at stated times.

Artistic societies are represented by the Western Australian Society of Arts, whose objects are to hold exhibitions of art at various times, to acquire a library of books on art, and to deliver lectures to students and

others. This society has for several years past held two exhibitions annually, and has done much to inculcate an aesthetic taste throughout the metropolitan area.

### NATURAL HISTORY AND SCIENCE SOCIETY OF WESTERN AUSTRALIA.

The formation of this society may be said to date back to the winter of 1891, when a number of influential citizens decided that the time had arrived for the formation of a society "for the consideration and discussion of questions of natural science." A society was duly constituted and a code of rules drawn up, one of which was to the effect that a meeting and an excursion should take place each month throughout the year. The first officers elected consisted of the following gentlemen:—President, Sir John Forrest, K.C.M.G., F.G.S. (Premier); vice-presidents, the Hon. J. G. H. Amherst and Mr. A. Jameson, M.B.; Council, Messrs. J. S. Brooking (Deputy Surveyor-General) and H. R. England (manager of the National Bank), Dr. H. F. Harvey, M.R.C.S., and Messrs. H. D. Holmes (manager of the Western Australian Bank) and G. T. Poole (Colonial Architect); Hon. Secretary, Mr. B. H. Woodward, F.G.S. The society was unable to publish its proceedings, as its funds were limited and the membership small, but thanks to the untiring labours of its honorary secretary and the hearty co-operation of its other members the society prevailed upon the Government of the day to set aside an area of 160,000 acres between Pinjarra, North Dandalup, and Bannister as a permanent native fauna and flora reserve. This reserve, which was gazetted on February 14, 1894, was regazetted on January 22, 1902, with a reduction of 50 acres, and is still in existence as a lasting monument of the pioneer society in Western Australia. Interest in the society dwindled so that it practically ceased to exist in 1895. Two years later the botanists of the State on July 1, 1897, inaugurated the Mueller Botanic Society, which published the first part of its Journal in September, 1899. The society had as its patrons, the Right Hon. Sir John Forrest, P.C., K.C.M.G., and Sir Geo. Shenton, M.L.C.; President, Mr. E. J. Bickford, F.L.S.; Vice-Presidents, Messrs. R. Helms and H. C. Prinsep; Council, Messrs. J. S. Battye, B.A., LL.B. (who was also editor of the Journal), A. W. Milligan, D. Ross, and V. F. Shotton, and Drs. F. Tratman and F. M. Wilkinson; Consulting Botanist, Dr. A. Morrison (Government

Botanist); Treasurer, Mr. F. Blakeley Dalton; Auditors, Messrs. J. W. Langsford and M. O'Callahan; Hon. Secretary, Mr. J. A. Peart. Included among its members were a number of ardent workers in the realm of botany. Between 1899 and 1903 eleven parts of the Journal were published, which contain original descriptions of scores of new species of Western Australian plants by Messrs. Cecil R. P. Andrews and W. V. Fitzgerald, Dr. Tratman, the late Mr. Alexander Purdie, and others. Well-illustrated descriptive papers dealing with the flora in general, the native orchids, the *Epacridaceae* or "Australian Heaths," and the *Protaceae*, which have appeared from time to time, will also be of assistance to all future workers. Analytical papers are not absent from the pages of the Journal, especially worthy of note being one by Dr. Diels on the "Plant Forms and Climate of Western Australia." As a result of its activities the society was soon in a flourishing condition; by 1900 the membership had risen to 200. Ten flower excursions were held in the months from August to January, and an equal number of papers read during the earlier part of the year. But the growth and decline which was noted in the first society was repeated in the Mueller Botanic Society. Notwithstanding the magic associated with the name of that giant among botanists, the late Baron Ferdinand von Mueller, K.C.M.G., etc., as a memorial to whom the society was founded and named, the membership fell off, and after the publication of part 11 of the Journal a meeting was held, at which it was decided to form a new society with a wider field of activity, and "The West Australian Natural History Society, with which is incorporated the Mueller Botanic Society," came into existence. In the words of the President, Dr. F. Tratman, "By this move a large number of scientific members were gained, by whose work and co-operation it was hoped that the society would become a useful and influential scientific society." At first the labours recorded were mainly botanical, but in May, 1905, a new departure was inaugurated, for the number of the Journal then published contains a paper by Mr. B. H. Woodward on "Recent Discoveries regarding the Fauna of Western Australia" and one by Mr. A. Gibb Maitland, Government Geologist, on "Salient Geological Features of New Guinea." Since that date almost every branch of natural science has been touched upon; papers and lectures have been delivered on astronomy, botany, chemistry, ethnology, geology,

The FREMANTLE LITERARY INSTITUTE is entitled to take front rank among the educational institutions of the State. Established as far back as 1851, no reliable records of its early struggles and vicissitudes are available, but old colonists remember a small building

in High Street, long since demolished, in which the Literary, or as it was then known Mechanics, Institute was founded. Subsequently the Institute was removed to Collic Street, and later the Government was induced to give a grant of land in South Terrace on which to erect

mineralogy, ornithology, petrology, and zoology, which often contained records of original research by the lecturer, and therefore are of value, as they increase the store of knowledge of Australia and the world in general. Professors Michaelsen and Hartmeyer, who collected in this State for several German Museums during the winter and spring of 1905, have kindly forwarded extracts of their voluminous work, "Die Fauna Suedwest-Australiens." The work, which has been undertaken and is being completed with that thoroughness for which German men of science are famous, will be invaluable to all zoologists working in this State, and the society must be considered the richer for being in the position of publishing this English *résumé*. Messrs. E. S. Simpson, A. Gibb Maitland, L. Glamet, and W. D. Campbell have dealt with the geology of Western Australia; Mr. W. D. Campbell has discussed the need of an ethnological survey and described some unusual objects which he has named "dancing boards"; Dr. A. Morrison and Messrs. Cecil Andrews, O. H. Sargent, and J. H. Maiden (Government Botanist of New South Wales) have noted new species in the plant world, and gone into the peculiar conditions under which some of our plants manage to exist and thrive; economic botany has been dealt with by Messrs. Connor and Pfister. There is every reason to believe that the assistance the society will obtain from the newly-established University and its Professors will enable it to produce, in the near future, a record of good and thorough original work unequalled elsewhere in the Commonwealth.

#### THE WESTERN AUSTRALIAN ASTRONOMICAL SOCIETY.

This society, established by students of astronomy at the end of 1912, has for its objects the association of observers, especially the possessors of small telescopes, for mutual help, and their organization in the work of astronomical observation; the circulation of current astronomical information; and the encouragement of a popular interest in astronomy. At the first meeting of the society the Acting Government Astronomer (Mr. H. B. Curlewis, B.A., F.R.A.S.) was elected President and Mr. C. Nossiter (another member of the Observatory Staff) Secretary. Although of such recent constitution it has already shown itself active in astronomical matters, and has an excellent field for work in a State which occupies so wide an area of the Southern Hemisphere.

a more suitable building. Here a well-equipped library of something like 2,000 volumes was established, together with reading-rooms, etc. Some of the moving spirits in the Institute in the early eighties are still with us, but most of them have passed away. Mr. W. S. Pearse was

President in 1884, and many prominent citizens of the day were associated with him on the Committee. For many years the fortunes of the Institute were at a low ebb, but with the discovery of the rich goldfields of Coolgardie and Kalgoorlie and the consequent rush of population to

Bartlett, Perth.  
MR. CHARLES FROST.

these shores the Institute entered upon a more prosperous career. The foundation-stone of the present commodious and up-to-date building was laid on March 15, 1899, by the late Mr. E. Solomon, M.L.A., who was then President, and from that date the affairs of the Institute have steadily progressed. To-day there are over 10,000 volumes on the library shelves, comprising works on history, biography, geography, travel, science, and the best works of fiction. In the reading-room the tables are fully supplied with the principal interstate daily and weekly papers, and also the best illustrated and other British and American papers and periodicals. A writing-table with necessary equipment is also provided, and in the smoking-room chess, draughts, and card tables are available. On the ground floor is a fine lecture hall, and also a free reading-room for the use of the general public. The officers controlling the Institute during 1911-12 were:—President, Mr. C. Frost; Vice-Presidents, Messrs. W. J. Green and W. E. Wray; Committee, Messrs. F. G. Barnett, R. B. Carter, W. J. Flanagan, J. Fowlie, F. J. McLaren (Mayor of Fremantle), W. H. Carpenter, M.L.A., D. G.

Taylor, and Dr. O. Paget; Secretary and Librarian, Mr. J. W. Miller; Assistant Librarian, Mr. W. H. Raymond. CHARLES FROST, President of the Fremantle Literary Institute, has been a member of the General Committee of the Institute for the past nine years. He is one of the best-known men about Fremantle, having arrived at the Western Australian port from Victoria in 1895. In the same year he joined the literary staff of *The West Australian*, and in 1901 was appointed to the position of branch manager at Fremantle for *The West Australian* and *The Western Mail*. Mr. Frost was elected to the presidential chair of the Institute in 1911, and at the expiration of twelve months was re-elected for a further term. He is an enthusiastic bowler and occupies the office of vice-president of the Fremantle Bowling Club.

THE EAST FREMANTLE LITERARY INSTITUTE was established on January 1, 1904, the prime movers in its foundation being the members of the local municipal council. A committee of ladies was organized, and by means of balls and other entertainments funds to the amount of £350 were raised, which amount was subsidized by the Government at the usual percentage. In the original instance the East Fremantle Town Hall was extended

for use as an institute, and a committee of subscribers, with the aid of Mr. Urquhart, made a comprehensive selection of books for the library, which were purchased in January, 1904, and the building furnished and opened to the public. In 1902 the present buildings were erected, the foundation-stone being laid by Mr. F. McDonald, Mayor of East Fremantle, in August of that year, and the objects of the Institute—to provide a circulating library, free reading-room, and good reference library for the citizens—have been fully attained, as is evidenced by the increasing popularity of the institution and the number who avail themselves of the advantages offered. Besides the library these advantages include games such as draughts, chess, etc., and the subscriptions are arranged on a scale to place the privilege of membership within the reach of all. A librarian is in attendance during given hours five days each week, and the number of volumes on the shelves has increased from 397 to 1,910 carefully-chosen volumes representing the standard authors and the best and most popular writers of the day, besides which copies of many of the current magazines and journals are provided. The affairs of the Institute are attended to by the Finance Committee of the Municipal Council, with the Mayor as president. The librarian is Mrs. J. Evans.

## Political Organizations.

### THE LIBERAL PARTY.

The Liberal Party of Western Australia has for many years been represented by various organizations. In March, 1904, the National Political League was formed. This organization embraced men's and women's branches. A fusion was effected in May, 1907, with the Liberal League, an organization which had come into existence to arouse interest in the 1906 Federal elections.

After amalgamation the new party adopted the name of the National Liberal League, and from 1907 until 1911 was, with one exception, the only organization operating in this State.

In 1909 Miss Grace Watson visited the State, and a separate organization for women only was formed under the title of "The Australian Women's National League of Western Australia," of which association Lady Forrest was the first president, and has continued to hold that position up to the present date. The formation of this organization was based upon a division of labour, the National Liberal League resolving to relinquish the care of the women's branches and confine its attention to the well-being of the men. Immediately after the Federal elections in 1910 a number of interested persons resolved to form an organization under the title of the Liberal League of Western Australia. This was successfully accomplished. At this time (June, 1910) four organizations existed, namely, the National Liberal League, National League (Fremantle), the Australian Women's National League, and the new association. The Liberal League of Western Australia affiliated with the Women's League, and in May, 1911, the National Liberal League resolved to join forces with the new league. The final consummation was reached in January, 1912, when the Fremantle National League branches became branches of the new organization.

From January, 1912, to the present time one organization has operated in the entire State—the men working under one league, and the women under their own, but both being affiliated. Early after this amalgamation it was felt further action should be taken to consolidate and strengthen the Liberal forces. Owing to the extensive area of operations of the league and the difficulties experienced in forming separate branches in the remote country places, a conference of the Men's League held in February, 1912, affirmed the principle of joint action and closer union with the Women's

League, with the object of making uniform the general and organizing work of the leagues. The executive of the Women's League also affirmed the principle and recommended its branches to adopt the proposals, and at the conference in June, 1912, the proposals were carried. The name of the Australian Women's National League was changed to that of the Women's Liberal League of Western Australia, and the constitutional amendments necessary for the closer union were drafted and adopted.

For eight months this plan of working was carried out. In the meantime it was felt by a large number of members that the leagues should work still more closely together, under one name and one office management. A draft constitution to bring about such a union was prepared and submitted to a joint conference of the Men's and Women's Liberal Leagues held in February, 1913. The two bodies, voting independently, adopted the constitution almost unanimously. From February to the present date (June, 1913) this plan has been carried out.

The effect of this amalgamation is that the men's and women's leagues are united under the name of the Liberal League of Western Australia. The central executive to manage the affairs of the league will consist, as heretofore, of a president, two vice-presidents, a treasurer, and twenty members elected at the annual conference, together with one representative delegated by each men's league branch in the State. In order to keep the women in closer touch with the central executive the president and three vice-presidents have seats thereon. The women's executive will continue to exist, made up of the general officers and twenty members elected by conference, together with one representative elected by each women's branch throughout the State. All appointments will be made by the executive committee, but it is provided "that women's organizers can only be appointed after having been recommended by the women's executive." The whole of the administrative powers under the new constitution will devolve upon the executive committee of the league, and will be exercised through its chief executive officer, who will, under the direction of the executive, conduct all correspondence and exercise general supervision over all affairs of the league. Important issues will result from this harmonizing of the constitution and concerted plan

of action. The men's and women's leagues will sit in conference at the same time, and decide upon matters of party and common interest, such as amendments to the constitution and organization. Then each will separate to discuss its own affairs.

The men's and women's leagues have over 250 branches established in the State.

The Liberal League of Western Australia is a member of the Australian Liberal Union and has adopted the following:—

**FEDERAL PLATFORM.**—The Liberal League of Western Australia shall be a member of and be associated with The Australian Liberal Union, the council of which will be constituted by the appointment of three representatives from each State of the Commonwealth. The platform of The Australian Liberal Union as passed at a conference of delegates from all the States at Melbourne on May 22, 1912, and which was adopted by the Liberal League of Western Australia on February 7, 1913, now forms part of the Constitution of the Liberal League of Western Australia, and is as follows:—*Objective.*—To secure the co-operation of all Liberal Organizations for Federal purposes, whilst preserving their separate State identities. *The Platform.*—To promote the unity of the Empire under the British Crown; to promote commercial interchange between Great Britain and her Dominions; to preserve and develop, where necessary, the Federal character of the Constitution, and to promote co-operation of Federal and State Parliaments. Within the scope of Federal legislation—To maintain the right of all men and women to work and enjoy the fruits of their thrift and industry, and to secure equal opportunities for all to do so; to oppose preference to or the penalizing of any section of the community, whether as employers or employes; to use all the powers of the Commonwealth in securing the fullest social justice to all, and to prevent any person or body of persons usurping the functions of government; to foster the co-operative spirit in all industries. Within the Federal sphere to promote humanitarian legislation by endeavouring—To ensure fair wages and healthful conditions of employment for all workers; to secure the adjustment of industrial inequalities between States with the aid of the Interstate Commission, provided for by the Federal Constitution; to control by law the operations of trusts and combinations acting detrimentally to the interests of the public; to promote the full development of the resources and industries of Australia, and to extend oversea markets for our products; to promote the settlement and development of the Northern Territory, and to secure to settlers in closer settlement districts therein the right to acquire their freehold, with safeguards against aggregation; to co-operate with the States and the Imperial Government

in promoting a vigorous immigration policy; to maintain a White Australia; to promote Australian defence on the lines of Imperial co-operation; to maintain the present tariff policy, as determined by the electors of the Commonwealth, and to establish a Board of Trade or other permanent non-political body to make recommendations for its adjustment, with due regard to all sections of the community; to maintain old-age and invalid pensions; to protect the sources of State revenue from Federal encroachment; to secure economical administration of public moneys, and to adjust taxation to the annual requirements of the Commonwealth; to consolidate State debts; to provide an adequate sinking fund in connection with public loans, with safeguards against diversion from its purpose; to establish a Federal Agricultural Bureau, in alliance with similar State bureaus or departments, in order to foster and stimulate production on scientific lines; to give effect to adult suffrage by securing full facilities for voting by post or otherwise; to secure wise and just laws in the interests of the family, under the powers conferred by the Constitution and in co-operation with State legislation.

The objects and platforms of the Liberal League of Western Australia are as follows:—

**OBJECTS.**—To combine for political purposes; and to co-operate in carrying out the platform of The Australian Liberal Union; to create a general interest in public affairs, in order to secure a fair representation in the Commonwealth and State Parliaments; to promote national prosperity and progress on the basis of the common interests of the whole people; to purify and make complete the Electoral Rolls, to stimulate interest in the Federal and State elections, and the full exercise of the franchise, and to provide efficient means to enable electors who are unable to attend a polling place by reason of being sick, infirm, or distant from a polling place, to record their vote; the establishment of an equitable system of taxation for Commonwealth and State; to advocate sound, progressive, humanitarian legislation; to protect the Commonwealth and State from injury by any class organization whose aims are not in harmony with the interests of the country as a whole, with equal opportunity to all and preference to none; encouragement of industrial co-operation and non-political unionism; to encourage individual effort and enterprise, to ensure to all the peaceable enjoyment of the fruits of their labour, and to oppose extreme Socialism; the maintenance of the Civil Service on lines calculated to uphold its status and preserve its efficiency; to maintain freedom of speech; to collect and distribute information on political and electoral matters.

**STATE PLATFORM.**—The State platform as adopted

on February 7, 1913, is as follows:—Maintenance of two Houses of Parliament; restriction of State trading enterprises to public monopolies; co-operation with the Commonwealth in the early establishment of the Naval Base at Cockburn Sound, and the early construction of the Trans-Australian Railway; construction of railways, water supplies, and other public works necessary to promote rural production and national progress; promotion of the full development of the resources and industries of Western Australia, and extension of oversea markets for products; encouragement and development of natural resources and expansion of secondary industries; promotion of co-operation amongst producers, the bringing of producers and consumers into closer touch, and the establishment of open produce markets and deposits for storage and export of products; enactment of and strict enforcement of the laws against adulteration and misrepresentation of foods, drugs, and clothing; re-establishment of a vigorous land settlement policy; maintenance of a system of freehold titles of land; encouragement of closer settlement and the dairying industry; promotion of a vigorous and continuous scheme of immigration; extension of agricultural, mining, and other departments of education, experiment, and research, particularly the provision of facilities for higher agricultural education in the country districts; systematic geological surveys and assistance to prospectors; proportional representation; expansion of our educational system on modern lines, and early construction of University buildings; provision of homes for the people, with right to acquire the freehold, and the granting of assistance to people to build homes on their own freeholds; amendment of State Children's Act to provide: (a) Board of control in lieu of departmental administration, (b) extension to mothers under boarding-out system of same terms as to foster mothers; establishment of women's hospitals; immediate appointment of the Interstate Commission to provide for the adjustment of industrial disputes between States; establishment of wages boards, with an appeal to the Interstate Commission when more than one State is affected; maintenance of freedom to borrow for the development of the State, and the provision of an adequate sinking fund in connection with all public loans; retention of the Savings Bank in the hands of the State; protecting the sources of State revenue and powers from Federal

encroachment; control by law of the operations of trusts and combinations acting detrimentally to the interests of the public; maintenance of the rights of all men and women to work and enjoy the fruits of their thrift and industry, and to oppose preference to or penalization of any section of the community; maintenance of law and order at all times.

**WOMEN'S EXECUTIVE.**—The special objects as adopted on February 7, 1913, are as follows:—To secure unity of action throughout the State by women whose principles are in accord with the league, in an honest endeavour to benefit the State as a whole; to educate women in the duties and responsibilities of citizenship and impress upon electors the value of voting power; to improve the condition of women workers in every sphere of life; to work for equality of women with men before the law, and equal pay for a proficient standard of work; to work for reform of drink and gambling evils, and better protection of children and young girls; amendment of State Children's Act to provide: (a) Board of control in lieu of departmental administration, (b) extension to mothers under boarding-out system of same terms as to foster mothers; establishment of women's hospitals; the wife to have equal rights with husband and in custody of children; that Federal Parliament be urged to exercise its constitutional right to "Legislate in Marriage and Divorce" so that the divorce law shall be uniform throughout Australia; that a committee be formed in Fremantle and other ports and centres to welcome and keep in touch with all female immigrants. Agent-General's office to be notified of such committees and secretaries' addresses.

The history of the Liberal movement in the State proves that, beginning in 1904, the men and women have worked under one constitution. This was disturbed in 1909-10 by the formation of a Women's League, having its own constitution and being an independent authority, but the old order of things is to be resumed, and the act of federation has been already completed. The new constitution and platform is considered a great advance over the old. It is broad and liberal, and gives to the smallest branch equal rights with the largest.

The president of the Liberal League is the Hon. Frank Wilson, M.L.A., and the organizing secretary Mr. Clarke James.

### THE LABOUR PARTY.

The organization of the Labour Party in the State is to be found in the "Constitution of the W.A. Division of the Australian Labour Federation," in which the objects of the party are stated to be:—(a) To strengthen

and consolidate the Labour organization throughout the State; (b) to confer on all matters of concern to wage-earners; (c) to promote and extend such legislative reforms as will secure justice to all.

The federation consists of a general council, the central executive committee, district councils, and affiliated organizations, namely, trades and labour unions and branches of the A.L.F. in the electorates.

The general council, to meet triennially, consists of one delegate from each organization, each organization selecting and financing its own delegate. Each district council is entitled to send one delegate, who must vote on division in accordance with the membership of the council. Every delegate representing more than fifty members has one extra vote for such fifty members or part thereof. Branches of unions are deemed to be organizations when their membership is not less than ten. One-tenth of delegates present may demand a call of roll at council meetings.

The central executive committee is composed of the president, two vice-presidents, secretary, treasurer, three trustees, and two delegates from each district council, and one delegate representing the federal members. District councils whose membership exceeds 2,000 have one extra delegate for each additional 500 or part thereof.

For the purpose of forming district councils the State is divided into eight districts, namely, Fremantle, Metropolitan, Eastern Agricultural, South-West, North Coolgardie, Murchison, Eastern Goldfields, and Geraldton. The executive committee may divide existing districts and create new councils or administer same from Perth.

District councils are composed of one delegate from each organization: each organization selecting and financing its own delegate. Every delegate representing more than fifty members has one extra vote for such additional fifty members or part thereof. Each district council may at each annual meeting arrange that full representation of organizations may be by delegates on the above basis.

Every affiliated organization in each division is deemed to be a branch of the party. Other political branches of the party may be formed to consist of not less than ten members over the age of sixteen years and resident in the electorate where the branch is desired, and who subscribe to the rules of the party, subject to the approval of the district council. The Western Australian members of the Federal Labour Party are also deemed to be a branch of the federation.

The executive committee is elected annually by ballot of the whole of the members of the district councils. Its duties are to control and finance the federal selection ballots and elections, and fix the date of holding the triennial general council.

The powers and duties of the district councils are set forth in the constitution as:—

- (a) Organizing branches of the federation where necessary.

(b) Strengthening branches and deciding all matters referred to it by branches.

(c) The conduct of State elections, selection ballots, and the endorsement of candidates.

(d) Assisting the executive committee when and how required.

(e) To keep a roll of all members of political branches. To issue a yearly ticket of membership upon the payment of the annual fee, such ticket to be produced when voting in selection ballots or seeking other privileges. Uniform tickets to be provided by the executive committee.

(f) To make regulations for the selection of candidates and the conduct and the control of the party's nominees in municipal and roads board elections.

(g) To draw up a municipal platform and policy for the various municipalities within their area in keeping with the general platform of the party.

Selection ballots are conducted three months prior to a general election where practicable. Candidates nominated for selection ballot must be members of the federation of at least six months' standing immediately preceding date of nomination. Candidates must be nominated by ten members of the federation (in writing) resident in the electorate to be contested. The election is conducted by preferential ballot, and every candidate must sign the pledge and platform of the party. All members of unions are eligible to vote in selection ballots, and all adult persons natural born or naturalized who have been members of a political branch for three calendar months immediately prior to the closing of nominations, and have paid the prescribed dues, are also eligible to vote.

With regard to State Labour members it is provided that the party may make regulations governing the business of the caucus; that in the event of the Labour Party obtaining Ministerial Benches, the Ministry shall be chosen by the party in caucus; that congress re-affirms the principle of no immunity at general or by-elections; and that congress re-affirms the principle of no alliance.

The platform of the party is defined as follows:—

OBJECTIVE.—(a) The cultivation of an Australian sentiment, based upon the maintenance of racial purity, and the development in Australia of an enlightened and self-reliant community. (b) The securing of the full results of their industry to all producers, by the collective ownership of the industrial and economic functions of the State and Municipality.

FIGHTING PLANKS.—(1) Effective reform of the Legislative Council, with a view to its ultimate

abolition. (2) Taxation of unimproved land values without exemption or rebates. (3) Initiative, referendum, and recall. (4) Right to work. (Amendment of the Constitution making it incumbent upon the Government to provide work for its unemployed subjects.)

GENERAL PLATFORM.—(1) Establishment of State flour mills and State agricultural development and export department, and the State manufacture of agricultural implements. (2) Nationalization of the liquor traffic, and local option as to continuance, increase, or reduction of licences. (3) Maximum day of eight hours. (4) Graduated income tax with exemptions up to £250, with special impost on absentees. (5) Non-alienation of Crown lands, with a view to the ultimate nationalization of all lands. (6) Departmental construction of public works. (7) Limitation of State borrowing except for the purpose of reproductive works; the term reproductive to mean the earning of working expenses and interest and of the principal by a sinking fund during the life of the said work. (8) State fire, life, and accident insurance. (9) Government manufacture of Government clothing and uniforms. (10) The abolition

of the present system of State Governors and Government House; the office to be filled by the Chief Justice. (11) The establishment of mining boards. (12) Free technical, scientific, and general education. (13) The day of Parliamentary elections to be declared a public half-holiday.

The pledge which every member of the party seeking election as a Parliamentary representative is required to sign is worded thus:—

I hereby pledge myself to support the candidate selected by the federation, and if elected to do my utmost to carry out the principles embodied in the State platform, and on all questions affecting the platform, to vote as a majority of the Parliamentary Labour Party may decide at a constituted caucus meeting.

The present executive officers of the Australian Labour Federation in the State are:—President, Mr. F. W. Burrows; Secretary, Mr. Alex. McCallum; and the headquarters of the movement is situated in Beaufort Street, Perth, where a handsome Trades Hall affords ample evidence of the growth and present position of the Labour movement in the State.

## Sporting and Recreation.

### THE TURF.

In Western Australia, as in other States of the Commonwealth, horse-racing holds pride of place amongst those sports which the people find suitable to the sunny climate of Australia. In the minds of those who see nothing but danger on the racecourse this no doubt is a state of things to be deplored, but it is a fact that cannot be questioned. Tested by almost any comparison the crowds which attend the various race meetings in the metropolitan area and on the goldfields are ample evidence of the hold that racing has upon the public, and almost give colour to the statement that the horse is after all the Australian divinity.

Anglo-Saxons are noted for carrying with them into new lands the institutions and customs to which they have been accustomed, and it is therefore not surprising to find that scarcely had the Swan River colony been founded when a party of lovers of the sport assembled together to keep alive the recreation of their far-away home. The first race meeting was instituted by a few gentlemen at Fremantle, and the result of their initial effort is to be found in *The Perth Gazette* for October, 1833, which gives the following account:—"This not inaptly-termed October meeting took place on Wednesday last, the 2nd inst., on the Downs, near Fremantle, and presented both a novel and interesting spectacle. As the origin of racing in the colony will probably be interesting to future chronologists, we feel it our duty to record that the sporting world are indebted to Captain Taylor, of the 'Helen,' who has lately imported a number of Timor ponies, aided by Mr. C. Smith and Mr. I. Weavel, for the institution of an amusement calculated to excite a considerable emulation among the breeders and importers of horses. It may be expected from the general interest which was evinced in the sports on Wednesday that before long some steps will be taken to hold periodical meetings. The spot selected for the racecourse has long been fixed upon as an appropriate site. It is about a mile and a half from Fremantle, on a slightly undulating plain, skirting the sea and the adjoining hills, which afford a full view of the course. The booths which were erected on the brow of the hill, with their variegated flags, the ginger-bread and nut stalls, and the lame fiddler, helped to contribute much to the animation of the scene. The groups of fashionably-dressed ladies and gentlemen promenading to and fro, the tilted carts, the

busy din of preparation, the cry of 'clear the course,' and at length the ponies being placed side by side at the starting-post, with the jockeys all appropriately dressed, we can assure our readers who were not fortunate enough to witness it, presented no contemptible display."

The second meeting was held in the following April, but interest seems to have waned in it, as Mr. Stephen Henty's horse "Jack," which had been eminently successful on the previous occasion, carried all before it, winning as much as £9 on one race!

According to Mr. Rowland Watt (from whose admirable article in the "Twentieth Century Impressions" most of our information has been abridged), there was no racing between the date mentioned and October, 1836. In that month a sports' meeting was held at Guildford. This took the form of horse races and ploughing matches, and was promoted by those interested in the breeding of thoroughbred horses, for which a market was open in India.

Between the Guildford meeting and the next racing fixture of any note there appears to have been an interval of nearly eight years; but in 1844, on the fifteenth anniversary of the foundation of the colony, a very successful race meeting was held at Perth. This took place either on the block of land on which the Subiaco limekilns now stand, or on what was then known as "Old Crane's," where one of the beauty spots of Perth, the present Queen's Gardens, are now situated. The principal event at this meeting was the Town Plate, for thoroughbred horses of all ages, weight for age, "to be run in heats, three times round the course." This race excited very considerable interest, and it was won by Mr. Cole's black horse "Wonder," only imported from England a few months before. In the report of this meeting given in *The Inquirer*, the following paragraph appears:—"Our racing friends will be glad to learn that the Margean Cup given by Mr. W. L. Brockman has arrived by the 'Trusty,' and will be open to competition next year. We mention this in order that parties who have horses qualified to run may make preparation in time. The cup is left in charge of the editor of this journal till next year."

The next race meeting appears to have been held at York in October, 1844, amongst the names figuring

prominently in it being those of Messrs. Lander, Parker, Woods, Dempster, Burges, Lefroy, and others. From this time races were held regularly at Perth and York,

with an occasional meeting at Fremantle, and it became evident that in the interests of the sport a controlling authority was necessary.

#### WESTERN AUSTRALIAN TURF CLUB.

On October 22, 1852, a meeting was held in Perth for the purpose of forming a turf club. As this event marks an epoch in the history of the turf in this State, we quote from the minutes of this meeting, taken by Mr. William John Clifton, the first honorary secretary:—  
“The object of the formation of a turf club was the

arrangements with reference to a racecourse; to fix the time for the club's first race meeting, and arrange the circumstances under which the same should take place. It was also resolved that a general meeting of subscribers be held to adopt the rules and regulations as laid down for future guidance, and also to make any alterations

Photos by C. H. Park.

improvement of the breed of horses in Western Australia and the establishment of regular racing meetings, under regulations applicable to the colony, to be laid down by a committee of subscribers. Twenty names were enrolled as forming the club, with power to add to their number. His Excellency the Governor was elected patron, and the annual subscription was fixed at 10s., with an entrance fee of £1. It was resolved that Messrs. W. A. Sanford, Hamersley, G. Eliot, S. P. Phillips, S. Burges, Charles Symmons, A. O'G. Lefroy, and Colonel Reeves be a committee for drawing up the racing rules for the club; three to form a quorum. The committee was also empowered to make all further

which may appear necessary for completing the formation of the Western Australian Turf Club." Such was the genesis of the body which since that time has controlled the destinies of horse-racing in Western Australia, and though in the lean days of colonial history it necessarily passed through many vicissitudes, it has now become one of the strongest and most important clubs in the Commonwealth.

The first race meeting on the site of the present racecourse was held in 1848; the first Queen's Plate, value £50, being run in 1853. In 1854 the stake was increased to £100, and for forty-five years, until 1898, the event remained the principal fixture in the racing

z

world of Western Australia. After that year it was eliminated from the programme, and its place taken by the Perth Cup, which has since grown to be worth £2,000, and to be recognized as one of the great races of the Commonwealth.

Since the early days the racecourse itself, which is situated about five miles from Perth, has been improved until it forms one of the most picturesque and well-appointed in Australia. The course is pear-shaped, and is one and a quarter miles round. The club has an excellent turf track, a commodious grandstand built on

the lines of that at Williamstown in Victoria, a leger stand, stewards' stand, administrative quarters, luncheon rooms, and beautifully-laid-out grounds. The Totalizer is used by the club under legislative enactment, and the provision for meeting the demands of the "tote" patrons is equal to anything of the kind on Australian racecourses.

The present officers of the club consist of C. Baxter Cox (chairman), C. G. Lydiard (judge), S. J. Chipper (starter), A. G. B. Main (handicapper), and G. H. Wickham (secretary).

### PROVINCIAL RACING.

In addition to the races held on the Perth racecourse, there are regular meetings under the auspices of the Helena Vale, Canning Park, and Belmont Park Racing Clubs, all of which are registered under the rules of the Western Australian Turf Club. Besides these races are also held by the Fremantle Racing Club at Bicton and on Mr. Wren's proprietary course at Goodwood, but neither of these is under the control of the Turf Club.

With the exception of the meetings at York, there appears to have been no racing in the country districts until the late fifties, when those interested held meetings at Bunbury and the Vasse. These were followed in 1862 by the institution of races at Geraldton under the auspices of the newly-formed Victoria Racing Club, and in 1864 Messrs. Waldeck, Foss, Fane, and others held a meeting at the Irwin. On October 20, 1865, Newcastle took up the running, and although the track was not the most suitable the Press reports assure us that the course was "crowded with the beauty and fashion of the district." In all these races professionalism was unknown, the horses being trained by their owners, many of whom have since held prominent positions in the

community. At the Canning meeting in 1872, for instance, Mr. S. H. Parker (now Sir Henry Parker,

the Chief Justice of the State) owned the horse which won the chief event, the rider being Mr. George Parker. Other names which figured more or less prominently in racing circles of this period were Messrs. W. H. Strickland, Maitland Brown, G. Towton, E. T. Harley, J. M. Craig, R. H. Sholl, and D. W. Harwood, and Dr. Scott.

Racing on the goldfields started

in 1896, when Coolgardie was at the zenith of its fame, and meetings held at Coolgardie, Kalgoorlie, Boulder, and Menzies. With the decline of the mines, Coolgardie and Menzies have suffered considerably, and have failed to maintain their early promise; but in Kalgoorlie and the Boulder there are racing clubs second only to the parent club of the State. At both centres well-equipped and beautifully-laid-out courses, forming the chief beauty spots on the goldfields, exist, and every year events are held which are regarded as important throughout the Commonwealth. The present secretaries of the Goldfields Clubs are Messrs. G. N. Clarke (Coolgardie), M. H. Walsh (Kalgoorlie), and J. Lyon Johnston (Boulder).

LAWN AND TOTALIZER AT ASCOT.

**CHARLES BAXTER COX**, Chairman of the Western Australian Turf Club, was born at Walkerville, South Australia, on June 6, 1863, being a son of the late Richard Baxter Cox, a solicitor, of Adelaide. He received his education at the North Adelaide Grammar School, afterwards attending St. Peter's College, and having first spent some time on a sheep station was articled to the legal profession in his father's office. He completed his law course at the University of Adelaide, and was called to the Bar of South Australia in 1896. Almost immediately afterwards he came to Western Australia, where he joined Messrs. Haynes and Robinson at Albany, and continued there until May, 1897. Subsequent to his admission to the Western Australian Bar he took control of the firm's office at that port until the end of the year mentioned, when he was taken into partnership and became connected with the Perth office, in which he has since continued. Both at college and in his University days Mr. Cox identified himself with most forms of sport, distinguishing himself particularly in rowing. He took part in the leading events in connection with both institutions and was a member of the first Interstate University Eight, on which occasion his boat gained second place, winning the event in the following year (1889). Upon arrival in Western Australia he became a member of the Western Australian Turf Club, subsequently being elected to a seat on the committee, which he has retained ever since. Towards the end of 1908 he was elected chairman, and during his period of office has used his influence in many ways for the reform of sporting matters, insisting upon clean methods and proving himself in every way the strong man fitted to grapple with the problems presented from year to year to the consideration of those who are intimately associated with the management of affairs connected with the Western Australian turf. He is also president of the Rowing Association of Western Australia, a member of the Weld Club, and a Freemason of long standing.

**WILLIAM HENRY JOHN STRICKLAND**, of 234, St. George's Terrace, is the son of the late Mr. Henry Robert Strickland, who came from England in 1830, settling in what was then known as the Swan

22

River colony. He was born at St. George's Terrace, Perth, on October 6, 1841, when all that locality was virgin bush, and owing to the lack of educational facilities his studies were pursued in a somewhat desultory fashion. When thirteen years of age he joined the firm of R. Hapwood and some years later, in conjunction with his father, took the management of the Freemasons' Hotel. In 1862 he married and started in business on his own account as proprietor of the Shamrock Hotel, Hay Street, Perth, where he remained for some five or six years. He next proceeded to Albany and for some time conducted that well-known hostelry, the Freemasons' Hotel, at that seaport. Owing to the death of his wife he sold out

*Bartletto,*

*Perth.*

**MR. WILLIAM HENRY JOHN STRICKLAND.**

in 1870 and returned to Perth, where he joined his father in the conduct of the United Service Hotel, which property he still owns. In 1879 Mr. Strickland, sen., having retired from business pursuits the whole management devolved upon the subject of our notice, who carried it on until his own retirement in 1896. Mr. Strickland has been identified with various progressive movements of his day, and was one of the founders of the original Perth Gas Company, of which he ultimately became chairman of directors, holding this position for many years. He is a director of the Swan River Shipping Company, besides acting on the Boards of several insurance, trading, and

other companies. He has taken some interest in military affairs, and his name is on the roll of the first Volunteer Corps formed in the Crown colony in the fifties. A Past Master mason, he has been identified with the craft for over half a century. Although now over seventy years of age he is as keen in the pigskin as many youthful sportsmen in the State, and often takes part in the chase after the kangaroo. He is, however, best known in racing circles and is the acknowledged authority in Western Australia on all matters connected with the sport of kings, having for many years occupied the position of chairman of the Western Australian Turf Club, of which he is now a life member. By his first union with Margaret, daughter of the late D. Crosset, of Portadown, Ireland, he had two sons. In 1875 he remarried, his second wife being Henrietta, daughter of the late Mr. Samuel Craig, of York, Western Australia, and has issue four sons and four daughters.

**JAMES ROSS MACKENZIE**, "Seaforth Park," Gosnells, is a native of Victoria, having been born at East Melbourne on August 12, 1857. He received his education at Brighton Grammar School, and at the close of his scholastic career entered the office of Messrs. George Martin & Co. and served thirteen years in that well-known house, passing through all its departments. He relinquished commercial life to engage in pastoral pursuits on the Georgina River, Queensland, which he abandoned owing to the great drought of 1890, eventually coming to Western Australia in 1893, having been attracted by the discovery of gold at Coolgardie. He was one of the earliest to seek his fortunes on the eastern goldfields, and holds a "pioneer's certificate," presented at the opening of the railway to Kalgoorlie. He was one of the foundation-members of Hannan's Club. He has been identified with various prominent enterprises and while in the mining industry successfully floated, among others, the North White Feather Consolidated Gold-mining Company (capital, £250,000), the Golden Zone, and the Kanowna Carbine, of each of which he was the prospector. He is a director of the Emu Brewery Limited, Mount's Bay Road, a member of the committee of the

Western Australian Turf Club, vice-president of the Royal Agricultural Society of Western Australia, and a member of the Western Australian, Masonic, and Tattersall's Clubs. His favourite sport is hunting, and he was for many years a leading member of the

*Bartlett's,* *Perth.*  
MR. JAMES ROSS MACKENZIE.

Oaklands Hunt Club, the premier Hunt Club of Victoria, on the committee of which he served for a lengthy period. He played football and cricket with the South Melbourne Clubs, of both of which he was a committeeman, being one of four who founded the present South Melbourne Football Club. He was Captain of the Albert Park Lake Rowing Club for several years and was a member of the Club's Junior Eight in their memorable races with the Hawthorn City Club. In 1907 Mr. MacKenzie married Dehlia, daughter of Mr. C. S. Lohrmann, of Southern Yorke Peninsula, South Australia, and has a son and a daughter. He is now residing at "Seaforth Park," about 12 miles from Perth, where he owns an estate of 2,000 acres and engages in mixed farming.

GEORGE HERBERT WICKHAM, Secretary of the Western Australian Turf Club, is the second son of the late Mr. Francis John Wickham, who held the position of accountant to the Railways Department in New South Wales. He was born at Parramatta, New South

Wales, on December 6, 1867, and received his education at King's School in his native town. Upon the completion of his scholastic career he entered the service of the engineering branch of the New South Wales Government Railways. Here he remained for about nine years until in 1894, attracted by the possibilities presented by the gold discoveries of the Western State, he resigned from the Service and found his way to Coolgardie before the railway had been constructed as far as Southern Cross. Upon arriving at the "Old Camp" he became connected with a prospecting party, and proceeded to the Menzies district, where he pursued a search for the precious metal for about two years with but little success. Contracting typhoid fever he returned to Coolgardie for hospital treatment, and for some time after his recovery turned his hand to any work that offered, during which time he gained a varied experience in many walks of life. In May, 1901, Mr. Wickham was successful in securing the secretaryship of the Weld Club, a position he held for five years, relinquishing it to enter upon the duties of his present appointment. During his term of office as secretary of the Western Australian Turf Club he has been mainly responsible for many alterations in the rules and regulations in force, all of which have had for their object the improvement of the conditions under which racing is conducted in Western Australia. One of the most important steps in this direction was the introduction of the system of stipendiary stewards, whose function it is to control racing matters, this system differing in Western Australia from that in vogue in the other States, insofar that while in the older racing communities stipendiary stewards have power only to recommend disqualification, here they have full power both to disqualify and impose punishments. The scheme of registration of horse's names throughout the Commonwealth has also been inaugurated, and it has now reached completion with the result that the confusion arising from racehorses in the different States having the same name is fast disappearing and duplicate names will no longer appear in the studbook. Mr. Wickham is a keen advocate of long-distance and weight-for-age races, his belief being based upon experience that the

fostering of such will not only improve racing generally, but will have the effect of encouraging studmasters to purchase and breed from the very best strains available. During his term of office the subject of this sketch has been closely associated with Messrs. W. H. Strickland (for many years chairman of the Turf Club), Everard F. Darlot, Charles Baxter Cox (present chairman), Richard A. Sholl (who has been a member of the committee for years, and who at one period of the Club's career acted as secretary), Charles A. Saw, and other gentlemen interested in horseracing and in the welfare of the Western Australian Turf Club. While it is reasonable to expect a man holding his position to be a supporter of sporting affairs generally, there is no doubt that the

*Bartlett's,* *Perth.*  
MR. GEORGE HERBERT WICKHAM.

gentleman under review has a genuine love for all healthy and clean outdoor recreation. He develops his muscles on the golf links and derives a deal of pleasure out of yachting, while the gentle art of angling has met with a fair amount of his attention. He belongs to a number of organizations, including the Weld, Royal Perth Yacht, the Perth and the Fremantle Golf, and Tattersall's Clubs.

ALEXANDER McDOUGALL, Chairman of Stipendiary Stewards, Western Australian Turf Club, is a son of the late Robert McDougall, who came to Victoria in the

forties and made a name for himself as a breeder of pure shorthorn stock in the early days of the pastoral industry of that State. The gentleman under review was born at Glenroy, near Melbourne, on December 8, 1857, and received his scholastic training at various schools, finishing at the South Yarra College, under the late R. K. Ewing, one of the prominent instructors of his day. At sixteen years of age he left school to enter upon pastoral pursuits on his father's property at Kielor, where he became acquainted with all the details of stock-raising, and continued there until 1887, in which year the late Mr. McDougall died. The property was then sold, and the subject of our memoir purchased that portion of it situated at Oaklands Junction, and here carried on

Bartletto, Perth.  
MR. ALEXANDER McDOUGALL.

farming and stock-breeding pursuits for a number of years. In 1901, having suffered heavy reverses on account of the serious droughts, he disposed of the farm and accepted a responsible position in the stock and station agency business at Camperdown, remaining there for five years. He next became connected with the horse trade initiated between Victoria and India, and resided at Sandringham until 1907, when he was appointed to the position of stipendiary steward of the Western Australian Turf Club, which he has since filled, in 1911 having been elected chairman of the stipendiary body. Since his advent to this State Mr. McDougall has been instrumental in instituting an

annual sale of blood stock yearlings, which has now become a feature of the markets, and also conducts periodical sales of blood stock in Perth. These sales are very popular, and a very successful connection has been formed in this way. Always a keen sportsman, Mr. McDougall has been a prominent figure in racing circles for many years past, and was one of the founders of the now famous Oaklands Hunt Club of Victoria, in which he occupied the office of master from its inception to the time of his departure for Camperdown, a period extending over twelve years. At that time he began to evince special interest in jumping events, and owned and trained many good performers in this department, amongst which "The Student" and "Darkie" were especially brilliant in their achievements over the "big sticks." Mr. McDougall attained an enviable reputation in Victoria as one of the best judges of "form" and "condition" in the State, and his services have been in demand all over Australia as judge in the sections of the show ring specially dealing with breed and action. He has served in this capacity in New Zealand also, and since coming to Western Australia has been requisitioned as adjudicator at the Royal Show and Parade. He was well known for many years in Victoria as one of the skilled players of polo, but at the present time spends the chief portion of his leisure time on the golf links. In 1888 Mr. McDougall married Jessie, daughter of the late Charles Forrester, of Melbourne, and has two sons and one daughter.

SYDNEY WILLIAM CURTIS is a son of the late Mr. W. C. Curtis, M.A. (Sydney), of the firm of Messrs. Curtis & Gannon, solicitors, of Sydney, and was born at Darlinghurst, New South Wales. He received his education at the Jesuits' College, Wollomooloo, near Darlinghurst, and matriculated at the University of Sydney in 1883, subsequently serving articles to Mr. George Massett Lawrence, solicitor, of Messrs. Lawrence & Rich, of Sydney, and afterwards being enrolled as a solicitor of the Supreme Court of New South Wales. He left Sydney for Western Australia in 1900, and was connected for some years with the firm of Haynes, Robinson, and Cox. He was admitted to the

Western Australian Bar in 1906, opening in practice on his own account in 1908 at Emanuel Buildings, St. George's Terrace. He is a Commissioner of Affidavits for Western Australia. The stirring life of the turf has always attracted him, and in New South Wales he was at times interested in several racehorses, following in the footsteps of his uncle, Mr. P. J. Keighran, who was a well-known racehorse owner in the sixties. In Western Australia he has also interested himself in racing matters, and in October, 1908, was appointed stipendiary steward to the Western Australian Turf Club in place of Mr. Ralston, who had previously filled the post, and still acts in that capacity. He is a member of Tattersall's Club and of the Western Australian Turf Club. Mr. Curtis has always taken keen interest in municipal management, and served for some time as a member of the Council of South Perth, in which suburb he resides, in 1905-6 being invested with mayoral honours. He has 60 acres of orchard property at Gosnell's, seven acres of which have been brought under cultivation of fruit-trees. Mr. Curtis is a member of the Royal Perth Yacht Club, and was one of the founders of the Sydney Amateur Canvas Dinghy Club. In 1897 he married Emily, daughter of Mr. Richard Rowe, of Meadowbank, and has a son and four daughters.

FREDERICK ROBERT SHOLL is the eldest son of the late Robert Frederick Sholl, of Bunbury, and grandson of the late R. J. Sholl, Government Resident in the North District. His father, a well-known member of the Legislature in Western Australia, was born at Bunbury on August 27, 1848, and after leaving school spent three years on a sheep station in the Irwin district. In 1868 he proceeded to the northwest, and was actively engaged in the pearling industry for about ten years. Subsequently he became a large investor in pastoral properties, and was among the first to send stock to the West Kimberley district, being a member of the original syndicate of the Kimberley Pastoral Company. He was also well known in the mining world, and assisted to form the syndicate which sent out Mr. L. R. Menzies, the discoverer of the great Menzies goldfield, also acting as director of the Lady Shenton and

Fraser Mines at Southern Cross. Industrial enterprise also secured his practical support, and he was one of the leading promoters of the Perth

Bartletto, Perth.  
MR. ROBERT FREDERICK SHOLL.

Iceworks Company and of the Perth Brickworks Company, occupying a seat on the directorate of both these corporations. He began his political career in the old Legislative Council in 1886, as representative for Gascoyne, and continued to sit for that constituency until 1890. This was prior to the introduction of responsible government in 1891, and

after this important development in the history of the State he represented the same district in the House of Assembly for seven years. He became a member of the Federal Convention of 1897, but resigned this post on the eve of an extended trip to Europe. In May, 1904, he was returned to the Legislative Council as

education at the High School, Perth. From there he proceeded to England, and entered upon a four-years' course at Epsom College, the headmaster of that institution being the Rev. Hart Smith. During a subsequent two years spent at Ely, Cambridge, he was a prominent figure in sporting circles, being a member of

Photo by Morris Clarke.  
PAIR OF BUGGY HORSES OWNED BY MR. F. R. SHOLL.

representative for North Province, and retained this seat until the time of his demise in December, 1909. Mr. F. R. Sholl was born on July 5, 1882, and acquired his elementary

the College eight and cricket team. He also took part in football contests, playing the British Association game, previously having been identified with the Rugby team at Epsom. After returning to Western Australia Mr. Sholl joined the staff of Dalgety Limited and afterwards went to Roebourne, where he was three years with Mr. C. M. Straker, during which period he gained a thorough knowledge of stock. This was supplemented by two and a half years at "Brickhouse" Station, under Mr. Septimus Burt, and, in 1907, he purchased the "Marron" property, situated about sixty miles from Carnarvon, in the Gascoyne district. The country was then in its virgin state, and Mr. Sholl, in conjunction with his brother, Mr. G. T. Sholl, spent the ensuing five years in developing this area as a sheep run, and after successfully establishing the enterprise sold out in 1912 to Mr. F. G. Dempster. Mr. Sholl is a great lover of horses and owns a handsome carriage pair of well-matched greys, standing 15 hands. These horses have gained honours in the Show ring, the near side animal in the photograph reproduced having taken first prize as a polo pony. A member

Photo by Morris Clarke.  
"MURAL CROWN" BY "MURAL"—"REWARD."

of the Perth and Weld Clubs, he is also connected with the Western Australian Turf Club and Tattersall's. GUY TREVARTON SHOLL, the second son of the late R. F. Sholl, was born at Perth on June 7, 1886. He received his scholastic training at Epsom College, England, in the vicinity of the historic Downs, where he remained for seven and a half years. Mr. Sholl distinguished himself in athletic sports in the Old Country, and was recognized as a good all-round athlete. He was captain of the hockey team, won the batting average one year in cricket, and in the following season distinguished himself as a bowler. He returned to his native soil in 1904, and was articled to the legal profession with the firm of Messrs. Haynes, Robinson, & Co., of Perth. In 1907 he relinquished this connection in favour of pastoral life, and joining his brother, Mr. F. R. Sholl, at "Marron," was associated with him in the management of the property. He is well known in Perth as a member of the Western Australian Turf Club, Tattersall's Club, the Perth Club, and the Weld Club. The Messrs. Sholl are both keen followers of the turf, and whilst at "Marron" they had racing stables at Carnarvon, but upon the disposal of their pastoral interests these were relinquished, and their horses are now trained in Perth. With "Mural Crown," by "Mural" out of "Reward," bred by their uncle, Mr. R. A. Sholl, they were successful in winning the Maiden Mile and Flying Handicap on the first day of the Carnarvon Cup Meeting of 1911, and the Carnarvon Cup, one and a half miles, and Lady's Bracelet—in which "Mural Crown" carried the steadier of 10 st. 6 lb.—on the second day. This horse afterwards won a race at Collie, and a double at Bridgetown, which included the Bridgetown Cup. The Messrs. Sholl also have in training "Dragoon," by "Carbineer" out of "Sylvi," and "Lancewood," by "Carbineer" out of "Reward," bred by Mr. R. A. Sholl, from whom they have been leased for the purposes of racing. "Dragoon" is well known to the racing public as the winner of the Hunters' Race, promoted by the Helena Vale Club, and run at Belmont Park (six furlongs, 9 st. 12 lb.) July 18, 1908, and the Hunt Club Bracelet, run on the following Saturday, when he carried 12 st. 7 lb.

JOHN FREDERICK GARY ROBINSON, grazier and pastoralist, Guildford Road, Belmont, began his active career at the age of sixteen, having previously pursued his scholastic studies at the Moorambia School, in the eastern district of this State. Proceeding to Roebourne, in the north-west, in April, 1881, he spent a couple of years in gaining experience in stock and station pursuits, being identified with the development of various pastoral properties in that district, and, ultimately, in conjunction with his brother, Mr. P. F. Robinson, of Midland Junction, formed the "Coongan" Station, which they still carry on in partnership. Mr. Robinson's station property is situated in the Pilbara district, and is distant some

of the equine mind, and the result has been a perfectly constructed building, the ventilation and other features of which are all that could be desired. Mr. Robinson keeps a fair-sized string in work, and has met with a moderate amount of success on the turf, several important events having fallen to his share in recent times. The stable shelters a smart sprinter in "Newmarrocarra," by "Maltster" out of "Conundrum," bred in New South Wales and purchased as a two-year-old by Mr. Robinson. This horse has won several valuable races in first-class company, and is equally speedy in events from five furlongs up to a mile. Patrons of the turf will easily recall "Prince Charlie," who in one year alone was returned the winner of no less than fifteen races over varying distances. Since coming to Belmont Mr. Robinson has evinced considerable interest in the welfare of the district, and two years ago was elected to a seat on the local Roads Board. He is a member of the Western Australian Turf Club and of Tattersall's Club. In July, 1897, he married Elsie, daughter of Mr. Christopher Coppin, one of the most prominent pastoralists in the north-west district, and has a son and three daughters.

Bartleto,

Perth.

Mr. JOHN FREDERICK GARY ROBINSON.

200 miles from Roebourne. Each year he spends some eight or ten weeks on the property, leaving Perth prior to the commencement of shearing operations and remaining until the wool has been despatched to the nearest port of shipment. In 1904 he left the north-west, and has now taken up his residence at "Tampina," on the Guildford Road, where he devotes a portion of his time and attention to the training of a number of thoroughbreds for racing purposes. In the immediate vicinity of the house are the stables, the most up-to-date of their kind in Western Australia, if not in the whole Commonwealth. In the erection of the stables special attention was paid to the many little details which go so much to make for the contentment

JOHN OSCAR PETERSON, of Perth, is the son of the late Mr. John Peterson, of Wisby, Sweden, and was born in London, England, on November 30, 1865. Until sixteen years of age he was at his studies, attending schools both in London and Sweden, but received the major portion of his education in Edinburgh, the home of his mother. In 1881 he arrived in Sydney and proceeded to "Yarrowin" Station, in New South Wales, where for three years he worked as station-hand. He next followed the calling of a drover in Queensland, and upon becoming familiar with the conditions prevailing in the western districts of that State contracted for taking fat cattle overland to Adelaide and other large centres on the coast. This work he varied with mining pursuits and passed six years in its pursuance, at the end of which period stock-dealing all over Queensland and occasionally in New South Wales engaged his attention. In 1890 he settled at Bourke, in the latter State, as owner of Tattersall's

Hotel and Livery Stables, in conjunction with which he continued in stock-dealing and carried on a saddlery business. The bank failure

Bartletto, Perth.

MR. JOHN OSCAR PETERSON.

of 1893 counted Mr. Peterson among its sufferers, and being compelled to realize upon what was available he sold out and came to Western Australia to make a fresh start in life. Arriving at Perth in February, 1894, he joined a party proceeding to the new gold find of Kurnalpi, and thence to Mount Margaret and Lake

Darlot, where he spent two years prospecting in all the surrounding country, but without success. Returning to Coolgardie he began business as a carrying contractor and continued in this line until the railway was carried through to the

the Kanowna Deeplead Mine he joined the rush to that district, but owing to an accident caused by falling down a shaft at Kalgoorlie was compelled to cease operations of all kinds for nearly two years. Upon recovery he left the fields and went

"ARTESIAN," WINNER OF THE PERTH CUP, 1911.

fields, when he disposed of his plant and took a trip to the Eastern States, during which he interested himself in the shipment of horses suited to the needs of Western Australia. Upon the discovery of

to Greenbushes at the time of the boom in tin, and in conjunction with Mr. P. A. Connolly became interested in a tin proposition which was subsequently sold to an English company. In 1902 Mr. Peterson purchased the lease of the City Hotel, Perth, which he personally conducted for upwards of ten years. He has various investments in real estate in the city and suburbs, and apart from his business interests gives a large share of his attention to sporting matters, his name being well known on the turf all over Australia. He is a member of Tattersall's Club, of which he has been a committeeman for seven years, and is also a member of the Western Australian Turf Club. Various good horses have been owned by Mr. Peterson, among which may be mentioned "Man-o'-War," "Milner," "Enchanteur," "Artesian," "West Park," and "O.I." the last named being purchased by him while on a trip to England in 1907. This mare, which he afterwards sold, was considered one of the best handicap horses in Western Australia. Mr. Peterson married in 1902 Ellen, daughter of the late Mr. McCabe, of Edinburgh, and has a son and two daughters.

"O.I." BY "WORCESTER"—"ST. CICELY."

THOMAS RYAN.—Mr. Ryan is known to the racing community as "Meekatharra Ryan," on account of his interest in the "Fenian" Mine at that centre, but at the present time his name is perhaps more frequently

at the same course on July 29 he again failed to get a place. His three-year-old career opened very badly, as he ran unplaced on three occasions in third-class plates. He opened his winning account on

Railway Stakes Day and the Fremantle Plate on Imperial Stakes Day. He was entered for the Second Class Plate at the Western Australian Tattersall's Club Meeting on January 20, 1912, and starting at 3 to 1, never left the issue in doubt, but won comfortably. On January 29 "Ejector" came out in the Wheatlands Handicap at the Western Australian Turf Club Meeting, and although he only carried 6 st. 7 lb., won in good style from a fair field. He failed in the Armadale Handicap at Perth on February 3, and also in the Belmont Five Hundred, for which he was well backed. On May 4 he ran unplaced in the Carnac Handicap of six furlongs, but later on in the same day he came out and won the Telephone Handicap with 9 st. 1 lb. on his back, beating the favourite "Egg Shell," who was placed second. The "Pistol" horse at Perth on June 1 went out favourite for the Suburban Handicap of nine furlongs, and although he was giving weight to every horse but "Flogger," he won easily. Two days later, with 9 st. 6 lb. on his back, "Ejector" won the June Handicap of a mile in the good time of 1 min. 42 sec. "Repetition," who was his stable companion, finished second. This ended his three-year-old career, and after a spell he made his first appearance as a four-year-old on October 19, when, with 9 st. 12 lb., he ran unplaced in the Leake Handicap

"EJECTOR" BY "PISTOL" BY "CARBINE."

mentioned as owner of the brilliant four-year-old gelding "Ejector," than which there is probably no horse attracting more attention among sporting circles in Perth. "Ejector" was bred by Mr. Ryan, and has a distinguished pedigree, his sire being "Pistol," by "Carbine" (son of "Musket") from "Wenonah," by "Galopin" (son of "Vedette") from "Esa," by "Uncas" (son of "Stockwell") from "Fleada," by "Hermit" (son of "Newminster") from "Cradle," by "Saunterer" (son of "Birdcatcher") from "Margery Daw," by "Brocket"; while his dam, "Lockette" (at present in this State) is by "Padlock" (son of "Wenlock") from "Pyrette," by "Bras-de-Fer" (imp., son of "Stockwell") from "Prima" (imp.), by "Oxford" (son of "Birdcatcher"). As a yearling "Ejector" was placed in the hands of the well-known trainer, "Jack" Kelly, who did not in any way hurry on with the colt's preparation. "Ejector's" first race was in the Aidful Handicap at the Perth course on April 15, 1911, in which he finished out of a place, "Ayrville" winning from "High Guard" and "Florabel." On May 13 he was unplaced with 8 st. 7 lb. in the Third Class Plate at Helena Vale, and in a similar event

December 2, 1911, when, with 7 st. 6 lb. on his back, he won the Third Class Plate at Belmont Park in easy fashion. His next effort was in the

MR. T. RYAN'S RESIDENCE, GUILDFORD ROAD, BELMONT.

Derby, and although he ran well for about a mile, the distance found him out, and he was unplaced. He also failed to get a place in the Swan Handicap of seven furlongs on

of six furlongs at Perth. The handicappers kept the weight on "Ejector," and he ran unplaced in eight consecutive races, though he always showed out prominently. At Perth

on February 1 of this year (1913) he won the Serpentine Handicap of six furlongs with 8 st. 13 lb. up, beating a fair field. On February 22 "Ejector" was unplaced in the First Class Plate at Helena Vale, but on the following Saturday he won the City Handicap of six furlongs with 9 st. 5 lb. in the saddle, a good field being behind him. The "Pistol" gelding made the pace merry in the Belmont Five Hundred, run on March 8, but could not see the mile and a quarter out. He was unplaced in the Easter

Handicap on March 23, and also in the Autumn Handicap on March 24, but on the latter day he ran a good third to "Egg Shell" in the Avon Handicap of nine furlongs. At the W.A.T. Club's Winter Meeting he won the Flying Handicap, 6 furlongs, carrying 9 st. 10 lb., and two days later, on June 2, 1913, he carried 10 st. 1 lb. to victory in the Roe Handicap, also over 6 furlongs, in the smart time of 1 min. 14½ secs. There is no doubt that when in form "Ejector" is a brilliant

galloper up to a mile, and Mr. Ryan is fortunate in owning a horse like him, as he is as sound now as the day he was foaled. "Flashlock," who won the Great Western Steeplechase at Boulder a few years ago, was owned by Mr. Ryan, who has also got a full brother to "Ejector" in "Ex-tortion," a two-year-old, who has not yet been given a chance. Recently Mr. Ryan had an interest in the "Le Var" mare "Repetition," and she won a few races for the partnership.

### FOOTBALL AND CRICKET.

After horse-racing probably the most popular sport for the winter months is football, the place of which during the summer is taken, though in a less degree, by cricket. Most of the conditions are highly favourable to the development of both games, as few cities afford better opportunities than Perth, while the country districts also show a strong disposition to afford facilities for both sports. In fact, as regards the metropolitan area, it may be said that the Association Cricket Ground, the Esplanade, and the Subiaco and Fremantle Ovals are in constant demand all the year round for exhibitions of one game or the other.

In football circles the most popular game is undoubtedly the Australian game—the evolution of the Victorian method. Its success throughout the Commonwealth is, of course, due mainly to the fact that it is the national game. In Western Australia its prominence is also due to the fact that in the days of the boom many Victorian players of excellence were attracted to the State, and these formed the nucleus of what is now the strongest football organization in the West. The controlling body is the West Australian Football League (Mr. J. J. Simons, secretary). During 1912 seven clubs competed for the premiership, the honours being finally carried off by Subiaco. As might naturally be expected, the national spirit pervades the schools, and in the great majority of State schools, as well as a fair proportion of secondary schools, the Australian game is played.

Its competitor in point of importance is the British Association game, or "soccer," which so far as senior matches are concerned is controlled by the Western Australian British Football Association, of which Mr. H. H. Brennand is secretary, and so far as the juniors are concerned, by a Junior Association which is affiliated with the senior organization. Though far behind the Australian game in point of popularity, "soccer" has undoubtedly caught on in Western Australia, and in the case of the schools is played to almost as great an extent

as the national game. The Rugby game is also played, but only to a limited extent. In fact, it seemed as if the season of 1912 would be its last, but there has been a revival during the present year (1913) which may lead to a permanent place for it among the popular games of Western Australia.

Curiously enough, in cricket Western Australia has never come to the front in anything like the same way as the other States. This may be partly due to the difficulty that existed in the early days in securing suitable pitches, owing to the sandy nature of the soil. This difficulty, however, will no doubt be surmounted as population grows, and the great game will, before many years, occupy that high position amongst outdoor sports which distinguishes it from its fellows both in the Mother Country and in the other States of the Commonwealth. The principal cricket ground, which was granted by the Government to the trustees, is beautifully situated on the banks of the Swan, not more than a mile from the centre of the city. It is 14½ acres in extent, and is used as the general metropolitan sports ground. So far the trustees have not been in a position to erect grandstand and other conveniences worthy of the ground, but these no doubt will come in the near future and will all help to raise cricket to that level which it ought to occupy in any Australian community. Much of the good work that has already been done is due to the energetic efforts of Mr. John Rushton, who for many years has acted as secretary and has always been an indefatigable supporter of the claims of the willow. Cricket in the State is governed by the West Australian Cricket Association, the committee of management of which consists of two delegates from each of the associated clubs. At the end of the season of 1912-13 there were twelve senior clubs, all of whom strove earnestly to advance the interests of the game. Mr. James Gardiner occupies the position of president of the association, with Mr. G. W. Warr as chairman of committee and Mr. R. G. Heath as secretary.

### YACHTING AND ROWING.

Perhaps no capital city in the Commonwealth is more admirably placed than Perth for the full enjoyment of all sports connected with water. Whilst Sydney has her beautiful harbour, Perth can lay equal claim to beauty in her noble and commanding river, the broad stretches of which, below the city, form ideal conditions for rowing and sailing. How deeply appreciated the river is may be seen at almost any time during the

West Australian Rowing Club, established in 1885. This was followed in 1887 by the Swan River Rowing Club, and shortly afterwards by the Fremantle Rowing Club, established at Fremantle.

More important, perhaps, than rowing is the wonderful popularity of yachting on the Swan, as evidenced by the number of clubs devoted to its interests. At the head of these stands the Royal Perth Yacht Club,

summer months, when the myriad of craft with white sails bellowing in the breeze make so charming a scene upon the broad expanse of water. In a lesser degree the same scene may be witnessed at Fremantle, Bunbury, Albany, and Geraldton, at all of which ports boating forms a popular recreation during the summer months.

Rowing in the State is governed by the West Australian Rowing Association, to which the various clubs are affiliated. The premier club is, of course, the

which since 1891 has borne by Royal Warrant the title of Royal, and is authorized by Admiralty Warrant to fly as the club flag the blue ensign of the Royal Navy. Next in importance comes the Perth Flying Squadron, and then the Mount Bay Sailing Club and the Perth Dinghy Club. All of these are active institutions, and their continued progress shows that the manifold attractions of the Swan have laid permanent hold upon the affections of the people.

### OTHER SPORTS.

In addition to those mentioned, it may be said that practically every sport to which English-speaking people are addicted has found a home in Western Australia. The one exception, perhaps, is baseball, which never

seems to have caught on to any great extent in any part of Australia.

Lacrosse is fairly popular, though perhaps the nature of the climate is against any pronounced development.

Tennis clubs and courts are numerous throughout the metropolitan area, and under the guidance of the Lawn Tennis Association, which has established excellent grass courts at Mueller Park, tennis may be regarded as probably the most popular of the less boisterous forms of sport.

Cycling, which at one time had a great vogue as a pastime, seems scarcely to have held its own; but considerable interest still attaches to the road races held under the authority of the Western Australian League of Wheelmen.

Golf, though more restricted on account of expense, is growing in popularity amongst those who are able to devote the time to it. Excellent links have been laid

out at Fremantle, South Perth, Cottesloe, Kalgoorlie, and other places, where, upon every possible opportunity, lovers of the sport may be found actively engaged.

Of the less strenuous games bowling is perhaps making the greatest headway, and amongst the clubs, now numbering about thirty, which form the West Australian Bowling Association, are to be found many players whose knowledge of the game is quite on a par with that of the better players of the Eastern States.

Lastly, mention must be made of hockey, which is being actively fostered by the schools, and is regarded also as a popular recreation for girls, a ladies' club having been in existence for quite a number of years.

## Veterinary.

The history of veterinary science in Western Australia is bound up with that of the same profession throughout the wide world. One of the earliest references to the practice of the veterinary art is contained in the code of laws given by Hammurabi, who ruled over Babylonia about 2,100 years before Christ. In this code it is set forth that "if a doctor of oxen and asses has treated either ox or ass for a severe wound, and cured it, the owner of the ox or ass shall give to the doctor one-sixth of a shekel of silver for his fee," but "if he has treated an ox or an ass for a severe wound and caused it to die, he shall give the quarter of its price to the owner of the ox or ass." Veterinary surgery in those days appears to have been a rather risky profession.

The ancient Greeks and Romans, more especially the former, produced several writers on veterinary matters, and amongst the best known may be mentioned Simon, Xenophon, Aristotle, Publius Vegetius Renatus, and Hippocrates. What little was known of veterinary science in those early periods of history was, however, lost sight of in the dark period of the Middle Ages, and the modern history of the profession may be said to date from the founding of the veterinary school at Lyons, in France, about the year 1761. This was shortly followed by the establishment of a second school at Alfort. It was close on thirty years before England followed suit, and it is to the credit of the medical profession that such men as Sir Astley Cooper and Dr. John Hunter took an active part in founding England's first veterinary college. The study of veterinary science was forced upon the Governments of the old world by the enormous losses which stockowners suffered from year to year, and precisely the same cause has forced the Australian Governments to a more serious study of the diseases which yearly levy so big a toll on the livestock industry.

The father of veterinary education in Australia was Professor William Tyson Kendall, F.R.C.V.S., who, in the face of many difficulties, established the Melbourne Veterinary College at Fitzroy in the year 1888. He received no financial support from the Victorian Government, but in 1889 the Veterinary Surgeons Act was passed which provided for the establishment of a Veterinary Board and the registration of veterinary surgeons. Professor Kendall's work received the recognition due to it in 1909, when his college was formally taken over by the Government and

incorporated with the University under the provisions of the University Act, Professor Kendall receiving the appointment of Lecturer in Veterinary Medicine and Obstetrics in the new veterinary school.

During the ten years that his college had been open 136 students had attended the lectures, and of those sixty had graduated as fully-qualified veterinary surgeons. It was one of these graduates—Mr. H. H. Edwards—who was the first qualified veterinary surgeon to commence practice in Western Australia some eighteen years ago. The Government and various public bodies were not slow in recognizing his worth and availing themselves of his up-to-date knowledge of veterinary matters. He held various public appointments, and for many years enjoyed a lucrative practice in Perth. Some two years after the arrival of Mr. Edwards, Mr. R. E. Weir, M.R.C.V.S., came to the State to join the Stock Department. He was followed some few months later by Mr. E. A. Le Souef, another graduate of the Melbourne Veterinary College, who came to fill the position of Director of the Zoological Gardens. Both these gentlemen have since come to be widely known throughout the length and breadth of the State, and the veterinary profession in Western Australia owes a deep debt of gratitude to Mr. Le Souef, who has worked unceasingly to maintain the social and scientific status of his chosen profession and to place its members on an equal footing with those of the sister profession of human medicine. To his efforts are due the early recognition of the value of veterinary science by the military authorities of this State and the granting of commissions to veterinary surgeons entering the Australian Army Veterinary Corps.

In Mr. J. L. Burns, of the Stock Department, the old Melbourne Veterinary College has another representative. Mr. Burns joined the department some eight years ago, having previously practised in South Australia and served as a veterinary officer in the South African War.

From time to time various members of the Royal College of Veterinary Surgeons have drifted to the shores of Western Australia, but at present only Mr. C. Syrett, M.R.C.V.S., of London, and Mr. John Robson, M.R.C.V.S., of Edinburgh, remain. The latter has established an extensive practice in Perth, and has become widely known as a capable and successful member of the profession.

In the years 1912 and 1913 there happened two

epoch-marking events in the Western Australian world of veterinary science. The former year saw the passing of an up-to-date Veterinary Act providing for the appointment of a Board and the registration of members of the profession. Provision was made for the registration of men who had not passed through a recognized college, but who had been practising for five years prior to the passing of the Act. Future registrations will, however, be confined to those holding a recognized degree. The fitting complement to the passing of the Veterinary Act came in 1913, when the Senate of the Western Australian University appointed a Lecturer in Veterinary Science. The gentleman selected for this position was Mr. E. A. Weston, another graduate of the old Melbourne Veterinary College and a Bachelor of Veterinary Science of the Melbourne University. It will probably be some years before the University will provide a full course leading to a degree in veterinary science. Such work could only be undertaken with a large staff of

professors, and will probably be inaugurated at the time when it is decided to found a school of medicine. In the meantime the lecturer will devote himself to extension lectures and practical demonstrations amongst the farmers, more especially in the newly-settled areas where many of the landholders know little of stock. In addition to this work it is intended to provide short courses of a practical nature for those registered practitioners who have not had the advantage of a college training, and to give the agricultural students studying under Dr. Patterson, the Professor of Agriculture, a course in elementary veterinary science. There is also a wide field for original research work, both in regard to poison plants peculiar to the State and amongst the local diseases associated with its varying soils and climatic conditions. It is hoped that the Veterinary Department will be able to do something in this field when the necessary facilities for experimental and laboratory work have been provided.

JOHN ROBSON, M.R.C.V.S., graduate of the Royal Veterinary College, Edinburgh, and post-graduate of the Royal Veterinary College, London, 74, Stirling Street, Perth, was born in the County of Northumberland, England, on July 26, 1881. At the close of his scholastic career he was engaged for a time in farming, and had seven years' experience in sheep, cattle, and horse breeding. In 1904 he began to study for his profession at the Royal Dick Veterinary College of Edinburgh, where he spent four years, in 1905 among other honours winning the silver medals of the Highland Agricultural Society for anatomy and physiology. In 1907 he was the successful competitor for the bronze medal awarded by the same organization in materia medica, and in the following year won the silver medals for medicine and surgery. The Highland Agricultural Society is a body known to agriculturists throughout the length and breadth of Scotland and it has always taken a deep interest in the study of veterinary science. Many sheep farms in Scotland are yearly ravaged by diseases of the Braxy group, which spell ruin to the unfortunate owners. Eminent men in the veterinary profession have sought to unravel the tangled pathology of these diseases, but without success. Some time ago a commission was appointed and spent seven years in the study of the Braxy group of diseases, and at the conclusion of its labours issued a voluminous report. This commission cost tens of thousands of

pounds and carried out innumerable experiments, but there still remains much work to be done. The bitter experience gained with these baffling diseases has doubtless stimulated the interest of the Highland Agricultural Society in veterinary matters and quickened its interest in the students passing through the college at Edinburgh. The medals which it offers are keenly competed for, and the winning of them is regarded as a great distinction. In passing, it is interesting to note that the recently-appointed Professor of Agriculture in the Western Australian University—Dr. Patterson—has been a member of the Highland Agricultural Society for many years. After graduating at the above-named institution Mr. Robson took out a post-graduate degree at the Royal Veterinary College of London, where he attended Sir John M'Fadyean's special course in veterinary pathology, bacteriology, and tropical diseases of animals, and meat inspection in the London market under Chief Inspector King, M.R.C.V.S. The London Veterinary College is the oldest of the colleges in Great Britain and has an interesting history. It was founded in the year 1790 as the result of the efforts of St. Bel, a gentleman of French descent, who had seen the benefits which had accrued from the founding of the continental schools of veterinary science. His first proposals were not received favourably, and the commencement of the college in 1890 was the result of two years' unremitting

labour. Unfortunately St. Bel did not live long to direct the college for which he had done so much. One year after his appointment to the professorship a sudden and brief illness ended his mortal career. In order that the college might continue its work the Duke of Northumberland came forward with a handsome donation, and many famous medical men rallied round the young institution. Mr. Colman was appointed to succeed St. Bel, and a committee of medical men undertook the examination of the students. It is pleasing to note that they also "permitted the veterinary students to attend their lectures on human anatomy free of charge." Since that time many distinguished men have directed the fortunes of the London Veterinary College, but perhaps the most distinguished is the present Dean and Principal, Sir John M'Fadyean, M.B., B.Sc., LL.B., M.R.C.V.S., under whom Mr. Robson studied when attending the post-graduate course. As a student Mr. Robson's name always figured in the honour lists in his different classes at both colleges, and in his professional examinations he acquitted himself with more than average merit. After taking his diplomas he acted as assistant to Mr. J. Cooke, F.R.C.V.S., during the summer of 1895, and in the following year filled the post of *locum tenens* for Mr. A. Chivas, M.R.C.V.S., of Corbridge. After occupying several other appointments of equal responsibility in England Mr. Robson decided to come to

Western Australia, arriving at Perth in July, 1909. He immediately established himself in private practice at his present address, and since that time has built up a very sound connection. At the present time he occupies the appointments of honorary veterinary surgeon to the Royal Agricultural Society of Western Australia, the S.P.C.A., and the W.A. Kennel Club, and also to the Perth City Council, the Metropolitan Fire Brigade, etc. He was also offered a position as veterinary inspector in the Stock Department in succession to Mr. Crossley, M.R.C.V.S., but after careful consideration decided not to relinquish his growing practice for a Government appointment. He rapidly made his way into the front ranks of the profession and threw the weight of his opinion into the scale in favour of the Veterinary Act, which was passed by Parliament in 1912 to regulate the practice of veterinary surgery in this State. About the beginning of 1911 Mr. Robson carried out a scheme for the erection of a hospital on his premises, which provides accommodation for a number of horses. He is a member of the first board created under the Veterinary Surgeons Act of Western Australia in 1912, consisting of Messrs. Weir, Le Souef, Robson, Edwin Rose, and Bodey. Mr. Robson has always sought to maintain a high standard in his work and to utilize the latest surgical procedures where they are likely to prove of permanent benefit. One of the latest surgical operations is that introduced by Professor Williams, of America, for the relief of roaring caused by paralysis of the recurrent laryngeal nerve supplying the vocal cords and muscles of the larynx, or "voice box" as it is popularly termed. The paralysis is usually confined to the left-hand side. Stripped of technicalities, the operation may be said to be performed by an incision being made into the larynx of the affected horse and the mucous lining of the paralyzed vocal cord, together with that lying opposite it upon the inside of the larynx, is then stripped off. The result is that the two raw surfaces grow together, and the paralyzed cord is firmly attached to the walls of the larynx instead of obstructing the passage of air through it as before. This operation is to supersede the other well-known method of tracheotomy, in which a silver tube is inserted in the trachea or "windpipe," with varying success.

Mr. Robson has performed this operation several times, and has obtained a successful result in a fair percentage of cases.

ANGUS MACINTOSH, veterinary surgeon, 229, Newcastle Street, Perth (Telephone 1183). Mr. Angus MacIntosh is a native of South Australia, having been born at Mount Gambier in May, 1872. He received his education at the State school of that town, and at the conclusion of his scholastic career took steps to acquaint himself with matters pertaining to all kinds of stock, with the object of becoming thoroughly familiar with the characteristics of the different classes. In order to attain this end he travelled throughout Victoria, and subsequently augmented his experience in New South Wales and Queensland, all the time being engaged in the handling of stock and kindred pursuits. At the age of eighteen he decided to move farther afield, and choosing the United States as his destination, sailed for America in 1890. Here he was employed in cow-punching for a time, and eventually he joined a veterinary surgeon in Chicago and gained a preliminary insight into the profession whilst assisting this gentleman in his work. Mr. MacIntosh afterwards was associated with other well-known practitioners in America, ultimately making his way to Boston, whence he returned to Australia, and after a short stay in Melbourne revisited his birthplace in the Central State. In 1892 he was employed in bringing a shipment of horses to Western Australia, and upon his return accepted an engagement with the late Sir Thomas Elder on his stud farm at Morphettville, where he spent a few years, during which his knowledge of horses became considerably extended. In 1896 he came again to Western Australia, and proceeding to the eastern goldfields established a small veterinary practice at Menzies, where he did some excellent and profitable work. The roving spirit prompted his return to South Australia for a time, but Western shores again exerted their attraction, and he returned to the "Cinderella" State. Mr. MacIntosh next took passage for England, where he made a further study of veterinary science, and revisited America for the same purpose, acquainting himself with

the latest ideas and methods in the treatment of animals and garnering up much useful information of a general character. In 1900 he established himself in practice in Stirling Street, Perth, and two years later purchased the property where he now carries on business, in the first instance erecting a few wooden boxes which served his purpose in forming the nucleus of his connection. In 1905 he paid a third visit to America, and during its progress gained considerable knowledge under the guidance of Messrs. Parke, Davis, & Co., the largest manufacturers of chemicals in the world. This firm has extensive buildings and experimental farms, laboratories, capsule works, and mechanical departments in various centres, notably Detroit in U.S.A., Walkerville in Canada, and Hounslow, a few miles out of London, in England. At Detroit their stock department alone covers a floor space of some 3½ acres. Here is to be found a veritable menagerie of animals used for experimental purposes, for the manufacture of vaccines, serums, and antitoxins, and for the testing of these products before they are placed on the market. Here are housed about 150 horses. Each animal before admission to this select equine circle is carefully examined by a veterinary surgeon, quarantined for a week or a fortnight, and tested with tuberculin for tuberculosis and mallein for glanders. To keep them fit and well the horses are given a run of several miles each day by the grooms in charge. A large herd of cattle is also kept, the animals being selected with the same care as is the case with the horses. They are used for the manufacture of several vaccines, notably black-leg vaccine and calf lymph for use in vaccination against smallpox, and for testing others, such as tuberculin and anthrax vaccine which are prepared direct from cultures of the germs causing the disease. A large assortment of dogs, fowls, rabbits, frogs, rats, mice, and guinea-pigs are also kept. The guinea-pig lofts shelter some five or six thousand of these little animals, which are chiefly used in standardizing various toxins and serums and testing their purity. In addition to the ordinary routine work, Messrs. Parke, Davis, & Co. employ a number of scientists in original research work, and one of their bacteriologists, Dr. W. S. Ferry, has recently announced that he has discovered the germ which causes distemper in dogs. It will

readily be understood that in these laboratories Mr. MacIntosh found a never-failing source of interest and instruction. Here he saw the serum so widely used as a preventive and curative for tetanus (lockjaw) being manufactured, tested, and standardized. Mr. MacIntosh is a great believer in the efficacy of this serum when used in sufficiently large doses, and backs his opinion by quoting numerous cases in which he has been successful with it. He also witnessed the preparation of anthrax and black-leg vaccines, used for protecting animals—principally cattle—

and it is this blood serum freighted with its precious store of anti-toxine which has snatched many a child from the jaws of death. The biological department forms only one portion of Messrs. Parke, Davis, & Co.'s extensive laboratories, as they are large wholesale drug manufacturers, their preparations, together with those of Messrs. Burroughs, Welcome, and Co., being known to veterinary surgeons and medical men throughout the civilized world. The physiological standardization of many of the drugs is accomplished by inoculating an animal with a given dose of

wattles is partly cut off, and the effect can plainly be seen in the blanching which takes place. If the administration of the drug be continued for some time the affected portion, robbed of its blood supply, mortifies and drops off. Returning to Western Australia at the end of a year, Mr. MacIntosh opened in premises in Newcastle Street, where he built a hospital and carried on very successfully, but, still not content with mere local experience, six years later he again sought the wider outlook of Continental practice, and for a time was closely associated with Messrs. E.

against these dreadful diseases, and tuberculin and mallein, which form the only reliable means of diagnosing tuberculosis and glanders. Parke, Davis, & Co. are also large manufacturers of diphtheria anti-toxine. This is prepared from the blood of a horse which has been rendered highly resistant to the poison of the diphtheria germ by having gradually increasing doses injected into it. To neutralize the poison the horse's blood has to form large quantities of an anti-poison, known as the anti-toxine,

the drug in proportion to its body weight. The effect on the animal is then noted, and if the drug is found not to produce the effect it should, or to have no action, it is known to be either impure or worthless. This is well illustrated in the testing of ergot upon fowls, preferably those carrying a large single comb. The action of this drug is to contract the small arteries (blood vessels). When a full dose of an active preparation is injected into the fowl the blood supply to the edges of the comb and

Merck & Co., large manufacturing chemists and biological experts at Darmstadt, in Germany. By them he was recommended to Professor Eberlein, principal of the veterinary college at Berlin, and subsequently continued his travels to America *via* England, returning further to pursue his researches, the whole of Great Britain in turn being visited, and the expert knowledge of every centre assimilated with a view to future practical testing in Australia. It was whilst in England at this time

that Mr. MacIntosh received instruction at the hands of Professor Hobday in the methods of operation on horses for roaring. His present fine hospital in Newcastle Street was erected upon his return from the old country in 1911, and is capable of accommodating twenty-eight equine patients, the recovery of these being facilitated by the installation of the most up-to-date appliances known to the profession. The operating-table was one of the first of its kind to be imported to Australia, and to this institution must be given pioneer recognition in the use of the ambulance for horses in Western Australia. Mr. MacIntosh was also the first in the State to practise dentistry on horses, and in many ways has been a leader in this science of such paramount importance in a country like our own.

E. J. STUART, veterinary surgeon, Beaufort Street, Perth, is a South Australian, having been born at Kingston, in the Central State, on May 23, 1875. He was educated at Mr. Caterer's College, and in

MR. E. J. STUART.

1899 commenced the study of veterinary surgery. In the following year he went to India, where he gained valuable experience in the various maladies of horses, and the remedial measures proved to have met with success in that country. Subsequently he travelled round the

AA

Philippine Islands, China, and Japan in pursuit of veterinary knowledge, and upon his return, at the latter part of 1903, came to Western Australia and established himself in practice at Subiaco. Owing to a rapidly-increasing business larger and more central premises became necessary, and he

instruments and gear of the most modern description for the treatment and handling of all kinds of animals and keeps a large stock of serums, bacterins, and the most newly-discovered drugs necessary for success in his calling. One of his recent successes was the treatment of a racing pony for a fractured

removed to his present address in Beaufort Street, where his hospital, though in a good position and with accommodation for twenty horses, is still inadequate to meet the demands of his connection, which is one of the widest in Western Australia, and he contemplates very shortly building a large and up-to-date hospital, which will allow scope for the treatment of all kinds of equine diseases. He has a great number of

tibia (big bone of the hind leg). The horse had been condemned, but the owner, determined to save him if possible, placed him in Mr. Stuart's hands, and so satisfactory was the result that the pony, which was named "Baltimore," has since won three or four races. It may be mentioned that Mr. Stuart's father was a partner in the whilom firm of Guthrie, Bulloch, & Stuart, of Victoria.

OPERATING TABLE, SHOWING METHOD OF SECURING ANIMAL

## Tramways.

### PERTH TRAMWAYS.

As far back as 1885 the Government, recognizing the advantages of tramways as a means of transport, passed the Tramways Act, 1885, to allow the promotion of a tramway company for the metropolis. No step was taken under the Act, however, till 1897, when Mr. C. P. Dickinson secured a concession from the Perth City Council to lay down and operate a tramway system in the city for a term of years, the agreement providing for the use of the lines, fares, a return to the Council of 3 per cent. on the gross earnings in lieu of rates, and other things. This concession was transferred to Mr. Allan Stoneham, who promoted the Perth Electric Tramways, Limited, sending Mr. E. E. Rogers out to Western Australia to act as managing director. For a time the difficulties in the way were so great that the company suggested the abandonment of the scheme, but in March, 1899, an amended agreement was made between the City Council and the company, and the work of laying the tracks proceeded with. That agreement provided for another schedule for Subiaco, Central Perth, Highgate Hill, East Perth, Leederville, Old Guildford Road, Bulwer Street, and Colin Street, and gave two years from the date of the original provisional order for the construction of 13½ miles and five years for the remaining four miles. The first section, along Hay Street from East Perth to Thomas Street, was laid and opened later in 1899, and soon continued to Subiaco by agreement with the Subiaco Town Council, which was quick to realize the importance of rapid and easy communication. Since that date the lines in the schedule have been constructed, and by agreements with the various controlling bodies the system has been extended

to Victoria Park, North Perth, Osborne Park, and Nedlands. The current is supplied from a central powerhouse erected in Claisebrook Road, and the cars are housed in a large car-barn situated at the extreme east end of Hay Street. At the present time there are 30 miles 11 chains of line laid down, all of which, with the exception of the portion along Wellington Street westward from William Street, are in operation.

For some years past the conviction has been growing that the system ought either to be municipalized or nationalized, and various negotiations have been entered upon between the Perth City Council and the company from time to time. So many interests, however, were involved, and, in the absence of a Greater Perth, so many suburban councils were concerned, that negotiations were not able to be satisfactorily concluded. In the meantime the Government became convinced that the system ought to be nationalized, and with that aim in view approached the company, ultimately securing an option over the whole of the interests for £475,000. To carry the matter to a conclusion a Bill to purchase the concern for that sum was introduced into Parliament in 1912, and after considerable discussion, aimed at protecting the various municipal rights, was passed. Under this Act the tramways became the property of the State on May 31, 1913. One of the controlling reasons for nationalization was that there existed an urgent need for extension of the system, but Parliament was not inclined to allow the company any further concessions. Now that the tramways are to be operated by the Government these facilities will no doubt be provided, and lines laid wherever the increase of population demands them.

### FREMANTLE MUNICIPAL TRAMWAYS AND ELECTRIC LIGHTING SYSTEM.

Amongst the advantages provided by the Fremantle Municipal Council for the use and convenience of its ratepayers, not by any means the least, but perhaps the most important, is its system of tramways and electric lighting.

Some years ago the Fremantle Council granted to a private company the right to a monopoly in the establishment of tramway and electric lighting facilities. For reasons best known to the monopolists the scheme that with its glowing possibilities had attracted the municipal

fathers never materialized, and in due time the concession lapsed and certain forfeitures to the municipality eventuated. At this stage there had arisen a king "that knew not Joseph" in the shape of a new, more enlightened, and more enterprising council, the members of which were prepared to go into the question with sincerity and propound a scheme that would establish these up-to-date facilities for the profitable benefit of the ratepayers. The proposal was launched under more or less discouraging circumstances, for a section of the public

showed its inconsistency in that, whilst it was prepared to allow the government of the town and the control of its finances to remain in the hands of the local councillors, expressed itself very strongly against the same body initiating and controlling as a municipal enterprise the work that it had been quite prepared to leave in the hands of dividend seekers who had not even the qualification of local ratepaying interests. In the face of this opposition the municipalities of Fremantle, East Fremantle, and North Fremantle, by their representatives on the respective councils, met to consider the possibilities of the proposal. At an early stage of the proceedings North Fremantle decided not to join the venture, and it was left to the parent municipality and its daughter, East Fremantle, to consider the advisability of undertaking the work that it was hoped and believed would eventually prove a benefit and credit as well as a profitable investment for the districts. After many preliminary meetings it was decided that the two municipalities should try to have the work undertaken, and a sub-committee elected by the Councils of Fremantle and East Fremantle set to work in earnest to secure Parliamentary authority to carry out the works that had, up to this stage, received the approval of the two councils. A Bill was accordingly drafted and sent to Parliament. The Bill was supported by the expert advice and report obtained from Messrs. P. W. Shaw, As.M.I.C.E., Mem.I.M.E. (the supervising engineer for tramway construction, New South Wales), and A. Diamond (assistant electrical engineer for tramways construction, New South Wales), who went fully into the details of cost and working, and on the basis of their report produced two estimates of working revenue and expenditure. One scheme showed an estimated profit of £1,010 per annum, and the other an estimated annual profit of £3,132. Either of the schemes was supposed to be capable of easy development. As a result of Parliamentary consideration, the Bill was accepted and became the "Private Act," 3 Edward VII., 1903—"An Act to empower the municipalities of Fremantle and East Fremantle jointly to construct, maintain, and work tramways within the boundaries of the said municipalities, and to construct and maintain works for the generation and supply of electricity for motive and lighting purposes within the said districts."

The Act granted power to the municipalities of Fremantle and East Fremantle to construct tramways and provide electric power and lighting, and to borrow money to the extent of £100,000 for that purpose; the money so borrowed not to be taken into account in estimating the limit of borrowing powers under the Municipal Institutions Act. It also provided that within nine months after the coming into force of the Act the construction, carrying out, control, and management of the undertakings should be vested in a Board

AA2

to be called the Fremantle Municipal Tramways and Electric Lighting Board, which should consist of five members. The Mayor for the time being of Fremantle to be an *ex officio* member of the Board; the other four members to be elected by the owners and occupiers, one each respectively, in each municipal district. The elected members to hold office for two years.

Acting under the authority provided in the special Act of Parliament, the councils of Fremantle and East Fremantle then entered into an agreement with Edward Noyes, of Sydney, and Henry Noyes, of Melbourne, (Noyes Brothers) to design and, after the constitution of the Board, to superintend the construction of the scheme. The cost was limited to £84,000, and that sum was to include any alterations and amendments required by the Board. It was also provided that in case the cost of the undertakings exceeded the sum of £84,000, exclusive of legal and clerical charges incurred by the Board and the cost of the administration of the Board's office, Noyes Brothers should pay the amount of the excess to the Board. To carry out the works and undertakings the sum of £80,000 was raised by F. Thone-mann, a Melbourne sharebroker; the currency of the loan being twenty-five years and the rate of interest  $4\frac{1}{2}$  per cent.

The next item of importance connected with the scheme was the election of the first Board, and for that purpose the Fremantle Council appointed Councillor Frank Nicholas to act as returning-officer and conduct the Fremantle portion of the elections. East Fremantle selected its Mayor, W. C. Angwin, M.L.A., to perform the same duty for the daughter municipality. The elections were held on Saturday, June 18, 1904, and the first Board was constituted as follows, *viz.*:—Frank Cadd, Mayor of Fremantle, *ex officio*; E. Solomon, representing Fremantle owners; R. J. Lynn, representing Fremantle occupiers; C. S. Nathan, representing East Fremantle owners; Harry Bennett, representing East Fremantle occupiers.

The Board lost no time in taking up the important duties that was entrusted to it, and on June 27—nine days after election—confirmed the agreement made between the councils and Messrs. Noyes Brothers. The necessary material was duly ordered, and on February 6, 1905, the work of construction was commenced. On November 30 of the same year tram traffic was opened on the South and East Fremantle routes of the system, Beaconsfield and Marmion Street routes being completed shortly afterwards. The whole of the works was carried to a successful conclusion and completed by the constructing engineers in accordance with the agreement on April 11, 1906. The balance-sheet for the first period, *i.e.*, to August 31, 1906, showed that after paying interest, £1,750 13s. 9d., and sinking fund, £333 6s. 8d., to date, a profit of £1,108 0s. 4d. had resulted.

The works embraced a combination of the two schemes recommended by the experts, Messrs. Shaw and Diamond, and the result proved to be within a few shillings of the estimated profit on their scheme No. 1.

The first item of importance in the development of the scheme was the acceptance of North Fremantle as a customer for electric light and power, and this the Board arranged to supply within the Fremantle boundary (for the Act would not allow the Board to go outside its district except with the authority of the Governor-in-Council), and the North Fremantle Council to convey the current to its customers and requirements within its own boundaries. During the second year of completed working the question of extending the tramway system into North Fremantle became an important one, and in this instance also the North Fremantle Council preferred to be a customer of the Tramway Board rather than a partner in the scheme, and having arranged terms satisfactory to each party laid down its own tramway system and opened it for traffic, under the control of the Board, on September 30, 1908.

Over the original area the development was so consistent that in 1909 the Board found it necessary to duplicate the South Fremantle route and about three-fourths of that to East Fremantle. Since that time the undertaking has proved a good investment and has consistently held its own. It has paid full interest and sinking fund ( $6\frac{1}{2}$  per cent.) on its borrowed capital, written off the preliminary expenses incurred by the councils and large sums for depreciation, and divided some profits with the municipalities. It certainly has not earned sufficient profits to relieve the ratepayers of any of their rates, but has by the providing of those conveniences that are essential to maintaining and increasing the population of the districts proved a very material factor in the development of the outlying portions of both municipalities as well as a very acceptable convenience to the ratepayers in North Fremantle. One

proof of this statement lies in the fact that since the installation of the tramways and electric lighting scheme rents of properties in the three Fremantles have substantially increased, and an unoccupied house is a difficult thing to find to-day. Of course this is not entirely due to the conveniences of the services, but they have played an important part therein.

The total capital borrowed and invested since the inauguration of the scheme is £140,000—an amending Act of Parliament passed in 1909 increased the borrowing powers to £150,000. The population served is but 20,000—a handful of people to undertake and work successfully such an important undertaking.

The following are statistics extracted from the first (1906) and last (1912) reports of the Board, *viz.*—

Number of car miles run—1906, 385,971.054; 1912, 481,345.369.

Number of passengers carried—1906, 1,969,636; 1912, 3,767,694.

Number of passengers per car mile—1906, 4.974; 1912, 7.827.

Average journey per head of population—1906, 89.528; 1912, 188.384.

Average fare per passenger—1906, 2.232d.; 1912, 1.688d.

Car revenue per car mile—1906, 11.569d.; 1912, 13.328d.

Revenue from sale of electricity for power and lighting—1906, £4,145 15s. 6d.; 1912, £16,084 5s. 1d.

Mileage of tram track—1906, 7 miles 40 chains; 1912, 8 miles 64 chains.

The above tramway figures do not include the traffic handled on the North Fremantle section.

The present Board is comprised of the following gentlemen:—F. J. McLaren, J.P., Mayor of Fremantle, *ex officio*, chairman; E. H. Fothergill, J.P., representing Fremantle owners; Hon. R. J. Lynn, J.P., M.L.C., representing Fremantle occupiers; J. F. Allen, J.P., representing East Fremantle owners; W. C. Angwin, J.P., M.L.A., representing East Fremantle occupiers; A. Mitchell, M.I.E.E., manager and engineer; secretary and accountant, J. T. Bold.

## Fire Brigades.

During the past thirty years the provision made for overcoming fires has undergone drastic change in almost every large city. Each town in the olden days used to possess its own volunteer fire brigade, which in many cases was an efficient body working actively in the public interest, subject to no compulsion, but in some cases more ornamental than useful. In place of this there is now a fire brigade corps specially trained for the work required of it, and ready at any moment of the day or night to guard the property of the citizens from the

brigade was equipped shortly after its formation with a large manual fire-engine. This engine, however, was not the first introduced into the colony, as one had been imported by the Government in 1862 and placed under the charge of the old pensioners at the Barracks at the top of St. George's Terrace. After the formation of the Perth Brigade volunteer services were established at most of the centres of population, and these, particularly on the goldfields in the early days when water was scarce, were a most important branch of citizen service.

TURNOUT AT THE CENTRAL FIRE STATION, PERTH.

ravages of fire. The adoption of this organized system in Western Australia is like many other State institutions of recent growth. The first fire brigade in the State, volunteer in constitution, was formed under the Perth City Council early in the eighties, and for a short period was under the superintendency of Mr. J. Sommers, who was succeeded by Mr. W. E. Victor, at one time Town Clerk of the City. This gentleman held the position until 1897, when he resigned, and Mr. J. M. Lapsley was appointed in his stead, the office of superintendent being still held under the City Council. This

During the nineties when, with the growth of the towns and the consequent increase in value of municipal property, more modern appliances became necessary, the Government under Sir John Forrest provided money for the purchase of steam fire-engines for Perth, Fremantle, Bunbury, Esperance, Albany, Geraldton, Kalgoorlie, and Boulder. The first of these was procured by Fremantle in 1895, followed by Perth in 1897. All the brigades at this time were purely volunteer with the exception of Perth, which was of a mixed character, having two permanent men in addition to fourteen

volunteers. In 1900 it became apparent that the fire-brigade system required to be reconstructed, and a Fire Brigades Act was passed, placing the management under a Board nominated by the contributors. The contributors consisted of the Government, the fire-underwriters, and the municipalities, the shares of the cost being apportioned as follows:—Government one-ninth, fire-underwriters four-ninths, and the municipalities four-ninths. The Perth Brigade came under the Act at once, and Mr. J. M. Lapsley was appointed chief officer. As it was optional on the part of municipalities whether they availed themselves of the provisions of the Act or not, only one other municipal council, that of Fremantle, availed itself of the opportunity. In 1909, however, the Act was superseded by a new measure—The District Fire Brigades Act. This Act compelled all local authorities to accept its provisions and contribute to the upkeep of the Board, the expenses being met in the proportions of two-eighths from the Government, three-eighths from fire insurance companies, and

three-eighths from local authorities. The Board is constituted as follows:—Two representatives appointed by the Governor-in-Council, three elected by the insurance companies, one by the Perth City Council, one by the Councils of Kalgoorlie, Boulder, and Coolgardie and the Kalgoorlie Roads Board, one by local authorities other than those named, and one by volunteer fire brigades.

The personnel of the Board at present consists of Messrs. J. B. Holman and J. R. Campbell (Government nominees), B. L. Murray, P. J. Sullivan, and H. G. Jeffreson (insurance), J. T. Franklin (Perth City Council), C. R. Davies (Kalgoorlie, Coolgardie, and Boulder Councils), C. Fraenkel (other local authorities), and J. C. Brennan (volunteer brigades). Mr. B. L. Murray is chairman, and Mr. J. M. Lapsley chief officer.

The cost of the system during 1912 was £29,207, and the income from various sources £29,599. The number of fire calls for the year was 807, of which 197 were serious. During the same period the Perth Fire Brigade Ambulance was summoned to 497 cases.

JAMES McFARLANE LAPSLEY, J.P., Chief Officer of the Western Australian Fire Brigades Board, is a son of the late John Lapsley, of Gourrock, Scotland, and was born at Beaufort (Fiery Creek), Victoria, on February 14, 1856. At two years of age he went with his parents to Scotland, where he received his educational training at the Highlanders' Academy, Greenock. Leaving school in 1869 he took a course of engineering under Messrs. McJanet & Park, of Greenock, upon the completion of which, in 1877, he came to Australia and settled in Adelaide in the employ of Messrs. W. & T. Rhodes, of that city. After eight years in this service he joined the firm of Messrs. Sykes Brothers & Co., of Perth, Western Australia, subsequently starting on his own account in that city as sanitary engineer, etc. After building up the largest jobbing concern of the kind in Australia he sold his business to Messrs. Dobbie and Co. and accepted an appointment to his present position. He had previously had experience in fire brigade work, first joining the service as a probationer in 1888, afterwards acting as engineer, foreman, and occasionally as superintendent, until he fully fitted himself for the responsible post he now occupies. Just before his appointment the new Fire Brigades Act had come into force, by which the volunteers were made a permanent body, the Act embracing the towns of Perth and

Fremantle only. In 1909, when a later Act included the whole State in its provisions, Mr. Lapsley was appointed Western Australia's first Chief Officer of Fire Brigades, and to him may be accorded the distinction of being the only native-born

MR. JAMES McFARLANE LAPSLEY.

Chief Officer in Australasia, and also the only mechanic in charge of a State. Being practically experienced himself, with a view to economy he inaugurated the employment on the station exclusively of mechanics, who manufacture on the premises all the requirements of the service from street fire alarms to the

top-boots worn by the members of the brigade. Mr. Lapsley was instrumental in providing the citizens with a free accident ambulance van, for which on May 5, 1905, he was decorated by the late King Edward with the Order of St. John of Jerusalem. A further distinction was conferred upon him by the present King in 1911, when he was appointed an Esquire of the Order—a distinction unique in the Commonwealth. With the permission of the Fire Brigades Board Mr. Lapsley induced the staff voluntarily to perform the work in connection with the ambulance, and further to facilitate its usefulness he procured permission for the public to use the street fire alarms in cases of accident, a privilege unknown in any other part of the Empire. He also holds the King's Police Medal, awarded primarily for his meritorious organization of fire brigades, Mr. Lapsley being the first fireman in the Commonwealth to receive the honour. He was created a Justice of the Peace in 1905. In military matters Mr. Lapsley has had some experience, having joined the Renfrewshire Volunteers as bugler and drummer in 1867 and served about ten years. On arrival in Australia he associated himself with the Norwood Rifles in Adelaide, in which corps he rose to the position of sergeant instructor. He was the founder of Scottish Freemasonry in Western Australia, and is Grand Master of the Scotch Constitution in

this State, and has also been second Grand Principal in the W.A. Chapter. He is a Past Prior in Knights Templary, and became a member of the Rose Crucian Degree in New South Wales in August, 1905, was one of the founders of Druidism in the State and also of the Sons of Temperance, passing through all the offices in the different orders and still holding his connection with these bodies. He was one of the founders

of the Caledonian Society in Western Australia in 1885, in which he still retains an interest, and has held the position of Chief on several occasions. In matters of sport Mr. Lapsley has manifested a catholic spirit, and assisted in the formation of the Swan River Rowing Club twenty-three years ago, being captain and coach of this club for a lengthy period, and still holds the position of President. He was president of the Western

Australian Rowing Association from 1907 to 1909, and is now vice-president, is president of the Perth Lacrosse Club, vice-president of the Western Australian Lacrosse Association, and is a general patron of all amateur athletic sports. He was married in Western Australia on November 23, 1887, to Evelyn, a daughter of the late Mr. Geo. Bell, of the Imperial Civil Service. Mr. Lapsley has two sons and a daughter.

## Country Districts.

### South-Western.

The extensive South-Western district of the State may be said to commence as soon as we get outside the suburban radius, and to extend through Bunbury down to Bridgetown and Busselton. It forms the garden of Western Australia. Within its confines is the larger part of the heavily-timbered lands, and its soil is the best suited for mixed farming and for carrying on those dairying pursuits which ought in a very little while to be the means of promoting a good export trade in agricultural products. Intense culture ought there, if anywhere in Western Australia, to find a home. It used to be said that the eyes of this district had been picked out by the first settlers, but the extensive selection that has proceeded during recent years is proof to the contrary. Certainly large tracts of good land, of which little or no use is being made, still exist, but with the increase of population and the demand for suitable soil, there is every chance that these will soon be broken up and become the homes of successful farming communities.

Many of the advantages which the district enjoys

are due to the fact that in it are to be found the principal rivers and mountains of the State. From north to south, about 20 miles from the coast, runs the Darling Range, forming the watershed for the numerous rivers and streams which irrigate the country. The rains, too, are more abundant and frequent, the average annual rainfall varying from 30 to over 40 inches, and serving to keep the rivers in flow for the whole year round. The soil between the ranges and the sea is divided into limestone and clay land, the latter receiving its name from the fact that it possesses a clay sub-soil upon which the blackboy or grass tree flourishes abundantly. This is usually looked upon as an indication that the land will produce heavy marketable crops.

In dealing with this, as with other districts of the State, we propose to follow the main line of railway. In this case it is the most convenient, as the line cuts through the best of the land, and from it are to be seen vineyards, orchards, farms, and every evidence of a prosperous agricultural community.

#### ARMADALE AND DISTRICT.

From Gosnells to Armadale all along the line there lies a stretch of country which is rapidly coming under cultivation and gives every promise of being one of the orchard districts of the State. The township of Gosnells, built during the past ten years as the result of the subdivision and sale of a large area of land held since the early days by the family of Gosnell, the English perfume manufacturers, has become the home of many whose work lies in the city but who desire more space and freedom than city life affords. Situated about 12 miles from Perth, it already has a population of nearly 500 people, most of whom have established orchards, gardens, or poultry runs round their homes.

Much the same conditions are to be found at Kelmscott, some four miles further along the line. This township is, however, of much older growth, being surrounded by some of the locations selected by the early settlers in the infant days of the State. Like its neighbour Armadale—in fact, like most of the old-established towns in Western Australia—its progress only dates some twenty years back, to the time when the gold discoveries galvanized the whole State into action and gave it that impetus which led to it becoming one of the most progressive States of the Commonwealth.

Armadale, which is prettily situated at the foot of

the hills, was originally known as Narrogin, and is by many remembered chiefly as the place where Ye Olde Narrogin Inn—a comfortable wayside hostelry favoured by the week-ender and holiday-maker—was to be found. It has also the distinction of possessing one of the few perennial streams in the State—the Narrogin Brook. Its recent development dates from the early nineties, when Mr. M. E. Jull pioneered the settlement by establishing there an orchard and vineyard. These afterwards became the property of the late Sir Arthur Stepney, by whose executors the vineyard still is held. Amongst others who have established or procured orchards there may be mentioned Messrs. Thomas James, H. D. Cullen, and W. L. Owen. Some distance up the valley from the township lies the old "Paradise" Farm, which for very many years has been held by members of the Marsh family. Armadale has of late years increased in importance through being made the junction where the railway from Fremantle through the Jandakot agricultural area meets the south-western line. The eastern side of the area touches this line. It is estimated that the area contains something like 10,000 acres of first-class land, and instances are known where 20 acres are keeping eight or nine men in constant employment all the year round. By means of the railway

residents of the port of Fremantle have been brought within easy reach of Armadale, which has also become a favourite resort during the summer months for residents of the metropolitan district.

### MUNDIJONG, JARRAHDALÉ, AND ROCKINGHAM.

Proceeding along the line from Armadale, and now passing one or two stations that are little more than sidings, the traveller arrives at Mundijong, whence runs the line to the timber mills at Jarrahdale, and is the point where the old company line that conveyed timber from Jarrahdale to the port of Rockingham crosses the Government railway. Like Armadale, Mundijong is being developed as orchard country. Some few miles beyond it are the Whitby Falls, where an extension of the hospital for the insane was established some few years ago in order to give patients the benefits of an open country life.

The township of Jarrahdale—really a timber station—was established many years ago in the centre of a splendid jarrah forest some eight miles from Mundijong. Since that time it has passed through the vicissitudes that usually attend a timber centre. After the amalgamation of the timber companies its importance waned for a time, but recently it has come again into prominence as the head station for Millars' Company. New mills, of the latest design, have been erected, which give constant employment for about 500 men. Apart from the question of timber, however, the district has risen to some distinction as a fruit-growing country, and

several fine orchards are to be found in the vicinity. Being well up among the Darling Ranges, some 900 ft. above sea level, the climate in summer time is ideal, and the fact that the district forms one of the picturesque spots in Western Australia adds to its charm. Close at hand is the Serpentine River, whose falls have more than local appreciation, and in which good fishing, particularly perch and trout, may be secured. In the early days of the Jarrahdale Timber Company's existence, a railway for transport of timber was built from Jarrahdale through Mundijong to Rockingham for shipment.

As a glance at the map will show, Rockingham is admirable as a port of shipment. It lies in the hollow of a horseshoe formed by Cape Peron, and is protected on the west by Garden Island, the harbour thus formed being at once safe and commodious. Apart from being a port of shipment for timber, Rockingham is also a pleasure resort. Shelter sheds have been erected on the beach for the convenience of visitors, and regular excursions are held from Fremantle during the summer months, while yachtsmen use the port as their headquarters when sailing round the bay. The population is but small—about 150—made up principally of those engaged in the timber industry and in fishing.

### SERPENTINE TO PINJARRA.

After leaving Mundijong there is no centre of importance until Pinjarra is reached, though mention may be made of North Dandalup, where some excitement was aroused a few years ago by the rumoured discovery of gold. Beyond the merest appearance, however, of the colour nothing was secured, and the hopes of a payable goldfield within easy reach of the metropolis were shattered.

Pinjarra, one of the oldest towns in the State, is situated on the Murray River, about 54 miles from Perth, and is the centre of the Murray agricultural country, which covers an area of something like 60 miles square. The district is well watered by the river, and has much good land, capable of producing all kinds of cereals, vegetables, and temperate fruits. Most of the land in the immediate vicinity of the town is in occupation, but there is still ample area available further afield. Pinjarra itself is connected with the capital by rail, road, and telegraph, and is the centre where the local and licensing courts for the district are held. It has several public buildings, including two churches, courthouse, mechanics' institute, post office, hospital, and bank. By old settlers it is remembered as the place

where what is known as the "Battle of Pinjarra" was fought in the late thirties of last century. The pioneers of settlement suffered considerably from the depredations of the aborigines, particularly the Murray River tribe. So annoying did these depredations become that the Superintendent of Police, with the authority of the Governor, and, in fact, with Captain Stirling's assistance, set out with an armed party to vindicate the law. The natives were encountered on the banks of the Murray near Pinjarra, and the conflict resulted in the utter annihilation of the tribe as a warlike force. In addition to being one of the main towns on the south-western railway Pinjarra is the junction from which railways and roads branch out to other centres. A railway line has been constructed from there into the timber country to the east. So far the line has been opened to Holyoake, but an extension to Hotham, some miles further on, is at present being built. This line passes through the timber centres of Marrinup and Dwellingup (where the State timber mill is situated), and for some time to come will probably, in view of the trans-Australian railway requirements, be one of the busy timber lines of the State.

Westward from Pinjarra there is an excellent coach road leading through Ravenswood, a prettily-situated health resort on the Murray River, to Mandurah. This town is situated on the east side of the mouth of Peel Inlet, some 14 miles from Pinjarra, and is surrounded by a rich fruit-growing land, in which sub-tropical fruits may be grown with ease and brought to a state of perfection. The climate and soil are also well adapted to vine-growing, and no doubt as settlement proceeds the district will become one of the wine-making centres of the Commonwealth. The inlet abounds with fish, principally whiting, mullet, and bream, and establishments for preserving and canning have been in operation for some years. To the people of the metropolitan district, however, Mandurah is known as one of the finest health resorts in the State, and throughout the summer

it is thronged with visitors seeking a change from the oppressive conditions of the city and goldfields. Several country residences have been erected there, amongst them being one belonging to Sir Winthrop Hackett, proprietor of *The West Australian* newspaper. The town may be reached by sea from Fremantle, or by rail and road from Perth. Though possessing a permanent population of less than 250, it can boast of a school, post office, two hotels, and other public buildings. Peel Inlet, on the borders of which the town stands, is named after Thomas Peel, one of the pioneers of Western Australia, who was deeply interested in schemes of immigration on the land-grant principle. Though the schemes were not altogether a success, the whole district around Mandurah was received by him as a grant from the English Government in return for money spent in endeavouring to carry out his ideas.

VIEW AT SERPENTINE.

ALBERT CORNISH, member of the Armadale-Kelmscott Roads Board, is a son of Mr. Edward Cornish, of Taunton, Somersetshire, England, late of Hamilton, Victoria, where the gentleman under review was born on April 6, 1870. He pursued his scholastic studies in his native town, with a finishing course at the Victorian Technical School, and at the termination of his education served articles to the engineering trade, gaining special knowledge of machines used in the brickmaking industry. He was engaged in his father's place of business until 1892, when he came to Western Australia, and after taking control of various brickworks in this State he accepted the position of manager of the Armadale Steam Brick industry in 1902, and has continued in this connection ever since. The business was then on a small scale, the weekly pay-sheet totalling no more than £13, while at the present time over £100 is paid away in wages every week,

showing the rapid development of trade under Mr. Cornish's capable management. The average output

Bartletto,

MR. ALFRED CORNISH.

Perth.

of bricks amounts to 100,000 per week, but with the installation of a 104 brake horse-power Crossley gas-producer engine this average will be increased to 150,000 per week. Mr. Cornish has always taken a very active part in public affairs, and was first elected to a seat on the local Roads Board in 1905, since which period he has served continuously in this body. He proved a most useful member of the finance committee and gave considerable attention to the Armadale water scheme, in regard to which he was frequently consulted by the engineer in charge, who considered his opinion invaluable. He was a member of the Armadale Progress Association and occupied a seat on the town hall committee. He is a member and acting steward of the agricultural societies of Kelmscott and Bedford Dale. Mr. Cornish's principal hobby is rifle-shooting, and he is more than a fair marksman, possessing a number of trophies which he won on the

range both here and in Victoria. He was an active promoter and foundation-member of the Armadale Rifle Club, and has filled the office of captain of the club ever since its inception in 1905. In 1898 he married Annie, daughter of Mr. Andrew Davenport, of Kalgoorlie, and has three sons and a daughter.

**JAMES WILLIAM GIFFORD TURNER**, Secretary to the Armadale-Kelmscott Roads Board, is a son of Mr. Samuel Turner, J.P., orchardist, of Beenun, Western Australia. He was born at Ashmore, Dorsetshire, England, on April 25, 1874, and received his education at Wanston, in the neighbourhood of Winchester. Upon leaving school he became identified with the postal department of Micheldever Station, and at the end

*Bartletto,* *Perth.*  
MR. JAMES WILLIAM GIFFORD TURNER.

of six years resigned from the service upon his departure for Western Australia in 1895. Arriving with his father and the other members of the family he settled down to farming pursuits on 160 acres of property, which was selected by Mr. Turner, sen., at Beenun, and assisted in forming a vineyard, orchard, and dairying farm on this holding. After continuing in this way for some considerable time he received the appointment of collector to the Armadale-Kelmscott Roads Board, and in May, 1908, entered upon the secretarial duties in

connection with the same body, and has retained this position ever since. During recent years rapid strides have been made in the improvement of the roads in this district under the jurisdiction of the Board. Mr. Turner also occupied the post of secretary and engineer to the Armadale Water Board, and is secretary to the local board of health, secretary to the Armadale Mechanics' Institute, and fills the same office in the local rifle club. Of the latter sport he is very fond, and what little leisure he has is spent on the rifle range or in his garden, where he cultivates many favourite blooms. Mr. Turner married in 1909 Ada Maud, daughter of Mr. Thomas Buckingham, of Kelmscott.

**JAMES KING**, orchardist, of "Valencia," Mundijong, was born at Barrhead, Scotland, on November 11, 1851. He is a son of the late Mr. James King, of Paisley, who came to Melbourne, Victoria, in 1853, and was one of the early pioneers of the country round Ballarat, in which district the gentleman under review received his education. For about seventeen years he was engaged in the grain trade in Victoria, his connection with which finally eventuated in the formation of the well-known firm of King, Jackson, & Co., of Flinders Street, Melbourne, flour and grain merchants, by whom a large business was carried on. In March, 1892, Mr. King left for Western Australia in the "Industry," bringing with him an extensive cargo of produce—the largest ever brought into this State by one vessel. Upon arrival he opened the Eureka Milling Company's business at Fremantle in conjunction with Messrs. Frank Wilson, Frank Cadd, and the late Thomas Thorne, and at a later date was identified with the flour and grain trade in the metropolis. In 1906 he established, in partnership with Mr. Joseph Ashton, the Beeda Flour Mills at Beverley, which ultimately he carried on, on his own account, until December, 1910, when the mill was destroyed by fire. Prior to this date Mr. King had acquired his present orchard property situated at Mundijong, and after the occurrence of the fire decided to devote himself to the cultivation of oranges on this holding, which is located about one

and a half miles from the station, on the Perth-Bunbury Road, 29 miles distant from Perth. The 140 acres of land are practically all cleared, and 40 acres have been planted with orange and lemon trees, besides which there are about 14 acres of mixed fruits. The healthy appearance of the trees and the fine specimens of apples and oranges which are produced are an eloquent testimony to the care and skilled attention which have been given to bring them to their present state of perfection.

*Greenham & Evans,* *Perth.*  
MR. JAMES KING.

The citrus varieties thrive best on the alluvial flats, and on other parts of the estate the soil being mixed with ironstone gives good results for cropping, and about 50 acres are under cultivation. The Mardella Brook, flowing right through the property, even in the dry summer months yields sufficient water to allow of irrigation as required; and close by are the Serpentine Falls, which are destined by the roads board in the near future to serve for the irrigation of the whole district. Mr. King has always displayed an interest in public affairs, and in former days, when resident at Claremont, became the first mayor of that suburb upon its formation into a municipality. Upon one occasion he aspired to political honours, contesting the seat for North Fremantle, but without success. He is a Justice of the Peace for the Perth magisterial district, and since coming to Mundijong has been appointed chairman of the local Roads Board.

He married Elizabeth, daughter of Mr. William Pratt, of Victoria, and has five sons and four daughters. Two of his sons, Messrs. James and Eric King, are associated with their father in the working of the orchard.

**FRANK JOHN BUTCHER**, storekeeper, Mundijong, was born at Mardella, Western Australia, on May 22, 1886, and is a son of Mr. Hugh John Butcher, of Armadale, an early settler in this State. At the close of his education he was associated with agricultural pursuits on his father's farm at Mardella, where he continued for a number of years. Subsequently Mr. Butcher turned his attention to storekeeping occupations, and purchased the business carried on by Mr. Cochrane at Mundijong, which he has conducted ever since with good results. Besides the ordinary stock-in-trade of a general store he makes a speciality of farmers' requirements and the varied assortment of goods in demand at an agricultural centre, and acts as agent for Messrs. Harris, Scarfe, & Co. and for the Queensland Insurance Company. In conjunction with this concern he owns a property of 180 acres freehold, in addition to 400 acres leasehold, and is developing a farm and orchard, where citrous fruits are cultivated with considerable success. The leasehold property is chiefly used as a grazing farm, and sheep of the Leicester strain have been found well suited to the climate and locality. Mr. Butcher was elected a member of the Serpentine Roads Board in 1910, and has retained this seat ever since. He is a committeeman of the local race club, and in general athletics has won distinction, holding numerous prizes for running. He is married and has two daughters.

**JOHN ADAMS**, Chairman of the Serpentine Roads Board (1911-12), is a son of the late Mr. John Adams, of Cornwall, England, where he was born on December 18, 1842. At the age of six years he was brought to South Australia by his father, who followed the building trade, and at the conclusion of his son's education initiated him into the same calling. Mr. John Adams subsequently started in business on his own account at Kapunda, in the same State, where he continued until 1873,

when he proceeded to Port Darwin. Returning to South Australia he once more settled at Kapunda, but at a later date turned his attention to farming at Appila, and for a number of years was identified with this district. In 1895 he left the Central State for Western Australia, and upon arrival became engaged in the building trade at Fremantle for a time. In the following year he took up his present holding at Mundijong, and eventually entered upon the personal development of the property, which consists of 160 acres, an area of 50 acres being cleared and cultivated. Dairy-farming constitutes the chief department of industry on the farm, butter being manufactured and a large supply of milk sent daily to the Perth market. Mr. Adams has found the shorthorn type of cattle best suited to his purposes, the yield of milk being good and the

Bartletto,

Perth.

MR. JOHN ADAMS.

quality of the butter satisfactory. He takes an active interest in the progress of the district, and as far back as 1901 was appointed a member of the local roads board, of which body he was twice elected chairman. He was secretary of the first agricultural society formed in the district, and is an active worker in the Methodist Church. In 1865 Mr. Adams married a daughter of Mr. James Copley, of York, South Australia, the issue being seven children, of whom two sons and three daughters still survive. Mrs. Adams died in 1898.

**JOHN ADAMSON**, Secretary of the Serpentine and Jarrahdale Roads Board, Mundijong, is a son of the late Dr. Alexander Rattray Adamson, of Cirencester, Gloucestershire, England, in which county he was born in 1864. He received his education at the Royal High School, Edinburgh, and upon its conclusion was apprenticed to seafaring pursuits in the barque "Mercia," owned by a private company in Scarborough. After five years in this service, during which he visited most of the ports of the civilized world, he left the boat at Port Augusta, South Australia, and prepared to settle on *terra firma*. For a number of years he was identified with the smelting and refining works at Broken Hill and Port Pirie, and in 1895 left the Eastern States for Western Australia. Upon arrival he came to the south-western district and turned his attention to agriculture, taking up 160 acres of land, which he subsequently sold in 1903. Conjointly with this venture he combined the management of a general store at Mundijong, disposing of this in 1910, after carrying it on successfully for about ten years. At the present time he finds scope for his energies in the development of about 70 acres of land situated near the railway station, and has planted an orange grove eight acres in extent. The homestead stands on the cleared area, and about half the holding is now undergoing rapid improvement, while the remainder is partially cleared. Mr. Adamson has always commanded the respect of his fellow-settlers for the intelligent interest he takes in the affairs concerning the community at large, and in 1900, when the Serpentine Roads Board was first formed, he was elected secretary, which position he still holds. At a later date the Jarrahdale Board was separated from the parent body and made a separate board, and since 1909 Mr. Adamson has held the joint secretarial office. He has also acted as secretary of the agricultural society for many years, and since 1911 has held a Commission of Justice of the Peace for the Murray district. He is a Freemason and has taken honours in the craft, and was secretary of the local race club. Mr. Adamson married Rose Ada, eldest daughter of the late Mr. Thomas Cross, coachbuilder, of Spalding, England, and has two sons and two daughters.

JOHN HAROLD MAXWELL LAW, farmer and grazier, "Karnup," Keysbrook, is a son of Mr. John F. Law, of Claremont, formerly manager of the Western Australian Bank,

*Bartletto, Perth.*  
MR. JOHN HAROLD MAXWELL LAW.

and was born at Sale, Victoria, in 1876. As a child he came to Western Australia with his parents and received his scholastic training at the Perth High School. Upon leaving that institution he became connected with the Government Service

*Photo by Deane Studio.*  
BORDER-LEICESTER RAM, "KARNUP KING" (18 MONTHS).

in the Paymaster's Office of the Railways Department, and continued here until 1906, when he purchased his present property at Keysbrook.

This was then virgin country, and since that period the axe has busily been plied in ringbarking the trees, the scrub and dry timber have been consumed by fire, and 100 acres have already been cleared and brought under cultivation. The remaining 500 acres are used as grazing pastures for the stock, pastoral operations absorbing the greater part of Mr. Law's time and attention. He has a fine flock of Border Leicesters, pre-eminent among which is the handsome ram "Karnup King," which gained the high honour of the championship in his class at the Royal, Bunbury, and Pinjarra shows, while a ewe of the same strain was awarded a similar distinction in Perth and Pinjarra. Recently Mr. Law has been importing Leicester ewes from Mr. Sutherland's well-known "Lara Estate" in Victoria, and is now breeding from this stock, the high-class pedigree of which should commend it most favourably to all purchasers in the Western Australian State. Mr. Law is a foundation member and first secretary of the Serpentine Progress Association. He is a keen athlete, and held the 100 yards running championship of Western Australia for three years in succession. He represented this State at the sports held in Sydney in connection with the opening of the Commonwealth in 1901, and holds

many trophies in the field of sport, at one time acting as secretary of the Perth Lacrosse Club and of the Western Australian Amateur Sports

Club. Mr. Law married Dora, daughter of the late Colonel Skinner, of the Imperial Army.

CORNISH HAMILTON DUNLOP, farmer and grazier, "Brocklehurst," North Dandalup, is a son of the late Mr. D. H. Dunlop, of New South Wales, and was born at Wellington, in that State, on October 19, 1868. For a number of years Mr. Dunlop was associated with pastoral pursuits in the Mother State and in Queensland, where he owned the cattle run, "Austral Downs," which he sold in 1886. In 1893 he arrived in Western Australia and proceeded to the Gascoyne to undertake the management for the West Australian Mortgage and Agency Corporation,

*Bartletto, Perth.*  
MR. CORNISH HAMILTON DUNLOP.

Limited, of their "Menginew," "Weonamia," and "Mount Augustus" stations, holding this position for seven years, at the end of which period the properties were sold. Mr. Dunlop then took over the lease of the Carnarvon and Port Hedland jetties, which he held for a year, and then purchased a half-interest in the business of Messrs. Baston & Co., general merchants, of Carnarvon. Conjointly with this he took a contract for the carriage of the mails between Carnarvon and Yanyareddy, and held these contracts for about seven years. At the end of this period he sold his interests in the storekeeping business, and in 1905 came to Pinjarra, in which district he purchased his present property.

This is situated close to the railway, and embraces 400 acres, 40 of which have been cleared and cultivated. The class of soil is well suited to the purposes Mr. Dunlop had in view, the river flats, well covered with chocolate loam, having proved excellent for the cultivation of potatoes and other root crops, while with irrigation fine crops of lucerne can be grown. Other departments of his industry consist of fruit-growing, poultry-raising, and the breeding of a few draught mares, while his flock has proved a payable proposition, consisting of Border Leicesters crossed with merinoes. Mr. Dunlop has held a Commission of Justice of the Peace for New South Wales for over twenty-five years, and was gazetted for the Murray magisterial district in the year 1911, in which year also he was returned as a member of the Murray Roads Board. He is a member of the Murray Agricultural Society, and has occupied the position of chairman of the hall committee at North Dandalup. He married Elizabeth, daughter of Mr. A. Bastian, of South Australia.

CHARLES LOVEGROVE, M.D., and C.M. (University of Trinity College, Toronto), L.R.C.P. (Edinburgh), L.F.P.S.G. and L.M. (Glasgow), was born at Horsham, Sussex, England, on May 29, 1844, and is the fifth son of the late Dr. Joseph Lovegrove, of the same place. He pursued his scholastic studies at Aldborough Grammar School, Suffolk,

and the University of Durham, subsequently beginning his medical course at the Liverpool School of Medicine, where he gained honours as prizeman in medical jurisprudence and toxicology. He graduated at Edinburgh in 1881, and after acting as ship's surgeon for a time was appointed surgeon to the Liverpool Corporation at its new waterworks in North Wales, where he remained for nearly eight years, until their completion. At a later date he held

DR. CHARLES LOVEGROVE.

the position of surgeon on the Manchester ship canal until the death of the contractor necessitated the reconstruction of the works. Dr. Lovegrove then engaged in practice at

Liverpool, but ultimately was ordered to a warmer climate on account of the health of his family, and in 1889 came to Western Australia. After practising at Fremantle for some time he proceeded to Carnarvon to fill the appointment of district medical officer, and in 1891 transferred to Bunbury, where he was stationed for about twelve months, filling the dual positions of medical officer, Bunbury, and magistrate of Bridgetown. In the following year he was transferred to Pinjarra as medical officer and magistrate, which appointment he held for twenty-one years. Shortly after his arrival a cottage hospital was opened there, but in time the accommodation thus provided proved inadequate, and larger premises were acquired. Dr. Lovegrove holds a Commission of Justice of the Peace for the whole State, and has taken an active part in the progress of the district. While at Bunbury in 1891 he was gazetted to a captaincy in the Defence Forces, having previously served in the South Notts Yeomanry Cavalry; and at a subsequent date he filled the position of medical examiner to the troops prior to their departure for the scene of the South African war. Dr. Lovegrove married Kate, fifth daughter of Mr. George Snodin, of Nottingham, by whom he has issue three sons and a daughter. After the demise of this lady he became united to Mary, widow of the late Dr. Harvard Brown, of Melbourne, sometime resident magistrate and district medical officer of Derby.

## HARVEY.

Leaving Pinjarra on the way to Bunbury, the train passes through several centres that are worthy of passing mention.

Coolup is the centre of a large agricultural area, which during recent years has been greatly developed by new settlers.

At Hamel a State farm was established for experimental purposes in 1898, but the work has recently been discontinued owing to the development of the Brunswick farm, a little further down the line. Many of the plots have been sold, but several have been reserved for the extension of the State nursery, where young trees are cultivated for the purpose of ornamenting the grounds surrounding various public buildings in the city and elsewhere.

Yalup Brook is mainly devoted to sheep-farming, while Waroona and Yarloop are active timber centres.

In both places as the timber is cut out the land is being taken up for agricultural purposes, and though the timber industry has many years of life before it, these, like other places along the south-western line, will in time become agricultural towns.

Harvey may be regarded as one of the gardens of the West. The district contains some 43,000 acres of first-class land, consisting of rich alluvial soil, producing heavy crops of grain and eminently suitable for fruit-growing. Here, if anywhere, there are ample opportunities for intense cultivation, and when the drainage and irrigation works which have been started by the Government are completed, the whole area ought to be second to none in the State in possibilities of development. Within the Harvey area is the "Harvey" Estate, formerly the property of Dr. H. F. Harvey, which was split up into large allotments and sold some years ago.

The land here is excellently adapted for citrous fruits, and the annual show testifies year by year to the marked progress being made. In addition to Dr. Harvey, several well-known metropolitan residents—Dr. D. E. Williams, Mr. B. H. Woodward, Mr. F. C. Faulkner, and others—have taken up blocks, upon all of which orange-trees have been planted and in many cases are now reaching maturity. The township itself is within the borders of the estate, a further portion of which is known as the

Korijekup Settlement. Though of comparatively recent establishment the progress made throughout the "Harvey" Estate is much in advance of many of the older settlements, in a large measure due, no doubt, to the fact that the owners of the various blocks are men who have made their mark in other walks of life, and have brought to the task of cultivating the land under their care sound judgment and discrimination.

JOHN MCKAY, farmer and grazier, "Glenisla," near Coolup, in the Murray district, is a son of the late Daniel McKay, of Scotland, a veteran of the Crimean War, where he served with the 93rd Regiment of the Argyle and Sutherland Highlanders. Born at Glasgow in 1852, the subject of this memoir when eleven years of age was brought to Australia by his mother, and was first associated with farming pursuits in the south-west district, coming to the Murray in 1865. Here he became connected with Mr. Jno. Gray Murray, resident magistrate for Murray, with whom he remained

district. It lies about six miles from Coolup Railway Station, and is well watered with running brooks, while the soil consists, apart from the hilly country, of rich chocolate loam on the flats, and has proved highly suitable for orchard operations. A considerable area is devoted to purposes of horticulture, the apple orchard alone covering 25 acres, where many varieties are grown for export, including Clios, Jonathans, Dunn's Seedlings, and Rome Beauties. Oranges, pears, and peaches are also successfully cultivated. Sheep are bred on the property, a cross between Leicesters and Romneys having been found a very marketable product, and to this department Mr. McKay gives a good deal of his time and attention. He has taken a very active part in local affairs, and for fifteen years has served as a member of the Murray Roads Board, at the present time occupying the chair. During an almost equally long period he has been a member of the school board, and he is connected with the Murray Agricultural Society, at the annual shows of which organization he is a successful exhibitor. In Freemasonry he has taken honours as Past Master of the Murray Lodge. Mr. McKay married Mary Jane, daughter of Mr. Alexander Campbell Thomson, of the Royal Engineers, and has three sons and seven daughters.

Eventually Mr. Fouracre turned his attention to the butchering business, and was responsible for the opening of a number of butcher's shops in the Murray-Wellington districts, where he was represented at Bunbury, Waroona, and Collie. In 1898 he entered into partnership with Mr. Wass in the establishment of the

*Bartlett,* *Perth.*  
MR. JOHN MCKAY.

until he reached his thirtieth year, and during this period he took up a holding comprising 100 acres of land, upon which his present homestead now stands. From time to time Mr. McKay added to this property, and has enlarged it to the extent of 1,200 acres, and, situated in the midst of beautiful natural scenery, with hills on either side, forming ideal grazing pastures, "Glenisla" is one of the most picturesque places in the

ROBERT FOURACRE, farmer and grazier, Chairman of the Drakesbrook Roads Board, Waroona, is a son of the late John Fouracre, of Somersetshire, England, who came to this State about the year 1851, and subsequently settled in the south-western district. The subject of this review was born near Perth on February 11, 1853, and at the close of his education at an early age began his initiation into farming methods under the guidance of his father on the home property, where he continued for quite a number of years.

*W. J. Ford,* *Bunbury.*  
MR. ROBERT FOURACRE.

present well-known business of Fouracre & Wass, with branches at Bunbury, Collie, and Busselton. In 1907, upon the demise of his father, Mr. Fouracre came to Waroona to take over the property formerly owned by the late gentleman, and has since devoted his energies to its further development. The estate consists of 2,640 acres, of which an area of 500 acres has been brought under cultivation, but the chief department of the industry lies in its pastoral operations, horses and cattle being bred and sheep fattened for the butchering business. The nature of the country is well suited to mixed farming purposes, the tracts of sandy and clay soil being varied by long flat stretches of arable land which, with an efficient irrigation scheme, should

afford ample scope for experiments in intense culture. In addition to this property Mr. Fouracre also owns about 3,000 acres of land bordering the coast, which he uses for grazing purposes. He is a member of the Royal, the Murray, and the Wellington agricultural societies, and in connection with the annual shows held by these organizations the firm of Fouracre & Wass has been eminently successful in its exhibits of fat stock, winning awards for sheep, cattle, and pigs. In 1904 Mr. Fouracre's long and worthy connection with local public affairs led to his election as a member of the Drakesbrook Roads Board, of which he is now chairman, a distinction conferred upon him for the fourth time. In 1908 he received his Commission of the Peace for the Murray magisterial district.

**JAMES HAIR**, auctioneer, valuator, and land agent, Waroona, is a son of Mr. Robert Hair, of Scotland, and, later, of Victoria, in which State the gentleman under

*Bartolotto, Perth.*  
MR. JAMES HAIR.

review was born in 1864. He received his education at his birthplace in Gippsland, and upon leaving school was engaged in farming occupations on his father's property. Subsequently he secured a holding, which he worked on his own account until 1894, when he left Victoria for Western Australia. Proceeding to Kalgoorlie Mr. Hair opened as an auctioneer and sharebroker on the

goldfields, where he stayed for eight years, but relinquished this line of business in 1902 in favour of his former calling. He carried on the development of a small farm at Hamel for about three years, when he again turned his attention to auctioneering, establishing in 1905 his present connection at Waroona. His business has steadily increased, its operations including a large land, estate, and hotel agency, while his monthly sales at Yarloop, Waroona, and Pinjarra, of sheep, cattle, horses, and other stock, are a feature of the commercial life of the district. He also acts as local representative on behalf of the South British Insurance Company and the Colonial Mutual Life Insurance Company. Mr. Hair has exerted himself in the interests of the community in which he resides, is president of the local library, a member of the Murray Agricultural Society, and in 1911 received election to a seat on the Drakesbrook Roads Board, which he still retains. His spare time is given up to the cultivation of his property at Hamel and to the development of a second holding of 160 acres, situated about four miles from Waroona, where the black loamy soil has proved very suitable for the growing of potatoes. Mr. Hair married Alice, daughter of Mr. Charles Wood, of Devon, Gippsland, and has four sons and two daughters.

**CHARLES McCAY**, storekeeper and farmer, Waroona, was born on April 3, 1864, and is a son of Mr. Samuel McCay, of County Tyrone, Ireland. Upon leaving school he went to Liverpool, where he was associated with storekeeping pursuits for about five years, at the end of which period he came to Australia and spent ten years in the same line of business in and around Melbourne, Victoria. In 1896 Mr. McCay came to Western Australia, and having purchased teams started a carrying business at Fremantle. Two years later he joined the Gill, McDowall Jarrah Company, and opened a general store for that company at Waroona, with which he was connected for five years. The combination of the timber companies brought him into the service of Millars' Karri and Jarrah Company, and he continued with this firm in the capacity of storekeeper at the Waroona, Yarloop, Worsley, and Waterloo mills

for two years. During this period he acquired a holding in the district, situated in the vicinity of Waroona, and has since added to the property, which now comprises 1,500 acres of land. He uses it mainly for sheep-raising purposes, the Shropshire type prevailing, and has about 250 acres cleared and cultivated, whilst the remainder has been ringbarked and is in process of further improvement.

MR. CHARLES McCAY.

After carrying on a butchering and bakery business at Waroona for about five years, in 1911 Mr. McCay opened in the general storekeeping line for the supply of workers in the agricultural centre, and still conducts this business. He has always taken keen interest in the advancement of the district, and in 1905 was elected a member of the local roads board, which seat he has retained ever since. He is a member of the Murray Agricultural Society, and acts as secretary to the local progress association. He married Jane, daughter of Mr. G. Kerbins, of Melbourne, and has a daughter.

**ANDREW HARRIOTT HENNING**, farmer and orchardist, Yalup Brook, is a native of South Australia, having been born at Adelaide in May, 1863, and is a son of Mr. Rudolf Henning, of that city. He was a student at the University of Adelaide, in connection with which institution he took his degree of LL.B., having previously served his articles to the legal profession. He

came to Western Australia in 1894, and upon his admission to the Bar in this State practised on the goldfields and in Perth for a number of years. In 1905 he purchased his present property at Yalup Brook, and commenced its development as a pastoral and fruit-growing proposition, five years later retiring from the practice of his profession and taking over the personal management of the estate. Mr. Henning has been successful in establishing a Shropshire stud, and is the largest exhibitor of this class of stock in the State, having been awarded first and championships for both rams and ewes at the Royal Agricultural Society's Show and at Bunbury and other local shows.

**SAMPSON MOORE, M.B., Ch.B.** (Liverpool, Eng.), is a son of the late Mr. Thos. Moore, of Flowerfield, County Derry, Ireland, and was born at Liverpool on March 14, 1875. He received his education at University College, Liverpool, matriculating at the University of Liverpool, where he pursued his medical studies and took his diploma of M.B. in the year 1898. Dr. Moore spent four years as house surgeon at the Royal Infirmary, Liverpool, under the late Sir William Mitchell Banks, afterwards filling the post of resident surgeon in the gynæcological wards of the same institution. He was house physician in the Northern Hospital, Liverpool, and subsequently acted as temporary resident medical officer of the fever hospitals of that city. In 1902 he left the Old Country for Western Australia by appointment to relieve Dr. Lovegrove, at Yarloop, and since that period has continued in the practice of his profession there and at Jarrahdale. In 1910 he was absent on an eight months' trip to England, and upon a subsequent occasion visited New Zealand, where he remained for nearly six months. Dr. Moore is medical officer for Yarloop, and in the discharge of his duties supervises the health of fifteen schools in his district. He is officer to the Harvey Health Board and Commonwealth Medical Officer for Area 86b. He is a member of the British Medical Association. Cricket and tennis are his favourite recreations. He married Winifred, daughter of the Rev. A. P. Bellamy, of Magdalen Laver Rectory, England, and has two daughters.

BB

**REYNOLDS DRIVER, J.P.,** Manager of Millars' Timber and Trading Company, Limited, Yarloop, and Chairman of the Harvey Roads Board, is a son of the late Henry Driver, of Delaware, United States of America, an early pioneer of New Zealand. He was born at Dunedin on February 14, 1868, and received his education at Christchurch, New Zealand, subsequently joining the service of the Bank of New South Wales in the Dominion. He relinquished this connection after three years in order to enter upon stock and station agency business, in which he continued until 1891. Upon the demise of his father in that year Mr. Driver was appointed United States Consul for South Island, and also for the Hawaiian Islands, which positions he occupied until his departure for Western Australia in 1895. After arrival in this State he was associated with the firm of Messrs. Baxter & Prine, contractors, for a short period, becoming connected with Messrs. C. & E. Millar at the very inception of their great enterprise, when they first commenced the development of the timber trade in Western Australia. For 13 years past he has occupied the post of manager of the largest timber station in Australasia, *viz.*, that at Yarloop, the average output being 200 tons per day, and, in addition to the duties of this position, supervises on his own account the working of a farming property of 1,150 acres which he recently purchased. This holding is situated in the vicinity of the township, and has a cleared area of about 650 acres, which is devoted chiefly to the growing of hay and other crops. Sheep-raising is carried on, merino and crossbreds being the types favoured; and Mr. Driver has attained good results in the breeding of hacks and buggy horses, having received first awards for gentleman's and lady's hacks at the Royal and Bunbury shows. He has taken an active part in the public life of the district, and acts as Justice of the Peace for the Wellington and Murray districts. He is a member of the health and drainage boards, and during the six or seven years of membership has occupied the office of chairman of the Harvey Roads Board. Mr. Driver is a member of the Perth Club. He married Fanny, daughter of the late Captain Pilmer, of New Zealand, and has two sons and one daughter.

**HUGH McNEILL,** proprietor of Yarloop Hotel and general store, is a son of Mr. Neal McNeill, of the North of Ireland, and was born in Belfast on October 1, 1870. At the close of his education he left that city for Australia, and arrived early in 1888 at Melbourne, where he followed his profession as mechanical draughtsman for some eight years. In 1896 he came to the Western State and filled a position in the Public Works Department at Perth for two years. In 1898 he turned his attention to farming and hotel-keeping, obtaining a licence for an hotel on his farm at Waroona. The business prospering, eventually he purchased the freeholds of the other two hotels in this town, and about the year 1907 procured a transfer of his hotel licence to Yarloop, where he has since personally conducted the Yarloop Hotel in conjunction with the adjacent general store. He is also proprietor of several other stores, among which the latter is the chief distributing centre, the principal branch business being in operation at Dwellingup.

Bartletto,

Perth.

MR. HUGH McNEILL.

The hotel at Yarloop is a large two-storied brick building containing dining-room, drawing-room, commercial-room and lounge, in addition to 16 bedrooms. It is situated about five minutes' walk from the railway station, and is well provided with stabling and motor accommodation, while a fine cricket and football ground adjoins the hotel, Mr. McNeill being a genial patron of all athletic sports. The present

State-owned hotel at Dwellingup was built by Mr. McNeill and sold by him to the Government in 1911. He takes a keen interest in the progress of the district, and on two occasions was a candidate for Parliamentary honours in the Wellington district. He is connected with all the local sporting clubs, and

The significance of this report was enhanced by observation of a few orange-trees planted in a small orchard surrounding the original homestead, which after forty years continued in full bearing without any signs of decay. Climate, soil, and locality all appearing favourable, the proprietors chose 2,700 acres in

medical diplomas. About thirty-three years ago he came to Australia and entered upon professional practice in the Central State, several years later becoming associated with Dr. Harvey, of Perth, in the proprietorship of the "Harvey" Estate. His son, Mr. Roy Hayward, to whom the management of the "River-ton" Estate has been entrusted, is a native of South Australia, where he was born on September 3, 1883. He pursued his scholastic studies at St. Peter's College, in Adelaide, and subsequently passed through the prescribed course at the Roseworthy Agricultural College under Professor Lowrie. Upon the completion of his training at this well-known institution he came to Western Australia in 1903 to take

MR. HUGH McNEILL'S HOTEL, YARLOOP.

finds his chief recreation on his farm and in motoring to and from his different branches.

**RIVERTON ORCHARD,** Harvey, the property of Dr. W. T. Hayward, of Adelaide, comprises part of the original "Harvey" Estate. It was one of the first areas to be selected for orchard purposes, and consists of 335 acres, finely situated on the Harvey River and adjoining the railway line, with the railway station not far distant. It forms a unit in the "Harvey" Citrus Colony established by the above-mentioned gentleman in conjunction with Dr. Harvey, of Perth, in 1896, and has fifty acres planted with citrus fruit-trees, most of which are in full bearing. The "Harvey" Citrus Colony, it may be interesting to state, was formed as a result of a thorough examination of the land in 1894 and a further one in the following year by Mr. A. Depeisses, then horticulturist and viticulturist to the Department of Agriculture, who estimated that 10,000 of the 13,000 acres composing the estate were especially suited to the cultivation of citrus fruits.

the centre of the estate and had them surveyed into ten-acre blocks, which were offered for selection on liberal terms. Of these only forty blocks still remain open for selection, a fact which testifies to the ready support given to the enterprise by settlers wishing to invest their capital where the most satisfactory returns seemed likely to accrue. Dr. Hayward signified his own firm belief in the possibilities of the industry by taking up an area for cultivation on his own account, and has since vigorously proceeded with its development, with very promising prospects. His selection has the advantage of forty chains of river frontage, and the soil is composed of a heavy, rich, chocolate loam, which goes down to the great depth of 17 ft. Besides the fifty-acre orangery already referred to, where the chief product is navel oranges, he has about ten acres planted with apple-trees, while a few acres are cropped for farm purposes, and potatoes are successfully grown for the use of the homestead. Dr. Hayward, who is the president of the Medical Association of South Australia, was born at Reading, England, and studied at Glasgow University, where he obtained his

DR. W. T. HAYWARD.

up duties in connection with the thriving fruit settlement, generally known as the "Harvey" Citrus Colony. Dr. Hayward is president of the Harvey Citrus Society, having been elected to that office in November, 1911.

**WILLIAM EDWARD ASH,** agriculturist, "Ontario," Harvey, was born in the Niagara district of Canada, and is an associate of Ontario Agricultural College, the diploma of which institution he obtained in 1880. While a student under Professor Brown, P.L.S., he conducted many experiments, the first being with "sorghum saccharinum," "alfalfa" (or lucerne), and sugar-beets

under sewage irrigation at the Ontario Agricultural College, and which were valuable examples to the farmers of Canada. Coming to Australia in 1881 he spent several years among the farms, orchards, and stock runs of the Central State, and upon the suspension of the Principal of Roseworthy Agricultural College in February, 1887, was temporarily appointed teacher of agriculture and farm superintendent. Upon the arrival of Professor Lowrie in December of the same year his services were retained until a reconstruction of the staff in 1889, when he left to take up a small orchard and dairy near Adelaide. Hearing of better prospects in Western Australia, Mr. Ash sold out and in 1891 was engaged by the West Australian Land Company to organize and manage its proposed training farm on the great southern railway, near Broome Hill. While holding this position he designed and planted its orchard at Katanning, one of the first in the State where modern methods of orchard culture were introduced. While on duty at Beverley in April, 1892, he discovered the valuable lady-bird (identified by Mr. Oliffe, of New South Wales, as *Oreus australis*) busily eating the native scale on the jam trees, and foresaw its present value in connection with the cultivated orchards. After the company abandoned the training farm owing to adverse conditions cropping up on the great southern railway Mr. Ash was engaged in inspecting and reporting on farming propositions, and subsequently accepted the appointment of manager of the "Harvey" Estate, which he held for nearly eight years. Here he introduced the modern methods of fruit culture and planting which have proved so successful throughout the district. In 1895 he took up a portion of his present holding, comprising seventy-nine acres, with thirty chains frontage to the Harvey River, and about seven years later, upon severing his connection with Drs. Harvey and Hayward, personally proceeded with its development. The soil is choice, being alluvial deposit of varying chocolate loam of good depth, admirably suited to fruit-growing. Oranges, lemons, and apples thrive well, and pears and apricots come near to perfection in the eighteen-acre orchard. Four varieties of prunes have been tested and proved that another industry has bright prospects at Harvey. The

BB2

English walnuts are fine examples of thrift and adaptability. Mr. Ash, being a pioneer, has had to experiment with many varieties, most of which, though making vigorous growth, have had to be discarded owing to inferiority of fruiting. An irrigation scheme is being laid down for the orchard, and with little additional expense the whole farm will be irrigated in the near future. In the breeding of Dexter-Kerry cattle from imported stock Mr. Ash has been successful, his exhibits at the Royal and Bunbury shows receiving first-class honours from the judges upon every occasion. This is only natural, as he possesses the highest credentials as a judge of pedigree live stock, and is regarded as one of the progressive men of the State. In 1892 Mr. Ash founded the Albany

W. J. Ford, Bunbury.  
MR. WILLIAM EDWARD ASH.

Agricultural Alliance, and he was the moving spirit in 1902 in organizing the Korijekup Literary Institute and its library, of which he has occupied the position of president up to the present time. In 1886 he married Emelie Julie, daughter of the late Mr. F. W. Geisler, of Norwood.

WALTER ERNEST HARPER, orchardist, "Yaralla," Harvey, is a son of the late Mr. Charles Harper, of Toppesfield Hall, Suffolk, and was born on February 21, 1865. He received his education at the Dedham and Brentwood grammar schools in Essex, and first entered mercantile life as a member of the

staff of the Bank of Australasia in London, where he continued for five years. He then came to Victoria and spent a further five years in the service of the same institution there and in New South Wales. In 1897 he resigned his position, and sailing for Western Australia became connected with the firm of A. Matheson & Co., of Perth, with whom he remained for five years, subsequently for a similar period filling the appointment of manager and chief accountant with Mr. A. E. Morgans, of Perth. In 1906 Mr. Harper established himself on his own account as auditor and accountant, and carried on for two years, at the end of which period he purchased the property where he now resides and started orchard operations. The place comprises eighteen acres, fifteen of which have already been utilized for the industry, 700 citrus-trees and 600 apples and stone fruits being planted and in a thriving condition. The soil is partly alluvial and partly of rich chocolate loam, and the vicinity of the Harvey River has favoured the laying down of an efficient irrigation scheme, the plant comprising a 6½ horse-power Tangye oil-engine, with 5-in. suction pump and delivery. Mr. Harper is a member of the committee of the citrus society and a successful exhibitor of orchard products, gaining in 1911 three first prizes, two seconds, and one third. He married Rose, daughter of Mr. Charles Dight, of Albury, a member of one of the oldest families in New South Wales, and after whom the falls at Studley Park, Melbourne, were named.

OSCAR CHRISTIAN JACOB RATH, orchardist, "Rathalia," Harvey, is a son of the late Mr. Claus Rath, of Germany, in which country the gentleman under review was born on February 1, 1865. After making some study of horticulture in his native land, as well as in England, he left for Victoria in 1883, and spent two years at Mildura, the fruit-growing settlement on the River Murray. Coming to Western Australia at the end of that time, upon arrival he proceeded to Katanning as manager on behalf of Mr. F. Piesse, and in 1896 purchased his present holding. The locality is very favourable for horticultural purposes, and Mr. Rath has utilized to the full the various advantages

presented by its situation on the banks of the Harvey River. He has put down an irrigation plant consisting of a 12 horse-power Tangye oil-engine, with 10-in. suction-pump and 8-in. delivery main, capable of throwing up 1,000 gallons per minute. This splendid irrigation scheme, in conjunction with the rich, deep chocolate soil, provides ideal conditions for the culture of oranges, lemons, apples, and varieties of stone fruits, which come to perfection in the succeeding seasons of the year. Already a large exporter of apples to London, Mr. Rath intends in the near future to open up the German markets for this class of products from Western Australia. The 69 acres composing the property are all practically cleared and 30 acres have been planted, while about two and a half acres of the graded land are devoted to lucerne-growing. Mr. Rath is a prominent member and a large exhibitor in connection with the citrus society, and for a number of years the Harvey-Hayward prize has fallen to his lot, this being an award for the most worthy exhibit by the settlers on the "Harvey" Estate. He married Elizabeth, daughter of Mr. J. Cooper, of Western Australia, and has a daughter.

**KENNETH GIBSONE**, orchardist, "Pentland," Harvey, is a son of Major John Gibsone (late 17th Lancers), of Warwickshire, who served in the Crimean War and during the Indian Mutiny. He was born in Leicestershire in the year 1876 and received his education at Leamington, being in the first instance destined for the navy. Failing in the eyesight test Mr. Gibsone entered Lloyds Bank at Birmingham, and was connected with that institution for eight years. In 1898 he left his native land for Western Australia, and upon arrival joined his cousin, Mr. H. G. Palmer, in agricultural pursuits at Harvey. Severing this connection, he next purchased 50 acres of the "Harvey" Estate, with the intention of planting an orchard, and of this area he has already cleared thirty-five acres. A tract of six acres has been devoted to an orangery, the navel and Valencia varieties being those favoured by Mr. Gibsone, and the soil, a rich chocolate loam, has proved highly suitable to the cultivation of this popular fruit. The remainder of the cleared portion has been applied to

purposes of mixed farming, potatoes being a very profitable branch of the industry, which is developing all round on satisfactory lines. Mr. Gibsone has been secretary of the citrus society since its inception in

*W. J. Ford,* *Bunbury.*  
**MR. KENNETH GIBSONE.**

1904, and prior to that date held a similar post in connection with the agricultural alliance. He is also secretary to the recreation ground committee and hall committee, and acts as electoral and postal vote officer for the district. An active Church worker, he is a member of the committee of management governing the affairs of the Anglican communion in the neighbourhood. He gives his cordial support to tennis and cricket and other athletic games, and rifle-shooting also receives a share of his attention. In 1898 Mr. Gibsone married Maud, daughter of the late Mr. J. J. Payne, of Narracoorte, South Australia, and has four sons and two daughters.

**FRANCIS JOSEPH BECHER**, J.P., orchardist, "Tweediana," Harvey, is a son of the late Mr. Michael Henry Becher, canon of St. James' pro-Cathedral, Melbourne, and was born in that city in 1873. He received his scholastic training at the Church of England Grammar School, Melbourne, and upon leaving that institution spent five years on the Mildura fruit-growing settlement, on the River Murray, where he studied orchard work, latterly

taking charge of a large fruit-packing shed. In 1896 he left Victoria for Western Australia, and was engaged in mining pursuits on the eastern goldfields for about nine years, during a part of that period filling the position of underground manager of the White Horse Mine, Bulong. Relinquishing this appointment, in 1905 he came to the Harvey district with the object of selecting a property, and finally purchased his present holding, comprising thirty-seven acres, twenty of which have been cleared and prepared for cultivation. Almost the whole of this cleared area is devoted to a large orangery, the navel and Valencia varieties having been chosen by Mr. Becher as those best suited to the soil and climate. In addition to his private enterprise he is employed as manager of about 300 acres on behalf of absentee owners, this area being part of the "Harvey" Estate. Mr. Becher has identified himself with public matters to some extent, and was president of the Harvey Citrus Society for nearly five years. He is a vice-president of the Western Australian

*Bartlett,* *Perth.*  
**MR. FRANCIS JOSEPH BECHER.**

Fruit-growers' Association, and in 1911 acted as one of the two delegates for Western Australia at the Conference of Ministers of Agriculture at Melbourne. He has been a member of the Harvey Roads Board for six years and is a Justice of the Peace for the Wellington district. Mr. Becher is married, and has a son and two daughters.

JOHN EDGAR KNOWLES, orchardist, "Runningdean," Harvey, is a son of Mr. John Knowles, of South Australia, latterly of this State, and was born at Port Wakefield on September 12, 1873. He was brought by his parents to Western Australia in 1882, and completed his educational studies at the Perth Commercial School, subsequently being associated with mercantile life for a few years. He next turned his attention to farm work on his father's property at Harvey, and finally launched out on his own account, purchasing his present holding in 1898. It consists of 90 acres, and

MR. JOHN EDGAR KNOWLES.

already half of this area has been cleared and a 15-acre fruit orchard planted, the remainder being devoted

to the carrying on of mixed farming, potatoes and other crops being successfully raised on the property. Mr. Knowles is a strong believer in irrigation, and has an 8-h.p. "Waterloo" engine and a Ruston Proctor centrifugal pump with an 8-in. suction and a 6-in. delivery pipe at work over the cultivated portions of the holding, 800 gallons per minute being the average capacity of the plant. Horse breeding and dairying is also carried on at "Runningdean." He has taken an active part in the proceedings of the citrus society, and has secured various awards for the products of his orangery. He is secretary of the Korijekup Literary Institute, and takes a cordial interest in matters of public concern. Outdoor sport finds a genuine advocate in Mr. Knowles, who is a successful rifle shot, and was secretary of the first cricket club in the district.

CHARLES ERNEST SHENTON, Manager of the Harvey Branch of the Western Australian Bank, is a son of Mr. Edward Shenton, of South Perth, and grandson of Sir George Shenton, whose name is indelibly linked with the early history of the State. He was born at Geraldton on July 16, 1880, and pursued his scholastic studies at the High School, Perth. At the termination of his studies he was associated with farming pursuits for a year, but relinquished agricultural life for banking, and became connected with the head office of the Western Australian Bank. Since first joining the staff he has held various positions, being

identified with branches at Kalgoorlie, Menzies, Kanowna, Geraldton, and Bunbury, and in 1910 was appointed manager of the Harvey

Bartlett.

Perth.

MR. CHARLES ERNEST SHENTON.

Branch. Mr. Shenton has found it interesting to watch the development of the district during the short period he has been resident there, and has connected himself especially with the different athletic organizations, being a member of the tennis, cricket, and football clubs. In addition he makes something of a hobby of horticulture, and spends a portion of his leisure time in this health-giving pursuit. He was married to Alma Adeline, daughter of the late Mr. E. Fogden, of South Australia.

### BRUNSWICK JUNCTION TO COLLIE.

Brunswick, where a line leaves the main railway for Collie and Narrogin, is the site of one of the State experimental farms. The site of this farm is about a mile from the railway station, and its main object is to prove how admirably fitted the whole south-western portion of the State is for dairying and fruit-growing. About 100 cows of the best milking strains are kept under the most modern conditions, and the young stock reared annually is sold to dairymen wishing to improve their herds. In conjunction with the dairying, pig-breeding and the growing of fodder crops suitable for dairy cattle are extensively undertaken. As the Brunswick River runs through the farm, a system of irrigation has been laid out, by means of which green fodder is always available. Surplus fodder is made into silage, and two large silos form an excellent object-lesson

to the surrounding farmers on the value of preserving food for their cattle. Though dairying in the State is still in its infancy there is little doubt that the work carried on at Brunswick State Farm will have more than a little influence in developing the trade to such an extent that the State will at least be able to supply its own needs, and perhaps become an extensive exporter.

Ensnconced between the hills of the south-west ranges, some 600 ft. above sea level, is to be found the delightful little town of Collie on the river of the same name, derived from one of that noble band of earlier pioneers, by whose indefatigable efforts the south-west country was explored in the infant days of the settlement. The physical aspects of the town, despite the fact of its being the centre of the Western Australian coal-mining industry, are of such nature as to charm the

visitor. The Collie River some two miles from the town widens into some magnificent reaches, which for natural beauty would be hard to surpass in any other portion of the island continent. The rail journey from Brunswick Junction to this centre passes through a continuous panorama of mountainous scenery, scarcely exceeded in beauty in any part of the Darling Ranges. In the town and within a few miles a large number of coal-mining leases are worked, and the yearly output can be estimated at not less than 300,000 tons. Notwithstanding the fact that Collie is a coal-mining centre, and south-west, it retains at present in its immediate surroundings an outlook of sylvan simplicity. Mighty forests of jarrah are in the vicinity, and within a few miles destined to be probably the most populous centre in the miles valuable timber concessions are assiduously worked. The town itself is well laid out, and many of the buildings show careful architectural design and construction. Electricity is the general illuminant, and the streets are well lighted and very well kept, the municipality being keenly alive to the comforts of modern civic life. The population is estimated at 3,500, and the municipality was proclaimed in 1902, since

which time it has made rapid strides. One drawback is the want of a proper water supply, but in the near future this pressing need will be met, and with a properly reticulated water service the town will take a leading position in the provincial civic life of the State. There are seven places of worship—Anglican, Roman Catholic, Wesleyan, Congregational, Church of Christ, Baptist, and Salvation Army—the last-named conducting a home for the reclamation of young people some little way out of town. Besides the banks, there are the usual Government buildings, including a school, an up-to-date hospital, and a courthouse. The housewifery and manual training centres of the school are on a thoroughly organized and up-to-date basis. Two newspapers are published in Collie, one a bi-weekly issue, *The Collie Miner*, the other, *The Collie Mail*, being a weekly issue, and this fact alone speaks volumes for the enterprise of this almost purely industrial community.

From Collie the railway is continued on to Narrogin, on the great southern line, thus tapping a further agricultural area and bringing the coal supplies within easier reach of the eastern districts and the Kalgoorlie goldfields.

ARTHUR ERNEST CLIFTON, farmer and grazier, "Innadong," Brunswick, is a son of Mr. J. E. M. Clifton, of "Rosamel," Australind, one of the oldest family residences in the State, built by the grandfather of the present occupant, who was a very early pioneer of Western Australia, arriving about 1839. The gentleman under review was born at the old home on June 26, 1873, and received his education at the Government School at Parkfield. At an early age he became associated with farming occupations on his father's property, but at seventeen turned his attention to the pearling industry, proceeding for that purpose to Shark Bay, where he remained about a year. Subsequently he entered upon station life on Dirk Hartog Island in 1893, returning to "Rosamel" for a time. Once more making the journey to the north-west Mr. Clifton spent six years on "Yeeda" Station at Kimberley, where he held the position of general manager prior to his departure in 1900. During this period he purchased his present holding at Brunswick, and in the latter year took up his residence there and proceeded with the development of the place. About 300 acres in extent, "Innadong" has half that area under cultivation, the remainder being

partially cleared and improved, ring-barking having been carried on and the scrubby portions dealt with. Horses are bred on the property and considerable attention is given to the

W. J. Ford.

Bunbury.

MR. ARTHUR ERNEST CLIFTON.

raising of sheep and pigs, while dairying operations are in full swing. The Brunswick River runs through alluvial flats, and water is pumped

by means of a windmill and laid on to the house, dairy, stables, sheep dip, etc. As the country increases in elevation heavy clay soil prevails, and the holding proves well suited to the purposes to which it is applied by Mr. Clifton. He owns in addition to "Innadong" 400 acres of freehold and 100 acres of Crown property in Upper Brunswick, upon which, though only lately acquired, improvements have already been begun. The homestead is situated two and a half miles from Brunswick Railway Station. Mr. Clifton has been a very successful exhibitor of dairy produce at both the Royal and Bunbury shows. He is secretary to the Brunswick Farmers' Association and occupies the same honorary position in connection with the local branch of the Liberal League; is chairman of the Clifton Agricultural Hall Committee; and a member of the Royal Agricultural Society and of the Wellington Agricultural and Pastoral Society. Mr. Clifton also fills the office of Commonwealth Meteorological Observer for the district, and is a vestryman of the local Anglican Church. His principal recreation is found in the ever-popular game of tennis. In 1901 he married Millie, daughter of Mr. C. W. Buckland, of Victoria, and has a family of two sons.

EDWIN ROSE, J.P., farmer and grazier, "Wedderburn Park," Brunswick, is a son of the late Mr. Robert Henry Rose,

W. J. Ford, Bunbury.  
MR. EDWIN ROSE.

born in December, 1863. At the close of his education at the Government school at Parkfield young Rose, at an early age, became associated with agricultural pursuits on his father's farm, and continued in this connection until twenty-one years of age. In March, 1885, he left for

upon cattle-raising on his own account in the Kimberley district, and in 1891 was joined in partnership by his brother, Mr. J. C. Rose, of the Warren. Cattle were purchased for the run, and Mr. Rose then came to Perth to raise capital for the purchase of 2,000 sheep. In April, 1891,

of Stanton Hall, Suffolk, England, who arrived in Western Australia about the year 1850 and became one of the earliest settlers in the south-western district of the State. After spending some time in Perth, the late gentleman eventually started dairy-farming at Crawley. In 1854 he purchased the "Parkfield" Estate, where Mr. Edwin Rose was

Photo by W. J. Ford.  
MR. EDWIN ROSE'S RESIDENCE, BRUNSWICK.

Kimberley with 27s. in his pocket and supplies for two years, and thus began to lay the foundation of his present fortune. After spending a few years on different stations for the sake of experience, in 1888 he entered

he left Roebourne with three white drovers and two blacks, and accomplished the task of driving the sheep overland, a distance of 800 miles, in seven months. With this stock "Quanbun" Station was founded and carried on until 1903, when it was sold. Messrs. Rose Brothers were the first settlers to send cattle over the Leopold Ranges, and in many ways assisted in the development of the district. They still retain their cattle runs in the north-west, and have about 17,000 cattle on these properties. In 1898 Mr. Rose purchased his present estate of "Wedderburn Park," in the Brunswick district and on the Bunbury line of rail. Upon taking possession from the previous owner, Mr. A. M'Andrew, only forty out of the 1,670 acres were cleared, but the new proprietor set to work with energy and determination, and to-day has 500 acres cleared and the balance prepared for grazing purposes, while many other improvements have been made. The homestead is a handsome brick structure, with a picturesque background of hills where excellent pasture is found by the stock, and each year 100 to 150 acres are devoted to cultivation paddocks. About 1,200 sheep of the Shropshire-merino type give splendid

Photo by W. J. Ford.  
"LORD DEAN."

testimony to the skill and judgment exercised in the founding of the flock. The stud rams were imported from Sir S. J. Way's South Australian estate, and an additional animal introduced from the late Mr. J. O. Wellard's flock originally came from Mr. Mansell's stud in Tasmania. Ten ewes from the same flock were recently added to the stud, earlier ones having been imported by Mr. Robert Carroll, of the firm of H. Wills and Co., and purchased by Mr. Rose. A few horses are bred, the stallion "Lord Dean" (champion at the Bunbury Show of 1911) doing service as sire for some time, and pigs and poultry are raised on a small scale. Stone fruits come to perfection, and in the event of the Brunswick to Bunbury water scheme being accomplished fruit-growing and agriculture will probably form an important branch of the industry at "Wedderburn Park." Mr. Rose is Justice of the Peace for the Wellington and Kimberley districts. He has occupied a seat on the Brunswick Roads Board for a couple of years, and for three years was president of the Wellington Agricultural Society. He was appointed a member of the first board created under the "Veterinary Act of 1911," and is a member of the Royal Agricultural Society. In 1902 he married Janet, second daughter of the Honourable E. M. Clarke, and has two daughters.

**HERBERT WILLIAM DRUMMOND**, grazier, Bengier, was born at Moora on June 21, 1880, and is a son of Mr. James Drummond, of that place. He was educated in Perth, and at the close of his schooldays made an early acquaintance with agricultural life on his father's farm in the above district. Having attained the age of twenty-one years, he launched out on his own account, purchasing 2,500 acres located about a mile south of Bengier. This property, which is capable of carrying 1,500 sheep, he applied to grazing purposes, and carried on successfully until 1912. He then sold out, retaining for his own purposes a tract of 800 acres of mixed soil situated on the west side of the railway line, which he had leased for several years previously. It is Mr. Drummond's intention to continue operations on this holding, and he has already stocked the property with Lincolns and crossbred merinoes, both of which types he has found very well suited

to the district. Mr. Drummond is a member of the farmers' association and Wellington Agricultural Society. He also acts as trustee to the Brunswick Recreation Ground, and lends ready support to all local movements for the welfare and advancement of the neighbourhood.

**ROBERT HENRY ROSE**, farmer, "Grassvale," Roelands, is a son of the late Mr. R. H. Rose, of Western Australia, and was born at Bunbury in 1884. He received his primary education at a local school, completing his studies at the Perth High

W. J. Ford, Bunbury.  
MR. ROBERT HENRY ROSE.

School, and was first associated with farming life on his father's property at Roelands. Having gained sufficient experience, in 1908 he took over his present holding, originally a portion of his late father's estate, and commenced operations on his own account. The property comprises 500 acres and is situated on the Collie River, one and a half miles southwest of Roelands Railway Station. The river runs right through the estate, and is flanked with flats of rich soil suitable for the growing of lucerne and potatoes, three crops of the latter being produced in one year. The remaining portion of the property is of rich, red loam, and about eighty acres have been brought under cultivation of hay, yielding about one and a half tons to the acre, while another sixty acres are also devoted to cultivation paddocks and a further fifty have been cleared for general uses. An orchard of twenty-five

acres produces fine apples for export, Jonathan's Pippin, Clio, and Dunn's Seedlings being some of the varieties grown. On the grazing pastures a good class of Lincoln sheep is run, with representatives from which Mr. Rose gained every prize awarded in this class at the Bunbury Agricultural Show in 1911. He has also had considerable success with his Ayrshire cattle, gaining first and champion for his Ayrshire cow and first and second for yearling heifers at Bunbury. In two successive years he carried off the President's Cup awarded the exhibitor gaining the greatest number of prizes for live stock at the Wellington Agricultural Show. He is a member of the committee of the Wellington Agricultural Society and a member of the South-Western Club at Bunbury. He is also a member of the Brunswick and Bunbury cricket clubs.

**JOHN GARDINER**, farmer and grazier, "Elvira Creek," Roelands, is a son of the late Mr. Alfred Gardiner, of Gloucestershire, England, who arrived in Western Australia by the sailing vessel "Trusty" in 1842, and

MR. JOHN GARDINER.

settled in the south-western district of the State. The subject of this notice was born on his father's homestead on December 6, 1858, and from an early age was identified with the operations of the farm. Upon the death of his parent on June 23, 1905, he took over the property, and has since carried on its development on his own account. Of the 1,200 acres comprising the area of the holding

about fifty have been cleared, and upon this cleared portion barley, wheat, and potatoes are cultivated, the wheat crop averaging about sixteen bushels to the acre. The greater part of Mr. Gardiner's time is given to horse- and cattle-breeding, and he is aiming to bring to perfection the shorthorn type of dairy cow, which is the strain chiefly in favour. The herd consists of about fifty head of cattle, and the daily yield of cream is sent to the Bunbury Butter Factory. Mr. Gardiner is a member of the Wellington Agricultural Society, and has gained a large number of prizes at the Bunbury Show for wheat, barley, and the household products of jams and jellies. He married Viola Blanche, daughter of the late Mr. J. S. Gibbs, of Roelands, and has three sons and a daughter.

**JOHN MONTAGUE GIBBS**, farmer and grazier, Roelands, is a son of the late Mr. John Samuel Gibbs, of Western Australia, and was born at Collie Agricultural Area on May 30, 1879. He received his education at the local school, and at the termination of his studies became connected with farm life on his father's property at the same place. At a subsequent date this land was sold and a selection taken up in the Roelands district, and upon the demise of Mr. Gibbs, sen., the gentleman under review entered into possession of his portion of the holding and then commenced operations on his own account. His property consists of 500 acres situated in the vicinity of the Roelands Railway Station, and of this area 150 acres have been cleared and cultivated. Hay, oats, and potatoes are successfully grown, and an orchard six acres in extent produces apples, pears, peaches, apricots, and other varieties of fruits, which find a ready sale in the local markets. Mr. Gibbs takes a keen interest in the breeding of horses, and has owned several notable performers, among them being "Noggerup," which was recently to the fore as the winner of various events at local race meetings in the southern district. He was also the exhibitor of "Dundare," "Linden Tree," "Past Mistress," "Mulga," "Lady Clare," and "Flight," all of which have gained some distinction in the show-ring. Mr. Gibbs is well known as a member of the Brunswick,

Waterloo, and Capel race clubs and of the Wellington Agricultural Society. He married Miss Martha Higgins and has two sons and two daughters.

**THOMAS JEFFREY**, formerly of "Glenarona," Waterloo, was born in the North of Ireland on February 26, 1830, being a son of the late Mr. Thomas Jeffrey, of that country. In 1852 he left his native land for Victoria, and for many years was associated with gold-mining pursuits at Bendigo and Forrest Creek. Latterly he became very well known in connection with transport work on the Brentwood and Bendigo routes. In the year 1890 Mr. Jeffrey came to Western Australia, and shortly after arrival entered into possession of the "Glenarona" property in the Wellington district, consisting of 100 acres, which he proceeded to clear and cultivate. Mr. Jeffrey also carried on mixed-farming operations, and is regarded as a first-class judge of stock. Mr. Jeffrey, who is now residing in the Northam district, has five sons and four daughters.

**EDMUND YEAMANS CLIFTON**, orchardist and grazier, "Koozbana Park," Waterloo, is a son of Mr. George Clifton, of London, who was one of the early arrivals in Western Australia, where he settled in the south-western district in the year 1841. The subject of our review was born at Fremantle on July 26, 1864, and in 1866 he was taken to England by his parents, receiving his education in the town of Weymouth, in Dorset. Upon leaving school he returned to Western Australia and entered upon farming pursuits at Newcastle. At a later date Mr. Clifton was connected with survey work in the north-west, eventually taking up land for farming purposes in the vicinity of Perth. He afterwards removed to Wongong Brook, and continued in agricultural life until 1889, when he joined the Police Service, and was stationed in the Kimberley district and on the goldfields, retaining his connection with the service for about five years. In 1894 Mr. Clifton purchased the property where he now resides, consisting of 1,400 acres of freehold, of which about 500 acres are cleared and cultivated. Fruit culture occupies a large share of his attention, and he has met with great success with his

apple orchard, Jonathans, Cleopatras, and Dunn's Seedlings all coming to perfection and proving well suited to the export trade, while the Prince Alfred, a very large variety, sells well in local markets. Mr. Clifton is a large exporter, and his careful grading and packing have earned for him a wide reputation and ensure for his products excellent prices. He also devotes a good deal of time to sheep raising, Lincolns and merinoes being the types chosen to stock the estate, the situation of which is

W. J. Ford, Bushbury.  
MR. EDMUND YEAMANS CLIFTON.

favourable for pastoral purposes, five miles of water frontage being provided by the Collie River. Mr. Clifton is a successful exhibitor of orchard products at the local shows and also at the Royal Show at Perth. He is fond of shooting and fishing and other outdoor pastimes. He married Emily, daughter of Mr. John J. Webster, of Freshfield, Preston Valley, and has one son and two daughters.

"**KOOROCHEANG**." This property, comprising 900 acres, is situated at Waterloo, about midway between Brunswick and Bunbury, and is owned by Mr. H. T. Belcher. The Collie River runs through a portion of the holding, providing two miles of valuable river frontage, and on its banks lie long stretches of rich red loam, where with the help of irrigation potatoes and lucerne come to perfection. This loam goes down about 12 ft., while, on the uplands, a clay subsoil underlies good chocolate

loam, and of the latter nearly 100 acres are cropped yearly, the average yield being about  $1\frac{1}{2}$  tons of hay to the acre. About 350 acres altogether have been cleared, the work of development being less strenuous here than in many localities, as the estate is not heavily timbered. The land carries about one sheep to the acre, and Mr. Belcher engages largely in the breeding of Border Leicesters and merinoes, crossing these strains with good results. A good type of heavy draught horse is also bred, the sire in use being the prize stallion "Ben Lock," grandson of the famous "Lord Benmore," who changed hands a few years ago for the sum of 1,200 guineas. As a yearling "Ben Lock" gained first prize at the Wellington Agricultural Show. HENRY THOMAS BELCHER is a son of the late Joseph Belcher, of Ballarat, Victoria, and was born at that city on August 15, 1866. He was educated in his native place, and at the close of his scholastic career removed to New South Wales. In 1898 he came to Western Australia and opened a butchering business in Bunbury, which he carried on until 1902 and relinquished in order to settle down to farming pursuits on the "Kooroocheang" property, which he had purchased some time previously. In addition he has various

been a member of the Dardanup Roads Board for about four years. He is fond of horse-racing, and for a lengthy period spent his leisure

MR. HENRY THOMAS BELCHER.

time in following this sport, owning the racehorse "Arthur," the winner of over 100 races in Western Australia within a period of five or six years, including the Greenbushes, Capel, and Donnybrook Cups. Mr.

MR. H. T. BELCHER'S RESIDENCE, WATERLOO.

properties at Picton, and owns building blocks in the neighbourhood, the value of which will be greatly enhanced with the further development of the district. Mr. Belcher has

Belcher is the present secretary of the Waterloo Race Club. He married Florence, daughter of Charles Roughley, of Windsor, New South Wales, and has one son.

HERBERT EDWARD WELLS, Mayor of Collie, is a Victorian by birth, being a son of Mr. James Wells, of Ballarat, one of the early settlers of that State, who was present at the famous Eureka Stockade riots. Born at Ballarat on October 9, 1873, the gentleman under review received his education at public schools in Victoria and began his commercial career in one of the large warehouses there. He afterwards was identified with mercantile life in Queensland, whence he returned to Victoria, and in 1895 came to Western Australia, where for about eighteen months he continued in the same line at Fremantle. Proceeding to the East Murchison goldfields, Mr. Wells followed gold-mining and prospecting pursuits there and at Coolgardie, and at a later date went to Leonora, in which town he opened as a boot and shoe merchant. Early in 1900 he removed to Collie, then a mining settlement with a population of not more than fifty persons, and commenced business once more on his own account, carrying on successfully until 1906, when he disposed of his interests to the "Ezywalkin" Company. During the course of the above year a project for establishing fruit and produce markets in Collie was made an accomplished fact by Mr. Wells. The delay and expense incurred by buying through Perth was continually being brought home to him and the other residents of the settlement, and after getting into touch with the growers of the district he established himself as an auctioneer and produce merchant, and since that time has continued to make a very payable proposition of his venture. Mr. Wells has had a long association with public life, and was one of the first members of the local roads board, his connection with which terminated only as recently as 1911, and during this period he filled the position of chairman and was elected by the Roads Boards Conference of Western Australia to a seat on the executive. He was also among the first councillors in the Collie municipality, and has been three times invested with mayoral honours. In 1905 he received his Commission of Justice of the Peace for the district, and upon his elevation to the Licensing Bench was gazetted for the whole of the State. He has taken office in the Masonic fraternity, his rank being that of

Past Master of the Collie Lodge. In matters of recreation he has given his cordial support to the Collie Town Football Club, of which he has been president, and he also filled the office of secretary to the first cricket association. His active interest in religious affairs led to the establishment of a Methodist Church in the town, where he conducted services for some months until the appointment of a regular pastor to the charge. Mr. Wells married Philippa, daughter of Mr. John Bayley, of Western Australian mining fame, and has three sons and a daughter.

**WILLIAM HENRY RIGBY**, M.B. (Melb.), Medical Officer for Collie district, is a son of the late Mr. William Henry Rigby, of Bendigo, Victoria, and was born at that town on September 16, 1867. He received his scholastic training at Mr. Hensby's school in Kyneton, with a

DR. WILLIAM HENRY RIGBY.

subsequent course at the Scotch College, Melbourne. After taking his medical diploma at the University of Melbourne in 1891 Dr. Rigby was associated with hospital work for some time and eventually entered upon professional practice at Coleraine, Victoria, where he continued for five years. In 1896 he came to Western Australia and was engaged in practice on the goldfields, afterwards returning to the Eastern States, where he settled in New South Wales for a couple of years.

The year 1900 found him again in Western Australia, when he established himself in practice at Collie, and upon the opening of the hospital there two years later Dr. Rigby received the appointment of medical officer to that institution, which he has held ever since. He is also district medical officer, and serves in the same capacity the local board of health and the roads board. He interests himself in the various forward movements of the neighbourhood, and holds office as trustee of the mechanics' institute. He is fond of aquatic pursuits and is examiner to the Royal Life Saving Society for Collie, while for purposes of recreation, fishing, shooting, and cricket receive about equal shares of his attention. He married Mary, daughter of Mr. Stephen Monger, of York, Western Australia.

**BASIL SPENCE GREER**, of the firm of Greer, Ferguson, & Co., accountants, auctioneers, commission agents, etc., of Collie, is a son of the late Mr. Henry Greer, of Melbourne, Victoria, in which city he was born on August 21, 1876. Upon leaving school he was articled to the accountancy profession, and several years later was admitted as a member of the Institute of Accountants and also of the Bankers' Institute in Victoria. From 1892 onwards he was associated with various commercial houses in his native State, and in 1896 left for Western Australia, where he first joined the Government Service in the Railways Department at Coolgardie, continuing there until 1903. In that year Mr. Greer resigned his appointment in order to take up land on his own account in Collie, and for about two years worked the 3,000 acres, which comprised his holding, applying it chiefly to stock-raising purposes. After two years he sold out his interests to his brother and accepted the position of town clerk of Collie, which office he administered for about five years, during this period being concerned in the carrying out of most of the public works which have proved such a boon to the inhabitants of the town. The formation of streets and erection of municipal buildings, including the new post office, were brought about, a telephone service was installed and the fire brigade introduced, besides

which the extension of the Collie-Narrogin railway line has linked the place with the important centres of commerce on the great southern line. In 1910 Mr. Greer established his present business in partnership with Mr. E. W. Ferguson, and has since conducted operations with

Bartlett, Perth.  
MR. BASIL SPENCE GREER.

increasing success. He is secretary of the Western Australian Coal-mining Company, secretary to the Collie Club, Limited, assistant secretary to the Collie Race Club, and to the annual dog and poultry shows. He is a Freemason and has taken honours in the craft. Mr. Greer resides a few miles out of the town and finds recreation in horticultural pursuits. He married Clara, daughter of Mr. J. H. Dyer, formerly a member of the Legislative Assembly of Victoria, and has a son and a daughter.

**WILLIAM DAVID BEDLINGTON**, J.P., lessee of the Collie Proprietary Mine and the Westralian Coal-mining Company's leases, is a son of the late Mr. William C. Bedlington, mining engineer of Northumberland, and was born at Merthyr Tydvil, South Wales, England, on February 10, 1851. At the close of his schooldays he was apprenticed to the profession of a mining engineer in his native country, and continued to augment his knowledge by filling various positions connected with the mining industry until, in

1872, he obtained his certificate entitling him to manage a colliery in any part of the world. In 1886 Mr. Bedlington came to New South Wales and was identified with the management of two or three collieries in the Newcastle district. Ten years later he left for Western Australia, and was among the first to open up Collie as a coal-mining centre, in process of which he did a good deal of prospecting, and was closely concerned in the floating of

the West Collie Coal and Fireclay Company. Since that time the majority of the mines in the district have been opened up and managed by him, and recently he has taken over the lease of one of the original claims of the Collie Proprietary Company, which at one time was under his control, and is now working it on his own account. Mr. Bedlington has played a very important part in local public affairs, having been elected a

member of the roads board at its inception in 1899, since which date he has sat continuously and has filled the chair for about five years. He is the senior Justice of the Peace for the district, and for a number of years has held a seat on the Licensing Bench. He is President of the Collie Club, Limited, and a trustee of the mechanics' institute. Mr. Bedlington married Janet, daughter of Mr. David Evans, J.P., of South Wales, and has two sons and a daughter.

### BUNBURY.

The city of Bunbury, which takes its name from Lieutenant Bunbury of H.M.S. "Beagle," and not from the family which settled there in the early days, is picturesquely situated on the shores of Koombana Bay, 115 miles by rail south of Perth, and is destined from its position, designed by Nature and improved by art, to become the commercial metropolis of the great south-west. The coast line here, running south, doubles upon itself, making a half-circle to the northward, where Casuarina Point juts out seaward and forms a barrier of sand and rocky reef between the storms from the south-west and the calm waters of the bay within its shelter. The only quarter from which rough weather can prove a menace to shipping is the north-west, and, to obviate this in a large measure, a massive breakwater of rock has been run out seaward along the course of the reef. Casuarina Point was named after one of the French corvettes "Geographe," "Naturaliste," and "Casuarina," which visited these shores in 1801, and left the names of their ships and officers on many parts of the coast. It is surmounted by a lighthouse, which serves as a guide and friendly warning to those who "pursue their calling in deep waters." Leschenault Estuary, a fine sheet of water runs up north parallel with the sea coast, and divided from the ocean by a narrow strip of land, 10 to 12 miles long, and in places two miles wide. The Collie and the Preston Rivers, with their many tributaries, help to swell the waters of the Estuary, whose surface is dotted with wild fowl and whose depths are filled with fish—a veritable paradise for the sportsman. The town site is one of the oldest in the State, having been proclaimed as far back as 1841. Though, like most Western Australian towns, it slumbered until the nineties, it has since that time made great progress, and though evidences still exist of the early days, they are rapidly giving way to modern and up-to-date structures of which any town might justly be proud. Its railway station is equal to anything of the kind outside the metropolitan area, and its public and municipal buildings are thoroughly up

to date. An extensive electric lighting plant has been established by the municipality, which also provides a public library, reading rooms, and bowling green for the instruction and recreation of the citizens. There are several fine churches, the principal among them being the Anglican pro-Cathedral. Excellent schools are provided for the children, and technical education classes are provided for those seeking technical knowledge. Secondary education is represented by the Girls' Grammar School, controlled by the authorities of the Church of England. A commodious theatre supplies the means of amusement in the way of plays and picture shows, and the comfort of visitors is well catered for by numerous hotels. For outdoor sports there is a large recreation ground available, which is also the property of the municipality. All these developments are evidences of a progressive community, and show that the people of Bunbury are fully alive to the advantages of their situation and determined to make it one of the prominent cities of the State. The town has been a city since 1904, when it achieved the dignity by the creation of a new Church of England Diocese, with the cathedral at Bunbury. Historically Bunbury looms large in the annals of Western Australia. Though the honour strictly belongs to Picton, a small village some three or four miles away, Bunbury is generally known as the birthplace of Sir John Forrest, Western Australia's greatest son. It is also noteworthy for the fact that a little way up the Estuary occurred, towards the end of 1839, one of those numerous schemes for colonization promoted by English theorists. At the instance of Sir William Hutt, brother of the then Governor of the State, an extensive tract of land originally granted to Colonel Latour was secured at Australind, a few miles up the Estuary from the present city of Bunbury. A party of officials was sent out to survey the land, and an elaborate plan of what would now be termed a garden city was prepared and exhibited in England in order to attract possible colonists. At first the rush to secure allotments was remarkable, but when doubts were raised

as to the possibility of securing the site, a large number of those interested withdrew. The scheme was, however, persisted in, and Mr. M. W. Clifton, F.R.S., appointed as the managing superintendent. Two or three shipments of colonists were sent out, but the idea was practically doomed to failure from the start. Apart from financial difficulties, it was too far from the Swan River settlement for settlers to have much chance of finding a market, and most of them left after a few months' trial for the more settled districts. By 1843 Australind had become what it has ever since practically remained, merely a name. Bunbury was the gainer by the disbanding of the scheme, for many of the settlers fixed their habitations there, and, in fact, through their efforts the town was brought into being. As a summer

ceasing through the summer. Recognizing these natural advantages, which are accentuated by a temperate climate, the municipal authorities have provided excellent baths in the shallow waters within the harbour, and have made due provision for shelter-sheds on the more exposed back beach. Commercially Bunbury must of necessity have a prosperous outlook. It is the natural port of shipment for the produce of this portion of the State. The coal output from the Collie fields, the produce of the rich Bridgetown district, and the timber gathered from the various mills in the back country, all gravitate naturally to Bunbury for export. Recognizing its growing importance in this direction the Government has erected a breakwater at a cost of £250,000, and has provided large accommodation for shipping,

VIEW OF THE TOWN AND HARBOUR OF BUNBURY.

resort Bunbury probably holds pride of place in the estimation of the people of this State. For this its natural advantages are largely responsible. Situated on a jutting point of land, it has on the one side an estuary teeming with fish, into which debouch the Collie and Preston Rivers, and on the other a rock-bound coast, lapped by the waters of the Indian Ocean, across which the health-giving westerly breezes blow almost without

placing the control of the harbour under the authority of the Harbour Board. So great has been the development, however, that the question of further facilities has been for some time under consideration, and soundings have been taken with a view of ascertaining the possibility of cutting a canal through Point Casuarina, and thus providing an inner harbour in the Estuary capable of accommodating an increased shipping trade.

CHARLES FRAENKEL, J.P., Mayor of Bunbury, was born at Graetz, Germany, on January 2, 1849, being a son of the late Mr. J. Fraenkel, of that place. He received his education in his native town, and subsequently he was

apprenticed to the leather business in Kosten, Germany. Having completed his five years' indentures, in 1867 he left the Fatherland for Australia by the s.s. "Great Britain," and arrived in Victoria in July of that year. Shortly afterwards

he commenced business on his own account at Wodonga, at a later date proceeding to Albury, New South Wales, where he carried on as a general merchant for some considerable time. In 1881 he went for a trip to the Old Country, and upon

his return in 1883 opened in Sydney as an oil and colour merchant. Retiring from business pursuits in 1886, Mr. Fraenkel spent two years in travelling, and eventually came to Western Australia in 1898 with the object of recruiting his health. For some years he conducted a tannery and boot-manufacturing business at

W. J. Ford, Bunbury.  
MR. CHARLES FRAENKEL.

Bunbury, finally giving up active commercial enterprise in 1905. He has large property interests in the south-western district, and also owns some agricultural land in New South Wales, one farm of 150 acres being in the Blackheath district. It was in the Mother State that he took out his naturalization papers, and since that period his sympathies and interests have become exclusively British, and his loyalty to his adopted country one of his marked characteristics. Always interested in the progress of public affairs, after his retirement from business he placed his time and energies at the disposal of his fellow-townsmen, and in 1905 was returned as a member of the municipal council. After several years' connection with this body, in 1908 he resigned on the occasion of his taking a trip to be present at the Franco-British Exhibition, and on his return in 1909 again received election as a councillor. In 1910 he was invested with mayoral honours, and the ratepayers showed their appreciation of his services by re-electing him to the chair in 1911 and again in 1912. While occupying this office Mr. Fraenkel has made every endeavour to reduce

the liabilities of the municipality, and his efforts in this direction have been rewarded with conspicuous success. He is chairman of a number of the charitable institutions of Bunbury and supports all movements for the good of the district. Since 1881 he has been connected with the Masonic fraternity, and he is a member of the South-Western Club and of the local bowling club, besides giving his support to the various athletic associations of the neighbourhood. In 1883 Mr. Fraenkel married Josephine, daughter of Mr. Joseph Cohen, of Melbourne, and has a son and a daughter.

Councillor ARTHUR NORTH, J.P., representing Central Ward in the Bunbury Municipal Council, is a son of Mr. D. North, and was born on September 4, 1864.

W. J. Ford, Bunbury.  
MR. ARTHUR NORTH.

After completing his education at the local State school he served five years to the blacksmithing trade, and subsequently spent ten years in this calling at Northam, York, and Coolgardie. In 1899 he returned to Bunbury and opened up his present land and estate agency business, which he has carried on successfully ever since. A vigorous advocate of municipal reform, he first entered the local council as representative for Central Ward, in 1908 being re-elected unopposed for a further term of three years in 1911. During his term of office he has identified himself with the movement for the extension of electric lighting in

the district, the water scheme, and the new municipal farm. A member of the Ancient Order of Foresters and the Independent Order of Druids, he has occupied the post of secretary to the Friendly Societies' Association for five years, and in this capacity has successfully carried through all arrangements for the annual sports held in connection with the association. He is secretary of the South-Western District Rifle Union, of which he has been a member since its inception. He is very fond of fishing, and was successful in starting a movement which led to the reopening of the Estuary, which had been closed to net-fishing for many years. Mr. North is secretary of the Traders' Association of Bunbury. He married Margaret, daughter of the late Mr. Owen Shanahan, of Dardanup, and has four sons and six daughters.

Captain JOHN GEORGE DODDS, councillor for Bunbury, is a son of Mr. Matthew Dodds, of South Shields, England, and was born on March 16, 1867. He acquired his scholastic education at the Union British School in that town, and at its close, after spending a year in the Government offices, was apprenticed to seafaring pursuits in the Samuel Lowther line of vessels.

W. J. Ford, Bunbury.  
CAPTAIN JOHN GEORGE DODDS.

He sailed in the "Walter H. Wilson," the first four-masted sailing ship built by Messrs. Harland and Wolff, of Belfast, and spent four

years as apprentice, in his fifth year occupying the post of third officer. In 1886 he took his second mate's certificate at South Shields, two years later sitting for first mate's examination at Adelaide, South Australia, and in 1890 passed his master's test at South Shields. Upon leaving the above vessel he joined the Blue Anchor line, sailing as fourth, third, second, and chief officer during the eight years he continued with this company. He then became connected with the Gulf line of steamships as chief officer in 1897, and in 1898 was given command of the s.s. "Hazelbranch" and "Elmbranch" running for the Gulf line. Subsequently Captain Dodds spent three years in the Baron line of vessels, and in 1908 retired from marine life, during his twenty-nine years of experience having traded on practically all coasts and visited all parts of the world. During this time he steered clear of all accidents and has a clean record at Lloyd's. While sailing with the Blue Anchor line he was a frequent visitor to Australian shores, and for five years sailed as third and second officer under the late Captain Ilbery of the ill-fated s.s. "Waratah." In 1909 he settled at Bunbury, and joined Mr. Smith in the business of master stevedores, shipping and insurance agents, under the title of Smith & Dodds. The partnership was dissolved in October, 1912, since which date Captain Dodds has carried on in business on his own account. He has interested himself in the general affairs of the community, and in 1910 was returned as representative for North Ward in the local municipal council, in the following year being elected by Government to a seat on the harbour board at Bunbury. Two months after his arrival in the State he was appointed marine surveyor under the Western Australian Government. He has taken honours in the Masonic craft and is a member of the South-Western Club.

**WILLIAM JOHN NORRIE**, Town Clerk of Bunbury, is a son of Mr. William John Norrie, of Edinburgh, Scotland. He was born at Bunbury on March 24, 1881, and after a preliminary course of education in his native town finished his scholastic studies at Perth. Upon leaving school he was articulated to the

legal profession with the firm of Stanley, Murray, & Walker, solicitors, of Perth and Bunbury, and upon the completion of his indentures in 1904 he received the appointment of assistant town clerk at the latter place under Mr. J. J. Tucker. In 1910 he was promoted to the senior office, the duties of which he has since fulfilled, and in intervals of leisure allowed by his busy life has employed himself in studying advanced accountancy with a view of obtaining his certificate in this subject. Mr. Norrie, in addition to his municipal office, holds the positions of secretary to the local board of health and to the Bunbury Water Board. He is one of the captains of the South-Western Club and takes a keen interest in sport, being secretary to the Bunbury Hunt Club, hon. treasurer and

W. J. Ford, Bunbury.  
MR. WILLIAM JOHN NORRIE.

executive committeeman to the local bowling club, in which he takes a prominent part, and a member of the Bunbury Cricket Club and of the Bunbury Football Association.

**THOMAS HAYWARD**, who represented the Wellington district in the Legislative Assembly from 1903 to 1911, is a son of the late Mr. Thomas Hayward, of Ringshall, Suffolk, England, and was born at Honington, in that county, on September 1, 1832. He received his education at Needham Market Grammar School and at Ipswich, and upon leaving school followed farming pursuits in conjunction with his father

until he left for Australia in 1853. After spending a short time at Perth he came to Bunbury and was identified with the farming industry in various parts of the district, eventually settling at Wokalup, where his son is at present in occupation of the property. In 1862 he opened a small store at Bunbury for the retailing of ironmongery and farming implements, and in the course of time built up a large connection, with the result that the business is now the largest of its kind in the south-western district. In June, 1898, Mr. Hayward retired from any active participation in commercial pursuits, and has since devoted himself chiefly to public affairs. He began his public career as chairman of the first roads board in the Bunbury district, which at that time extended from Pinjarra district in the north-east to Bridgetown and Capel in the south, and during his connection with this body he estimates that he covered over 4,000 miles in travelling on horseback to the various meetings and in other business relating to the board. Subsequently he was elected to a seat on the municipal council, and on several occasions occupied the chair. The pressure of business matters forced his retirement from these offices, but in 1900 he again came forward in a public capacity, succeeding Sir John Forrest as member of the Legislative

W. J. Ford, Bunbury.  
MR. THOMAS HAYWARD.

Assembly for Bunbury constituency for three years. At the expiration of this period he was returned for the Wellington seat, and held the

same until his retirement from the Parliamentary arena in 1911. Mr. Hayward is one of the few surviving original members of the Bunbury Agricultural Society, in which he held the positions of secretary and president on different occasions. Since his arrival the whole town of Bunbury has been practically rebuilt, only about half a dozen of the original structures now remaining. He is president of the hunt club, being a thorough sportsman, following the hounds and being present at the opening of each shooting season until 1910, when he was prostrated by serious illness. Mr. Hayward married Catherine, daughter of the late Mr. Joseph Logue, B.A., of Swan, and has a son and four daughters.

**SIMON CROWNSON JOEL.** J.P., M.B., B.S. (Melb.), Medical Officer to the Bunbury Board of Health, is a son of Mr. Isaac Joel, of Melbourne, in which city he was born on December 10, 1873. He received his primary education at Carlton College, continuing his studies at the University of Melbourne, and having decided to follow the medical profession obtained his diploma from that institution in 1896. In order to extend his experience in surgery he proceeded to England and spent two years in

W. J. Ford, Bunbury.  
DR. SIMON CROWNSON JOEL.

London hospitals. Upon his return to Australia, after a brief period in his native city, he came to the

Western State, settling at Bunbury, where he has been engaged in professional practice ever since. He fills the appointment of medical officer to the local board of health and also that of military medical

"Fraser River" Station, owned by Mr. J. A. Game, of England, and two years later he purchased the "Mount Anderson" property, situated on the Fitzroy River, about sixty miles from Derby. He still

RESIDENCE OF DR. S. CROWNSON JOEL, BUNBURY.

officer for the district. Dr. Joel has interested himself in the affairs of the district, and in 1904 received a Commission of Justice of the Peace. He is a member of the Masonic fraternity, and finds recreation in fishing and on the bowling green. In 1902 Dr. Joel married Kate, daughter of Mr. Charles Davis, silk merchant, of London, and has two sons and a daughter.

**GEORGE CANLER ROSE.** "Parkfield," near Australind, in the Bunbury district, was born at the place where he now resides on February 1, 1861, and is a son of the late Mr. Robert Henry Rose, who came from Suffolk, England, to Western Australia in the year 1850. Upon completing his studies at the local school he was associated with Mr. Lowe in the opening of the first banking establishment at Bunbury on May 22, 1878, but eventually abandoned mercantile pursuits in favour of agriculture, and for three years had charge of the late Honourable W. H. Venn's farm at Daranup. In 1882 he proceeded to Kimberley, where he accepted the appointment of manager of the

retains this station, which consists of 121,000 acres capable of carrying 25,000 sheep, and at the present time he has it stocked with about 15,000 merinoes. In 1892 Mr. Rose

W. J. Ford, Bunbury.  
MR. GEORGE CANLER ROSE.

returned to the south-western district, and in the following year took possession of the old homestead of

the Rose family, purchased by his father in 1854, and situated near Australind, at the head of the Estuary, thirteen miles from the town of Bunbury. The "Parkfield" Estate consists of 11,118 acres, and was at one time used largely for dairy-farming, but of recent years sheep-raising has absorbed the greater share of attention. About 3,000 sheep are run on the property besides fifty head of cattle and a large number of horses. The pig-geries also are an important feature of the farm operations, and form a very profitable department of the

director of the Bunbury Butter Company. Mr. Rose married Edith, daughter of the Honourable E. M. Clarke, of Bunbury, and has two sons and two daughters.

**ARTHUR ROBERT FOREMAN**, senior partner of the firm of Thomas Hayward & Son, general merchants and importers, Bunbury, is a son of Mr. John Foreman, of Ipswich, England, where he was born in 1865. At the close of his education, which he received in his native town, he was early associated

was admitted as a partner in the mercantile business established by the latter gentleman at Bunbury. In 1898, in conjunction with the late Mr. George Hayward, Mr. Foreman took over complete control of the concern, and it was carried on by them until 1908, when Mr. Hayward died. The subject of this

Photo by C. E. Farr. MR. G. C. ROSE'S RESIDENCE, AUSTRALIND.

industry. The homestead has earned a very pleasant reputation for the hospitality extended to visitors, in which even the casual guest participates. The various cricket clubs, the Bunbury Hunt Club, and other organizations have happy recollections of good times spent there, and their appreciation was marked by the hunt club in the presentation of a silver cup to Mr. G. C. Rose. Mr. Rose is a member of both the Royal and Wellington agricultural societies, and has held office for seventeen years in the latter body. He has been a large and successful exhibitor at the annual shows of both societies, and on one occasion gained the championship at the Royal for a merino ram. At the Wellington Show of 1905 he was awarded first prize for the largest exhibit of farm produce, his exhibit displaying 250 varieties. While at Kimberley he served as a member of the local roads board, and has acted in the same capacity at Bunbury for eight years. He is a

cc

with the ironmongery trade, but subsequently spent a few years in farming pursuits in Essex. In 1888 he came out to Australia, and after spending some time on Mr. Thomas Hayward's farm at Wokalup he

W. J. Ford, Bunbury.  
MR. ARTHUR ROBERT FOREMAN.

notice then conducted operations on his own account until 1910, when he admitted as partner Mr. F. W. Roberts, who has since shared with him the general responsibilities of the business. The warehouse is the most important of its kind in the south-western district, including departments for ironmongery, hardware, farming implements, provisions and produce, drapery,

T. HAYWARD & SON'S PREMISES, BUNBURY.

and all of the branches usually found in leading metropolitan distributing centres. The business is not only extensive and far-reaching but exceedingly varied in its character. The ironmongery trade is one of its most prominent features, and the great stock of farming requisites carried by the firm has made it one of the most popular depôts with the agriculturists of the district. Local produce is purchased, and the firm also ships and makes advances on wool. The business was first established by Mr. Thomas Hayward in 1862, and its jubilee in 1912 commemorated the enterprise, perseverance, and excellent judgment which have operated in the building up of the thriving concern which is one of the landmarks in the history of the southern seaport. The firm holds several important agencies, including the South British Insurance Company, Huddart, Parker, & Co., McIlwraith, McEacharn, & Co., and the A.U.S.N. Company. Mr. Foreman spends most of his leisure time in the cultivation of fruit and vegetables in his garden. He holds office as hon. treasurer of the Cathedral Council. In 1890 he married the youngest daughter of Mr. Thomas Hayward, and has three daughters and two sons.

**FREDERICK WILLIAM ROBERTS**, partner in the firm of Thomas Hayward & Son, merchants, of Bunbury, was born at Perth on August 27, 1877, and is a son of the late Mr. George Roberts, Manchester, England, one time manager of the Midland Railway Company, Western Australia. Educated at the Hon. H. Briggs' Grammar School, Fremantle, Mr. Roberts was subsequently associated with railway construction work for a time, afterwards being apprenticed under the late Mr. C. Y. O'Connor as surveyor in the Western Australian Government Survey Department. Having again been employed in the railway service, in 1906 he resigned from the department in order to enter into a business partnership with A. F. Spencer and Co., of Bunbury. He continued in this connection until 1910, in which year he purchased a partnership in the present firm of Thomas Hayward & Son, and has carried on commercial pursuits with the

firm ever since. Mr. Roberts has taken some part in public affairs, and was one of the original members chosen by the Government to form the Bunbury Harbour Board, which seat he has retained up to the present time. For some years he has been an active member of the Chamber of Commerce and filled the presidential chair in 1910.

MR. FREDERICK WILLIAM ROBERTS.

He is also hon. treasurer of the Wellington Agricultural Society. His chief recreation is in swimming, and he is captain of the Bunbury Swimming Club, also holding office as deputy-fieldmaster of the local hunt club.

**EDGAR HERBERT ZÖLLNER**, secretary of Beigel's Brewery, Limited, Bunbury, is a son of the late Mr. Simon Zöllner, of Sydney, New South Wales, in which city he was born on October 11, 1868. He received his education at the Sydney Grammar School and at Queen's and St. Patrick's Colleges, Sydney, and subsequently, for a short time, was connected with commercial life in the employ of Messrs. Roberts, Chambers, & Co. He then joined the staff of the Bank of New South Wales, but relinquished this service to enter upon ecclesiastical studies, which finally he abandoned and returned to mercantile pursuits. In 1896 he left his native State for Western Australia, and for a time occupied a position in the City Engineer's Office at Perth. His next

employ was in the Sherwood Beer Bottling Works, after which he became secretary to the Stanley Brewery Company, Perth, and eventually found his way to Day Dawn, where he spent about a year. Mr. Zöllner came to Bunbury in 1903 as local manager of the Bunbury Brewery Company, a position he held until February, 1912. The company subsequently went into liquidation. In March, 1912, he accepted the post of secretary to Beigel's Brewery, which he still retains. He has always taken an active interest in political questions, and in 1898 was elected secretary of the Western Australian Federal League, holding this post until within a fortnight of the taking of the referendum, when he was obliged to resign for business reasons, but retained his seat on the committee. He was secretary of the Western Australian Freetrade and Liberal Association, which organized the first Federal freetrade

W. J. Ford,

Bunbury.

MR. EDGAR HERBERT ZÖLLNER.

campaign in the State, and in this connection it is worthy of note that of the first eleven members sent to the Federal Parliament nine were freetraders. Mr. Zöllner contested the North Perth seat in Parliament without success in 1901, and had a similar experience a few months later. His wide interest in the affairs of the south-western district led to his nomination as the Government official candidate for the Bunbury seat in the Legislative Assembly when Sir Newton Moore was appointed as Agent-General

in March, 1911, but he was again defeated as the result of the passing of the Labour wave over the State. Mr. Zöllner is a member of the Chamber of Commerce, and is connected with the South-Western and Commercial Clubs. He married Florence Edith, daughter of Mr. Edwin Hay, of Newcastle, New South Wales, and has one daughter.

**HENRY HERBERT ABRAHAMSON**, shipping agent and commercial broker, Bunbury, is a son of Captain J. G. Abrahamson, harbourmaster of that port, and was born in London on December 27, 1877. He received his education at the Ongar Grammar School, Essex, and upon leaving school in 1892 came to Western Australia. He started business life in a mercantile office at Fremantle and spent five years at this seaport, at the end of

W. J. Ford, Bunbury.  
MR. HENRY HERBERT ABRAHAMSON.

that period proceeding to Kalgoorlie, where he continued his commercial career. In 1902 he came to Bunbury and established his present business, which he has carried on ever since. He represents a number of shipping, commercial, and industrial firms, including the P. & O. Steam Navigation Company, Messrs. J. & A. Brown, the South-Western Timber Hewers' Co-operative Society, the Collie Coal Company, Limited, Messrs. J. & W. Bateman (Fremantle), W. Thomas and Co., Limited, Shirley Limited, cc2

North British Insurance Company, Limited, and the Queensland Insurance Company, Limited. A follower of various kinds of outdoor sport, Mr. Abrahamson is chiefly devoted to the game of bowls and fishing. He has an orange grove at Harvey, with about ten acres of trees in bearing, where he spends much of his leisure time and finds recreation in the various processes of horticulture which this hobby entails. He is a member of the South-Western Club. In 1907 he married Ethel, daughter of Sub-Inspector Osborn, of Perth, and has a son and a daughter.

**AUGUSTUS FREDERICK SPENCER**, shipping and coaling agent, Bunbury, is a son of the late Hon. William Spencer, M.L.C., who arrived from England by the sailing ship "Trusty" on May 31, 1841, and was one of the very early pioneers in the south-western district. He took a very active part in the early development of the district and occupied a seat on the Council Trust before Bunbury was gazetted a mayoralty, subsequently being elected to the mayoral chair on five different occasions. The subject of this notice was born at Bunbury on August 21, 1872, and received his education at Hon. H. Briggs' Grammar School, Fremantle. Having concluded his scholastic career, he joined the firm of D. & W. Murray, with whom he continued for five years. He then entered into partnership with his brother, Mr. C. E. Spencer, and took over the business established by his father as W. Spencer and Sons, in Bunbury, many years previously. After carrying it on for nine years, in 1908 Mr. Spencer bought his brother out and opened the present business of Messrs. A. F. Spencer & Co., shipping and coaling agents, in connection with which he holds the agencies for the Timber Corporation, Limited, Messrs. Howard Smith & Co., the Collie Co-operative Company, Messrs. Lewis & Reid, timber contractors, etc., and also represents Dalgety and Co., Limited, in Bunbury. His first connection with municipal life took place in 1899, when he was returned as a member of the local council, and extended in all over nine years, during four of which he acted as treasurer. Mr. Spencer takes very great interest in sporting

matters and was secretary of the Bunbury Race Club for twelve years. He is a member of the South-Western and Commercial Clubs and has actively concerned himself in the advancement of the local football club since its inception in 1896. He is a member of the committee of the local chamber of commerce. In 1897 he married

W. J. Ford, Bunbury.  
MR. AUGUSTUS FREDERICK SPENCER.

Maud, daughter of Mr. G. R. Teede, and has a son and a daughter.

**FREDERICK OSCAR BENCKENDORFF**, shipping, forwarding, coaling, and insurance agent, Bunbury, is a son of the late Mr. William Oscar Benckendorff, a member of the well-known firm of Benckendorff, Berger, & Co., of Lloyd's Avenue, London, in which city the gentleman under review was born on January 30, 1869. He attended schools in London and Hamburg, and upon the completion of his education gained a wide experience in merchant shipping offices in Stettin. Upon his return to London he was engaged in the ship chartering trade for some four years, and at a later date was stationed at Havre as superintendent of logwood cargoes from Jamaica, whence he transferred to a shipping company's office at Bordeaux. After a brief visit to London he left for Australia in 1892, and upon arrival in Melbourne joined the firm of Wenz & Co., wool

merchants, of that town. Eventually coming to Western Australia he was appointed attorney and secretary upon the flotation of the Imperial Jarrah Wood Corporation, Limited, which had its headquarters at Bunbury, and continued in this position until 1903, when an amalgamation with the Millars' Karri and Jarrah Timber Company

W. J. Ford, Bunbury.  
MR. FREDERICK OSCAR BENCKENDORFF.

took place. He then commenced business on his own account as shipping and forwarding agent, and continued steadily to embrace every opportunity of extending his business until to-day it is one of the most important of its kind in the place. Mr. Benckendorff paid a visit to Europe in 1905-6, and was mainly instrumental in introducing Collie coal to the notice of European shipping companies. For some ten years he has held the agency for the Collie Proprietary Coal Company. He is also local representative for the Commercial Union Insurance Company in all its branches. Public affairs have received a share of his attention, and at one period he held a seat in the Bunbury Town Council, whilst at present he occupies the position of chairman of the Bunbury Chamber of Commerce. He is a member of the South-Western and Commercial Clubs and follows aquatic sports as a pastime. In 1894 he married Eleanor Hauteville, daughter of Mr. Mitchell Tartakover, of Melbourne, and has a son and a daughter.

Captain RALPH R. EDWARDS, master stevedore, Bunbury, is a son of Dr. Thomas Patrick Edwards, of Wales, latterly of County Meath, Ireland, where the gentleman under review was born on August 27, 1864. He received his education at King William's College, Isle of Man, and subsequently joined His Majesty's training ship "Conway," two years later serving his apprenticeship to the mercantile marine service with a Liverpool shipping firm. He took his master's certificate in 1888 after successfully passing his earlier examination in 1883, and was appointed to the command of one of the Barrow Steam Navigation Company's steamers trading between Barrow-on-Furness and Belfast. At a later

W. J. Ford, Bunbury.  
CAPTAIN RALPH R. EDWARDS.

period he joined the Australian and Vancouver trade, with which he was identified for a number of years, retiring from seafaring pursuits in 1897. Coming to Western Australia in that year, he settled at Bunbury and established himself on his own account in the stevedoring line of business, and since that time has carried on with considerable success. During this period the shipping trade in connection with the port has increased to a large extent, and improvements to the harbour and jetty have been made in response to the demand for greater accommodation and better facilities for shipping. Captain Edwards holds the contracts for

handling the cargoes on behalf of the Timber Corporation, Limited, and of the Collie Co-operative Company, as well as contracts for all interstate shipping companies. He is a member of the South-Western and Commercial Clubs. He married Esther, daughter of Mr. Edward Dixon, of Lancashire, and has a son.

WALTER JAMES COPE, acting local manager (1911) for Millars' Karri and Jarrah Company, Limited, Bunbury, is a native of England, being a son of the late Mr. James Cope, of Tixall, near Stafford, where he was born on August 12, 1865. At the close of his scholastic career in the North of England he entered the employ of his uncle, head of the firm of Watson & Co., builders and contractors, of Darlington, and continued in this connection until his departure for Australia in 1886. Although landing in the first instance at Melbourne, within a few months he arrived in the Western State, where he was engaged in storekeeping pursuits at Geraldton for two years. He then became associated with Messrs. E. and F. Wittenoom, merchants and

W. J. Ford, Bunbury.  
MR. WALTER JAMES COPE.

station owners, only leaving in 1896 to carry out his intention of taking a trip to the Old Country. Upon his return Mr. Cope spent about thirteen months at Kalgoorlie in the sharebroking business, which he abandoned to open in Geraldton as

agent and auctioneer on his own account. In 1900 he disposed of his interests in this district, and after a short time in Perth came to Bunbury, where he joined the staff of Millars' Karri and Jarrah Company, Limited, in January, 1902. During the absence in England in 1911 of the manager, Mr. Balston, Mr. Cope took control of affairs and was acting-manager for some time. He has always been an enthusiastic athlete, and is vice-president of the South Bunbury Football Club and a member of the Football Association Appeal Board. In 1889 he married Mary Adeline, eldest daughter of Mr. Vernon Birch, of Perth, and has two sons and two daughters.

Lieutenant GORDON LEVASON CURLEWIS, Area Officer for the District of Bunbury, is a son of Mr. George Campbell Curlewis, of Victoria, latterly of Western Australia, where he has followed farming pursuits in the great

W. J. Ford, Bunbury.  
LIEUTENANT GORDON LEVASON CURLEWIS.

southern district for many years. The gentleman under review was born at Geelong, Victoria, on March 19, 1885, and came as a child to the Western State with his parents, who in the first instance settled at Geraldton. Here he received his education and began life in a mercantile office at that port. At a later date he was transferred to Fremantle, and continued in the same service until

1909, when he joined Messrs. Dalgety & Co., Limited, with whom he remained for a year. He then commenced business on his own account in Bunbury, with Mr. Lowe forming the firm of Curlewis & Lowe, commission and insurance agents. The firm holds agencies for the leading farm implement machinery and fertilizers, and also does a large business in produce dealing. In 1906 Lieutenant Curlewis joined the Western Australian Infantry Regiment as a private, and in 1907, after passing the necessary examinations, received his commission as lieutenant, and later on was appointed Area Officer for the District of Bunbury. He is a member of the South-Western Club.

Lieutenant ERIC WILLIAM TULLOCH, of the 86th Infantry Regiment, is a son of Mr.

W. J. Ford, Bunbury.  
LIEUTENANT ERIC WILLIAM TULLOCH.

George Tulloch, of Ballarat, Victoria, where he was born on April 16, 1883. His early education was imparted at Ballarat and the Melbourne Grammar School. His studies concluded, he became engaged in the brewing business at Foster's Brewery in Melbourne, where he continued for four years, afterwards enlarging his experience at Maldon, in the same State. In 1905 he came to Western Australia and joined the working staff of the Swallow Brewery Company, two years later accepting the position in Bunbury of brewer in charge of Beigels' Brewery, Limited, where he still remains.

Lieutenant Tulloch began his military career in Perth by joining the No. 1 Battery, Australian Field Artillery, as gunner, and upon coming to Bunbury he received his commission as second lieutenant in "B" Company of the Western Australian Infantry Regiment (now the 86th Infantry). In 1907 he was given command of the company in Bunbury. He is a strong oarsman, and has rowed in three winning teams, representing Victoria in the Interstate Eights. He is a member of the South-Western and Naval and Military Clubs, and is also connected with the South Bunbury Football Club. He married Lillian, daughter of Mr. Edward Temby, of Clunes, Victoria.

JOHN LEMUEL BOLDEN, secretary of the Lumpers' Union, Bunbury, is a son of Mr. Lemuel Bolden, of England, who came to Victoria in the early days of that State. He was born at Gippsland on May 18, 1862, and received his education at a local scholastic

W. J. Ford, Bunbury.  
MR. JOHN LEMUEL BOLDEN.

institution, becoming associated, while still quite a lad, with station life in Queensland, where he remained for a number of years. In 1896 he left for Western Australia and with the exception of a few months spent at Kalgoorlie has since been working in the timber trade in the south-western district. He was elected secretary of the Lumpers' Union in 1901 and served a term of two years, being

again appointed to the position in 1907, since when he has held it continuously. In 1909 he was elected to a seat on the Harbour Board at its inception and continues to serve on this body. Mr. Bolden married Jane Maude, daughter of Mr. James Kennedy, of Victoria, and has a son.

**WALTER JACK BUSWELL**, contractor and brickmaker, Bunbury, is a son of Mr. Joseph Buswell, of Oxford, England, latterly one of the pioneers of the Western Australian State. He was born in 1871 at Bunbury, where his father was among the earliest of the settlers, and having completed his education at the local State school he became identified with the brickmaking and contracting trade.

W. J. Ford, Bunbury.  
MR. WALTER JACK BUSWELL.

In 1893 he established himself in business at Bunbury and has since carried on a very thriving and prosperous trade. His works, situated at Glen Iris, are the scene of busy industry. The plant is capable of producing 40,000 bricks per week, and his contracting business has the reputation of being the largest in the south-western district. In addition he is largely concerned in horse-dealing. In 1908 he served a term as councillor in the local municipal body. He is a keen sportsman with the gun and a lover of boating. In 1893 he married Emma, daughter of Mr. Thomas Elliot, of Busselton, and has two sons and four daughters.

**ERNEST JAMES WASS**, partner in the firm of Messrs. Fouracre and Wass, is a son of Mr. William Wass, of Congleton, England, and was born on January 2, 1871. He

W. J. Ford, Bunbury.  
MR. ERNEST JAMES WASS.

received his education at Birmingham, and left for Melbourne in 1888 in order to join the firm of Messrs. King & Co., of that city. Subsequently he enlarged his experience of stock as a boundary rider on various pastoral properties in Victoria, and while in that State commenced business on his own account. Upon arrival in Western Australia in 1895 he came to the south-western district, and in partnership with Mr. Fouracre established the present thriving concern, branches afterwards being opened at South Bunbury, Busselton, and Collie. Messrs. Fouracre & Wass have been very successful exhibitors of sheep, lambs, porkers, etc., at the local agricultural shows, gaining a number of premier awards for their exhibits. Mr. Wass has been a member of the Bunbury Roads Board for a number of years, and is also a member of the committee of the Wellington Agricultural Society.

**OWEN HINKLEY**, manager of the Bunbury Butter Company, Limited, Bunbury, is a son of Mr. Herbert Hinkley, of Buninyong, Victoria, where he was born on July 2, 1877. He received his education in his native town, and at the close of his studies started life

in the dairy produce business and spent twelve years in the Buninyong Butter Factory, latterly holding the position of assistant manager of that establishment. He then accepted the appointment of manager of the Toongabbie Factory at Gippsland, which he occupied for three and a half years, at the end of which period proceeding to Western Australia to open and take charge of the factory established by the Bunbury Butter Company in 1908. This enterprise was inaugurated by dairy farmers and residents of the south-west district and is conducted on co-operative lines, similar to those which have proved so successful in the Eastern States. The expectation that its establishment would give an immediate stimulus to the dairying industry for which the district is so pre-eminently adapted has been amply justified, the output of butter from the factory rising from 23 tons 12 cwt. during the first year to 50 tons 17 cwt. for the year closing in 1911, while the number of farmers to avail themselves of this market for their dairy products has increased from 77 to 160. The plant consists of one churn of 800 lb. capacity and one of 80 lb., the two being capable of turning out six tons of butter per week; a butter worker of 112 lb. capacity, a special up-to-date machine for purifying the cream, and a refrigerator of 3 tons capacity. The testing of the milk is done by a Babcock tester, and the most perfect cleanliness prevails throughout the factory, which is rapidly growing in public favour. About two-thirds of the butter manufactured is sent to Perth, the balance being disposed of locally. Various awards have been gained in open competition, including first prize at the Royal Show, Perth, and first prize at the Wellington Show in 1908, and two gold medals at the Franco-British Exhibition held in London in the same year. Further honours were gained in England when the firm's exhibit at the Islington Show of 1911 was awarded 91 points, being in advance of many Victorian and other prominent brands. Under Mr. Hinkley's capable management the concern has weathered all initial difficulties, and it is confidently expected that each year will witness a substantial increase in the output, to the benefit of the producer and the consumer alike.

The PRINCE OF WALES HOTEL, Bunbury. This popular house was established in 1882, and has continued to uphold its reputation during the long period that has

W. J. Ford, Bunbury.  
MR. WILLIAM LAWRENCE MARSH.

elapsed since it first opened its doors to the travelling public. Of more modest pretensions in the earlier stages of its existence, it has in the course of the years undergone many structural changes, and was practically rebuilt in 1906. It holds a central position off the main thoroughfare of the town, and, being about three minutes' walk from the

railway station, finds favour in the sight of the many overland travellers who visit the southern port. A fine brick structure, two stories in height, with a frontage toward Stephen Street, it boasts the great addition of a fine wide verandah, running the full length of the house, from which a splendid view

Darling Ranges where they meet the coastline. The accommodation of the hotel is liberal and arranged with a view of securing the greatest possible comfort and convenience to visitors. The twenty-five bedrooms are furnished in modern style, with the usual appurtenances of such apartments, and all the appointments

Photo by W. J. Ford.  
DINING-ROOM OF THE PRINCE OF WALES HOTEL.

may be obtained of the northern part of the town, including the harbour, and shipping, the Estuary, with its sunlit waters running far inland, and in the distance the

of the dining-room are such as to commend it to the most fastidious even of those accustomed to the many etceteras of fashionable dining in the Old World. The drawing-room furnishings are carried out on a tasteful and luxurious plan, the seductive lounge and easy chair providing reposeful resting-places for the summer visitor, healthfully weary with long days spent on the beach or other places of recreation in the neighbourhood. The reading and smoke rooms are replete with every convenience, and there are two travellers' sample-rooms for the special use of the "Knights of the Road," of which full advantage is taken, this being one of the recognized houses of call of the Commercial Travellers' Association. The stable accommodation is excellent, comprising three horseboxes and three stalls, while shelter for motor-cars is also provided. The cuisine is carefully attended to, and under the capable supervision of Mrs. Marsh, who in every way makes a study of the comfort and welfare of her patrons' necessities, leaves little to be desired. Every attention is given to

Photo by W. J. Ford.  
MR. W. L. MARSH'S PRINCE OF WALES HOTEL, BUNBURY.

all the details of house management, and the "Prince of Wales" being a family as well as a commercial hotel is extensively patronized during the season by visitors from the goldfields and other localities, including the metropolis, and by business people all the year round. WILLIAM LAWRENCE MARSH, the proprietor of the above establishment, is a native of Wales, having been born in Carnarvonshire, and first came to Australia in 1882, sailing by the old

Orient liner, s.s. "Lusitania." He first landed in New South Wales, and made his acquaintance with the conditions of life under the Southern Cross amid the older established civilization of the Mother State. Desiring to enlarge his knowledge of the continent, and perceiving wider openings for a man of enterprise and ability in the virile life of the younger Western region, he came to the Crown colony in 1889, and after a time proceeded to Cossack, where

for several years he was identified with the management of the White Horse Hotel, of which Mr. J. Ellery was proprietor. In 1897 Mr. Marsh took over the lease for eight years of the Prince of Wales Hotel at Bunbury, at the expiry of that period purchasing the premises, to which from time to time all the modern improvements found in the metropolitan houses have been introduced as opportunity has offered and the increase of business warranted.

### PICTON JUNCTION TO BUSSELTON.

Leaving the south-western railway at Picton Junction, we may proceed further into the heart of the south-western country by a line which at Boyanup goes off in two directions—the one leading to Busselton, and thence to Barrabup and Nannup, two timber centres of considerable activity, and the other proceeding to Bridgetown, with branches off to Boyup Brook and Jarnadup. Many of the stations along these lines are only timber or agricultural depôts, and can scarcely be dignified even with the name of village, but to the observant traveller they are evidence of the expansion that is taking place in settlement, and signposts directing his attention to the agricultural possibilities of the State.

Busselton, which has come to be known as the sanatorium of Western Australia, lies within the shelter of Geographe Bay, some 30 miles south of Bunbury. It is named Busselton after the founders of the place, while the district and the river are better known as the Vasse and received their name from M. Le Vasse, the captain of the French corvette "Naturaliste," which visited these shores as long ago as 1801. The immense headland which stretches out north and west and forms a natural barrier between the calm waters of the bay and the great rollers of the Indian Ocean, is called Cape Naturaliste after the same ship, while her consort is responsible for the nomenclature of Geographe Bay. From a historic standpoint the Vasse possesses features of great interest, as it dates back to the early days of Western Australian colonization. One of the earliest settlements established by Captain Stirling was at Augusta on the south coast. Among those who agreed to pioneer the district were some members of the Bussel family. After a time they found that the cattle strayed away from Augusta, and on following them discovered them quietly grazing on the richest stretch of pasture that the pioneers had up to that time seen. Recognizing that his cattle were better judges than himself, Mr. J.

Bussel secured this tract in exchange for his land at railway runs out to Barrabup and Nannup, where there residence there in 1834. The following year the Government Resident, Captain J. Molloy, removed from Augusta to the new district, and the town of Busselton was founded. Up to some twenty years ago Busselton was merely a charming country village, with grass-grown streets where arum lilies rioted in profusion. Even in those days it had achieved a distinction in the minds of newcomers from the Eastern States, as most of the steamers used to call there on their way round to Fremantle, and to the weary travellers, tossed by the seething waters of the Leeuwin, the little hamlet seemed a haven of desire. To-day Busselton is the centre of a great farming district and the port of shipment for most of the timber cut in the forests of the Leeuwin. It has several places of worship (the Church of England being one of the oldest buildings in the State), several schools, mechanics' institute, and bowling green. Its jetty is  $1\frac{1}{2}$  miles long, with berthing depth at low tide of 23 ft., and its harbour is considered to be one of the finest anchorages in the State. Its cool, temperate climate, excellent beach, and well-established bathing facilities have made it one of the favourite summer resorts. In fact, if to these we add the caves, which are reached by daily motor service from the town, and where in addition to the scenery there is excellent boating, bathing, and fishing, Busselton can probably claim to be the most-favoured haunt of the holiday-seeker.

From Wonnerup, close to Busselton, a line of railway runs out to Barrabup and Nannup, where there are several timber mills of considerable size and importance. The railway service at the same time taps an extensive agricultural area, where extensive dairying operations are carried on. In fact, one of the charms of Busselton is the excellent home-grown dairy produce always on hand to tempt the jaded palate of the city-dweller.

CHARLES HENRY LEWIN, "Riverdale," Picton, is a son of the late William Lewin, of Victoria, and was born at Ballan on February 18, 1872, where also he received his education. He was early associated with farm life, and eventually went on to a sheep station in Victoria,

W. J. Ford, Bunbury.  
MR. CHARLES HENRY LEWIN.

during the nine years spent in this way gaining valuable experience in various classes of work. In 1891 he left his native State for Western Australia, and upon arrival opened a butchering establishment at Bunbury, where he has since built up an extensive connection. In conjunction with this business Mr. Lewin has gone in largely for stock breeding, sheep, cattle, and horses all coming in for a share of his attention. He has at different times leased various properties, including Mr. Charles Brockman's "Sandridge" Estate, near

Picton, which he held for three and a half years, and "Greenham Park," at Boyanup, consisting of 1,000 acres, which he still holds and uses for fattening stock. Later he bought from Mr. T. A. Piggott the 25-acre holding originally taken up by Mr. M. Bunbury, and known as "the pick of the south-west farms." It is situated about half a mile from Picton, on the banks of the Preston River, with a well-drained swamp on the further side, and is very favourably situated for retaining the reputation it has already secured as the model farm of the district. On one side of the Picton Road is the old homestead holding, where two acres of good soil have been set apart for

means of which the water is raised from the river. The sprinkler system has been adopted for the irrigation of an area of  $3\frac{1}{2}$  acres, the 2-in. distributing main being provided with sprinklers at intervals of 40 ft. The dairy is built on the most up-to-date sanitary design, with double walls, the outer ones of weatherboard and the inner of iron, with 18 in. of space between which is filled up with sawdust. The floor is of cement, and the apartment is kept cool and flyproof through the hottest days of summer. Equally modern are the piggeries, where the prize Tamworth and Berkshire swine lead an ideal existence whilst fattening for the market. An excellent

the cultivation of all classes of market garden produce. Adjoining this are the lucerne paddocks and the portions devoted to the growing of barley, oats, and potatoes. There is an extensive irrigation system, the plant comprising a  $3\frac{1}{2}$ -h.p. Petter oil engine, pump, tanks, etc., by

system of drainage has been introduced, water being laid on by which the styes are frequently cleansed, and three times weekly the floor is strewn with fresh rushes. Most of the food is provided by the vegetable garden, and is cooked in steam-heated coppers conveniently placed. A

cross of very fine early porkers is obtained from the above-mentioned breeds, and in every respect this department maintains the repute of the farm. The slaughterhouse has been installed with the latest machinery and improvements, and every attention has been given to sanitary arrangements and methods for rapid handling, the motto of perfect cleanliness being writ large over the whole of the establishment. The old homestead, of roomy, bungalow design, has recently been abandoned by Mr. Lewin for a charming six-roomed modern residence, erected on a pleasantly-situated site not far from the original dwelling. Mr. Lewin has been a most successful exhibitor of stock and produce at the local agricultural shows, and, in 1910, out of thirty-three exhibits, secured twenty-five first and eight second prizes. He has been a member of the Roads Board for the past four years, and is a committeeman of the Wellington Agricultural Society. He is a vestryman of the South Bunbury Anglican Church, and takes great delight in shooting and hunting. He married Blanche, daughter of the late Charles Howard, of Victoria, and has two sons and two daughters.

**GEORGE FORREST, J.P.,** "Leschenault Mill," Picton, was born on the property where he now resides on November 19, 1858. He received his education locally, and from an early period was associated with his father in the milling industry on their own holding, where he has spent the whole of his life. The development of the land has occupied a large share of attention, and 120 acres have been cleared out of an area of 540 which comprises the extent of the property. A considerable portion of this cleared country is devoted to fruit-growing, 25 acres being planted with apples and stone fruits of different varieties, a fine orangery also being included within this area. Crops are cultivated, the average yield of hay being about a ton to the acre, and Mr. Forrest has put down an irrigation plant comprising a 12 horse-power Tangye engine, with 7-in. pump and 6-in. delivery main, imported direct from England. Following the completion of this scheme Mr. Forrest extended his dairying operations and increased the herd of Ayrshires, which have already gained many

prizes at the Bunbury Agricultural Show. Among the representatives of Victorian stock of his own importation is the Ayrshire bull "Chieftain," which gained the championship at the Royal Show, Perth, in 1910, and was shown with equal success at Bunbury, Bridgetown, and other district shows. He has also received awards for the ram "Mariner," imported from Victoria, and carries on sheep-raising with satisfactory results. Mr. Forrest was gazetted a Justice of the Peace for Wellington district in 1894. His time is chiefly filled with orchard work, but in leisure hours he finds recreation in fishing and shooting. He married Alice Helen, daughter of the late Mr. W. O'Neil, of Ireland, and has a son and three daughters.

**WILLIAM RAMSAY,** grazier and farmer, "Minninup," Capel, was born at Bunbury in 1856. He is a son of Mr. William Cunningham

*C. E. Farr, Perth.*  
**MR. WILLIAM RAMSAY.**

Ramsay, formerly of Ayrshire, Scotland, who came to Western Australia in 1846, and was one of the first settlers in the Bunbury district. After a preliminary course of education in his native town he attended a school at Perth and finished his scholastic career at a college in the city. Returning to his father's homestead he went to work on the estate, which at that time consisted of about 360 acres. This area has been added to by the purchase of adjoining land, and at the present

time 5,000 acres are owned and worked by Mr. Ramsay. The property lies about half a mile inland from the Indian Ocean, and is situated 12 miles from Bunbury and 18 miles from the Vasse. A considerable portion of the estate was originally under water, but by a natural system of drainage, which has carried the superfluous moisture seawards, it has been converted into first-class grazing land, and stock fattens well on its pastures. From time to time Mr. Ramsay has made importations from the Eastern States of horses and cattle for breeding purposes, and has produced some high-class stock, which he has exhibited with considerable success at the local shows. For five years he occupied a seat on the Bunbury Roads Board, but latterly has devoted the whole of his time to the development of his station, which is about the finest in the district.

**GEORGE EDMUND DILLEY,** farmer, "Colenso," Capel, is a son of the late Mr. William Dilley, of the Life Guards, Bedfordshire, England, and one of the early pioneers of the south-western district of Western Australia, where he arrived about 1837. The gentleman under review was born on his father's property at Capel on June 22, 1868,

*C. E. Farr, Perth.*  
**MR. GEORGE EDMUND DILLEY.**

and received his education locally. After some time spent on the home farm he was apprenticed to the watchmaking trade at Capel, and
